OPINION OF CHARLES COWAN, ESQ., M.D., L.R.C.S.E. Senior Physicicn to the Royat Bortsh
Physician to the Reading Dispenscry,
"Dr. Cowan is glad to find that the Profession has some reasonable guarantee for a gennine article. The material now
sold varies in almost every establishment where it is purchased, and a tendency to prefer a colourless and tasteless Oil, it not counteracted, will ultimately jenpardise the reputation of ant
unquestionably valuble additinn to the Materia Medica. Dr. Cowan wishes Dr. De Joxge every success in his under-

[^9]

## Nows of the rexerk.

Mr. Buchanan has been elected President of the United States, by a majority of 38 over Colone Fremont in the electoral vote, and by a majority of 155 over Mr. Filimore, who only obtained 8 votes from Maryland, the only State which voted for him in the electoral college. Deduct ing these 8 votes, the absolute majority obtained by Mr. Buchanan was 30 , a very small majority compared with that of 212 obtained by Mr. Pierce in 1852. If the election had depended on the popular vote Colonel Fremont would have been elected by a large majority obtained exclusively from the Free States, all the Slave States having given their popular votes in favour of Mr. Buchanan, with the single exception of Maryland, which divided its votes between Mr. Buchanan and Mr. Fillmore. In the Free States Mr. Buchanan obtained 348,294 popular votes, and 108,435 in the Slave States, making together 456,729; Colone Fremont obtained 554, 187 in the Free States alone, and Mr. Fillmore obtained 199,934 in the Free States, and 26,192 in the Slave States. Colonel Fremont therefore had a majority of 97,458 popular votes over Mr. Buchanan, and a majority of 328,061 over Mr. Fillmore, his absolute "plurality" in the Free States being 205,893 , while that of Mr. Buchanan in the Slave States was 82,243 . Of the result of this election it is at present difficult to speak. Mr. Buchanan's confidential organ in the Southern States declares that the programme of his policy will comprehend the admission of Kansas as a Slave State, the reduction of the whole of Central America to a slaveholding confederacy under General Walker, a descent from Nicaragua upon Cuba and the West India Islands genetally, the re-establishment of slavery in those islands where it has been abolished, and the annexation of the whole group to the Union. On the other hand, it is believed in quarters likely to be well informed and free from the influence of party, that Mr. Buchanan's policy as President of the Unites States will he widely different from that which he deemed expedient as a candidate for that high office.

## 

The Court. -The Queen, Prince Albert, and the Royal family continue at Windsor Castle. On Thurs. day evening the 13th her Majesty received by electric telegraph intelligence of the death of the Prince of Leiningen, which took place at Wald Leiningen, on the morning of that day. Immediately after the
receipt of the news her Majesty and Prince Albert visited the Duchess of Kent at Frogmore. On Friday morning the Queen and Irince Albert again visited the Duchess of Kent. On Saturday the Queen and Prince Albert walked in the Home Parl, and visited the Duchess of Kent. On Sunday morning the Queen and Prince Albert, the elder members of the Royal family,

Divine service in the private chapel of the Castle ; Dean of Windsor officiated. On Me the Castle ; the Queen and Prince Albert walked in the crounds adjoining the Castle. The Princess Royal and Princess Alice walked in the Home Park. Frince Arthur and the drive. Prince Frederict Louisa took a carriage out shooting. On Tuesday the Queen and Prince Albert walked in the IIome Park, and visited the Duchess of Kent. Prince Frederick William of Prussia visited the Duchess of Cambridge at Kew. Oalked in the morning the Queen and Prince Albert walked in the gardens of the Castle. The Princess Royal walked in the Home Park and visited the Duchess of Kent. The Princess Alice also walked in the Home Park. The Princesses Ifelena and Louisa and Prince Arthur took a carriage drive. Prince Frederick William of Prussia went out shooting. On Thursday morning the Queen and Prince Albert walked in the Home Park and vinited the Duchess of Kent. Princs Arthur and the younger Princesses took a carriage drive. The Duchess of Atholl has succeeded ViscountessJucelyn as lady-in-waitivg, aud General Sir Edward Bowater has succeeded the Hon. M. Sackville Weat as groom-in-wniting to her Majesty

I'rince Alpred arrived at Heidelberg on the 10th inst. with his tutor and attendants, and remained there two days, after which he continued his journey by way of Constance to Geneva, where he arrived on Monday. Court Mourning.-Orders were issued on Tuesday from the Lord Chamberlain's Office for the Court to go into mourning on Tbursday the 20 th inst., for the late Prince of Lenningen, to change the mourning on the $27 t h$, and to go out of mourning on the 4 th December. The Cabinet. - A Cabinet Council was heid on Monday, and was attended by all the Ministers. Anotber Council was held on Tuesday, and another was held yesterday.
he Persian Expedition.- Sir James Outram, K.C.B., left Southampton on Thursday for Bombay, in order to take the command of the Britısh foree destined to operate against Persia.
The Church. - The ceremony of confirming the elecThursday in St. Mary-le-Bow Churels, Cheapside. The consecration of the new bishop will take place to-morrow in Whitehall Chapel, when the sermon will be preached by the Rev. G. E. L. Cotton, master of Marlborough Durge.-The confirmation of Dr. Longley, as Bishop of Durnam, took place yesterday in York Cathedral-1t is signad the Bishop of Rochester contemplates
The Army.-Major General Sir J. H. Schoedde, K.C.B., has been appoisted Colonel of the 2d. Foot, in the roum of the late Sir J. Rolt.
Board of Iniand Revenue-Mr. Pressly has been appointed clairman of this Board in the room of the late Mr. Johu Wood; Mr. Herries has been appointed deputy-churman ; Mr. Keogh the chief secretary and Mr. Dobson the chief clerk of the Excise department, have become members of the Board.
The German Legion.-The steam troopship Vulcan, the freight ships Covenanter, Stamboul, Forerunner, and Abyssinian, have left Portsmouth this week with detachments of the German Legion for the Cape.
The Education Question.-A Couference toolk place at Manchester on We.lnesday, at the suggestion of Mr. Cobden, between Sir John Pakington and the principal gentlemen connected with the rival schemes of educawere originating in that city. The gentlemen preseat were Mr. Bazley, who presided; the Revs. Canon Cliftou and Dr. MiKerrow ; Messrs. H. J. Leppoe,
J. A. Nicholls, R. Gladstone, P. Bunting, R. W. Sniles, and C. H. Minchin. The following were the points on which agreement was arrived at, with the understanding that none of the part.es with whom the gentlemen preseut respectively acted or had acted, were to be held committed to them :-

That it is desirable to impose a rate for the support of popular indtruction in Manchester. 2. That all shoold deriving
aid from the rate fhall be sibjet to inquection but such ing tion shall not extend to the religions iustruction given in such schools. 3. That all sehools shall be entitied to aid, provided the instructic $n$, other than religious, shall come up to the required grounds. \& \& That the distinctive religious formularies, the the tanght, in sclionls connected with the different religious whero
minations, and reno minations, and receiviny aid from the rate, shail be given at
separaie hours, to be specified by the mankgers, to facilitate the with drawal of oljecting chiliren. ${ }^{5}$. That there shall be no

## yroretgh.

France.-The Swiss General Dufour has arrived in Paris, charged by the Federal Council with a mission to the French Government relative to the diference between Neufchâtel and Prussia. The Russian squadron Balved at Cherbourg on the 12 th , on its way from the Wibo the Mediterranea. It was composed of the Wiborg line-of-battle $\cdot$ ship, bearing the flag of Admiral Behrens, and the Puikam and Kastor trigates, and has simee been joined by the brig Philnetete. On entering the port the usual salutes were exchanged. The Assemblee Nationale, which is supposed to be the organ of both the Orleanist and Legitimist parties, contains an article headed "Let us be the Allies, and not the Tools of England," in which the theme English aggression and perfidy is treated with more than the usual amount of bitterness, and the
alliance of Russia covertly recommended. The follow
ing is an extract from the article, which is too lon
ing is an extract from the article, which is too lon

 derance, which is the cause of the feeling of union which exists
between the penple tan the croverrment of Englaud: and, although thie is much in English history which merits etertual
condemnation, we cannot help admiring the harnoony which is
thas able to resist all the chances and changes of political life. thus able to
indeed, we
Franoe with
Spans-The state of siege was raised on Saturday throughout Spain ly Royal decree. Negotiations are Princes and the reigning branch of the Spanish Bourbons. The Gazette publishes a Royal decree giving fresh sanction to such sales of Church property as were effected before the decree of suspension. A report has been current at Madrid that Senor Bravo Murillo was about to be
appointed Minister to London. It is however considered Lighly improbable that the Spanish Government can contemplate such a step, as it was Senor Bravo Murillo by whom the scheme for the confiscation of the overdue dividends on the forei,n debt was concocted and carried her way to Rome.
Maderpa. - In spite of the prompt and chavitable aid rendered by the British Government and people to the cholera, the Church authorities of Funchal still cherish their old principles of bigotry against Protestantism. Rita Gomez, a Porturuese Protestant, died at Fuuchal towards the end of last month, and the lioman Catholic authorities laving refused permi
Denmark.-A rumour is current at Copenhagen that King Frederick VII. has serious intentions of abdicating and of retiring to Switzerland with the Countess Danner, his morganatic wife. Should this design be carried into effect, Prince Ferdinand, who has been just restored to the command of the army, will suceeed to the throne. A Danish company has obtained a concession for a submarine telegraph from the island of St. Thomas in the West Indies to the United States, Mexico, and the islands in the Gulf.

Belgium. - A marriage is announced between the Archduke Maximilian, brother of the eimperor of Austria, and the Princess Charlotte of Belgium, daughter of King Leopold, and first cousin of Queen Victoria. The Prince is 24 years of age, and the Priucess not 17. SWitzerland.-The mission of General Dufour to the Emperor of the French is considered a pledge that the Neufchatel question will be amicably solved. It is believed that if the prisoners are released, the King of
Prussia will not be exacting as to the conditions under which his sovereignty over the canton Inowledged.
Nassau.-Some hope was entertained in Germany that the example set by Prussia of abolishing the gaming talules would be followed by the minor states of Germany. A Nassau paper, however, announces that the duke has concluded a contract with a Berlin house giving them also an additional month fin the year to carry on their trade. The lessees engage to pay 10,000 florins a year to the support of the theatre, and 50,000 to the musical bands.

Bavaria. - Very great excitement has been produced in Bavaria by the High Consistory of the Lutheran Church of the Confession of Augsburg insisting on auricular "confession and strict church dis ipline." The laymen are extremely indignant, and declare that they will not agree to any other than that public confession which is customary at certain stated periods when the clergyman publicly asks his hearers whether they repent them of their sins, and on their replying in the affirmative tells them that God grauts remossion The High Consistory it appears wishes to bring private confession into fashion, and as its members are employés of the State, all measures which tend to increase their power are looked on with extreme suspicion.

Prdssia. - M. Lindenberg, who was convicted in the affair of the Stolen Despatches, has petitioned the Prince of Prussia for pardon. The Prince has replied that the appeal against the sentence must first be withdrawn, which Lindenberg has just done, and renewed his petition for pardon.

Austria. - The Emperor and Empress of Austria left Vienna on the morning of the 17th for Italy. They iftend to stay three weeks in Venice, but it is doubtful if their Majesties will visit Milan. Sir Hamilton Seymour was the only diplomatist who received a special Invitation to accompany the Emperor on this Italian tour. This is the most marled indication which has
yet been given of the close alliance between England
and Ausria. The ill feeling Letween the Courts of
Vienna and Sh. Petersburg is understoot to have undergone no diminution; on the contrary, there is reason to
believe that the relations between Russia and Austria have become of a very delicate character, and that the
petty vexations to which Prince Esterhazy, the Austrian Anliassador at the Czar's coronation, was subjected at Moseow, have contributed to male matters worse be-
tween the two Courts. It is a fart that since the return of Prince Esterhazy the sympathies of the high Austrian aristocracy for Russia have greatly diminished.
Italy.-The Révuc de Paris pub ishes the following curious correspondence. The first is a letter addressed to the present King of Naples by Louis Philippe three moaths before the accessiou of King Ferdinand II. The second document is the reply of the King
 Ister, accordingly as the stern measurea of Prince Metternich may
hasten or postpone it. Your Majesty Fill be drawn into the

England, if she does not anticipate me, will not leave me alone,

## nexs to exp.

lively sympathy and my warnest wishes that you may succeed
in mastering that ungovernable people who make France the
curse of Europe.
" FERDINAND."
Russia. - The Grand Duchess Marie, sister of the Emperor, and widow of the Duke de Leuchtenberg, who way mentioned last week as likely to become the second with or without the consent of her Imperial brother the Count Gregoire Strogonoff, and to have left St. Petersburg with the Count on a tour of Europe The Emperor of Russia in a letter to General Luders giving him lave of absence for a year on
accuunt of his health, significantly expresses his "hope that if circumstances give occasion to recall him to employment before the expiration of the period named,
he will come to resume his duties with the sume zeal career. The Russian organ Le Nord has contained of late several articles which are considered on the conti nent as semi-official manifestoes againgt England, In one of these it protests, in language which might be suitable had Russia been the victor instead of the conquered, against the conduct of Austria and England, in attempting, single-handed, to enforce the execution of the Treaty of Paris. It says that such pretensions are
not to be tolerated; or if they are, then France and Russia, to compel Austria and England to execute thei engagements, should send back troops to Turkey and to to sanction so flagrant a violation of the law of nations. In another article, the Nord, indignant at the late vindication of English policy in the Siede, makes the following attack on the part taken by England in the Blach Sea, the language of which, it will be observed, bears a strong resemblance to that used by the Orleanist organ in Paris, as noticed in our French news
"The reasnn why Le sitcle has had the degrading courage to
declare itself the partisan of this insnlar policy is not a secret
it proclains itself evea to-day: it is aimply becanse it is

## sometimes i

'I'Urkrr.-Accounts from Constantinople to the 9 th Cabinat all the Ministers remain in Redschid Pacha's Cabinet except the Grand Vizier Aali Pacha. The
speech of Lord Stratford de Redcliffe, and the reply of the Sultan, at the investiture of his Majesty with the Order of the Garter, have been published in the Turkish journals. The Sultan expressed the great gratification he experienced at the fresh confirmation now given to his alliance with England. Sir C.G. Young, Garter
King-at-Arms, has received a maguificent diamondmounted sabre from the Sultan

The Blace Sea.-It is rumoured in Russian circles that, with a view to settle the difference respecting the Isle of Serpents to the satisfaction of all parties, Russia has proposed that the island shall be neutral, and that it shall be placed under the management of a mixed commission, who shall provide for the maintenance of the lighthouse. Two Enghish frigates and a despatch steamer are always at anchor off the island, while another English vessel is continually cruising between it and Odessa-with a view of watching the movements of the Russians, and preventing them from communiTurkish soldiers, who live on good terms with the half dozen Russians, who seem deserted in a conner of the island. The regular service of the lighthouse began on
the 15 th ult., and the light is exceedingly brilliant. the 15 th ult, and the light is exceedingly brilliant.

The Principalities.-The journals which attirm that Russia is willing to renounce her claim to the Isle of The Porte is preparing to fortify Giurgevo, and a camp of 25,000 men will be established in the environs.

Sea op Azopr.-An English gunboat has been fired upon ly the fort of Yeniliale, at the entrance of the Sea of Azoff. It appears that the liussian cruisers of Abasia having captured many Turkish vessels laden with contraband salt, Admiral Lord Lyons despatched some gunboats to require an explanation of this capture One of these gunboats, the Badger, was desirous to penetrate into the Sea of Azoff; when the Kussians refused her permission to pass the Strait of Yenikalé and fired upon her.
Candia. - The island of Candia seems to have been the centre of action of the recent earthquake. The number of persons killed during the earthquake in the island was 1970 , viz., 1400 Turks and 570 Christians. The loss of property is estimated at $250,000,000$ piastres. Persia.-The reports of the Persian operations before Herat are extremely conuradictory. One account states that the city has been captured, and that he chief Esa Khan and his sons have been put to deat and quartered ; while another account says that though
the Persian general obtained admittance into the fortress, the Affghans afterwards repulsed them with loss of 1000 dead and wounded, and followed up their advantage and again defeated the Permans in the open field. The success or failure of the Persians appears to be regarded in the light of a party question by the rival factions in Affghanistan, and it is clear that neither f these conflicting reports is to be implicitly relied on A large corpe of Russian troops was moring towards the Persian frontier, in order to maintain Russian influence in the approaching crisis between England and the Shah.
India.-The Indian papers give the following list of the troops and staff destined for the Persian Gulf:H.M. 64 th from Belgaum, the 2d Europeans trom Hy rabad, the 4th Rifies, under Colonel Honner, falion from Hydrabad, the sd Cavalry from Rajkote, 200 sabres of the Poona Horse, unter Colonel Tapp, from Seroor, and a like number of Sappers and Miners from Poona under Major Hill, Captain Blake's troop of Horse Artillery from Poona, Captain Hatch's Company of the lst European Artillery from ''oona, and Brett's Battery from Kurrachee-rmounting in all to about 5000 men. The staff is as follows :-Sir James Oatram, K.C.B., Commander-in-Chief ; General Stalker, second in command; Colonel Leith, Adjutant-General, Cap tain Collier, assistant; Major Pope, or and Thain, Assistants in charge of the Commissariat. The Quartar charge Quartermaster-General Captain Wray and Lieutenant Holland; the Pay Department unter Major Barr, and the Medical Staf under Dr. M•Kenzie. The force, if not very large, is said to be as compact and efficient as need be deaired, that may be assigued to it.

United staths- Whe Presidential election which of Mr. Buchanan. He obtained 163 votes in the Elec toral College, while Culonel Fromont obtained 125, and Mr. Fillmore obtained only 8. In the Fre States Colonel Fremont had a plurality of 205,893 in the popular vote, and a majority of 74 in the Electora rote. In the Slave States Mr. Buchanan had a plurality of 82,243 in the popular vote, and a majority of 104 in the Electoral vote. Mr. Fillmore's 8 votes were given by the Slave state of Maryland. It is expected by the Democratic party, who have returned Mr. Buchunan that this election will decide the fate of Kansas, the preponderance of the slaveholding power, and the ex nasion of slavery into new territories It also indi ates the acquiescence of a majority of the American people in tile principles of foreign policy procluimed by pominent part. The acquisition of Cuba by almos ay meana, and the aseertion of the maniest de ay" of the United States as an excuse for thei gressions on other American States, may ther ore be regarded as the keystone of the foreign polic the Union for the next four years. The official pro ramme of the new President, as laid down in his onfidential organ, the Newo Orleans Delta, is, after the admission of Kansas as a slave State :-

1. The reduction of the whole of Central America to a slave 2. A descent from Nicaragua, by Walker, upon Cube and the 2. A descent from Nicaragua, by Walker, upon Cubs and the hose islands where it has been abolished, and the annezation of 3. The adoption of this policy of slavery extension as
crion-preserving plank in the democratic platform of 1880 .

Australia. - By the packets James Baines an ightning we have news from Sydney to the 23d Augus The Ministry had resigned, and Mr. Cowper had been charged by the Governor with the formation of a new Cabinet, the principal members of which are expected to be Mr. Plunkett, Mr. Isaacs, Mr. Murray, and Mr. lood. The elections for the two Houses of Parliamen ad commenced and there was much political exciteent. Ninety members were wanted for both House -30 for the Upper House, and 60 for the Lower 0 wing principally to the bigh property qualification emanded of the members there was a dearth of candi dates, and there was little or no competition for the Upper House; and even for the Lower House there were several constituencies for which no candidates had presented themselves. In addition to her large cousignment of gold, the James Baines has brought from Melbourne 1000 tons of copper and tin 0re. This heavy cargo is supposed to have been the cause of her long passage.

## $\mathbb{C}$ ith Entelligence

Arrival op Gold.-The packet ship James Baines which has been some days overdue, arrived at Liverpoo on Thursday from Melbourne with 173,539 ounces of gold, valued at 694,156l., being the second largest import of gold by one vessel. The packet ship Light 140,000 arrived on the same day from Me

## fietropolis and tis erctntu.

Tere Deamagr Question.-A deputation from the Board of Works, consisting of the chairman, members of the Board, the engineer, and clerk, had conference with Sir B. Hall on Thursday, as proposed in the recent communication of the First Commissione rejecting the plan which the Board had proposed fo the main drainage of the metropolis. Sir B. Hall read to the deputation a letter from Capt. Burstall, R.N. who had been appointed by the Admiralty, at his request, to survey the Thames and report upon the ebb and flow of the river. The result as stated in the letter showed that the sewage discharged at the point selected by the Board would (during springe) reach the town of Woolwich before it was arrested by the ebb stream, and at the neaps would reach to a quarter of a mile below the Royal Arsenal. Captain Burstall reported further, that the nearest point to London at which the outfall should be made so as at all times to be certain that the fullest proportion discharged at an hour and a half before high water would not flow in or near the inhabited part of the metropolis, is in the upper part of Erith Reach, 15 miles from Loudon Bridge, 7.8 th of a mile from Erith Chareh, and a quarter of a mila below Jermington Point, Dearly opposite Rainham Creek. The additional length of drain necessary to be con-
structed by this outfall is exactly one mile, and the structed by this outfall is exactly one mile, and the additional portion of river above it thus freed from Captain Bursta should be at Rainham Creek, which would be an extension of 5 -8ths of a mile beyond that proposed by the will be Ball informed the depuration by that he did not think he should be justified in asking the Board to go beyond them; bat at the same time they might go oto the German Ocean if they liked. The right hon. baronet added, that when the question of outfalls is satisfactorily settled, the he Govern ill a day lowas lao pabice and the Government, will be to submit the plans which may be put into his hands to the consideralion of one or two of the most eminent engineers in the kingdom, in order that they may check those plans, and adivise him as to whether they embody a sclueme which may with safety, propriety, and expediency be undertaken. In explanation of Sir B. Hall's remark about the German Ocean, we may state that at a meeting of the Board of Works on Friday, a letter was read from Sir Morton Peto in avour of a plan proposed by Mr. MrClean for taking he sewage from West Ham station, in Essex, through Peto says thach into the German Ocean. Sir S. M. fixed sum, and if the Board will pay 4 per cent. on it, and let him have the manure
The New Entrance to St. J
fhe Nbw eniba di. dames's P'ark from Pall Mall next Mariborough House into St. Jumes's Par was permanently opened on Monday, when the following notice was issued by the Duke of Cambridge: "Ordered,
that private carriages and hackney cabs only be permitted to pass through these gates, and procted through he park to the gates at Buekingham Palace.-(Signed Grorge, Ranger. Nov., 1856." The thoroughfare to and from Belgravia and Pimlico through the Park will now be free day and night.
Harrow School Chaprl.-Upwards of 4000k, having been sabseribed towards the completion of this building, he works have now been resumed, and it is hoped that a year's time the two remaining portions of the design, including a beautiful memorial aisle to the Harrow men who fell in the Crimea, will be ready for pire proeted by Mr. Scott, is to be a part of the work The Satubday Haly Holidat.-By an order just issued by the Lord Chancellor the registrar's offices of the various county courts in England and Wales are to be closed on Saturdays at 1 o'clock, thus affording several hours' relazation to the clerks employed.
Tur Late Lord Dudigy Sxuart.-Monday being the anniversary of the death of Lord Dudley Stuart, the Polish exiles assembled at Sussex Chambers, St James's, to commemorate the event by paying a tribute of respect and gratitude to the memory of the departe
champion of the Polish cause. Major Giegud occupied champion of the Polisi cause. Major Gregud occupied Szulczewski said:-"The whole state of Europe point now, as before, to Lord Dudley Stuart's policy as regards Poland, as the only effectual chronic disorde under which it has been sufferiny ever since the annihilation of the national independence. An inde pendent Poland upraised again botween Curope an
Russia is the ouly means of effectually checking he aggressive European policy and her undue influence and power in the West, and is the only basis on which a free Italy and a free Hungary can be permanently establishe and the equitibrium restored, which will leave no other battlefields open to the nations of Europe than those of battlefields open to and moral and intellectual progress."

Law Amendmert Societr, -At a general meeting of this society which took place on Monday evening in Waterloo Place, Lord Brougham who was in the chair, stated that he had been informed by Lor Lyndharat that it was not the intention of Government to proceed in the next session of Parliament with Sir Fitzroy Kelly's measure in reference to the Ecelesiastical Courts. This was a subject of much regret, as
it was to be feared that any new measure to be
propounded by Government would No seos etifecurv correspondence with Sir F . the council of the society had passed a resolution tha it should be referred to a committee to consider and report thereon. Hia lordship moved that that resolution be confirmed. This was agreed to, and the committee appointed. Mr. Hastings the secretary, read a report of a committee on law reporting
which suggeated that an official record of ail judicial decisions should be undertaken by the Government and sold to the pablic at a moderate price, it boing supposed that an expenses of publication would be defrayed by such sale. Mr. Maculuen moved that the report be received. Mr. Serjeant Gaselee strongly protested against Goverument undertaking such a subject as an otticial record of judicial decisions. So far from it conducing to expedition it would be far otherwise, and for numerous other reasons he though such a step injudicious. After some discussion the motion was adopted. Mr. Serjeant Woolrych moved a resolution to the effect that all bills introduced into Parliament ought, after passing throuzts committee, to be referfed and preparation subject to the third reading, for the public service; and thas until the appointment of such ufficer that society should receive, for the purpose of such revision and preparation, any bill originated by, or under the care of, any momber of Parliament who is a member of the society-every effort being made to carry out the utmost economy of language in such acts. The further consideration of this subject was deferred
Crimer and Criminals in the Metropolis.-For ano months past London has lieen labouring under a plague of criminals so accurately known to the police an the Comissioners have actually reported their 38 highway robbers 773 ieglark, 1657
 besides hout of other affonders mot habitually unin besies wost the ofly to 16,900 personally kown to the police the mon dreaded at the present time are the 217 burglars and housebreakers and the 38 highway robbers, the former carrying on their depredations on private houses to the extent of from $40,000 l$. to $50,000 \mathrm{l}$. a-year ; the latter garotting people in the streets, and makiog it dangerous to Walk in any but the leading thoroughfares after dark. It is notorious that all these ruffians, who are mostly ticket-of-leave men, carry on their busiaess as systematically as any trade in the metropolis, and that numerous householders have relt it weensy to arm themselves with revolvers, in order to defend their honses and property and enable their families to pase through the dark and long nights of the present winter in ease and security. In consequence of the general impression that the police have hitherto shown themselves unequal to this emergency, a deputation of 18 gentlemen from the parish of I'addington waited upon Sir George Grey on Tuesday, for the purpose of bringing under the notice of the Government the insufficient number of the police force doing duty in that district. The deputation consisted of Mr. Russell, M.P., Mr. Oliviera, M.P., Sir Harry Goring, Meesrs Burslem, Jackson, Halsey, Baylis, Woolsey, and Harwood, Justices of the Peace; and other gentlemen. They laid before Sir G. Grey the details of a variety of outrages againat person and property which had notbeen detected by the police. They stated that the rateable valce of the property in the parish of Paddington is 522,570 o, the popaiation upwards of 50,000 , the streets reparred by the parish 22 miles, besides 10 miles not taken to by the parish, and the annual payment to the police force $10,570 \%$. The deputation did not complain of inefficiency on the part of the police individually, but strongly urged upon the Home Secretary the propriety of increasing, without delay, the number of police in the districk. Sir G. Grey paid marked attention to the statements brow the before him, asked a umber of questions bearing practically upon the sub ect, and promised immediate inquiry. With reference o the tichet-of-leave system it appears from remaris hich have recently proceeded from the judicial benc that the operation of the system in this country is abou a be very much restricted, and that convicts sentenced a penal servitude have been informed that the whole rerin of their imprisonment will, as a general rule, be

The Great Bulhon Robbeex.-William Pierce and James Burgess, the former for some time employed i the printing department of the South-Eastern Railwa Company, and the latter till last week a guard in the ervice of the Company, were brought before the Lor layor on Monday on remand, charged with havin been concerned in the robbery, of 15,0002 , worth of gol rom a package in its transit from London to Paris, in the month of May, 1855. It appeared rom the evidence hat the robhery was committed with great del:beration and adroitness, and that four persons were concerned in it; the two prisoners, a man named Edward Agar who is a witness on the part of the Crown, and a fourth erson, named Tester, who at that time was employed 8 elert in the office of the Kailway Compuny, and wh mot the present moment in England. Ut the fou ccomplices, therefore, Agar was the only one not in the service of the Company. He is now a convict at P irtland, undergoing a sentence for forgery, and is in her respects not unfamiliar with crime, and on a class who are engaged systematicaty in the commission of what are called large offences. The
way is which the discovery of the robbers was
brought a wout was sumewhat remarkable. Agar at the
time the offence was committed was living with a young woman named Fanny Kay, by whom he had a child, now
about two years of age. After the robbery had been about two years of age, After the robbery had been
carried out Agar was apprehended on the charge of forgery, whereupon he left the woman Kay and his child aid about 7000 l . worth of the booty in the charge
of his accomplice, Pierce. But Fanny Kay had a quarrel with Pierce, who turned her and her child adrift upon the world, and refused to pay the money due to her. She retaliated upon him by going immediately to authorities there what she knew of this matter. appeared however that what she knew as direct proof of taken by hoth Agar and Pierce, and also by Burgess, so far as he had any communication with the house wher they lived, that she should not know what they were engaged in during the time of this robbery. But her evidence was so conclusive in many of its details that it led to the arrest of Pierce and Burgess, to the pursuit of Tester, and to the appearance of Agar as Crown witness at the Mansion House. The difficulties which the enter prise presented at first sight were these : Bis in iron chest at the London terminus. This clest is placed under the especial charge of the guard, and is by him deposith ley. It is thus easy mouph for any one keeps the rupted the guard, or for the guard himself, if he has succeeded in obtaining master-keys, to deal with the iron chest as he will during its transit between London and Folkestone. The real difficulty lies in obtaining the chest. The other points are merely questions of detaii, which can be dealt with easily enough by graduates in crime. The robbery, according to Agar' Pierce. When the difficulyy Phe keys was mentioned Pieve ssid that theression of in which the bullion was transmitted was about to be sent up to Chubb's for a new key, as one had been lost, and that the new keys would for a brief space be in
the possession of Tester. This man Tester was brought by Pierce to a beer-shop at the corner of Tooley Street; he had with him the new key wax ; but, as it appeared afterwards, only one impression was avaiable for use. It became therefore necessary to go down to Folkestone to obtain an im pression of the other key. By one of those chances carry out their design with the greatest facility. The clerk in charge at Folkestone had gone into anothe room, forgetting that he had lef the ley of the sale in the lock. Agar, admitted by Pierce, immediately took an impression of the key of the bullion-box, which was mpressions occupied a very considerable time, and wa carried out entirely by Agar. At length the task was accomplished. When thus prepared the accomplices ufficient value shour hor bulion Folkestone under the charge of Burgess as guard ome further arrangemenis were however necessary hey would find themselves be prematurely discovered weight for another in the iron box. The expedient which presented isseff to their imagination was to fill a number against the bullion which they mightsucceed in abstracting, These bags they carried about with them, tied under their clothes, until the opportunity, so long waited for, arrived in the month of May in last year. On the evening in question Burgess was guard of the down express train to Dover. Agar and Pierce came to the station in a cab, with their shot-bags around them, and other shot-bags stowed away in two carpet bags which they brought with them. Tester also was at the station. Pierce was disguised with a large black wig his accomplices arrived at the platform Burgess raised his cap and passed his hand over his face, the signal agreed to denote that the gold was there. The two who placed them in the van in which was the iron box with the buition. After a litte manourring Agar contrived, with Burgese's help, to slip into the van, Pierce sil the while remaining in a first-class carriage. In a ew minuter the signal was given, and the train Redhill, the strangest Then, between London and nessed by any one who could have obtained a pee within the van. The guard Burgess had joined hi accomplice Agar; they had opened the iron box with of coin and bars of gold as rapidly as they could, and in making up the weight with shot bags. At Reduill Pierce also got into the van ; and at Redhill, too, one of the bags, which had been previously filled with gold emtarrassment when they arrived at the other end of the line. Between Redhill and Folkestone the three accomplices continued their work, and abstracted gold to the with tent in weight of the shot which they had brought done, and at Folkestone the iron cheort was taken out in the usual way and deposited in the safe. They went on
with the train to Dover, where Burgess, as if in the
usual course of his duty as guard, delivered the carpet-
bags containing the ballion to Pierce and Agar. They supped at Dover, and came up the next day by a train o which Burgess was guard. On their arrival in town they to the house of Pierce, who immediately busied himself
with the sale of the foreign coin. The gold bars were melted down in the washhouse of
Agar's abode at Shepherd's Bush, the windows of the apartment having been previously whitened and grea precautions taken to prevent the young woman Fanny Kay from obtaining any knowledge of the proceedings. When melted and beaten into another form the gold was sold partly at the Bank of England, and partly got Seward, described as a "barrister," bird-fancier, and old. fancier. A considerable portion was thus disposed of and exchanged against Bank of England notes, which were divided among the accomplices. Agar's arres
and conviction for another crime followed, and then he quarrel between Fanny Kay and Pierce, which led to the discovery of the real criminals. Agar's evidence on Monday was not shaken on cross-examination, and it was corroborated by that of the young woman Kay ho proved that the firmness of Agar to his compact t influence, had fallen before the natural affection tha the had for her and their child. At the close of the examination the Lord Mayor refused to take bail, and the case stands over for further investigation.
The Fradds on the Great Northern Railway. The adjourned examination of Mr. Leopold Redpath and James C. Comyns Kent, the clerk, arrested on suspicion of being his accomplice, took place yesterday at Clerkenwell Police Court. Evidence was given at great length to show that Redpath had received dividend on the amount of stock fraudulently standing in his name that Kent was the attesting witnesstoan instrument which had been forged and that there had been a unity action between the prisoners. The magistrate remande hem for a week and refused to admit Kent to bail hough two sureties of 4000 l. each were offered on hi behalf.-The examination of the books which commenced on Monday week, has daily revealed forgeries of the most startling character, which make it almost a matter of
certainty that Mr. Leopold Redpath's frauds will far exceed the amount originally stated. It is said to have been already ascertained that the company have been or a long time past paying dividends upon 200,000 . or $250,000 \%$ of capital, the existence of which they are naable to trace. An hour or two after the examination the Clerkenwell Police Court on Friday week, an fter Mr. Readpath had been removed to the House of Detention on the magistrate's remand, Superintenden Loxton, of the metropoitan poces of State to proceed to Weybridge and take possession of a house and estate which Mr. Redpat had in that town. On the arrival of the superintenden in Weybridge, he found that a large mansion nearly opposite the parish church, called Messellagton House him last year for 30 . 000 , together with the extensiv grounds by which it is surrounded. In this mansion he found that 10 servants were engaged, including fisherman to attend to a punt on the river, a coach man, aud a courier, who was specially employed to The cook was paid 300 a a year, and the others on a scale of equal liberality. Here, too, the Superintendent me Mrs. Redpath, who was in a cheerful state of mind, and inquired about the expected return of her husband in a the frauds for which he was then a prisoner in the hands of justice. It was the melancholy duty of the superintendent to communicate to her the intelligence of the fate of her husband, when she became paintuliy depressed, and fainted. Fortunately she has no children. When the superintendent searched the house he found it furnished in a style of the greatest splendour Pictures by first-rate artists, jewellery of the most costly description, plate in the greatest abundance numerous that it is said a large cart would be insufficien to carry them away. In the stables adjoining the hous were found four horses, a brougham which cost 180 guineas a basket carriage, and other articles calculated to con tribute to the gratification of the most luxurious taste. Some documents, too, of an important character were found bearing particularly upon the charges agains the prisoner. The furniture was sealed up with the official seal of the police, and a body of officers left in possession of the house. The police, under the directhe prisoner's house in Chester Terrace, which he purchased about three years ago for a sum exceeding 3000l. This house is furnished in an elegant and costly style, and is said to be filled with articles of vertu, antiquities, and pictures. Soon after purchasing it he mounted his carriage, and, in addition to an establishment of five or six female domestic servants, he kept coachman, groom, butier, and footman. Redpath lived there in the highest and most luxurious style. He was a the habit of receiving a great deal of company, and gave parties and dinners of the most expensive chaact Whether or not peas were in season they wer to be seen on his table, at a time when they conld not be obtained at Covent Garden Market at less than 7. or 8 per quart. Grapesar 10a. per ll. luxury. His munifcence and gererosit (1th
people'smoney) were the tall of the entire neighbourhood, hin instance of his extravagance and of the style in which the did everything, it is mentioned that it was his ractice, prior to leaving home every morning, to have in Princess Street,'Hanover Square. Either the principal of that eatablishment, or some one deputed by him, arrived at 27 , Chester Terrace, every morning in a cab, which was usually kept at the door for about an hour, whilst the hairdresser was performing his operations, Redpath was not only weil known as a constant guest t fashionable parties, but even contrived to get pre ented at Court. He was almost as well known in Paris as in London, being a frequent visitor to the Hotel Windsor, where he lived in most princely style, his otel bill being said to have averaged 100 l . a-week, esides what he expended at the expensive cafes which e was in the habit of visiting, and where he though nothing of ordering wines at 30 or 40 francs a bottle During a recent visit it is atated that he became a com of Leda and the Swan in silver. The Empero offered 700l., and Redpath 750l, and the coveted orna ment was duly conveyed to the mansion at Weybridge. ntimate, was a preatron be nightly seen either at the Royal Italian Opera or the Haymarket, to the stage of which he had ready access, Haymarket, to the stage of which he had ready access, away his money to the actors in a most extraordinary oanner. It was also a feature of his sytem to be con sidered a most charitable man, and his position as governor and almoner of Christ's Hospital and of the S Ann's Society, aided in obtaining for him a hig character in that respect. Since his capture howeve circumstances have transpired, in connection with th iraffic in votes, in these, as well as other similar institutions for money considerations, which, if pursued, ma open a large field for inquiry among the governors and subscribers. As regards the St. Ann's Society, it is saic hat he was not only a governor, but an auditor of the natitution. On the occasion of its annual festivala Redpath was in the habit of paying from 50l to 100 l rom his own pocket in order to add to the splendour he dinner-a fact of which very few of the guest were cogaissnt. At the first dinner of the society after the return of the Duke of Cambridge from the Crimea, when his Royal Highness presided, 100 guinea were so expended, the subscription liats also bearing the names of "Loopold Redpath, |Esq., 50l.; and Mrs. Redpath, 50 h ; and in the course of the evening Red path handed in another cheque for 105l., as a donation rom a "Citizen who admires the charaeter of the Dak of Cambridge, and who wishes to congratulate his Royal Highness on his return from the Crimea." With egard that about 180 a he was clerk to Mesars. Wi derson, then the owners and managers of the lime mail steamers to the Peninsula and Mediterranean. H left their employment shortly before the service becam so extensive that it was found expedient to organise the Peninsula, and Oriental Steam Company. Redpath then attempted to establish himself in business as seller of steam-vessels, and resided at Dartmouth Ter race, Blackheath Hill, but after furnishing his house and contracting debts which he never paid, he became a baukrupt, and seems to have retired to a very private ife. He then became a lawyer's clerk, and occupie abscure apartments in Cumberland Market, whilst his wife (who was the daughter of the late Major Sherman, an Indian officer who resided at Maryland Point, Stratfor Essex), obtained a situation as companion to an elderl lady named Simmons, at No. 3, Cumberland Place After this he emerged again from obscurity, and ob tained employment at less than $2 l$. a week as a clerk in the transfer office of the Great Northern Railway in which office Robson of Crystal Palace notoriety wa also then employed. From that time it appears they have been on terms of intimate friendship. Robso was known as what is generally termed a fast mo" while Redpath's predilections seem to have gone in the direction of a magnificent display at home as a con noisseur in art, man of literary taste, a patron of charitable and religious institutions and projects, and a surrounding his table with men of distinction in the Church, art, literature, and science. Redpath and Robson for a long period lived as neighbours near the Regent's Park, and were in constant communicatio with each other, though they were men of entirely dissimilar habits and pursuits. There is reason believe that at a future examination this acquaintavceship will be proved in a manner which will leave no doubt about their having worked in concert, and having been connected with each other in the perpetra tion of the great frauds with which their names have become identified. Both Robson and Redpath ficked largely on the Stock Exchange, an which induced that Redpath was unlucky to an extent which eventually him to commit fur

Another Extensive Fraud on the Great Northern.-William Snell, chief clerk in the accoan tant's office of the Great Northern Railway, a very respectably dressed man, aged 27 , residiug at Nightingale Place, Hornsey, whice Court on Thursday magistrato at clefruding the Company of about 1000 l He had admitted his crime to the chief accountant, who had asertaied ath 500 l had been stolen rom the Company's casi box and applied by the
misener to his own use. The magistrate remanded Great Hire in the City,-On Thursday evening the premises of Messrs. Hodghinson and Rolls, envelope and aljutting on the Prerogative Court, were destroyed Dy fire. The flames spread with such rapidity that peril, for if any portion of it had ignited the "whole mesge of buildings would have been destroyed, as there 8 not a single party-wall throughout the precinct. bbone.- At the last meeting of the parochial Mary ties of Marylebone, a letter from the Poor Law Bcard was read, recapitulating the proceedings between the inquiry instituted by their inspector into the alleged flogging of women in the workhouse to the resignation f the master, and stating that unless the directors and guardians at once fill up the vacant office of Mastex, the Poor LaW Board, however reluctant to adopt such a mandamus to enforce upon the directors and guardians their legal obligation. A special meeting is to be conrened to take this subject into consideration.
Starvation of a Mother and Family in MaryleMann, the reputed wife of a carpenter named Franklin was discovered with her four children in a state of mother was quite unconscions and died soon after the discovery was made. It appeared from the evidence at the inquest that she was a woman of very peculiar and September last, when she insisted on workhouse until with her children in direct opposition to the wishes of the parochial authorities. She then went to live in Walmer Place, and nothing more was heard of her by the parish officers until they received information that
the family was in a state of destitution. Accordingly, the assistant overseer and inspector of poor for the district, went to 7, Walmer Place, and there they witnessed a horrible spectacle. The mother in complete state of nudity, and having all the appearance of extreme starvation, lay stretched in an unconscious state on a dirty mattrass on the foor of a miserable were haddled together in one corner of the room, in as naked a condition as their parent. The whole family were quickly removed to the workhouse, where the tated they had not tasted food for five children, who tunately rallied, and, with the exception of the two eldest, are progressing favourably. The workhouse surgeon made a post-mortem examination, and proved that the other suffered from disease of the brain, the immedate cause of death being an effusion into the brain, reaulting from a tumour. It was clearly proved that neither the deceased nof the children had applied for
parochial assistance since they left the workhouse. The coroner, in summing up, said that from the state of the poor woman's brain it was quite clear that it had rendered her children, and hence the frightful state of destitution into which they fell. His only surprise was that the elder girl, 13 years of age, had not had sense enough to apply to the workhouse. It appeared, however, that she had not done so, and therefore there could be no blame whatever attributed to the parochial authorijes. The jury returned a verdict of Natural Death.

The Suppused Murder near Erith. -The inquest Erith last carter, whose dead body was found near further of a positive character was elicited, and the nquiry was adjourned for a week. Goverument has offered a reward of $100 l$. for the apprehension of the murderers, 100 l . has been offered by the friends of the deceased, and $50 l$. by a local society for the prosecution
of felons. It was stated by the local medical men at the inquest that it was impossible for the deceased to have intlicted the wounds himself. Of the 16 punctured wounds in the chest, breast, and ribs on the lett side, no less than five had penetrated the heart, and there was an extensive fracture of the skull at the back part of the head, a portion of the skull about the size of an egg Carter was the son of a market-gardener, now dead, but Who formerly resided in York Road, Battersea. He intended to proceed to Australia, and on the 21sto October he executed a power of attorney appointing of obtaining $100 l$. in ready cash to enable him to proceed on his voyage. When he was last seen alive he had a bundle containing his outfit, and is believed to have been on his way to join his ship. At the close of the pro-
ceedings it was stated that the police had obtained ceedings it was stated that the police had obtained
important information, which, if divulged at present, might defeat the ends of justice, but which would pro bably lead to the apprehension of the murderer. young man called Worrell was subsequently appre headed on suspicion, but he destroyed himself yesterday morning in his cell by taking prussic acid, leaving a he disgrace of the accusation had driven him to commit suicide.
Suspected Murder and Suicide in the Hackney Road, -On Saturday night a man called Henry Fenn, committed suicide, residing in Great Cambridge Street, hour afterwards the body of his nife was found drowned
reason to helieve that the husband murdered her and then took his own life. In the absence, however, of positive evidence to establish the fact, the jury returned and one of "found drowned" in the case of the wife, husband.
Foundling Hospital.-A statue to the memory of Captain Coram, the founder of this hospital, was placed, on Monday, on the stone structure in the centre of the R.A and subscription. The figure, which represents the privatenthropist as handed down to us by Hogarth, is 8 fee high; and relieves the monotony of a line of
The City Gas Company. In consequence of
THE City Gas Company. - In consequence of the the gas works in Blackfriars, negotiations have been opened, under the auspices of the present Lord Mayor, for the purpose of effecting an amalgamation of the City Company with the Great Central, which would have the effect of removing the woris of the forme rom their present locality in Blackfriars to the site of the latter on Bow Common. The only difficulty which as presented itself is one connected with the price gas. Parliament has fixed the price of that manufac tured by the Great Central at 48 . per 1000 feet, on the supposition that it could be made at a profit at $1 s .9 d$ been sufficient to defray all charges affecting its disti ation bution, and a dividend of 8 per cent. to the share cent. when the consumption becomes greater. On the ther hand the City Company, which sell their gas a have ame price of $4 s$, pay only 3 per cent. dividend, and have a strong conviction that it is not possible to supply
gas of the quality now in use at 4 s. per 1000 , and at the same time puy a fair interest for the capital embarked. It is said that the difficulty occasioned by this difference of opinion is likely to be adjusted, and the two companies will apply to Parliament for the necessary powers early in the ensuing session.
general Post Office.-Arrangements have been made by the Board of Works to open up the centra portion of the large entrance-hall at the General Post Office, St. Martin's-le-Grand, in order to obtain more light, which is mucl needed. This object is not to be effected by means of a ridge and furrow roof, similar to that of the Crystal Palace, but by forming a hipped roo ver the opening, under which there will be constructed onorizontal light, occupying the area of the centr partment of the ceiling.
The Pubic Health, - The Registrar-General eekly return states that the deaths registered in London, which in the two preceding weeks were 969 November rose in the week that ended on Saturday November 15, to 1090 -an increase which is usual in this munth, proverbially known for bringing with it cold weather and logs. In the 10 corresponding weeks of the years 1846-55 the average deaths were 1051 , which if raised in proportion to increase of population fore still 1156. The present rate of more. The births of 816 boys and 739 girls-in all 1555 childrenwere registered in London during the week; in the 10 corresponding weeks of the years 1846-55 the average number was 1433.

## pandincial.

Cheadie.-The following letter, in reply to Lord Talbot's circular, has been sent to the Shrewsbury tenants by Messrs. Currie, Woodgate, \& Williams, the solicitors for Lord Edmund Bernard Howard and
Mr. Hope Scott and Mr. Serjeant Bellasis, his trustees "Sincoln's-Inu Fields, Nov. 12.
"Sir,-You bave probably received a notice from Earl Talbot VVN

fisappointed turday evening. In two cases they were , the injured parties having been induced that those charges were not gone into. In the third case the complainant refaed the hribe In the third and appeared in support of the charge. The defendant (who pave their names as Robert Gibson ensign of the 9th Reve port), were seen between 8 and 9 o'clock on Saturday pori), were seen between 8 and 9 o'clock on Saturday
evening near the Fountain Hotel, St. Margaret's, in company with a third officer, who bears the sobriquet "Brown." Two of them were provided with ridivg whips, and they were heard to say that money was cheap, and they would have a "spree" somehow. They first commenced a series of attacks upon an old man selling sponge, whom they brutally hoocked about, and then assaulted an auctioneer, a feeble old woman, and a tailor named Laming. In this way they passed through several streets, creating the greatest uproar and excitement, striking at every one they came near. The crowd increased as they approached the barracks, until the police arrived and took them to the tation-house amidst yells, hisses, and great confusion Direct charges were only made against two of the fficers, who procured bail, and were shorty afterwards released. On Monday morning they were placed at the bar, when evidence having been given, the defendants said they merely acted in self-defence having been first struck; but by whom they conld not tell. The bench coavicted them of the assaults and sentenced them to pay a fine of 30 s , each and the costs, or in default one month's imprisonment. The fine was quicily paid and the parties released. It is stated that Holl report of the affair will be forwarded to the
Horse
Doncaster,-Between 12 and 1 o'clock on Sunday morning a fire was discovered among some corn stacks in the farm premises of Dx. Mathews, a magistrate for the West Riding, in the village of Hatfield, near this town. The flames spread with the utmost rapidity, and hi short time extended to 14 stacks, the wbole of which were destroyed.
quently found near one of the stacks, and there is no value of the property destroyed is estimated at 1400 l . Manchester, - M. Kossuth delivered his second ecture on Wednesday week, and his third lecture on Saturday in the Free Trade Hall, the subjects being respectively the Neapolitan question and the Austrian Concordat. The following is a summary of the lectura N Naples:-
${ }^{\text {" }}$ The just interference of England and France in the affairs of meaning of royal congresses and the bresence of Franch the English fleats in foreign waters? His answer was 'Woe to the nations when kings put their heads together, and diplomatists met in fond embrace. England, which Austria had recently with Louis Napoleon; and the French Eroperor was in eoneert merely to prevent the French people from pondering on their own affairs. Would England, he asked, lend herself to such a
policy? Revolutions wers not possible where they were not policy. Eevolutions were not possible where they were not
wanted. Englishmen might require reforms, but they did not
Want a revolution. With the French people the case revolution, With the French people the case was dif sprung take no root in the soil of his conntry. His government could have no future, because there was po reason
hy it should ever have existed. Revolution in France Why it should ever have existed. Revolation in France was a Cents. were at 66 , while in 1848 they stood at 73 . Louis Napoleon knew that Italy was a volcano, and therefore his whole solicitude was turned to prevent an explosion. Hense his desire for joint
intervention with England. But let the people of England take intervention with England. But let the people of Englard take hations. Having given a description of the rise and fall of
Sicily, once the gardey of Europe, but now the most miserable place within the parde of Christendom, M. Koossurth referred to the
insurrection of 1848 , contending that Great Britain, nsurrection of 1848, contending that Great Britain, having once cecognised the nationality of the Sicilians, was bound either io
follow the policy of non-intervention with the Governments of authority, any attempt to break down the form of goverument winld be reasouable, but to paralyse the democratic energies of a
people, to swing thens upon the rope of diplomacy, and then to nation. The object of the British Government, as represented
by Lord Pulmerston the secure the peace of Europe, endangered by the atrocious, misrule
of the King of Naples. But how was that object to be anainel A spark kindled at Naples would set the whole continent it a
blaze. The ruler of France knew that, and wanted intervention, to avert the catastrophe. But why, should Great Britain lend
her shoulder to supprit the tottering trone of European des-
potism? England had nothing to fear from continestal revolu-
tion. The throne of her Sovereign rested her people, and not upon the persoual safety of any Hapsburg,
Bnurbon, or other continental despot. Diplomatic relations were brokeu off with the Kiug of Naples, and vessels of war were
crusing off his coast to protect, it was said, the lives and prowarned the people of ingland how they lent themselves to the difficulty. Ours was a great nation. lis glory was raised upon
the self-rliance of its sons; but let it not, in the zenith of its
fame, in the height of its moral and materisl grandeur, defcent destinies of Italy."
The fonowing is an extract from the lecture on the Austrian Concordat, in which M. Kossuth treats of its Protestantism : -

wife during his absence had opened a shop for the sale Duchess of Atholl, Lady in Waiting to the Queen, has of grocery, and was doing comfortably. He was been received into the Roman Catholic Church within however in a very low, desponding state, and continued so until Friday when he committed the murder, it is supposed, in a paroxysm of insanity

Accident to the Chiff Secretary.-Mr. Horeman met with an accident on Saturday while hunting in the county Dublin with the Ward hounds. His hors fell and rolled over him, but fortunately without causing miles after the accident, and was able to transact busi ness as usual on Wednesday.
Dreadfll Murder of a Rallway Cashier.-A most painful sensation was created in Dublin on Friday afternoon by the discovery of a shocking and mysterious tragedy at the terminus of the Midland Great Western having been found in his office with his throat cut in a frightful manner, and under circumstances which at first led the public to suppose that he had committed suicide. In the early part of the morning the absence of the deceased was not noticed, and his office door re mained closed without attracting particular attention until $110^{\circ}$ clock, when his sister arrived at the terminus to inquire about his absence, stating that he had not returned home during the previous night. Inquiries were then made, and as one of the porters observed then for the first time that the gas in the office was still ighted, a good deal of alarm was felt. A ladder wa procured, and a boy entered the room the unfor window, when he discovered his face in a pool of blood. The door was broken open, and several persons conaected with the rail way entered. The body was examined and found to be quite cold, the throat being cut from ear to ear, in such a manner as to leave the head almost hanging from the body. Such a discovery at the present moment, when men's minds are hiled with reports of the defalcations of railway and other officials, immediately created the impression that Mr. Little had been guilty of some such breach of trust, and had sought o escape from the consequences by suiciae, bat circumstance of a large sum of money being his desk, and the discovery of his accounts being made up to the day in the most exact manner, completely
falsified the supposition. An inquest was comnenced in the afternoon, but only a very imperfect examination of the circumstances having been made, the coroner thought it right to adjourn the proceedings, and in the meantime caused the detective police to make a rigid eearch on the premises. On resuming the inquest on Saturday the evidence obtained in the meantime left no doubt that deceased had been the victim of a most brutal been cut had disappeared, nothing witb a sharp edge having been found in the room except a penknife, which was quite clean. The key of the door had also
vanished, the murderer having evidently locked the door and taken the key with him. A towel was found covered with marks of blood and some cuts, as if the knife with which the deed was done had been wiped on it in a hasty manner. The throat was mangled in a shocking manner, the lobe of one of the ears was cut off, and one side of the skull nearly battered wircumstances of instrument. Some of the myster unexplained. Thus, a large sum of money amounting to several hundred pound in still lay on the desk of the unfortunate gentleman, indicating that the robber either did not see it, or was satisfied with a sum of 300 . which he appears to have taken from the iron safe or preas in the office. The secretary of the company showed that the deceased had made up day last, and that no circumstances could be discovered to impeach his character in the slightest degree. After hearing some general evidence, as well as that of the medical gentlemen who had examined the body, the jury
returned a verdict of Wilful Murder against some perion or persons unknown. On Wednesday the canal ear the station was drained, when an engineer hammer, with human hair still adhering to it, was
discovered. There is no doubt that this is the instrudiscovered. There is no doubt that this it the instruaid that the police are now on the track of the murderer.

## Enotland.

Election of Lord Rector of Glasgow University -The election to the bighest office in Glasgow Univer sity, now vacant by the retirement of the Duke of Argyll, took place".0n Saturday. Three candidates wer originally nominated-viz., Sir Edward Bulwer lyat wat Lord Stanley, and Sir John fersche. and a very keen canvass was carried on on dropped, and a very keen canvass was carried on on
behalf of the others. Sir E. Bulwer Lyttou was supported by the Conservative students as well as by an influential section who desired the election to rest upon purely literary grounds. Lord Stanley, on the other hand, was supported by the Liberals on political grounds, as a rising statesman likely to do honour to their party The result was that Sir Bulwer Lytton had a considerable majority in all the ations into which the students are divide and 108 , the numbers being 242 to 134 .
he last few days. There are now four Lcotch Duchesses onverts to the Roman Catholic Church, vizo, the Duchesses of Hamilton, Buccleuch, Atholl, and the Dowager Duchess of Argyll.

Fatal Collisions on the Newportand Hereford.On Wednesday the 12th inst. a collision took place Hear Pontrhydrun, between the exprees train fron had escaped from the Pontypool station on the Monmouthshire liue, and were running at a fearful rate down the steep decline towards Newport. The driver guard, and firemen having done all they could to everse the train, and seeing a collision inevitable jumped off and escaped unhurt, but several of the pas sengers, includiug some Irish sailors on their way to
Birkenhead, were severely injured. In the afternoon still more serious collision took place on the sam ine near the Nantyderry station. The engive of the down express from Heretord after leaving Abergavenny jumped off the line and crossed the up-line, when a goods train came up, and ran into the passenger carriages. The engine was thrown upon its side down the embankment, and the train presented the appearance of awreck. Two of the passengers were killed, viz., Mr Edward Henry Hands, of Wolverhampton, and Mr Mark Hicks, of Tetbury ; and several others were
severely bruised, among whom was the guard of the express.
Fatal Accident on the Waterford and Kilienny. - A fearful collision took place on Wednesday near mail ran into a ballast train, kill ng five labourers in the latter, and severely injuring four passengers in the mail train, one of whom, Dr. White, of Dublin, Inspector of Lunatic Asylums, is lying in a precarious pat waterd of the labourers killed, four had their heads cut completely off, and the other, who was the ouly one who showed any signs of life after the collision, had his arms cut off.

The Great Whought Iron Gen.-A very elaborate report respecting the experiments at Shoeburyness with the great wrought-iron gun bas just been issued showing the results of 50 rounds, each fired with a 501 b . charge, the projectile being solid shot, 2801b. weight. The length of the gun, it will be remembered, is 15 feet 10 inches, and its weight (exclusive of the carriage) 437 cwt . From these exper $m \cdot n t s$ it appears that its ranges exceed by 10 per cent. h ise of the beat solid shot guns in her Majesty's service, and by 20 to 25 per cent. those of the 8 and 10 -inch (shell) guns Further experiments are to take place on the 25 th inst when the power of the gun will be tried against the bomb-proof floating battery Trusty. This vessel wil leave Sheerness for Shoeburyness early on that morning under steam power, assisted by steam-vessels, and gunboat will be in attendance to convey the officers who are to superintend the experiments. The Trusty will be towed upon the sand within 600 yarde range of the battery erected for the parpose. On the larboard side of the vessel, a large target is to be painted, so that each mun may be laid for the target Thirty-two each 8 will be firt tried, and the weight increased until the monster gun is fired. It is reported that several officers have voluntered to remain on board. While under actual fire they will remain down in the While under actual fire they will report the effect by fure hold ; and after each shot, will repart the effect by a preconcerted code of signals, which wil be afrang the screw steam guardship Edinbargh.

 fue Hops increases, and such are very scarce.

## The agricultural Gazette. SATURDAY, NOVEMBER 29,1886 .

At the present moment the comparative merits of hick and thin sowing are actively discussed, not only at farmers' clabs but at every market table. Farmer Holdfast, whose white head and wrinkled brow would lead us to suppose that he had farmed for at least half a century, gives as his conclusion, derived from all those years of experience, that he whilst Mr. Newingt, who is but a young agriculturist, states with equal confidence that the best crop he has ever seen was from the sowing of three pecks.
Now, as there is in this a great deal of difference, one may at first be led to conclude that one or both of these gentlemen must be in error as to facts; but if we inquire a little further into the matter we shall find that while the larger quantity might not have been too much in past times, and may not
even now where the condition of the past is maintained, the smaller seeding on the other hand is not too little where all the conditions of the soil have been improved.
Farmer Holdrast when he was young, and we all know with what tenacity the lessons of our youth are adhered to, was taught that the rougher you got
in your Wheat the better, and so the ground with a single ploughing was sown with the grain, and imperfect harrowing left some of the seed exposed
then, on a cold andrained soil a large portion perished
from exposure : mach of what wa corered and from exposure; much of what was covered suffered
from similar canses and from similar causes, and a large proportion of the plants that ultimately appeared would spring from such a depth that their tillering would have to commence at the third or fourth joint or node upwards, in which case new routs must be made at that node and all below would die away, and thus much time and energy of growth is lost to the plant, which would therefore tiller but slightly, yielding even then but weak stalks and stunted ears

But the process of tiliering is interfered with in another way by too thick sowing, for if the seed should come up well this, like thick planting of trees, causes the plants to grow up thin and emaciated ; the central axis is elongated. in which case the lateral buds are not usually brought to perfection, or, if they do grow, they are thin and irregular, and without a disposition to reloranch, for it must be remembered that when lateral branches are strong they in turn give off others. So in deep and thick-sown Wheat each successful grain has to answer for at most but three or four ears, whilst one seed under the best tillage will make from 10 to 20 ears of corn, and well tillered corn has always the largest heads. Upon this subject the following experiment which we carried out last year may not be without interest, although even here we have no analogy to the rough work of
Farmer Howprast's youlh Farmer Holdrast's youth, as our ground was so
smooth that our seeds came up well, and did tolerably afterwards.
On Febrnary 2, 1854, we planted eight rows of Wheat with 24 grains in each row at depths as follow

The produce of these bracketted groups may be stated in proportionals as 2, 6, 4, so that from this experiment we were led to the following conclu-

1. Shallow sowing perils on account of the winter exposure of the whole plant.
2. A range of depth from $1 \frac{1}{3}$ to $2_{2}^{1}$ inches is best. 3. That deep sowing is longer in producing the plant, and its plants are always weakly
3. Irregular sowing at different depths within a wide range requires far more seed for a good crop than depositing the seed uniformly at a proper depth or within a moderate range.
Again in the comparatively rougher farming of the past much grain was choked with weeds; and thus it appears that thick sowing was an absolute necessity in the earlier days of farming, in order to guard against the contingencies arising,
lst. From the colder climate attributable to a general want of draining.
2 d . From the consequent bad tilth of land, thereby resulting in rough clods, amongst which seed would be scattered at irregular intervals.
3d. From the very irregular depths at which it must consequently be sown.
Let us now glance at the condition of matters as Mr. Newlight, an agriculturist of the moderm school, would have them. His land is well drained, and already great changes have been made in the climate of our soil thereby. Formerly we have seen a Wheat crop perilled because the seed could not be sown in time to get a good plant before Christmas, and now in the same districts we have seen winter Wheat sown in January and February answer remarkably well under thin sowing. The land is more free from weeds, and though much remains to be done in this way, yet it is seldom we see so foul a stabble under the hands of the modern school as are met with on the farms of those who retain the prejudices while they have lost the energy of their youth. Under the present mode of farming too only the most intractable soil is obliged to be left in large clods, so the seed can be deposited by the drill or the dibble with a regularity as to distance aud depth that enables us to calculate the effect of quantity with a degree of certainty not formerly attainable. In the present day a wider range of time can be taken for Wheat sowing than formerly on acconnt of the great improvements of modern husbandry ; but inasmuch as one sort of Wheat is better for sowing at one season than another, it also happens fortunately that science and energy has been brought to bear upon the production of varieties of Wheat adapted for different circumstances. This is a matter of which we shall see the force on examining the following Table extracted from an essay in the Journal of the English Agricultural Society. In the experiment upon which the Table is founded a plot of Red Lammas Wheat was sown on the 14th day of each month in the year. The soil, it may be stated,
was thin, and the drstrict was considerably above Tavel of the sea.

| Year. | Sown in: |  | Height ot Crop. | Length of Ear. | Remarks. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1851 | June ... |  | ${ }_{8}^{\text {ft. }} \mathrm{in}$ in. | Inches. 3 | Clean straw. |
|  | July ... | ... | 210 | 2 | Ditto. |
|  | Angust | ... | 41 | 4 | Ditto. |
|  | Septermber | $\ldots$ | 311 | 4 | Ditto. |
|  | October | $\ldots$ | 310 | 4 | Rather blighted. |
|  | November | $\ldots$ | 39 | 4 | Ditto |
| 1852 | January | ... | 310 | ${ }_{3}^{31}$ | Ditto. |
|  | February | $\ldots$ | 36 | $4 \frac{1}{2}$ | Ditto. |
|  | March... | .... | $\ldots$ | .....) | Failed as a croy. |

This, while it shows that for the same Wheat September, October, and November are the best months for sowing, vet for four months afterwards, blighted in the straw. The straw of winter Wheats sown after December are almost certain to be blighted, so that different sorts should at all times be chosen for different seasons.
Again, as the old farmer from necessity got in his Wheat very early, he could thus trust to a strong plant-for usually only the strongest survived-for tillering, and thus it happened that of his seed he always provided for the greater part being lost ; with the modern farmer, however, too early sowing is often liable to objection as bringing on the state called "winter proud," which means a thin attenuated growth -a result sure to happen with early and thick sowing on improved land.
These remarks therefore tend to show that under certain conditions thick sowing is a necessity-a necessary evil, however, becanse certainly the crops of the past were, when the practice was required, not equal to those of modern agricultare. The
increase per acre over whole coanties has been as increase per acre over whole
much as from 5 to 10 bushels.

On the other hand thin sowing under improved tillage is as much a necessity as thick under the older mode, and we believe that even thinner sowing than our friend Newhert has been suppesed to advecate, will some day
occupy his descendants.

## CONVERSAZIONE AT THE ROYAL AGRICULTURAL COLLEGE,

IT may be interesting to our readers to learn that a scientific conversazione, the first we trust of a series, was held in the hall of the Royal Agricultaral College moters, in affording to numerous visitors, many of whom were attracted from a considerable distance, a very agreeable and instructive evening; presenting to their view, in well arranged series, a great variety of agricultural products and scientific objects elucidating
farm practice. The chair was takien by Edward Holland, Ericq., M.P., who intreduced the various subjects to be brought before the company in his usual
happy and interesting style. The room, which is 70 feet long and lofty, was well lighted, and presented most effective appearance; the walls, hung with ments of instruction; several of them being the work of students, especially a very comprehensive geological survey of the colitic range in the neighbourhood. The botanical department was here represented by a series Esq., of the Worcestershire Naturalists' Club, who illustrated them by a short lecture, specially alluding to the poetical features of forest scenery. Natural history variety of insect life, described by Mr. Jones, of Gloucester. Space would fail were we to attempt anything like a regular enumeration of the diagrams, which were generally admired, as excellently adapted for the purposes of instruction. Above these, and floating proudly mations, our competitors and coadjutors in the great cace for that which will prove of more value than territorial riches-the knowledge of nature. Ranges of tables on either side of the room were devoted to the
varions departments of science bearing on agriculture, which form part of the college course; tables were covered with agricultural produce, principally from the college farm, and very creditable both as to size and quality; together with ether feeding substances, amongst side with theliving plant from the botanical garden. Mangel Wurzel of various kinds were shown; and here a fact was pointed out which msy be worthy of remark, the finer ize of those sown on the ridges immediately above the midging had been adopted. We were informed that the root crops upon the farm generally are very good. Two tables were devoted to productions from the Botanical Garden of no ordinary interest, showing princially the extraordinary effects of cultivation upon et species from their cultivated relations, and the
reverse procese of a downward tendency when field
swive, after wome years' education having produced
root rivalling our garden crop both in size and
quality. The Wild Oat Avena Fatua has produced both Potato and Tartarian Oats, and the cultivated Oat has been proved to degenerate into the wild variety A case containing the produce of successive years point out the immense importance of such experiments as are constantly being carried on in the Botanic Garden, and we rejoice to learn that the British Association have requested the indefatigable Professor Mr. Buckman to furnish an annual report of them. In connection with this department we noticed a large colliection of hybrid Wheats grown by Mr. Maund, who during the course of the evening delivered a short lecture in explanation. Veterinary science, justly considered of great importance to the agriculturist, was well represented by some excellently prepared anatomical specimens, amongst which we part Further on the teeth of animals as indicating age Swedish Turnips, varying greatlv in size, the result o a series of experiments by the Professor of Chemistry on the effect of various manuring substances, any re marks upon which, save that they promise to be of th highest interest, would be forestalling that information
which we look for from Dr. Voelcker at some future period. Amongst various chemical productions, a toa of the newly discovered metal aluminium excited much interest. Powerful microscopes revealed the wonders of the invisible world, whilst on an opposite table electrica apparatus served to amuse and interest.

## NEW DISINFECTANT

Sir J. S. Forbes recently called the attention of a M'Dougall's disinfecting powder, a quantity of which he had obtained, and was using in the byres and stables with advantageous 'results. In his remarks upon this powder he said that he had not yet had sufficient time to try its effects in preserving the essentia qualities of the ranures, but he had no doubt whatever that it was perfectly capable of achieving that important result. They were aware that the exposure of anima manures to the action of air and moisture greatly
deteriorated their value, and in time rendered them altogether worthless. But the loss of the manure was not the only evil sustained from such exposure. The noxious gases yielded by animal manure when in a state of decomposition were highly detrimental to health, and their effects as Mr. M•Dongall, of Manchester, in
lecture delivered at the Baliewell Farmers' Club pointed out, were visible in the "unsanitary condition o the atmosphere in and around the stables, cow houses, piggeries, \&c.-a lowering of the general health of the locality, from which neither the farmer his family, nor his servants can escape,-and a greatly increased liability to disease among the cattie. The great loss of cattle of late years is attributed in a reat degree to this cause, yet, says Mr. MDougallAmazig as it may sea, mall forid ano prejuice amell of putrid dung upon their 'premises; they bave been ed near accustomed to thomg been fact reared near in appears to them bo narural and necta sary a thing in a faxm yard, as 1 wns once told, 1 smells so like home, that they would feel as if all were supplying a great desideratum to obtain a disinfectant which would have the effect of removing all offensive smells, and at the same time preserve all those elements in the manures which gave them their agricultural value. Mr. M•Dougall pointed out that the ordinary deodorizers or disinfectants failed to accomplish this, and were besides open to objection, on the ground that they introduced pernicions substances into the manures which they were applied. Thus, chloride of zine and nitrate of lead are strongly acid and corrosive,
being costly and both highly poisonous. Chloride of lime is also expensive, unpleasant to use, and "acts most detrimentally upon manures by decomposing the ammonis they contain." Other substances, such as charcoal and copperas, are also pernicious in their action upon organic manures. The noxinus emanations from these manures, which it is desirable to remove, are sulphuretted hydrogen and phosphuretted hydrogen, and the fertilising elements, which it is necessary to M'Dong, are phosphoric acid and manure. Mr. M'Dougall says that his powder fulfils both these abjects-thus realising what the late Professor Johnston
confessed as the desideratum that must still be sought, vizo, "an effective disinfectant either to decompose or to combine with both the alkaline and acid products of decomposition." It is composed of two acids and two bases, the acids being sulphurous and carbolic acid, and the bases, magnesia and lime. The general effect is thus described by Mr. M'Dougall :-" We use sulpharous acid to remove the offensive smell, carbolic acid to prevent putrefactive fermentation, a little lime to neutralise and dry this latter acid, and magnesia to combine with and preserve the phosphoric acid and ammenia and, in special cases, we add a soluble phosphate to pre-
vent the loss of any of the ammonia" Thus the vent the loss of any of the ammonia" Thas the
chemical action is complete, decomposition is arrested, and the valuable organic agents in fertilisation are retained in quiescence, spell bound by the $\mathbf{r}$ affinities, until they are brought into juxtaposition in the seed-bed problem is soived is the complete and instantaneons subjection of the most outrageously offensive odours by the exhibition of this deodoriser, and the increased
$\begin{array}{ccccc}\text { Ammonia, } 4 \text { per cent, or } 99 \mathrm{lb} \text {. per ton, at } 6 \mathrm{~d} . & \text { f } & 8 . & d \\ \text { per } 1 \mathrm{~b}\end{array}$
-while that of a ton of the ordinary night-soil, as usually sold to farmers, and which contains 0.5 per cent., or 11 lb . per ton, is only $6 \mathrm{~s} .2 \frac{3}{2}$ d. Sir John next referred to the benefits which had been dcrived from the use of the disinfecting powder at Mr. Murray's extensive horse bazaar in Manchester, and concluded his interesting observations on the subject by reading the following letter from Mr. Murray

## Bronghton Mews, Manchester, Not. 3, 1856. $u_{\text {AIE }}$ JOHN s.

 it to the Mayo
observing the
obedient serven
"On this," said Sir John, "I have only to observe that the large increase in the market value of the stabledung we are assured is all profit, as he actually saves the price of the powder by the saving of litter, from its additional effect (perhaps from the chlorine evolved, besides the mere quantity of dust) in drying his stalls. The operation of the powder I shall slow you upon well made court and byre dung as you go down stairs to the yard; and, savoury as I believe you will find the original deposit to be, I think his olfactory nerves must be sensitive indeed who can detect, even on close juxtaposition, the slightest effluvium, even immediately after a moderate sprinkling of the powder has been applied. I have only to add that the last requisite of a deodoriser to meet our wants is here completely fulfilled. Its portableness you see, and its cheapness Mr. Murray's letter proves, by the saving of litter equal to its cost ; but as the cost, at 108 . per ewt., scarcely exceeds $1 d$. per $\mathrm{lb}^{2}$, and as half a pound, dredged through a white iron dredger over the foot of the stal when the dung has been removed, before the fresh litter is laid down each day, will serve two beabk or one horse, it cannot be considered, in any circumstances, an extravagant outlay, taking into account the sanitary effects which the dragoon officers' certificates so confidently declare to result from its effects, independent on enanced manurial value.
Dr. Foreman, Fettercairn, at the request of Sir John, next stated the result of some experiments he had made with the powder. His experiments were directed to generated sulpharetted bydrogen in large volumes in a close room, which was immediately overcome, and carbon deposited, blackening the locks of the doors, \&c., from the carbon deposited by the action of the powder.
In answer to Mr. Cowie, Sir John stated that the powder could easily be applied as a whitewash to the walls and ceiling of a room, and could be otherwise used * a fumigator in infected apartments

The company then proceeded to the farmyard, where a quantity of farmyard manure was turned over, emitting, of course, a powerful odour, which disappeared almost instantaneously on the application of a slight sprinkling of the powder. Abridged from the Montrom Standard.

FARMING IN STAFFORDSHIRE
Having now been one of the judges of farms and crops for the Keele Farmers' Club for several years, which has given me an opportanity of soveral Esq. going over the estate belonging to Ralph Snyde, Esq. on oele hall, and remarkog the mpay perhaps be on upon his estate, the following may per not without its nse, or nuintereating to some of yon not wit

Keele Hall and village are situnted on a high ridge of 1and in North Staffordshire, on the west side of the river Trent, and very near the source of that river; conse quently at a considerable alcitude above the sea, and of course not situated favourably as respects climate, either in temperature or moisture, and thus less adapted for the culcivation of arable crops than a great extent of country in the game county. The corn harvesi of ecuntry in the same county August. The soil is mostly a strong clay loam resting an a strong red marl, or rock, of Keele, Norton, and Badenall. That portion ies is estate which lies more enstward, and in the Poters clay moetly a poor clay loam with a dificalt to cultivate.

Some years ago the estate was undrained, the fields
small, and the fences broad and crooked, the roads indifferent, the farm buildings and homesteads bad and inconvenient, particularly for the present improved Keele is bordering on the stock
and comfortably out of that very disagreeable district. The vilage is about two miles west of Newcastle, and three miles east of Madeley station. The country around and boned it is excellent grazing land, and with good management, grows heavy crops of Wheat, Oats, Barley, management, grows hea
The gardens and pleasure grounds around the Hall are very extensive and beautifully laid out. The varieties of flowerg, plants, shrubs, and trees, are ex-
ceedingly numerous and well arranged for effect. My favourite flowering shrub and the Queen of flowers (the Rose) is cultivated in the greatest perfection, and in the greatest profusion. There ar grounds amongst rocks and trees, the former clothed with Ferns, Mosses, Lichens, and other rock plants, rery healchy and beautiful, particularly the Oaks. To see and inspect the gardens thoroughly would require a man a whole day. I was never in any other gentleman's garden where every part was so well kept and
the plants so lealthy, both in the open ground and in the forcing houses. The old Ilall has lately been taken down and a new one built (not yet fivished) I liked the old one best; ; it was plain but substantially built, I believe in the Norman style.
leman of the-an elderly man-is a true English genhis tenants, right sort. He loves his home, hisgardens, his tenants, and his neighbours, better than politics and followed his example
Some years ago he engaged Mr. Tbomson, his present agent, who I believe is from the West of Scotland. undergoing great and permanent improvements, by thoroughly draining the land, making exchanges so as to make the farms more compact, opening waterfences and planting new ones where required; thus improving the size and shape of the fields, and increasing the extent of the cultivable land, and reducing the annual expense of keeping up the old fences and of cultivating small crooked fields. New roads are made Where required for the more convenient occupation of the farmsand fields. New farm-houses, out-buildings, and homesteads are erected, more adapted for the improved estates in the county of Stafford where provements have been made in the buildings, farns, and arm management. And lastly, Mr. Snyde and his agent do not forget the labourer and his family, that class to which the whole world is indebted for its food, its
drink, clothing, and shelter ; for what would the land be worth, or how could we live without workers? He takes care that the labourers on his estate have comfortable cottages cottages are more comiortable, more cunvenient, more substantial, or in better taste than in the village of Keele. Every attention is paid to the sewerage, neatin the East order. He does not, like the lase, labourers worse thau pig-cots, and the labourers fed in mout the same style. Nor does he adopt the present becoming ashamed of their conduct in this respect, and are calling meetings to discuss the subject, and to induce the thing wither a new leaf. Mr. Snyde does the thing without consulting any one except his agent
and architect as to the best mode of doing it Here and architect as to the best mode of doing it Her am glad to see that many of the English landowners are going in the right direction as respects
the improvement in their cottages, as well as on their farms.
There is another individual at Keele who deserves notice, -Mr. James Young, a tenant farmer west of Scotland. Great merit is due to him for the skill he has acquired in his profession, and for his energy, industry, and determination in carrying ou his own views in introducing a better system of cultiviews were different from his own. Neither have his eyes or his mind been closed to anything useful in the prac tice of the old tenants, and more adapted to the soil and situation than what he had been used to in his own
experience and in his own country. For want of this sometimes great mistakes are made by strangers. Many of the resident or native farmers on the estate are now quite alive to the improved system of cultivation and of managing stoci. Many are very enterprising active men, cultivating yreen crope in the best style, raising adopting the best mode, and sowing the best seeds, in laying down land to permanent pasture. Mr. Charles Holland, very active energetic farmer, of Lymes, near Keele, has laid down 30 acres this eeason withont a corn erop beautiful appearance, full of plants, of great variety, and very luxariant. The Alsike Clover seemed to grow well. Mr. Ford, of Badnall, near Norton Bridge, a very enterprising farmer, laid down 30 acres last year ou a
Barley crop, which has now the appearance of old rich
pasture, and here the Alsike Clover is growing well.
Both these gentlemen had the prize awarded to them
for Mr Frand down to permanent Grass.
Mr. Francis Stamier, of Silverdale, is the "Mechi" of Staffordshire. He lias had the first prize awarded him this year for the best cultivated farm. This farm has been entirely remodelled, and new farm buildings gives the farm a remarkatly neat aprearance. The cul civation of each crop stems perfection as respects clean ness and the weight and quality of the proviuce. The cleanest crop I liave seeu this seasou in the county of Staffordhire. He had the first prize awarded him for steal crop. There are two very large timis at the home machinery for covernpes laid, with all other necessary Whether this be a profitable speculation or not, from my want of experience on this practice, and from want of a clearer detail of cost than I have hitherto seen, I am unable to judge. As to all other outlay on permanent inprovements and on cultivation I have nut the least doubt of a proper renunerative return. It is very
clear that Mr. Dodd, the bailiff, understands his busiwhich he has to pay attention. Mr. Peake, of Bradwell Hall, wio has gained several prizes, has made great improvements in the cultivation of a cold, light-Iying stablarn clay iand farm. The same may be sald o prop. Shaw, of Cold Norton. A new tenait on the is commencing in Henry Raiston, Huneywell, near heele, and his green crops are very good and correctly manazed He won the second prize for Swedes and the first for Mangels. In my opinion he made a mistake in letting his Oats grow too ripe before cutting, by which he iost far more han the seed, besides being thrown into bad weather. Mr. Adam Mountlord, of the Snyde Arms, in
Keele, has improved the cultivation of his farm and obtained several prizes.
The live stock on the Keele estate is in the course of improvement equally with the land. The members of the club are composed of the tenants of the estate, and their landlord at the head. They have annually a show of stock, implements, roots and seeds, with ploughing and draining matches, and like all other meetings of English men finish with a good dinuer and wine. Mr. Joseph Stockton, of Newcastle, is the Secretary to the elub, a poit which he appears to fill with credit. W. Ruthwoell Haydock Park Farm, near Warrington.

$$

risk in England in the cultivatica of Crrals under this method,
it is now proved on wanous of the new farms to be no greater
than the rink there under the ordinary nuethod. Count Gasparin
 tells me that he has had as nuch grown on a farn belonging to
him in Scotiand an a fert. In this feat of Mr. Teller he used,
as I understand from lina, in addition to linin farm. Furd manure a large propondion of gana, in and histis easy advanco is due to the
new implement for its distribution in solution as liquified manure; but in other farms, which) 1 think the moat important foreign or other than liquified solid stable dung or diluted atable
Mr Telfer's farm, however, would furnish an example of the practical dangers attendant on the masonings of the class of abstract or "geometrical rezoneers" in phiticn ecimenty, who have
on the question of subsistences ansumed as a present general and on the question of subsistences ansumed as a present general and
absolute condition of sess and less return belng obtainable from
the cultivation co inferitor solls. Now, it so happens that quite as fond returns under the new method of cultivation have been abtained from inferior soils as from suyerior ones; verifying
the views of the great vegetable physiulokist De Candolle. who predicted that the future of agriculture would depend on arrangements for giving to plants fore and water or
moisture at the same time. The soil of Mr. Telfer's farm is moisture at the same time. The soil of Mr. Telfrr's farm is a
common sea sand. It is thus desaribed by Mr. Morton in his eport, as "an old enclosare from the blown annd of the sea suore
formerly a sandy waste;" and "while the difference which to the farmer it exhibits from the wilderness it was, is at least as great as that exhbited by the richest specimens of fertility, I
know that the difference is in this case due wholly to art and not know that the difference is in this case due wholly to art and not
no nature. The land on some of its extent has been hearily clayed, and hase yielded henry crops of Wheat; but a great deal f that I baw was as light a sand as was ever cultivated-a pure
and soil, which the severe frosts of the winter have not made
Mr. Wilmot, an emainent agriculturist, who has had under his the largest landed proprietors-las on a farm near Congleton, is Cheshire, brought a sandy peat to almost as great fertility as that of Mr.Telfer, and excepting the W hent rrop and the Italian Rye grass on most crops 10 agreater ananith of ferthlity, without any foreigo gets a Cabbage weighing 30 lbs. on every superticial yard, or tons per acre. I might adduce other examples to show that poverty. Mr. Wilmot's ontlay was for draining this land about 5 l. per acre and about 2l. 10. for the distributing
apparatus, composed of wooden pipes, which of course would
be eligible for those countries where iron or superior be eligible for those countres where iron or superio
earthenware is dear. The siandy peat land was valued los. per acre reat: after the improvement it was valued as
worth fron 40 s . to 45 . per annum. The cost of iron pipes
distributing apparatus on such a farm as Mr. Telfer's would he in England 3l. to 5 . per acre, accarding to the close-
ness of the pipes; and the wrking expenser ot distribution, in
cluding the interest on the outlay, would be, if done by gravitaon, about 9 s. per scne, and if by steam power, allowing for the us luding 7it per cent. for wear and tear. In the published minate the sorts and quantities of materials on which to form their own estimates. I need not speak in Belgium or in Switzerland on the advantages of liquid manure; but where I have objected to
its being so long retained and wasted by noxinus decomposition; to its being delivered in too high a state of concentration in single inslead of repeated applications, I have urged that it ought gene-
rally to be diluted in some six or seven times its folk Which the nnswer has been, that the labour of distribution already very high. To this I reply, that by the new method by one man and a boy, aided iy steam power, as much liquic
manure is distributed as by between 100 and 200 men, distribu-
ting manure from yessels ting manure from vessels on their back as in switzeriand; and that it appears in England, that as much manure may by the imin use in Belpium. When the term irrigation is applied to the new method of distribution, $I$ wonld oberve that, as the chief
paid execative officer of the General Board of Health in England, paid execative officer of the General Board of Health in England,
Whilst I have protested against the retention of manures in houses,
in cabinets said to be inodoré or chemical manipulations there in any form, I have equalls protested against the methed of applywater irrigation near towns or villages by the method of submer sion, which produced ague, typhus, and diseases injurious to men and to cattle. I found my objections confirmed
by experience and by the Legislature in Italy, which
in several parts prohibits the formation of weter in eaveral parts prohibits the formation of water
meadows nearer than six miles to town. But I am enabled to object to this method, Thich Fill appear hereafter to be
only worthy of the Saracenic period in which it nriginated, on bave amounted ia sume instances with the conneeted works to as
much as 407 . per acre, and in Eugiand from $4 t$. to 30 ? per acre; generally costing double the expense of the pipe distribution, I obiect to the waste of water as well as of manure, for, properily effect. By immediate applications of manure before decom-
position can commence, the waste in coxious eraporations, -in stables as well as in houses - is avnided, -the fertinsing matter is at once fixed in chemical conbination with the soil,-and we now
find that when applied in proper doses it is held permanently in the foil until it is removed by the act on of vegetation. Any yne who will pass proper solutious therngh scills, or will apple them by will give it-in the intervals of horticultural culture of two Wher in the interval, may easily tast the capability of acy poil. maxims I have elsewhere pnunciated will be recognised, namely, of animal and vegetable matter indicate the generation and presence of the causes of insalubrity and preventible disease, for the runa distriets ail continuons offensive smeelis from
animal and vegetsble decorapoition denote the loss of fertilising
matter, loss of mones, and bad hustandry. In the house, in the
street, and in the farm-yard, iu urban as well as in rural dis-

4 Areen-topped White Turnip was gathered last weel off the farm of Mr. John Hewitt, of Lea, near Gainsbro' Lincolnshire, measuring 3 feet 4 inches in circumfer
ence, weighing $27 \frac{1}{4} 1 \mathrm{bs}$. The field, which is sand, was manured with "Tiger's manure," from Beverley, 2 cwt to the acre, drilled in with other management. The
Turnips in the same field averaged 14 lbs apiecemany much more.
Boydell's Endless Railway Engine. - To show how backward people are to appreciate valuable inventions possibly destined hereafter to work a complete revolu tion in the agricaltural world, I will instance Boydell's
Engine, an engraving of which will be found in the Patent Journal, March 7, 1847, entitled "Boydell's Facilitate the Din applying Apparatus to Carriages to Facilitate the Draft." When on the committee for the
examination of implements at the Society of Arts about eight years since, we were called on to give our decision on the mexits of rather an ingenious steam plough,
exhibited by an American. At a glance it could be seen exhibited by an American. At a glance it could be seen
that immediately the engine had got well into an arable feld it must inevitably, from its weight, sink up to the axles, and poseibly disappear altogether. It was at this
time that I was more than ever forcibly advantages to be derived in ploughing land by use of Boydell's enginea to draw the ploughs as brought before and called the attention of my fellow judges to the it admannely of an invention of this description, thinking Other hasty weighta ; but I have heard nothing of the
matter till lately, and now I trust it is meriting tha invention. Having been fully alive to its properties may be blamed for not calling greater attention to myself, but I was at that time, and have been ever since
engaged in matters of equal importance ; and probably this might have been the case with the other member of the committee. Sigma.
Seed Hybridising.- Your leader in the Qazette of the 1st November on Turnip seed and hybridising is worthy of attentive perusal, for in no part of our profession are Ask a farmer which Wheat he finds most prolific, or produces the best sample, you may receive a sabislactory answer-because the bushel decides the former,
and the miller the latter. But ask him which Turnip or Sivede produces the most weight on a given space equally manured, and most nutritious; I venture to say
that in nine cases out of ten the answer will be evasive. that in nine cases out of ten the answer will be evasive. The reason is obvious. It takes too much trouble to writer has conducted, it has been found that, equally manured, some varieties of Swedes have produced onesixth more weight ; and moreover, from equal weigh more nutritive value was found. The produce per acre the farmer can determine if he would only take the trouble, but the solid matter or nutritive the chemist to determine. It is a well known fact tha we farmers are no chemists, and we talk lightly of the
science; therefore, as the farmer and seedsman are linked science ; therefore, as the farmer and seedsman are linked together in the matter, I would suggest they should go Turnip or Swede most productive on his soil and manuring, the seedsman to have the specific gravity of each class tabulated, in order when called for to show his farmer friends. In the Baker Street Bazaar, I doub not as usual we shall have exhibited gigantic Mangels and magnificent $S$ wedes, all being well to gaze upon and admire by Londoners. But for us farmers, "who live are select the lind of soil wom which the specimen applied, and the distance grown apart-these, combined with the seedsman's specific gravity, would be interest ing hints, and for which none would be more thankful than your humble servant. A Friend to Improvement.
Rape. -There is no doubt that Rape cut now will sen up shoots, seed shoots, in the spring which will be luxuriant in foliage in proportion to the present strength of the plants, and as the ground is or may be made rank with manure, and as it is deep, \&c., as with every thing else so with Rape, these conditions will in increasing the rankness of the leaf delay the appear more valuable for feeding in the ariog by brimo so much later as well as more abundant. In poor land so much later as well as more abundant. In poor land
and with late plants for feeding the spring shoots will be hardly worth leaving upon the ground, still they will give some picking for sheep. But as to cutting now or in the course of the winter, as to the production of spring shoots, I think it is immaterial when it is done, and so for feediag purpose well over. Rape, as doing pretty well in indifferent conditions, does not receive in general the treatment deserves ; under the same treatment as Turnips it is anything else. I have weighed in Ny cattle to almos transplanted in July from a May sowing, that without is root and lower stem weighed 6 lbs , and I think with good treatment the weight of a general crop might be
brought up very near to this ; and as this might be ffected after some early removed crop, with the addition of what the spring shoots would produce, per haps there could not be a more valuable green crop From its oily nature it ought also to be a very nutritive food. I have offered it and Vetches together to a com and she has left the Vetches and taken to the Rape; plot of Cabbage in which there happened to be a few plant of Rape was trespassed on by pigs and ducks, they did not touch the Cabbage, or at least only in passing, til they had picked every Rape plant bare. Ducks thus feed ing may seem something strange; we used ever to conside in the destruction of what was injurious. In Ireland they were then fed on Potatoes; but since the fatal disease in these, ducks, like everything else, have been taught to eat Cabbage, and now no green thing in the garden is safe from them, and we have thus lost the benefit of their services as insect destroyers. Can we have a more beneficial treatment of land or a more profitable green cropping year than a highly manured crop of winter Vetches followed by transplanted Rape ffording three crops of green food with frequen and hgs of the land, two of these crops being full and heavy ones, the third perhaps equivalent to a
half one, and most of the stirrings of the land occurring at the most leisure time of the year? Even the trans planting of the Rape, the most operose of the opera ions, falls in between hay and corn liarvests, and if driven into the corn harvest may occupy the men and women on wet days, or at any intervals when there is not work for them in the but then it may be cut in frost and cannot be stored, should I think it so cold and watery a food as Turnips. I am not aware that it has ever been used as fatting food, but I should think it better adapted to that pur pose than Turnips. I question whether much less corn J. M. certainly less oilcake, might not be required with it J. M. Goodiff.

## Boriflicg

North Walsham.-At the late annual meeting held the other day, Mr. Cubitt said his object in establishing neighbourhood, and they could not agriculture of the practical turn to their meetings. They had had a very good show during the day, and he might perhaps circumstances of the district ought to be considered they lived in a district hemmed in by the sea, and he thought the show of cart horses under all the circum tances was an excellent one. The animals exhibited had been hard at work up to the day of the exhibition, and their condition was, therefore, highly creditable the breed was more deserving of attention than th mprovement of the breed of hackneys, which wer only worth 301 . He had been offered 44l. for a two fear-old; and if they could get between 300. and 40 , hackneys, and he advised them to apply all their energies to cart horses. Next year he should pro pose that they should increase their prizes in this genous to the district, but it was not so successful with sheep or bullocks. They farmed very little land but their object was to farm well ; they paid a high rent, and wanted, therefore, to grow the utmost they could upon a small extent. The Turnip crop he considered a very important one, though perhaps on tha subject they might think that he spoke from intereste motives. Without a good crop of Turnips, it was im possible that a farmer could show a good balance-shee Tume end of the year. Without a good crop of Turnips, the farmer could not have good stock, and was, , 1 it might be interesting to the company to know ho Ge succeeded in growing his Turnips. His friend, Mr. Mr. Theobald, had expressed an opinion that the farmer were humbugged a great deal with regard to them He hnew they were. There were three grand secret in growing a good crop of Turnips-plough deep, sow early, and make your own artificial manures. The basis of manure was dissolved bones, and it required no skill no no capita, but simply a hlle attention, to dissolv ons. farme missolve bones by getting bones in it. By this means he could dissolve bones as well as the most scientific man in the world, and by putting on 5 bushels per acre of this manure, and a little guano, they might come to the association and compete successfully for the prizes for roots. His own land was extremely good, he lived under a most liberal landlord, who had granted him a 20 years lease, and he hoped at pend of Turnips, but good tillage was equally important There was an immense deal of difference between good hoeing and bad hoeing. After he had been in the north of Eugland, and had seen the manner in which the Seotch farmers executed this wark, he was perfectly disgusted with the process pursued at home; and he had told his men that if they hoed his Turnips so that he gained the prize he would give them the money, and he had no doubt if other farmers did the same they would Theobald had alluded to the education of farmer That was a most important question, for education might be carried too far, and their sons and childrea might be made good for nothing. Farmers sons, he believed, should be educated at the plough's tail, the home be educated well, but when they were bras not ashamed to confess that he had gone through every description of work on the farm, and he believed that if all farmers thoroughly understood the nature of field work they would be in a much better position. There were many farmers ruined by theory' but very few ruined by practice. [!]

## Farm Memoranda.

Dishley Farm, in Mr. Bakewell's occupation. The following is abridged from Arthur Young's "Farmer's Tour.
Mr. Bakewell, of Dishley, one of the most considerable farmers in this county, has in so many instances improved on the husbandry of his neighbours that he merits particular notice. His breed of cattle is famous throughou the kingdom ; and he has lately sent many to Ireand. He has in this part of his business many ideas whichly beglected perfectly new, or that have hitherionst, whether neglected. This principle is to gain the beast, whuable sheep or cow, that will weigh most in the most raluab joints.; there is a great difference between an corse 50 stone, carrying 30 in rossting pieces, and ister, and boiling ones, and another carrying 30 in the later, 20 in the former. And at the same time that hegame shape that is of the greatest value ince, that he gains a breed asserts, from long exper fed than any others. These ideas he applies equally to sheep and oxen.
These the old notion was, that where you had much and large bones, there was plenty of room to lay fiesh on ; and accordingly the graziers were eager to buy the largest-ved to be an utter mistake.
syatem Mr. Bakewell has proved

He asserts, the smaller the bones, the truer will be the portance are the wool being equal to any other; and the
make of the beast-the quicker she will fat-and her sheep standing the fold better. He sells no tups, butlets make of the beast-the quicker she will fat-and her
weight, we may easily conceive, will have a larger proportion of valuable meat-flesh, not bone, is the butcher's object. Mr. Bakewell admits that a large-boned beast may be made a large fat beast, and that he may come to a great weight ; but justly observes that this is no part of the profitable inquiry, for stating such a simple proposition, without at the same time showing the expense of tory argument. The only object of real importance is the proportion of Grass to value. I have 20 acreswhich wil pay me for those acres best, large or small more profitably in the joints of value, that the query is answered in their favour from long and attentive ex perience. Among other breeds of cattle the Lincolnshire and the Holderness are very large, but their size lies in their bones; they may be fattened to great loss to the grazier, nor can they ever return so much for a given
The breed which Mr. Bakewell has fixed on as the best in England is the Lancashire, and he thinks he has mproved it much, in bringing the carcase of the beast into a truer mould and particularly by making them broader cver the backs. The shape which should be sheep, is that of an hogshead or a firkin; truly circular with small and as short legs as possible; upon the plain rinciple that the value lies in the barrel, not in the legs All breeds, the backs of which rise in the least ridge, are bad. I measured two or three cows, 2 feet 3 inches flat across their back from hip to hip-and their legs remarkably short. Mr. Bakewell has now a bull of his own breed which he calls Twopenny, which leaps cows at 5l. 58. a cow. This is carrying the breed of horned cattle to wonderful perfection. He is a very fine bullmost truly made, according to the principles laid down bove. He has many others got by him, which he lets ravely selle any. He would not the 200 l for T wopenpy He has several cows which he keeps for breeding that he would not sell at 30 guineas a-piece.

Another peculiarity is the amazing gentleness in which he brings up these animals. All his bulls stand still in the field to be examined; the way of driving them from one field to another, or home, is by a little switch; he or his men walk by their side, and guide him with' the stick wherever they please, and they are accustomed to this method from being calves.
In the breed of his sheep Mr. Bakewell is as curious, and I think, if any difference, with greater success than in his horned cattle, for better made animals cannot be seen than his rams and ewes; their bodies are as true barrels as can be seen*, round, broad backs, and the egs not above 6 inches long, and m most unusual proof of kindly fattening is their feeding quite fat, just within their fore legs on the ribs, a point in which sheep are never examined in common, from common breeds never carrying any fat there. In his breed of sheep he profatting in the valuable parts of the body, and the living m much poorer food than other sorts. He has found from various experience in many parts of the kingdom, well as upon his own farm, that no land to bad for a good breed of cattle, and particularly sheep. It may not be proper for large stock, that is large-boned stock, but undoubtedly more proper for a vaiuable well made sheep than the usual wretched sorts found in most parts England on poor soils-such as the moor sheep, the Welsh ones-and the Norfolks. And he would hazard any moderate stake that his own breed, each sheep of which is worth several of those poor sorts, would do on them. Ase poor soils than the stock ging been found the strongest indication of hardiness, and what the graziers call a kindly sheep, one that has always an inlination to feed
He has an experiment to prove the hardiness of his breed which deserves notice. He has five or six ewes, that have gone constantly in the highways since Mayday, and have never been in his fields; the roads are narrow, and the food very bare; they are in excellent order, and nearly fat, which proves in the strongest manner the excellence of the breed. And another circumstance of a peculiar nature is his flock of ewes, that have reared two lambs, being quite fat in the first week of July-an instance hardly to be paralleled.
The breed is originally Lincolnshire, but Mr. Bakewell thinks, and very justly, that he has much improved . The grand profit, as I before observed, is from the same food going so much fartherin feeling these than others; not, however, that Mr. Bakewelle breed is small-on the contrary, it is as weighty as nine-tenths of old at $2 l$. a head. Other collateral circumstances of im-- The following is an account of two sheep of Mr. Bakewell's I thid

## Miscellaneous.

Agricultural Education.- When farming is conducted on scientific principles, the increase of crop would in its production ; but when it is, as too often happens, regarded as one of those callings that only require regarded as one of those callings that only require
strong arms and industrious habits to ensure success, it is very likely to prove anything but successful so long as the trae priciples of cativating and maintaining the fertility of the soil remain unlearned. Strong hand and patient industry might suffice while population continued thin and scattered, and while the land was subject when population has become dense, when the land is subject to hation has become dense, when industrious habits will not alone suffice to enable the iarmer to meet and overcome his difficulties. In these days "the battle is not with the strong," but with the intelligent ; and if the farmer expects to succeed in his profession, he must begin by acquiring a knowledge of the nature of the materials he has to operate upon-the nature of the productions he is to raise from them-and how best his great machine, the soil, shall be best maintained in efficient order. Mr. Quinn, of the Dromiskeen Model Agricultural School, County Louth, in the Journal of the Albert Agricultural Training Institution.

## Calendar of Operations.

Fabm, near Hexham, Nov. 17.-The cessation of actual drying, permitted one of the most tedious harvests on record three montlis' harvest, but this year we hat Barley cut near this on the fifth of August, and in the beginning of this month
there was still Corn out. Not only has the harest been tedious, but disastrous; a very large porlion of the Wheat crop is unsound, and little of what is sound is in marketable con
dition. The weather though not favourable for bringing the damp stacks into condition, has been very much so for Wheat
gowing and Turnip storing. We are now in the midst of the lawing and Turnip storing. We are now in the midst of the
laperation, and have a strong force ou. We pay 5s. $6 d$. per acre for topping and tailing. Our plan of storing is to leave
a portion of the nearest stubble field (if near a road) unplonghed and there to store our Sweder. If there is no stubble tiel
convenient, we store in the field, where they are grown, use. The carts are fillert by our own workers, pulting every night if possible, and taking care that there are
fillers enough to keep the carts constantly going each cart going from 10 to 12 turns in the afternoon when storing
close at band. A man at the heap helps to empty the carts and keep the heap well thrown up and copered with a thick contin
of straw. We put nos il on the heaps, except a few spades ful Turnips keep milch better without soil ; our heaps ar about south. We purpose trying a portion of our crop ths y ear in a
large flat-topped heap ahout 2 feet decp and well covered with mitting, we hope to have all nur Swedes stnred this Week, when Our sheep were put on Turnips on the 8th, and the cattle put
into the yards on the 15 th of October. The latter are doing very
well; but a cousiderable number of the hogets have fallen. Fully the half of the Potato crop is lost with disease. for Wheat sowing that has been for many vears, find it is nos nearly all in. There will be a little sown no doubt after Turnips, Which are now being fed off, although it is now doubtful whether be put, as the price of Barley is now so high that it competes in produce 5 quarters Wheat at 70 s. will produce 7 quarters little choice in the matter to the farmer, but to the mation the
Wheat is the most valuable as a necessary of life, and aspecially if we consider how Barley is so often converted int into calculation : l. s. $d$. Will be the guide, and it is not likely that damaged this year so that the better qualities are scarce. The late Turnips do well with the mild weather that we have, an shere is stil abundance of Grass, so that we are not likely to be
so badly off for food as we thought. There are now a good many
lambs dropt of the horned breeds, and the luck is generall lambs dropt of the horned breeds, and the luck is generally good
Mangel Warzel bas been got up and is in most cases a good crop and appears already to find buyers, so that we may soon expect to see it more generally cultivated than it is; we every year se
more of it, and no one who once Swedes is not common, and I fear will not for some time, for wo can hardly like to pull them now as they are not stopt growing,
Our market is now well supplied with wheat and in much hette Our market is now well supplied with Wheat and in much hett
order thun it was. Beef is neither in graat supply nor much

## NOTES AND QUERIES：

A MEDIUM OF INTERCOMMUNICATION FOR LITERARY MEN，ARTISTS，ANTIQUARIES， GENEALOGISTS，PHOTOGRAPHERS，\＆c．

NOTES AND QUERIES will，it is believed，be found to bring before the general reader every week a wast amonnt of corious and interesting information．It was established for the purpose of furnishing to all lovers of Literature a
 elacidations or unceorded dates－which all who read occasionally stumbere upon；－－and，on the other，of supplying a medium through Which they micht address those Queries，by which the best informed are sometimes arrested in the midst of their labours，in the hope of receiving solutions of them from some of their number．The success which has attended this endeavour to supply a want long felt by literary men，is rendered manifest by the necessity of permanently enlarging the Paper from 16 to 24 pages．For
opinions of The Quarterly Revienc，Athencum，Examiner，Literary Gazelte，Spectrotor，Dublin Review，\＆ec．，as to the utility，\＆e．of NoTEs

## SATURDAY，NOVEMBER 29， 1856.

If Truffles are ever to be cultivated successfully the starting point must be，a correct knowledge of what we want to cultivate．But unfortunately this is the very point in which there has been the greatest deficiency in those experiments which in our own country at least promised the best results． It is perfectly useless to choose the most favourable site，to prepare the most promising compost，or to make other arrangements which may be supposed likely to succeed，provided we do not select such a species of Truffe as is capable of flourishing in our variable climate．Now to the generality of persons in England，a Truffle is but a Truffle，whatever be its peculiar structure．They have no notion that the species are very numerous，that a few only are fit for food，or of such a size as to make them worth notice，or that the Truffle of the English market is a notice，or that the Iruffe of different species from that of Paris．If then French Truffles are selected for experiment， even should they be fresh．and much more if they are the mere sweepings of the oilman＇s shop，

the－greater part of which have been submitterd io some process of drying by artificial heat with a view to preserve then from decay，it minht be aurured very safely that no succ－ss can possihly attend the experiment．Toshow how very different the common British Tiuffl is from that of the French markets，we have subjoined a sketch of the sporidia of the two species．
In outward appearance indeed there is little or no
ditterence，hut the aroma and ihe colour ot i．e vems are so distinct that even without a microscopic examination there can be little doubt about the matler．Now thoush several species of Truffle have been found in Fngland，it is curious that the black seede 1 ＇Irufle（Tubermelanosporum）which supplies the Paris markets，with an occosional admixture indeed of what may be called the Euclish Truffle （Tuber aestioum），has never yet been found as a native of Great Britain．Turassfindeed states that it was found by Mr．Broome at Rmabe，in Wilt－ shire；but Mr．Bronam＇s specimens belong really to Tulice lorumale，a species which selilum attains any ize in this country，and which together with Triber macrosporum，which is also a natise and which altains a marketable size in Frarice，may be safely pronounced as quite unfit for cultivation．Tuber m lanosporum requires douhtless a warmer climate than we have to offer，and its cultivarion therefore in the open air may at once be set down as hopeless． Having then satisfied himself as to what he wants to cultivate，that it is the English and not the French Truffle，the next point for the cultivator is to obtain a supply of the proper species at the proper time．Now here he must not be misled by mere names．The Truffe gatherer will probably tell him that he finds both English and French Tiuffles．The fact however is that what he calls French Truffles are merely those young and almost worthless indi－ riduals in which the veins are still pale，because the sporidia to which they principally owe their colour are not yet developed．Such specimens may be thrown aside as utterly unfit for propagation．
If Truffles are to be cultivated at all，it must be from the germination of the sporidia，or in other words from the running of the spawn，and this can only be anticipated from ripe and perfect individuals． Now，Tuber aestivun，which must be the object of cultivation，is a species which，as the name implies， is of earlier growth than some o her species．Even in summer individuals may be found which have arrived at their full size，and in which the fruit is perfected，but this is by no means usually the case， and the safer practice would be to take Truffles of the present season for experiment．These must of course be of English growth，and the best plan will be to procure them directly from the Truffle－hunter． As，however，much depends upon the particular year，the cultivator should not trust to chance，but should examine for himself．A common pocket lens is quite sufficient for the purpose，as that will show at once，if a thin slice be taken and held up to the light，whether the little sacs imbedded in the veins are colourless，and filled merely with the matter of which at a later period the reproductive bodies are to be formed，or whether they are of a rich golden brown and teeming with fruit．

Haviug ascertained precisely what kind of Truffe we are to cultivate，and having ohtained a proper supply of seed Truffles，our next point is to consider what are the habits of the Truffle with a view to its successful cultivation．Now there is not a particle of evidence to show that the Traffle is parasitic in any stage of growth，much less that it is in any respect due to the agency of insects．It grows from spawn like other fungi．The difficulty is how are we to get that spawn to run．This must of course be effected by placing the seed Truffles in conditions as nearly as possible similar to those in which they are found in nature．In Poit ou the mode of forming Truffle grounds is very simple．A portion of the naked down is inclosed and sowed with acorns，and in the course of a few years the soil teems with Truffles，and continues to have a crop till the trees have become large enough to expose the soil．The Englivh Truffle does indted sometimes grow on lawns which are very imperfectly shaded， but this is not its usual habit；the richest Truffle grounds that we have seen have leen in young plantations where the lower branches were not thick enough to exclude the light，but where the heat of the sun could not penetrate，and，if so，where it was modified before reaching the sull by a thin but comp act layer of regetable matler．The Truffes do not however crow in the re＂－table mould．but in the soll itself，which may be ut varions degrees of density，hut which must be t？mounhly drained．It is a－eless therefore to make vecetahle matter enter largely into any compost for Trufter lieds．What is wanted is a good firm soil，free from hail decayed vegelables，and intimatcly mixe toy ther，so as neither to become positively hard after having been cowlen hy water．nor to he fitle！with marities like a spone．Fnglinh Truftes are．We blirve，never foun！where the noit is essential＇y andy，though we are not prepared to say that they ane fournd only in a careou－soil．A few yarns whl sonet：mes make a differe ce．Truffles，for instauce，late never
hern found at Kew，but on the Syon mide of the Tham＋s，where the soil is no lower simiy，they are sometimes met with；thongh；however，a fuw

Truffles may occasionally grow in districts which
are not calcareous, all the best Truffe grounds of England are in districts which are strictly so. It is, therefore, a matter of prudence that the cultivator, while he secures a proper texture, should at the same time supply calcareous matter. If not absolutely essential, which we are rather inclined to think would prove the case if the soil of Truffle grounds were carefully analysed, it is at least clear that the admixture of such matter must be beneficial.
Our advice, then, is first to choose a site for the Truffle bed in some young plantation, consisting of Oak and Beech slightly mixed with Fir, where the ground is perfectly drained, and then to remove the soil to the depth of a foot, without however destroying the young roots of the surrounding trees. The space should then be filled up to within a couple of inches of the original surface, with a mixture of equal parts of good loam and road scrapings arising from pulverised limestone, with a slight admixture of old corporated with the other materials. If the road scrapings cannot easily be procured, soil from some chalky district into the composition of which chalk enters largely, but does not remain in a crude undigested state, micht be substituted. On the soil thus prepared the Truffes should be studded, and a fresh layer of the compost added, till it is level with the original surface. The whole should then be protected by about 2 inches of fallen leaves, amongst which a few Fir leaves will be found useful, as thry will help to retain the broader leaves in their place. Much of
course will depend upon the locality, but the bed should not be placed in a position where it is likely to be exposed to prevailing winds, and the Truffles must be protected from squirrels and other animals to which they are acceptable. The experiment might be varied by planting a bed with divided instead of whole Truffles; or the Truffles might be grated and mixed with water, and the mixture applied by a common watering-can; but I believe the two former methods are the best. If these ex-
periments should succeed, there will be an opportunity of ascertaining how the spawn runs, which is in reality a desideratum as regards the English Truffle.
As regards the French Truffle Tutasne has had an opportunity of examining young Truffles in September proceeding from the spores of the former year, and there is every reasou to believe that the process is much the same with our English Truffle. The spawn is at first white, and forms cylindrical branched threads, except where it is closely wrapped round the fungus. As the Truffle grows the spawn vanishes, leaving behind only a few brownish threads, as may be often seen in Tuber oestivum. Should the habits of the two species prove the same no results can be expected under at least a twelvemonth from the commencement of the experim ment; but if the spawn can once be made to ran with any certainty it may soon be possible to prepare it for the market.

For ourselves we feel sanguine that a few well considered attempts, founded on the principles now pointed out, will lead to success if the matter is taken up by intelligent minds. Rules cannot be given at present ; they will follow the trials which we hope will be made now that the habits of the Truffe are correctly known, and that we have put an end to the foolish recipes of the quacks who have hitherto misled gardeners. The trials will be attended with very small expense. Almost every country clergyman must have access to a plantation in which to operate. If not he can sow some acorns in his garden and make a plantation for himself. As to gardeners, there is not a place in which every faclity for conducting the proposed experiment is not at hand, and they must recollect that no result could be more acceptable to their employers than supplying the cook with plenty of good fresh Truffles. We should think it would answer the purpose of those who live in the proper districts to advertise fresh seed-Truffles for sale.

## A Mr. R. Blackett, of the Rivenhall Tile Works,

 Witham, has sent into circulation a handbil eulogising a contrivance for border edgings called Hogg's Edging Tiles, which he manufactures for sale. Mr. Blaceetr has put prominently forward, as was natural, a favourable opinion that was expressed of these tiles in the year 1852, and again in February 1853, when it was stated that they appeared to possess much merit. Nothing could be more true; they are very good looking, and appcar to be extremely well suited to the purpose intended. But Mr. Blackett has forgotten to add that this appearance was deceptive: we mnst therefore supply the omission. An indispensable quality in all such inventions is that they shall stand the weather. In September 1853 we reported that theydid not tand; and this was explicitly repeated
in the October following. Their value was therefore
merely apparent. What they were really worth may be seen at this day in the Garden of the Horticultural Society, where their remains are still left in the place they occupied originally. What the strength of Mr. Blackett's may now be we do not know from personal experience, but we think it right to state that a correspondent reports the new
ones to be no better than the old ones.

VEGETABLE PATHOLOGY.-No. CXLV. 599. Parasite (Uredines,* Rust). Under this are comprelended numerous parasitic fungi, which attack plants belonging to almost every natural order. Some mischievous. Their spores are of different colours, yellow, orange, white, brown, de., and their structure 600.
evalence white rust is familiar to every one from its other Crucifers. The mycelium spreads amongst the
 tissue, distorting every part, and in the flowers an enormous size. A figure illustrative of this will be found in the
Transactions of the Horticultural Society o
London, vol, 3, p. 266 London, vol, 3, p. 266 , is represented in the annexed woodcut. The mycelium of parasitic fungi is often difficult to observe because of its minuteness, and the perplexity caused by the the matrix. In the white rust, Cystopus, easily seen; and any on Who is sceptical about plants cannot do bette than to make i ject of investigation
of interest. Few plants in point of fact are more curi ous as regards structure, and few were more puzzling tili Tulasne explained that two kinds of spores are proluced in the same heap, the one more numerous forming monilifurn chaius with cylindrico-globose arti-
culations separated from each other by a short narrow culations separated from each other by a short narrow
connecting thread, the other larger, thicker, and connecting thread, the other larger, thicker, and
darker, divided into three distinct lobes, after the ashion of Triphragmizam. Both of these germinate, but the larger seem the more perfect. The same thing occurs in the common Rose Rust, which belongs to the genus Colcosporium. Some of its spores germinate at definite points, like many pollen grains. Roses often suffer greatly from this blight, which is capable of being propagated by the spores, as where the soil in which a healthy Rose tree is planted is sprinkled with water in which infected leaves have been immersed the tree is pretty sure to be rusted the following season
601. The most important, however, of the species of rust is that which attacks the spikes and leaves of corn.
We must, however, first distinguish between U. linearis and U. rubigo-vera, the former being simply the young state of Puccinia graminis before the dissepiments are ormed. As the two plants frequently grow together it was at one time thought that $U$. rubigo-vera was also a mere state of the Wheat mildew. As long as the rust is confined to the leaves it is of little consequence especially if the growth of the plant be vigorous. Th check undue luxuriance; but if the spikelets and check undue luxuriance; hut if the spikelets and at a later period of growth, the effects are disastrous The matter which was intended to nourish the germen is diverted, while the mycelium causes a.sort of hyper trophy, and the grain, which was at first swollen Wheat the diseque is scarcely and shrivalent, but in the white Wheats it is so virulent that in countries which do not suit them it is often almost impossible to secure seed. In all these cases so many of the spores all to the ground that no system of washing or steeping is effectual. The especial varieties which are most subject to the complaint, a remedy which is very easy where red Wheats form the stapie of the crop, bat where white Wheats are most suitable to the soil we fear that there no known remedy. The rotation of crops is how ever greatly in favour of the cultivator, for rust is far less common on other cereals than on Wheat, though unhappily it occurs on many Grasses, by which the plague is propagated.
602. It is right to state that Desmazières considers the pecies which grows on the inflorescence as differen from that which grows on the leaves, and has therefore published it as $U$. glumarum, Roberge; but after an examination of his own specimens this opinion is not borne out, for there is no one essential character to

- From uro to burn. 1
separate them, nor are the spores as he describes them
mooth, but minutely granulated as in U. rubigo-vera. M.J.B.

## NEW ROSES.

IT seems to have become a fashion to depreciate Perhaps the fable of the "Fox and the Grapes "is not" altogether inapplicable in the case. But that it is a ashion, and a mere fashion founded on a little truth and much error is my conviction, and for that reason I am induced to offer an investigation of the matter, Let me admit at the outset that numbers of worthlesa new Roses are annually palmed on the public at high prices, but this does not establish the position of your correspondent "A. R." that "the old Roses are the best yet." Surely he has just awakened from a long ong aleep to recommend among 12 "not beaten yet" uch second-rate kinds as La Reine, Madme. Laffay, General Jacqueminot (Hybrid China), parte, and William Jesse! The first is sometimes fing he third loose, flimsy, and often washy in colour the fourth of indifferent shape; and the last littlo find himself if he relied on such kiuds in competition? Surely at the bottom of his class; and their position is about the same viewed from the mero decorative point of view. No one can regreb with falsely flaming descriptions so-called new Roses, which are neither novelties nor improvements, 'The practice is too general with flowers and fruits too, and nown a, raiser of seedings to offer from to 2 kinds one year at from 10 to 25 francs each, and not one of
them prove worth as many sous. The remedy is, apprehend, to the found not in repudiating noveltice in toto, but by keeping a watchful eye on the source whence real acquisitions proceed, and whether a deaier errs from iguorance, careleseness, or selfishness, ignoring him in future transactions. Not that this rule shoule be too strictly enforced; no point in the entire corre of horticu must be some rist on the part of purchasers; all will err occasionally, but thste are - of enatinuously. Now for the would invite the attention of your readers to the following: - Hybrid Perpetuals : General Castellane (rich crimson), General Jacqueminot (brilliant purplish red), Gloire de Vitry (bright rose), Lord Raglan (searlet
crimson), Madame Desirée Giraud (white, striped with carmine, (Madame de Cambacères (rich rosy carmine), Madame Masson (reddish crimson, chauging to violet, Madame Martel (white, suffused with rose), Madame Vidot (transparent flesh-colour), Souvenir de Levesoa Gower (dark red, changing to ruby). Bourbon. Fented Gloire de Dijon (yellow, shaded with salmon). Although these have issued from the hands of the raisers within a space of two or at most three years, I would place them in the seale against the 12 of "A. R." which are a sort of omnium gatherum of all time, notwithstandigo balance.

Thus fur I write boldly, because supported by ascestained facts, but I am now about to enter an impes question-lut judging of the quality of new Roses arises from the roots becoming dried in their transmission to thia country, so that they seldom fairly establish themselve the first season. What we are we believe we shall bo therefore be taken on trast, of the 00 or 80 new vaieties found correct in the main. Or lhast season the following blcomed to our satisfaction : Hybrid Perpetual Arthur de Sansal (purple shaded with crimson), Bacehus (crimson scariet, brighter than Géant des Batailes) Dr. Henon (white, tinted with yellow), Genera s colours (rosy carmine), Imperatrice des Fraoçais (4esh ), Ms dame with white), Mathurin Regnier (pale tent des Jas dins (brilliant crimson), Pæonia (reddish crimson, shomy, with many good qualities, but indifferent shape), F in Noir (almost black, but not full), Souvenir de it Rition $d^{\top}$ Angleterre (bright rose), Triomphe de $l^{\prime}$ Exposition (reddish1 crip
One word in conciusion. Permit me to ask those Rose amateurs and dealers who repudiated the were Roses some two or three years since (and hlfered in many), whether their collections have no as good Roses now as then. The object is to reach few draw out by the exercise of the judgment the rew rea diamonds from amidst the multiplicity of paste sare tions glittering on every hand. To wait is to lose all known-demonstrated-to or two years of the enjoyments

GENERATION OF FUNGI
Thovgr so much has been done by Tulasne, Caspary, and others towards the ele assumed by individual species of fungi, insomuch that from two to five different forms
druit may exist cuncurrenty or otherwise in the sume
nonus, and at the same time so many indications have
men discovered of bodies either actually endowed with the power of impregnation, or representative of such the power it curious that as regards the higher fungi reparch has either been altogether baffled or has met with that while in the higher Cryptogams the organs of mpregnation approximate so closely to the animal type, wrea plants so low in the scale as Algoe exhibit vital pheoomena in this respect of a higher order than any
Phenogams. In the same tribe of plants, then, we need be surprised if we find inferior species endowed with ore distinct indications of sexual distinctions than
which we have every reason to believe are of her systematic dignity. The subject has lately been en up by Hermann Hoffmann, and the results of his restigations are given in the Botanische Zeitung of
rch 1856. His attention was first directed to the rexicular bodies which are so conspicuous on the gills of wo inky Agaries which are now known by the name of of ind anything which made it probable that they have ny sexual function. After maceration for some days but, as he very prudently observes, the same phenomenon takes place so often in other cases as to make th att of little weight. He therefore considers it as certain that these bodies, which he calls Pollinaria, are of no
rass significance, and that they are in fact mere modiHis attention was then tu am, and he there discovered oblong bodies produced sthe tips of certain privileged threads which at last marate from their attachment. These bodies were
amitted to the influence of a damp atmosphere without aimitted to the influence of a damp atmosphere without
inving any germination, and he therefore concludes tat there is much probability in favour of their being me spermatia. He ascertained however in Agacricus tom these so-called spermatia, and that their influence berefore, if exerted at all, must be directed to the fertiCyptogams.
On the whole the result obtained is not of any great portance, but the investigations as far as they go are best object to which attention can now be turned, Win a view to the confirmations of Hoffmann's notions, didg of fruit, the one like that of an ordinary Agaric, wit would be interesting to ascertain whether the Paiboid fruit would germinate. In closing our remarks tcannot help adverting to the carelessness with which
rell-known plants are so often described as new by rellknown plants are so often described as new by
ferman botanists. Actinobotrys Tulasnei, Hoffoman, has described in the first volume of the Journal of parlioniformis, and it is mentioned in Caspary's o manted Bremia lactucce, Regel, is the same thing; a gin with respect to Sphceria acuta, Hoffm., the nature haria was proposed for its reception many years since, wides which it has been long ago shown that Greville
gared the fruit of Spheria coniformis for that of loffimann's $S_{\text {. acuta. Whether or no the latter may }}$ a mere $P$ yycnidium of the former is a distinct a mere Pycnid
nestion.* M. J. B.

## Home Correspondence.

Preservation of Wood.- Your Paper of the 15th inst. ith preservative liquids, and it will probably induce any to adopt it. I must however beg lenve to deny ansertion that sulphate of iron has been found to Towards the end of the last century Dr. G. Fordyce had observatory window much injured by dry rot ; he rected me to scoop out the decayed parts of it, then to
ap the crevices with a saturated solution of sulphate iron. This not only checked the dry rot but pre4rved the window for many years. So satisfactory a His his cellared a friend to try the experiment on beama pored most successful. When the ships of H. M.'s ontharn was desired to report upon them, and his fully proves that sulphate of iron has been
an efficient preventative of dry rot. Sulof copper was recommended by Dr. Hales a century ago for the preservation of wood, but oferable. The preservation of wood was a subject atch considered by the late Sir S . Bentham, who was Wy means by which ite durability would be insured. parpose by exhaustion, which atill appears to be the only ficacious mode of preservation where the pieces are of uscribed in the Gardenerg' Cheronicle is decidedly in its

 Mot aribe from tporophores, bat are generated like the sporidia
Itheor from the protoplum.
preservatives is not however the only mode by which it can be preserved, for Sir Samuel has instanced that in have been preserved by simple exprosure to the air, thus insuring their slow dessiccation, so that the interior moisture may evaporate without rending their exterino surface. Indeed, slow dessiccation seems essential for imber as well as to preserve the flavour of vegetables, as instanced in the Gardeners Chronicle. The late Mr.
William Strutt said that dessiceation hy steam would be found a superior method, indeed this has been proved in an instance practised hy the fatiner of the late Mr. R. Prosser of Birmingham, who contracted for the erection
of an edifice, of which the timber was still growing. of an edifice, of which the timber was still growing.
Nothing daunted by this circumstance, he dried the wood by steam, and it still bears evidence of the correctness of his views. It must be nhserved that to this day it has not been ascertained whether the preservatives act mechanically, or chemically, or conjoiutly,
Fuel for Boilers.-After reading your correspondent's remarks (see p. 773 ) respecting boilers and fuel, $\bar{I}$ confess myseff unable to make out what he means In the boilers is either house cinders, gas or oven coke, or Welsh coal. These," he adds, "are valuable in the order in which they stand." House cinders are thereore set down as best, next cokt, and last Welsh coal Further ou he says," Gas coke is never quite equal and equal to good oven coke, but superior to ordinary gas coke." Again, ho says, "The principle of a conical
boiler is that it should be filled full of fuel." In another place he says that the boiler is most powerful when it is only partly full. Now, as an old stoker of nearly 40 years' standing, who has had all sorts and sizes of boilers
to deal with, I would advise every one who is not prac tically acquainted with those matters to "fiyht shy" of these three-dozen-hour-boilers; any stokehole boy would shudder to be told that he had only to make up his fire something like every other day. Such state
ments as those of Mr. Rogers and "Sigma " are to the point if they were confined entirely to orchard houses, but their tendency is to induce a belief that the ereetion of a heating apparatus, and the keeping it supplied with fuel, is quite an easy matter ; while every gardener knows that as far as forcing is concerned just the conknows that as far as forcing is
trary is the fact. $D$. A., Devon.
Peturia imperialis.-Mr. Milner having asked me "in Peturia imperialis.-Mr. Milner having asked me "" beg to inform him that in the autumn of last year excavated a bed about two feet, and then filled it up with fresh loam from an adjoining Grass field, tho-
roughly incorporated with a certain proportion of well decomposed cow manure and finely sifted coal ashes, or rather, I should say, the ashes from culm formed into balls with an admixture of clay, the kind of fuel gene rally used in this quarter. The bed was then allowed to remain undisturbed in a rough state until the second week in May, when it was merely hoed and raked over, and the Petunia plants were inserted therein along with from varieties, some of which were turned out or pots seed previously raised in a hot bed. Every plant grew most blossomed splendidly. By it, nothing but empty
calices or green caps were produced, precisely as calices or green caps were produced," precisely as
described by your correspondent " J . G ." in a previous Number, and several of my neighbours to whom I gave cuttings, which readily rooted under a handglass, have told me that they met with no better result from those in the open border. It is far from my wish to dis-
parage the merits of the plant, whatever they may be. parage the merits of the plant, whatever they may be experience, and perhaps the failure in my case may have arisen, as Mr. Milner states, from improper cultivation; yet the circumstance of my having got
it to develop its flowers upon being treated in the way I formerly communicated to you, leads me to imagine that in this locality at least it is not at all calculated to form a bedding plant, so far as its flowering is concerned. I dare say, however, that if it be kept in the gre then planted out, some of these may come to maturity in the open air ; but I have my doubts as to any that may afterwards appear in embryo doing so here, no matter what the soil may be that is used. Nevertheless if Mr. Milner will be so kind as to inform me what mode of treatment he would recommend my adopting, I shall feel exceedingly
obliged to him, and will have much pleasure not only in obliged to him, and win have mach pleasurin the result trying it next summer, but in giving him the result of my exper
South Wales.

Quercus sessiliflora.-The specimens sent herewith were gathered by me some weeks ago in one of the combes of the Quantock Hills, in the west of Somerset shire. The tree grows plentifully there, though gene rally of a amall and stunted form, owing no doubt in part to the high sitaation, but more perhaps to its being so frequently lopped to obtain wood for charcoal. A
few low trees bore, as thickly as Oak trees nually bear acorns, the Pear-shaped appendages of which I send a specimen. From their position on the branchlets they appear to occupy the place of acorns. What are they Are they formed of the material of which acorns are ureally formed, and therefore an anomalous formation usualy formed, and therefore an anomalous formation
of the acom? Halesleigh. [Yes. The imbricated scaly of the acom? Healesleigh. [es. The imbricated scaly
bodies you speak of are female flowers converted into
lest-1uts in collsequence of some diblur ance of then
structure at the time they were about to form acorns.] Setting Boilers.- Will you allow me to ask your corre pondents to five their experience as to the best mode of fixing, more particularly the conical boilers; whether to fix them on bricks, so as to allow only a flue to pass to fix them on bricks, so as to allow only a flue to pass
round them, or to allow the fire to have an opportunity round them, or to allow the fire to have an opportuoity
to pass from the bottom all round; I mean as though to pass from the bottom all round; I mean as though
the boiler was swung; if the latter, what depth should there be from the level of the bars to the bottom of there be from the level of the bars to the bottom of
the boiler? Being about to alter my boiler, which the boiler! Being about to alter my boiler, which
heats four houses, I wish to do it in the best possible manner. Ore in the Trade.
Stem Tubers of Potatoes. - When taking up the Lenther Jacket (round) Potato, which had flowered well and seeded, it had a number of amall tubers growing from the leaves up the stem, besides an abundant supply at the roots. Is this detrimental to the main crop, or is it an advantage? Will these small tuhers if set produce Potatoes! I have observed this also in the in the Chinese Kidney, but I have not seen it in a round Potato before. Qy. Was it owing to the dryness of the season that an old set of the lrish Lump Potato produced a second show of tubers ! E.S.H. [These stem tubers are very common, and will do perfectly well for sets]

Seeds of Courds. - It may only be partially known that the roasted seeds of many of the Gourd tribe furnich an excellent addition to the dessert, particularly those of the Cucurbita Pepo gigantes, which are produced in abondance, and possess a nice nutty flavour. A micus.
Mncomparable White Celery.-In the first week of March last I sowed this and Cole's Crystal White ; the
sorts were planted out in ridges the last week in May sorts were planted out in ridges the last week in May
and treated alike in every respect ; the first week in and treated alike in every respect; the first week in September the Incomparable was fit for use, while Cole's
Crystal White was not for nearly a fortnight afser, and Crystal White was not for nearly a fortnight afser, and when it was fit it hore no comparison with the lnenmThable during the whole time the two sorts lasted The Crystal White showed a great disposition to seed, and was tough to eat. The Incomparable grows about 18 inches high, and is very bulky. It occupies little is the and no great embankme prown this sort ; was sent here with other seeds from Mr. Veitch of Chelsea ; and I am so pleased with it that I shall not in future grow any other White Celery. Sannel James, Patshull, Uitrighton, Wolverhampton.
Mulberry True-Can any one tell me how I can get a Mulberry tree trained on a south wall to bear fruit Mine is about 11 years old, and covers a largish extent of wall. It is very healthy and vigorous, but bears very small fruit, and that generally falls off before ripe. I was induced to plant it from seeing one at Downton Castle in a similar situation, which bore splendid fruit abundantly. I have root-pruned mine several times without effect. Should it be cut to spurs in the winter and then have the shoots cut back in the summer ? can make nothing of it. W. D. F. [Mr. Knigh Mulberry belonging to the late Mr. Williams, f Hitmaston) his tree is suffered to protrude its bearin branches, as spurs, several inches from the wall; and in the soil and climate of Pitmaston (both of which are extremely favourable), the fruit ripens in great perfection and abandance. But in cold situations (and it is chiefly in such that the Mulberry tree will be found to deserve a place upon a south wall), little fruit will be produced, and that will ripen but ill, unless the bearing wood be brought closely into contact with the wall ; and the great width of the leaves, and vigorous habit of the ree, present some difficulties to the cultivator, whe of training and pruning is ad ound necessary to diminish the luxuriant ree, and st the same time to increase its
bear fruit. Such effects may, however, be readily probear fruit. Such effects may, how ; by destroying a smal portion by several different means; by destroyd the trunk or large branches or ringing, by tight and long-continue igatures, or by training the bearing branches almout perpendicularly downwards. I have adopted the last mentioned method, because it greaty increases the disposition in the tree to bear fruit, without injuring its general health, and because it occasions a proper degree vigour to be every Mulberry, at Downton, cod been trained more than 25 years upon a south or south-east wall in the usual fan form, and had each extended nearly 30 feet in width, and 13 in height, without having ever produced fruit of any value, except small quantities, near the extremities of their horizontal branches. At that period, I cut away all the larger branches, except three on each side, leaving one on each side to extend its whole length apwards, with an elevation of about $45^{\circ}$, another with the young and slender wood of these large branche was preserved as I found practicable, and the whole of this was trained nearly perpendicularly downwards, with the exception only of a small part, near the tops of the most upright large branches, which was bent inwards on each side, with a considerable inclination downwards, to occupy the central part of the space allotted to each small crop only but in every subsequent year my trees have borne well, except in the last season, when, owing

## to the badness of the preceding summer, a small quan-

 tity only of blossoms appeared in the spring. By the wall, by the means above mentioned, I have had Mulberries ripe as early as the 20th July, and the crop continued successively to ripen, in much perfection, till the end of October. As the blossom buds of the Mulbery tree camnot be readily distinguished fromothers in the winter, the best period for pruning is others in the winter, the best period for pruning is
when the blossoms first become visible in the spring ; and it is my practice to pinch off every barren shoot, which is not wanted to cover the wall, and to stop every bearing shoot, under similar circums ances, at the third or fourth leaf. Mr. Wiliams has stated that the bud immediately below the point at which a hearing or other branch is pinehed off usually affords fruit in the following year ; and I have found his observation in this, as in all other cases, to be perfectly accurate. If I were now to plant Mulberry trees I should wish to obtain such as had stems 3 or 4 feet long, as the first shoots of these, after being planted, might conveniently be trained downwards, and if plants of this height, previously propagated from bearing branches, were selected,
I do not entertain any doubt but that fruit might be obtained in the second year after planting; and by proper attention, to shorten and renew the dependent bearing branches, such trees might essily be very long Mulberry, as Mr. Williams has remarked, is a much superior fruit, both in richness and flavour, when ripened upon a suth wall, than upon a standard tree, even in situations where it ripens well under both modes of culture; affording an exception, I believe, to all or almost all other fruits, to which the wall gives increased balk and beauty, at the expense of richness and flavour.] Ginger:- I have got a good crop of Ginger this antumn. Will any of your correspondents acquaint me with the best method of preparing the root for pre-serving-the nuter coat of the root be
unsightly? W. Mason, Necton, Norfollo.
Syrian Pruits.- I feel particularly obliged for your kindness in answering my inquiries so promptly. May I again refer to Vol. IlI., Part 2, of the Horticultural Society's works fir 1848 , regarding Syrian fruits in the
pobsession of John Barker, Eeq., of Suædia, to whom a Knightian medal had been awarded for the introduction of the Stanwick Nectarine. He says, "I beg leave to make the Society my humble acknowledgments for the honour which they have been pleased to confer on me, and which I regard as an earnest of the distinguished favour I presume to hope to receive at their hands, when I shall hase introduced isto England 20 varieties of-1. A new species called 'the Sweet-kernelled Jhach,' among which are six varieties of the Nectarine, all of equal, and some of superior value to the 'Stanwick Nectarine.' 2. A new species of the Apricot with Ispaban. 3. 'The large sweet White Mulberry Iran,' from which a syrup is extracted hardly to be distinguished from syrup made from sugar. It is highly extolled by Sir Alexander Burnes in his 'Travels in Bokhara.' 4. A Plum, with a sweet kernel, calied 'Aloo Bokhara,' which is also celebrated by the same traveller. When ripe its stone is in view through the skin. 5. The farmous 'Pomegranate of Tabriz,' without seed, weighing from 50 to 60 ouncor, and the still more renowned 'Quince' of most parts of Persia of the same size, which ripens on the tree or in the store, losing all its austerity and eaten at the dessert like a and the 'Pomegranate of Tabriz,' are yearly forwarded as presents by caravan to Bagdad. The Pomegranate is not eaten as are the common sorts, but is squeezed into a goblet, and drunk off like a draught of sherbet ; and the high perfumed odour of the 'Quince' is such, in Oriental exaggeration, as that when there is a single ripe specimen of the fruit in a caravan, every one who accompanies it is conscious of its presence." Then he goes on to say, "I am to-day packing to be forwarded to my son-in-law, Mr. Warmington, 100 small seedling berry of Ispahan.' At the same time will be forwarded to that gentleman 500 specimens of 'the Dwarf Apple of Armenia; ' they are all much past the age of puberty, though only 18 inches high. I received them two years ago from Armenia, and they do not appear to I have often seen them planted in pots and cases on the ternces in the city of Aleppo, of 40 and 50 years growth, never exceeding 2 feet in height, nor in the their ever having been pruned. To test the fact that their diminutiveness was not eansed by their heing anways kept in pots and boxes, 1 planted out three of in the years growth, and after in progress. I remarised that they bear best when their roots are cramped; they are very easily propagated, roots are cramped; they are very easily propagated, well from cuttings. Among the trees now sent there are 17 which were made from cuttings two years ago and 10 budded at the same time with the Ribston Pippin and other sorts." Pray tell me, sir, have these most valuable species of different trees been introduced, or have they been lost sight of \& The Armenian Apples would do exceedingly well for the orchardhouses so much spoken of in the Chronicle if the warmth was enough for them. F.N. [None of these fruits ever reached the Horticultural Society except the Dwarf Apple of Armenia, which seems to be the French

## Paradise. What were sent to Mr. Warmington were

 bought ly Messrs. Veitel. It is very doubttul whether many of them would be worth having in England. is however the best, thounh the ugliest, of Apricots, and the Stanuick Ntctarine in heat is the que en of her race. Therefore all are worth trying except the I'omegranate, which is hopeless, even in an accelerated orchard house.]Slnte Walls, and howo to prevent Damp rising up Stone and other Walls.-Two years ago I built 48 square of stone wall, 2 feet thick at the buttom, rising gradually
to 9 inches at top, with a coning 13 inches wide; the inside was faced and perpendicular, the outside rough and what is called "battered." The stone in my par of the country is very porous, and when taken out of the quarry soft and easily worked, it becomes, on exposure to the air, case-hardened and very durable. All our old churches and abbeys are buik this sandstone. In consequence of the porosity of this stone damp rises rapidly, and causes it to look dark and green so that brick has now almost taken the place of stone To counteract this I hit upon the following expedient, notice of which I inserted in the Gardeners' Chronicle about a year aud a half since; I again refer to it as the experiment has proved perfectly successful. Immediately above the ground-line on the inside of the wall I had boiling coal tar poured on evenly from an iron ladle, on this as much slaked lime as the tar would course of stone wes bedded in mortar in the tar, this cos me 5s for s wall 400 feet long and 20 inches thick a the ground line. These are the resulte. immeditaly above the tar line the stone is perfectly white and hand and the mortar, composed of hot grey lime and finelysifted coal ashes, as bard as cement and not affected by frost. On the outside of the wall, the ground being here, a course of stone is visible below the tar line; thi course is green, damp, and soft, the mortar also soft, and the frost has crambled it away. am aware that slate in cement cuts off capillary atthick. I have lately used the same means with the same success in brick walls. I will next week give a description of a slate wall I have recently built; it has mically built, and I trust, as the north side is nearly as warm as the south (the rays of the sun I do not get) I shall be able to ripen fiuit on this side. Sigma
Stone Pines.-W Wat had I better do with my seedling Stone Pines sown in March? I have but five, one in a box where 30 were sown, but only three came up, and four in a large pot where some 24 were sown. They are strong healthy plants from 5 to 7 inches high, and are in the open garden plunged to the rim in the soil. They have stood $25^{\circ}$ and $20^{\circ}$ on Grass with impunity, with no more protection than some Scotch Fir branches over them. I want to leave them out all winter. Can I venture to do so? Our winters are not severe, but they are wet. We seldom have such sharp frosts so early as e have this year, and yet I do not remember fros being so long in coming; the night of November Gth was the first we had. Until then not a plant had been hurt in the gardens. Ihave some seeding Cypresses sown in March also, from seeda I picked in a burial ground near Constantinople. They are about 4 inches high, and are by the side of the Stone Pines in a pot in the open ground. Can I venture to leave them out all winter also? The cold at Constantinople is often indermere (it is not our cold that kills ypresses and routhern European Conifers, but our bad summers, in which they cannot ripen their wood. We oubt whether the Cypress will live out-of-doors Windermere; but the Stone Pines may live if they survive the first three or four years, for trees are said to exist both in Durbam and the south of Scotland. We
advise you to place an old box or some such covering advise you to place an old box or some such covering spring to pot them separately, or to plant them out for the ensuing eummer.]
Wellingtonia.-Should not the scientific men of Europe entreat the Government of the United States to protect from destruction the few specimens that remain of their wonder of the vegetable world? It would be a sad thing if these giants, trees which have been (if the calculations are correct) thousands of years in attaining their present growth, should be at the mercy of any money-making speculator. If the ground on whieh theystand is not national property it should be purchase for the nation, in order to preserve them, and to form the nacleas of an arboretum worthy of the Union. D.T.W., Uxbridge.

Horticultural, Nov. 25.-J. J. Blandy, Esq., V.P., the chair. The following were elected Fellows:-Rear-Admiral James Ryder Burton, K.H., 15, Park Square, and Dunston Priory, Kent
Captain Hugh Berners, RN. Lasndford House, Downton, Salisbury.
Elphinstone Barchard, Esq., Putney Heath.
Charies Wentworth Dilke, Esq., the youngest, 76, loane Street.
J. R. Scott, Esq., Cronch End, Hornsey.

Mathew Thomas Hodding, Esq, 38, Craven Hill

Maurice Medlane, Esq., Sutton Court Lodge, Chisw:
John Kirby Hedges, Esq., Wallingford, Berks.
John Kirby Hedges, Esq., Wallingford, Berks.
Mortimer G. Thoyts, Esq., Sulhamstead Hon Berks.

George Barker, Esq., Stanlake Park, Berks Thomas Huntley, Esq., Whitley Grove, Reading Rubert Allpay, Esq., Wokefield Park, Berks. Joseph Gurney Barclay, Esq., Knott's Green, Leyton Charles Ba
Edward H. Reynard, Esq., Sunderland Wick, near Drinil, Yokorire
Kichard Benyon, Esq., Englefield House, near Reading.

Albert George Sandeman, Esq., Hyde Park Garderis
Prof. Edward Solly, 15, Tavistock Square
Wham Charles, Esq., 27, Austin Friars
Rev. Mathew H. Buckland, Laleham, Middlesex
Rev. James J. Peach, Holme Pierrepoint, Notts
Rev. Thomas Staniforth, Storrs, Windermere.
Miss Charlotte Louisa Walpole, Hampton Court, and Grafton Street.
Miss Frances Margaretta Walpole, Hampton Court, nd 9 Grafton Street.
Miss Caroline M. Jervis, Newsell's Park, Royston.
Miss Charlotte Bertrand, Golders Hill, Middlesex.
Mrs. Henry P. P. Crease, Antron House, Helston,
Mrs. William Wylde, Sulhamstead House, Turnlan Green
Mr. Robert Parker, Nurseryman, Hornsey.
Mr. George H. Bunney, Nurseryman, Strationd.
Mr. John Standish, Nurseryman, Bagshot.
Mr. Stephen Shilling, Nurseryman, N. Warnboro'.
Mr. Wm. Davidson, 36, Great Russell Street, Bedfur Square.
Mr. George Fleming, The Gardens, Trentham.
Mr. Henry Phelps, Bowood, Wilts.
Mr . Thomas Mcore, Physic Gardens, Chelsea
M. Jules de Liron d'Airoles of Nantes, as a Foreigs Corresponding Member.
A crowded meeting of Fellows and their friend assembled on this occasion to inspect one of the most interesting house exhibitions which has ever been hell under the auspices of the Society. The principal admire the skill with which our English gardeners had contended against as bad a season for its production at er known. On this, however, as on all occasio of competition all could not win. But it is not too much to say that all deserved much commendation. We trust we shall be found to have done justice to all.
The collection from Mr. Tillyard, gr. to the Right Hon. the Speaker, was especially remarkable, merely for its excellence but for the variety of fruits which it included. A mong them were Black Jamaica and Queen Yine Apples handsomely grown, Black and
Dutch Hamburgh Grapes, beautiful fruit of wintes Dutch Hamburgh Grapes, beautiful fruit of wint
Nelis, Urbaniste, Passe Colmar, Beurré Diel, Delice d'Hardenpont, and Ne Plus Meuris Pears ; fine fruit Rivers' Double Bearing Raspberry, Red Currants Oranges, and American Cranberries, some account p. 40 yards mode of growing which will be fouc Dr. Lindley's prize of $5 l$. was deservedly awarded. The next prize of $3 l$., offered by C. W. Dilke, Esq, wa won by Mr. Ingram, gr. to her Maje:ty at Frogmor Muscat Grapes, a very good C'ayenne Pine, a Queen and another sort of Pine Apple something like an Eaville from Babia; Glou Morceau and Chaumontel Peari Court Pendu Plat, Blenleim Pippin, and Cox's Orange Pippin Apples, the last a handsome fruit as yet not known. Of fruit of foreign growth, Mr. Lewis His Duchesse d'Angoulême, Beurré Diel and Gloo Morceau Pears had acquired a size and brilliancy of colour seldom found in fruit of Engis growth. Among Apples he had large and hanasomed a puanet full of the beautiful little Lady Apple of Pomme d'Api of the French.
Apples of home growth were more numerous than might have been expected considering the scarcity this kind of fruit this season. By far the best collection came from Mr. Snow, gr. to Earl de Grey, Wrest Parh, Beds. It consisted of Blenheim Pippin, Court Pende Plat, Old Golden and Franklin's Golden Pippins, the Golden Harvey or Brandy Apple, Ribston, Cockle, Fearn, Sturmer, and King of the Pippins, Newton Spitzamberge Beachamwell, Court of Reinette. Mr. Ingram, of Frogmore, next insel Court merit, sent Old Nonpareil, Kosemary Russet, Court Pendu Plat, Old Golden Pippin in fine condition, clean, Orange, and Frogmore Golden Pippin, the
healthy, good-looking fruit. Mr. Munro, gr. to C. Pearce, Esc., of Russell Farm, Watford, also turnisbed some good table Apples which were however not ferent from those just Ma. Snow was again firs Apples for kitchen use Mr. da Canada, Orange Pippin, Hanwell Souring, Fearn's Pippin, Winter Queen, Normanton Pippin, Selina Apple, fine; a red coloured Apple unnamed, Bed fordshire Foundling, Dutch Mignonne, and Flowd Kent. The next beat collection of Appies for curs, Eqq. of Preston Hall, Kent. Among them some specimen
of the Wellington or Dumelow's Seedling were espe-
cially remarkable for their size and beau'y. Pears of home growth were numerous and unusually fine, but several of the collections contained unripe
fruit. This remark especially applies to those from Mr. Robinson, gr. to Lord Boston, and to handsome specimens of Beurré Rance from Mr. Jones Nash of Bishop Stortford, and others. Mr. Sno:v's collection, to which the first prize was awarded, contained Ne Plus Meuris, Beurré Rance, Passe Colmar, Vicar of Winkfield, Old Colmar, Beurré Diel, large and fine; Marie Louise, Chaumontel, Glou Morceau, Winter Nelis, Easter Beurré, and Forell $\rightarrow$ or Trout Pear. Mr. Ingram of Frogmore, whose collectron stood second, had Knight's Mouarch, Glous Morceau, tion stood second, had Knight's Mouarch, Glou Morceau,
Vicar of Winlifield, Chaumontel, Easter Beurré and Vicar of Wink Diel. Mr. Tillyard had Beurré Diel, large and
Beure Beurré Diel. Mr. Tillyard had Beurré Diel, large and
fine; Easter Beurré, Passe Colmar, Ne Plus Meuris, fine; Easter Beurre, Passe Colmar, Ne Plus Meuris, growth were contributed by Mr. Webber, of Covent Garden. They consisted of Glou Morceau, Easter Bearré, and Beurré Diel.
Muscat Grapes that could hardly be excelied and that have rarely been equalled were furuished by Mr. To these Mr. Dilke's Esq., of Keele Hall, Staffordshire. general collection (not contended for) was very justly transferred on account of their extra merit. Excellent fruit of this variety of Grape was also shown by Mr. Wortley, gr. to Mrs. Maubert, of Norwood, Mr. Nash, of Bishop's Stortford, and A. Glendinning, Esq., of Ashgrove, Seven Oaks. Mr. Frost also showed a good dish of Muscats. Other kinds of Grapes consisted of beautiful specimens of Black Hamburgh (to which a first prize Nash, of Bishop's Stortford; ond from Mr ; from Mr Nash, of Bishop's Stortford; and from Mr. Hall, gr. at
Colebrooke Lodge, Putney. Fine bunches of BarColebrooke Lodge, Putney. Fine bunches of Bar-
barossa likewise came from Mr. Lancaster and Mr. Povey, gr. to the Rev. J. Thornycroft, of West's St. Peter's from Mr. Frost, and of Royal Muscadine from Mr. Ingram, gr. to J. J. Blandy, Esq., of High Grove,
Reading, who was also an exhibitor among table Pears Reading, who was also an exhibitor amoug table Pears. growth, came from Mr. Miller, gr. to Sir W. Smith, Bart, of Eardiston House, Worcestershire; Mr. Ivison, produced others. Mr. Rubinson, gr. to Lord Boston, had also some extremely well grown plants of Otaheite Oranges in pots loaded with fruit. These it would seem had been overlooked by the judges; for no prize was awarded them although they certainly wel Of Miscellaneorion.
Or House, Glamorganshire, sent three well grown Black Jamaica Pine Apples, Mr. Frost a good smooth Cayenne Pine, Mr. Hamp an Antigua Queen Pine, Mr. Samuel Solomon of Covent Garden two varieties of
Pine Apple, and some large and handsome Catillac Pears from Jersey; and Mr. Edward Moss examples of late Strawberries. They had been sent through the post from Roby Hall, near Prescot, and were anfortunately considerably injured from that mote of travelling. Mr. Lewis Solomon furnished good-louking French are now supplying Covent Garden Market ; Messrs. Henderson, P'ine Place, three hinds of Beet, of which their "short topped" was evidently the best ; and Several exhibitions of roots of the new Chinese Yam (Dioscorea Batatas) were produced. Of these one of the most important came from Mr. Sibbon, gr. to R. C L. Bevan, Esq., of Trent Park, East Barnet, and along with it Mr. Sibbon furnished the following memoranda. He says, "Ny first trial with the Ditscorea was in the
spring of 185.5 . I commenced with 10 small tubers no bigger than Peas, weighigg less than a quarter of an oz., which I received from Mr. Cutbush, nurseryman,
Highgate. Only scren of the 10 grew, the produce of Highgate. Only scren of the 10 grew, the produce o
which was $2 \mathrm{lbs}, 5 \mathrm{oz}$; the longest tuber was 19 inches and the circumference $4 \frac{1}{4}$ inches. That lot I cut up in March, 1856 , into about $1 \frac{1}{1}$-inch pieces, and put them into two shallow pans in losm, sand, and leaf-mould, one month. Seeing no signs of their breaking, I then placed them in a pit with Cucumbers; there they broke nicely in a month. On the 10 th May I potted them separately in small pots, and put them under glass with no heat, all growing till June, then planted them on a raised bed of half decayed leaves, covered over with 12 card garden mould; the space they occupied was for them, and a very convenient distance for cleaning and taking them up. I dug them up the first week in November, the largest tuber being 39 inches long, in circumference 7 inches, and the weight Jlb .8 oz . The Weight of the whole was 42 lbs .8 oz, - a very good crop,
I think, from such a weak beginning. This plant is selfI think, from such a weak beginning. This plant is selfpull it out of the ground, as may be done with Carrots or Turnips, which is so much complained of by farmers, Dr
Dr. Lindley observed that the planting in pans, keep he them in a fruit room, and then starting them in quite as unnecessary, as they would out in the open ground at wis 1 foot apart required. Roots of this Yam, which had been made the subject of four different experiments, were furnished
from the garden of the Society. They had been planted
out 6 inches apart early in March, and the fullowing
the result of the different methods of culture pursued:-

It will be seen that the three latter cases were satisfactory as to produce, and that of the four trials the resule of employing small axillary buds as sets is the least encouraging, and is not to be recommended, except in cases where no better sets can be obtained. The produce from them is small, and they are very apt to fail. When cooked this Yam was atated to be excellent.
That it can be successfully cultivated in this country That it can be successfully cultivated is this country the specimens before the meeting fully proved, and in order to show that the past season has not been particubeen prepared

## Tonthly mean temperature of the soil at 1 fout and 2 feet deep, from April to Novem- ber, $1 \lessdot i 6.6$. <br> Tempreatroo f hie oif at and 2 ft deep, from. Chree pyramidal Pear trees were exhibited by Mr Rivers, of Sawbridgeworth, and with them the following nemoranda. He said.- The trees (Lonise Bonne of ersey) are from sever to eight years from the colla of the graft; as soon as this took place, about three or four years ago, all the Quince roots died, for, as will be four years ago, all the Quince roots died, for, as will be
seen, the stump is quite bare. These (Pear) roots seen, the stump is quite bare. nearly 5 feet, and so hard was the clay that the spade could not penerrato it so as to take them out to their full length. As soon as these roots struck into the clay the tree ceased to bear, and its shoots becmmo fun of cankery spots, the leaves more green than those on the Quince roots, and the young shoots more vigorous, although they cankered and died back. Out of a plantaion of 2000 pyramids of this variety on the Quince only the tree now sent and another have struck root from the collar of the graft, and both are in the same state. Last year every tree except these two wae covered with the very finest fruit ; the tree sent did not bear one, the other produced two or three, which were cracked, spotted, and worthless. No. 2 is a tree of the ame sort on a Quince stock, which grew within 5 feet No. 1 ; this, in common with the others in the same plantation, has no canker, and has borne fine clean fruit. The soil is moist, and briags on moss to a small extent. No. 3 is on the Quince, and is a young tree that has been twice removed. Trees of this kind where the soil is not favourable, and I have a part of my nursery the soil of which is very wet and cold, I remove biennially, giving them a compost of sand and rotten manure. In a few yeara their roots become like those of Rhododendrons, and keep close to the surface, so that the trees keep in good health and bear profusely. The fibrosity of the routs of the tree sent is remarialle.
'These specimens were extremely interestimg, showing, as they did, that the Quince was better suited for
-Howed how necustary it 18 to keep the roots of ou
fruit trees near the surface, and indicated thet certain circumstances at least, to deep rooting we ow barrenness and canker.
Although towers were not specially invited, there were a few rare specimens. Foremost among these was that most beautiful of all greenhouse climbers, the Chiloan Lapageria rosea from Messrs. Veitch. This is a plant which few flower well: but which in the Exeter nursery is every year literally loaded with rich rosy blossoms. The secret of this success is attributed to planting it in well drained porous soil, and giving it planting it in well drained porous soil, and giviag it were stated to have the good quality of keeping were stated to have the good quality of keeping
in perfertion in water three weeks together ia a warm sitting ruom. Messrs. Maule of Bristol, sent A magnificent bunch of cut flowers of Vanda cærulea, Which is certainly one of the handsomest of all our winter blooming Urehids, A good specimen of Calanthe vestita also came from Mr. Woolley, gr. to H. B. Ker,
Esq. Messrs. E. G. llenderson had a well flowered Liparis longipes, a graceful looking plant, and among other things some pretty cut fluwers of hybrid Bonvardias, which seemed likely to he acquisitions. Mengr. Jackson of Kingston, and Mr. Warner of Broomfield, both exhibited Orchids, the latter showing Sophronitis Mrandiflora and the pretty little Cattleya hulbosa. what was supposed to be new Tusgilago, from Japan it had large dark greeu leaves handsomely spotted with yellow ; it was stated to be hardy, and will therefore wake most splendid plont for rockwork and other out-door decoration. Chrysanthemums were exhibited from Mr. Doxat's garden at Putney Heath, and by M'Intosh, of Hamuersmith Mr Holmes, of Stoke Newiogton, requested space to be kept for him, but Newington, requested space
neglected to send his plants.
Examplis of the first cones seen in England of Abies cephalonica were uroduced by H. L. Long, Esq., of Hampton Lodge, Farnham. The tree which produced them is from 25 to 30 feet in height. In Loudon's Arboretum Lritanuirum, 11 x . Lons, in a letter dated Dec. $3,183 \%$, says:-" 1 lost a great number of plants by spring irost and by rabbits, owing to want ot care whilst I was on the continent. I have only three plants left, and they are in full vigour, and have made shoots during the past summer from 6 to 7 inches in length. The highest plant is 3 feet, and the breadth of space covered by its branches is 4 feet in diameter." Growers of Conifers well know how tender this Fir is when shooting in the spring. Mr. Long was however able, bv temporary shelter for a few years, to rear the plants described is the foregoing paragraph, till they were too high to be injured by the low ground frosts of spring. : From the Garden of the Society came spikes of Pampas Grase, which has flowered magnificently in the garden this autumn ; also bunches of 乌lack Hamburgh and Braddick's Black Hamburgh Grapes, small but ripe and well coloured, from Ewing's glass wall, and Eugenia Ugai and Psidium Cattleyanum, both bearing fruis. There were also specimens of Cucurbits farme, which
the French say is an excellent variety for soups and the French say is an
other culinary purposew.
In reference to the Pampas Grass, it was mentioned that, through the kinduess of Mrs. John Wood, the society had a good supply of its seeds for distribution, and that they would be given away to all Fellows who might apuly for them

## 2otics of Wooks,

## The Unity of Worlds and of Nature By the Rev. B.

 Powell, 2nd ed. 8vo. Longmans pp. 556 The spirit of inductive philosophy, the unity or plurality of worlds, the philosophy of creation-such are the lofty subjects to which the learned and acute Savilian Professor has addressed himself in the volume before us. It is to the famous "Vestiges of the Natural History of the Creation" and to those essays on the "Plurality of Worlds" which not long since attracted so much attention that we owe the admirable volurae before us; attention that we owe the admirable volurae before us; rendered a double service to science, the first by rendered a double service to science, the first byexhausting the arguments to be found in support of their per thilful dispassionate review of the arguments for or against their several views. Professor Baden Powell against their several views. Professor Baden Powell "Vestiges," but does nut belheve in a plurality of inhabited worlds. Tu quote his arguments briefly would be unjust; to give them the space their importance demands is beyond our power. We therefore content oursplves with recommending his pages to the perusa of all who are interested in high science and natural theology, and with making a few extracts, chiefly from the chapter on final causes. There are those who require that a reason should be found for every peculiarity of structure, for all that is unusual in function, and even for the very existence of one living species in a given place rather tha: of another. They demand to know why the Dionæa surings upon a fly and bolds it in its rigid claws, why the Rose is armed with thorns or the Hawthorn with spines, why Oaks are caused to shed their leaves, and Laurels to retain them. And when the man of science avows his inability to find an answer, the world throws itself into the arms of inge nioustheorists, delighted to know that the Dionea feedson putrefying matter, that thorns are given to Roses for defence, and that Oaks shed their leaves so that snow
may not break their limbs in winter.
our author's remaris are admirable.
In a strictly philosophizal point of view the inference that everything 'has a use' may certainly be regarded as a generalisation which carries with it a
high degree of probabilty. We find that many things have a manifest use; but then we find innumerable others for which we can discover no use, and by which no visible end or purpose is answered, but it is not an unfair extension of the inference that, in these cases some unknown end is answered ; that, in fact, every whole; though in by far the greater part of Nature we fail to perceive what the particular relation or depen dence may be. It may suffice to convince us of this if we merely ask for what purpose is life itself con-
ferred? or, to what end does the material universe ferred ? or, to
altogether exist ?

The remark of Bacon that final causes are not in themselves to be rejected, but have been wrongly placed in philosophy, is one of more value than seems generally towards inductive investigation have been obtained from the consideration of the ends to be answered by certain observed conditions. But it is in general a cases argue from physical inductions to final causes, but not from final causes to physical inductions. The the increasing demands of scientific enlightenment it will not sutfice now to argue solely on the adapta tion of means to a known purpose, or a practical design evincer, and an obvious end answered. If we cannot discard the term, we must enlarge it meaning. We may speak of 'desinn' with reference to the ider of practical utility. Such modes of expres sion are far preterable, as not leading the mind to any undue expectation of what it will not realise. Thus in an expansion in proportion to the progress of the science. We obtain more enlarged ideas of design as we advance from the more confined views of the older schools towards the wider principle of symmetry and Enity of composition. So that 'fina causes, properly undelstood, so far from receding (as some pretend
before the advance of modern science in the wider and more philosophic sense, eminently derive increasing evidence from its progress. The study of the higher principle of symmetry and unity of composition can in but a part of the same great srgument. Nor is it just to accuse those of the modern school who are engaged, ss their special and legitimate object, in investigating the former, of undervaluing the latter."

Not less excellent is the manner in which the permanence of species is handled. We can find room for two paragraphs only
${ }^{6}$ In the first place, then, the belief in the essential and inherent immutability of species, not only in the present state of things, but as an eternal law of Nature the ancient earth, has been upheld contessedly on the limited experience of modern observation, but thence extended by analogy in the same way (it is alleged) as in the case of other great natural laws.
"This argument, however, appears to me altogether unfounded. Of the operation of other great natural laws,
through all the series of past ages, we have direct evidence. The laws of gravitation, heat, light, equilibrium and the like, present positive proof of their influence in the records preserved to us throunh all geolouical time ; whereas of the permanence of species in those past formations, we have no evidence whatever: on the contrary, the apparent phenomena (to say the least) are whether those perpetual changes in species which we observe, are to be considered real gradual variations in the development of organisation, or to be explained in sny different way."

## Calendar of Operations.

 (For the ensuing week.)
## PLANT DEPARTMENT.

Conservatory, \&c.-Should dull weather continue nceasional fires will be required for conservatory and ing in order that the houses may be thrown open during the day to promote a free circulation of air ; this will
dry up damp, and help to keep the plants in a healthy dry up damp, and help to keep the plants in a healthy
state. The more delicate kinds of Heaths and hardwonded plants are often attacked with mildew, and as nothing induces this so mech ase means for giving ai during the night and in bad weather to plant-houses in dependent of the ashes. Let the surface soil of the pots be lightly stirred so as to remove Moss, \&c., as well a Fucharate a free evaporation from the surface Fuchsras which have been out of bloom for some time,
and which have ripened their wood, should be removed to a pit or spare house where they can be protected from frost, or in the case of want of room to back oheds for the winter, and protected with Fern made with regard to affording ventilation to hard-
wooded plants are equally applicable to l'elargo-
niams. Cinerarias, and Calceolarias; these latter will require a nigat temperature of $45^{\circ}$. Place the
plants as near the glass as means will permit, in order that they may get as much light as possible. Seedling Cinerarias and Calceularias should lave a shift if requi-
site; if the plants are strong they may be transferred at site; if the plants are strong they may be transferred at
once to their blonming pots; after potting place them at the warm end of the house. Pelargoniums should now have their shoots thinned and neaty tied out to stakes; keep them then to produce stocky plants, and umigate on the first appearance of green fy. As many plants suffer from drip at this season, a careful hook out plants removed. Orchids will more especially requixe prequent examination, as an exposure to its effects would be most injurious. As Camellias come into flower preserverather a drieratmosphece in the house, as the blooms soon become spotted, and decay when the air is damp.

FLOWER GARDEN AND SHRUBBERY.
Let lawns be well rolled when sufficiently dry for the purpose; every part of the turf should be frequently swept during the winter. Nothing adds so much to the enjoyment of pleasure-ground scenery as well kept turf, and when connected with evergreen shrubs an agreeable relief to the drearin $8 s$ of the season is afforded which renders the loss of more attractive plants less to be kept dry and firm, in order that they may be traversed with comfort at all times. While the weather continues mild the planting of deciduous trees may be proceeded with, provided the state of the land will permit the peration to be profitably conducted, with the exception of the more hardy kinds; the planting of evergreens had better be deferred till April. Deciduous shrubs may be pruned whenever there is time except during severe rost. Many of the larger growing plants will only require going over once in two or three years, to reduce straggling shoots to proper limits and to thin out where too thick. Smaller growing slirubs, as some kinds of Robinias, Cytisus, Spireas, Deutzias, \&c., should be runed annually if a conod show of flowers and uniform shaped flowers are desired. Secure standard Cytisus,
\&c., by firmly staking them after pruning. The pruning and tying in of climbin, plants on trellises, \& Ee., may remain till February. Mnny of the above plants ar partly evergreen, and when pruned at this season their
supports have a somewhat nuked appearance through supports have a somewhat nuked appearance through
the winter; any straggling loose growths should, how ever, be cut away at once.

## FORCING DEPARTMENT.

Pineries.-Where the bottom-heat is wholly dependant upon tan or other fermenting material it is very apt to decline too much at this season, when the temperature of the atmospinere is being kept rather low If this is found to be the case a few inches of fresh an should be put on the surface, which will generally be found sufficient, but if the beds have not been renewed lately, and have got worn out, it will probably be neces ary to remove the plants and add a considerabl quantity of $\tan$ or leaves. Where shed room can b spared, a quantity of tan should always be kept in readiness for such work in winter, as if nsed fresh from the tan-yard it is almost certain to starve the roots hefore fermentation commences, and then heats too violently. Let no trouble be spared, however, which circumstances may render necessary to secure a steady bottom heat so as to preserve the roots in health, expect the plants to make vigorous growth in spring Be fespecially careful of those expected to start into ruit soon, for if the roots of these are injured now there will be little chance of getting the fruit to swell well.

HARDY FRUIT AND KITCHEN GARDEN
Where orchard trees have been for some years left npruaed, the hand-saw will be required to thin out the larger branches; keep the middle of the trees open to admit air and to promote the formation of fruit buds on the interior branches. It is however a bad practice to leave any description of fruit tree to itself, as it would in all cases pay the cultivator to prune them once a year at least. Whenever the ground becomes dry put in a second crop of early Peas and Mazagan Beans, as the firat crop will most likely fail through the wet state of the soil. If Peas are sown in the open quarters the drills should be protected by a ridge of earth left to the north or east of the rows; keep down mice by trapping, they are troublesome to early sown crops of the above. On adry warm border a fow beds of either singly or with the short horn Carrot; cover the beds with straw or litter till the seeds germinate, when they should be uncovered every day when not frosty. A frame should likewise be placed on a gentle bottomheat for a sowing of the above to draw early. Place some protecting material round the stems of Globe Artichoke or earth them up to keep off frost. Celery and Cardonns may have a final earthing up when the soil is dry if the weather has prevented its being done sooner. Leeks should likewise have more earth drawn to them before frost sets in ; they are an excellent vegetable when well blanched. Hoe between the earliest planted Cabbages, Lettuces, \&c. ; this should be frequently done to growing crops through the winter, as by keeping the surface loose and open frost is preroote are kept in a more active state.

## The Mgritultural Gazett

SATURDAY, NOVEMBER 29, 1856.
"VERT few are ever ruined by practice." said Mr. Cubitt at an agricultural meeting at North Walsham the other day. Now, we had supposed that if ever a man was "ruined" at all it was precisely this to which his ruin was to be attributed What is the cause of agricultural failure if it be not imperfect, ill-juidged, careless practice? It is surely to what a man does, or to what he does not do, that we most attribute whatever consequences overtak him.

Perhaps, however, we are hardly doing justice to
the statement that was made. It was as follows:"There are many farmers ruined by theory, but very few are ruined by practice"? To the former part of this assertion we make no objection. No doubt many a man has been ruined by theory, though not of course until he has attempted to develope it in practice ; and what is the theory to which, more than any other, agricultural distress has properly been attribatable? There are such theories as-that the style of farming by which the former
generations prospered will answer for the present-
that "education may be carried too far," even to the extent of "making farmers' sons and daughters good for nothing "-that the doctrines of the chemist and geologist are mere speculations-in short, that an ounce of practice is worth a ton of theory. Let these theories be developed the farm shall be maintained just as it was when the grandfather of the present tenant occupied it-so that the tenant next in tarn shall have all the strength of arm and strength of prejudice derived from education merely at the plough tail-so that no experience but his own shall be held of any weight or influence whatever-and very probably they may lead to agricultural distress and ruin

But the theories referred to by the speaker at North Walsham, we presume, were not such as these. We may suppose that he referred to such speculations as those of Baron Lifbig, when he taught us the uses of ammonia in the air and rain, and therefore in manures; or when he pointed out the agricultural value of the mineral part of the manure heap, and the relative values of the several ingredients in substances used as food-or those of Professor Johnston, who brought to bear so extensively the force of chemical analysis on agricultural products, and on the substances and on food both for plants and animals-or those of Professor Way when he pointed out the absorptive powers of soil, and the stores of fertilising matter which have thus accumulated there, and the tendency of tillage and of liming, on the one hand to increase those stores and on the other to bring into play a portion of them for annual use-or those of Messis. Lawes and Gilbert, when they indicated how the theory of growth as being mere building up of the matters presented to the plant or animal as food, is overruled by the influence of specific habit in the plant or animal in influence of specific habit in the plant or animal in such theorists as Bucrland, De la Beche, Trimmaz, Morton, Paine, and others-the ideas they had promulgated and developed in detail, that a knowledge of the under structure of the land has a bearing on the practice of those who cultivated it.

Are these the theories which have led so generally to ruin? We had supposed that it was to these and such as these upon the contrary that recent agricultaral progress was due. We had thought that the management of the manure-heap, so as to retain its fertilising powers, had been greatly improved by the suggestions of such men as Lirbig-that the enormons extension of our guano imports and of our manufactures of manures, with all the consequent extension of our average annual produce, was for the most part due to the information these theorists had given us on the nature of those mineral substances which plants require as food. We had thought that the discoveries of phosphate of lime and soluble silica which geological theories have extended and to which they have even led-that the light thrown by such theories on the practice of land drainage and on the means of improving the mineral constitution of our soils were generally admitted to have been useful.
Mr. Cubitt could not have alluded to the "theories" which had led to all these beneficial results. He must have merely meant to point out how the tendency to listen to the advice of men who are not farmers is leading agriculturists from the real source of their gaidance and their strength. Few have been ruined by adopting as their guide the results of practical experience. How many on the other hand have experience. How many on the by taking as their guide the literature of science and the records of its progress, instead of those results of local experience in which they could put all the confidence of actual observation!
Was this his meaning? Let the speaker select his locality and compare the produce of the land at present with its produce 20 years ago-let him enumerate all the particulars in which the agricultural management characteristic of it now differs from what existed then-and let him then inquire how many of the altered plans originated in the locality itself. The land is drained where formerly it was wet and winter cultivation was impossible; and how much of the force and energy which have been directed to that one operation has been inspired and directed by the researches of Parkes and others into the philosophy of the subject. Perhaps this, together with the use of imported manures and that of more nourishing food for cattle and for sheep, by which the homemade manures have so much increased in value, will be admitted to be the chief causes of the increased produce of the district. But here again, where would be our certainty in the use of purchased manure and purchased food were it not for the researches and the aids of science? Where, indeed, would have been the employment of so-called artificial fertilisers at all had not scientific men first
discussed the operation of manures as the tood of
plants, and pointed out the possibility of concenplants, and pointed out the possibility of concen-
trating the really efficient portions of them within manageable linuits as to weight and bulk. We do not think that a speaker so intelligent as the remainder of his address on the occasion we allude to proves him to have heen, could have ventured to recommend a disregard either of the lights of science in their influence on the future, or of the obligations under which agriculture has undoubtedly thus been laid in reference to the past.
What then could have been the meaning of the words employed? Alas! they will not bear analysis. They were but the empty echo of a cry of 20
years ago. They then expressed a sentiment which was believed, and for which in the then undetermined state of many branches of science there may have been some foundation. But no oue now will listen to a warning which, whatever be the phrase employed, must be taken as a blow at the belief, gratefully entertained by all intelligent men, that science, here called theory, has had a most beneficial influence on the practice of agriculture, and on the prosperity of agriculturists.
No one is prepared with greater earnestness than the writer to insist on the importance of practice and experience as essential parts of agricultural education Mr. Cubitt cannot speak too strongly on the value of a field education for the farmer-no art can be taught except by the actual practice of it under the superintendence of one acquainted with it: but it cannot be allowed that this undoubted truth be so expressed as to convey either ridicule or denial of what is equally true-that farm practice has been greatly improved by the researches and suggestions of scientific men, and that agriculture will prosper most in the hands of men of liberal education.

The influence of agricultural maxima upon agricultural averages is a subject to which we have often referred in these columns. It is very smali indeed. We doubt not there are instances of yield as great whether of grain or roots to be quoted, both of French and of American agriculture, as any that we can point to here, though their average acreable yield does not nearly reach our own.-It is not a very remarkable thing that a single Turnip should weigh $27 \frac{1}{2}$ lbs., as a correspondent last week told us in reference to a crop near Gainsboro', but it is very remarkable indeed if true that the general produce of the field should average 14 lbs . apiece. Indeed, unless our correspondent shall be able to inform us that the gross weight of the roots was actually divided by their number in order to ascertain it, we must pronounce it to be incredible. It is said that many weighed. much more - but it is plain
that to constitute an average of the weight asserted, one half the number must exceed that weight as much as the other half fall short of it. If the field was drilled 27 inches wide, and the roots were 15 inches asunder, there would be upwards of 17,000 Turfips on the acre, and these at 141bs apiece would exceed 100 tons. That this is possible crop of course we don't deny, seeing that i is possible to grow a single Turnip 14lbs in weight on the 17000th part of an acre; and we are obliged to correspondents who inform us of these remarkable instances of grow th because it is well that attention should be occasionally directed to the possibilities of agriculture. We must say, however, it is not likely that Mr. Hewitt has obtained the crop to which this statement points, although it is certain that he grew a Turnip just short of a quarter of a cwt in weight.
As an illustration of ordinary experience we may mention that we had occasion to weigh and number the roots (Swedish Turnips) on three patches in a Turnip field the other day, each 500 square feet in extent ; they numbered 319,319 , and 360 respectively, and weivhed $515,523,514 \mathrm{lbs}$. respectively.
Here was a thicker crop than usual, drilled upon the flat in rows 18 inches wide, but many roots exceeded 5 and 6 lbs . in weight, although the average was only $1 \frac{1}{2} \mathrm{lb}$.-and a very good crop it was:- 1 lb . per square foot very much exceeds the averag

## RAPE CAKE AS FOOD

Having on various occasions occupied the pages of your periodical (see Gtusette, September 21, 1854, P. 634,) as an alvocate of Rape-cake for food, in the use of offer some remai ks on Dr. Voelcker's paper on oil-cakes, I agree with Dr. Voelcker's observation that it is unsafe to attach a precise value to different articles of food; we well know that well got hay is very different in composition and also in effects from spoiled or inferior haya remark equally applicable to other materials; in
aexigning a value to such substances we include only thoee of gond average quality.
It is about six yeara since

I began the use of Rape-
cake for food. After various trials for fattening, and
also for milk, I gave up the use of Linseed-cake altogether, being fully persuaded that in point of economy for both purposes, Rape-cake had the adcake afforded quite as much in quantity, but had nut cake aforded quite as much in quanticl,

When I first gave an order to the manufacturer with whom I deal for Rape-cake for feeding, he required time to prepare it; his object was to enable him to
select seed free from Mustard or other impurity. On one occasion only have I had from him cake of which I had reason to complain, and on that I sent for a small supply
notice.

## I now proceed to notice Dr. Voelcker's objections

 seriatim:Before I commenced my present process of steaming the cake together with Bean-straw, malt combs, other substance rich in aroma, I had some difficulty in persuading my cattle to eat Rape-cake ; by perseverance however, I invariably succeeded. In my present prac-
tice (by steaming) I find no such difficulty; I can as readily accustom them to eat Raf.e-cake as I formerly could Linseed ; many of my cows become so partial to it that they sort it out from amongst the materials with which it is blended.

I do not at all object to Rape-cake when kept for six or 12 months. Before I commenced steaming I found my cows refused cake when quite fresh, whilst
when kept a few months, the same cows eat it readily when kept a few months, the same cows eat it readiat
it becomes milder and more tender (easier to masticate) by keeping. To preserve it from mould I cover it with rough seels (shells of Oats) which have been kiln dried ; saw-dust or chopped straw, if dry, will equally answer the purpose. Since I began steaming I find no objection to its being given fresh; I am led to think that this process affects the essential oil, renders the taste milder, and the cake easier of mastication, besides which the flavour of the Bean-straw or malt combs will in some degree be imparted to the cake.
3. In regard to the ohjection of a greater propor tion of woody fibre in Kape than in Linseed-cake, use Turnips or other roots in limited quantity (I never give more than 50 lbs . to 60 lbs . each per day), by allowing 8 lbs . of Turnips per day, or 56 lbs . per week in addition. If we take 5 lbs . per day or 35 lbs . per
week, which I hold to be the maximum allowance of cake or other food rich in albumen per beast, and reckon 10 per cent. of wondy fibre more in the Rape cake than in the Linseed-cake, it will amount to 56 oz for the week, whilst the 56 lbs . of Turnips supply 82 oz . of sugar, starch, \&cc. If we assume the price of Linseed-cake at $4 l .10 s$. per ton higher than that of Rapecake, this on 35 lbs. will be about 1 s .5 d ., whilst the 56 lbs. of Turnips at 10 s . per ton will only cost 3 d Swede Turnips contain also about 15 per cent. (reckoned as dry) of albuminous matter, which is doubtless the most valuable component of food, whether we conside it assimilated in fibrine or as an ingredient of manure A pound of lean beef, say rump-steak, will cost 9 d . reckoned as dry without moisture equal to 3 s. per lb . a pound of suet at the same time will cost $6 d$, to $7 d$. suet or other fat is almost free from moisture. Nitrogen is known to be the most valuable ingredient in manure, whilst sugar, starch, \&.c., have no ascertained value whatever.
would not be understood to adopt the teaching that substances used as food are efficient for fattening in proportion to their greater per centage of nitrogenous compound. I hold such doctrine to be untenable.
4. As to the more frequent adulteration of Rapecake as compared with linseed, this might reasonably be expected so long as it was sold for the purpose of to charge cake for this purpose. But at prade for Rape cake for feeding as compared with that for manure, should hold the vendor responsible for supplying me with genuine Rape-cake.
If the experience of the best stock farmers shows that Linseed is more efficacious for fattening than Rape-cake, I am inclined to think this attributable rather to the quality of the oil than to the properties noticed by Dr. Voelcker.
In the composition of feeding substances we discover as proximate elements albumen, legumin, gluten, protein, compounds all very similar in chemical composition, but differing somewhat in form and solubility. We Ind also sugar, starch, gum, dextrine, agreeing with and oils, ag from each other in like manner. We find also varied properties; they consist of two varieties, the unctuous represented by Rape and the dry by Linseed oil unctuous represented by Rape and the dry by Linseed oil.
Hitherto these oils have obtained no distinction in agricultural chemistry, but I entertain a strong persuasion that in the animal economy their effect is different. These oils consist of proximate elements, oleine and not been able to ascertain. In a small volume kindly lent to me by Mr. Wilson, the scientific director o Price's Candle Manufactory, I find a popular treatise on the preparation of manufacture of oils by Fontenelle, which supplies interesting statistics derived from the researches of French chemists, who appear to have given more attention than our own to the properties of oils or fats.
The unctuous class of oils, Olive, Rape, \&cc., are found
point), some at a little higher, others at a little lower
degree. Linseed and other oils of the drying classes requ're a degree of cold $47^{\circ} 30^{\prime}$ below frying classes $30^{\prime}$ below zero, to effect their congelation.
Fontenelle supplies only aualyses of a few of the oils showing their composition in olein and stearine :

Olive oil is found to contain of olein ...
of stearine
Rape oil is found to contain of olein $\begin{gathered}\text { of stearin }\end{gathered}$

Fontenelle does not supply the composition of Linseed
An analysis of Linseed, Cotton, and other oils which able.

The olein fats require but a low temperature to melt liquefy them, whilst the solid fats, margerine and stearine, require a temperature of $120^{\circ}$ to $130^{\circ}$ for the same purpose.

Linseed contains a great proportion of mucilage, and on being dissolved in water forms a stiff jelly.
Lehman, in his Physiological Chemistry (a translation which by Dr. J. Day, F.R.S., has been published by the Cavendish Society), a work displaying great research, a copy of which I have been unable to
obtnin except for a short time on loan, states that the obtnin except for a short time on loan, states that the more available for respiration than margarine, and thus accounts for the fat of animals being more of the solid (margarine and stearine) than the oil of plants, which contains a considerable portion of olein.
The practitioners in medicine are now using extensively pure Cocoa-nut olein for pulmonary complaints in lieu of cod liver oil. I propose shortly to occupy your pages with the treatment of pleuro-pneumonia, in which I have used Cocoa olein with apparent advantage Those of your readers who peruse the Royal Agricultural Journal will have noticed the peculiar result of my dairy practice from cows treated with Rape-cake as part of their food, showing a more than ordinary produce of butter in proportion to milk, and a sting more extraordinary richness of cream. On examining for this peculiarity as the Rape-oil accompanied by an adequate supply of albuminous matter.
I have from time to time held conversations with tock feeders possessed with information beyond the reach of prejudice, who state that after comparative reach of prejudice, who state that after comparaseedrrials the pre five than cake was more effective for fattening than Rape-cake. These considerations, together with the persuasion that given for fattening, has led to a change in my mode of feeding. I am now using as extra food, together with straw, and a limited supply of Turnips or other green food-

## per day of malt combs <br> b. per day of malt combs

The $\frac{1}{2} \mathrm{lb}$. of Linseed-oil represents the quantity contained in 4 lbs , of cake; the oil alone costs $40 \%$. per ton, whilst in cake, reckoned as oil only, it costs 88 l . per ton, the cost of Linseed-cake being 11l. per ton, having $12 \stackrel{\downarrow}{5}$ per cent. of oil. The whole of these extra ingredients of food cost $3 s$. $1 d$. per week each. This pracdients of food cost 3 s. ld. per week each. 3 his practheir increase was very satisfactory till December and January, when they were sold off to Mr. Wilson, of Bradford, who reported them of prime quality, with a great deal of loose fat.
In the spring of this year I observed the like treatment on 30 heifers, but without any roots or hay from March to July, when they were sold to different parties, who, as far as I have learnt, reported favourably of them. The average gain was 14 lbs. per week each. them. The average gail was the lot gained 24 lbs per week throughout the course of 16 weeks. She cost $11 l$, at the Enster fair, and sold in July for 18 l . 10 s. In my experience as a feeder I have not had an instance of a like gain. It will be observed that these cattle were without a par ticle of roots or other green food during a part o March, the whole of April, and a part of May. I am at present treating 30 for fattening in like manner, with some addition of green food; their appearance and weighing denote a very satisfactory improvement.
The readers of your Gazette will be pleased to accep some portion of these statements as conjectural rather than ascertained. If in offering them for publication in your pages I succeed in engaging the attention of Dr. Voelcker and other teachers of agriculural mistry, and also of those who, like myself, are seeking to apply the rules of science to economise their pracley Hall, Nov. 18.

THE AGRICULTURAL LABOURER.
The means of improving his condition exercises the ingenuity and engages the interest of all benevolent men, but it must be confessed that how sicely they address themselves to the task, they do to the succeed in advancing the position or as he is somecomforis of the working man, inasment; sometimes the imes the subject of a mere experised is resented, an sometimes the superiority and pretensions of the sometimes volunteer philan thropist are contested.
his independence, although we may wilhold pecuniary
aid we aust extend to him our sympathy and our
respect, and instead of imploring for him "a continued attention to his wants on the part of the employer," we
should be mure disposed to congratulate the employer should be mure disposed to congratulate the enployer
for having a skififul, honest, industrious, and self. relying man who can earn his tivelihhood, so as not merely to keep himself "from the parish" but said that this is exceptional, but we believe that there are more of this description than is generally supposed, that nearly all farmers of 100 acres and upwards have more than one such man in their employ, and that the farmers have during the last three or four years con siderably advanced the information, corrected the habits, and raised the condition of the labourer; and it would not be a matter of surprise if some fine day it was
suddenly dıscovered that he was no longer out at nurse, that he really had faculties of observation and acquisi tion, and that he was worthy to share in all privileges and responsibilities of an English householder. And
truly in some villages it is high time that an intelligent truly in some villages to fill the minor offices patent to all small communities, as there are some instances of the one or two farmers being at one and the same time guardian, churchwarden, overseer, constable, tax collector, overseer of highways, and nominated very superfluous ability to perform the manual operations required in filling up forms, keeping the necessary accounts, and transacting the complicated busithe agricultural labourer that occupies the tender commiseration of so many gentlemen and ladies? of so many clergymen and amateur agriculturists?
poorer class more numerous in towns-far more than in viliages !-a class of disorderly or defective people, morally, mentally, or physically unequal to steady persevering exertion and good conduct? Many of these are applicants for relief even in the middle of summer if a
wet week deprives them of their" hand to mouth " sort of independence. Illness or misfortune will, we know, sometimes reduce a flourishing family to want, but are there not many who, whether ill or well, cannot or will not thrive? -objects of charity with numerous friends, always craving, never eatisfied, no house would be large enough to make them clean or prosperous, they know too but how tardily is it recognised. If a large proprietor builds, with much pomp and circumstance, 10 or 12 according to his measure of the wants of the tenant farmers on his estate, a small bricklayer or a retired publican takes his measure of the wants of a district by running up 40 or 50 in a row, to cost 202 . or 302 . each, and pay $2 s$. a week rent; tenant farmers can do very little in this case, their interest is only an anuual interest in the affair; they must pay more for labour, and their labourers must waik a long way to work because some settled poor. Such landlords covet all the landed pro perty in a parish, therefore small capitalists are shut ut of the market; perhaps a lot of almshouses, the legacy of some repentant or kindly disposed person, attracts a lot of poor widows or old men to make the number than there might otherwise be. For such cases the only desirable change appears to be that every facility should be afforded for the legal transfer of smal estates, that houses of various calibre and of convenient disposition might be built, and as soon as the worldly wealth of the agricultural labourer will enable him to pay the rent of such places we may hope the law of supply and demand wil furnish them in sufficient number Allotments small or large are gond for labourers; the arge stimulate his ambition aud energy, and awaken him to a path for promotion. Education is more well and properly attended to in union workhouses and with the best effects; there are also instances where and imposture, but there! are far more numerous instances where it introduces the child to a good situation and wherein it helps him to be useful and induces him to reach forth from pauperism to independence; it is blessing to those who taste it, and if there be exceptions, they prove the rule that education is qualification for a better position, it is consciousness of power to use faculties, it is latent capital, a sure help to the wel disposed. The occupations and habits of the young when cast on their own resources require a little further consideration, and we will if you please allude to them on another occasion. J. W., Peterborough.

## the potato blight in ireland.

The following details of the Potato blight in my locality, where it has especially prevailed this season, may not be quite uninteresting or useless. In February yard duat arial the crop was dug out in the course of July, and no diseased tuber appeared. Early in March, sets of the same sort were planted in a field bed of freen lea which had not been broken during 20 years, with which the rich mould of a hedge ditch was intermixed-no cther fertilising substance was applied; the aspect of this bee was due south, and a close hedge sheltered it on the north. The foliage of this crop was extremely luxuriant, and the tubers were large and abounde perfectly sound : it were dug at the close let the remainder mature their growth . the result was, that at the end of August onethird of these was rotten.
Another head-ridge of les at right angles to the former was cropped in the same manner and with the same sort of Potato, but at a later period: the fertility of the soil and the consequent luxuriance of the foliage of the plants diminished gradually towards the lower extremity of this headland. Where the foliage was rank and the tubers were most promising, the greatest degree of malady prevailed ; where the contrary appearances occurred the least failure took place. After the sowing of Barley in this field had been completed, an, which had been long waste, was cropped also and mavured in the same way. I expected little produce from this as the season was far advanced. The plants grew, however, in a heal thy manner, though not la means, and preserved of guano) until their late maturity the light applicstion of ga
here there was no disease. and chiefly manured with a compost of lime and earth and artificial* guano, grew well but not luxuriantly the haulms did not intermingle and crowd or over shadow each other; the loss from blight was about 4 per cent. In adjacent fields the failures were from
Fresh broken old lea has been always considered (and I am sure rightly so) as the most favourable soil for Potatoes, yet I have lately seen 30 per cent. diseased on such soil, half the drills in this instance being manured with farnyyard dung, and the otin war ceptible. I have had proof in my own case that the potash obtained in ashes of burnt weeds was powes less as an antiseptic; the earth teemed with large tubers, and rank stems and foliage gave the most promising
indications of a heavy crop where I had applied such
*This was imported from Messrs. Nottidg Gracechurch

ashes, but there the rotten tuber was frequent. We of this his favourite esculent, an assertion which is borne,
see the failure on peat soil also. The philosophical part of the subject is quite beyond my range, yet I cannot avoid allusion to the question, what is the morbific agent in the cases of Potato murrain? I think it is no presum

First, I cannot conclude that the decay arises from an hereditary taint or debility in some of the varieties of the Potato, though it must be admitted that some sorts are more able tn resist blight than others. Of this, indeed, I have seen a decided pronf. One of my work men this year planted 30 drills with Primroses and two
with Seotch Downs ( $q y$. Dons) ; he lost about 25 per cent. on every one of the drills, with the exception of those bearing the Downs (qy. Dons or Duns); all the drills were manured in the same manner, and seeded on the same day. Keports reach me also from various parts of my neighbourhood that the Downs have altogether or nearly escaped the malady; a red-streaked and interior sort lias also suffered very slightly if at all ; but I am disposed to think, notwithstanding, that the comparative nonlisbility of such sorts is to be found in some peculiaxity of organisation distinct from constitutional waint. the case, how do we account for the that the Primrose sort has not now failed generally throughout this county but only in particular localities, and even in these but partially, severely in some fields, and scarcely, or not at all, in others
One of the correspondents of this Gazelte (July 16, at Restronguet, in Mylor, adjoining each other, the middle one only has disease in it; they were all planted at the same time and under precisely similar circumstances." Some of the
Ammoniscal men
Ammoniacal manures have been more than suspected of occasioning the mischief, but the healthiness of Potatoes continually raised through their agencies dis proves such allegation. The ammonia contained in the guano, which I freely used, was decidedly serviceable to my crop, and I cannot suppose that the same gaseous substances conveyed from stable litter would be noxious to the same sort of crop. A very imaginative theorist that nitre in the soil causes the malady in question, and that salt would correct it. But sea weed and sea sand saturated with salt are freely used, and yet the preventive is not practically found in salt. Early sowing may and probably wisease, because the blighting periol usually occurs at a season subsequent to their maturity, or at they are most liable to injury ; but in my case some of the latest planted tubers and least luxuriant in vegetation were found to be among the healchiest.
Coldness of temperature and much moisture have been assigned as predisposing causes of the murrain, but neither cold nor moisture prevailed before our About the 20th of last August the temperature was higher than the average ; the weather was steady, there was no apparent combination of unpropitious circumstances. Moisture !-the soil was too dry, there
was neither moisture below the surface, nor in the atmosphere, to cause the malady.

It was about the middle of August when two or three days of dark, calm, and rather foggy weather caused us to ask the question, is not this blight? and then we faradvanced in theirgrowth to receive seriousiniury. But two or three days afterwards rumours were rife that the dreaded disease had appeared in various fields, and especially very near the sea side. I observed the biackspotted leaves of Beans on my own land in patches her and there, and similar affections on the leaves of monly perceptible-on the Potato led me to conclude with more competent inquirers that currents of elec-
tricity occasioned the malady which seemed traceable in their apparently capricious courses. Those very leafy and strongly staiked plants, which most abounded in moisture, would be much more attractive of the electric flaid than less succulent ones, and consequently the most severely affected by it. Convinced that electricity exercises powerfal inflence air and on vegetation, I see much reason for believing that the morbid changes which 80 suddenly occur in the Potato plant when excess of electricity (atmospherical or terrestrial) may prevail, are attributable to this uncontroliable agent of good and evil. An obvious difficulty however arises here-if electric influences now cause follow aiment in queation, why did not the same results 10 years? We cannot suppose that there is a new modification of the physical laws of electricity. I leave the philosophy of this to those who are qualified to dis-

## Home Correspondense.

Large and Small Potatoes as Sets.-As my experi-
ments in Potsto planting were carried on extensively during the 17 years that I occupied my property, on Msidenhead Thicket, 1 feel authorised to offer the following remarks. During the 7 or 8 years that I was of the Horticultural Society, Thomas Andrew Knight, secertain him own theory and practice in the cultivation

## supply us with animal food, no person has yet formed

 anything approaching a fair estimate." Mr. Knight entertained the highest opinion of the "no-blowing Ashearly varieties, it was his great desire to prevent thedeveloprnent of blossoms and seed vessels. The annexed quotation from another letter will convey a pretty correct idea of Mr. Knight's principles and practice :selecting the largest I tubers (of Ash-leaved) whole, crops. As a general rule, I think Potatoes ought to be planted in rows distant from each other in proportion to the height of the stems; the height being full 3 feet, the rows ought to be 4 feet apart, and the tubers of the
very largest varieties, whole, never to be more distaut from centre to centre than 6 inches. By such mode of planting the greatest quantity of leaf (the organ in whic the light, the rows always pointing from north to south." These directions were adopted in practice with mos satisfactory results till the fatal attack of the disease in August (1847), when one of the most promising articie, wherein we observe many just rewarks upon the consequences of planting very small sets, cannot but concur with him in propesing whole and large Potatoes at wide distances," provide always that these distances be restricted to the row only; and I am the more confirmed in the opinion tha very minute Potatoes tend to deterioration, in size at and Cuchill's Lapstone Kidneys, without one single tuber that could be brought to table. To close the subject, I that could be brought to table. To close me sinject, Potatoes (either of Ash-leaved for summer use, or Regents for the winter stock), are planted in February or early in March, the final result at digging will b found comparatively satisfactory in every respect. J. 2 Storing Tumips.-In a late number of your Paper you nips. My system for a number of years has been employ women or boys at from $6 s$, to 83 . per acre, who pull tops and clear the roots, and fill them into carts
Each person takes two rows or ridges, of which they pull tops and clear, throwing the roots into one continuous row; in this way the roots which grew on four ridges are thrown into one row, which leates three clear drills between the rows of roots for the carts to pass when taking them up. It is likewise more convenient for filling by taking two rows at the same time; the fillers work on each side of the cart without confusion; one third are drawn home to be consumed in the yards by cattle, the remaining two-thirds are eaten on the land by sheep with corn or cake. Those consumed on the land are drawn together into oblong heaps about 6 feet wide at the bottom, and containing from 8 to 12 one-horse carts. The heaps are afterwards covered with stubble and a liyht covering of earth, well beaten down to shoot off the rain. Those that are drawn home are either stored in the root-house or made into narrow pits and neatly thatched with stubble, but not covered with earth. If early storing of Turnips was more generally practised we would see fewer rotten ones and hear less frequent complaints of their not keeping. It is asserted by some farmers that the use of artificial manures is injurious to the keepin: qualities, and prediaposes the 'Iurnip to decay. This anything in the roots to cause this, but by producing a more rapid growth, and hence it attains an earlier maturity having arrived at maturity, the longer they remain subject to rot or decay and also deteriorate io value for feeding. All plants, while the leaves remain green, are during the day continually appropriating carbon from the air. When night comes this process ceases, they then absorb oxygen and give off carbonic acid; therefore when the roots arrive at a certain stage, and comparatively cease to draw nourishment from the soil, the leaves may still remain green, but the temperature being low the plant is losing more carbon through the leaves, in the form of carbonic acid, than what it is abOverstone.
Drying of Grain.-I have on a former occasion in your columns suggested that reaping machines to be perfect should be made adjustable, in order that during wet weather in harvest time the ears might be reaped separately from the straw. To effect such a desideratum, the cutting apparatus of the reaping machine would have to be adjusted higher than at present; and preceding by a few inches the comb-like teeth between which the stems of the corn are received, there should be a rod (and this should be adjustable) the breadth of the machine. The object of this rod would be to ben down the corn, which, as soon as relieved from it would spring back and be received between the comb like teeth, and there amputated, as at present the strav lower down is by a reaping machine; by means of the cross rod being adjustable the machine would be adapt-
able for the various descriptions of corn and the length of the ear, and with the small portion of straw cut of along with it, would be nearly uniformly of one length I would, however, suggest that parallel with but in advance of the cutting edge, there should be a little in advance and higher in elevation a strong wire or other blunt edge for the purpose of bending back the ear when in between the comb-like teeth, and thus the
cutting edge inmediately following would amputate the and at the same time the ears would be projected into the receptacle-canvas bags, $\&$ c.-provided to collect them in. In the A pricultural Gazette of the 15 th inst. A Landlord" in the North British Agriculturist propose that after the corn is cut by the scythe, the ears should be separated by women with short knives. I beg to suggest that this operation would be more quickly per formed by having a low cart, at the back of which should be placed an 18 -inch or 2 -feet projecting rack incline open at the outer ends, and narrowing so that when the cut corn is placed between by one set of labourers, the heads would be prevented from falling through, but open enough to allow the weight of the straw to bring of ear down to where it is allotted to it. Another se
of labourers might then with knives or shears separate the ears, and the teeth of the rack being sufficiently nclining towards the cart the ears would fall into it Cutting edges could be fixed to the edges of the rack slightly moveable by pressure, so that by pulling at the traw the head would de separated and aitably for tha purpose. Another mode suggests itself by having in place of the rack a flat surface, but, as before, inclining sufficiently so that when the ears are amputated they will slide into the cart or receptacle placed for them; at ne side of this inclined platform a long knife should be t one end attached, similarly to a "clogger's" knife, and the handle being at the other end and held by one of the labourers, who would elevate it and depress it as cutting edge was serrated, and the operation would be per formed by one set of labourers bringing the cut corn, and preading it across the inclined plane, where the knife would have to be depressed with its edge at a suitable angle upon the straw, which, by being withdrawn by he party who brought and spread it, would have its unfortunate wet harvest, it struck me much Wheat unfortunate wet harvest, it struck meys, if not from all damage, at least the injury might have been consider ably less. No doubt some fields of Wheat were le getting it dried sufficiently to thresh, and have it in unfortunaty wind, and even when the intervening finer weather occurred, the wind was very slight, and not near enough to dry off the wet attached to the cut corn. As to me they might have been very profitably employed by making a cheaply constructed platform revolve, and by placing the stooks upon this platform, and with the horses whirling it round and round in the open air, substitute for wind would have been obtained, and a great object attained of shaking off the wet and drying arrested would have been vastly retarded; whatever grain would have been shaken out on the platform could have been easily collected. If it was only sufficiently dried to enable the farmer to make it into small stooks with the ears inside, leaving an opening in the centre if circular, and an alley if rectangular, it would have been greatly preserved from receiving the amount of damage it inevitably did by being allowed to stand untouched in
the fields. A platform as suggested would be easily and
 placed to form the floor to collect the falling grain Although a few preceding harvests have been very favourable to getting the corn crop dried with litu trouble, surely when the harvest is overtaken by an unfavourable wet season, some effort to alleviate thlar injurinus effects of such a catastrophe should be a regula and customary business of the farmer. W. Wooler. Wo fear the scheme of revolving platfor
The Advantages of Planting or Dibbling Grain at defined intervals and proper and uniform depths are the following :-The plants are enabled to grow in a natura or circular form; they can be hoed every way, straw is clead, stiff, and erect; the crop, however heavy, is never laid or lodged, thereby co-operating with the reaping machine; every grain grows, planted at a proper and uuiform depth, and the or 10 years it has been my endeavour to invent and perfect an implement that should plant the grain at defined intervals and uniform depths, and at the same time that a man should be able to deposit the grain with the reatest accuracy and at the rate of 2 or 3 acres a day without fatigue to himself. Whether I have at last ac complished this it must be left to others to decide. Aor of ortheoming Smithfield show will have the han

## Farm Memoranda.

 , Mr more to it than most men in England. He is extremely clear, from long attenion, that this disorder is owing solely to floods-nor from land being wet, only from rains which do nothe young Grass springs that rise. He conjectures that is of so flashy which springs in consequence common complaint. But nature that it occasions this comme is clear in his facts herter this idea is just or not, ar they act) are the cause. Perhaps the most curious experiment ever made on therot in sheep is what he has frequently practised．When appear that he keeps in larger stock on a given number he fats them for the butcher；and to be sure that they shall be killed aud not go into other hands，he fots them before he sells，which from long experience he can do at pleasure．It is only to flow a pasture or meadow in
summer，and it inevitably rots all the sheep that feed on it the following autumn．After the middle of May， water flowing over land is certain to cause it to rot， whatever be the soil；he has acted thus with several of affect as， impunity all winter，and even to the end of April，but after that the above effect is sure to take place．Springs he asserts to be no cause of rotting nor yet the Grass which rises in consequence unless they flow ；nor is it ever owing to the ground being very wet from heavy rains，unless the water flows．This theory of the rot upon the whole appears satisfactory，and that part of it whisputed．

In the breed of stallions for getting cart－horses，Mr． Bakewell is also very attentive；he has those at present that he lets at from 25 to 150 guineas the season．He conceives the true make of a cart horse to be nearly and very sluort legs．He makes them all particularly gentle，and apprehends that bad drawing horses can be owing to nothing but bad management．He has one stalion that leaps at 5 guineas a mare．
entive to the point of wintering his cattle；all his horned beasts are tied up in till the end of March，feeding them according to their kind，with straw，Turnips，or hay；all the lean beasts have straw alone；he never litters them，on account of making the straw go as far as possible，that it may be
eaten up perfectly clean．Young cattle，that require to eaten up perfectly clean．Young cattle，that require to
be kept quite in a thriving state，have Turnips，and also fatteuing ones；and late in the spring，when Turnips are gone，hay is whony their substitut．
The conveniencies for tying up beasts，which Mr． Bakewell has built at his own expense，are a remarkable instance of spirited husbandry；he has formed such numbers of stalls for them，by building new sheds，and converting old barns and other places into standings for of all sorts ；and all in the house．
The floors on which the beasts stand are paved，and 6 or 8 inches higher than the level of the yard，they are lifficulty，the consequence of which is that his dung falls beyond his standing，and on the lower pavement， and when he lays down，he draws himself up on to the higher pavement，and is clear of it－by this means they are kept quite clean without litter，and the men who are
employed on purpose keep the whole constantly swept employed on purpose keep the whole are barrow the dung into the area of the yard， that is surrounded by the sheds，and then pile up the dung in a square clamp．
By using no straw in litter he makes it go so far in wintering cattle，that he much reduces the expence of winter feeding them ；and this has occasion his horned catcle．He used to draw with teams of oxen，and found that he must keep double the number worked，to have， in the common manner，one set coming into work，and another going out ；and then he had his cows bulled a 2 years o！d，consequently they were wintered on hay when 3 years oll he draws all with cows，they live on straw at 3 years old，when they are bulled，and worked cill years old， hence one winter at hay is changed to two at straw， which，from Mr．Bakewell＇s management，is a great saving，and the work all gained at the same time；and let me observe further，that the calves bred from cows rising from 2 to 3 －the latter age is too early to breed， both for the calf and the dam．
saw the teams of cows at work，and they were to hey draw jus well as oxen of the same size．He would not have taken 120l．for one of his teams of six cows．
He has water in cisterns in his farmyards，and all the beasts are let loose to drink once a day，except those on Turnips，which do not want it
He prefers，in the raising of manure，the dung arising from cattle that eat a given quantity of straw to any manure to be gained from such quantity of straw he could eat enould not litter with it，but take in his neighbour＇s cattle to eat it for nothing ；and would give them the same attendance as his own．This is a particular idea，which may ver
Mr．Bakewell very justly considers the raising dung as one of the most important objects of husbandry；and for this purpose his vast slock of cattle is of noble show proportion of his shis management，but lhow not only the excellesed；for no tender cattle aso the hardiess fis in all con－ could be kept in such quantities．which are arable，and sists of about 440 acres， 10 and the rest Grass．He keeps 60 horses， 40 hargerep， about 15 acres of Whest，and 25 of spring corn；the Turnips fatuess in which he keeps all these cattle be considered， and that he bnys asither straw nor hay，is must at ence

## all others，of the excellence of his husbandry．

He makes his Turnips go as far as possible by carting every one to his stalls，in which manner 1 acre goes an most of by giving it all to his lean beast，hot in litter－ or as food in quantities at a time，but keeps the cattle hungry enough to make them eat clean，giving but a mall quantity at a time．

Of his hay he is also very choice；and the means he has taken to command as large a quantity as possible are perhaps to be reckoned amongst the rarest instances of $8 p$ rited husbandry ever met with among the common farmers of England．It is that of watering his meadow that lie along a small brook which runs through one part of his farm．This improvement was begun by his himself．
I cannot conclude these observations on this very spirited farmer＇s undertakings，without expressing the satisfaction I felt at viewing them．Nowhere have seen works that do their author greater honour ；they are not the effeet of a rich landlord＇s determining to be a good farmer on his own land，but the honest and truly and expensive works on the property of another．It is true，he is fortunate in a geverous and considerate land lord ；and much do I wish that such excellent farmer may always meet with the same encouragement． truly good farmer cannot be mo much favoured，a bad one cannot have his rent raised too high．Let me exhort the farmers of this kingdom in general to take Mr．Bakewell as a pattern in many points of great kingdom in general benefited not a little．

## Miscellaneouz

The Albert Training School，Glasnerin．－The educa tional arrangements of this important national Institu tion have，within the last two or three years，been greatly extended，and the present course of instruction which it affords may be regarided as calculated，in an eminent degree，to prepare the young farmers and teachers of the country for future usefulness in their occupations．Among the courses of lectures which have been rendered available to the papils，those of Professor Hodges on the structure and feeding of the animals of the farm are，we consider，of great practical importance．The lectures in this department are at present in progress，and are illustrated by an extensive the pupils havecimens and drawings．Examinatoses and we have learned that the deuree of proficiency and we have learned as stribinuly illustrative of the advantages of the system of training pursued in the establishment．It must be gratifying to the friends of education to perceive the progress of this Institution That it is now regarded by the agricultural public as valuable school is shown by the applications for ad－
mission from all parts of Ireland．We do not，indeed， mission from all parts of Ireland．We do not，indeed， know any Institution in the United Kingdom which lass so many advantage to the young farmers of than of obtaining present efficiency of the establishment must be attributed to the zealous exertions of its excellent Director， Dr．Kirkpatrick，by whose efforts，liberally supported by the Commissioners of Education，a comparatively insignificant farm school has been elevated to the position which the Albert establishment now so worthily occupies．Belfast Northern Whig．

MEDICAL AND Erice 78.6d... EEONOML BOTANY; or An Acconnt of the
The Vegetable Kingdom contains, among prace. large quantity of plants of no known importance to man, various useful species
employed in medicine, the arts, or in the many branches of
domestic ceconomy. The principal part of those which can be domestic coconomag. The principal part of thase which can
brought by teachers in Europe under the notice of students, Which, from their great importance, deserve to be among the
earliest subjects of study, are mentioned in the following pages, Thabe Kivadow of the author, with the sequence of matter departed from in a few instances, when it was believed that the
onvenience of younger students would be consulted by doing so The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably
extensive means of illustrating their lectures, and all IBotunic Gardens, may furnish the larger part of the species which are a greater work would have been beyond the reach of the majority
of purcbasers; and secondly, because experience shows us that those who have to study a science of observation, succh as Botany, a limited number of objects."

## Che Gardemerty Chronicle.

SATURDAY, DECEMBER 6, 1856.
To our reporter's account of $\mathrm{K}_{\mathrm{ew}} \mathrm{G}_{\text {ardens, }}$ published a fortnight ago, an old correspondent objects that it is laudatory rather than critical. "While it is the duty of a reporter," he writes, "to praise what is praiseworthy, it equally behoves him to blame what is blameable." And then he proceeds improved, the health of the plants excellent, the keeping perfectly satisfactory, and the new arrangements in progress in the Palm stove admirable, yet the ugly misplaced Museum, the miserable Victoria House, and the great dark heavy Orangery stuffed with Araucarias and other fine things which are dying there ought to have been pointed out as being discreditahle. As to the new Museam, for which so much of the beautiful piece of water, so many noble trees, and so picturesque a part of the garden have been needlessly sacrificed, it is difficult to conceive what head could have planned such a monstrosity. Seen from the road with which it is neither parallel nor at right angles, it is frightful, seen from the garden it is mean as well as mis placed."

We hy no means deny that these remarks are well founded; on the contrary we agree with cur correspondent in much that he says. Undonhtedly the place occupied by the Maseam is most unfortunate; but there it is; nobody can remove if and it is now useless to complain. The consolation is that however much there may be to criticize externally, it is a good roomy place and we doabt not will show to advantage the multifarious collections it is to receive. The Victoria House, a mistake of a former Chief Commissioner, would be better removed from the vicinity of the great Palm House, and altered so as to become habitable by plants. In its present unventilated condition nothing can grow in it except Gourds and tropical weeds; were it provided with an ample and constant
supply of fresh air there is no reason why it shonid not be found well suited to water plants, as well as others.
Upon the Orangery and its contents we have something more to say. That it is erowded with plants is true; that those plants suffer from their confinement is undeniable, and what is still more important it is well known that the paants themselves are the finest of their kinds in Europe Such Norfolk Island Pines and other Conifers can only be found in the countries they naturally inhabit. But where are they to be placed? Kew contains no other shelter than the old Orangery so that crowded and suffering these regal specimens must remain until a proper residence is provided for them.
Let us hope that one of the first of the future improvements at Kew will be the construction of a vast glass shelter, under which may be cultivated in perfection those beantiful plants of temperate countries, which are inpatient of winter cold and damp, bat for which our English summers are perfectly adapted. The races of so called greenhouse plants are in no respect levs striking or less beautiful than the Palms and similar trees for which the nolle Palm House was constructed, and they are far better suited for ornamental purposes in the United Kingdom ; for few can afford to construct hothouse, or even to maintain it, while the half hardy trees and shrubs of climates only a little better than our own are enjoyable by every body.
We would therefore urge upon the consideration of We would therefore urge upon the consideration of Government the completion of the grand collection of Kew hy a greenhouse worthy of the nation and the place. Therein might he found the natives of our great Australian and South Afican colonies, associated with all that is rarest and best in temperate America, and the rich Mediterranean region. Orange trees and Australian Myrtles, Pomegranates and Gum trees, Acacias and Proteads, Norfolk Island Pines, Alerces, Araucarias and Saxegotheas would blend their foliage or intermix their flowers with all that is most picturesque in the vegetation of the Eastern and Western worlds. If our artists are to enlarge their ideas and improve their taste by the contemplation of unfamiliar natural oljects it is in such a collection that they would most effectually do so.
But it may be asked, where is this construction of hothonses and greenhouses, and this constant increase of Garden plants to stop? Our answer is, Stop here.
No mistake could be greater than to imagine that national garden ought to contain all known plants in a living state. When we consider that above 80,000 species of cultivahle plants are known exclusive of endless varieties scarcely inferior in importance to species, the ohject is obviously unattainable. Nor is it worth at aining. What our ancestors happily called the Hortus siccu: or dry garden, which moderns term the Herbarium, is the place where all vegetable forms are to be preserved
for purposes of science. It is there that most species and varieties can be compared and examined. it is there they can be systematically arranged, which is mpracticable in a living garden, and without which they are useless for purposes of study. And such is he skill of those who now prepare plants for the Herbarium that multitudes of species are just as examinable when dead as when alive. A garden, whether public or private, must of necessity, and should from choice, be a mere Selection of species remarkable for their beauty, or singularity, or diversity, or utility to man. But especially should it contain those which from their magnitude, or olours, or textare, or manner of growth, are ansuited to the cabinets of an Herbarium, and these should be shown to the $u$ 'most possible advantage. Were the aim of a public garden directed to these points alone its whole aspect would he wonderfully mproved and its value for all public purposes be reatly increased. We no longer see in this country at least endless ranks of sticks standing in pots with a few leaves at cue end and a label at the other, the collection being denominated a Botanic Garden ; the whole aspect $0^{5}$ such places is changed noder the influence of improved taste, aided by the skill of modern gardeners ; hut we have not carried the alteration far enough, as some of the houses at Kew themselves testify. And there is great danger lest the eagerness with which new planis are introduced should again load, in spite of all resistance, to crowding plants into glass houses, especially in poblic gardens, for the sake of gratifying the vanity of persons who expect to be able at all times to point to a plant and say "See ! this is what I gave酸.
While then we earnestly advocate the construc tion of one other most noble Greenhouse at Kew, as indeed seems to be inevitable, we most certainly would stop there. Nor woald there be any need of
further ontlay if the views now explained were adopted as a fixed principle of the establishment gates of the garden; Collection not Skle
the doors of the Herbarium and Museum.

Recent letters from Ascension report the continued and signal success of the interesting experiment in reciaiming a volcanic waste which is now in progress on that island, under the orders of the Admiralty, as we explained on a former occasion (see p. 851 of our last volume).
Crops of all kinds were looking extremely well. From Oats shaken out of the bags of Cape Oat straw some land on the Peak had been successfully cropped for green food. The variety, although very coarse, frequently proancing seven stems from single seed, seemed well adapted to the soil and climate. Nearly 30 acres were under cultication with Vegetables and Fruit, eighteen were occupied by Sweet Potatoes, the most important crop. Eight acres and a quarter were in Grass, twenty-seven and a quarter were occupied by trees, roote, \&c., and about an acre and a half were fallow.

Nothing could surpass the health and good condition of the animals on the island, consisting of cattle, horses, sheep, and donkeys, Ewes had lambed abundantly, and imported Southdowns had proved as active and hardy as any of the island sheep. Their introduction promised to be attended with the hest result. The following statement of the supplies issued to the fleet and garrison during the first six months of the present year shows conclusively what the productive powers of the island are likely to become

French Beans were perfectly at home, and proved invaluable. Two roods of White Canterbury Kidney Beans, sown with seed saved on the spot, produced in one fortnight 1245 lbs . of green Beans, and 3 bushel of seed had been saved from 20 perches of land.
The Coffee shrub was making some progress in spite of difficulties, and had furnished a couple Vines brought by Commodore Adams from Sierra Leone, where they prosper, had been planted in a place made as Vine borders are in England, in the hope that this fruit, which has not yet thriven, might thus be established. Pine Apples, brought by piece of waste ground had been formed into a terrace along a bank of American Aloes, and supplied with rich vegetable mould brought down from the Peak. This, mixed well by the spade with the chalky had formed a border 2 feet deep. In Febraary there were 500 plants growing as vigorously as under the best English cultivation. The Cochineal insect, brought to the island by Sir Wm. Wiskman, was breeding fast rpon a kind of Opantia called the White Prickly Pear, which has become plentiful all orer the island. About two hundred plants were established with the insect upon them in large quantities, and there was reason to believe that its cultivation might be turned to profit. In shor every crop that had been tried had succeeded, more or less, with the exception of Turnips.

A piece of ground attached to the Hospital has been successfully planted with ornamental shrubs, and now forms an extremely gay and agreeable place of resort. A yellow Tecoma from India had completely established itself, and for four months successively kept the garden in beauty with its rich golden flowers. With it are associated species of Ficus, Eucalyptus, Ilex with very large leaves, Vitex, and Laurus, with Oranges, Melia Azedarach Acacia leucophylla, Buddlea madagascariensis, and some Grewias. Brugmansia saaveolens grows wel and flowers abundantly.
A sheltered ravine planted with Guavas, Loquats, sour Limes, Peaches, Oranges, and Figs,
was very flourishing, and the Guaras were showing truit in abondance. In another wlace, called

Palmer's Springs, Bananas were growing away most vigorously
Rairs continue to be more frequent than formerly. They set in last year as early as August, and Mr. Wallace, in charge of the farm and garden ground, is of opinion that if the island is equally
favoured this year, the gardens and fields on the mountain will be as luxuriant and well cultivated as any in the world.

## New Plants

189. Castanea chrysophylla, Douglas in Hooker's Flora

We find in the new No. of the Botanical Magazine an excellent figure of this rare plant, with the following description.
"One of the greatest rarities perhaps in the subject of the present plate-a Chesnut with the under side of the leaves of a pale golden hue, occasioned by the presence of innumerable minute peltate scales of that colour. Specimens of the plant probably exist in he herbaria discovered so long ago as 1830 , by Mr. David Douglas,
about the grand rapids of the Columbia (Oregon), Cape about the grand rapids of the Columbia (Oregon), Cape
Orford, and near Mount Hnod, in North. West America, constantly inhabiting the hills; and it has since been found by travellers in California, especially by Burke and Hartweg, and these collectors were able to send seeds to Europe, of which very few indeed appear to have germinated. Our solitary plant was reared from seed gathered by Burke: and, although now only bikes of flowers, and these, in one instance, wer succeeded the following year (1856) by several fruits of the size here represented, but which fell off before they were mature. The tree bears our severest winters perfectly unharmed. This is said by Douglas to form a beautiful tree in its native country, varying in height from 20 to 0 feet. We make our description from our own small plant above mentioned, which is branched almost to the base, the young branches tawny or goldencolour. Leaves, the smallest of the Chesnut kind, two and a half to three inches long, shortly petiolate, ovato-oblong, acuminate, coriaceous, entire, glabrous, very dark green and somewhat glossy above; beneath clothed with dense, minute, farinaceous scales of a golden-yellow colour. Spikes of flowers from the axils of the upper or terminal leaves, as long as, or shorter than, the leaves, on short peduncles. Male flowers occupying the upper half, numerous, crowded; femal flowers one to three or five, distant, scattered at the base, all sessile. Male Flowers :- Perianth cupthree inner less villous thsn the outer ones, Stamen 10 to 12 or 13 ; filaments long, flexuous, much longer than the perianth. Female Flowers, accompanied by some imperfect stamens. Perianth as in the male Ovary having its base incorporated with the perianth, very hispid, dividing above into three glabrous styles. These ovaries remained the whole winter on the plant nd daring the following summer became a three-lobe ruit of the ize represented at fig 5 , and mmature before the autumn. It is three-lobed, and very prickly, as in Castanea vesca."

## VEGETABLE PATHOLOGY.-No, CXLVI.

603. Parasite (Gymnosporangium, Podisoma*). The very carious productions comprised under the genera which form the subject of our present notice caznot be considered as materially affecting the cultivator. They re, however, in themselves and the consideratioladies of plants would not be somplete unless it included a notice of them. They are confined exclusively to species of the genus Junipervus, on the branches of which they form clavate or lobed gelatinots masses which resemble externally the species of Tremella, which are so common on decaying sticks in winter. The branches, however on which these genera grow are by no means decaye and the same brauch will produce a new crop for many successive years, each individual leaving behind every year a little orbicular disc, which waits merely for new season to sprouit out again into a fresh plant. In eneral the branches of the matrix are not at all distorted $\boldsymbol{b}$ but in $P$. macy formed, looking very much like the strolilus of a
Cypress
604. This latter is very common in Pennsylvania upon those plants of the Virginian Juniper which have been closely clipped, and is known under the name o Cedar Apples, and brought into the market as a popular vermifuge. The trees, though covered with the parasite, do not seem to suffer, fur as fast as the parasite grows so fast the swelling increases upon which it is developed. In like manner tho-e species which affect the branches of other Junipers without causing much distortion, if njurions at all, are so only after a long series of years, which is the more surprising as the large gelatinous masses must make a strong demand on the mother plant.
605. It was said that these parasites are externally like a Tremella. The resemblance is, indeed, not merely ex ternal, and there is no doubt that these plants fom
$\boldsymbol{a}_{\text {gmnosporangium from ruwns naked, } \sigma \text { fos } x \text { a seed, and }}$ arson a vessel, poasoma from nus a foot, qua rapa a body,
nice connecting link between the two grand divisious Coniomycetes and Hymenomycetes. In Tremellc the bearing at their tips large globose swellings which frequently divide into four lobes, each lobe giving rise to a long thread tipped by a hoat-shaped spore. In like mamer the base of the gelatinous mass in hese parasites consists of a mass of flexuous distinct threads springing from a more intricate set beneath The tip of each thread is crowned by a uniseptate on the conical cell which hall the apance of the spore of a Puccinia. Each cell, however, germinates at two or four points, and the elongated threads result ing from this germination bear the true spores, which are broadly cymbiform and capable of germination There is therefore a very close resemblance between the Tremella and the Podisoma. The great difference exists first in the arrest of development which takes place in the pseudospores of the latter, a cireumstanco which is still stronger in Puccinia and other allied genera; and secondly in the fact that the sporiform bodies in Podisoma germinate like true spores, while the apparent cermination of the sporophores of TYcmill is nothing more than an extension of the walls of the cell into filiform processes. In Podisoma the inne membrane protrudes in the form of a mycelium, exact as the pollen tubes are protruded in Phænogams. The better plan, perhaps, is to regard the growth of Podirom and its allies as a sort of alternation of generations, the propagation of the plant depending upon the germina tion of the spores of the second or third order; and is this postponement of propagation which in all pro babir keeps up the connection of the parasite failu of the parasite and the appearance of a new crop meanwhile the parasite has been making preparatiou fo fresh attacks, for which had the ultimate germination taken place at once the nurse might not have been pre pared for the reception of the new generation.

DECREPITUDE OF THE PEAR TREE.
As already stated, every individual being, whether an animal or vegetable nature, has is acrage period falls into decay, and arrived at its limit disappears from the face of the earth. As many years as a seedling Pear tree requires to armive at its full growth, so many years takes to decay and die off. The age depends on the particular race, its degree of acclimatation, the coll
ditions, more or less favourable, under which the tree has been pianted, and the care with which it has bee subsequently managed.
Of all fruit trees the Pear, when sprung from a good race, attann the greatest age. This age varies from 10 or 150 up to 300 years or more. It is easy to ascertain its age by examining, when the tree has been sawed over by the ground, the annual layers, which show the progress of its growth, its stoppage and decline.
ayers, very large near the centre, become sman and maller towards the circumference, where they ar almost imperceptible. It is in accidental situations that trees attaining the greatest age are found ; but the sol must be rich, deep, and free from stagnant water cofrob these observations, the truth of which be under stood how necessary it is in our cold and variable climates, when it is intended that the trees shoul attain a great age, only to plant stocks raised from seed of hardy and vigorous sorts. In raising from seed, there are always some seedings which have no
similarity to their parents. For this reason it is neees sary to make a careful selection in the second year of their growth. All the seedlings having a smooth bar of an olive green colour, spotted with grey, and a that naturally grows straight and upright, may be considered to possess the characterist
ness of growth and long darald Penr of the woods hav The stronised - some anthors have recommended the Suec Vert Pear, which suceede better in astion soil than those of the Poire d'Amande and Napoleon. In several experiments made within the last 10 year arined fine stocks from these three varieties but heve found that the most substantial have bee derived from the Sucrée Verte. Nevertheless we hav observed that vigorous varieties from recent rhich wer sele, gave a better resuit. The stocks summer the fourth year of their frowth, not at six methe above the ground but at three feet or more, for the following reason : trees worked too near the uround as iable to sun-stroke, as formerly stated, whise Thos haded at young trees raised for ord can the same seaso Thir mats at the ploter season. Their shooss are sho pymid either wium period in order to form a fine py lder the trees half stem or tall stem; and when of the branches Thus tred to moderate the prospect of good arop for many years. It will be understood that the neare we conform in practice to the rules of a rational sysu of cultivation the farther we put off the perion wealnesa and decay, and the more we deviate fran weakess and the does that period arrive Crops too heavy for the richness of the soil, too st ves Crops too heavy considerate lopping or thirsing of the pruning, and inattention to the destruction of insec are so many causes which hasten the period of indi-

THE GARDENERS' CHRONICLE.
viduat decay in the Pear tree. The time however will come when atenes its vigour and only produces poor
when the tree loses when lavourless fruit containing no seeds. The terminal and 日avourlessort, slender, their bark cracks, and they no longer perfeet their wood, losing their leaves and becoming dried up.
wh to be these characteristics of old age it onght to be destroyed, has an unsightly appearance, and can only deposit diseased excretions by its roots, which it ought not to be allowed to do. till oother tree ought tapsed, planted in the same place tupiany the decayed tree be removed. J. De Jonghc, Brusels.

## Home Correspondenee.

Fuel for Conical Boilers.-There is an old adage "None are so deaf as those who will not hear," which
has its parallel, "None are so dull as those who will not anderstand ;", so that I fear I shall ever fail to make myself intelligible to your correspondent "D. A." There is certainly a slight ambiguity in the expression which he has quoted from your Paper of Nov. 22; ascending as well as descending series, and that the numerals, $1,2,3,4$, may be said to be valuable (or to ave value) all I have written is clear and consistent With respect to his second difficulty, it seems also to have escaped his apprehension that a boiler is not always most available when its fire is most phich shall come to its maximum power some hours after it has been left, especially if the pipes are hot when the fire is made up for the night. The object of a hot-water apparatus is duration and uniformity of hear,
boil the water out of the pipes at 9 p.as., with the probability of finding them cold in the morning. I too have had to do with many hoilers of many forms for the last 30 years and more, and have wit-
nessed many varieties of mismanagement, the result of whessed many varieties of mismanagement that the very last person I should think of employing to managemy fires is "An Old Stoker." I should have some hope of his atoke-hole boy if he had not been $t 00$ long with him, and I think he would sufficiently winter to be willing to take some pains to attain it. A simple statement of the work performed by the boiler of my Orchid-house will show what may be expected from a conical boiler with proper fuel properly managed. The 6 inches long by 14 feet wide, and span-roofed. One part is a transept 4 feet higher than the other, and the sides and ends being also glazed with vertical glass, on an average 3 feet 6 inches high, exclusive of the gables, it presents a form more than usually difficult to heat. It seturn from which the water traverses a tool-house through 26 feet of 2.inch pipe, where some slight Faste of heat takes place. (Welsh coal exclusively) amounts on an average of six years to $7 \frac{1}{2}$ tons per anmm, which
is as nearly as possible 46 lbs. per 24 hours, on an average through the year. The absolute consumption ranges as high as 80 lbs . to 90 lbs . or periuaps 1855 , when the thermometer was $10^{\circ}$ below freezing by day. At such seasons some slight waste takes place up firaresides two miles off, and at this season leaves soon anter 5 p.m., and does not return much before A.s. ; he finds on his arrival a fire as good as he left, is not 5 en $60^{\circ}$ at $8 \mathrm{~A} . \mathrm{M}$, , and that it has no is not often below two degrees above or below that during the night. I have two other boilers in constant work whose performance does not differ materially from the a definite statement. I observe in your Paper of a definite statement. 1 observe in fuel occurred, statement by a correspondent, A. Chy inconsistent with mine, and which some notice. He states that in 1855 he expenith a conical in fuel in forcing a Vinery 44 feet long, with a conica boiler, and that in 1856 he obtained the same resuits with I may remark that the season 1855 was one of extraor dinary severity, and that my own Orchid-house during the early months of that year consumed nearly double to attrial amount of fuel. canse alone. I think it was more probable that the conical boiler was unequal to its work, in which case a great waste of fuel would take place. Moreover, as he oees not state what kind of fuel he employed, ial together posaible that he used bituminous coal, whith great waste unsuitable, and could only be employeded my results in weight of fuel, because that alone affords data for comparison in all places. From the country in which consumption, computed at the highest price he gives, 188. per ton, appears to me very large. Coal with me coste $258 .$, and Welsh coas 328 . per toa, , and as carriago formas a large proportion of its cost, chich is intrinsically the strongest, to be the cheapest fuel, not to mensioa the adpantage of getting rid of all smoke. I have
the data I have given I believe all who wish may calculate pretty nearly what their consumption of fuel ought to be in proportion to the size of their houses, and the quantity of pipe employed to heat them. It should however always be borne in mind that there is no worse Where than the use of an insufficient amount of pipe Where that is the case the house can be heaterature and this is attended with very great waste of fuel from heat passing up the chimney. A Vinery 14 feet wide ought scarcely to have less than six rows of 4 -inch pipe if it is to be used for early forcing. J. Rogers.stand An Old Stoker and others distinclol plan for excluding frost from an orchard house, and that I said exclucing fout forcing I have burnt cinders in a nothing about forcigg. conical boiler ; they do not keep up a strong hent lonyer than six hours, and the boiler must even both for giving out a strong heat and for lasting purposes. The joints of iron pipes, made with Portland not stand a great pressure of water. I have mixed, will not stand a great pressure of anater. found hat although the joints be of even double thickness, till the water oozes through. Sigma.
Hogg's Edging Tiles.-Mr. - informs me tha he has written to you stating that these tiles will no stand the weather. The fact is that the tiles supplied by Mr. Hogg to your correspondent were not made by me. I have made them for four years and never ha a complaint, and can show specimens laid in 1853 a perfect as when new. 1 am satisfied that my earth wilh bear any exposure, which is not the case about as reason able to condemn this material for garden edging, as to argue that because some bricks perish by frost, thereore bricks are not a suitable material purposes. The following is a copy of a note received Trith Hogg. Russell Blackel, Raizay Mary, Ir tham, Essex. The tiles, which were supp Ely, in Mr. - , where not yours, but Soham, a place within three miles of Ely. So that, if these, wards found were made ard as an objection to yours, the frost, are brought forward as an ojection to yours, you may with confidence assert that ${ }^{\text {n }}$, 11.
yours." Robert Hogg, Hungerford last week's Paper an
New Roses.-I observed in your last New Roses.-I observed in your last week's Paper an
excellent article on this subject by Mr. W. Paul of Cheshunt. How far his remark relative to the fable of "the fox and the Grapes" may be applicable to the case in question I will not pretend to determine, but this much I will say, that I consider the poor unfor tunate new Roses have been depreciated to an extent they do not deserve. I am quite ready to admit that our novelty-loving neighbours across the Channel have paluned upon the public far too many new kinds with high-sounding names which have not realised the descriptions with which they have been accompanied. Bu why condemn all because a few have proved unwornually imported into this establishment with a view of testing their respective merits, but only those of sterling worth their respection number imported last season the following have flowered here this past summer in great perfection, flowered here this past susly assert will be found to and 1 thiuk 1 ma learlessly asse Perpetuals-Arthu please the most fastidious. Hybrid Perpetuals-Arthon white slightly tinged with pale yellow-this, although white slightly tinged with pare pill prove rather delicate very beautiful Rose, Genr climate; General Pelissier, pale lilac rose, for our climate; General Pelissier, pale of William Jesse, with flowers of immense size Gorm of William Jesse, with flowers of immense sizit of Lonise Odier: Madame Knorr, deep pink with rosy centre, very large; Mathurin Regnier, bright lilac rose much in the way of William Griffith but having a greate depth of petals; Preonia, light carmine, form of Robin Hood Pauline Lansezeur, light crimson, shaded with violet Souvenir de la Reine d'Angleterre, bright rose, ver large and very double-this is, indeed, a very super Rose; Toujours fleuri, rosy crimson, Bhaded with violetthis will prove an acquisition as a pot Rose ; Triomphe d'Arranches, deep red, a large bold flower, but perhap a little too coarse to be reckoned first-rate; Triomphe de $l^{\prime}$ Exposition, bright crimson, the flowers are very large and fincly formed. Bourbon-lmpératrice Eugénie large aush with deeper centre, form and size of Souveni de is Malmaison. Charles Wood, Woodlands Nursery, Maresfield, Sussex.
Maresfield, sussex.
Preserving Cinger. - For the information of your orrespondent Col. Mason and others who may be interested in the preservation of Ginger, I send you the following extract on the subject from Browne's Natura History of Jamaica:- - syr , it must be dug while its exture is yet tender and ful of sap; and then the shoots seldom exceed 5 or 6 inches in height. These roots are carefully picked and washed, and aiterwards
scalded until they become tender enough for the purpose. They are then put into cold water and scraped and peeled gradually; this operation may last three or fous days, during which time the roots are constan in water, but frequently shifted both from cleass, and to take off more of their native acrimony. After they are well prepared in this manner, they are put into jars and covered over with a thin syrup, which, atter this is sometimes again removed, and a fourth put on,
but it seldom requires more than three syiups to he well preserved. The shifted syrups are not useless, but are diluted and fermented into a smal
Fears.-In the Gardeners' Chronicle of Nov. 22 I observe an article in which my name occurs several times; and I find that the author acknowledges my ideas respecting the thinning and pruning of fruit trees to be good, and this is much. I will he so courteous as to admit that one year is more favouratile to the production of fruit, as well as other vegetable products, than nother. But I still persist in maintaining that trees which have been well reared, well planted, and treated ccording to the rules of art, afford the greatest chance of success. By seeking for the causes of failure, the eultivator will find useful instruction, and of these causes of failure I have pointed out several in previons communications. In No. 48, p. 741, I see that at the exhibition on the 25 th of November there were three pyramid trees, of the Louise Bonne (of Jersey), on the Quince stock, one of which had struck ront from above he graft, freed itself from the Quince stock, and losig he power of drawing nourishment from lie ly imperfect uced cankered shoots, bearing, if any, only pointed out, al though useful to caltivators to know. We have observed the same thing in our cultures for more than 10 years, and the causes to which we attribute it are these:- The roots that are emitted from the junction of the stock and graft are called, I believe, in scientific language "adventitious roots;" and this kind do no subdivide but penetrate far into the soil, whether the latter be good or bad. Without subdivision of the roots there are neither fibres nor spogioles, 1 lithent tion of which unquestionably is to 1 . from the soll, that nourishlict so essul the mation of the organs of fructicalion, and of the young fruit. It is not only the Louise Bonne which in freeing itself from the stock gives the above result, but all the varieties which have been work upon the Quince have done the same, forming adc If thious roots at the junction of the graft and stock. this effect does not take place immediately, to perform their fanctions. In order to avoid this serious evil it is essential to plant the trees on Quince stocks so that the adventitions roots may not form at the junction of the graft and stock. In a special article upon the cultivation of the Pear upon the Quince stock I shall revert to the subject, and treat upon it at greater length. J. De Jonghe, Brussels.
Mulberry.-In the kitchen garden here there is a standard "Mulberry Tree" which annually bears great quantities of excellent fruit. The tree is never pruin to and every twig is loaded wisen the ripen till October till the fros "W D. S" uses the knife too ycur corresponden 1 had fine vigorous Mulberry treely. Five years ago had a piece of wall 20 feet by tree cat own, the had undergone the usual routine of 10 feet; the tree had undergy years, but it never pruning and nailiug for many years, bot fom produced anything, and having plenty of fruit from the "Standard Tree" I employed the space onme House, Herefordshive.
W'ellingtonia gigantea, Clematis from the Rocky Mountains, dec. - I am sorry the Syrian fraits (see p. 790) never arrived, not on my own account but for mat o others. Would it not be well to ay co aerning the Welligestion "C. T. W.," Horticritural Society, who could memorialise the American Ambassador in Londo on the subject, and who would no doubt pay promp attention to so rensonable a request from so distinguished body especially as the movement is made to save the remainder of those magnificent trees from destruction or father mutilation. How ever any persons in thei enses could lay axe to or in any way injure such splendid specimens of vegetation passes comprehension. May it not be suggested to the Ambassador that a wider search in the same range may bring other most desirable things to light? In reading Astoria, or Enterpris beyond the Rocky Mounta for the sbove mountains, the deserving of particular notice ; each flower is composed deserving of particular 3 , of 6 leaves or petals, abour ith with white Its leares tiful crimson, the isside sol doed by threes This of a fine green, are oval, and dispersed by isees. them. When it has reached the topmost branches it descends perpendicularly, and as it continues to grow extens frons tree to tree, until its variour gilis interace the grove like the rigging of a ship. The stems or trunks of this Vine are tougher and more flexible than Willows, and are from 50 to 100 fathoms in length. From the fibres the Indians manufacture baskets of such close Goosebers to hold wat 9 feet high, of excellent flavour. In wandering through the woods last autumn twelvemonth with a companion we came opposite Downton Castle, the residence of the late president of the Horticultaral Socity, and were beyond measure struck with the beauty of the wild Clematis and the Virginian Creeper, which mingling together ran up from base to battiement of the left wing of the castle ; the rich heary masees of the Clematis contrasted most beautifully with the deep crimson frost-tinted leaves of the Virginian
contrabo Now, it thus Viue trom the Rochy mountanh
could be introduced into England, would it not beaddin
another must vigorous and, I should think, most cer another must vigorous and, I shouid think, most cer
tainly a hardy climber to our list, with its splendi large crimson blossim? What an excellent effect
would have on building or tree! I once before sa would have on building or tree! I once Lefore saw
near Ludlow a wild C'emat's running up a Spruce Fir that had been shredded up all but the head. climber was one mass of blossom, broad at the base, but gradually tapering as it ascended the tree; the dark, but nothing like the superb effect the light green had resting on the crimson. Pray excuse this long epistle. Of course the Clematis was in full blossom at Downton at the timie mentioned. F.N., She ewsburyy. We have no faith in travellers' tales of Vines with six petale, and wonderfully good wild fruite. It is astonish-
ing to see how small the they are put to the test.]
Diosconece Batutus.-From experiments that have been made, and the specimens produced at the Horticultural Society's meeting of this root, it would appear that it is quite hardy, easily cultivated, a ad that occupies but little space in the ground. I therefore think on that account, as well as from the circumstance of its being apparently very prolific, that it is likely to become hereafter, if not exactly a substitute for the the feeding of cattle and pigs, and consequently its exthe feeding of cattle and pigs, and consequently is exI received two small roots of it from Messrs. E. G. Henderson \& Son, but, from what cause I cannot tell, did not nieet with the same success as you mention others to have done. One of these I planted about the middle of March in the open ground, the other in a araall pot, and then placed it in a cold frame. The up towards the end of April, but it was cut down by vegetate, nor could I in searching it did not again time after discover any vestige of it whatever. The one in the pot, when it had grown to the height of about 3 inches, was transferred without disturbing the soil into a much larger sized one, where it did not make a
greater progress than an inch or two more in height, and it now rernains in the frame with its leaves all turned yellow. Will you inform me whether I ought to allow it to stand just as it is during replanting pext March? Also, in the event of my then cultivating an increased number of roots what is the proper depth to place them in the soil, they may be treated like the common Potatoes with regard to manuring, earthing up, \&c., and what height the stems usually attain? There is one thing I confess pomewhat puzzles nie to comprehend, namely, that if room to swell to such an enormous size as has been represented? Do the roots or fibres, then, extend to $a$ great distance on either side of the row, instead of along the rows I should imagine will require to be several yards separate from each other when the crop is cultivated in that form. J. H., Whitland. [The tubers do not swell to an enormous size; quite the contrary; only on long and slender. Plant exactly like Potatoes, level after setting. We should take up the root and replant next March.]
Fount having been travelling in Switzerland I have placed for the present in a pan under a giass in a cold room. Many of them having lost their fronds and throwing up young shonts which are weak and watery, as it would do no good to shorten them like another plant, would it be best to let the weak shoots grow or to cut them off close, so as to force the root to throw up fresh shoots? I would also ask whether the rough outside husk of the Cocoanut could be mixed with advantage with the peat soil under' a glass case. Filix. [Keep thena cold for the winter, and in spring they will sprout of themselves unless they are d
Iris reticuluta.-A correspondent asks in your impres sion of the 15 th ult. whether this cau be procured any where. I obtsined it this sutumn from Messre Rollisson, but the plant, if true, certainly does not correspond with Loudon's deseription of it. He says it is only a quarter of a foot high, but the plant I received is a foot at least. I should be glad to know whether you think I have the true plant, which, I understand, is the best of the genus. A. R. [I. reticulata is a bulbers species, with rush-like four-cornered leaves, ofter a foot long. The flowers do not rise half so high. It is a charming plant. There are figures in the Journal of the Horticultural Society, Vol, IIL., p. 166 ; and in the Motanical Cabinet.]
Miscellaneous about Ti ees.- It may have been obliable to split their bart a short diatance abore the groand, and thereby to cause a wound which takes a long time in healing, though the bealth of the tree does not seem to be materially affectod by it. Such is the and Cryptomeria japonica. In one young empervirens former species a considerable lump of waxy or gummy former species a considerable lumap of waxy or gummy there the bark has beeu lifted up by it, and the secrenatural healing process it is perhaps not nafe to remore
hardy Bamboo? Is it Arundinaria or Ludolfia glaucalled in France Mart n See to be had in England, and what is its quality? [It is a crisp winter sort of no value
here.] The Olea japonica of the Horticultural society's Garden is what comes as Olea excel-a from Mateira. Is not Maclura now to be had by the inundred for maiing
hedges, and where is it sold? [By all nurserymen of note.] Has the heautiful blue of the fruit of Jlomnina would alkaties have an effect in fixing it so as to prevent its fading? [Don't bnow.] A letter from Baron Jemale bearing-but before me, mentions a Ginko female bearing- out not ripening- 13 fruits in the
Viema garden. Has it ever done so here? [No.] He also mentions a Gypsophila paniculata from the Levant as a substitute for soap used for washing wool, shawls, and lace; is that generally known? [Yes, A Aster Carolinianus, a very remarkable departure from '
common run of Asters, is about to flower with me ; seems according to Loudon and Sweet that there exists no figure of it. N.B. It has been here about 16 years without showing a bud until this season. The Turkey Oaks have borne a vast quantity of acorns this autumn. I have been led to compare the varieties, which seem ndless, including Lucombe Oaks, \&c. I think I can distinguish the following:-1. Nurmal Turkey Oak: leaf jagged, stem straight, branches horizontal, leaf Leaf regularly and largely indented, handsome foliage
9y. austriaca? 4. Very irregularly sinuato-lobat
luxuriant foliage. 5. Aimost evergreen, stem straight branches thick or ascending, maling a fine head; handsome tree. 6. Leaves as No. 1, branches spreading close ; habit like Q . pedunculata. All these have mossy cupped acorns. No. 3 may possibly be called a Lucombe Uak of the old original batch. The common Lucombe of 40 to 50 years ago is very different, and seems to bear acorns sparingly. The so-called evergreen Lucombe of 15 to 20 years ago is no Cerris at all (save in leaf), and bears amooth cups like an Ilex. S
Cross Breeding. - I have been lately collecting all the evidence which I can get from the observation of others and ny own, on the natural crossing of varieties of is curiously conflicting, lut preponderates anainst their ever crossing without artificial aid. I should esteem a singular favour if any of your correapondents would give in your paper or send me any evidence showing ither that Leguminous crops, when grown close together, do sometimes cross; or, on the other hand, that they may invariably be grown close together without any chance of deterioration. Charles Driwin, Down, Bromley, Kent.

## Baripties.

Linnean, Nov. 18.-Prof. Bell, President, in the chair, A. B. Cooke, Esq., R. Garner, Esq., J. T. Law, Esq., and P. L. Selater, Esq., were elected Fellows. The following papers were read: 1. "Description of a new species of Draparnaldia," by J. B. Hieks, M.D. This plant, which Dr. Hicks first found two years since, and again in the present year, he names D. cruciata, from the cruciate arrangement of its parts. The frond is 3 to 4 inches long, light green; its branches proceed from the main filaments at right angles mostly in whorls of four, placed crosswise ; and the ultimate tufts of branchlets also grow in a cruciate manner from the branches, and bear ciliæe of extreme tenuity and length. The filaments are invested with a mucous layer. The plant is met with in the streamlets issuing from some of the bogs of the New Forest, and grows attached to sticks and stones. The paper was aceompanied by
drawings. 2. "Note on the Palm tree of Timabuctu," by Dr. Seemann. After remarking that the species of Palm which grows at Timbuctu had till now remained a botanical enigma, the statement of its being the Cocoanut Palm being obviously open to grave doubts, Dr. Seemann states, that from information afforded him by Sir H. Barth, together with the descriptions contained in the letters of Dr. Vogel, he had reason to believe he had correctly determined it to be the Boraseus? æethiopicus of Martius. This Palm, it appears, is difused over the whole of Central Africa, and forms extensive forests, especially on the banks of the numerous lagoons. At a distance from such waters it is only found isolated; and sometimes is met with in company with the Date and the Doum Palm. The trunk is about 2 feet in diameter, and according to Vogel 40, Thonning 60-70, and Barth 60.80 fee high, undivided and unarmed, and Barmounted by a mas

## nificent crown of fan-shaped leaves 5 to 12 feet in diameter. These leaves, like those of other Palms,

 diameter. These leaves, he those of other Palmsare usod for thatch and for making baskets, mats,
hats, and other articles. It produces large bunches of truits which are nearly round, about as large as an ordinary Melon, each 4 or 5 lbs , in weight.
These fruits have three seeds surrounded by a fibrous husk containing pulp, to obtain which the natives The seeds are then planted, and in about a fortnight young plants have sprung up, and these believes that a kind of flour called "fidogma" is also derived from their roots. The albumen of the seed, when soft, is eaten. "It is curious," observes Dr. Seemann, "to find this Palm applied to the same uses n Africa as its congener the Palmyra (B. flabelliformis) fruit, the eating of the young seedlings, and the preparation of a lind of flour." Though there is nothing peculiar in the mode of eating the fruit, there is in the fact of eating the seedlings, aud it is a curious specula tion whether this idea is of native growth or has been derived from the East Indies. Though not inclined to Seemann thinks thach credit for inventive genius, Dr to them - for, he adds "if the applications of this Palm had been adopted from the Palmyra, it is not likely that the most useful one of them, the extracting of toddy for making wine, vinegar yeast, and sugar, wonld have been overlooked. But neither of the B.? æthiopicus, nor of any other African Palin do we find it recorded that they serve for that purpose; all we hear is, that the Date tree in Northern Africa, after the heart of its leaves has been cut out, accumulates a thick sweetish and refreshing juice of a slightly purgative tendency; and that the ancient inhabitants of the Canary Islands, the Guanclies, knew how to prepare from it a beverage which replacer the Grape wine, and also vinegar, honey, and sugar." The extracion of toddy seems to be peculiarly Asiatic. In America it is entirely unknown, the so-called Palm wine not being obtained by means of the spathe from a living tree, as in the case with genuine toddy, but by a hole cut under the crown of a tree previously felled. Both Africans and Amerieans kill the tree, the sap of which they procure, the former by destroying its
terminal bud, the latter by felling its trunk; only the Asiatics preserve it, merely cutting its spathes, and allowing the juice to ooze out through the wounded parts." instead of carefully husbanding them as in the other which furnishes the reason why Africa and America never have produced, and as long as the present process is continued never will produce any Palm-sugar, "of which Asia sends to Europe alone more than a hundred thousand tons annually." 3. "On the previously unobserved, Occurrence of certain Fungi in and near London," by the Rev. J. M. Rodwell. The authoz states that he has found the rare Agaricus ulmarius finely developed on the trees in St. James's Park, in the Green Park, and also in Gray's Inn Gardens; James's Park and Kensington Gardens; and of Fistulina hepatica at Highbury ; and he suggests that it may be due to the greatly increased purity of London air iu consequence of the reduction of the amoke nuisance that these fungi have made their appearance in the places mentioned. In St. James's Park he also atates that the usual Aregmas and Ecidia are to be found, but these also he has never seen previously to the present year . "On the Nature of the Cor,nal Scales in Saponaria, by M. T. Masters, Esq. The author considers that the organ consisting of two abortive stamens united. In some young flower-buds of a semi-double variety of Saponaria officinalis recently examiued, the scales were in some instances found completely divided into two strap-shaped bodies, standing quite distinct in front of the petal. In one case, the scale single below was bifurcated above, each subdivision bearing an anther, and several similar scales were found adherent to the claws of the petals. There were also numerous cases showing an intermediate condition between the ordinary scale and that of two distinct stamens. From these observations Mr. Mastere concludes that it is fair to infer that the scales on the petals of Caryophyllese are cosposed of two abortive stamens united; and in consequence that these bodies do not constitute any rea exception to the laws of alternation. The flowars of this Saponaria also afforded instanees of both marginal and free central placentation.
Empomological, November 3.-W. W. Sannders, Eaq, F.R.S., \&c., President, in the chair. Mr. Sannal Stevens exhibited a specimen of the Chinese Wax
insect upon the twig, recently received from Mr. Forture, and Mr. Bowring stated that the Peln Wax was used by the natives for coating their ordinary candles so as to give them a hard surface. Mr. Stevens also exhibited the larver of Noctus Ashworthii and those of a moth still intesting a bottle of Liquorice powder produced at a former meeting of the Society. Mr. Augustus Shepherd exhibited specimens of various rare moths taken near Brighton, including Acronycta alni and Phibalapteryx gemmaria. Mr. Saintor Cook, including some rare moths taken by Mr. Hitellina and musculosa ogophora empyrea, and Cucullia Verbasci; also the extremely rare beetle Uleiota planata, takea under the loose bark of Lime trees, and also a remartalk
from China. He also stated that Herr Dohrn had in-
formed him that specimena of the singular blind beetles from the caves of Carniolas (Leptoderus three species, and Drymeotus Kovacsi), were now to be obtained at the price of 3 . Mr. H. Adams exhibited speci fasciolatus, Trechus nanus, and Drypta emarginata, and slarva which was supposed to be that of the last-name beetle. Mr. Foxcrof exbibited some of the rare species of Lepidoptera captured by him during his ex cursion to Scotland in the past summer. Mr. Bowring
exhibited a monstrous specimen of the Chinese Cybister limbatus, a water beetle which still retained the head of the larva, and Mr. Westwood stated that mimar instance had occurred in the butterfly Nymphalis Populi described by M. Wesmael. Mr. Gregson exhibited Coleophora Vitisella and the case of its larva, of Pieris Daplidice neor Glagoow. Mr. read a letter received from Mr. Wallace, dated from Lambok, near Borneo. Insects were so rare in this island that during two months he had only captured apecies of beellapeuyres of a Ceylonese. Thwaites catching its prey. The secretary gave notice that a among the members.

Tisits to Remarkable Places: Old Halls, Battle-Fields, and Scenes illustrative of Striking Passages in English
History and Poetry. By William Howitt. With upwards of 80 highly finished Wood Engravings,
New and cheaper Edition 2 rols, 8 vo, price 25s. Longmans.
Two beautiful volumes opportunely produced, and admirably suited to box-giving Christmas. The author visits and details with his acknowledged talent many of
the more remarkable places in England and Scotland, the more remarkable places in England and Scotand, traditional histories, in sid of which he has enlisted art, and so presented the reader with as complete a sketch of the scenes before him as any general reader can
deaire. Penshurst, the ancient seat of the Sidneys; the deaire. Penshurst, the ancient seat of the Sidneys; the
Field of Culloden; Lindisfarne, Flodden Field, Bolton Priory, Hampton Court; the singular old Mansion ompton-Winyates; Tintagel Castle; Staffa and Iona; the Battle.Field of Edge-Hill; Winchester ; Priory; Lumley Castle ; Lambton Castle : Jarrow Hilton Castle, with the singular history of Stoney Bowes and the Countess of Strathmore; Brancepeth and Raby; Seaton-Delaval, and the Delavals; Morpeth and Mitford; Warkworth, Alnwick, and Bamberough ; Hermitage Castle and its traditions; Keeldar Castle and Dilston Hail--these are a few of the curious old places which the author has charmingly illustrated. The work is upon the plan of Walter scott's popular Border antiquities, and we do no injustice to that great name wheu we place
these volumes of Mr. Howitt on the same level as his.

A Manual of Iomestic Ecrnomy suitted to familics
spending from 1001 oto $1000 l$ a a year. By J. H. Walsh, spending from 1001 . to $1000 l$.
12 mo . pp. 736 . Routledge.
If we are to believe the clever housekeepers to whom we have shown this book it should be just what they thing with which the inexperienced have to deal. Aud in fact in 730 closely printed double columns of small type the author has collected infcrmation upon all type the nuthor has collected information upon all
manner of sut.jects-as a few of the titles of his chapters indicate. Firstly we have house building, with the prices of masons', plasterers', bricklayers', carpenters ${ }^{3}$ work; plans of houses, and cost of all sorts
of furniture, from gas fittings and table lamps down to pots and pans. Then come servants and their wages, the daties of employers and servants, and the laws which regulate such matters. Next in order is the way of choosing what is to be cooked or consumed, mutton and After this we are trocery, bops, wow to ourselves in health, how to cook our food, and not to be so absurd as to fancy that French cookery is better than English. Towards the end of the volume we are introduced to the nursery, the lying in room, the sick room, and a drugs. What more can we say ? except that the author has been "assisted in various departments by a committee of ladies" and that the volume "is illustrated ty more than 200 wood engravings." If we were to offer too much in the volume, that its prices are likely to mislead, for nothing is more fluctuating than price, and that at least the chapter on drugs ought to have been omitted or greatly simplified. Imagine an author gravely advis:ng the purchiaser of medicines for domestic
use to supply herself with Bucku leaves, Cascarilla, use to supply herself with Bucku leaves, Cascarilla,
Catechu and the like. If this is not book malking we do not know the meaning of the word. However the volume is well got up and cheap.

## Garden Memoranda.

Biddulpeg Grange, the residence of James BateMan, Esq-Concludedeis from $p_{0} 5766$, - The last and most necemary to give any description, is the Chinese garden,
which stands neariy in the centre of the grounds, being surrounded by the terraces on the north, the Pinetum larger piece of water to the west, and, more immediately to the south-west, the rocky glen so lately described.
This Chivese garden is approached on the one side by This Chinese garden is approached on the one side by
steps and a steep iucined plane through a rude cavernstitps and a steep iucined plane through a rade caveni-
like tunnel, which conducts to a Chinese temple overhanging the "ater belonging to this part ; and, on the oner side, it is entered from the eastern terrace, or
from the lower terrace, through a very well-arranged from the lower terrace, through a very well-arrauged courses that the visitor will now be supposed to take.
The root-garden, or, as it is here called, for want of a better term, "the Stumpery," consists of a very picturstumps of treesof 8 or 10 feet on either side of a winding and rapidly descending walk. They are so irregularly arranged as to jut forward in the boldest prominence, and even to e uvited into a rustic arch in some parts ; while in others they recede far enough to allow room at their bulbs, or miniature shrubs.
Mr. Bateman has been singularly fortunate in procuring a quantity of the most guarled, contorted, and varied masses of wood imaginable for this purpose ; and they are joined together and disposed with consummate
art. The blocks being all of Oak, too, they are likely to be very durable. Over considerable portions of the whole, masses of Ivy, Virginian Creeper, Cotoneaster, and other trailing plants scramble about in the wildest manner. And the interstices, as well as the open spaces
now and then occurring at the base, are all used for the now and then occurring at the base, are all used for the group Fo some characteristic and interesting phei or the Hellebores, which are among the earliest of the winter-flowering p'ants, are clustered in great variety. Then follow the Anemones, Epimediums, Scillas, Dog tooth Violets, Lulies of hie valley, sc., each kind is desirable for it, and all being intermingled with Gaultherias, Pernettyas, Cotoneasters, Savins, and such other dwarf evergreens as serve to produce a sufficiency of green clothing at all seasons of the year. Even the rarer hardy Orchises, and the Cypripediums, have an appropriate corner assigned to thena, and seem quite at home in it.

Among the Hellebores, H. lividus is remarkable for its large thic evergreen fuliage, which resembles that of a Mahonia, and possesses a very decided character E. rubrum is E. rubrum is the most slowy. Tiarella cordifolia is pretty little trailing plant with the appearance of a
Saxitrace, which clothes large patches of roots. Spirzes Saxitrage, which clothes large patches of roots. Spirsea
venusta, with its stately habit and fine rosy flowers, is a venusta, with its stately habit and fine rosy flowers, is a
handsome herbaceous ornament to this part, Actoa spicata also forms a noble feature of the same class and standard Cotoneasters, with fine drooping heads, have a happy effect at somse of the salient points.
Descending through the root garden, the transition to the Chinese department, which first begins to be marke d by the use of rocks instead of atumps for sustaining the banks, is gradual and easy. But before the level of the
loner ground by the Chinese poul is attaincu, a general view of the principal features of this curious scene opens upon us, and embraces all the more noticeable objects. beyond the primary of this singular piece of landscape, rous Chinese and Japanese hardy plants with which our cardens abound appears to have been the representa thon of one of those eccentric and somewhat grotesque efforts of gardening art in which the Chinese are said to indulge, and some crude idea of which has no doubt been familiar to every one from childhood, in the old Willow-pattern dinner plate. Iuto a marvellously small area, the Chinaman delights to crowd his miniature models of mountains and lakes, bridges, and other archi-
tectural embellishments, and to furnish the whole with tectural embellisiments, and to furnish the whole with
his stunted and crippled trees, or with those exaggerated trainings after pictureqqueness exhibited in to little decrepid and half dead trees, or other deformed and monstrous vegetable objects. With his puny fort quainspect-tower crowning one of his tiny hime, and his quaint covered bridge and cosy pleasure house to securely at ancher herobably dreams that he has created a prodigy of art, and adds large dragon-shaped flower beds, and other equally harmonious details, to cumplete the scene
Must of these curious features have been aptiy gardut and embodied hy Mr. Batemall in his Chinese garuen; and there is a good deal of artistic grouping, walis, temple, bridge, \&c. But the most important eff.cts are produced by clustering together masses of spiry plants, such as Irish Yew, or plants with a dis inct colour, as Golden Hollies. A separate little dell covered with tufa, various trailing and other plants clcthing these banks, for the reception of all the chrice and new varieties of Moutan Pæony, which will here have just the amount of shade, protection, and other
conditions proper for them, and which, when in bloom, conditions proper for them, and which, when in bloom will no doubt be surpassingly handsome.
In another part, on the north side of the pool, there is a straight prece of terrace walk, entered upon through a characteristic arch at either end, these arches being flanked with low walls towards the water, and connected by a wall of a regular curve at the back; the recess
thus formed affording space for some singular flower
beds, partially filled with coloured sands, while the beds, partially filled with coloured sands, while the wall is used for such plants as are of doubtful hardihood and the border in frout of it for tender herbaceous an bulbous plants requiring sheiter. Rude blocks of stone are placed at regular intervals in the coping of this
wat weent them, on a bank behind, are fine plants of the Chinese Arbor-vite.
As it will be imposs ble 10 convey a full description, in writing, of this unique region, only a few of the principal plants in it will be noticed. The Cryptomerias are in admirable bealth and verdure on a north bank, and there is a peculiarly Chinese specier, called $C$. Dana looking as ragged and dwarf as even a Chinese could desire. Woarnum plicatum is quite hardy here. There is a perennial Heracleum, with the habit of H. giganteum, which is very bold and effective. Griseinia hittoralis is anw dwarf evergreen, which has proved hardy. The charming little evergreen Azalen amoena is also hardy, and exists here in a large patch, which is covered with rosy flowers in spring. Azalea pontica is used in quantity, bor its showy orange flowers, and the rich tints of its foliage in autumn. A mass of purple-coloured foliage is procured by the Purple Beech, Nut, and Elm; and, white foliage of Amygdalus incana occars. A large group of the various apecies of Funkia occupies a prominence near the foot of one of the mounds, and both leaves and Howers form a conspicuous object. Mere is reat character, too, about a mass of different species
Yucea. Tree Ivies, with a few golden-leaved kinds interspersed, compose another large irregular cluster
The principle of grouping, for the sake of obtaining distinct masses of colour or form, is carried out still more extensively in this department than in the rest of the grounds. It includee, besides the plants already enumerated, quantities of Aucuba, Pyracanths, Pyrus japonica, Thuja aurea, Weigela rosea and coreensis, Anemone japomien and Gordon's hybrid Anemone, Japan Lilies, Chinese Junipers, variegated Cupressus thyoides, and inany other sorts. Where any particular character in regard to form alone is sought, such things as the upright or fastigiate Thorn, the American Weeping Sophora ian eeping penula, and plants of similar or different habits are employed.
Some of the more noticeable among the species remarkable for their individual peculiarities, are a largeleaved Holly, like Ilex latifolis, but with much thicker foliage and a denser habit. It is growing against a wall, and is called I. Taraja. A variegated variety of Acer Negundo has an unusual degree of whiteness about the leayes: it was obtained from the Continent. The neat little Deutzin pracils, so familiar in the decoration of greenhouses, stands out here entirely uninjured. Rubus nutans, a thoroughly trailing species, is usefur for cover ing banks, especially as it does not extend itself beyond a reasonable limit. Polygonum vaccinifolium is a very pleasing trailing plant, covering large patches of ground and loaded with its sp:kes of pretty pink flowers all through the autumn. Spireea callosa is somewhat like s. bellia, but with a stronger habit and finer heads of flowers. The stately Lilium giganteum, at least 9 or 10 in height, has the tropical appearance of a Canna Laurus regais is a somewhat new kind of sweet Bay with an exceedingly powerful odour. Garrya macro hyllis, which is a noble evergreen, was growing withou even the protection of a wall. Piptanthus nepalensis here assumes a vigorous and compact habit, and is valuable for its deep green foliage, which hangs on very late in the autunn. Taxus procumbens, a dwarf spreading kind of Yew, resembling the common species in everything but height and form, is a plant too little known, and has great merit for clothing banks, or for undergrowth. The Assam Tea, the Chinese Orange, and numerous other inhabitants of China and the East, have warm and sheltered corners duly prepared for them. And so rich is this garden in rare and curious plants, that it would require much more space than can be sllotted to the subjeet to notice their various charac ter:stics and merits.
With the mention of one ingenious expedient for masking the overflow to the Chinese pool, this account -so unavidably extended -mat bo blose. It is a matter of common observaion that the contrivances for concealing the exit drain to any piece of
ornamental water, and for preventing leaves and other ornamental water, and for preverting leaves and other floating refuse from entering the draim, are of the clumsiest and most inefficient description. In Mr. Bateman's pool large masees of rock, and single blocks, are tastefuily thrown out into the water in front of a bank of rocks, and one of these stones is hollowed beneath so as to overlie the pipe which carries off the surplua water. The edges of this stone rest upon others below the water, and these lift it just sufficiently above the overflow pipe to enable the water coll a free escape Hitherto the plan bas answered perfectly.
The abeence of any distinct kitchen garden, and of all rit-houses and plant-houses beyond the small conservatory, is accounted for by the proximity of Knypersley Hall, the seat of Mr. Bateman senior, where everything f the kind exists in abundance, and from whence the Camily at Biddulph Grange is supplied.
It remains only to observe that the difficalty of describing a place which is so full of intricacies, withou plans or illustrations of any kind, has been strongly felt ; and the writer is conscious that, in aiming to convey
a distinct impression, he many have stumbled on undue
prolimity. There is very much abmut these gamens, it was impossible a leguntely to represent within reasonthese articies do not contain the unal delineations of these articies do not contain the u-ual delineations of done hy Mr. Bateman is approved and praised, it must be noted that the writer has purposely adopted the critica principle of pointing out only those things which, for It is proverbially easy to find fault, and, generally, com paratively usele:s as well as ungracious.

Undoubtedly the chief defect of the place is the exces-ive multiplication of parts, which breaks up the Whole area into suall portions, interferes with
unity and connertion, and produces, in some degree, a want of breadth and reposs. For thas, however, variety and distinctness of the numerous departments, and the greatly superior interest that thus attaches to
an examination of the place or a residence in it. The relative desirableness of a large open area, with a few a nor nate - ite scenes, or me minutely subdivided like Biddulph Grage, must consequently depend very much on individual inclinations and taste. Elward Komp Landscape Gardener, Birkenhead Park.

## Hiscellaneous

Liquidambar styraciflua, commonly called Sweet gum (says Dr. Wright in the American Journal of Medical Scieuces), is indigenous to nearly every part of
the United States, and constitutes one of our largest forest trees. When an incision is made through the wark of this tree, a resinous juice exudes, which possesses an agreeable balsamic odour. When this substance first exudes, it is of the consistence of turpentine, and posseswes a stronger smell in that condition than it does ments made by Wood and Buche in their Dispensatory, this tree furnishes a considerable quantity of resin in the Middle States, particularly in the States of Ohio Indiann, and Kentucky, brdering on the Ohio River It is amuully collected in those States, and sold under
the name of gum.wax. It is a much more agreeable masticatory than the Spruce-gum, and is chewed in the West by nearly all classes. Ry proper incisions, one
tree wiil yield annually about 3 llss of the resin. The chemical composition of the specimens collected in this latitude correspond with that given by M. Bonastre of specimens gathered elsewhere, viz.: benzoic acid, distillation and ether, an oleo-resin, a principle insoluble in water and cold alcohol, termed styracine. The bark of the tree contains tannic and gailic acids, to which its
astringency is due. What I wish more porticularly to astringency is due. What I wish more particularly to call attentions to is the employment of a syrup of the
bark of this tree in diarrhees and dyseutery, and more especially the diarrhoes which is so prevalent among children during the summer montis in the Middle States, and which frequently terminates in cholera syrup is that given in the United States' Pharmacopæia for the preparation of the syrup of Wild-Cherry barre, of which the following is a copy, the Sweet-gua bark
being subistituted for the Wild-Cherry bark:-"Take of Sweet-gum lark, in coarse powder, five ounces; sugar (refued), two pounds; water, a sufficient quantity. Moisten the bark thuroughly with water, let it
stand for 24 hours in a close vessel, then transfer it to stand for 24 hours in a close vessel, then transfer it to
a percorator, and pour water upou it gradually until a pint of filtered liquor is obtained. To this add the sugar in a bottle, and agitate occasionally uutil it is dissolved." The dose of this syrup for an adult is about one fluid ounce, to be given at every operation, as long as the operations this medicine possesses is that of havivg a pleasant taste, and of being retained by an irritabie stomach when other substances are rejected. Children never object to it on the score of kad taste. Pharmaceutical Journal.

## Salendar of Operations

(For the ensuing week.)

## plant department.

Conservatory, \&c.-In changeable weather like the present this structure will require very careful manage-
ment. The best plan is to keep as low and dry a ment. The best plan is to keep as low and dry a temperature as can possibly be perane say from $40{ }^{\circ}$ time. In mixed greenhouses see that the young stock of Heliotropes, Pelargoniuns, Cyclamens, and other flowers grown especially for winter as regards watering. This is a good time to introduce the following things into the forcing pit, provided they have received the necessary treatment
through the summer:- Rhododendrons, Azaleas, Persian Lilacs, Sweet Briars, Moss and other Roses, Ledums, Kalmias, Daphnes, Anne Boleyn Pinks, Dutch Bulbs, \&cc. Unless, however, they are in proper trim, it will be labour in vain, and no mode of forcing or form of pit can compensate for this; the great secret of materials, is to keep down accumulating damp and mouldiness by an almost constant ventilation, increasing The linings in order to raise the necessary temperature.
Those who are fortanate enough to ponsess pits heated

Wimeans of hot-water will of course pursue a somewhat taining stores for next summer, and have efficient pro tecting material always in readiness with whic
them wheuever the weather is unfavourable.

## Forcing department

Pinery.-Water plants in pots as little as possible a this season ; where the general stock is grown in thi manner it is a good plan to cover the pots over 2 or
3 inches with the plunging material ; where the bottom heat will permit that to be done it obviates the necessity of watering so frequently, Vineries
-Use fire-heat sparingly in houses where the fruit 8 ripe, but sufficient must be used to prevent the moisture of the atmosphere being frozen to the
class inside the house, for if this is allowed to lappen the moisture on thawing is liable to drop upon the bunches, injuring the bloom and causing the berries to decay. Admit air on every favourable opportunity, and examine the bunches often and carefully, вo as to make sure of removing decaying berries Where forcing is fairly perceived that they are affected Where forcing is fairly commenced be careful to main taiu a properly moist state of the atmosphere, and this
must be especially attended to while severe weather must be especially attended to while severe weather
lasts, particularly where the buds are bursting. The evaporating troughs must be kept constantly supplied with water, and the paths, hed, \&c., should be frequently syringed, and it will also be advisable not to have the tender foliage too near the glass until the weather changes. If fermenting material is used for warming the border, this must be well covered with dry litter to protect it from the frost, and turned ccasionally, adding some fresh as may be necessary to eep the heat in the border regular. It will be adisable, however, to have some dung and leaves thrown ut to heat, as there would be some danger of chilling the bed by turning it in the present state of the weather, and mixisy it with the dung or leaves which had not commenced fermenting. Houses which it is intended o commence forcing the beginning of next month should also have some fermenting materials placed on he borders so as to encourage the roots a little before he vines are excited, which will be of great service towards getting the buas to push strongly and without
loss of time. Strawberries. - Where these must be obtained as early as possible, say by the end of February, lot should now be introduced. Any house or pit will o, provided a temperature of from $45^{\circ}$ to $50^{\circ}$ can be maintained with a moist atmosphere. Let them also Rhubarb may be brought forward in a Mushroom house.

FLOWER GARDEN AND Shrubberies.
Now that the leaves are off the trees let lawns and shrubberies have a thorough cleaning. Examine pillar and trellis Roses, and if the weather is favourable see the soil wants renewing, or the kinds changing. For choice sorts roomy holes should be made capable of containing three or four barrow loads of well prepared soil. Turfy loam of good quality is the chief thing; to his add a portion of rich rotten manure, and if at hand a little sandy peat or leaf mould.
hardy fruit and kitchen garden
Trench, dig, and ridge every spare inch of ground Whenever the weather will permit these operations to be observed in gardens, the soil of which is of a clayey ature. If frost continues, let the manure necessary be wheeled out for the whole of the spring cropping, laying it in heaps either on the spot where it is to be used, or as near as possible to it. What is not required for
immediate digging in should be piled in small mounds and soiled over, to prevent loss from evaporation. Do not uncover tender vegetables after the breaking up of frost until they have become completely thawed, and even then do not uncover suddenly; leave a very light protection on them for a day or two, in order to inure them gradually to sunlight.
state of the weataer at chiswick, mbar london. Frothe week endiag Dec. 4, 185G, as observed at the Borticultaral Gardens.

 papilionaceous flowers ever cross secidentally. The case of the
Laburnumu and Purpe cytisus producing the Cytisue Adami
should be disreyarded, its history being very obscure, and pro-

 explained. It is useless as well as wrong to cintinue the dis-
cllssion.- $H$ asks us to inform him as to the best means of heating a greenhouse under the following circumstances:-
It is to be built against the drawing-room, one window of which Tt is to be built against the drawing-rnom, onp window of which
will open into it, a chininey anywherevisibe would not be
advisabe, and he asks if he could hear it hy a colke fire inside? Whether that would require a chinney? And whether the
fumes from the coke would injure the flowers? To this we
answer certainly they would : and so would answer certainly they would; and so would gas if recourse were
had to it. In short, a good mode of warming very small grees-
 at night with a thick straw mat, or somes such material, which
would keep out severe frost. T . Diammd we must give the
 kuch as are sold by thousands from the Carron and other Hood. I foot in length of such pipe will heat 222 cubic feet of
air $1^{\text {. per minute, when the difference between the pipe and }}$
air is $125^{\circ}$. He reckons that when the external air is at $10^{\prime}$ 200 feet of 4 -inch pipe will be required to heat 1000 cubic feet of air to $60^{\circ}$. In your case we suppose that a double row of
pipes all round would be necessary. Melun Pir: A Constant Peader. One circle of 3 -inch pipes is
enough. We recommended rough slabs for the flooring because they are very cheap. It is thue they will not meet, but by laying straw or turves across their joints the earth of the bed will be prevented falling into the chamber. slate is netween and more expensive, but not better. The space between some water will find its way down into the chamber between the slabs, but rinthing to signify if the turves or straw are
packed closely. The chimney pots should be empiy, and their packed closely. The chimney pots should be empiy, and their
base should be 6 inches above the Glabs, resting on the earth.
 come again as bally as ever. You must invigorate your trees
if the growth of Moss is to be prevented. Aames of Frists:-Fs. Your Auple is the Court of Wick.
asse of Plants. - We have been an often obliged to reluctantly decline naming heaps of dried or other plants, that we venture
to reunest our correspondents to recol lect that we never have to request our corsespondents to recollect that we never have Xoung gardeners, to whom these remarks more especially apply,
should bear in mind that, before applying to us for assistance, thould bear in mind that, before applying to us for assistance, We cannot sare them the trouble of examining and thinking
for themselves; nor would it be desirable if we could. All we for themseives; nor would it be desirable it we could. All we
can do is to help them-and that most willingly. It is
now requested that in future, not more than fowr plants
may be sent us at one time. $-F$. Salvia splendens, one of the earliest irpprted of the brilliant scarlet kinds.t. but we are assured, upon what we believe to be the best authority, that there is nothing deleterious in connection with them If they are properly managed.
Orchids : Flora will be obliged by some of our correspondents informing her whether there are any Orclidaceous plants
sufficiently hardy to grow and flower in a conservatory, the sufnciently hardy to grow and fower in a night.
heat of which is sometimes as low as $45^{\circ}$ at
TrEEL Forks: $W C$. The size of this tool must depend on the Strei Forks: $V$ C. The size of this tool must depend on the
soil it has to worl, and the strength of the workman. Unsoil it has to work, and the strength of the workman. Un-
doubtedly the best size is that with four prongs or tines. But
take care that the fork is steel: we have sean most rascally take care that the fork is stel, we have sean most rascally
tools of thiskind, the tines of which bend like iron wire.
Trawrerires: A Grower will not easily identify either Sir
Harry or any o o cor sort by comparing what he has with
colnured prints; nor is there any such representation of that

re on application, and Mlustrated Catalogue

DRIZE STEAM ENGINE AND THRESHING L. Maciline (Hursars's', Prize awarded by the Royal
Agricultural Society if England, now ready for delivery at
Wr. Drat Co, Warehouseg, 8wan Lane, Upper Thames Street, near London Rifitre.
COLLEGE OF AGKICULIUREANDCHEMISTRY, 38, Lower Kenrinyton Lane, Kennington. near London.
The systen of studies pursued in the College comprises every Engineerlag. Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.
Analyses and Assags of every description are promptly and accurately executed at the College. The terms and other par Mr. Nesbit is prepared to make engagenients to deliver in the country a limited number of Lectures on Agricultural MR. DONNE'S DORKINGS \& BUFF COCHINS few Adult liens to dispose of bred from the Birds which have Won the Silver Cups at Birmingham, Liverponl, and Windsor
Also, Eggs from the best 1)orkings and Cochins will be ready shorty. The sbove Dorking Chickens are the Brothers and Second Prize at Birmingham at the last show; and the EGGS CRYSTAL PALACE.-POULTRY SHOW.-The of POUCTMY, PIGEONS, And RARBITS WIII Iake place on the 10th, 12th, 13 th and 14 th of January next.
The Entries will close on Saturday the 13 th December inst. The Entries Wil close on Saturday thlations, may be had on
Schedules of Prizes, with the Regulation
application to Mr. Hovarros, Secretary to the Poultry Exhibition, Cryst
may be addre Agricultural lipplements. - The Iargest collection of the
best Implements and Machines, by Ransome, Garrett, Crosskill, best Implements and Machines, by Ransome, Carrett, Crosskill,
and other emiuent makers, is now exhibived at the Cryatal and other emiuent makers, is now exhrbied at the Cryatal General Arrangements.- The Palace is open daily, on given) from 12 titl dusk: Admission, $2 s$. Bd.: Children, 18. On other dars from 10 till dusk ; Admission, $1 s$ : Children $6 d .0$.
Crystal Palace Band performs daily in the New Coneert Room. Crystal Palace, Dec. 6.
COLCHESTER POULTRY EXHIBITION. Brembs of Poultry. - The Fouth Annual Exhibition of this Society will be held in the Caqte Bailey, Colchester, on WED NESDAY. THCRSDAY, FRIDAY, and 8ATURDAY, Decem-- Lose on Wennesday, December 17. of Pultry, (not less than ten pens and five varieties,) shown for best collection of Poultry, (not less than six pens and three varietip, ) shown for general competition; A Plece of Plats,
value Five Gulnesm, for the best collection of Poultry, (not less than five pens.) shown for general competition, courributed in this care by Essex or Suffolk Exhibitors ; a Silver Medal, value
Two Guineas for the best collection of Pigeons. (not less than five pens,) will be awnarded, in addition to the ordinary prizes.
Prize Lists, Certificate Form of Entry, \&ec., may be had on application to the Honorary Secretaries, 19, High Street DRIZE CATLLE SHOW OF THE SMITHFIELD CLCR, -The Annual Exhibition of Prize Cattle,
Seads, Roots, Implements, \&c., commenceq on TUESDAY and closes on FRIDAY End Baker Strept. Open ROYAL AGRICULTUKAL SOCIETY OF The GENERAL MEETING of the MEMBERS will be held on $8 A T U R D A X$, Decomber 13, at 1 Of the Council.

## The Agritultural Gasette SATURDA Y, DECEMBER 6, 1856.

A short account of the Midland Coanties Show Birmingham this week is given in another page. We doubt not we shall next week have to refer more particularly to some of the principal animals exhibited when they make their appearance at the Baker Street Exhibition of the Smithfield Club. Among the agricultural events of the ensuing week are the meeting of the London Farmers' Club, when Mr. Thomas opens a discussion on the important subject of crop rotations-the meeting of he Smithield Club and their ann Friday at the Tuesday, Street Bazar-and the meeting of the Society of Arts on Wednesday, when a discussion will take place on the ntilisation of town sewage.
IT is a fact characteristic of many a profession besides agriculture that the man most defective in the theory he may hold, is nevertheless often most successful in the practice he exhibits. This arises either from a false theory being held entirely in abeyance; or, if it be merely deficient, from what is sound in the opinions entertained being energetically developed. Take the relation in which the working man stands to his employer as an instance -how many masters there are of liberal sentiments and large profession in this matter who neverthe less leave their neighbours to themselves-while others, holding, as we believe, defective they believe the best, and effecting great good in consequence. the best, and effecting great good in consequence.
Of the several speakers at the London Farmers Club the other day, when the condition of the agricultural labourer was discussed, we sympathised most fally with Mr. Williams, of Baydon, Wilt-

This we believe to be the true way of treating the labourer. Trust him-put him in the way of working for himself-synipathize with him in all his successes. Having some 10 or 12 years ago let 20 acres to 60 or 70 allotment tenants in Gloucestershire, 40 to 80 perches being allotted to the tenants in proportion to their ability to cultivate the land-the only stipulation being that not more than one-half should be in any year in Potatoes or in corn-and all the conditions as to moral conduct Sunday working, \&c., being well understood without having ever once been made the subject of remark or rule, we can testify from the success of the whole plan to its soundness. Having revisited the place last summer after an ahsence of some years we found better crops of Wheat had been reaped last year than had been ever known before-mos families had three months' bread besides their vegetables from their plots-and it was a common thing to hear it said they would not lose their plot land for 6l. or $8 l$. a year.
Nevertheless look at the patient, laborious, and successful practice of some men, who look with a degree of suspicion on the working man, or if this be too harsh a term, who think that, though there is a possibility of educating him too well, he must be looked after, and tended and provided for We do not know if Mr. Baker, of Writtle, or Mr. Thosas, of Lidlington, will admit that they are appeared to us to think that it was the basiness of the farmer to "form the principles" of his men, and "to give continaal attention to their wants ;"
sentiments which may be considered redundant sentiments which may be considered redundant
rather than defective as regards the theory of the relationship between labourers and their employers. But whatever may be thought of their opinions no one can fail to admire their practice. And Mr. Baker with his cottage building, his evening schools, and even his allotments-and Mr. Thomas with his admirably organised and managed "classes" of boy-labourers-may be safely left in the enjoyment of what opinions in the abstract they may choose to teach, so long as methods so well conceived, benevolent, and efficient are kept by them in operation for the benefit and instruction of the people in their employ.

In a recent number of this Journal we quoted the opinion of Mr. Willoughby Wood on the profitableness of attention to the principles which guide the saccessful breeder of our domestic animals. "In a knowledge of the principles of breeding the agriculturist will find a mine which will repay the working as amply as the chemistry of he soil or the physiology of vegetation."
At the late meeting of the Chemico-Agricultural Society of Ulster, Mr. Andrews of Comber, in his excellent address on the claims of that society to public support, referred, on the other hand, to the ${ }_{6<}$ importance of knowing the principles of cultivation. "Hundreds of pounds a year of premium are apby a few inches the hongh of an ox, or produced in some degree a more rotund development of some muscle which was admired and which no doubt was useful-but the observation he made was that while the breeder who prodaced these bearties in utility and fashion was largely rewarded, a very small sum was considered quite enough to give to those who applied themselves to produce the means by which the animals were supported." The two aspects in which the theory and practice of agricultare present themselves. On
be pitted against each other-they are the parts of a consistent whole. We cannot sell our root crops,
and it is therefore of the highest importance that we should be enabled to consume them profitahly. The cultivator has every reason to thank the breeder and to thank those societies through whose encouragement the breeds of of cattle have been by him so much improved.
Stated positively, however, on its own account and not in depreciation of the ather divisions of Mr. Avdrews said on the primary importance of the art of cultivation and on the first class value of all
such efforts to teach right principles on this subject as the Ulster Chemico-Agricultural Society are kind now existing-and we hope that its labours and those of its able chemist, Dr. Hodges, will not be allowed to drop for want of that support for which Ir. Andrews urged so powcrful a plea.

## His aduress will be found in another column.

TREATMENT OF PLEURO-PNEUMONIA
There are perhaps not many holders of live stock, who being at a distance from a veterinary of skill, do Such are my circumstances, and latterly I may say that this office has chiefly been discharged by myself.
During the present season my own feeding stock, hut more especially milk cows, have been visited with that discouraging disease pleuro-pneumonia. As the remedies I have applied differ in some respects from any I have noticed, and have also been comparatively speaking successful, I seek to explain them in your columns. My feeders are strictly enjoined without loss of time to announce to me any appearance of ailment-a practice I most strenuously advise to any one who concerns himself about the treatment of his cattle, more particu'arly ns revards the disease of which I am epeaking, he chance of su
early application.

The first appearance which arrests the feeder's attention is loss, or partial loss, of appetite. If on examination I detect any of the symptoms which characterise
pleuro, viz., a cough, quickness of respiration, intermittent warmth and chillness of horns, loss of and acceleration of pulse, I proceed at once to bleed till the 6 quarts to be taken. I then give-

Epsnna sults ... ... 8 oz. $|$| Digitalis |
| :--- |
| Flour of sulphiur... |
| idrachm. |

## Spirits of nitre

Tartar emotic ... $\frac{\text { d drachm. }}{2} |$| Treacle |
| :--- |
| Coco-olein |

These ingredients are mixed, and given with plenty Indian meal mixed with a small proportion of Pea-meal. In some instances when a renewal of the difficulty of breathing and acceleration of pulse have shown themselves, I have thought it advisable to repeat the bleeding Tartar emetic and digitalis in the gruel. I think this treatment applicable only to the very early, and on no account to be resorted to in the more advanced atages of the disease.

## I continue to give morning and evening in gruel-

## Coco-otein Spirits of nitr

At noon I give the gruel with the addition of a little sugar only. The doses of sugar or treacle and sulphur bowels sufficiently open. It will be observed that in the first dose I give Epsom salts, on account of their quick action, but afterwards I prefer treacle with sulphur The patient requires watching with the greatest care
the sick room ought to be well ventilated at the top, but the sick room ought to be well ventilated at the top, but
kept warm dand night. A depression of temperature or exposure to draught has been observed to disturb the breathing. When the feverish symptoms have abated, I give oatmeal instead of Indian meal in gruel I continue the coco-olein with sugar or treacle morning and evening throughout, with occasional doses of to the pulse has become feeble and below 60 beats per minute, accompanied by languor and weakness, I have given a wine-glass of brandy in the morning and evening's gruel with apparent advantage. The attendant is taught to offer the animal changes of food, brewers' grains, bran mash, hay, Grass, green Rape plant, on
other palatable material. It is encouraging to find the other palatable material. It is encouraging
animal begin to eat, and make its selection.
The treatment has varied in some respects from what I first started with; towards the commencement I lost two, but latterly and since I have used the precise successful ; out of the whole 14,12 have recovered.
The time they have been unwell bas varied f 14 to 21 days; the healthy metion of the skin has been in a great degree maintained, as I have scarcely observed in any instance that extreme fastuess of hide or staring coat which usually accompanies this disease in its lengthened stage. They have lost in weight to the extent of l ewt. to $1 \frac{3}{3} \mathrm{ewt}$. each. The milk cattle whilst suffering have reduced their yield of milk to 3 or 4 quarts per day, but on their recovery have in a great measure regained this. In no instance have If found a greater

My success is attracting the attention of my neigh only, with success. In ave tried it, each on one animal only, with success. In a future paper I purpose to treat Messrs. Price \& Co. at my instance have pre ment. Messrs, Price \& Co, at my instance have pre-
pured coarse oleiu for catte at a cheaper rate than is used by medical practitioners. T. Horsfall, Burley Hall.

## DIARY OF A DAIRY FARM

noyember and december.
Very little remains now to be added to the information given in previous months upon the management of the dairy, except to attend to the rules already laid down. Great attention must, however, be paid to the late made cheese, for if the frost sets in while it is tender it will prevent its ever becoming firm, and it will run out in the sides and become indented and rough on the top, which of course causes much waste ; however, to be most usefully appropriated by being used for toasting ; the taste is generally mild, and it has been very gad ideed when usen in this way, and generally approved, it being more tender and digestible than ordi-
nary toasted cheese, which often becomes hard from the process of toasting, whereas this never becomes so, and is more like a rich cream on the dish; but there is a greater advantage in keeping it from the imjury occasioned by the frost than in using a larger quantity than may be required for toasting. It may be well to prevent the severe wather from taking effect upon the late made cheese by removing it to a warmer situa tion than the dairy or cheese loft, where it may not be so likely to suffer ; if convenience offers, 2 the andergroun cellar or a room where it may have cloths also may a fe thrown be very desirable. Woolle cloths also may be thrown over the cheeses, or any-
thing that would in some degree protect them thing that would in some degree protect them
from the frost is quite worth attending to, and the quality may be preserved from injury by atten tion to these particulars. The cheese vats should lee well scalded before being stacked away, which should be done in a manner to allow of air passing between them, otherwise they will become mouldy ; this should be avoided, and they require frequently to be examined and upon them, everything requiring to be kept from any used are liable to have the taste affected are
und this is not prevented by proper attention. The cheese cloths should be boiled in sour whey before they are washed to be putaway for the winter ; if there should be any salt left in them this will entirtly remove it, the salt would cause them to become rotten if left in. Butter is usually troublesome to manage a this season. Cream should not be allowed to be chilled at any time before it is prepared for being made into butter, which must at this season be done by warming in a tin vessel placed in a furnace of boiling water; the heat of the cream must be regulated by the weather which, if very severe, will require more heat than if less so, and care and experience is necessary to regulate this as if made too warm, the quality of the butter will thereby be deteriorated. Sometimes dairy cows are allowed to eat Turnips or the tops of Mangel Wurzel at this season, which has an improper influence upon the
butter by giving it a very unpleasant flavour ; this should be prevented if possible, but if this food should be allowed, a small quantity of saltpetre is a very good thing to remove the taste; abont the proportion of effect. It should be put into the cream pau before the cream is poured into it, and then be frequently stirred before it is churned. The milk is now gen:erally from cows which have calved many months, and has some times not that sweetness which it has earlier in the season, therefore it is a sufficient reason for skimming it every 12 hours instead of allowing it to rema:n 24 which is sometimes done, the butter will be the sweete when this plan is adopted. If the temperature of the dairy can be regulated by stove or otherwise, so that the milk may not feel the severity of the season, it will have a very beneficial influence on the butter, both as to quantity and quality

The colour of late made butter may be very materially improved, and the taste will prove to be much iresher and sweeter by adopting the!following recommendation:-The night before the cream is to b churned, take two or three good-sized red Carrots each gallon of cream ; after washing, grate them, an stir the pulp into the cream ; the juice will mix with it, and the pulp will remain in the cloth or strainer whe the cream is poured into the churn. The flavour of butter will be much improved and the appearance changed for the better by this simple and wholesume addition. The Carrot as a colonring is far less expen sive than

The dairy cattie should now get all the warmth and slelter the farm buildings can supply. The oldest cows being generally those which ealve cariest in nex yea shoald now be dried, and these will do wh a libera supply of Oat or Wheat straw, with one bushel of 40 lon of roots given to them, half in the morning and half a night. The younger cows, which are stil miked on for another month or 60 , should during this time get mor liberal fare hay being substituted for straw, cr if no this, double the quantity of roots should be given them, or they 0000 become poor ; and they should not
be allowed to lose flesh before they come to be dry.
Young heifers to calve for the first time next season
vegetable nutrition rear evident that while the laws of plants be supplied with Young heifers to calve for the first time next season
should now get careful attention, as it is very desirable their growth should not be checked up to the time of milking, good wholesome food tending more to health and good growing condition, such as hay or straw, or
both perlaps, cut into chaff and mixed with roots, being better than any meal or cake, as less likely to produce fat, which is not desirable in young in-senson heifers. Cutting dry food into chaff is much the best plan for these animals, as it prevents waste and induces them to eat more of it, as young catte will not, as older cows,
consume the straw whole or uncut. Great attention should be paid to any cows calving now, and shelter Weaning calves should be in the to their doing well, Weaning calves should be in the yards; chaff and roots being their best food, the latter cut fine enough for
their feeding on them readily. Should the supply of roots be insufficient on some dairy farms to give all a full quantity, the weaning calves might have one
meal given of oilcalk--about 3 lbs, a week would be meal given of oilcake-about 3 lbs. a week would be
sufficient-or half a pint of meal from Barley or refuse sufficient-or half a pint of meal from Barley or refuse
Wheat thrown over their chaff, with a bit of salt. It is quite necessary that weaning calves should have warm shelter and divided into small numbers together. It is an old saying of men of experience, "That if you have but two weaning calves on a farm you should keep them in two places." It is certainly more conducive to health, not only on account of each getting its proper share of food, but also to hinder their breathing each other's breath, which often oceasions infectious disease, for from their disposition to herd so close together, should one be only a little disordered, and the breath
sour, another catching this might be subject, and often sour, another catching this might be subject, and often
is, to a worse attack, and so infectious complaints are often increased and become fatal.

The year's accounts of the dairy can this month be closed, and the produce of a cow, on an average in a
large dairy, bas yieded at present prices the following amount :-

4 cwt at $6 \mathrm{c}, \mathrm{s}_{\mathrm{s}}$
40 lbs of batte
So lbe of batter (milk and whey) …
A mele keep of a store pig from sour whey

## home Farm Management.-No. Xir.

Practical farmers are still far from being convinced that the application of manures in a fluid form is profitable or can possibly be made so. A more general and economical demonstration of its profitableness must be afforded ere they shall have confidence in the system and be induced to adopt it. It is the interest as much as the duty of the proprietor of an estate to afford on his home farm that evidence of its utility which his conanider require, outlay and at some pecuniary risk. This
con risk is incurred simply because the principles of liquid manuring are so imperfectly understood that it is sesrcely possible to get them put into practice without
some failure being experienced, arising either from miscalculations, or from the ignorance of those intrusted
cone with the execution of the operations. Perhaps the
worst error that can be committed is that of laying down a greater ex'ent of subterranean pipeage than can be occasionsilly kept at work. It was an error of this kind
more than anything else that made the irrigating works at Myremill so unprofitable to the landlord. The interest on the pipes lying anused in more than a hundred acres is something considerable, and at Myremill there was always a large extent of piped land not subjected to the irrigating process. Wherever the system is to be tried at the first. An acre of Italian Rye-grass takes an enormous quantity of tank liquid, and at the first it is much better to have an over-supply of the latter than a
deficiency for the extent of land is is intended to be applied to.
But the question is a natural one-" Is liquid manuring profitable ?" And it may be equally well asked-
"Will good crops pay?" The answer to the first query will serve as a reply to the second. Liquid manuring will assuredly prove remunerative provided it be carried out on economical principles. It is not always the farmer who raises the heaviest crops that has the largest profits. The best returns are usually obtained
in cases where a fair bulk of produce is obtained and a in cases where a fair bulk of produce is obtained and a
strict economy observed in the every day expenditare. strict economy obsarved in the every day expenditure.
There may be true economy, however, in liberal appli cations of both solid and fluid fertilisers. No good farmer will deny that farm-yard manure, guano, bonek, and other enriching substances used in a solid form are sure an most soils to prove faithful in returning their price with liberal interest. And it would be no difficult employed prove that the same feruilising ingredients under proper management. Without attempting to go so fully into the subject as its importance may warrant, I shall endeavour to show nome of the advantages which ought and must resull from manures being applied to the soil in a soluble state. Every one knows that before manurial matters can lave any effect in promoting the growth of plants they must be dissolved-they must, in other words, be converted into liquid manures. This is done slowiy but effectively in the soil partly by rains and partly by atmospheric action. These are the agents provided by Nature for bringing about those changes in
the compesition of fertitising ingredients which are mecesangy to their being assimilated by living plants
vegetable nutrition require that plants be supplied with indicated the necessity for meeting these wants ly effecting certain important changes on the substance aeting Irom no other motives than those which commen sense may dictate, to help Nature in the performance sense may dictate, to help Nature in the performance
of her very important operations? Chenical, pluvial, and atmospheric agents are all capabie of manures that may be put into the Eoil; but if the various processes are to be combined in one, and to be kept completely under the control of the farmer, aust be done Nothing certhinly is easier that this must be done. Nothing certaiuly is easier than to pre-
pare a "soup" suitable for the nourishment of a crop of pare a "soup" suitable for the nourishment of a crop o cereal, a lezuminous, or a root crop it matters little. The ingredients which are known to be capable of nourishing any particular species of plant are put into the tank in The proportions necessary to give a normal produce, and diately begins to act. But it may be said that this is he most direct course that can be adopted to produce plethora and abnormity in cultivated planis. Not at all, nary solid menuring system the dung applied to the soil in one year is intended to last several years-during the whole rotation course. Were that manure or its equivalent in fertilising substances applied to the soil at once in a liquid state the plethoric effects on the immediately succeeding crop might be very injurious for the manure intended for four or five years would in this
case be made to expend its strength in one year. The proper way to employ tank liquid is to use no more at one time than the crop on the land requires. It may even be necessary to divide the liquid requisite
for the production of the season's produce into two ar three dressings. One very obvious advantage result ing from the liquefying of manures is that the solid
fertilisers necessary to oo over a hundred acres of land fertilisers necessary to go over a hundred acres of land
managed on the four-course rotation may be made a suitable dressing for one crop over no less than four hundred acres. In this way the sound commercial principle which aims at speedy returns is brought into play. Instead of manurial ingredients being locked up
in the soil for several years they are at once made to bear a part in the development of vegetable structures, farmer.
It is necessary perhaps to state before going further, that by the term "liquid manure" I mean something more than either the urine of animals or the severely diluted drainings of an exposed dung-heap. The only the of tank-liquid which can be profitably employed in the nourighment of general farm crops is that which as in urine. These may be obtained either from disas in urine, These stall-manure, or from guano, bones, flesh, rapecake, or other matters that may be put into the tank Urine alone will nourish Grasses and produce great ingredients in excess, and is destitute of others which are required to halance with them if a sound produce is
to be obtained, it can only be looked on as an uncertain and dangerous dressing, upless used in small quantities. Another most important advantage resulting from the adoption of the liquid manuring practice, is the facility afforded by the appliances it requires, for dressing bay and other crops that are flagging in conse quence of drought with such water as may be at command. In some dry seasons the saving large part of the outlay on the irrigating works. Then, if from any unexpected weakness in the soil, a crop should seem sickly in the early part of the season, a suitable liquefied dressing will renew its growth and give a large produce, when otherwise it mighthave bees per acre of tankage, pipeage, engine, pumps, and other fittings, may be taken on an average at $5 l$, and this at a rent charge of $7 \frac{1}{2}$ per cent. adds only $7 \% .6 d$. to the annual rental of the soll. Now if we consider the being possessed of promoting the growth of a crop at any time in the vegetative season we may think it needs any time in the vegetaive season we may by that means alone the irrigating process may in many cases be made remunerative. And when we take ino account the enormous benefits which result from the use of
liquid manure in the raising of Italian Rye-grass, the liquid manure in the raising of Italian Rye-grass, the It was ably shown nearly two years ago by Mr. J uhn C. Morton that this crop is capable of affording an extraordinary amount of food for house-fed stocls, and that the only means by which it can be grown in perfection is by liberal applications of liquid manures. Mr. Teller, of Cunning Park, has proved experimentally various cuttings, can be talken in one season off land which was originally little else than blowing sand. He uses very large quantities of manures by the acre, but it is because shey are applied in a liquetied state that he gets such returns. Mr. Ralaton, of Dunduff, also in Ayrshire, has increased the aggregate produce of his farm more than six-fold by the adoption of the irrigaing system. And as for Mr. Mechi, he ley to profitable farming.

Did space permit 1 could afford most convincing of empley "facts and figures" of the profitableness Yet I do not expeet the practice will gain favour for a long period with tenant farmers. It is so much more simple to soak up the drainings of the cattle stalls with litter, and requires so much less skill and attention to prepare and apply solid manures that they are not likely to think of, or to adopt the liquefying system. But the fact is nevertheless indubitable that in This syatem we have a germ which with the
thactice of soil cuiture shall oue day rinther racticion dom The time not yet arried bat vill menuredy dom. The time has not yet arrived but will aesuredy stomach shall compel the British farmer to grow double the produce he grows at present And then liquid manuring and the careful use of every pint of city sewage that can be got hold of, will, as matters of course, If laded on all hands.
If landed proprietors wish to set a good example in the use of tank liquid on theer home farms hey ought to be most careful to make it remunerative. Operating on a small scale an inexpensive tank will suffice in the first instance, A singlo action force pump connected with a little air-veseel will be quite capable of distributing by means of engine, water, or horse-power the The land laid acth pipes should be charged with all the sunk and floating expenses that may be incurred in carrying out the operations and credited with the produce. A few years will thus afford convincing prool of the profitableness or otherwise of the system, fruit is if made known to the tenantry will bear its should be laid out under areen crops-s eimilar extent under corn-but the larger part of the experimental field ought to be pat under Italian Rye-grass. To secure the successful culture of the latter crop it is necessary to put the soil into very high condition before three to four three to four busbels per acre is pat into the ground in autumn the young plant will be ready to come away early in the following spring. A ileral areasing sanoul a similar one after each cucting during the season. Even on poor stabborn clays I have seen three to four cuttings taken in the year, and on loamy good soils fire or six cutiongs may be expected.
The first thing in carrying out the irrigating process is to secure a liberal supply of watar. In many cases facilities which may be maturally afforded for bringing it from a higher level. But in other casen it will be necessary to form a reservoir for the eollection of rain water, or to sink a well for an underground supply oither from drains or springe. All this may be done in mere experimental plot is to be attempted, and therefore there can be no good resson for liquid manuring not being pritied gome extent on every home farm in the ary. It to mex ber in the country. It is only by this means that the praclice ir desers 10 every pas their as one of their regular branches of Sarm management.

## Home Correapondence

Hoeing and Cultivating between Rows of Cons in the Early Stage of Growth.-After some years experience in hoeing and stirring between the rows or Whest and other grain, I have been able to form the following opiniun, both as regards the mode of operation and the results to be obtained. I proceed thas with corn that has been drilled, or what is far better, with grain that has been deposited at stated intervals in the rows, in other words, plauted in or dibbled with a very small iron rod, for the plants or stools of two or taree logether not only grow in the natural circular form, and throw out short stems before winter (if planted enrly), but the intervals admit of the rows being hoed across, which I conceive to be of equal importance with the usual method of hoeing. As soon as the and rure sumer the surface to cause the soil to be mellow, and if the plants be high enough I earth them up slightly; this is of great importance, as the earthing up induces the plant to throw out fresh roots, and very stout ones too, above the first roots; this tends to cause eariy tillering, and at the same time it strengthens and stays the plants when they have afterwards to contend against violent winds and raing. This. hoeing likewise cuts off all young weeds which have just commenced their growth. I boe sgain before winter (for I seed early in September), and raluer deepor this time, so as to cut the roots and excite the plant to
tiller, for I prefer the plant to tiller well in autumn and avoid this operation as much as possible in spring. I now leave the crop alone till the following year, when I hoe again, bat this time not deeply, for if at this season you hoe and stir 2 inches deep you cut the roots of the corn, which excites the plant into action and causes it to tiller afresh (I do not mean to say that the plante will not tiller on the approach of warmer weather, but if you do aot cut the roots they will not do so to the same extent), quence hate stams that have been tirown out ia conso the sample beopes nerens and the othes cars suffier; besides that, if it be Wheat, the firm bed in which this
plant delights will be disturbed. By the two former lavings the weeds will in a great measure be eradicated,
still there are always plenty of weeds in spring; but this last hoeing is chiefly to break the crust and open the channels of the soil, allowing the air and dews to penetrate. Now these three hoeings come rather expensive if done in the usual manner, but the expense by the crop, but I know of no hand-hoe, ex cepting the one I am about to speak of, which will do the work as I should wish to see it done. A man,
generally speaking, is obliged to work too fast to do the work well, and as he often treads on the weeds after they have been cut off, they take root again; at any rate be presses down the soil with his feet, which anstead of being left open and mellow to admit air and dows, is again closed up. My idea of a hoe is, that a man should have it entirely und an inch lie should be able to do so, or 1 inch or 2 inches; and also, ex cepting by great carelessness, he should be unable to thoe up a single plant, and that he should not tread on a weed after it has been cut off; also that the soil should be left open and mellow, and above all that he should be able to hoe one acre a day. Such a hoe I trust have invented, and if any one wishes to see it he can do so at 223 Stand, Smithfield Show, where he will see other original inventions. Sigma.

Large and Small Potatoes as Sets.-With respect to planting large Potatoes close in the drills, and giving the greater distances between the rows, I willingly give way to Mr. Knight's opinion as stated by "J. T." in the Gazette of November 29. It suits with my genera rule of tillage better than planting them at equal distances each way. But it is not as only regards the advantage of exposure to the direct rays of the sun, which I believe they would obtain either way, but as arlowing, in the greater distances between the rows, a freer paseage of air ; this I consider most essential as affording a more continuous supply of fresh aerial food to the leaves of plants, In rows at narrow distances, and more so in broadcast tillage, more or less stag nation of air must occur, and the plants be thus compelled to re-imbibe the excrementitious matters they have thrown off in perspiration. As the diffased light of the sun appears as effectual to the decomposition of carbonic acid as the direct one, I do not know that it may not be advisable to give the lines of plants the direction of the most prevailing winds instead of that of north and south. I have never planted whole large tubers so near to each other in the rows as Mr. Knight recommends, but I doubt not, in allowing them the greater distance from row to row, from the small leaf and manner of growth of the plant, that it is a plan deserving of all attention, and as productive over wider dropping as he, in his practice, found. If I do not change my mind I will adopt it to some small extent, say half an acre, in the coming summer. I shall take 4 -feet rows, with Seotch Dons or Downs, and as Cabbages are found to answer well in our beds, perhaps try some between the rows; in their young growth they will not check the passage of air. J. M. Goodiff
Thick or Thin Seeding.-Seeing in your Paper that a-discussion on this subject is proceeding, I beg to give you an account of a field I sowed last autumn. The land, a red Wheat with white chaff. The field was sown about the middle of December broadcast, and three bushels and one peck of seed to the statute acre of was then to harrowed in along with seed. The crop did well and proved not at to thick. The specimen I send will show you that it does not appear stunted or ill fed. I do not mean to advocate thick sowing, but the quantity of seed sown is so different from Farmer Newlight's, that the circum stance appears very uncommon, and my crop was no in the slightest way too thick. It obtained the prize a the Hale show held here in the neighbourhood on the if th of September last, so I will leave you to form your own conclusions. No doubt there is much difference to
be observed in locality, time of sowing, nature of soil and kind of seed. It was sown on a poor field, but the ground was fine and well harrowed. Henry Ganthorp, Harnworth, Warvington. [What was the produce per acre !]
Cross Breedin

Cross Breeding.-I have been lately connecting all the evidence which I can get from the information of other and my own, on the natural crossing of varieties of piants. The evidence in regard to Leguminous plants is curiously conflicting, but preponderates against their ever crossing without artificial aid. I should esteem it give in your Paper or send me any evidence showing either that Leguminous crops, when grown close together, do sometimes cross; or, on the other hand, that they may invariably be grown elcse together withou any chance of deterioration. Charles Darwin, Down Bromley, Kent.

royal agricultural of england.

## Monthly Council: Dec. 3.-Mr. Etelyn Denison,

 President, in the Chair.Finances and House.-Mr. Raymond Barker, Chair man on the Finance Committee, presented the monthly report of the accounts of the Society; from which it
5507. Mr. Barker, as Chairman, also read the report Prizes for Essars.-Mr. Thompson, Chairmañ, o the Journal Committee, reported the following wards:

##  mechanical modes of deepening the staple soile. give it the full benefit of atmospheric influence. <br> II. To T. W. P. Isasar, of Terrace Walks, Bath (Land-Sur- veyor): the Prize of 20l, for the best Essay and Plans

Veterinary Lecturis.-Mr. Raymond Barker and Mr. Thompson, as the Chairmen respectively of the Finance and Journal Committees, brought up a jointFebruary
February. of the General Salisbury Committee, reported the recommendation that the Country Meeting of next year hould be held in the week commencing Monday, the 20th of July. This recommendation was adopted by the council.
Prizes for Implements and Stock.-On the motion of Mr. Fisher Hobbs, the preliminary arrangement of the Country Meeting Prize Sheets for next year was referred to the Implement Committee, and a Special LiveStock Committee then named, with a request that they would report their recommendations to the Special Council of Thursday, the 11th of December
Steam-Ploughing. - The Council received from the Stewards the Judges' report of the trial of Mr. Fowler's plan of ploughing by steam-power. The President directed a Special Council to be summoned for the ensuing week, when their report on the trial of machinery competing for the Society's prize of $500 l$. "for the steam-cultivator that shall in the most efficient manner turn over the soil, and be an economical substitute for the plough or the spade," may be taken into deliberate consideration.
Decease.-Notice was given that the vacancy in the Council, occasioned by the lamented decease of Mr . Woodward, would be filled up by election at the monthly meeting in February

Communications were received from Mr. Pain, Mayor of Salisbury, on the subject of Prizes for Hampshire Down Sheep; from the Board of Agriculture of Lowe Canada, on the establishment of an Agricultural Society; from the Smithsonian Institute of America, a present of books; from the Agricultural Society of the Duchy of Nassau, on the entering into communication from the Baron de Forrester, a valuable collection o his works relating to the capabilities of the soil and climate of Portugal ; from Mr. Knowles, a copy of his is Farmerd-book; and resentation-copies of works connected with agricul ure, for which the Council ordered their usual acknowed ments.
The Council adjourned to their weekly meeting a 2 o'clock on Weduesday, the 10 th of December, open to all Members of the Society.

## birmingham cattle shew

The Midland Counties gathering has been this year week earlier than usual, in order that its interests an those of the Smithfield Club may not clash. It has gained by this in the appearance of many good animals, which will no doubt reappear in Baker Street, and would have been sent there only, had the meetings been together.
A new section for Welsh Cattle has been this year opened, which ought to have some influence on the cattle of the Principality, considering its nearness to the scene of the show. The Herefords were as usual a very excellent class, Mr. Philipps, of Berkshire, Mr. Naylor, of Welshpool, and others, contributing to it first-class animals. The Devons were an unusualiy good class. The short-horns hardly came up to their usual standard, first-class animals, however, being exhibited by Mr. Stratton and others. The best division of the exhibition was that of pigs, which is more useful than any of the others, seeing that prizes for breeding stock are offered, and a very excelient class of animals, better probably than have ever before been seenin Bingley Hall, were gathered to compete for them. As to the numbers shown, we may say that last year and this have been on
the whole nearly equal, viz., cattle, 112 against 109 the whole nearly equal, viz., cattle, 112 against 109 sheep, 107 against 46 ; and pens of pigs, 26 against and the poultry show, especially in the principal classes, was as usual the finest thing of the kind that is.
The following is the award of premiums :

Chrmico-Agricultural of Ulster.-At the annual meeting of this society, the annual report was read, and the following remarks were made by Mr. Andrews of Comber:-He thought it was fair and right when they met on any occasion like the present, that they should express their feeling that while other societies, having reater show and parade, received a far greater extent f support from the great body of the community, the ilent operation of a society of that kind, whose objects vere reater importance, was comparatively neglected. It was not for the purpose of depreciating the efforts made n other departments that he would ask them to adopt the resolution that he had to propose to them, but merely that they should endeavour to induce those who were o deeply interested fully to appreciate the importance f the Chemico-Agricultural Society, and to place them more nearly on a footing with the efforts made in ther departments, and which were individually of very reat importance, but certainly not in a relative degree to greal support which they received compared with that society. As to the improvement of implements, it was a matter of unquestionable in the efforts that had been made for the improvement of implements there had been but a moderate expenditure, and no wasto of power whater. He believed it cost the great Agricultural Society very little to reward exhibitors of implements, and it was both an economical and an extremely useful appropriation of the small sum which they applied to that purpose, but they found enormous sums applied to the improvement of stock Now, there could be no question of the great wility of improved breeds of cattle. They knew that they tended to economise the food. They lnew that the same quantity of food applied to the feeding of a good race of animals would produce a greater return than in feeding an inferior race; but it was a matter of not less importance that food should be produced in sufficient abundance, and in the most profitable manner, for the purpose of sustain ing the cattle. Hundreds of pounds a year of premiums were applied in rewarding the breeder who had length ned by few inches, the hough of an ox, or produced, ned, mene ment of some a doubt, useful. But the observation made was, that while the breeders who produced some of these beaztie in utility and fashion were largely rewarded, a very small sum was considered quite enough to give to those who applied themselves to produce the means by which the animals were supported. He did not speak for the purpose of depreciating their efforts, but for the pur pose of inducing persons to believe that the efforts of
 that they were entitled to some little support beyond that they were entilol sut them. The resolution that which had been doled out adopt was as follows:which he asked the meeting to adopt was as follows "That, in the present state of agriculture, it is obvious that,
While the efforto the national and provincial societies have been conspicuously siccessful in the improvement of iveck the
 govern the nutrition of plants that, for the propublic have bee found inadequate, and the society is again compeliedriculture who
the proprietors and all persons interested in agr have hitherto withh
Mr. Andrews went on to say that it was not on the ground of either taste or fashion that he asked support for that society. It was really as a matter of absolute gain. It was quite impossible that the farmer cnowledge of the labours with advantage if he had ing They had atgrounds which certain crops best. They had at-
tained, only within the last few years, a considerable amount of knowledge. Twenty years ago they knew almost nothing, he believed, of the action of manures, supplied to plants to supply the want which the growth of certain plants had made of the elements of fertility in the soil, but now the farmers had got some little insight into these matters. Mr. Andrews proceeded to give an illustration of the greatly-improved cultivation of green Erops in a district with which he was acquainted, in consequence of the farmers having been led to use guano and bone manure, and continued - Some knowledge of chemistry was absolutely necessary to enable the farmer to understand the phenomens which he observed, and to prevent his being led by appearances into the commission of great errors. The more they considered the subject the more they would be persuaded of the great import ance of exteading their own chemical knowledge, and the knowledge of those upon whom the immediate cultivation of the soil necessarily devolved.

## Calendar of Operations

## NOVEMBER and DECEMBER.

Wegter Ross, Nons. 25.-The weather since the close of har vest has been favourable for all out-door labour; so favourable indeed, that notwithstanding the lateness of harvest, our
gutumnal work is nearly as far advanced as it is at this season autumnal work is nearly as far advanced as in ordinary years. Shonld the weather continue favourable our Wheat sowing will be completed in a few days. In this neighbourhood, however, as a large proportion of the Wheat crop is sown afiter Turnips eaten off by sheep, the sowing of Wheat cannot be completed until spring. In this county, of late years,
the proportion of Wheat has been so materially increased, that Barley has been well nigh supplanted, and the breadth of Oats has been much narrowed, but I believe that many farmers, from the high price of and brisk demand for Barley, would willingly liave their inferior and presently unsaleable Wheat transmusted into a respectable sample of Barley. Thur Potato crop has been
lifted, and a miserable affair it is. The produce is greatly below an average, and a large proportion is under the marketable size; and, besides, the disease is so energetically at work that there fs stood out wonderfully for years, has now become so wealx constiallow it to take its place amongst the thinga that were. A dweller in the south can only have a faint idea of the pain a true Highlander experiences in taking farewell of a race of Potntoes on a day. Our Turnip crop is beyond an average. I had the curiosity to weigh a certain pronortion of a field of Pomeranian Turnips, when I fonnd the following, viz., 19 Turnips in each 6 lineal yards of a drill, rad each Turnip weighed, on an average,
4 lbs. the drills were $2 \overline{7}$ inches wide, and the quantity per acre 4 lbs.; the drills were $2 \bar{z}$ inches wide, and the quantity per acre
was 36 tons 9 cwt. The largest Turnip weighed 18 lbs., and ita circumference was 38 inches. Ifound also that the root and stem, on an average, weighed one-fourth of each Turnip, so adding one-
fonth to the above quantity, we have as the whole reight grown, fourth to the above quantity, we h
on an acre, in $4 \frac{1}{2}$ months, 45 tons.

Notices to Correspondents
Corv Avpragez: Bro, $C$ MF Willich tells as that the average prices for the year erding Michselmas, 1856, were:-

While for the ste following weeks, eading 14 th November, 1856, the average prices were:-
Wheat ... ... 65s. $6 d$. per imperial quarter. $\begin{array}{lllll}\text { Wheat } & \ldots & \ldots & 64, & 8 d \text {. per imperial q } \\ \text { Barley } & \ldots & \ldots & 44 & \text { ditto } \\ \text { Oata } & \ldots & \ldots & 26 & 5\end{array}$ It appears from the reports this week from almost all the
places of European supply, that prices are rather receding, and as America has still a large surplus to export, we may reasonably expect that the present price of Wheat here will not be exceeded, although it minst be admitted in London, and the price of bread is now neariy range very high in consequence of local deficiency. France and England are both importing countries. According to an account made up annually to October during the last ten years the average injportation of Wheat (including flour) into the six years to Michaelmas, 1868, of imperial quarterk. For the six years:-
the imports of Wheat stand as follows

oldex Pasabants: JG. Lentile, Buekweat Barley, mam
gors. W W. W . OH to some aprictitural journ first, and falling that, offer to Ridgway or Longman.

NEW EDITION OF DR, J. D. HOOKER'S LAST WORK. Now ready, Second Edition, revised and condensed, with

HIMAKAYAN JOURNALS. Being Notes of a he Khasia Mountains, \&ce. By Josepa Daltor Hoorse, F.R.s. "'Dr. Hooker's Himalayan Journals" are another sterling contribution to that high class of literature which has been established by our leading naturalists. In these volumes are contained he results of an amount of mental training, that could scarcely hife. They are most ably written; they are illustrated by the Writer's own pencil and brosh, in a way that would have maintained his credit if he had gone out only to make sketches."Examiner.
deeply interesting facts, curious, instructive, and varied in subjeeply interesting facts, curious, instructive, and varied in subwhich reflect great credst on Dr. Hooker's talent as a draughtsman, and impress the reader by means of the visible image." - Spectator. "DDr. Hooker's Himalayan Journals.' In the very highest
rank of well qualified observers, we can, without fear of contradietion, place the eminent author of the roost interesting journals
now before as. The getang-up of these foumals is worthy of their matter. The illustrations are excellently executed, and selected with great judgrant. Not one of them could be dispeased with; and Mr. Marray has done a real service to the
canse of knowledge in thus liberally illustrating a work which cause of knowledge in thus liberally illustrating a work which must ever remain a standard on
Papers, by Professor E E Forhes.
"' Dr. Hooker's Himalayan Journals,' We shall not be charged among the most important which have as yet appeared upon our greas Asiatic possessions. Moreover, they are among the mos ontertaining, 10 they are written in a very agreeable style, and
the pervonal nartative is not interrupted by the dry formalitie London: Johi Murray, Albemarle Street.

## The Garmeners＇©fromitle． <br> SATURDAY，DECEMBER 13， 1856.

Among the fruits that are natives of this country there is scarcely one more generally cultivated and esteemed for its delicious flavour than the Raspberry It occupies a place in almost every garden，and when in season we scarcely know a fruit that is more refreshing and agreeable to the palate，or one that is more useful and in greater request for making into a preserve．Considering how valuable it is for the dessert and other purposes，we are somewhat sur prised on contrasting it wo wonderfully improved of while years by superior cultivation and the arts of man，very little change has been effected in the Raspberry．In saying this，let us not be misunder－ stood as overlooking or undervaluing one or two excellent varieties that have been brought into notice within the last 10 or a dozen years；on the contrary，we regard them as a move in the direction we have ourselves in view in offering these remarks， but what we mean to state is，that in no instance do re remember to have met with a Raspberry whose ruit is so superior in size and flavour to the old Red and White Antwerp，when grown in perfection，as the British Queen and one or two other kinds of Strawberries are，in comparison with the old sorts of hat fruit which were cultivated some 20 years ago． How are we to account for this？We have no
ground for saying the one kind of fruit is more easily cultivated and susceptible of improvement by artificial means than the other,
for alnost everybody knows the contrary to be the fact, the Raspberry being a plant that will grow and fruit in a soil and situation where the Strawberry would barely exist. Perhaps it is owing in a great measure to this circumstance that so little attention has hitherto been paid by our great fruit growers to the improvement of the Raspberry; but to whatever cause it may be ascribed, let us hope that the time is not far distant when varieties of our favourite froit the Raspberry may be obtained which shall as far surpass, in size and flavour, those of the present day as the fruit of our first-rate Strawberries now surpass those of years long gone by.

The Raspberry is found naturally to grow in groves or thickets, in rather low situations where the soil is moist, but not under the drip of trees. When cultivated, we find it to thrive in a great variety of soils-from a clayey loam to a black vegetable mould-we have seen excellent crops in all ; hut the highest flavoured were those grown in a rich loam, where the plants were fully exposed to the sun and air. Raspberries are seldom grown singly, but occupy a small compartment of the garden, where they are usually planted in rows 4 feet apart, and about the same distance between each plant. One great advantage of having them in a plantation by themselves is, that it enables them to be more easily covered with a net, and protected from birds when the fruit approaches maturity. It is also more convenient for staking and training in whatever form may be considered the most favourable for the production of fruit.

Almost every one knows that the shoots or canes of Raspberries are only of two years' duration, and that they require to be pruned in a peculiar manner. At this time, if it should happen not to have been done at an earlier period, the whole of the old stems which bore fruit last summer must be cut close to the ground and removed, and a selection made of such canes as are considered the best for fruiting next year. These may be tied together and supported by stakes until spring, when the unripe portion near the point of the cane is to be shortened, and if approved of they may be trained in the way represented in the annexed cut, taken from our volume of 1849 , where the uprights between every two or three plants are supposed to be iron. and the horizontal lines to which the canes are attached tar-rope.

But we think a neater and better mode of training Raspberries is the one we gave in our volume fo 1842, from which we borrow the accompanying woodeuts.
2.

3.

Whe:e this method is practised a row of Rasp berries will have something of the appearance represented in fig. 3. The arched portions tied to the stake in the centre are the canes which fruited last year. These must now be cut away, and replaced by the upright shoots of last summer trained in a similar manner to those represented in fig. 2. By means of bending the canes in this way the buds are induced to hreak more regularly than when allowed to remain in an erect position.

A method of training at Haarlem closely resembling in some respects the one just noticed has recently been figured and described in the Revue

Horticole; from which we infer that although it has been practised in many of the Scotch and English gardens for nearly half a century, it is
almost unknown to our gardening friends across almost unkn
the Channel.
However opinions may vary with regard to training the Raspberry, and the effect which such treatment may have upon the size and quality of the fruit, there can be no question that by pruning we may very considerably prolong the fruiting season, and even make the plants bear a second crop in autumn after the first crop has been gathered. The way in which this may be done is thus described in the last edition of the "Theory of Horticultare," page 365. "The strongest canes, which in the ordinary course of things would bear a quantity of fruiting twigs, are cut down to within two or three eyes of the base; the laterals thus produced being impelled into rapid growth by an exuberance of sap, are unable to form their fruit buds so early as those twigs in which excessive growth is not thus pro duced, and consequently, while the latter fruit at one season the others cannot reach a bearing state till some weeks later.

Another mode of obtaining an autumnal crop of Raspberries was many years ago communicated to the Horticultural Society by the late Mr. Johs Mearns, when gardener at Shobden Court, in Herefordshire. This was by removing in May the young fruit-bearing shoots from the canes, learing in some cases one or two eyes, in others cutting them clean off. Under either plan they soon show an abundance of vigorous shoots, frequently three or four from each eye, which produce blossoms in the beginning of July, and on these a good crop of fine Raspberries is borne in August when all the regular produce on the plants not so treated is consumed.
It was probably owing to some such mode o ment that we were indebted for the beautifu ish of Raspberries which formed a part of the fine ollection of fruit exhibited from the garden of the Right Hon. the Speaker, at the meeting of the
Horticultural Society on the 25th of November last, and to which the first of the prizes offered by Mr Wentworth Dilke was justly awarded.

We were rather disappointed some time since in seeing it stated that the Raspberry was not worth the trouble of growing in an orchard-house, as we had an idea that it would have been found well suited for such a purpose, especially when we recollected to have seen it forced so successfully about thirty years ago in what was then Mr. Labouchere's garden at Hylands, in Essex. The result of future experiments, now that orchard-houses are becoming mor numerous, will we trust prove more satisfactory, and entitle this fruit to a very different character from that which it has received.

Before concluding our remarks, we would briefly notice a fallacy respecting the Raspberry which appears to have obtained general belief. From the roots being what are called travelling they keep nea the sarface and spread in all directions, throwing up suckers at some distance from the main plant Hence it has been supposed that Raspberry plantations require to be renewed every six or seven years, but this is decidedly a misconception, as we know that by judicious thinning and management, and an occasional supply of good manure, they will continue to produce abundance of fine fruit for 15 or even 20 years, without the necessity of making a new plantation

We shall be glad if the fewoobservations we have made on this snbject should be the means of inducing some of our great fruit growers to give the Raspberry a larger share of their attention than they have yet done, and there is no doubt but in due time the same degree of success will attend their efforts to improve this fruit as have rewarded the labour of those who have devoted so much of their time to similar pursuits. $B$.

## NEW GARDEN FERNS.-No. XVI

3. Soniophlebium atpendiculatum. Polypodium apPendicularum, Linden, Catalogue, 1856 ; J. Smith,
Cat. Kew Ferns, 1856. Polypodium scriptum of Cat. Kew Ferns, 1856. Polypodium scriptum of gardens.
ronds oblong with a broad base, pinnatifid or subpinnate ; seg-
ments linear-oblong acute or attenuate, the lower one sublo bate ; sori small, sub-immersed; ; rachis, costa, and veins purple
This gree
This is one of the most elegant of recent additions to our living Ferns, the conspicuous coloured veining, purple on a pale green, producing a very pleasing effect. The rhizome is creeping, as thick as a stou quill ; the fronds a foot or more long, oblong, or elonately triangular, that is, broadest at the base, where it 34 or 5 inches wide, narrowing upwards; deeply pinaatifid, almost pinnate in the lower part ; the lobes inear-oblong, acute or with a longish tapering point the lower ones often again sublobate. The rachis, costa, and veins (the branches of the latter clavate at the tips)
on the pale green ground colour. The sori seem to be small ; they are sub-iminersed, and are produced on the apices of the lower anterior veinlets in a single series, Polypid common Polypody. The plant, referred to doupodium by M. Linden and Mr. Smith, is un M. Linden. We have seen it in the collection of Mr Veitch, of Chelsea, as well as in some of the public gardens. Some of the plants at Kew have been received direct from Mexico ; but we are not awaso whence M. Linden's plants were obtained.

Hook and Grev. Icon. Fil., t. 90
This curious little Australian Fern, looking something like a simple-fronded hairy Asplenium Ruta-muraria, has been raised both by Mr. Headerson, of Wentworth, and by Mr. Young, of Taunton. Its fronds are pinnate with flabellato-cuneate pinnee more or less lobed and cuneated. The sori form several lines, occasionaliy forked, on each of the small pinner. M.

## CANKER IN FRUIT TREES.

Every gardener and cultivator of fruit trees knows well the trouble this tiresome disease gives, more pas ticularly with Apple trees; there are, indeed, some varieties of Apples, such as the Ribstone, Golden and Newtown Pippin, and the Nonesuch and Old Nompareil, that in most descriptions of soil defy the care of the proner, and in spite of cankered shoots being removed and cankered places being cleanly cut out, become so diseased as to be barren and worthless.
Some few years since I commenced an experimental Apple plantation on a dark-coloured tenacious kitchen arden soil, about 2 feet in depth, resting on a yellow netuous calcareous clay. This site had been planted with Apple trees by one of the earlier members of my family about the year 1720. Some of these trees grew to an enormous size and gave large crops; others, such as the Nonesuch and Old Nonpareil, were in 1820 comparatively small trees and their heads masses fof cankered shoots-occasionally they bore fair crops, but the trees were most unsightly and unhealthy; still in spite of this they lived as long as those of large size, and all died off gradually before 1830. On the site of this old orchard I commenced my experimental Apple garden, feeling that if I could make Apple trees $f$ tender kinds grow without canker under such circumstances it would be a step in the right direction. I therefore planted a piece of ground with young treez grafted on the English Paradise stock (very nearly related to the Doucin of the French), in rows 4 feet apart, and the trees 3 feet apart in the rows; this was years and then had them taken up (all but a few which had not made much progress), and replanted in the same places they had occupied, not pruning their oots unless one long and straggling made its appearance, and giving to each tree two shovelsful of charred and burnt earth. My intention was to remove thems biennially, but owing either to the pressure of business or forgetfulness, they rested three years unremover, and only within these few days they have had their third lifting, all having been replanted in the places they were tasen from, and $I$ have the great satisfaction of finding my experiment completely successful, for the Old Nonpareil-still a Nonpareil, or rather a Sanspareil in flavour and consistency, $i_{0} e_{n}$, in tenderness and uiciness of flesh-the old Golden Pippin, the Ribston3 Pippin, the Red Astrachan, the Golden Reinette, the Royal Russet, the Scarlet Nonpareil, the English Codlin, and many others all terribly subject to cankes are compact dwarf bushes full of healthy blossom bads, and without a speck of canker on them; their roots are so fibrous that I find their removal does not affect the size of the fruit, in fact some were on dwarf bushes on the Paradise stock planted out in March of the same year ; and, by the way, have more than once had some of the finest Pears from trees on Quince stocks removed early in March, anc crops on them when all others failed, owing to their blossoming period being retarded by being removed till the danger from early spring frosts was over. This seems to open a new field to cultivators. Pear trees on Quince stocks may be taken up, say in January, their roots laid in the ground, their tops aganse north or north-east wall, till the middle of March, snd then replanted in their proper situations. Let some your readers who have shaken off the trammels of oit fashioned fruit gardening, and who dare to build orchard houses, try this.

To return to Apple trees. If larger trees are sought for than those grafted on Paradise stocks are likely to make, trees grafted on the Crab stock may be planted, these will give a larger produce, and by biennial removal can be kept in a perfectly bealthy stale, even ist soils adverse to their culture as orchard adapted for be recollected that this system is not arape, but to orchards where cattle are suffered to gralture. orchards and gardens devoted enly to fouital trees the I have in my experimental gardell two for biennial most forcibly exemplify the good effects of I have removal and the bad effect of deep toe years before stated that my trees remained ; two trees only havast have suffered from this, and in our climate, viz, the delicate varieties cultivated in our then to

* In this soil the varieties alluded

Fall Pippin or White Spanish Reinette, and Newtown and up to the bearers (at an angle) to which they are Pippin, both received from America; they are rapid large blotches of canker, which, under ordinary circumstances, would soon cause their destruction. I have had their roots brought near the surface, shall cut out the canker as deeply as possible, and make them healthy trees. When one looks into our old gardening authors and sees the specifics for the cure of
It is strange to observe the backwardness of the Belgian and French gardeners in inducing fruitfulness and health in their trees by attention to their roots. I "once upon a time," made a long stay at Bruges and looked into most of the gardens in and near the town the soil I found rich, black, and unctuous beyond any cad ever seen, but their Apple trees were they were pruned carefully every year, but their roots having struck deeply into the soil out of the influence of the sun and air, the young shoots were cankered, and large blotches of the disease were to be observed on the stems and old branches; the idea of operating on their roots was ridiculed and treated as a Chinese would a recommendation from an "outside barbarian."
To conclude, it must be borne in mind that there are many varieties of Apples the trees of which are not subject to eanker, and which on the Crab stock grow into large healthy orchard trees, or on the Paradias make healthy espaliers, pyramids, or bushes for the fruit garden ; but those who wis
Apples, the Golden Pippin, Old Nonpareil,and Ribstone Pippin, should devote a portion of ground toa plantation in rows four feet by three of trees of those sorts on the Paradise stock, and have them lifted biennially have them lifted Diennialy be deep and tenacious, like be deep and tenacious, like that in which my trees are planted, a dressing of burnt earth or charred garden refuse mixed with the soil when they are replanted, Will be most advantageous; if, on the contrary, it be light and poor, two-thirds cotten dung and one-third tenacious loam or clay, prepared and well mixed during the summer, and two or three shovelsful added to the soil for each tree in ceplanting will give additional health and vigour. recommended is but light labour, for an active la bourer can lift and replant 40 trees can liem. I need ecarees per diem. I need sarcely equally efficacious for $\mathbf{P}$ equally efficacious for Pear and other trees liable to canker ; if a cultivator is inclined to be idle he need only to remove those trees liable to it, and as trees to bin the or anker. Thos. Rivers, The Nurseries, Sawbridgeworth.

## Tree-Lifting machine

In the autumn of last year the Marquis of Huntley signified his intention to have a number of valuable trees transplanted on the grounds here ; but not having had anything suitable for such important work it cecurred to expressly for the purpose. I therefore submitted a exproly $f$ a design to his lordship, who soon art gave trial imme the plan to be carrica. ciately after it was finished, and having been found wel adapted for purposes of transplanting, and also as a means for conveying various materials from one place to another, I am induced to attempt a bri
of its construction and mode of working.
The machine in question has four wheels (see fig. 1), The hind wheels are 3 feet in diameter, and the fore wheels are 2 feet 10 inches in diameter, and similar in make to those of a broad-wheeled cart, but not dished. The axles are 6 feet 6 inches in length, and 4 feet 10 inches in the clear between each pair of wheels. The axles are bolstered (see fig. 2), so that the under surfacs of the bearers (fig. 3) are above the top of the wheels. The front wheels are furnished with shears and shafts, and consequently turn on a strong centre bolt. The bearers are 12 feet 6 inches in length, 4 inches in breadth, and 6 inches in depth. They are connected in front by means of three wooden bars, two foch are morticed into the bearers, the third bar is tolerably strong, intermediste, and lower down through this the centre bolt passes, and is the only means by which the bearers aro athched to the boarer wheels. The hind wheels are attached to the boarers by an upright flange from the top of the axie, through which and the bearers a sinch bolt runs horizontally on each side, and is fastened by a nut. There are also
two atays at each aide parsing under the axle, Na 4

I may dinch bolts and nuts
I may here notice that the bearers are a fixture at the fore-wheels, it not being found necessary to detach them, as is the case with the hind wheels before adjust ing the whole apparatus for lifting a tree. The clear space between the hind and the fore wheels is 7 feet,
thus allowing a mass of earth 7 feet in length, and it thus allowing a mass of earth 7 feet in length, and it be raised; but in order to show that this can be effected, a few remarks regarding the upper frame may be necessary. This frame (No. 5) conin breadth, and 4 inches in depth. It is so sdapted that it is capable of contraction aud extension to suit the purpose of the operator, and its arrangement is as follows:-Two of the bars are laid across the bearers at 5,6, or 7 feet separate. On sccount of their length they project at both sides, and have a hole exactly through their centre to admit 1 -inch bolt (fig. 6), the import of which will be subnequently noticed; the remaining two bars are placed above the transverse bars and conse quently run parallel with the bearers, these having each two 1 -inch holes at 18 feet apart (No. i). These and the
transverse bars have other corresponding holes at equal transverse bars have other corresponding holes at equal
distances towards their ends, so that the size of the mass to be lifted can be determined at pleasure, by sliding the bars out or in and dropping a $\frac{3}{4}$ inch bolt having a head into the hole at the regular places at which they intersect each
other ; from this it will appear that the workmen have
complete guidance in proceeding to diz the trench around the tree to be lifted. This trench necessarily requires to be roomy, as the four wheels must be let down to near the level of the bottom of the ball. Having made the necessary excavation, the aid of another frame (fig 8) is required; this frame also consists of four wooden bars, having holes perpeudicular from those in the upper frame, and is placed around the sides at the bottom of the ball and fastened at the corners by bolts and nuts; but before fixing it six iron bolts 14 inch in diameter as previously adverted to (No. 7), having a serew 1 foot 6 inches down from the top with strong heads, are introduced through the holes in the baris before noticed, two of these being at each nide, and one at each end; thus arranged their heads hold on the under surface of the under frame. Ten iron bolts (No. 9) should be at hand at this stage of the process, two of them 1 feet 6 inches in length, $1+$ inch in diameter (see fig. 9), the other eight bolts should be 5 feet in length and 1 inch in diameter, all pointed. The long bolts should be driven through the ball, which they should enter close riven the lower frame, keeping them inces aper and that their points 9 inches apart, and on the frame at the oppohall come through the remaining bolts should be site side of the dianonally.
Having the machine at hand, the upper frame should be lifted off, the hind wheeln, including the axle, detached. The bearers must then be drawn back over the bull, the hind wheels brought in behind the tree, adjusted, and fastened to the bearers; the upper frame should then be put on, taking care to introduce the screwed bolto, which are $4 \frac{1}{2}$ feet in length (fig. 7 ), into the upper frame, that their points shall appear above to afford the nuts a hold, which nuts, it may be noticed, are 3 inches square. Six men should then be stationed around with a wrench 18 inches in length at each nut, and commence simuianeously to turn them, which operation they will easily perform, and no resistance is likely to impede he process of lifting the tree. in the various entire, and drawn to the place asaigned it by horses
without boing shortaned or compressed. It may here be remarked that the tree or shrub, as the case may be, is raised and carried erect, and when lowered into its place no difficulty is experienced in extracting the round iron bolts; I may also notice that the tree is simply raised 10 or 12 inches from its bed when it comes in contact with the bearers, by which and its own weight it is rendered so perfectly firm, that no guide rope is required. Six men are employed in working the machine, and the greatest weight yet attempted viz. 4 tons, has been raised with alight effort. Johr Reid, Orton Hall.

## Home Correspondense.

Biddulph Grange-Mr. Kemp having concluded his very elever and graphic, though far too favourable, account of the grounds at this place, I feel that the time has come when I ought to tender my acknowledgment to another artist, my friend Mr. Cooke to wit, to whose ver-ready pencil and inexhaustible invention my gar ens, I am well aware, owe their chief attractions. With Mr. Cooke's skill as a landscape-painter the public is abundantly familiar, but it is not sn generally known that he occasionally forsakes his atudio to practise the craft of a landscape gardener. In this capacity he has helped me through so many difficulties, and enabled me to realise so many, but for him, impracticable conceptions, that I foel natnrally anxious at once to confess my own obligations to him, and to point out the quarter from whence others also may hope to derive the like assias ance. James Bateman, Biddulph Grange, Dec. 10.

To Kieep Catlle from Barking Trees.-Having planted some standard fruit trees in a meadow, I was long annoyed by the cows rubbing against them and barking them, \&cc. After trying the usual means without success, I employed the following, which has answered every purpose:When planting drive in a stout stake, and make fast the plant; drive into one side of it' few stout nails, leaving them projecting leaving them projecting protect oneside of the plant. protect one side of the piant. of 1 -inch deal board, about of 1 -inch deal board, about or $\begin{gathered}\text { or }\end{gathered}$ ing to the aize of the stem or the plant, and drive some stout mails through, so that the points shall stand out about an inch ; bore a hole through each end of the strips in the direction of their width, pass a bit of galvanised iron wire through as many of them as will nearly surround the tree; place them in position, and twist the ends of the wire to secure them. In the winter when the cows are move the strips, clean are away, untwist the wire, remove the strips, clean and wash the tree, and replace in del es ; I have often seen them come ap and gently themselves against the nails, but have never had a tree injured by them since, and I have adopted the plan some years. T. H.

Horticultural Society.-"Hippolyte" was very glad to see the statement relative to the new conditions of subscription to the Horticultural Society. It is perfectly clear and satisfactory; he does not, however, quite anderstand the phrase "seeds and cuttings in London." Will you kindly state whether this means that the sabseriber of 9 . 2s will have to apply for them in London, and that to those who pay $4 l .4 \mathrm{~s}$, they will be sent ? If this be not the meaning, perhaps you will explain its real signification (1). "Hippolyte" also begs your kind advice on the following matter. A Ghent seedsman advertises in his seed list seeds of from 50 to 60 species of Fern. Having read recently in the Chromicle that no success attends the attempts to raise Ferns unless the fronds or theca are gathered prematurely and placed on pots of soil, he is doubtful of the propriety of procuring any of the seed in question. Do you think it would bo safo to purchase, or to sell if purchased? H. would be very thankful for a reply to this query in your next Number (2). [1. London means such seeds and cuttings as can be provided for general distribution. Applications are made by letter. This is to draw a do which may be propagated in the garden. 2. We should not be purchasers of Fern seeds.]
Large Boiler System of Heating. - The most efficient and economical mode of heating horticultural erections is a subject well worthy the attention of gardeners and horticultural buildera; but there seems to be at present some dispute as to which is the best. There has been a discussion in your pages lately about conical boilers ; but I have been recently informed by a gentleman in the vicinity of London who has been making extensive alterations in the heating of his houses that the boiler he has made use of is the tubular boiler, something similar to that manufactured by Mesars. Weeks. The gentleman referred to formerly had 10 fires, but
by putting a builer at each end of the range of houses
he has now only two, and I believe the alteration
promises to give every satisfaction. I know another place in this neighbourhood where one boiler heats two efficiently. It is therefore worth the trouble to inquire whether the present almost universal plan of having a boiler to every house is the best that can be adopted, or whether Messrg. Weeks's plan, followed out to a certain extent, is not a better method of heating. there is ample room for improving both the heating and ventilating of houses few will deny, and it is not a little surprising that one of the heaviest bunches of Black Hamburgh Grapes that has ever been grown in this country was produced in a house heated on the much abused Polmaise system of heating. C. Anderson, Monks Orchard, West Wickham.
Sir Harry Strauberry.-Noticing that you state that Sir Harry and other Strawberries cannot be identified by comparing them with coloured plates, I beg to say that as regards Sir Harry this can certainly be done, as I possess a coloured lithographed copy of the oil-painting
now in the Crystal Palace at Sydenham of a one-year now in the Crystal Palace at Sydenham of a one-year
old runner of that variety. This plate I purchased from the propagator, and no one can be mistaken if they compare a genuine Underhill's Sir Harry with one of the prints in question. Henry Huskisson, Hazleveell Hall, Worcestershire. [We abide by our opinior.]
considerable importance to the clergy was but judgment not given at the tifrie, and since then I have been unable to meet with anything about it
forget the names, but the case was an action brought by a clergyman who had been presented to a living, to pre-
vent the executors of the deceased clergyman from removing a hothouse erected by him. Could any one tell me how the juilgment was given, and whether it would equally apply to a cold (brick) frame built on the surface of the ground, the foundation being conerete your readers may remember the case and be able to give me the judgment. A. R., Bromley.
Ice-houses.-I should be much obliged by any of your correspondents stating, from practical experience, the
smallest size an ice-house could be made to receive the material ; for of course the greater quantity the more certainty of keeping. Also any experience they may
have of an ice-house built in a well-gheltered wood, chiefly above ground, with double walls, \&c., and very thickly enclosed with Heather. An Old Subscriber
Heating. -The best way to heat a small greenhouse at the back of a room where another chimney would be unsightly, is to make a circular chamber at the back of the fireplace of the rom, and conduct the heated air by means of pipes carried along the sides of the walls of the greenhouse. Let a valve for cold air be placed
opposite the valve in the chamber through which the opposite the valve in the chamber through which the
hot air escapes, to cause it to circulate. This plan will be found efficient for a small greenhouse. $A_{n}$ Old $S u b$ scriber.
Grapes at Basing Park.-Mr. Duncan, the gardener
here, having sent us three Grapes of previous black sorts, he has favoured us with the following aceount of them:-The black Grape No. 2, which from the Barbarossa, to which it had been referred The bunchesare smaller, and generally without shoulders; a deep black colour, and somewhat densely covered a deep black colour, and somewhat densely covered and flavour, I thinh, unsurpassed. The Barbarossa, on the contrary, has large shouldered bunches, berries nearly globular in form, and neither so deep in colour
nor so well bloomed as this variety. The skin, too, is nor so well bloomed as this variety. The skin, too, is flavour is not equal to that of this Grape. The foliage partakes more of the Hamburgh than Barbarossa character, from which it differs in being much smaller, cupped in form and narrower than in that sort; the lobes, too, are more deeply inBarbarossa the leaves are rounder, less firm in textare, and they become reddish purple on approaching maturity, whilst those of this Grape remain green until they are fully ripened. This Grape ripens simultaneously with the Hamburgh, and is invariably black under all circumlengthened period after ripening, and it is so very much efteemed here that I am very considerably extending its culitivation. It has been grown here for a number of years, cuttings of this and several other good sorts
having been presented to me by a gentleman who having been presented to me by a gentleman who
obtained them from some Spanish source. One of these, a white or rather golden-coloured variety, with downy leaves, much resembles the Hamburgh in point of form ; the flavour too is rich and excellent. The No. 3 Grape, a specimen of which I also forwarded, is from the same source; the bunches and berries are scarcely medium size, form of the latter roundish oval, skin thin, of a golien yellow colour when ripe, and somewhat transparent, flesh delicate and rich, and the
flavour sweet and grod. The foliage is very downy, and flavour 8 weet and grod. The foliage is very downy, and
the leaf-staliss make wood of a brownish red, which gives it a very remarkable appearance. No. 1.- Cuttings here many years since from Mr. William Lindsey formerly pardener to the Dule of Devonahire a

The bunches are large and shouldered; berries small, globular in form, of a very deep black colour, thickly covered with a pale blue blcom, flesh almost destitute of fibrous matter, flavour very sweet. This sort is much esteemed here ; it does not however keep to a late period on account of the berries being so free from pulpy matter. The foliage is peculiar, being large and
very downy underneath. This variety, like No. 2, colours deeply black whenever it is grown and they are less liable to shank than any other sorts that'have come
under my observation. James Duncan, Basing Park. under my observation. James Duncan, Basing Park.
[The names of these varieties appear to be unknown in this country. No. 2 is decidedly different from the Barbarossa, and is a thinner skinned and much richer Grape. The Barbarossa belongs to that class of Vines, the leaves of which assume a deep reddish-purple tinge When beginning to fade; but the Grape in question,
No. 2, does not. We attach no importance to No. 3 but Nos. 1 and 2 are real acquisitions, remarkable for the excellence of their quality.]
Temperature on Windermere from 28th November to 4th December both inclusive, situation high and exposed. Thermometer on a north wall 5 feet from ground. Readings show the maximum and minimum of preceding 24 hours.

The instrument is a Six's thermometer. T. S. P.
Ripening Strawberries on Hollow Walls.-The Strawberries that were grown here last season were some of the finest I have ever seen for flavour and size; the British Queen was ripened on both sides and to the very point ; and although the season was wet and without much sun, the flavour was exquisite. Myatt's Surflavour could not be praised; probably with more sun there might be more richness, and if this could be Strawbery it would be invaluable, for never saw I producing abundance of fruit. Now I am about to mention a plan which I think throws a new light on Strawberry ripening, $i_{0}$. of exposing the fruit on small hollow walls, a plan I adopted last season with the
greatest success. The walls I used were smali curved cylinders, a separate one to each plant. I procured the common 2 -inch draining tile, and having curved it when reshly made, so as to form a half circle, I placed it on the side of the plant where the fruit grew, so arranging the fruit as to give it the full power of the sun. The benefits derived were as follows: The heated tile imparted warmth to the fruit, which not only caused it to ripen quickly but thoroughly. Being hollow it did not become overheated, and unlike perpendicular walls the circular form caused the fruit to be exposed to the direct rays of the sun ; and, what is of importance, it received none of the splashings from rain ; at the same time the hollow pipe prevented evaporation in some degree, an snails were easily caught under the tile, as in a trap. This contrivance I have found beat all others for ripen ing and producing prize fruit. These tiles can be obtained at the kiln for about 1l. per 1000, a little more being charged for bending them into a half circle, Sigma
Camellia Buds.-I beg to inquire the reason why the buds of large Camellias have turned brown and died off, so that instead of their being as usual in magnificent flower, they are very poorly furnished with blossoms, and those of a small balf-withered size. The trees have been fresh planted in large tubs. What drainage do
they require? What watering do they need ? The they require? What watering do they need ? The
foliage looks healthy, and the formation of flower-buds was so sbundant that half of them were taken off with the hope of the remaining flowers being very fine; but nune of them are fine, and they soon drop off, even when vigorous enough to come out. The trees are all under glass. R. A. H., Wansfell, Windermere, Dec. 8, [There is something wrong at the root. Perhaps the soil is too cold in comparison with the sir perhaps the plants have not made new roots enough to feed the blossom buds.]

## Sacieties.

Linklan, Dec. 2.-The President in the chair. J. Ball, Esq., M. P. ; W. B. Carpenter, M.D. ; R. S. Hill, Esq. ; John Garland, Esq. ; and W. H. Holds-解 Corynoid Polypes," by P. H. Gorse, Esq. Of this new polypus, which was named Lar Sabellarum, a beautiful drawing accompanied the paper. 2. "Note on the African species of Copal," by T. C. Archer, Esq. This communication referred to the gum-resin of the Robo-tree of Sierra Leone (Guibourtia, Bennett), of which a description was read at the last meeting of the Society. Mr. Archer thinks this gum-resin is probably one of three kinds imported largely into Liverpool under the name of African Copal, African Yellow-gum, and
African Red-gum. The first comes in rounded tears, usually large, transparent, but rather dull on the surface and of a pale straw-yellow colour. The other two are
often semi-opaline, from a mikiness which exists in some of the masses; pieces of this, evidently only nearly 3 lbs . The usual size of the fragments is that of a hen's egg. The quantity of these gums received in the port of Liverpool is enormous; more than 150 ton were imported in 1855, the whole of which it was stated is consumed in the manufacture of varnishes, under the
general name of Copal. 3. "Note respecting certain landular appendages of the leaves in the autumn rosette of Epilobium montanum," by D. Oliver, Esq., jun.
This paper consisted of a description of certain planThis paper consisted of a description of certain glandular appendages observed on the younger leaves of the which the anthor believed were undescribed. 4. Th commencement of a Memoir on the phenomena of torpidity, and the production
animals," by G. B. Holland, M.D

## Shotites of 3ooks.

The Lord of the Isles, a new illustrated edition. 8vo. Black, Edinburgh
An exquisitely beautiful book. The wild scenery amidst which the poem is laid seems to have led the publishers to entertain the happy idea of bringing out an edition illustrated in a manner worthy of its author hey have been ably second. bir or, Gilbert, and Messrs. Whimper and Evans, and the result is one of the handsomest volunes which th English press has produced. The paper itself, a delicat Maize colour, like that which Her Majesty was please to select for the "Natural History of the Dee-side," sets
off the cuts to great advantage ; add to which the bindng of the volume is as gay as deep blue, scarlet, and gold can render it.
Descriptive Geography of England. By T. Challener. Small 12mo. Longmans.
Although this is a neat little volume it is not to be recommended as being fit for school or any other purpose. Take for instance what the author says of Timber trees, fruit-trees, Agricultural and Horticulural productions," things which have no earthly connection with geography. He teaches children that plant are found in every climate, which is not true. Among ur timber trees he teaches children to include the Laurel, the Laburnum, and the Elder, which are not nly not timber trees at all, but mere exotics having nothing to do with the geography of England. He teaches that the "very peculiar features of the vegetable productions of England" are-the Royal Forests ! ; and rincipal We must add that the plan is no better then the exe tion ; it includes all sorts of things that "children "do no want to know, and those things are as we have shown very ill explained.

On Poisoning by Strychnia, with comments on the Medical Evidence given at the Trial of William Palmer for
the Murder of John Parsons Cook. By Alfred S.
Taylor, M.D. London, Longmans. 8vo, pp. 152.
The great Palmer case may be regarded as having settled once for all the important point that the nondetection of poison in a corpse is not conclusive evidence non-poisoning. Every one remembers with what mphasis the counsel for the prisoner dwelt upon the witnesses for the Crown ailed to detect strychnia in the body of Cook, and how certain medical witnesses called for the defence en-
deavoured to make the jury believe that if strychnia had deavoured to make the jury believe that if strychnia had
been administered Dr. Taylor ought to have discovered

The question at issue between the have discovered men was one of the highest importance to society, as well as one of considerable interest in a medical point of view; it was a question whether evidence furnished by chemistry was alone worthy of credence, or whether that derived from physiology and pathology had not at east as high claims to alt law, chemical test desperate effort, was made on behalf of the prisoner to persuade the jury that reliance ought to be placed on chemical tests alone, to the exclusion of tests derived from other branches of medical science. The object of Dr. Taylor, in the publication before us, is to show the danger and error of such a notion ; he saym-

Can a person die from poison, and no poism be fourd by chemical analysis in the body?-I here pat this question generally. At a very early period in the progress of this case, it was found that if the defence failed in assigning the symptoms of Cook to some latent dis ease, the only point on which it could rest was this :/ If it be alleged that a person has died of poison, let be produced in a visible and tangible form; if it cannot be produced, then, supposing proper skill to have hat no employed, the only inference to be drawn is, poison was taken, and that death was from poison to a very simple iskue indeed. It is casting aside physiology and pathology, and requiring our law authorities to place entire and exclusive confidence in the crucible and test-tube of the chemist. But has organic chemistry, with all its modern advances, yet reached a poinerilly, no death can occur from poison, speaning genernily, except the poison be still found eiluer in all of these the tissues, the blood, the excretions, or the viper-poison parts at one and the same time I Is the viper-poicon
producing one of the most formidable convulsive affections known, namely hydrophobia, be detected in the
tissues? Is there any chemical process by which the tissues? Is the Ordeal Bean of Africa, or even of the common Laburnum, the seeds of the Ricinus communis, Germany, the poison of the Enanthe crocata-can be separated and demonstrated to exist after death in the
blood and tissues? If not, then the allegit person can die from poison except the poison be found admirably adapted to cover a multitude of deaths from thogy and physiology. It is all the more realed by pathology and physiology. It is all the more dangerous, the murderer, especially of the scientific or professional murderer, are daily becoming more refined. I could add largely to the list of poisons which either by their nature, by their tremendons power in very small doses,
or by the mode in which they are introduced into the system, might infallibly produce death without leaving a physieal or a chemical trace of their presence in the body. I forbear to do this. Such an enumeration would
undoubtedly serve my purpose of refuting that which believe to be a gross and dangerous error on the part o some of the chemists who gave evidence for the defence making public means of death wouldes of perpetratio crime which it would be dangerous to promulgate. Th fallacious doctrine here broached for the temporary purpose of saving the life of a wretched criminal was, mount, is for a time, a large amount of popular support. There was an astonishing
plausibility about it, especially in the form in which it plausibility about it, especial y in the form in which it Was almost daily circulated in newspaper paragraphs
emanating from the solicitor for the defence or his agents. It only required bold assertion, and the
chemical differences hitherto admitted by chemists to chemical differences hitherto admitted by chemists to
exist between organic and inorganic poisons at once exist between organic and inorganic polsons at once
vanished. Alarm was also spread and allowed to pervade the public mind by the ailegation, that unless
poisons were invariably detected in, and separated from he dead body, in cases of alleged poisoning, any innocent person might be convicted of murder by poison When the death was really due to some latent disease. It is fortunate that the jury in Palmer's case have, by dangerous doctrine, and have shown that 12 men may be as safely directed to a just decision by the views of pathologists and physiologists as by the assumptions of deteet a poison; but it fails, without the aid of physiology and pathology, to show whether it was or was not nable us to determine whether the poison was duced into the body during life or after death. Even with regard to the poison in question in this particular cmployed as a medicine, that the discovery of traces of in the stomach, blood, and tissues (assuming that the processes used are satisfactory) would not justify an
allegation of death from poisoniag by it. The symptoms allegation of death from poisoning by it. The symptoms
must be made known. The 'tetanic complications which it ordinarily produces in the body when taken i poisonons doses must be clearly established, and a judgment must be based on these symptoms. We are not, therefore, to suppose, as the public have been are convertible termes, that the finding of poison in a body is a proof of death from it, and the not finding the poison is a proof of death from some natural cause.'
the auth par the general que by stry and no trace of that poison be found by chemical analysis in the body?" A careful comparison of all the cases upon the subject known to medical men leads to only one answer, which is in the affirmative. Then comes this further question, "What becomes of the strychnia in a case of poisoning in which it cannot be detected by poison is absorbed and diffused in the blood, and this opinion is not a new theory, as the witnesses for the defence wanted to make the jury believe; it is of more promulgated for 14 years by Liebig, and is generally received as true amongst well informed medical men.
A careful perusal of all the evidence given on Palmer's trial, and of the interesting comments upon it, must great an unprejudiced mind to the curning, deceit and sophistry was mainly owing to Dr. Taylor himself, impartias impartiality exhibited by him at the trial have brough uncharitable, it may at least be a source of consolation to him to know that the great body of his fellow-countrymen feel that they are deeply indebted to him. Io quote from our able eotemporary the Examinernio truth truth is, and it evidently is the duty of the pable now
to say so, that if Dr. Taylor had not abided firmly and resolutely by his justified opinion, he would have been open to the severest censure, and his reputation woul
have suffered nos a momentary but a lasting injury." have suffiored not a momentary but a lasting injury. The Palmer case was a sad example of the manase seientific witnesses received a blow from which it wil not easily recover; and if any value yet attaches to the testimony of surgeons, physicians, and chemists, 18 a
who upon that memorable occasion formed so honour able a contrast with their less scrupulous and candic rethren

## Garden Memoranda.

Messrs. Sharp and Co.'s Nurbery, Slehford Lincolnsurra.-An idea prevails very extensively tha Lincolnshire is a flat fenny county, that its climate is damp and rainy, that aquatic birds and eels find every-
where congenial resort, and that Lincolnohire mean can be distinguished by a peculiarity common to the madoving creatures they are reputed to possess in such numbers. In travelling to Sleaford from Grantham, the visitor entertaiving this belief, and probably induiging in the prospect of agreeably extending his acquaintance amongst these aquatic delicacies, will not only bo disappointed in his expectations, but will have his preconceived ideas of the aspect of the county completely upset, and his locomotion impeded by encountering bold swelling hills, and seeing a rich undulating country on overy side, possessing every component of a picturesque landscape but water. We are glad to have the oppor tunity of disabusing our non-travelling friends of Lincolnshire friends from the weight of a prejudice Lincolnshire friends from to Which exists against their counly and cimate. Lincoln and successfully cultivated, and are, or should be, a pride and successfuly cultivated, and are, or should be, a pride rather than a reproach to Lincolnshire men.
gical characteristics of the county are varied and valuable A fine range of Oolitie limestcne runs through the county, affording in several instances excellent building stone ; rich lias clays occur in extensive tracts, and immense alluvial deposits of unexampled fertility are sprend over the lower parts of the county. With these advantages the county possesses hiberal inndords, good farmers, and large, well arranged, well cultivated farms uninjured by hedgerows, timber, or extensive woods. This may seem somewhat digressive, but in reality it is not so ; the actual bearing of all these circamstances on the sabject of our notice is direct and considerable, and besides it might appear unreasonable to those entertaining the common prejudice against Lincolnshire that a county, such as they imagine it, should be seed grounds The actual circumstances explained, it weell bo seen that singular advantages belong to the position. Messers. Sharp \& Co.'s home nursery is situated near the thriving town of Sleaford. Thirty-one acres are here devoted to the rearing and cultivation of forest trees, shrubs, fruit trees, \&c. \&c. The soil of the nursery facilitates the operations of the nurseryman, being a sandy calcareous loam, evidently congenial to
the majority of plants which are generally cultivated to meet the requirements of the horticultural world The presence of lime in the soil renders the eultivation
of the Rhododendron and its congeners a matter of of the Rhododendron and its congeners s natter of Coniferous plants are extensively cultivated, and the collection comprises all the beautiful and hardy intro ductious of late jears ; Araucaria imbricala grows with singular vigour and beauty. The bright green foliage of Pinus insignis, united with its hardy nature and and it habit, rendersit a desirable tree for all planers, indicate a deserved public appreciation of it Large quantities of the elegant Cedrus Deodora share the tame $\mu$ round ; with these are associated Abies Douglasi and Morinds, Cupressus Lambertians, and many others of our larcly extended collection of this interesting and valuble tribe of trees Picea Webbians appear here with its leading shoots destroyed by frost ; i is a variety which cannot be recommended for general planting, though eminently beautiful where it does thrive. The common Silver Fir does not succeed in this nursery. Judging from the immense quantities of Larch in various etages of growth, this tree ranks high in the favour of foresters. The Spruce Fir, by the same rule, enjoys a similar appreciation ; hundreds of thousand ol rom this nursery to supply plantations in all parts of each large quarters appropriated to their cultivation Examples of the various deciduous trees are adequately represented on the grounds, and several large divisions planting.
Extensive plantations of fruit trees exist, and seem to prosper in the peculiar soil of the place. So general is The appreciation for the queen of flowers, that it is are here cultivated. A walk, a quaster of a mile in extent, runs parallel with the public road, and is rendered interesting to visitors by a judicious arrangement of fluwers and ornamental shrubs, and trees placed in borders on each side of the walk. The placed in loorders on each side of torticult Society holds ita annual exhibition
on Messrs. Sharp's grounds We are inforned that there a decided disposition in this agricultural neighbourhood liberally patronised, the exhibitions have hitherto been Tiberally patronised, the exhibitions have hitherto beet singularly success ul, and the prociuction
given a deserved repute to the Society.

Mesars. Sharp's principal seed grounds are situated at and vear Heckington, a village a few miles distant from Sleaford. A very extensive track of land is here employed in the cultivation of farm and garden seeds, and even this is inadequate for the varinus requirements of the business of seed growing. The necessity which exists of keeping the different vegetables having1 a natural affinity apart from each other to prevent hybridisation is a formidable difficuly, and entails much trouble and expense on seed growers. The varieties of the various vegetables which cannot with propriety be associated with each other are distributed in several distinet localities. Mlessrs. S. have land engaged in the growth of seed in no lens than eight different parishes.
In purtuing the business of seed growing, it is 28 and most cennine samples of seed as it is advantagenus to the gardener to have his seed true to its description. Amongst other things conducive to this result is a due observance of the rule of inheritance, now practically recognised by horticulturists. The objects which owe heir present importance to their ready adaptability to the scts of the cultivator, fall more imp evident that it he scope of his rule. . unimpaired its required peculiarities, we must employ a specimen in full posseesion of the propertien pority value and desire transmitted. To ensure purity of stock, the plan pursued by Messrs. Sharp, the case of the ordinary farm and garden seeds, is first 0 grow a limited quantity of each kind, and eatisfied of heir genuineness to save seed for their own sowing from them; the seed thus saved is employed in their soed grounds. The extended cultivation of the Turnip leads to the demand for large quantities of seed, hence this valuable vegetable in all its approved varieties occupie considerable share of attention in thesegrounds. For seed roots the seed is sown in July, snd the Tumips re transplanted in land prepared for them in October. Mesers. S. find large succulent bulbs are subject to njury if they remaia exposed during the winter, and hat they suffer deterioration if housed in dry sheds. They find it better to employ bulbs of a medium size, which in transplanting are covered with soil being established in the ground they maintain vigour and sueculeses which ensures a vigorous growth ithe spring. Sharp's improved large Swede a ppears the avourite ; of this variety alone 30 acres are cultivated for seed. Green and Purple-top Swede rank next kling up 26 acres. The White, Green and Red Globe ary up 26 na coupy 45 acres; and, alo priaced bserved, in such cases varieties of the same plant when likely to hybridise are widely distributed.
In the management of Carrots for seed purposes the seed is oltained from carefully selected stocks and sown in May. In October the Carrote are selected and travsplanted in rich soil, receiving a dressing of Peruvian guano ; they are then covered over with soil o protect them from frost. By the adoption of this yystem-which by the way is not generally practised-the Carrot makes roots and starts into growth early in the epring. The seed harvest is thus forwarded; ss many 30 scres of the different varieties of Carrot aro

Mangel Wurzel is treated in the same manner an Carrot, and Parsnips share in the same management.
The Cauliflower, Cabbage, and other members of the Brassica family, from their close relationship and conequent liability of intermixture, present in their cultivation many difficulties to the seed farmer ; that these are not always succesffully overcome, growers of any of the multifold varieties of these usefal vegetables mow full well. For seed purposes plants of the leading varieties of the Cabbage tribe are planted out in July, and attaining maturity produce seed the following year. Seed crops are proverbially exhaustive ; hence high arming is of nectssity practised, and artificial manures re called into requisition, and the soil maintained in the highestetate of ferility. There is a proneness in cultivated egetables to degeneracy in poor soils, and high cultiation is eesential to maintain the character of a highly eveloped vegetable. This principle is well observed here; the natural soil, too, is in favour of the successful culture of garden vegetables. We cannot too emphaically enforce on seed prowers the necessity of a strict bservance of a system of management that secures soil ossessing every constituent of fertility, and plants possessing every constituent
Celery is planted from the seed beds in the month of October. Lettuce grown for seed is seldom remunera ive, foreign seed keeping down the price, although the mported seed is inferior. The hotrest land is chosen, but a good crop is seldom secured. The cultivation of Radish for seed was an experiment made last year for the first time; it succeeded so well that 10 acres were mployed this season for the purpose. The seed is sown in February and harvested in October.
Peas are grown very extensively by the Meesrn Sharp, and as they are considered liable to mésalliances, onsiderable precautions are employed to secure separation. The loeality offers varieties of soil and position,
and the growers are thus enatied to give sultabie suils
to the hardy and more delicate varieties. 180 acres of Peas were grown this season, and 30 aeres of Beans. Onions are not largely sown.
In coonection with this large seed farm are necessarily many extensive barns and store rooms. At secare a large building, formerly the A ssembly Room of the town, which when we saw it was filled with many the town, which when we saw it was filed with many
thousands of bushels of Turnip seed, beeides quantities thousands of bushels of Turnip seed, beeides quantites
of Carrot and other seeds. In novelties Messre. Sharp of Carrot and other seeds. Jn novelties Messr8. Sharp
possess a very fine
Swede Turnip, discovered in the possess a very fine Swede Turnip, discovered in the
neighbourhood, a dwarf hardy Brocelio of great ex-
cellence, called Ingram's Hardy Late Winter; znd an cellence, called Ingram's Hardy Late Winter, znd an
excellent second early Potato called Parker's Seedling, excellent second early Potato called Parker's Seedling,
We should mention that the land of the locality produces excellent Potatoes, and the best sorts are much cultivated by Messrs. Sharp.
We noticed a marvellous quantity of Quick in Messes. S.s grounds; a quantity was about being raised at the period of our visit, and it evidently deserved its title, it growth is due to the warm rich soil of the place.
We are glad to recognise the existence of a seed farmer who, holding a larye extent of land, can cultivate
his own seed, giving at the same time personal supervision to the numerous interesting operations connected with the business.

## Miscellaneous

Uniformity of Nature's Operations.-The agencies that now operate on and modify the surface of the globe-that scoop out valleys and wear down hills; that fill up lakes and estuaries and seas; that submerge islands; that rend the rocky crust and throw up new mountain-chains; and that influence the character and distribution of plants and animals, are the same in kind, though differing it may be in degree, as those that have operated in all times past. The layers of mud and sand gravel now deposited in our lakes and estuaxies and along the sea-bottom, and gradually solidifying into
stone before our eyes, are the same in kind with the shales and sandstones and conglomerates that compose the shell-beds of our estuaries, and the coral-reefs of existing seas, year after year increasing and hardening belong to the same series of materials, and in process of limestones and marbles we quarry ; the peat-Mosses, the jungle-growth, and the vegetable drift that have grown and collected within the history of man, are but continuations of the same formative power that gave rise to the lignites and coals of the miner ; the molten lavas of Etna and Vesuvius, and the cinders and ashes
of Hecla, are but repetitions of the same materials which new compose the basalts and green-gtones and trap-tuffs of the hills around us; while the corals and chelis and fossis, the fragments of plants and skeletons of animals now imbedded in the mud of our lakes and estuaries and seas, will one day or other be converted now stone, and tell as marvellous a tale as the fossils we Without this woiformity in the great operations of nature, the history of the Past would be an uncertainty and delusion. We can only read the past as connected with the present ; and premise of the future from what :ia now going on around us.-Adranced Text-Book of Geoloyy, by David Page,

## Calendar of Operations. <br> (For the ensuing week.)

## PLANT DEPARTMENT

Conservatory, \&c.-Next to Camellias, Azaleas are perhaps the most showy plants that can be had in bloom at this season, and where there is a good stock to select from some of the most forward plants should be placed in heat at once, moistening them overhead two or three times a day. Unless, however, plants can be had which made their growth and set their buds early in the season they need hardly be expected to flower so finely as under more natural circumstances in spring, and unless the buds are plump there will be some danger of the plants starting into growth instead of flowering. Dutch and where hardy shrubs are forced for the decoration of this house, these should be got into flower as soon as circumstances admit. Do uot forget to introduce into rentle heat a good batch of Roses, choosing the mos poomising plants of T'eas, Bourbons, and Hybrid Pe petanis, which are the best kinds for winter flowering a gentle bottom-heat will be of great service to these as also to most other plants subjected to heat in order to get them into flower as quiclly as possible, and a moist atate of the atmosphere must be secured, admitting a little air freely on every favourable opportunity. In greenhouses damp or insects soon do irreparable injury to soft-wooded plants at this season, and these must be fery carefully attended to if they are to be wintered in rather cool and dry, giving whatever water may be necessary on the mornings of fine days, so that the superfluous moisture may be removed before the evening, avoiding the use of fire heat except when
necessary to prevent the temperature falling below $40^{\circ}$, or to dispel damp when this cannot safely similar treatment, except that they are very subject to
sphere ; they must therefore be narrowly watched for this enemy, and smoked liphtly two or three evenings Euccessively if this pest makes its appearance, keeping the atmosphere moist and giving air on every favourable opportunity to prevent the foliage from flagging. Cine and should not be allowed to suffer from want of pot room These must not be trusted in cold pits after this season, for they cannot endure much frost. Plants intended to flower early should be encouraged with a gentle heat, keeping them near the glass and admitting air on every favourable opportunity

FORCING DEPARTMENT.
Pineries.-If circumstances should render it neces Pary to subject a portion of the stock intended for fruit ing to a brisk temperature at once to induce it to fully selected, and placed in a small house or pit by hemselves ; and, where anything like a regular supply heated compartments, should be at command; and without this convenience no gardener can reasonably be blamed for having too many ripe at one time and none a others. It is not by any means desirable to start more plants into fruit at this early season than may be absosutely necessary, for they will produce finer fruit later in the season than can possibly be obtained from them now and where a separate house cannot be commanded for those which must be subjected to a high temperature, we would advise that the plants selected for fruiting command, filling the rest of the house with young stock. The former should be afforded a bottom heat of about $85^{\circ}$, and the latter about $10^{\circ}$ or $15^{\circ}$ lower ; the atmosphere should range from $68^{\circ}$ to $75^{\circ}$ by fire heat, allowing it to rise $5^{\circ}$ with the assistance of sunshine, keeping the young plants near the glass, and properly supplied with water at the root. This temperature will be considerably too high for young stock at this season, but we have seen this system practised with considerable success ; and although the young plants may get somewhat drawn, they will gain substance as light increases, and the evil will be less than running the risk of starting a his early period of the season the greater portion of the plants that are at command for keeping up the supply are fairly broken the points of the shoots should be kept nearly on a level with the lowest part of the Vine; and f this should not be found sufficient to induce the bud o start equally throughout the length of the Vine, the rod should be bent so as to bring the most forward bud to the lowest level, elevating those that are backward, Maintain a thoroughly moist atmosphere by frequently sprinking the floor and passages, dc.; and syringe the Vines lightly at least twice a day until the leaves begin to appear, when the amount of moisture must be moderated. Give every attention towards securing a gentle warmih for the roots ; turning the litter, and adding resh as may be requisite, and keeping it well protected rom the effects of heavy rains and severe weather. Be atisfied with a moderate night temperature until the buds begin to push, when it may gradually bel raised to $60^{\circ}$ by the time that the leaves fairly begin to open.
flower garden and shrubberies.
Where the tenderer kinds of Roses are found to require protection this should be applied at onee, for it may soon be too late to save the plants. Also get irhout delay, for unless these are planted before spring they seldom furnish strong shoots for early budding. Many object to planting shrubs or trees in winter, believing that the roots if hurt at that season are liable to rot and certainly early in autumn is a very preferabie season; but with favourable weather we would $n$ delay such work a single day, and if the soil is properly
prepared by draining, \&ce, where necessary, as should prepared by draining, \&c., where necessary, as should ewer failures from planting now than if the work was delayed until March. Where however the ground to be planted is of a clayey nature, and in an unkind state at present, it will undoubtedly be better to defer planting until spring, meantime using every means to improve the state of the ground; and soils of this nature should always be dug or trenched some considerable time before plauting, as neither draining nor anything but exposure to the action of the atmosphere will bring them into a fit state for planting ; while, however, we would not hesitate to plant small" stuff" generally, at present things which are at all tender had better be left until the chance of severe frost is past, and the transplanting of large evergreens which has unfortunately been delayed until now should be put off until the weather becomes mild in spring, especially things which are known not to be perfectly hardy. Holl walks and lawns after frost to keep them firm and smooth. There will be comparatively little to be done in the flower garden at present, and any spare time will be well spent in going over the stock of Plants in pits for next season's use, removing every decaying leaf, and where the surface soil has got green, removing this and top dressing with sandy loam. There is nothing so unfavourable to these plants at this season as damp, therefure take every opportunity of admitting fresh air
hardy fruit and kitchen garden.
It is always desirable to get as much of the proning and uailing done before the approach of spring as possible; lose no favourable opportunity therefore of forwarding these operations; for, besides the advantage
of having that kind of work done before the busy
season, the garden will present a much neater appear ance after the wall trees are nailed and the bordera
made trim, and the small fruit bearing bushes pruned, and the ground among them turned over. See that standard trees which have been recently moved or root pruned are firmly secured against injury from winds, and also get any root pruning or trausplanting remaning to be done this season executed as soon as possible. Endeavour as far as circumstances will permit to have a good supply of Parsley under safe protection ; for there is generally a large demand for this, and in the event of a severe winter it is difficult to ave it by the ordinary protection of hoops and mats. Lettuces, Cauliflowers, \&c., in frames should be freely exposed on all favourable osesions. See to maintainin regular supply of Seakale, Rhubarb, and other forced vegetables, for which it is likely there may be a considerable demand. Look over root stores "ecasionally to see that nothing is going wrong, and be very careful o any Broccoli that may be fit for use or turning in. A was recommended last week, take advantage of frosty weatherto get manure wheeled upon spare ground, an see to ke eping a good supply well rotted and fit for use when wanted
state op the weather at chiswick, near london.

## The agricultural Gasette. <br> SATURDAY, DECEMBER 13, 1856.

The paper read by Mr. Fotherolle Cooke at the Society of Arts last Wednesday descriptive of the Leicester Deodorising and Sewage Works is given in another page. We hope next week to give the discussion which ensued, in so far as it turned upon from Mr. Wregstard's process as it is there carried out. At present we may say that the general result of all that was said appears to be that the manufactured material is not so valuable as to pay for carting it to any great distance. The only facts
indicating otherwise that were elicited being that a indicating otherwise that were elicited being that a
thousand tons of it had been actually removed during the past week by the farmers around Leicester. No analysis was forthcoming from the promoters of the scheme indicating the composition of the material in its fresh condition; the only figures of this kind being given by Mr. Lawes, who quoted Dr. Voelceer to the effect that 50 per cent. of chalk, 16 of sand, 10 of water, and only .7 per cent. of ammonia were present in it. Such matter will not pay the farmer for his cartage of it. Mr. Law es accordingly, who led the discussion, came to the conclusion that the off-hand decision quoted in derision by the lecturer, "Away with it to the German Ocean !" was a result to which we were driven by the pestiferous character of the material on the one hand, and the agricultural valuelessness of its product under Mr. Wichsteed's process on the other.

Mr. Chadwick argued for the liquid or irrigation method of applying the manure as against that of
extracting its solid part-pointing out that in so far as the nitrogen in sewage matter had assumed the form of ammonia, the addition of lime, as in WrersTEED's process, woald not throw it down, so that thus the best part of the liquid must run to wastecontending too that when added in the liquid form the soil absorbed and deodorised it at once-and showing from agricultural experience at Rugby and elsewhere the possibility of throwing all the sewage of the town hour after hour upon the land as soon as made, with the best effect opon the crops.
Mr. Sidney, in a most vigorous address, drew from the wonderful extension of all the appliances and all the results of agriculture during the past ten years, along with the fact that all schemes for utilising sewage had failed, the inference that the thing was agriculturally valueless. Farmers could not, in the face of all the illustrations he adduced be accused of supineness-their unwillingness to use the sewage matter offered to them must be accounted for only on the ground that the expense of so doing would exceed the returns. Mr. Sidiney devoted a good deal of his address to pointing out the errors on this subject that had been spread in the earlier days of its discussion, and the agricultural failare of those illustrations which Mr. Chadwick had adduced.
We then had two addresses from members of the Metropolitan Board, the one of whom contended for the propriety of conveying all the sewage matters of the town to a distant point there to be thrown away or dealt with agriculturally, as might be found advisable-illustrating, however, the way in which dilution destroyed its value by the case of gas water, for which manufacturers of ammoniacal salts gave 1s.6d. per 100 gallons when the ammonia in it was strong enough to need so much sulphuric acid for its saturation, and for which they would give nothing at all when half that quantity of sulphuric acid sufficed to saturate its ammonia. The other member made a very telling reply to his colleague's argu-ment-leading the meeting back to what, after all, is the true point from which to view the subject. He contended that these commercial illustrations were entirely ont of place; that the problem for solution really was how to render sewage matter harmless in the cheapest manner-that Mr. WickSTEED's process did this, as was proved by the increasing health of Leicester, and that whether the result was worth anything to the countryman or not was beside the question to the citizen. The question for the latter was whether it was cheaper to carry all the contents of his sewers 20 miles away by pipeage at enormous cost there possibly to do mis-chief-or to extract and fix the mischievous part at home and deal with the solid result-one part in a housand of the whole-giving it away, perhaps, or paying men to fetch it if they would not take it otherwise.

As Christmas approaches the public is supposed to become nnasually hangry: and after the English fashion of "feeding the mind" with anticipate viands, and whetting the appetite over a "bill of
fare," it has this week flocked to the live larder in BakerStreet. People unskilled in the bucolic heraldry of the "Herd-book"-the "Peerage and Baronetage" of the beeves-may wonder what atility there can be in forcing dumb animals to such a miserable state of repletion, and distending them to an amplitude of fatness that certainly proves how goodnatured their skins must be. And assuredly if all that the Smithfield Club did was to show the marvel-loving public what degree of magnitude and ponderosity certain varieties of cattle can be made to attain when over-feeding is strained to the extremity of Nature's endurance, its proceedings ought to meet with execration instead of applause, and the members themselves to be indicted under Martin's act.
When we remember, however, that it is not alone the size but the character and quality of the animals which enters into competition; that consumers of meat are interested in the production of cattle having a minimum of bone and offal in proportion to their flesh, and the graziers are profited by a breed which comes earlier to maturity than another; when we consider also that the nutrition of animals according to their destined use, whether for supplying fat, mascle, or dairy produce, is now almost a science, we perceive a new significance in the instituting of a test-point to which cattle, sheep, and pigs can be reared and fed. The most "oblate spheroid" of an ox that has seemed to challenge to eat and get fat against any beast of his age becomes a standard of excellence in aptitude for feeding and ability to furnish the world with beef.
If it were practicable to test a steer as we do a shape of meat) he can get out of a given weight of food, with anything like a constant result that would be applicable to the whole breed represented
by him, the comparative virtues of our meat-pro-
ducing aninals would have beenlong ago ascertained ducing aninals would have been long ago ascertained the advantage of the community. But from the numberless feeding experiments hitherto made no such rigid couclusions can be drawn; and our only course is still to bring all the rival varieties of cattle and systems of management
into competition, allowing each by a comparison of cost of time and weight to establish its position as better or worse than another. The prize animals of the domesticated menagerie in Baker treet may be neither directly remunerative to the feeders, nor, when butchered, palatable to consumers, but they are valuable as being the greatest achieve ments of our live stock improvers, labouring to outhat manayement yielding the most extraordinar specimens under extraordinary circumstances, which is found to be most profitable for ordinary business where lesser degrees of bulk and fatness are required.
The Smithfield Club does not lavish its distinc tions upon the most corpulent bullocks and pinguid swine, simply as such, but with a more practical issue confers them apon those which have most economised their rations. When the Society was instituted, in 1798, one condition for candidates was that " the kind or kinds of food must be certified ;" the next year a discrimination was made between beasts fed on "Grass, hay, Turnips, Cabbage, or other vegetables," and those fattened by "oilcake, corn, or any other food in addition," and the rule was that the judges should decide only after the selected animals had been slaughtered, and the difference between their living and dead weights, and even the proportions of fore and hind quarters, tallow, hide, offal, and butcher's meat in each carcass ascertained. In 1801 the candidates were required to state the condition of flesh of their animals when put up to feed : and the time of fatting as well as the ase and breed, and the sort of food, has always been a main point consigered in the adjudications.
Undoubtedly the fat stock exhibitions have tended wonderfully to remodel and improve all our varieties of live stock, not only advancing the art of agricul ture; but effecting a saving in the consumption of cattle-food relatively to the amount of meat produced, and amazingly increasing the supply
tables, Think of the days (not so very remote) when we had no short-horns, which are now grazing so many English counties and infusing into the native cattle of many countries the blood that insures perfection of form, indicating propensity to fatten, beautifully-grained meat, and soundness of constitution. The famons beasts of our fathers' day seemed bred with a view to superphosphate rather than to good roasting beef. What clumsy bone, what coarse ungainly heads, what a pelicanlike dewlap, what a leathery integament of hide stretched over sharp hip and wiry rib; andif some times of nighty weight, how sluggish had they been in arriving at maturity, and how tough were the joints they farnished for the spit! Again, in the cays before Bakswell made a "new Leicester," what un shapely slow-feeding flocks were scattered thinly upon our meads; and what lean lank hogs prevailed alike in farmstead and village, that no abundance of meal could make sleek, and that advertise the coarseness of their bacon by their porcupinelike bristles. Now, thanks to the exertions of our leading agricultarists not only to cultivate the best breeds themselves, bat to instruct the pablic by competitive exhibitions, unthrifty animals are becoming rare, and the wonder is how our swine can grow so portly at such an early age; how the improved varieties of sheep on mountain, vale, and marshland can accumulate so quickly their delicatelyflavoured mutton; and our graceful cattle thrive with sach rapidity in pasture, byre, and stall. It is a fact that short-horns now reach maturity in two and a half years in place of four or five formerly. The quantity of meat, too, in an ox of a given weight is now vastly greater than in the early days of the Smithfield Clab, owing to the smaller percentage of bone. The "offal" of the prize beasts used to averace as much as from one-quarter to more than one-third of their live weight, a proportion that would now be thought preposterous.

As an illustration of the benefitaccraing from such shows, take the case of our poultry. The "mania " of thelast few years and the competitive exhibitions have keeping, in preference perhaps to maintaining inedible dogs or cats, but has doubled the weight of the individual fowls; thas by judicious breeding wonderfully augumenting the quantity of a costly article of diet, with little greater outlay in the birds'
food. The varieties, too, are all defined and

ystem, so that everybuty has now learned lint un
o have game fowls for layin egrys, Iorkings fproducing plenty of delicate food, and hardy Cochins an unfavouable country and climate, but where most chickens, or average the heaviest weight. Another word we add while on the subject of ve so freely upon lamb and veal and other young delicacies, they must no longer inquire for delicious flavoured four-years'old mutton; and the fewer carcer and dearer must they expect to find full grown beef and mutton. I. A.

We are unable to give this week a report of the very interesting discussion on crop rotations that
took place on Monday last before the London Farmers' Club. Mr. Thomas, of Bedfordshire, who farms on the estate of his Grace the Duke of Bedford -the pattern tenant of a pattern landlord-contended most unanswerably for greater liberty of those of custom imposed upon the cultivator, by insisting on his following an order of croppingproper for the day when agriculture was a thing of mere routine, but hindering men now from using those means which increasing intelligence and skil had given them, and not only so but involving them in losses arising from the incompatibility of the rules laid down with the very nature of the plants they cultivate. Mr. Thomas took for his illustrations the faults of the four-course system on the one hand, and the Duke of Northumberland's agreements on the other. He showed how Clover every four years was in the very nature of things as proved by universal experience impossible and the modification of it, by which Beans or mixed seeds were made alternate every other fourth year with broa how the heavy crops of Turnips grown as guano an superphosphate now could grow them-consumed y sheep, fed on corn and cake as they now were fed-rendered the land unfit for producing good malting Barley. The crop was sure to fall, and in great measure therefore spoil, and when some one urged that the way to meet this was to cart home the crop and not consume it on the field, or to give his sheep less enriching food along with it, he replied with great force, that the proper object of agricul ture was not to find methods by which the fertility of soils might be kept in check, but how the very highest degree of fertility which could be conferred might be profitably utilised. His expedient was to make the four a five years' course, by taking Wheat after the Turnips, and Barley after the Wheat, and this he contended was possible, now that artificial and imported fertilisers could be purchased and supplied. Mr. Thomas's criticisms of the Northumberland agreements were of course received with general applause. He showed how the point insisted on-the application of so imply impossible. The consumption of all the crops would not produce the manure which, according to this agreement, was needed for their growth. And the enormous penalties must of course in every case be incurred, and cultivation would become impossible.

The only criticism of any moment which Mr. Thomas's argument received was from Mr. W. BenNETT, who pointed out that the arrangements proper in the case of Mr. Thomas and in that of his Grace the Duke of Brdford-both men of intelligence and honour-might not be generally advisable, inasmuch as neither character nor conduct were universally rustworthy, whether among landlords or among tenants; that the necessity of rules arose out ou the absence of that intelligence and ability which, however, whenever they did exist, ought to have the freest scope given to their exercise. We shal again refer to the other addresses that were given.

## EMIGRATION TO CANADA.

Seting a request for information from an intending emigrant to Canada, I beg to offer him my assistance having resided several years in that country. I should recommend him on no account to stay in Lower Canada, as from the peculiarities of their laws and system of tenure (though now perhaps about to be remedied), an want of ambition and energy in the French Canadians, he will nint find himself very comfortable there. Upper
Canada, west of Kingston, is the part I should recounCanada, west of hingston, is the part I should recou-
mead. There is a very fine country reund Cobourg, at the back of Toronto, in fact all the way to Amherstburg, where he may purchase with advantage. This seem giving a very wide range to select from, fut good land is found in all those paits; in fact, the whole of the land in Upper Canada, as a rule, is of excellent quality, and with common care and skill one cannot go wrong. The price of land of course varies much. Round larg

Cally the forther, ss it is the laryest town in Upper
Canada, it is very expensive, as choice farms may feteh from 100 to 150 dollars an acre (buildings included, unless of brick), a dollar being 4s. $2($. sterling, and even more should they be so situated as to be near or on the plated by every Canadian. Round smaller towns they average from 50 to 100 dollars the acre, or even less, averaging to distance, roads, and other circumstances West of London stretches a huce tract to Lake St Clair and Amherstburg of most fertile black soil but is a dead level the whole way, it might be too subjec the ague to be plensant. As a rule, fat rich land subject to the ague, and will remain so till more generally cleared and drained; it is a gently rolling tract, wit good natural drainage, that is the most healthy. It is rouchly well iapora both select a farm and running hooks, if possible ; but care and judgment will provid against the trouble and loss incurred by want of water, he greatest calamity that can happen in dry ho eather. The spring and brooks get lower and lowe 11 the summer till the Sentember and November rains, the first of which refresh, the second fill them, though the end of October is generally the driest time.
Land in Upper Canada is, as a rule, divided into lota 200 acres, each subdivisible again into half an quarter lots, they being so laid out, somewhat on the chessloard plan, that there is a rond to each 50 acres half or more be required, it
The best Wheat is generally grown in a tract of land hing from Simcoe 5 miles north of Lake Erie, round y Brantiord and Paris, to the head of Lake Ontario, horth of Hamilton ; but drought is rather too frequent a visitor there for me to recommend it toostrongly forsettlement - besider the land, originally rather too light, and cultivated rother too exclusively with Wheat, and very lightly stocked with cattle, must have its powers decreas ing. The county of Oxford, of which Woodstock is the capital town, is the part I am best acquainted with, and an emigrant will find there the requisites of good land, plenty of water, aud thriving and energetic farmers, who will prove to the newcomer most valuable books of peninsula lying betreen on the highest part of Onpeninsula lying between Lakes huron, , mists that pass over the lower country lying round; at the same time the rise is so gentle that the fact is only discovered by the superior greenness of the Grasb statistics of railway levels, and the flow of the rivers watering those parts. From all I have heard and seen place of residence.
The best book I believe to be "Morton's Cyclopædia," as it containg such full information on every point though "Stephen's Book of the Farm" is also an admir able work ; and should he add to that the Cardeners Chronicle to keep himself up to the topics of the day, he will find himself thoroughly provided. Of course, allow ances must be made for the difference of climate and the cessation of labour on the land during the winter for instance, he must not expect Wheat after Turnip or any root crop, as the Wheat ought to be in by sep tember 15, and the root crops till towards the end of October. His aeighbours, however, will give him al information he may require on that point.

As for the time for going, the earlier the better farming operations commence directly the snow off and the ground dry-say April l; and the winte stock of food having been consumed, the grain al threshed out and sold, fat stock disposed of to the butcher, \&c., it is the time preferred by all for giving ap possession, though the summer is, of course, the bend ume for judging of the quaity and cleanness on and its crops. There are, however, always some farms in the market that can be entered on almost at any time. I would remind "E. J. C. B." that it is no ins the to a man to offer to buy his land, though some of first class farmers would require a good bonus to in and them to quit places
lived many years in.
As regards clearing land, it will be difficult to find a farm in a good situation that requires clearing to any extent at first. A fresh settler would not like quite new lot, nor would he find it easy to get one in a good situation, and such a farm as he could buy woule lot) from 50 to 100 acres cleared (speaking of a whole lou) with a log or frame house on it, and a barn and our buildings; so there would be time for him to dec He for himself the best way of laying out his property. hould be careful too, in examining his intendeolland chase, to see there is a sufficient quancty on pickec say at least a quarter, and that not cur int all the good over, as he may fird when too late tr sold in a neigh rees have been cut down and burnt, or sol twisted woo bouring town, and nothing but the knotly frewod left, which is very difficult to convert into and no and it is only in the towns that coal is bum altogether even there.
Should it be necessary to purchase land in the winter ith an on arsive with snow on the ground, correct idea of the quality of the land by the trees that grow in the woods. Good hard-wod Beech as it is termed, marked by a plentiful growks, is the best, and Maple, with large straight cle light to heavy loum. and of a very good quality, from houg I have seen them Oak and Pine prefer light land, though pure brick elay. both growing on soil of the patuse swapps

He should also be careful as to his neighbours, that hifferent nations having naturally a tendency to cling different nations having naturally a tendency to cling
together ; so he might cast his lot among Irish, Germang together; so he might cast his lot among Irish, Germans,
Scotch, or native Canadians, instead of Englishmen, of Scotch, or native Canadians, instead o
which latter race I presume him to be.
Thich latter race I presume him to be. Canda will astonish "E. J. C. B." when he sees it, so little having been said about it, as Canadians lack that power of buasting so peculiar to our cousins south of the lakes, but it surpasses the States in every
point. The rapidity of incresse in material prosperity point. The rapidity of increase in material prosperity, acteristic of the States, in the sonndness of its institutions, in public morality, in freedom from taxation, in everything dear to a Briton it is immeasurably superior; ture it fearlessly challenges comparion.
I ought to mention the prices of stock of different sorts, but they vary so, such high prices being given for I ean only give, as it were ther breeding purposes, that for instance, fetch from 80 to 200 dollars; cows from 30 to 80 ; Bheep from 3 to 10 . Thorough-bred animals of the different English breeds, of couree, are at a fancy price, as here
I should sum up in the following words:-Buy good roling hard-wood land, thaling especial care it is well
watered, near a town, either present or future (as towns Watered, near a town, either present or future (as towns
rise quickly in Canada), on a good macadamised road, leading to a railway station, with good neighbours. Put your shoulder to the wheel (an idile man had better stay here), and if you do not become a happy and a wealthy dian Farmer.

## Home Correspondence.

Cotton Cake,-I observe in your publication of the 8th ult, an article upon the subject of feeding cakes for animals, in which is introduced an analysis of Cotton
cake. It is so different from that made of my cake by Professor Way, that I am induced to send you a copy of the latter ; and I also tale the liberty of sending by rail to your address a sample of the cake itself.
will do me a favour by presenting it to the author of the article referred to. I am afraid many spurious asticles have been introduced to the public under the name of Cottou cake, which by dieparaging the genuine article may result in a grievous injury to the agricultural world, for there can be no doubt of its intrinsic value. I have read and heard so much tending to its disparagement, that I am induced to withdraw my some enterprising individual may take my place, and that so valuable a boon to the agricultural community of this country may not be lost. I believe for refining the oil made from Cotton seeds, and, if W, will no doubt tend to continue the supply n cake. Whether the patent has been extended to this
country I am not aware, but I hear some negociations have been set on foot to effect a purchase by a very eminent firm in Liverpool.-Copy of Professor Way's analysis of Cotto

-Wm. Barber, Poulton Hall, Sheton, Cheshire
Leaf Feeding.-The conrtesy of Mr. Ben Giles is worthy of all consideration from me irrespeetive of the
interest which on this subject I feel. I therefore enter with pleasure on it with him, and I am happy to have met with so old a leaf-feeder. I myself am but a
novice in comparison, for I am only a leaf-feeder with intent for some 20 years, although like every one else who hoes a rowed crop, I have innocently been one from my earliest village days. Mr. Giles touches rather incidentally on a subject that, if considered at all, may had to much discussion, as lighting on the cause of the ascent of sap; to this I will againrefer, but first I would not appear to be of accord. He says "the better the culture the less this evolvement," that is of inorganic matter from the soil (and necessarily, according ing my views, of organic matter also), thus affect-
ing whole argument in favour of leafing my whole argument in favour of leaf-
feeding by exhalation from the soil, promoted by
this this more perfect 'culture, and facilitated by repeated stirrings of the surface. If gond culture promotes, as We have reason to believe it does, the reduction of the
crude matters of the soil into a soluble state, aud so cruce matters of the soil into a soluble state, aud so
accessible to the ronts of plants, it must render them also capable of entering into that state of which Liebig rumarles, "we cannot say whether they have really as sumed the form of gas or are dissolved in one," and in Which state I have supposed them offered to the leaves of plants, and, if capable of being so offered, there
cannot be a doubt that every movement of the surface effectuates an escape of gas or vapour-our noses even tell us so-and necessarily the ascent of the inorganic matters that this vapour carries with it 1 inatanced salt as being most open to common observation; but, as bodies as are coubt may exist of the capability of such elements of plants, of ented under the term of inorganic it may be as well to refor to the authority of Liebig. In his "Chemistry in ite Application to Agriculture""

London, 1842 , p. 108, he observes-" How much more
wonderful and inexplicable does it appear, that bodie which remain fixed in the strong heat of a fire, have ander certain conditions the property of volatilising of which we cannot say whether they have really assumed the form of gas or are dissolved in one! Stean causing the general have a very singular influence in causing them to assume the gaseous form. A liquid during evaporation communicates the power of assuming the same state in a greater or less degree to all substances dissolved in it, although they do not of them selves possess that property." Note, this extract i
from the chapter on the inorganic constituents of from the chapter on the inorganic constituents of
plants. That the leaves of plants are fed by an ascending gas or vapour is, I think, plainly indicated by the stomata or mouths by which they receive it being
placed on the under side of the leaves; were they fed by a descending gas- that is, from the falling atmospheric food-we should expect to find these stomata or mouths on the upper surface of the leaves, from which probally they perspire. To me roots appear to have two princiral objects in
descending deep into the earth, the fixation of the plant and the obtaining of water, at the same time admitting that with the water they necessarily take up whatever they find dissolved in it; but Mr. Giles seems to express a doubt of this last hypothesis, and "thinks it quite as probable that they gend their roots so deep into the earth in search of food lege organic thas what they find nearer the surface." I one of the greatest objects of tiliage is the breaking up and decomposition of the crude inorganic constituents which they can be taken up by them, the greatest amount of their inorganic food must be found near the surface; it does not appear then very probsble that the roors in search of this inorganic food should descend
through an area in which they abound into ose of scarcity. Nor indeed can we conceive in this inorganic food any attraction that could draw down the roots. We labour for an end, and we must suppose that within the more immediate circles of our labours the end is to a greater degree arrived at than at more distant ones plants with their daily bread of inorganic food to our he soil continuously open to atmospheric action, to oxidate the metals of the soil, how can we suppose the crude inorganisation of the soil to be acted upon at depths to which it is scarcely possible the oxygen of the air can penetrate ? Most roots descend into the will descend 6 fethur says the roots of our ceresis should descend so deep in quest of soluble inorganic matter !-hut what shall we say of the tap roots of Uaks and other trees seeking it 40,50 , or 100 feet below the lately, or what shall we say of the enormous trees deecend heights their heads tower in the air! Can they seek at these depths inorganic food which has been rendered gluble by contact with the atmosphere ; is it not more probable that they seek water, that they may furnish a continuous stream to supply the enormous respiration
of'their lofty heads? Are roots ever found to spread or extend themselves into a dry medium, be it ever so redolent of inorganic food? But the attraction between the root of a plant and water does not rest on argument, it has been subjected to experiment, and a wet aponge placed near a root has been foumd to attruct towarde it the thirsty mouths of its fibres. We have a selfhe root why need we look for any other? why tax our magination? But to what end works this immens perspiration of plants? Is it, as in the animal, mainly to get rid of excremental matter, or does it not act a most mportant part in constituling the motive power which causes the ascent of the sap? As it takes place, the water mmediately in contact with that evaporated supplies its place, and thus in succession a continued conduit is reated; the laws of adhesion and mpillary attraction eem to me all sufficient to effect this from root to leaf M. Goodiff.

## Eocietits.

the smithfield club cattle show
The current week has seen meetings of the Smith field Club, the Society of Arts, and the London Farmers' Club ; and the subjects which have severally engaged their attention stand first, second, and third in regular agricultural sequence. The subject of manures,
especially those derived from the consumption of food especially those derived from the consumption of foo by man, occupied on Wednesday night the attention of A large meeting, party agricuitaral, at the Society of Arts; the rotation of cropping by which manures are of a large meeting, wholly agricultural, at the London Farmers' Club; and the results of the consumption of those crops were shown at Baker Street by the Smithfield Club, to what may be termed a mulkitude of the general public.
The Exhibition of the Smithfield Clab in not, hewever, wholly one of results-the means to those resulta also occupy attention. We had specimens of poudrette nad variety-among then no fewer than 12 combined locomotive steam-engines and threshing machines, and speci-
ments and menores, the resuits of che use of these nuplethe result of their consumption cattle, sheep, and pigs, ments exhibited in the galleries, and the steam-engine placed below exceeded 12,000 l. in value, while the catile pheep, and pigs may have been worth $7000 \%$ or 80001 . as food.
The general objects and results of the Smithfield Exhibition are referred to in another page; we refe Many of the one or two items in the present show.
Many of the prize animals of Birmingham were successful here as well. The Hereford and short-horn heifers, shown by Mr. Heath and Mr. Stratton respecvely, ench received the first prizo in itr clnes at both places, though the Gold Medal for the best in the ard was awarded to the Hereford at Birmingham, but to the short-horn, as we thought more justly, at Baker Street. There is, however, no satisfaction in looking at these classes, so well filled too as they were at both the shows. It ought to be no satisfaction to any one to see a wellhbred young cow-fit only for the lds, if they do classes for heifers under four-yearnimals as will not breed, do mischief it is probably the system of over-feeding breeding stock for exhibition that fills these classee, which may to some extent be looked upon as the unfortunate complement and result of the July and other shows of our agricaltural societies. Lord Feversham showed a 2 years and 9 months old pure bred short-horn heifer, worth perhaps $40 l$. to the butcher, but worth mueh more if she would breeds, which, it would seem as if she hed not had the chance of doing-a chance certainly not improved by the courso of feeding which must have fisted her for exhibition here.

The ehorthorn oxen were of various quality, some of them apparently hardly ripe for exhibition, whick younger clase, siad however of the prize ox in the younger clask, viz. the 2 year and 10 months steer exhisainsbury, in which the value of Mr. Bates'a blood was apparent,
The Devon classes were good, and the Gold Modal for the best ox in the yard was won by one of them shown by Mr. Heath, of Ludham Hall-a remarkably thick, extraordinary thichness for a Devon,
There was a remarhably good show of Sheep. The Southdowns ware remarkably good, especially the light weight pens, where, as well as elsewhere, his Grace the The Richmond was successtul.
The Piga were few compared with the large thow at Bingley Hall. The prize lists in these well as in other classes indicate where the merit lay. We may here add that we have received from Mr. Wiley, of Rageley, a protest against the decision of the veterinary referee at Birmingham, who had disqualified his pen of 3 pigs as not being of one litter. This proteat is accom panied by declarations subscribed before a magistrate, In the galleries we noticed the stands of Messrs. Howard (ploughs), Garrett (drilling machines, water. drop drill, sc.), Busby (catt (ariling machines, waier Wediake (haymaking machines, \&c.), Dray (waygons and a general assortment of implements), Claytou (drilling machines, \&c.), Hill \& Smich (hurdles (drilling machines, \&c.), Hill \& Smith (hurdles, (carts and rollers, \&c.), Holmes \& Son (drills, \&ce.) Ransome (ploughs, chaff-cutters, \&c.), Barrett \& Exall (threshing machine, chaff-cattors, \&ce.), Hansom patent Potato digger), Burgess \& Key (reaping machine, \&e.), Patterson (crushing mills, with obliquely arranged grooved rollers for acting scissors-fashion on Beans and corn, \&c.), Boby (patent corn dresser), Philipps (Turnip grater), Moody (Turnip grater), M'Neill (roofing felt), Moore \& Co. (Hydrochurn, in which the beaters are a tin flanged vessel capable of holding hot water), Sigma (dibbles and hoes), beside many others: and we may name Mesors. Burreil, Garrett, Wedlake, Cambridge, Tuxford, Barrett, Ransome, Brown \& May, Clayton \& Shattleworth, Holmes, Boby, and Hornsby as showing each a complete locomotive engine and threshing machine
We must refer to the stands of seede and roots by Messrs. Gibbs, Skirving, Sutton, Lawson, and the Irish collection of the Dublin Society. The Swedes by Messrg. Gibbs were wonderful, the Mangel Wurzels of Mr. Skirving were astonishing, the general merit of Mr. Sutton's collection was first-rate, their specimens culture ; the collection of agriculture than of hortiadmirably arranged and very full. Lawson, too, was admirably arranged and very full. The weight of
crops from whicla the specinens were selected had been crops from whick the specimeus were selected had been
ascertained, and the specific gravisy of the roots them selves was given: thus some specimens of Tumnips were stated as being of a of 30 tons per acre, pecific gravity as high as .893 ; while others from a erop of 27 tons, sp. gr. 752 -differences thene of enormuen gricultural impertance.

also to be largely increased．
Socisty of Arts，Dec．10．－The Utilisation of the Scocage of Towns．－The following is an abridged repor of the Paper read at the meeting of the Society．We
are indebted for it to the columns of the Society＇s are indebted for it to the columns of the Society＇s
Journal ：－Mr．Fornakaril Cooke ssid－I am to have the honour this evening，in compliance with a
request from the Council，of addressing the Society on the important subject of the atilisation of the sewage of aition includes，not only the converting of putrefying refuse matter，rich in the food of vegetable life，to useful parpone，but also the purification of our streams， and the improved health of the crowded population of
cur streets．This three－fold good may be attained in
different different ways－lst，by employing the sewage as it
pases from the tow，to flood or water the land． 2 d ，
from the town，to flood or water the land． $2 d$ ， parating chemically and mechanically both the
natural channel－beds，whilst the solid residuum is pre－ pared in a convenient form for agricultural use．The operation on a small scale at Edinburgh and elsewhere with the most satisfactory agricultural results ；and the deodorising system has，so far as its sanitary and manu－ acturing results are concerned，achieved a perfect suc－ cess at Leicester．There the entire sewage of a popula－ tion of 65,000 has been operated upon since Mny， 1855
to the present day，and 6000 tons of solid matter have been separated from seven or eight million tons of sewage We have，then，in both cases practical facts，not theo－ tion，whether the sewaye will bear the cost of convey ance and distribution，and the solid manure the cost of manufacture，remains to be determined
Having mentioned that fluid sewage has been most advanta－ geously applied to land（especially meadow land and crops of
Italian Ry－gras）under particular circumstances of eason and
locality，I desire，before I proceed to describe the deodorising
systen the locaity，to state my reasons for thinking that no method yet
systen，to
proposed for the employment of unprepared fliid eewage is appli－ eable on a large scale
due order，I sull have an opportunity of pointing out how the
objections to the fluid asstem mav be obviated，by working it in conjuntion thit fleod dorisem mation．The suphiay of fuid semage being
constant，it should be dealt with constantly；it cannot be accu－ mulated or stored up．But the farmer cannot constantly employ
it．He canno employ it where his ripening cops are standing，
to nor dur
or deep
minds wieds of March，have soddened his heavy clays．During hay harvest in y une，he will gladly take a fall supply；and again，during the autumn season of con－
tinued drouglit and with bare fields，all the farmers of the district would be clamorous for a portion of the then stinted stream o This sewage of the metropolis is said to contain sorme 10,000 tons of ammonia，a quantity which would suffice to supply with
ammonia about 500 square miles of land annually．But the sewage containing that quantity of ammonis would be too small to be distributed equalif over the land；and，practicaly，
square mile daily
would
be the largest dressed with sewage．The demand during the dry season would
exceed this．The idea that naturally suggests itself is，let
and reservoir be made that shall storanp np the secumulation of the
previous season．But the reservoir for London required for only previous season．But the reservoir for London required for only
one day＇s supply during dry weather must messure more than
12 million of cubic feet，and would occupy somes al acres of land 10 feet in depth，and such a reservoir，with its putrescent exha
lations，must be hermetically sealed up．Such a project is obviousiy impracticable．The sewage，When not required for
irrigation，must either run to waste or be differently treated．Buu
even mithout such a storing of putrescent matter，would there be no danger to the health of the country population in having
neveral square miles of land between London and the Thames mouth soaking，or drying after a soaking，with fermenting sewage－dressing leaving on the surface a scum of putrifying
organic matter under a burning July sun，－－a gentle easterly breeze wafting the fragrance over the metropolis during the dog
Now let me turn，in contrast to the deodorising system ：
The leading feature of the deodorising syatem is，that it does not deal with highly putrescent sewage，abounding with liberated ammonia，but with the fresh sewage as it descends in the sewer
before putrescence has made any material advance，and it is in that state，and bofore the semage learves itt underground course to enter the deposit reservoir，that it is intimately blended with
cream of lime，which instantil deprives the semage of all odour and precipitates almost the whole of the salts and solid matter contained in it to the bottom of a reservoir，from which it is
removed again，always under the cover of several feet of scent less water，through covered channels to filter frames，and in these filter frames the consolidating process is completed．I will now， arranged and perfected by Mr．Wicksteed，at Leicester，to
whom we are indebted for conceiving and working out the Whom．We are indebted for conceiving and working out the sewaye is conveyed to a spot less than
mile
mile as it arrives，and scarcely sllowing，time even for in
cipien poutrefection，it is raised 18 feet，by pumps worke
by steam power．Whist passing fimm the pumps the sewa hy steam power．Whist passing frm the punps the sewage
becomes intimately mixed with a body of linie and water，pro－ portioned to，and constantly varying with the nature of the
sewage which produces an instantaneous and perfect deodorisa tion．It then flowar puccessively through two canals，the first
60 and the other 130 feet long， 45 feet broad，and 16 deep，which are traversed by the sewage water in about two hours and a half and the water which emerges when the lime has been well pro
portioned is almost pure and perfectly scentiess，whilst the greater portion，or about seven－eighthh of the solid matter origi－ nally held in solution or suspension，is deposited 88 fine mud in
a trench at the bottom of the first canal，from which，by an Archi a trench at the bottom of the first canal，from which， $\begin{aligned} & \text { medes，or an archin } \\ & \text { men }\end{aligned}$ tinued action from beneath the deep stratum of the deodorise shaft to a small tank，in the npper part of the building by Jacob＇s ladder，similar in principle to the ladder of buckets used in dredging machines．A series of centrifugal machines are then charged with it，and effect the separation of the remaining Water，learing the deposit in a plastic state，fit o be formed int
a brick or cake for drying．At present nearly 3000 on on of this half dry deposit are heaped up in the yard of the Leicester morks， and emit no smell whatever
The inbabitants of London in maintaining their vitality consume about 12,000 tons of nitrogen annu－ ally，equal to about 15,000 tons of ammonia， 10,000 ons of which are，as 1 have before stated，carried off by the sewers．The phosphatee amount to about 6000 tons． Now，good guano，as it reaches the farmer，contains，on
an average，about 16 per cent．of ammonia ；and 4 cwt．， or 450 lb ．，of such guano per acre，would be considered a rich average dressing，and would contain 72 lbs．of ammonia．The ammoniacal matter in the sewage o quantity to 320000 acres or 500 square miles．Now this quantity of ammonia，if it could be entirely pre erved，would represent，at the market price of $60 l$ ．per on， $600,000 \mathrm{l}$
When the idea first fixed itself in my mind，that during m Wn lifetime thirty million pounds worth of ammonia had thug
gone o to wast from the city of London alone，I fele that the
git fit aloo that there is another question linked with it of a much higher order－the sanitary precautions which must precede that utilisation，on which pre－
cautions the health and lives of the population are greatly de－ cautions the health and lives of the population are greatly de－
pendent，as I will proceed to show．For mark how improved
smitary arrangenuents，with deep drain age，and a rapir remoral
and

|  |  |  |  | 淢总 | 部范 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 432 | 374 | 806 | 591 | 466 | 967 | 1773 |
| 1853 | 448 | 345 | 796 | 404 | $48)$ | 884 | 1680 |
| 1854 | 420 | ${ }_{3}^{421}$ | ${ }_{816}^{241}$ | ${ }_{344} 39$ | 310 348 | 739 694 |  |
| 1855 | 450 340 | ${ }_{324}^{366}$ | 816 664 | 344 355 | 348 | $69 \%$ | 1498 |

I fear also there is even a stronger and more general feeling against the process of deodorising，and the manu－ facture of manure from the sewage；but I believe this feeling arises chiefly from the subject being taken in wrong point of view．I must beg you will strive to listening to the statement I am about to make．
I am not going to describe solid sewage as an English guano， Torth 4．or or．per ton，but as a substance containing ingredients especialy valuable on heavy soils，and availabie near the place
of its production．I shal show that it can be made at 38 ．or 4 ， per ton．and that it it likely to realise a rather laryer sum in
the market under judicious arrangements．At must ber remem－
bered that the great mass of farmers do not look alone manures rich in nitrogenous matters．Lime，chalk，marl，sea－ are paid for，and carted sometimes many miles during
the less busy season of the year；and sewage manure will also find purchasers，at a low price，where it can be obtained at a short and cheap carriage． river a water carrlage on a tidal stream both up and down its for barging to foreign depots．Solid sewage，though it may con－ from the earthy matters held in it in an extremely divided tate．Its composition is very variable；the analyses that have
been published have been too often made from the dry lump， after long exposure to the air，and are so far fallacious．
Sewage contains the debris of every description of animal and Seqage contains the debris of every description aral substances The refuse from our abodes unquestionsbly forms the greater
 employed in renewing and not in increasing his frame．Ever kitchen sink also supplies a large quantity of adimal refuse， Waste．Every falling shower washes into the sewers masters，as well as potash from the decomposed granite of the streets． Manufactories add many other substances to the foregoing，an
tons of somp increase the richness of the stream．These miscellaneous matters，dissolved and broken down in the waste stained by some bright coloured dye，generally offers a nearly
niform blackish grey mixture，of which this is a farr specimen Very little solid matter，except chips or shavings of wood， contains a vast variety of ingredients，the most valuable bein food，not even those which most abound with it when harvested Who ever thinks of giving his Clover a nitrogenised manure？ Gypsum，or ashes，are the most energetic stimulants to much nitrogen as a crop of Wheat．Give a crop of Clover only ammonia in the air or in the soil．Again，the Clover plant， after carrying off with it so large a quantity of nitrogen，is nitro－ the best preparers for a crop of masat，which dore，should not be Valued solely by the nitrogen it contains－nevertheless，
tains more nitrogenous matter than farmyard manure－besides tains more nitrogenous matter than
many other substances $\$$ Which roo
Deodorisation，in its practical sense，does not simply Den the rem， tion the abatraction of all extraneous matter， 800 or 1200 tons of water ouly furnishing one ton of solid dry residuum．
conain the salts，and especially the ammoniacal salts，with the undecomposed nitroge－ nous matter，but it the fluid part is to be employed for irligaving
then the suspended matters alone should be separated，leasing the more valuable salts in solution．

We now arrive at the queation，what is the cost of production of this heterogeneous compoun

barges lying alongside the works．The cost of removal I have
 of paming it praaty in faverr of the deodorising pitan

 deodorised and solidified in the outskirts of the mewage is irrigation, this portion of the expense would be much diminished Whilst the make wonld be nearls the same. To effect the double object, I suggest that the effluent stream on its course to the river-- Bay at Long Reach - be conveyed through such an extent
of the comparatively level county of Essex as could consume the water for irrigation. Supposing the season to be favourable for irrigation, and the whole of the water to be required at any particular time by the farmers, the sewage would be treated with s greatiy reduced charge of lime, only just sufficient to fix the in suspension, allowing the salts in solution to pass off with the still turbid but deodorised water in such a state that the whole would sink into the soil without leaving a putrifying scum on the surface. When a reduced quantity of irrigating water wa meet the demand, and at those hours when experience only to bave shown that the fertilising salts were most abondant in the semage. Such an arrangement might be facilitated by a simple
line of telegraph between the sluice-keepers and the London

Mr. Cooke then proceeded to discuss the new drainage plan for the metropolis.
[We shall report the discussion next week-meanWhile we add that we have received letters urging the adjournment and reopening of this discussion, on the ground of its present incompleteness.]

## Notices to Correspondents

Boz- Feeding por Pigs: J SE. Mr. Warne's mixture will no
doubt fead bacon well ; but the plan of bor-feding doubt feud bacon well; but the plan of box-feeding, $i$. e., of with pige. They root the straw about so much as to further
fermentation more than their treading checks it. Linseed, fermentation more than their treading checks it. Linsoed,
however, makes very oily flabby bacon. inkrficient Manuris: $F^{i} A S$. The following is a case against you, proving that justice may be had in instances of loss Was decided by Sheriff Barclay at Perth. An agent for the prospectus furnished by him as being equal in effect to twice the same quantity of guano, sold a considerable quantity to try it from the certificates in its favour, as well as from its being much cheaper than guano. Wherever it was tried, howthe farmers could discover, it had no effect whatever ar as manure. In such a case it was hardly to be expected that the farmers were to pay for the article, seeing that they had been heavy losers by using it. Some of them accordingly refused, Messra. Reid and Luke-for the amount of their purchase In evidence it was proved that on these parties' farms and on others in the neighbourhood, it hed turned out a total failure, and their plea was, that as they were led to expect an
article which would act as a manure, they were not bound to pay for it whea it had not done mo. For the pursuer it was pled that the statement in the prospectus was correct, and that the whole certificates annexed were genuine, and that if he proved this, he was not bound to guarantee that a crop would ing the article, which was what he pretended it to be, snd Which succeeded elsewhere. The sheriff, however, held that it defendants' district, and that he was not entitled to judge of what it had done else where. If the agent sold the manure to raising crops. Lnsgred: Farmer. "English Linseed," i.e., the Flax crop, is
of easy and profitable cultivation. Paper-makers cannot affurd to give the price per acre for it that linen manufacturers will Linseed fibre before converting it into linen and then to rage, or straw chaff, ซe should prefer Linseed to Linseed cake. Boil the meal into a thin mucilage or boup.
forster Crop of Turmips: Wondering Sandy will have seen "Allowing the Turnips to be only 14 lbs a-piece, and singled oat to 12 inches apart, the produce per acre would only be about 120 tons! That is not bad, however, when we consider that the field is 'sand' and manared with 'Tiger's manure' (of
Beverley) to the acre. What a run there must be for Tiger's manure next season!" Ke says:- "Last spring I received (by invitation) a profesBional visit from a weil-known draining engineer. He had
previously informed me that his terms were three guineas a day and expenses. Me arrived at half-past 2 P.M. on one day and left me at noon the next, and thus his time of absence from his home (London) would be about 40 hours; his time at my
 explains his charging for three days by saying that he 'calculates eight hours to a day', as 'regulated by professional
custom, and acknowledged by Acts of Parliament as the length of a day." " [Your card did not reach us ; but that is immaterial Roops: MP. A sheep will eat from 18 to 20 lbs . of $\$$ wedes a day. If store sheep have access to any other food on the ground on find about 20 lbs a day the quantity required.
lo aimply hand-weeded, or spudded out of pastures minn fnfests.
What is Drenag? which is "from a noun now known only as a provincial word, Dredge, we are a mixture of Oats and Barley sown together. Blandford and used as food for farm-horses. When Barley is but there it produces a thin grain with a oad yield per acre,
it is believed it adds much to the welght per acre. They sow ond-fourth Barley and three-fourths Oats. This, with a slight
admizture of Beans when given to the horse, tends more than any other corn to produce the muscle and fat which is wasted
during the worklug hours. Sarley does not offer so great an formation of fath. Beang containd twice the amount of fleshe producing substances either of Oats or Barley, therefore we and acceleration" read " loss of cud, and dec. ${ }^{\circ}$ " in col. $c$, 1 lta line "loss of condition and of price," should be. loss of "condition and of time;" and in 8th line from top, "coarse olein," should As usnal, many communications have been receired too late,
and others are detained till the necessary inquiries can be made We must also beg the indulgence of those correspondents the

## Cottam's Patent Inventions for Stable Requisites.

Awarded a Prize at the Paris Exhibition, and Patronised by the English and
French Governments.

THE Original INVENTORS of the PATENT ENAMELLED MANGER RACK and WATER TROUGH 1 AS ONE FIXTURE, to which they have made important additions, the main features of the same being explained in the A represents the Pat
A represents the Patent Halter Guide and Collar Rein, the bell
of which is talien to the back of the manger, works with ease and freedom up or down the guide bar, and is noiseless in its operation, as also a sure preventative against the most restive horse 8 The in the stall.
8 The Patent Fortable Seed Box can be instantily detached from the Rack without disturbing the hay. The saving of the
or mixing with the food in the manger, is alone sufficient to claim general notice.
ight and durablex detached, mado of Galvanimed Sheet Iron D The Patent Saddle and Harness Bracket combined, can be used with great advantage in Harness Rooms, where apace if an object, as the long portiou of the bracket can be turned up out of

Cotram \& Hallin, the Inventorb, have designed these Fittings on strictly scientific principles, and they are, if not perfect, the most in keeping with the science of the present day of anything yet produced. The facts of their having been extensively lntro-
duced by architects of known practical experience, besides obtaining the favour of both the English and French Governmenta, are
valuable duced by architects of known pr
valuable proofs of their utility.
COTTAM'S MANGERS are constructed in the best possible manner, both as to form and utility, are cleanly in appearance, durable, and impervious to infection; manufactured Plain, Galvanised, or Enamelled.
Improved Stable Guttering, witle moveable safety covers, Sanitary Traps, Stable Pumps, Patent Loose Box Fittings, Harness-room Appendages, and every article in Stable Furniture. Chaff' Cutters and Oat Bruisers, kept on shovo at

Everything connected with a Garden procured from the best Sulham,
HOREIGN SEED OHDERS.-Plymonth is admir 1 ably situated for the execution and transmi-sion of Forkios Orders. The Subscribprs have duting the past stavion formarde Seeds to Australia, New Zealand, United States, Canaida,
Impia, Mata, France, Austra, Portcaal, Ionian Islanos Gadeira, Gambia, China, Cape ofgood and they have shaplied several RUssian OFFICERs (lately quartered in Plymouth), to take to their native country.
The following letter has just been received from a Nurseryman in Australis, and is important in showing that by careful and proper packing seeds withot injury.
"The case of Seeds you sent me arrived in excellent sondition, and they are all growing well, and, from every appearance, $I$ should have supposed that they had only travelled a short distance instead of SO MANY THOUSANDS OF Miles. This I consider is owing to their being well ripened and dried, and carepullx and properly picked. I have to tender my best thanks to you for your out to this Colony are destroyed owing to their getting damp on the passage."
Our plan of packing them suceseds admirably, and all the Toreign Orders will be attended to with proptness and care.
Wiliam E. Rexdle \& Co., Foreigu and Export Seed Mer hazts, Pl

## WALTON NURSERY, LIVERPOOL.

To Noblbies and Gristlemen Plaming New Pleagure Grounts or tiprofing Parke or Deives,
TV. SKIRVING begs to off r his Stock of TREES - and SHRCBS of varions fizes, adapted either for immediate effect or for extensive new Plantations, where smalier
sized and less expensive plants are reqnired. In addition to his general stock of the leading kinds of Trees and Shrubs, which is allowed to be the most extensive in England, he this season offers upwards of a hundred thousand of the two most valuable Trees lately introduced, the ARAUCARIA IMBRICATA and
CEDRUS DEODARA, of various sizes, from one to six feet CEDRUS DEODARA, of various sizes, from one to six feet. W. S. invites any one wanting Specimen Trees and Sbrubs to height of such trees (as quoted in list.) gives no idea of the value of well growa select plants for choice situations.
N.B. A few handreds of the larger sized and finely shaped plants of the Araucaria Imbricata and Cedras Deodara have been griwn in tubs, to secure their travelling in safety to great distances in this country, or to any part abroad.
CAMELLIAS, some of estra large size, well adapted for well set with flower Buds, at very moderate prices.

CHARLES NOBLE having retired from the business atablishing a NURSERY on his own account, near the Sunningdale Scation, South-Western Rail way. He takes this opportunity of returning thanks for the very liberal favours bestowed upon the late tirm, and hopes by strict att
a share of such patronage in future.
Cearies Neals also begs to say that he will shortly be in a position to execute any orders with which he may be favoured, ione be addreased CHARLES Noble, Nursergman, Bagshot, Surrey. J OHN sTANDISH begs to ady that the Nursery formerly condncted by himself, and subsequently by the
firm of STANDIGH \& NOBLE, is now carried on solely in lis own firm of STandrsf \& Noble, is now carried on solely in lis own name, and he takes this opportlinity of acknowledying, and tanlate firm, and hopes to receive a continuation of the sause, which having and experiencoin to merit. He aisn bpge to state that having gmad experience in Planting, aud the management of Plantations, he wifl be happy to give advice on those subjects. A nd
he also emhraces the present cecasion to say that he has engaged the assistance of a Landscape Gardener in gnod practice, to give advice in layisg out new grounds and in contemplated Improvements, a. well as in all subjects relating to Ormamental Gardening and Garden Architecture. SATURDAY, DECEMBER 20, 1856.
An advertisement in another column will have apprised the public that the Council of the Horticultural Society are contemplating a fundamental change in the objects to which they propose to devote the Garden, the maintenance of which appears to them, and to many others, indispensable to the welfare of the Corporation. The subscription that was opened with this great ohject in view, although not reaching the amount which the Council anticipated, has nevertheless made very considerable progress, and, with the monery Street will it a sale of the Hoase in Regen pecuniary affairs upon a satisfactory footing.

Althoush unable to announce the plans of the Council with respect to the ensuing year, their views not being yet matured, we nevertheless understand that they are resolved to throw all possible vigour into the operations of the Society. It is intended that the Garden should be principally devoted to practical Horticulture in all its branches, and made great school of experiment, where all new inventions, new fruits, new garden plants, new vegetable seeds, and new building contrivances shall be fairly
tested. A guide hook for the information of visitors is in preparation. Communications have been opened with foreign countries with a view to procuring exotic seeds for distribation, the forerunner of which may be regarded the bequtifu! hardy Pampas Grass now giving away, and the valuable serdling Camellias, for which the Society is indebted to the liberality of one of its members, Francis J. Sloane, Esq., of Florence; these will be in distribution about Midsummer next.
In addition to the usual monthly meetings in London, which retain their former character, it is said that two grand meetings are to be held in London, in some large commodious building, the oue early in May for such horticultaral productions as may be then procurable, and the other in October for a grand exhibition of fruit in which continental frait growers will be invited to join the English gardeners. It is even whispered that an exhibition in the Garden, upon an entirely new plan, is under consideration, the great iron conservatory being cleared for the parpose, in aid of the usual tents.

We entertain no doubt that these arrangements, or such of them as may be eventually carried out, will be so framed as to give the Fellows of the Suciety all possible advantages and privileges, beyond what the public can obtain by the mere purchase of tickets. Should this be so a very large accession of Fellows, under the new regulations, may be anticipated. So well indeed do these regulations already work, that at the very first meeting after they came into operation 17 new Fellows were elected, on the second meeting 37 , and we hear that many more candidates for the Fellowship have since presented themselves for ballot at the meeting in February. The cost of a Fellowship is now indeed so small, admission fees having been abolished and the annual sabscription being either four guineas or two guineas, at the option of the Fellow, that a considerable increase in the numbers of the Corporation seems to be a certain event. So large a number as 54 elections in two meetings has not occurred since July 1821, the period when the Society was in its highest prosperity.
Ir will be in the recollection of our readers that we some months since announced Lord Firzwilliam's intention to institute some experiments upon the relative strength of the timber of our two species of native Oak, Quercus sessilifora and Q. pedunculata (see Gard Chron. 1855, p. 803). A very interesting communication from Mr. Henderson, who has charge of his lordehip's woods at Wentworth, shows that these experiments have now been

With the view of settling a disputed point, hout which we have interested ourselves, and taken some pains to get set at rest, "I have now," he writes, "inclosed for your consideration the details of all the experiments and the results, and also specimens of the two sorts of timber experimented
upon. Yon will see by the inclosed tables that upon. Yon will see by the inclosed tables that these experiments, taken as a whole, are in favour of the greater strength of the timber of $Q$. pedunculata. The pieces of each sort differ considerably from one another in the weights which they bore, but Q. pedunculata sustained weights varying from 68 stone to 52 , whilst the greatest weight borne by Q. sessiliflora was 60 , and the least 44 stone. Taking the average of all the experiments, $A$ pedunculata) gives 57, and B (sessilifora) 51 stone. "In order that you may better understand the inclosed tables, I will now explain the manner in which the experinients were conducted. Two strong trestles 4 feet 8 inches high were placed 6 feet asunder, and fastened together by tie-boards; on these the scantlings ( 2 inches square by 6 feet 9 inches long) were placed, each end resting with about 4 inches on the trestle. The 6 feet of scantling between the two supports was in each case divided into eight equal parts, numbered in the tables 1, 2, 3, suspended, and at each of these points the deflection was taken as the weights were added, in sixteenths of an inch. The weights were suspended by means of an iron strap (made to fit on to the seantling), to which was attached an iron chain carrying a box to contain the weights. The box, chain, and strap weighed together exactly 4 :tone, and all the weights used in the experiments were 4 -stone weights. A 4 -stone weight was added at the end of every two minutes from the commencement of
the experiment, and the greatest deflection of the scantling marked in the centre at the time of its breaking. In the tables A represents $Q$. pedunculata, and B Q. sessiliflora; 13 experiments were made on each sort. A scantling also of each kind was afterwards weighted-at once-with 52 stone to prove how long they would bear it without breaking; A
bore the weight six and a half minutes, $\mathbf{B}$ only half
a minute. Taking the greatest deflections of the different pieces, it appears that the aggregate individual pieces, the greatest deflection in $A$ is only very little over that of $\mathbf{B}$, and the least of $\mathbf{A}$ not much over that of $B$.

However, the experiments, taken altogether, would indicate a greater degree of toughness in the timber of $\mathbf{A}$ than of $B$. In the seventh experiment a scant ling of $A$ bore a weight of 60 stone with a deflection of 8 inches; it then splintered and slipped from the support at one end. It was then reversed and weighted with 40 stone, when it broke with a deflection of $9 \frac{17}{18}$. In the ninth experiment a scantling of B bore 48 stone, splintered with a deflection of 6 inches, and was reversed and weighted with 28 stone; it then broke with a deflection of $9 \frac{1}{2}$ inches. In the progress of these experiments it very soon became evident that there was a very perceptible difference between the weights of the scantling of A and B ; and that difference became more manifest in finding the specific gravity of the two species. A 4 -inch cube of Q. pedunculata gave as a result 972 , while one of sessiliffora gave only 864 . Other experiments made on larger and smaller pieces gave a somewhat similar result, showing the greater density of the timber of $Q$. pedunculata.

In most of these experiments the outer or back side was placed underside, as being the position in which-in the opinion of some-timber bears the greatest strain; but other trials were also made with the bark side uppermost, and although the weights sustained were not the heaviest which either kind had borne during these experiments, yet they were also not the lightest. The specimens inclosed are two 4 -inch cubes similar to those used in finding the specific gravity, and the other pieces are parts cut off the erds of the scantling used in the experiments. Lord Fitzwilliam has directed that two more trees be set aside for experimenting on next year. If any one can suggest improvements in the manner of conducting the experiments, so as to make them more decisive, we would very gladly adopt them."

Mr. Henderson has forwarded the details of the experiments, in which the amount of deflection step by step until breaking occurred is noted down with minute exactness. Those tables are too long for insertion in this place; but we have abstracted the following tables showing the general result:-
A. Quercue pedunculata.

These results do not entirely correspond with $\overline{\mathrm{Mr}}$. Hzmbreson's conclusions, probably owing to some difference in our mode of looking at the tables from which they are drawn. They howerer show that
while the average breaking weight of Q. pedunculata was 59 stones, that of Q. sessiliflorawas only 50 . The tables themselves place Q. sessilifora in a yet more unfavourable light, as appears from the following statement:-

| $\begin{array}{c}\text { Q. PEDCYCLLATA, } \\ \text { out of } 12 \text { trials, carried }\end{array}$ | $\begin{array}{c}\text { Q. sessiluflorá } \\ \text { out of } 11 \text { trials, cartied }\end{array}$ |

Not at all
Mr. Henderson speaks of three experiments with these Oaks when the scantlings were placed with the bark uppermost. In these cases the tables give the results as follows:-

So that it appears to be by no means immaterial in what manner the bending is conducted
while $Q$. pedunculata with the bark upwards broke with 48 stones, it bore more than 54 stones when bent in the opposite direction. There can be no doubt that as a general rule wood bent outwards breaks with a small strain, and that it is only when bent inwards that it shows all its elasticity: as is familiar to archers; a circumstance probably due to the greater hardness of the inner layers of wood. Nevertheless, in the experiments before us, the position of the scantlings seems, in the case of $Q$. sessiliflora, to have been unimportant, 42 stones having been the average weights resisted by it in both cases, and that it even required 52 stones to break it when bent outwards instead of 50 which broke it when bent inwards.
This very striking circumstance was not without its parallel in other instances, as we find upon a careful examination of the tables before us. Thus in Exp. A 1, it required 60 stones to bring the deflection to 3 inches, while in A 8.48 stones were sufficient for the purpose; and again the breaking weight of A 1 was 68 stones, but in A 8, 12, and 15 it was only 52: an excessive difference. Similar differences occurred among the experiments with B .
These variations show how little value belongs to single experiments in cases of this nature. The manner of cutting the timber must indeed be attended by great differences in resistance, as we have formerly shown (Gard. Chron. 1856, p. 244) accidental unobserved flaws, a sudden twist in the grain of the wood, some indeed say the north or south sides, will cause further differences in the strength of scantlings from the same tree ; and these causes of error cannot be wholly avoided except by taking the average from a considerable number of trials. It is therefore extremely satisfactory to learn from Mr. Henderson that Lord Fitzwilliam intends to push the inquiry still further; and it is much to be desired that the example set by this great and enlightened nobleman should be followed by others. As far as they go the experiments at Wentworth are certainly unfavourable to $Q$. sessiliflora; and if the second series shall correspond it will be a necessary inference that on the Wentworth estate $Q$. pedunculata is the more valuable tree. But it by no means follows that it would prove to be so on other soils; take for instance those of the New Forest or the Forest of Dean; and it seems to us worthy of the consideration of Mr. Howard whether it may not be desirable to have the present question tested experimentally in every one of the Royal Forests. The new (34th) report of the Commistioners upon the Woods and Forests of the
Crown shows that the honourable gentleman has directed his attention to questions of practical forestry; and we venture to submit that this is one which most especially deserves to be the eabject of
inquiry. It could be prosecuted more easily and satisfactorily by the examination of Oaks grown on the various soils in the Royal domains than by any private individual, even though inspired by the zeal of a Fitzwillian, and an official return of the resuliss would probably settle for ever a most important public question.

HORTICULTURAL JOTTINGS MADE DURING A JOURNEY TO PARIS.
Having lately made a journey to the French capital, and had an opportunity (through the kindness of my
resnected employer) of seeing the Royal and the best market gardens, with the nurseries and seed establirhments there, I venture to commit to paper a few notes which I hope may prove interesting to the readers of this periodical.
I had gone to Paris with the idea that we English gardeners weré a long way behind our ingenious neighbours, and had much to learn from them, but Inow think very differently. The productions which so largely fill our markets, the beantiful Spring Lettuces which come here in the fullest perfection long before ours are ready, these, with many other things, have excited our surprise and made us feel alurost ashamed at being so much in arrear ; but when we come to know that in the climate of Paris, at M . Vilmorin's, Thunbergias were ripening their seeds in the open air, and also the different kinds of Maurandia, it needs no great stretch of imagination to conclude that they have a far better climate than nure.
They have a They lis or the che bo sunst very must very materially aid them in the -an of the cloches, or bell-glasses, under which their fine Lettuces are grown. I give them the greatest credit for their assiduous ingenuity in the management of these ; but fully think it impossible to succeed in our constantly moist climate as they do with them.
Judging from the fine fruit which I saw in the shop of M. Joret, in the Rue Marché St. Honoré, and ulse at Versailles and Fontainbleau, I should say they are very good Pine growers. They cultivate the young plants principally in beds prepared for them, without pote, and fruit them in very small pots considering the size of the fruit produced by them. They seem to feed the plants much by a large supply of ammoniacal gas, fruiting them over a chamber filled with hot dung, and plunging them in a shallow bed of tan.
In Vines they do not shine at all as we do ; no such Grapes as English gardeners produce are to be met with. Here are none of those fine fleehy delicious Muscats, or Hamburghs, that were shown at the meeting of the London Horticultural Society the other daj. Their only well grown Grape is the Chasselas de Fortainbleau, which at that place covers a wall 1300 yards long and from 12 to 15 feet in height. The Vines when I saw them (the 18 th of October) were loaded with produce fully ripe over the whole of this space; they were of the richest amber colour, and were in fact delicious in taste, and most inviting to behold. The Chasselas thus ripened is one of the very best of Grapes, but sucl. as these are not met with in any quantity in the markets ; those are smaller and much less ripe ; but from such Grapes and a piece of bread many a Parisiati workman makes his dinner. Whey are grown for tha market at Thoméry

In French gardens the Vines are trained on a low trellis, and when they want to force them a frame is placed over then about 3 feet 6 inches high at back and 1 foot 6 inches in front. It is made of old ship timber, not painted, and a dung lining surrounds this economic structure, which has as well pipes along the front for heatiny. Uulike good Errglisl2 gardeners in the present day, they do not force the same portion of the trellis in successive years; but if this piece is forced this year, another is chosen for is next year's crop. I think that they are wrong ia pursuing this antiquated notion, as there can be no pursuing this antiquated not that all plants which are forced soon acquire a habit of pushing their buds at that particular period of the year at which they have been excited. I could not help smiling therefore when gravely assured that this resting was an element of their success.

In Figs they do not seem to shine so much as they ought to do I saw only some small green ones, not over-ripe, in M. Joret's shop.
Their Peas are truly magnificent.- I saw Crassane Passe Colmar, Duchesse d'Angoulême and. Beurré Diel prodigiously fiue, particular
of an exquisite flavour too.
In the way of retables, magnificent Cauliflower: were hawking abog also Peas, in the midrle of October. Fruit of the purple Egg Plant, called Aubergine, were on sale for calinary purposes, and the seeds of Haricot Beans, abourelets. parts grown, were exposed under the nam. for cultiva I saw the Dioscores after the second year for che and tion little hetter than we have it in this cr' growth in they say it is of no use without two years grw may Paris. If, as experience proves, it is so shy, and it take our leave of it as an article of the tables of the will only serve to make a dish at cent Cardoons wer wealthy portion of society. Magnificent Escarolle, the to be seen in all directions, as well as Escarot their Batavian Endive, beautifally blanched; chief point of excellence Asparagus. M. Joret had some of apecialité into ever beheld. Its culture is a specialité into
which 1 felt much interest in making inquiry. It is
managed thus:-The ground is deeply trenched with a managed thus:- The ground is deeply trenched with a
most abundant addition of the best rotten dung from old most abuodant addition of the best rotten dung from old
Meion beds. It is then divided into beds, about 3 feet 8 Minches, with alleys. 2 feet 6 inches in width. In March they plant their roots 20 inches or 2 feet apart in the row, and the usual routine follows till the next autumn, when the bed is liberally manured and deeply covered by the mould from the adjoining alleys. Thus excavated they form a receptacle for hot dung, with which they are filled as the produce may be required; the beds being covered with their small frames, which are about the width of the bed. These beds produce the Asperges blanches, or large white Asparagus.
The beds are not cut previously to being foreed, and those who desire to have this excellent vegetable in its fall perfection, must give it special culture. The system of forcing old roots from beds which have been long in cutting can only disappoint those who expect ane produce. Indeed this plant seems simply to require plants, and a three years' course of this before cutting plants, and a three years' course of this before cutting
the shoots. In the market gardens around Paris both Celery and Cardoons are blanched by filling up amongst them with long dry stable litter, of which large stacks meet the eye on entering the grounds. The Cardoons are planted about four feet apart on the flat surface, and are entirely filled up with this material. I saw this in
the grounds of M. Chevalier, at La Chappelle, whose the grounds of M. Chevalier, at La Chappelle
guarters of Cardoons were wonderful to behold.
Perhaps it is one of the strangest things that they have not a morsel of curled Parsley in their gardens; it is all as perfectly plain as the wild plant, and looking to the fondness which the French evince for decoration, one wonders at this.
It is usual with market gardeners, who are obliged to crop heavily, to manure heavily also. But I have never seen soil so rich in manurial matters as the Paris gardens seem to be.
It being the middle of October I had an opportunity of seeing the very interesting process of planting the Detuces under the cloches or bell-glasses of which Dr. Lindley gave some account in a former Number of
the Gardeners' Chronicle. A sloping bank is formed for the Gardenerg' Chronicle A sloping bank is formed for
the posed of well-rotted manure from the old Melon beds posthing could in fact be lighter or richer than it is each bank is made 6 or 7 feet in width, and the glasses are placed in rows close together. The Lettuce plants
which are raised under one or more glasses are Which are raised under one or more glasses are
now most carefully transplanted, putting 32 , to be again thinned to 8 , and finally to 1 , under each glass. The success with which these are cultivated is very great, aud they supply the English markets long betore we get them. In severe weather straw mats (made from Rye) are placed over them, and great vigilance is used in giving and taking air. But their sheet auchor is the iryness of their climate, wanting which I do not think the same results could be obtained in this country, however indefatigable we may be.
I had expected to have seen the Chinese Yam producing very fine large tubers in this "land of the sun," were: not bigger (after two yearg ${ }^{2}$ cultivation in M. Wilmorin's garden) than those I have at Nuneham. I noticed a pretty pyriform Tomato in that garden, and no Chinese Radish, of which I bought geeds. Henry Bailey, Nuneham, Dec. 8 .

## (To be continued.)

## NEW GARDEN FERNS.-No. XVII.

30. Gymnogramma peruviana, vat. argybophylla. Fronds densely pruinose on the upper surface.
This very elegant Fern, which might be called the Ehlivcr-frosted Fern, was exhibited at the Crystal Palace Brocklehurst East summer, from the gardens of T. have originated. Its history, however, is not very clear, thoogh it is probably a natural variety, the spores of which have been imported amoug South American Orchids. Though a very desirable plant for cultivation, and of very distinct appearance in an ornamental point of view, owing to the dense coating of ceraceous particles on the upper surface, producing the appearance of it is frosted with silver, yet there can be no doubt is is only a variety of the true Gymnogramma peruviana
as is not the plant usually so named in gardens. The latter appears to be that called $G$. distans by Link. The silver-frosted variety produces from a short erect caudex ${ }^{\text {a }}$ speondary secondary pinnules of which are roundish and lobed.
These fronds, frosted above (not whiter there tlan other binds are beneath, as was stated in the gossip of a contemporary), are on the under surface quite white, as in gardeng ive fand the other silver Ferns grown in of Mr. Veitch, of Chelsea, and Mr. Parker, of Hornsey. 31. Onychitu auratum, Kaulfuss. Pteris certsocarpa, Hooker and Greville. Lomaria aurea and carui Frolia, Wallich. Allosorus auratus, Presi.

 This is a very
This is a very elegant evergreen stove Fern, remark-
fortile, and occasionally others which are only partially fertile. It grows about a foot and a half high, the fronds glossy in texture, quite smooth and cut up into very numerous minute segments; they are supported by stoutish and rigid stipes, which are scaly at the base These fronds are at least quadripinnate, the primary and secondary divisions and often the tertiary ones being pinnatifid or pinnatisected, the narrow perhaps rather of the segments not being distinguishable from the rachis-like parts. The primary and rachis-hke parts. The primary and secondary pinne are attenuately ovate, the tertiary divisions ovate, the segments of the latter cuneately oblong below and cat into simple linear teeth, narrowly cuneate and simple,
or with one or two teeth above; so that the ultimate divisions may be described as narrowly wedge-shate and simple or inciso-dentate, each of the divisions having $a$ single vein along its centre, which terminates before reaching the point. The fertile fronds are equally com

pound, but they differ in having the ultimate segments not cuneate but linear and mucronate, considerably longer, the terminal ones frequently an inch long, aut every one distinctly narrowed into a stalk at the hase.
These narrow segments have a lmear sorus extending along each margin, the indusia of which meet in the centre, so that the whole segment is occupied by the fructification, which usually assumes a rich golden colour. It is a native of the East Indies, where it is found in Nepal, Assam, and Khasiya; in Malacca, Java, and the Philippine Islands. It is a very elegant Fern, which will no doubt become a great favourite with cultivators. Judging from its North Indien habitats, it may be expected to succeed in a close greenliouse, especially if the cultivated plant should have been obwich, however, we have no information. T. V.

PRACTICAL LESSONS IN BOTANY FOR BEGINNERS OF ALL CLASSES.-No. XIII. By the Rev. J. S. Hersiow, M.A. Rector of Hitcham, Suffole. Flower. - From what has been said of leaf-buds and flower-buds, it will be understood that flowers are always developed about the summits of branches, aldhough such branches are often reduced to the state the floral organs. Is is instructive, and will lead to the foral orga the orrect notions of and floral organs, to observe the way in which buds sometimes afect an intermediaso character between leaf-bud and flower-bud, hesitating, as it were, whether to form an ordinary branch widh leaves, or a pedancle with floral organs at its extremity. Garden double Roses often have the parts of their innermost whorls green and leaf-like, and these sometimes extend into a leafy branch which again reverts to the condition of a flower". One of my village class last
year pointed out a lush of the "trailing dog Rose" (Rosa arvensis) covered with flowers whose petals were all small and green. Portions of this transferred to Kew and my own garden have fully retained their monstrous character.
N.B. Illustrative examples of the relation subsisting between leaf-buds and flower-buds are common among garden Tulips. Half a bract (longitudinally divided) is, in these cases, green, the other half coloured. One side of the peduncle is evidently under the influence (whatever it be) which induces the formation of a perianth,
and this side shows a decided tendency to cease growing ; Whilst the other side contiguous to the green half of the diflerent reases as usual. In conseq ite of these it curves and it curves and cracks repeatedly. I have known the
tension so great that the peduncle has soapped asunder tension so great that the peduncle has smapped asund
and the flower fallon by an act of self-decapitation! Floral Organs of the Bean.-Although "floral organs" generally have been noticed in $N_{0} .5$, those of the Bean may be here referred to as an example which servea to typify an extensive group of plants whose flowers are constructed on the same plan.
Calyx (wood-cut to No. 12) of 5 cohering sepals (monosepalous), the lowermost of which is the longest, the others in pairs of equal length.
Corolla Five petals, forming a "Papilionaceons" (Bullerfly-shaped) flower. The uppermost or innermost

s. Petals of the Corolla.
petal" (s), differently shaped from any of the others, is the "standard" (vexillwm). On either side of this is a petal (w) termed a "wing " (ala). These two resemble each other. The two lowermost ( $k$ ), which also re emble each othe legs by (carina) guous edges. The upper portions ( $l$ ) are the limb, and the lower (c) the claw, of these petals.
Stamens. The filaments (M. B.) of the ten stamens ohere (monadelphous) through the greater part of their

## Stayemb axd Piottr (mharond).

length, and thes form a membranous tube about the pistil. Esch of the free upper portions eupports an anther (a).
N.B. The majority of British papilionnceous flower have the uppermost atamen free, the other nine cohering. Such are consequently "diadelphous," In many exotic papilionaceous flowers, the filament are all fre from cohesion.
Pistil.-This consists of a single carpel, and offers a good illustration of the mode in which such an organ is constructed. It is regarded as a small simple leaf folded longitudinally upwards till its edges meet and coliere. The outside of the carpel thus constructed will correspond to the under surface of the leaf, the inside of the cavity to the upper surface. The line of union between the cohering edges is called the "ventral between the cohering enges is called the "ventral
suture" $(v)$. The maiu body of the carpel is the suture" (evary (e). The extremity lengthens out and forms the
one ovary (e).
curved "style" (sty), on the summit of which is the "stigma" (sti), where the external tissue of the carpel "stigma" (sti), where the external tisoue of the carpel is exposed, all the rest being covered, as in all leaves,
by a skin (epidermis.) Within the ovary (o) the margins of the carpellary leaf swell a little along the line of ventral suture, and are termed the "placenta" From the placenta are developed small round bodies alternately from each side, called "ovnles" (little eggs) destined to become seeds when the orary passes to the state of fruit.
N.B. The formation of compound pistils may be deferred to a more general explanation of the alterations which take place in ovaries and ovules the they respectively pass to the condition of fruit and seed.
(To be contimed.)
TRADE MEMORANDA.
Grorge Woolmer; states that he is a Market Gar. dener, with 10 acres of land, living at Stratiord.

## Home Correspondence.

Orchids.-Having a great friendship for "Florn," allow me to furnish, in reply to her inquiry about growing Orchids in a conservatory where the temperature falls to $45^{\circ}$, an extract from Paxton's Magazine of Botany, vol. xiv, p. 13. "In our principal Orchid hoase at Chatsworth, a large erection long and wide, we have spaces which constitute the back portion ; the border is made of rough blocks of Oak, scraggy pieces of gnarled and distorted trees; these are placed close together and thinly covered with leaf monld from the woods, pieees
of twiny Mosses are also introduced, and into these the of twiny Mosses are also introduced, and into these the
Orchis roots spread. The sorts used are Coelogyne Orchis roots spread. The sorts used are Coelogyne Miltonia spectabilis, Oncidium Lanceanum, Stanhopea tigrina, Odontoglossums, Dendrobiums, Cymabidiums, Lycastes, Zygopetalums, Bolbophyllums, and a host of other genera are included, and the largest measure of success has attended the experiment. The temperature has been that of a close cold pit, No bottom heat, very great
shade, and not sin subject to great alterations of urou, int
and wet. They are fastened on the blocks by comper wire, but soon their roots cling to then like Ivy." In answer to anl inquiry by anotier of your correspund int:,
Paxton says in the Magazine of Butany, vol ix., p. 9in, that Messirs. Loddiges make use of Urchid baskets of Cocoa Nut husku split into halves tlightly dressed at the edges and fasiened together with copper uire The loose way in which they are attached at the edres allows the water to drain trough, and the interior being of a loose fibrous uature the routs adhere to it readiy Norice.
Britioh Ferns.-In a small book on British Ferns lately published by Mr. R. Hardwicke, 26, Duke Street Piccadilly, I fina Asplenium palmatam introduced for the first time as a British Fern, and said to have been
found in Essex, Lancashire, and Ireland. Would you inform me whether this account may be considered as correct, and the Fern treated as hardy? S. N. [You duction of this plant into our list of native Ferns (see Gard. Chron. 1854, p. 270). We do not believe that Asplemium palnatum has been found wild in Great heard of it otherwise than by Mr. Hardwicke's book.]

Ioe Stacks.-The following method of preserving was for many years successfully practised at Hatton
Castle, Aberdeenshire:-On the south side of the pond a foundation of rough gravel was made, about 1 foot high over which wns placed another foot in thickness of try diameter, 7 feet to he eaves, and about 4 feet more to the point. This was well thatched from top to bottom with Oa straw, from 10 to 12 inches thick. It was again thatched with branches (mostly old Pea-sticks) about 2 feet 6 inches to 3 feet thick, and again thatched with Oat straw, tied down with straw ropes, There was a
drain from the centre of the stack running to the pond, but entering below its lowest surface. The stack was shaded by Spruce trees. J. H., Rotherham.-
We have a very economical plan of preserving ice a this place. I had a circular hole dug in a dry tank with a north exposure, and shaded by trees. The hole is 12 feet diameter at top and 2 feet at bottom, 8 feet deep, with a common drain at bottom, the outlet of whir is covered over with loose rabbish to prevent the I put about 1 font in depth of faggots at the bottom, then a layer of clean dry straw (Wheat straw is best) on the top of the fargots, and also all round the sides of the hole 6 inches thick; then the ice is put in, broken, and rammed thgether till the hole is full. is then piled up in the shape of a cone and covered over with a layer of straw put on as evenly as possible over with Laurel boughs. The above plan I hav practised for four years, and I find it to answe the purpose perfectly, viz., it secures a good supply have always plenty of old ice till we get the new-a desideratum which many with expensively constructed ice-houses would he glad to realise. Some object to this plan, because of the waste that takes place when opening to any great extent when the operation is speedily per formed and the hole well stopped ap again. Daring the ary weather we hall hast Juywe had occasionto take and now we bave a good supply of "old ice." I also find that the cleaner the ice is when got together, the better it keeps. I do not know the smallest quantity that would keep under the circumstances your correspondent described. I have not tried less than 20 tons,
but our general rule is to gather 30 tons. I have no doubt that were the pit made double the size, we could keep a supply for two years. James Maxton, Homme House, Herefordshire
Anomalous Fructification in a Pern.-I take the liberty of writing to you in reference to a botanical which I trust yourdill becams acquainted with, and cultivated Asplenium marinum for some considerable time, but have never observed any trace or sign of fructification upon any of the fronds. In October I cut some of the fronds off; they were put in a flower-pot
with the superfluous mould. In about a fortnight I required the pot to put some other plant in, when I was very much astonished to see the tender green colour so
peculiar to the Ferns, and on examination I found that peculiar to the Ferns, and on examination I found tha showed it to Mr. W. M. Searby, my master, who was as much surprised as I was. He sdvised me to bury some more, which I did, with the same result; the spore cases were empty. 1 have sent you a specimen of one bat Im sorry to say it is badly pressed. I mentioned the laughed at me. Candell Clarke, White Lion St., Nomeich. laughed at me. Candell Clarke, White Lion St., Nomecich.
[We have never observed anything like what Mr. Clarke describes, which if we understand him rightly is this"that fronds of Asplenium marinum quice barren, cut night become fertile." We fancy there must be some error of observation, and yet as he speaks of repeating the experiment this seems hardly poseible. We very spech donat whether a slow growing plant like the spee es in question could under any circumstances pro It in however a plant of thick substance and firm, so
may be that the tronde when cut off had already forsied
their sori, hut that hese were accidentally "oligocarpous, and had not lifted the iniusium so as to make theniselve appricent, the inherent vitahty of the ronds sufficing Hable them -utsequently to protrude themselves in gpite of the disadvantineous conditions in which they wer mens of plants drying tor the herbarimm. This may be all the more likely if (as seems not improbable) the spores are in some measure anulugous to buds. Under se microscope we find some unopened spore-cases, and spores with their muricate or granulate outer coat
evidently lying amongt the more numerous spore-cases which have burat, these latter appearing to be partially decayed, as they might well be buried amongst dam earth. This rather euggests that the spore-cases ha been there from the first. Though we are thus unable to explain satisfactorily or to confirmi Mr. Clurke's orl, though common:y, is not always coincident with th development of the frond. We have sometimes notice what appears to be a gradual production of fructific保 after the frond has been formed. T. M.]
Roses.-1 hope you will allow me a little space No. 48. to rejoice to think my remarks have drawn out
professional; we amateurs want a little more of the kowledge in such matters to be vouchsafed to us. shall have a word or two to say on his general remark before 1 have done, but now let us go straight to the pout alout my list of 12 Roses. He selects five as senn rate kinds, and would imply them to be very second ate. If they are, I am very sorry to think that dealers catalogues should so mislead persons who wish to buy nd have no other means of ascertaining the qualities the different Roses but from the descriptions therein iven. I will just place in parallel columns Mr. Paul's descriptions of the five Roses he selects, as given in the chronicle and his Catalogue for 1855.56; perhaps this will the best explain what I mean

Chronclef.

of the fineas.

Lonis Bonaparte is not in Mr. Rivers's catalogue.
Now, one thing seems quite clear-either the dealers' catalogues are intended to take in the uninitiated by these splendid descriptions, or else the Roses are what I say they are. Mr. Paul can settle that. If at the stant" had appeared, I for one should have had nothing to do with it, but not a syllable about that defect in any catalogue ; and I said in my communication on Roses hat it had that fault, and it is a great one; but I say, oo, that if you do catch a good bloom, not one Rose in its class can compete with it. If you will allow me, will next week send you a few observations on Mr Paul's list of 12, but now I must stop. I have only to ell him that so far from having "just awakened from a long long sleep," I have been wide awake a long long time ; ton wide awake to give a high price for a thing of which I have only seen a dealer's description. Amateurs buy experience as well as Roses, and if they take my advice, they will "look before they leap ;" nevertheless, shall heartily thank Mr. Paul or any of the large growers if they will give us a true and faithful list of hat Roses are really worth their price. A. R., Bromley.
Steel Forks.- You say you "lhave seen most rascally tools of this kind, the tines of which bend like iron
wire." Now I use and superintend the using of a great wire." Now I use and superintend the using of a great
many. I have tried more than one maker, and from many years' experience I can say that those made by Parkes, near Birmingham, will never disappoint any one who wants a good tool. I am sure they will not bend like iron wire. I believe Parkes is the original maker, and I think none of the many imitators can equal him. received three forks about s yar ogo with a request to try them, but I found they were all too soft, and were sent back (these were from another very large manufacturer). You say 4-tined ones are the best. I think that depends on the kind of ground; that abcut here is very light 4-pronged one would not lift it, but for cleansing land rom Couch and other weeds, the 4 -pronged one is the best, and would do for digging in strong clayey soils. I can only say that whoever has once used these forks will never wear out many spades afterwards. They have set the spade at rest amongst gardeners in this neighbourhood, except just for edging of beds and a few other small jobs. I merely send you this for the benefit of your correspondent "W.C." and others, who may want

## really good turl huying them siag huying them sil.gly, send them to the onew for 3 s, $E$. $H$. The size 1 use for digging coste

Veronica.-I send you a specimen of a new Veronica, hybrid between V. decussata and a seedling from . speciosa, by which you will perceive that the habit of the former is maintained, thus improving speciosa, while the colour is quite distinet from that of both parente. A Devonian. [In colour the flowers are a beautiful lilac; the spike sent was however small, and not sufficiently advanced in bloom to enable us to form a correct opinion respecting the merits of the variety.]

4 Guide to the Propagation of Plants; or the Avt of Multiplying Plants by Seed, Cuttings, Grafts, doc. Paris 12mo. Librairie Agricole.
The author of this volume is already known to the public by his edition in French of Endlichers Coniferee, and by various contributions to horticultural periodicals. Placed at the head of the nurseries belonging to the Garden of Plants at Paris, his position gives him opportunities of acquiring practical knowledge of the art o propagation, such as can only be gained in such places; and as a ready writer, with a well arranged mind, he possesses the power of communicating his knowledge clearly and precisely to others. With these qualifications he could hardly do otherwise than produce a work of value in practical gardening. And he has done so. Not that we find much novelty in M. Carriére's pages; the subject is in truth threadbare; but what we do find is what is most wanted, plain detailed directions for doing the various works of the garden propagator.
The matter is divided under five principal heads Seeds and the various ways of dealing with them 2, the general management of plants, both hardy and tender : 3, of propagation by layers, 4, by cuttings and 5 , by grafts. In nothing has the author shown his good sense more conspicuously than in the manner in which he has treated the last subject, which in France has been refined upon, or we should say if speaking of our own country, wiredrawn and mystified, till at las it may be compared to a spot on which the sunlight is concentrated, and which is so much illuminated that nothing can be seen. It seems that by one device or another somewhere about 130 sorts of grafts, as they are called, have been proposed as different, a number, as M. Carriére says, quite enough to startle the boldest gardener. Like a sensible man he sweeps away all this rubbish, and with it the names of horticultural worthic by which the so-called 130 sorts of grafts have been distinguished. Instead of the grafts Palladius, Thouin, Duhamel, Atticus, Aiton, and so on, we have the follow ing table, in which we think it will be admitted that differences are carried quite far enough

This has at least the merit of being intelligible; we think, however, that it is susceptible of some improve ment. We may possibly select occasionally som, unless portions of M. Carriére's book for translation, English we should hear of its being about to receive an hile an dress, which it well deserves. In the meanweats his extract
subject.
On the soil and situation suitable for Cuttings.With some few exceptions, sandy soils, somewhat moist, are best adapted for striking cuttings. When this mode of propagation is employed on an extensily scale, which however is rarely the case, it is geaerally in soil of an opposite character, that is to say in those that are strong and wet. Indeed meadows, or marshy grounds, are almost the only soils in which recourse iars had to propagation by cuttings, and Willows and Poplars are almost the only species of plants propagated in such places; but in gardens where the extent of ground devoted to the etriking of cuttings is generally gmal
where, consequently, ull necessary care can be bestowed
and where the species which can be propagated by this mode are extremely numerous and variable in their nature, the soil is almost always modified. cases peat is employed; or, in its absence, mixtures are soil, the beds should be hollowed the open air, in dry soil from the centre towards the edges. If, on the othe hand, the soil is moist, the ground should be raised and if necessary may even be formed into ridges. Further if the ground can be slightly shaded, it will suit many species. Nevertheless, the plants must be sufficiently As for cuttinge, which, from any cause, cannot be struck in the open ground, recourse is had to huthouses or frames; for those which ought to be struck, without hent, under bell-glasses, a northern aspect sheltered by a wall or hedge is chosen, the ground being prepared as plants intended to be struck. This mode of propaga tion is very advantageous, and is very frequently em ployed in nurseries.
On the most expeditions modes of carasing Seeds to germimight inform us what of practice and observation, science that heat and moisture excite and occasion fermenta tion; that fermentation is the commencement of decom position, and that decomposition is accompanied by disengagement of heat, which, added to that which already exists, transforms the decomposing body, and changes its nature. This being admitted, we sayvitality is latent, and the action of which, so to speak, is suspended by elements which are torpid, or in a state of lethargy ; that this state can only cease on the transtransformation can only take place by the influence o two principal agents, moisture and heat, it results that according as these agents manifest their presence with more or less energy, the awakening the vitality, conse quently the germination, will be more or less active. e ; bence the use of stimulants, a fire heat by flues, hot water, steam, dung, hotbeds, \&c But as heat and moistune play, as far as our knowledge goes, the most important part in germination, it is by successful results will bembina Nat meless, the mode of heating employed is not a matter of indifference for, according as the heat is obtained by one or other of the above modes, its action will be more or less favourable to germination. Thus, all other thing being equal, dung-heat is the best, then that of hot water, then that of steam, and lastly fre-heat by peculiar to it alone; for whilst it produces heat also disengages ammoniacal gases which are very favourable to germination. The second does not dry up does not give out any gaseous matter. The third i similar in its effects to the preceding, but it has the defect of varying to a considerable extent; for, as suon as the fire goes out, or even when it is not properly fed heat. Lastly, when flues are employed the heated air and amoke pass through them together, and only a dry necessary, the great drawback of which is that they wash the soil, and carry away from it a portion of th organic matter which it contains.

If to any one of these modes of heating the beneficial influence of propagating glasses is added, more on explains their frequent use.

## Garden Memoranda

Gardens at Lews Castle.-In the middle of last September I visited the Lews, one of the largest islands of the Hebrides. It is separated from the mainland by a sea some 40 or 50 miles broad, aud it forms the northern extr mity of the county of Ross. Lews
Castle is the seat of the proprietor, Sir James Matheson, Bart., M.P., and is one of the finest residences in the north. As it may be interesting to hear something of gardening in this quarter, I beg to furnish \& few remarks on what appeared most deserving of notice.
One is apt to expeet that in a district an far north One is apt to expeet that in a district open ground must be confined to native sorts or to those kinds that are reckoned most hardy. This, however, is found to be a mistake, for the influence of the sea oceasions a adapts the aituation winter many kinds of plants which suffer from frosts on the mainland.
The principal flower garden covers a large space in the immediate vicinity of the castle. It stands on a and partly irregular, and generally has a south-western aspect ; and from many parts commands a fine view of Loch Stornoway and its capacious harbour. It was rendered gay by a profnetion of flower clumps and beds. The richness of the bloom of the following kinds was very remarkable :-Saponaria calabrica, Natas, Nens,
benas, Nemophilas, Cupheas, Stocks, Agapanthus, benas, Nemophilas, Cupheas, Stocks, Agapanthus,
Gladiolus, Heliotropes, \&ce. The blossoms of the plants * We have no doubt but electricity, which performs such an
 but itso office ebing still mitnown to as, we must coniine ourselves
to muppositions.
folinge was almost hid with trusses 6 and 7 inches in diameter. Shrubberies of the richest foliare divide the flower garden into compartments pleasnag! yaried by irracts, slopes, rocky mounds, culonuades, and fountains several yards in. diameter, and endure the winter several yards in. diameter, and endure the winter
without dying down. The Aralia japonica assumes a timber-like fiyure ; the Leycesteria tormosa becomes a great busth, sheds its seed, and multiplies like a weed; Rhododendron.
A glazed avenue, extending alongside one of the divisions of the flower garden, had a very brilliant effect Here Ruses were remarkable for their vigour and
beauty. I measured some of their foliage, and found seauty. I measured some of their foliage, and found
single leaves 6 inches long by 3 inches broad. They stood in pots sunk on a level with the surface. The most attractive sorts were Devoniensie, Goubault, Baronne Hallez, Dupetit Thouars, Acidalie, Vicomtesse Decazes, Duchess of Sutherland, and Géant des Batailes. Fuchsias, Lilium lancifolium and Humen and 10 fept in heipht 1 space beyond the for garden and shrubberies down to the margin of the sea was planted with a vigorous and waving crop of Tussack rass.
All the departments, but particularly the orchard house, gave ample evidence of akilful gardener. The Peaches and Neclarine had ben an abundan crop, and were neary over, but the Pears and Plums
were at their best. The trees, about 3 and 4 feet high, stood in pots, none of which exceeded 12 inches in diameter, and they were loaded with fine frait. Pears generally ranged from one to three doz. on each tree, fine
well-grown fruit. One tree bore only three Pears, but well-grown fruit. One tree bore only three Pears, but
they were far above the ordinary size; none of them was noder one pound weight. The largest fruit yielded by the same tree the previous year is said to have weighed 23 ounces. The plant was received without name; from its appearance and the reported quality of the under pot cultivation, the frait of the Marie Louise is more subject to crack and become unshapely than any other kind. The summer pruning had been performed most skilfully; some were operated on heavily, while others that naturally produce fruit-buds or young wood were left untouched. The state of the Plum trees was all that could be desired; the variety was great, among which were Golden Drop, Green and Purple Gages Jefferson, \&e. For appearance and fruitfulness perhaps the Golden Drop deserves the first place in the rchard house.
Mr. Conlon, the head gardener, attributed the sucessful management of this house (upwards of 100 fees ong), and of all orchard-houses, to the free circulation of air and uniformity of temperature, particularly at the time of the blossoming and setting of the frait. The quality of the soil used in potting the trees must also tion. Here, generally, the soil was composed of a mix ture in which a coarse gravel, or broken rock, formed the principal commodity, and was made rich with well atate, is found to be most coneural
large assortment of Cherry-trees in pots steod in a cool situation in the open ground. These bad been forced early in summer, and displayed the tints of vineries on their shedding foliage exception of one part appropriated to the White Muscat of Alexandria, which bore a fine crop of large fruit.
Extensive ranges of pits were closely filled with very promising young plants for bedding newly struck ; they were unusually far advanced for this purpose, but it appeared the nature of the climate rendered it necessary
to have them well advanced before the approach of winter
The kitchen garden was only remarkable for the vigour of the growth of vegetables in general, a vigour which enbanced the value of all the crops, we observed, except that of Onions, of which all the sorts appeared
far too luxuriant to mature their bulbs during the refar too luxuriant to mature their bulbs during the remainder of the season. Fortunately, however, the
influence of the soil and climate had not a similar effect on the Cereal crops throughout the country those generally were quite ripe. The stack-yards were filling up; new grain was mamefactured and in the market; and the harvest was farther advanoed than in any of the many districts I had recently seen throughout Scotland. J. G.

## Miscellaneous.

The Gardens and Pruhts of Egypt.-Before leaving Cairo, I had an opportunity which I had almost despaired of, of seeing the gardens at Shoobra, about four miles from that city, and the finest in Egypt, but which have been closed to the publie for some time. Through the kindness of Dr. Abbot I obtained access to them aiday or twe same plan in this country, in long etraight alleys or walks, eroaing at right angles, or converging to a centre, where owner. Every garden, like every field, must be kept perpetually watered by the sakeeyeh or shadoof (the Persian wheel, or the more simple pole and bucket), in this arid clime. Egyptian gardens, both public and private, consist of squares or phalanaes of trees, inter-
mected by little anised channels, or water courees, fed by
the wheel at the river, or from a well of geuerauly brackish water on the premisee, which is also raised by
one or nther of the two primitive machines just named; one or nher of the fwo primitive machines just named;
for fumps are unhnown, except in Frank lhuses, or in for jumps are unhnown, except in Frank houses, or in
sugur manufactories, in every part of Egypt. The trees sugar manufactories, in every part of Egypt. others are met with there, but are not in such common employment for ornament or utility. Orange, Lemon, Lime (abundant), Pomegranate, Myrtle, Oleander, FigSycamore (Fieus Sycomorus), Mulberry (Morus alba
and nigra); Nebr (Zizaphus Spina Christi), Prickly Perr or Indian Fig (Opuntia vulgaris, Cactus Opuntia, L.) chiefly for hedges; Cassia fistula, Lebbek (Accacis Lebbek), a native of India, and the pride of Cairo in the Usbeekelh, \&c., Poplar ('Populus alba), a tree of northern origin, but which resists drought and heat to a surprising degree, although delighting in wet places ; Willow (Wreping W. chiefly, Salix babylonica), Khenna (Lawsonia inermis spinosa), called in Eagland Egyptian Privet, and in Jumaca Mignonette tree. The leaves of we knenna are in great demand when dried, for tinging colour, fibgers, and paims of the hands of adull orange ven themongst the Eyyptian women of all classes, and this very unbecoming pignuent Roses, which grow well in Egypt, and are very sweet, form with flowering shoots of Khenna almost the only fragrant nosegays in ase monrst the people, and branches of Khenns either by itself or encircled by Roees, are hawked about the streete and oold for a fow paras or fuddahs, and are carrie carris at are perpoluanyblag a Caires, stream of everyday life, carts, carriages, Khenns hel, 1 . Khenna blossom is very powerfal; to myeel, it recals flower, hates mixed whe the fragrace of flower; but the flowers spon fade, and the smell becomes vapid, and positively unpleasant Nubiave but it is raised abundantly along the Nile in both countries for its leaves and about Cairo for its flowers; a fence or plantation of Lawsonia will perfunse the air of the whole neighbourhood, particularly in the cool of the evening. The other shrubs in general cultivation in Egyptian gardens for ornament, are Jessamine, white and yellow, (Jasminum officinale, and J. revolutum ?) the former, a larger flowered variety than ours ; the pretty Duranta Ellisi, most extensively used for garden hedges ; Sessaban (Sesbania Rgyptiaca), wild in the upper country; a beautiful purple Convolvulus, with deeply five-cert leaves, used for covering wals and hoases, do not know the name of at present. These, with some others, are the principal plants of a ligueous or arborescent character seen in cultivation. Of Egyptian floriculture very little can be said in praise; the garden of the humblest cottage in England can show a more choice assortment of border flowers than that of the proudest palace of the ruler of Egypt himself. Of the ruits of Egppt, I can now say with confidence that on the whole, in no part of the world sre they fewer in
number, or of worse quality. This is the height of the number, or of worse quality. This is the height of the
season, and I have visited the fruit and vegetable marks of Cairo repeatedly, as well as those of the provincial towns, and found little or no variety in any of them. Water Melons hold the first rank among Egyptian iruits; they are grown in vast quantities in the fields throughout this country and Nabia, and at this time of year constitute a great item in the dieb of the poorer and midding cluses, and are seen at the table of the upper ranks also, it being the custom to eat aliees of Water Melon at dinner in the intervals of each diah that you partake of. They certainly come to great perfection in this country, and, as 1 myself experience, may be eaten freely in any quantity without danger; and deliciously refreshing the pulp of the Water Melon is in this sultry climate. Grapes are plentiful, and have been in seasou about three weeks: they are of all Winds, good, bad, and inm to be depended upon for quality: but Grapes are neither so aboudant nor so cheap as the former. I forgot to say that common Melons of every lind are plentiful in the markets, bat not liling this fruit I am no judge of their meritg. I believe, hore from the report others, that s large proportion are of very indifferent sorts ; no pains being bestowed in Egypt in selecting and propagating superios varieties of fruit and vegetables: grafting and budding being rarely practised, and thinning out and pruning equally neglected, every advantage that the sunny clime of Egypt would afford to the horticulturist is thrown away. Stone fruit is universally bad; the fruiterers stalls and the markets are now filled with Peaches, fair to the eye, but small, and very stones for hardness, on one side at least. Most of the Peaches here bave a point or projection opposite the stalk, and a somewhat oval form. Apricots are over for the season : all I have seen axe extremely small, hard, and tasteless, and are usually gathered before; they are quite ripe. In Eyria, Apricots are dried in great quantities, and exported to Eqypt under the name of Mishmush, where they constirute a most palatable and convenient article of traveller's commissariat, as, when stewed, they keeps perfectly well in this dry climate, and sufficient for a month's consumption, or longer, can be stowed in a very small compass. Mismush was a principal article in our cuisine during our voyage ap the Nile, and from its portability, it is ex
(the moon of the faithful) is the same fruit diffe
ently prepared, and is equally known as mishmush, b ently prepared, and is equally hown as mishmush, but sists of the pulp of the Apricot rolled out (after drying I should suppose) into thin sheets 2 nr 3 feet long, and a fout or two in width; and from its dark, colour, resembles nothing so much as a blacksmith's old leather apron; when dressed, however, it is no despicable dish, and in the upper country is the kind of mishmush most usually seen in the markets; we could sellom procure usually seen in the markets; we could seldom procure
the entire fruit, and when we could it was rarely of the the entire fruit, and when we could it was rarely of the
best description. A small round Plum, the size and colour of our Greengage, and (if I recollect right) very like the Yorkshire Wine-sour, is sold in quantities, and
though scarcely eatable at de sert, is the only Plum I though scarcely eatable at de sert, is the only Plum
have seen in the country. A dish of small wretched green Apples and Pears made its appenrance for several weeks successively at the dessert at Shepherd's hotel, for ornament ouly I suppose, as no one could reasonably be expected to partake of them! Figs are good and plentiful; the larger kinds, as the green Ischia, \&c., I St. John's garden at Kyde fully as saccharine and as well-flavoured as in this country. Pomegranates abound later in the season; I eat them in their perfec. tion last year at Alexandria, Cairo, and up the Nile; but at best, they are an insipid, though refreshing and splendid looking fruit. Bananas succeed well even in Lower Egypt, where I have eaten them as good as in
the West Indies; but their cultivation is confined to the gardens of the wealthier class generally, and to the vicinity of the principal towns. Dates of course grow everywhere, and are so emphatically the fruit of the country as to have obtained the name of Iamr, a word which signifies fruit of all kinds in Arabic. This concludes the list of eatable fruits, or such as might be made so at least by proper calture in Egypt ; there are others called fruits by courtesy, such as the Prickly Pear (Cactus Opuntia), the Nebr (Zyziphus Spina Christi) and especially that of the Sycomore (Ficus Sycomorus), whose Figs are much in request amongst the common people. In taste as well as in aspect they resemble the common Fig (Ficus Carica), but are vastly inferior in the quantity of saccharine matter they contain. Of the the valley of the Nile, I shall give an account at some future time. A bare list of the varicus productions that line the banks of this ancient stream with, I really believe, not a single mile of interruption in any part
of its vast length, would almost fill one of these pages. of its vast length, would ald
Letters of W. A. Bromfied.

## Calendar of Operations (For the ensuing weet.)

## Plant departuent

Conservatoky, \&c.-Attend carefully to specimen hard wooded plants, which it may be neceseary to winter in this house ; many of these are impatient of fire heat and a confined atmosphere. Use no more artificial
warmith, therefore, than is absolutely necessary, and endeavour to counteract its drying effects either
means of evaporating pans, or loy sprinkling the borders \&c., in order to prevent anything like a dry parched state of the atmospliere. It is in many cases difficul to maintain a sufticiently moist atmosphere without causing drip, as the moisture in the house geta condensed upon the glass, and unless provision is made by means of
inside gutters and pipes to catch the condensed moisture and carry it off, it is nearly impossible during frosty weather to preserve the beauty of flowers for any length of time; and in cases where there is no provision marie against this kind of moisture falling upon the plants the temperature should be kept as low as may be con-
sistent with safety, avoiding moisture in the atmosphere ns far as possible whenever the glass is affected by frost Plants in cold pits that may have been excluded from light and air for a few days must not be ton suddenly uncoverel; on the contrary, they should be very gradually inured to exposure. Take advantage, howTery sparingly supplied with water at the root so as th prevent the production of weakly sappy wond. Look requently over anything subject to the attarks o
mildew, apply eulphur the moment this pest makes its appearance, and see that everything is perfectly free from insects. It there is any prospect of a scarcity of bloom next May, a portion of the Achimenes and Gloxinias should be repotted at once and placed in a warm part of the stove, choosing such as have been the longest at rest ; and a few Clerodendrons, Allamandas, a plant or two of Echites splendens and Dipladenia crassinoda, command with weil ripened wood, and that have been sone time at rest, there will be nothing gained hy attempting to start them into growth at present, for in mnst cases it is difficult at this season to maintain a sufficiently warm temperature to secure anything like free growth from these unless the plants have been well prepared for an eariy start. A gentle bottom-heat of about $80^{\circ}$ or $85^{\circ}$ w.ll be of great service to such things
in inducing a healthy ront action, and if this can be secured there will be little difficulty about obtaining free vigorous growth. Let Ixoras and all other hardwooded plants that have made sufficient growth be lept
rather dry at the root in oder to check their
growth, and induce a tendency to form bloom buds; but
do not let the soil in the pots get so dry as to affect the
foliage.
Pineries. - Forthe supply of riptient August being usually obtained from from May until into fruit without making growth in spring, a fair pro portion of the stock should therefore be in a well matured state by or shortly after this season, and any many of them to show fruit at once should be carefully avoided. That portion of the stock expected to furnis the autumn supply of fruit should not be too much checked at present, indeed these may be kept growing method of the winter, which is perhaps the most certain method of preventing their fruiting too early in spring Where the stock of plants likely to fruit without making farther growth is considered insufficient to meet the demand until August, the stronger plants of those for autumn fruiting should he encouraged to make growth as early as can be done without weakening the foliage, with Exa view of preparing them for showing fruit in April. ing in the open bed, and do not allow it to become unhealthily dry, for this would prohably result in a great portion of the stock showing fruit prematurely, and it is also a work of some difficulty properly to moisten the no more fire-heat for the get too much dried up. Use maintain the requisite temperature, which, for the general stock, need not be high for some time yet Vineries.-As soon as the buds in the early house are fairly started the temperature should be increased to $60^{\circ}$ at night and $65^{\circ}$ by day, allowing it to rise $10^{\circ}$ on little fresh air, but recollect that the folliage will not ear exposure to cold drying winds, therefore air should be admitted in contact with the heating apparatus, and when it may be necessary to give back air the sashes or ventilators must be opened but very little, and if pieces of netting could be nailed over the openings this would greatly assist in preventing cold currents blowing into the house. Where the border cannot be warmed, see that it is well protected from wet, \&c., by a thick covering can be recommended. Look over ripe Grapes often, removing any decsying berries, and aim at securing, a dry atmosphere with the least possible application of fire heat. Peaches.-Until
the trees are fairly on the move do not keep the night temperature higher than from $40^{\circ}$ to $45^{\circ}$ by means of fire-heat ; but an advance of $10^{\circ}$ early in the day, with plenty of moisture in the atmosphere, should be secured. Syringe the trees frequently, and secure a thoroughly moist atmosphere. Also see that the inside border is in a moist healthy state, and if this is not the case, two or three applications of tepid water should be given. It is becoming very much the order of the day to have Peach trees and most other things which are wanted for very early forcing in pots; and this plan offers the advantaye of being able to afford the roots a mild regular bottom-heat, which is of the
greatest importance in early forcing, and excellent greatest importance in early forcing, and excellent
crops are thus obtained. But the trees must be prepared for this purpose by having been grown some time in pots; and where these are not at hand, unless they can be purchasedi from the nurserymen who prepare them, nothing can be done this season except next year. Strawberries.-Where ripe fruit is wanted early, a portion of the most promising plants should now e selected and placed in a pit where they can be afforded a gentle bottom-heat; or if this cannot be commanded, a Peach-house or Vinery which has just
been closed for forcing will do. They must, however, be kept close to the glass, for they require an the light that can possibly bo ufforted them at this season, and a free admission of air on mild days, with a low temperature until the fruit is fairly set, and if these conditions can be combined with bottom-heat, success will be more certain than under any other circumstances, and this will be more easily done in a small pit than in a house, the temperature of which must be regulated by other things.
flower Garden and shrubberies.
If not already done, get all borders neatly trimmed ap for the winter; in doing this, places intended for Hollyhocks, Dahlias, \&ce, next summer should be prepared by deep digging and working in plenty of good rotten manure ; there is generally as much time to spare now for that kind of work as at planting time. See that coarse growing plants which may be encroaching
upon their weaker neighbours are reduced so as upon their weaker neighbours are reduced so as to occupy their proper places. Valuable plants, as varie-
gated Hollies, Rhododendrons, \&c., if not growing as treelyas it is desirable that they should do, would be benefited by a liberal allowance of rotten manure or weildecayed leaf soil applied as a top-dressing, covering it with a little fine soil, and working it into the ground around the ball towards the extremities of the roots. But Rhododendrons, and what are generally termed American plants, ear removal so well that these where not growing satisfac-
torily should he taken up, the ground well prepared by a liberal addition of peat or leaf soil, and replanted. Continue to give careful attention to half hardy plan's in cold frames, taking advantage of every favourable opportunity to expose them freely to air. Anything of which there is but a spare supply of plants to propagate from should be placed in growing quarters at onee, taking
mildew, \&c., for soft-wooded plants in heat at this season are very subject to the attachs of insects.
Do not let Pears get overripe before barden
Do解 put them aside for inat exhibit symptoms of decay, an parieties of Pears moediate use. Any of the choice fruit room should be removed to a warn dry room for few days which will be found to greatly improve them. Keep all fruit as cool and dry as possible; if frost excluded from the house, it can scarcely be too cool where the object is to preserve fruit plump and sound as long as possible. Push forward pruning, nailing, ying espalier trees, and such like tedious operations a last as the weather and circumstances will admit. Get manure wheeled upon vacant ground when the weather is frosty and this can be done without injuring the walks, and get all spare ground turned up as soon as possible, so as to expose $\mathbf{j}$ to the action of the weather or land that has been long cropped with vegetables tressing of fresh loam would in many cases be prefer able to manure, and where this is wanted and can be btained it should be got to hand, in order that advantage may be taken of trosty days for wheeling it upo the ground. Where fresh soil cannot be obtained, charred vegetable refuse, such as prumings of shrubberies, edgings of walks, and many things which turn up in course of the season, may be cheaply made to form

## SATURDAY, DECEMBER 20, 1856.

The supplement to those tables already published on Scottish Agriculture, which indicated the acreage of the several crops this year, has at length appeared and the average produce per acre for every district in the country as determined by local Agricultural
Committees being applied to the acreage of each Committees being applied to the acreage of each total agricultural produce of Scotland for the year 1856. In the following table the figures for the current year are compared with those of 1854 and '55, and it will be seen what a rapid and continuous advance has annually been made in the produce of the Wheat crop. This and the diminished growth of Potatoes are the principal points deserving notice in this year's returns. Jn neither case, however, is the whole truth told.
The seven million bushels of Wheat of 1856 are not worth so much for food as the five millions grown last year ; and the 400,000 tons of Potatoes, though existing at the date of the inquiry, were then in a rotting state, and have since no doubt diminished in quantity from this cause. This year's crop is
therefore of less value intrinsically as well as in the market than that of 1855 :-
Aemiculttral Prodece of Scotland.

Mr. Halr Maxwell continues to report the frank and cordial manner in which Scottish agricniturists
have furthered this statistical inquiry. It is my pleasing duty," he says, "to inform my Lords that the returns continue to be freely and voluntarily made by the agricultural community. Instances there are, no doubt, of opponents who plead the objections so frequently heard in England ; but such cases are singular. The farmers of Scotland have practically satisfied themselves that the inquiry is in no respect inquisitorial, and that it canno possibly divulge or compromise individual interests. They appreciate with intelligence the importance of statistical information, antically extended ove the three countries, believing that its results are the three countrales, partial."
Tue Times informs us of the failure of an expedition fitted out at Aden for working the guano to be found on the Kuria Maria Islands. Captain Ord and his party were forcibly hindered by the Arabs from prosecuting their object, which had been ceded guano Mrajesty by the Imanm of Muscat. He was immediately and in the most peremptory and insulting manner ordered to quit the islands within one hour. The isladds, it was averred, were never a dependency of the Imaum, but belonged to a chief
who resided at Marbat, on the mainland adjacent, without whose authority no person had any right to get foot on his territory.

It is to be regretted that this scheme has for the present failed, but if the same energy is brought to bear upon it again, and adequate protection supplied either by her Majesty or the Indian Government, there seems every probability of its eventual success.
It is a compliment to Mr. Carrds agricultural foresight and intelligence that the very words which many years ago he used in reference to that part of the agreement between landlord and tenant which determines the course of cropping permitted to the latter, should have been adopted by the London Farmers' Club in their recent resolation on the subject of crop rotations. This resolution stater, as Mr. Carrd had written long ago, that "the landlord who continues to bind his tenant down to a prescribed routine from which he must not under a penalty deviate inflicts upon him a very serious injury without any corresponding advantage.

These words were quoted by Mr. Thomas at the close of his paper on this subject as the result to which his past experience and his present argument had led, and they were adopted by the Club after a full discussion of all the points involvedto which landlords, farmers, and land-agents had all contributed. In this discussion the danger of too great liberty as well as the injuries arising from excessive stringency of rule had been fully insisted on, and not only the general principles which shonld influence the relationship of the owner and the occupier of the land, but the details of every separate point in which these principles would have to be developed were fully represented. On the one hand was justly argued that the particular routine of practice which was undoubtedly a great improvement on the cultivation of a century ago, and might most properly have been made
the rule of agricultural improvement then, was not necessarily an improvement on farm practice now and could not properly be made the rule of agricultural outine at a time when much fuller knowledge exists of the caases of fertility, and when much more bundant means for the maintenance and increase of hat fertility are at our command. And, on the other hand, the several particulars in which our ordinary otations, as generally prescribed in leases, are a fault were examined and exhibited
The alternate system of cropping as shown in the our-years course is a vast improvement on the long ago, but we have long learned that the Clover which it prescribes every fourth year cannot be rown every fourth year, and that the Turnips, which came round as often, of fen fail. We hav learned, too, that in those cases where this crop acceeds, as latterly by the ade to vield, there has follosphate its consamption by sheep upon the land such a growth of straw in the succeeding Barley crop, that the earliest rains have laid it spoiled the sample of the grain, and killed the nate agricultural dilemma can exist than the light land farmer on the Norfolk course of cropping thus encounters. Probably he fails in getting Clove and in getting Turnip, and then of course he fails of getting corn; possibly he succeeds in getting Tarnips; and then his Barley falls, spoiling the grain which it yields, and killing the Clover which covers.
The remedy generally adopted for this unfortunate predicament is to nake the four-years course one of ix or even eight years duration: in the latter case, is regards the Barley crop, laying down only hal he extent with Clover seeds, taking Beans or Peas pon the other half; and as regards the Wheat crop breaking up only half its stubble for the Turnip crop, and putting in Mangel Warzel on the othe half. The crops then come round thus:-(1) Wheat ; (2), Swedes or common Turnips; (3) Barley ; (4), Clover ; (5), Beans or Peas. and every green crop thus is taken at eight-year intervals. The fault, however, pointed ont by Mr. Thomas as regards the Barley crop after Swedes or Turnips eaten on the land remains in full force. luxuriant growth falls, and a good malting Barley becomes impossible. And Mr. Thomas's plan of remedying the Norfolk course by taking Wheat after Tornips, and Barlev laid down with seeds fter Wheal is the great innovation on the alterhate system sanctioned by the resolution of the London Farmers' Clab.

Mr. Bargr, of Writtle, a land-agent as well as a arner, seems to have sanctioned some such plan as this in agreements which he has recently drawn up, for he told us that by these agreements he had ensbled tenants to take a second corn crop in any
case where 30s. worth of guano was applied aloug
with tit per acre: and there sems no reason why,
provided ferility be in th or any or provided fertility be in this or any other way pre
served, any crop which the farmer grows should served, any crop which the farmer grow sho he occapies.
It is well, we think, to call the attention especially of Scottish farmers, who even more than
English agriculturists are bound down to a prescribed rotation of cropping, to a resolution affirming the advantage to all parties of more liberty in this matter, ayreed to by a meeting comprising Lord BERNRRS and other Euglish landowners, along
$a$ a large and influential body of English farmers.
It may be well, no doubt, for a while to bind down ignorance to a routine prescribed by greater knowledge; but after the lapse of years the know ledge which prescribes it itself is ignorance in comparison with the discoveries which have since been
made: and the rule proper for a time when (1) Oats, (2) Oats, (3) Oats, followed by natural Grasses for as many years, was the custom cannot properly apply to the present, when chemists
have answered the question-What is fertility and when commerce has furnished the means of its artificial maintenance.

## Home Correspondense

The Cottage of the Working Man.-The extensive circulation of the Gazette throughout the United Kingdom offers a valuable channel for the publication of sugges tions having for their o jeet the welfare of the workia classes. It is quite impossible in either one or two commnications embrace all the points conneeted
with the imperfect dwellings of labourers, artisans, and poor travellers, particularly as the space allotted to correspondents is necessarily limited in a paper having
so many claims upon its columns. Nevertheless a few words may induce inquiry and exertions, and lead to change in what all must deplore. The disgraceful state of the lower class houses in towns and villages entails so knowledge of those who live in comfort and are exempt from such trials, that it may be an advantage to al parties-those who would thankfully receive and those who would willingly perform kind offices-to enter prehensive terau-instruction should be carried much further than the mere mechanical operation of reading
and writing. The ideas of adults and children ought to be guided in the $\mu$ roper direction, teaching them to fee their position towards their Maker and their neigh bours, giving them a taste for useful employmen and a hatred of idleness, thus preparing youth to of truthfulness and honesty, and incur seed proper distinction between right and wrong. In crowded rooms, crowded rooms, where the vitiated atmosphere is the cause of disease, producing fever, diarrhoea, consumption,
\&c., the sufferings of the poor are terrible. It does not require any stretch of imagination to picture the distress of an unfortunate member of a family, prostrate from some infectious ailment, lying on the only bed in his possession, his complaint aggravated by the presence of his wife and children, who are obliged to remain in the same room, without the conveniences so requisite insure cleanliness and common decency; what must be the feelings of those who hourly witness the anguish and afford relief by afford relief by chapging the foetid, sufficating, noisy
room for one at least free from the intrusion of others, and where comparatively frosh air and more humanising comforts might be enjoyed? In vain does physician prescribe, medicine is not so much wanted as the pure breezes of heaven, wholesome food, quiet and freedom confined and disgraceful cellars and garrets crammed with human beings, whose very natures become demo ralised. Under such an aceumulation of horrors what proepect has the minister of religion of making any imfrom labouring in so hopeless a field, no energy or exertion can overcome the habitual profligacy of many years standing, interrupted as a clergyman must be by every any attempt to improve either body or mind will end in disappointment, and man is reluctantly compelled to leave his fellow-man in a position inferior to the anmalis which we keep for pleasure and use. Th arue prosperity of a country depends upon its religious,
moral, and social condition being in a wholesome state each class contented and enjoying freedorome and pro tection, labouring in their vocation not only for their own benefit, but cheerfully assisting in the preservation insure the greatest amount of happiness to a people to England, though blessed above all other countries, does not pay sufficient attention to the instruction of the youth of both sexes. The immorality amongst high in a great measure, to the grent truth-that the Eye of their Maker, which neither Freping Mangel Wurzel.-I am sorry that I hav bit Grower" reepecting Mangel. Wurzel before.
or five feet at the base, and then packed up to a point every $C$ feet. In the spring I open the stacks at both
ends, first for immediate use, and the other if "sprouting" to have them turned over, the sprouts
rubbed off, and some soil again thrown keep them moist. After the end of May I merely keep a sufficiency for my pigs through the summer months, and find very few rot till the end of August when the stubbles come in for the pigs. I last year and the year before had (merely from curiosity) a few bushels put a a heap and again covered with soil, to see how long hey them sound till near Christmas. The Orange Globe
leeps rather better than the Long Red. Mangel Wurzels are such gross feeders that I have never attempted to grow any without farm-yard manure ; two cwt. of salt recommend in addition. I have this year grown some very respectable roots, on soil so near the slate bank that it is impossible to pitch hurdles on it. S. P

Pig Feeding.-I have turned my attention to this branch of farming, and, as you signify in your last week's Paper that some statistics on the subject would not be unacceptable, I shall be happy if my experience can be of service. I breed all my own pigs. The sows
are of the improved Essex breed, commonly known as Mr. Fisher Hobbs's ; the boars principally of Mr. Northey's breed, which he called the improved Leicester and which with the same prime quality are rather arger than the short Essex sort. I have accommodaresponsible man, a woman and a boy to attend, to bed them, to scrape and steam the Swedes, to feed them, and throw out the dung. This latter is done every riday, when I find that each pen containg a one-horse load of very rich dung. My steaming apparatus is
very simple, but most effective; thanks to Mr. Mechi's very simple, but most effective; thanks to Mr. Mechi's
recommendation in your columns of Mr.C. W. Willisms's book on the "Combustion of Coal," \&e., I can steam 1 ton per day of Swedes with less than 50 lbs . of coal and a little wood. Owing to climate our corn not of first-rate quality, but we make up in quantity sowing an equal mixture of Barley and Oats, which our land, which presents two or three different characters in every field, from stiff clay to light Barley soil. The xpense of grinding is met by the miller's customary carriage. For the Dr. and Cr. account below, I have taken an average pen of 3 pigs for the sake of concise ness :

Thus I calculate if 1 can clear the dung, it is 15154 as I can do after making the market value of my own farm produce at home. I cannot give any estimate of the expense of rearing pigs to a proper age for feeding anless the old saying is true, that it costs $11 d$. per week to make a store pig gain 1s. Walter 1'. Bullock, Hegadon
Reaping Machines.-My last letter appeared hard upon the present reaping machines, and hence it might be supposed I condemned the attempt to introduce a reaping mechanism, in lieu of the unassisted scythe altogether; such was not my intention, I consider the desire to substitute the former for the latter as a step in the right direction. Your readers will have observed I make a wide distinction between a transaction with ive plant and with dead material; now Wheat when ripe comes under the law of dead material, and is to be deal the present contrivance unphilosophical because it is fixed, or permanent and expensive; and uneconomicnl, because it does in no wise abridge the after labours of carting and threshing. In this letter I can only point to what I shall consider the per-帾 get on the average more than 12 inches of straw with the ear, thereby saving the labour of carting, stacking, and threshing. I shall be asked what "condition" is necessary to be fulfilled by the farmer that so great an eondition required of him is that the crop be maintained nan erect position, and then labourers (mechanically assisted) shall "top" an aere of Wheat with the same ertainty as they can now top an acre of "hedgerows." But to enable a farmer to maintain his Wheat in the field in an upright position by artificial or natural means, he must divide his fields into small allotmentswhich proposal for the subdivision of fields into parts is the very havis of operation on which my eircular system of tilling land depends for pay to maintain the Wheat crop in an erect position ? Ask the Mesars. Hardy whether they consider it would pay them after all their toil and expense to allow Ask any seed-grower. [Will Mr. Burcham tell us how it can be done! When studying field practice I eeveral times maintaived half an aere of Wheat

1 an erect pusition, when all around it went duwn and .d secured a number of square yards of the ears of ais Wheat,"quite sufficient to prove that, with the aid my general tillage machine and circular method of ltivation, harvesting the "staff of life" could be ndered both safe and certain. I had a model in the xhibition of 1851, and a reporter in describing the crn-cutting apparatus, facetionsly termed it as a number of scissors, evidently intended for cutting corn." Now he might have used the more Ween correct With 4810 stroks of would hav durable mechanism, the "strokes" divided ampand imited number of men, according to my calculation and experience in the field, we could cut and cart straight away to a storehouse an acre of Wheat in period of time so short that I dare not now name it
 answer to this is let your readers again peruse tha capital letter of "A Landlord" in the North British Agriculturist, given us in the Gazette. See what abour our present harvesting Wheat is-cutting collecting, band-making, tying, stooking, pitching, bind ing, carting ; unbinding, unpitching ; stacking, thatch ing; unthatching, unstacking, unbinding, threshing straw rather than corn, restacking atraw! If nearly a these labours could be avoided by adopting the simple expedient of maintaining the Wheat plant in an erec position (so that it might be decapitated), is there no sufficient inducement? I know I shall be charged with aiming at a perfection in harvesting Wheat such as can never be attained, bnt time will show who is right and Who wrong in this as in many other matters of the field. C. Burcham, London.

To the Right Mon. the Earl of Clarendon, K.G.". On the motion of M. de Trehonnais, seconded by Mr-
Fisher Hobs, the best thanks of the Society were voted to the Earl of Clarendon.
Mr. Kaymond Barker, as Chairman of the Finance Committee, laid before the meeting the balance-sheet of the auditors, and also the country meeting balanceseet of the Chelmsford Account.
On the motion of Mr. Druce, seconded by Prof. Simonds, thanks were voted to the auditors, Mr. George Raymond Barker and Mr. Dyer, for their kindness in aditing the accounts of the Socisty. Those gentlemen with the addition of Mr . Astbury (in the place of Mr Ninight whose contipued indisposition obliged him un willingly willingly to relinquish the duties of the office), were
On the motion of Mr. Astoury, seconded by ar Burness, the thanks of the Socsety were voted to Prof.
Simonds and Prof. Way for the lectures delivered by them before the members. Prof. Simonds returned thanks
Mr. Corbet and Mr. Fisher Hobbs expressed a hope that the December General Meeting might in future be held earlier in the week of the Sminhfield Club Show. On the motion of Mr. Eitwall, seconded by Mr. Jonathan Gray, and supported by M. de Trehonnais, the cordial acknowledgments of the meeting were voted to the Chairman for the kindness and impartiality with which he had presided over it on that occasion.
The meetings of the Council stand adjourned over the Christmas recess to the 4th of February
[We very deeply regret to learn that Professor Way is suffering from an illuess brought on during the discharge of his duties as chemist of the Society. We suffered from the injurious effect of mercury.]

Societt of Arts, Dec. 10 : Utilisation of Sewage.A very interesting discussion ensued on the reading of Mr. Cooke's paper on this subject, and we make the following extracts from the report of it in the Society's Journal.

Dr. Lyon Playfair (the Chairman) said-When they life depended the whole system of vegetable and animal life depended one upon the other-that vegetables lived upon carbonic acid, water, ammonia, and certain mineral
substances-that these affurded food to animals during substances-that these affurded food to animals during
life, and were again resolved, by the effete matter during life, and were again resolved, by the effete matter during
life and decay atter death, into the same subatances, viz, carbonic acid, water, and ammonia, it was not, he thought, a wise polscy on the part of the metropolis to send away all that matter to feed sea-gulls and sea-lions, in order that it might be brought back again from Ichaboe in the form of guano. Instead of this general and wasteful distribution of our treasures throughout the world, it would be far better to use them economically and productively at home. He would mention one philosophical fact. The effete matter of a population was of all thing food of that population. The Irish fed very mach upon Potatoes, and Potatoes grew well in Ireland, because the effete matter of the Potato feeder was exactly suited for the growth of that crop; and, in like manner, the population of the metropolis of this country would be best provided with food suited to it by the application f permage of the metropolis to the land. The 12,000 tons of nitrogen consumed in the food of its inhabitants was capale of being spolied to the of a similar are 1 Noture's teachinge Hepent at the statement He was in maintaining their that the inhabitan 12000 tons of nitrogen an vitality, consumed about nually ; but, ignorant of the mode of arring at this his own data, and came to the result of 11,768 tous, phich was very near the amount stated in the paper.

Mr. J. B. Lawes said, that he read before this society, about two years ago, a paper upon the sewage of London, in which he expressed an opinion that it would not be possible, by any process from sewage, which should be racture a solid manure the manufacturer and to the agriculturist.
This subject was very fully entered into at that time. Indeed, the interest taken in it was so great, that the Council of the
Society was kind enough to devote an extra, night to the discus sion. Mr. Wicksteed's pampthlet was then before the public, in
winch he endeavoured to show that a profit of 22 per cent. culld
be obtained upon a capital of one million, by applyn to to the be obtaintd upon a capital of one million, by applying to the
sewage of London that process which had since been carried out
at Leicester, and described this evening by Mr. Cooke. Mr
 not justify Min. Wicksteed in assigning to it a greater value than
a few shillings per ton. It must be gratifing to those who, like
hime (Mr. Lawee) considered that the value of any manure could ope determined by its chemed had beel confirmed that night by Mr. Cooke. Thi
opinion heposit was no longer a valuable artifial manure, but
sewage deposit was to be ranked with lime, chalk, clay, sce. Mr. Cooze nad
"that it would find purchasers at a low price, when it could be
obtaned at an easy and short carriage; and that, by judicious
"the reat objection to Mr. Wiksteed's process was worthless matter,

Valuable in the sewnge, which, cornsequently, flowed back into the
sewers or rivers. It was well known to chemists that lime would net precipitate ammonia or its salts from a liquid enrtaining Mr. Ceoke endeavoured to meet the ubjection by saying,
that in using Mr. Wicksted's process they did not deal with
inghly putrecent sewrare abmunding in ammonia. Professor hiphly putre-cert sewsere abmunding in ammonia. Professor-
Way, howe ver, held a different opinion: he examined sewer-
water from places in the centre of London, trom Barret Court and water fromp places in the centre of London, rrom Barret Court and
Dorset Square, and stated that all the nitrugen in the liquid state seemed to be in the form of ammoniacal salts; that in one case 84 per centr, and in the other 80 per cent. of the whole
ammonis in the
保 therefure, he (Mr. Lawes) might lament, with Mr. Cooke, that
thirty ruillien pounds worth of ammonia had zome to waste in the city of London during his life, he (Mr. Lawess could not admit that this waste would be stopped by the application of Mr. Wiek steed's proeess. Mr. Cuoke had, perbaps wisely, abstained frow
furnikhing an analysis of his manure, but be (Mr. Laver) would, however, venture to quote one Fhich had lately been given him by Profossor Yoelckere, Professo
Agricultural College, Cinencestor:-
Analysis of Lsicester bricks made frome the sewage of the town of
Letcester, by Afr. Wichistedi's lime process.

Aat containing nitrogez equal to 060 ; wancala, 072 Now, here was a substance containing 80 per cent. of mattar to taining not more insible to ansign any money val on. Whet could be done with 300,0 or 0 tons. of this substance, the annual applied to the London sewage? It certainly could not be sold, aud it was donthtul whether it could be taken as a gift. He ( Mr . Lawes could bardly think that the Chief Commisuloner of Public
Works wnuld constder bimself justified in permitting deodorising works to be erected in the metropolls, from which 8 or 9 -tenth of the ammonis in the sewage operated upon would flow back into the sewers, or river, more especially as ammonia whe the vehicle of miasma and contagion. He (Mr. Lawes) consioner
that the proper metlod of using bewage was by irrigation. If that the proper metliod of using sewage was any district upon which the fluid could be dupnsited, he was disposed to join in the
Mr. E. Chadwick, C B., said that, on the statement made Iby Mr. Cooke, that "it behoved the authoritie generally to consider whether the effavinm from an extensive area saturated with sewage, poisoning the atmosphere by putrifying and steaming during the hea of the summer, might not be as injurious to the health of Kent, aye, to the metropolis itself, as the most efficient subterranean removal of sewage might be beneficial, ${ }^{\text {1 }}$ was to be observed that by one set of authorities, at the least, the foundation of such apprehensions had been carefully examined, and provisions made to meet them and it was, doubtless, the duty of those who had the responsibility of new works to re-inveatigate the subject, and to examine the works in actual operation. The first scheme for applying the sewage of the metropolis Deanston, and was simply an application of the practice t Edinburgh of applying it by submervion. The result the investigation of the Board Healch was establish sanitary objections and economical nature.
objections of an agricultural and economical nature.
Most persons who lived in the neighbnurhood of the parks, a the period of tnp-dressings, bad been annoyed by the frequent ill ness occasioned by them. Similar evils were st times experienced during the heary dunging and top-dressings of market gardens
with decomposing snimal manarea. Great loss aluo ename agrienlturists agreed that twa-thitids or thre-fourthe escaped nuianoce, Was nct to apply chemicals, but simply to perform
net into water to arrest the gases, and applying it by the water car or by steam power. was now proved in a sufficient number of instances. It had bee done at Rugby now for three years. In respect to the drainage it was to be observed, tbat choue who only knew the orerflo of he old conditions, as decomposing manure detained for weeks, ponths, or years, were unaware of the new conditions of town drainage, in which all cesspools were abolished, seli-cieansing
 all refuse was immediately removed by the new self-eleansing drainage and sewers, and afterwards distributed by steam power oo the principle of the water cart. The results of the working were in enmplete accordance with the principles and facts to which he had adverted. The sewage was at once received in the chemical combination, until it was taken up by vegetation. The effect was shown in the pellncid and uanally inodorous con-
dition in which the surplus water ran away on the days when there was mo rainfall.
Mr. S. Sidney said this was the third time that the value of sewage manure had been discussed by the Society of Arts. On the first occasion he characterise as wind exaggerations the poetical viow which Mr. Med not of the refuse of cities. On the second occasion, Mr. Bennet Lawes, in a most able paper, exhausted the chemical part of the question, and came to the conclusion, that a distant limised application of sewage manure to Grass land in a liquid state was its only profitable use ; and now Mr. F. Cooke, in his very candid paper, was content to talse manufactured sold oowage at from 2s to 4 , per ton, a price that would not bear the cost of carriage, as he (Mr. Sidney) had shown in former discussions.
This theory of tha enormons whe of town sewage was not new. In 1848, Mr. Smith, of Dasnston, in a report circtiatea
under the authority of the Board of Health, wrote-" Assuming that 5 cwt . of sewer water is equal to 2 l cwt. of guano-hat the
sewer water of every town was worth 1 . per hasd per annum sewer water of every town was worth 1h. per hasd per annum
(that would give three millions starling for London); and that, (that would give three millions staring for Lowden), and that
therefore, snch an ineome annually world providen fand the iopprovement of all towne in a maner corraspondigg with the
most enlightened views with requat to sanitary regulations.'

 manire thoorites mainatained that the abeenco of demana for hite

 had been invested in manufactories or prodici, drills, horse
hundreds of steam enginef, threshing machines
hoes, clod crushers, ploughs, harrows, \&c., which were eagerly bought up. During that period millions bad beon sunk in draining, paid for by farmers' rents; hundreds of thousands of tons of
gnano, costing from 10l. to 15l. a ton, had been consumed. Manubeen established in every great town and every agricultural district. These manufacturers imported bones, bone ashes, and battle-fields of Europe for the same invaluable material ; they sewage lay at their doors, offered to them gratis, and yet they cther instances in support of his views, Mr. Sidney said that in thas follnwing ont the history of British agricuture where it could by gravitation be cheaply applied to Grass land of a quality sufficiently porous to absorb it. At Rugby it flowed and the river was polluted. But few boils were like that of the Kaghy farm. If he were asked why we neglect British, and send so of the home production, be would answer, why do we drink China of the home production, be would answer, why instish herbs, Eastern sugar instead of British honey? Why do we wear American cottonaud Italian silk, instead
of British home-spun? Why do we prefer Rosewood to British Why toast our friends in foreign champagne instead of

Mr. Sheriff Mechi said that the earth was the best and cheapest deodoriser that they had. So effective was it that where he had applied large quantities of liquid manure of the strongest descrip , sit dead bodies of animals in large quantities, he had found bis cattle feeding upon the parture so treated within
twenty-four hours after the application, and forty-eight hours after no smell whatever was emitted.

Again, with respect to liquid manure not being good for other description of crop, and so effective that, where it was applied in considerable quantities, he had seen its effects on subsequent
crops for three or four years. Having a piece of land undone, crops for three or four years. Having a piece of land undone, unquestionable for several years. But before they could a alalky, gravelly, and sandy soils, they might put any quantity
of liquid mavure with effect, especially for those quick-growing crops which consumed large quantities of food by their rapic public that it was to their interest to use this description of manure. If sewage was profitable to be used by the farmer, it Was useless uniess the agricultural public were prepared to lay ystem limself, he could state as the result of his experience for
the last four years, on his farm of 170 acres, that it was a most profitable operation. Applying the water of hondinn alme-even drained land, would be profitable. The water meadows of Win-
chester and the Duke of Portland proved this. He hoped never
stiff clays, for unless that notion were exploded, it was in vain to hope that
eiay lands
Mr. Wright (a member of the Metropolitan Board of Works) said it was a favourite practice to point out in matter language the enormous amount of ferting matter
He appealed to the chairman, as a chemist, and one acquainted With manufactures, whether the cost at which it could be sared
was not an essential element in the question. Quarız might conWas not an essential element in the question. Quariz might conexpense of extraction. IIe applied that remark to the subject abstract the valuable matters in the sewage than the value when extracted, they must adopt the best plan they could for getting
rid of it. He would instance ammoniacal liquor of gas worka. The ordinary strength of that product in gas works was, that it liquor, and thus form a salt of ammonia. It was more profitable to sell it for a low price to parties who tonk it away from the gas the mandfacture could not be carried on profi:ably if the dilution in sewage was infinitely less than in any ammoniacal ever made.
He had hoped for more detailed facts as to the expenses at Leicester. If, as was stated, they were selling it at 2s per ton, thought, that aftes the diversity of opinion they had heard that evening, to ask the Metropolitan Board to rumh into this scheme,
would be asking more than practical men of business would be inclined to concede. The Board of Works were doing all they is could be operated upon. Mr . Willinson said he belonged to an increasing section of the Metropolitan Board, who believed that in deodorising would be found the successful solution of the great question of the day.
He contended that they had nothing to do with the commercial consideration of the question. The question was how they could
mont efficiently, in a sunitary point of view, effect the complete system gyon Cooke with regard to the samitary effects of tha
carried on ander their drawing-room, and the prucess minght be
in a sanitary point of view from the adoption of the deodorising
process . and as the representarives of the sanitary interest of the
metropolis, it was the duty of the board to pause before they
committed
Dr. Letheby, Medical officer of Health for the City of London, said the constituents of the sewage of towns consisted for the most part of undigested matters,
and when those were acted up by lime-whether they were in an undecomposed state, or in a putrescen state, the lime precipitated the phosphates, which, in the act of falling, carried mechanically ore left urea uric acid, and other substances of value, wholly untouched The process, therefore, he considered deficient in the first principles of chemistry
Another argument was, that the mortality of the town o disinfecting the sewage had been introduced.
return bufore them would at first sight indicate town had progressed, pari passu, with the introduction of thi
system. But let them look at the other towns in the NorthMidland counties, and they would find that there also, in precisely similar proportion, had there been an me therefore of opinion the chemical principle involved, and the sanitary result claimed,

Mr. Cooke replied
He had ascribed the diminished number of deaths at this all-important fact to the general sanitary measures adopted. of the sewage, and that quicklime liberated the ammoniaster plan was, therefore, chemically wrong. He (Mr. Cooke) had stated that it was cream,
or hydrate of lime, that was employfd, and that the ammonia, or hydrate of lime, that was employfd, and that the ammonia, College at Cirencester declared that in the dry bricks there was only 72 per cent. of ammonia. He (Mr. Cooke) had shown that
the dry brick lost its ammonia, and should not be taken as the product of the system, It had been said that the process was a (Mr. Cooke) had stated that it did sell, at a price that covered the outlay in production, and that 1000 tons had heen sold in the last fortnight. He was told that there was a fallacy in valuing
the ammonia in manure at 60 . per ton, as that was the price of the pure artlcle. He replied, how, then, was guano valued? It解 in proportion to the qua ase the pure guano, on the same ground that in private lif hicory, champagne instead eplied that, that gentleman was wrong in each case. The deodorised sewage was no counterfeit; it was of low value, but duced, and for what it was worth. He (Mr Cooke) showed, by
sales that were going on, that it could be dipposed of at a price which would cover working expenses, but the Metropolitan Board were willing to spend 38,000 2. per annum, without any
return. He showed a saving of $1,200,000$. per annum on the engineers' estimates. Another gentleman declared that irrigation
was desirable, but that it infected the air. He submitted a plan for purifying the sewage water before it was employed for

A rote of thanks was passed to Mr Cooke.

The following letter has been received since the meeting :-
"There was no time for practical farming men to make any since I have been engaged in farming on rather a large scale different modes now known for munuring and enriching any land at the least cost ; and with respect to the manure made by Mr
Wicksteed's proceas, I should kay that it is with the farmer solid manure con-

Wrrth to the farmer as much ns 100 lhs. of guano; and if the
farm is near to the works, it may be cheaper for him to buy and
expense of carrsing this manure on to his fields. The grea of its distribution, as the engine will pump up and distribut manure alone from the darmyard on to the fields and distributing
it, will cost $4 s$. per ton. Also when the manuring principle is
applied to land through the soil, and becomes more quickly combined with it than when put on the land in a solid state; and until the
manuring principle has chemically combined with the soil, the
food for plants is not proluced. Frofessor Way has shown us, fond for plants is not proiluced. Professor Way has shown us, taining such usual proportion of alumina as all corn lands bave allumina, and the liquid is discharged free from it, wherefore it more desirable to apply the manure dissolved in water, and, as is
now the custom, to apply guano to the land in wet wea-her, that now the custom, to apply guano to the land in wet weather, that
its ammonia may be quickly washed in; and 1 may here remar found that peat charcoal has not so good an effect in arresting
ammonia from liquifs as common earth, and it is therefore of no value tor that purpose. If I could get a supply of liquid mianur
brought to my farm, I should be glad to receive it, and would di tribute it over my land; but until that can be doue, I see n
reason why farmers should not use Mr. Wickstped's solid
manure, if its cost per ton, when put on the land, will not exceed manure, if its cost per ton, When put on the land, will not exceed
the const of loo los. of guano. But, of course, it by Mr. Wicksteed's
prucess the per centage of amomonia can be incrensed, is value to the farmer will also be greater. John Eetaell.'

## Farmers Clubs.

Central
Mr. Thomas retelred first to ayriculture in the reign of the earlier Georges, when two crops and a fallow were the rotation which prevail, amo that of hic Romana of the improvements first effected in agriculture north of the Tweed. He said:-
I believe I am only dong justice to cur friends north of the
Tweed if I state that it was the agriculturists of that country Tweed if I state thiat it was thu gryiculturists of that country
Whe, at the close of the last century, took the lead in those vant
improvements which began to distinguish our husbandry. They smaller and smaller in their produce, whilst with intervening
crups of Clover or roots the produce increased, and this led them
to the conviction, which the science of chemistry has now elucl-
dated, that cereals and bulbs each extracted a different substance
from the soil, and that this extracted matter, whatever it was,
was in time restored, either by the effect of the atmosphere or
the agency of manure. The researches of the goriculura We agency of manure. The researches of the agricultural chemist were then unknown, but the idea was correct in the
main; and thus first arose the famnut agricultural system of
alternate corn and green crops, which has now so long maintained its ascendency. The rotation of cropping which on
strong lands in. Scotland first obtained, and still retains the greatest favour, is the six course-always premising that the
land must be first made dry by draining-usually com-
mencing with a fallow, or fallow crops, such as Tare, or Cole-
seed, and then Wheat, Beans, Barley, Clover, and Wheat. It g sometimes altered to fallow, Wheat, Clover, Osts, Beans,
Wheat; but by some, there is an ohjection to this course, from the Bean Crop being, bo late in the rotation as to canse mors
difficulty in keeping it clean. But, if a landlord will insist that dincuty in keeping clean. But, if a course of cropping, perhaps
his tenant shall be bound down to one con
none better than one of these two could be found. The cultivation of the Turnip soils of Scotland may be included with those of
England. Whilst this energy was being di played by our
northern friends, enterprise and experiments were not wanting in England. J. W. Coke, afterwards Earl of Leicester, had
succeeded to bis vast estates in Norfolk, where a soil naturally attempted, but the greater part presented only sterile sheep
Falks, or was devoted to the parposes of the warren. His active and energetic mind deplored such a state of things, and he
resolved upon improvement. He saw that the soil wanted solidity befure it would yield productive crops of corn, and the
Turnip and Clover crop seemed to afford a remedy. And hence Whing the famous rotation of Turnips, Barley, Clover, and and permanent succeas. The swedish Turnips, then called kuts Baga, were then firstintroduced to this country. Red Clover had these two crops, and also of the corm crops which succeeded beheld the gigantic improvements which were here displayed, that they were anxious to introduce the like into their respective estates; and when they fuund persuasion unavailing, to compel
their tenantry to improve by coercion? There can be no doubt, their tenantry to improve by coercion? There cat on the which I have had so often to allude were frat in an improved system of agriculture; but it has at last broken down, after holding its the germs of its own dissolution was clearly seen many year back by the late Sir J. Sinclair, and many other eminent agri calturists. I know not how the case may be in Norrol, I am this I do know, that in every part of England with which
intimately acquainted, there is one universal lamentation over the difficulties which the system now presents. The Swedes,
though more certain of obtainment than they once were, through the agency of peculiar manures, are yet subject to strange and year, in the total ruin of the crup. The Barley, where the crop
of Swedes had proved large, and had been fed on the ground with
the addition of cake or corn, we find in fruitful seasons laid flat on the gronnd; and when a period of wet takes place at the time
of harvest, seriously sprouted, even before touched with the scye the grain unfit for the maltster, and the straw valueless as fodder.
The farmer then find that his young Clovers have been killed by the lodgment of the Barley crop; the next year produces him the succeeding one yields him but an inferior crod of weat; for when it succeeds Clover, is influenced by the degree of fertility in in the ground, as las been so accurately pointed out in more than
one lecture of our triend Mr. Nesbit. Let us endeavour now to
ascertain the causeof this diease amor ascertain the cause of this didease among the Swedes (the cause of
the frequent failure of the remaining three crops $I$ liave already alluded to), and then see if we can throw out some hints for an
improvement of the rotation. That when a longer period than improvement of the rotation. That when af Swedes, the crop
four years elapses between the crop of
is usually found to be henvier, and success more certain, is well known. A remarkable instance of this I may quote,
as taking place in a parish adjoining the one in Which
I reside. At the close of last year my neighbur Mr. A W crouch, in common with the rest of us, lost almont the entire inexplicable disease ; but across this Iarge field was a broad belt of magniticpnt swedes, totally uninjured by disease, and preSeightimurs. What was the cause? Each part of the tield had
been manured alike, and each acre had receeved the hike atten-
a mainder of the filld had at the same period been cropped with
Swedes. Our friend Mr. Joseph Paine las told me that the

 endeavoured to sketch out what I believe would be found,
upon trial, to be a great improvement on the Norfulk fourcourse system. I conld not have ventured upon recommending
such a rotation to your notice, did I not recognise the powerful
assistance which agricultural chemistry has brought to our aid ; and, although I agree with the remark, "that it is a great mistake to suppose that men can be made farmers by teaching them to those gentlemen who have given up the ir time to its study; han empty thanks can be offered without offence. I have not as yet alluded to the covenants which should secure a landlord
from the results of an impoverishing and faulty management To avoid tbis, much depends on the judicious choice of a tenant agreement, relinquishing into the incoming tenant's hands, one year before the expiration of an agreement not renewed, a prothat in the last year not more than three fifths of the entire
occupation should be under white straw cropping. I conceive
that some such arrangement would unfetter the lands of a tenant very much during the major part of his lease, and could not, by Mr. Thomas concluded with remarks on the Duke of Northumberland's agreement with his tenantry.
Mr. J. Paine (Bedfordshire) had long recognised the the subject getno kith his name, which Mr Thomas had mentioned, came under his notice about two years ago.
It happened that on a 30 acre piece, well cultivated for Turbips, and with a qood plant, the greater part optor being about seven acres, which lad borne a crop of Peas during the routine of the previous four years, and which was consequently eight years
from the Skede crifs, and about an acre and a half which had been well limed. Here the produce was very good, but these por-
tions were all that was worth a farthing, thoniyh the entire field had been sown with the same seed, under precisely similar cir cumstances. When the process of hoeing was performed, a more time, saving the two portions referred to, the roots were not worth
picking up. What was the conclusion to which he naturally came? Why, that the fault lay in sowing the Turnins too frethe agency of articicial manures, the farmer might in some districts cultivate his land even upon a six-course. There was one land's agreements. Now, if they had none but such men as the
Buke of Bedford to deal with as landlords, there would be little need of requiring what was called fixity of tenure. The farme
would feel himself tolerably safe and quiet withnut. But sumed, be always some black sheep in the flock. Metore, then,
terant invested his capital in artificial manures, and the in terant invested his capital in artincial manures, and the int-
provement of the soil, he onght, in justice, to lave a guarautee
that he would he enabled to reap the henetit of his oulay. Land
was not all fitted for Turnips; hut where it was so, he thought that if they commenced one course of four or five years with
Mang+ Wirzel and the next course with Turaips, they would not experience much difficulty in getting a good Turnip crop.
Moreover, upon strong lands they would never do better than
raise a crop of Wheat; but they could not get two crops of raise a crop of Wheat; but they could not get two crops on
Wheat in five years without incurring the cost of two or three
cwt. of guano per acre in one of those years. The absence of the of the improvements recomnended by Mr. Thomas, though this might be easily remedied hy the establishment of $n$ good
understaning between landlord and tenant. Let it not be
supposed that they were giming to benefit themselves at the expense of the landords of the kingdom. On the contrary, they
had no wish to extend their cropping, without, at the same time extending their improvements in cultivation; bnt, to do this,
they must have security of tenure. Were the E.English Turnip
intreduced in one course and the Swede in another, he believed it would also be found grestly to aid the growth and fertility of
the latter, Certainly in plan, similar to that which he had adopted with Clover, was attended with nuch advantage. That plan was
to sow mixed Clovers (white Clover Grasses and so on-not brad Clover) in one course, and then broad Clover in the fol-
lowing course. If the seeds of Tarnips were "coursed " in this same way, he saw no reason why equal benefit should not arise

Mr. R. Baker was satisfied that Mr. Thomas's excellent paper would be attended with beneficial results. To be, not to bring in rotation in successive years such crops as draw from the land the same description of support, but rather that one
crop showld so alternate with another as to supply its sucessor lith tood, or, at all eventa, not to be injurtions to it. Rye or Tares, or other vegetables, to conclude with Tnrrips. On
his light land he always took Kye before Turips, ffter the
Turnips, Barley, and then Clover. The Turnips furaished Turnips, Barley, and then Clover. The Turnips furaished
abundant food for the Barley, and the Barley, was good preparg-
tion followed with an antumnal fallow, manured slightily, tind tool Barley again. But of course the rotation must vary according as should have the privilege of selecting that mode of rotation which
Was begt adoped gentlemen present. had seen the experiment We had adoptod the Bystem of taking Oats after Turnips, and Wheat atter Oats, and
he found that he could grow better Wheat in this order than by he found that he could grow better Whest in this order than by
any.other procees heihad ever tried. In fact, the crop was most productive one, his Lust yielding, upon being threshed
out, five quarters an acre; and whenever he could get that quantity he was fully satisfied. The time had now arrived whes the old idea sbout the exhaustion of the soll ought to be entirely Wuly give him an opportunity of clearing the crops as they came
in zotation, and an ample supply of manure of an organic charccter, and he could go on producing crops year by year for
cxer: in other worde carry out Thathad beenironically termed the
on the tenants, and tied them down too stringently to a particulur
system system of cultivation, whilst it was difficult to induce the land
lord to alter that system even in the present das. In the case
ho homever, of some farms which he had let since Michaetimas. hhe
hadd had been able to intrcuuce a clause to the effect, that two white
straw crops shonld not be taken in sucession, unless the
tenant firgt manured the land upon which such crep
 manure of like nature, not the production of the thrn,
the alue of 3os. per acre at the teast. So long as the tenan
did that-so lonk as he put into the land that which was nece sary to support the crop he took out, if lie took it in rotation-
he would do injury neither to the landlord nor himself. Indeed Whenever a second straw crop was introduced in that way b tenant might goo on producing and reproducing to the advantage of both. The circuinstances of the times demanded that the
farming capabiities of the country ghould be developed. W had a limited area u pon which to maintain a rapidly increasin population; and if the support of the poople wast tr be derive
from the soil of the country, there must me more liveral covenan in leases to enable occupiers to raise the largest amount of pro-
duce. It was advisable that the "cuistoms" of the country rell tive to the letting of land should also be changed, for some
Mr. W. Dennett went a long way with Mr. Thomas in acknowledging the desirability of removing the restric tions whicli in many cases fettered good farmers in developing the resources of the land-and he doubted not on much good land of the country an extra whit straw crop might be produced under cleanly farming and an outlay for artificial manure, to the benefit of the farmer and nithout injury to the land.
At the same time he felt hound to say, Indeed, it mon'd te
useless for that club to argue this point uiless thes conld take

entertained. For it must be admitted there are, as
cases, two sides to this questiun-before coul can
largely the systeal of farming from four to the five cong who let the land will require some security that such privilege slaill not be abused. With spirited and good farmers (and nure
especially where land is unkind for Turnip.)-under good cultivation it would be a great improvement. The five or eve the six course system might be followed to zdrantage by
jivdicious arrangenentof crops, and aliberal appliarice of manure.
But it must ever be born in mind that But it must ever be born in mind that a bad, instead of a good
farmer, with such latitude given him might heggar the lani; aud hat laws are not made for
 vould admit) very vexations and foolish ones (cheers). It wonld be idle, however, not to admit that this subject Was surrounded
with difficulty. The great desideratum is how to give full scope to an enterprising go-ahead farmer, who will keep hls land
cosa, and in these day of artifcial manure keep it up to the clean, and in these days of artificial manure keep it up to the
cark. Perbaps the granting of a lease with general covenants mark. Perhaps the granting of a lease with genernal covenants
to keep the farm in good heart and plight, without reatrictions as to cropping (except for the last four yearr), when to rave any retrograde movement in fartoing on the one hand or celaim for
nuex hausted improvements on the other, the renewal of the lease would best obriate the dificulty. His friend (Mr. Themas) mulut excuse him if he said that he thought he had radher overdrawn
the case in pointing out the evils of the four-course system. That gentleman ssid, "to feed on the land the whole Turnip crep and oftem with corn or cake, only threw down the Rariey,
damaged the quality, end often apoiled the young seeds.", which was all very true; but he (Mr. Bennett) very mult questioned
the policy of fuch a course. On well-farmed land he thuybht, at least, one-third of the Turnips sbould be consumed in making the manure at the farnh homenstall. Mr. Thoms furtier stated, that the two frequent repetition of Swedish Turnips cailued
their failure, whichis was another serious evil. He (Mr. Repinntt however, thought this minght be largely obviated by the stbut:-
tution of Margel, the common Turnip, or even $k$ olilrabi, alter

 ion in the different varities of Clover alternatele with Peas
or Beans, onf portion of the Clover season, and the land-
ord who debars his tennt atginst the latter acts Iniudicioualy. While, thereffore, quas are seeking some attoreliorair which the four-coursee system wask dopperd, and the astoninhing advancement of agriculture within the lanst 50 yeans, whist
never he lost sight of.-Mr. Owen Wallis proposed the following resolution:-" Resslved, that it is the opinion of this meting that
the lanallora tho binds his tenantry down to a prescribed rontine
 ferrng any corresponding advantage." Mr. smithies seconded
the uotion, which was put to the meefing, and carried

## unanimously

## AT A <br> IIEETING OF NOBLEMEN AND GENTLEMEN, HELD IN WILLIS'S ROOMS for the purfose of promoting the erection of <br> A PUBLIC MEMORIAL TO THE MEMORY OF THE LATE JOSEPH HUME,

IN GRATITUDE FOR HIS LONG AND EMINENT SERVICES IN THE HOUSE OF COMMONS,

## EARL FORTESCUE IN THE CHAIR,

## The following Resolutions were unanimously carried:-

Proposed by Lown
That the disinterested services of Mr. Hume for above 40 years in the House of Commons, his successful efforts to check the waste of public rooney, his constant support of all measures conducive to the spread of moral and intellectual improvement, and his unvarying advocacy of constitutional liberty, claim a lasting record of the gratitude of his count rymen.
Proposed by the Duke of Sonereset, seconded by Thosas Thorstex, Esq., M.P.
"That a subscription be therefore opened for the erection of some public memorial in honour of Mr. Hume"
Proposed by the Right Hon. E. Ellice, M.P., seconded by Lord Hathertor
"That such subscriptions be limited to sums not exceeding 10l. fromeach Subscriber."
Proposed by Earl Granythle, beeonded by Lord hobert Grosyezor, M.P "That the promotion of such subseription th

## The Garmenerg ©hromicle.

Our readers will not have forgotten the long discussion respecting Polmaiss Hrating which took place in these columns some years since. Although for many reasons the subject was dropped, especially on account of the death of its enthusiastic advocate, the late lamented Mr. Merire, yet we have never altered our opinion of the advantages that attended its employment under certain very frequent circumstances, provided the great difficulty, that of preventing the splitting of the hot plate from which the air derived its warmth while passing into a greenhouse, could be overcome. Evidence, upon which the utmost reliance may be placed, and which has lately reached us, shows that the difficulty in question no longer exists; and that this simple method of warming greenhouses, as now managed, fulfils every condition that can be demanded of it. Were we at liberty to mention our correspondent's name it would be recognised ky many Lancashire gentlemen as one of the highest credit in their county. We do not propose just now to offer any comments of our own, but merely to produce the statement which has been made to us.
"One does not hear much of 'Polmaise' now," writes our correspondent early in December, "but I am more convinced than I ever was that there is no system of heating equal to it. I have had it at work now for many years in my church and schools, and it answers perfectly, and last week at Wansfell, on the banks of Windermere, I saw a greenhouse and stove thus heated, which had been at work for six or seven years, and it was impossible for plants to look more healthy. The stoves made by Whitehrad, of Preston, seem entirely to have overcome the difficulty as to any escape of gas. They are made of wrought iron, and are from 5 to 6 feet high.
They are lined with fire bricks to about half their height, and the fire bricks of course do not touch the
sides of the atove. I should 8 sy that in order to give Polmaise fair play it is quite necessary to be able to excavate at least 6 feet under the building to be heated. I thought you might like to hear the testimony of a man respecting Polmaise, who has had it in constant use for some years. I know no place where Polmaise is to be seen to so great advantage as Wansfell, Windermere.

In a second letter, written a few days later, he says :-"I may as well add something more to what I have already told you. In the first pl ce, I have just been pulling down a Polmaise apparatus in my garden-but why ?-not because it did not work perfectly, but becanse, from the situation of the ground, which is liable to floods, the stove could not be placed sufficiently low to secure bottom-heat. The stove had been at work six or seven years. It gave abundance of heat and I never was troubled in the slightest degree with the escape of gas. I have already stated to yon that there is a Polmaise stove in the church here, and another in the schools. In the church there is a second Polmaise stove which I had made of fire brick; it is only sunk I foot below the ground level in order to avoid flood waters which annoy us much, and the hot air is admitted into the church about 4 feet above the level of the floor. It works capitally. Sometimes when the fire is just lighted there seems to be some escape from the stove, but nothing to be disagreeable in the church. I do not, however, mention this brick stove by way of recommending it for plant houses; but only to give another instance of the successful working of the principle of Polmaise here. I am acquainted with two places where Polmaise (so called) has failed-the one a church at Frayles built by Lord Derby, the other a church lately built at Ambleside. In the former church my late gardener was sent for to superintend the building of a brick stove. In the latter, Whrehead of Preston pat up one of his wrought iron stoves; neither would work, and I will tell you the reason why-because in both cases the air drains were altogether wrong. Had my gardener or Whitrhead made the drains, I have no more doubt that both stoves would have answered than that I am writing to you. Indeed the system cannot help working if it has only fair play. The more simple the plan the better. In my mind the shorter the drains the better; let them be large enough; let the cold air drain almost drop down to the bottom of the stove, and the hot air drain have a very quick rise into the bailding to be heated, and all will go well. But good as the system of Polmaise is, hot water is and will be more popular with people in general, because of the common belief that what costs the most is best, and unhappily Polmaise is not to be compared with hot water in point of expense.'

It seems to us that this statement is of no small importance to those to whom the cost of hot water is an insuperable bar to the possession of a greenhouse.

Soms observations were made in the Gardeners Chronicle for 1854, p. 740, on a paper of Dr. CaspARY's respecting the formation of plates and threads of ice on the stems of certain exotic plants. The cases in which he observed the curiou* phenomena were those of plants still remaining in the soil and capable of supplying a rapid succession of fluid from below. Lecomte, however, states that it may take place in half dead stems, pruvided they are still green; and the fact we have now to bring forward shows that it may take place equally when there is not the slightest vestige of vitality. A branch of Walnut about I inch in diameter, perfectly decorticated and more than half decomposed, attracted our attention just before sunrise on the 19 th of December, from the dense woolly coat with which it seemed to be covered. There was only a slight hoar frost on the ground, and from its state the thermometer could not be lower than $30^{\circ}$ of Fabrenhert, but we had no opportanity at the monent of ascertaining the exact temperature. On inspection, the substance projecting from the wood was extremely beautiful. It was arranged in parallel or slightly spiral lines, according to the course of the outermost wood-cells, and the individual threads, which were of a pure white and lustrous as spun-glass, were an inch or more long, curling over gracelully after the fashion of little tendrils, and sometimes marked at short intervals with slight constrictions. A moment's examination was sufficient to refer the phenomenon to the same series as those recorded by Lifcomte, Herschele, Caspary, and others. There was at any rate no question of vital action here, and as mere physical causes are sufficient in the present instance to acconnt for it, it is probable that they were the only agents in the other cases.

The half rotten wood was saturated with the moisture of the previous day, and under the
influence of a slight depression of the thermometer below the freezing point, there was juststrengt enough to affect the outer surface, while the inner substance being gorged with moistale and less expanded acted at once as a powerfal mechanical agent to force ou the expanding surface water as it was converted into ice, and supplied the consequent deficiency. The threads were protruded only in the depressed strix of the surface with which one or more medullary rays were in connection, and towards which several ducts radiated. In this case the tissues, whether cells or ducts, were clearly all filled with moisture, and the state of their walls was such from incipient decomposition as to present little impediment to the passage of the contained fluid Such phenomena do not require a very low tem perature, the effect of which would be so rapid that time would not be given for the formation of the threads or the continued supply of fresh fluid. It seems curious, however, that the matter is not of more frequent occurrence ; at least, in the course of more than 30 years' observance we have never met with a similar case before. M.J.B.

## ENTOMOLOGY

the new aleyrodes of the Greenhouse.
During the past 12 months the greenhouses both in the public gardens at Kew and in the gardens of the Horticultural Society at Chiswick, have been infested with a new pest, under the appearance of a very minute white four-winged insect, like a miniature moth, to which my attention was first directed by Sir William Hooker, and subsequently by Dr. Lindley. It especially attacks the leaves of Mexican species of Gonolobus, Tecoma velutina, Bignoniæ, Aphelandræ, Solanums, and other similar soft-leaved plants, and is supposed to have been imported with living plants or in the packings of Orchidacese from Mexico, in all cases attaching itself to the underside of the leaf. Here it sits tranquilly with the tip of its short naked sucker or rostrum thrust into ittle white cloud of the insects is raised. They soon, however, settle again to renew their attacks, which are shortly followed by a discoloration and blackening, and subsequent drooping and falling of the leaves. The ordinary fumigations have been tried, and the winged insects, which are very delicate little creatures, are easily killed, but in a day or two a fresh brood of the perfect insecta makesits appearance in as great numbers as before, and this continues to be the case after repeated fumigations. Nor is the placing of the plants out in the open air more successful in getting rid of the enemy, as Mr. Gordou pointed out to me a cluster of plants which had been in the open air for more thau a fortnight, and which were swarming with the insects as thickly as those within doors.
The insect when seated with its four wings closed ver its back is not larger than the head of a good-sized pin, and were it not for its beautiful clear white colour it would be seen with difficuity. A micus Aleyrodes (one of tion proves it to belong to the genus Aleyrodes (one of which aberrant groups alied to Aphis al native species one (A. Chelidonii) found upon Chelidonium majns, and also on the common Cabbage ; another first determined by Mr. Haliday infests the common Phillyrea.
The body is soft and rather fleshy, the head distinct, with a pair of antennæ consisting of only six jofints. the first large, the second long, and the four following short and slender ; the eyes are four in number, each being small and round, the two on each side placed near each other; the rostrum short, fleshy, apparently two-
jointed, emitting from its apex a fine pointed (certainly compound) black seta, which is the real instrument by which the plants are wounded. The whole body, legs, and wings of the insect are covered with a white powdery secretion, analogous to the white floccose matter of the Apple-blight Aphis, the white mass in which the eggs of various species of Coccus are enveloped, and which is developed in many other Homopterous insects ; the wings are of moderste size, rounded at the tips, with a single central strong rib; when at rest they are placed
over the back roof-wise, and the legs are rather short over the ba
and simple.
On examining some of the infested leaves I found them covered with great numbers of flat bodies of extremely delicate texture, fringed with long, straight, slender hairs (having a rood deal of the appearance of some small species of mites) ; theirnumberwas greatest on the lowerleaves of the plants, and I counted notfewer than 250 upon a single leaf of moderate size. They are of an oval flattened form, the margin being very thin; the fore half of the body is occupied by two portions, which sluut close by a straight slit along the middle of the back, but are generally seen more or less opened like the doors of a cupboard. These bodies are the envelopes of the pape of the Aleyrodes, which have already made theirescape in the winged state, but with them were mixed many mach amaller specimens of the insect destitute of the fine hairs and very transparent, of a very Hat oval figure, the middle and hinder half of the body exhibiting traces of the abdominal segments, with the anal apparatus placed at some distance from the hinder extremity of the body; the rostrum, very minute and conical, is seen at some distance from the anterion
extremity, and around are seen several pairs of tubercles,
which seem to represent the eyes, antennæ, and legs, and which are seen much more clearly in Professor
Burmeister's figures of the young of Aleyrodes Chelidonii.

The present species, although very closely resembling A. Chelidonii, differs from it in its smaller size, in having only 6 -jointed antennæ, in the want of the dusky spot on each wing, in the more suddenly angled rib in the middle of the fore-wings, and especially in
the long straight rigid hairs with which the body of the the long straight rigid hairs with which the body of the pupa case is defended, and within which the insect hies agents (except heat and cold), which circumstance ex plains the cause of the sudden reappearance of the insects so soon after fumigation. In consequence of its being only hitherto known in greenhouses it may be specifically named Aleyrodes vaporariorum.
The history of the common species, A. Chelidonii, formed the subject of one of Réaumurs remarkable memoirs (Vol. i1., Mem. 7), and his account furnishes us with several particulars worthy of attention with rid of this new pest, which doubtless possesses labits quite similar to those of Réaumur's insect. It might be supposed that as the latter was attached to a native plant in the open air, its powers of propagation would be much less continuous than those of the species now before us, which being produced in houses in which an
uniform temperature is kept up, would most prouniform temperature is kept up, would most pro-
bably continue to propagate throughout the whole year. This is indeed the more probable because Reaumu expressly teils us that he had observed A. Chelidonii in the months of December and January after sharp frosts, "comme en éte," in all its stages of eggs, young just hatched, full grown larve, and perfect iosects. The plants are in fact as thickly infested with the insects in all their stages at the present time (December 24th) a they were two months ago, notwithstanding repeated fumigations.

After describing the structure of the perfect insect its mode of sucking the leaves of plants instead of eipning the honey of flowers, its four eyes, and it mealy wings--in all of which respects it was so different naturalist who could not think that such iny creatur ought on such account to be removed from them and to

form a separate class by itself-he informs us thit on the 25th June he observed a female seated on the under side of a leaf, where she remsined several days. By
the 2 th she had formed a small circular enclosure around her body about a line in diameter, entirely covered with the white powder with which her whole ondy was covered, and around the circumference of this space were arranged nine small eggs of an elongated oral form, fixed upright. The number of eggs which Réaumur found in one of these groups never exceeded 14. The number is, however, sometimes more than double that stated by Réaumur. This is the more im portant since Réaumur's calculation that a single female may in the course of a year (owing to the rapidity he subsequent generations) become the progenitor of 200,000 individuals was based on the supposition that each female deposited only 12 eggs, whereas 1 have observed not fewer than 36 in a single group. By the Oth of July none of the eggs remained visible in the place where they had been deposited, but at about a quarter of an inch from the patch of white powder were bserved a number of minute oval flattened bolies like miniature tortoises, which proved to be the young larve, and of which the six legs were visible through the trans parent skin of the back. They remained here fixe for four or five days, slightly increasing in size, their nutriment consisting of the fluids of the leaf, which the extracted by means of their rostrum. On the 15 th July they underwent a change of form, becoming more oval, with one end of the body pointed. On the 20th July they reassumed their previous turtoise Fike orm, but somewhat more convex, and beneath thisfignire the insect assumed its pupa form. On the 24 th July the perfect insects appeared, thus nccupying less than nonth in undergoing their transformations.
The woodcut represents the perfect insect magnifier the natural size indicated within a small oval ; one its antennæ more strongly magnified; part of the under side of a leaf, with the young insects and pupa cases o the natural size ; a pupa case, slit down the upper surface, maguified, and a young insect much more strougly mace, maguinied, and

## NEW PEARS.

There is a fascination in new Pears almost equal to that in new Roses and new plants; but this is not felt England to anything like the extent it is on the Con tinent, and more particularly in Belgium. Whether $n$ ot the theory of Van Mons is correct, it is undoubtedly
 excell emarkable for their hardiness. The way they manage in Belgium ahout sending forth to the world the new Pears from the Van Mous' collection, and also thowe (with other kinds of froit) raised by M. Gregoire and others, is perhaps interesting, and a few words about may not be out of place.
Some few years ago the whole collection of seedling Pears raised by the late Van Mons was purchased by Monsieur Bivort, author of "Album de Pomologie," transplanted to his nest. ne near Jodoigne, in Belgium. I saw them there two or three
years after their transplantation, and well remember he surprise I felt on seeing such large and tall pyra mids, many of them 12 and 15 feet in height, and upwards of 20 years old, succeed so well after being emoved many miles, and planted in a soil not ver favourable to their well doing. A few years since and Bivort discontinued his busiress of hion of he Pears, under the title of the "Société Van Mons," and under the patronage of the King of the Belgians. The members of the society pay an annual subscription, an are entitled to receive grafts only of Pears, Plums,
Cinerries, and Apples, and plants of Strawberries and Raspberries. The society at present, judging from it catalogue, has not entered into the culture of other hinds of fruit. The number of subscribers now amounts of and upuards, the major part of which are residen bers $A$. France comes nexn inians, Americans, an (last and least) one Englishman, fill up the catalogue A list of the subscribers is published ammally the members who first joined the society are called t ornders, and have the privilege by rotation of namin have been tested by the society and thought worthy of cultivation. Three new Pears from the collection were the three first names on the list of founders, viz., Madame Adelaide de Réves, Seraphine Oryn, (so named by M. all described as "de toute première qualite," the first two ripening in October, the latter from January to March. The greater part, however, of the new Pear grafta jum seedlings of M . Gregoire, who, if w may judge from the descriptions attached to them, Esperen in the excellence of his seedling Pears.
Their names and season of ripeni:g are as follows may add they are all first-rate in quality, as decide by the jury of Belgian Pomologists :-Colmar Delahan January and February ; Commissaire Delmotte, end January ; Dr. Lentice, October; Hélène Grégoire, October; Iris Grégoire, December and January ; Léon January and February. Rousselet Vanderweeken December and January; Dr. Nelis, November and December. With the exception of the two latter, the December. With the exception of the two later,
fruit of which is snall, the second of medium size, these are all described as ot first size, and consequently ikely to add some valuable varieties to our list of late Yeurs. It must, however, be some few years before long experience that varieties of Pears which are invariably good in Beloium and France sustain thei character in all the southern, south-western, and sout astern parts of Eugland, hut that a variety fuctutes with soil and season in the above countries arcely worthy of cultivation in this country, Ther new to a great portion of your eader, that are quil worthy of mention, ss they heve been fully tested our climate. I have been particularly plensed this season with Alexandre Lambré from the Van Mons collection; this ripened towards the end of Novemb the fruit gathered from a pyramid on the Quive shape and size it resembles a Passe Colmar ; Indeed grthat race (for there are races omarkably hard, grows freely on the Quince, is remamid or standar Berwate Dussart - in 1854 I thought his one of the most delicious Pears I ever ate, its aroma was so delightiul ; it has not however sustained its high character; it ripens in December, and as so many fin Pears ripen in that month it is not worthy of ext 11 cultivation. Not so however wifh Prince M. (Wich C., from the collection of the late Van Mons), which wely to prove one of the most valuable the tree is a heautiful and luxuriant grower either on the Pear or Quince and does not seem to know how to canier. is not so precocius in bearing even on the Quince a some other kinds. My specimen tree, buddeti on the Quince stuck and now some five or six years on husson buds, so that it will dature age ; the Quince hearer wisen of a tolerably mature age,
stock is most highly favourable to it, bet few Peat srow with equal visour on it. It is in shape much like Beurre Rance, not quite so large, is melting, very til Mareh and wiil probshly in some season
longer; we have thus a most valuable late Year worthy of extensive culture.
Alexalure bivort is another excellent kind of Pear; we owe this to the collection of the late Major
Eaperen; it is named after Monsieur Bivort, the Esperen; it is named after Monsieur Bivort, the
director of the Société Van Mons, and seems well adapted to our climate, grows well on the Quince but is better adapted for an espalier or spreading bush than a pyramid ; the fruit is of medium size, greenish yellow, melting, and juicy, with a delicious aroma; it ripened here in February last and is well worthy of culture. Maréchal de la Cour, (V. M.) or as it is called in
Belgium Conseiller de la Cour, is worthy of a place in Belgium Conseiller de la Cous, is worthy of a place in erery garden although in season ; in vigorous growth on the Quince it rivals Prince Albert but does not form so compact a pyramid, as its habit is spreading something like that of Beurré Diel. When it made its firs appearance it was said to be an especial favourite of the delicious, and it has a peculiar agreeable aroma unlike hat of any Pear I am acquainted with; in size it is about the medium.
Dr. Trousseau (V, M.) : this large and most excellen Pear commenced to ripen towards the end of las
December and continued good till the middle of January ; it is melting, very juicy, with a delicate vinous flavour exceedingly grateful ; the tree is very bardy, grows well on the Quince, and is better cul
Beurré Bennert (V. M.) : this is a pretty round Pear rather below the medium size, of a bright canker, bat succeeds better on the Pear than wo n the Quince. My specimens ripened about the middle of last February ; they were not however equal in quality to the description given me by Mr. Bivort from
received the variety; it deserves further trial.
Leopold the $\operatorname{lst}(\mathbf{F}, \mathrm{M})$ : this is a most excellen January Pear; the tree forms a delightful compact
prolific pyramid of slow growth, just one of those trees prolific pyramid of slow growth, just one of those trees
that will grow into beauty without much trouble in
Pruning.
Passe Tardive (Esperen) : this is a long keeping Pear and has risen and fallen in estimation more than once; it is a great bearer, and flourishes as a bush or against a wall with a warm exposure it will prove really good. My specimens kept sound till the end of last May ; they were not rich but soft, juicy, and agreeable If grown as a bush or low pyran
warm corner and light warm soil.
In writing about this late Pear I am reminded o another which has been placed among kitchen Pears, bu Which I think may be found worthy of better treatment this is Léon le Clere de Laval (V. M.) which is one of
the largest and handsomest Pears in cultivation, keepin sound till June and July, and then becoming soft and eatable. Now I am inclined to think that if it were planted against 2 south or south-west wall it would ripen is really worthy the expeximent.
Bezy d'Esperen (Esperen) : this very excellent Pear with Bergamotte Esperen. It is of the same race, but the tree is iuclined to be thorny, and it is much more vigorous in grow, it also ripens from one to two months earlier, generally early in January, whereas the keeps well all through April. I received the Bezy sbout 12 years ago from the collection of Major Esperen, Who then lived at Malines, and at the same time the Bergamotte, Josephine de Malines, Fondante de Malines,
and a very late Pear which seldom or never ripens called Bonne de Malines, of course quite distinct from the Winter Nelis which sometimes goes under the name. The Bezy d'Esperen is most maxuriant Albert in that respect, and bears well as a pyramid, being quite hardy; it is round with much of the very good without any distinguishing aroma.
Bergamotte d'Esperen may be described in few words: it is one of our best very late medium sized Pears, of the Bergamotte shape, very hardy, a free grower on the Qnince, and a most abundant bearer under all circumstances.
Gansel's Late Bergamot: this was raised by the Wo Jno. Williams, Esq., of Pitmaston, from the I have mislaid his note sent with it as to its parentage). This is one of the most vigorous growing trees I have ever met with and slow in coming into bearing unless double worked on the Quince. My trees bore for the
firss time in 1855 . the fruit, in shape exactly like the Gansel's, but one-third smaller, ripened towards the end of December. In flavour this delicious Pear is like its parent, having the same exquisite aroma; the flesh is Gansel's Belting and full of juice, it is in Mr. Williams advised that it should be grown only as a standard or pyramid and not trained to a wall.
Doyenné Defais: this is a French variety of like the White Doyenné, or as Pear amateurs would say, of the Doyennéc, shape, as all or nearly all htalks. It ripened with me the commencement of last stalks. It ripened with me the commencement of last
January; it is melting, very juicy, with a delicate
perfumed flavour, and of high excellence ; the tree is
hardy, forms a handsome pyramid, and grows freely on the Quince.
Beurré Superfin: this most excellent Pear was raised $t$ Angers; the tree is inclined to be thorny, is remareably hardy, and like most Pears with that habit is large and of the shape of the Brown Beurré, and its kin is covered with a light russety coat. When first introduced it ripened in September, but latterly it has kept well all through October. No Pear can bo more delicious, as it is perfectly melting and full of juice of a most refreshing quality. The tree succeeds well on the Quince, and comes into bearing more quickly than when grafted on the Pear, and forms a healthy nice pyramid.
Poire Prevost (V. M.) : this is one of the handsomes ate Pears we possess, being, when ripe, of a bright red nad yellow. It is also one of our uit put forth from the buds inserted in the Quince stock, so that a tree budded in August has given fruit the following season, Chis is very reatol ; grows well on the Quince but not rapidly, and forms a small prolific pyramid. Its fruit is medium sized, of a highly perfumed or musky flavour; and keeps well till May. These last two seasons it has not softened or become melting, and seem to require a warm climate. It will be therefore
advisable to plant it against a south or south-west wall, or grow it in pots in the orchard house. These highly perfumed flavoured Pears are greatly esteemed by some amateurs. Thos. Rivers, Nawbridgeworth.

PRACTICAL LESSONS IN BOTANY FOR BEGINNERS OF ALL CLASSES.-NO. XIV. (Concluded from p. 897).

Bean, the calyx withers, but remain
Fruit.-In the Bean, the calyx whers, but remain and summit of the style perish. The ovary and base of the style gradually enlarge, "ogether ", and the ovales passing into "seeds." A single pericarp (the Bean pod), and its contained seeds, here constitute the "Fruit." But, in many plants, other portions of the flower remain (persist), and form "accessory appenStrawberry, the fleshy eatable part is the "fioral

eptionably botanical terms its the preceden on lucendo) classical (except on the precith the tucms hich it is, ruch ilis a modified representation if it ruclescence, which may still replace it if it be though more advisable. Even in less decided cases than those referred to, its use may often be advantageous. For xamples, in the "Inflorescence" of Anemone puisatilla he involucrum is close to the flower, in its "Infructesence" far part. In Euphorbia we have a remarkable Inflorescence " of numerous diclinous flowers, but an Infructescence" composed of a single pericarp, with he accessory bracts
seed.- On opening the ovary of Bean-flower, about hree or four sinall ovules ( 0 ) will be seen, adhering to he "Placenta," the slightly swollen combined margins of the carpel which form the ventral sature. These ovules are attached alternately the one and older margin by a short thick stalk, the "funicular or umbili cal chord" (funiculus), which is somewhat expanded at the summit (carunculate). The internal structure of the ovale need not be yet explained, but we see it projects a ittle on one side which is turned towards the placenta and is perforated at the summit of the projection by minute hole termed the "foramen," and which, in the位e " micropyle" noticed formerly When the ovule has ripened as a seed, it spontaneously When fers and the scar left on separates fron "he "hile" before noticed.
In conclusion. These notices might have been made little more complete by tracing a Monocotyledonous plant from the embry stute ill the same way as the Bean; but more than sufficient has now been stated in illustration of the general plan which has been pursued or impressing some of the most important particulars of the general structure of plants upon the susceptibl minds of young children who possess no other botanical work than the grand folio to which they can bave con stant recourse in the free Library of Nature. If I may advise those who are desirous of giving practical Lesson in Botany which may not only serve the patpose I bave exploined in a former No. the mental faculties, and improving the moral apprehensions of young children, I

## to them-

lst-Contrive (what needs very little contrivance) to nterest children about the structure of flowers. Among the girls (I speak of purely agricultural villages) you will be sure to succeed; from the boys you can expect litlle or no progress whilst masters and parents are so little careful to have them educated.
2d. Insist, without any compromise, upon your volunteers mastering the meaning and acquiring the powerof ap plying a few hard words. Xt is singular what difficulty some grown-up people feel at shaping their muscles to the pronunciation of a new word, even friend of mine keeps his pony Zoe at stables where the country hostler cannot (P) One valve of the pericarp, with its peeds $(8)$; ( $(V)$ ) ventral, and (d) dorsal
sutures; $(u)$ funicular or umbilical cord; $(0)$ ovary, (from the ovarium); approximate nearer to this name than Zooky. The first Basil lately baptized mother and all her neighbours. But if we begin
receptacle," whilst the numerous pericarps upon it are vulgarly regarded as seeds. In the Raspberry, the fioral receptacle is not eatable, but the outer part of each pericarp upon it becomes succulent. Whichever part beginner should remember that the pericarp or "seed vessel" originates from the ovary, the seed from the and becomes thoroughly incorporated with the ovary, it is not regarded as an accessory appendage to the fruit but as forming part of the "inerior pericarp" its readily
The ripe pericarp of the Bean not only splits reat The ripe pericarp of the Bean not only splits readily it at the back (dorsal suture) though there is here no union of edges, as in the former. The two portions
formed by these splittings are called "valves" (P). formed by these splittings are called "valves" (P). All fruits which split spontaneously or readily along determinate lines are said to be "dehiscent," in contradistinc
hiscent."
N.B. Compound pericarps, and the few technical names applied to fruits, may be deferred.
Suggestion to Botanical Teachers.-Wherever the restriction of a technical term can be rigorously maintained, it is highly important not to employ it in different senses. Modern Botanists refer all "Headhe
(Capitula) of flowers to "Inflorescences," with or without an Involucrum, and no longer regard them as "Compound Flowers" with "Common Calyx." But the pound Flowers" with "Common Calyx." But the seeds, with or without accessory appendages, which belong to a single fiower, whilat the term "Compound Fruit"" is, in some cases only, applied to certain crowded pericarps and seeds collectively, which belong to several flowers. Thus the crowded inflorescences of Compcsites and Grasses are not called "compound fruits" when the ovaries have become pericarps, although those of Figs, Mulberries, Fir-trees, \&c., are so regarded. This is apt to confuse beginners, who do not see (any more than I car) why the term "Compound Fiower" is discarded. I have therefore suggested, and have adopted my own suggestion (!) that the term "Infructescence " should be employed to signify the aggregation with little children, we find we have no difficulty in getting them to say a Rose is an angiospermous, caly-
cifloral dicotyledon, and as a ready consequence, to be soon able to appreciate the affinity between it and some other angiospermous calycifloral dicotyledon which may be brought before them! J. S. Henslow.

## The History of my Crchard House - Some few years

 go I pitched my tent on one of the pleasant bils in surrey. My garden is at the foot of the hilland without walls, so I bethought me of an orchard house, and having, the pleasure of calling the originator of them my friend, who is accustomed to pay me visits twice a year,thought $I$ was sure to succeed, as he volunteered to give my gardener such directions as could not fail of bringing on success. Accordingly I had a house built in the valley, and as it was much sheltered, more than usual ventilation was provided for by extra shutters. I must now say that my gardener was a respectable person who had been in his last situation 18 yeare, and was called a good gardener. My house was duly furnished with very nice trees by my friend ; they were potted into 13 -inch perforated pote, blossomed the first season very well, and set a fair quantity of fruit. My friena had been done, gave instructions for daily syringing and aluudant ventilation, and went his way. In the autumn he again came, and our first gardeu visit was to the orchard house; guess his surprise to find a lot of Peaches about as large as Nurmegs and as hard, and the leaves of the trees covered with red spider. and so it ended in a quiet grumble, for a man so respectable would not it was thought deceive hia employer. Another season came; the trees, althong weakened by the attacks of the red spider the preceding summer, bloomed well, and again set a good crop of fruit. The usual spring visit was made by my friend, more stringent rules laid duwn as to watering the trees abundantly in hot neather, and never passed, the autumn came, and my Peaches were
perhaps as large as Walnuts, as hard and as bitter. Was at a loss to account for all this. I thought the as before every tree eaten up by the red spider. He
then saw that my quiet respectable gardener, knowing my ignorance, had been deceiving me, and some other matters turning out not quite satisfactorily, he was dispartly from others, that he "wanted no instructions to manage Peach trees in pots" "his method was not to their leaves drooped and withered, and "as to syringing it was all nonsense," and he had been a gardener all his
life without using such a plaything. I last winter engaged a new gardener, industrious, and above all tract-orchard-house trees, but that if directions were given to him he would follow them; accordspring, my trees, now but wreeks of what they as my loam was light and sandy the compost was rammed in with a wooden pestle. I had not much duced. My gardener ventilated freely and syringed regularly, and last autumn I had the pleasure for the first time of tasting some really good Peaches from my cumference. I should think it is yeryprobable that others as ignorant of gardening as I am have in like manner suffered from the obstinacy of their soi discnt gardeners, and so I have been tempted to give the "history of my orchard house." $A$. D
Bits "rpon the relative streur account of the experiments "upon the relative strength of the timber of our
two species of native Oak, Quercus sessiliflora and Q. pedunculata," at Wentworth. As I have paid some attention to the growth of Oaks for the last 25 years may perhaps be permitted to offer a few remarks on the subject. With regard to the difference in the two sorts I believe there is essentially not any, the apparent and such as soil and locality will always produce
sow them, and their produce when transplanted situation and soil every way similar will prove to be one of the same tree, or which is by far the most common of the two, the Q. pedunculata. I think it likely the wood of $Q$. sessiliflora (as is natural with trees been grown in por soil, or an elevated black aspect) is The experiments made at Wenunculata the toughest. prove any thing conclusive, much less "the disputed point." cat from the same tree would scarcely breali at exactly the same deflection with the same weight applied ; and in difference in, whether Q sessiliflora or pedunculata, the differ ence in deflection to the breaking point would be found to vary considerably. I believe the two sorts of British owing to what may be termed a sport of nature, and as regards the hardness, toughness, or durability of the timber, this mainly depends on age, soil, and situation. I shall be glad to hear if other parties who bave stadied observations, or if they can produce proof to the contrary. W. H. Rogers, Nupseryman and Landscap opinions of our correspondent. Undoubtedly Oaks sold some years ago in Hampshire as real Durmast proved to be nothing more than Q. pedunculata, but that was the fault of the man who collected the acorns.]
blanch his Couve Tronchuda, which increases will development of the leaf atalks as well as renders them crisp, he will find a dish of them dressed à la vegetable, $L$
Training Raspberrics.-The following method whicl I have adopted answers well. The Raepberries ar planted in ruws 10 feet apart, and one foot asunde in the row. A bar of paling on posts 3 . 1 feet
ligh is placed on each side of the row 3 feet from the plants. The canes are fixed to the paling by means of Willows one foot cane from cane. By this means the fruit-bearing canes are kept free from each other and free from the young suckers to which they fom a protection against wind, the space betwixt the wheeling pannure, gathering frout, ge. W. D.

The Patato Disease. - The following letter was sen to the Munchester Givardian at the time it is dated, and as two more years fully confirm all that is here said in
favour of drying Potatocs at high temperatures, I think it is worth republishing, particu'arly as I see by the correspondent from Wester Ross in the Gazette of the 6th inst. that in Scotland they are in doubt whether Clitreroe, Dec. 14. "The Potato" geed time. T. G., "is so important an esculent, the distemper to which it has been liatile for the last 10 years has produeed such disastrous results, that any one who can suggest a plan for mitigating the $V$ rulence of the disease even in the slightest degree is entitled to be heard, and provided he
deals only with fac's and does not dogmatise and theorise upon them, the public will sonn learn to appre ciate his plans at tneir true value. I offer the following
attacked by a dry rot which turns it brown and shrivels up the skin ; in another the Potato turns black and dropthousand and one infallible nostrums for preventing the distemper have left us as ignorant of its cause and cure as we were when it began in 1845. Before the days of Potato dis whe in many other parts of England, particularly with the
early varieties, to expose the Potatoes intended for seed on the surface of the bed where they were grown for few weeks; the action of the sun and air upon them
turned them green, enabled them to resist the frost better, and made the succeeding crop earlier by a weel ducing a beneficial effect orted to by some persons, bat the the plan is still re different here since 1845 from what it was before that time. I had raised some exceedingly valuable varieties from the crab of the Lemon Kidney, the whole of which whom I had given somethod, and although a friend to Whom I had given some of these for two or three years supplied me with fresh seed, which I persisted in expos-
ing in the same manner from an idea that we should ing in the same manner from an idea that we should the same-they all perished. After this there appeared in the Cardeners" Chronicte a plan of (I think by Professor Bolman, or some such name,) half roasting the sets, which was said to entirely eradicate the disease but this was tried by one of my neighbours without any beneficial results. In thinking on this plan from it, it might be owing to the fact that the spores (or perhaps the mycelium) of the fungus to which
the disease is attributed might be destroyed by a temperature considerably lower the destroyed by a temthe vegetative power of the Potato itself, for this is the case with some fungi. I believe, although I don't grow them, that the proper temperature of an artificial Mushroom bed is somewhere about $60^{\circ}$, but that if the fermen tation of the dung of which it is made is sostrong as to raise the temperature to $90^{\circ}$, all the spawn is destroyed, and ther is no crop. So with the miasma of the plague, the viru of cow pock, \&c. Dr. Henry proved that a high tem-
perature (I don't remember what) was quite sufficient to prevent all chance of contagion; whether this will be ound true with regard to the cause of the Potato disemper (whatever that may be) I do not know, but it was the idea on which 1 acted, and with the following results. My friend having again supplied me in the spring of last year with a few more of his early Potatoe When dug up, instead of having them spread on the the upper floor of an engine-bouse, where owing to peculiar circumstances the temperature was about $90^{\circ}$ and left there a month; the consequence was, that with
the exception of two or three that were tainted when they went in, every Potato was quite sound and continued so until they were planted last spring crop that they produced had not one trinte in the same manner, and up to the present time (they were dug in July) there has not been an unsound one in them ; the same plan was also tried last year both in top and tuber, and with the exception of two they were exposed to the high temperature, with the same result. These were again planted last spring and although the tops were attacked by the distemper
yet as the tubers were immediately dug and taken into the engine-house, there is not, so far as I know a fresent, a failing one among them. Encouraged by hese results 1 have now tried the plan with some shere Potatoss of two varieties of Kemps, and althoug b in the one kind, which were quite ripe, only four Potatoes have been found tainted in 120 lbs . (hall a load) ; in the other kind the loss has been 4 per cent., or 13b. in 24, but other persons who had supplied themselves out of the same lot of Potatoes, at the same time, lost
60 per cent. of theirs. These Potatoes were not ripe (which is easily seen by the epidermis peeling off with the slightest touch). When they had been exposed to the bigh temperature for three or four days, they began to soften, and this softening still remains, though they were ouly kept that time (three or four days) in the warm room, but they are perfectly good and seem likely to keep very well ; the sort which were quire ripe keep frm, and the quality of the Yotato is excellent.
may be objected that even supposing this plan to suc ceed, there are not many engine-honses with a temperature of $90^{\circ}$ applicable to the drying of Potatoes perhaps not-but there are malt kilns, Oat kilns, Hop where the same plan could be carried out, if it be found to succeed. I do not think I have determined the proper time for keeping them in the hot room, but a month does not destroy then vegetative power, and three or four days seems to check the disease; how nuch less will be sufficient I do not know, nor how much higher a temperature the Potatoes will bear with
impunity. The above plan is submitted rather to sugcest what may be done than as the best mode of doing it, and it is offered with much diffidence, seeing how many attempts have been made and how little success has been achieved. The sul ject is attended with difficulties no one would perhaps expect who had not paid some attention to the subject. In 1846 the
asease than any other sort grown in this district, and in that year I had not only an abundant some extent in that year 1 had not only an abundant supply for my
own use, but I was able to furnish seed Potatoes to my neighbours when they were not readily
attainable elsewhere. In consequence of this I recom. atrainable elsewhere. In consequence of this I recom. should grow Kemps, as being" comparatively free from the distemper, but every year since then the Kemp has Fluke Potato has a reputation all over the kingdom for resisting the disease, and the raiser of it from seed had, if I remember aright, a testimonial presented to him by some two or three years ago, for the great benefit he had conferred on the public by making its merits known. But this year even the Fluke has not escaper, when they were dug out yesterday of them were tainted When they were dug out yesterday, "and I hear and see
the same complaint of them not only in my own neighbourhood but in the Cardeners chronicle, and io addition to this in some fields in this district a considerable number of the sets did not vegetate at all when planted last spring. It may be that, like all the sorts of weatoes I have known, they have a tendency to wear out, and have less vigour in their constitution than this be the case it is much to be regretted, for they are of first-rate quality and great croppers ; however, they produce crabsabundantly, and itis very desirable in my opinion hat new varieties should be raised from so good a stock. have been acting on this idea myself and have now
ten or a dozen kinds raised from the crab of the Fluke, scme of which seem to be very promising, but being aly their first year it is too early to speak positively about them. The only other recommendation my experience enables me to offer is to plant early, but even dis does not always succeed. There appears to be a gour of vitality in the earlier part of the life of the p'ant which enables it to resist the attacks of the sease; but when this vitality is weakened by the growth of the tubers, if the weather is favourable for the spread Thus it has happened in some seasong thate to suffer. earlier varieties have been much tainted the later kinds continued entirely free, and a favourable change of weather setting in before these later kinds were too far advanced to maturity they escaped with little injury. The importance of the subject mast be my excuse for troubling you, and if my suggestions induce other people to experiment on the subject I shall have done as much as I expected $T$., Sept. 15,1854
How does the tap root of the Oak penetrate hard ancs inform us that ronts do not penetrate hard substances, hut that they search out crevices and there insert e see plaily the not a satisfactory answer, when straight downwards, penetrating the hardest and stiffest soils of Sussex. The point of the root as it comes from the acorn is soft, not tipped with iron, as might be soft substance is able to go straight through a hard substance? I cannot helo thinking there must be some ther cause besides the one above mentioned. I hare wo theories on this subject, which appear to me reasible, and, reasoning from analogy, the first one is that there exudes from the point of of. The first, chemical matter with either acid or alkaline properties probably one kind of plant may exude an acid, another an alkali, so as to suit the different soils adapted to each plant), and that this substance converts the soil into a pappy matter which then allows the point of the root to creep on, and possibly the fluid part of the pap may be gain absorbed charged with inorganics for the nutriment of the plant. Nature generally effects two ends, and by the same means: why should not the root eat its way into the soil like the worm, or as the fly eats sugar,
moisten the soil first and again snck in the fluid when saturated with nutriment, and push the point further in gain, can it be that the root follows the course of worms holes? We know that roots get into drains and fill them with fibres. The earth is full of worms, as may be seen by pouring a weak solution of corrosive sublimate on a lawn, when in a few minutes it will be covered with worms. The chief thing against this is hat there roust be a mom-hole under each tap root. My suggestions may be quite wrong, I am only writing for intormation. Can any one enlighten me further I am not satisfied when told that this is effected by mechanical means. I cannot help thinking that the powerful aid of chemistry must be called in ; and if so, and any one knows all about it, I should like to have the full partienlars. Sigma.

Roses.- I you are not tired of hearing about Roses, I will fulfil my promise of last week. First, I wish to say I do not want to deprecinte the new Roses; and I may tell Mr. Paul that among others I have-Gloire of Norfolls, General Jaequeminot, Gloive de France, Lord Raglan, Madame Hector Jacquin, Madame Knorr, Madame Place, Souvenir de L. Gower, Triomphe de 'Exposition, all new Hybrid Perpetuals ; and several Noisette and Tea Roses. What I want dealers to do is to elmmate all which do not equal many we already have, and not to charge a high price for them as new
say they were the best, for I purpoosely omitted the very new sorts. Now, as to the 12 recommended by Mr.
Paul, I find that two, viz., General Castellane and Madame Masson, are bad growers; Madame Desirée Giraud, a most inconstant Rose; Prince Albert, a doubtful opener in many soils; and Gloire de Dijon Of Lord Raglan I can only say that I marked it and Madame Hector Jacquin (both new) as the two best Roses I saw at the London shows. I am glad enough to get a new variety when it is good as well as new, but
no oue wants to buy a Rose which must be budded fresh every year to keep it alive, or which will only throw one true bloom in a season, or (as many do
which dealers call hybrid perpetuals) which produces only two or three blooms all through the autumn. We want good hardy vigorous growing sorts which will bloom anywhere, and from which you may go on culd sorts as Mrs. Elliott and Mo you may from also want the Rose to agree with the description given in the dealers' catalogues, and then we amateurs shali know what we are doing when we purchase. But poor William Jesse as little more than semidouble, and yet he includes in his 12 first class sorts General Jacqueminat, which is notoriously semi-double, and saved only by its colour. Will
Messrs. Paul, Lane, Rivers, Francis, or whoever took the three prizes for cut blooms of Roses at the July show, send a list of the names of those which appeared in their respective stands, and let us see what new one stand, and can call to mind very few with new names. One word more as to the concluding paragraph of Mr. Paul's article. It is very pleasant to get hold of most amateurs will agree with me that it is the dealer's business to pick out the diamonds and sell them at their proper price, anase a mixture, and spend money and time in making his own selection, not to speak of wasting ground in the cultivation of indifferent varieties when it might be filled with the choicest and most undeniable collection. A. R., Bromley.-Whatever I may think of your give him credit for skill in argument. I humbly submit, however, that his skill is that of the dexterous pleader rather than of the sound logician. Now, "A
beaten yet" he includes La Reine, Madame Laffay General Jacqueminot (hybrid China), Louis Buonaparte, and William Jesse. I, in good faith, differ from him, and am content to leave the public to judge between us; and whether after reducing the numerous varieties of Roses to "the 12 best" (mark his) they are more than second rate. This is the real question at issue between us, and as
" $A$. R." writes anonymously, I might be allowed to leave the matter here without noticing the insinuations contained in his article of last week. But as the
triumph of truth is alone my object, I will endeavour triumph of truth is alone my object, I will endeavour to clear away the dust-clouds in which his dashing
charge has enveloped the matter. In the first place lie ought in fairness to have seen that in my original article
I spoke of these Roses in comparison with 12 "not beaten yet ", whereas in the catalogues they are spoken of in comparison with about 700 varieties. This alone explains the apparent discrepancies so triumphantly paraded. Things are small or large only by comparison the best," if of full" size in comparison with Roses in general, and so on with the rest. Does he not also see that La Reine may be at once "magnificent" and "uncertain," Louis Buonaparte "glowing," large, and
full, -but "of indifferent shape." His inference that "either the dealers' catalogues are intended to take in the uninitiated by their splendid descriptions, or else
the Roses are what he says they are " is puerile in the the Roses are what he says they are" is puerile in the
extreme. I apprehend the uninitiated do not generally make sweeping statements in matters with which they are imperfectly acquainted, and then read the different catalogues for fragments in support of their assertions. 12 recoma without prejudice they will not select che catalogues I have seen (I have notseen Rivers's) do not make them appear so. To show how little practical knowledge "A. R." pos-esses of the case he has in hand, he insinuates that the dealers make the new Roses appear better than they are from interested motives.
This quite the reverse of my experience. For years past we have found the new Roses sell faster than we could propagate them, if backed by our own recom-
mendation, whereas the stock of old favourites is all but illimitable. I do not wish to become the a pologist for the Rose-growers' catalogues ; they need nothing of the sort at my hands. The catalozues may not be correct in every minute particular, but to argue thence that they and unjust. To show however that the many attach more value to them than "A. R." does, I may mention one or two facts in convection with our own: mere than 50,000 edions have been published amounting to nearly year. It would have been more generous if "A. R." aspersionsed to write anonymonoly before casting Who labour hard for the gratification of others with, very moderate profit to themselves. Unless he think proper to pursue this course, to stand forth in substan-
this controversy I coufess that I am not sufficiently Quixotic in spirit to find satisfactiou in wrestling with a shadow. William I aul, Nurseris, Cheshunt, Herts. Ice stacks.-By the following method I have been able to supply my employer with ice every day for the long by 10 feet broad, raised one foot above the surface of the ground with broken stones to secure a perfect drainage, and covered over with three inches of sawdust. $T$ build the ice ( 65 cart loads) in the form of a hay stack, using large pieces for the side walls, and breaking
the centre bits as small as possible. I cover the stack the centre bits as small as possible. I cover the stack with a coat of Spruce or Silver Fir branches, and sur-
round the whole with boards to the height of 6 fee betwixt the boards and the ice. I then cover the ice all over with sawdust 2
feet thick, and thatch the top with straw sufficient to turn rain. TV. D.
Boilers.-The article in a recent Number respecting the best size of boilers is very suggestive, not only upon its own acconnt, a very important one, but also on the houses, and I hope you will permit me to call the attention of the proper authority to these two impor tant subjects, the best description of boiler, and the best description of houses. That proper authority is, no doubt, the Horticultural Society, and I cannot even fancy any reason why it has not years ago adopted the practice of its two sister societies, the Highland Society offered premiums for the best description of boiler and the best description of houses-for these societies offer premiums for every description of agricultural imple-ment-and for plans for heating. Other things being equal there can be no doubt that the one large boiler must be far superior to several smaller ones-but is it experience can easily decide ; yourself, Mr. Glento your raders, bould be judges in whest tremselves to your readers, would be judges in whose report the public would place implicit confidence. The only
element to be guarded against is having for judges men element to be guarded against is having for judges man
who are prejudiced, and I need not say the most enlightened are always liable to be prejudiced in favour of systems which they have tried for many years and Which have answered their purpose; such men are above all others the very best to supply facts, although for the reason I have given could not make good judges. Anything like jobbery would be impossible. Suppose the judges were to decide that Mr. Weeks' plan of boiler was the best, and that certain sizes would perform certain work, that is, heat to the requisite temperature 4-inch pipe of certain length - any provincial Manuacturer could supply a similar boiser, and all Mr. Weeks would get would be the protessional credit, and that no small nee, of having recomended the besi boiler, aided perhaps by orders from those who
like to have things made by those who have had most practice. What therefore I would suggest would be that the Horticultural Society should
give notice that one or two prizes would be given-I think one would be the best, fo: it is difficult to sepa rate the questions for practical utility-for the best essay with plans for the best mode of heating the in the eountry. ith plans for the houses. Her another question immediately arises, and one not so easy to be answered: What are the descriptions, number, and size of the houses usually required, differing, as these must necessarily do , in the taste, and habits, and number of the family? One with a fortune of 20006. per annum being quite content with a Cueumber means, requires an almost daily supply of the greater of glass, boih fruit and flowers. Bnt diffenlty is not impossibility, at lenst to some minds; and although I do not doubt your practical experience would seon suggest a useful solation of the question, in the mean time permit me to offer mine ; and what I would suggest would be, that the essays and plans should be confined to one honse of each kind of a size suitable to moderately-sized family, say one stove-house, one Vinery, one Peach house, one green-house, two Cucum ber pits, two Melon frames, two fureing pits. M reason for this is, that with these houses the proprietor with a skilful gardener, might gratify his own tastehe may grow Pines or not, Orchidaceous plants or not have abundance of fruit and fiowers, although of course he could not expect either a Pine Apple or a bunch of Grapes on his table every day in the year. The bes arrangement for these honses, both with the view of heating and appearance, will exercise the ingenuity of
the several parties who advertise in your columns as the several parties who advertise in your coinums as
hothouse builders. One whose means were unlimited at least for chis purpose, would of course require two or three, or even more, instead of one of each kind. The plans would therefore require to be different; but depend upon this, the person who carried off the prize would ing the him ; and in such employment the successful competitor would reap his merited reward. An Uld ¿ub. in my communieation last, week res, eeting informa Tropeolumes, "secure" was printed "receive. mental climbing plant produces abuadance of tubers mental climbing plant produces abuadance of tubers
which are of nice flavour and very nutritious. Puor which are of nice flavour and very nurritious. advantageously grown on this description of land by
being planted in rows like Potatues, and staked as Scarlet Rumners are. In proof of its productiveness one small set planted in A pril and dug up in November produced 43 tubers, averaging 1 ounce each, and all within 1 foot of ground. Exoniensis.

Golden Hamburgh Grape. - I learn from Mr. Veitch, of whom I ordered Vines of this variety, that plants of it are not to be sold this season, owing to some failure in its propagation. It is also reported that Mr. Busby has not been able to fruit it this year in perfection ; ip
fact, that it has degenerated. Mr. B. did not exhibit fact, that it has degenerated. Mr. B. did not exhibit
fruit of it during the seasoa that has "just passed, and it will be satisfactory to hear why he didnot do so. Vitis.

## gacietifs.

Linnean, Dec. 16.-Prof. Beil, President, in the chair. The Rev. C. Kingsicy, and G. H. Kingsley, M.D., were "On a species of Pilobolus," " Oy F. Currey, Esq. A species of Pilobolus, recently met with at Blackheath, growing on cow-duag, Mr. Currey considered to be $P$. roridus of Boiton, which has hitleerto been regarded as a doubtful plant. It appeared in the form of small dull yellow points on the surface of the dung, a thin layer of which sept moist beneath a bell-glass yielded an abundant crop of the perfect plants in a few hours, others continuing in succession for a fortnight. The paper con sisted of a detailed account of the structure of the fungus. Torpidity, and the production of fat in hybernating Animals," by Dr. Holland. 3. "Note on the rhizome of Pteris aquilina as an article of food," by the Rev. M. J. Berkeley. The rhizome of the common Bracken being used in the north of Europe to make a coarse kind of bread, Mr. Berkeley, having lately lad occasion to examiue some of the raiznmes, was induced to try what zomes were roasted. They were found eatable, but very disagreeable from their slimy consistence and peculiar flavour, in both these respects resembling ili-ripened Brinjals. Thinking they might afford a better food if the slimy matter could be removed, Mr. Berkeley scraped some of the rhizomes which had been previously washed and peeled. The pulp thas obtained was placed in water, which, after 24 hours, having become extremely slimy and of a yellowish-brown
colour, was carefally decanted, the palp being again Plp. being again This water was also poured off, and the pulp when sufficiently dry was kneaded into a cake, and baked apon the hearth. The result was a coarse but palatable food, quite free from any disagreeable flavour, indeed Mr. Berkeley thought it much better, and probably not less nutritious, than Cassava bread. [The analysis of this fecula, which was not given, would have been a useful and interesting addition to this paper.]
Entomological, Dcc. 1.-J. O. Westwood, F.L.S., Vice-President, in the chair. An interesting collection
of Lepidoptera from Moreton Bay, Australia, collected by Mr. Diggles, was exhibited; amongst a number of new and beautiful species several were remarkable, bearing a striking resemblance to English species, including Agrotis suffuss, Sphinx celerio, Lithosia pulchella, \&c. A species allied to Bombyx pudibunda was interesting from having a wingless female. Mr. Douglas of which feed upon Inula dysenterica in August, and it was suggested that it might possibly prove to be the autamnal brood of G. inopella found in the summer, the autumn broods being always larger than the summer ones; the caterpillars of the latter arriving at maturity more rapidly, and consequently taking less food than the former ones. Other instances of this difference Geometra illunaria and Julisiong illistraris and delunaria. Mr. Augustus Shepherd exhibited a new British Agrotis and a new Ypsipetes taken by Mr. Hodgkinson Preston. Mr. Waterhouse exhilvited specimens of Aricerus Coffere, a native of India, Africa, and South America, as well as a reputed British species which had attacked Nutmegs ; and Mr. Douglas mentionerl that it also proverl injurious to a quantity of Mace in the Lon don Doeks. Mr. Lubbock made some observations on he various recorded iustances of fertile eggs deposite male. Various additional instances were mentioned by other members present. Mr. Westwood called attention to the excellent series of memoirs by M. Lederer on th Lepidoptera of Syria, Siberia, \&ce.; and also apon the in the Vienna Transactions: and also to the published on exotic Coleoptera by M. Perroud in the Lyon Transactions. Mr. Edward Shepherd stated that he had recently visited M. Lacordaire, the fourth volume of whose great work on the Coleoptera was in the press, os well as the plates of the genera, executed by $M$ Coleoptera from the Dardauelles and Mount Olympus, tribut on of insects

description or Kithicn Garden plun's [Description des plantcs potageres]. By Vilmorin-Andrieux and Co quar Paris. Litrarie Agricole. stands confessedly at the head of Continental seedsmen.

Wherever seecs are an article of commerce there their
name is universally known; and wherever garden or agricultural seeds of the hiyhest class are wanted from foreignens to this mercantile house customers repair. A brok therefore treating of the articles in which
Vilmorin and Co, so largely denl is of the highest value, and may be taken as a standard of accuracy for the climate of France. The plan of the work is to describe briefly thue of smaller moment. Thus among Lettuces, the cultivation of winch is carried in France to the greatest perfection, 55 sorts are included in the first category and 77 in the second. It is moreover to be remarked that the synonyms are moit carefully enumerated, wher ever the experience of Messrs. Vilmorin has enabled
them to ascertain them. Thus we find that what in the French markets is called the Romaine brune Anglaise is the same as the Incomparable and d'Angleterre of Frauce, and the Brown Cos, very large, Bearfield Cos and Bath Cos of England. It seems however that our asention of our Charlton, first earlies, double blossoms Longpods, Nonpareils, and the like, all of which they doubtless regard, not as races, hut as well saved samples doubtless regard, not as races, hut as well saved samples a goud index the volume containg useful tables of foreign weights and measures of length and capacity carefully reduced to the French standard.
Mr. Thwaites's last report (for 1855-6) on the Botanic Garden Peradenia (Ceylon) is before us. We see with pleasure that its able and active superintendent is combining practice with science and hat a Museum of return peculiar value is a list which accompanies of the number of indigenous species in each genus found on the Island. Let us hope that it is the forernuner of the much wanted Flora of Ceylon, for which we trust the Government will furnish Mr. Thwaites with the necessary funds. The list in question includes 2916 specier, of which 247 only are Ferns.
When we announce a second series of Leech's Pictures of Life and Character, insued by Mr. Punch, we know that every person of taste who loves harmless merriment will eagerly seek to be acquainted with these admirable specimens of comic art, unrivalled as they are for a combination of pungency, drollery, and good humour as well as artistic merit of the hichest order in the path which Mr. Leech has chosen for himself.

The Cabinet Lavyer, a Popular Direst of the Lavos of England. 17 th edit. Longmans. 12 mo . Pp. 788. upon eviry brancio of the law civil and criminal. The fact that it has now reached its 17 th edition is alone sufficient to show that it is found useful to a numerous class of perzons

## Mirecellaneous.

Geoloyy as a Branch of General Education-Nor is alone the miner, the engineer, builder, farmer, landscape gardener, and painter, that can turn to profitab.e account the denuctions of geology. The capitalist who voyager, the statistician and statesman, onsistance from the same source, and bring a knowledge of its facts to bear on the progress of their nations. also the holiday tourist, the military officer stationed in distant countries, and others in similar situations, is passessed of the requisite knowledge, may do good furtherance of our industrial prosperity. Indeed, we the not affirm too much when we assert that had oue tihe of those win, during the last 50 years, have travelledor settled in America, Austraia, New Zealand, india and other countries, been possessed even of a smattering of geology, these countries, as to their substantial wealli and social progress, would liave been in a very different position at the present day. Their gold-fields and coal-
fields, their mines of iron, copper, and other metals, take mank an:ong the most important discoveries of the present age ; and as the spirit of civilisation is now evolved and directed, not progress can be made without those mechanical appliances to which the possession of coul and iron is indispensable, no facility of commercial interccurse without a sufficiency of goll, which has hitherto formed the most available medium of intercliange. The assiotance which geology has also conerred, and the new light its deductions have thrown en the other branches of natural science, are not among the least of its claims to general attention. The comparatively recent science of physical geography, in all Fiat relates to the surface configuration of the globeis climate and terperature, the distribution of plants and animals, and even touchiug the development of man only lay claim to tine character of a science when treated in comection with the fundamental due rines of geology. So also in a great degree of botany and zoolngy : the respecies has given a new siguificance to the science of species has given a new siguificance to the science of
hife; and henceforth no vitw of the venutahle or animal Kingion can iay clain to a truly scientitic character that dnes not embody the discoveries of the pa'rentologist. In fact, so inseparably woven into one great syatem of life are fussil forms with those now existing, that we cannot treat of the one without considering the other ; and can never hope to arrive at a knowledge of ereative law by any method, which, however minute as
other. Combining, therefore, its theoretical interest with its high practical value-the complexity and nicety of its problerns, as an intellectual exercise, with the
substantial inealh of its discoveries- the new light it throws onfthe duration of our planet and the wonderfal variety of its past life, with the certainty it confers on our industrial researches and operations - geology becomes one of the most important of modern sciences, deserving the study of every cultivated mind, and the Advanced Text-Book of Geology, by David Page, F.G.S.

## Calendar of Operations. <br> (For the ensuing week.)

## PLANT DEPARTMENT.

The forcing houses and pits will now be kept in full activity to supply the various calls for plants in bloom, which at this season of the year are more or less in before plants are moved to sitting rooms to gradually harden them for a day or two either by placing them in the conservatory or an intermediate house. In addition to keeping the conservatory gay with blooming plants, let the arrangement of the pot plants be occasion ally changed by grouping the plants somewhat differently avd adding a few striking ones as some of the hardiest Palms, \&c. for effect. Pay attention to the
plauts intended for successive blooming. Insects shonld plants intended for successive blooming. Insects shonld
be kept down by the syringe and fumigating and every means enforced to keep the foliage clean and healthy. The numbers of plants brought forward will depend on the demand and must be regulatednaccordingly. Azaleas, Rhododendrons, \&e., for forcing still out of doors should have some protection should severe weather occur or remove them to any spare house till wanted. Narcissi, Hyacinths, \&ce., should be protected by a frame, as they now begin to grow; remove the plunging material down to he surface of the pots to prevent them rooting upwards. Mignonette and Neapolitan Violets will require abun-
dance of light and air to keep them from damping. As dance of light and air to keep them from damping. As on suddenly, be provided with ample means for covering pits, frames, \&ce, should it occur. As with the exception of forced plants most other things are now in an factive state, the temperature of plant houses should various inmates. Nothing can well be worse for the development of a healthy vigorous habit in plants than subjecting them to a high temperature at the present season of the year, when light-so important to the heal hy action of vegetable life-cannot accompany it. Wher Achimenes and Groxinias are required to bloom early
few pots may now be started by plunging them in a little bottom heat.

## FORCING DEPAETMENT.

Early Vinery.-As soon as the bunches ean be discerned on the young shoots the extra buds should be removed, excepting such as may be required for pro-
ducing bearing wood next season. In leaving these latter ducing bearing wood next season. In leaving these latter
elect such as are formed'searest the main stem to avoid elect such as are formed 'searest the main stem to avoid
the awkward appearance of long spurs at a stage further their growth. Such shoots as have more thar one buuch should have them reduced to that number, sclecting the one likeliest to form the handsomest bunch. Tyiug in the young wood should be managed carefaly,
bringing the shoots to their proper position by degrees, bringing the shoots to their proper position by degrees, are started a few inches the syringe may be gradually withheld, as too much humidity at this season will sometimes hinder both the foliage and bunches, and a sufficient degree of moisture can easily be kept by sprinkling the floors and heating apparatus several times daily. Regulate the admission of air so as to have a increased, of course, by day agreeably with the state of the weather. Gradually advance the night temperature to $60^{\circ}$ and then to $65^{\circ}$ by the time the flowers are ready to open, keeping the thermometer from $10^{\circ}$ to $15^{\circ}$ higher by day according to the amount of light you, can commasd. Keep up the heat in the outside border by additions when neces sary, bearing in mind the injurious effects any sudden check to the roots now in action will produce on the coming crop. Bring succession Vineries into worl as wanted. Late Vineries in which Grapes are still hanging wiil require fires daily and airsufficient to keep the house and fruit dry ; remove decayed berries and dead leaves, and weil protect the roots from frost. For a late Grape the Barbarossa is found to possess valuable properties. PEach Houses.- Peaches and Nectarines whic large excess of fruit buds, and this more especially on weakly trees; a natural consequence of allowing these to remain are weal flowers and inferior fruit andjwood When therefore such is the case the trees will be greatly benefited by well thinning the bloom buds, leaving the largest and those most favourably placed ; of course a considerable number will be still left to allow for casualties. Syringe twice or oftener daily till the bloom is ready to expand, when it must be discoutinued The night temperature may advance to $45^{\circ}$, with un The night temperature may advaice by day accompanied with a protionate increase by day accompanied with a proportionate
admission of air. Fig House- Damp tie trees ct r admission of air. Fig House-Damp tie trees cr a
frequently, and if wanted early increase the heat a derre frequently, and if wanted early increase the heat a legrte
or two weelly. Pingry. - Pines are often veficient in flavour at this season, which is improved by exposing
the ripening frat to all the light you can command, and giving but little water. A good supply of air is like wise essential at all times for high flavoured fruit, and more than ever necessary at this time. Continue an increase of heat to Hines now wanted to start, employin it lprincipally by day. Attend to linings for Pinea grown in dung pits and keep the atmosphere in which they prow dry. Strawberries in bottom heat for forcing will require air daily to prevent drawing in those earliest stat ; wen they the truss of flowe they should be removed to shelves in the Vineries and Peach hbuees to bloom, but the principal crop should be advancing slowly as yet.
flower garden and surubberies
Except in the driest localities nothing more can be Eone in this department than paying attention to order and neatness. The bedding stuff, however, must hav attention, for in all likelihond many things are suffering from damp, and such plants as appear to suffer most should be removed to other quarters where a drier temperature is kept. Keep the stock in pi:s and frames well ventilated, and the surface soil of the pots frequently stirred. Dust with sulphur Verbenas and similar plants attacked with mildew. Be particular in keeping the interior of pits containing plants of the above descrip tion as dry as circumstances will permit.
hardy fruit and kitchen garden.
Figs against walls will require some protective material placed over them in the Midland and Northern counties, Sume wall trees, as Pears, Plums, and Cherries, \& a stacked by apecies of scale insect, in which case the infected trees should be well washed with a mixture of soft soap, tobacc water, and lime ; a half pint of spirits of turpentine, ma be added to each 4 gallons of the mixture when they are much iufested. The lime is added to give body to the mixture, and to show that no parts of the trees ar missed in dressing. Let this be applied during dry weather if posible, that it may remain on for some time and before the trees are nailed.

The agricultural $\mathfrak{G a z e t t}$.<br>SATURDAY, DECEMBER 27, 1856.

Ir is worth while to revies at the close of the year some of the subjects which have nocupied the attention of agriculturists during it. Even though we confine ourselves to our own columns it is surprising in how short a time the whole range of agriculture comes under the criticism of our correspondents and our readers. Soils, manures, machines, plants, cultivation, produce, food, animals, the relations of landlord and tenant, of master and servant, the duties of farm bailiffs, questions and topics past, recent, and current connected with agriculture and agriculturists have engaged the attention of writers in our columns. And if we look through the pages of other periodicals, the journals of our Agricultural societies, the columns o the North British Agriculturist, the Mark Lane Express, the Dublin Farmers' Gazette, or if we look back at the topics discussed at farmers' clubs, or recollect the unreported discussions of the marketplace, we shall hardly find a point which has not been commented on.
Take the subject of Manures:-Mr. Bowditch has described in the Journal of the Agricultural Society the process of fermentation in the dungheap, and he has given us his experience of earth as a conservator of the volatile products of that process. Professor Way has given us a nost admirable and detailed account of the different artificial manures, valuing each according to the several ingredients it contains. Mr. Grady and others have thoroughly discussed the merits of the different superphosphates manufactured. Mr. Bowditen has introduced new manure into the narket in which the waste products of the gas manufactuie are collected and condensed. Mr. Chadwice has ggain urged the method of liquid or rather liquefied manuring which he has so long advocated. And Mr. Wilkins contends, as heretofore, for the practice of underground liquid manuring on which he is an enthusiast. Mr. Fothergill Coore has called ath at plan of utilising sewaye which the works at Leicester named sundry legal decisions, both in reference to

What a maure is, involving its freedom from tor and in reference to fraudul-nt manure dealers.
On Soils and Cultivation we have had further reports from Mr. WAY in reference to those absorptive properties of earth which he has so ably investigated: the influence of lime upon them has latterly been examined by him : he has examined, too, with most valuable results, the waste of which dranage waters are guilty as regards the soluble fertilising matters which they carry off. Mr. Smith, of LoisWeedon, has published his experience on tillage without manuring, or rather on the effects of tillage independent of manuring, on all sorts of crops, a practice which seemed at first as if like Tull's experience it wis inapplicable except to Wheat. The application of steam power to the cultivation of the soil has been discussed before the Society of Arts, and it has been successiully illustrated by more than one during the past year. The subject of land drainage too has occupied the attention of our readers, as it always must while it so largely engages the services and the means of landowners, farmers, and drainage engineers.

On Agricultural Machines we can refer to our eports of the meetings at Chelmsford and at Colchester in illustration of the advances that have been made. Reaping machines are admitted as a necessary farm implement. Locomotive steam power is, in England at any rate, wonderfully extending its help to agriculture. Implements of tillage received at Chelmsford a careful trial and examination by the judges of the Englinh Agricultural Society, and the steam plough though not yet acknowledged by our wational societies is evidently on its way to meet us.

On Plants and their produce we may refer to the extension of Italian Rye-grass, to discussions on the relative value of different sorts of Wheat, the papers by Professor Buckman on the development of cultivated plants from their wild origin, the series of valuable papers on the diseases of plants by Mr. Berfeley, the discussion on the multiplication of weeds by seed, and on the hoe as beine often a sowing machine instead of an extirpator. The breaking up of Grass land has been discussed hy Mr. Wood ; and the rotation of crops by Mr. Thomas, before the London Farmers' Club. The communications, too, of information on the number of seeds in a lb ., and the number sown per acre, by Messrs. Rendle, Lawsos "J. C. X." and Hardy, properly come under this head. The proposals to harvest hay and grain ciops, drying them by artificial means, must also be named here; and so must information as to the character of the past harvest-various in England - late and disastrous in Scotland. The subject of thick and thin seeding has been re-discussed : and a crop of Mangel Wurzel has been reported in France the double of our English maximum

On Animals and their Food, we may name the new cakes which have been introduced-the Carob pod-Mr. Horsfall's continued reports on Rapecake as food for dairy stock-his paper on the treatment of pleuro-pneumonia - Sir Charles Knightley's sale of shorthorns-Mr. Willoughby Wood's letters on cattle breeding-the Paris agricultural show and those of the English, Highland, and Irish Agricultural Societies-and revelations and discussions on the adulterations of cattle food. The profits of pir-feeding have been among the last of the subjects under this head discussed in our columns.
Take now another classification of agricultural subjects :-The relations of landlord and tenant have been discussed in papers on the lease by Mr. Grey, of Dilston, and the Hexham Farmers' Clnb; and the Dilson, 1 in has been illustrated in the cases of the Dukes of Bedford aid Northumberland respectively. We had Mr. Thomas, the tenant of the former, contending the other day for that greater liberty of action which is allowed himself, and holding up to ridicule the agreement insisted on by the latter, armed as it is with all sorts of pains and penalties against the infraction of impossible rules. The subject of farm bailiffs, their duties and their character, was fully discussed in the earlier numbers of our Paper this year. The relation of master and servant, especially with respect to the agricultural labourer, was very ably discussed before the London Farmers; Club
On the scientific relations of agriculture we may refer to the papers by Lifbig and by Lawes in the Agricultural Journal-to the reports of Prof. Way in the same work-to the lecture by Dr. Playfair before the Royal Institution on the principles underlying agricultural experiments, and to a paper by Mr. Baker on the relations of geology to agriculture
Among the more important agricultaral events of the year is the atlitude towards farmers taken by the Society of Arts, which is gradually occupying ground that ought, as it appears to us, long ago to have been
energetically worked by the national Agricultural Society. And no more interesting and important
agricaltural meetings have been held throughout the year than have filled their hall in the Adelphi, listen to Mr. Fowler on Steam Culture, Mr. Wrey Hoskyns on Recent Agricultural History, and Mr. Fothergin Cooke on Town Sewage. The Society has also made a beginning towards the furtherance of agricultural edocation by initiating an examination on this as well as other topics open to members of the local institutions in union with itself.

The agricultaral statistics of the year onght to fill an important place in its agricultural history. The attempt at their collection in Scotland this year has been as usual perfectly successful ; in Ireland, too, it has been as successful as the methods there adopted permit; in England it has been abandoned!

This enumeration, then, of the subjects of discussion during 1856 shows how much of the whole field of agriculture comes every year under the review of the agricultural journalist. It is ob-
viously but an imperfect resume after all of the contents of our current agricultural literatureobviously so, we venture to say, even to the readers of our own columns only-much more so of course to the readers of other periodicals as well. And the inference we draw from the
enumeration is simply this-that whatever be the defects of 'book farming,' taken by itself, and no one can assert of any art or business that it can be taught efficiently from a book, the farmer who avails himself of books is likely to bring greater intelligence to bear upon his operations than the farmer who neglects them.

About eleven years ago a plant of Wheat bearing three ears on a remarkable stiff and short straw was pulled by Mr. George Hope, of Fenton Barns, débris of which it had accidentally grown. The grains which these ears contained on being sown for field; and as the Wheat retained during that time the characters which distinguished it at first, Mr. Hops sent it into the market as a new variety, and the Fenton white Wheat accordingly is now known in every part of the country. It is characterised by a moderately large ear of even shape on a straw not only remarkably short, but remarkably various in length. The consequence of this latter peculiarity is that its yield of grain generally exceeds the expectation formed of it by those who see it before harvest for the first time. Its performance has always exceeded its promise during the years that we bave known it. This abundant yield is no donbt the result of the distribution of the ears through various heights above the land; there is not that crowding of them which
there would be if they stood all on one level. And this one sort accordingly exhibits in itself a result which can be obtained in
mixing two or three sorts together which grow straw of various lengths. We take this instance, because it is so generally known, to illustrate What might otherwise be a mystery, viz, the result of an experiment reported in France on the productiveness of different Wheats as compared with that of a mixture of them all.
There can be no doubt that the productiveness of a crop is due, among other things, to the use it can make of air and sunshine ; and many sorts o Wheat, the ears of which when mixed shall grow at different levels above the land will, just as
Fenton Wheat is fonnd to do, yield all the more abandantly from this one cause. But there are other causes as well as air and sunshine contributing to the productiveness of a crop, and it is probable that different sorts of Wheat may vary in their power of using these several tributaries to fertility; and not only so, but it is possible that the neighbourhood of two different plants to one another may affect their power reciprocally of exhausting and so using the
fertilising influences around them. Thus, and as an extreme case, whether the plan be generally practicable under ordinary farm management or not, there can be no doubt that alternate rows of, for instance Beans and Carrots, will under proper management yield more than half a crop of each per acre.
But whatever be the cause the results recorded in another page, as observed in France, may be trusted to as true of that particular case; and, if they may be taken also as indicative of a general truth, it is believe that they do contain a general truth; and the case of Fenton Wheat to which we have re ferred if it does not furnish the whole theory of the case certainly contribates to it; and the practice which generally prevails and seems to be in creasing, of using mixed Wheats for seed, show
that in England, too, we
sponding to the French.
We commend the subject to the consideration of
rrespondents, and shall be glad to learn from them any experience bearing either way upon the results recorded in another page.
A correspondences has been published in the Times during the past week on the subject of Steam Culture, to which we shall invite the attention of
our readers as soon as the space at our command permits. "I. A. C." asks indignantly why the English Agricultural Society has not long since rewarded "John Fowlre" for his success in ploughing land by steam; and William Smith gives one
of several reasons in the fact, as alleged by him, that he and not the other has the strongest claim to the Society's award.

We agree with the former in his regret that some mark of distinction appropriate to the great
energy and public spirit which Mr. Fowler has energy and public spirit which Mr. Fowler has
exhibited in this matter, and significant of the respect with which his efforts certainly are regarded by agriculturists generally, should not have been attached to the premium offered by the Society specifically for success in steam culture, and which "I. A. C." speaks somewhat contemptuously, must guide its award, in justice to the others striving for it, as well as in the interests of agricul ture generally, which it is believed by most
will not be served by any sanction of the methods yet in operation of obtaining tilth by steam.

THE PRACTICAL VALUE OF FOOD.
In estimating the practical value of an article of food,
The Age of the Animal.-Young and growing animals require a more concentrated and more readily
digestible food than full-grown or store beasts, $i$. e. food being, comparatively speaking, rich in nitrogenised matters and poor in indigestible woody fibre. The food upun which growing stock is fed not only has to supply the daily waste of muscle, but must also increase the weight of the animals ; and as the process of renewal in young animals moreover proceeds more rapidy than in a larger supply of flesh-forming substances and of bone a larger supply of flesh-forming substances and of bone
materials. Hence the great value of Linseed-cake and of Linseed jelly for young stock, and the poor condition of young beasts fed upon tos much chaff. The yet tender organs of digestion necessitate a more digestible food than that upon which store beasts may be fed with
economy, and thus the same food which may be valuable for store beasts will often be found totally unfit for young stock.
2. The Various Kinds of Animals.-We know by experience that the best food for horses is by no means the best for cows or sheep, and hence the nutritive value of an article of food will be different in relation to orses from what it is in relation to cattle. The organisation of the digestive organs of our domestic animals fully accounts for the different effects which are to different kinds of animals. Thus whilst Beans are highly nutritious when given to horses, their value for straw, given by itself, may support store cattle, it cannot sustain for any length of time the life of sheep or horses. The nutritive value of food thus varies with the description of the animals to which it is given.

The Natural Disposition or Temper of the Animals. -Whilst some animals, like the Herefordshire cows
and short-horns, are naturally good fatteners, Welsh cattle and Kerry cows, to mention only a few instances, never will become very fat, even if they are kept for a long time on abundant supplies of the choicest food. The practical value of food is thus likewise influenced by the natural disposition of the animal which is kept upon it.
4. The Purposes for which Animals are kept.-The ffect which food is capable of producing is also influenced by the purposes for which animals are kept n the farm. The value of food necessarily will be a different one, if we speak in relation to working animals, Thus, for instance, the same kept for dairy purposes. Thus, for instance, the same amount and kind of food
which in summer is hardly capable of keeping working horses in good condition, is more than sufficient to render them plumpand fat in a short time in winter, when they are retained for days and weeks together in the s'able. The nutritive value of food thus is influenced by the work done by the animal. The harder it is kept at work, the greater the waste in muscle, and consequently the richer the food ought to be in flesh-forming matters which is given to working
horses or bullocks. Highly nitrogenised food, however, though of great value when given to working animals, does little good, and may even do harm when given in too large a proportion to fattening beasts. Valuable food for fattening stock is food rich in stareh, and still nore so, food rich in ready-made fat; or, to speak generally, food not so well adapted for working animals, muscle material. These few examples will show that muscle material. These few examples will show that value of food cannot be invariably the same, but is
regulated, amongst other circumstaices, by the purpose fitness of the same kind of food thus varies with the age, natural disposition, and kind of the animals to which it is given, as well as with the purposes for which they possible to classify the various articles of food in an order which will indicate their relative feeding values in all cases. But supposing the composition of food to be known, and the wants of the animals are well considered, it is still impossible in all cases to estimate will priand what practical effect a reeding substance stances and contain fay as well as saline and earthly matters; and yet it may be, comparatively speaking, poor food, inasmuch as its constituents are not assimilated by the animal organism. The digestibility of food consequently is a point which ought to be well kept in view in estimating its nutritive value. Our knowledge of this process of digestion, unfortunately, is so limited, that we cannot speak definitely of all the conditions which regulate the digestibility of food. Still, however, a few circumstances may be pointed out, by way of example, which influence the assimilation of food by the animal system. Amongs other conditions the digestibility of good depends-

On the Kinds of Animals.-The same description of food which is assimilated in a great measure by one kind of animal remains almost wholly undigested when given to another. Thus it has been proved by direc experiments that cows will extract a great deal of nourishment from cut straw, whilst horses do no possess the power in the same degree of appropriating nourishment from cut straw, and sheep in
2. On the ameunt and character of the Woody Pubre contained in Food.-Feeding materials, containing but a small amount of woody fibre, are generally more readily digested than those articles of food which, like straw principally consist of woody fibre. Hence Barley meal, Uats, and grain in general, substances rich in starchy compounds, are so well adapted to the rapid fattening of animals. The condition of the woody fibre further affects the nutritive value of food in no mean degree. Whilst the woody fibre in roots left too long state on the land, or the fibre of Grass an Clover left standing until it become dead-ripe, is no readily digested, there can be no doubt that the soft fibre of young Grass, Clover, and roots, is readily assimilated in the animal organism and transformed into starch sugar, and finally into fat. It is for this reason that crops, more especially Oats, when lharvested before the plants have become dead-ripe, produce strai which is greaty more nutritious than the straw of dead ripe grain crops. Ia some parts of scotland the custom prevails to cut the Oat when the top of the baulm description that store cattle are kept during the winter almost entirely.
3. On the A mount of Flesh-forming Substances.-Food too rich in these constituents is not readily digested by cattle, whilst working horses are greatly beuefited by food of that description. Thus, Bean-meal or Peas ought to be given sparingly to cattle, because Beans and Peas contain a very large amount of flesh-forming substances, which renders them indigestible when given
4. On the Bulk of the Food.--The normal functions of the digestive organs not only depend on the composior bulk of food contributes to the healthy activity of the digestive organs, by exercising a stimulating effect on the nerves which govern them. The whole organization of ruminating animals necessitates the supply of bulky food to keep the animal in good condition. Experience shows that horses require a less bulky and more concentrated food than cattle; but if we reverse the case and feed cattle with too concentrated a food and horses with too bulky a feeding substance, much of the foed will remain undigested.
. On the Form in which Food is presented to the is said to poseese litte happens that an article or food may te piven to value, whici, properly preparod, mith advantage. Thas, warls very acceptable food for cattle. The bruising of Oats Barley, cake, \&c., the making of Linseed into jelly, the steaming of hay and cooking of food, are illustrations, showing how, by an alteration in the form of a feeding material, its digestibility, and with it its nutritive value becomes enhanced. The benefit of ateaming or cooking of food is principally due to this circumstance. It does not add anything new to the food; it does not call into existence any fresh nutritious matter ; but brings the nourishment present in the food in an unfit condition into a state in which it is more readily assimilated by the animal. Steaming, moreover, reduces the bulk of the food, and ma-ticates, so to speak, the food for the animal. The auimal, therefore, is enabled to consume in a given time a larger quantity of food, and so saved to some extent the work of mastication, which, like every movement of the muscle, is attended with a certain loss of the substance of the beast. The quieter and warmer we keep the animal, and the more we facilitate the assimilation of food, the more rapidly it will become fat. By steaming, likewise, the disagreeable smell of musty hay or cake is destroyed, a
stetumed fuod becomes more palatable.

On small Proportions of Substances with which

THE AGRICULTURAL GAZETTE.
we may not even be acquainted.-Professor Liebig's researches on the juices of flesh have made us
acquainted with a remarkable crystallised substance, to which he has given the name of Kretine. This substance appears to exercise a remarkable function in the digestion of food. Liebig also showed the presence of phosphate of potash and lactic acid in the juice of flesh, and considers these constituents indispensable for the digestion of meat. He has indeed proved that flesh from which all juice is perfectly extracted by water so indigestible that even dogs will refuse to eat it. The total amount of the compounds which appear to play so important a function in the digestion of meat is bu very small. Now if the digestibility of flesh is deter mined in a great measure by small quantities o substances, the importance of which remained unnoticed until the master researches of a Liebig on the juices of flesh made us acquainted with the influence the above mentioned substances play in the process of digestionquantities of compounds which exercise a similar influence? In conclusion it may be observed, that the conomical value of food is further influenced-

By prejudicial substances which food may conterim.Thus, for instance, Mustard-cake cannot be used as a feeding material, notwithstanding its containing a large amount of flesh-forming and fat-producing substances, gives rise to the production of the poisonous irritating essential oil of Mustard ; or, the refuse cake, produced feeding purposes on account of the drastic effects which the oil, still remaining in the cake, will produce in the animal system
2. By the mechanical effect the food exercises.-An illustration in point is offered in bran, which, on accoun of its sharp edges, stimulates the nerves of the digestive canals to such an extent that much of it passes throun the system undigested. Otherwise brall ought to $b$ very nutritious, for it contains even more flesh-forning matters, as well as more fatty matter, than wheaten believe, are nrincipally relaxing effects of bran which, I be overcame ty the cooking or sterming of the bran?
3. By the physical condition of the food.-It is so selfvident that mouldy, fusty food cannot be so good asit is in fresh state, that I need not"dwell on this point. Every (there are some exceptions, as for instance, Mangels, which become better on keeping), - the better it is adapted for feedling purposes.
4. By the flavour which it imparts to the meat or the mo - The economical value of an article of food is also regulated by the flavour which it imparts either to the meat or the mills. An article of food may be excellen for producing flesh or milk, and yet, on account of the disagreeable flavour which it imparts to either the one or the other, it may not be desirable to emplny it as a feeding material. The case of Fenugreek seed, to which reference is made above, fully proves this. These remarks, and others which will suggest themselves to food alone cannot determine its economic value, but that variety of circumstances have to be taken into account belore we can arrive at anything like a correct Voelcher on the Chemistry of Food.

EXPERIMENTS ON SOWING A MIXTURE OF VARIETIES OF WHEAT.
(Frol the Jourial d'Agriculutir Pratique.)
Some experiments were lately made by M. Lucien Rousseau, of Angerville, one of the most distinguished practieal farmers of the Beauce, with a view was best adapted to the soil and climate of his district These experiments have led to the establishment of a fact of the highest importance, whether we regard that fret by itself or with reference to the careful and methodically conducted experiments by Which it was
discovered. discovered
Adjoining the ground in which M. Rousseau's experiments wrere being conducted was a piece of land of much the same size, which on account of some Elms standing upon it, was less favourable for experimental purposes than the ground selected. No Wheat was therefore sown in this piece of land for the purpose of experiment, but it was sown with a mixture of all the kinds of Wheat experimented upon in order that the experiments might not fallow land. The result was that the land on which the mixed Wheat was ground yielded a much heavier crop than that obtained from the far better land on which the unmixed Whea
The sorts of Wheat chosen were selected from those kinds wheh were supposed to be best fitted for cultivation in Beauce; the grain was tender and bright, and the straw was soft and light coloured. A mixture of grain arising from sorts so selected does not present any marked differences of appearance so as to be
lessened in value. On the other hand, the increase in yield and the greater chance of success arising from the variety of different constitutions of the kinds sown gives the reault obtained by M. Rousseau an importance adopt a mode of cumilar to that formerly followed in growing meslin corn, only modified so as to be suited to the present state of agriculture. By taking
care not to mix sorts, the grain of which has not the nearly the same time, it appears that very important advantages may be derived. Louis Tilmorin.

The following is the result of M. Rousseau's experi ments, which were made with 15 sorts :-

which, stifled if they are alone and too thick, cannot ge up or consequently ripen? The mere fact that the ears do not all appear at once necessarily prolongs the time of flowering, and no doubt increases the chances of good impregnation; for if the first flower which has lost its pollen has not been fertilised, owing to the badness of the weather, it may still be capable of being impregnated hy the pollen from a later ear. Another advantage seems to result from this want of simultaneous earing and unequal length of stem in mixed Wheats; and that is that the ears being less crowded get more light and air, and their flowers can consequently more easily expand, and are thereby alone rendered more fit for impregnation. This accords with what we find in practice, for Wheat which is a little thin is generally better fertilised than that which is too thick.

This hypothesis of more easy impregnation naturally leada to the supposition of better maturity, and the Barley and spring Wheat, seem to confirm the notion. We find in these mixtures that each grain is generally much finer than the grain of the same kiad of Wheat grown unmixed. Is not this owing to the fact that the ears, not being all on one level, are more free, afford: more protection to each other, and derive more advantage from light, and so escape that early ripeness which we call scorching? Scorching, which is so common ears of a compact mass not traversable by the sun's rays, which are reflected from the surface, and thus ripen the ear without penetrating to or ripening the root, as is indispensable to perfect cultivation. In mixroot, as is indispensable to perfect cultivation. in mix-
tures again may not crosses be obtained, which, under tures again may not crosses be obtained, which, under
favourable circumstances, may lead to new and valuable varieties?
In a practical point of view one of the greatest advantages in sowing mixtures is the removal of all uncertainty as to the particular kind it will be best to select. For even if in a mixture of 15 sorts, three or four are not adapted to the coil and climate, the spaces which will be left by them will be readily filled by the other sorts, and
even if some of these should be bad, coarse, and not even it some of these should be bad, coarse, and not weaker and later kinds. Lucien Rousseau.

## Home Correspondense.

Down's Farmers' Fivend is much used in this neighbourhood for dressing Wheat and is much approved of The crops here suffered dreadfully from blighted ears; in some cases the Barley will not yield more than half as much as usual. What is supposed to be the cause, sown Barley, where several stalks have crown trom one sown Barley, where several staks have grown in one root, if one ear is blighted all are so. Last year I could not find a single good ear produced by a root where others were blighted; this would appear to indicate the seed being in fault or injured after being sown. Any information on this important point would 1 think be acceptable to
The L'tilisation of Sewage.-I attended the discussion on this subject at the Society of Arts on Wednesday evening; and alt!ough the subject was ably introduced and ingenioully detended by Mr. W. F. Cooke, yet no satisfactory solution appeared to be arrived at. With the exception of the introducer, the othexpeak the limited to 10 minutes, which period, although the utmost that could be given, was olso many who would have addressed the meeting had there been an opportunity. It is much to be regretted that the discussion was not adjourned, as it was evident that it could not be half discussed. I would suggest, as the subject is one of immense importance as well as highly interesting, that the discussion should be re-opened, that the attendance of scientific and practical men throughout the ccuntry should be invited, and that the whole merits of the sulbject should be fairly gone into. It might the discussion morer in their names to the secretary. Perhaps 20 minutes would be sufficient for each speaker, and it would be better that the discussion should be again adjourned, rather than the matter should be imperfectly discussed. There is no tribunal so fitting as the Society of Arts, and there is no subject more worthy of its consideration. W. C. Spooner
In offerin! Prizes for Animals at Agriculturat Mectings, distinction should be made between those smothered in far, by which the framework is totally concealed, and those whose proportions are visible,
though well covered with wholesome meat. If farmers though well covered with wholesome meat. If farmers
are to benefit by periodical gatherings and exhibitions of stock, attention must be paid to certain rules by which information can be obtained as to the expense of feeding, wher it will be proved that disgusting looking pigs, which cannot stand, but require propping up to eat, are not worth their "keep," that is, will not remunerate the agriculturist who has to live upon his land, and from the produce. It may be an amusement-there is no accounting for taste-nto watch an unfortunate quadruped daily increase in size, till he becomes unable to stand without the assistance of his attendant, who is obliged to
cram him by hand. This may almost be said to be cram him to animals for no good purpose. If individuals choose to favour the tallow chandler and sosp boiler, in preference to the farmer, they have a right to do so, having it is presumed money to throw away; neverthe-
less they should not be allowed to carry off the prizes for
the best animauls, or at any rate they should cume under
a separate class-for instance lard and dripping
feeders, in contradistinction to those who show for the meat market. Animsls are required with the power of producing weight in a short time, on the ordinary food supplied by the farm, and when in fine healthy co
tion affording a fair return for expenses incurred. man may be highly delighted with a pig whose head can searcely be distinguished from his tail, looking more cying he will be able to "turn a penny" by such a breed, he ventures, in a moment of enthusiasm, to pur chase one of the beauties. Having taken the bargain home, the usual mixture given to growing stores is set
before her, however the new comer turnsup lher nose at before her, however the new comer turns up her no
the food, and instead of improving in flesh falls off, tinuing to do so till she is again pampered up with all linds of strong and ruinous compounds, so that by the time she attains the age for breeding, she has cost four times the sum of a well made useful cross, profitable at will thrive where a "show" pig will starve. The first thing to be considered with regard to stock is not who dering public a live mass of grease, which, after a gleam of astouishment has passed away, fills the mind with a of astonishment has passed away, fills the mind with a
sickening sensation and compassion for the sufferings of the brute. Falccn.
Professional Advice.-I have read your correspondent's remarks under this heading in the Gazette of the 13 th inst., but what do you think of the charges made to me a well known draining engineer of London; he stated his terms to be 3 guineas per day, and actual expenses. Fie arrived at the station at half-past 10 o'clock, A.M. and left me before 40 clock, p.a., the same day. Ite walked over a part of my land occupying him about two
hours; he then lunched with me, and left by the train hours; he then lunched with me, and left by the train
that would reach London at 11 o'clock the same evining Under any circumstances he could not have been absent from his home more than 26 or 27 hours. As I am
situate under seveu hours per rail from London, person leaving London by the $90^{\prime}$ clock P.M. train would be wilf me between 3 and 4 oclock, A.an, and could at 11 o'ciock the same night. His charge is for three days 91.9 s., expenses, 62.88 , total $15!.78$ s. He explains by saying his charges are quite consistent with the Questions answered about a Fen Furne.-1. Aus regards the level of our farm I have no correct data, hut suppose we are fully 6 ft . beiow high water. We are 13 miles
from deep water, and I understand there is 14 ft . of tall, so that there is a good natural drainage. 2. The engines drain 25,000 acres, are of 140 -horse power, and raise ably higher than would be requisite if the drain to sea was in a more perfect state. They keep our water armout 1 foot from the level of the lower portion of the private engine, 1 foot 6 inches lower than the general angines. 4. Our own eugine is 6 -horse power, but not ore than 4 is requisite for working the water wheel ongines is 620 acres; we have 60 acres of wash land adjoining the river-which is drained ly a small of drainage works for the past 30 years will exceed js per acre per annum. 6. The farm has been in our occupation 30 years uext Lady Day. 7 . The rotation firs seeds; sth, seeds pared and bursed, and sown with
Rape in July ; 6th, Oats; 7th, Wheat. The second rotation whst, fallow; 2d, Oats; 3d, Wheat ; 4th, seeds; 5 th, Wheat, which is still the practice of many
Fen farmers. The seeds having been ploughed up for Wheat with one furrow, the burning was given up. The rotation we have followed now for some years is-lst,
fallow: 2d, Wheat: 3d, seeds : 4th, Wheat ; 5tl, faliow ; 2d, Wheat: 3d, seeds; 4th, Wheat; 5 th , ing the land in good condition and clean it is much the best of the three; the only inconvenience connected wish it is that you are obliged to consume all the Rape early in the season, to enable you to sow the land wheat more under the present than it was during the two previous rotations, and which I think has been produced from the following causes -1 st, not haring two
white crops in succession; 2 d , from better drainage by means of our own private engine and under food, having expended enlarged outlay for cattle five years in oilcake. 8. The soil of this farm 30 years a ao was a light peaty soil, varying from 1 foot to clay, a strong silty clay, upon a subsoil of blue buttery until clayed was not well adapted for the growth of Wheat ; from 20 to 40 acres sown in spring was all that was grown on the farm, and that for only a few years previous to our nccupation. From draining and the farm has wasted until we plough some quantity of clay up whenever we fallow. This year I have ploughed where we ger hold three horses, and it is a strong pull by cutting trenches 2 ft . wide at 20 to 30 ft . intervals, the hadg 1 to 2 ft . of clay, according as you thought the trench; 190 cubie yards per acre we found suffieient, and at that time cost 30 s. to 35 s. per acre.
the clay is near the surlact, it is better so make
frequent trenches and take a smaller quantity out of
each as the land is more easily levelled. Our farm was all each as the land is more easily levelled. Oar farm was all ciayed many years ago excepting the 60 acres of wash years ago, and I am now claying a portion of it by
carting the clay of the old Jand where it lies close to the surface. By leaving the ploughed soil I can take a fo of the subsoil without damage. There is nearly 3 of peat on the wash land, and the clay not good. The acre), will do it better, as by the ordinary mode of claying a considerable portion of good soil becomes
buried in the trenches. Excepting the first seven years we have seldom practised burning, and no farmer in clay, I believe, is calcareous. By claying we obtain as much lime as is required, and where lime has been
appl:ed, which has only been for trials, it is uot found to do much good.

## Eocietieg

Eass Berwicismine : Adulteration of Manurc.principles upon, which the, said-In considering the manures should be conducted, the first idea that strikes the purchaser is how he may best ascertain the quality of the commodity he is about to purchase, and how he delivered is equal to what the seller has held it out to be. There is no mode of actually testing this that I am purchaser. This may be done in a very satisfactory manner with those I may term simple manures-that is, those that are composed of few ingredients. It is more difficult to ascertain with any degree of exactness the component parts of those called compound manures.
A certain latitude ought therefore to be allowed in such cases, and although the same chemist might not always bring out the same results, in different samples of the same cargo, and more likely different chemists might much as to affect the value of the manure
extent, and, therefore, even in such cases it may great best guide. Having ascertained the quality
generally done ; but whe is seller, which is generally done ; but what is not generally done, and
what should be strongly impre-sed upon the attention of the members of the Club, is that the purchaser should have the analysis of the stock after it is delivered to
him. Should this system become general, it would not only satisfy the mind of the purchaser, hut it would also be the greatest boon to the fair trader, or the manufacturers of these manures, by keeping tricky or unfair competitors out of the market. So long as we can be dissolved bones, soda, or sulphate of ammonia, this would be a satisfacto principle to act upon, as they would be thoroughly tested; but if compound special manures, that are said to be exactly suited to the particular kind of crop they may be recommended for, are to be preferred, then would suggest that every man should try it for himself in the first place on a small scale, and if satisfied with the result, deal with a party on whose lonesty he can place confidence, for a more extended use of only good result that I can sce oarise from bringing more forcibly upon the minds of the Club the propriety of a more extended system of analysis by the purchaser, after the delivery of the stock, to make certain as to how it agrees with the analysis given by the seller, by dulter means the farmer would be protected from adulteration, and the fair trader from fraudulent competition, and to lessen the expense to individuals all in the same neighbourhood, and purchasing from the same cargo, who might club together, and either fix upon a parcel to take the sample from, or take a little from each and mix ; but for those who buy largely it would be well worth while to do it individually.

Mr. Wilson, of Edington Maines, said it was with great satisfaction to him that the subject had been taken up by the Club. For a length of time he bad
been strongly impressed with the urgent necessity been strongly impressed with the urgent necessity
which had existed for the farmers combining to put a stop to a system of wholesale plunder to which they had been subjected. It was more especially their duty to oppose the practice of seling spurious minnures, considering the high prices whick guano now brought. A rery fair plan had been adopted by the Messrs. Townsend of Glasgow, who offered to deai on terms
which be thought should suit every one. The sellers first submitted the manure to a competent chemist for analysis, and after that they offered a written guarantee that the manure supplied to the purchaser would be of
equal value to that stated by the chemist. He hoped the example would have a good effect, and be generally followed. Some respectable dealers in this district might feel offended if customers said, 6
deal with you unless I get a written agreement." But saying that there is not any man, however high his standing, who could take a hurse 1 to the market, and send it withont a warranty of its soundrese, and the
individual who would complain of being required to do so would be laughed at. In doing so they would be simply doing as they would wish to be done by. In
this questiou there were none more deeply interested
than the honest dealers in manures, because it was
quite evident that the adoption of such as had been proposed would drive the fraudulen dealers out of the market altogether. It was therefor their duty to procted, and if they did not do so they would be wanting in a duty to themselves, and to the community. They ought all to combine and require from the seller a written guarantee of the quality of the manure bought. Sone might think that in this district they had not much to complain of. It consisted with his knowledge that within the last year several farmer within the locality had purchased guano at $7 l$. or $8 l$. ton, and he believed none of them had satisfaction from The fact of the agent having a commission of no less than 11. per ton for the sale of the guano was
sufficient evidence of its inferior quality! These facts would show how easily they had been imposed upon.

## Farmers' Clubs.

Hexeam:-The Application of Lime--At a re cent meeting of this Club Mr. R. E. Ridley rend a paper on this subject, from which we make the following extract :-L:me differs from most other ma nures--it may almost be said from all-in this respect that it is auvantageous in agriculture as a mechanical
agent as well as a chemical one. It not only supplies food to the plants directly and indirectly by its influence upon the other constituents of the soil, but it is of great advantage in rendering clay soils opener and lighter, firm. It is well known that hot lime has a great affinity for water. It will gradually absorb the moisture from the atmosphere, swell greatly in bulk, and fall to a fine powder. Now, when hot lime is ploughed into the land and allowed to, burst there, it will exert a powerful dis integrating effect upon the soil. Its operation will be something like the action of frost, which we know thoroughly opens and lightens the soil, with this difference that the particles of lime becoming mixed with the soil
prevent it from becoming trampled into so close and hard prevent it from becoming trampled into so close and har applied with a view principally of lightening the land, it is essential that it be applied as hot as possible. In fact, it should be ploughed in as it is carted from the kiln. None of it should be over-night exposed to the dews, otherwise you may expect it to be powder in the morn ing, and its utility for the purpose you desired greatly injured. When ime is used on yogh sons with the object of increasing the tenacity and solidity of such soils, it is better that it should be in the state of hydrate -that is, be completely burst or fallen by its union with
water, before it is ploughed in. But water should be thrown on to it as soon as possible, or if it is allowed to fall from the absorption of moisture from the atmosphere, it should be put into large heaps and well covered, and nut be spread upon the surface of the feld several days before it is ploughed in, otherwise it grader ally combines with the carbonic acid of the aterene as
and beconses mild. In this state it is the same and beconses mild. In will not answer the purpose for which it is intended. The reason is, that hot lime unites chemically with sand, and forms a silicate of lime, and by this means the eandy paricles are cemented together to a certain extent ; but if the lime be mild or if chalk be used, unless it be applied in very great quantity, there is no
adhere to the sand nor to each other, and the land is as friable and open as before. To obtain, therefore, the best melacked, to strong land, and slacked, but still hot to light soils. But perhaps the most important use of lime in agriculture is its chemical effect. It destroys many injurious substances that from time to time are generated constantly being formed various yegetable acid that are more or less injurious to vegetation. Lime, when brought in contact with these injurious matters, to use a common phrase, kills them, that, chemicaily combines with them and renders them harmless. It does so mucfiect the same purpose when mild, though much more slowly. Grass land in the state just described is said to be sour, and it is well known that if it is ploughed up and thoroughly limed so wh in arable land, though its effects may not be so well known or, so easily recognised, and there is no doubt but thus caused Whenever we form compost heaps from the cleansing of ditches, or the cuttings from road or hedge sides, we of ditches, or the catings with these ingredients. And wisely, because it is a powerful promoter of vegetable decomposition. Now, when lime is put into the land it acts exactly in the same way; you are in reality making a vast compost heap. If, for instance, you plough it in with the lea, it will quickly decompose and destroy the
Grass and other roots, thereby rendering them more readily useful as manure. So, also, when it is applied to a soil containing fold-yard manure, it wil cause the manure to decay much mosesed, and render them available to the growing plant. If, on the contrary, it is applied to a poor, hungry soil, it has comparatively smal to fow six bolls per acre, and a well-manured one 12 bolls, by the addition of lime the former may produce say nine bolls, being an increase of three bolls from the ase of lime, while the latter may produce bolls in favour of lime being applied where there is manure. The reason of this additional produce is per fectly plain to the chemist, who knows that the lime will decompose the manure more rapidly, and make itact more speedily. Land, therefore, that is properly supplied with ime will cause the fold-yard manure that is put into it to be spent much sooner than if it were deficient in lime It will enable the farmer to have his manure nearly al supplied to the growing crop the year it is applied instead of having it partially decomposed during the winter, to have its elements washed into the subsoin o nto the drains. Anwn that the manure required by the principle laid down, that the manure required ay having put into it in one /year what is intended to serve four or five. There is a peculiar property which lime, in common with other alkalies, possesses; it is that inducing, while decomposing vegetable matter, the nitrogen of the atmosphere to unite with the oxygen acid. Nitric acid is the active principle in nitrate soda, and is, as we all well know, of great value as a
manure. Lime, therefore, not only sets free the nitrogen that is in vegetable substances by decomposing oo disposes matters that an additional supply ot nitrogen is taken from the air and made availabie as a manure. lime, but they are so we pass on with the mere mention of them, especially as this paper is already too long. Plants take up lime quantity, varying from $8 \frac{1}{2} \mathrm{lbs}$. per acre for an ordinar is therefore important that there should supply in the soil which they can reach. Lime is famed for destroying the tough useless Grasses, and for promoting the growth of a sweet tender herbage. It is
also valuable for killing noxious vermin, especially worms and slugs, and will, when hot, if it comes in contact with their eggs or larve, most certainly destroy them. Lime ought always to be applied to land in a hot or caustic state, where it can be procured in that stan soils, we have 8 en that it is valuable in this state only. And though in its chemical effects it will, generally speaking, in the end be the same, whether hot or mild, yet its action in the former state is so much more rapid and effective that there can be no doubt but that it is most useful When so applied. We ought, therefore, to avoid allow-
ing it to become mild before ploughing it into the soil. ing it to become mild before ploughing it into the soil.
We think the proper time for applying lime is on the We think the proper time for applying lime is on the
Grass at the time it is ploughed, for the reason before alluded to, that it is effective in destroying quickiy the roots that are being turned into the soil. It ought also, we think, to be applied each rotation of four or five years, as the case may be. And that when the land
is in fairly limited condition, the periodical addition need not be more than from two to three tons per scre, varying
with the tenacity or looseness of the soil on which it is with the tenacity or looseness of the soil on which it is
uied. On Grass land it should be applied as frequently, though nothot, butin the shape of well-limed compost. It is assumed that the land to be limed is moderately dry, either naturally or from being drained, because lime
applied to very wet land is likely to do no good whatever. Mr. Wood remarked that he had never seen lime take a greater effect than some taken from the
ruins of houses. Mr. Ridley said the plaster of the walls of stables contained a large propoth this conntry the of French obtained from the walls of cellars and stables in French obtained from the make their gunpowder. Lime had a peculiar property in assisting the formation nitric acid. He had seen it applied to old Grass and came away green very soon. When lime and mauure were put into the soil together they had a wonderful property of making more manurediture; Professor Liebig said to an immense amount.

## Farm Memoranda

In the Upper Ward of Lanarkshire, between 700 and 800 feet above sea level, is situated a farm of 700 acres on which the tenant, who has a lease of 19 years, is making most important permanent improvementsto a very large extent from his own means. Of the 500 acres of arable land which the holding contains, more than half has been reclaimed by him from a state bor dering upon barrenness, and instead of it being worth only from $2 s, 6 d$. to $5 s$.-its original value-it can now be safely rated at 25 s. to 30 s , an acre. About 150 acres of Turnips are grown annually, and of this year's crop it may be said that there are few heavier and Grasses
part of the kingdom. Roots, Oats, Barley, and are the principal plants grown ; Potatoes, Oats, and Barley being the only crops sold off the land. Beef, Barky bu biry produce are largely marketed, the whole Turnip crops, supplemented with purehased food, being consumed on the farm. As the result of high farming the tenant required some time ago increased farming the tenant required some to accommodation for stoek, and offered to pay his house accommodation for stock, and offered to pay his offer was declined. He received a grant, however, of 400l. towards the cost of erecting a new farmstead With only this aid, and some home-grown wood, which was allowed him, he commenced, and has now very roofed homestead on the conter principle, connected works, will cost from 1100l. to 1200l. The whole buildings are finished in a superior manner, every means having been employed to secure convenience in the carrying out of the daily operations, and afford comort to the animals kept in them. At his own expense iron irrigating pipes, and is fitting up an engine and se of force pumps expressly for the purpose of distributing over the
manure.
Taking all the improvements made by this enter prising farmer into account-including as they do during the last in thousand pounds on works which the landlord ought to have carried out, and in consequence he has doubled the produce of the soil and added greatly to its intrinsic value. And now he incurs an outlay of $700 \%$. or $800 \%$ in connection with farm erections and irrigating applilease become the property of the owner of the soil
Well, it may be asked-what can the inducement be which leads a tenant farmer who has no other business解 his capital so liberally in effecting proprietors' improve The snswer is--his own interests induce him to take this course. He knows that a judicious expenditure on such improving works will prove remunerative even to a tenant, provided he gets time to reap the fruits Impolitic and unfair as it is that landed proprietor should leave enterprising and skilful tenants to carry out improvements which they themselves ought to make, rist in the country who, if their rights are properly secured, are determined to push forward, even should they in the first instance have to submit to a heavy expenditure. The occupier in this case pays a fair rent for very, and though his outlay for many years hay him well. And if he from an exposed farm, on which Wheat can rarely be grown, is enabled by sheer energy and skill, backed as they are with capital, to make a good profit where many an "old school conclusive proof that we only want these requirements on the part of the farming community generally, and then, with the cooperation of landed proprietors, the cultivable land in ur whole population? Landlord and tenant must go hand in hand, and, if they do this, capital and skill, properly devoted to the cultivation of the soil, will the poor, and provide food for all, however defective contmental harvests may be. [^2]:    To Mr. Greex, Lepns.-Sir, As I alwass appreciat public and useful improvements, I must pladly give my testimony to your highly improved linwing and Rolling Machine. The one storime of trial the lawn was wet, it was cut with the greatest nicety. So complete and simple is the invention, that amateur gentlemen, and even ladies, may work either the 16 or 20 -inch size With ease and pleasure, providing the Grass is not too long. For extensive places I shonld say the 24 inches would either of the smaller sizes would be best. I congratulate you on your very valuable invention, which in my opinion, entirely peditious in its operations, and consequently must prove a great saving in the management of Grass lawns, and a great boon to
    Other Testimonials may be had on application to the Manufacturer.
    The above Machines are warranted to answer the purpose as described, or may be returned, and may be had of all prineipal Ironmongers, Nurserymen, and Seedsmen in England; also Mr. Charles Garrood, Superintendent of Agriealtural Department, Crystal Palace, Sydenham.
