point to the spoke; and this I need not say is little more than half the weight of the other, and it is much more than half as strong, as you will see. Our ladder has been eminently successful, and is a prime favourite in the farm-yard. I may add that the holes should be bored with an auger of a tapering form, so as to weaken the sides as little as possible, at the same time leavivg the rungs of full strength where they require it. I. T.
Fhuce Potatoes.-I last year purchased a bushel of Fluke Potatoes.-I last year purchased a bushel of Fluke Potatoes for sets, and thinking them too large to set whole, I cut the largest in two, and set the smaller whole. As soon as they came up there was a perceptible difference in the growth from the cut and the whole sets ; the whole sets all grew with a strong top, but the cut ones grew some of them feebly, and about onefourth of them entirely failed. I took up several of the with a grub near an inch long, of a light colour, the whole length of the body. I do not know the name of it, but perhaps you may know it from my description; the same grub frequently destroys the crop of Onions. I had a quantity of Regents planted with cut sets by the side of the Flukes which were not damaged in the least ; it wonld therefore appear that the grub is partial to the Flukes, but that it will not eat through the skin. J. Aldroyd, Royston.

\section*{Eorietic:}

ROYAL AGRICULTURAL OF ENGLAND, Werkly Councile, April 30.-Mr. Miles, M.P., Vice-President, in the chair. The names of 29 additional candidates for election at the next monthly Council were received.

Chemical Science.-Prof. Way, the consulting Chemist of the Society, read his first report on the progress of chemical science both at home and abroad in reference to agriculture; which he was requested to revise
for pablication in the Journal. On the motion of Lord Berners, seconded by Mr. Evelyn Denison, M.P., the thanks of the meeting were voted to Prof. Way for the report he had then read to the Council. Mr. Deeison added that it had given him great satisfaction to listen to the reading of that report. As far as his own limited knowledge went, he fully concurred with what Mr. Way had stated, especially in reference to the controversy between Baron Liebig and Mr. Lawes. He was giad to find that we might possibly see ourselves within that term of the discussion at which those two eminent chemists might come into harmony on points respeciing
which they had hitherto held opposite opinions. He concurred with Mr. Way in his views on the impulse which mechanical progress in the cultivation of land might give to the development and application of chemical science.-Mr. Miles, on putting the motion from the chair, remarked that the great utility of comfrom Professor Way, consisted in their bringing at particular times before the minds of the members connected statements of such facts as had occurred, or been communicated, at irregular intervals during a lcng course of years. They supplied at once in connected course of years. They supplied at once in connected The early attention of the genius of Liebig to the application of chemistry to agriculture, the great experimental research of Mr. Lawes, and the perfect unanimity which appeared likely to take place eventually between them, to the benefit of agriculture, were ying character.
The Council adjourned to their Monthly Meeting on Wednesday, the 7th of May.

\section*{Farm Memoranda}

The Works of the Nitrophosphate Company near the Victoria Docks are well worth a visit. The quantity of material accumulated for future use, the enormons daily supply for daily use, and the store of manudiminishing by daily issue, impress one with a very high sense of the extensive operations of the company and of the demands of agriculture which here meet with but one of a multitude of sources of supply. Bones from Spain and South America lie in shiploads-
in heaps exposed to the air. Storage for oil of vitriol is provided in large cisterns within the building. Blood to the extent of 3000 gallons daily is brought in by the company's collecting vans. These are the three ingredients employed. The bones are crushed upon the premises, and with a certain proportion of crushed coprolites are placed in a horizontal cylindrical vessel, and sulphuric acid being added the whole is mixed ap for some minutes by the revolution of an
armed axis: and, the end of the vessel being then armed axis: and, the end of the vessel being then
opened, the whole pours out on to the floor below, opened, the whole pours out on to the floor below.
Though liquid as it issues it soon solidifies, and the process continuing, the floor soon becomes filled up to the level of the machine from which the supply proceeds, This machine is placed so as to permit the material from it after mixture to fall into another division of the premises, which when filled up to the level of the machine presents a mass of the manure 50 yards some months' supply, so that the material is not hurried into use, but lies for many weeks before being sent out to customers. The perfect completion of the action of the acid upon the materials used is thus secured, and the article is proportionally efficient.
bished, that the main ohject of artificial manure should be to supply the two inaredients ammonia and phosphoric acid-the mixture of blood with bones and acid seems to be the cheapest and the most efficient way of presenting these two substances in a form available for use in the field. This mixture, to which we understand the company professes to possess a patent right, is now made in probably every manufactory of manures in the country. And it is fortunate we think that no attempt has been made by patentees to maintain an exclusiv right, even if it exists. There is thus a better chance
of a large demand being more fully supplied: and certainly the Nitrophosphate Company appear to have as much to do as they can execute.

\section*{3ntuictos.}

Reports of Jurors and others on the various classes of the Paris Exhibition.
\(W_{E}\) refer to this for the purpose of extracting passages from the report of Mr. Denison, M.P., to the Board of Trade on the agricultural implements and produce exhibited. It commences with the picture of English and French agriculture given by M. Leonce de Lavergne in his work on the "Rural Economy of England." Reports on the trials of ploughs and reaping machines, the one by Mr. Amos and the other by Mr Fairbairn follow. Neither of them adds much to existing knowledge on the subject. Mr. Fairbairn eon cludes his remarks on the reaping machines with the following sentences:-
"Ona careful examination of the several machines entered for the prizes, it will be observed that in every one of them an attempt was made to effect a certain purpose by certain means of transmission, calculated to retard rather than facilitate the progress of cutting. In machines of this description, where horses are employed as a motive power, it is desirable to make the action as easy as possible, and to effect the motion of cutting reaping, \&c., with as light wheels and gear as practicable. Now these small wheels and their attachments at present in use appear to me to be the very worst and
heaviest parts of the machine, and \(I\) would earnestly heaviest parts of the machine, and I would earnestly
urge upon the makers of reaping machines the absolute urge upon the makers of reaping machines the absolute necessity of increasing the diameters and dimensions of the gear which works the cutters, and at the same time to fix and attach the journals and ends of the shafts into one casting, so that they cannot vary in position, bu must move, and technically speaking, go and come with the machine. These alterations being made, the proper clearing apparatus being attached to the laboung-boards, we might then look forward greater certainty and effect than is now accomplished by the present machines. The following table, which Mr. Edward Combes has kindly handed to me, gives the results of the different trials as follows:-
Trial of Reaping Machines on the Farm of M. Dailly, at
'rappes, near Paris, \(2 d\) August, 1855 .

"From the above table it will be seen that M'Cormick's American machines performed the most work in the least time ; that Atkins' and Manny's executed as nearly as possible the same quantity of work in the
same time, there being a fraction in favour of Manny

\section*{the quantity of work done.}
"Heducing the whole work done to a standand of 200 square metres, the competing machines will stand thus :-

\section*{\(\mathrm{M}^{\text {'Cormick's }}\) Manny's}

\section*{Atking'
Drey's}

If we are, therefore, to take the quantity of grain cut in the least time, Mr. M•Cormick's machine will stand first on the list, and the others according to their position in the above scale

In the investigation of this subject, we bave hitherto confined our observations to the machines. There is, however, another element equally important and essential
to the efficiency of the process of reaping, and that is, to the efficiency of the process of reaping, and that is, the preparation of the land; and, in fact, before we can look forward to ultimate success, the surface must be levelled, and the present injurious system of ridges dispensed with. To a casual observer it is fobvious that the present state of culture, as pursued in most parts of Europe, is not calculated to afford the necessary facilities for ensuring a successful progression to machinery. To apply machinery successfully to the labours of a farm, the land must be prepared, not for hand but machine labour ; and the successful introduction of reaping machines will chiefly depend upon the preparations that are made for their reception. The system of ridges may be tolerated, and overcome by the sickle, but to give to the new process of reaping by machinery its full effect, a totally different plan of operations must be pursued, and the fields laid down with a perfectly smooth surface. The larger description of stones and other obstructions should be removed and in place of the superflyous water not required for the nourishment of the plants being allowed to flow between the ridges on the surfaces of the field, sweeping in heavy streams, as it now does, everything before it, the new system of drainage will require to be adopted, and the water carried under in place of running over the surface.
To make a machine, such as a reaping machine work well, everything must not be left to the machine; the agriculturist must do his duty as well as the engineer, and that duty once duly performed on both sides, a prtainty of action will be secured, which will solve the The , and effect satisfactory results.
The most interesting feature of Mr. Denison's report however relates to the question which he had to answer: "What has been the progress, if any, which has been made in agriculture since \(1851 .{ }^{\prime \prime}\) The very interesting pages in which this question is answered this Paper (see pages 288 and 307 ).

\section*{Miscellaneous.}

Rotten \(\vee\). Green Manure. - I have been in the habit of using manures for 25 years, and it has always run in my mind that the rotten or decomposed manures were the best for green crops. Some two or three years ago, in \(1852^{\circ}\) I think, some little conversation was taking place, I dare say 1 may say with a pipe and a pot, about the best state of using manures. One said green manure was the best, others said it should be decomposed. I thought: this is a little matter which may be of some benefit to me. I went home determitry a little next year, which I did, saying nothing to any one. That was in 1853. I tried the experiment on a small scale for early Potatoes, and was not able to ascertain which was the best. I did not see any difference between the carly. Potatoes and the second crop. You will understand this when I say I am a great early Potato grower, and I try to get second crops. In 1854 I tried it again, and the way I did was this: I carted out my farm-yard mapure in the latter part of January, saving a quantity of the green manure undisturbed. I did not throw it broadcast, but put it down and turned it over in a heap well trodden down a the sides. This I tried in March, putting on both kinds of manure at the same time, in the same quantity a nearly as possible I rot up Py Potatoes in July, and nearly pos that ganure was much better than the the decomposed better than the green pase manure yielded half as many Potatoes again as tho green manure. As that was a dry season I was no satisfied with that result, and so 1 havo the the year again in a similar way, and yesterday I took the weights of the second crop now growing, which I will read to you. The rotten manure was carted from the farm yard into a heap, and turned well over at the time, about the middle of February. The green manure, which was made at the time the other was carted into 2 heap, was carted into the field, put upon the Potato butts and ploughed in at once when the Potatoes were being planted. As nearly as possible an equal quantity was used of each bind of manure, allowance being mad for the additional buik of the green manure. The Potatoes were Early Radicals, planted about the 25th of March, and taken up the 25th of July. There were March, and taken on the manure and of better quality than on the green manure. They were not accurately weighed, but while two pairs of getrer filled a hamper from the green-mannre land, two pair from the rotten manure filled rather more than hamper and a half. The Turnips were sown on the 2 lst of July, and at the present time those from the roten manure appear vigorous in growth and quite green, while those on the green manure appear to
more in bulb. A portion of each lot was taken up and weighed yesterday, and the result is-on the rotten manure, total weight of the tops and bulbs per statute acre, 10 tons, 14 ewt., 1 qr., 4 lbs. ; weight of bulbs only, 2 tons, \(4 \mathrm{cwt.}\),1 qro, \(4 \frac{\mathrm{lbs} . ; \text { ditto of tops only, } 8}{}\) tons, 10 cwt . On the green manure, total per acre tops and bulbs, 6 tons, \(2 \mathrm{cwt}\).3 qrs., 12 lbs ; weight of bulbs only, 2 tons. 10 cwt. ; ditto of tops only, 3 tons, 12 cwt., 3 qrs., 12 lbs. So that although the rotten manure exceeds the green in weight of tops and bulbs by 4 tons, \(11 \mathrm{cwt.}\),1 qro, 20 lbs , the green manure exceeds in weight of bulbs only by 5 cwt., 2 qrs, 24 lbs. The rotten manure Turnips are, however, still green and vigorous, while those on the green manure have a very small top, which is brown and withered. Mr. Taylor, at Chester.

\section*{Calendar of Operations.}

Wester Ross, April 23.-A more favourable seed time than month of March we scarcely had a drop of rain, and the long pared it for the sted. In the begiuning of this month the lighter oils were atanding much in need of a copious shower; the Growing Whaking no progress, and on the 12 th inst. when all was expectation, we were tavoured with 24 hours of an abundant rain has greatly inuproved, and now looks thick-set, dark-coloured earlier fields, is already affordingea good bite to the cattle Barley sowing, which ordinarily takes the last place in thi there is such an unusualiy small proportion sown this year, that it is probable that, in the coming year, there may not be such a disproportion hetween tho prics of Wheat fand Barley as thire has been these last two years. The allotment for Oata has been皿ototo disease this coming season, we should be necessitated to import a large quantity of this grain. Potato planting is Well advanced generally, and on many farras is concluded. The breadth planted this year is smaller than has beeu planted for many years. Although they were pretty, and although the price has continued throughout the winter about 32 . per ton, the demand has rot been so gond as in years Wone by. The Muir of Ord market was held last week on better lots of Cheviot hoggs there was a brisk demand, and the price of last market was pretty well maintained; but for inferior dots and for Leicester crosses there was little demand, with
lower prices. On Thursday there was an unprecedentedly large lower prices. On Thursday there was an unprecedentedly large
number of good cattle on the ground, but prices were sadly fallen. number of good cattle on the ground, but prices were saay On cattle worth 122 . there was a drawback from last year's prices of fully \(2 l\); and as many a lot that was there exhibited had eate all their Turnips and nearly all the straw ere they came away, they had to be disposed of at the current price, so not a few farmers returned home with no more money'n their pockets

\section*{Notices to Correspondents}

Auspican Purcaases of Shorthorns: \(F R S_{\text {. It }}\) is owing t tained so high; but this has been seen rather in the case particular strains or families of the breed than in sales of the general quality. There has been a great demand, especially for animals descended from Mr. Bates' herd, from across the Atlantic, and this having been met by most determined compeBrompton, who has more of what is called the Duchess and Oxford families of Shorthorns than any other in Evgland prices have been run up at sales where any of these animals have been shown to an extraordinary height. This has been
seen more especially at the Tortworth and Hendon sales. Such sales as the late one at Fausley, however, prove the
esteem in which the breed generally is held. There were ahipped from Liverpool for New York only last week 24 hea of shorthorned cattle, purchased at sales and from herds in be found the names of Earl Ducie, Sir C. Knightley, Messra Booth, Bolden, Fawkes, Towneley, Barnett, Fowler, Lindsell. Among them was enterprising Irish farmer Mr. Christy. for the best yearling heifer at the Royal Dublin Societr's ahom by Col. Towneley, of To nneley Hall challenge cup of \(50 l_{\text {, given }}\) the first prize at the Royal Agricultural Society's Lincoln in 1854, and yavergricultural Society's show held at herds of F. H. Fawkes, Esq., of Farnley Hall, and the above Mr red breeders. A portion of the animals were consigned priced animals New Yors, who bought some of the highes priced animals at incaster, 1000 gnineas for a bull. lue Vitriol in Cheese: \(H\) will, if he looks again at the Diaty see that the use of blue vitriol was described as a fact-no the end for which it, on the contrary, other plans of attaining that in Wiltshire and in Ged were recommended. We know and probably still is used in the way described, in quantities however which must be harmless; though in any quantity its use is culpable.
Lnseal Measuke: Mesars Hardy write, in answer to an anonymous correspondent, that the number of feet per acre of what strip an acre in extent. Of course the length will vary with the width of the strip in question. If a foot wide it will be 48,580 feet long.
Stable Architrcivre: An Anonymous Correspondent bays:siderations) seems to demand from their owners more attention to their welfare than they have hitherto received. I am about erecting a stable for 10 , and would be very glad to have a pondents. I propose to bave no loft, and to any of your corresinch boards, for the roof. What is the bett plan of ventilation? and would not the horses be better placed as we tie up cattle with a teeding path at their heads; half the space allowed to earh horse being for manger, and half for rack, on the ground? Such an arrangement, it seems to me, would avoid the incon-
venience and chance of accident from feeding the horses from behind, and promote their comfort by keeping their noses further from the wall." (The stalls must be cleaned from behind, and if the width of the building be fixed upon, it seems apace between their heels and the wall than by giving a gangway between their heads and the wall. For farm horses We would recomm3nd pantile roof not pointed, and that would ensure rentlation enough.
and others are detained till the nons have been received too late, We must also beg the indulgence of those correspondente, the insertion of whose contributions is still delayed.

\section*{NEW AND BEAUTIFUL PLANTS}

\section*{offered by}

\section*{MESSRS. WILLIAM ROLLISSON \& SON.}

THE annezed List of valuable Plants has been selected from a large and rieh collection of novelties; and the mending them. Messrs. W.

\section*{NEWCASTATOGU E,}
contrining prices and descriptions of upwards of TWO HUND
can he had per return of poot by enclosing two postage stamps.

MEYENIA ERECTA.-This beautiful plant is a native of the

 throat. The blossoms ave produced in the greatest profusion of a large Achimenes flower, but with a tube considerably
larger, and about 2 inclies in length. Without enlarging further on the merits and extreme beauty of the plant, we deem it quite it to be the most beantiful plant of modern introduction. During the past season it was exhibited as a new plant at the principal
Horticultural Exhibitions, and received varions prizes. with Horticultural Exhibitions, and received varions prizes. wit
the highest encomiums that c uld be passed uponit. \(21 s\). each
AZALEA INDICA EMPRESS ECGENIA.-An Indic variety, of an excellent and compact babit, and blossoming in the
most profuse manuer: its colour is extremely pleasing, of a besutiful transparent rose, with intense spotting on the upper petals : the flowers are large and exquisitely formed. We hav
much pleasure in heing able to offer this superb variety, an make no doubt that it will be an universal favourite for many
years to come; as some proof of its merits. We may add that
during the past season it has recoived the following during the past season it has received the following, prizes:-
First Class Certifieate at the Horticultural Society's Rooms, Regent Street: Silver Medal at the Royal Botanic Society'
Gardens,Regent's Park; First Class Certicateat the Horticultura
 oright cerise, blossoms of gond form, spotted on upper segmenta
ree erowth and excellent habit. 10 . \(6 d^{\prime}\). .each.
DENDROBILM M CYMBIDIOIDES. - This interesting preudo-bulbous Orchid has hean went to us from Java: on Collector found it on one of the small hills adjoining the a lam RHODODENDRON COCCINEUM PUNCTATUM. -This pecnliar free flowering variety will be a desirable addition to our
thoroughly hardy kinds: the habit is good, colour a crimson thoroughly hardy kinds: the habit is good, colnur a crimson the style of an Alstremeria. 15. emch.
RHODODE NDRON INCOMPARABTLE.-A nseful, hardy, and very late blooming kind, with noble trusees of finely shaped
RHODODENDRON STAMFORDIANCM. -This varietr is hich constitute a pond Rhododendron, being perfectly hardy late, and a profuse blonmer, with unexceptionable grow th; colour petals, which renders it extremely titnactive. 18. Es. Each.
RHODODENDRON PA VONIUM.-A very monspicuons iate and free blooming hardy varkery, of e doep blush colour and rich
dark blotch on the upper petale, aimilar to a Geraniom. 15s. each.

RHODODENDRON CLOWESIANUM.-A free flowering shape, and thie ypper; petals are strikingly marled with dark RHODODENDRON MAGNIFLORLM.-A late blooming hardy variety, with remarkably fine foliage, immense tinss, and
most gitantic blossoms; colour lilac purple shaded with red, most gigantic blossoms; colpur lilac purple, shaded witl fed,
intensely spotted with greenish brown on the top petals. 21 s. ** A set of the above Sir Rhododendrons, 41.1 15s.
DICTAMNCS ELEGANS.-A beautiful herbaceous plant arger than in the older varieties; altogether it is a great imrovement. \(108,6 d\).each.
ARIES CRA SSIFOLIT
ABFES CRASSIFOLIA. - This very distinct and handsome be a great acquisition. Grafted plants, 31s. 6d. each.
AZALEA HARTNELLII.-A new hardy variety that we car very strongly recommend it it bossoms freely with very large
trusses, the flowers individually are also large and well formed: arieries. top petal yello.
 with confidence, having selected it from several hundred seedings, all of which were pretty, but not possessing fulfi-
ciently distinctive properties to entitle them to be named. 18. eachi physodes virescens. -This new and interesting distinct species we have lately imprited from the Cape of
Good Hope the plant is of pretty close habit; the flowers some-
one are considerably longer, and instead of boing white, as in the lastbrica amabilis.bood habit, belonging to the "retorta" sectron: it is a mosi bundant bloomer, the finwers individually are large and flaskvery nefful for autumnal exhibition purposes, as it blossoms from July to October. 15s, each.
ERICA AFFINIS.-This is a nice variety, much resembling our well-known E. Cavendishi, but for exhibition purposes it
will he found a desirable acquisitiou, as it blossoms earlier thin the last-named variety; the flowers are also a shade lighter, being more of a lemon colour; the habit is gond, and the thossoms RHODODENDRON RETUSTMDer. 10s. Ga. each RHODODENDRON RETUSUM.-A very diatinet greenhouse species, discovered by Mr. John Henshall on the
"Pangeraugse," one of the lofty volcanic mountains in the western part of dava, nt an elevation of 10,000 feet above the
level of the sea ; the flowers are of a tubnlar form, freely pro
 CERINA. This is really a fovely and by far the St. Panl, of a delicate canary colour, very aho
badedsomest species in this section, 21s. emoh.

The following is a List of New and Good Plants, setected from our general stock of novelties, that were introdnced ky us and that we have proved to be of stering merit and we also include in this list a few new plante of especial merit that ge have imported from foreign harticulturists during the present year.
GESNERIA MPELLEXI. - This plant whi be found a most When we say that it 18 more bandsome than \(G\). Donckelaari; the flowers in shape are similar to the Glinxinia erecta, but produced
after the manner of a Geemeria; colour lilac purple, with a white
BEGONIA SPLENDIDA.-This exqnisite plant was dis covered in Java by onr collector, Mr. John Henvhall, during his
esearches in the Indian Arrhipelago. It is an extremely beaniful plaut, of ornamental foliage, the stems and leaves of which it presents so striking an appearance that it is alone altnchether to be WEINMANNIA TRICOSPERMA.-A greenhouse plant from equal in beauty to that of a Fern; it is of good habit whind is cultivation. 108. 6 .
MANDIROLA ROEZLI.-An extremely hanisome GesneriTACCINIUM ERYTHRINCM, shrub, from the volcanic mountains in Java, sent to us by our cet above the level of the sea; the habit of the plant is. very and thickly set; the folinge of a very dark grien colour, ovate
are of a fine bright crimson, prospecies will probably prnve hardy, as V. Rollissoni has done. 21 s , can strongly recommend, the blossoms are large, of thick wayy mine. \({ }^{7 s}\) s. 6r., 10s. 6 d... and 21s. found in Chiloe and Patagonia, and is remarkable for its beatitiplant, it is perhapg withnut a rival, 103.6 d .
TYDA ELEGANG.-A beantinl TYDNA ELEGANS,-A bonatinl stove plant from New
Granada, with bright acarlet flowara: very chowy. 7 s. 6 d.
BIGNONIA CHRY
great addition to our stove creepers; the blossoms are yellow great addition to our stove creepers; the blossoms re yellow,
tippe. with white, exceedingly handsome abd attractive, ios. \(6, l\). delicate violet colour inside the prety Gesneriacens plant, of a ERICA AEMCLA. -This is \& very beautiful hybrid, in the Erica Massoni section, of a fine bright crimson colour, after the
style oriea aristuta, but very much higher in colour; altorethe this is a very distinct variety, 150.
ERICA EXIMIA SUPERBA.-This variety may really be
said to be three times fine as the said to be three tímes as fine as the parent, whose narne it beara; it is a very compact grmwer, and excellevt, in habit, with tubuiar tained the first seedling prize at the Royal Botanic Gardeus,

BIOTA MELDENSIS. - This distinct ornamental plant is a atiabe addition to our evergreen Couifera. It has been raised (Junipervis virginica) and the Chinese Arbor-vitæ (Thuja occiwe can stronglv recommend it. 50 s. AMPHICOME EMODI.-A beautiful greenhouse plant from
orthern India; flowers large, funnel-shaped, with an orange Gube, and pale rose-coloured limb. \({ }^{21 s}\).
GENETYLLIS HOOK ERIANA (syn. G. fuchsioides).-This s the extremely rare scarlet species, and the plant allinded to in
Dr. C. F. Meisner's paper "On new Species of Chamelancies", recently read before the Linnean Society. It has been introduced rom West Ansiralia, and sueceeds well in a greonhouse. 21s. RHOPALA ORGANENSIS.-A Exquisite ornamental stove plant, frr exceeding in beatity any other sort in this femily. \(42 s\).
ACBRIETTA MOOREANA. - distinct and very free flower ing Alpine plant, of a purplish blue colour. Ss
BIGNONIA ROLLISSO NI.-A first-rate stove climber from Brazil; the blosome are of a bright.golden colour, tipped wit f goud habit, and the flowers freely produced in bunches. 21 . gond hahit, and the flowers freely produced in bunches. \({ }^{218}\) (Van
RHODODENDRON PELARGONIEFLORUM
Houtte's).-Pink, sbadod with yellow, beautifully apotted : Houtte's).-Pink, shaded with yellow, beautifully spotted; a BEGONIA SCAMANNI.-A very distin
DAMARA OBTUSA.-A most diotine from New Caledonia; a great acquisition to our greenhouse RHODODENDRON FERBUGINEUM ALBUM.-Tbis is precisely the same as the old R. ferrugineum, with the exception
that it has blossoms of snowy whiteness ; it is an interesting plant, and extremely rare. 31s. \(6 d\).
RIBES SUBNESTITUM
hucen trom Calfornia: its flowers new species bas been intro oliage hithlv ornamental fowers are of a deep crimson, and the ERSRIA ADIANTIFOLIA INCISA.-This is a very PTERES A A PERICACLIS.-A stove Fern from the Eas ndies, and one of the most handsome of this pretty tribe; an indi CROTON DISCOLOR.-A truls magnificent ornamental stor plant, dark green on the upper surface of the leaf, with brighi
 handsome, and desirable plant; the leaves are few, lying on the dreen in a panicle, which rises from the base of the leaf. 15 s .
BEGONIA OPULIFLORA MINIATA.-This remarkabl hybrld has been obtained by fertilising Boputiflora with \(B\). bright-coloured flowers of the last-mamed variety, but prodaced bright-coloured flowers of the last-named
nobeels similar to
B. opulifiora. 210 s. each

\section*{The Garmentes Chromicle}

While examining lately some examples of bad grafting we met with the following remarkable case, which will be regarded with no small interest by those who are desirous of learning now wood is really formed. A small scion of an Apple had been whip-grafted upon one side of the cut of a much larger stock, as is shown in the annexed figure, 1. It had apparently formed as strong a union as is usually found in such cases, but upon applying a little lateral pressure the scion came away, as at 2 bringing with it a considerable quantity of young wood, 2 a. Upon a more minute examination it

with Gaubichaud, Dupetit Thovars, and others of their school, will accept the specimen as-a new proof of the accuracy of their views that wood really descends from above in the form of fully orsanised tissue. On the other hand those who adopt the more common opinion that wood is organised where it is found by organisable matter passing downwards will see here a confirmation of their theory; while the physiologists who maintain that wood is a mere secretion from the surface of old bark or old wood will, it is to be hoped, admit that such a specimen as this is inexplicable upon their interpretation. It is obvious, indeed, that the new wood \(2 a\) is really derived in either a solid or liquid form from the two branches at 2.
This is much the same as the case of a Willow which formed a sheath of wood several feet long over dead wood, and beneath dead bark, where any superficial d \(\_\)posit was obviously impossible. Or it may prrhaps be better compared to the celebrated txample of a Rose Acacia mentioned by the late Piof. Achille Richard. The Rose Acacia had been grafted on the common Pseudacacia. The stock had died ; but the scion had continued to grow, and had emitted from its base a kind of plaster composed of very distinct fibres, which surrounded the extremity of the stock to some distance, forming a sheath, and thes showed incontestably that wood descends from the base of a scion to overlay the stock.
That being demonstrated it becomes the more difficult to understand how it is that although the wood of a stock is derived from the scion, yet the branches which sprout from that wood are not like those of the scion but of the stock. In other words a (the scion) under its new condition of life does not produce A , but ( (the stock).
The true explanation of this puzzling phænomenon s doubtless that in our common trees there are two distinct systems of organisation, simultaneous in their appearance, coexistent and coæval, but independent; the one longitudinal, which is what passes downwards, and the other horizontal; that the first is incapable of producing new roots, and is to be regarded as a mere provision for conveying sap, and for giving strength to a tree; that the latter aloue has the power whoots. This latter, called the growing ontwards and fitting on its myriads of extrenities to the surface of the wood beneath the surface of the wood beneath the
bark; so that when a branch is produced it necessarily comes from the horizontal system, derived in the beginning from the stock and not interfered with by the scion.

This is the view that was many years since taken by the writer of the present notice, and we are not aware of any attempt having been made to show its inaccuracy. Dr. Harver, in his" Trees and Their Nature" (noticed at p. 132 of the present volume) does not advert to it ; or if he does we have failed to find the place, for which we trust to be excused, seeing that life is not long enough to permit the use of books without an index.

It is not for the sake of puzzling physiological heretics, or for the sake of the orthodox that this question has been thus revived. The case before us has been fixed to our pages for the sake of the ignorant, or the ill informed, who have not yet discovered that to remove the branches of a tree is to paralyse its wood-producing powers; and who sally forth in mid-winter, or indeed in mid-spring, or whenever they happen to think about it, arned with saw and axe, and good brown bills, for the purpose of making a raid upon the plantations under their care. Incredible as it may seen, there are plenty of woodmen who firmly belisve that few branches will furnish as much new timhe; as many. Let was found that this mood had heen insinuated be as hope that they will reflect upou our Apple tree, tween the bark and wood of the stock as at 3 , the repent of their foolish courses, and resolve in futare wood of the scion having remained quite inde- to follow a wiser and better practice, pendent of that upon which it was moulded; it had moreover divided into very fine descending fibres, the broken points of which are shown at \(2 a\). In oiher words the scion had formed a woody sheath of its own, which covered over the wood of the stock avd was independent of it.

How is this to be explained? Those who believe

It seems to be intended that the Camp at Aldersshott shall be permanent; for we find that the ground near her Masssty's Paviliou there is enclosed for the purpose of being covered with ornamental \(\frac{\text { plantations. About } 50 \text { acres are within a fence }}{7}\) feet high ground is much broken and undu-

Lated and the pavilion stands upon its highest part, commanding a magnificent view of the surrounding are for the most part very poor, yet there is in the valleys good soil on a clay bottom. well adapted to the growth of Rhododendrons and other ornamental plants. The design of the ground and the planting plants. The design of the ground and the planted to Messrs. Standish and Nobre, of Basshot.

The last number of the Revue Horticole contains the following statistical account of the quantilies of Vrgetables amd Fruit consourd in Paris in the year 1853. It professes to be an extract from an unpublished work by M. Husson, an officer attached to the Prefecture of the Seine.

We have reduced the French weights and values to their English eqnivalents, and corrected a mauifest error of the press in the French original

while on the other they meet with poor or injurious earth, or any mechanical impediment to their lurther progress, the consequence will be that the one side will be well nourished, while the other is starved or supplied with injurions matter, hence that few branches will be developed on that side, and those suljject to early decay. It is obvious that when the evil has once taken place little can be done towards the removal articular derm, but where the intereat, some measures may be adopted amending the soil on the one side, or checking laxuriant growth on the other. Such steps however must be taken with caution. Re also recommends incisions in
the bark of the weaker branches, where more generous diet is administered to guard against the contrary evil of repletion, but whether this recommendation depends on personal experience or not of its benefit, is not stated.
480. Ré speaks of another case belonging to the same category under the somewhat barbarous name of Cladipodystrophy, + in which the upper portion of a tree is so vigorous that the hase fails, but I have seen no instances of such an affection. In grafted trees other the graft and stock are not well adapted to each exceed in diameter that of the stock, large warts will often be formed at the point of union, and the top ramy in some cases become so heavy as to prove more than the stock can bear. I have never, however, seen any cases in which the stock has perished from the overluxuriance of the graft. Ail the nutriment must pass through it, and it can avail itself of all as it passes, and as it is on its own roots, such nutriment will be as suited to its nature as if it were ungrafted. The
returning sap will certainly be altered in quality and does in some cases affect the stock, but I am doubtful whether to such an extent as to cause serious disease or death. Where the stock fails, which is sometimes the generally from some other cause. M.J.B

\section*{EXOTIC SHRUBS AND TREES,}

Geowy ry a Syall Garden in the East of Scotiand.
My garden covers in all about a third of an acre, and a considerable part of the space is required for vegetables, fruit, and Grass. In the remainder, indeed in every spot where room could be found or made, I

\section*{From vusaus half, ous badly, and \(\quad\) stico to nouriyh}
outish.
have (chiefly within the last two or three jeare) aitempted the rearing of exotic shrubs and of a few trees of the same character, to a number which will one day make the place a jungle. Everything of the sort which I lave must grow out of doors, winter and
summer. I have no glass beyond a one light frame. However, almost all my plants are still very young and failures in my earliest season or two have rendered me very cauticus. Accordingly, not a few of the more doubtful 'plants have litherto received so much produabtful plants have hitherto received so much pro-
tection that their safety is far from giving conclusive evidence of hardiness. But my collection contains a evidence of hardiness. But my collection contains a good many things that are not very generally grown out
of doors in Scotland, and as a whole, it is pretty consiof doors in Scotland, and as a whole, it is pretty consi-
derable for au amateur, who has little ground and no derable for au amateu

If any part of my experience is worth recording, it should be understood how our climate in the east of Fifeshire stands both for evil and for good.

My eastern wall is about 600 yards from the nearest point of the beach, and though houses close on the east do shelter me a little, the spring winds from the sea cause plants even farther west than the town, to be in danger nearly as grent as that to which our notorions hay exposes shipping. The March gales tell with great severity on most of the Conifers. The mounain plant Pinus Cenibra, for instance, which grows beantifully about Edinburgh lives indeed here, but my plants are gradually losing their laterals. The Irish Yew and common Thujns have their eastern sides stripped bare, and the whole tree made scraggy, at least in my garden and most places in the neighbourhood; although even these succeed better in a closely sheltered little walk of mine beyond the garden; and in the garden a hedge of the Common Yew (which is not safe everywhere in the town) is growing well and bushily. For broad-leaved Evergreens we are yet worse off. The Common Laurel, everywhere delicate, has lost with me in the garden every leaf, and been transferred to the walk just mentioned; the Laurus nobilis does not thrive even there. The Portugal Laurel, as is usual, succeeds better. Arbutuses keep their leaves tolerably; succeeds better. Arbutuseskeep their leaves are in gardens here plants of the Andrachne, and at least one old tree of the A. unedo, the comrade and at least one old tree of the A. unedo, the comrade of which however was killed some winters ago; and, here as elsewhere, the red-flowered variety of the
A. unedo is much hardier than the species. ExperiA. unedo is much hardier than the species. cxperi-
enced gardeners dissuade from all attempts at growing any of the finer Rhodoracer.
On the other hand, we have several advantages for growing tender shrubs and trees that are deciduous. Although a very liard bed of blue clay runs below our ground, yet in most piaces and throughout my garden it lies severul feet decp, and above it is a subsoil sandy and dry, for some plants too dry and thich. It may be and dry, for some plants too dhat myself have several borders very noted too that I myself have several boriers very
much dried by deeply-drained walks and by a large much dried by deeply-drained walks and by a large
sunk compartment; and that in some of my more sunk compartment ; and that in some of my soil of slipppery experiments I have dug for the special soil pits three feet or mure in depth, bottoming these with loose stones and saud. Our lowest temperature in winter is a good way above that of places even a little more inland, though considerably farther south. In February, 1855, when the Horticultural Society's Garden in Edinburgh had frost going down to \(+5^{\circ}\) my thermometer noted moruing and evening gave nothing below \(+18^{\circ}\), and the registering thermometer of one of my scientific friends marked only about \(+16^{\circ}\). Last winter again I noted nothing below \(+21^{\circ}\). Some of the older linds of Fuchsia prosper exceedingly with us. The F. glubosa planted by me on a south wall preserved its wood till it covered a space of 9 or 10 feet up and across; the \(F\). Carolina and more than one of those with white or pink calyces, if only slightly covered with leaves or litter, throw up every spring strong flowering branches from the root. The wood of the Grape vine is, as might be expected, pretty hardy ; so is that of the Fig; a joung Fig tree of my own, on a south wall has come near to ripening a crop, and the ripecing, am told, is quite reached by a tree belonging to one of my neighbours. Walnuta, here and further north, ripen far enough for pickling. In warm summers we gather ripe Mulberries plentifully from an old tree of mine (Moras nigra), which, by the way, has imitated in its grow the well-known tree at Canterbury, its trunk running horizontally for about 8 feet from the root, and gteadying itself for risine the of that space, by throwing out a root thiclier than a man's leg. Perhaps, also, some amusement may be given by a whim of mine which certainly amused myself. A Casuarina equisetifolia placed in a sheltered borde, severs ; but from the nearest walls, survived two in February made no growth, and was killed outright in Febrallish 13.55. I had been tempted to try it by seeing an Mr. Moy's plant, in the shelter
nursery at Aberdeen.

As to a good many of my plants, I hesitate whether they are worth maming at all Not few of them are quite familiarly known: and probably the rarer or more novel among them, or such as will generally be more now ang their character for trardin ore of cultain, But there are at leas Lardiness arready ascertained. But thers in Scotland some, in regard to which gardeners in Scoland Ther be willing to get encouragemellaneous list of shrubs Therefore I set down here a miscellan for more winters than one, while a good many of them
have had no protection at all, and thuse whech have had and brilliantly healthy, flowered well last autumn ; ny are promising to need lees and less.
Cedrus Deodara, top shoots always in danger from frost, unless horizontally covered ; Pinus excelsa, top shoots hitherto prolected frich aced, and becoming more like the P. strobus than they were in a nursery mot more than a mile to the west; Pinus pinaster and P. pinea, the latter troublesome and doubtful and plant already lost; Taxodiun sempervirens, ripe wood per feetly hardy, and growth quick, but leaves oy spring ahnost completely browned, as in every other place
where 1 have seen the plant in Scotland; Salisburia where 1 have seen the plant in Scotiand ; Edishargi adiankifolia, hardy on a wall here, and in a standard Varieties of the Quercus llex, which thrise admirably here; two handsome upright evergreen Ouks (hybrids of the Q. Hiex ?) the one the Q. Fordi, my other plant I think, the Q. Shepperdi of catalngues; the Quercus han in the Edinburgh Botinic Garden; Fraxinus entiscifolia pendula, grafted 5 feet high on commo Ash, fine and perfectly hardy; Linodendron and fowered (the white I am just about to plant) thrir ing better at a pole, round which it twines sponboth places; Fortune's Weigela and Forsythia; his Jasminum nudiflorum which totally uncovered has flowered on a west wall for the whole winter Jasminum revolutum, east wall, quite hardy; Pip green this winter, and now in luxuriant flowering Hypericum nepaulense, Syringa Emodi, Deutzia, Yucca gloriosa) (irequent in Sootland); Mahonias (several
species), the M. aquifolium, M. magnifica, and M. repens, leaves a good deal hurt ; M. nervusa, quite unhurt, Tamariscus gallica and T. germadica, the later very hardy; Hydrangea hortensis, unprotected, Garrya elliptica, Bupleurum fruticosum, Menispermum canadense, Austolochia sipho, several Honeysuckles Catalpa syringefolia, growth doubfful ; Paulovnia imperialis, a small plant killed to the ground by each o last two winters (in spite of some covering), but no for the second season budding from the root; Halesia tetrapterus, Diospyros virginiana, Chionantlius vir giniana and Magnolia tripetala, all of which have stood the last two winters, but the thriving of wing up a tree stems now buiding more than a foot up, and bigher than the straw-covering.
Here may come a very short Herbaceons appendix:Dielytra spectabilis, as hardy as a Dandelion; Lilium lancifoliam, several varieties; and L. eximinm, covered in autumn when planted with small billocks of Moss, all safe and shooting freely; Agapanthus umbellatue, border, covered with some straw, and occasionally a inverted flower pot, alive but probably spoited
 tank, result as yet doubtful ; probably no doubt at all of the failure of a Cornum capense, which also is, or was, in the tank.

The treatment which has assisted in preserving the shrubs and trees still to be named may deserve to be described rather more minutely; accordingly they are arranged according to the head and amount of protection they have received. To each name is annexed, in parenthesis, a cypher denoting the number of winters the plant has stood in my ground. Plants having a higher figure than 1 have endured the February frosts of 1855 ; and the few having a figure above 2 have been tested also by the few hours of frost which swept the whole island so destructively towards the end of Ap
1854. If the plants are on walls, the point is noted.
1854. If the plants are on walls, the point is noted.
I. Slight covering of straw above roots, and rou I. Slight covering of straw above roots, and round flowering ; the B. Darwini, killed in spring 1855, but about to be tried again; Arbutas procera (2), on east wall, flowering richly just now; another plant about to be set out as a standard : Paliuras aculeatus (3), grow th almost nil ; Gaultheria! Shallon, and G. procumbens (i) Bignonia radicans (3), west wall, not yet flowering Photinia glabra (serrulata ?) (2), on east wall, thriving ; Ligustrum japonicum (2), an invaluable evergreen, which, far from walls, and having merely a small straw rope about its roots, has at present scarcely a part of any leaf withered or discoloured on either of two plants. Plants on walls ; covering as in No. I., but thicker and wider; withered Spruce branches also in front. - Camellia japonica, double-flowered red (1), future ; Pittosporum Tobira (1), planted out in May last, flowers undestroyed till near Christmas, and new lower-buds now seemingly in promise, more round ower part of stem; Eucalypuss cordata (1), the plant Which was obligingly identified in the Gardener's' closely sheitered by a wall from the east, not a iwig or leaf hurt, and the brancllets quite heallhy, which since the spring growth began have been allowed to projec
eyond the loose coverings, growth also very rapid.
1II. Small plants on walls S. and W.; strazo over roots, and a short wayiy up; a mat fixed as a penthouse weather.-Broad-leaved Myrtle (5) about 5 feet high, grown well in several gardens here in defiance of Syd

Escallonia albo-enceinea (1), seemingly a variety or nifurid of E. rubra (?), leaves gone and wot now shooting and leating vigoronsly; Acacia deallota (1), a plant lost hefure, probbibly through inssufficient care ; Chimonanthus grandifurus (1), this also lasted but recovering: Ccanothus rigidus (1), and Veronica formosa (1), buth quite uninjured.
IV. Stundurd Piants-tops corered rith cloth hime ontally stretched on hoops; hillscks of strave or Moss losely around. - Sophora japonica pendula (2), thriving well-a plant killed in April 1854; Aralia japonica (2) pper part of stem twice lost, but has made 12 15 inches of safe upright growth eachi season, leafing luxuriant ; Cupressus sempervirens stricta, en
5 and 2), adopted in despair as substitutes for Iri-h Yews, and really thriving and louking well, especiall he oider of the two ; but other plants of the species have died with me, as lave the C. torulosa and C. Lam-
bertiana (macrocarpa?), the latter most probably bertiana (macrocarpa ?), the latter minst probabi)
through my own fault, and both (two different-lookin plants of the last names) about to be tried ngain; Cry tomeria jyponica ( 1 ), mat hung on east side during spring gales, full 5 feet high, lower branches much
browned, most of the upper ones and the whole cluster of top shoots quite green and healthy, a young plan lost previously ; Pinus insignis (1), mat as for Cryptomeria, a go oi bushy plant, 3 feet high, ends of many green as yet, and the buds pushing very freely; Libocedrus chilensis (1), about \(2 \frac{1}{2}\) feet high, very promising, has lost only the yery tips of lower and outer branchets budding strongly. W. S., St. Andrews, Fifeshire

\section*{Home Correspondence}

The Lacebark Tree. - This plant, described by you correspon dent "S." as being perfectly bardy in Dorset dendron regium. Seeds were sold by Carter of llol born a few years since under the name of the New Z aland Lacebark Tree, together with a crimson flowering shrub from the same country. I purchased a packet of both, but the latter proved to be the well known Clianthus, and the former the tree I name. It is tolerably hardy with me in South Devon, but certuin'y does not grow "prodigiously." Against an east wall in a somewhat exposed situation it was much injured during the cruel winter preceding that we are now emerging from, but in a shrubbery border more shel-
tered it stood well. I too have had many Indian Rhododendrons blooming gorgenusly lately, and A cacia dealbata, 30 feet high, has been a mass of flowers. 4 Deronian.
Parsley in many gardens is liable to disease, and the crop sometimes dies out rapidy, so that where there is a year. I do not reeollect whether the disease to which Parsley is subject has been noticed in "Vegetable Pathology" or not. One of my neighbours some time ago had his Parsley crop very much cut up before had none in the spring monthe, and the call for it was rather increased than diminished, which is often the case when there is a short supply of an article; at least gardeners think so. A large party was expected to dinner, and a plentiful supply of Parsley was wanted the gardener had none of the genuine article in the garden, so he had to look about for a substitute, and found one in a commonly despised yet wholesome vegetable, belonging to the same natural order as the Parsley, although the leaves were simply pinnate, an those of the Parsley 1 think are tripinnate. So he gathered a supply as near the appearance of the arricle wanted as possible, and sent it to the kitchen. The article
took well-no one found fault with it, the gentleman declaring that he never eat better Parsley in his life, and wished解 where the gardener He however kept his thumb on the secret, and he had no difficuly throughout the spring in supplying the hou: with Parsley. P. M.
Petunia Imperial.-Two plants of this novelty in the Petunia way have been in flower here for the last three weeks. The blooms measure corsiderably over two inches across, and are quite as double as those of any first-rate Carnation. It is very sweet, the scent resembling that of a rich Stock. It will prove a grea vases, \&c. The habit in pots is dwarf and good, flowering early, and it has every appearance of con tinning in bloseoso for a length of time. J. F., Cliveden, May 8, 1856.

Canopy for the Protection of Wall Trees.-The gar dening world is respectfully informed that there is chis season an abundant crop of Apricots at St. Fugan's, near Cardiff, being the fith y ar in which the trees have borne plentifully under the protecting cannpy figured at page 389, 1854, and that Peaches and Nectarnes are being trained in a sinilar manner. The words a gond
and bad fruit year will no more be heard; there will be always a plentiful; crop of wali-fruit unless the prejudices tage of the public. Received opinions it is sometimes lage of the public. Received opinions it is sometimes
difficult to remove, though the alteration is only a sure and cheap remedy. Therefore, let all such doubting persons visit St. Fagan's without delay, and be convinced on the spot that fle w. W. B. M. Lis \({ }^{\prime}\) e, LL.D., St. Fagan's, May 2, 1856.

Moss on Tires.-In some gardens there is a melancholy crop of Moss and Lichen with which beth trees and bushes are covered. Such crops may be asefal to dyers and Cryptogamic botnists; but they are not profitable on buthes in gardens or on fruit trees, ami althoush various modes for destroying thems have appeared from time to time in your pages, there is yet a plentiful crop of them in many places, Good drainage, quick lime, and lime-water applied from time to time, will heep them in check. Sume gases also are too strong for them. Some time ago the gases arising from the burning of iron-stone had a strong effect apon Lichens that were growing upon trees and old wood they were both killed and bleached by the gases, ame the stems of the trees and wood upon which they grem
appeared as if they liad been whitewashed. P. Mai appe

Force of Grouth in Plants. - Will you, or some one of your readers, explain the modus operandi by which it is believed by physiolegists the young plant gets through the surface of the ground. Is it due to the effect of a mechanical force in the plant, aeting with a continnous yet infinitely slow motion, or in other words a mere slow thrust? [Yes.] Or is there any chemical action npon the surrounding soil by which the soil is caused to expand, and so a passage is opened through it for the prisoner ready to escape? The marvellous phenomenon of young Mushroom bursting through the hard surface of the ground without any breaking or bruising of its onter skin has long puzzled your constant reader, A Bumpkie,
Rass. [Its cells muluply and expand irresistibly under Rass. [Its cells muluply and
Grafting Pears.-In the case of fan-trained trees, wat do you think of grafting the centre of string Pears with others of wealier growth? I think it would De an advantage. It may be done without lopping or dizfiguring the trees-merely cut a notch in the side of the branch; slip the sciou under the bark, and in two rears it will take the place of the original shoot. This an old plan, but our modern gardeners seem to hive in a tree of Marie Louise. J. M \(M^{\wedge} R\)

Ancient Trees.-Some memorial trees have suffered from the late high winds. We learu frum the newspapers that Wallace's Oak, which has stond for ceruries as a land-mark at Elderslie, was uprooted with the ale Oue of the large Silver Firs, which grew in fiont f Bannockburn House, is also upset. It was no an ornamental plant in the days of Prince quarter 110 years ago. P. Mackenzic.

\section*{Foreign Correspondence.}

\section*{The Pusaika Dat} Kangra, March 8.-Since I had the pleasure of writing o you last time I have left China and I am now in India in the Punjab. I shall not trouble your rewders at present with my journey from Calcutta to the northwest provinces, but shall ask them to nccompany rie at once to the Kangra valley, It was dark when reathec the Old Fort here, in which I had been kindly invited to take quarters with Dr. Williams. Early on the foricuing morning Dr. Jameson and myself set out for a place called Holta, where there is a large Tea plantation belonging to Government. Our road led us ronnd the side of a barren bill covered with Euphorbia heptagorm and other weeds which invariably indicate a dry, gravely, winter monthe whe hor of this hill a very different scene presented itself to oor eyes. This was a large and beautiful valley, here and there studded with low hills of an irregular forma and hounded on the north by the Himalaya mountains, whick are here about 16,000 feet above the level of the sea This valley appeared very fertile and was covered with crops of Wheat and Barley, which at this season (March 2) were quite green and just coming into ear. It is well watered even during the driest weather with which re fed by the melting suoms. of the Himalaya. I stood still and gazed upon the Wnnderful seene which lay before me.
fertile and as well watered I had often seen in Chima fertile and as well watered I had oten seen ionderfil where they are by no means rare, but whose peaik northern houndary white with snow, and whose peaim
reared themselves far above the lower cloads, was grand iudeed
As we rode onwards through the valley and had 3 nearer view of the cultivation, it did nat give me a very high idea of Indian farming. The natives do not seen to have that energy which the Chinese possess, ama Barley much to nature. Their erns their Flax, whieh is grown for its seeds only, from which oil is expressed was poorer still. Perhaps there may have been soms excuse for this state of things this year, as the stanion had been unusually dry, but I caunct help thinking that much was owing to bad or careless farming. When thra winter crops are ripe the ground is irrigated, and kice cultivation commences. This I am told is the stapic crop of the vallev, and a large quantity is annually pro duced, and bought up to send to the more populoms places of the Punjab. Indian corn is also grewn largel on the higher and drier lands.
The common trees of the valley are the Mango, the Silk Cotton tree (Bombax), Me'ia Azedarach, Ficus rent giosa and other species of Fig; with Bambuos, Wil lows, Mulberries, Peaches, Plums, Widd Lherry, wevend apecies of Jasmine, de. This list will give an jdea of the sort of climate which the valley enjrys, and in widi-
fion I may mention that the Musa is common, and Aerides apparently, growing upon many of the trees. The Linums trinynum is quite the Primrose here; a with its pretty yellow blossoms. On rich soil it forms a Will its.pretty yellow blossoms. Ont on waste places and hill sides, where the herbage has been closely eaten by cattle, the flower stalks rise out of the ground like our own Prim rose. I had no idea of the beanty of this species unti I met with it here, and I cannot help thinking it wrth more attention than is generally bestowed apon it at home. In company with this, and flowering at the thousands of pretty tiny light blue blossoms, growing sometimes out of the crevices of the rocke, and at other places in such profusion on the brown sward as to form neat yet br lliant carpet of flowers.
Through such scenery we rode from dayhreak until 4,R.M.s, and visited and inspected two small Tea plantu: observed one of those curious examples of Nature? grafting, or, I should rather say, apparent gra!ting, the old Virgilian tale of Apples growing upon Plan the old Firgilian tale of Apples growing upon Plant growing out of an old Mango at enme 6 or 8 feet from
the ground. The union at first sight seemed complete the ground. The union at first sight seemed complete,
but no doubt the old stem of the Mango was hollow, and the Peach was deriving nourishment from its own roots from mother earth. I am afraid I shall not be able to find you an example either in Chins or in India to con firm the old Roman theory.
The Government Tea plantation of Holta, of which more anon, is situated considerably higher than the valley through which we had passed, and is about 4000 feet above the level of the sea. It is just at the frot of the high mountain range, and within a short distance of the also apparently and one and tains. At some short distance up I noserved forests of Pinus Webbiana. Here, too, the Rhododendron arboreum begins to be met with, Vacciniums are abundant, of Rubus, Roses, and such plants as flourish liest in a temprrate climate. The Rhododentron is now in in an temprate climate. The Rhododentron is now in
full blom, and presents a most gorgenus appearance. A
jungle of these trees seems almost on fire, so brilliant is jungle of these trees seems almost on fire, so brilliant is
the colouring. If I tell your readers that these trees the colouring. If I tell your readers that these trees
are so large and so abundant that Dr. Jameson is catting them down and using the wond to make tea chests, they will think it
is true nevertheless. \(R . F\)

\section*{flotites of wooks.}

Mr. Murray has published a new and cleap edition of Gordon Cumming's famous Lion Hunter, illustrated with numerous clever woodcuts. Such a spartsman as Mr. never before the subject of a tale, Elephants and was are bagged like rabbits; the destruction of a rhinoceros is as simple an affair as running down a fox; and as for elands, quaggas, antelopes, and such "small deer," Mr. Cumming talks of them as if he had been shonting hares. Not but what the work was sharp enough on some occasions. Take the following as a specimen of concealed himself on this occasion in a watching hole at midnight :
"Som after a heavy clattering of hoofs was heard coming up the vey, and on came an immense herd of blue wildebeest. They were very thirsty, and the
leading cow came boldly up and drank in front of me, I sent a ball through her, when she ran 60 yards up the slope behind me and fell lead. Her comrades thundered across the vley and took up a position on the opposite rising ground, leaving the carcase of their companion to the hyænas and jackals: soon after a lion gave a most appalling ruar on the bushy height close opposite to us, which was succeeded by a deathlike s:illness that my four barrels, and, hastily loading, kept with breathless attention the atrictest watch in front, expecting proaching ; hut ho was too cunning. He saw all the other game fi, ht slyy of the water, so made a circuit to he roared I heard a number of jackals bothering hiun he roared I heard a number of jackals bothering him wildebeest; he growled from side to side as if in reply, and then all was still.
inutes, when I heard the intense anxiety for about 15 minutes, when Theard the hysenas and jackals give way wildebeest, and, turning my head round, beheld a huge and majestic lion, with a l.lack mane which nearly swept the ground, standing over the carcase. He seemed aware of my proximity, and lowering his head, at once seized the wildebeest and drageed it some distance up
the hill. He then halted to tulie breath, but did not expose his broadside, and in a quarter of a minute 12 yaxus luid hold of the wildebeest and drasged it alyout noble head. "I hall no side exposed to me in to very ; he stond with his right taking him rather low, I fired : the ball took effect, and the lion sank to the shot. All was still as death fur
many seconds, when he uttered a deep growl, and
slowly gaining his feet, limped towards the cover, where he halted, roaring mournfully, as if dying. I had now die immediately, and if I did not look for him till the morning, I knew very well the hyæenas and jackals would feast upon his carcase. I accordingly went up to
camp, and, having eaddled two lonses, went with Miarcamp, and, having eaddled two horses, went with Mar-
tin to seek him, taking all the dogs, led in strings hy the tin to seek him, taking all the dogs, led in strings by the natives. On reaching the body of the wildelieest, the dogs were slipped and went off after the lyyænas and
jackals: we listened in vain for the deep growl of the ion, but I was persuaded he was dead, and rode forward to the spot where I had last heard him roar, when I had the immense satisfaction of beholding the magnificen old lion stretched out before me.
"The hall had entered his belly a little in front of his flank, and traversed the length and breadth of the body rippling him in the opposite shoulder. No description Shis moat majestic animal of the surpassing beauty of me: I lighted a fire and gazed with delight upon his me: I lighted a fire and gazed with delight upon his
lovely black mane, his massive arms, his sharp yellow lovely hack mane, his massive arms, his sharp sellow
nails, his hard and terri,le head, his immense and nails, his hard, and terriole head, his immense and throughnut; and I felt that I had wou the noblest prize that thit wide world could yield to a sportsman. Having
sent fir rheims and the lechtervit, we bore the lion to the camp. On my way from the water I sliot with single ball an extremely old black bull rhinoceros.
"On the afternoon of the Ath I dzepened my hole and bayged three black rhinoceroses, and the best pallah in a tronp which came to drink.
"By the following evening we had cleared away the reater part of two of the rhinoceroses which lay right ever, obliged their leaving the third rhinoceros almost apposite to iny hiding-place, in the hope of attracting a on, and soon after the twilight had died away, went
down with Kleinboy and two natives, who lay concealed in another hole, with Wolf and Boxer ready to slip, in the event of our wounding a lion.
"On reaching the fountain I looked towards the carbase of the rhinoceros, and, to my astonishment,
belie ground near it alive with larre animals which Kleinboy remarked were zebras. I answered, Yes;' but I linew that \(z\)-bras would not be capering round the carcase of a rhinoceros, so I quickly arranged down to feast me. It was bright moonlight, as clear as I need wish, and I could see six large lions, about 12 or 15 hyzenas, and rom 20 to 30 jackals, feasting on and surrounding lions feasted peacefully, but the hymenas and jos. The fought over every mouthful, chasing one another round and round, growling, laughing, screeching, chattering and howling without intermiesion. The hyænas did way before the tions, although they always gav them in the most disrespectful manner, and stood laugh. ing, one or two on either side, when any lins came after their comrades to examine pieces of which they were dragging away. I lay watching thi banquet for about dragging away. I lay watching this when the lions had three hours, in the strong hope that drink. During this time two black and two white rinoceroses made their appearance, but, scared by the mell of blood, retired.
length the lions, apparently satisfied, walked about with their heads up, and seemed to be thinking of the water, and in two minutes one of them, turning h face towards me, came forward ; he was immediatel followed by a second lion, and in half a minute by the and eng four. It was a decided and generat more, 15 yandent that they were all coming to drink, within "I I charged
himself into a stone, and knowing from old spoor exactly where they would drink, I cocked my left barrel and placed myself and gun in position. The six lions came \(s^{\prime}\) eadly on along the stony ridge, until within 60 yard of me, when they halted for a minute to recomoitre and one of them stretched out his massive arms on the
rock and lay down. Again they came forward, walking rock and lay down. Again they came forward, walking of them put down their hads and were lapping the water loudly, when Kleinboy put up his ugly sconce ; I turned mine slowly to rebuke bim, and again looking a the lions, found myself discovered
ten honess, who seemed to be the leader, har all 1 me, and, with her head high and her eyes fixed the little vley to cultivate my acquaintance! This ununfortunate proceeding put a stop at once to all further mintemplation: I thought, in my haste, it was perhaps others had noticed me her, especially as none of the which she saw me do and halted, exposing a full broadside. I fired ; the ball entered one shoulder and passed out behind the other. She bounded forward with repeaten growls, and was followed by her five comrades until they had reached the cover behind me, except out old gentleman, who lowked back for a few seconds. I listened anxiously for some sound to denote the approaching end of the lioness; nor listened in vain e boon heard her growling and stationary, as if dying hen slipped Woif and Boxer, and following them into

Where the old lion had fallen two nights before. She was an old linness, with perfect teeth."
Sport like this is something diff
Sport like this is something different from deer-stalk ing. Similar stories fill above 370 pages, and he must b something more or less than human who can read them
without breathless attention. Had their without breathless attention. Had their hero lived i former days he would have been deified as a second Her
cules. Everybody who has five shillings to find his money uncommonly well laid out in the spe wil tion of this extraordinary narrative, the truth of which is now unquestioned.
Manual of Quotations from the Ancient, Moderm, and Proverbs, and Fumily Mottoes By E H. Mishime,

\section*{Ph. D. 12mo. Crockford. Pp. 308.}

It is difficult to disenver what primeiple has guided \(\mathrm{D}_{\mathrm{s}}\) Michelsen in this edition of Macdonnell's Dictionary of Quotations. The object of such a bonk would seem to be that of explaining to the unlearned the meaning of classical and other phrases often in the mouth of th other expressions, the point of which proverbial an ordinary understanding. Such a purpose is intelligible and useful. But we fail to discover that it has guide the compiler in the work before us, which looke as if it had been written to order, the object being to form saleabie volume containing a given number of phrases. Harmatian, Hidalgo, \&c., or common sentences harius, Harmatian, Hidalgo, \&c., or common sentences having no difficulty about them, are introduced, appears incom prehensible. Take for instance "Je suis prêt," "Recte which involves no peculiarity or idiomatic difit culty whatever. With sentences like that any quantity of pages may be filled. Then as to the mottoes of our nobility in foreign languages, some are given, but manyare omited. And in what concerns proverbial expressions, the selection is to the last degree meagre : a few French Italian and German ones are discoverable here and there, but of the Spanish, the most pithy of all, scarcely one appears. We must also be permitted to remark that "Scapham seapham dice" is not to call a boat a bacrun" Nhe letters D. M. S. signify "Divis maniis (!) sacrum." Nevertheless the bouk has its use, and we
doubt not will be acceptable to those who are not fastidiout will be acceptable to those who are not fastidious about quality, providing an article is cheap. Nor indeed would it be fair to conceal that a good many thoroughly well done, would be both instruetive and amusing.
A second number 'of Dr. Hooker's Flora of Tasmania (Lovell Reeve), has just reached us. The text
includes the remainder of Leguminous plants, and ters includes the remainder of Leguminous plants, and ters-
minates in the midst of Umbellifers. In addition to minates in the midst of Umbellifers. In addition to colony may well be proud of having secured the publication of such a work, and Mr. Gunn of having his long and invaluable labours so brilliantly illustrated.

The Manual of School Gardening (National Socidy) is a little pamphlet of 5312 mo pages, intended to show how such a garden as a National Schoolmaster is likely to posse3s may be managed. The directions are plain ing sentenee all will agree:

The schoolmaster who devotes his leisure hours to gardening will of course arail himself of the help of his them for their services, if, while he is superintending heir labours, he can impart habits of order and forethought. This he can only do, firstly, by working out a pre-arranged plan on well understond priusiples ; and reasons, by explaining to his fe low labrurers tha exciting their interest and seeuring their confidence. What boys do out of school hours is, after all, the best test of what they learn in school.

\section*{Garden Memoranda}

Shrubland Park, Ipswich, Suffolk, the of Sir William Middleton, Bart,-The flower gardens at this place have of late years acquired great celebrity, and the alterations recently in progress being now completed, we have great pleasure in presenting our readers with a short descriptive notice of them, for which we have the permission of Sir William Middletan. The mansion and gardens are so intimately blended tagether, bounds frould ben and design, that our sketch of thew grou sines to deribe impersil we not devate a ter of great taste in design (and execution also); and wo of grould not be doing justice to the liberal proprietor of Shrubland and his estitnable lady, if we omitted informing our readers that Shrubland is the work of their own crea-tion-the designsfor the gardens and parterres, we under stand, as well as the main features of the mansion, ha ing been laid down by themselves. A residence for both Sir William in taly appears to he spirit the great Italian masters in architecture and gardening which they so well knew how to combine. And the have thus been enabled to carry out at Shrubland the purest designs of the Italina school, as exhibited in the palaces and villas near Rome. True, we cannot assimiEuropr climate and scenery to that of the south o Europe; but, notwithstanding, Sir William has been a very perfect copy of Italiau gardening ; and, taking
into consheration the great superior, ty of Enghah
gardens, abrewards floral embellishment, Shrubland must
far outvie the best gardens of Italy, though we must yield in comparison to her glorious climate-her groves of Orange, Myrtle, and Bay, and the classic associations of her villas.
First, then, the mansion is situated on the brow of an eminence, which rises abruptly from the general level of the ccuatry to the west, witich is overlooked by the comthese few years great alterations and additions. have been made to the exterior of the house, under the direction Charles Barry. From the south wing rises a lofty campanile tower; the view from the upper story of this comprises a wide extent of country, and affords a may also add, that the entire designs of the upper and lower terraces, and adjoining grounds, are seen to best advantage from this
The situation of the house and ground immediately in front was extremely well adapted for displaying the Italian style of gardening. As before noticed, the
ground on which the mansion stands shelves rapidly to ground on which the mansion stands shelves rapidly to
the west, and forms naturally a steep woody bank: the west, and forms naturally a steep woody bank :
advantage has been taken of this position to form two advantage has been taken of this position to form two
grand terrace gardens-the lower one bein, some 70 or 80 feet below the upper one, with which it is connected by a noble flight of stone steps, leading from a favilion which forms a centre of the balustrade, the boundary of the upper terrace, and directly opposite the centre of
the mansion. We omitted to name that, connected the mansion. We omitted to name that, connected tory, which is kept constantly gay with plants in bloom, and which can be thrown open to the morning gallery. The balcony garden, as we have before stated, is directly in front of the house, and is divided in two by a centre walk leading to the pavilion, through which a fine view \(\operatorname{loggia}\) at the extremity of the lower garden.
To describe any of these gardens without referring to a plan is almost a hopeless task. The principal feature in the design of the balcony garden is a group of four large beds on each side the centre walk. These have raised stone borders, wide and massive; next a band of bard ; and between the turf and Box edging inside band of white sand. This gives a high architectural finish to the garden, and is, besides, quite in keeping with the walls, balustrading, vases, and other architectural accessorits which surround it.

The great object in this garden is to have large masses of colours; hence it was imperative that the
beds should be large, to produce a grand effect, and rich warm colours are only employed for the like purpose-four of these beds are scarlet, two purple, and two blue. The scarlet beds are planted in thisway :-In the centre, Shrubland Scarlet Grraniums; next, a band of Punch Geraniums; then a band of
Mangles' Variegated, followed by Tom edging to fiuishated, followed by rom lhumb; the dwarf scarlet Geranium. When in full bloom nothing can exceed the richness of these groups as regards arrangement of colour
The two purple be
eds hav
surrounding this, "Love-liesby a band next, Geranium Purple Unique ; followed edging of the Baron Hugel or Princess Royal Gerauium, with a well-defined horse-shoe leaf, from which the flowers are taken off, that they may not interfere with flowers are taken off,
The two blue beds are planted with the centre of Salvia patens, mixed with Chimese Delphinium (Larkspur); next a band of the African Lily (Agapanthus) ; then a band of Lobelia racemosoides of Barou Hugel, as for the purple beds, the scarlet of Barou Hugel, as
flowers also taken off

Two long square turf plots flank each side of these beds, forming altogether a balcony garden. These have a tracery pattern in white sand with stone tripods, and in the centre a fine plant of Libocedrus chilensis, planted by H.R.H. Prince Albert, when he risited Sir William and Lady Middleton in 1851.
The eight beds described above are connected by a stone pattern aud three circular beds. The centre one with Yuccas. There Humeas, and the same on stone boxes planted with planted with Portugal Laurel, in imitation of Orange trees, for which they are excellent substitutes. The borders under the retaining wall at the top nearest the house, which supports the terrace walk, is \(\mu\) lanted nith Gelyhocks in lines, fronted with Lady Middleton Geraniums, a rosy coloured scarlet raised here

Before leaving this part we must not forget to menracant space to the right and left at the top of the racant space to the right and left at the top of the
garden; these have a good effect, and contraat well garden; these have a good effect, and contrast well left, leading towards the entrance gate from the park, is a long border under the conservatory terrace, formed into the "chain pattern." The oval centre beds are filled with Cerise Unique and Cummander-in-Chief Geraniums, alternately; the bands are yellow Heartsease and blue Lobelia, with the space intervening between the beds and the parallel lines of the border filled in with white sand.

On leaving the balcony garden, and descending by
iew is very striking, with the loggia directly jn frut, in the boundary line within which is a large open space, bottom the steps branch off ripht and left, formine circular sweep, the area of which is filled with fountain in a large stone basin, hith a circular walk starts from this direct to the it. A wide central wall racts diverge to the right and lefr, having the foumain as a common centre. Passing through the loggis, a deep dell separates the highly dressed grounds from those beyond. This part has only very recently been added and crossing the dell by a rustic bridge, we find ourselves among great masses of shrubs (selected chiefly for their foliage), herbaceous and common wild plants -everything, in fact, which couveys the idea of wild and natural scenery. Looking from the upper pavilion-or,
indeed, any part of the higher grounds-these masses indeed, any part of the higher grounds-these masses
of shrubs are completely under the eye, and it was imof shrubs are completely under the eye, and it was imembellishment within the boundary, as well as form a back-ground fcr the panel gardens and other part of the
grounds on a line with them; and we doubt not, grounds on a line with them; and we doubt not, a We grow up, they will produce the desired effect. garden, to notice the retrace our steps to the panel passes dirough it, having green Hade cr drive which This green walk is mearly a mile in length, and terminates at one end with a Hight of steps and balustrade to a platfurm from which diverye walks and drives in the wods. From this eminence there is a fine vista of its ending near the Swiss cottage the lower ground, and the grounds. This drive is margined by parallel beds the ground filled with choice Geraniuses raised frem right of the panel garden is the French garden, enclosed within a Laurel wall, in which, set in niches cut out a the wall, are a number of marble busts, 4 feet high This garden is laid down on gravel with Box edgings, and is planted with dwarf flowering plants, as Lobelias Brachycomes, Cupheas, Golden-chain Geraniums, \&c.
Proceeding southward from the panel garden by the long walk, we reach the fountain garden, which lies to the right. This is nearly circular in shape, and has a
fountaiu in its centre, from which four wallis radiate, fountain in its centre, from which four walks radiate, besides, a boundary wall and a conservative wall, taking the sweep of the garden to the west. This wall is built hollow, and is heated by hot-water pipes: the west side is covered with greenhouse and half-hardy climbing plants, which have the protection of glass during winter; the plants grow with great luxuriance, and bloom profusely in the summer moutlis, when the hlass is removed. On the garden side plavts of a more the horder at the base contains many interesting hall hardy plants.

The four divisions of the fountain garden are each panted m six colours, with white to begin and finish with. Each division has its separate plants, hut the
colour and height of each are the same. Commencing with the centre it is white, which is continued all ronnd through the four divisions; next purple, yellow, scarlet
blue, pink; and lastly, white again at the outside blue, pink; and lastly, white again at the outside.
This arrangement talies up a va-t number and variety This arrangement takes up a va-t number and variety
of plants, as the height and habit have to be studied, as well as the colour of each; but the arrangement when well done, is unique and very pleasing.
Beyond the fountain garden are some beds on gravel, with raised stone edgings, and planted with mixed colours; amongst others, the shot-silk bed our esteemed friead Mr. Beaton speaks so much of, is very conspicuous: its composition-variegated-leaved Geraviums, mixed with Verbena venosa, or any light purple variety Below well known.

解 ties arenlection of summer Roses. The climbing variebowers over the to a fancy iron trellis, which form in the form of the heraldic York and Lancaster Rose, with red and white Roses and a yellow centre bed
Towards the southern extremity of the grounds is an exceedingly characteristic Swiss cottage, with the accomof curiosities among other thinss, some interesting relics of Napoleon the First, the Duke of Wellington, Lord Nelson, \&c. At a short distance from the Swiss cottage is the Verbena garden, in which are planted those kinds not used in other arrangements. By this garden is the Box terrace, forming a beautiful seroll pattern laid down on
a smonth surface of fine sand of a reddish tint, completely in the parterre style of the French. 'The interior is planted wich very dwarf flowers-as Silene Schafta, dwarf French Marygold, Lobelia ramosa, \&c. The whole of the retaining and dividing wall is surmounted with rich balustrading, in the same style as the mansion, pavilion, and loggia, all of which are from
the designs of Sir C. Barry. Hence, there is a harmony and unisun between the several parts rarely met with, which does credit to the admirable taste and judgment of Sir William Middleton. In addition to the Italian features of the entire place, a great number of busts, vases, and statues are disposed throughout the grounds ing the veculiar tone of Italian scenery so characteristic of Shrubland.
Mr. Foggo, the present head gardener, informs us
that 50,000 planis of Geramumis, Vervenas, Ketumias, n 50 the independently of annuals, \&ce., raised from seed, which are likewise worked into the general arrangement. To procure annually such a large number of plants, and to arrange each to the several compaiments for flowering, requires a large amount of care and forethought. Both sir William and Lady Middleton are deeply iuterested in all that is going on, and provide liberal help to keep the whole in the highest order of neatuess; and to keep p so larse and brilliant a display of bloom throughout the senson, large reserves are ulways ready to fill up
vacancies and maintain uninterrupted the display. We parameies and maintain uninterrupted the display. We sive plant-growing departments hereafter, as well as To be sppreciated, Shuts on the Brownlow terrace. To be appreciated, Shrubland should be seen in ite summer glory-say between June and Octoher. The coup d'oil from the steeps leading from the upper emple, which overlooks the panel garden, 30 feet below, with its fountains, statuary, parterres, and exquisite longia, or open temple, at the further side, in the foreground, and a wide stretch of cuuntry beyoud, has ew equals.
Mr. Beaton, so well known to the horticultural world, was for many years gardener here, and many of the Geraniuins, \&c., employed were raised here by him. te was followed by Mr. Davidson, who sunerintended the princifal improvements noticed. Mr. Foggo, who succeeded Mr. Davidson 13 months back, is very auccessful in meeting the requirements of so large an undertaking, and will maintain the high character Shrubland for many years lias enjoyed, as one of the Florist, Fruitist, and Garden Miscellany for May.

\section*{FLORICULTURE}

Ranunculuses.-In season like the present, the following advice by Messrs. Tyso regarding the watering howers in A pril will doubtless be acceptable:-Genial showers in April and May are essential to a vigorous
and healthy growth. The Ranunculus delights in a moist and healthy growth. The Ranunculus delights in a moist must be plentifully supplied, just at the time the flower buds are appearing. This is a critical period, and for lack of mois ure many plants fail to bloom, and send uponly an abortive flower stem. Water from a pond or brook is better than from a well ; if such cannot be obtained fill a large vessel with water from a pump, and expose it to the sun and air before use. It should be applied (morning or evening, according to the state of and nomerature) between the rows, from a spouted pot, weather. It may appar an anomalous direction to water in wet weather, but advantage should be taken of a shower faling to give a generous watering, ns the plants are then naturally in a better state to receive moisture than in dry weather, when their pores are contracted. As a general observation, it is better to water copionsly three times a week, than to administer small quantity every morning and evening. To obtain fine blooms for exhibition a little weak manure water may be nccasionally given. We have tried numerous watural and artificial guanos, \&c., in some instances without perceptible benefit, and in others with positive injury. The most simple and useful agent we know of is superphosphate of lime, reduced to fine powder, and mixed with the water. We are aware that many connoisseurs have been at first delighted with the
luxuriant foliage of their plants, traceable to potent doses of liquid manures of varied name, but the apparent benefit has in almost all instances been realised at the uture risk of the health of the tubers. We are not adverse to novelies, because they are such, but to the experimentalist we would speak the language of caution. Try your hand on a small scale only; never apply a afford to lose.
x, \(2=5+2 y=\) not over bright; ;.venly spotted. Cineraria Mrs. Hoyle, from
Mr. C. Turner, colour pure uhite, tipped with purplish rose ; of \(\pm=2=2\) \(2 \times=2=2\) \(\pm=5=5\) to be a fine early rarify. Oher Cinerarias of merit wern Mrs.
Curner and Mr. Edward, both raised by Mr. Bousie; Earl of
Clarendon (Turner), and Queen of May (Lidgard).

\section*{Miscellaneous.}

The Coco Nut Palm.-Of all the gifts which bountiful nature has bestowed on the inhabitants of the tropies, thisl perhaps is the most valuable, and certainly the one most fitting them for a paradisiacal state of illeness. What ther fruit is there in which, as in the Coen Nut, we fid a refreshing beverage contained in a cool limpid state in a nutritious pulp of the consistence of blancmenge, and as agreeable to the taste ! In a young nut the lining pulp of which was thin and almost of gelatinous sof thesa, the quantity of contained fluid exceeded spring water, pleasantly, slightly sweet, of specific gravity 10183 . The pulp was rendered brown by the
*inctare of iodine. No starch particles could be detected I good strong turfy peat, adding a liberal sprinkling of at uodre the microscope, nor oil globules. The water |clean sharp sand, and some crushed broken bones, when smasparent, was of the speeific gravity 10203 . It did souteparent, was of the specific gravity 10203 . It dic aeetie or nitrie acid. Sugar, it may be inferred, was its principal ingredient. The lining pulp was found to consist of 36 per cent. solid matter and of 64 water, as
deternnined by thorough drying. As is well known, it -leternined by thorough drying. As is well known, it
cbeanded in oil. I conuld detect in it no starch particles. In composition I believe it to be very like the ripe Aimond. The emulsion it makes is equal to that o tea. The Coco-Nut Palm, I may add, thrives best by the sea-shore ; it thrives even within high-water mark, Siewed in this light, may it not be considered as de sigwed by a kind Providence to yield a drink in situaere often not to be fisund. It is only the traveller in wreh regions who can justly appreciate its value, and Weh regions who can justly appreciate its value, and
te sufficiently thankful for such a blessing. In Ceylon the natives are in the habit of putting a portion of salt into the ground when they plant te Nut, so convinced are they that salt is required for its succeasful gro
Dr. Davy in the Etlin. Neve Philosophical Journal.

Thie Apple.-Apples have been believed by some anse been introduced into Italy from Media, and that the Falisci, or inhalitants of Montefiascone, were the tirst to plant them in rows. But this must apply to some partieular variety, not to the species, which we lave already stated to be indigenous, but very early appear still more difficuit to identify with ours than The lears. Among the few that modern authors have scomnised, the Appiani of the Romans are supposed to be the Appie or Appiole of modern Italians, the Appia pyriormis to be the Appiolona lunga, the Syriaca rubercany, \(M\) cheli, in his above-mentioned manuscript, tescribes 56 sorts under the Medici princes, 52 of
which are figured by Costello. Jownal of the Hort. Socie'y.

Arlificial Manures.-In these days of unscrupulous aduiterations, it is well for the farmer to know where
yie nay be sure of procuring an artificial manure in a genuive state. Whoever sees the Gardeners' Chronicle is aware how repeatedly the learned editor has wan ned nis readers against profligate dealers, who make no And I have also heard of parties who to 90 per cent.! leas materinh, the "rough stone" as it is called at the quarries, to grind up and mix with the coprolite! No Which they find do not answer their expentan wothing can be more distinctly shown by Mr. Laweo' xperiments, as well by those of a few others who know ruanures are powerful stimulants to certain plants some for one kind. some for another. The rate at which Mr. Lawes manufactures superplios phate of lime, and th th is is \(m\) to present he public with genuine condition as it can be procured. This is not pared to do the sane, but as there chicf source for pure guano, so there is unq̧uestionably rit Deptford, a genuine supply of superphosplate of lime, Whin as the so-called coprolites, and other sources from whence it is obtained, themst lves contain. Here ther are no pois nous scrapings of ships'-bottoms to make weight, no ground rough-stone, no grey earth from extras thought quite good enough for farmers who will ot trouble themselves to take the necessary precautions (1) have the article they purchase testel by competen suthority. Lecture by Rer. J. S. Llenslow.

\section*{Calendar of Operations.} (For the ensuing week.)

\section*{PLANT DEPARTMENT}

Conbervatoby, \&c.-Aithough a slight shade is ardizpensable on the forenonns of ligight warm days, This ulust be used sparingly when the weather prove atoue properly, and they soon fade if kept in ton shady ithe weather will adnit. Where it can be accomplished watering should be done in the norning, in order to get ath eaperfiuous moisture dried up before evening, so as in avoid night damps, from which there is some danger Aving the present state of the weather. New Holland Iw ners, when done flowering, should have their shoots wril trimmed in before growth commences; thin the Wam branches where necessary by cutting out weakly sene but aways have an eye to securing plenty of young frated with scale they will be most conveniently cleaned and where necessary the paint washed, \&c., immediately 2.f er pruning, so as to have all clear wefore the plants thut into growth.

FORCING DEPARTMENT
Pikmars-For plants intended for winter fruiting wo wuald recommend using a somewhat lighter soil than cintereraly employed for Pines, as there will nut be so
nutud danger of getting this ton wet as when a strong tenacicus loam is used. We prefer a compnst consising of aluout two-thirds mellow turfy loam, with one-third
rously, and fruiters can be liherally supplied with manure water withont any langer of the stil getting sodden. But the great advantage of a light soil is that
it soon parts with its moisture, and the plants are more manageable in the way of getring them into fruit at the proper time. Maintain a thoroughly moist atmosphere, especially where the fruit is swelling, and give plenty of manure water to all growing stock, as well as to plants in ruit. Vineries.--See that inside horders are properily supplied with water, giving sufficient quantities to horoughly moisten the whole mass of antities of water when inf vigorous health and swelling a heavy crop. Give Vines in pots manure water, first chung sum ture as that of the house. Attend to the regulation of the rowth, stopping laterals, \&c., and timely thinning o he bunches and berries, before they injure the principa fied up in their places before the shoots get too far advanced, as there is considerable danger of breakiug these off when they are allowed to get ton long befor the rods are tied up. Look sharply after red spides and use every means to keep clear of this pest.
Figs.-Aftend to stopping and thinning the shoots, and aim at securing short-jointed strong growth by ex posing the young wood to all the light possible. This will, of course, necessitate keeping the trees rather thiv, but it is useless hoping for a crop of good frui from trees that are crowded with wood. Keep the atmosphere moist, and give the foliage a good washing with the syringe after shutting up the house in the afternoon, to prevent red spider, and also see that the oots are kept properly moist. Where the fruit ripening, syringing must, of course, lie dispensed with, and the atmosphere kept drier, therefore be careful to the frui foliage perfectly clear of insects up to the time close moist, worm tomperaure to plats are close, moist, warm temperaure to plants recently planted out until they get into full growth, but avoid and warmith after the roots fairly get hold of the soil for it is generally somewhat dimeult to secase a crop rom wood of this sort. Give air as freely as the state of the weather will admit, in order to secure firm short jointed wood, and where the crop is seting, as the young fruit is very apt to damp off unless the atmosphiere is kept moderatily dry. Endeavour to secure a steady botiom heat of abrut \(80^{\circ}\) or \(85^{\circ}\) for plants in all stages and also to keep the soil in a proper state as to moisture ; avoiding having to water while the crop is setting, by well soaking the soil before the principal blossoms begin to expand. Keep a careful look-out for insects and use every precaution to prevent these getting esta blished upon the foliage, for there is hardly any chance of a crop of fruit unless the foliage can be preserved healt
flower garden and surubberies.
Except in favoured localities it will be unsafe to commence planting out bedding stock until we experience ecided change of weather. Meantime get the plants well hardened off and nicely arranged, so that when planting out is commenced it can be done expeditiously Also decide upon what is to occupy each bed, and hav everything in readiness before planting out time. Push forward late propagated stock and endeavour to beep the whole healthy and growing slowly in their pots. It is remain in very tad practice to allow bedang and very scantily supplied with water, until they get almost dried up. They should be exposed to the weather as freely as circumstances will admit, but never to such an extent as to brown the foliage and dry up the \(t\) ssues Endeavour to get mowing and other work here in forward state so as to be able when beduing out can be safely commenced to command suffieient strenyth to propprly care for the plants in the
protecting, \&e, as may be necessary.
hardy frult and kitchen garden
Proceed with the disbudding of Peach and Aprico trees, leaving for the present, however, any shoot the paves of which overhang and shelter fruit, out the pford of such should be pinched out in order to afford those intended to be left at the final dis budding every encouragement. It will also be neces-
sary to go over Pear, Plum, and Cherry trees, to remove gross shoots and to stop those not wanted for laying in. This repeated as may be necessary during summer is greatly preferable to the old practice of allowing the shoorts to remain upon the trees till midummer, and then cutting them back to two or three eyes. This showery weather seems to be very favourable or the increase of insects, and nothing must be allowed o interfere with the destruction of these pests. Ground from which Broceoli and other winter greens have been cleared should be manured and trenched, or dug, as may be requisite for the succeeding crop; or if it is intended for Celery, the trenches sthould be got out at once, 80 as to be able to get a crop of Lettuce or Spinach between the trenches, See to getting Tomatoes prepared for planting out, also Sweet Basil, \&c., with riage Cucumbers and Vegetable Marrows; also make a
sowing of Sweet Basil, Marjoram, Savory, \&c., on a light warm border, and get the early Celery prepared ir planting out as speedily as possible, and attend to the plants for succession crops.

\section*{The Mgricultural Gazette.}

SATURDAY, MAY 10, 1856.
Our readers will doubtless remember the very able address-on the contributions of geological science to the improvement of agriculture during he past 15 years-yiven by Mr. Pasne, of Farrham, efore the Society of Arts, on the occasion of Mr Hoskyns' paper on recent Agricultural Piogiess. It wis, in our opinion, by much the most satistactory and instructive of the reports then given on geology, chemistry, mechanics, and practice, respectively presenting in the fullest, tersest, and most subtantial manner what lay within the limits of the subject assigned to the speaker. Among the topics named was that distribution of soil and drifted material in varying thickness over the true subsoil, a knowledge of which would materially cheapen and facilitate the operations of the land drainer. Although this was placed foremost on the list of subjects introduced by Mr. Paine, yet it was barely more than named, the experience of Lord Berners in the drainage of the Keythorpe estate being referred to as an illustration of the benefits derivable in this
way. Such a mention of what Mr. Trimmer calls the way. Such a mention of what Mr. Trimmer calls the
Keythorpe system of drainage was perhaps all that it could claim from one who in a single quarter of an hour had to trace the whole long boundary line between geology and agriculture. But when a speaker has an hour at his disposal for discussing the relations of geology exclusively to the art of draining land, a much fuller discussion of
this topic might have been expected. This, howthis topic might have been expected. This, howWrittle, who gave a lecture last Monday before the members of the London Farmers' Club on geology and hydranlics in connection with the drainage of the land.

We have not space to give a full report of the opening address, or of the discassion which followed it. If the former was in our opinion defective in its bare allusion to this subject, the importance of the Keythorpe system was amply vindicated in the subsequent discussion, the greater part of which was occupied by Mr. Bailey Denton in its condemnation. He asserted that
such facilities for drainage as the Keythorpe estate had exhibited were the result of gravel veins underneath the clay, not of occasional gravel and porous beds above it-that nevertheless the cost of the operation when compared with instances of the ordinary system within his own experience was not remarkable, while the actual result in the drainage of the land was by no means satisfactory-that in fact the theory of the operation as furuished by Mr. Tinmer was erroneous, while the result of the operation, as held out for examination by Lord

THE AGRICULTURAL GAZETTE

Braners, was imperfect. We must add that, while
doing this, Mr. Dentors did full iustice to his lordship's public spirit in throwing Keythorpe npen for agricultural inspection and discussion ; and we must also say that his opinion that the drainage of that estate was imperfect did not appear to he shared by those nembers of the Clab who had visited it.
Mr. Baker's allusions to the geology of his snb ject were almost entirely confined to those considerations on which the theoly of springs is based-that alternation of porous and inpervious strata, and that distribution of them at vaiious angles of inclination, and over districts furrowed by valleys on whose sides they crop out-a knowledue of which is certainly necessary to an economical determination of the number, depth, and direction of the dains to he laid down. In his references to the hydraulics of his sabject he very properly considered drains nerely as channels through a medium saturated with water, the several particles of which by their nutnal pressure, consequent on the earth's attraction, make their way hy paths of least resistance a channel of this kind is as truly the opening of the
flood-gates of a pond as if, instead of being filled np to it with earth, the surface of the land were the surface of a lake. In such a case, the sill of the gates being but three feet below the surface, all the water below that level remains unmoved and unaffected by the motion of the layers above it. There is no pressure upwards, forcing the water
to boil up to the exit channel opened : there is to boil up to the exit channel opened : there is
pressure downwards, forcing those portions neareat to the exit out, and causing each in turn of all the portions lying above the level of this channel to escape. The drop of water from the clouds of reaching the earth does in fact sink at ouce, urged by its own weight and afterwards by the weight of others over it, until it reaches an impervious bed :
this may be a bed of earth already saturated, being this may be a bed of earth already saturated, being
below the level of the drains or other means of exit, or it may be a bed of hardened earth; in either of these cases there it stops, forming, it may be (in virtue of the capillary attraction of the soil), a little nucleus of moisture, a patch of saturated earth above
the general level of the drains, down whose sides as it were other drops percolate, and thereby approach the exit channel, out of which the additional drops of water ultimately escape. It was to the existerce of these impervious lay ers of earth that Mr. Bares ducing from an experience of their existence an argument for shallower drainage than what is now generally contended for. And it was here, we he did to the existence of that furrolied surface of our clay formations contended for by Mr. Trimmer, as a general rule, the accidental use of which on the estate at Keythorpe furnished a most gratifying into surface geology in Norfolk, Hamp:hire, aud elsewhere had enabled him to detect. The existence of a furrowed subsoil under the drifted porous material over which the surface soil is often tound, is the point on which what Mr. Trimser calls the Keythorpe system turns.

You must be satisfied to walk over your fields without seeing these furrows in your subsoil, and of of geology to be assured of their existence. Any section furnished by is chalk pit will however exhibit them to the eye-and though we cannot see them under ordinary clay soils, their existence seems in many cases \(v \in r i f i e d\) by the action of a trial drain on holes full of water in its neighbourhood, some of which it empties while others remain full, thus proving to all that there is a porous separation between it and the former, and an impervions interval between it and the latter; and proving to Mr Trimmer that this is a case, like those he has seen elsewhere, of a wavy conformation of the impervious subsoil, a whole line of lofty clay heing the impervious interval in question, and a series of troughs or worn hollows filled with gravel, sand, or other porous staff being the porous interval in question.
This conformation Mr. Denton has not seen, and therefore does not believe; in this, resembling some of a party with whom we this week visited the extensive clearance is proceeding on the crown lands. Mr. Fowler's drain plough was at work, but the watched it could not be satisfied that they whe watched it could not be satisfied that they were
being efficiently laid. The test, of course, will be furnished by a year or two's experience; and we must say that in the general opinion of its visitors this seems already to have satisfactorily resulted in favour of the Keythorpe system on the estate of ord Berners.
Weference to the subsequent discussion passing
bullock that if you found water pouring into drains at 30 inches or 3 feet deep, just where it was obvious that an al'eration in the texture of the subsoil forbade its sinking further, there could be no use in making the drainage deeper. This of course is Mr. Trimmrr's opinion also. Mr. Parkfs' system of deep drains was generally condemner by
these speakers, and it was vigorously defended by these speakers, and it was vicorously defended by it has lirherto bren at meetings of the London Farmers' Club, that the depth of 4 feet and further sanctioned by the Government inspectors on all sorts of soil was extravagant. So that when a gentleman, whose years entitled him to say so,
rose at the close of the diccussion to express the opinion that common sense and experience are the two ingredients niost needed by the land drainer, it was evidently thought that he too was about to condemn these extravagant proceedings, and it was with some surprise that he was hesrd to add that those who had not that experience would be astonished to
find through what an extraordinary depth of clay soil water percolates to drains. Our experience, though limited enough, enables us to corroborate this remark, and we must conclude with the opinion that the true policy will ultimately, and in the long run, be found to recommend a system so far uniform as to interval (in conformity with the uniform sapilies of water from the clouds on to the surface of the land), and so far uniform as to depth (in con formity with the uniform wants of plants beneath on the one hand and, as to fall in justifying Keythorpe practice as a system which Mr. Trimmer argues, and on the other that condemmation of the "gidiron" plan of drainage in which everybody

\section*{NOTES ON COPSE WOOD.}

Ture Euglish and Continental methods of treating copsewood differ in some details; in others they are
identically the same, or very nearly alike. The German system is never to make a complete clearance, except of the underwood, and to remove the timber by successive fellings at intervals of about 10 yeurs, reserving at eawh the most promising trees, so as to establith a forest of are not felled are most congenial with the soil. These This is the usual British practice sloso. In Germany and in France the fellings do not usually recur so frequently as in England, where there is a more frequent and general clearance. In Scotland and in Ireland the fellinge are at longer intervals of time, more after the Mr. Masage
Mr. Monteath, in his "Fopester's Guide," fixes from 24 to 30 jears as the period which ought to intervene between the fellings of natural Oak-woud, as the bark is hen in its prime. He would have the first felling from a planted coppice at the end of about 15 years from the
time of heading down the young trees (not designed for tme of heading down the young trees (not designed for when the roots of the stochs or butts will enalle them to bear severulshoots. But this experienced forester discouraged
the practice of felling Oal Bark, when of felling Oak coppices souner than 24 years. three or four times more than at present, and therefore an important element in the calculations. But now, bark in chemical agents have leen substituted for foreign timber has beeome free, the chief motives for allowing coppice timber to stand for a long time have ceased. The commercial value of British Oalk for siderable, the question is rather the value of fellings, for the purposes to which underwood can be applied. Quick returns pay best, and the demand from oopers, mopstick makers, and others, is sufficient to insure a fair price for underwood of eight or
nine years" growth, the usual a at athich it is cut in many of the English woodland districts. In some counties, however, the cuttings are not made until the twelth season, and according to the prevailing quality of the soil. For instance, copses are generally cut in Berkshire, which is gravelly in the copsewood localities, every eighth year, though in the chalk soil of Hampshire the twelfth year is the average period of cutting. Climate also has its effects on the growth. The most rapid vegetation is in gullies and hollows, and the slowest in high and open land. The absence or presence of mill also in the soil, besides its conatituent qualities, When there is a remunerating price
When there is a remunerating price for young Oak copse wood, it is more beneficial to cut and sell it than to leave much of it standing. The local market is chiefly Beech saplings are fit for hoops and staves at eight yearss growth, and Alder is at this age of sufficient height ior five lengths of a mopstick, and Hazel at the same age is fit fur barrel staven. Ash indeed may be profitalily left standing for 18 years; it is then best suited for Hop poles, sheep crilis, and other farm purposes, and also for those of the cooper; it grows very freely and is but it should every coppice of which the soil is luamy

Underwood of eight or nine years yruwll is better foem hurdies and hoops than that which is older; ; will thea produce middling hoops 13 feet long, and thess ane worth is. \(6 d .1\) er 1000 .
The state of the case as regards the commercial valce of coppice wood seems tu be this: foreign timber of foll growth can be imported by us on cheaper ternis than our native timber can be sold with much profit ; as regards the use of wood for fuel, the facilisine of con veyint coals by land and water to every part of the kiughom have greutly tended to discourage the extension of coppices uuiess where nothing more valuahie will thrive. The same remark applies to plantations gene rally. Where wood fuel is wanted and therefore vala and forests is of proportional estimationder enpices there is a proportional estimation. There also there is a continual demand for native timber or various surts and ages for buildings, ordinary furniture, farm implements, barriques, sabots, and fuel, proving the commercial advantsge resulting there from a careful economy of every thing under the denomination of
In calculating the relative advantages from selling copsewood without reserve once in every eight years, or of to an advanced age, the Enclish land proprietor tree consider whether the frequent returns of cash at short dates are not mole advantageous than the money proceeds from trees 1 ft during a long period-a return which he may not live to enjoy, and which, even if weneficial to his heirs, may not produce to thena a sum equivalent to that which would have accumulated by banking the suns received during every eight, nine, of twelve years, fructifying at compound interest. While park or embellishment exists among us, timbere in a this or demesne will be left unfelled ; but to gratify his natural and justifiable taste the owner often incurs meh pecuniary loss.
Many persons must look to the pecuniary considerations alone with rezard at least to coppices and plantations. The rature of the produce of a single felling of nodel cood of eight years' growth ranges in Berks-a and acre, nay even beyond these extremes. Assuming the maximum to be the value, the return for the occupation deduat by coppice timber during eight years (with some rates) is not equal to what the ordinary, peturn would be in the same time from the land if under ordinary farm cropping. But in very inferior soils, on the slopes of rocky or gravelly elevations, and in ravines and mountain dells, coppice is not only ornamental, but very remunerative ; and the periodical clearings afford pleasing scupation to the labouring poor
Some estimates of the value of copsewood made, or rather imagined 25 years ago, appear now to be quite
fabulous: thiey are very far removed, indeed, from the reality at the present day.
In Berkshire the ordinary coppice consists of Ash, Oak, Birch, Alder, and Willows. In clay soils the Oak Ashominates; in gravelly and stony, the Birch and are chiefly grown. ground, though it succeeds best in dry soil and shade, which latter peculiarity gives it especial value as underwood. The Alder, though formerly of little estimation, and generally planted for the mere purpose of affording sheiter to less hardy trees, runs up so rapidly, and is so useful in its live state for protecting 1 iver 1 anks from the destructive influences of undermining currents, that it is no longer despised, and when cut and seasoned for the tarner's purposes and various other uses, it answers so The to be in full request.
The management of a natural or long established coppice in Berkshire is as follows:-In November the owner of it makes his bargain with a woodman, who undertakes to cut and clear away the crop of underwood by the 10th May following. The iruplemente with which he performs his work are the axe and bilihook. With these be makes a clean cut slanting upwards of every stem and twig from the butt without lefr, else the chening the barls from the portion of stool roots to the new shoots would he obstructed. if however the felling be not delayed beyond the 25th March, there is little danger of injury from this ill treatment.
If Oak trees in a coppice be doomed to the axe, principally with a view to the profit derivable from the bark, they are not felled until the end of April or commencement of May, nor later than the middle of July, then they will yield their barls most freely. Thus an exception is made in the case of Oaks, from the geueral rule that cimber cut when the sap is most stagnant is the most solid and durable. A sufficient reason
for cutting all underwood designed for hops and every article requiring pliacy designed for hoops and cut in winter and therefore before the rising of the sap they will b

The felling by the purchaser cannot, like other kinds of piece-work, be executed to the disadvantage of the seller or emplayer, because both parties wish to have the closest possible cut-the buyer, in order to have the entire crop, of which the butt ends are the mest valuable, and the seller to have the stocks nearly level with the ground for the strengthening of the shoots. For the purpose of layering to supply vacant spaces, which is a tore cheap aad expedin connot to l . than replanting, the eutting cannot be too low. Besides,
sightliuess of such stumps is another objection, and vigor ous shonts would not issue from them. It is better to have few anl strong stems than numerous and feeble ones origin nearest to the ground. Mr. Monteath observe origin nearest to the ground. Mr. Monteath observe,
that "t the purchaser should be bound to cat all the that" "the purchaser should be bound to cat all the
plants or seedling trees with a saw 2 inches above the plants or seedling trees with a saw 2 inches above the
surface of the ground." We have not seen a saw so used in England; the adza is the tool within our observa tion empluyed for cutting wood both large and small,
and our woodmen cut closer than 2 inches; and the stools as treated by them do not require dressing Mr. Nionteath suggests, unless a stool here and there may need being rendered convex enough to preven moisture from lodging upon it. At the general felling the live wood is entirely cut away from the adjacent
fence; but in this case every care should be taken, hy fixing rails if necessary, to keep off trespassing cattle the ditches should be scoured, and the mould from them thrown over the stocks in the banks.
The application of fresh earth to the roots of trees even in decay may prolong their vigour and existence to
almost an indefinite period. The saplings of the Blat and Huntingdon Willows, which will grow freely in any clay soil, may be layered with especially good effect to fill up gaps in the fence. The hedge-row timber is eithe left standing (we still allude to the Berkshire system) or treated like their congeners within the boundary. Wher ornamental appearance is an object, the permanence of
Oak, Spaniln Chestnut, and Montain Ash is duly encourared. How beautiful is the Holly tree !-an happily how well able to protect itself with its "touch me not" prickles! Even on commons which have been for ages trimpled on, ill-treated by man and heast, the
Holly often stands, a vestige of primeval forests. To avoid the nghed appearance which woodland stripped of its sylvan garb exhibits, even the standing Oaks
Chestnuts relieve it in some measure; the couse, how Chestaus relieve it in some moasure, the cop ever limited in extent, may be felled in successive por tions; this is not unusual except when proprietors loch more to cunvenience and profit than to picturesqueness. M. \(D\)

\section*{A STEAM-CULTURE REVERIE.-No. VII.}
whereby land, which in its natural constructing land whereuy land, which in its natural state has but a thin surface soil capable of yielding only the most scanty Pulse, shrubs and trees!" Such is the high-soundin Pulse, shrubs and trees!" Such is the higl-sounding title of a scheme patented May 8th, 1847, by Messrs.
Bryant \& Tuthill. Arvidet aridum-"the wilderness Bryant \& Tothill. Arridet aridum-" "the wilderness
and the solitary place shall be glad, and the desert shall rejoice and blossom as the Rose.
When good old Jethro Tull farmed a shallow soil on the chalk hills of Hampshire, be gathered it into narrow ridges, exposing the substratum in the intervals, in
order to double the thickness of good soil under his drill-rows of plants. Mr. Smith, of Lois-Weedon, not content with such an artificial staple, deepens his Northamptonshire clay by spade-trenching, burying the upper staple, and bringing up the bad subsoil to be move and translurmed into rich mould. The above patentees in a different manner proposed to it into strips-packing one furrow-slice upon another, raised to the same level, open to tillage or clay spheric enrichment : the process being effected by novel instrument called "the land-transposing pled by This is a sort of traction paring implement fitted shoars and cutters; and the slices of soil being collected into a curved "apron," are there broken up and then delivered on one side in a stream of powdered earth-this being effected by means of a horizontal shaft transverse armed with blades arranged in a scre form (like the barrel of a pug-mill or a sausage-meat mincer), this shaft revolving inside the apron and being the machine.
did not see this instrument, however, at my mechanical friend's rendecrous of outlandish-looking tillage engines; inasmuch as the preposterous nature of the operation to be accomplished, combined with the power needel to perform it, had too nearly the character of the invention which a newspaper paragraph in 1850 proposed for taking up the soil bodily into a receptacle pounding and comminuting it by cutters, rollers and sieves, excracting weeds, mixing seed and manure and then discharging and spreading it again as a condition imaginable. Could the "transposing pleug be moade to act, it is possible that some work might be found for it; but the system of culture suggested by the Mr. Thomas Caux eight or 10 yenrs before in view the introduction of the Turnip crop on hat lands, enabling the roots to be fed off where grown; and this was to le carried into effect by tilling and sowing the ground in small squares, leaving spaces and lie on . and lie on
Among the number of revolving tilling-cylinders or diggers-which, as I have before stated, my friend tested ky attaching behiud a light pneumatic locomotive, and driving them by spurwheels or pitch-chains from the crank shaft of the engine-I observed a fac-simile of
the subsiler patented July 29, 1847, by Mr. Jose, hh
is a modification of the well-known drain-cutting of a wheel (suitably hung in a frame) having curved cutters fixed on its peryhery, and made to revolve so that the blades entered the soil at the bottom the loose earth during the upper half of their ro ation. Rotary motion was communicated to thi "slotting" or grooving machine by a short endles chain from the windlass of a portable horse-worl imunediately in advance : and by simultaneously windiugap a single chain anchored ahead, the horse work also To keep the endless driving chain at a and the horse-work and excavator a sufficient distance apart for the horses to pass between in their walk round the windlass, an iron bar was interposed; and the cutting wheel or dise was, of course, supported upon Iever frame by which the depth of its work could be regulated. The implement proposed to be worked in a imilar way for raising subsoils to the surface of land or teeth fixed round it spindle with four or more tine quadrants of a circle ; and the peculiarity of the inven quadrants of a circle ; and the peculiarity of the inven the soll backwards and forking it up behind, the teetl make their cut upwards, bringing up the subsoil in front the tool's advance; the broken earth lies in the way o the tool's advance; the tines are unable to clear themselves, and much of the soil (as I saw for myself) is
carried back over the top of the cylinder. The rotation carried back over the top of the cylinder. The rotation
of the subsuiler also acts avainst instead of with the progress of the carriage which supports and the powe that propels it, involving a great expenditure of motive force.
At first view, I must say, the strong curved tineswith side-blades in some cases to give them the broade action of spades-appear exactly suited to undermine and prize-up a strong subsoil; and the slow motion principle (of which indeed it is thes a most importan in the working of rotary diggers intended to deal with, heavy earth in considerable masses-turning it in "spits" rather than in a granular and pulverulent state But considering that the action of the machine is merely that of stirring and mingling instead of perfect trenchng, no provision being made for carefully burying the urface earth ; and that the teeth forcing their way downward through the broken soil, and penetrating the hard ground in the same direction that the machine travels, renders necessary an enormous amount of
power for its propulsion, I do not wonder that all hope fits general application should have vanished under my riend's repeated trials. I. A. C

\section*{ROTATIONS OF CROPFING}

Is it not pitiable and at great risk of famine to find ourselves so dependant on others for a large amount of should be so because we will not gvail ourseives of the means in our hands? Is it not absurd, where wealth and science so abound, that much land in England-I do not speak of Irpland, for there it might be expectedshould not yield one-third of the produce that it might and ought to do? -that our fathers' practice in a barbarous age should be deemed all sufficient for their sons in one of progress ?-that while the rich capitalist is expending sums which place him far beyond the reach out comparison by far the most numerous olas, do no avail themselves of the li,ht thrown on perpetual fallows by the Lois. Weedon system to which their means may be found equal ?-that they do not adopt cropped and way of thorough working their land cropped and uncropped, doing the heavier work of months of winter, when labour is much more easil attainable, and when the violent mechanical actions of rost and thaw would disintegrate and reduce the crude upturned portions of subsoil, and the lighter work of superficial stirrings in the parching summer monthe, when actions perhaps equally poweriul are in operation to fertilise those crude matters, and to enrich the whole surface opened out by such light workings to the continual instant inflow of the dews, light rains, and other sources of aerial wealth; their very inpourings and outrustings serving also not only to the improvethe of the soil but to the feeding, through the will grateful vegetation, which, never stinted, ever fed their toil?
It is not a question to adopt exclusively and in its Integrity the Lois-Weedon system ; it is enough to take it as a text, but to adopt one of perpetual fallow, one reeding every crop would bo a proparal for a suc couling one, where the tillage of the cereal should rival that orn stubble of a succeeding crop as the Turnip frack reception this, the grain crop must be sown in rows with such intervals as to permit of frequent light surface stirrings through the whole time of its growth, even to its blossoming. These stirrings, after the deeper winter forking, may be superficial ; indeed, all that appears to me as necessary, except where it is required to uproot weeds, surface, for it is un this crust that the dews and light

Showers rest; they penetrate it not
the sun and other natural the filize and other natural causes of evaporation vofertilzing, when they carry, in their vajours, their ertilizing contents to enmich other lands more pervious o their reception on their future descent. This crust so continually forming ly the closing effects of surface disintegration requires to be as continually broken by mechanical operations.
The destruction of weeds and the continual inflow of atmispherical elements of the food of plants will so maintain the fertility of the soil as to render it capable of jelding arain crops, as we see proved by the LoisWeedon Wheat fields, and being in such a state of ferUility it will necessarily require less manure to bring it into a state to bear in great perfection the most exigeant reen crop, and such an amount of manure we may well suppose the ordinary refuse of the farm will supply; o that the man of small capital may thus be enabled to compete with him of large who does not avail himself thes? natural resources.
When I speak of the deep winter forking of the ground let not the expense alarm or deter any one, for, of the land-and this is pa to deepen the active surfice fie land-and his is palpalle every nie, for who ould give as for with ther able surface as for that with a deep one :-yet it does not ppear to me necessary for the purpose of obtaining a fresh supply of the inorganic eleacens of plants to bring pany large quantities of crude soil or to do so very frequently. In most soils the bringing up of an inch would give a supply of them lor years; pissibly once in ten ears would be more than often enough to bring up resh stuff; and taking this to be true, and placing our rows of grain 2 feet asunder, a single row of furking in the centre of each interval once in ten years would cerainly not be any very frightful annount of labour, or ur any alarming expense.
Except for this purpose of kringing up fresh mineral matters, the inorganic food of plants-and everybody knows how small is the quantity they take up-this deep poduction of not appear to be requisite, since for the of Wheat, and of course of other cereals, mere and very superficial stirrings of the surface, without even what can be estimated as a fallow, seem all-sufficient (aided by some ght matters in the way of manure to make good periaps he inorganic and organic matters subtracted from the sil by the previous crop, and whin foressary from the absence of fallow and deep working), crops, and Mr. Piper's experience pives us more than successive crops of Wheat on the same ground to the full as heavy as those of Mr. Smith's without using spade, plough, or fork, or stirring in any way the soil
to a greater depth than what the hoe can effect in drills 1 foot apart, and this merely with the view of destroying the weeds; ns these hoeings with him are only two to the crop, and indeed as the closeness of the rows pre clude a greater number, the land derives no benefit from fallowing, for this cannot be considered in any way fallow, either in the disintegration of the soil or in the exposing it to atmospheric influences.
fter the make a beginning all wat will be necessary, ow the spring cere preparation of the land, will be to the ordinary means at the farmer's disposal : there is no necessity for new implements or other preparation ; the future work may also be effected in the same way and by the same implements as used in the common a low crops; there is nothing in it to perplex the mplest, it is all plain sailing, only let the one The labour will be well repaid at harvest by superior crop, by the increased fertility of the land, and yrain or otherwise; if it be desirable to lay down to Grass there will be time for two or three hoeings before the seeds may be sown, and from not being oppressed by a mothering crop of grain, the air freely sweeping
along the intervals, they will be more luxuriant and along the intervals, they will be more luxariant and growing grain; they will also be cleaner. Indeed, take it in any way you will, the perfeet fallowing of our grain rops will be most advantagenus, not only to the succeeding crops, not only to the future fertility of the and, but even possibly more largely so to the immediate crop, for 1 have no hesitation iu saying that on nine cazes out of ten such a wide-rowed crop will yield one-fourth more than one sown broadcast or in rows at less distance, and I am quite satisfied that in persisting in this course generally through the land we should become independent of foreign supply, for I do expect that the increasing fertility of our soil would keep pace with the increasing demand on it by a growing pppulation.
In offering these riews to the consideration of the ess rich of our husbandmen, showing how withont isurring the expenses of high farming, they may erial influences, by drawing on the banls of atenospheric wealch, as the sich amoug them do by drawing on the banks of Perr, I do not object to their employing every banks of Peru, Ido not object to their employing every the cleaniness of tilth induced, the acquisition of larger mounts of soluble inorganic matters will fit the soil for he recepion of more and more organic matters. A healthy state of vegetatiou must demand a proportionate mount of all the elements that build it up; do any exist in excess they must be taken up and voided by plants at f their growth and pertection. It were well did our
their needs.
In proposing 2 feet as the distances of rows of grain do so as an average. I am quite sure that in poor land under proper preparation this will not be found a great deal ton much, and I am ns sure that in rich land it will be found even ton little. I have found it so. It is also the least distance at which we could with it as a nostrum. J. M. Goodif:

\section*{DIARY OF A DAIRY FARM. MAY.}

Tas work of the dairy in the month of May is always of much importance, it can now be conducted with interfere; as in all well regulated dairies they are now old enough to do without much milk, and the cows having the advantage of pasturage, the cheese is expected in this mows should be of late calving, their milk should the cows should be of late calving, their milk should not be used for clieese for at least a fortuight, new milk
always having a tendency to make it heave. The same mode of management should be adopted in the making of cheese in this month as that recommended in the
month of April. The whey from the cheese is generally allowed to stand 24 hours for the cream to rise upon it for butter, it should then be allowed to stand 12 hours longer, and skimmed a second time, though some persons let it remain, and only skim it once before being taken from the dairy for the pigs. It is a much better plan to skim it at two several times, the whey butter apt to ferment when in the vessels prepared for its reeeption, and the butter will then be likely to be soft and not so gond in quality; nothing will so effectually prevent this as constantly changing it from one utensil as that recommended for the milk cream, taking great care that the same slice be not used for both, which would cause the milk butter to partake of the flavour of the whey. Cheese is now supposed to be made twice
a day, and the brine which drops from it when in the last press before it is taken out and placed on the shelves for drying is quite clear, the quantity is small, and it ought to be put into the rennet jar, perhaps every
two or three days, which lieeps up the quantity, two or three days, which keeps up the quantity,
and is thought an improvement to the cheese ; it will not have the effect of weakening the rennet for a few weeks, as it increases in strength by
being moderately old. When it is found to become weaker this addition of the brine must of course be discontinued, but even then, if the brine be eaved, it is better to use it with the next quantity of fresh brine made for rennet.
In most cases it is better to postpone making the cwt, at least till weigh ahout four or five to cheeses have been in the loft about a fortnight in dry weather they will be firm enough to serape; this is accomplished with a common knife, first moistening the cheese with a wet flannel, and nust be done carefully all over the cheese, so as to take off the roughness that may be quite smooth on the surface, and sharp in the edges. The sooner this can be done it into a state of forwardness for the factor; it will on'y require wiping round the edges and about an inch within after this scraping once a week, taking care to
allow the blue coat to remain on the top of the cheese; this blue coat is considered a sign of richness by the factor. There is a plan frequently adopted to promote this by rubbing the Ehelves with Elder leaves or the green of the Potato. The ripeness of the cheese is often ascertained by the favourable appearance, and it is desirable to see it look well, although of secondary im. portance to the taste. In some districts it is customary to paint the ourside of the cheere with Indian red; this shonld be mixed up with a little warm water, and rubed on with a piece of flannel, and should be done immedaser ater the cheese is scraped before any grease arises upon it, and the same mode of treatment afterwaras be adopted as if not painted. This practice is not to the cheese, and is unpleasant in consequence of the colour eoming off upon the board and shelves, therety
giving additional trouble to the dairymaid, and oftentimes an untidy appearance to the cheese rooms.
Sage cheese is grea ly esteemed by many persens. ghould be made at the end of May or beginning of vat is proper for this cheese. The plan of making it is to bruise a quantity of Sage in a mortar, also a litte green colour, the Sage alone not being bright enough in itself; these juiees squeezed together through a cloth, and added to about a pailful of milk, with a proper pro. portion of rennet, will make enough Sage curd for one thick cheese. When the whey is drawn from this in the usual manner, the curd will be found of a much deeper colour than might be expected from the pale green given to the milk. This Sage curd should be kept
quite separate from the bulk; all the whey should be quite separate from the bulk; all the whey should be
carefully got from it and thrown away: when the curd is ready for the vats, having been crumbled into small particles separately, some of the green curd should be mixed with the other-about one-third is sufficient, either care should be taken that none of the whey drawn from
flavour of the Sage. The after management of this cheese is the eame as that of other thick cheese.
The milking cows by this time may be coneidered to be turned to the most forward Grass in the richest pas tures, and as their supply of this food must be so variable, depending very much on the season being a forward one or otherwise, a good dairy furmer should have provided a supply of Rye or ltalian Rye-grass, so that a little
given in the yards when the cows come to be milked given in the yards when the cows come to be milked
will give them full feed of green crops, as it is found they will give them full feed of green crops, as it 18 found they
resist hay. Even when they have not a full supply from the pastures they will not readily make a good meal of dry fond after tasting the green, which not being sufficient to satisfy them they roam about rentless and uneasy, and of course fail to yield anything like a full supply of milk, and as the produce this month is considered very secured to be as preat as possible. It is of creat importance that good water should be supplied to dairy cows. A stream that has been some little while exposed to the air after rising from the spring before running through their pastures is considered the best water, and the drinking piace should have the soil re water may pass through pure and fresh. Cows much water may pass trough pure and frough or hole, and are shy of going to a large suriace of water, thnugh there should be abundant access and egreas to and from the watering place, or the master cows will often damage
the others in meeting them. The weaning calves sliould get fed now much the asme as described last month, the only difference being in the case of the older ones, which may be gradually getting a dininished quantity of Linseed or oalmeal, this of course being less needful for them as they become stronger and more able to eat the fond provided for them. They should have a sunny field to run in by day, with some Grass to pick from it, but through this month it has been found that they do better on finely cut Swedes or Mangel Wurzel and good lay, on which they will feed plentifully, having the misture o a little skim milk, or the mixture of Linseed or oatmeal, which though much shortened in quality, thould be given a little warm, though it should beeome gradually cooler as the calves get older. Should Grass be supplied at this time as their stable food, it is found to produce to ticularly liable ; and carelully guarding against this is very essential th ther stang into strong growth. They have been found to do far better in small number together, on account of their great dieposition to fee and be constantly very close together; and their readily taking any infectious disorder renders careful attention to what may appear trifles in the rearing of calves very desirable to ensure success, by simple means and which able "hen weaned or reared on the farm than if pur chased at market and brought on the farm at almost any age, will be thus obtained. They should have warm sheds by night, and to feed on their hay and ronta, and it has been found a very good plan to tie them up to give them their milk, as it makes the animals quiet, and and one then gets its proper quantity undisturbed and if convenient het them remain so for an hour
 their liquid food, all the better, as it prevents their suck-
ing each other's ears or skins, which is often productive of much harm. It is calculated that about one pig can be reared on the sour whey for every two cows in the breeding sows, reckoning that each one would have eight young pigs each, might now be kept with a run in any rough Graes under orehard trees not much used for other purposes, and given as much of the sour growing hey The whey sliould be make stron the dairy in pipes to prevent the slopping of its being carried out in bucketa, and it should run into a very large vat to collect, for it is much better for pigs' food when old, or at least some mixture of it should be so and using daily from this vat, which is as often getting replenished from the dairy, makes a very wholesome drink for pigs, on which they will grow and do remark ably well. And as the pigs are small to begin upon it and do not drink so much as afterwards, a stock collects inr their larger appetites, and this with the wash which large farm houses must supply, with garden refuse in
addition, is found enough to keep the number of pigs mentioned, viz., about one, of the age and description given, to every two dairy cows in milk.

\section*{AGRICULTURAL STATISTICS}
 CNITRD King ind-A Minister for
STATISTICS SHuLLD be Collected.
papers which proceed, in continuation of my previous papers which have appeared in your columne, to demoncountry, "the greatest of all mannently manufacturing facture of a nation's food," by -

A view of the amount of employment afforded to our population by the labours of agriculture. An estimate of the annual value of our agricultural production.
First-Labour Employed in Agricultere-Of this I make an enumeration from the census tables of 1851 . agriculture, excluding altogether the classes of landed
also the artisans employed in making and repairing the machinery and implements used in agriculture:

\section*{Farmer
Graz \(\begin{aligned} & \text { rars } \\ & \text { Bailiffs }\end{aligned}\) \\ gricultural labourers. \\ arm servants (in-doors)}
\begin{tabular}{|c|c|c|}
\hline Males. & Females. & Tota \\
\hline 275,676 & 28,044 & 313721 \\
\hline 3,036
12,805 & 11 & 7 \\
\hline 1,006.728 & 70,899 &  \\
\hline 235,943 & 128,201 & 19965
36419 \\
\hline
\end{tabular}

If we add together the workers in all the branche more usually termed "manufacturing," we shali have an array of numbers small compared with the above. I find by the same census tables that the aggregate of the workers in cotton, wool, silk, and linen is but \(1,186,061\). Thus the producers of a part of the nation's food are 50 per cent. more in number than are those engaged in roducing the fibres which clothe not ony our own population
Again, if we number the whole adult male population hetween the ages of 20 and 60 , we find them to be ,769,212; of whom there are enumerated under the \(1,224,546\) persons. Ihus one out of every four male adults at the labouring age is directly engaged in the Sabours of "the fields and pastures."
Second-The Annual Value of Agricullural Produce tion.- Here we have no such precise informatinn as has guided us in our comparison of numbers. I shall nnt follow the estimates of \(\mathrm{M}^{\prime}\) Culloch, Mill, or other s'atists, for the result of the Scostish inquiry, limited as it was, has conclusively shown that their estimates were ver. random guesses; I shall use as a guide the degree of information a partial inquiry has afforded na.
By the Scotisl? returns we have what I believe to he close approximation to the production of that portion of the kingdom. I have valued that production by \(m\) medium standard of prices, about midway between the highest and the lowest years of a cycle of seven (88. prir bustiel for Wheat may be taken as the key to my seale;; and I attain thereby to the result of \(16,14,715 \%\). as the Salue of the produce of the agricultural industry of For England and Wale
For England and Wales we have as yet to guide us only the returns from the 12 selected counties "statisticated last year. Building on this foundation we may, estimate of the area devoted to each species of crop which cannot be far from the reality. Taking that estimated acreage and approximating to it the production of a very moderate return of crop ( 26 bushels per acre of
Wheat is the key-nute which governs my scale) I obtaint, using the key-nute which governs my splied to the Scottishe same standard of price as was appos the value of ons returns, a resuit of producticn in England and Wales. Comparing this with the Scottishl aggregatd given above, I see no reason to think that it is likely to be much in error. The population of Enyland and Wales is rather more than six-fold that of Scotimd, white the scale of living is certainly considerably hiyher:
The returns of Scottish production are-say in ruand numbers- \(16 \frac{1}{2}\) millions. Of this we may safély assume that sheep and cattle of the ralue of 11 millions are exported to and consumed in England. The consump tion would then stand thus:-

\section*{In Seotland}
. \(£ 15,000,000\)
In Eugland and
from Ireland
\(190,000,000\)
\(20,000,0 \times 18\)
In Ireland (suppose)
£165,000,000
as the product of the agricaltaral industry of the United Kingdom.

The declared value of our whole foreign exports was in 1854 (the year of greatest export ever known) \(97,184,7261\)., being but equal to \(4-7\) ths of the production of British industry in the "fields and pastures !" Thus certainly we prove that the first occupation given to all industries : of it is emphatically said by an inspired writer, "the profit of the earth is for all; the king him self is served by the field."

Of this greatest of all interests what cognizance has been taken by our ruling powers-by our legislature and executive ( Of course I exclude from my viev protective and free trade legislation.) What depart ment of state is charged with a surveillance over and relations of agriculture with other home interests an with foreign countries? To what minister can agrieut turists carry their wishes! For commerce thiere is Board of Trade with a responsille minister at its head and a large staff of officials who are not supposed govern ment ind of ideness. To the colona Alstratians have still access to a chiof secretary of state. The Woods and Forests and the Duchy of Lancaster have grea officers of state in superintendence of their affairs. Why should there not be a responsible minister of agricultare "They manage these things better in France." Nay, even her canada we may take a lesoon; the proinister of her council, or prime minister, being alsent Premier of agriculture. Who that hear 1853 can doubt that speech It the Lewes meeting of the right place" hero also?

For such a minister there would be no lack of func tions legislative and consultative, with some executive He would be the foeus for the colliection, comparisom,
and diasemination of the knowledge of home and foreign thke cognizance of drainage, improvement, and enclosure take cognizance of drainage, improvement, and enclosure schemes, and of other like measures, which are now the enclosure commissionera, who are irresponsible to the enclosure commissionera, who are irresponsible to Parliament, and indeed unknown except to a few ener getic and improving landowners and their improvers.
He would give attention to guano explorations and monopolies; to geological surveys at home and abroad whosphatic and other mineral-manurial deposits ; and finally, though I have not even glanced at many usefu functions which could be exercised by such an official, he would control and direct an agricultural census or inquiry which, carried out at intervals of 5 or 10 years information, as I shall afterwards show, than is sough to be collected by the measure at present proposed.
I leave this suggestion of a minister of agriculture to more weight of influence than I possess or aspire to,

\section*{If as I believe its vein be good,}
and pass on to a consideration of the bill for the collecIts compulsory powers I approve of, believing Its compulsory powers I approve of, believing that they will but seldom require to be exercised if any
management is shown by the officials charged with the inquiry; but I think that the agency through which it is proposed to work the measure is very objectionable That the ". Board of Trade "should have the supreme direction of an inquiry to be responded to solely by auriculturists seems absurd; and that the poor lay officials should be entrusted with the organization of
the local details of management is more than absurd-it is insulting. As a national measure the proposed inquiry is very defective. A national collection of rural It should give a view of the appropriation of every acre of the soil of the country; while the inquiry as proposed I observe an epitome of the agricultural statistics of several European countries in your number of April 2jels, and they are in this respect more complete than those proposed for England, than those collected in heads under which acreage is enumerated. 1. Under T.llage. 2. Meadows 3. Permanent Pastures. Uncultivated. The first three headings are those which Uncultivated. The first three headings are those which
only will be filled up under the proposed British system; are the others so unimportant that no notice
should be taken of them? Woods and forests form no should be taken of them? Woods and forests form no
insignificant portion of our national wealth; why are insignificant portion of our national wealth; why are
they untabulated? Uncultivated lands are not unknown even in our finest counties; let us be informed
where they are and what is their extent. There are where they are and what is their extent. There are
brawny arms which would prefer to employ themselves brawny arms which would prefer to employ themselves
in subduing these home wilds rather than in hewing in subduing these home wilds rather than in hewing

He who criticises and censures the plan of others should be ready with a plan of his own. Mine would be very simple. Let a central authority, say the minister and tabulating the schedules required, no local officer having any interference or concern therewith; this would obviate all local prying into and disclosure of
farmers' doings. This minister to hold a record of the propurietors of the soil. For the formation of such a record there is perfect facility; and the census tells us that the number of the class is not excessive, being but 34,627 in all. To each of those let a "proprietor's schedule" be issued, in which he should fill up the number of acres he owns; how many of these under waste, how many let, and to whom. A summation of thess schedules would give us the total acreage of the kingdom, and a view of its appropriation whether to agriculture, pasturage, timber growing, or to purposes of ornamentation and pleasure. An "occupant's schedule " transmitted direct to the tenant farmer would be filled up ly him with the acreage under each denominacion of crops, and with the live stock he holds.
The "proprietor's schedules" being filled up at Ladyday there would be abundance of time after their receipt to prepare and circulate the "occupant's schedules" before the lst of June; and by the lst of July a very moderate amount of diligence should enable the departmental staff to prepare, and the minister to publish, a each connty of the kingdom.
For the direction of commercial operations, this publication at so early a date would be very valuable, and we may rest confident that having it, trade inquiries and the extended correspondence which your own and other journals devoted to agricultural affairs hold with the world some weeks before and after the ingathering of the harvest, would lead to the formation of an estimate close enough to the truth to serve the purpose of directing the currency of the markets, weeks if not months earlier than any esti

That official estimate may, under the circumstances, be advantageously deferred till December, when the minds of farmers will be fully decided as to what the actual result is from three or four months of threshing. How should it then be formed? Let some men of
energy and practical kowledge, such as we have in
raluators and improvement inspectora be commissioned ovisit the different counties, forming them into districts when they are too large or diversified fur a eingle estimate to be applied to their whole extent. Let these inquirers" call to their aid in each county or division jury-as the French would term it a "Conseil des experts - and outain from it a verdict of the acreage production of each crop. The clerkly computation required to form from those materials a full return of y the 31 st of December an authoritative statement thereof, with every claim to public confidence in its the closing year's production; the purposes of an early estimate had been already accomplished.

I believe that this system would work well and smoothly, as it would enlist in its favour the opinions and feelings of the farming class, who have some right to be jealous and suspicious when they observe that the them under penalties to give answers to questions which they may without much stretch of imagination the poor-law officials, be turned to their disadrantage by disclosure; while landowners, who in relation to the upon to give information which, as I have siready pointed out, would make the proposed collection a real record of the rural state of our country. Even the intelligent farmers of Scotland whom you so much praise for their carrying through of a quasi volunteer you may judge from the strong expression of opinion contained in the last number of their organ The North distrust and suspicion should be thus allowed to prejudice a measure to the usefulness, if not necessity,
which I have already given my'humble testimony. which I have
May 2, 1856.

HOME FARM MANAGEMENT-No. III.
When a tenant farmer enters to a farm which he has taken in lease, he naturally looks pretty sharply going tenant for stock or crop. If the value of the stocking is to be determined by valuators mutually appointed by the away-going tenant and himself, he will be very careful to appoint only such a person as he considers likely to do him full justice. Now, however necessary this may be in the case of a enant entering to a farm, it is still more requisite when the occupant is to be both landlord and tenant. Amongs he worst informed classes of workmen, there is a very hard when their employer is a landed proprietor as when he is a tenant; or is at least dependent on his wn exertions for a livelihood. And I fear that this innate desire to act differently towards the rich than towards those who are in poorer circumstances, is not
confined to workmen, and may actually exist to some extent in the mind of a well-meaning outgoing tenant farmer without his really being sensible of the fact Man is so much a creature of circumstances and his actions are so largely influenced by association that even a well-intentioned person may thus unconsciously err. It may be only to a very small extent that the evil referred to is indulged in, but as it is the principle and not simply the act itself that I point to, its emall ness is scarcely an extenuation. Most certainly the good circumstances, he can afford to let poorer persons who have dealings with him have favourable bargains now and then is much too general amongst those who are connected with acriculural pursuits. Is it not a foct that in many instances the propietor tho farms his own is leeched in every direction, and counted lawful prey to those harpies who openly or covertly hover round almost every nobleman and gentleman's seat in the United Kingdom? No wonder that home farm management is rather a sorry game for landlords
to play at in many instances. No wonder that an amount of shrewd sharpness, in addition to general agricultural qualifications, is essentially necassary to qualify the manager of a home farm for his respon sible charge. There are very few instances in which a respectable tenant relinquishing a farm about to be taken into the proprietor's hand would willingly take any advantage of the latter. Nay, such a tenant would be the first to agree to a fair valuation being made of the such a case thagned. But it may be requa his own interests in a very careful manner. On the farm there may be both live stock and implements, which thougls entitled to have a price put upon them may yet be farming rinciples. Better far in that instance to let the outgoing tenant make the most of his farm stocking by bringing the portion of it usually reengnised as landlord beginning to farm his own land will do well to stock it anew altogether. His steward can in that case the feeding and dairy stock that are likely to give the largest returns, and the various implements which in the circumstances will best serve the ends in view. It may cost more money to go to a general market to procure necessary stocking than to purchase
it from the away-going tenant, but then if the management is judicious there is no throwing away of means
on unsuitable purchases.
And the very facilities that this general marketing affords for introducing both cattle and implements of superior classes to a district where, from having been seldom seen before they will excite surprise and curiosity amongst the older fashioned farmers, should be looked upon with some degree of favour. An old-school farmer will not admit the advantages resulting from improvements on his own practices, but neither will he lose sight of any new if it is once prosed to be worthy of his attention he if it is once prosed to be worthy of his attention he
will quietly adopt it withont acknowledgement, as if he had practised it all the days of his life.
It is of home farm management as furnishing a axample to tenant farmers, while at the same ten proving remunerative to the joiat proprietor and High, that I wish to treat in this series of articles. with some without good profis goes for very littl unless a careful distinction may be safely aftirmed that lord's and the tenant's business and cash accounts, ondless confusion and unsatisfactory profits are sure to be the result in home farming.

It is obvious, therefore, that an accurate system of book-keeping is indispensably necessary on such a farm. semblance of book-keeping neglecters of even the proprietor failed to set his tenantry a good example in this respect. There is no necessity for adopting a comthis respect. There is no necessity for adopting a comsufficiently elaborate to admil of the figures being properly checked and balanced from time to time no practical mind can doubt. Assuming that a proprietor has just got possession of a farm he intends to cultivat for a series of years, let us see what mode of ledgerizing
would be most suitable for keeping the whole accounts a a satisfactory state
In a previous letter I stated that there should be two primary headings in the books, or perhaps better two landlord's an-one for permanent improvements on the But under each of these heads or separate ledger accounts there should be numerous sub-headings. The permanent improvements ought to include-1, cash; 2 , drainage ; 3 , farm buildings; 4, irrigating and engine works ; 5 , roads and tramways; 6 , fences ; and 7 , general appliances. Under the tenancy heading will be ranged - 1 , cash ; 2, aggregate stock account ; and , rennected with the farm three will cover everythig checking the other subsidiary acccunts in detail as well as in the gross. The second account will contain-(1) feeding cattle, (2) dairy stock, (3) young cattle, (4) horses, (5) machinery, and (6) implements. In addition to these there should be accounts under the following heads:- green crops including (1) Potatoes, (2) lurnips, and (3) other feeding crops; white-crops omprehending - (1) Wheas, (2) Barley, (3) Oats, (4) cut Grasspand hay; and (5) pasturage; and black crope comprising-(1) Beans, (2) Peas. In this way every kind of stock, crop, \&c., has a ledger account for itself but that account is subsidiary to one to which the profit closs at the end of the year is transferred.
All this may appear complicated, but it is in thaty a matter of great simplicity. Let me just trace the orter in which an entry made in either the day or are bought from the outgoing tenant at a fixed price, and the transaction is at bnce noticed in the day-book.
If the price is not to be paid at the time, but is to stand as part of some larger sum to be afterards in the day-book into the regular journal and post the mount to the credit of the tenant, and to the debit of the account entitled Feeding Cattle. But if payment is immediately made, then the amount will be entered on the credit side of the cash-book, and carried to the ledger to the debit of the Feeding Cattle account. So with every distinct account, guano or nitrate of soda intended for a cereal crop will be debited against Wheat Barley, or Oats, as the case may be, and credited to cash by the payment being made. Whenver an account is debited for any particular purchase, some other one must be credited to balance with it The Feeding Stock account becomesindebted cash for the price of purchased animals, and when these are fattened off and sold cash in its turn becomes indebted to Feeding Stock for the price. It is inthis manner that all double entry books are kept, and without such enties time with any degree of accuracy.
The following may be taken as a full set of books for the tenancy department of a home farm:-
1. Day-bool, into which every buying or selling transaction is carefally recorded, aceording to its date. transactions, but for any other kind of entries that the daily occurrences may render desirable.

A Journal, intended to be a descriptive record of every transaction involving the question of money. No entry can be made in any of the ledger accounts till it has bern journalized in the pages of this book, and hether the transaction be a cash or a credit one, must appear here in detail the creditor always balan ing with the debtor side of the account
4. A Ledger large enough to bold all the tenancy accounts for at least a couple of vears.
5. A R,tation-book, in which the extent and yearly
course of cropping of every field will be stated in a
tabulated form. In another part of this book the and of the entire farm should be recorded.
6. Time-book for recording the work on which each workman is daily engaged, and stating the wages payable to him. At the end of every week or fortnight, according to the return of the pay-day, the amount paid is posted to the credit of cash and to the debit of the different accounts to which it belongs.
And 7. The Horse Labour Book. This is distinet from the ledger acconnt entitled Horses, being simply a day book in which the work performed per diem by each horse, and the money value thereof are respectively stated.

Now it may be thought that really there is mo necessity for being at the expense of procuring all these books and at the trouble of keeping them in good orler on the principle which has been pointed out, but I would jurely the propriok-eeping of any kind is necessary, to set a good example to his tenantry should adopt a creditable system of keeping his accounts. A day-book, cash-book, and ledger nay suffice for a farm where the entries are all made by the farmer's own hand, but on a home farm managed altogether by employees the case is very different. The books of a home farm should at all times be in that state that the proprietor or his agent can turn up the ledger account under any parti ular head, and ascertain the exact state in which it atands as to profit or loas. And then in his private Farm," showing the profit or loss at the end of every year, as brought from the regular books, and in this way he may know at any time not only how the farm is payiag on the whole, but discover also the exact department in which there has been a loss that may in future in the way I have indicated be the principal objection to the system there need not be much dfficulty in removing that. There must be some sort of bookkeeping, and the difference in the time required to attend to the incomplete as compared with the complete system is frequently little more than the time which ander the former would hang heavily on the hands of the clerk. On all the best managed estares a clerk must be kept at any rate, and the person who attends to the farm books may either be bis assistant, or if the property is too small for this, one good peaman will do all the writing which is required.
By having an active farm manager there will be no necessity for much expense being incurred in the keeping of the accounts, for a mere lad, if his education and general intelligence are up to the mark, will be quite able to overtake the work. One thing is perrectly cestain that if a home farm cannot a junior clerk, it will not pay without at least some system of book-keeping, and may be given up at once if

I have dwels somewhat longer on
(he keeping of farm accounts than I intended, but really the whole question point. Even the knowledge that all the expenditure of a home farm must pass through a regular set of books and be open to inspection at any time will prevent a needless outlay in many instances. And the conclusive evidence of profit or loss whieh well-kept books afford is a great incitement to the manager of such a farm to do his best in developing its resources and adding to its
profit. J. Lockhart Morton.

\section*{Home Correspondence.}

Relative Talue of Guano and Oilcake. - In Mr. Nesbit's interesting lecture alluded to in your Paper equal in manuring power to \(2 \frac{1}{4}\) tons of oilcate, is believe Mr. Lawes's estimate is much higher, 1 ton of guano equal to \(4 \frac{3}{4}\) tons of oilcake; but perhaps in this he only takes account of the ammonia in each, and reckons the oilcake as consumed for food, i. e., Stoducting the portion assimilated by the animal. In Stockhardt's Chemistry the proportion is given as I of guano to Mr . Nesbit for the data on which he founds his calcula tion: It is a very difficult practical question to many Is it better to use oilcabe or guano? If Mr. Nesbit is right, and nearly half the cost of cake may be charged to the manure, it ought to answer at least on those farms (or districts) u here any profit is made on stock. And the case is still stronger with Rapecake (where the stock can be got to eat it), since the cost of \(2 \frac{1}{2}\) tons of Rape-cake is only \(2 l\). or \(3 l\). more than that of 1 ton of guano. \(X\).
(hick Sowing Poor Land.-My answer to your corre appeared in the Guzette I con Poor Land" not having appeared in the Guzette, I conclude it has either been mislaid or not considered wosth notice. As the subject some future cocasion be given to set the question at rest, fully explaining the meaning of "poor land" in ite legitimate sense, not bad soil made fertile by tillage. Another note published on the 26th ult. recommends Wheat to be sown thick to smother weeds! When thoroughly cleaned, it is sometimes highly manured for betches, which grow rapidly, overtop, and kill the weeds, is wheat for the same purpose, unless to be cut green, scientific pursuit details may be swallowed days of generalities, nevertheless the former are the essentials
to practicul men who have to live by their industry.
Fulcon. [The article in question Fulcon. [The article in question was never received.]
W'raste of \(I_{\text {r }}\) on per Acre.-The particulars furni-heri] Wreste of \(I\) on per Acre.-The particulars furni-hed annual consumption of iron per acre on a farm, are probably as correct an estimate as can be formed of the wear and tear of that material in a light land district I have no doubt they will be considered sufficiently approximative for the object of the inquiry, notwithstanding they exhibit a wide difference from the data furnished by the agricultural establishment at Grignon, where the land is of a similar character (mechanically) according to the Journal des Economistes for June 1854 , no less than between 7 and 8 kilos of iron per acre The inquiry, though apparently of small interest, is really of some importance to us just now. The strong convictions of their inpolitic and prejudicial bearing on agriculture that induced the agricultural jury of the late Exhibition to seek for a diminution of the protective duties on agricultural machinery are now largely participated in by the agriculturists of France gene-
rally. The approaching Exhibition, at which English rally. The approaching Exhibition, at which English implements and machines will be largely represented, will no doubt furnish them with another opportunity for demanding still further relief from those fiscal charges which even now practically prohibit the importation of many of those machines most desirable for the cultivation of their land. W.

\section*{Eocietiz\%}

ROYAL AGRICULTURAL OF ENGLAND.
Monthly Council, May 7 :-Mr. Miles, M.P., Vice. President, in the Chair. Fifty-six new members were elected

Finamers-Mr. Raymond Barker, Chairman of the Finance Committee, submitted the monthly report on the accounts of the Society ; from which it appeared that the current cash-balance in the hands of the Society's bankers was \(3657 l\). He also laid on the table the several quarterly statements of account in reference to the different branches of income and expenditure.

Journal.-Mr. Thompson, Chairman of the Journal Committee, reported recommendations in reference to the preparation of a complete analytical Index to the Journal of the Society; and to an alteration of the terms in which the grant is at preseat made to the Royal Veterinary College. It also expressed, on the bers of the Council would favour them by suggesting, before the lst of June, subjects for the essay prizes to before the lat of Jun
be offered for 1857 .

Chbmical Amalysis.-Mr.Wren Hoskyns, Chairman of the Chemical Committee, reported the progres in preparing the new schedule of charges to be made by the consulting chemist of the Society to its members.
Guano-Substitute.-Mr. Raymond Barker reported communications from the committee, and the Council gave instructions in reference to them.
Chelmsford Meeting.-Mr. Barnett, Vice-claairman of the Chelmsford Committee, reported the suggestions of that committee, which were adopted. The dining pavilion to accommodate one thousand guests on Thursday, the 17 th of July, the principal day of the show, was finally ordered.

Dinamometer.-Colonel Challoner transmitted the engagement entered into by the Implement Committee with Messrs. Easton and Amos, to complete for the Chelmeford meeting the requisite dynamometers for the trial of field implements on that occasion.

Foreign Prize Sheet.-Mr. Miler, M. P., reported the steps he had taken, in conjunction with Lord Feversham, to carry out the intentions of the Council in reference to the conditions under which foreign cattle were to be shown in competition for prizes at the Chelmsford meeting.
Trustee. - On the nomination of Mr. Milward, seconded by Mr. Raymond Barker, Mr. Evelyn Deni son, M.P., was unanimously elected one of the Trustee of the Society, in the place of the late Mr. Neeld, M.P Thorough-bred Horses.-Mr. Fisher Hobbs pre rial, requesting the Council to accept the a mem rial, requesting the Council to accept the following prizes for competition, under the general regulations
of the Society, at the ensuing country meeting of the Society, at the ensuing country meeting.

Honorary Member-On the motion of Mr. Evelyn
Denison, M.P., M. Léonce de Lavergne, author of the excellent work on the Rural Econongy of Great Brita and Ireland, was unanimously elected an Howorary Member of the Society.
Pollury Steward.-On the motion of Mr. Fisher Hobis, Mr. Joseph Cooke, mayor of Colchester, was appointed Steward of the Poultry department for the Chelmsford Meeting.
Cavelement Steward Elect.-On the motion of Mr. Cavendish, Mr. Barnett, of Stratton Park, was appointed
Steward Elect of Implements for the Chelmsford Meeting.

Cocxirry Meeping of 1857. - Invitations were pir bury, Taunton, and Winchester, requestechester, Sxilis to select the place of the country meeting the Council year from one of their respective localitites, The vari ous memorials, plans, and other documents the variceived, were referred to an inspection committee, with a request that the members of it would personally visit che proposed localities, and report upon them to the council on the 4 th of June
House List. - The balloting list of Council to be re commended for adoption by the general meetiag on the \(22 d\) inst. was prepared agreeably with the terms of the

Lecture. - On the motion of Mr: Lawrence, Professur Simonds's second lecture "On Parasites affeeting \(D_{0}\) mesticated Animals," was arranged to be delivered as proposed ou the 25 th of June, at twelve o'clock.

Forbign Cattle Entries,--On the motion of Mr. Brandreth Gibbs, the period for receiving entries from abroad of foreign cattle intended to compete at the Chelmsford meeting was extended from the lst to the during une, in order that entries might be effected during the Paris exhibition, to take place in the first
week of June.

\section*{Farm Memoranda}

Lea Green Hall: Church Minshull, CheshirgTo Mrs. Mary Robinson, as tenant and ocellpier, for the best managed Dairy or Grazing Farm of not less than
"Inspectors" Report.-The claimant's farm contains 257 acres. The soil is of a strong rich description with the exception of some 25 acres, which is of a sandy nature.

This year the cropping was as follows:-Pasture land, 115 acres; meadow land, 65 acres; meadows irrigated, 4 acres; Wheat after Potatoes, 18 ace: ; 4 acres ; Potatoes, 51 acres; acres; Clover and Vete: s , 3 acres; Mangel Wurzel, 1 acre ; orcharis and garde \(s\) 3 acres ; plantations, occupation roads and was : 11 acres.

The customary course of cropping adopted is as follows, viz. -lst ear, Oats; 2 d , green crops; 3d Wheat; 4 th, Oats or Barley with seeds to lie one or two years.
"The quantity and description of stock kept this season, is:-Farm horses, 6 ; dairy cows, 69 ; heifers, 5 ; sheep, 6 ; lambs, 60 ; pigs, 40 ; rearing calves, 12 ; Turnips, and ground Oats, and in summer are turnedout to Grass.

About 400 ton of manure is annually made on the premises, which is applied to the meadows and green crops. Claimant purchases annually about 10 tons of boiled bones, and I ton of guano, all of which is applied to the green cropa, Clover roots and pasture lands. The meadow land on this farm is maintained in a productive rich soil, and in old turf. A considerable portion of the pasture land has been drained; still there are several acres which require that operation. The Wheat in No. field was part after Clover, and part aftes the bas, that which succeeded the Clover was Oats after leas, a medium crop; Oats after Wheat, only a light produce, with the exception of about one-half, which was as fair and full crop. The Clover日 were mostly uniform and thick. The Potatoes, Turnips, and Mangels were kept free from weeds, and showed good management. Claimant has used annually for draining 10,000 tiles, which are laid on slate soles; and she has also within a period of seven years marled 35 acres eradica:ed 3000 lineal yards of old hedges, drained the ditch bottoms, and levelled up pit-steads, at a cost of 40 b ; has also sunk a well and put down a pump adjoir ing the kitchen, and erected over it a large shed; and built two walls to surround the gardens. All the materials for these erections were foudd by the landlord and the work completed at claimant's expense. All the fences and gates on this farm are in good order. The appesard, barns, and other accommodations fo and were 11 have been particularly well atend gardens in most respectable keeping. "- Journal of the \(M\) anchester and Liverpool Agricultural Socitty.

Huvgarian Agriculture.-I find the Magyar cila racter to have a great resemblance to that of the 'Iurks,
the Magyar is uncivilised recause he feels no desire to be better; he is on perfectly gond terms with himself he has no internal desire to labour, to improve, to take pains, and to f ersevere until he arrives at a great future result. Even if the common Magyar go to Pesth or Vienna, you find him a waiter in a tavern, a barber, or any light sauntering employment, but rarely in a trade that requires severe labour or a long apprenticeture, he is equally remarkable for a spirit of antique, incurable, Asiatic indolence. Ot the value of manure they have not the least idea, or rather they set ton much store by it, for it accumulates in the towns so as to breed a fever from time to time. The agent of the Steam Navigation Company wished a heap of dua be removed from the vicinity of the landing-place here but the peasant answered that the dung of his father
stand how he should be called on to remove it for the
publice convenience. It itever struck hin that if he
laid it oi liis land he stould put money in his pooket, so laid it on his land he should put money in his porket, so
it was rennved by the steam boat agent. The lopyis
Then here are of the rudest description, and are all of wo d excent a coarse ploughshare, which turns asile the
earth so insufficiently that ail the earth so insufficiently that all the plonything is dene with six oxen, when, with a modern plyugh, a pair of
stout oxen is quite sufficient for the heaviest land. The harrows lonis as if they had cone out of Nosll's ark, being entirely of rude branches of trees pregsed
tozether in the most inartistic msnner, and do their work so imperfectly that a considerable part of the seed corn is blown away. When harvest
time comes, the Wheat instead of being reaped is time comes, the Wheat instead of being reaped is
mown down like gras, the mower receiving an mown down like grass, the mower receiving an
eighth of the whole for his trouble in mowing. The eighth of the whele for his trouble in mowing. The
corn is then heaped up in stackg, and often lies on the pround until the outside grows green again.
There is no thresling except in the model farm of There is no thireshing except in the model farm of
a wealthy magnate here and there, and even with them a weathy maguate here and there, and even with them
if a wheel gees wrong there is nobody in all the country round who can repair it, and a man must be sent for from Pesth and Viemna. The grain is trodden out hy horses in the open air, at an immense lose, and the substitute for a granary is no doubt the same as between the Lena and the Oxus before the days of Arpad. A hole is duy in the earth, narrow at the top and broad
below, and liere the corn is deposited. To exclude the damp, the mouth is so narrow and the cavity so deep, that the man that takes it out is let down with a rope, gets so earthy a flavour that the bread gets an unavoidable goatt, which every traveller in the back about \(\mathbb{E}\) zolnok, as well as all along the The ground Tokay to its confluence with the Danube, near Belgrade, is fat black humus, and consequently not good for Potatoes, but excellent for Rapeseed and Wheat, the proportion of Rape sown to the product being around and better agriculture the vale of the Theiss might become a Peruvian gold mine ; for instance, from here to Mezäd Tör is a five hours' joorney, all black alluvial
soil, and only two houses are to be sean soil, and only two houses are to be seen. It, therefore, follows that those who really are laborious and understand the modern proceas of agrieulture have very good
incomes ; for instance, Mr. Z
 from the Aimasy family, for the sum of 33,000 florins (about 1,3001 . sterling); the expenses of cultivation amount to about the same sum-together 2,6001. One
year lately his income, from Rapeswed alone, was 90,000 florins, or about 3,600 l. sterling ; and this from only a third of the land, another third being grain, and the rest pasture and mixed crops. In a good year he makes
6,0001 . per annum, which, with the deduction of 6,000l. per annum, which, with the deduction of 2,6000 . per annum for rent and cultivation, leaves him above
3,0000 . per annum. But you may rest aesured that Mr. Z- knows the value of time, and does not saunter about all day someking his pipe, The poor, saimple,
brave, and Riehard" to tell him that there are ""n needs a "Poo pains."

\section*{Miscellaneous.}

Finger and Toe in Turnips.-I shall close this paper with a few remarks on a recent innovation in our without any discussion, and that, is to pass into use part of agriculturists, is to be given through their maintaining silence on the subject. I allude to the meaining which we have hitherto attached to the term finger and toe" in Turnips. Professor Buckman, in tural society of Eigland on this subject and contends then elaborate paper "finger and toe" in Turnips should be restricted to of finger and toe in Turnips should be restricted to the cegeneracy which takes place in Turnips when they views have been maintained withed roots. The same views have been maintained with great ability in some and Vecember 1855.) Mr. Berkeley, a most profound writer on vegetable pathology, also adopts the same and maintains thars \({ }^{\text {C }}\) Chronicle (8th December 1855), and maintains that a distinction should he drawn between the disease of "anbnry" in Turnips, ant I cannot discover sufficient reasons for drawing any Nastinction bentween " finger and toe " and "unhury." for. The causes of degeneracy in Turnips have been very ingeniously traced, both by Mr. Buckman and Mr. Berkeley. But no one, until now, I believe, ever thougist of considering the tendency of the cultivated root to revert to its wild state, as a diseased condition of the Turnip. The degeneracy of Turnips was never confounded with the disease so well known under the not inappropriate name of "finger and toe." It is a great reflection upon the intelligence of the officers of man has done, that they were analysing soils for the purpose of discovering the causes which soils for the purpose of discovering the causes which produced is not sufficient their root crops. If the term dergeneracy is not sufficient to express the revering to wildnees in our cultivated varieties of Turnip, the finger and the, it appears to me, is exceedingly inapproptiate. Indeed, both the writers who are now contending for the
reetriction of the term "finger and toe," are obliged
ultivated var eties of Turnips, is not a diseave in the strict sense of the term. Why then call it a disease Why call the tendency of certain plants to revert to their natural methots of growth a malady; a malady which can only tee faid to attain its worst stare when the plants are about to attain their most healthy o natural state, by entirely running wild ! Rut we ar told that this degeneracy-"this malformation, is finger and toe, being merely a forked or digitate method n
growth. Finger and toe is common to a'l root crops It seems to me, however, that the use of the term digitate bere, and in all Professor Buckman's writings Royal question is improper. In his paper in the Royal Journal of Agriculture," there is a drawing o as could, be imagined, and which a described as digitate, as could be imagined, and which a described as digitate,
and affected with the disease of "- finger and toe." But, notwithstanding this, the root cannot be said to be either "digitate," or "fingered," or "tned" in the
botanical sense of the tern. It is forked or branched certainly. "A digitate root"" says the "Imperial Dictionary" "is one in which the tubercles are divided into lobes like fingers." Now, none of the degenerating roots which have been figured and described by
Professor Buckman answer to this description; but on the other hand, a Turnip, attacked by anbury, often has its roots lobed by the formation of excrescences ; in sense of the term. Therefore, to restrict the proper finger and toe to the degeneracy of root crops seems to me totally inadmissible, from whatever position we may dopted has been formerly written and done in the matter. think we should still adhere to the view which Mr Curtis has taken on this question in Morton's "CycloTurnips sufficiently indicated by its other name of fingers and toes." Mr. Russell in the Quarterly Journal Manares
Marple-top Yellow ; Purple-top Yellow; they were sown on the 11th June 1855 , and lifted and weighed on the 22d of Novenaber The soil is black loam, lying on whinstone rock, natu rally dry, of medium fertility, and inclined to grow a mall quantity of straw.

\section*{Manure
applied.}

From the time the Turnips brairded until the end of August the different lots could scarcely be distinguished from each other. About that period the whole began however, those grown with guano suffered less than the others, and from that time until the end of October distinctly marked themselves by a greener and fresher appearance, which, although to a less extent, continued until they were lilted. The Turnip tops have been al left on the ground to be ploughed in, and it is intended the result of the Wheat crop. The following is an analysis of the manures employed, as furnished by Professor Andenson, Chemist to the Highland and Agricultural Society of Scotland :-

kaline salts equal to 234
Mr. Scott, in the Hirhland Society's Transactions
Mr. Nisbet Hamilton on the Agricultural Statistics of Eost Lothian.-He states the "average return of five parishes in 1854-without exception the greatest harvest nown-as amounting to 35 bushels per acre." There In looking larger harvests in Scotland than that of 185. districts No. 3 and No. 4, each embracing four parisher, ive the returns at 35 bushels-the one Mr Wripht of Southfield, the other Mr. George Hope, Fenton Barns. To which of the two enumerators Mr. Hamilton refert, when he spealis of the enumerator as "san honest and reputable man," it is impossible to say. In the county generally, both gentiemen may be thus described. But twould appear that, though honest in Mr. Hamilton's estimate, they are, like the Highland reiver Rob Roy, produce of their respective districts returning the produce of their respective districts, the highest in cotland, they, according to Mr. Hamilton, have returned it 15 bushels under the fact; and. curious enounh, he gives as a reason that without 50 bushe's of Wheat they, as occupiers, could not meet their engagements, aud pay rent, some \(4 l\). an acre. In 1854
some farms were upwards of \(5 l\). an mere. Now, what is

Thet win reterence th the produce of kast Luthian? thuse one of the farms on the estate of Uirleton, rented the years 182? This we had from the then tenant, the has M1r Wenels. Whon at that time was nue of the larest occupiers in the county, having, besides, other farms. Nor were his rops under those of his neighbours. The best farmer in the county of his day, the late John Brodie, occupied wo large farms; duriug the same year his average arm of Lawhead, occopied by the late Andrew. The rather exceeded, but not much, this amount. We could urnish other instances, but these being three of the leading farmers of their time are sufficient. These were douhtless years of very small produce, and certainly, with such crops, rents were paid with difficulty, burge they were generally paid. \(14 \frac{1}{3}\) bushels leave a of Mr. Hamiltontrasted with 50 bushels, the estimate re . Wemen necessary to pay such rents. We Hamilton's, that on ther from this estimate of Mr. the owner, the home farms of Biel and Dirleton, shat amount- 50 bushels, was the produce of 1854 . We can assure the honourable nember, if he could secure his tenants 50 bushels of Wheat, and other crops corresponding, the rental of the estates would soon be doubled, and the tenants still in a flourishing condition. But however high the produce is, mainly through the skill and capital of the occupants, it is yet far below any such esimate. North British A oriculturiat.
Bone Manure in Chester.-It must be admitted that during the last 15 or 20 years, and especially during the last 10 , most extraordinary improvements have been effected in this country by the application of bone manure and by this country by the application of bone manure and by dramage. It is notorious that by these mprovenente the quantity of the herbage has been so increased, and the quality so improved, that on many farms double the number dairy cows are now kept on same extent of Grass, and in better condition than ormerly. The fertilising effects of bone manure sre such, especially when applied to our poor clay soils in a state of Grass, that herbage often the most miserable becomes supplanted by white Clover, Trefoil, and other nutritions Grasses, whose verdant stems then start up from the grateful soil without the help of either the viously could scarcely be at all recognised. But perhaps to no crop is the application of bone manure in Lancashire and Cheshire "Clover root " counties "seeds"" When I state that the usisl rote tion of cropping is, 1st, Oats ; 2d, Potatoen, Turnips, or other green crops (manured); 3d. Wheat ; 4th, Oats or Barley, and laid down to Grass; the necesssity of some manure being applied to the seeds will young Grass-root after the two last white crops prices of bone manure (boiled bones being \(5 l\). 10s. to 6l. per ton, and raw bones 8l. per ton) nearly all our west Cheshire farmers-excepting those in the neigh bourhood of large towns, where night soil and other manures are readily obtained-are applying either crushed boiled bones or finely-ground raw bones, but principally the former, to their Cl .ver roots, and after the rate of 10 to 12 cwt . per statute acre. Such confidence have many of our farmers in bones, that they will apply them to wet clay hand, I will not eay with the expectation of rendering drainage unnecessary, but at least with the belief that if bones are applied, the turf Grass, may he dispensed with. It is, however, a wellknown fact, that whilat some moisture, such as rain, is necessary to discolvs any solid manure and fit it as food for plante, exceraive moisture, stagnating on the surface or in the soil, will destroy much of the virtue of the White at Cheater

already manufactured. cows per 100 acres are generally kept on dairy farms?-
As at least nine-tenths of dairy farms in general in the vale of Gloucester is pasture land, and that of a description peculiarly adapted to dairy purposes, at least
\(2 \overline{5}\) cows can be, and generally are kept on ino acres besides the usual quantity of young stock necessarily reare At what age are they generally sold when considered unfit for by all dairy fammers that the zounger the cow, the richer in the milk yielded, although the quanger the cow, the richer is mo great the first year of the cow's ealving as the secnnd or
third; the second and third years are the most profitab'e, quantity and quality of mill being considered. Supposing the she ie at her prime; if she continues to produce her calf in good season, i.e., from February to April, she is generally retained advisable to continue to milk her; \(8 \mathrm{~m}, \mathbf{1 8 t}\), her milk is fast
deteriorating in quality; 2 d , she is becoming of less value deteriorating in quality; 2d, she is becoming of less value every year to the grazier; and, lastly, which is a material
point, it has been proved beyond question that an a a yed cow
consumes much mire food than a young one, particularly in Winter, when hay being nearly her only foud, it adds very of age is to good farmers the usual time for casting off the dairy cow. In all packs there are favourites either on account are occasionally allowed to remain in the dairy pack to 10 or
even 12 years of age, as fatting and milking does not work well together. The cast-off dairy cows are stldom fatted by dairy milk for the season) to grazing farmers. - (3.) What are the nsual prices realised for old cows when sold? - The price usually con lition. - (4.) What do you consider the value of young cows
which have just dropped their first calves?- From 147. to 181 for 3-sear olds, which is the more general age of the cow's
producing her first calf; but some farmers, particularly on very rich laud, allow their cows to calve at 2 years old. From
100. to 14 . is the usua price for this age.-(5.) What prices a suficient number of heifer calves each dairy farmers to wean proper quantity of cows yielding milk. The quantity required milked; after these are selected, the remainder of the heifer calves and all the males are either sold to the hill farmers for
oid) to butchers at (very joung - not more than 4 or 5 days oid) to butchers at a very low price, frequently for 106 , or 158. ; the price obtained for those for rearing is generally from \(255 s\).
to \(\$ 0\) s.-(6.) How many meres of Grass are allowed to ench cow in summer (1st of May to 1st November); and how much hay Will she consume in winter?-One and a half acre of Grass is
the usual allowance for a cow from the 1 st of May to 1 st of December; and as she will consume about \(2 \ddagger\) tons of hay (if
fed on that fuod only) require the same quantity of land, viz. 13 acre, for the winter as for the summer.-(7.) Eatimated expense of summer and winter keep for each cow? -The value of the lad required to keep a
cow during the six summer months we presume would be about 4l.; and as the expense of hay-making and attendance on the
cow during the winter must be added to the same quantity of land, we think 51 . is a fair estimate of the cost of her keep from 1 st of December to 1 it of May.-(8.) What quantity of Turnips or other roots are allowed in winter, if any; and also if oilcake,
Linseed, or Bean-meal are ever given to cows? Linseed, or Bean-meal are ever given to cows?-As a general
rule, Grass in summer and hay in winter is the only food given by dairy farmers to their milking cows; certainly in \(n\) ) instance is oilcate, Linseed-meal, and rarely
sionally Barley straw, where any, is grown, is cut into ochasionally Barley straw, where any. is grown, is cut into chaff
with hay, and given during the time no milk is yielded, which rnantity of milk produced annually by each cow, and at what quantisy of milk prodiced annualry by each cnw, and at what nearly as possible the quantity of milk yielded per cow annually; and the months of May, June, and July are the most productive montus in the season for quantity, after which time it
graduallr diminishes.- (10.) Arerage rilantity of cheese, double and single, and whey butter yielded by each cow? - Very little
double Gloucsster cheese is now made, the farmers finding the
 is the average of the countr per cow, and about 30 lbs. of whey
butter annually.-(11.) What is the whey worth for feediry piys? - The ralue of the whey for feeding pigs is estimated at RAPESEED: \(R A\). 1. The true "branching Rape," if you can get Rape, but inquire, when you purchase, what dinferent sorts of Rape, but inquire, when you purchase, what kind of crops the
seed has been produced from. 2. About 2 quarts of seed per
acre; generally about 8 s. or 10 . per bushel. seed, jnast as Turuip seed; or cent when only some has begun to tmais brown: let it lie to ripen, then thresh in the field with

 A. at the same time respectfully solicit notice to their new HAND MACHINE, specially adapted for mowing small lawns, verges,
around flower beds, \&c., and which has now undergone a trial amply sufficient to enable the Patentees witl all confidence to offer tit as the cheapest as well as the most efficient and complete machine extant. The improvements effected by the Patentees enalle close to the edge of flower-beds; has great facilities for quick turning, cutting and whenls or rollers in mowing verges; will cent can be effectually regulated in a few seconds by merely turning a screw, and being simple as well as complete in its construction the machine can be easily worked and managed by a common labourer. The machines are fitted with due regard to strength and superior to mowing with the screthe, while the simultaneous operations of rolling and close cutting greatly improve and bautify the turf. The Rolling and Mowing Machine is now in common nse at all the Rnyal Gardens, Windsor, Kew, Buckinghand Palace, and Osborne. A. Shaska \& Sos have much pleasure in submitting the following from the numerous unsolicited teatimonials
received by them in favour of their New land Machine:-
received by them in favour of their New Hand Machine:
 sive extreme satisfaction; indeed, they are preferred to all others." From R. K. Gnode, Evq., of Heathir Hall, Ashly-de-la-Zouch.
UGentlemen, The Machine does its work far better than can be dome with the scythe, and at half the expense."

\section*{SAMUELSON'S}

REGIStered budding's Lawn mowing machines PLEASURE GROUNDS, LAWNS, BORDERS, BOWLING GREENS, ETC.

To cut from 16 inches wide, for a boy to work,
\(\mathrm{U}_{\mathrm{p}}\) to 30 inches wide, for man and pony'.
 Width Cut \(\overline{16 \text { ins. }} \quad \overline{19 \text { ins. }} \quad \overline{22 \text { ins. }} \quad \overline{25 \mathrm{ins} .} \overline{30 \mathrm{ins} .}\)
THE REGISTERED IMPROVEMENT renders unnecessary the great care requisite in the handing of these machines on the old plan; all that is now requiredi can be doue by any unskilued Labougrb, who has only to push the machine hefore him. The Registered adjustment insures a
 knives from cutting into the soil, however uneven the ground may be.
Copies of Testimonials will be forwarded, post free, on application to the manofacturer.
The above may also be procured at the priacipal Agricultural Implement Dep 6 ts in London; of Messrs \({ }^{\circ}\) J. Veitch; \& Son, Exotic Nurseries, Chelsea ; in the Agricultural Department, and on the Lawns of the Crystal Palace, Sydenham; and of all respectable Ironmongers \& Seedsmen in the country.

B. SAMUELSON, Britannia Works, Banbury.

GREEN'S NEW INVENTION IN LAWN MOWING AND ROLLING MACHINES,
SOLE MANUFACTURER, iron AND WIRE WOBKS, NORTH STREET, LEEDS. REGISTERED JULY 24, 1855.-No. 3739.
THE ADVANTAGES OF THESE MACHINES supersede all others by having 2 amall Wheel in front of the Grass Box, consequently will mow verges and round flower beds,
 the Grass any length required; and baving two rollers behind, and a small one in front, they roll the
width they cut; thay will turn in very litte room, and eut at the same time. All the working parts made much stronger than the old machines. The bototoun Blades are so constructed that they cannot
tear up the ground; they are only drawn, and not pushed and drawn as in other machines, tear up the ground; they are only drawn, and not pushed and drawn as in other machines,
consequently do not require half the power to work them. The three first sizes can ve worked by one persion with ease; the latter with a pony or donkey.

Testimonial from Joshua IIajor, Esq., Landscape Gardener, Knostrop.
To Mr. Grben, LeEDs.-SIr, AB I always appreciate public and useful improvements, I most gladly give my testimony to
our highly improved Mowing and Rolling Machine. The one sent for my inspection and trial (cutting a breadth of 24 inches) was your highly improved Mowing and Rolling Machine. The one sent for my inspection and trial (cutting a breadth of 24 inches) was nicety. So complete and simple is the invention, that amateur gentlemen, and even ladies, may work either the 16 or 20 ineh size With ease and pleasure, proriding the Grass is not too long. For extensive places I should say the largest size iz8 inches) would
be most suitable; for even in undulating ground two persons may work it; but in flower gardens, when beds, de., are crowded, either of the mmaller sizes would be best. I congratulate you on your very valuable invention, which in my opiniou, entirely peditious in its operations, and consequently must prove a great saving in the management of Grass lawns, and a great boon to the phblice, -I am, Sir, your most obedient servant, Joshtu MAJOE.

Other Testimonials may be had on application to the Manufacturer.

\title{
NEW AND BEAUTIFUL PLANTS. MESSRS. VEITCH AND S 0 N,
}

\author{
EXOTIC NURSERIES, EXETER AND CHELSEA
} AVE much pleasure in now offering for sale, for the first time, the following novelties, of their own recent introduction, and in the selection of which they have been guided solely by the determination of submitting only such phants as are of general usefulness and sterling merit.

Plants will be ready for Delivery on and after the 26th of May.

\section*{AESCHYNANTHUS FULGENS.}

A very fine species, of a rich nrauge sarlet, shaded with
 where Sir William Jackson Hooker says, "It hlossomb very

\section*{CEANOTHUS FLORIBUNDUS,}

Perhaps the finest species of Ceanothus yet introduced; raised from seeds sent home by Mr. WirliamI Iobb, and has proved to
be perfectly hardy. It was figured by Sir Willian Hooker in Curtise "Botanical Magazine" for september, 1854, and deseribed as being "cortainly the mest beautiful of the several
blueflowered kinds yet known to us. The leaves are copious, blue flowered kinds yet snown to us. The leaves are copious,
compact, and llossy; and the flowers, though really yrowing in crymber, ate so deane as to be perfectly globoses, and these heads, crowded at the extremity of numerous short branches, at.d of the
richest mazarine blue that can be looked upon. It fowers in richest mazarine blue that ean be looked upon. It fowers in
June." A few extra sized plants, 21 s. each; smuller size ditto, 10s. 6d. each.

CLEMATIS GLANDULOSA.
This is a fine stove cliniber of free growth, and an abundant bloomer. Sent home fron Mount Salak, in Java, by Mr. Thomas
Lobb. The petals are dark purple or nearly black, witl pure white anthera. The two distinct colours produce a fine contrast. Strong plants \(10 s\) s. 6 d. each.

CUPRESSUS MiNABIANA.
We bave succeeded in raising plants of this beantiful Conifer
 Nevada of oorth (alifornia, where it forms a bush frem eight to
ten feet high. Dr. Liudley, in describing it as a new plant in the Gardeners' Chroricle, June 23,1855, said, "The specimens gathered by Mr. W. Lobb, and from which Messrs, Veitel have their green and glaucous scales associated with the deep rich brown of Tamarix gallics on their branches, and show that in Youth and vigour the species must be exceedingly handsome."
A few extra sized plants, 213 , each. One year seedtings, 10s. \(6 d\).

DELPHINUM CARDINALE.
A new and rare introduction, of remarkable beautr, possessing Was Ggured in the "Botanical Magazine" for Ilecember, 1\&55, and desernbed by Sir Wm. J. Hooker in the following terms:-"We
have now the plassare of making known a species of Delphinium have now the plaasare of making known a species of Delphinium the plant, and excelling in the brilliancy of colour of the tlower and that, as rich a scarlet as can well be looked upon. It is one
of the many novelties selected by Mr. Willital Lobb, in of the many novelties selected by Mr. William Lobb, in
Call fornis, and introduced to Son, of the Exeter and Chelsea Exotic Nurseries. Treated as hardy perennial it cannot fail to be a great favourite with all hardy perennial ine cannor," Strong plants, 0 s . 6 d . each.
overs of handsome flowers."

\section*{DODECATHEON INTEGRIFOLIUM.}

A now and beautiful species from Califor ria, pertectly distinct portant addition to our spring flowering plants. Estahlished pilantor, 5 s. ench.

FUCHSIA MALAKHOFF A large sud very showy double variery, raised at our Nursery.
Broad crimson repals, and purple corolla. Pronounced ty the editor of the "Florist," to be "reitainly the rutist striking and thowy of the donble varieties." It is of excllent habit, and
Messrs. Vand Son lave no hesitation in marranting it to give Messis. . and Son have no hesitation
batisfaction. Good phents, 7 s. 6 .

FUCHSIA PENDULINA.
A very distinet and beautiful hybrid raised between \(F\). serra tifolta and a pendulous Peruvian species, prodicing even o
small plants fife corrmibs of delicate carmine flowers 3 inche in length, and very glosss, deep pink corolla, foliage ornamenta and altogether it may be considered one of he most elegant of
its tribe. It received a Certificate of Merit at the Nationa its tribe. It received a Certificate of Merit at the Nationa
Floricultural Meeting, October 4, 1855. Giood plants, 7s, 6d. each

\section*{JUNIPERUS PYRIFORMIS.}

A rery distinct and fine fpecies, met mith by Mr. W. Lobb on the meuntains of St. Barnardino, in California, where it forms low tree 10 to 12 feet high. The truits are reniarkable for being purple with a glaucous bloom, and it is periectly hardy. Price
each
LEPTODACTYLON CALIFCRNICUM
A lovely plant for the greet house or conser vatory, It is from
South Calitornia, and forms an exceedinglv pretty liw shrur marka ble for the slender segments of its copions foliage, and for the graat beauty of its Phlox-like flowers, which are vroduced from May to Augnst in very great prolusiin, crmplet ly covering th
plant. Collur of flowers rosy pink, most delicately shaded. may be called a ministure tree Phost It Iase exhibited at Society's exhubition on the 4th July in the same Eeasonn, and on both occasinns was awarde a Large Silver Medal as a new plant of sterling ninerit and great beanty. It was very accurately figured
in the "Florist" for Uctober. 1855 . This 1s unquesticnally one of the fivest and best H lants Merssrs. Tr. and Son have ever had the oflesaure of ofering to the pubicic. Flants of two sizeslargest size, 21 s , each; bwaller ditio, 10 s . \(6 d\). . tach.

\section*{OUVIRANERA FENESTRFLIS.}

It affiords ns much gratification to be the medium of offering very rectant prind, was kncwn in this conntry, only by difiec specimens and drawings. It is a rative of Madagascar, fron

\section*{TECOMA FULVA}

A beantifil Bignoniaceous plant with tubular flowers of bright tellow shaded with crimson, fifured in ti.e "Moranical Magazine,
Febiuary, 1866, and described by Sir William Houker, whe Febiuary, 1856, and described by Sir wiliam How
says, "There cannot be a question but that the handsome plaut here figured is the Bignonia fulva of Cavanilles, till recently appalently only kmon to that author and to Louis Nee, who
reported to have gathered it. Our flow ring specimens were repprted to hase gathered it. Our flow rings specimens were
reared by Messrs. Veiteb, of the Exeter and Chelsea Nurseries. reared by Messrs. Veitcb, of the Exeter and Chelsea Aurdertes.
and sent by them in November, 1855 ." Strong plants, 108 . 6d. The usual alloroance of ons plant over will be made to the trade if three plants of a sort are ordered at one time.
MESSRS. VEITCH AND SON also offer the following choice selection of Plants, the major
aralia papyrifera; or Ricr Paper Plant.
In addition to the fine follage of this beautiful stove Plant, it possesses peculiar interest from the circumstance of its pith
being the material from which the Chinese manufacture their being the material from which the Chinese manufacture tbe
beautiful Rice Paper. Plants in two sizes, 213 s. and 42 s. each. DESFONTANIA SPINOSA.
This fine evergreen shrub, originally sent us by Mr. William Lobb, from Patagonia, where he discovered it in the region of haiw, has proved, as we expected it would do, perfectly hardy in tubular flowers, tipped with fellow, render it a very desirable mequisition. Extra-sized plants, 30s. each; second ditto, 21s. each; smalier plants, 10s, 6d. each.

\section*{HEDAROMA TULIPIFERUM}

Young plants of the best variets of this firsthelass Greenhouse
ovelty, 7s. ©d, and les. bd. each.
LAPAGERIA ROSEA
Confessedly the finest conservatory climber yet known, the lowers beiny of a rich bright rose, marbled with white inside,
nearly 3 inches in length and 2 in diameter; of particularty waxy substance, and consequently the thluwers remain a considerable time in perfach

\section*{LILIUM GIGANTEUM.}

This noble Lily having been generally exhibited, is too well known to render any description of it neecessary. Fine specimens
from 21s, to \(84 s\). each, according to strength of bulb. Small seedfrom 21s. to
lings, \(5 s\). each.

\section*{LOMATIA FERRUGINEA}

Thit fine evergreen shrub was found in Chiloe and Pata-
gonia by our Mr. William Lobb, It attains a helght of 6 or
8 foet, gid is ramidable for its be a fine leaved conmervatory plant it is perhaps without a rival. Plantro, 10s. 8d. and 2lo. each.

NEPENTHES RAFFLESIANA.
penthes, we are able to uffer beautiful seeding tis fine Ne forming an abundance of pitchers. 21s. each.

PINUS BENTHAMIANA (Tree).
Having raised seedlings of this heautiful Pine (which is doubtless the inest of the long-leaved Californian kinds, and which
has proved to be erfectly hard has proved to be jerfertly hardy), we are now enabled to effe
eetabilishod phantus in pots as follows:-Single plants, 10 s .6 d . 6 plants, 50s. ; 12 plants, 843 .

\author{
SATURDAY, MAY 17, 1856.
}

The readers of the Gardeners' Chronicle will not have yet forgotten Polmaise hating, or the long and earnest discussion that was excited by the plans of the enthusiastic and much to be lamented Mr. Meere. Knowing as he did the immense importance to gardeners of air in rapid motion, eager to render their work œeconomical, and convinced that this could only be accomplished by dispensing with costly hot-water apparatus, he proposed a plan for obtaining currents of heated air by means of hot iron plates over which cold air was to be compelled to travel on its road into the house. In short, he clearly saw that, if it could be accomplished, the true way of heating the air of a plant-house must be, not by radiation from pipes, but by warm currents driven or drawn in every direction.
It is needless now to relate how many attempts were made to bring this plan to bear; how certain success at one tinie appeared to have become, or how continually hopes were disappointed at the last moment. It was like the gold making of the alchemists - the precious metal disappeared at the moment of projection. Sometimes the iron plate cracked, on another nccasion smoke found its way through the sand-joints into the house, now and then the draught took a wrong turn ; and worst of all, everything else having succeeded, no sufficient mount of heat could be secured
Hence, after a patient expenditure of money and time, "Polmaise" heating was abandoned; not because the principles which led to its contrivance were wrong, but because it was evidently insufficient to carry out those priuciples, the importance of which every succeeding year has rendered more and more apparent. To keep warm air in active motion in glass plant honses we have always maintained to be the great desideratum of modern gardening; there is not a practical man who does not endorse that opinion; and all which now remains is to show how it can be effected. To the method proposed by Mr. Jones we lately drew attention, and we have now to mention another plan.
Mr. Robert Hazard, of 8, St. Martin's Place London, proposes to effect all that Mr. Meere failed to accomplish, by what he calls a "heat extractor." This consists of numerous 2 inch or 3 inch cast-iron pipes, open at each end and secured there to iron plates ; in other words it consists of a pair of castiron perpendicular plates held together by horizontal open pipes. These are so placed that all the smoke of the fire-place is compelled to travel through them, almost wholly giving its heat to them as it passes, before it reaches the chimney for escape. The "heat extractor" thus constructed, and built into brickwork so as to intercept the smoke, without permitting it to pass into the house, is fixed on the level of the floor, opposite an opening into the house to be heated; and the mouth of a cold air drain is at the same time brought into communication with the open bottom of the apparatus. The moment the pipes in the "extractor" become warm the air from the cold drain rises among them, and absorbing heat in its passage finally, rushes into the house, and distributes itself as happened in

Polmaise, the only difference being that a very large area of heating surface comes into action apon Mr, Hazard's plan without any risk of heating, instead of a very small area, and the certainty of cracked fire plates. In order that the heated air, as it passes into the house, may acquire the degree of moisture which is necessary for preserving plants in full health, the incoming air is conducted over a cistern of water, from which it takes up as much as its own temperature will permit.
The great advantage presented by this system consists in the abundance of heat which it provides, and in the application of whatever heat the fuel may give out to the service of the house, instead of allowing it to passaway uselessly and wastefully by the chimney. The "extractor" may be used withont hot water, or may be adapted to the fireplace of any existing apparatus.

How it works is thus described by Mr. Hazard in the case of its application to the forcing houses of Charles Eyre, Esq., of Welford, near Newbary :-
"I applied the extractor in January 1856, the weather being \(10^{\circ}\) below freezing; we therefore were obliged to finish before we left for the night, and it was 12 o'clock before we were able to light the fire under the boiler; at 7 o'clock on the following morning Mr. Davinson, Mr. Eyre's gardener, and myself tested the air from the extractor, when we found large volumes passing into the house at \(140^{\circ}\); but the thermometer on the hot water flowpipes nearest the boiler only indicated \(95^{\circ}\). After several days' experimenting, the external thermometer being at \(12^{\circ}\) and \(14^{\circ}\) below freezing, the advautage was more evident in favour of the extractor, while the apparatus in the Fig house was working admirably and economically. The old Polmaise stove formerly consumed one barrow of coke in 24 hours; while my apparatus only required the same quantity to last four days! Thus saving three-fourths of the fuel formerly used. The advantages of my apparatus were so evident that I received an order for an extractor to be attached to the conservatory boiler; the consequence was an immediate economy of fuel, and another important resalt. The under-gardener, who could not before leave the conservatory during severe nights, was now enabled to leave the fire from 8 o'clock in the evening until 7 o'clock the following morning.
'In February, Mr. Eyre, in company with F. L. Popham, Esq., of Littlecot, near Hungerford, wished to prove the advantage of my system by actual tests. A thermometer was suspended 1 foot down the top of the chimney of a Pine pit, heated by hot water, where no extractor was attached, and it indicated \(430^{\circ}\). The same thermometer was then suspended down the chimney, where the extractor intercepted the smoke, when it only stood at \(160^{\circ}\); a marked difference of \(270^{\circ}\) in favour of the extractor. The thermometer was then placed in the same manner in the chimney of the Fig house, when it only stood at \(105^{\circ}\).
"And as Mr. Davidson was trying the two systems fairly, one against the other, Hot Air v. Hot Water, by shatting off the circulation of hot water in one house, and allowing it to flow in the other; thermometers were placed in different parts of the house, heated by the hot air alone; one being placed in the front path, 1 foot from the floor, and another similarly placed in the back walk. Singular to relate, the one in the front indicated \(62^{\circ}\), while the one in the back walk, and nearest the admission of hot air, only stood at \(60^{\circ}\). To carry the experiment still farther, and show that there was nothing to fear from placing plants immediately above the ascending current of hot air, I suspended a thermoneter 3 feet above the grating, when it only stood at \(68^{\circ}\), although the hot air was streaming out of the gratings at \(170^{\circ}\), proving the rapid manner the heated air mixed with the surrounding atmosphere.'

This it will be observed is Mr. Hazards own account, with a few curtailments.
F'or ourselves the only opportunity we have had of seeing the apparatus at work has been by favour of Messrs. Oetzmann \& Piumb, who have used it for some months in their extensive pianoforte manufactory in Chenies Street, where it is employed for drying the timber. We understand that the action there is perfectly satisfactory ; and from what we saw of it we should imagine it unlikely to get out of order.
Of course we refrain for the present from saying more than that the contrivance promises well Further experience will show whether any unexpected inconvenience attends it. Should it continue to perform as it appears to have done, we can easily conceive that it will offer a means of heating cheaply the small greenhouses now so common everywhere, without having recourse to expensive hot-water apparatus, or the cumbrous and troublesome flue.

A small "extractor" intercepting the waste heat of a chimney might perhaps in numerous instances convey through a grating into a greenhouse on the first floor of a London residence all the heat which would be required in such a place.
This is not the first time that the apparatus has heen mentioned in our columos. On one occasion Messrs. Garraway \& Co. recommended it for hothouse heating ; on another it received a very good word from the Rev. Geo. Denison, of East Brent, who had applied it to his parish church ; others are said to have gained experience in its use, and we are sure we only express the desire of our readers when we say that they will be grateful for further information upon the subject.

The interesting account which we last week published of the consumption of vegetables an fruit in the Paris markets, deserves to be considered in comparison with what we know of the consumption of London, as given in Dond's Food of London (see antè p. 214), upon the authority of Mr Bratthmate Poole. We shall thus learn something more than usual of the habits of the Paris population, and of the kind of cultivation that their wants demand.
M. Husson takes the population of Paris at \(1,053,262\); but this is exclusive of Saint-Denis and other densely populated faubourgs, and we presume the casual population is not included. Taking these into account, the amount may be estimated at \(1,500,000\). If that of London be regarded as amounting to \(2,500,000\), the comparison will be near enough for all practical purposes connected with the points into which we propose to inquire.

Adopting these numbers, and the statements of Mr. Bratthwatte Poole and of M. Husson as the bases of calculation, we have drawn up the following table, showing the comparative annual consump tion of certain vegetables and fruits in London and Paris, and the average consumption per head per annam:-
\begin{tabular}{|c|c|c|c|c|c|}

\hline
\end{tabular}

It will be observed from the above that some vegetables are consumed in much greater proportion in London than in Paris. These are Potatoes, Cabbages, Turnips, Onions, Cucumbers, and Gurkens. Of Potatoes, fully three times more per head than double: Turnips in times as many, but some doubts may be entertained as to whether the quantity of Turnips stated by Mr. Poole does not include those brought in for the London cow-keepers. Of Onions about seven times more are used in London than in Paris; of Leeks we have no account for London, but on referring to last week's paper it will be seen that these are largely used in Paris, their consumption being about four times greater than that of Onions.

Vegetables of which less proportions are used in London than in Paris are Carrots, Peas, Asparagus, Lettuces, as compared with what may be included in M. Husson's denomination of Salads, Celery, Radishes, Gourds, and Vegetable Marrows. In Paris the quantity of Carrots used is four times greater than in London. Of Peas the proportion is as \(3 \frac{1}{2}\) to 6 , or nearly twice the quantity more per head in Paris than in London. In the former, the quantity consumed of Asparagus is 20 times, Salad 5 times, Celery 3 times, and of Radishes twice that consumed per head in London; whilst of Gourds and Vegetable Marrows the quantity is 14 times greater
With regard to fruits, it appears, so far as the
comparison goes, that, with the exception of Filberts and Hazel Nuts the consumption in all cases averages very much less per head in London than in Paris. The supply of Raspberries for the London market is very limited; and there can be no doubt that if the supply of this as well as that of various other fruits were increased, so would be the demand. The quantity of Apples, Pears and Plums which enter into the diet of the Parisian is almost incredible. Of the three kinds taken together, white only 32 lbs .7 ounces per head are annually consumed in London each inhabitant of Paris requires 529 lbs .

Among esculents two articles also appear which plainly point to the habits of the people, and about whose uses the English care little. The French table mentions as many as 438,000 kilos of Black Winter Radishes, an article unknown in our own markets, and of Sorrel, an unimportant London vegetable, the consumption in Paris is greater than that of Salads in London of all kinds put together.
But since M. Husson's book is likely to appear very shortly we shall take a future opportunity of returning to this matter.

We understand that a further small supply at Mexican seeds received from Mr. Botteri is ready for distribution to the Fellows of the Horticultural Society.

\section*{VEGETABLE PATHOLOGY.-No. CXXI.}
481. Vulnera (Wounds).-Vegetables are subject to a variety of external injuries, arising from very differen causes. As in the human frame, these may be of more or less importance according to their extent, or the organs which are affected. Vegetubles, from their pech liar organisation, bear partial injuries much better thar animals, because there is no common nervous cena which can be paralysed by the affection of any particuar part. The more, however, the energies of the plantar directed towards the nutriment of a single bud, the mor any serious external injury is felt. Half a great Oan for instance, might be removed with far less hazard thail

\section*{the stem of A Crown Imperial could be cut of foo} its appearance above the eurface of the ground.
482. By one of the most important laws of nature the animal world derives its support eititer mediately or immediatey form the Yegeathe ingdom. Every part, animals. The Grases which forms so greata a portion of the food of ruminant and other Ramimation semem within certain bound togrow the better for being eropped, and this, is the case with many other plants, while others The leavese of dififerentent plants are of developened in in difierent Ways. In somo increase takes place at the base, in others at the apex. When Grass is mowed, the leaves
in twenty-four hours have increased visibly in length, but many leaves when eaten by insects make little or no effort at increase. In the latter case the injury for a time is considerable, and the evil is remedied only
lay the pushing of the young axillary buds. The proby the pushing of the young axillary buds. The pro-
cess, however, is exhausting, and the quantity of wood deposited and of nutritive matter stored up is greatly diminished. Other injuries are produced by insects, but these will come under another head.
483. If the destruction of leaves is formidable as preventing the due elaboration of the juices, the evaporatissues, the destruction of the blossoms by auimals is equally mischievous in another direction. The grand the prodaction of frit, and if the no fruit can be produced. The injury in this ease is, however, merely temporary. All the energies of the plant are directed in another quarter, the consequence copious supply of abundant wood is produced, and a copious supply of those matters 'on which the production of fruit depends. The tree, in fact, may b
the following year for the present injury.
484. The young shoots of most exogenous plantsare filled with a mass of cells, which are of immense importance in the perfection of the nascent wood and the formation of the perfection of the nascent wood and the formation of
buds on which the future growth of the tree depends. This body is called the pith, and as it is surrounded by bundles of spiral tissue, all the axillary buds* and leaves are in close communication with it. According to varying circumstances the pith retains its energy for a greater or less length of time, though at last it dxies up and becomes entirely inactive. In this condition any injury to it may be altogether harmless, but few injuries are so fatal as those which happen to the pith while the plant is young. Death is certain if the main stem is concerned, as may be seen constantly in such plants as Lettuces, which seem to fail suddenly without any some grub has eaten into the pith, and the powers of the plant have been immediately paralysed.
485. The roots of plants are liable to many injuries, Where the green parts depend mainly upon matter stored up in them, injury may be serions, but unless the lesion is extensive, the plant in general suffers but sively without much injury. New fibres will soon be thrown out, if those which remain are not sufficient to supply the requisite nourishment. Root pruning, in act, is often practised to check the luxuriance of foliage and to induce the tree to throw out fruit buds. For this and if this is done at once, the spongelets will retain their moisture and be able to act, but where there is njury. Indeed, it is a practice which must be exercised with caution, and with some reference to the condition may be useful, a complete transplantation, might be ery injurious. This is one of the caser in which gardeners shoma not act upon mere theory; indeed, in all, theory should be merely the handmaid of practice. M. J. B.
how to destroy mealy bug, \&c.
Mealy bug, when once thoroughly established in our glass houses, has been found by most gardeners to be a many well of a collection of plants where it was known to exist to any great extent. Having had to encounter such diffihad the those just stated, and at the same time having have been led to believe that some account of the modus operandi by which such a result was arrived at might be useful. Let us however commence by describing the of it, and then pursue in the form of a journal step by tep the way in which the work of extermination was conducted, and the restoration of the plants to health ffected.
Orchid House and Stove, April 13, 1854.-Here I found a miscellaneous collection of plants, several of
which would have been better accommodated in the greenhouse. Tacsonis mollissims, in a pot trained along he back wall, was well covered with mealy bug ; Stephanotis floribunda, Petrea volubilis, Combretum purpureum, Allamanda cathartica, Jasminum Sambac, were the Allamanda climbers; these, with the exception of The Stephanotis occupying a considerable space had been sponged frequently, the leaves were generally
* Adventitions bads do not necessarily arise from the pith, and
 good deal of misconception has provailed on this subject.
if scale and bug as could possibly be desired. This remark also applies to the greater part of the plants all ance was such as to convince an experienced person that fire-heat had been used unsparingly, and that a giding rurature and a close atmosphere our and many of the rat h he leaves were pal guttatum, in a large basket, and Aerides odoratum in a similar position, were the two best plants in the collection, and had they not been closely connected with bad neighbours I might have stated that they were clean. Dendrobium speciosum, Cattleya crispa, and many others were covered with white scale and wealy
bug; Oncidium Papilio, carthaginense, and two or hree others were dead, or so far gone that there was ittle hopes of their recovery.
Early Vinery.-In this house the Grapes were setting an abundant crop, the leaves were large and flabby, an excessive quantity of water had been used and they had the appearance of being clean. Camellias were growing
beneath the Vines, and they also looked clean. The beneath the Vines, and they also looked clean. The person who showed me round informed me that he caused great trouble. I observed that the Vines had not had any winter dressing, consequently I looked forward to the future with anxiety.
Second House of Grapes.-The Vines here were coming into bloom, the outside border had been tampered with the previous summer, and the growth they had made and were making was weak. On examining the foliage ound bug, and here also the Vines had not got any inter dressing. This house was full of plants, chiefly the exception of a few Begonias, which were all in a dirty state ; black scale, mealy bug, and red spider were the principal insects. Adjoining this house was a small division, consisting of four lights, which had been taken from the above house at some former period for the purpose of preserving Pine Apples in when ripe, or for small division of early Grapes. In the pit of this house were plunged two or three Francisceas, an Ixora, and a large Euphorbia splendens. On the back wail was
trained Cereus grandiflorus profusely intermixed with a trailing Solanum. Vines were planted in the outside border, and had grown the full length of the rafters hey had not been pruned back, and were now making laterals. I had not seen anything so weals, and bug and red spider were plentiful throughout the house.
Greenhouse or Conservatory.- \(\Lambda\) deep back wall, together with a mass of stone in front, gave little hopes of growing anything with advantage here. The house was literally full of plants. Vines were also trained to the roof, and exhibited better health than anything I had yet met with. As they had attained a good age, and as a gravel walk was their only border, I came to the conclusion that the subsoil must be good, and that the natural soil of the garden agreed with
Amongst the plants there was nothing remarkable.
La le ping ins
reaking, the wood had been well rubbed were jus sulphur, large quantities of which were still adhering to the stems. The buds were numerous and weak, and whether there would be fruit or not. This house also whether there would be fruit or not. This house also
contained a great number of plante, Buch as Azaleas, Camellias, \&c
Peach House.--A Peach and Nectarine tree were the principal features here ; a Stanwick Nectarine had been recently planted; Figs covered the back wall, Vine were planted at each end and partially trained along the roof; a shelf along the back wall contained Straw berries. The Peach trees were in good health, growing very luxuriantly, but without fruit. I was informe that every year they produced abundance of bloom, bu always cast their fruit, and never bore anything like a crop. In front of this house are five divisions of pits, plants which were occupied with stove and greenhouse Cucumbers. The plants were in the same state as regards insects as those in the Orchid-house. The Pines were not clean, but being small and not very badly affected I experienced little difficulty with them. Such charge condition of the steck 1 had engaged the tais of the houses, but I may just mention that although painted the previous year, the crevices of the woodwork were tenanted in many parts by small balls of the menly bug, and in some instances there was a line of this substance reaching a considerable distance. It is not my intention to advert to the out-door department. Therefo permit mow to give which wort, the remedies 1 applied, and the success which attended their employment.
Orchid House and Slove during May.-Having procured a bottle of turpentine, 2 lbs goft soap, 1 lb . common soap, several libs. of sulphur, a couple of painters' sash
brusbes, half a dozen camel-hair pencils, and a few brusbes, half a dozen camel-hair pencils, and a few
gallons of tobacco liquor, I untied the plants, and after rubbing the trellis and all suspicious parts of the wood work with turpentine, I carefully commenced cleanin the plants. Every part was first examined with a penci dipped in turpentine; on portions of the two year old reely, a split in the wood or a crevice in the bark wa not allowed to escape ; parts of the leaf least susceptible of injury were also operated on freely, but towards their axils and around the buds great care was taken to touch the insects only. This requires a steady and practised
hand, and ought to be well done; the pencil when
fresh dipped should not be applied immedit draw it once or twice across a small piece wood kept for the purpose; after doing this Ihave generally found sufficient strength remaining to destroy the bug, and there is less danger of the turpentine spreading and injuring the leaf or buds. The second process consisted in washing the plant well with soap and water. In doing this common soap was used plentifully ; a common paiuter's sash brush was first put into water, then rubbed on the soap, then applied to the plant and so on alternately, according to the good sense of the workman, from the root up to the tender points Whe young shoots, which were carcfully hand picked. hant the soap and water process was finished, the plant was well washed with clean water applied with force from a syringe. The young shoots mentioned as
being handpicked were then dipped in tobacco liquor, and the plant trained or placed in its former position. Ventilation from the roof was afforded at all times, and very freely from the windows and door, when the thermometer stood at or above \(75^{\circ}\). Fires were kept
very low, and the night temperature at from 50 to \(60^{\circ}\).
Early Vinery during May.-When thinning the Grapes, the pencil and turpentine were constantly at leaves, as before described, wherever bug was observed. The Grapes were thinned extremely, so that when the bunch was tied out every berry hung separately, and the interior of the bunch could be examined with facility. This I found to be of the utmost importance. The Vines were syringed once a day in clear weather ; air was admitted more freely as the Vines were able to bear it, and by the end of the month the utmost freedom was used in this respect Camellias having set their flower buds were moved outside under shelter, and the house was rendered as open as possible.
Secend Division of Grapes during May.-As the Vines were coming into flower water was withdrawn for a sing auring which insects of different kinds made phur, prgress. The pipes were well pa inted wirh sulthe house was shat close during the night. Tobaceo smoke was also employed. These measures in some degree were doubtless effective in stopping the increase of my tormentors, but all would have been of little avail had there been no syringing for a length of time. On the evenings of fine days water dashed freely amongst the lines and plants, and on the roof and ar a the house, together with a free some plants I thinned outs, was my best pluned hard in, while repotting and washon with soap and water was daily business. The pencil and turpentine were hangdaily bull The pencil and turpente were hangsmall division adjoining this house the plants were repotted and cleaned, and the Vines were encouraged to
 down in the autumn.

Greenhouse or Conservatory during May,-Many of the plants here were removed, and the house was thoroughly cleaned. In rearranging a few of the more hardy stove plants were brought into this house.
Late Vinery during May. - The Vines here were disbudded at once, and as it was evident there would be no fruit, only such shooss were left as were intended to produce fruit the following year. Liquid manure from a end of the month the foliage was changed to a dark green. It was in this house that the mealy bug first made its appearance 16 years previous to this present time. A climbing plant, the name of which I could not lears, to be planted and trained on the trellis on the back wall t ald with Vi the go the ad Win, "I syripl with the then gardener sid, lsynged winater, and nade use of all manner or things, but and spoiled the Grapes, and it has now got into the wood and no one has been or ever will be able to get the better of it." The plants in this house went through the same process of cleaning as the others, the large Azaleas were yringed with tobacco-water to destroy thrips. Fires were not lighted ; the house was syringed two or three times weekly, according to the sat
Peach House during June.-There being no frait I had the roof removed from this house and the trees fully exposed; it will not be necessary during the summer months to notice this house, training and occasional syringing were all that it required. In the pit divisions wo were set apart for Pine Apples, one for the worst of the plants and one for miscellaneous things; the Cucumbers I allowed to remsin.
Orchid House and Stove during June.-This month found the general health of the plants improved. In the case of Hoyas, Russellias, Stephanotis, and others making their young wood the bug seemed to grow with it ; no sooner did a bud break than this pest made it appearance. Where it came from it was not easy to say disease of the evil was difficult One the always observable, viz, that after a close heat of \(90^{\circ}\) or \(95^{\circ}\) the insectsincreased in numbers; many of the planis required this temperature. A large Musa Cavendishi planted out in the centre of the house had to be washed, the worst of the others were also washed, and many of the young
show pinched off. A luw temperalure, careful sy
and go rd ventiation were stul my best remedy.

Gar'y Vinery during June.-Here many of the Water was not soginuing to change coly administered ; the partial chatily was nuch to be feared. It was soon apparent that crop would be lost it a remedy was not found conts ue the syringe would destroy the hlonm only, the Greped : I had seeut bruised laurel leaves recommended, so I had armfuls of the young shoots with their leaves placed along the floors of the house, and with a beater, something like a plumber's dresser, they were well bruised on the spot and strewed wherever there was
space for them to lic. The house was sluut close and left abnu' \(50^{\prime}\) 'lock in the evening; on going again at \(9 u^{\prime}\) 'lock Ifelt satisfied. The following morning it was observed thap the bug when touched was not able to retain its
ho'd, liut dropped to the ground. I therefore resolved to place Comnion Laurel shoots in all the houses, bruise them in the same manner, and to continue them for a time. This occurred ahout the last fortnight in June. As the leaves became withered turyentine was sprinkled over them; the effect of all this upon the foliage was very remarkable, it assumed the most healthy appearremedy for destroying insects, they were also an excellent assistant to the plant.

Turing June.-The Granes here were thinned and the bunches tied out, as in the case of the early Vinery. No more of the young wood was al nwed to remain than was necessary for the health of the line. All false ties and whatever wald in any
way harbour insects were removed, and every freedom possible given to the full play of the syringe ; the pencil dipped in turpentine was constantly ready for use This house being much larger than the early finery, had doabts whether the Laurel shoots would have so good an effect; the quantity was therefure increased, and the pest if not absolutely eradicated was at leas entirely subdued. I felt myself once more at ease with respect to my work of extermination, knowing as I then did that with a little extra exertion success would be the oertain result.
Greenhouse or Conservatory during June.-A constant exchange of plants was carried ou here. Greenhouse kinds were removed outside, and their
by ohiers from the warmer plant houses.
Late Vinery during Jume.-A
Lue were taken out, and Begonias, Achimenes, \&c., introdaced in their room. were making good wood, and a perceptible mprovement was evidently taking place all over the house. Liquid manure was administered freely to al the borders every two or three weeks throughont the Prow, seasnn.
hift, I the Pines having grown eo as to require a t properly prepe of the divisions, and having cleaned best plants. In the previous deseripion I omitted to atate that these pits were heated with hot water, and that a bottom-heat of \(60^{\circ}\) to \(75^{\circ}\) could be obtained. In the preparation a bottom 2 feet deep of stones was laid dow upon which was put the soil for the plants, conture. During summer these plants made rapid progress and 14 months after planting I cut several fruit weighing 5 lbs and 6 lbs each. Twenty months atter plantivg all the original plants had produced fruit ; the remaiade Cucumbers having yielded quantities of fruit were pulled up and the division appropriated to late Melons. The plants having got into a growing state were distributed
throuvhout the houses. Two of the divisions wire devored to Melons, and two to Pines, and there was also a miseellaneous division, and as this arrangemen will continue for the next three months, it will not be necessary to advert to it further.
\(J u \cdot\), A, Auqust, and Scptember:-A few general remarks ear. Every plant was examined at least pnce a week the Vines still more frequently; not a leaf was allowed to gr we but such as was of paramount importance. The bunches, which are more liable to he attacked than the leaves, required most attention, and a suspicious bunch with wire as to lany immediately under the bustrung bottom of the dish was then covered with turpentine; this broukht the bunch into close contact with the vapour of the turpentine. Again, in a bunch where the bug was to be seen, a berry was cut out and the pencil dipped in
turpe:tine very carefully introduced ; the Common turpe:tine very carefully introduced; the Common
Laur-i leaves used as formerly stated had brought the Laur-1 leaves used as formerly stated had brought the
insects under manageable control, and all that was now wanted was attention to details to complete the work of destru tion. Thunbergia grandiffora, on a back wall, showed a great liking for bug; the old leaves and woon were to all appearance quite clean, but no sooner did a young shoot make signs of growth than this pest applied to such free growing subjects was to pinch the shout off, curtailing the growth until it became clean although previously cleaned, were about this time cut down level wod 1 . well, and made gond plants the following all pushed Gardenin made gond plauts the following summer of any; they were pale in colour and sickly to commence with, and looked as if I should lose two or three ou
f sume seven or eight of florida and Fortuni. The of turpentine inflicted the ereatest injury, and the bug seemed to corgregate on the smonth part of the bark. In noticed.
O?ther, Norcmber, and December:-To find a bing was now a rare occurrence, the temperature of the houses was considerably rednced, and the use of turpentine entirely dispensed with. I ennsidered the whole clean and the general health of the plants established; I was enemy in full force the ensuing spring. That another seas I not I was well a ware, but I had observed too many
efforts of my tormentor to return prove fruitless to effirts of my tormentor to return prove fruitless to
have any fears regarding it. In the early part of the period now under notice the early Vines were pruned, the lonse bark rubbed off, and they were dressed over
with the following mixture, viz.: 1 lb , soft soap anil 2 lbs . sulphur mixed together in tbe form of dough. Should there be any difficulty in uniting the sulphur with the soa the application of a litt!e heat will overcome it. portion of this was taken as required, diluted with warm water, and well rulbed over all parts of the wood with painter's bruch. There may be some who would recommend an addition to this mixture, others who may think it too strong, especially when applied to the youmg wour. I have, however, found it efficacious for all the
 syringe act upon it disadvantageously. About this time few of the Orchids were shifted, many of them wer placed on hard blocks, using very little moss, and taking
care to leave a clear descent for the water falling from he syringe, which at this season was seldom used, but when required was applied with considerable fnrce.
Januain and February. -Orchid House and Stove. During these two months a complete overhanl wa effected in this department, in which no insect, certainl no bug, was to be found. Saccolabium guttatum and Aerides odoratum were removed from flat baskets and placed upon large blocks, standing nearly upright. In this position the syringe had full play, and during the looming season their flowers were seen to advantage growth were encouraged to do so. In the early Vinery the Vines pushed into leaf in a healthy manner, although at this period there was severe frost, and from this ime forward I saw no more bug.
tra hands were employed, nork just recorded no ittle extra exertion for the first three or four months on t e part of the regular workmen was all that was
required; afterwards the work became lighter, and of course thie need for extra labour diminishied. I ma add that in my attempts to destroy insects I have at different times made experiments with orher substances besides those I have pointed out, but I have found that caution united with energy in the use of such remedi-s as we do possess a knowledge of, is much more beneficial an tampering with things of which we may have

\section*{Home Correspondence}

Can Florers be Groun in a City? -This question has ften been asked by the admirers of those fragrant gits of nature. As a lover of a garden and being
doomed to pass the greater part of the year in a city I determined to try if I could not have a few of my avourite companions around me. I erected a smal greenhouse (against a western wall) and have now asgood Show of plants in blossom as I ever saw in the county Wicklow, where our country place is situated. good Cytisus, and several fine forced Roses. I think rom my observation of a town garden that the best rowing plants are Roses, next Cinerarias and Cytisus, weet scented Geraniums thrive very well also. To yey determinen to pay a little attention to flower lived 100 miles from the smoke of a city. I hope to fill my greenhouse with some Pelargoniums I have kept back in a small frame; and if you consider that my otice of rearing plants in the midst of chimneys, \&c., is worthy a place in your columns I shall be happy to give ou the result of my experience. Flora. [Pray do.] A mphicome Emodi. - You say that this plant has been Some six years ago (1849) I sent seeds of it from India or my father. He succeeded in raising numerous plants, which he freely distributed in this neighbourhnod. It lowers annually with us and perfects its seeds, from解 fal. On my gave seed have leen equally siderable quantity of the seed to Sir W. J. Hooker, from which doubtless numerous plants have been raised and distributed. Rollisson \& Sons advertise it for sale as a plant from Northern Indis. Nepaul is its halitat. It very rarely found in the north-western Himalaya, as found it in one place only; viz., on the Bojh mounand clefts of rocks of Subathon, growing out of fissures and clefts of rocks. Decayed vegetable matter was the
only soil in contact with the rocks. I use peat, rotten only son in contact with the rocks. I use peat, rotten
leaves and eand for its cultivation in pots. It is a pretty leaves and eand for its cultivation in pots. It is a pretty hing; but our cultivated planes are much inferior in
beauty to the wild ones in their native climate. Nut. Wieary, Wexford.

Grerman stanks. - Atout a fortnight ago I sowed on a ery gentle bottom heat 26 varieties of German Stock 2 they came up well, but they are now damping off to off. Can you tell me how to treat them to put a stop 80 this? For the last three years they have gone off mate or less, and I imagined that the light snil in which they them in a strong loamy on enis sowed ver wisw a little leaf R.T. [Light soil suits them best, but it is not the soil that is at fault. Damp and insufficient ventilation have doubtless caused the mischief. You would have been more successful if you had sown them in pans well drained and filled with light eoil, in a tolembly warm situation but at the same time airy, as
for instance on the flue of a Vinery just commenced to be forced. After the plants are up we need scarcely say that great care has to be observed in watering them. Some seldom or never water them overhead at all ; but when dry place the pans or pots they are in in saucens filled with water, until it is found the soil has absorbed sufficient moisture, when they are removed. By this phan much of the shanking or fogring of of which you complain is obviated. They should also be pricked off into pots or pans as soon as ever they are strong enough to bear the operation, and placed in a cool pit to harden pre paratory to their being planted ont. This is a poimt which should on no account be neglected.]
Finus Tchugatskoy.-I observed in your paper a few weeks a question relating to this Conifer. As the quired io quired information may sent out by French nurgerymen under of Pinus Thuratoy; its al ane of Pinus Tchugatskoy; its real name is Thujopsing Thuja dolabrata, and the name is derived from Tchugatsken, a promontory of Russian Americe, whence it comes. The name is so peculiar that I have no doubt that this is the plant referred to by your cur respondent. Wentworth W. Buller, Strete Ralegh, Kxeler.

\section*{Zoticts of 3ooks.}

Adamson's Coutage Garden (12mo, Black), having favour a second edition may be assumed to has it written ; no better remmation of it can le needed. The greater part of the little volume is occupied by monthly calendar of operations.

A third edition of Colonel Hutchinson's capital book on Dog-breaking (small 8vo, Murray, pp. 328) is before us. It is superfluous to say that no sportaman can more ledge, than will be found in all similar books pus The present edition contains new matter concerning setters and pointers, Spanish retrievers and bloodhounds, and conveys some useful lints abont game. The woodeuts of which there is a profusion, are worthy of the letterpress, which is saying a great deal.

Marvels and Mysteries of Instinct, or Curiosities of Animal Life (12mo, Longmans) by G. Garratt, is a closely printed volume of 248 pages explaining the author's views of the nature of instinct, illus-
trated by the usual assemblage of anecdotes, true, doultful, and incredible. Mr. Garratt is so familiar with his subject that he begins with Adam, with whom he would apparr to have had a personal acquaintance. Adam stood," he says, " as he was intended to stand, the noblest creature of all creation. The world has not seen his beauty since. His face, too, what an illustration of fine physiognomy ! Who among men has ever seen
its like? No internal evil had traced lises of external deformity down his calm symmetrical features. It was an index, not of vice within, but of the purest ans heavenly-like virtue. He was pure, too, iv eve poles of his feet Such was peculiarity of his physical constitution, mental or to hire the firt principle of knowledge. As appeared his body, so appeared the knowledge and the reasoning faculties of his mind, both ready for mutual action ; mid at his command, too, wa the language, of which he could make immediate wis (This particular has had a resemblance in the day of Pentecost.) We cannot suppose that Adam began to learn at his \(\mathrm{A}, \mathrm{B}, \mathrm{C}\). Of such infant tol haw nothing, and if ever he was a child at all, it must been at those times only when it is said that the mand nce a man and twice a child, and in that sense mertor This is one of the first paragraphs in
"Instinct is the perfection or the essence of Reason, Reason put forth in fullest maturity.
Re Rean put forth in all than Instinct, which is givenito govern the animal. We her, wre ers are table to understand how We hope our readers af then reason instinct is the perfection of reason, superior to instinct.

\section*{A new contribution to the aneedotes of the late was is furnished by Major Porter's Life in the Trencher ( 12 mo , Longmans, pp. 195). The gallant author holthe fiveurable intary dogua the call criticiam,}

Who had the management of the war, is unbecoming
and unsoldier-like when it proceeds from inferior officers; a maxim which fortunately is not universally received or we should never have seen Napier's Penin-
sular War. With this proviso Major Porter has prosular War. With this proviso Major Porter has pro-
duced an amusing, gentlemanly, and occasionally graphic picture of one part of those operations of which civilians must otherwise know nothing. Nobody would imagine, after rising from its perusal, that trench work was such very bad worlk after all. We hear nothing of work. And yet it seems to us that the enduravee of the troops under sufferings which may indeed have been duration, which is everything, deserves a record from some soldier who knows what misery was when it became conld be roused to a renewal of labour which they knew could only be their death. When they marched to their graves with perfect resignation they showed qualities that should never be forgotten, and Which can nev did
be too loudly proclaimed. However, Major Porter did be too loudly prociaimed. However, Major Porter did bably saw nothing of that worst. We doubt not that
general readers will prefer his pages as they are; for general readers will prefer his pages as they are; for
they are full of life and anecdote, told with the easy grace of a man in whose profession imperturbstility is a quality of the highest order. His description of the characterist
have seen.
"First there comes the round shot, rushing through the air with a sharp, shrill shriek, very startling to the nerves of the young soldier; then a volley of grape, buzzing along with a sound not unlike that of a covey of birds very strong on the wing; next we have the but having in addition the unpleasant peculiarity, that when it reaches its destination it bursts into pieces, scattering small fragments of iron, in the most undesirable profusion, in every direction. These are varied, and grandly in the air, easily to be discerned in the night by the fiery train of its burning fuse, tracing a majestic curve high in mid air, until, having attained its ore altide, it commences to descend, falling faster and faster, til down it swoops on to the devoted spot against which it had been directed, making a sound in its passage through the air like the chirping of a pee-
wit, or other small bird. This missile was always considered by the knowing hands to be the most formidable enemy that we had to contend against, owing to the impossibility of forming an accurate judgment as to the spot where it would ultimately fall, and the difficulty Which consequently ensued of protecting oneself from
its splinters. In the case of a gun shell, the impetus given by its onward course communicates itself to the fragments when the shell bursts, which continue, there fore, to travel in a forward direction, merely spreading out laterally. In the case of a mortar shell, however there is no such onward impetus: the shell drops almost perpendicularly downwards towards the ground, and when it bursts, the pieces shower themselves with the utmost impartiality in all directions.
"In addition to these pleasant little varieties, the Russians were often fond of giving us a pyrotechnic This consists of a shower of hand grenades shells, of about the size of a man's closed fist, discharged to the number of from 20 to 30 at a time ont of mortar. The effect of sueh a discharge in a dark night was really magnificent ; and when the boequet was not contemplate its effect in an unperturbed frame of mind contemplate its effect in an unperturbed frame of mind, it really became a most beautiful sight. Imagine the
sudaten rise of five-and-twenty fiery meteors into the sudden rise of five-and-twenty fiery meteors into the air, each leaving a long curved trail of light in its track, and, as they reach their destination, lighting up
the atmosphere with short, fitful flashes, as they burst the atmosphere with short, fitful flashes, as they burst
in succession. But though thus pretty to look at, they were most awkward customers to deal with; for among so many, the impossibility of dodging them must be apparent. There was nothing for it, therefore, but to lie quietly down on your face, and wait patiently till the storm had burat, and the iron hail had ceased to fall."

A camp dinner furnishes another clever sketch
I fonnd D——in rude health, and in high spirits. He had invited a couple of his brother officers to join our repast; moreover, he had not failed to pay a visit that morning to a vivacious and fascinating vivandiere, well known to the Second Division as Madame Henri, from whom he had procured a plentiful supply of some very decent champagne. Is it to be wondered at, then, that we were all exceedingly merry, or that I should At the close of a very pleasant evening, we were taken by one of the party to his tent, there to pariake of supper, prior to retiring to rest for the night. This meal consisted of a very exteneive and in every way admirable the Duke of Portland to the Crimean army-together with a gallon jar of potent old ale, proceeding from the same source Both these abich as been the subject of no little pride to their respective concoctors. Had his Grace's cook, who I presume superintended the preparation of that most admirable pie, witnessed the rapidity of its demolition, and the perchargy with which, time after time, we returned to the charge, he (or sha, as the case might be) must have
been deeply gratified at the tribute thus honestly paid

10 his culinary
Portland! Portland! say evening with the utmost enthusiasm that was altogether a wonderful evening for Truly, Wright oasis in the dreary destrt of salt beef through ton and champayne in abundance for quarter of matpie and ale for supper; drauplt ale, mind you, as precious in mine eyes, from its rarity, as so much
liquid gold-can it be wondered at that my mind fondly dwells on such unwonted luxuries? Gentle reader, do not consider becanse I speak thus enthusiasgastronome: such is far from being the case but you had lived, as I had, for the previous month unvarying round of salt beef or pork, you would have felt quite as much enthusiasm at such a sudden and anlooked-for change."
One story more, and we must close this enjoyable Volume.

I was riding down into the trenches yesterday, passed a group of sailors in the Valley of the Shadow Death. They were employed carrying ammunition into the batteries, and had stopped to rest at a point One of them, a fine weather-beaten, sunburnt specimen of a genuine British Jack Tar, was grumbling in no
measured terms at the burden he had been carrying, measured terms at the burden he had been carrying, interspersing his remarks with those oaths without
which a ssilor can rarely express his ideas. 'Hullo Jack!' said I, reining in my teted; ' \(w\) hy this is the first time I have heard a nailor grumble sinee I have been out here. No, nor you don't hear no sailor a grumbling now, Sir,' was the reply. 'I be'ant no sailor.' 'You not a sailor ?' I returned, gazing on the man's unmistakably nautical appearance in amazement. If you are not a sailor, tell me in the name of goodness what you call yourself.
sailor,' the man returned, with a sly twinkle in his eye, as he slowly shool his head; then suidenly ooking up, he exclaimed, 'Illl tell ye what I be Do you sse this shell as 1 'm a carrying into the with his foot to the projectile in question, which, after he tell ye what I be; why I be nothing in the world but broken down owld Commissariat mule?

Tenby, a Sea-side Holiday. By P. H. Gosse. 8vo, Vars Voorst. Pp. 400.
This is a natural history guide book, and a remarkably good one, as might have been expected from the name of the author. We donbt not it will decide the whereabouts of many a summer tourist looking out for a station, and we hope it will bring many a recruit to the ranks of the lovers of natural science. It is just one of those gossiping books which are demanded at a Mr. Gosse tells us how he got to Tenby, talks of the laces there, the caverns, Monkstone, North Cove, Hean Castle, Hoyle's Mouth, Tenbyhead, and other places to be visited, shows where the marine animals, his well-known favourites, most abound, teaches how to get at them, when to catch them in a visible condition, how to keep them, how to study them, and what their points of interest are. Of such matters is the book made up and to us it seems to be perfect in its way. We only fear that the microscopic mollusis, of which the volume
contains so many pictures, will disappoint the unscientific contains so many pictures, will disappoint the unscientific observer when he finds that a gaudy yellow or orange
coloured creature represented as 3 or 4 inches long is to be found in a drop of water, and only to be seen through an achromatic microseope.
It is announced that Mr. Gosse desires to form at Tenby a Marine Natural History class; we advise al visitors to join it who are desirous of finding something to occupy their minds about.

\section*{Carden Memoranda.}

Mfssrs. E. G. Hexderson's Nurserv, Wellingtox Road, Sr. Join's Wood.-Ameng many plants now in flower in the show houses here was a number of pretty little specimens of Eriostemons, and conspicunus among them was one named pulchellam, a sind peculiarly wel adapted for amateurs, for it has a neat dwarf habit and qualins most profusely in a very small state, desirable house room ; Boronia Drummondi, quantities of which we noticed covered with little pink star-shaped flowers, also possesses the same good properties, and for similar purposes is well worth attention.
parden has been formerly stated, a kind of winter garden has been made here by removing the partition taking awsy the stage and arranging the plants in groups on the floor, which is traversed by a 3 feet wide end of the house to the other. Camellias form the bulk of the plants in the clumps, which when in full bloom must have a brimiant appearance, and here and there where they can be seen to most advantage, some
very fine standard and pyramidal Bays, Palm trees, variegated Yuccas have been introduced, as well as a few remarkable Conifers, among which we notieed a beantiful specimen of Libocedrus Doniama. Among plants at present in flower here was a eharming white
Camellia elightly streaked with earmine. This was named De la Reine. The same collection also contained
another light kind called Jenny Lind, which is like
wise reported to be very fine; but unfortonately
wise reported to be very fine; but unfortanately
we did not see it in flower. Standard Azaleas and Rhododendrons are now beautifully in blossom in this house, the latter comprising many of Smith's yellow hybrids of various shades, some of which were vexy pretty; also standard Deutzias, common Laburaum, Cytisus filipes, and other plauts of a highly decorative character. In the centre is a small aquarium surrounded by a little rockwork, on which are placed
numbers of the prety Grass-like Isolepis gracilis, the bright green foliage of which falling down towards the surface of the water has a very good effect. The walks are edged with pieces of white flint intermixed with Ljcopodium denticulatum, which is extensively used here for such purposes, for which it is found to be very suitable. The above arrangement has had many admirers, and may be taken as a fair example of what may be done in this way even in common lean-to houses.
Of Bhotan Rhododendrons we noticed a whole houseful of Nuttalli, which is said to be one of the finest species of the genuas yet introduced. Among other remarkable plants may be mentioned Aralia japonica, a species with very handsome foliage; Ardisia crispa, a free flowering kind, and stated to produce brilliwnt
scarlet berries very plentifully even in small scarlet berries very plentifully even in small plavts;
Begonia xanthina argentea, a varity with Begonia xanthina argentea, a variety with larye variegated leaves; Gonocalyx pulcher, a greenhouse shrub with red tubular blossoms tipped with white ; Locheria (Achimenes) magnifica, reported to be most beautifal plant with large brilliant red flowers, spotied and streaked with violet ; a Petunia with large sized double white flowers, and a charming litule Vexbena, violet purple striped with white. For planting in small baskets to be suspended from the roofs of greenhouses nothing could possibly look prettier or answer better than this last named plant. In addition to the foregoing we remarked an example of the handsome Eucharis amazonica in blossom. The flowers of this plant, which are of snowy whiteness, are
appearance, large, and showy
Out-of-doors early Tulips are now in full bloom, and planted as they are in large masses and somewhat closely together nothing could be more striking or showy. It may be worth stating that these are alway have suffice to have done flowering, and the bniks to have sufficientiy ripened to bear taiking up before it is
safe to fill the space they occupy with bedding plants. Thus there is the advantage of an early display of flowers of the gayest colours, and that before the room is wanted for the ordinary bedding plants. This fact may therefore be worth the attention of those wh.
to have their gardens dresey early in the season.

\section*{Miscellaneous.}

Composition of the Ground Nut.-This singular nut (Aradis hypogma), becoming now of so much importance in connection with the industry and civilisation of the western coast of Africa, not only abounds in oil, to which it owes principally its commercial value, but also contains a considerable quantity of starch-rather an
unusual alliance-and in addition a large proportion of unusual alliance-and in addition a large proportion of
albuminous matter. The starch particles are about albuminous matter. The starch particles are about To 'av of an inch in diameter. In no other instance
have I seen so much starch associated with oil. Dr. Dary in the Ellin. New Philosorhical Journal.
The Ammabromer, or Sand Food of Sonora.-This new plant has recently been brought to notice by Mr. H. B. Gray, who was attuched to one of the recent explorations across the continent for the purpose of to the Paing practicability of construeting a ariway fleshy root : a parasite which Professor Torrey, of New York, to whom Mr. Gray submitted it for examination, finds to constitute "a new genus of the small group or family represented by the little-known anomalons Corallophyillum of Kunth, and the Pholisma of Nuttall ; in the floral structure and the scales mare like the latter, from which it is distinguished by its woolly, plamose calyx, and it singular cyalniors rance of asked sandhills skirting "Adair Bay," near the Gulf of California, furnishing an isolated band of Papigo Indians with an mportant article of food. The fresh plant is coswed by roasting upon hot coas, and ras ples the sweet Potato in taste, having much saccharine mater about it. It is hisewise dried and mixed with It is repre kinds of food, such as Musquit, Beans, ce. It is repreansed to le a very deiceres vegenut it would constitute an important acquisition to the table, probably not second in demand to the sweet Potito or Asparagus. In the opinion of Professor Torrey it cannot be grewn elsewhere, unless the root of the shrub, which is entirely uder ground, \&ec., to which it attaches itsell, can be ransplanted. The name given on the sand food of Sonora. The Year-Book of Agriculture.
Brazitian Stimulating Nareotics. - We find the ollowing curious statement in a catalogue of botanica保 "Hooker's Journal of Botany:"- \(\begin{aligned} \\ \text { "ortions of }\end{aligned}\) stems of a Malpigniaeeos to Benth), ealled by the Incribed Basi ( 12 to and dietyon, called Canpi-pinima (i. e painted Caapí), the dietyon, ealled Caapi-pinhou (her prom these ingredients leaves being veined with red. (the Banisteria entering much more largely than the
Hamadictyon) is prepared an intoxicating drink known
to all the natious on the Uaupés by the nume of Caapí.
In the Dabocurís (or festas) of the Uaupe Indians, the young men who figure in the dances drink of the Caspi five or six times during the night, the dose being a small cuya, the size of a very small teacup, twice filled. In two minutes after drinking it its effects begin to be apparent ; the Indian turns deadly pale, trembles in every limb, and horror is in his aspect; suddenly contrary symptoms succeed: he bursts into a perspiration, and seems possessed with reckless fury, seizes whatever arms are at hand-his murucú, cutlass, or bow and arrows-and rushes to the doorway, where he inflicts deadly wounds on the ground or doorposts, calling out against whom he has a grudge) were he within my against whom he has a grudge) were he within my off, and the Indian becomes calm, but appears much exhausted.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

\section*{plant department}

Conservatory, \&c.-As New Holland plants go out of bloom their seed pods should be picked off, and the shoots out back and arranged in the form most
favourable for rendering them compact and bushy, favourable for rendering them compact and bushy, placing them in an airy part of the greenhouse uoter time for shifting such as require more pot room will be when the buds have fairly broken, as they can then be kept somewhat close for a fortnight to encourage a free root action without incurring the risk of the buds breaking summer and autumn decoration, and do not allow them to sustain any check for want of pot room, or careless ness in watering. Fuchsias for late blooming must not be kept too warm ; on the contrary they should be placed in a moist, cool, shady house, where- they will grow much more freely than in a high temperature
Srove-The plants here will now be pushing freely and will require frequent attention in the way of stopping, training, \&cc. Keep them properly furnished with pot room, and afford them all the sunshine they admitting air freely on fine days. Also give them sufficient space for the perfect development of their foliage. Pay strict attention to the deatruction of insects and to keeping everything clean and neat. Go over creepers frequently so as to direct their growth which without attention gound too much entangled Syringe and shut up early on the afternoans of bright ayb, and be as sparing a per moist growing atmosphere, giving theme pushing steaming every bright afternoon by syringing and shutting up early. Admit air in moderate quantities on mind days; but carefully avoid currents of drying wind. Exa nine the plants individually as often as can
be done and water such as require it ; but be careful not to give too much to those starting ;into growth, and a cool atmosphere will greatly prolong the beauty o those in bloom,
forcing department.
Pinkrirs. - Plants swelling their fruit should be divested of all suckers, except as many as may be wanted for stock, directy they make their appearance. This
will throw more of the energies of the plant into the fruit, and will also secure stronger suckers than if too many were left. Our more valuable sorts of Pines are not, however, very apt to produce any excess of suckers,
but some varieties of Queen still in cultivation produce so many that the fruit never attains any size unless the suckers are thinned early. Guard against any decline of the bottom-heat, and where this is obtained from fermenting materials, o little fresh tan should be added before the heat gets too low; and it will be much safer to add \(s\) few inches occasionally as it may be wanted than to follow the old practice of renewing the bed only once or twice in the year. See to keeping the soil about the roots, where the piants are in pots or planted and give manure-water regularly to fruiters and stock in free growth. Vineries.-Go over the Vines in suc cession houses, frequently removing laterals, \&c., before they shade or interfere with the principal foliage Where plants must be grown under the Vines the latter should be kept sufficiently thin to allow of a moderate
share of light reaching the plants, and neither laterals nor any useless wood should be allowed to obstruct the light. See that none of the plants are infested with red spider or thrips, especially the latter, which if once
allowed to get upon the Vines is very difficult to eradicate, and is most destructive to the foliage. Azaleas ar very subject to this pest, and if these are grown under the Vines they must be closely watched, and kept clean are tied up in their places before the shoots get too far adranced, as there is considerable danger of breaking these off when they are allowed to get too long before the rods are tied up. Look sharply after red
spider, and use every means to keep clear of this pest. spider, and use every means to keep clear of this pest
Figs.- Attend to stopping and thinning the shoots, and aim at securing short-jointed strong growth, by ex posing the young wood to all the light possible. This will, of course, necessitate keeping the trees rather
thin, but it is useless hoping for a crop of good fruit thir, but it is useless hoping for a crop of good froit
from trees that are crowded with wood. Keep the
with the syringe after shutting up the house in the after noon, to prevent red spider, and also see that the roots are kept properly moist. Where the fruit is ripening, syringing must, of course, be dispensed with, and the atmosphere kept drier, therefore be careful to have the begins perfectly clear of insects up to the time the fruis moist, warm temperature to plants recently planted out until they get into full growth, but avoid inducing a gross havit of growth by too much moisture and warmth after the roots fairly get hold of the soil, for it is
generally somewhat difficult to secure a crop from wood generally somewhat difficult to secure a crop from wood
of this sort. Give air as freely as the state of the weather will admit, in order to secure firm short-jointed wood, and where the crop is setting, as the young fruit is very apt to damp off unless the atmosphere is kept moderately dry. Endeavour to secure a steady bottomheat of about \(80^{\circ}\) to \(85^{\circ}\) for plants in all stages, and also to keep the soil in a proper state as to moisture;
avoid having to water while the crop is setting, by well avoid having to water while the crop is setting, by well soaking the soil before the principal blossoms every precaution to prevent these getting established upon the foliage, for there is hardly any chance of a crop
flower garden and shrubberies.
Recently transplanted shrubs and trees must be carefully attended to with water until they shall have got that too much. the the the the souring the young rootlets and the after-growth of the plants. Let it be remembered that the soil should be kept constantly moist but not over-saturated ; large plants which may appear to be suffering should be sprinkled over-head with the engine on the evenings of fine days. This will in some measure tend to repair the loss they sustain by evaporation. If the planting of any tender Roses still remains to be done this should be seen to immediately taking care to have the soil made deep and very rich, which is the great point towards obtaining a fine display of bloom in autumn. Keep a sharp look out for "the grub," and do not allow this pest to destroy the plants,
and if green-fly makes its appearance on the young and if green-fly makes its appearance on the young
shoots syringe the affected plants lightly with a mixtere shoots syringe the affected plants lightly with a mixture
of tobacco-water and soap-suds, and give the plants a good washing with clean water from the engine next morning. See that shrubbery borders, \&ce, are cleared of weeds, decayed leaves, \&c., and rendered neat and clean. The weather is still anything but tempting for dranced favourable change, and be proceeding with the planting out of all properly prepared stock under favourable auspices betore long. Meantime we would recommend keeping the plants under shelter, giving them every attention to watering, \&c., so as to prevent theix sustaining any check.

HARDY FRUIT And KITCHEN GARDEN
Persevere with the destruction of insects if any on fruit trees, in order to afford the young shoots a fair chance of making healthy growth; also proceed with disbudding and stopping gross shonts. Look after Gooseberry caterpillar, and do not allow the foliage to be injured before adopting means to eradicate it. Perhaps he readiest way of destroying this pest is to give the trees a good washing with a powerful engine, directing the water against the under sides of the leaves as much as possible, which will wash off the caterpillars, and they are then easily destroyed on the ground by means
of an iron rake. The little red grub which is so destrucof an iron rake. The little red grub which is so destruc tive about some places to the young shoots of the Rasp means of destroy this exterminate, we king care fully for it, catching and killing it, and this is tedious work at this busy season. Get trenches prepared for Cucumbers, and filled with stable manure and leaves or any other materials which will ferment ing the plants ; and get the later prepared for planting out by exposing them rather freely to light and air on every favourable opportunity. Attend to patting n succession crops of Peas, Beans, Turnips, Spinach, \&c., and secure an unceasing supply of Lettuce and othe salads by sowing frequently. Where ground can be spared, and labour is scarce, Lettuce should be sown at foot apart, and thinning out the plants when strong enough to proper distances in the lines. This is some maving of labour, and avoids checking the plants by removal Do not allow Caulifiower plants to suffer through dryness at the root; an occasional soaking of manure water will be useful to these and Cabbages. Use the hoe among growing crops, and get weeds deatroyed wherever they make their appearance. Get manke is a good supply being prepared for the Celery crop, for without plenty of old rich manure large crisp Celery can hardly be obtained. Directly the weather become more favourable get spring-raised Caulifowers pianted out, if not yet done, selecting for them a sheltered situation amongst such things at planting time so as to screen amongst such things at planting time so as to screen
them from the sun, are a kind of protection, and pre vent their being dried up before their roots get hold of the groand. This is a matter which will well repay a little attention.

\section*{SATURDAY, MAY 17, 1856.}

As that useful farm implement, the hoe, is now in constant action throughout all parts of the country, a few words upon its use, and notes on the nature of some of the enemies against which it is levelled may at least excite to thought upon a sabject which is now beginning to attract a great amount of attention.
If we examine into the action of the hoe in spring, say in the Wheat crop, we shall soon see that the operation is productive of great benefit to the growth of the plant. Soon after hoeing it starts into fresh and vigorous leafage, tillers anew, and indeed generally improves so much as in most cases to satisfy the farmer that he has lost nothing by the expense of hoeing.
The mechanical stirring of the soil, the breaking the pellicle which is formed in some instances by the rains of early spring, and thus letting the air into the groand, and stirring up new matter to be acted upon and dissolved for the increasing growth and consequent increased requirements of the plant, each and all contribute to the effect produced; whilst at the same time the removal of interlopers in the shape of weeds tends to confine the food so eliminated to the rightful and
legitimate fumily. It is doabtless the knowledye of
the good resulting from hoeing that has confirmed the good resulting from hoeing oation that weeds are anecenvity. as we were told the other day they (weed-) "wele sent on purpowe to make us work, and land is always grateful for labour." Now proper nechanical apuliances would no be used if we wan'ed the incitement thereunto which weeds undoub:edly present, we shall (ffer a few remarks tendine to show in what manner the hoe is made subservient to weed propagution and contimuance.
If we examine into the natural history of many of our common annual weeds, we shall see reason to believe that in their wild state they have each an appointed time of growth and flowering, but that, as weeds, many of them have accommodated themselves to agrarian conditions; and indeod they have been so long cultivated that they are as much changed as the plants of our crops, and hence can accommodate themselves to all seasons. We see that we have as much a spring and autumn growth of Groundsel, Chickweed, and Speedwell as we have a winter and summer Cabbage; so that with each of these weeds, though we shall have them come up with the root crops now sown or sowing, yet, in the Wheat fields at this moment, or even weeks earlier, are innumerable plants of this kind in perfect seed. Weeds for the most part differ from crops in a very important particular of growth: in grain, for example, all the seeds are ripe at nearly the same time ; but with weeds, and especially the kinds just mentioned, the plants may appear in rigorous growth, and still flowering and starting new flowers at the ends of the branches long after the first formed flowers have ripened their seeds. It was a knowledge of this fact which made os curions to inquire into the extent to which some of our annual plants ripen their seeds early in the spring, and the following table will give an approximation to the number of seeds six of our common weeds may ripen before they die; and also the amount of ripe seeds which they may produce as early as the month of April, these being all gathered in one field on the 15th April in the present year when the estimate was taken.

Table of the Ripening of Weed Seeds.
\begin{tabular}{|c|c|c|c|c|}
\hline \begin{tabular}{l}
Veronica polita, Grey) \\
speed well
\end{tabular} & & \(x\) & \(=450\) & 150 \\
\hline Verunica hederifolfa, Ivyleaved spsedwell & & +3 & 750 & 300 \\
\hline Capsella bursa-pastoris, , & 150 & \(\times\) & \(=4500\) & 200 \\
\hline Cardamine e irsuta,
Bitter Cress & 150 & 25 & \(=3750\) & 5 \\
\hline \(\left.\begin{array}{l}\text { Stellaria media, Chick- } \\ \text { weed } \\ \ldots\end{array}\right\}\) & 500 & \(\times 10\) & \(=5000\) & 00 \\
\hline Senecio vulgaris, Ğroundse & 150 & \(\times 50\) & \(=7500\) & 00 \\
\hline & & & 21.950 & \\
\hline
\end{tabular}

Now, if we reason upon the facts presonted by this tahle we shall see that although spring hoeing cuts up an immense quantity of weeds it assists in sowing an enormous increase, one plant of each of the above making up the aggregate of 6025 seeds which may be sown by hoeing, whilst if not hoed as many as 21,950 seeds may
Now, it is not pretended that all these seeds must arrive at maturity, or if they did that the many greatly diminish their numbers; but we must not forget that in the case of the spring ripened ones the very process of hoeing ensures their being duly sown and thus put out of harm's way in a much
surer nanner than though they had been left to surer nianner
themaselies.
The table, moreaver, will show us that if we would cope with weeds we mast become acquainted with their habits and modes of growth, and so learn when and how to attack them. There cannot be a greater mistake than to suppose that we can do weeding at our convenience, nor can we on the other hand, appoint a set time, but we must be up and doing according as our enomy presents himself, bearing in mind this, that although we call plants weeds whenever they are inconvenient to us, yet that they are no exception to the great law of nature, which provides for the continuance of the species of all its objects, and consequently however humble the weed the beautiful contrivances of means to this end may well excite our wonder and admiration, whilst at the same time the trouble expended in the attainment of such knowledge would much shorten our labour in dealing with them agriculturally.

Anowe the many agricultural entimates to whose failure attention has been oalled, we have been struek with the near approach to accuracy of that
illage in England and the distribution of it among the crops cultivated. In the following fizures the first column gives the returns sanctioned by the Buard of Trade-being the result of a rule of three sum in which the whole area of England, as compared with that of 11 countirs examined, is made to yield so much land under every crop, according to the proprortion of each which those 11 counties have returned. This first column, then, is taken to be accurate, and probably is so very nearly Its figures very wonderfully agree with those of Mr Catrd in colmm No. 2, derived from data obtainer when he was reporting on the agriculture of this countiy as the Times Commissioner.

\section*{REPORT TO A LANDLORD.}

I have enclosed a transparent map of that part of your estate which is to form the farm; ench of the fields is numbered in black ink with the same numbers as the plan you gave me. The arable part of it I have divided not 8 fields, and numbered them with red ink; bat to get 8 fields I have taken the arable part of No. 15 as one, and I propose to grub up the fence between the
Nob. 21 and 36 c on your map, and form these two inte Nos. 21 and 36 c on your map, and form these two into
3 fields, which I call Nos. 5,6 , and 7 , and by this arrangement the arable land will be divided into 8 fields of nearly equal dimensions, and a regular system of cultivation may then le easily adopted

This farm will consist of 87 acres of arable and 129 of pasture, besides your garden plot of \(5 \frac{1}{2}\) acres: -

I propose the following arrangement of the arable land:-

The arable land being thus divided into 8 fields, a roation of 8 years, if properly arranged and adhered tn, will pluce each of the various kinds of root crops 8 jears part, so that neither Turnips, Mangel, Swedes, Carrots, nor Clover will be planted on the same field oftener than adhere to this principle, as mnst soilsget sick of producing good crops of roots and Clover when they are often repeated on the same ground (Turnips grow to fingers and toes when planted every 5 or 6 years, and Clover fails), but this is not the case with grain, which may be repeated every 2 years if aftera fallow crop.
As there is this year in every one of those 8 fields several kinds of crops, it will be necessary next year, in some instances, to plant roots where they are produced which produced also to kow grain on the same ground to establish your plan at the commencement than to get into it by degrees. I would advise you, therefore, to adopt and continue the following plan without the least deeds burnt, and the land plarined this sutnum, the weeds burnt, and the land ploughed before winter, and
be planted part to winter and part to apring Vetches mo food for horses in summer; that part of it which is in Clover may be planted to Beans, but should be ploughred before January. No. 3. To be planted to Wheat. No. 4. To be Mingel. No. J. To be Oats or Barley. No. 6. Potatoes and Turnips. No. 7. To be Wheat. No. 8. To be Swedes. This is the alternate system of root crops followed by a grain crop, sind this course over your 8 fields each year will also be the course over each of the fields during years.

I would only make one observation. In following this systens it is absolutely necessary that the land be made perfectly clean and kept free from weeds, and that the land be all drained and subsoil ploughed at least 14 inches deep, and that all the root crops be well manured either with stable-yard dung or guano and superphosphate of lime. By attending to this these is no d fficulty in producing good crops of Wheat every two years, if you apply a good dose of dung to the previous crops of roots, and get a larger crop. Horsehoeing the land between the drills deeply five or six times curing their growth, and carting the crop all off fter all your root crops.
Under this system there must be an application of manure every year to each of the root crops, so that there must be provided manure for 44 acres per there must be you give to each acre carty there must be a yearly supply of 1000 cart loads. To manufacture this quantity of manure, it
sary for all the 44 acres of roots and the Ciover to be consumed in the farm-yard, feeding-house, or boxes. Boxes are the best and most economical mode, not only Boxes are the best and most economical mode, not only The feeding the beasts, but af mannacturing will produce 800 tons of roots, and the The 33 acres will produce 800 tons of roots, and
straw of 44 acres of Wheat consumed by stock during winter, with the 30 acres of hay from the permanent pasture land, and the 10 acres of Clover consumed during summer, and the leaves of the roots camied home, will produce the quantity of manure you require; Lut as you cannot begin at once with this quantity of manure, it will be necessary for you the first two years to apply guano and superphosphate of lime, in addition of pueno you have. You may hate lime per acre to all the root crops the first two years.
Yearly Value of this Farm.-With respect to the rent of these 217 acres of arable and pasture land, the relative price of the produce of arable and pasture land is as follows:-Where the average price of 'Wheat per quarter is 568 or 7 7s. pes
bushel, the average price of beef and mutton has been bushel, the average price or beer and m. The prodnce, \(6 \frac{1}{2} d\). per lb., or 7s. 6 d . per stone of 14 lbs . The proacee, of When this farm of 21 acres 1 value at 180 quarter of Wheat, including the poor-rates, church and road rates. If we therefore take the average price of the produce
the previous year to get the money value of the prome rent for the this will be a correc estimate for hoth arable and pasture land.
The following is an estimate of the horse-power, live stock, implements, and expense of cultivating this arm. Horse Power.-Under this system of cultivation thene will be 33 acres of roots, 11 acres of Clover, 44 acres of Wheat to cultivate yearly. There will be 1000 londs of manure to cart from the buildings to the fields, 800 tons of roots to cart from the fields to the buildings, 300 tons of the leaves of the root crop to fetch from the field to the yard for the stock to coneume and trample into ma nure, besides the carting home at harvest the Whea it from 44 acres, and carting to market the Wheat as it threshed out. As your arable land is at a disd, you
from the farm buildings and your roads not good, will require more horse power than if the builaing were in the middle of the farm and the rads good You may require for the first two years, till you have got all the land into good order, drained, and subsill ploushed, six horses; but afterwards four horses wit be sufficient to do all the work of the farm, and all the carting required for your house establishment.

The A pricultural Implements required for this Farm136 Pusture, 87 Arable :2 ploughs with draft trees 4 one-horse carts long harvest frames to fit the
wheels and axles of the durg
garts mibyil plough
t pair of light iron rhami 1 nubooil ploue trees
pairs of heavy fron rhom-
trees
Ws with draft \(\begin{aligned} & 2 \text { horse hoes } \\ & 4 \text { sets of plough and cart har. } \\ & \text { ness for four horses. }\end{aligned}\) Also,-barn implements, a threshing machine with shaker, winnowing machine and corn separator, mall steam enyine, chaff cutter, corn and Linseed

The implements for the yards are ladders, forks, wheelbarrows, dung forks and shovels, spades, pickaren, baskets, \&c. ; for the beasts and sheep, Turvip catters, feeding troughs, hurdles, and troushs for the pigs.

Stock:-In estimating the quantity of stock which shach be litan may be kept on the farm we musce during the summer months pard what the hay and roots will pro duce dumer months, and what the hay an the 129 aeres of pasture land, say 30 acres are made into hay yearly, pasture land, say 30 acres are made pasture. I woald there will, therefore, be 100 acres of pasture. to breed propose that 10 dairy cows be kep
10 calves. The beast stook would be

10 eows,
10 year-olds,
10 two-year-olds, to be sold.fat.
tw-year-olds, to be sold.fat.
they become three yearsold thene woullibe

40 head of beasts ; they may require 50 acres of the itad stock required and pay for one year's expense of ' continues, which is the answer to the fourth question pasture land during the summer months. Forthe remain- the cultivation of your farm. The expense of draining : proposed. The result to the owner was therefore as ing 50 acres of pasture I propose a breeding flock of 100 may be about \(6 l\). per acre, and if you drain 20 acres ewes, 25 of their lambs to be reserved yearly to keep yearly this will cost you about 1201 . per annum, and up the ewe stock, the remainder with the cast-off ewes to be sold either for lireeding stock, or, when fat, to the butcher. Your roots during the winter months will enable you to keep more than your 40 head of beasts may have to buy from 16 to 20 beasts in autumn to fatten by consuming the surplus roots and oil-cale.
The skim milk of the dairy and the light grain and 60 to roots will enable you to keep and dispose of from 60 to 80 pigs yearly. The consumption of this crop of straw for litter, will enable you to manufacture the quantity of manure you will require for your root crop.
The number of hands you may require as yearly tabourers will be a shepherd, who must also be cownan, two ploughmen to work the four horses, but for the two first years you will require three ploughmen. To do all the other work which will be required on the farm, such as repairing roads, hedging, ditching, hoeing, weeding, \&ce, three men will be sufficient, but besides these
there will be additional hands required daring there will be additional hands requir

his rent.

CONVERSION OF LAND IN COPSE WOOD. We add the following report on this subject as a pendant to the kinson, of Jpperstone, Notts, and was written at the request of J. E. Denison, Esp., M.P., hy whom it has been published in a
paper on the Grubing up of Woods in the last Number of the paper on the Grubbing up of Woods in the last Number of the
Agreeably to your request, I bes to hand you the ollowing statement of the result of converting wood definite I sliall example, that of Brockwood Hills Wood in this parish. This wood comprised 136 acres, and consisted chiefly of Oak timber, and Ash and Hazel underwood. It had been wood for a long period; ceptainly for 500 years, and probably much longer.
The stock of Oak timber averaged 38 trees per acre, and the average size of the trees was 15 feet each. The underwood was of excellent quality; it had been cut intervals of 18 years, and being in the vicinity of ood market, reailsed higher prices than the average of
The soil
The soil was a strong red loam of considerable depth and of good natural fertility. Although the stock of timber was not so great in number of trees, or so larige in respect of size, as many of the ancient woods in Notts ; yet altogether this wood was, I think, as fine and as profitable a specimen of woodlands as any in the county, and certainly much above the average. In 1840 it was proposed to the owner to stub this wood,
and convert it into arable land, and in support of that proposition a careful inquiry was made as to the following
1. What was the annual value to be expected in perpetuity from the wood, if continued as a wood?
2. What was the present net market value of the stock of timber and underwood, producing such nnnual ralue, supposing it to be stabbed and sold ?
3. What would be the total expense of stubbing, lurning, draining, fencing, and preparing for tillage?
4. What would be the annual value of the land for agricattural purposes, when prepared for cultivation, as arable land ?
The first point, though esselitial to be known, is ordinarily very difficult to estimate, because in addition to the underwood, which recurring at regular intervals may be exactly valued, there is the question, whether he occasional falls of timber exactly represent the fll short or are in exceas of that imorease, and treach all bhort or are in excess of thene, and wrench information on this point, which has led to the false and exaggerated notions of the value of woodlands which exaggerated notions of
have hitherto prevailed.

In the case of Brockwood Hills a fair test existed on this point. The wood was purchased of Lord Howe in 1816, and the whole of the timber was then numbered nd measured.
The timber was again measured in 1840 , when it was proposed to stub it, and these two admeasurements gave the means of determining whether the timber felled between 1816 and 1840 fairly represented the growth of that period. It was found that the net annual income derived from the wood in the 24 years, from 1816 to 1840 , averaged \(70 \%\)., being equal to an annual rent of nearly 10s. per acre. I may say here that my experience of other woods leads me to the conclusion that 108. per acre per annum is above the net income derived from the average of woodlands in the midland districts of the county.
The second Question.-The present net value of the stock of timber and underwood was found by admeaaurement and valuation to be \(7344 l\), or \(54 l\). per acre, and this sum was slightly exceeded by the subsequent sale.

The thard Question-The expenses of stubbing and preparing for cultivation were for each acre as followe:

Stubbing the roots of 48 Onk trees et le. each,
axe felling … \(\ldots \ldots\) mi..... in the winter
after felling, and stubbing all the roots of under-
Wood, at \(2 s .9\) d. per 100 square yards, or per scre
Spreading ashes after burning. per acre

income of

198140
\(\frac{2040}{6993140}\)
This result gives an annual income after stubbing of 3932.148 ., against the income accruing from wood Gain of
Gain of income to the owner by the operation of, per nnum, 3232. 148.
Although the case here stated, from the value of the timber and the high quality of the land, is somewhat exceptional, yet I believe there are few cases in the country where a pecuniary gain would not result from convering woodland into tillage; and I think it may be laid down as an axiom, that where the stock of wood is sufficient to pay the expenses of clearing, and the lands sufficiently fertile to be worth 20s. per acre for agricultural purposes, there the growth of wood is a low to the owner.
The notion of woodlands being profitable, aseumes that the annual growth of wood is equal to the interest of the capital stock plus the rent of the land. But I do not believe that a single instance can be shown of any Oak wood, which produces 3 per cent. interest in perpetuity upon the capital stock, and so there is the lops of rent during the entire period of its growth.

\section*{Fome Correspondence.}

Manure Water in Drains.-As many of your readars seem to doubt the accuracy of a statement put forward by Mr. Mechi, to the effect that manure water will retain its dark colour after passing through a clay soil to the depth of 4 to 5 feet, I beg to say, in corroboration of Mr. Mechi's assertion, that I observed a similar result in the autumn of 1852, when having dressed a field of some 9 or 10 acres with rich farm-yard manare, I was prevented from ploughing it in by a break in the weather, which lasted for nearly a fortnight, during the whole of which time the drains discharged a highly coloured fluid, which I tasted and found anything but agreealle, the manure lying all this time spread upon the surface. From the moment however that we got it turned under ground the water from the drains resumed its usual pellucid appearance. At first I confess I whe both surprised and disappointed, but on reflection the cause appeared to be obvious and simple. The heavy rains splashing on the dung washed and rinsed it thoroughly, and passed at once to the drains through the cracks and fissures to be found in all well-drained land, without giving time for any chemical action of the soil; but once covered in by the plough the rain conld soil; but once covered in by the plough the rain conld
reach the dung only by slow percolation through the upper soil, and no longer rinsed the dung as before, cansequently the soil had sufficient time to absorb and appropriate what before passed through the cracks and
fissures without doing any good. Any one, however, fissures without doing any good. Any one, however, thousand gallons of liquid manure on a meadow even in wet weather will soon be satisfied of the leaky condition of a well and deeply drained field, and this I think is one of the many objections to the liquid manuring system on strong soils, for no doubt some portion of its manurial properties must be retained in water which had so strong a taste as that passed through my fact to competent to the task draw conclusions. J. C. Sherrard, Kinnersley Manor, Reigate.
The Keythorpe System.-I am much obliged to Mr. Sherrard for the notice with which he has honoured my letter on the Keythorpe drainage in your paper of the yy hands in Mr Bailey Denton and Mr. Hewett Davis I or bet, whichever it may be. The two gentlemen I have mentioned agree in denouncing the Keythorpe have mentioned agree in denouncing they cannot both be right. Mr. Denton approves of its irregular intervals, in contradistinction to what he has named "gridiron" systems ; but he charges it, rather unfairly, with being a system of shallow drains, seeing that it has
drains \(7,6,5,4\), and 3 feet deep. Unfortunately, however, there happened to be a few only 2 feet deep, which Lord Berners has explained to be virtually 3 feet deep. Mr. Davis, on the other hand, is satiafied with the depth of the drains, but complains of the irregular intervals. Again, while Mr. Denton places his drains at irregular intervals, he rejects the principle of teatholes, by which the distances and depth of the Keythorpe drains are regulated, while he has not told us by Both Mr. Denton and Mr. Davis deny the existence of the aubterramean furrows of which the Koytharpe
ould make up his mind whether he will be the ppomant or the inventor of the Keythorpe system, 10 since the publication of the paper by M. de la Trehon aais in the Journal Pratique d"Agriculture, which has caused so much sensation in France, he seems to ish to act in both capacities, which is clearly impos sible. However, as M. de la Trehonnais is now in the feld, and has taken up the discussion in a most tempe rate and conciliatory spirit, and as I am confident h will do full justice to the system which he has so ably xplained to the French agriculturists, I am quit ansied to leave the discussion, for the present, eserving myself for another pamphiet, when Mr Denton shall have published one which I rather thin he has in contemplation, or until the discussion shal have reached that point that I think "my battle"
come. J. Trimmer. [This unfortunately did not reach come. J. Trimmer. [This unior

Loxpon,- On the Application of Geology and Hydrau lics to the Drainage of Land.-Mr. Robert Baker, of Writtle, referred to the various depositions of the relation to each other, and explained by the geological map the respective positions assigned them upon the surface of this kingdom, passing by proceeding from the south-east in a north-westerly direction the diluvium crag, clay, chalk, gravel, loam, and other deposits of Suf foll and Essex, passing over the Londonclay to the chalk clay, and thence to the chalk of Cambridgeshire, th green sand of Huntingdonshire, to the oolite of Somer of an alternating character, a porous soil usublly resting of an alternating character, a porous soil usubly reating percolating freely through the former until it reached the latter; and there, meeting with resistance to it further descent, fowing underground until reaching some point where the obstruction was least, it flowe out and formed springs. Were it not for the retentive character of the clay, by which the water was prevented our use, thus almost dispre the opinions advance by a certain class of drainers, that water perco lates freely through compact homogeneous clay. Mr Baker next proceeded to explain the nature of Artesian borings for water. The ordinary springs he had re voirs beneath. The description of land lying above was called springy land, and it required a mode of drainage entirely different from land of more usual description which obtained an overcharge from above, from which it conld not be relieved except by evaporation, or by slowly percolating through the subjacent soil. Water by its own gravity would descend into a soil more or less porous,
nntil from becoming fully surcharged it would flow over the surface at the lowest point of inclination, or it pro ceeded laterally and horizontally to an adjacent drain and thas, by gradually discharging itself through the soil, left it dry and fit for cultivation, and the production of agricultural crops of grain or roots. Upon the majority of strong clay soils the largest portion of the water that became absorbed effected its passage into drains a little below the point where the cultivable soil united with the tenacious subsoil below, or if the upper stratum happened to be porous it sunk deeper, until at length i found its way into the drain in the manver before de scribed. By way of experiment this winter he had tranch cut exactly one yard from a new pipe drain, 3 feet deep, the drain being also of the same depth, an parallel thereto. This trench was filled with water, which mehes, but the remaining portion of the water remained in the trench, to the depth of about 2 feet, for several day afterwards; proving that it conld not escape throng
the clay, or if it did so, only by percolating very slowly Water sinks by its own gravity, and if it meets but little resistance exerts a pressure in accordance; but if
esistance is aways least nearest the drain, the water escapes at once rather than by sinking in the soil downwards, where a greater resistance exists than is found in the direction of the drain. The space of soil neares he drain being the first that becomes discharged of water, the next portion of the soil also discharges itself and so in succession to half the distance beiwixt the earest drains, and continues 80 to discharge itself until uperabundant supply; but if the distance is too great betwixt drain and drain, the water does not escape freely from those points furthest distant therefrom. will thence become apparent that in draining soils of retentive character at the surface, the depth of drain is o longer an object than is absolutely necessary to carry of the water reely. It she liable to derangement by below the surface as not to thable to dont external interference, and for this a drain 3 feet in depth
would be amply sufficient. But if, on the other hand the upper soil is kept in a wet state by the upward ction of water from below, then the drains will need be made deeper, to enable them to carry it off sufficiently and not to allow it to rise by the pressure rroduced from below, by its flowing from a higher level, aided by the tated that undonbtedly the line down the hill was the best (provided it was not too sudden); and explained that a drain of 3 feet in depth would drain a porou soil, even deeper than the drain itself, as water lying above any point of exit would be drained to the epth of the point in question, in a direction up th evel of the drain; but that a drain diagonaly would the soil below. Mr. Baker then adverted to the effects that had been produced at a later geological period upon the surface soils of this kingdom, by water converting the clay subsoils into ridges, aimost simila to the ridge and furrow system pursued above; and afterwards by subsidence filting the interstices so exca vated with porous soils, through which water percolates reely. Hence the system pursued upon the Keythorpe estate of Lord Berners, in Leicestershire, and which had been drained by taking advantage of this circumstance, by first digging trial holes at various distances, from point to point, and afterwards by observirg how far distant the drains operated upon them, cutting other drains to secure a perfect system. Mr. Baker said that this question had been gravely discussed, with little dvantage; the fact was, that every drainer set up theory of his own, which he would not resign, however onvincing any other theory might appar a much practice confutedion ald sion had probably taken place respecting pipes in clay as had taken place over pipes of clay,
and probably with as little satisfactory result. Mr Baker then referred to those indications of the Baker then roferred to those indications of the indices to the need of drainage.
Mr. Bailey Denton said that Mr. Baker had stated that drain \(t\) if feet depth would not draw water, and that clay was imper ious. It was his intention to publish the result of some experi penetrate clays, the water running from the outlet answering \(t\) penetrate clays, the water running from the oure the soil was pro
the rainfall. At Haiskwoth, in Bedfortehire
claimed to be undrainable, but it had been drained nevertheles, and that with such accuracy that it responded most minutely t the rainfall. That fact was an incontrovertible answer to all
that might be said to the contrary. He had been challenged to give an (pinion with regard to the K eythorpe drainage. He had
only recently seen it. The quality of the soil at Keythorpe wa gravels. Thd there was rock. The gravels and sand, were drained perfectly in some places; but it appared as if, where it was per
iectly drained, it was done by accident and not by system. As to the clays, some portlon of them was not drained at all, anothe
portion was drained shallow, and again another portion was
drained deep and drained well age drained deep and drained well. But, upon the whole, there
seemed to be atotal want of anything like system or premeditamajority mere defective. Mr. Trimnuer left the impression by thi paper that the estate consisted of clays, whereas a large portion
of it was gravel and sund. Lord Berners had, no doubt, made use of plose variations in the soil to drain the clays, but he had ot made use of them to empty the ridges and furrows
Mr. Trimmer understood Mr. Denton to ayy that the Keythorpe
estate was not effectually drained, and also that the subterraneous estate was not effectually drained, and also that the subterraneous furrows (the corrugated surface to the subsnil), which he (Mr
Trimmer) had described, did not exist. The Keythorpe drainage in fact depended very ruch upon the presence of those furrow Eixpress, in which he spoke of those furrows, controverted the
tatement of Mr. H. Davies that they did not exist, asserted that they were at Keythorpe, and that the Keythorpe srstem depended upna them. Wit
 the Keythorpe system would be applicable; but although ther Was the same bnulder clay on which he relied for the applicabilit of water came in, unless at the junctinn of the boulder clay with and atill no water came in. On the level surface which Mr stiff clay, yet not a drop did not see what was to be gained by carrying the drains below Mr. B. Webster gave a short history of drainage. Elkington began by cutting of the springs. He attempted the same system
by deep drains on the strong clays of the conntry, and it was system of uniforma drains, which, answered well, , and was adopte
throughout the conntry. Later still Parkes recommended a sya tem of deep pipes in strong clays, and this had decidedly no
answered. Mr. Denton would bear him out in saying that any rate wide intervals and small pipes had decidedy falled
And if they examined the drainage in any connty in Englan
they would find that deep drainage at wide intervals was no they would find that deep drainage at any county in intervals was no
only objectionable, on the ground of expense, but had likewise most completely failed. So that the question still remained
be decided, whether upon those strong reteutive soils there

N.B. Cost of carriage, \&c., not included in these prices.
J. Trior \&\& Sow's Manufactory, Warwick Lane, Newgate
Street, Londen.

J. TYLOR and son's registered garden - SYRINGE,-Smail size, for Amateur use, 21s. each. Large size, for Gardemers' use, 25s. each. Extra for Telescope Tube as shown in engraving for watering panter can be deposited in the pot without wetting the leaves, 10 .
wis. By a simple arrangement this Syringe is rendered more effiective than any portable Conservatury or Gardue Garden or
offered to the pablic. It is equally adapted for Gat Consarvatory use, and is capable of diacharging twioe as much water in a given time as any other Syringe now in use, The arrangernent consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the
Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made selisupplying, a great ssoving of labour is effected; and the neceasty of stopping to fill the syringe at every discharge bed for any
away with, the direction of the water can be maintained fur length of time. It is perfectly cleanly in in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience aitendant on the ase of every other Syringe. Its construetion is perfectly simple, and cannot
out of order; the gronnd in ball valves and fittings used for filling out of order; the gromid in ball valves and fittings used for filing
all other pateat Syringes betng entirely superseded. To be had of any respectable Ironmonger or Seedsman in townor comntry. J. Tplos \& Sons, Manufacturers of Horticultural Apparatus,
Warwick Lane, Newgate street, London Warwick Lane, Newgate Street, London.
N.B. These prices do not include carriage, package, or expense of delivery in the country.

BEADON'S PATENT EAVES GUTTER TLLE Dior Farm Buildings, Roofs of Honses (either old or new, whether of Thatch, Slate or Tile), and other structue.
This is the cheapest kind of spouting known, and is especislly adapted for Farm Buildings and Labuurers' Cottages. It wit last as long as the building without repair, requres no pain, Price of will bear the weight of a adaer ag is \(4 d\). Stop-ends and outlets \(6 d\). each. Any masor can put them up. If 100 feet or more are required, a man will be sent to fir them at bd. per fout. \section*{SATURDAY，MAY 24， 1856}
meetings for the ensuing mebe．

How ought Oak bare to be cured？One would have thought that so simple a question must by this time have received a satisfactory answer and yet，if the reader will turn to p． 659 of on volume for 1854，he will find that foresters have by no means made up their minds apon the subject． Considering that the crop of bark forms a very Considering that the crop of bark forms a very woods，and that the value of the bark is most seriously affected by the way in which it is cured， it is not much to the credit of English foresters that so important a part of their practice should still be unsettled．We therefore see with pleasure that Mr．W．Thomson，the Crown Depaty Surveyor in Chopwell Woods，has endeavoured to show by an appeal both to evidence and reason that there is only one method which ought to be employed，and that＂no local circumstances whatever are suf－ ficiently important to warrant its rejection．＂We
think so too, and for that reason proceed to give a condensed accouft part of the first volume of the Transactions of the Scottish Arboricultural Society. We need not follow Mr. Thomson in his description of the miserable plight in which Chopwell Woods bad been brought by a long period of neglect and mismanagement; for a full account of the place will be found in our volume for 1853, p. 419. We therefore proceed at once to the management now in operation, premising that wages are as follows:-Men, \(2 s .6 d\). to \(3 s\). a day; women, \(1 s\). ;
boys and girls, \(8 d\). to \(1 s\). ; the first working nine hours, the others only eight hours a day.
First of all, the most expert labourers proceed with felling, keeping in a body, and passing from tree to tree as rapidly as possible under the leadership of a workman of known excellence. A second class, generally of an inferior quality, and paid lower wages, follow, pruning the trees of all the branches, rendering them perfectly smooth and clean; they also attend to the removal from the larger boughs of all the branchlets which may be considered worth stripping; in doing which particular instructions are given to them to form as many clefts as possible (i.e. branches about \(3 \frac{1}{2}\) or 4 feet long, 2 inches in diameter, and formed at one end like a fork), the use of which is indispensable in curing the bark; thus a double portion of the work is executed at one and the same time. As soon as the trees are pruned, they are carried out to the several roads which intersect the woods, laid neatly side by side, and handed over to those who are stripping. There are thus three classes of labourers engaged in preparing the trees for stripping, namely, fellers, pruners, and carriers (the last two may be alike in qualifications and wages). Some recommend that trees should be stripped where they are felled, alleging that, after they are peeled and allowed to remain until the stripping
season is ended, they will become lighter, so that season is ended, they will become lighter, so that
the expense of conveying them to the roads will be a mere trifle. Mr. Thomson, who has tried both ways, is convinced that his own plan is infinitely preferable in all respects; inasmuch as if trees are stripped where they are felled, a very considerable portion of bark will be lost in its transmission to the drying stages; and the additional number of trees carried to the roads when dried will not compensate for the bark lost or sotherwise destroyed.
The next process, stripping, is of sufficient importance to command the constant attendance and The trees should be neatly sorted along the maroin of the plantation roads; they should, if possible, be laid in heaps containing from six to twelve, and to each of these heaps two of the women should ke
sent to strip. It will invariably be found the better plan to have the strippers employed two and two together, in order that the one may assist the other in lifting the ends of the trees upon their horses, and to cast them aside when peeled. These "horses" are forked pieces of small trees or branches about \(4 \frac{1}{2}\) feet long, placed diagonally on the ground, at about 5 feet apart at the bottom bat allowed to meet at the top, into the clefts of both which the end of the tree is permitted to rest. Thus placed, the tree is made perfectly firm and ecure, and being raised to a considerable heigh from the ground at one end, every facility is given for removing the bark with care. This is done by the use of a "peeling-iron." Care should be taken to see that the bark is removed in pieces as large as possible, and always by the iron; it should never be torn off in shreds by the hand, as is often done by careless labourers, for it is thas rendered much more difficult to deal with in the fature stages of its manufacture; and if in the least degree damp when stored, it will become so firmly consolidated into a mass that it will be almost certain to be affected with mildew or rot. While peeling the trees is proceeded with, the boughs which may have been considered worth stripping and prepared for the parpose, should also be dealt with in the same manner. Chopwell Woods are exceedingly unhealthy, and the conse quence is that many trees, and still more branches, even in the most favourable season, cannot be stripped at all. Mr. Thomson directs all such to be thrown aside, finding it a waste of time to operate pon them ; and, considering the very low price now btained for bark, it is unprofitable to strip boughs under 1 inch diameter at the small end; moreover he never allows a mallet to be employed.
Large timber trees will, of course, have to be stripped where they fall, their removal being impossible without materially lessening the quantity and njuring the quality of the bark.

While stripping is going on, curing is actively proceeded with. Neglect at any time, especially in wet seasons, entails an incalculable amount of loss,
for when injury is once inflicted on this description
of produce, the effects are irremediable. Buyers are able and willing enough to detect the slightest damage; and unless there is a very close competition for its purchase, it is certain that producers will have to submit to a reduction in price more than equivalent to the actual amount of damage.
After describing the Scotch and English modes of curing, Mr. Thomson thas describes his own:-The reader will recollect that instructions were to be given to the labourers who pruned the trees to prepare a number of fork-like preces ointed at the thick end, and driven into the ground along the margin of the roads, two abreast, at about 18 inches apart, and from 6 to 9 feet from each other length wise. Into the clefts of these a number of rails (the smallest of the trees) are horizontally placed, the end of each resting upon its fellow, until the whole presents the appearance of a double row of paling. One of the sides of this stage should be made 2 or 3 inches higher than the other, so that if rainy weather sets in it may be impossible for any quantity of water to lodge upon or amongst the bark; but in no case should the lowest rail come nearer to the ground than 30 inches, so that the Grass which grows around may not have any injuious effect upon the bark, and that a free current of air may at all times be secured beneath and amongst

The bark is placed across these rails, and sorted as neatly as possible, care being taken to see that a sufficient number of large pieces is laid at the bottom to prevent the smaller portions from falling through, and the largest pieces of all are reserved to act as covers; these should be neatly laid on, with the fleshy side dowuwards, and maintained in their position during rainy or damp weather, but in fine days they may be removed, which is an un doubted advantage both to themselves and to that which they are designed to protect. Having it thus laid on the stages, little more is required to cure it, except in extremely wet seasons, when it will have to be turned over occasionally ; and it is at such times as these that the absolute necessity of careful stripping is felt, and its advantages enjoyed. If the sa is good, and if the work of stripping is neatly performed, it will be found that the bark is taken off all round the tree without breakage, and in pieces of not less than 2 feet in length; in which case, assumes its original shape as soon as it begins to dry, and being thus formed like a tube, it becomes nearly impervious to water. Stripped as above described, and laid carefully upon the drying stages to a moderate thickness, without being closely compressed, it will be found that, in ordinary seasons, very little loss will be experienced from mildew but if any of the operations are negligently perormed it is probable that even one-half of uantity prepared may be more or less injured.
Mr. Thomson finds storing bark in stacks to be under every circumstance preferable to housing. On the day previous to that on which the bark is to be stacked, a man is sent to prepare a suitable site for it, and to clear away rubbish around the place. The bottom of the stack is prepared by collecting a sufficient number of peeled branches and rough boughs of trees, so that the heap may be raised to a height of at least 18 inches from the ground, in order that a full current of air may have access at all times, and to prevent water from stagnating beneath it. The bottom should be made perfectly circular, from 12 to 14 feet in diameter, and altogether similar to that of a corn-stack. Twelve feet will generally be found high enough to build the body of the stack, which should be allowed gradually to swell in its proportions as it advances in height, until it attains an extreme diameter of from 15 to 17 feet at the esves ; this is done, as in the case of cornstacks, to throw all the water which may fall upon and run down the roof right off the eaves on to the ground. The roof is constructed in a conical form, and is drawn to a point as sharp as possible. A stack of these dimensions will be found to contain from 14 to 15 tons of timber bark, and from 12 to 13 of sapling.

The necessary preliminaries being made, if the bark has to be carted from an average distance of 300 yards, two single-horse carts will lead in one day as much as will constitute a stack of the above dimensions. It is important that each stack should be completed on the same day in which it is begun, lest rainy weather should set in, and spoil the bark. A man is wanted to assist the carter in loading, and two or three lads will be required to pick up any small pieces which may fall off the stages or out of the man's arms. Daring the erection of the stack, the labourers must throw aside all the large pieces until it is built to the eaves; these are then placed on as the stack progresses, exactly in the same manner as slates are put on a house. If this is neatly done, no portion of the bark will receive the least injury from weather, even though subjected to
year's exposure. Mr. Thomson particularly objects to thatching with straw or reeds.
The last point to explain is the most important of all, namely the cost at which the work can be performed, and the market value of the produce. In showing this Mr. Thomson furnishes the particulars of the operations of one year, in which he prepared for sale rather more than 133 tons, the season being considered to be a good average one. He however begs the reader to call to mind the unhealthy state of his woods and the high rate of wages in the neighbourhood. He does not give an account of the expense of felling trees, because this item should be charged against the timber, for the trees may have to be cut down at any rate, whether they are afterwards stripped or not.
Expense incurred in Stripping 133 tons of Oak bark in the manner

This shows the expense of stripping to be only l. \(2 s .10 \frac{s}{4} d\). per ton.

Expense of curing 133 tons of Lark, as above described:-
18. per diem, \(\mathrm{f0} 10\) 101 days of a lad erecting stages, at
32.2 days of a boy or girl setting up
12.
do.

r something less than \(4 s .6 d\). per ton.
Hence it appears that the whole expense incurred stripping, curing, and storing Oak bark, in a district of country where the highest rate of wages in Britain is paid to labourers, amounts to only 1l. 9 s. \(4 d\). per ton; and Mr. Tномson adds, in proof of the satisfactory manner in which the bark was prepared, that not a single complaint was made against its quality, and that he received made gaid for bark in the same neighbourhood during the year to which these calculations refer
In a postscript he further states that his experience during the present year (1855) corroborates all the foregoing remarks, especially as regards expenditure. There is on hand an estimated quantity of 118 tons of bark, stripped off very onhealthy trees, cared in the usual maner, and stacked in most excelleat condition at an aggreate expense of 1661.1 s .5 d ., or 17 s \(2 d\) per wile labourers' wages coz tinue at the rate quoted in the preceding tables.

We venture to think that this statement merits the attentive consideration of country gentlemen, now that the bark season is at hand.

FEw phenomena in the vegetable world are more surprising than the rapidity with which a tree that produces thousands of blossoms is relieved of all except those which not only have been fully fer tilised, but which in consequence of superio strength take the lead at the expense of their neigh bours, and are destined to produce perfect frult. We have lately been watching with much interest in hope of throwing some light on the matter, the for mation and fall of the young fruit in a vigorous Pear tree, The froit in the first instance se admirably, insomuch that it was impossible for the tree to support such a crop as was promiven A portion, therefore, must of necessity have given way, had not some weeks of inclement weather come in aid of the requisite failure. The cold was not, however, such as to do more than depress the vitality of the fruit, in consequence of whic tissues ceased to swell, the chlorophyll lost its green tint and its separation became needful in order the healthy and vigorous growth of its more favoured companions. As failing tissues are very apt to com municate a fatal taint to healthy parts with which they are in contact, it is requisite that after separation should take place as
vital energies have ceased. is the frnit to be
The question then is, how how is its stalk to thrown off? or in other words, how? It is well separate from the mother bramortion of a member known that in animalsative process takes place in becomes dead, a forma pron of the symptom the sound portion attended by many of the sympt cells of ordinary inflammation; a mulnitude gradually press are in consequence generated, whalls away. In the
-
ions of vital heat, a process precisely similar in its onses cannot be expected, but if we mistake not something closely analogous takes place, by means of which the dead part is pashed off. When the young fruit is just ready to fall, if a slight degree of violence is used, the union is easily broken. If then the disc by which the fruit and branchlet were united be examined, it will be found to exhibit a granular appearance, from the presence of a number of almost free cells, which are often as white as snow, and are either thinly dusted over the surface, or form a rather thick stratum. These cells are generated at the point of demarcation between the dead and living tissues, and as they increase have a tendency to throw off the dead or dying fruit stalk exactly as the new animal growth does the putrid slough. They are dissolved instantly in strong sulphuric acid; on the contrary, they do not Field to caustic potash, and with iodine and sulpharic acid the outer coat becomes blue, while the aitrogenous matter within remains yellow. They are then nothing more than ordisary parenchymatous cells, very similar to those which occur on the walls of accidental cavities in Phænogams, but unlike them, instead of being studded with little raised points they are perfectly smooth. While this action is in progress in the young shoots, the old axile portions from which the peduncles of last year's fruit were separated in autumn are undergoing a somewhat similar process, though a more gradual one. Wherever a bract or leaf was situated on the new effete axis separation takes place, descending step by step till the whole is removed. Four or five irregular fissures are formed in this way before final separation is accomplished, and at every step the disc is powdered with the same glistening cells, which are often so abundant as to be easily removed with the point of a penknife.

The chemical reaction of these cells is just the same as in the other case, and there is nothing to confirm the notion of Schacht that the fall of dead organisms is due to the formation of cork cells. It is very possible that after long exposure to the air they may alter their chemical characters, but this is a different matter to the production of cork cells in such a position before separation, and we can ourselves bear witness that after they have become perfectly brown from exposure, their chemical reaction remains just the same as before. A similar process in all probability takes place in those cases where branches of some thickness separate spontaneously by \& circular fissure, and something of the same kind may exist even where there is at each bud a transverse interruption of continuity in the pith. M.J.B.

We observe that Mr. Forrester, in his new wine circular, gives a very gloomy account of the Portuguese vineyards. The high position which his growths obtained in the French Exhibition, where out of 24 samples of Port wine exhibited by growers and approved of by the jury, fourteen were those of his firm, entitles his statements to particular attention. It appears that the stock of wines in Oporto does not now amount to more than 5000 pipes of 1853 30,000 pipes of 1854 , and 20,000 pipes of 1855 of all qualities. Choice old wines in the hands of native holders for sale to exporters, cannot be estimated at more than 7000 pipes-for which fabulous prices are demanded; and it now appears not only that the proprietors, anticipating alrenewal of the blight, have dibbled Indian Corn into the rugged grounds amongst their Vines, but that a new disease caused by an insect has made its appearance, and threatens the Vines of Portugal with the fate of those in Madeira and Teneriffe.

ON THE CULTURE OF PEACHES, APRICOTS,
and Vines under a moveable glazed STRUCTURE.
Ald cultivators of fruit trees know that the Peach, Apricot, and Vine are natives of much warmer climates than those of England and Belgium. We have not yet succeeded in obtaining in our latitudes, by means of seed, varieties hardy enough to bear, in the open ground, fruits

\section*{wall with a good aspect.}

When we examine the gardens of the ancient religious establishments of the country, we find there are still many vestiges to attract the attention of the observer. These gardens are divided into several compartnents by walls of \(7,8,10\), or 15 feet high, furnished with copinge which project from 12 to 18 inches according to the height of the wall, and at the bottom of these walle are raised sloping borders, 6 to 8 feet wide. For the best aspect, facing the south-east, south, or south-west, the protection of a still higher wall is afforded. It was on these, according to the testimony of the old friars, that fruit trees which would not succeed elsewhere in gardens were cultivated. The riches of these institutions permitted the erection of these costly but durable and useful structures. At the present day all these precautions are not taken, even in the gardens of the wealthy; yet the injuries to fruit trees in spring, and consequent losses of crops, are such that it is high time to adopt remedial means. Recourse is had to copings, which shelter the blossoms from snow and late frosts. Some employ mats of rushes, straw, or Russia mats. Others again have
uraned horizcotally, for by that mode they occupy leas space, theyare pruned at the fall of the leaf in November A pricot trees they are not pruned, but merely cleaned and the branches trained and nailed in their natural direction from the centre of the tree. Towards the end of February the moveable structure is placed against the wall.

As soon as the fruit is set, and in a fine day in Apri or May the moveable structure is taken of from the Peaches and Apricots, in order to perform the operations of disbudding, pinching, and the removal of old exhausted branchlets. The fruits are thinned at the same time by cutting them through the middle, and the leading shoots are nailed in. If insects appear they are killed by sprinkling with tobacco water, which no insect can withstand ; afterwards the trees are syringed with clean water. The wall is left uncovered for a day or two if the weather is favourable; but if not, these opera tions are performed without taking down the structure It remains up till the Peaches and A pricots have nearly arrived at maturity, which is about three weeks or a month before ripe fruits can be obtained from unprotected walls. The period of ripening depends, of course, upon the season being more or less favourable. The sashes when taken off are laid aside till the following spring, whilst the trees exposed to the influences of the atmosphere regain their vegetation and productive vigou for the tollowing year -J DeJunglic

Explanation of the Figures.-The Explanation of the frawing was placed saginst a wall of a new conprretion and which has existed for rere than 25 wears The wall is formed of a framework of Oak, form ing squares, in which are set on edge two courses thick of blue paving tiles, 9 inches square, so as to break joint This wall is \(6 \frac{1}{2}\) feet high, and is covered by a board, \(x\), which serves for a coping, and is supported from sash to sash by pieces of wood, \(y\). In the coping boards are fixed hooks which hook into two eyes on each sash. The sashes rest upon Oak posts, \(z\), 3 feet 3 inches. Each post supports the ends of two sashes, which rest partly on the one and partly on the made of Pine, and are framed and lazed in the ordinary way The in. glazed in the posts are closed ervals between the posts are cosed, up which can be remored at plea, \(t\), ,' which can bo rem from in or out by being tied to laths nailed in or out by
This is so easily moved that the whole of it, though 58 feet 4 inches in length, can be removed by two men n 8 minutes, and again replaced in 12 minutes. When the moveable part of the structure has been taken down, there only remain the posts, the use of which no one would suspect Besides effecting its principal objectthe protection of fruit trees, such as The Peach Apricot and Vine, \&c - the structure serves at the same time for the production of early vegethe for which purpose a border \(3 \frac{1}{4}\) feet wide is available.
The expense of the entire structure was at Brussels 7l. 0s. 9 d., or about 28. 5d. per foot run. It is composed of the following items:-

\section*{Straw}

Gratuity to the gardener
The glazing, painting, and making the straw
mats, having been done by the gardener at
spare times in winter, are not taken into
spare
account.
moveable glass structures, which appear to me to be preferable to all other modes of protection. By means of these we have seen producen Peaches, Apricots, and Grapes, perfectly formed, and of a delicacy beyond which nothing could be desired. We have seen one of these structures in the garden of Mr. Charle Van der Straeten, at Texelles lèz Bruxelles. This garden is situated on the highest part of the environs of the city. The ground is cold and stiff during winter, but the layer of vegetable soil is very deep.
The moveable structure represented in the foregoing plan is placed against a wall, facing the south-west composed of tiles 9 inches square. All details respect ing the wall and moveable structure are given in the explanation to the plans; some remarks as to the fruit trees, and the period when the structure is put up, may however, be given.
The wall being constructed of tiles, and the joints being perfectly filled up with plaster, no refuge is afforded on its surface for insects. This is a circum stance worthy of note. Against the wall is placed a trellis work of round rods attached to the uprights of the Oak framework at the distance where the reflection of heat is greatest. This is another point to be noted. After the Vines have been three years planted and
-Charles Van der Stracten.

\section*{VEGETABLE PATHOLOGY.-No. CXXII}
484. Vulnera (Wounds). The most conspicuous and indeed often the most serious wounds, are those which affect the branches and trunk or their investing bark. It is well known that the bark of a tree cannot be removed to any great extent without the probability of very serious injury. A principal part of the ascending sap passes through the young wood, and if the surface of it dries \(u p\) in consequence of exposure s portion of the supply is cut off from the upper pranch Life may be supported feebly for a year or bron ingsmuch as a small quantity of sap is conveyed by two, in of ware cases the supply older layersin the exigency, and death at length is not sufficient in exig ensues. The Lita lity where subjacen long sustained vitality where the bark depth and it rolated by Prosper Alpinus that in the sixteenth century related by Prosper Alpinus that Memphis of very ancient date, under which there was a tradition that the infan

Siour had rested with his parents, and of which the
wood w..s in consequence much snught for relies. In spite wood w.s in consequence much snught for relics. In spite, ife was still carried on.* In some cases of accidental or will. 1 removal of the bark, fresh tissue will be thrown ont fron the medullary rays, provided the surface is moist ind protected from the air. This happens oceawhere it is de-irable to insure recovery is to protect the surface by some covering, taking care however that the air is not so confined as to encourage the growth of mould to the destruction of the infant tissue. Bruises are annetimes more fatal than actual decortication, where the affected surface is not large, because the tissues are apt to decompose and an ulcerated condition
to ensue. The mere luss of sap is seldom of any material consequence. In such cases the best treatment is douhtedly to remove the injured bark, and the exposed surface will after a time be covered with bark, if no granu'ations appear upon its surface. Serious decay will very rarely take place apon a surface thus exposed. 485. The wood, however, as well as the bar may be involved in injury, whether intentional accidental. In one of horticulture, pruning, stantly made, without affecting ultimately the bealth of the plant. The exposed portiun either is covered dies down the next bud, withers un, the wood lost as the new bud increases. A litle caution, however, is necessary in trees which produce stone fruit, as gumming may ensue from injudicious or careless treatwhether it is better to cut them off as close to the trunk as possible or not. There is, however, no doubt tha in the first case the wound will heal up more completely, and with less danger of decay. The removal of large branches indeed can seldom be necessary, except where superflunus wood. The great art of pruning is to pro vide, not only for the present and following year, but for future contingencies. Where it is requisite to head down a tree, large wounds cannot be avoided, but even an these cases horizontal sections should be as infrequent moisure resting on the surface and penetrating the tissues.
480. In some cases, however, it may be needful to by wind or other causes. Where this is the case it is for if not there cut as close to the trunk as possible which will grently injure the value of the wood. Several plans have been proposed of protecting the cut mentioned in the fure just as applicable to the cases menti,ned in the foregoing paragraph. The object is
to apply some varnish or cement, which shall not be so hick as to impede growth at the orge, or shall not be of :uch an irritating nature as to affect the neighbouring living tissues, but which shall effectually pre-
vent the admission of moisture and the growth of those fungi which are so injurinus to timber. The best of these is that given in Lindley's "Guide to the Orchard and hitchen Garden, Pp. 507, 508, and which is commonly called Forsyth's. One bushel of fresh cow-dung is int:mately mixed with half a bushel of lime rubbish, as from ceilings, the same quantity of wood ashes, and \(1-16 \mathrm{th}\) of a bushel of river sand, all finely sifted. The edges of the wound and surface being made perfectly an inch in thickness, care being taken to thin it gradu ally off' at the edges. A powder of wood ashes, and onesixth of the same quantity of hurnt bones is then it to remain half an hour to absorb the moisture More pouder is then rubbed on with the hand till the whole acquires a dry smooth surface. The be made of the proper consistence by mixtud may be made of the proper consistence by mixture with
urine or soap-suds and laid on with a brush. The surface will want occasional examination to thash. The plaster is not removed by the growth of the young plaster is not

\section*{NYMPHEAS.}

Therr are at present in the stove tank at the Oxford Botanical Gardens some Nymphreas, which, if they do not contribute to the unraveling of the complicated synonymy of the genus to which they belong, at least poeseaned jears, a plant in all reepects like that figured in the Nympliza Magazine," tab. 4535, under the name of Baxter. my attention to what he thinks a variety of that plant or possibly a hybrid. It is three or four times larger than the \(N\). micrantha of gardens. The sepals sposs, the petals are of a pale blue colour, and the form, in the remarkable buthifese of N. corulea. In leaves, and all able buloiferous character of the littlo or no difference between it and the so-called N. micrantha. For purposes of cultivation the large equally readily pron, and it During the last year, too, we received
J. H. Unina, Arboretum Biblicum Nor. 1699 .
of Hambur, h, under the name of D. Lehmann This is undoubtedly the same as the plant cnltivated here and elsewhere, and figured in the "Botanical Magazine" as N. micrantha. I mention this, as Lehmann himself refers the N. micrautha of the "Botanical Magazine" to N. vivipara, Lehm., the description of which latter correnponds in many
respects with that of the large blue form of the so called N. micrantha before mentioned. Dr. Planchon in his "Etudes sur les Nymphéacées," refers the N. micrantha of the "Botamical Magazine" to N. Guineensi of Schumacher ; the original N. micrantha of Guillemin and Perrottet is supposed by him to be a form of N. ccerulea, and is not, as far as 1 know, in cultivation. From the same source also we have received a Nympheea called by Dr. Lehmann N. poecila. With us this plant ia perfectly undistinguishable from tha vm of Nymphea cerrulea known in cultivation a . cyanea. Perhaps it may be as well to remark that the true blue Wrown in this country as N. cyanea, is of specimens in the herbarium, as well as of the figures in Delile's Egypt and Ventenat's Jardin de la Malmaison shows. The South African N. scutifolia is als generally cultivated under the name of N. cœrulea,
from which it differs in the under side of the leaves, and on the sepals, in the bbtuse form of the latter, which are also somewhat "hooded" at the points, and in the elliptic form of the the acute sepals are flat at the apex, not blotehed, and Dr. Hooker, in pyrami' al and acutely pointed.

Dr. Hooker, in lis recently published and invaluable Flora Indica," p. 240, cites Professor Henslow as Nymphæa alba from Naracter whereby in the same pond. There is, however, a difference in the number and arrangement of the intercel ular canals in the flower and leaf stalks the two plants. In N. odorata there are four large central canals, surrounded by a few of very much N. odorata minor, and in N. pygmea, In N. alba there are al-o four central canals, but these are surrounded by the central ones. The other species of Nymphrea that have examined differ, not only in the arrangenent che canals, but also in the fact that there is a different disposition of the tubes in the leat and flower stalks,
instead of the arrangement being the eame in both rgans as in the species referred to. Maxwell Masters.

\section*{Home Correspondence.}

The Fighland Fine.-Is there any real distinction between the Highland Pine and the Scotch Fir? and if there is, which is the best? I see in many nurserymen's catalogues they are offered as two distinct kinds. There is much difference of opinion on this subject. Both are Pinus sylvestris-lut they are probably distinet varieties.]
Easy and effectual mode of fumigating Conservectories. - Take some coarse brown paper, cut itinto squares of about 16 inches. Soak them in a strong solution of nitre ; put them by to dry. Spread them out flat, and cover the surface thinly over with tobacco ; then begin at one of the corners, and roll it up as the cook does a roll pudding; tie the middle with a thread and also the two ends. Having shut up the house and made all flower pot, and upon threse rolls-light them at both ends, and leave them to do their work, which they will do most effectually heir work, which they will do most effectually.
half an hour you will find the green-fly \&c, destroy Give a slight syringing next day and your plants will b found to be perfectiy clean. If the conservatory is
very large, it will be necessary to remove the plants affected to some smaller compartment. These plants should not be made up till wanted, as the paper will contract moisture, and so will not burn freely. Dry The above at the fire previously to making the rolls, greatest benefit from it. G. Leapingwell, Came found the Charcoal.-"The wood charcoal may be burnt i room without a chimney, as Mr. Ladlin has deprived it of all noxious eflluvia."-The above is copied from an advertisement in the Cardeners' Chronicle for last week a. though you are of course not responsible it ; for statement thus made, yet I think you responsible for any be the means of diffusing a falsebood which might caus the most fatal consegnences. Pray therefore inform those of your readera who are liable to be deceived by matter this charcoal itself, and not any extraneous carbonic which when burnt produces the deadly gas, all the of any utpleasant smell which might serve to give warning to those inhaling the gas. P. W. J., Guildford if Mr . quences he is likely to find himself in the presence of a
Heating and Vertilating.-I imagine my simple plan for comenanding a free and continuous ventiation with Warm and moist air will answer very well in most instances, from the trials I have made. My new house
now in progress is about 40 feet by 12 feet inside, with
a sunk walk a foot deep in the centre; through itte whole length brickwork is carried up from the bottom of the waik to 18 inches above the surface on cither are laid on the ground, and the ends of these are fized) into small brick and cement tanks these are fixed end of the house and one in the centre), in lengths of about 19 feet each ; there are four pipes lying parallel to each other, and a fifth below, from the bottom of the tank furthermost from the boiler, as a return pipe; the whole are enclosed in a chamber 9 inches in height by feet wide ; slates are laid over it, and on this is abon inches of a free sandy earth, for a hot bottom plunging, propagating, \& c. In the front wall on a level with the ground are apertures 9 inches high and 2 feet ong, leading directly into the heated chamber ; these openings are commanded by sliding doors of slate, and the interior of the house, in the side hrickwork next from the chamber 9 inches high by 3 feet long, wits sliding slate doors, four in number ; both within with without these doors will be kept open more or less night and day. In the back at the op of the loss night openings with shutters and regulators. Thus all the ir admitted into the house must pass by the openings and front, through the beated chamber, into the house, and as ending makes its escape through the apertures in the back wall, the tank supplying the necessary tpleasure, and one or more of the pipes each end to regulate the heat. The plan is economical and simple. It may not answer all the requirements desired ly many, but I believe that it will be found to answer very well. I have had in a small greenhouse, from which I could not keep out the frost, a few Denrohes, Stanhopeas, Lælias, Odontriglossum, a Peristeria, Patycerium grande, Eschynantis, Hoya bella, Renan thera, Cattleya, and other things generally coddled through the winter; they look rather sulky, but they have survived, and some or all show evidences returning vigour. Thomas Ingle, M. \({ }^{\text {Pcat Plants.- Pray recommend }}\)
onuth of England with peat soil to everybody in the and tomentosa, Andromeda formosa, and all the Nliciums - they are all beautiful with me. In al some plants resist frost better in peat than other soil ; but The Musterd Tree of Seripture. - In Stanley's "Sinai
and P'alestine," p. 419 , allusion is made to this quasi tree, and in a note Professor identify it with the Salvadora persica, which "is reporte to grow in the neighbourhood of Damascus, in the valley saret Jordan, and on the shores of the lake of Gense ought to be h you tell us what this Salve strange that it should never have been introduced. I cannot find the name either in Paxton or Loudon. I at one time thought the Broussonetia papyrifera to be the scriptural Mustard tree ; I suppose merely because its seeds are so like Mustard in form, size, and colour, only not of so bright a yellow. T. R., Herts. [The Salva doras are Persian and Indian trees of no beauty, and Horticulturul Society. Th.]
gardens of this question. Chiswick appears to me to be quite a national Society, through its gardens, has bad upon horticulture not only in England but throughout the world, which is especially testified to by Mr. Behrens' noble offer, and as I attribute to this the great improvement in the and the in of plants (though hardly enough recognised) it would seem a sin to break up the very valuable establishment at Chiswich. The question is now whether the gardens are to be given up or whether the which an experiment and a bold push may be made to restore them to their pristine glory and usefulness. This is really a very trifling sum, and it does behove all lovers of gardens to come forward and add their mite to so good an object. I believe-independently of Chiswick and which are too large to be removed-that the collection of fruit trees is the most perfect in the world, and the value of such a store as an authority and for the supply of varieties throughout the king dom is incalculable. For this alone the public ought
not to allow the garden to be destroyed. I will only add that the garden thine destroyed. I wire per suaded I feel that the experiment of two exhibition at Chiswick this year (I say two lest one day should bo unpropitions) ought to be tried, and could pretty well There are numbers whom I know who think the same. There have been abundant causes for the failing funds derived from them during the last two years, but this with too much ampeng that rival exhibitions must not be thought of. I have made inquiry among some of the leading nurserymen, and they are moot villing to exhibit at Chiswick, although there are of course the exhibitions in Regent's Yark and at the Crystal Palace. As to the latter I am by no means inclined to consider it so formidable a rival as some
people. The prizes are certainly high and the place attractive ; but for the fashionable world it is far less accessible than Chiswick; and provided ihe weather be long the broad turf and under the shade of the trees, is to most people more agreesble than the thronged
nave and galleries of the Crystal Palace，beautiful thounh
they be．The drive is far more easily and conveniently they be．from the West End to Chiswick，than by the different broken routes to Sydenham Hill．I would therefore urge on the authorities to prepare imme－ fident，out of love and gralitude to the old place，such will be the interest in the public mind，that the memory of old times will revive；and as has always （with the exception of the last two years）been the case， the result would recur again，viz．，a handsome surplus over expenditure would be handed over to the funds o the Society．An Oldish F．H．S．，May 2

\section*{为orieties．}

Linnean，May 6．－The President in the chair．Mr． Gaskoin exhibited some of the jumping seeds，described by Sir W．J．Hooler and Mr．Westwood in the Kew Journal of Botany，the motion of which is due to the ing papers were read：－1．On the Action of Sea Water on the Germination of Seeds，by C．Darwin，Esq．The seeds experimented on were placed in bottles flled with
salt water artificially prepared to resemble sea water， and were submitted to different degrees of temperature without however any apparent influence resulting from the latter conditions．Other seeds were also experi－ mented on by the Rev．M．J．Berkeley，these having
been immersed in sea water－at Ramsgate for about a been immersed in sea water－at Ramsgate for about a
month．The results of both series of experiments were embodied in this paper．The total number of kinds of seeds experimented on amounted to 87 ，and of these 23 or more than one－fourth，did not endure 28 days \({ }^{5}\) im least degree，for 30 out of 56 seeds planted germinated well after 137 days＇immersion．Of Celery seed，im－ mersed for the same period，only six out of several mersed for the same period，only six out of several dwarf Kidney Beans and Hibiscus Manihot，both of Which were killed by 11 days＇and common Peas by 14
days＇immersion．Tussilago Farfara germinated under days＇immersion．Tussilago Farfara germinated under
water after nine days；but the young plants kept alive for water after nine days；but the young plants kept alive for
some time．Those affected in the next degree were found to be Phlox Drummondi，Trifolium incarnatum，Linum usitatissimum，and Sinapis nigra，very few of which sur vived 15 days＇immersion．As general results，three out of 17 endogens and 20 out of 70 exogens were killed by 28 days＇immersion．This fact，together with the marked powers of endurance in the Atriplex，Beta，Spinacia，and kheum－lower organised exogens，Mr．Darwin thought accorded and was perhaps connected with the fact，вo much insisted on by M．de Candolle，of the wider range of the endogens，and of the lower organised exogens， than of the higher exogens．Four Solanaceee and two of these groups furnished one of the longest survivors of all the species tried．Of 10 Compositeo only one was killed by a month＇s immersion．Of eight Cruciferes， all withstond the influence well excepting Sinapis niyra which was hilled liy 25 days＇immersion，and thr－－of them survived 85 days．This power of endurance in the
seeds of this fanily was alluded to as perhaps surpris－ seeds of this fanily was alluded to as perhaps surpris－ ing，considering the oil in their seeds．of nine Leguminose，all resisted the salt water badly，with the
exception of the hard thin seeds of Mimosa sensitiva， which germinated pretty well after 50 days ；three species of Lupine seemed just able occasionaliy to with－ stand about 36 days＇immersion，the seeds of the other Leguminosre having all been killed in much shorter periods．Mr．Darwin suspects，however，that it is the water and not the sult which kilis the Leguminosa：for
he found fresh＂Reliance＂Peas all killed by 13 days＇immersion in pure water，and had been assured that kidney Beans were killed by immersion for a much shorter period．The author stated in conclusion his conviction that of very few species，as far as we yet
know，are the seeds all killed by 10 days＇immersion；ti at know，are the seeds all killed hy 10 days＇immersion；th at
some seeds would float for this reriod；and that under favourable conditions some plants might thus be transported over arms of the sea 300 miles or more ia breadth．The paper was accompanied by an enumera－
tion of all the kinds experimented on，with a statement of the results．2．On the Vitality of Seeds after Pro－ longed Submersion in the Sea，by James Salter，Esq． The object of this paper was to record that in 1843，on the occasion of Poole Harbour being deepened，the deposied brought up from the bottom of the harbour was area by the shore，and in the following year was covered by an abundant vegetation totally different from that of the neighbouring shore，and consisting of Oats and Barley in abundance，Epilobium hirsutum in profusion， a few plants of Lysimachia vulgaris and Centaurea calcitrapa，and many others which had not been noted，
None of these plants grew naturally in the vieinity，and None of these plants grew naturally in the vicinity，and
on the other hand none of the ordinary shore plants of on the other hand none of the ordinary shore plants of
the neighbourhood appeared on this new made ground At the head of the harbour it appears that the river Frome and the river Piddle discharge their waters into it，and Mr．Salter asks：－＂Is it too mueh to suppose into the rivers in which these plants sprung bad fallen gone with their waters into the harhour，and ultimately reached the position from which the mud and they liad been collected？＂This explanation seemed probable； but whether received or not，Mr．Salter thought it was seeds had been for a period，probably considerable，at
as that of the ocean，and had retained their vitality until in this way brought under influences which resulted in sects of Singapore，Malacca，\＆e．，by F．Waller Esq

\section*{Notices of 引ooks}

An Inquiry into the Nature of the Simple Bodies of Chemistry．By D．Low，Eeqq．，F．R．S．E．3d ed． 8vo，pp．386．A．\＆C．Black．
In this new edition of a work noticed by us in 1844 at p． 103 of that year，Mr．Low endeavours to show by new arguments that all the simple bodies of Chemistry are compounds of hydrogen and carbon，with the ex－ n no degree alter the opinion expressed in 1844．The matter may be as Mr．Low believes if to be，but he does not prove it to be 80 ．Neither can any train of argument however ingenious，or line of speculation chemical demonstration．If chemists are to admit that oxygen is a compound body Mr．Low must decompose it into hydrogen and carbon．Then indeed he will have established his case so far as oxygen is concerned－
but not till then．Nor does it but not till then．Nor does it give us confidence in the
justness of his views to find him dwelling so much upon justness of his views to find him dwolling so much upo minm；for if he could decompose sach bodies he would not be entitled to infer from such a circumstance that other bodies which he cannot decompose are neverthe less decomposable．
Beyond these remarks we have nothing to say．The work is undoubtedly one of great talent，and we have no has conducted his cause logically，learnedly，and skil uliy，although，since they cannot apply to their science the doctrines of probability，they may be unable to admit that he has made out his case．It may be true that sulphur is a compound of hydrogen and nitrogen，it also may be true that gold is a mere condition of sulphur combined with something else，and hence that gold is reducible to hydrogen and nitrogen，but until it has been so reduced men of science must be pardoned for with holding their implicit assent to the theory．The learned author＇s concluding remarks upon gold illustrafe per－
fectly the manner in which he deals with his sub－ ject：－
ld年，it will be seen that it is not very closely associated
 of the metals，conducting us to the conclusion that contains sulphur ；and its external characters are those of a sulphuret．It resembles so closely bisulphuret of tin in certain states，that the two substances can carcely be distinguished by the eye，and it has an almost equal resemblance to sulphorets of titanium an golden－yellow colour which distinguishes the latter sub－ stance．It resists the action of pitric and muriatic acids separately，while it is rapidly acted upon by aqua regia，which is likewise the case with other sulphuret of metals，as cinnabar and bisulphuret of tin．Further when lightning has struck gilded ornaments they have hecome blackened；and it has been found，on analysing the blackened matter，that the presence of sulphur was distinctly indicated．But whence comes the sulphur？ The hypothesis has been proposed that it accompanies the thunder；but it is more reasonable to believe that it exists in the gold，and has been evolved by the action of the lightning．Gold，then，we may fairly assume， further，this is no anomaly in the case of gold，since other metals，we have seen，niay be believed to contain sulphur，or the elements of sulphur．The powner of projection of the alchymists was probably in many cases
sulphur，or a compoutd of sulphur，and the reseniblance to gold which its action produced on tin and other metals，was calculated to confirm these early chemists in their visionary hopes．Yet we are not entitled to ridicule the alchymists．They were misled by a theory， as we perchance may be mibled by theories，and we must remember bow many ages of experimede，such as is，which we now possess of the fundamental truths chemistry．Not only did these early chemists believe that sulphur existed in gold，but some of them supposed that gold was their principle of sulphur converted into absurd．Nor was there anything very extravagant or which may be termed a semi－metal，and into antimony， which is a true metal ；and why，it may be asked，may it not be supposed to pass into gold，which is likewise a metal？Gold，then，for anything we know to the con－ trary，may be a sulphuret，or even，founding on the the state of the which we cannot command，and by meaus of that \(\pi\) hich cannot enter into our experiments，a vast period of time．Gold is manifestly the production of the earliest periods in the geological history of the globe，and has been produced under conditions which we can never imitate．We cannot hope，like the alchymiste，to form gold by any agents at our command，hat it is not heyond the limits of a reasonable expectation that we may be we possess，and by means of which other bodies，before
held to be simple，have been proved to be resolvable into simpler elements．

June is a duodecimo volume by Mr．Stainton（Long－ mans），intended to point out the charms of that month， is an enthnsiastic naturalist who summer．The author hedge，and ohjects to admire beneath every stone．He describes the June of Scotland，of the Lakes，of Devon－ describes the June of Scotiand，of the Lakre，of Devon－ pire，illisex，and of London，the wolume is witten necumuh the scathedra style oo much in the exc cathedra style，which does not int－ prove the sparkling passages ；but upon the whole it is
likely to interest tlie young who are naturalists either likely to interest the young who are naturalists either
in csse or in posse．1lis attack upnn the boarding－ inc csse or in posse．His attack upon the boarding－
school system of exercising young ladies by marching them in colurons along a dusty road up io a certain point，and＂then right about face－and back again＂－a method of progression which he compares to that＂of an ordinary 16 －legged caterpillar，＂is amusing and trae． But we fear there is little chance of the gentle damsels being permitted to exchaige their formal march for a band run after insects and flowers．Before they teachers must understand a litlo natural hatter ond where are such teachers to be found in ladies＇ bourding schools ？ \(\qquad\)

\section*{Garden Nemoranda}

Messrs．Veltch＇s Nursery，King＇s Roan，Chblsea． －We need scarcely state that the spirit of improve－ ment is still active here．Since our last visit many are in hand．The square at the end of the prin－ cipal show house has recently been remodelled，laid out and planted with much care．The design selected or being of diferent colours，some white win Derbyshire par and others surfaced wih a beautifur warm yellow gravel，have the effect of setting om the advantage．But this is not all；it will be remembered that three sides of this square consisted of glass houses containing Orchids and Yitcher plants，and that on the fourth side there was only a bare wall．For the latter has now been sub－ stituted two neat span－rofed houses，one of which is wholly occupied with Furus，chiefly from Madeira，and the other with Orchids in flower，intermixed with the better varieties of Fern，while between them，forming an entrance to the conservatory，has been put up aneat and useful portico，thus completing in a convenient in this portion of the grounds．At the end of one of the new houses just noticed has been formed in a suitable comer out of dours a hardy Fernery in the hape of terraces raised one above the other with vitrified bricks for a centre piece，around which is a walk，and beyond that similar terraces，which slope is enclosed．The plants which are all in pots are plunged in their places in coal asties and peat，and over the whole is to be thrown an awning of canvas．In this cool and shady re treat are to be tried Madeira and other Ferns，with a yiew to ascertoin how far such varieties will succeed under this kind of treatment．In the winter time it is we believe however intended to give them contigudinal protection．in a long strip give colle tion of her aceous plants，among which we noticed the new Delphinium cardinale．This is reported to be a plant of rare leauty and to posecss a colour new to the genus to which it belongs．If the coloured plates which we have seen of it can be trusted（and we have no reason to doubt their correctness），it is as rich a scarlet as could well be desire，prettily relieved in the it shall have become known it cannot fail to be a great favourite．
In the conservatory we observed two handsome specimens of Chamærofs humilis，and in the glass－ covered promenade leading into it were various planta， chiefly remarisable for fine foliage，but intermixed here and there with Azaleas，Rhododendrons，and other things in flower，so as to give the whole a dressy appearance．Prominent among the latter may be mentioned Deutzia gracilis in the form of tall standards and istarias of similar shape．The latter were，how－ were in full blossom they looked extremely well，and with the Deutzias formed an agreeable contrast．In this house we remarked one of the best specimens of Thujopsis borealis perhaps in the country．It measured quite 4 feet in height from the top of the pot，was close and bushy，and altogether mis the handsomest of Coniters
In the different Orehid houses several Phalænopsis， Cattleyas，Aerides，Dendrobes，and Oncids were in flower，and a visit just now to the house in which the Yitcher plant are kept is indeed a treat．The centre bed is an open tank with inverted pots in it for the plants to stand on，and thus sitnated，with a with such viguue，and form pitchers in anch profusion as to rival，nay even probably excel，their wid beauty and luxuriance．Tastefully intermixed with these plants were numerous wide glass pans in which have been placed examples of thie Madagascar Water Yam （Ouviraudra fenestralis）．This wonderful plant，whose skeleton leaves resemble beautiful network，is planted
with Derbyshire spar, whose white appearance permits
the lattice-like foliage to be seen and examined with
mecured by appearance, and strong stocky growth facility, while above it the water (which is filtered) is as clear as crystal. These plants of themselves-for they are numerous, Mr. Veitch having the whole stock of it-would form objects of great interest, but when we state that they are surrounded and backed up with noble specimens of Nepenthes of every shape and kind, from the rare and valuable N. lanata to the
great N. Raffesiana itself-of which Messrs. Veitch have succeeded in raising a considerable number of fine seedling plants, which are already pitchering freelywhile in front are some splendid pots of variegated Orchids, need it be wondered at that this house is considered by all who frequent it to be one of the most attractive features of the place? Next in point of interest is probably the aquarium, in which are some magnificent variegated and other plants raised on pedestals above the water, while in the latter Nymphæas of different kinds grow luxuriantly and blossom most abundantly. Nor must we omit to notice a house wholly devoted to plants remarkable for fine foliage. The great merit belonging to plants of this description is that they are equally interesting in midwinter as in the height of summer, and that, visit them when one will, if well gratification and delight. The arrangement in this house, with the view of producing the best effect, we need not say is most complete, and it may therefore be taken as a model of what all such houses ought to be The very fine specimen of Stephanotis floribunda which covers the roof of one of the small stoves is already one mass of bloom, a condition in which it will continue for waeks to come.
Concerning the new plants now on sale in this establishment, we have nothing to add to what is given in our advertising columns at p. 338, where all the more important of them are fully described, and their respective
merits carefully pointed out. In the different orchard merits carefully pointed out. In the different orchard houses we observed a good stock of young fruit trees in pots, and in the houses devoted to the raising of Vines from eyes was an excellent supply, including the new and on all hands acknowledged excellent sort the Stockwood Golden Hamburgh. Associsted with them
also numbers of young plants of the Singleton Fig.
Along the sides of the main walk were arranged several pairs of magnificent standard Bay trees, which rose up from among small Conifers and other plants in pots. The walks were in first-rate order, and everything was neat and trim. In short, neatness both indoors and out is scrupulously observed here, a lesson which it is to be hoped young men employed in this establishment will not forget when they shall have been transferred elsewhere to situations of trust on their own account.

\section*{Miscellaneous.}

Sale of Mcssrs. Loddiges' Orchids.-As was announced at page 320 the first portion of this extensive collection of Orchids was brought to the hammer by Mr. stevens inst. The following prices were obtained for some of the more important lots:-A noble specimen of Vanda Batemanni fetched 43l. 1s.; V. suavis, 101. 10s.; V. teres, 10l. ; Aerides nobile, a very fine plant allied to
A. suavissimum, 21l.; A. Schröderi, 19l. 19s.; A. A. suavissimum, 211. ; A. Schröderi, 192. 19s. ; A.
quinquevulnera, 10l.; A. odoratum maximum, \(9 l .10\). A. Larpentæ, 91.; Saccolabium ampullaceum, 15l. ; S guttatum, \(7 l_{0}\); Coelogyne Lowi alidas asperata, \(14 l\), ; C pandurata, a fine plant allied to the last named species, 14.: Oncidium Harrisoni, 91. 10 s. ; 0. Lanceanum, 9l.; O. purpuratum, a species in the way of Lanceanum, D. speeiosum, 5\%. 5s.; D. chrysotoxum, 5l. 10s. ; D. (For the ensuing week.)
PLANT DEPARTMENT.
r, \& C . - Now that cold
Consrrtatory, \&c. - Now that cold pits and frames will be getting cleared of the bediding stock, they will form excellent places during summer for the growth of many things for the autumn and winter decoration of the conservatory. Indeed many of our most usefal plants for this purpose will do better for the next
three months in cold frames than in larger houses, where the regulating i, of the atmosphere is not so much under control, nor the plants so readily examined, as in these smaller structures. Roses are perhaps more generally admired than the conservatory in antumn and early winter if properly attended to at the right time. Young plants of the perpetual flowering petaals, if placed in a cold frame and properly astended petaals, if placed in a cold frame and properly attended water, will soon form nice sized specimens. Bat in order to secure their bloomingifireely in autuman and
early:winter, the flowers must be picled off as they
to the night dews, and keeping the shoots stopped and tied out as may be required, and otherwise attending to the habit of the variety.

FORCING DEPARTMENT.
Pineries.- Where the quality of the fruit is the first consideration, which it is or should be in every instance, care must be observed to have the soil about the roots where it can be done without injuring the rest of the stock the atmosphere should be kept rather dry, admitthere is no chance of fruit of prime quality if the soil is very wet about the rnots, and the atmosphere kep period. In the ated with moisture during the ripening period. In the case of plants growing in pots the trouble of collecting and placing together those
approaching ripeness, so as to be able to treat them approaching rupeness, so as to be able to treat them
properly, would be well repaid. Now that we have something like summer weather give air freely to the growing stock, particularly in the case of plants that may have been making rather weakly growth, but shut up early in the afternoon, dewing the plants lightly with the syringe, and sprinkling every available surface, so as to secure a thoroughly moist atmosphere. Use re heat as sparingly as may consist with maintaing keep the degree of temperature. Be very careful root, and give plenty of manure water to those in vigorous growth, and also to plants swelling their fruit. Vineries.-Where Muscats are grown for a late crop the night temperature of the house must not be allowed to fall too low after the bunches begin to appear, and a temperature of from \(65^{\circ}\) to \(70^{\circ}\) must be maintained while the fruit is setting to ensure good sized, close bunches. Keep a sharp look out for red spider in
houses where the fruit is colouring, and if this pest makes its appearance lose no time in coating the hotwater pipes with sulphur. If not already done get the litter removed from the outside borders, but if it is found that the roots have crept up into it, which will probably be the case where the Vines were started early be left, and every decayed portion at the both the youn roots. And if many roots are found at the surface it will be necessary, after removing the litter, to top-dress coat of turfy loam, leaf soil, and horsedropings will answer very well for this purpose. See that the borders of houses, where the fruit is swelling, are not allowed to get too dry.
flower garden and shrubberies,
保 the groper keeping of then may be as confnoion every despatch to bring this work to a finish. But if every despateh to bring this work to a finish. But if
any portion of the stock is not sufficiently prepared, any portion of the stock is not sufficiently prepared be necessary, and plant out nothing but strong plant that have been carefully inured to the sun and air, for weakly ill-prepared stuff is so much at the mercy of the weather, that it is folly to depend upon its covering the ground in any reasonable time. Give sufficient water to settle the soil about the balls of the plants the first warm morning after planting, and give no more until the soil becomes dry, unless warm drying weathe should set in, and then a gentle sprinkling jevery morning will greatly benefit the plants,

Asparagus beds will be greatly benefited by liberal waterings with manure water from the stable or farmyard tank, especially where the plants are weakly. Attend to recently planted beds, and water as frequently as may be necessary to keep the soil moist. Get in Dwarf breadth of Champion of England, or Knights variety for late crops. Situation some other suitable do with the proper selection of dosiety for bearing but proper selection of a variety for late bearing, but wo have found nothing among the many new varieties which we have tried equal to these
for resisting the attacks of mildew, and very few surpass them in quality. Get Tomatoes planted out against the walls, and Vegetable Marrows and ridge Cucambers under the shelter of hand-glasses, also French Beans that have been raised under glass. Sow Cauliflowers for late use, and attend to keeping up a regular succession of Spinach, Turnips, \&c., and such things as are preferred in a young state, and do not overlook Lettuce, \&c., for Salad. Where Gooseberry trees are badly infested with caterpillar, use every posFoxglove leaves is employed for that purpose, as it is by some, the fruit must not be used until after the trees have been well washed with rain. Attend to regulating the growth of trees designed to be trained in any particular form, stopping useless shoots to throw more ticular form, stopping useless sho
strength into those that are wanted.
state of the weather at chiswick, near london. For the welk ending May 23,1856 , an obverved int the Forticulcurl Gardeos.

\section*{© \(\mathfrak{C l}\) (gricultural Gasette. \\ SATURDAY, MAY \(24,1856\).}

Our readers may perhaps not be aware that the Association in Edinburgh for Promoting Improvement in the Dwellings and Domestic Condition of Agricultaral Labourers* is the only one now in operation with that object in view throughout the country. There used to be an institution having a similar object in the county of Northumberland, and the Laboarers' Friend Society, of whose doings we have lately heard nothing, had their eye on this among other methods of improving the social condition of the labouring classes; but the Scottish society, which necessarily confines its direct operaions to Scotland, is we believe the only institation now which confines its attention to the improvement of agricultural labourers through the improvement of cottage architecture. There is in many localities quite as much need of such an institation * Patsicis Morersoz, Esq, 20, st. Andrem Square, Edia burgh, Secretary.
in the south as there is beyond the Tweed. The publications of the Scottish Society, however, reuder it available here as well as there, and we therefore call the attention of our readers to them.

An anvual s'a'ement is issued by the directors, to which a report by their architect is appended, cuntaining infurmation on plans and on details of cottage structu:es. The second of these reports is now before us:-

The Directors have ascertained from many sources that the general issue of their Firat Annual Report last spring, amounting to nearly 1300 copies, has been productive of a very beneficial effect on cottage improvement. They have been informed that several of the plans
appended to that report have been executed in different appended to that report have been executed in differen architect, and are giving satisfaction in every way: that others have been only partially followed, and that all have served the chief design of their publication, which was to stimulate subscribers

On the plans for cottages here referred to, the repart goes on to say that the directors-
nnider three separate sleeping or living apart ments as the very least accommodation that ought to
be affurded for a proper division of the sexes in a he afford'd for a proper division of the sexes in a provided for in promoting any social improvement among the peasantry; and therefore they camot but regard with the deepest regard the erection of new cottages having only two such rooms for lal,ourers who

The improvements suggested, it is said, cannot be carried out at such a cost as to render the investment immediately profitable as a commercial speculation; but as to the ultimate advantage
landowner by the erection of commodious buildings, in the improved character of the labouring population on his estate, there can be no doubt whatever.
"The Directors find that they cannot profess to give plans for cottages haviug all the requisites for comfort and social decency at a commercial remunerating per confident that, where such is insisted on, these humane provisions must to a great degree be sacrificed ; but the directors do profess to afford directions for building cottages where a plain style is adopted, which shall embrace all these, and yet yield such a per centage on
the outlay as, with a corresponding increase in the efficience of their occupants as labourers, will prove highly remunerating to both landlord and farmer.
The report by the architect contains references to a number of cottage fittings on view at the Society's rooms. A fire-box by Mr. Mushet, of Dalkeith; a "bothies"" drain tubes, with spigot and faucet joints; syphon traps; hollow tiles for facing the interior of walls; perforated bricks; methods of lathing and plastering between rafters in attic rooms; fire-clay hearths; and many other maters of importance in detail are described and illustrated by drawings: and schedules of measurement and specifications for the erection of the plans for cottages, recommended by the architect, are given. This series of reports will be a very valuable the wav of information and suggestion on the improvement of the dwellings for his labourers.
At the annual meeting of the society the repo for the current year was adopted on the motion of ir Juhis S. Forres, who said:-
The report read was of a general character, the Cormer reprert being so fully detailed that it was unnecessary on this nceasion to bring forward mach more of the same kind of matter. The plans given in that report he believed had been found very generally satisfachad assisted those who that were given by the architect on the plan they should adopt. It was now proposed to publish detailed tabular measurements to enable parties withere them without farther communication with this office or any other party. It was proposed also to lithograph a few
plans on a large scale of three or four of the princeipal plans on a large scale of three or four of the principal
designs furnished in the report. Whenever any gentleman proposed to them to build they had sent tracings of the plans he required, with any additional information necessary, and they believed that with these desigus and tabular measurements they could put the plans into the hands of any competent country tradesman, and have them executed. They also propose to issue with this year's report a considerable number of woodcut illustrawere inserted at the end of last year's report. These would comprise several additional fittings which had been presented to the Association. One of these was the
hollow brick instead of lathing, which had been suggested by Mr. Stuart, and which was now in use in the new cottages that had been built. They had found by calculathous that this brick could be supplied as cheaply as damaged. It also secured entire dryness, having the property of becoming of the same temperature with surface, that could ile it presented a mmooth aniform surface, that could easily be papered over. In some
and they had been the means of quite protecting these apartmenis against damp. T'nis he himself had tried with the most complete success, and he thousht it one of the most valuable improvements made by the association. Their architect (Mr. Fowler) had visted various parts of the country on the invitation of landlords, to inspect their cottag+e, and had been erabled to render valuable assistance to them in carrying out plans for their improvement. Lord Kinnaird had recently employed him in this way, and they were happy to find that he had satisfied his Inrdship's expecta-
tions in regard to the cottages he had built tions in regard to the cottages he had buile
or improved. The very large number of cottages Lord Kinnaird had improved, was an excellent oppor tunity for the architcet to see how their plans luoked in execution, and observing the various modifications in arrangements thus detail it was necessary to keep in
view. He might remark that the Association were view. He might remark thas notion that there were detail impressed winute, that ought to escape their notice. The comforts of social life, as they believed, depended on triffer, and these constituted often the thin wall of partition that separated domestic happiness from domestic misery, and a little well-adjusted outlay would make all the difference between th:ese two extremes."

Mr. Caird's letter, to which we last week referred Lives some interesting particulars of the condition o French agriculture, the differences between it and that of England, the improvement of which the former is capable, and the mode in which that admits of the most economical accomplishment, as proved by the history of the latter.
We are unable to find room for the whole of the paper on this subject, and must therefore be content with such quotations as shall give the views ex pressed on these several points. Mr. Caird says:-
"The main distinction between the agriculture of the two countries is shown by the different proportions in which the cultivated land is appropriated to the leading crops of both. While France has 53 per cent of its cultivated land under corn, England has lut 25 per cent; hut in Grass and meadow, the nalural food of 22. Though ha has por under corn in the two countries are altogether different, as well as the actual extent of land under carn, and the numbers of the population of each, the supply afforded by the agriculture of both countries to each individual of the population is very nearly the same, as is shown by the following

"To obtain necessary food for the people, French agriculture thus employs twice the extent of Wheat land which would be needed in England. And though the means differ so greatly, the similarity of results does not end here ; for while the English import
\(5,000,000\) quarters of Wheat annually, which, added to \(5,000,000\) quarters of Wheat annually, which, added to heir onn growth, gives \(7 \frac{1}{2}\) bushels of bread corn for each individual of the population, France grows
\(3,000,000\) acres of Rye, which is used for bread and will adel about two bushels to the \(5 \frac{1}{3}\) of Wheat, thus giving likewise \(\boldsymbol{\gamma} \frac{1}{2}\) bushels of bread corn for each individual of the French people. So marvellously do the results correspond with the necessities of the case, though the means are totally different."

The most important part of the letter to English readers is that in which the cause and the remedy for this extraordinary difference in the agriculture of the two countries are stated. The cause does not exist in the soil or in the climate of France, both being growth of corn to those of England. It exists in the greater sources of manure which the English ystem affords :-
"Every acre of corn land in England receives on the average the manure produced from 3 act \(s\) of Grass (such are the relative proportions of the land in Grass and corn), while in France the manure from each acre of Grass must be spread over two and a half acres of different systems, while that of England affords fiom its Grass lands the equivalent of nine loads of manure to enrich each acre of corn, that of France yields little more than one load to each acre."

The remedy then for the backward state of France, as regards its produce of corn, mast be one which shall increase its supply of manure :-
" The soil of that country is in its natural state of 12 or 13 bushels an acre, and it is a simple question of the produce to 20 bushels."
"In England that increase has frequently been accomplished by the application of guano or nitrate of soda. o the immediate adoption same resource is also open xtent of \(15,000,000\) acres it is France. Bat over an The supply of these manures would fail were it even possible or advisable (which it is not) to excite such an
"The increasing demand for and price of mest in

France points to a more permanent and better remedy
In England an increasing' denand for animal food seenis con-tantly to follow an increase of prosperit among the people. It shows itstlf in the details household expenses, where the expenditure of the lomen class of labourers is for bread in the proportion of 9 to 1 laid out in meat, butter, and mill, while that of the wealthy class is exactly reversed, being in the proportion of 1 to 9 . The increasing wealth of the people is thus constantly enlarging the demand for meat and thus constandy enlarging the demand for meat and within the last 80 years, while that of corn has made little or no advance. This, as I pointed out in 1851 the chief cause of the great attention which is paid in England to the rearing and feeding of live stock and to the management of pastures and green crops. The same process seems now to have begun in France. The supply of meat is not equal to the demand. A neces sity has arisen for enlarging the supply, and in propor tion as this branch of husbra nerative so will it extend over the country, and gradually readjust the balance by providing more ample sources of manure to the exhausted corn lands.
"Then will begin a steady advance in the average produce of the corn land. From 12 or 13 bushels an will soon reach to 16 or 18 , and, sma though the figure may appear, even that increase roould France. It would amount to nearly \(10,000,000\) quarter of Wheat, equal to twice the annual importation of foreign Wheat into England.

The first step in the change will be the cultivation more extensively of roots and forage, as the food of live stock. According to M. Lavergene, there is in France somewhat larger extent of land under fallow and root than under Wheat. Let a part of this, as in England be made the preparatory crop for wheat. If manured with artificial manure, and cropped with a root such a Mangel Wurzel, which is peculiarly adapted to the soil and climate of France, this, with forage crops, would supply food for more than all the sheep and catte that now exist in France. Abundance of food at all seasons would lead to early maturity, and, instead of sheep being kept they are four or five years old, as was France, they would be fattened in the first or second year. A rapid increase of numbers would follow, and the prosperity of the French farmers would impercep tibly augment with a change of system which enabled them to send every year to marhet one half of their sheep stock, instead of one-fifth. Within the last few years this change has been taking, lace with great profit in the richer parts of Ireland. There seems no reason to doubt that it might be followed with equal success in France. It is more of an axtificial system than the ancient one, and depends for its success on an ample provision of winter and summer food. But that is prethe consumption of this winter food forms the great source of manure for improving the Wheat crop."

The encouragement which, as Mr. CAIRD shows, exists to the improvement of French agriculture is even greater than that which English farmers find just in proportion as the first increase of produce is more easily gained than any subsequent increase.
"There is more profit to be had by a good farmer in entering upon a goud soil which has been badly farmed farmer who has already raised the produce and value of farmer who has aiready raised the produce and value of
the land to its highest pitch of productiveness. That seems precisely the present position of France as com pared with England. And, accordingly, the prospect of agricultural profit by improved farming is extremely favourable in France, and the steps necessary to reaiiso this improvement are direct and simple. No igricultural refinements are needed here, such as a first-rate farmer in England must use to get a profit by adopting a practice in agricultural art which his predecessor hac omitted."

And again :
"The margin for increase in France is so much greater than in England that a rise of 20 bushels an acre seems easily within reach, and, when attained, would still fall greatly short of the present average of England. Yet this average is by the whole amount of the average produce of France (12 to 13 bushels an acre) below the regular crops of the best cultivated English farms. While the average of France is to the average of England as \(12 \frac{1}{2}\) to \(26 \frac{1}{2}\), the average of Engiund is to the average of the best English farms as \(26 \frac{1}{6}\) to 40 ."
Mr. Cairds letter will no doubt be widely circulated in the sister country, as we may now call her. guide to the conclusions which many an arricultural lourist will form from actaal inspection during the next few weeks.

AGRICULTURAL STATISTICS OF EUROPE.
(By Mr. H. Reader Lack, Board of Trade.)
(Continued from \(p\), 288.)
Divistin 2.-Acgtria, Holland and Belaitre. Bor is evident from Mr. Denison's repart to the farmers on the on Paris Exhibition that many of the this country in the use of good implements and machines, and we may be quite sure that as soon as chines, and we may be quite sure that as soon
the results of their use become generaly known, the
continental farmuers as a body will readily adop
in preference to going on in old-fashioned ways.
When this comes to pass many of those now uncultivated acres in central Europe will be reclaimed and forced into production to meet the wants of the age. It behuves English farmers, then, to be upon their guard, lest the foreign producer by adopting the use of English machinery drive them, if not out of the market, at least so hard us to leave but a small profit on their produce.

The increasing means of transport throughout the world, and especially in Europe, will bring the countries Whose productive forces we are reviewing within a few competition in the disposal of Wheat, \&c., in the British competiti

But let us proceed with the enumeration of the statistics of the production of those states comprised in this division.
Austria.- The soil of the Austrian empire in the year 1850 was distributed under the following heads:-
\begin{tabular}{|c|c|c|c|c|c|}
\hline \multicolumn{4}{|l|}{Arable land} & \multicolumn{2}{|l|}{English acres.} \\
\hline \multicolumn{4}{|l|}{Meadows and gardens} & & \(51.573,32\) \\
\hline & & & & & 17.2 \\
\hline \multicolumn{4}{|l|}{Vineyards ...} & & 17,462,84 \\
\hline \multicolumn{4}{|l|}{\multirow[t]{2}{*}{Olive. Laurel, and Chesnut plantations}} & & 1602 \\
\hline & & & & & 158, 2 2 \\
\hline \multicolumn{2}{|l|}{Woods and forests} & & \(\cdots\) & & 48.924 - \\
\hline Uncultivated and wast & lan & \&c. & & & \(25.448,96\) \\
\hline
\end{tabular}

It will be noticed that the extent of uncultivated land in the above-mentioned year was less than one-sixth, and that of the land uuder cultivation (exclusive of
woods, \&c.) leas than one-half of the area of the woods,
The last returns of the crops produced in the Austrian empire are for the year 1846, and some allowance must therefore be made for progress since that period. The above figures and those relating to live stock given below are taken from Hühner's "Jahrbuch für Statistik," published at Leipzig in 1852
The amounts of the various crops, according to the ents for the year 1816, were:
\begin{tabular}{|c|c|c|c|c|c|c|}
\hline \multirow[t]{2}{*}{Wheat} & \multicolumn{4}{|l|}{} & & \multirow[t]{2}{*}{Imp. Qrs.
\[
10,195,497
\]} \\
\hline & ... & ... & \(\ldots\) & \(\ldots\) & .... & \\
\hline Barley & ... & ... & ... & ... & ... & 10,417,597 \\

WOYAL AGRICULTURAL OF ENGLAND
Weerer Councily, May 21 : Mr. Miles, M.P., VicePresident, in the chair.
Vethrimary Collear-The following report was College :-College:-

\section*{Royal Veterinary College, Aprit, 1858.}

Tar Governors of the Rayal Veterinary College in preentiog
thear anmual report to the Conncil of the loural Agricultural thear ammaal repnrt to the Conncil of the lloyal Agricultural
Sreity, have annin the pleavure of conpratulating Suepty, have agnin the pleasure of congratulativg them on the
undisturbed harmeny which las con'inued to exist between th two iustitu'ings. In a uniurn myeh as this the Governors find an assurance that Veteridary Science cannot fail in her continuous. efforts of investipation into the nasture suld causes of the diseases
affecting the fiocks and lierde of ther anricalturial affecting the flicks and lierds of ther agriculturist, and thereby ciples ot the Ruyal Ayripultural Society, t., leud her not altogether unimpitant aid in thal consentyation of an essential pontion of the national wealth. The means which the Governors have given effect to, during the past raar, Late ditfered on no
important paricular tr ma those originally laid down fur their guldanft and nophoved of hy the suciets: average number of fuur a heek were delivered by the I'rofessor of Catle Pathology during the nession commencing in October, lectures is nuw buing delivered, which will be brominh course of

 and pig. and they theredre etnhrace thic hatiire and causes, as
well as the preventive and curave treatment of tho several affections, of these animals. Thene lectures have have been regularly atiended by all the pupils of the college.
The Gusernors bave alon called the ispecial attention of the class to their cole of laws which provide that the students before
 elamination to that atisfaction of thes l'rotessor of each
department of their studies. Plousion is thus made, as the Council will perceive. tor the more perfect education of much general good must result; for the Governors would remark that rery raluable pssistance to the advancement of cattle
pathology is given by the other professors of the College whose instructions are extended tho the thatony, physinlogy, and paThingy of the horse, to che mistry, mate ria medica, and pharmacy
Since the last annual report to the Council 50 students have entered at the College, and as the time of their pupillage extends over two sessional years, an average number of 80 has bees in daily attendance.
Practice ur ture College. - Mary interesting and instructive made availathe to the general infurmation of the pupilas bear givernors, however, would be glad to see a more uniform occhpancy of the sheds and boxes which they originally erected at considerable cxpense for the reception ot cattle and sheep when
the subiects of diseane: and they had hoped that after the pointed manner in which they drew had hoped that after the tural body to this subject in thair last report, they hhould now Lave been enabled to congratulate the Council on the large inerease of patients of this class which had taken place. Every nomber of the cocioty heing antitled to all the privileges of a sheep, and piga is concerned, removes all ground of objection on the seure ot expense: atd the fovernors believe that the sole cance of the fewness in sumber of thene patients dephend rather
on the forgetuluess of the memplers of these privileges than anything else.
Consultationg and Comomications.- If the admission of crmer yeats, the consultations has hot materially differed from he contrarr, grestly increased. i'mmi all parts of the comntry particulars of special cases, and asking advice as to the the ment of the affectud animals. Much ut' the I'rofessor's time has been occupied tn replying to these letters, and he bas often had the satisfaction of learning that great good had resulted from well as the medical treatment of the animals in the hygienic an Veterinary Insprction,- During the past fear, and pro-
bably arisimg in part from the increased number of communications, the members of the Society have not asked for the personal inspection by Professor Simonds of the animals suffering former occasions, The Governors desire to see this hond of connection between the two institutions extended and strengthened
by a more frequent ase; and they would suggest to the Comeli by a more frequent use; and they would suggest to the Council
whether a modifioution of its rules relating to these inspections might not be advantageonsly adopted. Next to the admission of patients, these inspections afford the surest means of practically advancing cattle pathology. At the annual meeting of the Society at Carlisle the general inspection of the animals was
made as heretofure, and with much benetic to the interests of the Society, as several cases of illuess and accident also occurred during the days of the meeting. Besides these circumstancea some of the animals had to the disqualified from wrong entrie With regard to their agk, and others from the existence of here
ditary diseases and defects. Epizoortics - The chief of these maladies have been plearo parta of the country, the first named with its usual severity. A stated in a fumer report pleuro-pneumonia belongs to a class of
diseases which can be far more pasily prevented than cured, an diseases which can be far more pasily prevented than cured, an
the Governors would remark that the measuresthey recommended for adoption as prophylactics have stond the test of further expe rience, and been of essential service in numerous instances of out hreaks of the malady. Inoculation as a preventive has had bu few advocates, nor can the (invernors believe that those who
have refrained from adopting it are acting otherwise that on right principles of science, and consequently they have no recnurse to the nperation. The diminution in the number o cases which in a few isolated hare seemingly accompanied the antrutuction of inocuration have but singuine coincidents, and ar altogether due to the ordinary canses which regulate the or
breale, extension, and departure of this class of digeases. Parasitic affections -These maladies, which are more or less the cause of heavy losses to the agriculturist, have been remarkably rife, and during the last summer many bundreds. lambs have fallen victims to the presence of worms in the re this time, but in somewhat diminished nifmbers. In too many instances nothing was done by the flock-masters to arrest the progress of the disease, nor, indeed, was its true cause ofter ascer tained by them, The most marked symptoms of the affection changes of temperature), hurried breathing fastidions apm tite, and a falling away in condition, the animals being in very nany instances ultimately carried off by diarrboes, which superrenes upon the other symptoms. In some cases death takes place more suddenly, arising from active congestion of the
lungs. The estibitinn of a frw doses of oil of turpencine and Linseed oit as an anthelmintic, foll, ised up by
chalybeate tonies, and the occa-ioual inhalation of diluted chlorine gos were found to be very effective remedies. Too these
were added, and with mach advantage, the supplying the

Lord Berners remarked, that in all cases of disease among the farmer's live stock, means of prevevtion He referred to several districts where disesse prevailed to a great extent. In his own neighbourhood the remedies prescribed by Prof. Simonds, and received from the Veterinary College, had been attended with nimost uniform success. - Mr. Slaney objected to technical words in describing symptoms and remedies-
He thought that in addressing farmers plain English ohould at least be given as well as words heterogene
ously compounded from the Greek and Latin. - Mr Miles remarked that his Devon flock lambs, as
well as the flock of his brother, had suffered lose to the amount of 20 per cent. from a sort of con-
sumption. It commenced about the latter end of September by the animal's aneezing and wasting away, bu
invariably disappeared, even in the worst cases, as soon as the warm weather came. The heads of the slueep pper par the nerners had lost some upper part of the nostris.-
of his best lambs by worms.
The Council adjourned over the Derby-day to their monthly meeting on the 4th of June.

On Thursday the halfoyearly general meeting of the Society was held. The report, which we shall give in
fall next week, stated that the Society consists at the present time of 85 life governors, 139 annual governors members, forming a total of 4979 members, or 97 more members, forming a the number at the previous anniversary. The than the number at the previous anniversary, The in so favourable a condition. The funded property consiats of 9264l. in the New Three per Cent. The Council have decided that at the end of the current year the offer
of the 100 t . prize for a substitute for Peruvian guano of the \(1000 l\). prize for a substitute for Peruvian guano
shall be withdrawn. The Chelmsford meeting, to be held in the middle of July, promises to be equal in

Theetings ut the socity in other parts of the kingdom. large beyond precedent; and as a great number these, instead of lying inactive, as hitherto, in the yard, will be at ordinary work during certain hours of the show, they will present a new and instructive
feature in the exhibition. The Council have been induced, on the representation of a very large proportion of the implement manufacturers who exhibited last year at Carlisle, to apportion their prizes and trials instead of including them all in single successive years. The implements for prizes and trials have accordingly been divided into classes for this three years rotation machinery for the tillage and drainage of land. Implements and machinery for the cultivation and the fureparation of crops for market and cattle food. the fureparation of crops for market and cathe food. and trial implements for the Chelmsford meeting, in addition to the special prizes of \(500 l\). for the best steam cultivator, prizes for reaping machines, and prizes for new and miscellaneous implements. The live stock portion of the exhibition will include foreign cattle and
sheep belonging to foreigners, and bred abroad. For the purpose of making entries for foreign animals during the approaching Great International Show at Paris, in the first week of June, the Council have exthe 12 th of that month.

The report was unanimously adopted.

\section*{Farmers' Clubs.}

Wirral.-Weights and Measures.-At a meeting of this society it was referred to a sub-committee to consider what steps can now be taken towards the
introduction of uniformity in the weights and measures in use in the United Kingdom for the sale of agricultural produce; and, to this end, to communicate with, and ascertain the opinions of, other agricultural associations, and of individuals possessing influence in the markets for such produce.
to them, and, in particular, having reviewed the various measures to them, and, in particular, having reviewed the various measures
adopted by the legislature, during the last hall century, for
introducing imperial weights snd measures throughout the kingdom-and having given their earnest attention to the repirt
of the committee appointed by the House of Commons in 1833 ,
"To inquire into the present practices of selling corn in the To inquire into the present practices of selling corn in the
United Kingdom"-and having inquired into the practices now
prevailing and their effects-find that the principal evils of the alm produce has occasion to resort to more than one market, he is purpose whatever, they check the freedom of commercial inter-
course, afford facilities for the commissicn of fraud, often cause ristakes and disputes, and always isvich of trouble and and loss of
rime. That the quotations by which producers, dealers. and
time time. That the quotations by which producers, dealers, and
the public seek to inform themselves of the variations of the
price of the same commodity at the same time in different parts of the kingdom (in order to their equalisation
by the legitimate action of trade) are deprived of a great part of
their proper utility, in consequence of the weights or measure
quoted for each locality being very commonly unintelligible in
most others. \({ }^{\text {3. That }}\). The inconveniences thus arising are increased precisely in proportion as the commercial intercourse the improvement of road and postal communication; and, hence are now much greater than they were when reported on by the
parliamentary conmittee of 1833 , and are growing greater year by year. The committee, however, observing the obstacles whic
have more or less frustrated every attempt hitherto made to
enforce, by law, an uniformity of practice in this respect, are dis posed, eren now, to doubt the propriety of urging the matter on
 such opinion will be to excite discussion of the well-known fa
referred to, they have determined, in performance of the dut
imposed upon them, to submit to you the following questions:-
Is it not, in your opinion, desirable, and especially so in is it not, in your opinion, desirable, and especially so in view o
the more ready and rapid communication and greater facility o
transit of fate years effected between different parts of the country, that renewed efforts should now be made, by those most measures used for the sale of agricultural produce in the Unite
Kingdom? 2. Is weight, or is measure, where both are practi cable, deemed by you the more accurate indicato
regards agricultural produce, particularly corn?

\section*{Hebietus.}

Plea for our Highland and other Agricultural Labourers; or the Bothy and Bondage System in Eas Lothian and Nei
Son, Edinburgh.
THIS is the manifesto of a committee in Edinburgh for the improvement of the condition of the Highlanders The particular object of their appointment was the well being of the Highland immigrants, who at harvest time proper southern counties having been thins inquired into, the evils here complained ot became apparent. Indeed, as the pamphlet states, the evils of "bothies," or houses in which unmarried farm-servants are lodged together, and left to shift for themselves in the preparation of their food, and other necessary domestic operations, have

\section*{ountry}

The manner in which the subject forced itself upon the attention of those whose immediate object was of
another lind is more fully related in the following paragraph :-
in number of gentlemen in Edinburgh, intereste in the welfare of the Highland labourers who are now
annually induced by offers of work to immigrate,
chietly for the summer season, into cerran Lowland counties, have had their attention forcibly directed to on the farms where they have their temporary residence. It has been found that, generally speaking, that accommodation has been of an inferior, sometimes of a wretched description. In many instances, doubtless, the farmers have made praiseworthy efforts to lodge these poor Highlanders as comfortably as possible ; but still they have, for the most part, only bothies to offer them-bothies, too, of a very bad description-consisting of old neglected out-houses, fitted up in a very rude manner, containing little furniture, and few or no means of ordinary comfort. Generally four, five, or sixsometimes even so many as 10 or 12-Highland girls are found crowded at night into one poor hovel or comfortless apartment. Andi, as them to perform case, office of a matron or superintendent, these young women are much exposed to the influence of evil company, and the formation of improper habits. It is but just to say that these girls, as a class, have hitherto conducted themselves with exemplary propriety ; but by constant exposure to demoralising may be rapidly deteriorated and their value as labourers Greatly diminished
We quote further to show how the other evil of same causes

It may be asked by those not well acquainted with our richer agricultural districts, why it is necessary to crowd these imported labourers into bothies, and why there is in many Lowland districts such a want of bouse accommodation. A variety of causes have gradually produced a scarcity of houses in the purely rural parts farms into one, which began about a century abo has farms into one, which began atout a century ago, has bamlets that once contained a considerable agricultural population The policy of landlords in leeping the population. The policy of landlords in reeping the fromber of houses on their estates at the minimum, from an exagg a pauperism, poacbing, and other evis, has also ted tion below its just and natural limits. The consequence is, that in many thriving agricultural districts, as in parts of East Lothian, there is a want of native hands to
cultivate the soil ; there is a confessed scarcity of house accommodation; and the farmers are compelled to resort to all manner of shifts, first to procure labourers in sufficient numbers, and then to furnish them with some sort of shelter. Some of the richest agricultural districts of the country are actually under-peopled ; and the glaring anomaly is seen of a land teeming with abundance inhabited by a scanty and diminishing population.

One great evil resulting directly from this state of things-a grievance bitterly felt by the hinds in several of our most important counties be deacribed in order to be condemnel it intelligent interest in the welfare our agrimitural inourers. In very many districts of East Lothian, Berwichshire, Roxburgh in burgis, in
 the population is forcibly kept down below its natural furnish furnish each a stout, full-grown field-worker all the year round, or at least during the summer season. This is popularly and appropriately called the "bondage-system." When the hind has a son or a daughter of his own who can work the 'bondage work', he may sometimes feel the arrangement to be an advantage; but it often happens that his children dislike field-work, feel it to be a great drudgery, and prefer some other employment. out one or the hind who has no family, or whose children are al young, has to hire a stranger into his house as his 'bondager.' This inmate, generally a person of but an inferior grade, is ofter felt to be a burden, a spy, or a moral planue in his small house and among his young family. And further, what he receives from the farmer family. And further, what he receives of his 'bondager,' frequently does not pay the expenses to which he is put. He has often to give the expenses to which he is put. He has often to who
between 5l. and 7 l. a half-year for such a substitute, who only earns for him \(10 d\). or \(1 s\). a-day, while, from wet weather and other causes, there is wot a little broken time. Now, when to the wages he has to give the 'bondager' is added the expense of board, lodging, and washing, it is no wonder that the poor hind can often say, in bitterness of spirit, that besides all the annoyance to which he is put, he is a pound or two in the half
The results of this system are stated to be-a feeling f hardship and injustice generated in the minds of the hinds who are thus bound-a system of constant removals among farm servants whe tendency to extensive emigration, which in the same way is produced.

The bondage-system may be regarded as a type or sign of the depressing influences to which the many and the agricultural population generang, hat that system istricts long been exposed. By down in various ways. their families are injured or kept down are, as has been Bondagers hired into their houses are, as has and shown, infringements upon their domestic out to fieldthe hery drudgery from good situations to undertake that heavy drudgery,
comfort. Thus, through the interference with his natural freedom and his family arrangements implied in the bondage-system, the condition of the hind is depressed, and he is, the scale of society."
"In many parts of Scotland, as in Dumfriesshire, Ayrshire, and the contiguous counties, a considerable number of the sons of ploughmen, cottars, and small farmers, receive a liberal educatiou, and enter one or other of the learned professions. But in those counties where agriculture is most flourishing, and where it might have been expected that the labouring classes would be in a peculiarly thriving condition, very few ons of hinds or farm labourers rise above their native level, or achieve for themselves a college education.'
The pamphlet then discusses the remedy.
"Landlords of late have done much to improve the wellings of the farm-servants, but they have done little or nothing to increase the number of these dwellings. They have in general forgotten to inquire if, while improved modes of culture call for more field labourers, these labourers can be got by their tenants in a proper and natural way; if they are suitably and decently lodged; and if any hardships are endured, both by tenants and their labourers, from want of sufficient house accommodation. Let it be conceded that the large-farm system in the richer agricultural districts is the most profitable and productive, and also that a surpins rural population ought always, if possibe, to be
 are very apt farms, and hl few nor small. In East Lothian and in Berwickshire the large-farm system exists in perfection, and the agricultural produce of these counties has for many years been greatly increasing in quantity and value; but the population of both, during these past 20 years, has been nearly stationary. In 1831 'the population of East Lothian was 36,145 , and in 1851 it was only 36,386 ; in 1831 the population of Berwicksbire was 34,040 , and in 1851 it was only 36,297 . The agricultural statistics of these counties during that period would show an immense increase of produce; but the population, has been little more than stationary in amount, and, it is greatly to be feared, deteriorating in comfort and in chagealy to ties, nearly similar conclusions might be drawn. But enough has ?seen said to draw the attention of benevolent and patriotic Lowland proprietors to a subject so closely connected with their highest daties and truest interests, while in its general bearings it has even a national importance.
In case this subject should excite interest in the minds of any of our readers, we reprint the concluding sentence of this pamphlet.

Communication on the subject, for the information of the committee 'for the Improvement of the Condition of the Highlanders,' may be forwarded to Henry Callender, Esq., C.A., 32, St. Andrew Square."

\author{
SATURDAY, MAY 31, 1856.
}

The London season for Horttceltural ExhiBrtooss has commenced in earnest. Last Saturday was the first great gathering at Sydenham, and Wednesday saw another floral display in the Regent's Park. Thousands flocked to both, and nobody seemed weary of the enjoyment. Undoubtedly the love of flowers is undying; and if anything can strengthen it our wonderful specimens of horticaltural skill will do so. It is also certain that by accustoming the eyes of thousands, annually, to all that is perfect in cultivation bad gardening every day becomes so much more distasteful, even to the humblest amateur, that we may hope to see in a few years its total disappearance except in the grounds of the sluggard.
The reports of these meetings given in another column will furnish the enquirer with ample information respecting details, to which we need not further advert. In a general point of view there
was litule or no difference between Sydenhans and the Regent's Park; the specimens in one were as good as those in the other, most of them having in fact been transferred from the Crystal Palace to the Botanic Garden. In each there was also the same want of novelty; as far as we could discover, the only plants shown at Sydenham for the first time were a very curious Californian "hardy" hulb from Messrs. Vfitch, and a singular hybrid Azalea from Messis. Standish \& Noble. The former was not particularly handsome, but possessed considerahle botanical interest, forming what seems to be a new genus allied to Brodiæa. The second was a very nice thing obtained as a cross between A. amœena and lateritia ; as usual in colour and foliage it was half-way between its two parents; but in addition it presented a new instance of a mere monstrosity being preserved by the act of hybridism. A. amœena is remarkable for having what is called a "hose in
hose" flower; that is to say a corolla and calyx exactly alike in colour and size, one standing within the other, the calyx in this case having developed in the usual form of the corolla. Crossing has in no degree interfered with this peculiarity, and the hose in hose A. amœena has assisted in the production of a hose in hose hybrid. We should like to see the effect of crossing A. amoena with indica alba, or indica phœencea; for the colour of lateritia is a fault. Messrs. Veitce also produced what are almost as new to the world as the two plants already mentioned, namely, Embothriom coccineum, a noble half hardy evergreen shrub with deep red h,lossoms, and Correa cardinalis, a handsome species resembling C. speciosa but regarded as distinct by Sir William Hooker, who has published a figure of it in the Botanical Magazine. In the Regent's Park there was a very noble plant from the Bishop of Winchester, the Peristeria fuscata of Warczewitz, and an Odontoglossum Phalænopsis from Mr. Linden, concerning which we shall have something to say hereafter.

Those who watched the crowd inspecting these vast arrays of plants cannot have falled to observe how it lingered among the Orchids and Roses, clung to the fruit, admired the Azaleas, Ferns, and plants with fine foliage, and with what indifference it passed by the Heaths. So it always is ; not because one sort of plant is more fashionable than another, but because the eye of taste dwells with more pleasure upon graceful forms and glowing colours than upon trim and dumpy bushes; just as a regiment of cavalry is more admired than a line of infantry, and either than a row of neatly dressed shopkeepers' assistants. As to the fruit it always secures an abundance of admirers, who compare what is \(\epsilon \mathrm{x}\) hibited with what can be bought in the market, and love to gratify their senses with its fragrance and luscious aspect.

The way of exhibiting is totally different at Sydenham and in the Regent's Park. In the Crystal Palace the method employed by the Horticultural Society is followed; long lines of narrow tables with a screen behind are covered with plante, while here and there a break is effected by throwing out a cross table or by some similar contrivance. It is not easy to employ this mode with more skill than was shown on Saturday. Its great advantage consists in presenting every plant distinctly to the eye ; and for those who go to study Horticulture no better way of showing can be found. Its fault consists in the absence of any great general effect, except when tents are empty, or froml one or two favourable points of view.

In the Royal Botanic Garden a totally different plan is followed; as much ground as four or five large tents can cover is excavated and laid out like an irregnlar flower garden, with beds and banks of turf, apon and among which plants are disposed. The middle of the area being the lowest, the spectator as he enters the exhibition sees at a glance the entire scene, here glowing with the bright colours of Azaleas, there gay with pyramids of Roses, and in another place festooned and carpeted with fantastic fragrant Orchids, while the recesses are filled with the graceful forms of Ferns or other plants not in flower. Undoubtedly the scene, when it first meets the eye, is one of the most beautiful that can be conceived.
Nevertheless, we cannot but feel that in both exhibitions the effect is seriously impaired by an unexpected circumstance. At Sydenham the beauty of the plants is terribly diminished by the sarrounding ohjects. The rich colours of the interior, the gilding, the painted work, and the lofty columns contrast badly with the diminutive plants, which are completely overpowered. To look well ia such a place they should be alnost
as high as the galleries, and be seen thence. In the Regent's Park the plants cannot perhaps be said to kill each other, though even there it is so
to some extent. But, which is nearly as bad, the
eye soon becomes weary of the gaudy scene. As in
a huge picture with finely painted details but with no repose, there is nothing on which the eye can rest. Wherever it turns it meets gay colours and little else. To the right is red yellow orange and blue, to the left orange yellow and blue and dazzling white; in front scallet prevails over red, behind crimson and yellow struggle with rose colour and blue. Such a scene is a garden kaleidoscope, exquisitely beautiful, but soon becoming wearisome

No one knows better than the writer of this how great are the difficulties to be encountered by the managers of such meetings. If therefore he offers these remarks it is in the hope that defects which strike the bystander more than those concerned may be gradually removed. Every year has witnessed some improvement since the first Chiswick flowe show in 1833; and it is not to be doubted that the skill and good taste which have already effected 80 much will by degrees succeed in correcting what is still defective.
We ought to add that the Garden itself in the Regent's Park was looking better than usual. It is evident that time is rapidly concealing there what once offended the eye. Cgly mounds are becoming covered with thickets, trees are breaking the monotonous diversity of the ground work, and living screens have already put out of con-
spicuous view much that should never have been seen. The turf was in beautiful condition, and Wednesday would have been a very enjoyable day had it not been for deluges of rain which threatened to wash away visitors, bands, plants, tents, and everything else. The Crystal Palace, which was also in admirable order, was not exposed to such a danger ; the weather was, however, uncertain enough to keep most of the visitors under glass during the afternoon. Let us hope that the sightseers of June will have better fortune.

Dr. Robert Caspary, of Berlin, has inserted in the Ratisbon "Flora" a long paper on the daily periods of growth of the leaf of Viotoria Regra, the result of his own observations made in the botanic gaiden at Schöneberg, near Berlin, and of a comparison with the few observations published by others on the daily growth of plants. For this purpose he, in the month of August, 1854, made careful measurements of three different leaves of Victoria every hour, day and night, starting from the moment when they first opened out horizontally on the water, and continned in one instance for 56 successive hours. Again in October, 1855, he repeated the hourly measurements for 24 successive hours in the case of three more leaves, and measured others four times a day only. These measurements were accompanied by thermometrical, hygrometrical, and other meteorological observations ; and in several instances he modified artificially the warmth of the water or of the air, the light, and the moisture of the air, in order to ascertain their respective influence on the growth of the leaf. He also examined anatomically the leaves at various periods of their growth, from their first appearance as a slight protuberance enclosed within the stipules, to that of their perfect development. These measurements and observations are detailed in a series of tables, and discussed with great minuteness, and Dr. Caspary finally deduces the following con-clusions:-

After the Victoria leaf has once expanded horizontally on the surface of the water, no further formation of cells takes place. From that period the growth of the leaf is solely an expansion of the cells without any division or other increase in their numbers.
The respiratory system, the thin parenchymatous chlorophyll-containing portion of the leaf, is at the time of the first expansion of the leaf much farther advanced in growth than the vascular ribs and veins. This difference gradually disappears, as from that period the chlorophyll-holding parenchyma grows slower than the vascular veins in the proportion of 1 to 2.2 .
The leaf grows day and night withoat interruption, but not regularly. After a period of very rapid growth there follows usually a slow one, and after a slow period often a very rapid one.

Notwithstanding this irregularity certain daily periods are clearly perceptible. The most rapid period of growth is between 12 and 1 p.m. ; later in the afternoon it is at its minimum ; it reaches a second though smaller maximum of growth in the night between 12 and 1, A.m., sinks to a second minimum in the morning and then rises again towards mid-day. The afternoon minimum is smaller than the morning one.

The daily periodical growth of the Victoria leaf is in all its three directions, towards the apex, sideways, and towards the base (measured always from the central protuberance corresponding with the
petiole) ; but it is greatest towards the apex, smaller to the side, and least towards the base. In the first three days the mean hourly growth is 5.13 millimetres towards the apex, 5.06 millimetres to the side, and 3.54 millimetres towards the hase.

The growth is most rapid on the day of the first expansion of the leaf, when the mean hourly extension of the radius is 4.8 millimetres. The mean hourly extension of the radius in the first three days is 4.59 millimetres.

As to the absolute amount of growth, the maximum growth of the leaf in an hour is from 22 to 25 millimetres in longitudinal diameter and from 26 to 27 millimetres in latitudinal diameter. In 24 houre the maximum was 308.3 millimetres in longitudinal 367 millimetres in latitudinal diameter. The surface, according to the calculation of Dr. Caspary's friend Dr. Borchardt, increased from 4 to 5 per cent, in an hour or from 75 to 123 in 24 hours, or in measurement, it increased by from 0.2556 to 0.2872 square Prussian feet in an hour, or by 4.1720 to 50832 in the 24 hours. One plant, in a period of from \(21 \frac{1}{2}\) to \(25 \frac{1}{2}\) weeks prodaced from 613.6 to 727.6 square feet of leaf surface.

Evaporation had no perceptible influence on the growth of the Victoria leaf, in a plant-house where the atmosphere was always near the point of saturation. When even the leaf could not evaporate at all by the complete saturation of the atmosyhere it continued to grow undisturbed.
The daily periods of relative moisture, from which one might have inferred an indirect influence on the growth of the leaf, as affecting its evaporation, had however no perceptible effect on its daily periods of growth.

The daily periods of atmospheric pressure, which might also have been supposed to influence the evaporation, and by that means the growth of the leaf, had also no such perceptible effect

The daily periods of light have no perceptible influence on the periods of growth of the leaf, for by artificially altering the daily periods of temperature the leaf can be made to grow least towards mid-day when the light is the strongest, and the maximum of growth can be made to fall at pleasure upon any hour of the night in total darkness. Light causes no enlargement of the cells, but only effects changes in the matter they contain.

The maximum period of growth of the leaf depends on the maximum period of warmith, and especially that of the water.* By heating, the maximun period of growth can be made to fall on any hour of the day or night. Warmth acts immediately on the expan sion of the cells, not indirectly by influencing evapo ration.
The ordinary rise in the rate of growth in the night cannot, however, be deduced from any periodical change in temperature, or from any other known agent, but its canse must be sought for in the vital priaciple of the plant itself.

Clear warm water promotes the growth of the leaf. An overcast sky, an alternation of sun and shade from passing clouds or cold rain, even if they do not directly act on the plant itself, reduce nevertheless the rate of growth by lowering the ten3peratare.

This charming plant may be almost described as an Orchid in the disguise of a Lily of the Valley, so alike are leaves, flowers, colour, stature, and fragrance. is however a genuine Pholidota, approaching P.chinensis, but larger in all its parts, and bearing 5 elevated wavy lines on the surface of the lip. The pure white of the flowers changes by degrees to clear cinnamon brown
For our knowledge of the species we are indebted to the Lord Bishop of Winchester, who forwarded a beautifully grown specimen from the garden at Farnham Castle, where its origin is unknown. It bas been cultivated there many years, but flowered for the firs time last year. It has much the appearance of a smail Coelogyne from which the pedicellate pollen masses and bilabiate dehiscence of the anther remove it.

in the water than in the air.
ony much handsomer but the hip is lobger, and the
sepals and petals are very acute. We have received it from R. Hanbury, Esq., and also from Mr. John Edwards. It is a fine thing. Native country unknown. VEGETABLE PATHOLOGY.-No. CXXIII.
487. Velnera ( Founds). -The bark of trees is sometimes injured or destroyed to a serious extent by various
ruadrupeds, either in consequence of their goawing it ruadrupeds, either in consequence of their goawing it
away for food, or by rubbing with their tusks, horns, or bodies. Goats are perhaps the most mischievous of all and should never be encouraged where there are youn plantations. In some parts of Scotland, as in the Isle of Mull, where they once abounded, it was found impossible to obtain flourishing woods solong as the breed of goats was encouraged, and they have accordingly been destroyed. The most bountiful supply of food will not prevent their ravages, as they prefer the bark of some are only destructive where there is scarcity of food. They will indeed always browse on the young shoots o Thorns and other trees as far as they can reach, but they do not actually strip off the bark except in case of ry serious injury
488. The worst enemies of all however are mice and rabbits, but especially the latter. Where the former
abound very much, they are capable of doing great misabound very much, they are capable of doing great mis-
chief, but there is happily no motive for their encouragement; it is far otherwise with rabbits the landlord and keeper both encourage them in their turn, partly from pecuniary motives, partly to make up encourages them with the first view, he is sure to suffer in the end. A large stock of rabbits will impoverish any tenantry, and if the tenants are without skill or capital their ruin sooner or later is a matter suffers partly from loss of rent, and much more permanently from bad cultivation; on the other hand, the lamage done to his woods will far outweigh any gain which may arise frem their sale. It is true that the trees which have been barked by rabbits do not always
die ; the destruction is either not so complete as to stop the flow of sap through the young wood completely, or the wounds are covered luring the following sipring ; but in either case the growth of young shoots is stunted, and ho useful poles or underwood are produced. A heavy fall of snow about three years after the underwood has been cleared is almost certain destruction, where a heavy stock of rabbits is kept up, and the injury is not themselves affected, and the wood ultimately destroyed.* I can speak of this from my own experience, and am therefore urgent on a point which may seem to many of little importance.
489. Trees sometimes suffer injury again from animals where they are not sought for food. Itis the habit of severa they seldom do so without slightly abrading the surface. No permanent mischief, however, would accrue if they ised all trees indiscriminately for this purpose, but so far is this from being the case that they choose particular individuals for the purpose, repeating the process till
the bark is often entirely destroyed. These trees are well known to German foresters, and are known by the name of Mahlbäume (trees which have Leen marked) and we are not without examples in our own country. related by Hartig (as quoted by Meyen) which is worth reproduction on account of its physiological interest. It frequently happens that fir trees are barked to the extent of two feet or more by game. Such trees are not, howsaturated with resin in cosed portions of are all escap or evaporation of the ascending sap is prevented, and vegetation is carried on as before
490. The trunks of trees are sometimes injured by pre, less extent. Such trees seldom royed to a greate injury is extensive, but where it is confined to one side they may not ultimately suffer more than from any other cause which destroys the bark.
491. The natural effect of age is to cause the older portions to decay, and if these are exposed by accident adverse influences of weather increase the tendency. Trees in consequence become hollow, retaining merely where there was no external lesion, and which were apparently healthy, I have found the whole of the wood Whyed with the exception of the last seven rings. Where there is free admission to rain decay may become even more extensive, and where it is desirable to prevent complete destruction some means must be cavity may for instance be closed with sheet lead or carefully the whole of the decayed matter has been carefally removed. If this is well managed the new wood will gradually grow over the edge, and effectually prevent the removal of the metal, and the tree may be
preserved in health and vigour for many years. Such preserved in health and vigour for many years. Such
trees in fact sometimes appear to be peculiarly productive, where the injury has not been sufficient to affect the general health. M.J.B.
* It has befre been mentioned in this Journal that on an
eatate, the value of which depended greatly on the timber, a
proprietor two proprietor two buadred years ano left on record a strict injunc-
tion to his successors tion to his successors, ss they valued their own interesis, to
destroy the rabbits, The advice was negeted; flourishing
woods became vorthese, woed grubbed up.

\section*{THE APRICOT}

ITtle is a general complaint that Aprient trees bear hu entertained be properly cultivated against a wall with a good aspect or under glass. In the present state of its cultivation this opinion appears to be well founded. On examining into the causes of this bad result, they camnot be found in the constitution of the tree which our predecessors have transmitted to us, but in the stock on which it is worked. In fact, when Apricot trees are raised from the stones of the most hardy varieties, healthy trees, of ground, are obtained in a few years. Plant beside these seedlings trees budded at standard height on the Mirabelle Plums or on the Damas, on purple or on white
fruited varieties of the Plum ; and every spring you will see the trees so worked produce fine blossoms like those of the seedlings. But after flowering the seed-
ling trees set as many fruits as they ought to bear, ling trees set as many fruits as they ought to bear, whilst the budded trees drop their flowers withou setting their fruits, except perhaps a small number
compared to the strength of the trees. This we have proved to be the case in our own cultures for five years and our experience leads us to conclude, that, for the Apricot in the open ground, there is no stock known that a seedling Apricot of a good kind is in our climate as hardy in the open ground as a Pear or Cherry tree. To obtain this desirable result, it is necessary that seeding. Apricot should be treated the first three years with certain precautions, and that it should after-
wards be planted in a suitable soi!. For the benefit of wards be planted in a suitable soi?. For the benefit of
amateurs we shall state, in a few words, the modes of culture which we have pursued, and which we continue o practise. In the months of July and August the stones of such varieties as appear the most vigorous and
hardy are collected and placed upon the dry floor of a lark room, where the kernels acquire the necessary degree of firmness and maturity. In the month of De . cember the stones are planted in wooden tubs, containing leaf-mould. Each stone is placed on its back or grooved side, the thin edge being uppermost. There should be about 4 inches thick of leaf-mould mixed with one-third of silver sand below the layer of stones, and these should be covered with leaf-mould to the depth of 2 inches. A copious watering is then given, and the tubs are placed near the glass of an Orangery or greenhouse. About the middle or end of March, on inspecting the stones they will be seen to be split, and a radicle and plumule developed ; and some stones with double ernels will exhibit the rudiments of two plants. The ubs are carefully unhooped, and the plants are pricked out 6 inches apart in rows 2 feet asunder, in a light deep
soil, rather dry than moist. On inspecting the seedlings in the following July all laterals which are likely to acquire considerable strength should be immediately cut off; and this operation
should be continued during the month of August. The stem should not be divested of leaves or small leafy spurs. This summer pruning when the seedlings are in a growing state scarcely leaves the traces of scars, as the wounds made at that time quickly heal over. This is an essential point, and one on which the future welfare shoots is neglected the first year, it must be done the second, and then the wounds heal with difficulty, canker is apt to ensue, and frequently the result is the canker is apt to ensue, and requ.
After the fall of the leaves, the seedlings are taken up, three-fourths of the tap roots cut off, and the plants laid in for the winter in the driest part of the garden. About the end of the following March the seedlings are quartered out at a foot apart, in rows
three feet asunder. The second year, continue to disbud the stem up to the height of five, six, or seven feet from the ground, according as the plants incline to form a head. They are left the third year in the same place, Superfluous and badly placed shoots are removed by summer pruning. At the end of the hird year, about the fall of the leaf, the seedling trees are finally transplanted to where they are intended to remain for bearing. Fruit is produced in the second, or at latest in the third year after the second trans plantation. Does it not require an equal number o years to rear a stock intended to be worked for difference in the open ground? Nevertheless, what difference between a budded Apricot tree and one raised from seed ! It is said that an Apricot tree raised from seed is apt to canker, and that it is but short-lived. This is an error. Cankers are the
result of unsensonable pruning, and of the too long result of unsensonable pruning, and of the too long
delayed removal of useless shoots. By judiciously removing useless shoots in the month of July, trees with a smooth bark, and perfectly healthy, are obtained and as to what age they would attain it is impossible to say. Examples are on record of such having reached the age of between 70 and 80 years.
It may be asked, will a seedling yield good fruit like that of its parents? Whence have arisen the good varieties of Apricots which already exist is not by denied that among seedlings a number will be found with slender wood, forming trees of low stature; bu with slend be easily recognised after the second year of their growth in the nursery rows. They are only fit to be budded with the better sorta
The following is the criterion by which we ean recog-
good fruit :-Well-conditioned wood, purplish brown next he sun, and pale green on the opposite side. Buds large and heart-shaped. Leaves large, shining, dentate, with
large veins tinged with red. The rree, in slourt, large veins tinger with red. The tree, it bliort,
pushing strong shoots up to the time of its first bearinir pushing strung shoots up to the time of its first bearin-
truit. When in the third year these characters are discerned in a seedling it may be allowed a place in the garden, and may with confidence be expected to yield an abundance of excellent fruit during a long spries of years. The only subsequent culture whinh the tree requires, consists in removing superfluous shoots in
July, and in shortening by one third the leading shoots in the end of March as a means of renovation, and in order to obtain fruit-bearing wood along the principal branches, and in the interior of the tree. It is thus hat we have obtained from seed 30 fine trees which bear abundantly excellent fruits, of various forms, round, oval, or oblong, and superior in flavour to those grown on walls or under glass, although indeed not large.
If amateurs knew the beauty of these kinds of trees, their great productiveness, and long duration, they would plant no others in the open ground. It is in a light deep gravelly soil, rather dry than moist, where the roots of the seedling Apricot trees can penetrate in all directions that the tree succeeds beat; but we have seen them succeed everywhere except in soil that is too compact and cold, and where there is stagnant water during winter. J. De Jonghe, Brussels.

NEW MODE OF RREAD MAKING.
It occurs to me that Wheat mainly, and secondarily Rice, Barley, Indian Corn, Guinea Corn, R!e, is fittest for use when, after being cleared of husks and extraneous enveloper, no portion of the grain itself is rejected. Clean, sound, whole Wheat, then, with all its bran and all its flour, is to be crushed or ground to a desirable fineness, with no after bolting or screening of any hind. The meal or flour is now to be mingled in a long trough of wood, or stone, or iron, in the proportion of half-a-pint of water, or so, saturated with carbonic acid gas, to a pound of flour or meal. The commingling may be effected by means of a long shaft or axle,
set round with coga in a spiral fashion, and moved by steam or other power. The gas-impregnated water may be kept in suitable reservoirs, the water being gasimpregnated in the manner usual in making what is erroneously termed soda-water. When the yas-water and meal are thoroughly commingled, the dough is to be placed in a machine the counterpart of the common brick and tile machines, which will deliver the loaves as fast as they can be placed in the permanently-heated vens. The loaves ought to be so arranged in these French bread. The temperature of the oven should be regulated by a thermometor, and the stay of the bread in the oven up to the period of its delivery, must also be exactly regulated.

I desire to promulgate this system of baking, because Hithere it to be the best and cheapest that has been hitherto devised, and properly carried out ; absolutely precludes all additions and adulterations - even that of cleauliness, quicliness, and economy of the process, the saving in the bran amounting to some 20 per cent; bext, the saving of material in making the carbonic acid gas out of chalk, instead of out of flour. How much this last item may amount to \(I\) am not at the moment prepared to say, but the eaving would be considerable, and, in the aggregate, prove very great. The carbonic acid gas is derived from the alchoholic fermentation induced in the glucose or Grape sugar and the dextrin, of course, at the expense of the flour. If all the sugar and dextrin undergo transformation, the loss from this source may be roughly estimated, I would say, at from 8 to 10 per cent. Regnault, Chemie, Tome iv, p. 501 . Lastly, there is the greater certainty, economy, and salubrity of the kneading and baking processes themselves.
The bread thus made, by commingling flour with water saturated with carbonic acid gas, in the proportion I have mentioned, is light and exceedingly palatable. If preferred, the bread can be seasoned
with salt, or flavoured with sugar. I would invite with salt, or flavoured with sugar. I would invite bakers generally, capitalists, governors of charitable establishments, and even the Government, to the adoption of this mode of saving food for human beings, producing, as 1 find on trial ard experiment, a most wholesome and palatable nutriment, and calculated in effect to realise, approximatively speaking, as great a saving in the proportion of food as the introduction of steam has effected in general mechanism. Henry M•Cormac, M.D., Consuling Physician to the Belfast Hospilal, \&c.

\section*{Home Correspondence.}

Curing of Bark.-I have read with much interest your observations on this important subject. I wish, however, to observe that I live in a neighbourhood where it is quite useless to pay any attention to the curing of bark. The purchase of bark is (if 1 may be allowed so incorrect an expresion) a complete monodistrict There is none of the usual bargaining between seller and buyer. These parties fix the price, which is alike for all bark, good and bad. I should be glad to bear whether other districts are similarly situated. A Country Gentleman.
Ikex dipyrena.-This beautiful Holly is a pative of
 trem u tains of the Himalaya, and is not only an ex-
reedingly irnamental but a himly interestiny aperies. It is stated in Loudon's lar e eworh, the Arb. and Fruti-
cetum, to be among the "species of Ilex which may retum, to be among the "species of Hex which may
probably be found hati h . riy in England." This was the s.ate of our information in 1833 , the date of the publieation of that iquatic work, It is found to be pr rectly
lurdy in the gard ns hre at an elevation of 400 fert alove the sea. An article appearell in the Gurcieners Chonicle lately on Panaguay 'Tea (Ilex Paraguariensis) from the pen of one who had not only drank decoctions of the geuuine herb, but had tasted some drink made from other species of Ilex, \&cc., used as substitutes for the real Paraguay Tea, which he remarked was custiy from its first costance it had to be carried as well a must have Tea of some sort, they made it from an nfusion of the next bent herls which the localit afforded. This accords with the accounts of other
travellers, who not only say the same thing, but what is of infinite'y more service, they give us the botanical names of the plants really used for the making of this
beverage. Conspicuous among these are Ilex Dalroon I. cassiue, I. vomit ria, and I. dipyrena. Some of these have been used hy Amerimn Indians far heyond the reach of Paraguay Ten, so that we hive whole tribes
naing all these species of Holly which I have named as Tea; and wi \(h\) uur illens of there plants being tender, or, in other nords, only half hardy, it seemed as if we own Ground Ivy (Glechoms hederacen) to take, other harmle ss herb as a suhstitute for Tea. Dr. Koyle states that \(11-\mathrm{x}\) dipyrena bears a close resemblance to the emmmon Holly, which it does, but when I have compared both plants growing here side by side, I find a month hefore the common Holly ; still it is perfeetly hardy in this part of Devonshire, and this is well known, or I have seen young plans in stock out of doors is of any one to try to prepare home-grown Tea, and to carry us thus one stage nearer to the manking Tea from carry own Holly, which, accorling to Dr. Rnyle, as well as from my own ubservations on the living plant in the gardins here, I. dipyrena so much resembles The season of the year is now coming when the tender leaver can be gathered, dried, and parched, to make
Tea from the conmon Holly, and surely it is worth while to begin the manuacture of ans article of such vast national importance as cheap Tea would be. It is only a few years since Chinese Tea was as great a curiosity in this country as Paraguay or South Sea Tea had hard work to get poor people to eat Potatoes when first introduced into France, our children may yet be surprised to find that we have been so long in believing hy a ducing a drink to cheer tut not demoralise. I have somewhere real that the learned botanist Bonpland, ho acompanied humbolat in his travels in south America, actually planted a Tea plantation in Paraguay ties interfered, and not it to Europe ; but the authorities interfered, and not only prevented him from carryHad there been no virtues in the Holly him is it it likel that Bonp! ind, a native of France and well versed in the economy of plants, as well as thoroughly acquainted with the luxuries and necessities of the most highly civilised nation in Europe ; is it likely, I say, that he should have embarked in Para uay Tea culture if it had not held out prospects of importance, and he did that on the spot where Holly Tea was the beverage of himself and all around him? Alex. Forsyth, Torquay.
Bees.-I have just lost a hive of bees under such in the hope that somes that I send you the particulars may be able to explain a phenomenon which I havents seen mentioned in any book, nor witnessed during many years of bee-keeping. A healthy hive (one activity. Two days afterwards, seeing no leees coming out, he thought they had deserted the hive, but, on examining it, he found all dead lying around the queen, and the majority with their thighs loaded as they had returned from their day's labour. There wrs no appearyear, and the comb is not discoloured more than is usual at that age. Domden.
Grapes with Vincgar Berries. - We have some Grape Vines which do not suceeed. They are no thicker in the been planted 5 years ; ours the other day which have annd regularly produce many shanked or vinegar berries little squares of glass 5 . The house being glazed with times a large amount of fresh air, but they, the Grapes, never coo.our. The subsoil is and and saud and clay of a soft light nature; the top soil is not heavy, but is apt to run twgether and form a compact mass. It was top
soil from a pasture originally; the great depth of sand beaw must drain the bed. The plants have clean hea thy toliage, but it is apt to flag in a hot sun. Can reside your readers suggest anything for us? We rain-fill. A 12 Years' Subscriber, May 27

other of your correspondents to detail in your coiumns
the way in which it should be treated. \(S\). \(V\).

\section*{zorutieg.}

Caystal Palace Exhibition, May 24. - The first of the three great horticultural fêtes to be held this season under the auspices of this Company took blace on Saturday last. The morning was gioomy, and frequent heavy showers fell during the forehoun; in the aftelnoon however the wenther cleared up, and a very numerous company availed itself of the opportunity of inspeeting
the rich collections of fluwers and fruits brought together the rich collections of fluwers and fruits brought together on the occasion. The great fault belonging to last year exattered all over the building, and that for want of unity of expression, much of the grandeur of ffect which it would otherwise have had was lost This season's display was wholly confined to the transept and nave, and thus arranged in a uniform and connected once grand and imposing, had it not been for the magonce grand and imposing, had it not been for the mag
nificence of the Palace itself, whose splended ornamentation, it must be admitted, is too much for plunts to contend against successfully. A light canvas cover ing suspended above the plauts served to sereen them rom the direct rays of the sun.
As regards the exhibition itself it was certainly in every respect an improvement on that of last year True, the number of lants was perlaps not so great ndifferent cultivation may be said to have been comparatively rare.
One of the main features of the show was the collecdou of plants remarkable for fine foliage and grouped of their individual beauty they were arranged with taste and skill which does credit to the firm from which they came. In the centre was a noble example of Dracæna indivisa, with a clean stem some 5 feet in height and a famous head of Yucca-like leaves : ither side of this was a magnificent Palm tree (ChaPandanus variegatus argenteus as one such bushes of rood fortune to see; the dense drooping silvery striped eaves of these plants stiuck all who could get nea enough to inspect them with admiration. Other portions of this remarkable exhibition were made up of Norfolk Island Pines, Dammara ubtusa, Cycas revoluta, Aralia pulchra, the Dragon tree (Dracena Draco), two beautiful specimens of the tree Fern l'icksotia antarctica, the Stag's Horn Platycerium, Philodendron pinuatifidum, two plants of Livistonia borbonica, one or wo Orchids and other plants, all of them handsome and well-grown. Other groups of plants with fine Coleus Blumei, the handsome Cissus we noticed diums and Marantas of different kinds, Norfolk Island Pines, and dense flowerless tussocks of Maxilaria tenuifolia
In the class of stove and greenhouse plants, always a numerous one, there was no lack of fine specimens, and them. Of large groups the best was that furnished yr. May, gr. to H. Collyer, Esq., of Dartford it coutained a beautiful P'imelea spectabilis, several Azaleas, Dipladenia crassinoda, some Epacrises, a very fine specimen of the sweet-scented Siephanotis floribunda, Gompholobium polymorphum in the form of a bush and nicely bloomed, the best variety of Everlasting called Aphelexis macrantha purpurea, some Cape Heaths and Chorozemas, and a very badly flowered specimen of Hedaroms tulipiferum. The next group remarkable for superior cultivation was that from Mr. Dods, gr. to Sir Johu Catheart, Bart. Some of the plants produced by this grower were matchless in point of distinction which them well merited the high mark of distinetion which the judges thought proper to confer on them. The specimens more particularly deserving of remark were Gompholobium polymerphum, Boronia pinnata and serrulata, Eriostemon buxifolium, Adenandra speciosa, a double red Azalea, and A. Gledstanesi splendidly flowered, Aphelexis macrantha purpurea, Erica Cavendishi, Pimelea spectabilis, Chorozema Henchmanni, and Epacris miniata. Among other collections were many plants skilfully grown and well bloomed described.

Orchids were supplied in their usual profusion and beauty, and judging from the eager and patient attempts of many to get a glance at them over the shoulders of should say that they have lost none of their interest. A very fine collection was furni-hed by Messrs. Veitch. It contained Calanthe veratritolia, a noble plant; Cat-
tleya Mossiæ, covered with slow y flowers of extranrdinary size; C. intermedia, the large variety of Oncidium ampliatum, Trichopilia suavis, the charming Dendro bium Farmeri, the purple variety of Aerides odoratum a handsome variety of Saccolabium Blumei, two beautiful plant- of Phalæenopisis, the rich orange searlet Lælia cinnabarinu, the rare Cypripedium villosum, and other Lady's Slippers; Vanda suavis, and the greatly prized Epidendrum vitellinum. Another excellent In this we ol from Mr. Gedney, gr. to Mrs. Ellis. In this we olserved besutiful examples of Onci-
dium ampliatum, Cattleya Mossize, Saccolabium guttatum, Dendrobium nobileya, Mossiæ, Saccolabiu

Rhubarl-scented D. macrophyllum, extremely well
flowered; Calanthe veratrifulia, with many syikes of flowered; Calanthe veratrifulia, with many spikes of
slow-white blossoms; Plalænopsis grandiflorn fuld bloomed ; Plassus IVallichi aud Ly caste -himneri, foty but more especially the latter, ilteraily coltred with flowers, Mr. Mylam, gr, to G. Reed, Fa-q., alvo fur-
nished a very fine group. In this was the stately Phaius Wallichi, one of the best bloomed plants of Vands teres that has perhaps ever heen shown; the droet.smeling ... suavis, Epidendrum alatum, Dendrobum densiforum, with some 12 bunches dix; Barkeria spectabilis leautifuly cheotleya AclanMossiæ, nearly 3 feet high and as much throuthey covered with flowers ; the charming Saccolabing, and morsum ; Odontoglossum hastilabium; l.elia purparata, a comparatively litule known species of rare beauty, and Odon toglossum citrosmum, with much more colour in it than is usually found in flowers of this plant. Mr. Woolley, gr. to' H. B. Ker, Esq., and others, also showed Orchids; but the above furmed what may be
termed the cream of the collections. termed the cream of the collections.
Variegated Orchils, extremely well grown and beauAnrectoc, came from iessrs. Veitch. The sorts were phyllus, ins, and Physurus argenteus and pictus. which the Queen of flowers is susceptible grandeur of of the foliage was a matter surprise. The health sidering the unfavourable spring through which we hav just passed. Messrs. Lane's collection was, as in fact it always is, particularly fine. It contained beautifully bloomed plants of Baronne Prevost, Lion des Combats, Duchess of Sutherlani, Lamarque, Paul Perras, SouDuchess of Sutherlani, Lamarque, Paul Perras, Sou-
venir d'un Ami, which is one of the handsomest of Roses; Comtesse Molé, Adam, and Coupe de He' e. In Messrs. Paul's group was a magnif. cent example of the yellow Vicomtesse Decazes, also finely bloomed plants of Chenêdolé, Madam Lafiry, Jules Margotin, Blairi, the glorious Géant des Batailles, Mansais, and Paul Récaut, a variety of great beanty, and not yet so well known as it should be. Mr.
Francis of Hertford sent among others Lamarque, Flis of Herford sent among others Lamarque, Mr. Busby, gr, to J. Crawley, Eso Among amateurs, Luton, Beds, had the best plants Conspore them were Chenêdolé, Paul Perras, Madeline, General Jacqueminot, Auguste Mie, and William Jesse. A. Rowland, Esq., of Lewisham, and others also showed Roses in pots, all of which were beautifully flowered and well grown. Mr. Wilkinson of Ealing likewise contributed a few small plants of choice kinds on Celine stocks. A new and promising Bourbon Rose was shown by Messrs. Paul \& Son. It was named Bacchus.

Azaleas formed, as might have been expected, one the most striking features of the show. They were kinds by far the best were those furnished by Mr. Green, gr. to Sir E. Antrobus, Bt. Many of them were literally pyramids of flowers with scarcely a green leaf to be seen on them. The more remarkable plants among them were Perryana, which we need searces say is one of the best Azaleas in cultivation - Gledstanest, triumphans, I veryana, a white kind streaked with pink; and coronata, variegata, rosea punotata and Rawzoni. Mr. Gaines, and we believe others, exhibited in this class. Among amateurs, Mr. Carson, gr, to W. F.G. Farmer, Esq., furnished the best collection. It consisted of Broughtoni, a very fine specimen of the old Chinese yellow ; sueciosissims, doubla red, and splendic plants of lateritia and variegata. Mr. Roser had a large and striking specimen of optima, a kind with red flowers of the most brilliant description. In the class of new kinds the last-named exhibitor produced Marie, a good orange scarlet ; delicatissima, white with crimson stripe; Glory of Sunning Hill ; and magnifica, the latter a good
white. Other varieties worthy of especial notice, chiefly from Messrs. Ivery, of Dor especial notisiflora, purple kind the edges of whose petals had a peculiarly erisped border; Admiration white, striped with pink Beauty of Europe, a white suffused and richly spotted with salmon; Trotteriana, a dazzling purplish crimeon Lord Raglan, diatinct in colour, large, but not striking Criterion in the way of exquisita, but apparently an improvement on that variety; General Williams, a good rosy salmon ; and Barclayana, white with a greenish

Rhododendrons were contributed by Messrs, Lane \& Gaines. Messrs. Lane's group consisted of aurgum, Sabinianum, sulphureum, decorvm majus, primulinum elegans, and delicatum. These, it will be observed,
are chiefly yellow sorts. Mr. Gaines' varieties have been so fully described by us on former occasions that we need not further advert to them here. Messrs. Veitel sent R. caucasicum pictum, a pretty variety, to which the jucges awarded a first prize

Tall Cacri came from Messrs. Green \& Grix, and were, as a mater of elurse extremely showy. We however, noticed nothing \(n \in w\) among them.
Pitcher plants, a collection oi which was shown by Messrs. Veitch, formed one of the most interesting portions of the show. They consisted of Nepenthes and phyllamphora, the latter literally loaded with soanll pitchers

For New Plants the exhibition on this occasion was chiefly indebted to the last named firm. Foremost among them .was Correa cardinalis, a brilliant geariet rinum coccineum, a half hardy slrub with bright scarlet
flowers; the whice blowsomed Ceanothus oregonus, a
hardy dwarf bush; a Trop eolum in the way of the com-
mon Nasturtium; a genus near Bronl æea, a new hardy hardy dwarf hush; a Trol æolum in the way of the com-
mon Nasturtium; a genus near Brol æea, a new hardy bulb from California; a New Zealand slirub in the shape of some species of Philippodendron and Nidularia picta. Of plants not in flower this firm sent the singular Ouvirandra fenestralis or Madagascar Water Yam, noticed at p. 359, the extremely handsome Fern
chenia microphyllia, and a Sundew (Droseradichotoma), plant of no particular beauty, but of yery curious structure. Of other novelties Mr. Epps had the handsome
red leaved Begonia splendida frum Java, and Hedared leaved Begonia splendida frum Java, and Heda-
roma tulipiferum, a beautiful greeuhouse shrub with drooping brown and white bell-shaped flowers; a handsome Gesnerwort came from M. Miellez of Lille; and Messrs. Standish and Noble sent an Azalea, a cross between the Chinese amoona and lateritia. To the value of this mule as an ornamental plant it added the curiosity of having "hose in hose" flowers, i.e., a double corolla one within another, a circand taking the size, furm, and colour of petals. This therefore independent of ito beauty will always render this singular hybrid one of much interest. From the conservatory at Trentham were cut flowers of Cantua dependens, charmingly coloured, and apparently produced in great abundance. Among Gloxinias, some good plants of which were
exhibited by Mr. Dall, of Pimlico, we noticed two fine exhibited by Mr. Dall, of Pimlico, we noticed two fine varieties called erecta stellata and erecta Castellumi. These were extremely beautiful, and are well worth attention.
Of Pelargoniums there was a large and excellent display. Mr. Turner, of Slough, had as usual admirably grown plants, amung which we observed National
Wonderful, Una, Sanspareil, Basilisk, Mrjestic, Go vernor General, Arethusa, Lucy, Petruchio, Carlos, and Magnificent. Messrs. Dobson and Son sent Harriet, Bouquet, Arethusa, Rosamond, delicatum, Ambassador, Conqueror, Gertrude, Lucy, purpureum, and roseum, Messrs. Fraser and Gaines also had collections so good. Messrs. Fraser and Gaines also had collections. In the to E. Foster, Fsq., Clewer Manor, near Windsor, contributed very five plants, covered with flowers of gond quality, and so had Mr. Wiggins, gr. to E. Beck,
Esq., of Isleworth. Fancy Pelargoniums: Mr. Turner sent Empress of France, Electra, Madame Snntag, delicatam, Celestial, Mary Howitt, Lady Hume Campbell, a superb plant of Jenny Lind, Queen of Roses, Cloth of Silver, conspicuum, and Richard Cobden. Messrs. J. \& J Fraser exhibited Advancer, delicatum, Madame Sontag, Princess Alice Maure, formosissimum, Princess Marie Galitzin, Miss Sheppard, Jenny Lind, Argus, floribundum, Celestial, and Gaiety. In the Amateurs Class, Mr. Windsor, gr. at Kiddapore Hall, Hagnificum, Duchesse d’Amale, Fairy Quer Berrier, Electra, and Princess Alice Maude, all fine plants and well flowered. Mr. Bousie had well bloomed Triumphant, a weil flowered flant of formosissimun, an i Richard Cobden.
Of Cinerarias Mr. Turner had a most excellent collection. It consisted of Emperor of the French, Admiral Dundas, Purple Standard, Viola, Orlando Etoile de Vaise, Duchess of Wellington, a fine forward
variety; Sir C. Napier, Lady Paxton, Magnum Bonum, Bousie's optima, and Brilliant, an extra fine lieht blue edged variety. Mr. Beck, of Isleworth, also sent 12
varieties; among them were excelsior, a good sort, and an improvement on Scottish Chieftain.
Messrs. Dobson \& Son staged 12 Pansies in pots the sorts being Queen Victoria, Omar Pasha, Father Gavazzi, Mary Taylor, Marian, Emperor, Aurora, Topaz.
Fuchsias were exhibited in tolerable profusion, but by far the best were six plants from Mr. Busie, gr, to These were fine pyranidal specimens about 7 feet high and upwards, densely clothed with foliage and flower from the ground to the very top. The sorts were
Queen of Hanover, Autocrat, Alpha, Macbeth, Glory, and Othello. In other groups were also some wel grown plants, hut the alove were those to which general attention was destrvedly directed.
The display of fruit considering the season was gond. It consisted of sume 40 Pine Apples, 20 dishes of white Grapes, and nearly 40 of black ; 11 dishes of Peach 8 Figs, some Plums, chiefly Prolific and Early Favourite, and great quantities of strawberries.
Only one Miscellunenus Collection of Fruit was exDute of Moscow Queen Pine Apple, beautiful burches of Black Hamburgh Grapes, Nectarines excellent for the season good British Queen Strawberries, two hybrid Melons, well-ripened May Duke Cherries. Of Pine Apples, Mr. Davis of Oak Hill exhihited a collection containung gond fruit of Providence, Black Jamaica, a Blood Yine, and Euville, and several Queens. Mr. Nichols sent from Devonshire some good Envilles, Providences and other kinds. Mr. Robinson, gr. to Lord Buston, produced three extremely well grown Providences ; but being shown wrongly they only specimen of Providence, and good fruit of that variet where also shown by Mr. Kobinson, and Mr. Bailey,

Mr. to the Duke of Marllorongh, had the lest tuo well grown Black Jamaiens; Mr. Taylor of variety of that fruit, over ripe, was shown by Mr Turnbull.
Of Grapes, the last-named exhititor furnished three good dishes consisting of Muscats, B'ack Hamburghs, and St. Peters, Mr. Munro, gr. to Mrs. Oddie, had
the next best exhibition of this kind ; it contained Sweetwater, Grizzly Frontignan, and Black Hamburgh. Of single dishes of Black Hamburgh the best came from Mr. Davis, and the ex: in point of merit from Mr. Clarke, of Hoddesdon. Other exhibitions of this variety came from Mr. Bundle and Mr. Spary, of Brighton. The best exanjles of Frontignan came from Mr. Montgomery Henderson, who produced well-grown Mr. Reid, gr. to J. Hunt, Esq , of Sydenham. Muscat generally were so unripe as to be wholly unfit for perfect, came from Mr. Turubuli, wre fo from being perfect, came from Mr. Twathbul, gr. to the Duke of fully ripened bunches, and so had Mr. Jackson, gr. to H. Beaufoy, Esq. Muscadines were slown in good condition by Mr. Smith, gr, to S. Ricardo, Eeq., and Mr. Williams, gr. to C. B. Warner, Esq. Mr. Mavia and Mr. Spary each showed a basket of Black Ham
hurgh Grapes, and Mr. Hill had beautiful bunches of burgh Grapes, and Mr. Hill had beautifu bet.
Grapes in pots were exhibited liy Mr. Forsyth, gr. to Baron Rothschild, at Gunnersbury Park. They wer set up in pairs in the form of arches, one at each end
of the table, and had a very pretty effect. On the four Vines (Black Hamburgh) we counted no fewer than 3 nice bunches of well coloured fruit.
Peaches and Nectarines were generally speaking well coloured and of good size. Mr. Gardiner, gr. to
Sir G. Phillips, Bart., had a dish of handsome Royal George Peaches, and good fruit of the same variety was contributed by Mr. Fleming, of Trentham. Violette Hative came from Mr. Evans, gr. to C. D. Newdegate Esq., and Royal George from Mr. Hill, gr. to R.Sneyde Esq. ; variety of fruit was also furnished by Mr. Hill and Mr. Evans.
The heaviest Melon, weighing 5 lbs., was communi cated by Mr. Boreham. The variety, we believe, wa named Orinn, a green fleshed surt, which was also awarded a first prize for good flavour. "Marna Patamn," from Mr. Nichols, was highly commended by the judges for its flavour. This is a small variety. A handsome scar!et fleshed Melon was exhibited by Mr. E"n", of Budr: \(\mathbf{n}\).

Of \(\mathrm{ki}_{\mathrm{j}} \mathrm{s}\), excellent fruit of the Brown Turkey kind came from Mr. Richards, of York, and Mr. Busby, of good dishes of the same kind of fruit
Cherries in three dishes were exhibited by Mr. Fleming, who sent beautiful fruit of Elton, Black Eacle, and May Duke. Mr. Evans furnishe! Early Purple Griotte, Circassian, and May Duke. Of single dishesWilton, at Heaton. Mr. Evana, Mr. Munro, and Mr. Wilton, at Heaton. Mr. Evane, Mrl. Muaro, and
F'eming also showed good single dislies of Cherries.

Plums, early Trolific, were exhibited by Mr. Fleming. of Strawherries 3 dishes, the best, came from Mr Ewing, of Bodorgan. The sorts were Br:tish Queen, Bietou Pine, a white variety, and Keens' Seedling. In single dishes Mr. Dunsford carried off the first prize, with extremely nell grown British Quetns. Keens' rom Mr. Ingram, or to J J. Blandy, Esq., of Reading. Strawberries in pots were shown by Mr. Rowe, of Watford.

Among Miscellaneous Fruit we noticed Oranges and itrons from Mr. Williams and others ; and Pears still in an excellent state of preservation from Mr. 1 , the varieties were Ne Plus Meuris, Knight's Monarch, Old Crassane, and Beulré Rance. Mr. Ayres, gr. to Lord Crassane, and Beur re Rance,

Royal Botanic, Regent's Park, May 28. - This Society's first exhibition this season took place on Wednesday last. The morning was fine; but in the afternoon there was tlunder and heavy rain which lasted till evening, and doubtless had the effect of grestly diminishing the attendance. The show itself was in all respects a good one. Falling as it did, however, so soon after that at the Crystal Palace, it was as might exhibited there. We have, therefore, now only to advert to a few new things that were not present on that occasion. Stove and Greenhouse plants were shown in abundance, and so were Azaleas, Cape Heaths, and Roses in pots. Orchids were mot quite so plentiful is at"Sydeuham, but among them were some rare specimens of good cultivation. Pelargoniums were all that could be desirtd, and there was one or two nice collections of Ferns
Among New Plants the most remarkable was a Peristeria of siugular beauty from the Bishop of Winchester. For some rearon unknown to us this was placed second by the judges, whit inst prize was awarded to Broughtomia hacina, whids. The latter and an Epidendrum were shown by Mr. Wheeler, of an Epidendrum were shown . Linden produced what was called

Mersrs. Veitel
Phatronepsis trum
sent the Califurnian Granada. which has been previnu-ly described by us. Eurybia alpina, a hardy New Ze:land shrub with white Asteralpina, a hardy New Ze, land shrub with white Asteralso ohserved plants of the Sikkim Rhododendrons, also ohserved plants of the sime and cinnaberinum, the former with nine Dalhousire and cinnabrinum, the former with nine
large white blossems on it and the latter with orange and jellow flowers of no part cular beauty. Messrs. Standish atd Noble sent a cut specimen of Spireas randifora, a showy kind introduced some time ago by Mrandiflora, a showy kind infroduced some time ago by pretty Gastrolobiums ; and cut speciniens of BougninThe latter we need not say is by . West, of Lymington. The latter we need not say is by no means a novelty; but it is seldom seen in flower. We also noticed some cones and cathins of Araucaria imbricata from Mr. Barnes, of Bieton.
Mr. Hamp contributed an interesting collection of Amaryllises, and we must not forst to notice Mr. Francis' charaing group of Roses on M:netti stocks. These were as fine as anything in their way could well he; although unly one year from the bud not one of them had failed to flower.
Horticultural, May 27 .-Col. Challoner in the chair. Messrs. Etandish and No le again exhibited the same pretty hybrid Azalea which they showed at the contributed by Mr. Westwood, of Turuham Green. The rest of the plants came from the Suciety's garden. Among them were seeds pesented to the Societ, by Sir 'homas Mitcheli. It was suted that the ripesedo this was shod hasers of catle have perished from eating them. So deadly, in short, are their effects that this variety of "Watcie" has received the mame of the Australian Upas Tree. Along with it were Alonsoa Warczewiczi, a scarlet-flowered species, which was reported to make an effective beduing plant ; Nemesia versicolor, a Cape plant of a beautiful pale blue colour, and represented as being also suitable for beds Boronia Drummond, which is one of the handsomest of the genus ; the hardy Californian Ceanothus papil losus, from a cold pit, covered with blue blossoms Aquilegia fragrans and californica, and a charming mule raised by crossing the former with the latter; this was exactly intermediate in appearance between the two parents, but in all respects handsomer than either of them, the flowers being neither white nor scarlet, but heautiful violet and yellow, large and showy. Fremontia calycina, a hardy slirub or small tree from California, was also shown, and is worthy of especial notice, being perhaps the only plant of the kind in Europe. A seed of presented to the Society by Messrs, Wrench \& Sons, and it is now flowering for the first time. The blossoms are creenish yellow, stiff and waxy looking saucer sliaped and abrat an inch ina stated to be without the parlicuar claw whichlat piant pos with !eaves in the form of a kite, were aloo the beautiful pink-flowered hardy evergreen Eseallonio macranth and a pretty plant of Calceolaria Kayi. The same esta blishment hikewise furnished a collection of Strawberrie finely fruited in what are called 488 or 5 -inch pots, and it was stated that that size had been proved to be quite large enough for all purposes of Strawberry forcing. Among 10 sorts, all suhjected to exactly first same treatment, Cuthill's Black Prince was the first to ripen; next in point of earliness was Hooper Seedling of other sorts Vicomte Hericart de Thury a French bind has fruit of good size and quality and a French Reice also contributed , Black Spine and from the w.en, Stanley's Winter with the Lettuce called Romaine verte Maraichere,
which has proved itself to be an excellent winter \(\operatorname{Cos}\), quick growing and hardy.

\section*{fotites of mooks.}

Under the title of Where there's a Will there's a Way (Lougmank), a small 8vo volume has appeared, in which managed to sege mane wides. It seems that the party orjected to two things in the Chamoun arrangements ; firstly to the exorbitant sum charged by the guides, and secondly to the quality of the guides themselves, so they determined to dispense with the g entlemen's services and to guide themselves. Two attempts were made ; the first, by way of Courmayear to the Col du Géant and Mt. Blane de Tacul, failed the second from St. Gr rvais by way or tellers managed Goute succeeded pell toli, as we found by those who take up their unpretending volume.
Count Streletsky in a pamphlet on the Discovery of Gold and Silver in Australia (Longmans) claims fo himself the credit orested in the question will find this distingrished traveller's case stated clearly and tempe raty in the pagesbefore us.
Those who wish to imitate in a small way the marine aquaria which Mr. Mitchell provides on marine aquaria which Mr. Mitchell provides on
grand seale for the visitors to the Zoological Cardens
hould procure a little pamphlet called Sea Ancmsones; Co.). The authoress, for we can scarcely doubt that the pages are from the hand of a lady, wished to have Sea Anemones and other beautiful inhabitants of the deep upon her table; so she set to work with knowledge and eal, experienced the usual amount of disappointment and success, learned by degrees how to secure the las without the firs!, and here in a few simple pages tel. s her friends how to profit by her example. Let us quote her own diffident words:-
"I have now finished my task, and must only add that the whole of what I have stated is the result of \(m\) own experience and observation, in amateur collectiog on a small scale ; and as I myself found in my early beginnings the need of such simple descriptions and in structions as I have now endeavoured to give, I hope it may not prove a useless work, but may be made the means (slight and unscientific though it be) of helpin some who are in need of help, yet find more scientific works beyond their reach
These sentences are a key to the whole, but they must be taken to describe in a very quiet way what a ndifferent person might honestly call a clear practica guide to the management of marine zoophytes an molluses. We especially admire its plain English unpretending style, in which there is not a trace of pedantry or affectation. The purpose of the writer was o tell the unlearned three things; firstly, what Sea Anemones, Starfishes, Sen Urchins, \&c. are; secondly, how to eatch them, and lastly, how to keep them in we entertain object she completely accomphishes; and curious races of marine polypes and molluscs will, with her aid, soon become universal ornaments of the draw ing-room, wherever there is easy access to fresh seawater. "My aim," says the authoress, "is solely to aid small collectors in the management of those little glass vases and drawing-room arrangements which lasses, and free from an delicate order, with brigh ance every inexperienced collector should be grateful.

\section*{Garden Memoranda}

Messrs. Waterer and Godfrey's Exhibition op Aurrican Plants. - These extensive growers of this charming class of plants intend to open in a few days a
magnificent exhibition of them at Ashburnham House, magnificent exhibition of them at Ashburnham House,
in connection with Cremorne Gardeus. For this urand in connection with Cremorne Gardeus. For this grand
display an excellent tent has been erected, about 365 feet long and 95 feet wide. Provision has been made in the roof of it for ample ventilation, and on the ventilators, which are to be transparencies, have been painted representations of plants and birds, Which when they shall have been put up and arranged in their places are expected to have a pretty effect. Magnificent Rhododendrons and hardy Azaleas in large numbers have already been brought from Knap and neatly designed clumps which are surrounded by gravel walks 6 and 8 feet wide now in course of formation, and edyed with turf. At the entrance handsome specimen Conifers have been placed, among which specimen Conifers
we haverved two capital plants of among which Thuja anrea. Some of the Standard Rhododendrons planted here are of great age and size, such as are ouly to be found in old establisthed nurseries like those in question. When the whole shall have been completed at cannot fail to form one of the finest floral sights in the neighbounhood of London. The only fault, if fault it may be called, at present observable is the want of a mass of flower could be looked down upon and seen a once. This may however yet be supplied.

Calendar of Operations.
(For the ensuing wcek.)

\section*{plant department.}

Conservatory, \&c.-Many New Holland and other reenhouse plants will sorn be geting past thei best, and some foresight and care will be necessary to
avoid being short of specimens in bloom with which t supply their places. If former directions have been atended to many things in the stove (as Allamandas Clerodendrons, Croweas, Achimenes, Gloxinias, \&c. should now be in a forward state; but these must be carefully prepared for removal to the cooler and dirier atmosphere of the conservat(ry, otherwise there will be great risk of injuring the folage, \&c. Where circumstances will admit, plants that have been grown in a warm moist atmosphere should be removed vious to their being house abnut a fortnight pre gradually inured to a free circulation of air, \&e. By attention to this and placing the plants in the warmes corners in the conservatory, the Clurodendrons, Allacomers in the conservatory, the Chrodendrons, Ala
mandas, Achimenes, \&c., will continue growing slowly mandas, Achimenes, \&c., will continue growing slowly
and blooming for some three months, whereas if this is heglected their beauty may be very short-lived. Aim fter removing an even temperature in the conservatory after removing thence plants that have been grown in the stove, and avoid allowing the atmosphere to become very bright on warm days. Also see that every plant is perfectly clean before placing it in this h use, and hat the creepers, \&c., are not infested with insects. Go over the house every morning and remove decaying fowers and leaves as they make their appearance. nit we experience more settled weather valuable apecimens of greenhouse plants should not be placer everything in a growing state should be sladed from the orenoon sun for some weeks after removal to the open making rapid growth, and must be carefully attended a to watering, stopping, training, \&c. Examine Heath requently for mildew and apply sulphur the moment pery very liable to be attacked by this pest at this season. The fest preventive is keeping the plants in vigorous Atend to supplying healthy vigorous plants with potroom as they may require it, and avoid allowing them to sustain any check at this season.
forcing department
Pinery. - Where the quality of the fruit is of first importance, care must be observed to have the soil in a healthy rather dry state during the period of ripening, for as there is no reasonable hope of obtaining high avoured fruit from plants growing in pots, the trouble ecessary to collect and place together those approach ng ripeness, 80 as to be able to afford them a rather ry atmosphere, and avoid touching them with the yringe after they begin to colour, will be well repaid uckers that are not very strong will be benefited b being left on the stool for a month after the fruit is cut vigorous plants. Any neglect in the way of watering ay
vin maintainug a moist atmesphere in the case of succession stock may lead to their fruiting prematurely, therefore let there be no lack of attention at present. Plants swelling their fruit should be encouraged with plenty of liquid manure and a moist high temperature, shutting up early in the afternoon after syringing. Vines.- If has commenced colouring, no time should be lost in coating the hot-water pipes with sulphur. The sulphur should be mixed in water with abnut equil quantities of lime and soot, and applied with a brush. The lime serves to prevent the sulphur being washed or rubbed off, and the snot helps to prevent the disagreeable appearance. The temperature of late houses were th fruit is now showing must not be allowed to fall too low at night if good sized bunches are expected, and where Muscats are grown for a late supply, there will be but little chance of securing a good crop of these unlessa temperature of \(70^{\circ}\) is maintained. Attend carefully to young Vines recently planted, keeping the borders in a healthy moist state, maintaining a moist atmosphere, and shading if necessary until the Vines get a fair start. Proceet diligently with thinning the berries, \&e., immediately they are ready, for they prcgress rapidly at this season stop all laterals in time, and allow no confusiun Mecons. - Where the fruit is swelling the soil should be kept in a properly moist state, and every means should there is to preserve the foliage in perfect health, as there is no possibility of obtaining good flavoured fruit unless the foliage is kept in health. Keep the Vines thin, and prevent their being encumbered with useless laterals, and remove any decaying leaves at once, as these when left only serve as a harbour for insects. There is yet plenty of time to secure a good crop in dung beds, and if any of the frames which have been used for getring up "hedding.out stuff" can be spared for this purpose the plants should be got out at Nee. Very little artificial heat will be necessary at present, but the beds should be made sufficiently high
towards August. This will he best managed if necessary he bed some 2 feet lijigh with any useless materigl whin will not derment, placing on this some 18 inchial whic ermented stavie manure, which will afford sufi heat for the present.

\section*{The Maricultural Gazstte.}

SATURDAY, MAY 31, 1856.

As a notice of the Agriculture of Russia in that part of the empire noot nearly resembling England in its climatic circumstances will he interesting at he present time, we take advantage of a correpondence which has fallen into our hands to state pondence which or two particulars which throw light upon its one or two particulars which enpondent is an English present condition. Our corresponden district. That he is a man of energy and enterprise may be gathered from the fact that he is ahout to introduce the Lois Weedon system of Wheat cultivation, believing that there is a gnod chance of its making its way under all the nnfavourable circumstances of an adverse climate and of a people altogether unaccustomed to fallow cropping, and certainly ill
prepared for great an advance in scientific
agriculture. The eneral sysem in operation there is natel fallow and two succresive crops of grain, the first autamm s.wn and the o he. sp, ing sorsn.

Our curr spumbent is to adopt the Lois Weedon system on a farm of 150 acres arable; and this is not a havily aniopted resolution, fur he has evidently had it in contomplation for some time past, having written on the subject in January 1852, althoun he has been hitherto prevented pursuing it, with the exception of a small experiment, by some untoward circumstances. His soil is well fitted for it, being a good theat or loamy clay on a marly clay subsin and very fiee from stones, but still there are difficulties, for the ground is frozen to the depmh of 12 or 18 inches through the long winter of 226 days, and the early setting in of frost is against the winter forkiny of the ground, allowing little time before the ground is iron houm for that operation; and the rapidity of growth in the short summer will afford very little time for summer hoeings. This must render the fillowing process, the expo-ure and disintegration of the soil, very inefficient comparatively with what may he effected in a milder climate, still with some modifications the system may, we believe,
be followed out with success, and the great principle that of a crop and fallowess, obtain a footing. It will require the mind of the cultivator to be active, to adapt the practice he will pursue to the couditions in which he finds himself, but since be has the spiriterd enterprise to undratake it, we may expect he will not break down in expediences, and that his returns prevalent in his neighbourhood, and protably the prevalent in his neighbourhood, and proliably the
general average produce of Russia, which appears very low, the winter corn avtraging 16 or 18 bushels the summer a little more; while the profit derived
from cows is the insignificant sum of 18 s. a year.
The tillage system is, after the spring crops, it one or two additional ploughings, none of them decper than 3 inches; apply to the failow what little dung the cows, fed on straw and a little bad hay, have made in the winter; Wheat and Rye are then sown the beginning of September, which are succeeded by spring-sown crops of Oats and Burley fallow. Thus they have but two light crops in the three years, and as the dung seens to be all aid on the fallow, they do not appear to raise any green crop for winter food. The possibility of such great inducement to the adoption of the Lois there is the possibility correspondent; in addition a more remurerative crop of obtaining each year a more remunerative crop of grain. In the summer pasture; of which and of meadow-and on coarse contented to get half a ton to the acre of hay-a, out 50 aeres rent-free are attached to every 100 acres being in its ; the only value attached to the Grass Frum the early selting to the arable land.
From the early selting in of winter the Wheat and Rye must be got into the ground hefore the middle of Septenither (harvest commerces about the middle of August). As the ground remains frozen (it was so at the date of our correspondent's letter, the 28th of April, ) the spring sowing must course be late. At the date of his letter, as may be supposed in this state of the ground, there was no
vegetation; indeed he says, "The Wheat has no begun to grow since winter, and exhibits but a few meter rises to \(55^{\circ}\), bit as soon as the thermo ear in seven wreks, and fit for the sickle by the ear in seven Wreks, and fit for the sickle by the liable to ingust." The Wheat is not considered thermometer stands as low as \(12^{\circ}\) below when the covered with snow, as it is when the whiter advances (the thermometer at \(25^{\circ}\) below zero) it semains unhurt; but the cold wiuds in the spring are frequently fatal to it. Insects, worms, \&rc., suffer full as abundant as in Russia, for they are to the grain crops only averaged 10 bushels to the acre, and give better expectations. The well in stock, appears to be about as four to five of Ence of grain \(2 \frac{1}{2} d\). \(p \in r\) pound, but necessarily very ind fferent.
As not more rain falls in summer than is neces sary for the crops, ant as in winter, from the frozen state of the ground, the snow in dissolving does no is considered unuecessary, except where called for in some wet places: indeed, in such a state of agriThere is never been thought of.
There is one remark our correspondent makes that we did not expect in a land of serfdom, "c Hand
hoeing will not do here, the people are too indepen-
- Probably zero of Rearmur's seale, which is \(3 \Omega^{\circ}\) Fabr.
spenk of free la' our as he says, "as the mast, l.ow are only a diminy a lay, prhips the pride might lee overcome he the. inducment of a few additional pence "" and if Lis Weedon practice is not worth that it will
be worth no hing there. We should think they so much depeld on horse labour, that hand labour is a novelty to them in the tillage of the land. This must be overcome

Cuw dung, contrary to our noiions, is more highly appreciated than either tha' of sher \(p\) or pigs ; in fact no more of these are kept than are necessary for the ase of the house.
We are in error in supposing the country a areat Flax one, " but as every one grows a little it makes it alsundant, yet it is dreadfully coarse; "it fetches
3\%l. per ton. It is very probable Riga seed 37. per ton. It is very probable Riga seed
acquires its fame from this coarseness, as well as from the great quantity they are able to export.

A very useful paper in a recent number of the
Veterinarian "draws attention to the importance "Veterinarian" draws altention to the importance of wholesume provender for cattle. There are few things, it says, standing more directly in the relation of cause to effect than bad food and disease. The surgeon too often traces disease and death to improper doften poisonous food
The adulteration of oilcake and other feerling stuffs is the main source of the illustrations which the
writer adduces. Rape-cake adulterated with Mustard seed and oilcake adulterated with refuse almond-cake are among the instances he quoteshe former a case known almost ever since the use of the material-the latter recently publisher at, we believe, a meeting of the English Agricultural Society by Mr. Frnier Hobbs, who had known eight or ten bullocks poisoned by cake adulterated in hat way.
The main point however in the paper to which we would draw attention as connected with field operations at the present season is referred to in the

In the present im
necessity is created for large system of husbandry, be kept on a farm, for large quantities of stock heavy root crops from the calls for the raising stock and the good cultivation of the farm act and re-act on each other, flourishing or declining as collateral circumstances operate beneficially or otherwise on these primary essentials. How important, then, is it that these ront crops should be in a healthy state; and how much of this may depend on the kind of manure which has been employed as a dressing for the laud, we at the present time are to a great extent ignorant of. Chemistry, botary, physiology, and practice must all unite to accomplish a satisfactory solution of this question. We regret to say that experience has confirmed our long-existing suspicions that there are artificial manures which produce a state of plethora, not to say disease, in plants, which renders them unfit for the food animals when they are too freely partaken of. very few weeks since we were consulted hy one of our most celebrated breeders of sheep, in consethis kind. As he had sustained from a cuuse of particular field of Turnips, several died some what suldenly. An early removal at once stayed the fatality; but this returned when the sheep again went on to these Turnips. This was repeate 1 again and again, and always with we same result ; no losses occurring in the interval although the sheep were fed on other Turnips, grown on the same kind of soil, but without the same artificial manure We could multiply these cases to a considerable xtent.
Now, it may be true that cases of unhealthy regetable growth and of consequent disease in the cattle fed have multiplied since the introduction of artificial manures; but we must think that a great deal more is made of the "rickety" growth consequent upon a partial feeding of the plant than it deserves. where it rider whose horse hat Nesit the other day, over a sound crop of Turnips grown picking his way so suddenly "smash" into a rotten crop which had been manured with superphosphate only must Anything inducing altogether exceptional.
Anything inducing rapid growth lays the p'ant open to certain forms of disease, but rapid growth is a very desirable thing notwithstanding. The Glargow, and Ayrshire daisies with the succulent Italian Rye-grass on which the cows were fed has heen an entire failure. We do not belicve that diseased crops of Turnips after superphosphate are anything more than a case of rapid growth, at which every farmer aims, or that by the use of artificial than the raising of the ordinary experience of Turnip growers now-a-days to that of the best years
in old-n time. There is always more ruthemens in a good Turnip year than in a bad one, int a good and we hope that the cases in one nevertheless superphosphate theory which have been quoted will not deter any from its use with as much liberality as ever.

Home farm management.-No. Iv
Success in home farming is to a very large extent manager. In any case he has much in his power and it is rinht he slould have if he is fully qualified for his office. A perzon who is entrusted qualithe management of another's affairs, and has usually considerable number of men employed under him, can only to be looked upon as a mere servant that to be a responsible agent left to a considerable ex to be a responsible agent left to a considerable ex-
tent to his own discretion. If he cannot be entrosted with the duties of his office he should at once be discharged to make room for a suitable successor. But if he is really qualified for his situation there can be no greater mistake on the part of an employer or his agent, than that of constant fault-finding and petty in terference. An intelligent manager having a rightly constituted mind, will take a pride in doing his utmost to promote the interests of his master, if he sees that he is trusted and respected by bim. A conscientious man will do what appears to him to be his duty in any case, but there are two ways of discharging the duties of an office. Treat a farm steward properly and give him that improtance in the eyes of the workmen he employs \({ }_{2}\) which is intispensable to the maintenance of his uthority over them, and if he does not become a must devoted and valuable servant he is the wrong man for
the place. The right man in his proper place treated ad trusted as he deserves, will identify himself with the affairs managed by him in a way altogether peculiar to the case. Every hour of the night as well as of the day will attest his devotion to his employer's interests if these should call him to activity. He will ever be on he watch to turn things-which less zealous overseers would disregard-to a profitable account, and be even more anxious to make the most of everything than if he were acting on his own bebalf,
How different from all this is the case of the manage who is at no time thanked for anything he does, how ever much it may be out of the way of his regular duties-who feels that he is just looked upon as a sort
of living machine doin of living machine doing nothing wirhout orders-and Who knows that do what he may for his employer's ward. Petty complaints, sour looks, and perhaps cuttin reproofs before his workmen are the only recognitions of faithful service which he expects bey ond his bare salary.
Why the man in such a situation as this is perfectly miserable, life is a burdin to him, and how to kill time becomes a question of importance; le goes through his duties, but neither activity nor zeal characterise his management ; his ouly aim is to put in a term with as much comfort as possible in the circumstances-or keep hold of a livelihood till some other opening occurs. But who is to blame for all this? Is it not the superior of the farm manaser, who will rather indulge in scolding for triffing errors than at once dismiss the cause of of his ? There is assuredly little hope of curing a man of his errors by fault-findin, for the very reverse of a cure is more generally the result. Where a fault is committed by a farm steward there is no more successful way of preventing its recurrence than for a superior to pass it over with a few good counsels; if that will no do, after a fair trial discharge the man by all means, for he is absolutely incurable.
It may be thought, however, that I am supposing proch when I assume that there really are either proprietors or agents of estates who would so far with their farm bailiffs But I have rease to know that there are a good many employers in the United Kingdom, to whom the charge may be brought home with the force of truth. These persons after having got a bad name in their respective districts labnur under very great disadvantages. Superior men will scarcely enter their service, and with the employment of inferior persons the causes of weekly and daily "scenes" are
immensely increaser. As there can be no profit in perpetual interference and captious quarrelling, an effort ught surely to be , ut forth in quarters where the evil still prevails to bring it to a speedy termination. Not hat an employer sh uld abdicate in favour of a farm manager those rights which belong to ownership, but that having once selected a proper man to take care of his interests, he allow him that discretionary power which will enable him to disclarge, with the greatest possible success, the details of the general course of management that may, either with or without his counsel, be laid out for his uuidance. To give a home arm manager so much power as this implies, without his lieng in possession of abilities and acquirements to and I pur the cliarge, would be a very great mistake, and I purpose therefore to indicate the class of men and for surt of training they require to render them suitable for such an office.
In speahirig of home farms I wish it to be understood and quality, bose in view which are of first-class size circumstances, but with slight mo lifications according to
bailiff who does not require to work with his
hands. But 1 would not sny that the steward of a frst-clas, farm ought never to have wrought with his
owa hands. Nay ! the very reverse of this, for I would regard an applicaut for such an appointment as tisqualified fur it in whe very important aspect, if he had
not practicaly extented every kind of farm work. How can an overser r judge of any kind of nork if be cannot
do it hims.-lf How can he detect an ungualified or sham workman if he himself s ignurant of the manner home farm will have no certainty that he is getting his work rightly executed, neither will he have sufficient ime beena worker, aud can even yet take an implenient in his hand and slow the way in which it should be in his hand and show the way in which it should
used. Unfortunately there is a sentimental and silly opinion, held even in the middle ranks of life, that a young man is disgraced if he has
perform manual labour. Loving mothers pe fectly sensible that their sous ruust in one way or another live by their own exertions, will by no means
consent to their learning either practical farming or practical engineering, hecause thry must soil their fingers and sleep the sleep of a labouring man for some jears James or John is at stake, the sail James or John must be kept from lean ning a healthful and promising ousiness, and be sent to a counting house deek to drive and the sign manual of "gentility" falsely so called, Till once absurdities of this sort are entirlly given up education, we are not likely to lave that influx of new blood into the accricultural profession which it so urgently requires at the present time
have so many properly qualified home farm managers as the improved state of ayriculture demands. Many of
the young men, who not connecied with syricult pursuits by birih are yet desiruus to with agricultural receive so imperfect a training in the practice of the art, that their fortunes and prospects are often ship wrecked wl:en they take to farming on their own imagine that farming is a business requiring so little practical knowleige that with their school-taught livelibood from it, or if they have not capital start farming for themselves, that they will succeed in giving satisfaction in farming for others. The son 30 farmers, on the other hand, are liable to depend despise theoretical acquirements. But fiom neither o these classes are the most successful farmers or the most highly qualified home farm managers likely expect our first-rate ment to spring not from any par ticular grade of the community, but to be themselve an elucated class. Their education must not be cin-
fined to either practice or science exclu-ively, but should have for its objects-1. Practical agriculture farm. 2. A careful study of farming practices in dif ferent districts; and 3, an acquaintance practically provements. Then in the scientific department they must acquire a well-grounded general knowledge is logy ; 4, natural plulusophyy--the latter including meteorology and mechanics ; and 5 , natural history I am laying out a course of instruction for farm managers little less than that of some of the learned professions. Yes; I amp perfectly aware of the fact, for
what is farming in the highest sense but a profession requiring more skill and general acquirement than per haps any other business? The cultivator of the soil is the connecting liuk between the great inorganic world and relation to Nature, for he is tho agent that draws forth her resources and demonstrates her latent power. And can he do this in the most effective manner without a comprehersive knowledge of all the laws which his the farming of the Vnited Kingdom is carried on with comparatively small share of this comprehensive nowledge, and is considered superior to that of any other country in the world. Were our home farm
managers and \(e\) nant farmers educated as they ought to be, this country would no longer require to import her millions of quarters of Wheat, for it would not onl become self-supporting, but ultimately capable of export-
ing large quantities of grain. How desirable is it that thi shoulu be the case ! and how important that all the home farms in the kingdom should be the exemplars of the general systems of management that are capable when niversally adopted of t.ringing about this result
In sele ting a steward for a first-class farm, therefore, "practice with science" should be the guiding motto. The difficulty is to get men that are really of the right stamp, for theory run wild is ten times more dangerous than good hy hrid of qualities is sometimes puzzling enough. and and systems Agricultural Society of Scotland are instituting purpose to grant diplomas to those who possess certain puadifications, the inducement to acquire both practical and theorretical knowledge is likely to be increased, and and theoretical knowledge is likely to be increased, and
the diffieuly referred to gradually overcome. But it
would be a mistake to suppose that the mere possession
of agricultural knowledge would fit a mann for the office of adricultural hoowledge would tit a man for the office
of farmu tuater. He must be of sterling probity, aective, inlustrious, painataking, civil, know human
nature well, and above all he must have a good monal nature well, and above all he must have a good moral
character, be soler and punctual in the discliarge of all his duties. A man accorl'ng to this model, and pos sessed of suitable scientific and practieal knowledge, will speedily acquire the cunfilence of his emploser, and develope the resourecs of the farm intrusted to his care easy matitr to get men who are up to the mark in all these respects, but ic is right at least to aim at a ligh nearest to and to regard those who on the whole ec me nearest to it as most destrving of preferment. If the his salary will require to be good, lut then by his superior managensent he will far more than compensate the wages of a secoud-rate man.
I have aiready referred to the evils resulting from the part of his employer, and have now to notice also the bad effeets which must result from ony improper bearing of the former towards the latter. The farm bailiff is a responsible servant, but is still a servant
notwithstanding. His duty is to study obedience to his macter, and while a man in his ponition possessed of strong and independent cast of mind will spurn to flatter a superior or creep in the dust before him for the sake of avour, yet duty, principle, and commou civility require respect. If the situation is one in which he is tempted -nay, even compelled in self-defence to cast these be incomparably better for him to resign his charge at give way to temptation and act uncivilly towards his superior, his influence is gone, and if his imprudenc lead him so to act without any real temptation he is ery rightly served.
In the carrying out of the farming operations it may often be the cuse that a proprietir taking an interest in his manager. The duty of the latter in that event is to sate unreservedly his views and his reasons for them; show respectfully the objections he entertains on practical grounds to the opinions expressed by the espons:bility does not ruggestious are handlords of act ve inquiring habits are often misled by their bailiffs brow out on farm manacment That reserve and hrow out on farm management. That reserve and minds on subjects they ought to be intimately acquainted with are wholly out of place, and may lead to very unto his steward for counsel in practical details of farming, and if the latter acquiesce in everything that is brough before \(\lim\) from thit quarter, he is not the man for his
place at all. No considerate landed proprietor or agent will object to a farm manager stating his objections to any proposal that may be made in respect to the
farming of the land under his charge. Indeed in many ases the steward must give a practical bearing to the theoretical schemes introduced to his notice by those tho are above him, or bear a share of the blame re sulting from their failure when put into operation.
It is very frequently the case that in consequence of proprie ors are ensbla and fombery excellent sugges proprie ors and on the subject of furm manges保 or detect everything that is incapable of being carried into execution with any chance of success, they should the same time be ever ready to carry out, as far as may be possible, those new ayricultural system that are thus suggested to them. Nothing can be more pitiable than to see a bailiff priding himself on his oo noblemanments as a fawerer comprehensive o well-informed his mind may be, can instruct him. It is thus that vapid practice sets itself against science, and bars its progress. The asseveration of "Talpa's" more"-is the perpetual chatter of some agricultura incumbrances known as farm managers of the old sehool, that must speedily either be reformed or displaced altngether. J. Lockhart Morton.

\section*{Home Correanondence}

Thin Sowing.-The interesting phenomenon of vege tation drawing towards the light has aften been exempli fied amongst Potatoes stored in a dark cellar ; a shoo
from one of them will often make its way across a floor from one of them will often make its way across a floor
of many feet in brea ith, and rise up the door towards the keyhole where a ray of sunshine appears. Roots will also travel long distances in search of food, and hav ing discuvered a spot where nourishment for the paren plant is deposited, they will multiply their fibres in hundreds. The attraction which induces this beautifu natural appearance is not fully understuod, as the rocts have frequently to pass through a comparatively barren portion of the soil previous to reaching the desired point. The study of physiology may in the knowledge foldatict and will be aufficient for their guidance and instruction; proving the advantage of deep stirring in order to give
ull development to the root progress. It does not seem reasonable to suppose that because land is poor. Whear should be sown thickly to insure a crop. The more senable course would be to limit the supply of seed to the coppability of the land to support its gruwth in all
stages. It being always understood that allowance must be made for casualties, \(v^{\prime} z\)., destruction by bird and insects, but iot for careless farming. The wonder ful paths of the tender roots through masses of soil, amost impenetrable to the steel fork, excite astonish inent and raise the thoughts of man "to Him who maketh the grass to grow upon the mountains. plauts are have shown that the ronts of that the plants themselves "riller put" in an extraordinary manner undr favounhle circumatances ; these facts are in favour of giving the crop room erough to display its vigorous powers of production. It may therefore be fairly suguested to the farmer to use his discretion in sowing aocording to the quality of the land he cultivates, always remembering that two leads of Wheat will no come to perfection where the natural soil has only provided for one; and that if he requires to increase the yield he must bring draining, labour, manure, and duce inence to benr upon the question. Attempts to introtre he wous npposition from prejudice, strengthened by old times" when form afford to let weeds have a The markets have lately been liigh, but the daysare coming which will again call forth all the energies o agriculturists to enable them to compete with the oreigner. It will therefore never pay, either to Falcon.

The Gapes in Poultry. Amongst the various sug gestions for the cure of "Gapes" in fowls, which have appeared in your valuable journal at different times, I have never observed any allusion to a very simple remedy, the efficacy of which I witnessed whe some years since at a farm house in Devonshire wher a number of white fowls were kept, a large proportion
of every brood being always lost from this disease, and of every brood being always lost from tins diseabe, an the white breed would have been relinquished, onl that when reared they realised a higher price in the market (Barnstaple) than the darker kinds. I therebelieve first appeared in the Transactions of the Linnean Society:-

Fingers aid Toes in Turrips. - In the Gazette of the 16 th May, p. 331 , is given an extract from Mr. Russell's paper in the "Quarterly Journal of Agrieulture," on which he appears apprehensive that the not very ancient and probably not very erudite term of fingers lost to posterity from want of discussion on the apathy of agriculturists to so lamentable an innovation in the olden nomenclature. As words are only intended to convey ideas, if people will understand fingers and toes to mean a disease, the term may as wel answer the purpose as any other, whether anbury or not; but as words should convey definite ideas, to the end of being generally understood, and the better if without the lisbility of being mistaken, there lies trifting objection to the use of the term which Mr. Russell himself very candidly offers to our olservation, in Professor Buckman's, Mr. Berkeley's, and others' mis pretty ladylike hand of Prof. Buckman with its healthy fingers doesnot give the digits of the gouty lumpy diseased innd which \(\mathrm{Mr}_{\mathrm{r}}\) Rusell describer Buckman's drawing we have as good and regular finger as can be, "as like a hand with its five fingers as could be imagined, yet still in a botanical sense it cannot be
said to be digitate or fingered." So that its form really said to be digitate or fingered." So that its form really
signifies nothing, and fingers and toes to mean disease require something more than a well formed hand and fingers, that is to say, without the adjective diseased or some other equally distinctive, they convey no iden whatever. The fingers and toes must display in their formation all the lumps and bumps and excrescences of disease, for the fingers and toes of a mere forked or branched root will both in appearance and language inicale a disease they have not, and lead, as they have dio Professor Buckman and others, to false conclusions ile trni fingers and toes conveying then to one the one an indication of a corrupt state and to another one of regression (a regeneracy-not a degeneracy
definite, and therefore does not deserve to sufficiently definite, and therefo does noterve to be retained. But other plants show this formation of ront which are not subject to the disease we are treating of, as
Carrots and Parsnips ; and again other plants are subject to it, which from the natural formation of their roots cannot when diseased be said to taise on any form of fingers and toes, as Cabbages, \&c. Surely tiren fingers and toes is not a term sufficiently distinctive to characterise a disease which exists independent of such a formation, nor does there appear any necessity for retaining a name bo indefinite, given probably ly ignorance and on a mere superficial observance of its appearance, since we have another, possibly more appropriate, and in its appearance certainly more generally applicable. Anbury applies to the disease wherappears, irrespective of the formation of fingers and almost, I believe I may say always, containing maggots. It may be that we night by the aid of some Greek word have found a more decidedly characteristic term for the disense, and not have been obliged to go to the horse for it, for though some distant analogy may externally exist, in all its pathological characters it is, I believe, very distinct from the horse anbury, yet for want of a better, and a better than finger and toes it certainly is, we must retain it. The finger and toe formation does not invariably show itself even on the Turnip, at least it is necessary to draw very much upon our imagination to find it. In all I have examined it more frequently developes in an unsightly and huge excrescence on the body of the Turnip, swelling out on one side, seldom I think with any root-like process, when so attacked. The finger and toe formation certainly is not in this case such as to draw attention to it from the more obvious bulbs of the disease, and which

Wheat in 2 -feet Rons.- It gives us great pleasure to observe in your agricultural columns of the 9 th inst. A
paragraph headed "Rotation of Crops," by Mr. J. M. Goodiff, whose views are so coincident with our own. We cannot but think, however, that he ought to have given us some credit for the introduction of planting who introduced it in apart, wical point of view. We have several acres this year on the same plan, worked well between with the fork on common stetched land during the winter monthe, which is now progressing favourably from a small quantity of seed. We have also one acre of Wheat thus treated, which is sown with Lucerne and scent well. Mr. Goodiff is unmistakably on the right done well" and success is certain. We have this season about 40 acres, on various fields and suils, at less than half the usual number of rows on a stetch, of sod at less than a quarter the ordinary quantity eminent agriculturist in poticing it observed, is Ar Hardy, you ought, and will no doubt by this process ensure every plant to produce some 10 or a dozen fine
bushels of \(s\) ed, obtain at best but a produce of two weak ears from each grain, or ahout 50 fold." Our
answer was that we very much doubted if they ever chtained even half tha amount, v.z., 50 hushels per acre
from such a proceeding. We also observed that we should be well satistied to reap two good ears from each plant of our own half liushel planted, say 100 fold or when we reminded himped he \(h\) mself became thoughtful, that were it possible to obtain half as much even as this from their 2 bushels (say no more, though many use it) it would amount to 200 bu-hels produce per acre, seel. have had the effect of calling the attention of sciuntific nue
chemical principle of agriculture, and of practical men to the
application of those principles in a farming and economical application of those priciples in a farming and economical point
of view. The graest questions howrver inoved in this contro-

the feterinary Inspector of the Society, has delivered before the
and the Royal Veterinary College have transunitted to the
Council their annual report.
One of the original ohjecty for which the Society was founded,
the last in the order of enumeration, thongh by no means the the last in inportance, is that which proposes by to promote the comfort and welfare of laburers, and to evcourage the improved
management of their cottages and gardens." This great and management of their cottages and gardens." This great and both nfficially by the Council and individually by the members
of the Society. Various ameliorating measures have been proposed, which as far as they have gone have been useful, but
they fall far short of that extended system which the importance of the subject demands. The Snciety has distributed at less
thar prime cost upwards of 30,000 copies of cottage tracts, containing practicnl suggestions for the management of labourers gariens, and for cotrage econony and cookery; they have also
published in their Journal Sir George Nichols's Prize Essay on the best means for improving the condition of the agricultural labourer, as well as Mr. Goddard's and Mr. Macvicar's Prize
Essays on the construction of cottages. Last year the Prize for Lissays on the construction of cottages. Last year the Prize for
the best essay on labourers' cottages was rentwed, and several essays on that subject are at the present moment under the consideration of the judges. The Comecil, however, regard all these
efforts as too limited and temporary in their character. The effortis as to limited snd temporary in their character. The
intelligent mind of the labourer, who performs the operations on the farm, and the high moral principle within him, which is the
surest guarantee to his employer, are beat sustained and cultivated by making every effort to render the labourer happy and comfortable.
The Chelmsf, Meeting, to be beld in the middle of July,
promisps to be equal, in every respect, to the most successfal of promisps to be equal, in every resprct, to the most successflul of
ormer Counry Meetings of the Society in other parts of the
kined is large beyond precedent; and as a great number of these,
instead of lying inactive, as hitherto, in the yard, will be at ordinary work during eertain hours of the show, they will

first of these hends will form the Prize and Trial Implement former the Chelmsford Meeting; in addition to the Special Prizes of

On the motion of Mr. H. Wilson, seconded by Mr. Thomas Scott, the thanks of the meeting were voted to Lord Portman, the President of the Soziety. In acknowledging the vote, Lord Portman said:
W.th regard to the subject of drainage, which was introduced
by Mr. Scott, he held that there was. no unitorm svsten din not believe that there could be one. The quality of the soil and the nature of the water ware such important elements in
drainimo operations, that until these hal been aseertained it was
 they could, and apply it to the best of theirabubility in their several
localities.

\section*{Farm Memoranda.}

Creslow, Putlowes, and Bragghton, Buchs. - This farm has long been celebrated in the annals of grazing for he wonderful animals which have been ted on it. In the days of the great war the late occupier at different 2,1231 ., which is an average of 1061.6 s . for each bullock, a price probably never before or since realised by any one grazier. And the present worthy
tenant, though he does not attain the notoriety which followed his late relative and predecessor, still furnishes a constant supply of useful animals, of which the splendid Cotswold ewes at the last great Christmas market were very fair specimens. Creslcw is a farm of 860 acres, but with additions the occupation now 500 cattle, and in the winter 700 ewes : in grassy seasons, alter the ewes are gone, slieep are bought, to come out at Christmas. The h.use and premises are Portland oolite, and the base of Kimmeridge clay Une grazing field, perhaps the largest inclosure of really good ground in the kingdom, contains by admeasurements. This field consists of a series of hill and dale, and consequently the soil varies much in quality Where the stone and clay join, the water, which filtered through the stone, is thrown out by the clay; and here draining is necessary, which is principally done with turf. The main drains, which have pipes, the cattle. The summer stock for this field is 220 bullocks, and 200 ewes with their lambs, generally here called couples." It is very curious to Herds of catle and flocks over whis which purchased from different fairs, locate themselves in different parts of the field, retain their old companionship, and seldom trespass on their neighbours' domain, or stray away from their own part of the ground. The greate number of the oxen are Herefords, some Devons, and late in the year a few Highland Scots. In consequence of the protracted drougit last summer, the grass a Creslow was unusually short, and the stock did no make anything like their usual progress. This farm possesses the advantage of having about 100 acres of for the whe whables straw and roots to be before the catcle are tied up, they are supplied with hay in racks, which are placed round the ricks in the field The sheds betore Christmas were well filled with Hereford oxen, which were receiving hay, a bushel of sliced Swedes, and three or four cakes (of three ibs. each) daily.
The grazing land at Putlowes, though of less exten thau that of Creslow, is decidedly of superior quality and presents that true feature of the feeding district a rich, deep loam, resting ou a strong clay. It is really wonderful to see the size and fatness of some of 20
cattle here. In last October there were in one fitd 20 splendid oxen, weighing 160 stone ( 8 ibs ) eavi, not od of which had received hay or oilcake. Now, in selectwhich show an aptitude to fatten and have sufficient ago
to accumulate flesh quickly. This most successful grazier, in common with all those who are engaged in feeding cattle, is sadly puzzled to find oxen of a proper age to feed; for, while lots of flesty steers are to te lad everywhere, great good bullocks are not to be found, and the steers will not increase in weight and razing fields appear to be liked, it the land is really good and water plentiful. At Putlowes there is a yround of very excellent quality, containing 98 acres. The usual stock for such land is a-bulnock to an acre but sheep are generally kept in addition, to the extent of one fat sheep, or one couple (ewe and lamb), to each ox. The cattle which are not disposed of from Grass
are perhaps supplied with a little hay in the pastures are perhaps supplied with a little hay in the pastures before they are tied up. They are stalled for about
woo months, and fed on hay and oilcake. The quantity owo months, and fed on hay snd oilcake. The quantity calies or 18 lus. per day being a common allowance, and some instances have cccurred in which an ox has eaten 15 cakes per day. This is surely more than the stomach of any bullock can profitubly assimilate. Putlowes has long been extensively known for its Christmas beef. This year a stall of 40 very superior Herefords and shorthorns realised on an average more than \(40 l\). per head.
At Broughton House the stock has lately been confined exclusively to Devons. This farm lies about one mile south of Aylesbury, on the Tring road; and, as the Portland stone is clearly seen in the garden allotments hy the toll-gate, it must of necessity follow that this superior grazing land is on the gault clay. This confirms the remark that was made in describing the geology, that the fertility of the land did not depend so much on what clay it rested, as on the quality and depth of the top soil. There are two or three fields at Broughton House as good as any in the county; but there are some, where the deposit of mouid is not so deep, which are only of a second-rate description. The farm contains about 200 acres, 56 of which are mown There is no ploughed land, so the litter for the stalled cattle is purchased. There were last autumn 36 very fioe Devons, good fleshy animals, but not possessing the touch or farness of those at Putlowes. These cattle had each half a truss of hay and 6 Linseed cakes in the day. Journal of the Agricultural Society.

\section*{Miscellaneous.}

Fish Manure.-"The fish-either the refuse of the market or otherwise-is cut into pieces, and submitted market or otherwise-is cut into pieces, and submitted atmospheres) for about an hour in suitable vessels. It is by that time sufficiently cooked, and is then ready for the presses, which expel a great proportion of the water, and leave the residue in the form of a cake. This cake is, by means of a coarse rasp or grating machine, broken up into a sort of pulp, which is spread out in thin layers on canvass, and dried by means of warm currents of air. It is sold either in this state, or more minutely divided by means of the ordinary grinding processes. It is slated in this condition to correspond to 22 per cent. of the crude weight of the fish, and to contain from 10 to 12 per cent. of nitrogen, was 20 francs per 100 kilogrammes (about \(8 l\). per ton) and the demand regularly increasing." Professos Wilson on the Agriculture of the French Exhibition.

\section*{Calendar of Operations}

Farm near Hexhain, May 19 - - Since the date of our last report we have had, till Friday last, bitteriy cold east winde, which have cut up the Grass especially where stocked, and the corn has
also suffered very much. Sinca the 12th inst. We have had fine growing weather, and the crops have rapidly changed from heing withered and "blaed" to a fresh healthy green, and of Grass there is now a full bite. Previous to the 26 th ult. the weather was very dry, which greatly furthered the cleaning of fallows,
and we are now nearly ready to go right on with Turnip sowing as boon as weather will permit. Our first sown Mangel is just appearing above ground, and the remainder is well spronted. W have sown a few acres of Swedes which are also just lonking up, having been a week in the ground. Wheat on strong clay lands up, and Oats sown. Oats and Barley are generally looking well. At Stagshawbank Fair on the 9 th and 10 th insts., there was but an indifferent show of sheep and cattle; hoggs nearly sit for the butcher, and strong fresh grazing cattle were good to sell, but for of food. Horses were a shade cheaper, but really good dravity horses still bring large prices.

Notices to Correspondents.
E. We have not seen his cessay, and should be glad of a copy. The Oxford Farmers'
Cirb have just awarded a prize to bim for it. The subject is most seasonabie - the cultivation of roots. \section*{J. Tylor \& Sow's Manufactory, Warwick Lane, Newgate
Street, Londun.}

IT TYLOR and SuN'S IVEGISTERED GARDEN - SYRINGF,-Small sizo, for Amateru' use, 21s. each Extra for Telese Tube assa en
plapts on stands at a height of 8 feet 80 plants on stands at a height of 8 feet so that any quantity of
water can be deposited in the pot without wetting the leapes, 108 . By a simple arrangement this Syringe is rendered more effective than any portable Conservat ry or Grardels Pump ever offered to the pablic. It is equally adapted fol Garden of Conservatory use, and is capahle of discharging twice as much
water in a given time as any nther syringe nuw in use. The arrangement contisists in atraching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at erery discharge of the previons contents. By this means the
Syringe is always charged, and the pull-up strok of the piston Syringe is alwass charged, and the pull-up stroke of the piston
rendered purfectiv pasy, it having, indeed, no wock to do, the rendered purfectly pasy, it having, iniped, no work
barrel being previously full of water. Being thas made selfsupplying, a great saving of labour is effected ; and the necessity
of stopping to fill the syringe at every discharge being donie away wi'h, the dirpction of the water can be maintained for any
leny hi nf time. It is perfectly claanly in in its action, as it is not in a well-known monconimer attondant on the une of every "ther Syringe Itscmin strintion is pertectly simple, and rannot teit
out of order; the ground in ball valves and fittings used for flling all other patest Syringes being entirely superseded. To be had J. Trios \& Sons, Mannfacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, Laridon.
N.B. These prices do not include carriage, package, or expense

\title{
NTEW AND BEAUTITUL PLANTS. MESSRS. V E I T C H A N D S O N,
}

\section*{EXOTIC NURSERIES, EXETER AND CHELSEA,}

AVE much pleasure in now offering for sale, for the first time, the following novelties, of their own recent introduction, and in the selection of which they have been guided solely by the determination of submitting only such plants as are of general usefulness and sterling merit.

\section*{PLANTS WILL BE READY FOR DELIVERY ON AND AFTER THE 26th of MAY}

\section*{ESCHYNANTHUS FULGENS.}

A rery fine species, of a rich or Fratge scarlet, shaded with Sellow. Collected 2t Moulmein by Mr. Thomas Lnbb, and
 freere, and fuw plants can exceepd it in benut,"," It was exhibited
fre the Horticulural Soceey' Rooms,
at, Regent street, in November, 1855, and deenied worthy of

CEANOTHUS FLORIBUNDUS
Perhaps the finest species of Ceanothus yet introduced; raised from seeds sent horue by Mr. Willinm Lohh, and has proved to
be perfectly hardy. It was Gigured by Sir Willian llooker in be perfectly bardy. It was figured by Sir Williann Hooker in
Curtit's "Botanical Magazine" for September, 1854, and described as being "certuinly the micst beautiful of the several
blue-flowered kinds yet known to us. The leaves are copious, compact, and glossy: and the flowers, though really growing in
corymbs, are so dense as to be perfecty globose, and these heads, corymbs, are so dense as to be perfectly globose, and these heads,
crow ded at the extremity ot numierous short brancles, and of the June." mazarine extra sized phants, ale ench; smaller aize ditto, 10 s . 8 d d ench.

CLEMATIS GLANDULOSA.
This is a fine stove climber of free growth, and an abundant hlomer. Sent home from Mount salake, in Java, by Mr. Thouas
Lobb. The etals are dark purple or nearly black, with pure White anthera. The two distinct colours produce a fine contrast. Strong plants 10 s , \(6 d\), each.

CUPRESSUS M'NABIANA.
We have succeeded in rasing plants of this beantiful Conifer from seeds gathered by Mr. W. Lobb, who found it on the Sierra Nevada of North Calitornia, where it frmm a bushi from elght
ten feet high. Dr. Litudler, in describing it as a new plant in the Gurdeners' Chronicle, June 23,1855 , said, "The specimens gathered by Mr. W. Lobb, and from which Messrs, Veitch have raised young plants, presented a most striking appearance, with their green and glaucous scales associated with the deep rich
brown of Tamarix gallica on their branches, and sho that in brown of Tamarix gallica on their branches, and show that in
youth and vigour the species nust be exceedingly bardsome. A few extra sized plants, 21s. each. One jear seedlings, 10s. \(6 d\). each.

> DELPHINUM CARDINALE.

A new aud rare introduction, of remarkable beauty, possessing 2 colonr hitherto nnknown in the genus, to which it belongs. It Was fenred in the "Botanical Magazine for december, 1855, and
described br Sir \(W \mathrm{~m}\). J. Honkre in the following terms: "We have now the pleasure of making known a species of Delphinium equalling, if not surpassiny, any orther in size and bymmetry of
the plant, and excelliug in the brilliancy of colour of the flower, of the many novelties selected by Mr. William Lobb, in California, and introduced to our gardens by Messis. Veitch and
Sout of the Exeter and Chelsea Exntic Nurseries. Treated as a hardy perennial it cannot fail to be a preat favonrite with all
overs of hand some flowers." Strons plants, 10 s . 6d. each. CODECATHEON INTEGRIFOLIUM. A new and beautiful species from California, perfectly distinet
from D. media, and being hardy and lree blooming it is an important addition to ours spring flowering plants. Established \(p^{\text {lants, 5s. each }}\)

FUCHSIA MALAKHOFF.
A large and very thawy double variety, raised at our Nursery Broad crimison sepals, and purple corcolia. Pronounced by the howy of the double varieties." It is of exellent tabit, and

FUCHSIA PENDULINA.
A very distinct and beantifml hybrid raised between \(F\). serra tifolia and a pendulus Peruvian species, producing even on small plants fine corymibs of delicate carnine flowers 3 inches
in length, and vers glossy, deep pink curtolla, foliage ornammental and altogether it may be considest one of the most elegant of
its tribe. It rrceived a Certificate of Merit at the National JUNIPERUS PYRIFORMIS.
A very distinct and fine species, net with by Mr. W. Lobb on the mountains of St. Bnr nardine, in Californin, where it forms a very like small Pears, when young, and the bervies are deep purple with a glaveous bloom, and it is perfectly hardy. Price

LEPTODACTYLON CALIFORNICUM A lovely plant for the preenliouse or conservatory. It is from
South California, and forms an exceedingly pretty low shrub Sourkable for the slender secments of to coninv toliage, and for the great beauty of iss Phlox-like flowers, which are produced from May to August in very great profusion, completely covering the
plant. Colour of flowers rosy pink, most delicately shaded. It plant. Colour of flowers rosy pink most delicately shaded. at Chiswick on the 20 th June, 1855 , ard at the Royal Botanic both occasions was awardeed a Large silver Medal as a new plant of berling men it and grat beauty. It was very accurately fgured
in the "Florist" for (ctoler, 1855. This is unquestionably one of the finest and best plants Mersri. V. and Son have ever had the pleasure of nifiring to the public. Plants of two sizesOUVIRANERA FENESTRALIS.
It affords us much gratification to he the medium of offering or sale plants of this singularly beautifnl aquatic, which, untila a
very rectat reriod, was known in this country only by dried specimens and drawings. It is a native of Madagascar, from Whence a constderable number of living plants were brought home last tyar by the Rev. Mr. Ellis, and transferred by that gentenan bys exclusively. with ane (xeeptinn of specimens Chiswick, nnd others retained only ffrr his own private conlection. It would be difficult by mere verbal description to convey an
adequate idea of this interesting plant, which has been derigadequate idea of this interesting plant, which has been derignegetable productions." It consists solely of beantiful " net work" or tkeleton leaves, the anpearance of which fully justify the ppoular name of "Lattice Plant" which has been applied to it. We have found it thrive surcessfully cultivated in plass or
earthen ware pans in water at a temperature from \(70^{\circ}\) to \(80^{\circ}\); the earthenware pans in water at a temperature from \(70^{\circ}\) to \(80^{\circ}\); the
skeleton leaves float kracefully just leneath the surface of the water, and the effect produced by a large plant, with leaves of rarious sizes and shades of green, is very striking. We invite ail lovers of plants to an in.pret
tiful novelty.--Price 105 s . each.

RIBES SUBVESTITUM.
A very pretty flowering hardy shrub, sent from Califoroia hy Mr. W. Lobb, and belonging to the same section as our R. speciosum. The flowerr, however, are considerably yarger than thone
of that species, and of a deep crimsou colour. Strung plants. 78. 6d. each.

RHODODENDRON MOULMEINENSE.
A white species from Monlmein, where it was discevvered hiv Mr. Thomas Lohb, on the Gerai mountains, at an elevation nt 5000 feet above the level of the bea. It is figured by Sir Willian is quile distinct from all other Rhododendrons in flower, folisge. is quite distinct from all ther
and liabit. Price 10 o. \(6 d\). each.

RHODODENDRON PRINCESS ROYAL.
Our plants of this lovely hybrid greeenhouse Rlododendron are not Jet ready in numbers equal to the very large debiand towl
t, but we shall duly advertise the same when it will be sent curt and orders taken in the interval will be exeented in the metation received. It was exhibited at Chiswick June 20,1855, an Chroxicle, the same weel in the following ternis:
"To turn to the real novelties there, it is impossibip not t? direct attention. in the first instance, to the vely curivals anis
ingularlit beautiful Princess Roral Rhododendron exlibited singularily beautiful Princess Royal Rhododendron exhibited in Messis. Veitch. This striking novelty was obtuined fram the
white R. jasminiforum by the palest variety of 1 l javanicum, White R. jasminifloum by the palest rits orents, but its fowers were a clear pure rose colour." At this exhibition it was awarded a Large Silver Medal.
When ready, the plants will be of two sizes.
The large size....................
The smaller size...........

42 s . each

\section*{TECOMA FULVA.}

A beautiful Bignonisceous plant with tubular flowers of brifl: vellow shaded with crimson, figured in the "Botanical M Mgazine. February, 1856, and described by Sur William Hooker, win sayg, "There cannot be a question but that the handsome playly
here figured is the Bignonia fulva of Cavanilles, till recently apparently only known to that author and to Luvis Nee, who is reported to have gathered it. Our flowering specimens wetin
reared by Messrs. Veitch, of the Exeter and Chelea Nurserief. reared by Messrs. Veitch, of the Exeter and Chelsea Nurseries.
and sent by them in November, 1855 ." Strong plants, 103 . 6 deacli. and sent by them in November

MESSRS. VEITCH AND SON also offer the following choice selection of Plants, the majority of which are comparatively new, and all are of intrinsic excellence:-
aralia papyrifera; ob Rice Paper Plant, In addition to the fine foliage of this beautiful Stove Plant, it possesses peculiar interest trom the circumstance of its pith beautfful Rice Paper. Plants in two sizes, 21s, and 42 s. each. desfontania spinosa
This fine evergreen shrub, originally sent us by Mr. William Lobb, from Patarginia, where he discovered it in the region of
snow, has proved, as we expected it would do, perfectly hardy in smow, has proveid, as we expected it would do, perfectly hardy in
this countro. Its elossy IInlyy-like folis, this country. Its gless Holly-like foliage and rich scarlet
tubular foriers, tipped with yellow, Tender it a very decirable acquisitinn. Extra-sized plants, 30
each; smaller plants, 10 s . 6 d each.

HEDAROMA TULIPIFERUM
Yonng plants of the hest variety of this Erst-class Greenhouse
LAPAGERIA ROSEA
Confessedly the finest conservat ry climber yet known, the nearly 3 inches in lenp,t and 2 in di ameter; of partichite inside, substance, and consequiently the flowers remain a considerable time in perfection. Plants, \(10 s\) s. \(6 d\). and \(21 s\). each.

\section*{LiLium giganteum.}

This noble Lily having been geverally exhibited, is too well This noble Livh having been geverally exhibited, is too wall from 2ts. to \&4s. each, accurding to streng:h 0 bulb. Small seedlings, oेs, each.

\section*{LOMATIA FERRUGINEA.}

This fine everyrpen shrub was found in Chiloe and Pata-
 Gne leaved constrvatory plant it is perlaps without a rival.
Plants, 10 g .6 d and 21 s . each.

NEPENTHES RAFFLESIANA.
Having been siccesstul in rassing seeds of this fine Neforming an abundance of pitchers. 21s. each.
pinus benthamiana (Trie).
Having raised seedlings of this beautiful Pine (which is doubtless the finest of the long-leaved Californian kinds, and which
has proved to be perfectly lardy), we are now enabled to cfier established plants in pots as follows :-Single plants, 10s.6d.; 6 plants, 50 s.; 12 plants, \(84 s\).

PHILESIA BUXIFOLIA.
A beautifuldwarf evergreen hardy shrub, with mall dark folinge, discorered by Mr. W. Mifam Lobb on the Andes of Patagonis
bejond the snow line, producing freely its beautiful large belt shaped defp rose-colcured flowers, the petals of which are of great substance. Piants, 7s. \(6 d ., 10\) s. 6d., and 21 s .

\section*{PODOCARPUS NUBIGENA}

A perfectly hardy and fine Taxacer us plant, sent from Pata-
gonia by Mr. W. Lobb. Ebtablished plants. 21s, each gonia by Mr. WTEPIS ASPERICAU. 21 s , each. PTERIS ASPERICAULIS.
A stove Fern from the Fast Indies, rery distinct and of great
beauty. Strong plants, \(21 s\), smaller ditto, 15 s.

\section*{RHODODENDRON CALIFORNICUM.}

A distirict species. sent from California by Mr. W. Lobb, having survived the past two winters in the open border, without any protection whatever. The foligep is gend, and it is an abundant and late bloomer. and will dinhtless be
bybridisers. Giood plants, is. 6 cle ench.

RHODODENDRON JFSMINIFLORUM Few pants have excited so nuich arimiration as this lovely exhibited by us so fiten that any further description is unneces-
sary. Plants, \(10 \times\). \(d\). to \(21:\) each.

RONDELETIA ANOMALA.
A beautiful hothnuse shrub, raised from sevis sent to thr Hortienlural Society by ins generous and iroerainating il
spondent G. E. Skinner, Esq. The Plant has soniething appearance of a Bouvardia ; the flowers are of a rich vermine of that and flnwering in November, it must be regarded as been abletit most to Our gardens, Plants, 5s, to 7s 6d ench.
add to our gardens.
SONERILA MARGARITACEA
Perhaps the most claste of all variegated plants. prodacin. with dark glossy green leaves, dotted all over nith silvery whit spots, a profusion of beautiful crimson flowtrs with yen
stamens. it it \& dwarf compact plant, of particularly nas greenhouse. Good plants, \(5 s\) s. and \(7 s .6 d\).
tecoma velutina.
Found by Mr , Skinner in G uratemala growing in a temperathro
 the Horticultural sciety, and described by
plant of uncemnion teanity. Established plants, \(7 s .6 d\). and 10 s s.

\section*{TORREYA MYRISTICA}

This is a splena hardy Taxaceous plant, ent from (nalifornin by Mr. W. Lobb. It is from the Sierra Nevada, ata migh terne sich tion, and attains the heipht of from 100 to 150 reet.
of this plant is very linited. Strong seedlins plants, 63 , eacl. WELLINGTONIA aIGANTEA.

WELLINGTONIA aIGANTEA. advertisements ir circulars, it 13 only pecessary niw say thys it is a Coniferous tree of inmense dimensions and great of the first raised, extrats sized plants mind perfectiy hards. A tew of the
42 s . Smaller plants, 15s. and \(21 s\).

All Wellingtonias sent out by us are Seedlings.

A general Retail Catalogue of Plants, now in course of pablication, will be ready shortly, and may be had on application.

MRETINES TOE TRE BNBUING WEEE
}

The world is sssured by men of "much experience that the Stbawberry Grow er must take care how he forces that fruit. "Strawberry plants intended for forcing should be two years old."-"Pot runners in August, pinch off all the flowers the next year, and force them in the second." "Never use any but stools of two years' standing."-"Strong plants may be taken ont of the ground and forced immediately. -"Root your early runners in small pots; after-
wards carefully shift them into larger." Such are the stereotyped directions of Practical gardeners. enough. "Twenty-fours (8-inch) are what you should have; but for small sorts yon may make shift with thirty-twos ( 6 - inch)."- "Nine or 10 -inch pots are indispensable."-"Take care that the pots are sufficiently large to hold three plants, for fear that one or two shoald go off."-"For small sorts \(4 \frac{1}{2}\)-inch pots will do ; but for others they must be 5 inches or even \(6 \frac{1}{2}\) inches in diameter. Strawberry if it is to be forced successfuily. Neglect these precautions, and the blindness of some plants or the flowerless condition of others is explained.

Can it be really true that so mach fuss is necesary in so very small a matter as getting a few Strawberries ripe in May? Will nothing less than two years' coddling, and pots as big as a hat crown furnish this fruit a few weeks before its natura season? And are gardeners excusable for losing their crop because they have not been two years in heir place, or becanse the
In the Garden of the Horticultaral Society, in the year 1855, Mr. Gordon caused runners to be taken np from the ordinary plants in the open borders in the first we k in August, and potted in \(2 \frac{1}{2}\)-inch pots (small 6ils); the soil used was a mixture of quarters loam). When potted they were placed in a close frame until established, and when the roots had filled the little pots, which was in about four or five weeks, the plants were shifted in the same kind of soil as before into 4 -inch fruiting pots (48s). They were afterwards transferred to a fully exposed situation in the open air, where they remained until the first week in December, at which time they were removed to a border in an unheated orchard-house, where they were kept rather dry daring winter. On the 14th of March the pots were removed to the front shelf in a Curvilinear Vinery, kept at a temperature of \(40^{\circ}\) until the middle of April, when the temperature was raised to \(55^{\circ}\). The plants were watered twice when the fruit was fairly get at an interval of three days, with a weak liquid manure, made with half-rotted cow-dung and water, allowed to stand a few days before using.

And what was the result of this simple common sense operation, unassisted by two years preparation, big pots, and other etceteras of practical Strawberry growing? The result was a large, abundant crop of excellent fruit, much of which was the quality was as good as possible in good varieties : as for indifferent sorts, their bad quality was exactly what it always is-neither better nor worse.
Specimens of this mode of cultivation, just beginning to ripen, were shown in Regent Street on the 27 th of May. The average number of perfect follows:-Keens' Seedling 26, Myatt's Eliza 24, Hericart de Thury 29, Princess Alice Maude 33, Cule's Prolific 37, Ingram's Prince of Wales 45, Hooper's Seedling 45, Roval Pine 49, Reine Hortense 56, Cuthill's Black Prince 79.
Thus it appears that it is possible in Strawberry furcing to save half the time, half the quantity of earth and manure, half the space occupied in the forcing house, and mach of the cost of pots and abour, without in any way diminishing the quantity quality of the fruit.
The Strauberry is not the only garden crop to which this principle is more or less applicable. Blind routine may be beaten in more ways than one.

Our attention has lately been called to some young Queen Pines, which, in company with several others in the same house, are affected with some disea-e which partially chlorotizes the leaves while the fruit is contracted in the centre, and either entirely abortive or greatly deformed. In one specimen in which every flower has failed a whorl of leaf-buds is produced beneath the crown, and where the flowers have not so completely failed, the dead floral organs have carried a slight degree of d-cay into the core, exactly as the frozen pistils of a Pear do into fruit, when the petals have not been so affected as to prevent their expansion There is indeed a slight tendency to decay also where the flowers proved entirely abortive. From the contracied portion, moreover, little globules of gum ooze out exactly like those which are so com mon in the Cucumber disease. The plants had been syringed with water of a lower temperature than the house; they were, moreover, raised from suckers o plants which fruited in the same way two years ago, both of them circumstances likely enough to have
produced disease now. We should, however, have
been content simply to answer the communication in our notices to correspondents, were it not that the condition of the plants seems to suggest some comparison with the symptoms 80 notorious in the Cucuniber disease. Pines, indeed, are radficulty in understanding how a disease once generated may be handed down

Our notion with respect to the Pines is that they had originally been treated with highly azotised mannre, that they had then received some sudden check, which had induced such an organic change that the cells no longer produced healthy chlorophyll, and that the proper fanctions could not in consequence be carried on. To attempt to propasate from some plants is as sure a source of fature mischief as to graft from a cankered tree, and any error in cultivation would be certain to aggravate he evil. In the Cucumber, propagation is carried n by seed only. Our theory is just the same in his case. We believe that the evil has risen, in the first instance, from unfavourable causes acting on highly manured plants, seriously affecting their constitution; and as strumous parents almost inevitably produce a strumous race, the seed of such plants is capable of handing down the disease It is very easy to ascribe such evil to atmospheric influences, bad cultivation, or any other cause, which cannot admit of proof; but the fact is that the Cucumber disease appears under every kind of cultivation, and in every variety of atmosphere. It is by no means confined ogardens where the cultivation is high, or wher highly azotised manure is used. It was prevalent last year in plants grown in the open air upon the naked soil, where Cucumbers have been successfully grown for many generations, and in one parish where guano has never been used by marke gardeners. We saw it in the West of England extremely virulent on Cucumbers in the open air again under the most ordinary cultivation. Ever person with whom we have had communication complains more or less about it, and it is equall virulent in the present season. We remarke in Covent Garden, a few weeks since, that in Cucumge estabishmer number for the seaso which hat the most unequivocal mark of the disease. It the whole of the seed from the same fruit does not produce diseased plants, but this again is just what happens wit children of strumous parents ; all are not equally affected; and though disease may not break out in the first peneration it often returns in the second or third. Supposing, then, the evil to have become very general from the injudicious use of forcing manures, does it follow that nothing can be done to check it? In some cases certainly the attempt is hopeless. The plants occasionally betray the evil almost as soon as they have germinated, and sometimes perish before they have flowered; but where the disease is not so inveterate a great deal will depend on cultivation. Where it has prevailed very much we have generally found either that the much we have generally found either that the that above, in consequence of which the leaves have been gorged with moisture, which they could not get rid of by the ordinary means, a condition extremely likely to produce or aggravate such symptom; or the bottom-heat has been insufficient, and in consequence there has been an insufficient supply. In either case, especially in the first, we have remarked disease very active. When the disease has been once set up, the fatal effects are so much the more speedy if the sun is allowed to burn the leaves.

The mixture of dark green and pale yellow on the froit, a circumstance again which was remarkable in the Pine Apples, the oozing of gummy matter, the tendency to decay, and the distortion of the fruit accompanied often by a failure of the crown, are symptoms which ought not to be mistaken. Bat every failure of a crop is not to be aitributed to a disease which has imputation enough of evil already. If plants are burnt or starved or suffocated or mildewed, the blame ought to rest upon the cultivator, though with all his precautions and with the most consummate skill the disease will sometimes baffle his exertions. M.J.B.

antherâ suberosâ subangulari valvis anticis corneis rostratis
It is in the rich collection of the Lord Bishop of
Winchester that this fine plant has at last flowered.
with others from M. Warczewitz, and thence trans. ferred to the care of Mr. Lawrence, at Farnham Castle, who exhibited the specimen before us at the late exhibi? tion of the Royal Botanic Socie \(y\) in the Regent's Park The judges there, not seeming to know anything about the species, gave it a small silver medal, although it is certainly the best novelty of the present Beason, in either Botanical or Horticultural point of view.
The flowers are thick, waxy, deliciously fragrant, and produced in pendulous racemes of 8 or 10 each. When closed they measure \(1 \ddagger\) inch in diameter ; externally they are dull brownish purple; in the inside closely speckled with rich crimson ; while the lip, which presses close against the column, is blood red except at the base, where it is spotted like a bird's egg. The sepals are united half-way, but readily tear asunder; the dorsal no much more than half as wide as the laterals, longer, and standing a little apart. The la'erals are almost circular but apiculate and unequal sided. The petals are about half as long as the dorsal sepal, oblong, with a pal callosity at the tip. The lip is smaller than the sepals and much concealed by them, and has no tendency to and \(u\) arm in mas tomenc
 her (hes) falling down over the ears Ion aps (lacral a nive abe perfectly destitute of all superficial processes.
Mr. Reichenbach, jun., who examined a wild specinen in the Imperial Herbarium of Vienna, ascertained it to be the Anguloa squalida, marvellously mis-represented in Endlicher and Pöppig's work above qued, and regarded it as a new genus to which he gave the name of Lycomormium ; to this he was principaly led by discovering on the anther "a fleshy acute long double tooth." It appears, however, that this process represents in reality the two anterior valves of the anther in the form of a pair of sharp horny lobes. This is, doubtless, a striking character, and would waturally attract the attention of our acute friend, especially when coupled with the texture of the anther self wich resembles a thick piece of cork. The ther, Peristeria, that we can hardly attach much importance

\section*{o this structure}

Why this species should have been named "squalid" we are unable to guess, for it might as well have been called scarlet; we, therefore, prefor the name of fuscaule, under which the plant has existed in our gardens for the last three years.

\section*{76. Vrikgia glutinosa}
. foliis oblongis apicnlatis iuermibus virentibus basi purpuren-aanguineo-maculatis, ramis foliis elatiore vagiris acuminatis pedalibus), bracteis (coccineis) distichis arctè imbricatis.
This very noble Bromeliad was exhibited at the last meeting of the Horticultural Society from the Hon. James F. Stuart Wortley. It had been presented to the late Lord Wharncliffe when in the West Indies three years ago. Its native place was the Caraceas Waterfal the rrinidad. It is certainly a Vriesia, with which the whule structure of the flower, as well as the remariable habit, corresponds. We have only geen flowers satisfactorily, but as they have a nearly superior ovary, ang and a dimidiate scales at the base of sopal about the genus. The of the petals, 18 oub nearly 4 feet from the base to the tip of the branches nearly 4 feet from the base then with pale closely covered up to the branches with pale gree enncave scales deeply stained with blood 14 to 18 inches The branches of the flower stem are from 14 to 18 inches long, eovered closely with giatinous bracts, the colour of a boiled lobster, but much brighter because of the natural varmish which is spread over them. There scarcely a stove plant, certainly none of the same with a more noble aspect than this.

VEGETABLE PATHOLOGY.-No. CXXIV.
192. Parasite (Parasites).-Scarcely any part of the organised world is free from the attacks of parasites, provision which is clearly one amongst many ordered by the Creator to maintain that balance amongst living beings, without which a few of the strongest only coun preserve their station upon earth. These parasites ma be either animal or vegetable, and each of these two grand classes may be subject to the ravages of being belonging either to its own or to the other organic order The whale has different Cirripedes burrowing into is flesh, the \(n x\) and other ruminants have the lay various oestri occupying the intestines, skin, or fromi sinus. Insects have hosts of larve living at that expense and ultimately exhausting their energies, the same may be said of multitudes of higher animala whose muscles, glands, arteries, and even the brain itself are at inser in like manner, while all har animals of various kinds and affinities living on the surface, or occupying, to a greater or less extent, high digestive cavities. But no less are these ancluding even as they may be in the scale of creation, including man himself, subject to the attacks of staneous Minute moulds infest their tissues, producing espiration disorders or blocking up the passages of resply into while in inferior animals they peoetrate deple their substance, and ultimately convert tho who on which they prey into a fungoid mass. Nor a life spent in waters, where fungi in general will not fiourish, exempt; even there a eure tribe of plants of doubtful affinity, oscilatang as it whe the

\section*{animals on which they grow. \\ 4)3. If we turn to the vegetable world something of} the same kind arrests our attention. There are, first, a number of plants which, though at first growing at their own expense, soon take possession of others throwing out wart-like bodies or spongelets from their stems which suck out the sap from their victim, which is at once appropriated to their own uses. No sooner does this take place than the connection with the earth is entirely dissolved by the decay of the root. Other cases occur of plants called false parasites, as Ivy, Woodbine, Clematis, \&c., which resemble these exter nally, but in which no nutriment is derived from the infested plant, which merely affords a proper support detsining sufficient vegetable matter about its trunk for the purposes of growth, where such matter is requisite. Sometimes, however, the supplies of natritious matte are derived from the air or from the moisture which it contains, in which case the trunk simply serves as fondation on which the roots may run either to keep the false parasite in its place, or at the same time to act as purveyors of nutriment. In other cases the seeds of the parasite germinate on the matrix, their radicle penetrates through the bark till it reaches the albumen, and is thus able to profit by the elaborated juice. Such parasites may either be clothed with leaves, or furmished only with colourless seales.
494. These cases are, however, harmless in com-
parison with those in which the parasite parison with those in which the parasite makes its first growth entirely within the substance of the plant, and only makes its appearance externally after it has become deeply incorporated with its tissues. The more or less complete destruction at least of the part on which such parasites are developed is always consequent on their presence, and some of the most important diseases of regetables depend upon their growth. These belong almost entirely to fungi, which are capable of growing on plants which were in perfect health previous to being attacked. This fact has frequently been denied, but there is not the slightest foundation for the notion that fungi cannot grow on healthy tissues. The presence of the spores may indeed at once produce disease, in consequence of which the fungi when developed may flourists the more vigorously; but if so, the disease is still produced in the first instance by the spores.
495. A mongst fungi there are false parasites as well as amongst Phænogams. It is not every fungus which grows apon a plant which is really parasitic. Where parts are already in a state of decomposition fungi may grow as upon any other putrescent matter, and the neighbouring tissues may decay the sooner in conse quence of the presence of the fungi. Such cases are constantly occurring in timber, which it is well known soon runs to decay if fungi are once allowed to establish themselves on an unsound part. Other false parasites also infest the leaves and truuks of trees, as Mosses, Lichens, \&c., which derive no nutriment from the natrix ; and doubtless when these are very abundan they may be injurious by exclusion of light or air, or he harbouring of noxious insects
496. As animals have their vegetable parasites, so in urn vegetables are infested by animals. The eggs of insects, for instance, are deposited in the young tissues, the growth of which is diverted from its normal course and multitudes of excrescences of various forms are generated, which are known under the common name of galls. These are seldom injurious, except where hey attack the reproductive organs. Other insects, as Vibrios, live within the tissues themselves, and as parasites are more destructive. Others again are attached to the tender bark under the form of scales, not only exhausting the sap, but dispersing their numerous progeny all over the plant, at the same time inducing the growth of soot-like fungi till the functions dependent on light and seration are at length fatally mpeded, while myriads of minute insects belonging to the genus Aphis, almost equally inseparable with the scale insects from the mother plant and even more pro-
liferous, suck up the juices from the leaves just as they liferous, suck up the juices from the leaves just as they formation of wood and the storing up of nutriment for future use in perennial plants, or for the carrying on of the less enduring functions of those to which a shorter existence is allotted. \(M . J . B\).

NEW GARDEN FERNS.-No. XII.
23. Grjuitis aurita, T. M. Gyniogramua avrita, Hooker, Icon. Plant, t. 974
ronds ovate oblong or bromdy-lanceolate, acuminate pinnatopinnatitid; pinnere remote, sessile, opposite, broad at the base, ovate, the basal pair twice as loung as the rest, crenato-lobate; veins simple or forked, the suterior venule bearing a short
oblong sorus; stiper elongated, glosay brown, lateral, adherent to a creeping rhizome.
An ornamental deciduous hothouse Fern, native of Khasiya and Assam. It has a slender creeping rhizome about the size of a goose quill, to which the lateral fronds are adherent. They grow 2 to 3 feet high, and have a long brown glossy stipes, the brown colour being also continued up the rachis and forming a contrast with the light green of the frond. The pinne are remote, 4 or 5 inches long, and have a peculiar appearance, from their spreading position and the enlarged size of the basga pair of segments ; these are deeply lobed or pinnatifid with roundish oblong lobes, the rest being slightly but usually more or less crenato-lobate; the margin is hairy. The sori are short oblong, forming two lines borne by the anterior branch only of the forked veins,
veins is fertile also, and the two sori then lie close together side by side, but they are never, we believe, forked. The veins are sometimes simple

and they "always extend quite to the margin. Si W. Hooker describes the rachis as slightly hairy the hairs are probably very easily detached, as we do not find them on our specimens. The texture of the plant is membranaceous, becoming rigidly so when dry The plant has a very distinct appearance, and has been cultivated for several years by Mr. Henderson, of Went worth. Equally with the Grammitis Hewardii, this plant appears to us to belong to the genus Grammitis its naked sori being always short, simple, ublong masse of spore-cases, not having any tendency to become forked, and therefore having none of the slight character of Gymnogramma. Its creeping rhizome is a feature variance with both these genera; but we do not think such differences afford sufficient ground for separation In allusion to this habit, the plant had been named Gymnogramma repens in a paper on cultivated Ferns not yet published, of which the earlier portion wa his "Icones Plantarum," has figured a bipinnate variety his \({ }^{68}\) Icones Plantar
of this Fern. T. \(M\).

WARDIAN CASE AND AQUARIUM COMBINED.
Not being aware that a fresh-water aquarium has before been connected with a Wardian case, I beg to the two, which I have had in operation for some time.
 propose to introduce to the notice of cultivators a double cylinder made of the same material as garden por or bey ore, and or 80 as to leave a cavity between the two of not less than a quarter of an inch. The tubes should be closed together at one end; the outer one I would have pretty freely pierced with small holes, large enough to admit the roots of the Melons, perhaps \(\frac{1}{4}\) of an inch diameter. What I propose is to place a certain number of these tubes upright, of course on the surface of the stratum, be that what it may, on which the soil is placed (they should be long enough to reach quite through the body of soil) in the pit frame, or whatever structure is employed for the growth of these plants ; I would allow 8 of these tubes to a plant or light, the first 4 being made to stand at right angles, and at the distance of 15 inches from the plants each way, the others at regular distances towards the front and back. The object in having a double tube is the having, as it were, three surfaces for the roots to ramble round; they would spread over the outer tubes and then introduce thempres into the interior surfaces through the small holes, and for their encouragement the inmer tubes during the growing season should be kept filled with liquid manure, which by absorption through the sides would feed the roots collected in abundane round the three surfaces, as well as greatly benefit the plants generally by the
ammoniacai vapours rising up amongst them. W. \(\boldsymbol{H}\)., Belper, May 31 .
New mode of Bread Making (see p. 373). -Living in the country, and out of the way of yeast dealers, the raising of bread with "carbonic acid gas" has quite delighted me; but Mr. MCormac gives no very precise directions. How is the gas to be got, and how is it to be sept? Any particulars would greatly obinge. J. C. Northumberland.-I have been much gratified at Noring Dr. M'Cormac's account of the "New mode of Bakiny" I have been in the practice of using bread Baking. I What-mesl, and raised by effer vescence, for some time past, and I am bappy to give my teatimony as to its efficacy in promoting easy digestion and complete nutrition. It is also more agreeable to the palate than the bread commonly used It is to be regretted that this plan of baking is no brought into general use; it would be an incalculable boon to the community. J. Burns, Hampten Court.
Fumigation-A notice in your paper (see p. 358)

The apparatus consists of four parts made of fin lass, with a little cobalt to give it a tinge of blue. Con
which contains the water in which are the the tank plants, fishes, mollusks, and insects is about 12 iuches in diameter, and about 9 inches deep; near the top in the inside is a flange with a groove, into which rums the condensed water from the bell-glass, which forms the Wardian case for the Ferns, Lycopods, \&ce. from his groove it descends to the tank below. Tino the centre of this vessel I put the glass pedestal. I then
cover the bottom with aboat \(2 \frac{1}{6}\) inches of fresh, but not very rich, soil, in which I plant my aquatics: I use for this purpose Valisneria spiralis, A ponogeton distachyon, Nymphrea odorata minor, and N. macrantha. On the soil I put 1 inch of well washed flints, or sea gravel, which prevents the insects or mollusks from making the water foul. I then introduce the water through a fine rose to about 4 or 5 inches deep, into which I put gold fish (small) or sticklebacks, or acy other small fish, mollusks, Succines putris, Planorbis cornens, carinatus and marginalis, Cyclas rivicola and cornes; icus, Gyrinus, and several ymbetes, Hygrotes, Hada must be taken and several other aquatic Lenera, care ivorous larve 1 then prepare for introducing the ivorsus lare. 1 then prepare for in lucing the into a blue glass dish, with a rim at the bottom to keep it steady on the pedestal ; this dish is \(1 \frac{1}{3}\) inch deep by 7 in diameter, the soil is raised in the centre about 2 inches ; in this I plant the tallest Ferns or Lycopods, and the smaller round the edge of the dish. The Ferns I plant are Adiantum Capillus Veneris,
Lastrea dilatata Schofieldi, a beautiful small Yorlhire variety; Asplenium viride and trichomanes; Asplenium fontanum, \&c.; Kycopods Willdenovi, umbrosum, stoloniferum, mutabile, densum, and lepidophyllum. When planted I cover the soil in imitation of rockwork with agates and pebbles of any sort. I then give the whole a good watering before placing the dish bell-glass One before mele then the present time has been standing in a window eight months, the water has never been changed, or any addition made except a small quantity once given to the Ferns, \&c, in the dish. Should the water become green in the summer a small piece of gutta-percha pipe, with a small rose at the end, will draw off the water, which may be replace. The bell-glass may likewise be removed with benefit to the Blants, and a sprinkling

\section*{Home Correspondence.}

How to Encourage Melon Plants to make Roots.The advantage of covering the surface of the soil in Melon pits with boulder or other stones, pieces of tiles, slates, \&cc, in order to attract the roots of the plant to the surface is well known, and in practice the plan is pretty generally acted upon. If you plunge a pot in the soil of a Melon bed for some days, on taking it out the hole left in the soil will be found lined with a network of beautiful white roots. Aeting on this idea pots are made of, and as porous as possible, the outer

bout a method of fumigating conservatories, reminds me that I have long intended asking you a question on the subject; not however respecting the operation, or the apparatus that may be recommended. With these bellows to the patent hurdy gurdy contrivances, so full of sound and fury, signifying nothing, and I may just slip in (by way of parenthesis) that a fine wire sieve is the simplest and what I really want to know is whethe
it is a house full of smoke or the deleterious matter driven off in burning a given quantity of tobsceo that destroy insect life, and whether that matier would not be equally if not more destructive, driven off by perfect than inheren Combustion. I am inclined to believe it would be more deadly, becanse my senses tell me that a miff caught when the materials burst into flame is intensely pungent comared with that produced from the smoulder we take snel ains to preserve. I need not say that an answer that would settle this satisfactorily is of some importance, a if it really depends upon the quantity of tobaceo enn sumed, not upon the masses of its consumption, the fumi gation process would be wonderfully shortened and implified. It wonld be mere muonshine to speak about any danger to plants from doing the thing in a comfort ab:e blaze, notwithstanding the strong recommenda tions that puff eool smoke. J. M. [We have no doubt some experienced correspondent will give an answer to this quention.]
Mower Show at the Crystal Palace. - The late axhibition and the award of the prizes has given particulary to those who contributed in the particulary to those who contributed in the class
Miscelanous to whieh the judges has given no prizes whatever. The least they could have done for their own honour saake weuld be to give the prizes offered. There where many who could not afford it
has put themselves to many Pounds expenses exhibited in this Class and retarned without any remuneration whatever, and with plants too, had they have been exhibited at Chiswick, would have gained a handsome reward, and there is \(a\) kind of shuffling in the manner them in their several Classes there is no one now ean understand wither he has gained a firet, second, or third prize except by refering to the schedule And neighbourhood of Shoreditch or Smithfield would we believe it not a drop of milk for our coffee no butter and no waiters every one who did not choose to go self. By inserting this I trust we may get better thim ment next time. An Exhibitor. [Another correspondent complains of the judges whe, he says, knew nothing about the subjeets on which they adjudieated.
Covent Garden to admire the objecis there, my eye caught a fruit new to me, and labelled Nespres japonica. 1 bought a 18 . worth to see what it could be, and was
tolid it was an importation from the East Indies. When 1 got home I found I had some sort of Pome, and soon came to the conclusion that Nespres was only a mar vellous misnomer for M(esp) illo(s) ! As four letters of the latter word agree, perhaps an etymologist would say an \(N\) is only an \(M\) which has lost one leg, an \(i\) is very rid of I must leave the \(\%\) or Pomes were neatly done up in separate wrappers of whitey-brown paper, and I suspect the region in the East Indies from whence they were imported must be gituate within 50 miles of London-probably some
geutleman's coneervatory. H. S.J. [May not Neapres We Neflier ill written and ill read? The French call the plant the Neflier du e'spon. The frait in our markets is 8 aid Plane Madeira.
Oat Plantations.-1 inclose a few branches of young Onke planted this year in old woodland, whieh had produced a erop of Scatch Fir, and which was cot down
last year. These branches are attacked I fear by some inseet. I find where the ground is naturally damp, or where I have found it necessary to drain it, that there is not a plant touched, but where the ground is naturally dry the whole Oak plants are attacked in the same way ss these twigs. Would you be good enough to say what Quercus the \(2 d\). [As no inseet aecompanied the specimens we cannot say what it is that has done the misehief Probably some night feeding Careulio-possibly C A bietis-which hides in the ground by day, and breed is the old stamps of the Seoteh Fir. It is evident that this barkis is gnawed off]

Cucumbers. - Having given the rival Cucumber Ayres's Perpetual and Wild's Ipswich Standard, a fair thal, I ean confirm Mr. Mc Ewen's atatement (see pi 302) as to the suporiority of the first-named for genernl cul tivation. As an exhibition Cucumber, for which purpose great lengus is one of the chief qualifications, the Ipswieh Standard is no doabt the best; but for the regular supply of a gentleman's family, which after all is the true teat of merit in a Cueumber, I can say without hesitation that Ayres's Perpetual is much
preferred. J. B. Whiting, The Deepdene Gardens.
Gardeners' Beneralent Instilution.-As the time approaches for an aloetion of pensioners, perhaps you place I must lament, in common with many other garceners, the wavt of the nam.es and astiotance onany Kingdemen Sarely if gardeners might seek sympathy Kingdom. Sarely if gardeners might seek sympathy
with asy partienlar cluss in society it would be that of
the nurserymen and seedemen. But to be fair in this matter, many of the trade stand forth in bold relief as
the decayed gardener's friend in the list of subseribers; the decayed gardener's friend in the list of Bubscribers;
all honour to them! Aud here I would make an earnest appeal to all those who would do good, by inviting attention to the character of all real gardeners as a body feeling assured that those who will give their case fair and full consideration will come to a conclusion long since arrived at by thinking, feeling, and ensible men, that as a body they keep pace with the rest of society, whether in a professinnal, mora cases tended to throw light on agriculture itself. But there is yet another reason for soliciting sympathy in their behalf; they are in the main married men, and possessed of families. This, as all hnow, arises simply possessed of families. of the character of their calling. Gardeners are not in the habit of changing so often as 4 rooms and ootmen; and indeed, if they be worthy the name, it is sarcely expedient they should do so. They do no
make money," to use a common phrase, like many lasses of society whose level is not in reality much above them; hence few gardeners are enabled to make purse for old age, unless it be the childless. I will and feeling public to remark how far I am right in these observations. One thing here I must name, and verily I fear it is the tup root of the evil. I spoke lemen may turn on me and use the old saying, "God elps those who help themselves," or to paraphrase it little-gardeners should help their own fraternity blash whilst I write this; for I believe that even hieves and robbers have a sympathy for their kind I lament to think that hundreds of gardeners, who fancy hemselves sate, do not care to place their names on our list. But so it is in all human affairs , and no person of charitable designs, who can afford it, will allow such pots and blemishes to damnify the whole picture And now I must beg to express an earnest wish that
I may not have to fight the good fight single-handed but that others of our good British gardeners would say few words on behalt of their less fortunate brethren Much good may be done this way, and here I must confess to some noble appeals from time to time Supineness is of no avail-"little strokes fell great Oaks." In concluding these off-hand remarks I invite every help. Our worthy chnimman ag the fortheoming annua gathering on the 11th of June, Sir Joseph Paxton, has shown himself well qualified, as the prince of gardeners, to lead the van. How noble his assistance looks in the Pabscription
The Bark
The Bark Trade.-In the last week's Gardeners' complains of the 31st May, "A Country Gentleman" his neighbourhood also have been too long obliged to submit to this odious yoke. I have the honour to state that I shall be happy to communicate with your corre spondent; I believe that arrangements may be made or putting the buying and selling of bark on a proper footing. H. Clinton, Colonel, Royston, Herts.
Diseased Orapes.- Will you please to examine the enclosed Grapes, and give me your opinion as to wha is the cause of the berries becoming so rusty ? There i healthy, and beaning in in crop. I have Museat and a Hambury hoth growing side by side on one rafter, each yielding 16 bunches-the Muscat with seven bunches affected in the way you see the enclcser bunch, and the Hamburgh clean, or nearly so. The Hamburgh berries enclosed were taken from a banch
quite at the other end of the house. I should remark hat the change in the berries took place at, or abou their first thinning, when they were the size of shot
and the change wis extremely sudden; nothing could be geen in the evening, but next morning the evil wa quite visible. Orbro. The berries are affected by rust When young the skin of the Grape is very delicate and ender, and if handled, or exposed to cold currents of air, or in any other way damaged, the part injured never recovers, but remains dead and rusty. Murcat are more delicate than Hamburghs.]
Result of not Protecting Wall Trees.-I have alway covered my Apricot trees with canvas, betting, \&c but six years out of seven I have failed in obtaining good crop. I determined, however, this year not ase any covering whatever, and take my chance; glad to say that I have an excellent erop. I could count 50 in a wquare foot, not in the lenst hart by the spring frost, or late cold winde; they are as frest and green as any one could wish to see; I have never seen so good
My Peaches and Nectariney apparently equally good; our wall is a very old stone I may add however that, with no projecting coping. protection, inever nat ahough am no friend to which allusion has been several times made in jour pages. G. A., Leytonutone, Essex.

\section*{Borieties.}

Bonivical or Evixburen, Apris10.-The Chairman ead a letter from Professor Allen, Thomson, Glasgow, in which he remarks:-"I get the, other day a curious
metatarsal bone of a large ruminating animal imbedded
in it. The bone was about 3 or 4 inches in din in it. The bone was about 3 or 4 inches in dinmeter, and so completely imbedded that the tnrwer had werked for some time upon it, and was about to finish the wood for a printing roller when his tool grated on the bone and be broke up the wood. I have, from the ringi of wood, made out its place to have been not far from the centre of " tree of not leas than 16 or 18 inchos in
diameter." The following papers were read diameter." The following papers were read:-1. Pe marks on the State of the Forests in Pogu, and other parts of India. Communicated by Professor Balfom 2. Remarks on some Edible Sea Weeds. By Dr. Dary In this paper a detail was given of some experiment on Chondrus crispus or Carrageen, Rhodymenia pal mata or Dulse, Porphyra laciniata or Laver, Laminari digitata or Tangle, and Fucus vebiculoses or Doaghlagh man. The anthor showed from the chemical compoa. tion of these sea weeds that they were valuable artioles of food, containing more nitrogen than is present in the ordinary artictes of vegetable food. 3. Un Fibron substances used in India, as communicated in the Reper the Jumo Nof tho Ma Balfour. 4. Notice of the Flora of the Cumbrae Istand. By Professor Balfour. 5. Suggestions for (1bservaticas on the Influence of the Poison of Epidemic Cholera on
Vegetatiou. By W. Lauder Lindsay, M.D., Perth The author remarks that the historians of the grea epidemica of the earlier and middle ages frequent record as a fact specially worthy of notice, that then national scourges were preceded or accempanied by the suden and unaccountable appearance on artiele ef food and clothing, over large tracts of country, of variod kinds of mould, or by an extensive failure of the crop The sudden appearance of Fungi, of blood spots, and of other minute vegetable productions, was rugarded with superstitions dread in early times. Some of theec保 certain epidemies, more especially of blights. Thi neou -the production of Fungi according to him being rathe an indication of previously existing disease in the tissues. At the same time these Fungi when developec cause marked changes in the character and virulence of the disease. Various gaseous matters when diffosed through the almosphere cause injury to plants, and it is robable that an atmosphere which gives rise pidemics in man and animals may also act prejudicially reat value as . Meteorological observationbliahent of secieties and journals for advancing the seience of meteorology is a matter of vast importance. The inquiry into the effects of cholera poisons on plants divides itself into two heads:-1. The satural influenee on plants of the unknown poison floating in or conveyed by the atmosphere which produces cholera in Experimentation on the artificial influemoe of the same poison applied to plants in different degrees of eov centration or dakion, and under different circu. predisposition, occ. in regard to the etiology pidemic diseases in plants, the following points aro pro pounded for invertigatien:-1. Origin and mode difusion of epidemic disenses of plants. 2. Ferso ef incubation, or what period elapses between the masifes tation of the poisoned state of the atmosphere, and we exhibition of its results on vegetation. 3. Contagion nt mg 4. Are the discases of plants met with during he prevalence of epidemic cholera specific; or hav they similar charncters to thoee acoruing under ordinary ircumstances! 5. During epidemic cholera, or prio its appearance, is there any marked prevalence fungoid moulde or tendercy to the growth of pacesitic fungi on vegerables? 6. What species and geners of plants have been noticed to be affected simultaneoved successively with epidemic disenes? Co-existence apizootic or maden deaths, and a high mortality animals. 8. Relation in date of epidemic divease piants, animale, and man, whether definite or accidental \(s\) bearing on the question whether the powa cholera is all pervading, all deatruetive, sua kow far, what extent, or within what limits are all shoses of organised beings affected by it. 9. Predisposition. A. in human cholera only certain persons are attacked, so epidemic diseases of plants only particular individal re affected. The symptomstology and pathology of pidemic disenses should be carefully studied by the sil of the microscope and test-tube. As standards of com parison, we should be intimately acquainted with the acters of the tieares of the plant calthy state, and in other and more usua diacas onditions. The disorganisation of the tissues under the nfluence of known chemical poisons ought also to be avertigated. Attention should be directed to the deveir opment of parasitic Fungi, especially to the date of thei appearance, the condition of the tissues of the plant an he time, and the species of Fungi present. In corm clusion, the author alludes to various modes of perfors in pots or boxes might be introduced into choleia warth or the atmosphere of such wards, of the concentrabl ffluvia from the skin and luugs of cholera patients ould be introduced into bell-jare or Wardian cases conaining plants of racus kinds. The plants selected thould pe delicate cultivated ones, sach as annuals, pecies remarizable for the development of the phonouena of irsitability, as the sensitive plant. Such pas of are most susceptible of meteorologreal changes, and of the action of known chemical poisons. Marsh miamsuer the exhalations from chemical manufacures, of misayps the eflluvia of typhus and other contagoun
could not fail to be interesting.-Mr. M6 Nab laid on the, learned iriend will also excuse ns tor expressing some table the following record of the flowering of spring plants at Annat Cottage,
late Mr. David Gorrie :-

Sweet-scented Coltsfoot flowering in remarkable abundance in the open groand, in the latter part of February; and also sweet-scented Violet. Garrya elliptica more rich in blossom than wiual, having
brought none to perfection last year. Bees busy gathering honey and pollen before the end of February.

\section*{fotites of Bonks.}

A Natural History of the Animal Kingdom, being a systematic and popular description of the Habits, lowest to the highest forms; arranged according to their organisation. By W. S. Dallas. 8vo., pp. 81 (Houlston), with numerous Woodeuts.
This is an attempt to popularise the study of Natural History by a systematic account of the various families of animated beinga, and by a description of the more common or curious of their habits. In reality it consists of the Animal Kingdom of Orr's Circle of the Sciences, with new paging and some other slight changes. The mere production of books of this kind, and the numbers 80 produced, evince a fondness on the part of the public for natural history reading ; we wish it were study natural history as a branch of scientific know ledge. On the contrary, we fear that the number of ledge. On the contrary, we fear that the number readers, and that people possess no more real knowledge of natural history now than when books were scarce
and not over good. And yet it might surely be otherwise, if the writers on systematical sul.jects were them selves more syatematical, and if, in addition to pages of description and gossip, they would simplify elassification, and show plainly and unmistakably by short but exact contrasts of characters in what the essential distincMr. Dallas has not dowe this; yet it would have added ittle to his labour, nothing to the price of the work and a good example was set him by Mr. Gosse in his Mavine Zoology. For ourselves we entertain no doubt that the greater part of elementary works on that the true business of beginning at the beginning books like that of Mr. Dallas will be valuable aids but as matters now stand the latter do little more than create more smatterers and fewer experts. In the
meanwhile we may recommend the volume before us as a useful work of reference, having a pretty good index, in the way of Paterson's Zoology and publications of a similar character. The woodeuts are better cut than printed, and are usually sufficient for their purpose, with the exception of what are called Portraits the Naturalists, which really are so many caricatures of the artist's hands.

A new (fourth) edition of Babington's Monmal British Botany has just appeared (Van Voorst). That this is one of the most popular of our systematical works on wild plants is proved by its steady sale; that it deserves its popularity the conscientious revision of each succeeding edition abondantly proves. It is in ferences between one plant and another are tantamount to distinctions between one species and another. While we cannot concur in that opinion, we readily admit that much acutenes of ribservation is shown by those who regard the subject from the same point of view as Mr. Babington; and pernaps the very difficulty of applying the supposed distinctious on which modern species are grounded arlds an interest to the botanical pursuits of present edition contains 12 pages more than the last. The species of Kanumculus are inereinsed from 21 to 26 , of Eptlobium from 11 to 13 , of Hieracium from 27 off Rubus, while on the other hand two species are struck off Rulus, and one off Salix. The Lysimachia punctata found by a correspondent of ours at Dulverion (see 1854, p. 614) is admitted with doubt, but the name of wastphalica is given tor is on our authority instead of
that of Weilse, with whom it orisimated. We hope out
surprise that while he admite distinet species Pruus Avium, and Cerasus, and creates or admits 80 many others of the most doubtful value, he should refuse to recognise a distinetion between Quercus sessilifora and
peduculata. We can only suppore him to be unacquainted with the former, ns indeed would appear to be the case from the short clraracter he assigns it as variety, which chatacter is wholly at variance with the species.

Social Delusions concrming Wealth and Want. By Hichard Jenninge, A.M. Longmsas. Small 8vo, pp. 241.
What is meant by value : What is it that enssti tutel value I The author of the worl before us believe that the great political economists of the day have given erroneous answers to these questions, and that the misery of the lower classes in this conntry is to a very great extent attributable to prevaing errors on the above pointe. That political economists have erred may be admitted; that they are now wholly free from error no one wonld be bold enough to assert; but that the misery which all deplore can be fairly laid to their account is what the author has certainty not proved, He has, however, endeavoured to lay bare some popular errors on political economy, and his worl is worthy of tomed to think and to exsmine for himself questions which are usually deemed concluded by authority.

Nomos: An Altempt to demonatrate a Central Physice Law in Nature. Longmuns. Smail 8vo, pp. 198. In this work the author seeks to show "that the inorganic world is ruled by one single law, of whose operation the phenomena of electricity, magnetism, light, heat, chemical action, and motion are only so many signs-the law, that is to say, which was named provisionally the law of the laboratory-and that no secret in the world of inorganic nature can be fully understood except upon this assumption." Whether th which, though affirmed by him, will probably be disputed by nome at laast of his readers.

\section*{Garden Memoranda.}

Mrssrs. Waterer \& Godprey's Exhibition of America Plans view on Wednesday last, and was inspected by a select company including' her Royal Highness the I uchess of Cambridge and other members of the lloyal family Many of the scarlet and ot er high coloured Rhododen the Azaleas, and altogether the display was extremely triking, especially when viewed from a raised platform which has been erected at one end of the tent, and from which the whole mass of bloom can be looked down upon and seen at one glance. When we state that 100 yards in length and 33 yards in width have been wholly devoted to these gay flowering never beyond the sound of music, both vocal and instrumental, some idea of the kind of treat a visit to this exhibition willafford may beconceived. As already seated the whole has been thrown into borders and beds of tasteful forms by good gravel walks 6 and 8 feet wide, edged with turf, and here and there, where there is room for them on the gravel turt mounds have been
raised, on which have been placed noble standard Rhododendrons, a few of which are now in full flower, and thus placed they serve to break the sameness which would otherwise to some extent prevail and have a very imposing appearance. Among the more remarkable varieties now in blossom we loaded with handsome trusses of brilliant ros flowers; atro-sanguineum, deep crimson or rather scarlet, very etriking and beantiful ; ornatum, lighter in colour than the last but notless showy; Sir Isaac Newton spotted purplish hlac with crimson buds, large and fine Archimedes, brilliant rose; Vandyck, a kind equally showy : Nero, ppotted rosy crimson, a fine equally showy; Nero, spotted rosy crimson, a fine upper petals; Prince Albert, said to be a fine kind, but flowering loadly here; Lord John Russell purple, with blotches in the upper petals; and Braya-
num, one of the very best of all the rosy crimson kinds, being excellent both in shape of flower and truss and brilliant in colnur. Currieanum, it may be added, is also a large beautifully spotted purplish crimson variety, and few in this way surpass Victoria, spotted elaret, with trusses of great size. Of lighter kinds, delicatissimum is well worth att - ntion, and so is Catawbiense album. Of other varieties there are no Fant of examples of every tint and shade, but of the strikiag. As regards Azaleas, little can be said, as they do not come true to colour under canvas. Among them re however some good yellows, which serve to reliev are however coloured hnes of the Rhododendrons. Altogether the display is one ol no ordinary kind, and we need not repeat is well wort inspection. On the gravel near the entrance have beee placed some fine standard Bays which form good subatitut 8 for Orange trees, and immediately inside some Coniftrs, including the singular little Abies some Coniftrs, ind other very dwarf growing kinds.

\section*{Miscellaneous.}

How our Ancestors lived in the Days of Good Quen Bess--In thinking of Elizabethan diet we mus remember that Hops, carp, and turkeys were al novelties, having been introduced in Henry VIII' time. Before that, ale was drunk new, Artichokes wer carce, and Potatoes mere luxuries, looked upon with suspicion. The dinner itself had som thing almos religious in its ceremonial. The great salt-cellar was harrier of clasees, and divided the baron from bie jester his fulconer, or his page. Feudality then shone it almost the full hrightness of its cont-armour blazonry The tolling-pin beating the dresser was the signal for The dishes entered, borne in procession and the sound of music ; the knight had his taster, his. coated serving-men with silver badges on their arwes, the steward with his chain, and the major. domo with his white staff; the pages and the serving-maidens had all their distinct places, hemmed in by grave chaplains and brawny liuntamen. All the ceremony of roynity was retained in come of these baronial halls ; and no wonder the ruff" grew stiff, and the beard grave and solemn; no wonder there were Justice Shallows and pompous nobles inflated by their service, which Sackvill received with such dignit becoming his learning and his years, but which to parvenus was dangerous and intoxicating. The Elizabethan kitchen was a subterranean world, hit by infernal fires, and quite independent of the revelry and pomp and gravity above. There, omnipotent as Jove, with hat faces and white aps: his sceptre was wolling-pin, a case of hnives swung at his side, chests of spices were his crown jewels; all day in this torrid region went up a hissing sound of imprisoned stewe and a bubbling of perturbed jnints scalding in those large sarcophagi called on earth cauldrons. The pastry was not then a mere question of vulgar pie-crust ou'a work of art requiring much mythologieal study, when Acteon and his hounds in bas-reliet or the siege of Troy were represented in raised paste. The sweetmeat rose in towers and battiements, and was gay with rold beak and expanded tail yet forgotten, or the white toothed boar with the Lemons in its mouth
roasted whole were everyday things, and cooking was altogether a science, more epical and Titanic than even Soyer could now dream of The Elizabethan cooking ras subtle and full of art: local dishes were then more strictly retained and less widely known; Devonshire mad y retained and less whely known, Devonshire her P . C . herring and pilchard pies, Hampshire was renowned The Spanish Oglio was, however, not uncommon lamproys. The Spanish Oglio was, however, not uncommon, and sing fish. There was stewed brom, wheaten flummery, smallage, gruel, hotchpot, barley potage, ond spinage broth, for a commencement. The second course was say, lampreys, Poor John, and mullet, stewed oysters, For the third, marrow puddings and black puddings, white puddings, bag puddings, and quaking puddings. For the fourth, supposing it a Lord Mayor's dinner, fricassees of veal, stewed beef, capons in white broth, humble pies, Scotch collops, chicken salad, veal toaste, pasties Pancotto roast partridges, and wild fowl. For the last custards the oreat city delicacy) eream and rarar, pies lartshorn jollies cherry marmalade pies, hartshorn jellies, cherry malabade, pesa nd almond marchpanes. Some of the dishes are curions enough; there is one of the kernels of Tulip stalle cooked like Peas, and soused turkey, boiled in white wine atd vinegar, and soaked for a month ; the sauce Fenvel and vinegar. There is picked goose with cloves and ginger, bran jelly, pickled capons, and borse-radioh sauce. Those pear puddings contain no Pears, and are formed of cold chicken chopped up with sugat, currants, and spices, made up into a paste the shape of the ruit; there is pith pudding and oatmeal pudaing eal toast fried in butter and bas green goose pie anc mitation red deer, and after the pastry white cheese nd Tanst Among the sweets we see pipins preerved whe in jelly, syrup, quince cheese served whole in jelly, applo syrup, quice cheese, in jelly ;
 leat golo, iced wih orana will of mbergris and musk, wesides and rose juleps. For the liquids, besides ale and all orts of beer small and stron 1 , claret, and sack, there is A pple drink and stepony, and honey drink, and brager, weath and methegim, and hydromel and strawberry, and cherry wine, and sack, with gilly flower syrup; the methegl:n is full of sweet country ferfumes. In white meath alone, so curious are these driuks, there was infused Rusemary and Thyme, Sweet Briar, Penayroyal, Bays, Watercresses, Acrimony, Marshmallow, Liver Wort, Maideu Hair, Betony, Eye-bright, seabioas, Ash leaves, Eringo roots, wild Angelica, Rib W ort, Sennicle, Roman Wormwood, Tamarisk, Mother Thyme, Saxifrage, Philipendula; and bes des all these, Strawberries nd Violet leaves were often added. The durations of cooking in old cookery books are frequently indicated by "s the time in which you wonld repeat a Miserere
for the Purtunit, who shanimed mimee pies and shivered at plum porridge. Baked wild ducks and pigeons de-
lighted the dura ilia of our ancestors, who revelled in buttered eggs, marrow sops with wine, the haut gounts of garlic sauce wore than in fricassees and hachys, which were not much known till after the Restoration. Elizabeth breakfasted on brawn and ale, because tea was not known, and choculate was still confined to Spain.
Asparagus and Lettuce were then rare delicacies; sibbolds, Rocket, and Tarragon served for salad, and Holland still retained the Endive and the Cress. Cock ale was one of the most singular beverages ever composed, and the receipt for its composition is too curious to bear abridgment. "Take 8 gallons of ale, take a sun well boil well, then take 4 lbs . of raisins of the flakes of mace, 1 lb , of dates. beat these all in morta and put to them 2 quarts of the best sack, and when the ale hath done worling put these in and stop it close six or seven days, and then bottle it, and a month after you may drink ir." The Queen's own breakfast consisted generally of wine, and bread and butter, and ale; a loast it did so in 1576 , not to forvet mutton potage,
chicken broth, beef, and mutton. Her Sunday's dinner chicken broth, beef, and mutton. Her Sunday's dinner on the 19 th of November consisted of beef, mutton, veal swan, goose, capons, conies, friante, custards, and fritters, for the first course. For the second, lamb, kid, herons, phensant, fowls, goodwite, peacocks, larks, tarts, and fritters. Her average dinner was varied with plovers, veal pies, custards, boiled partridges, boiled beef, snipes, pheasants, chicken pies, and tarts, and cos on an average 4l. a dinner. As an exception she had baked chickens, salleta, tongues, teal and deer's dow setts, bitterns and baked larks, and above all brewis, Her suppers were of the same kind on fast-days; the pensive ; the first course included but nike salmon haddock, whiting, gurnet, tench, and brill; the second, sturgeon, conger, carp, e-ls, lamperns, chine of salmon, perch, lobster, tarts, and creams ; the side dishes were and lamp porpoise, fish cullops and eggs, doriea, sole fish ; the second course sonetimes incluted warden pie, mmelts, boiled veal, boiled nutton, pullets, partridges, and panado. We rather shudder at such rich food as gulls and "great birds" (whatever short of a buzzard hey may be), nor is porpoise inviting, let alone bream and tench. The powdered mutton reminds us of Shakspere. The lower tables do net differ in anything but the less number of dishes, and the more frequen ccasions of ling, and stock hish, and the cheaper food The whole charge of diet for the con the amounted were stolen, at a loss of \(127 l . ; 14\) stuck fish were eaten by cats and spoilt, at a cost of 14 s ; the free messes and charities were 500\%. The stock fish had to be prepared by beating, and is frequently alluded to in old plays. Thombury's Shakesperce's Englund.

\section*{Calendar of Operations. \\ (Ror the ensuing woek.)}

\section*{PLANT DEPARTMENT.}

Cosservatory, \&c. - The beds of this house (if they have been properly made) will now require a large supply of water to keep them in a sufficiently mois state, and the soil should be occasionally examined especially near strong growing plants, for the amoun of moisture alisorbed by these at this season is greater han many persons magine. Whenever water bottom, and where it can be done without annoyance the family, \&c, manure water shout be given such plants as are known to enjoy it. This should be furnished, however, in moderate quantities, and after well soaking the soil with clean water, for to give it in large quantities would probably cause it to reach and injure some adjacent plant. If red spider makes its appearance upon any of the specimens growing in
the borders, the pot pants in flower should be moved as soon as possible, and the infested subjects given a thorough washing with the engine, and this should be repeated at short intervals until the enemy is thoroughly subdued. STove.-See that the specimens here are afforded plenty of space, for there is nothing more injurious than huddling growing plants together. The inmates of this house are mostly plants of easy propagation and rapid growth, and in many cases advantage is taken of this to grow too many for there is hardly a re-pectable specimen produced. There there is hardly a re-pectable specimen produced. There managed specimens will be more valued than a larger number of half-starved miserable-looking plants. Keep a sharp look-out for insects, and apply the proper remedies in time to prevent their injuring the plants. Attend frequently to the regulation of the growth of twiners, and prevent their getting into a state of
entanglement. Maintain a growing temperature with plenty of moisture in the atmosplsere, and give plent of clear weak manure-water to anything that is found to be benefited by it. Orchids. - The shading of this house during such weather as we have experienced of late requires considerable attention to avoid extremes. Now, however, that the plants are mostly in free growth and very susceptible of injury from bright sunshine, it will be safer to err in the way of using the shading too much than to allow the plants to sufer from of it Aim at securing rapid growth by keeping the
-phere, sprinhling the pailh, \& ec, often enough on careful nut to heep them sufficienty moist, loots by careful not to get the plants too wet at the roots by
using the syringe too freely over the foliage. See tha specimens in baskets or on blocks are kept sufficiently moist; thise will endure a light dewing with the syring morning and eveuing whilst in a growing state.

\section*{forcing department.}

Pinert-Where Pines are grown to any extent o the Hamiltonian system, a close watch must be kel as to keep them dry at the root or otherwise as circumblances may dictate, and those showing fruit must no he syringed over head to the extent of causing wafer to lodge in the centres of the plants, for this would pro bably cause the fruit to be detormed. Young stoc growing in dung pits must be allowed plenty of air to prevent their making weakly growth, and must not be ove the atmospliere, is more apt to be the case here than in houses heated by any other means. Encourage recently potted stuck mith plenty of warmth and a corresponding degree of humidity in the atmosphere, but water care most certain method of obtaining a regular supply of fruit is by securing and potting a limited number of suckers at short intervals throughout the growing season ; therefore attend to this, which will save much rouble and disappointment as compared with the of ractice of doing this but once, or at the most but twic in the year. Vineries.- Where Grapes are intended hinned so that they will scary the berries should bo hinned so that they will scarcely touch after they are flly swelled, for it is hardly possible to prevent their damping off during winter, when the herries are left a thick as is usually done for summer and autumn use. Muscats and St. Peter's will be benefi.ed by a very little fire-heat at night. Spare no trouble to preleast the next two months, and also that the border is not allowed to become too dry. Give ai freely and early in the morning where the fruit is he house by removing plants, sce at any of moisture in

\section*{flower garden and shrubberies.}

The work of planting-out "bedding stuff," if not already done, should now be finished without delay. jomenas, Petunias, awn as soon after planting as possible, placing the shoots so as to cover the soil equally; and let Dahlias be securely tied to sufficient stakes. No labour should be spared which may be necessary to properly care for the plants until they get fairly established, when, if the beds have been properly prepared, they will care for themselves during the rest of the senson. See that plants in vases are properly supplied with water, as, if allowed to get too dry at the root but for a single day in bright weather, before they get well inured to exposur and fairly established, the foliage is sure ta be injured and the appearance of the plants spoiled for some conaderable time. And should the weather prove warm and dry the whole stock of bedded out things must be well attended to with water, and will be greatly benefited by diberal sprinkling every evening, but to water a large stock every evening is next to impossible where the amount of labour is limited and water not within reach those, therefore, who expect their flower-beds to be as well filled and cover with flower in July as any in the country must make up their minds to maintain a suc cessful contest with dry weather at any necessary expense. And in most situations proper arrangement aid a trifing outly in laying down pipes fitted with union-joints would, with a hose, render any amount o watering which might be necessary in the Jdry season however, as recommending frequent heavy waterings, but merely that the soil should be kept in a health moist state, and any labour bestowed in the way moistening the surface of the beds on the evenings of
bright days will be well repaid. Use every possible dispatch to bring up any arrearg of work in this depart ment which may have accumblater during the time the hands have been employed in plantivg out.
hardy frult and kitchen garden
Now that we have nice growing weather, see tha very shoot on the Peach and Nectarine trees is fre rom insects, and otherwise lose no time in getting then cleaned. If not yet done, disbudding should be completer at once, in order that the strength of the trees may be thrown Who whe is to be the bearing wood for nex season. Where covering of any kind has been used, thi should also be removed, if not previously done. See tha Cherries are not allowed to suffer from their enemy the black fly, and endeavour to keep all fruit trees pertect clear of insects. The early Celery should be planted out without loss of time, and this must be well supplied with water until it gets established, and indeed through out the summer. or in a shady situation, the plants should be protected from bright sunshine for a week or so after planting and see that there are plenty of plants coming on for the succession and late crops. Give all necessary attention to Tomatoes, ridge Cucunsbers, \&c., until they get fairl established. After well soaking the Strawherry bed with water the surface should be mulched in order to keep the ground cool and prevent evaporation. It is: very usual practice to use the mowings of the lawn for
this purpose; but this is the very worst artiele that could be used, as it spsils the fruit hy adhering to it,
and in damp weather imparts to it an unpleasant flavour, and hastens decay. Next to tiles or slates clean straw is the best article for this purpose, and where this cannot ,e obtsined the rankest portion of the litter from the stable-yard may be used instead, and there need be no ears entertained about this spoiling the flavour of the
ruit for exposure to the air, and a \(f \in w\) showers perfectly exposure it, and although more troublesome to pply it will be found to answer the purposes as well as lean straw. Give Asparagus beds a liberal supply of manure-water, and where there is plenty of this at command it may be given with advantage to such thinga as Cauliflowers, Lettuces, \&c. Keep the surface soil frequently stirred among all growing crops, which will prevent the growth of weeds and strengthen the plants.

STATE OR THE WEATHER AT CHISWICR, NEAR LONDON,

SATURDAY, JUNE 7, 1856.
}

A Paper on the Breaking up of Grass Lands was read last Monday at the concluding meeting for this eason of the London Farmers' Club. Mr. Wood, the Chairman of the Club, who had drawn up this paper, came to the conclusion that it was not advisable to break up pasture lands, even under the abundant produce and paying prices on which his calculations were based. We certainly do not agree with him in the opinion thus expressed ; and

We do not think that it followed logically from the thas be contrasted with the bony Highlander, premises he laid down. The paper itself we hope to give next week. The report from our correat our command.

On Friday last a very interesting lecture was given at the Royal Institution by Dr. Lyon PlayFair, C.B., on the Chemical Principles involved in theory of fertility and of its maintenance by the application of manures, and accordingly the controversy of Lifrig with Messrs. Lawes and Gilbert came under review. The main points insisted on and illustrated with remarkable energy and cleverness were (1) the classification of the food of plants, cluding oxygen, hydrosen, carbon, and nitrogen, and earth food, including all mineral matters: (2) that inawmuch as the composition of the air is alike for all localities, sterility or fertility must
depend wholly on vaniation of the earth fond: depend wholly on valiation of the earth fond:
(3) that plants differ materially, not only in their requisitions for food, but in their means of procuring it: (4) that all the ingredients which they nerd are equally necessary: and (5) that of all the ingredients it was the one present in smallest quantity that determined the vigour of their growth.
Bat these points cannot all be taken oither as absolutely true or absolutely complete; thas (1), the strict classification of food according to the source of its supply is not possible. Soil contains ammonia, carbonic acid, and water, and is thas, as well as air, a source of nitrogen, carbon, hydrogen, and oxygen;
nitrogen thas becoming "a sort of earth food " nitrogen thus becoming "a sort of earth food"
too. Indeed in the opinion of some, and in reference too. Indeed in the opinion of some, and in reference to some crops, it is (2) according to the presence of present in invariable quantity in the air, that fertility is seen. But, further, the composition of the air as re_ards air food cannot be said to be invariable; it
is sometim S moist and sometimes dry, a matter important as affecting the supply not only of the soluble parts of earth food to the plant, which are carried to the roots by rain, hut of the ammonia of the air as well, which must be much less accessible
in a dry season than in a showery one. (3). As to the differences of plants in their powers of procuring food, no doubt theve do exist, and yet the illustrations given were imperfect. It is true that the Wheat plant presents but little surface of absorption to the air, and spreads a muititude of ramifications through the earth; and it is also true that the Turnip spreads a great extent of surface to the air
for a longer time, too, than the Wheat; but it is not true that the rootlets of the Turnip plant are either actually or relatively to those of the Wheat crop inconsiderable either in quantity or extent. Dr. Plaffarr said that as to earth food, the Wheat is a perfect Zuuave in its power of foraging, while the Turnip is an English soldier whose rations must be brought to his tent door; but the fact is that the
Turnip goes just as far afield as the plantit is here conTurnip goes just as far afield as the plantit is here con-
trasted with. The Jand between the rows of Turnips in a properly cultivated field is apparently mach faller of the fibies from the plants than the much narrower intervals are which lie between the rows we have dug them to the depth the former reach, we have dug them out of the subsoil 4 feet bolow the surface. (4). The fourth point relating to the equal value of the ingredients making up the food of plants, whether they be present in large quantity or in small, is \(n\) o doubt to be admitted generally, with, however, this exception, that for some of them
substitutes wonld appear possible, as the alkalies for one another, while others seem altogether indispensable. It was, however, for the fifth point that the principal place in the lecture was reserved The law of fertility was expressed thas, (5) "the body in minimo rules the crop;" that is to say, of all the ingredients needed by the plant, that which is present in the smallest quantity determines the vigour or the quantity only in relation to the demands of the plant in question: it is the hody of which, as compared with the quantity needed, the supply is least, that will be the weakest link determining the strength of the whole chain, for the superabundance of other ingredients, the extra strength of the other links, is then of no avail. And this qualification was plainly to be inferred from Dr. Playpair's own commentary on the doctrine he was then enforcing with so much energy and enthasiasm. We were somewhat surprised, however, that this qualification of the law
given in the terms jast quoted did not strike him as an explanation of Mr. Pusry's summing up of the theory of agricaltare, which he criticised so severely. That nitrogen is the food for Wheat, and that phowphorus was the food for Turnips, was held
to be vidienlous. "The muscular Arab might
and it might as well be said that nitrogen is
the food for Arabs and phosphorus the food for Highlanders."
Mr. Puser's remark on superphosphate as almost the only suggestion for which practical men were indehted to scientific men, lay more properly open betrayed an entire misapprehension of the distinction be ween an art and a science. "Liebig thought no more of his suguestion for disolving bnes in acid than he would think of a recipe for Warren's blacking." It is in the principles it has ascertained, out of which practical mon must them-
selves obtain instruction as to meins and methods, that the usefulne s of science shows itself,
On the statement, however, that phosphorus is the food for Turnips, nitrogen the food for Wheat, we do not think that Dr. Playfatr's criticism fell with equal force. This is just the practical version of his own law of fertihty. It is but an instance
given of the rule he has himself laid down that "the body in minimo rules the crop." No doubt Wheat needs other things than nitrogen and all these other things are equally important, and yet if generally nitrogen be the body in minimo as regards the Wheat crop, then it will be the quantity of nitrogen present in a useful form which will rule the Wheat crop; and we may say with Mr. Puser that "nitrogen is the food of Wheat." The rule many other cases, it appears that controversies as out of misinterpretations and misunderstandings which they generally aggravate instead of remove, rather than out of positive and inherent differences,
Dr. Playfair concluded with remarks on the general advantage which would arise oat of the scientific education of all classes of the agricultaral interest.

Wg have one more paragraph to add upon the question of iron consumed per acre in English agriculture. Onr correspondent who originally drew

The estimates in reference to the annual con sumption of iron per acre on a farm furnished by t at 28 lb , the other at 11 lb ,-the one giving a wide difference in themselves, bot are very much in excess of those already given. If we omit, however, from the calculation the 55 tons of inon piping used for irrigation purposes by Mr. Mechi, his estimate will be reduced from 28 lb . to about \(6 \frac{1}{2} \mathrm{lb}\). per scre. This would bring it nearer to that furnished by Mr. Howard, which from some reliable returns recently obtained in the north appears to be a pretty correct spproximation, On three adjoining
farms in Midlothian, consisting of 1264 imperial farms in Midlothian, consisting of 1264 imperial
actes of mixed soils, farmed on the five-course system, the average annual consumption of iron has been 4256 lb ., which would be at the rate of about \(3 \frac{3}{8} \mathrm{lh}\). per acre."

It must be remembered in reference to this, that the extent named over which this consumption has taken place is wholly arable, and that therefore this,
small as it is compared with the estimates already small as it is compared with the estimates already
publishod, is probahly above the truth as regards the country generally. The question is what is the actual waste per acre, not what would it be were our farm as fully stocked with implements as our implement makers would desire that they
should be.

THE PARIS AGRICULTURAL EXHIBITION A FEW days since a great di-play of rejoicings trok place in England, the blessingt , if peace were hailed by the English nation in a mamer befiting their greatness and the advent of that auspicious event was celebrated with hearty goodwill and rincere satisfaction. Here, in that nation which trook to was signed, in the metropolis of that nation which took so glorions a part in the eastern struggle, another display is taking place, another battle is being fought, and the re-establishment of peace is of France that convened in her capital the nations of the world, although the mind of the French Emperor must have been naturally turned to more pressing and sterner anxieties, the appeal he made last year was one of peaceful import, and now, on the morrnw of the filment.

A gorgenus prines, arected in one of the most enchant the robust yet penceful and gentle spirit of agriculture Who has made of it his abode and sits in it as in a temple, and in his train, as in the ark of old, bleating flocks, lowing herds have entered, and filled the spacion aisles with their multitudes. All breeds of agricultural animals are there represented. Those that tread the
hoandless steppes of the east, the rich plains of the Danubian Principalities and of the rich plains of the the sunny pastures of Spain and Italy, that climb the ateep and preoipitous slopes of the Alps, that dwell in the

Holscein and Denmark, the emerald paetures of Ireland, of the Scetch Highlards are there assembled beneath of the scoteh
the same roof.
But we may contemplate this exhibition from : higher point of view than as a more competition amoeg various breeds of animals and agricultural produce, It is suggestive of so many contrasts; the bleating of the flock, that but yesterday awoke the echoes of crago mountains, to-day resounds under the crystal canopy of a gorgeous palace, in the midst of the gayest and roost beautiful city in the world. Men belonging to different races and climates, and separated not more by dis. tance than by habit, dress, and Ianzuage, are brought together here, each displaying what he considered for want of terns of comparison as the best breed, the richest produce, the most effective implement in the world. What germs of progress and civilisation will be sown on this auspicious occasion! Who can form an idea of the extent to which agricultare sad all the physical and moral blessings that flow from her prosperity will advance all over the wortd from the imHow many prejudices will be crushed! how many ealousies soothed! how many fertile ideas awakened! how many improvements suggested! And yet, in the midst of this pleasing contemplation, it may possibly chill the minds of some of the many English spectators of the scene that in this gigantic lesson tanght to European agriculture for them there is no reciprocity; they have everything to give, hardly anything to gain. It certainly appears to the Frenchman's eye that there is no hint the Englishman can receive, no idea be can adopt to modify his own. no blood he can infue into that of his breeds, ao seed he oan entrust to lis furrows, no implement he can substitute for his, no appliances he can extend to his husbandry-and this
is no blind conceit, no effect of inordinate vanity, it is ungradgingly admitted by all. England from her olld and unpropitious climate stands in a very disadvantageous position in comparison with other nations ; in return for what she readily gives out of the saperabundance of her excellent sgricultaral breeds, syotems, and imploments, out of her industry and science, she has a right regards other nations more favourably situated her the seeds her cloudy wky fails in bringing to perfect maturity ; to suggest from their ingenuity new implements to supply the want and dearth of agricultoral manual laboar drained by emigration and an immense development of manufacturing indastry, or from thei scientific lore to proffer new discoveries, new appliance to increase the fertility of the land, or to reatore vitality 10 exhausted furrows.
But notwithatanding this drawback, it is far from our thought to say that no practical and materil great will accrue to English agriculture from thit the dastry is the market; the greater the demsind the greater the value of the produce, and although stoot gresting has of late years received in England vey is no encouragement both from home and abrona, there to that impout this exhibition will give a fres as and that English breeds will henceforth command in the European continent generally that attention which hitherto has been chiefly confined to America. Bot let it be understood, besides the empty gratification of fifflove, this is the only advantage Engiand will reap confess we shouid have desired a greater one, although we hardly expected it. Most of our readers are familiar with the beautiful
tructure erected last year in the Champs Elysees for structure erected last year in the Champs Ey Hyde Park in 1851 ; it is beneath the crystal roof of that palsce and in numerous sheds distributed in its vicinity that the exhibition is held, and although we feel strongly impressed with the excellence and magnificences of the arrangements made, we hatably confess our inability to convey to the minds of our readers even a faint idea of the grandeur, beauty, and exquisite taste diaplayed by the French Government to ta to give dectat and splendour this great occasion.
The central nave of the palace has been, as if by magic, turned into an exqu witely beautifal zarden, or rather lawn, intersected by meandering sanded walk, dotted with masses of flowers most artistically arranged, tatues, fountains, with basins enciroled in a frume of brilliant flowers and freshening the atmosphere withecoling showers. Tall trees of sombre green rise here and tre from grassy knolls, and groups of evergreeas of the flowers by their sober tints the gorgeous splend palse a flower and horticultural exhibition of the rarest merit; fruit and vegetables of truly astounding size and perfection being arrayed along the paths on the lawn, and at the foot of the groups of shrabs and flowers. Bat if he reception of the things exhibited is on a scale of magnificenee never attempted before, wo can assure with the truly imposing array of agricultaral riches gathered together in that fairy-like palace from all parts of

The immense aistes beneath the galleries are filled to repletion with cattle of all European breeds, and notwithstanding their large extent, such is the number of animals exhibited, that sheds had to be construeted row
in the palace. Cheep, large implemente, and the poultry, while in the galleries are exhibited the smaller implements, and agricultural produce of every kind imaginable, as well ss those various contrivances and curious inventions, more ornmental than useful, which generally creep
iato the farmstead in the train of affuence and into the

It would be impossible at this perind to enter criticall into anything like a description of this exhibition. This we reserve for a future article, and to yive an idea of the importance of such a task, we will just give the general statistics of the various branches in which the show is divided.
In the cattle division there are altogether about 1300 head, comprising all breeds; of these the shorthorus alone, exhitited both by Englishmen and foreigners, number about 200, but the animals being the produce of a cross between the shorthorns and other breeds are also very numerous, plainly showing in what estimation the Durham breed is held by foreign agriculturists. In the pic class there are 171 animals; in the slieep there
are 729 lots, many of three animals each. There are are 729 lots, many of three animals each. There are
174 lots of poultry, and about 81 lots of various domestic breeds, such as rabbits, goats, llamas, \&c. In domestic breeds, such as rabbits, goats, llamas, \&c. In
the implements there are no less than 2107 entered, comprising every variety of machinery from the ponderous steam-engine to the smallest tool used in
husbandry. Of these 372 belong to the United Kingdom. husbandry. Of these 372 belong to the United Kingdom.
This forms the second division, the live stock being the first. The third comprises all agricultural produce of any kind soever, and numbers no less than 4635 luts. There are besides 34 lots of books, engravings, plans, \&c., connected with the subject of agriculture. From
this resume our readers will easily form an idea of the magnitude and importance of this great exhibition, and what utility must acerve to mankind from the contemplation of such a comprehensive museum of agriculture opened to so many whom the narrow range of comparisen had hitherto kept in the ruts of ignorance and routine.
It would have been a delightful task for us to have continued our report in the same strain of commendation and praise as we have commenced it. There is however a reverse to this medallion, however beautiful the obverse may be, and it is really disheartening to find, that such a great idea, so generously and ungrudgingly carried out both by the Goverument that made the appeal and the exhibitors that responded to it, should be marred by the arbitrary proceedings of some who are entrusted with the care of carrying out the details and minor arrangements of the exhibition. Such demeanour towards exhibitors of respectability never disgraced to such a degree the hospitality of a country. overruled in with instances, the Englisi judges were out regard to their superior knowledge of cheir own breeds and implements. Indeed, if rumour be true, there have been exclusions made which we shall inly
be able fully to discuss in our next paper, for the same arbitrary administrative tyranny has withheld the publi cation of the award of prizes, contrary to all precedent,
So on Suvday last the public were admitted, but looken in vain fur the prize animasis, and we are told that the award will not be known until Thursday. The inconvenience of this is especially felt by the English exhibitors, Who might readily sell their animals, but dare not uame any price before the award is known.

There is ano her point which proves a source of great annoyance to exhibitors; it is the extension of the time first aamed for the duration of the show. It was to last only a week, and now we are told that the animals have gaived prizes not until the lyth. This is a serious evil for many who are obliged to keep their servants and themselves in this expensive eapital, when the presence of both is so much wanted at home. But there stilla very serious evil attending this delay; the foot disease is very prevalent in Paris, and several animals in the palace have been attacked, to the great danger of the others. It was only with the greatest difficulty that
Mr. Maxwell of Eidinburgh could prevail upon the anthorities to move an animal attacked by the disease from the vicinity of the Scotch cattle. The reason alleged by M. St. Marie, the head official, being that lusion that the disease was neither contagions no infectious.
The surmises as to who are the winners are rife among exhibitors; but however well founded these surmises may be, we abstain from publishing anything speculative and unofficial, as the award will not be known until Thursiday
Great fetes in connection with the exhibition are we understand in contemplation. On Thursday next
the French jurors, together with the principal writers in the agricultural press of Paris, intend to give a banquet to which they have invited the foreign judges and other strangers of distinction. We shall give a full report of all interesting proceedings that may oocur in our next article, as well as of the distribution of prizes which "ill take place on the loth.
Last year when a similar show took place in the the Iudustrial Exhibition, pid but very aliuht attention to the former, but on this occasion, whether they feel a greater interest for agricultural pursuite, or whether the pelace it as a place of and more attraetive they merely select it as a place of fashionable resort, they certainly
have flocked to it in very great numbers. Ou the firat
interest exeited seems to suffer no abntiment: but the the contrary, to increase mong all ranks of society. As to English visitors, they seem to have zaken Paris by asoault. We never recollect having seen so many here before. Within the palace, or in the streets as places of public resort, Englishmen are everywhere diso
cernible by their unmistakeable countenance, or the sound of their language.
The French Emperor serms also to take agreat interest in this show. On Saturday last he drove into the building; and shorily afterwards the Empress came in, and was wheeled a bout in a perambulater. She first
paid a visit to the beautiful floners, and at last hurriedly passed before the shorthorng, which she seemed to admire very much, especially the first prize bull Master Hutterfly.
Several private and important ales have already taken place, many sovereigns of Europe being in the English stock will meet with a great demand, and at very high figures, if one may juige from the admiration with which our animals are gazed upon, and the numerous inquiries made about price, \&c. We have therefore every reason to be proud and satisfied of this opportunity given to English agriculture to display her excellence and anperiority; and notuithatanding the
arbitrary proceedings to which we have alluded, we are convinced that this event will form an era in the history of ngricultural progress ; and that if England gains nothing for the advancement of her skill, she will
at least open a new field for the demand of her stock and implements, and add freeh laurels to her fame.

We have to add to the above that, though the dent wrote, yet the names of some of the prizeholders had transpired. Tius the first prize of 40l. for shortfy buls is taken by Mr. F's bull, the third by Lord Clanearty's Pro Bono Publico.
Mr. Fisher Hobbs takes a prize in the Herefords, Mr. George Turner in the Devons, Mr. Hugh KirkAllan Pollok in West Highlanders, and Mr. M.Com in polled Angus. Mr. Jonas Webb is, as usual, successful. Ta the Kerry breed, of which a number of specimens are shown,
Koe are distinguished.
As to the show of agricultural produce, its merits especially as respects the French contributions, are illustrated by the following instance:-M. Raiband l'Ange receives a gold medal for a suite of specimens the produce of one farm, ineluding the following list :Cereals, viz., Wheat, Barley, Oats, \&c. ; other crops,
as Beans, Peas, Lupines, Beet, Carrots, Lucerne, Clover, Sainfoin, Vetches, Lentils, Flax, \&c. ; oils, wines, fruits, acorns, tark, Lavender, Thyme, woo's, sulks.
The following, again, is the contribution of the Agricultaral Society of San Isidro, Catalonis :-103 varieties of wines : 39 varieties of Lentils and Beans, samples of Figs, Oranges, and Lemons; tobacco, liquorice, hemp, oork, sausages and cheese; various oils, and lastly the Algarota or Caroub pods, a swe food which has been to some
extent imported as food for sheep and cattle into extent imported as food for sheep and catte into
England, but which is used as horse food in the country of its growth. The credit of this admirable cuilection is due to the Condé de Forollar, Marquis de Palmerola, who is the president of the society which sent it.
We hope next week to give the prize list in full, 80 detals on both divisions of the exhibition.

\section*{DIARY OF A DAIRY FARM.}

Therre is solittle variety in the business of the dairy this season, that very few remarks can be made poir the management of it; the directions given for the month of May should be carried out as reanards the be attended 1 to watch the alo in the weather, the mode of treatment to be varied accordingly;
when it becomes very warm and close, such as it will when it becomes very warm and close, such as it will be when thunder is in the air, the mill will not then require any should be adued to ic as usual. Cheese lufts are generally placed over the dairy, and rooms near the which is never proper in the summer when it requires to be kept as cool as poseible, to prevent injury; and during the hot weather, it is an adrat ground hese and even if paved, if not daup and kept turned every and even if paved, in noin too long, it is better than a luit close to the thes daring the wery hot weather. It ometimes oceurs that a malt hove is attached to arm baildings, and being out of use in the summer, it has been appropriated to the cheese with the greatest advanage; and a farmer possessing this accommodot the iactor much earlier than where there are not these advantages. There is a kind of soft cheese known as tho Bath cherese which is highly esteemed by many persons, and made at this temson; the foliowing is she recipe for making it. Take one galloa of new milk, and add three quarts of cold water, with about two or ler curd take it out gently with the akimming dish, and
drain sufficiently from it, before placing itton whey will arain solicieatly from it, before placing ifon a cloth in half thick, and nbout nine or 10 wide, to be made haicu. square. The above quantiry of curd will be, as nesrly as
can be ascertained, the quantity for one cheese ; it requires to lave one or two dry cloths applied to it, and in two days it may be taken out of the wat and placed between two pewter plates and turned every day, the plates being wiped dry. It will generally be
fit for use in a week or nine days; Vine leaves should be pluced upon it, and it should be turned over upon thein a few days before it is used, changing the leaves every day (or it may be kept between Nettle leaves) to get it ready a little eooner.
his month convenient shade, or their constant uneasiness from the teazing of Hies hinders their feeding, and from their becoming so heated from ruming, has a very injurious effect on the milk, which is leas in quantity, very soon becomes sour after being taken from the hence considerable loss arises. If the herd be brought into yards to be milled they should have the shade of cool heds, or the operation of milking is very tedious, from the cows not standing, and often much milk is spilt from the awhward moving of the cows, and the whole is not takell from them, which is sometimes, under these circumstances, almost irepossible to do. A sufficient to remain only one hour in the yard; eight is abnut a proper number for a good milker to do are withed the hour. If a sufficient number the milk to the dairy, it has been found to sare mueh labour. This man, with yoke and buckets, shonld go round to collect from ench miker, as his pail become nearly full, and so lighten each one's load to carry from cow to cow, and prevent their individual journeys from the yard daring the milking hour ; by this means th milk is taken to the tub or vat in a much more equa temperature than if longer exposed to the heated found to act well on the cheese and butter produced froud to act well on the cheese and butter produced from it. When the cows have to be pastured far fom in the field, for a drive along a hot road exposed to the sun does equal harm to their milk as the racing sbout
the fields when exposed to the sun. A vessel is then the fields when exposed to the sun. A vesse according to cens, drawn by he mis should be left to stand in a cool spot and be taken home steadily with as little shaking may be. The cows should get no better pasture. They are found to feed better and keep more settled than if left longer in one field. A yood supply of fresh good water for them is in diapensable for their doing well and yielding a quantity of milk. The weaning calves may now be gradually according to their age, doing without milk, meal, of Linseed, if good pasture is provided for them by day and they are brought into yards at vight, and get sem Italian Rye-grass given to them, which they will very readily eat ; and if a small quantity of dry hay or Clover is supplied before they go out in the morning, they will generally eat a litte before they get any other
food, and this is found very beneficial. The moisture from the Gre is fousd very benencial. night is foun quite sufficient without water, frow which they should be carefully guarded, or they drink to excess, mad mueh harm is the result.

\section*{IMPROVEMENT OF SETTLED ESTATES}

A measure of general importanoe and of peculiar interest to the owners of settled estates, designated the "Drainage (Private Advances) Act Amendment," has been introduced into the Honse of Lords by the Marquis of Salisbury ; it has been resd
It behoves every one intertsted in gricultural im provement to support this measure, as it has been prepared to remove one of the obsrructions that have so long retarded the development of the resonrces of the caltivateable land of the kingdom. It is merely wo extension of the "Private Money Drainage Act" of 1849. That act empowered awners to borrow or advance, and expend money in draining land, and in draining only, and to secure the repayment of the debt so incurred by an aumual renteharge upon the entate improved.

The principle was found to work well, and enterpri sing individuals formed private companies and obtained under private acts of Parliament pewers not only make charges open land for money laid out upon it in draning, but also in the erection of farm buildings, the making of romds, de. This priwciple has aleo boen
found to work well, and large tracts of hand have been found to work well, and lar.
improved by its application.
improved public legislation has not kept pace with private enterprise. Whilst private companies have obtamed powers from Parlianent enable then, for their own profit, to charge land wim money expended in effecting imporkant and indeed esential works beardes drainizg the general public aet has remamed stationary, and means of executing with thi mode of payment other wrorke than drainage.
The matter therelore now stands thus; that say

Owner may, under the sanction of the Inclosure Com-
\(\mathbf{m}\) issioner \(\mathbf{r}\), borrow and lay out money in draining, an secure tl pasment of the sum expended by a rent charge on thei land drained ; but he cannot, utder any circumstances, lay out money with the same? mode ot payment in any of the other works above "named except by obtaining the services of one of the cimpanies, who naturally charge him for the use of their act of Parliament.
It has been through eight years of experience found advisable to concede this power to the owners on limited estates, but why should they be fettered with the charges demanded by the companies? Why shonld they be constrained to accept their services
when they might accomplish their object more readily and far more cheaply, directly through the Inclosure Commissioners? Of course the answer is clear ! This state of things was never designed by our legislators. It was never intended to exact from those persons creating charges on account of money laid out in erecting buildings, \&c, the fees they have hitherto It was known when the first of these private acts was It was known when the first of these private acts was passed in 1848 that the Private Money Drainage Act and why this was not then done it is unnecessary now to inquire.
The bill I now wish to draw public attention to is the extension of that act which has at length been prepared by the Government; and the object of the directly with the Inclosure Commissioners without the intervention of any private company, but leaving intervention of any private company, but leaving
them free to seek the assistance of the companies if them free to seek the assistance of it to their interest so to do. Charles \(P\). Humbert, Land Agent, Watford, Herts.

\section*{Home Correayondence.}

Agricull ural Metcorology.-1 was iaterested in seeing from the report of the Royal Agricultural Society that
Professor Way has "devised a mode by which the Professor Way has "devised a mode by which the
amount of nitric acid and ammonia in the atmosphere may be ascertained with approximate exactness,"
methods he has employed are not hinted at nor the results given. I shall look forward, however, with much interest to his experimental researches on this subject. This is an exceedin_ly important department of theoretical agricul. ture. The specific action of certain manures for certain crops evidently depends a good deal upon the variations circumstances. I suggested a mode several years ago which was forced upon me from practical consideration, and which may give a close approximation to the truth. The grounds upon which I rest these opinions are very simple. It is now universally admitted that rain water contains ammonis in quantities that vary a good deal. Liebig also discovered it in sea water, but so far as I am aware no analyses have been made that ascertain the
exact quantity. Now the immense quantity of ammonia exact quantity. Now the immense quantity of ammonia
that is constantly carried into the ocean by our rivers can only be returned to the atmosphere by evaporation. The circulation of water that goes ou betwixt the sea and the land must establish an equality in the amount of ammonia in rain water and in sea water. In fact, then, the ocean must be rekarded as the great reservoir of smmonia ; as rain falls the quantity of this sulistance must be diminished in the atmosphere; dry air must must alco be the means of keeping up the norma quantity which is constanty being precipitated along with the rains. The amount of moisture may ammonia. The number of grains of the vapour of water in a cubic foot is easily ascertained, and the percentage of ammonia in rain water might form of ammonia in a cubic foot of air. M. Ville's experiof ammonia in a cubic foot of air. M. Ville's experi-
ments in increasing the vigour of plants in houses by increasing the quantity of gaseous ammonia have im. parted additional interest on this subject. The leaves of all plants I have long urged can absorb a much larger quantity of ammonia from the air, or what is the same thing, plants require less manure when the air contains alarger quantity of watery vapour than when it contains little. If plants have the power of absorbing ammonia are the best reasons for supposing that they do, their facilities for doing so must be vastly increased as the vapour is increased. The increased vitality of plants as the moisture is increased has no doubt much the with the matter, but it is worthy of remark that the quantity of the vapour of water, and probably of ammonia, is doubled for every 20 additional degrees in the constituent temperature of the vapour. When the dew-point is \(50^{\circ}\), the air would only contain half the quantity as that in the air when the dew-point is 70 .
Now there are a vast number of agricultural fucts Which seem to indicate that as the amount of moisture is increased in the atmosphere, the greater facilities have all plants of absorbing ammonia directly from the atmosphere. R. Russell, Kiluchiss, May 31.

Stabling of Horses.-From an observation in the Agricultural Gazette of the 24 th ult, it appears that Howerer H." contemplates providing boxes for cart-horses. cannot think it judicions to separate the working horses of a cegarions, whille or resting; horses are naturally gregarion, they love society, and although they

Therelure be thought pugnacious in their habits, yet
when once accustomeri to assonate with their own kind, hey are reluctant to be parted from their companion and always welcome their approach of return. They are also very sensible to much continement, so that in all cases, whether of the nag or cart description, they whid have a roomy berth accessible to fresh air as intended for. A nag horse coming off a journey, often in a state of profuse perspiration, should be sufficiently protected from the external air, so that no chilliness is nduced or draughts admitted to occasion cold, but with cart-horses less precaution is needed, and the only enre required is that they be well rubbed down until their coats are dry and they may then be permitted after a feed to range a yard only sheltered from northerly wind. This ar rangement implies that a cover huilding is provided, with a manger long in proportion to the number of occupants, each horse requiring abo 4 feet of manger. The open part of such building should if possible face the south; when it tends either to the east or weat it will be necessary that the openin should not extend the whole length of such building, passage or doorway being left large enough to admit tree egress or ingress fir the horses to or from the yard. In the yard may he iutroduced one or more cribs for fodder, and on one side should be a trough well supplied with water, for of all animals domestiardent love of freedom and independence if well treated and properiy managed. The well-known proverb of "taking a horse to water, but you cannot make him drink," exemplifies in some measure his resolute rendency to consult his own inclinations, and yet how grateful for good ussge, how tractable to skilful handling, how emulous of surpassing his rivals, whether hunting or racing, whether spanking on the road in a dog cart, or trembling with energy at a dead
pull ! Let cart-horses which work together by all means pull! Let cart-horses which work together by all means eat together in a roomy sheltered yard, and if they are not overworked how amusing is it to notice, and how the lach and to guard acganst their attempts to mes for liberty or frolic or mischief, according to the natural bent or idiosyncracy of the animal sometimes is more serious than amusing, for a sharp-nosed and keenwitted raseal will by such tricks lead his congeners to sive scrape. A large yard with a covered shed will keep them in health; they will rest better, have a roll frequently, and often prefer lying in the yard exposel to wind and rain if the lair of straw is plentifully renewed rather than lie under cover; note the con dition of horses so liept as compared with the solitar rogues having equal measures of food, and it will be found that the social party will do far more credit to The farmer than those isolated; they will he less sus ceptible of inclement wealier, have fewer ailments, and do more work. These jottings are open to criticism let others marrate their experience; we are ready fo correction if wrong, and promise to weigh well contrary practice when other modes have been successfully pursued. There is indeed great room for discussion on matters pertaining to this subject, so many different plans exist of feeding horses, some with bruised food, some with all forder cut into chaff, some without hay, some wi hout Clover, some with much green food, some with scarcely any. Millers give bran and pollards, brewers give grains, foreigners give Barley, and small farmers tail Wheat; a good dea lepending upon the soil and situation of the farm and the circumstances of the owners. When horses go wrong the farmer is not willing to confess to any defect of information or negligent treament, and when there affair is thought deserving any notice. J. IT, Pcter borough.

that interesting and important inquiry
These recommendations were adopted by the Council Veterinary Grant.-Mr. Raymond Barker, Cbair mun of the Veterinary Committee, laid before the Council the following recommendation, which, on the motion of Mr. Thompson, was unanimuusly adopted:-

That the 2002. per annum voted by the Society to the
Veterinary College shall in tuture be appropriated as follows : viz., 100l. per annum tor the Lectures given in
Hawover Square by the Prufessors of that institution
and 100l. tor the general objects contemplated by that grant; and that the \(100 l\) per annum for the Lectures be
subject to the usual rules apuly ing to papers intended for Chelmsfurd Meeting.-Mr. Miles, M.P., reported the favourable progress of the arrangements for the Society's ensuing Country Meeting, to be held at Chelms ford in the middle of July next.
ford in the middle of July next.
Implements at Work.-Colonel Challoner, Chairman of the Implement Committee, reported recommenman of the Implement Committee, reported recommen-
dations in reference to the implements to be shown in dations in reference to the implements to be shown in
active operation at the Chelmsford Meeting. These recommendations were adopted
Member of Council.-On the motion of Mr. Raymond Barker, seconded by Mr. Miles, M. P., the Earl of Powis was unanimously elected a member of the Council, in the place of Mr. Evel
Strward of Cattle.- On the motion of Mr. Figher Hobbs, Mr. Jonas was unanimously appointed one of the Stewards of Cattle at the Country Meetings of the Society, in the place of Mr. Simpson, who retires this year by rotation.

Judges of Live Stock.-The Council appointed Judges for the several classes of Live Stock at th Chelmsford Meeting.

Disease among Cattle.-The Council were favoured by the Earl of Clarendon with the following communi cations from the Foreign Office :

\section*{James Hudson, Esq."}

Hambarg, May 24, 1856.
- My Lord, -I have the honour to trausmit herewith to your lordship copy of a despateh I received from Her Majesty's Mice
Consul at Lubeck of the 17 thi inst The disease, \#hich Blackwell alludes to, has been for some time prevalent in distant
more specific information as regards the subject, which when I recel a that this disease has assumed a very formidable characte in Mecklenburg, and that the loases are 90 per cent.-I have, \&e.

The Earl of Clarendon.
- Lubeck, 17 th May, 1856. - Sir,--I have the honour to report that in consequence of a contag cattle of Mecklenburg, the same disease, I believe, which has caused such ravages among the cattle in Poland, the Liibeck case the disease should appear within the Liibeck territory, and have moreover enjoined, as a precautionary measure, that no of Mecklenburg Schwerin and Mecklenburg Strelitz, excep such as are certified by the proper authorities the disease.-I have, \&e., (Signed) 'F. A. Buackwell.'"
'The Council adjourned to their Weekly Meeting on Wednesday the 1 ith of June.

\section*{Miscellaneous.}
\(A y^{7}\) esbury Ducks.-These ducks are perfectly white and are kept in immense numbers in the neighbourhood of that town. Wheu highly fed, they begin to lay about Christmas, and as all the eggs are hatched under hens, the old ducks are not permitted to sit, but continue laying during the season. The ducklings are taken rom their foster-mother the moment they leave the tion till she can endure it no longer, and then leaves the est a perfect skeleton, without the satisfaction o earmly ducklings are kept in to warmly housed, and allowed but a limited access to ater. ver, fesh, and almar ever bage. In eight or forwarded to London, where, in the early season, prices sometimes range as high as 148 . per couple. Of the numbers thus produced it is impossible to speak with certainty; but to illustrate the quantity, it may be stated that a little farmer at Bierton had at one time last season nearly 2000. Mr. Read in Journal of the Royal Agricultural Society.

\section*{Calendar of Operations.}

South Larcashire, June 2,-During the past week we have had abundance of rain, with occasional sunshine. Vegetation very thick, and likely to be a good crop. Clover is also very heavy in most localities; at speke (heme garden of hancasigh, thick, and is now for the seythe, and will be commenced with so soon as the weather takes up. In many partis the Whear crop has proved a perfect failure by the ravages of the wireworm and the severity of the Finter; many
fielle have been plonghed up and resown with Barley and Oats, fields have boen plonghed up and resown with Barley and Oats, and some places with spring Beans; there are, wevertheless, have buen turned in to check the Wheat. We have equial is not more \(W\) beat fown than last year, farmers not expecting so
sudden a cessation of the late war. There is a large breadth early and winter Potatoes sown, and with God's blessing we many "hogs" or heaps in the stack-yards yet unsold, which i this part has a tendency to keep the plice of Wheat down
Oats and Barley appear to wear a ricl and verdant colour, ar generally speaking thick on the land, and prumise to be a goo
crop. The fruit trees in bloom looked buth gorgeons an plentiful, but of late they are not showing that prolinc appearance hhort crop of fruit, except in occasional instances. We liav only a short breadth of Beans sown, and they not ying yigs are ex sure die in debt. Good horses, too, are in great demand at high prices. The recent shows of entire horses at Warrington, Wigan, and Liverpool have created a spirit of rivalry amongs
breeders which of late has been carried too far. Hay and straw bave fallen \(2 d\). to \(4 d\). per stoue, and stack yards are beginuing to look bare and empty. The rent days are mostly over, and farmers have now not much Wheat left on hand, having disposed of it before that great day arrived. Town-made manure has been for some time past very high, so much bo that farmers
would rather buy artificial fertilisers. Messrs. Gibbs \& Co. Will not retail less than 30 tons at once, Badly too much for any middle class farmer to buy, considering its present terrific high price, Fiz., 12l. per ton. The cottagers gardens do them infinite credi for taste, produce, and cleanliness; indeed, contentment seems to prevail everywhere, particularly when we consider the expense little towns. J. \(A\) \(\qquad\)

\section*{Notices to Correspondents.}

BotD's Scy paragement of it. He cannot make the nut and screw hold the blade in working position. The joint on which the heaviest cheeks radially grooved, so as to hold them fixed together when once serewed up. Is this so in the tool of which our correspondent complains?
Brrwing: Country Parson. Under the circumstances you name 50 will be advisable to brew at home, and supposing you bre mushing tub with false botiom of the same con:ents, and three shallow tubs as coolers to hold the same quantity, with cask to hold the liquor. Three milk buckets and a filler are what you need, and you AANDETJOF: \(S G\). We shall have a Leading article shortly o the subject, but we must warn you that nothing short of destroy them

\section*{T. GREEN'S NEW INVENTION IN LAWN MOWING AND ROLLING MACHINES,}
sole manufacturer, iron and wire works, north street, leeds. REGRTERED JULY 24, 1855.-No. 3739.
THE ADVANTAGES OF THESE MACHINES supersede all others by having without any change of Wheels, or adding the old fanhioned Holler, as in others; will also cut either wet or dry, and by the simple adjustment of a thumb screw, in front, can be raised or lowered to cat the Grass any length required; and having two Rollers behird, and a small one in front, they roll the width they cut; they will turn in very little room, and cut at the same cone. Ancte that they cannot tear up the pround; they are only drawn, and not pushed and drawn \(2 s\) in other machines, consequently do not require half the power to work them.

Testimonial from Jushua Major, E:q., Landecape Gardener, Knostrop.
 four highly improved Mowing and Rolling Machipe. The one sent for my inspection and wria (as wet, it was cut with the greatest drawn on flat ground with ease by one persot, and that amateur gentlemen, and even ladies, may work either the 16 or 20 inch size with ease and pleasure, providing the Grass is not too long. For extensive places 1 should say the 24 incher woald be most suitable; for even in undulating ground two persons maty work it; bu int fower gardens, whe bed, onare crowded, surpasse the smaller sizes would be best. surpasses, and must eventually supersede all others, prove a great sa

had at the Mart, and of the Anctionears, American Nursery had at the Mart, a
Lejtonstone, Essex.

\section*{COMPLETION OF}

\section*{THE TRAVELLER'S LIBRARY.}

In Twenty-five Volumes, price Five Guineas, in cloth.

THE TRAVELLER'S LIBRARY being now complete, the Publishers call attention to this collection as well adapted for Travellers and Emigrante, for School-room Libraries, the Libraries of Mechanics Institutions, Young Men's Libraries, the Libraries of Ships, and similar parposes. The separate Volumes are suited for School Prizes, Presents to Young People, and for general instruction and entertainment.

The Seties comprises Fourteen of the most popular of Mr. Macaulay's Essays, and his Speeches on Parliamentary Reform.
The department of Travels contains some account of eight of the principal comntries of Europe, as well as Travels in four districts of Africa, in four of America, and in three of Asia,
Madame Pfeiffers Fitst Journey Round the Workd is included; and a general account of Australian Colonies.
In Biography and History will be found Mr. Macanlay's Biographical Sketches of Warren Hastings, Clive, Pitt, Walpole, Bacon, and others; besides Memoirs of Jrellington, Turemue, F. Arago, se, In Biography and History will be fond Fuller, with Selections frum his Writings, by Mr. Henry Rogers; and a History of the Leipsic Camprign, by Mr. Grieig, which is the only separate account of this remarkable Campaign.

Works of Fiction did not come within the pian of the Trayeller's Library; but the Confessions of a Working Man, by Souvestre, which is indeed a fiction founded on fact, has been included, and has been read with unusual interest by many of the working classes, for whose use it is especially recommended. Dumas' story of the Maitre-d'Almes, though in form a work of fiction, gives a striking picture of an episnde in the history of Russia.

Amongst the works on Science and Natural Philosophy, a general viow of Creation is embodied in Dr. Kerap's Natural History of Creation; and in his Indications of Instinct remarkable facts in natural history are collected. Dr. Wilson has contributed a popular description of the Electric Tepegraph. In the volumes ori the Coal-Fitlds, and on the Tin and other Mining Districts of Corneerl: is given an account of the mineral wealth of England, the habits and manners of the miners, and the scenery of the surrounding country.

It only remains to add, that among the Miscellaneons Works are a Selection of the best Writings of the Rev. Sydney Smith; Lord Carlisle's Lectures and Addresses; an account of Mormonism, by the Rev. W. J. Conybeare; an exposition of Cailuray management and mismanagement, by Mr. Herbert Spencer; an account of the Origin and Practice of Printing, by Mr. Stare; and an accont of Zondon, by Mr. M'Culloch.
Summary of the Contents of the TRAVELLER'S LIBRARY, now complete in 102 Parts, price 1 s . each, or in 50 Volumes, price 2s. 6d. each in cloth.-To be had also, in complete Sets only, at Five Guineas per set, bound in cloth, lettered, in 25 Volumes, classifiel as follows:-

P A G E A N D C O．＇S COMPOSITION FOR THE DESTRUCTION OF BLIGHT \\ UPON THE
}

\author{
Hop，Roses，Wall－fruit Trees，Cucumbers，Melons，Vines，Stove and Greenhouse Plants．
}

Extra strong，4s．per Gallon，sufficient to make four．Jars and barrels charged at cost price．
Ten Gallons and upwards carriage free to London．
TESTIMONIALS of 1855 ．Thnse of 1851，2，3，and 4 having been previously published，and which are enumerated in a Pamphlet of 16 pages（procurabie of the Undersigned and all their Agents），a pertusal of which is respectfully solicited．

Mrow S．Show，Koop，Eurl de Grey，Wrest Park．
As to the sphis and other inseets which attack the trees，I consider your Compasition cannot be too highly recommenaded for ict．Invees．My tress were very much infested，and by two or three dressin
A pril \(6,1855\).

In From Heory Bulley，Bug，Nimeliant Puin，Oxfortl． I have funad it most effectual in llestroying the black fiy on Cherries，but it requires to be used in a less diluted state than Mrow Mr．J．Stephensem，Gr．to the Right Hon．the Farl of Durham
The Composition arrived quite safoly，and will，I belleve answer the purpose for which you recommend it．一May 28，1856 Mrom Mr．E．Sage，Gr．to the Right Hon．Earl Howe，Gopsall Hall I enelose an order for the amount of the Blight Composition， which I consider
Rrom Mr．W．Challis，Gr，to the Right How．Rarl Noloon，Trafalgar
I ans sntions to forward you my opinion of your Blight Com－ position，which I have nsed durlag the last summer on my frait treos with great swotest，
From Mr．John Mitchath，Gr，to the Righs Hon．Lord Wowloble． valuable wash．－Dec．10， \(\mathbf{1 8 5 5}\) ．
From Mrr．W．Poole，Gr，to the Right Hom．the Eiarl of Aylasford， Your Composition has again proved very．
thrip，green－fly，and spider are concerned．Bug we do not patro nise here，or I should bave tried it uppon them loag ago ostill，I cannot conceire why it should not prove

From Mr．W．Wats，Gr．to Sir Thomat Whichoote，Bart，
I am elind to may that after three application of your Blight Composition to my Cucumhprs and Melons，Which are grown in
its heated by hot water，I have Buceeded in most effectrauly destroying that greatest of all pests－thrip，and my plants，which With all my syringing，were literally devoured plecemeal，are tainly continue a eustomer．－A pril 19，1855．

From Mr．James Doat，Gr，to Sir Henry Halfond，Bane，
I am happy to say that the Composition answers well for the destruotion of green fly and other blight．I dipped several hundred plants in the Composition jnst as 1
Fram Mr．M．Russ，Gr．to Sir P．Shelley，Barl．，Boscombe Lodge． Compoifition，and can fay it has answered my erpectation in every way．I think those who have not made a trial of it should
avall themselves of the earliest opportunity to do Oval 4,1856 ．

From Mr．J．Chard，Or．to Sir Frederick Bathurst，Bart．，
In answer to yours of this morning．I
In answer to yours of this morning，I beg to say that I found form Mr．Thomas Bell，Gr．to E．L．Rudge，Resq，Abbey Manon I quite approve of your Blight Composition．－Jan．2， 1855.
From Mr．Loonard Hume，Gr，to R．Hamburys Eequ，Poles， I have used your Blight Composition apon Cherries，Plum and Roser for the black
sertipfaction．

Mrs．Warren begs to enclose Messrn．Page a Post－office onder for the amount of her bill，and at the same time to inform them， according to their request，that the Composition certainly did
both Roses and fruit trees good，and she can，therefore，recom and it \(\rightarrow\) Oct．31， 1865 ．

From Wilinm Dickenson，Esq，Newo Park
I am happy to testiny to the usefulpess of your Bifght Com position son the tress in the orduriag the last summer to destroy fectly effeetnal．－Nov． \(23,1855\).
From Mr．Coleman，Gr．to Major Savags，Norton Lodge，Midsomer
I have given your Composition fair trial upon some Stephanotis and Hopas，infested with mealy－bug．Three times
syringing with equal parts water perfectly cured them．I haye syringing with equal parts water pectarnes，and I think it is
also tried it upon Peaches and Nectin
the best remedy ever introdaced for all kinds of blight． the best reme
Nov． \(23,1855\).

From Mr．E．Sendall，Gr．to J．T．Moth Esq．，Burningham Hath． Itried your Composition on a Royal George iteach very mueb tion；upon Pomoh troes very much infested with green－Aly，and two applications killed every insect．I then tried it upon，some
young Vines for mildew．I syringed the Vines，kfp＇he bouse shat till the remperatnre reached 100 degrees，and if destroy d every spot of mildevr．I have rred it since with the same result，and
think it is invaluable．－Nov 24,1855 ．
From Mrr．W．Percay，Gr．to the Rev．Thomas McCalmont，Highfeld
I ana pleased to inform you that your Blight Composition has My Cneambers were infested with spider and thrip，which it entirely destroyed with two applications，and the black apbis on
my Chervies with one；bat the most important was its curing the Vins diseass．I dipped the buaches into the mixture twice，and not a trace of mildew was ieft．－Nov． \(6,1805\).

\section*{From Mr．Wallor，Gr．to W．H．P．Freeman，Esq．，Pylewell House} I have great pleasure in saying that after two applications of on my Peach trees，and I have never seen them look better a this season of the year than they do at present．－May 15， 1855. From Mr．J．Luoas，En to W．C．D．Estarile，Esq．，Burley Manor My Peach and Nectarine trees in the orcmard house were deatroyed that peat without injuring the young fuit．－May 15 ， 1855.

From Arr．Q T．Wran，Gr．to G．H．Aolerw，Esq．，Moreton Hall． I am happy to bear testimony to the complete edicioncy of your Blight Composition for the destruction of aphides and the Che com
beetle．My Cherry trees were much infested．At the mencement of the season they were well syringed with the Com position，whelt
August 3,1655 ．

From 迸．J．Hawes，Ar．to R．D．Masples，Eseq，M．P．
It is with pleasure I inform you that the Composition you seat me has been most affectual in killing the green fly on Peachea， Composition．I shall reconmend it to all my friasds，and con
inue to be a enstomer，－－J ane 22， 1850.
From W．H．T．Hawley，Esq．，West Green House
I have great pleasnre in bearing my testimony to the merits of success during the last spring and summer．For a series of years my wall fruit trees have been destroyed by a gradual decay which I supposed proceeded from catses affecting their roots，an In attributed it to the nature of the soll，to want of drainage，and in short every cause but the right one，which the use of your in which appenred es if scorched up，and the polsonous effects pro－ duced by these insects shortly exteoded themselves to the
branches，which withered and died，ard most of the trees have ultimately been quite destroyed by them．I have this year wel
gaturated the trees with the blight mixture once - just before the biossomes made their appearance，and again when the trees were in full leaf，and the result has been that not an aphi日 has
remained upon them；they have exhibited a thoroughly healthy appearance，and have made vigorous shoots，and have borne plentiful crop of frnit－results which never happened previonsly
I may add the effects of the mixture on my Rose trees and othe plants have been equally successful，and I shall be mach obliged to you to send me another supply before the winter closes，in
time to repeat the successful experiment next spring．
Nov． 24. time to
1855.
From Mr．Jumse Egorton，Or．to E．Turner，Esqg，Manor House，
I am pleased to bear testimony to your Composition，which have used with success．My Roses were infested with green tly but it upon my Cueumbers fore parfectig cleaneed．I al． ased it apon
Nov． \(24,1855\).
From Mr. G. Olarenshavo, Somerford Hall.
 indeed！－June 23， 1855
From Mr．Thomas Dixon，Gr．to Mrs．Oolt，Rownham＇s Park． Compopition，having nsed it according emeacy of your Biigit Wall trees and Reses，and fonnd one application quite snfficien to destray all ktnd of infects．－Dec．27， 1855.

Frow Mr．Webb，Gr．to Colonel Mansell，Smadmor
I used your Composition lest summer and found it answe fomarkably vosll，for it kills every

From R．G．Linzio，Esq，Jermyn＇s House
In reply to your letter，reqnasting my opinion of your Blight and shall eertainly continue to \(y\) effective daring －Sept．14， \(185 \overline{\text { n }}\)
From Mr．C．Prath，Gr．to Dr．Leesom，Boncharch，Isle of Thylt I have used your Composition on Pench and Nectarize tree
and found it or great servics．－Sept．19， 185.
From the Rev．W．Bernard，Clatworthy
In answer to your letter of the 12 th inst，I beg to say th ypring and early summer was gery me great satisfaction．The withstanding，our Roses have been particularly good，and our wall trees are in high health．－Sept．18，1865．

In my experimuts with this mixture I have found it to kil bug，an effectually as thrip and seale gnd all aphides and meat I bave fride to upon Hop－bines，and with one ryringing it has completely cleared them from lice and tly．When butter kaown
it will doubtlessly be extensively \(u\) ased by Hop growers as and as by gardeneis．For suealy bug and scale I take a large pan lay the head of the plant in it，and play apon it with all th can use the sathe the ryinge．on the prevents wante，and This mode of applying it is，thelefore，vers economical．

From Mr．Fomeroy，Gr，to H．Helloy，\(E^{\prime} q\) ，Bittprne．
I have used your Composition two Years on，wall fruit treen pillar tit is inseazi death，spplied with the mueh apprecinted over picking and other remedies for that peat ept．14， 1855.

\section*{The Garwentric Chrontele.}

\section*{meetings for tab enseling week.}

Soms years ago a wooden glazad span-roofed house, upon a plan furnished by an experienced cultivator, was erected at Chiswick, for the purpose of growing Tea Roses and similar tender varieties in the open border. A raised bed some 8 feet wide was constructed in the middle, and all round the -ides were other raised beds, narrower but otherwise similar. All these beds were rade to throw water off easily, that int the middle by being highest in the middle, those at the sides being highest at the sidts. Wooden flaps in the wonden sides and a door at one of the wooden ends furnished lateral ventilation ; sliding sashes admittel light and air by the roof. The borders were prepared with good moald, and planted with the hest varieties supplied by some of the noost celebrated Rose growers of England.
But somehow or other the Roses made a bad hand of growing ; their leiv s curled, mildew seized
them, and green fly, and other pests; sulphur was powerless, tobacco-smoke little better. Flowers came in small quantity, opened ill, or would not open at all. In vain was the house watered, and ventilated, and shut close up according to the most approved practice; the bushes were but ragged briars, and that which was expected to prove a verdant, fragrant, luxuriant Elysium was only a shabby, dried-up, balf starved, mildewed thicket. Instead of "a garden of Gul in its bloom." as Byron would have called what was expected, nothing better came of the experiment than what might have been found in the dirty anteroom of a London Bazaar.

The house was evidently unsuited to sach plants, and the borders were ill contrived. No light came through the sides, although the Rose is a child of light; little heat accumulated, although warmth is an essential condition of health in a tender Rose; the roots were ill supplied with the moisture which such plants delight in, for the sloping surface of the beds caused it to ron away into the sunken paths as fast as it was brought to them; and finally the Roses could not breathe; imperfect ventilation at once stifled and starved plants which nature intends to be waved by every breeze, to be steeped in dew, and to feed greedily upon a rapidly shifting atmosphere.

So the house was emptied of its Roses and altered into an orchard house, for which it is perfectly well adapted. It now produces fruit successfully, although the flowers of the Rose refused to appear beneath its roof.
It chanced at this time that another wooden house stood empty near it, equally unwarmed artificially, but in other respects the reverse of the orcbard house. It had tall glass sides as well as a glazed ridge and furrow roof; the transparent sides opened to the bottom; but the roof was fixed. It had been presented to the Society by Mr. Hartley, the eminent glass merchant of Sunderland, as a model of a cheap greenhouse; and a model Rose House it has proved itself to be.
Within this building, on a level with the floor, several flat brick-edged beds were made, and planted with Roses in 1854. As before, the sorts were supplied by Messis. Lane, Paur, and Rivers; many of the plants were in fact transferred from their former place; and the old mode of management was repeated. But this time with very different result. No more blighting and ineradicable mildew ; no more shrivelled leaves, no more dwindling spindling growth. Vigour was apparent from the first; strong wood, as clean as it came from the hand of nature; fine broad lacid leaves with the generous purple tinge of health in the beginning, succeeded by the richest and deepest green ; and as for flowers the bushes were loaded with all they could bear. In short success was perfect, thanks to bright light, copious ventilation, accumulated sun heat, and a soil that parted with nothing which it received except to the plants for which what it received was intended. This was the firstfruit of growing Roses in a house and in soil adapted to them. But the success of the first year was nothing to that of the second.
The other day the house was piled up with gigantic Roses, sweeter than the sweetest of the Eastern world; men were wheeling away barrow loads of fallen petals. Devoniensis seemed to have borrowed the shape and size of a Cabbage, and as to Fortune's climbing yellow China, its rich Nankin colour was actuslly glowing with salmon. We caused some of the largest to be measured on the \(3 d\) of June. Here is the result:-

Vicomtesse des Cazes
Madame St. Joseph
Princess Marie
Devoniensis
Goubault
Surabondaérin
Surabondante de Paris
Comte de Paris
Adam
Mansais
Souvenir de la Malmaison
Comte Brobinsky
Cramoisie supéneure
Abbé Moiland
Souvenir d'un Ami
Marshal Bugeaud
or Cuier
Lovers of Roses ! only think of flowers in which the whole face may be buried in fragrance; of Devoninsis eighteen inches round, of Mansais, Madame St. Joseph, Adam and Surabondante almost as big;
only conceive Madame des Cazes bursting forth into seventy such blossoms at the same time. Perhaps you may not recollect how much six inches are; cut, then, a paper circle as wide as half the length of one of our columns-carry it to your own Roses, place it by their side and see the difference.
Such is the result of substituting good treatment for bad. It is clear that Roses like to be well lodged, and well fed, and well attended-like their betters.
And now for the receipt to make such a house as this:-
1. Let the soil be Wimbledon loam, or any such soil, and old cowdung.
2. Prune hard back at Christmas.
3. Cut off the dead flower stalks as soon as flowering is over.
4. Water once a week in summer
5. Give no water in winter, or at least never let the surface soil be wet at that season.
6. Let all the plants be on their own bottoms, and not worked.
7. If mildew appears, immediately dust sulphur on with a piece of gauze or coarse muslin. This is much better than "sulphurators."
8. Sulphur in the evening; and wash all off next morning. If the mildew does not go, repeat the dose as often as necessary.
9. Give tobacco smoke once a week when the Roses are growing.
10. Give air to the utmost of your power, always by day ; and at night also if the weather is warm.
11. But shut up close at night if cold ; and keep close the ventilators next a sharp east wind.
12. Never shade.

Such is the way to grow tender Roses well in England.

\section*{New Plants.}
176. Lachenalia aurea.
L. foliis pluribus longis flaccidis obtusis recurvatis inæqualibus, racemo multifloro elongato apice abortiente, floribus pendulis cereis, sepalis fert duplo brevioribus obtusis petalisque apice
dilatatis subrecurris concoloribus. dilatatis subrecurvis concoloribus.
Of a beautiful Cape genus, far too little cultivated, although as manageable in a greenhouse as a Hyacinth

last spring at Chiswick. Its mumarows broad fiaceid bright green leaves, very little spotted, fall back upon the ground, while its stately purple-speckled seapes, sometimes 2 feet long, rise grandly upwards, loaded with magnificent flowers of the deepest golden hue and without a spot. These flowers are four times al large as in L. tricolor (the two-leaved common species to which it most nearly approaches), of a firm waxy consistence ad aimost wholly tubular, the very apex only of the petals nulate figure. The sepals are a little gibbous at the nulate and sometimes the ribbosities produce a toth two on their surface. No Lachenalia with which we are acquainted remains in flower so long as this.

\section*{GARDENERS ROYAL BENEVOLE3T} INSTITUTION.
The thirteenth annivergary dinner of this charity took place at the London Tavern on Wednesday lus, the 11th inst., Sir Joseph Paxton, M.P., in the elvele, supported by Sir Charles Fox, A. Anderson, Evin \({ }_{5}\) Crossley, Esq., M.P., Lieut. Paxton, J. J. Mechi, \({ }^{\text {a }}\), Mr. Wrench, and a large number of nurserymen ind Mr. Wrench

After the cloth was removed and the usual loyal frute proposed and drunk, the chairman gave the "Amy and Navy," which was responded to by Lieut. Paxter A. Anderson, Esq., then gave "His Grace the Delse of Devonshire, President of the Institution." This val replied to by Sir C. Fox, who stated that he had bowis his Grace from a boy, and believed there was nut a person in England who more completely supported character of an old English gentleman. His great desire was to see all about him comfortable; as to the interest he takes in Horticulture it requires no comment. The Chairman said he would have much pleasure in commonicating to his Grace the much pleasure in commanicatin of him, and remarked tribute of respect that had been paid cim,and recasectivg that he had found him that morning carefuliy inspecting
the list of subscriptions to the Institution, in the welare the list of subscriptions to the Instit
of which he took a warm interest.
What was termed the toast of the evening, viz., "Success to the Gardeners' Royal Benevolent Institution and long may it prosper," was next given by the Chairman. He sought assistance from the meeting in its behalf, and stated that if each member present would endeavour, when he went home, to get at least one more to join it, its funds would soon become increased. A statement concerning the history and present position of the charity, furnished by the Secretary, was then read. From this it appeared that the average age of the males now deriving relief from the Ingtitution was 80, and that of the females 79. Sir Joseph then went on to say that he thought the pension was too small ; instead of \(16 l\). a year for males, he would give them \(20 l\). ; and instead of \(12 l\). as at present for females, it should be increased to 16l. a year. The suhjeet of wages in general was then adverted to; he was convinced that gardeners were very much under paid, a circumstance which he attributed to the supply being greater than the demand. He compared the remuneration they received with that given by Sir Charles Fox to hundreds of his mechanics, and pointed out the difference which existed between them. He was sure that if gentlemen looked over the list of persons in their employment holding places of trust they would find that gardeners were the worst paid of all. This, coupled with often a large family and other difficulties, rendered them ill able to save money, and therefore late in life they were compelled to seek relief from this Institution, which had been established for the purpose, and on that nccount had a pecutis claim on all who took an interest in gardenery and gardening. He hoped, therefore, that much liberality would be exhibited that evening towards the good \({ }^{\text {gin }}\), was advocating, and that the funds of the he was advocating, and that the funds of
would thereby be materially augmented.
The health of the Chairman was then propared by Mr. Mechi. He believed that not only now, but in days to come, his name would he bonoured. He agreed with Lord Braybrooke, when he said that there was nothing to prevent the humblest individual from becoming was he was, a peer of the realm, and the asgertion. Let just a person who fally exemplied the mast structare orect the a no loss how to estimate his genius. Architects, he said, were ford of masees of brick and mortar with small loopholes to hook thrategh; of brick and mortar with small loophoides In fact, Sir
but the Crystal Palace was all window. In but the Crystal Palace was apon us. This was ar-age of steam and progress, and he hoped that Sir Joseph would be long spared to take an active parten prooperations. Sir Joseph Paxton replied, and then proposed the health of Mr. Crossley, who, he said, hark liberally presented the town of Halifax with a park which he was about to lay out.
A report on the state of the funds of the Institation was read by the Secretary; he stated that 26.2 l ., the proceeds of the sale of the celebrated Stanwick Nectarine, prad been liberally presented to the charity by his Grace the Duke of Northumberland, that donations anuounced on the present occasion amounted to nearly 2\%0l., and that the funded stock of the Institution was about 4000 l . Among the names of thnse who thus liberally contributed we observed the following :- His liberally contributed we observed the Duke of Devonshire, 21l.; Sir Josaph Grace the Duke of Devonsbire, 210., J.\& C. Lee, 10l. 10s. F. Croseley, Esq., M.P., 102. 10s. M. Smish,
out of doors, this is by far the finest species yet known. It was purchased by the Horticultural Society of a

After some healths had been drunk, the Chairman proposed "Success to Horticulture," and coupled
with it the name of Mr. Spencer, of Bowood. Mr Spencer, in a short but excellent speech, replied, that gardening was the pioneer of agriculture, and alluded to deep cultivation as a great means of increasing our national resources. Mr. Mechi, he said, was in fact only doing what the London market gardeners had done before him. They had long since discovered the benefits of deep tillage and manure applied in the best form for plants to avail themselves of it. In fact, he added, good farming was only good gardening on an farm profitably to follow the example so well set them by the London market gardeners.
After some other toasts were drank the meeting eparated.
The room we should mention was beautifully decorated with plants, chiefly Geraniums in pots from Mr. Turner, Chatsworth, Trentham, Dalkeith, and other great places

\section*{VEGETABLE PATHOLOGY.-No. CXXV}
497. Parasite (1. Phonogams. Dodder).-The genus Cuscuta, and its cognate genera or subgenera, which contain many species, are amongst the mosi destructive of parasites. They are closely allied to the Bindweeds, and differ principally in the spiral embryo, the entire absence of seed leaves, and their parasicic habits. The seeds germinate readily when sown plumule upwards. This becomes in a short time too weak to support its own weight, and therefore either In the former case it ana perishe in thuring plant. In the former case it soon perishes ; in the latter, the young plant begins to twine round its supporter,
and to throw out little processes, adventitious roots, and to throw out little processes, adventitious roots,
as it should seem, from the attached surface. According to Griffith these penetrate to the first completely formed wood. At any rate, they become so far incorporated with the matrix as to be able to profit by its elaborated juices and to be entirely independent of
their own root which soon loses its connection with the stem, when the plumule is once fairly attached to any plant capable of giving it nourishment.
498. This matrix must bear some positive relation to the particular species of parasite. Some species indeed seem not to be nice as to the object on which they are to prey, but others require plants of a particalar natural order or genus, and die if these are absent. This pecuthe distribution of these parasites, which would otherwise destroy vegetation altogether
499. The Common Dodder flourishes upon a variety of plants, especiaily upon Beans, Hops, and Nettles,
and sometimes, though rarely, attacks Cereals. Several real species have been confused under one common name, but after these have been eliminated, there still remains a species which affects plants of very
different characters. Though Beans sometimes suffer from Dodder, the most formidable species against which the farmer has to contend is that which attacks Clover. This species was originally imported from Affghanistan since spread rapidly over the country. It occurs at first in little patches spreading on every side, till the Clover is to a great extent destroyed, as if fires had attempt to pick it out for this. It is quite useless to every broken piece is capabie of growth. The only remedy is, whenever it appears, to dig the patch of spot, and will, if done sufficiently early, destroy the plant before seed is formed. If, however, unhappily, it with it, have been allowed to spread, or if seed is mixed with a sieve sufficiently fine to the seed be screened the Clover or Lucerne seed to prevent the passage of the Clover or Lucerne seed while the Dodder seed passes Dodder, and one-forth broader, a sieve may be found capable of effecting the purpose. One of this character is known in the trade as No. 17.*
500. Flax, again, has its peculiar parasite. This, of should be equally an imported species, and no Flax seed often other seeds, as Gold of Pleasure, largely mixed with it, and if the latter occurs in any quantity the are perfectly use must be much diminished, as its stems though its seeds yess for the purpose of producing fibres, Flax Diss seeds yield oil. Meyen is of opinion that the by means of does not derive the whole of its nutrimen by means of suckers from the parent plant. He thinks the nuiriment consists delicate to penetrate, and that which nuriment consists principally of the moisture however, well supported the matrix. The opinion is not, tions. It is supported, and is subject to many objec quantity of nutritive matter contained in the evaporated fuid could in great measure support the life of a plant belonging to a genus which in general demands fluids already elaborated. \(\dagger\)
of Agriculture. Lindey's article on Cusenta in Morton's Cycloprodia
+ In the figure of the + In the figure of the Flar Dodder in Eaglish botany, the
suekars are represented as very numerous.
501. Brotero has figured amongst his Portuguese
plants, tab. 165 , a species under the name of Cuscuta plants, tab. 165, a species under the name of Cuscuta
Europes barba Uve, which grows only on the bunches of the Vine. It does not appear to be very common, nor is it certain whether it is it distinct species. As it is confined to the bunches, it could only attack those which are very near to the soil. I ann not aware that \(t\) has been noticed anywhere except in one or two places in the neighbourhood of Lisbon.
502. The species of Dodder are confined principally to the more temperate parts of the globe. They sometimes attain a much larger size than our own indigenous species. D. Griffith reports one which ascends trees
20 or 30 feet in height. In the Tropics another genus of similar and almost equally destructive habits is abundant. This has the same relation to Laurels that Cuscuta has to Bindweed, but with chatacters even less distinctive, the only difference consisting in the perma-
nent succulent caly, nent succulent calyx. The suckers are produced in far
smaller numbers, but there is no doubt that the nourishment is derived principally if not entirely from the plant on which it grows, At least such is the therefore had ample opportunity of ascertaining its habits. M.J.B.

\section*{A WORD OR TWO ON WARDIAN CASES.}

Can any reader of this Paper recollect a Wardian case in which the imprisoned plants were in good health? I see a good many of what are popularly
known as Wardian cases in the course of a year, yet I known as Wardian cases in the course of a year, yet I
confess very few are such as I should care to possess. As a general rule the plants are sickly ; in most cases rotting from a superfluity of confined moisture, and upon inquiry you will be certain to learn that the plants you are examining and about which your opinion is solicited, are but the representatives of many generations that have before occupied their places, and which, he them, have hopelessly languished. How is this t of thoseunted for? By the simple fact that he majority cases are entirely ignorant of the true character and capabilities of such plant receptacles. And not only are the cultivators ignorant in that respect, but the makers and vendors are equally culpable. The great aim of their majority of makers would seem to be to render with the popular notion that they should be hermetiwith the popular notion that they should be hermeti-
cally sealed, and that, these conditions being secured, you have only to put a plant inside one to insure for it miraculous growth and longevity, irrespective treatment. Is not this the belief of nine-tenths those who patronise Wardian cases
Now these cases are in much request as ornaments a superlative degree ; but in this design they are so in other to which the principle will maply, as in every not be sacrificed to appearances nor need it be. There is ample scope for elegance of design in combequirements for the facility for affording the necessary that may be placed in them. And it has been urged times out of number (but the almost total disregard of the advice is, I am sure, ample apology for my case, having the welfare of its interior of a Wardian not be wholly cut off from the external air. A Wardian case is to be considered merely as a small conservatory or greenhouse, to be conveniently placed in a living room, or other situation where the atmos-
phere is not in a condition to support fa healthful phere is not in a condition to support fa healthful a considerable when certain plants may enjoy, to growth and health. Plants in a Wardian case will conditions be enjoyed in situations where the gratification would otherwise be denied. This is indeed a correct estimate of its value, but another and I am sorry to say mind.

As regards the treatment of the inmates of a Wardian case close attention is necessary. First take into contion generally; then of the particular plants you intend to cultivate. This with a knowledge of the proper
management of a greenhouse will enable you to succeed admirably. Throw away all ideas of any talismanic power existing in such a plant receptacle with respect
to plant developments, and consider the total exclusion of the air as a popular fallacy.
I have mentioned deaign in reference to these cases. Sopar as the plants themselves are concerned, except indeed under the very best management, those in which avoided. True, plants may be grown in them, but the tendency of inexperienced persons to allow the glass to remain for long periods without being removed is fata kind is that in which a tall bell-glass to cover the head fits into another glass serving the double purpose of a receptacle for the roots and a stand. I have seen several of these in use. Avoid them by all means; they are
plant sepulchres. Every Wardian case should be provided with facilities for ample ventilation; any one that does not possess such facilities is faalty in construction and in the management of any such case, if ventilation is wholly disregarded, failure in a greater or less degree must resuit. \(G\). W. L. \({ }^{1}\)

\section*{Home Correanondence.}

British Oaks. - You blame me for not having dis tinguished the British Oaks, but you probably have forgotten that in a recent number 1 asked for informa-
tion whereby to do so, and received an answer such as could not adopt, although it is docibless quite sufficient for a forester's use. I doubt the permanency of most of the characters given at page 134, snd fear that Dr.
Greville (Edin. Bot. Soc. Trans., i. 65, pl. 4 and 5) has Greville (Edin. Bot. Soc. Trans, i. \(65, \mathrm{pl}\). 4 and 5) has
shown that the same forms and proportions of parts are shown that the same forms and proportions of parts are of the leaves, the length of'the petioles, the length of the common fruit sialks, and solitary or clustered acorns, are a a scientifo devoid of constancy as to be inapplicable branches and the size of the buds The direction of the If there are two, are there not three species in this country? Martin long since gave plates of tliree (Flora Rustica, tab. 10, 11, and 12); and the late Professor D. Don described three (Leighton Fl. Shropshire, p. 478) but neither of those eminent botanists points out any permanent characters. Not residing in a county o baks, I am not well situated for attaining a practical prised, and not slightly sorry, to learn that my shor characters of the trees are "wholly at variance with the species." Let me venture to hope that the editor of the Chronicle or some of his correspondents will hindly take compassion upon my ignorance and enlighten me upo the true botanical distinctions between Q. robur and Q.
sessiliflora, and the proper position of \(Q\). intermedia. Charles C. Bubington. [There are only two wild specie in this country; and they are perfectly distinct. It is evident that our learned friend has never seen \(Q\). sessiliflora, which is not an eastern counties plant.]
ardencrs Benerotent Institurion.- 1 beg to offer Errington's remarks suggested to my mind by Mr think that if gardeners were better paid it would be better both for themselves and their emphoyers. Mr E. says truly, they do not make money. Here I may say that I am not speaking of our first-rate gardeners siluations, and in passing, I make bold to aver that any young man, let his ability be ever so good, if he lack very poor chance if he aspires to exercise his talents in a situation of that description. But in these remarls I refer to the great mass of gardeners, the middle classes of that community, if I may so speak. In too many
instances the scale of remuneration is very low indeed. I need only refer to the advertisements in your Paper for conformation of my remarks. Very superio qualifications are required if the salary rises above the stereotyped 208 . per week. Those nondescripts who are wanted to take charge of a pony carriage, to drive, possess so called. Taking into account the constant attention, care, and forethought necessary in gardening matters, gardeners ought to be well paid. I do not for one moment wish to detract from the merits of the Gardeners' Benevolent Institution ; far otherwise ; stil as Mr. E. seems to think that the lack of gardeners subscriptions to that charity lies in their carelessnes leave wants of their decayed brethren, I would beg leave to say from my own observation that many
gardeners, especially if married and with families, find themselves ill able to subscribe even one guinea annually. If the gardener must keep
pace with the times he must procure and study gardening terio times he must procure and study and other kindred subjects, and standard works of the kind are not proverbial for cheapness. But let the scale of wages be generally raised. Let us see no more advertisements for gardeners with abilities of the highest order, and every other qualification, and the wages (I blush to say it) perhaps 1l. per weels, or indeed perhaps less than itaral basis, and gardeners wold exert themselves more in the service of their employers; would be able and willing to assist their really unfortunate brethren, I say really unfortunate, for I have no sympathy for the hordes of broken-down gardeners who owe their misfortunes in old age to their own bad conduct. In fact it would be found, although misfortune will sometimes occur to the most industrious and praiseworthy, that the number of decayed gardeners would be greatiy decreased. Petit à petit l'oiseau fait son nid, June 10th.
Cure for Insects.-If "J. M. \({ }^{\text {a }}\) has a dislike to fill his conservatory with tobacco smoke let him try the follow ing, which I have found effective in the destruction of insect life. Procure a bushel of young Alder shoots they may be found now ; bruise them slightly and add chree or four times the same quantity of cold rain water, nacerate for two days, and apply the liquid with syringe. 1f, however, he wishes to continue with smoke and the longer he can retain it the sooner will he effect his purpose. According to my opinion the worst thing that could be done is to bring the whole to blaze, although the nearer he can approach that without injury the more perfect I would consider the pplication. H.
Roses.-Having a fine plant of a Rose called La Reine in my garden which produced numerous very fine bads which, however, mever came to perfection,
thought the situation might be too cold, and transple thought the situation might be too cold, and transplanted
where it continued to grow well, and has lately produced
many luas; but atter a tume they all become deformed, perfection any more than they did out of doors. Many of the buds are much larger than the one inclosed before they appear to suffer. Can anything be done to prevent this, or had the plant better be discarded I Anon.
It has received too much water and has too little uittom heat.]
A Correrpondent's Misfortunes.-Having on more than one occasion experienced your polite attention, I must ne in presume to trespass on your kindness for a brief s,ace to lay my complaints before you, which I think yu will say are just, hoping to benefit much by your char that my indulsent husband, who has a preat con tempt for growing anything but Wheat and Turnips, and such like cropu, does nothing but laugh at my mismanagement, as he terms it, when really there has
been no fault on my part whatevtr. By his permission been no fault on my part whatever. By his permission
I a ded about a quarter of an acre to my lawn last I a!ded about a quarter of an acre to my lawn last and the ground well dry and levelled. not quite right? Then I had some chalk put over it Well, I looked into your Paper, and found where I could buy the best Grass mixture for lawns, and wrote to a horrid man in the West of England, and he sent me a bag of seed which my servant sowed carefully, and last year with us was rather dry, the water-engine was occasionally used; surely this was all right, was it not Oh ! horror of horrors, my husband came in one morngrass and Clover, and offers to give me a shilling for grass and Clover, and offers to give no a a it. Provokin' man! hate to be quizzed. True it is, a long coarse Grass grows in tufts, and looks just like my husband's Oats and Barley, and the Clover is an ugly, tall, large, leafed thing, such as the cows and sheep eat. Now, is not this a shameful trick? be made to pay all the additional expense [certainly] I shall be put to in going over the same process as before, which cost \(5 l\).! I have met with so many vexations and disappointments from your advertising friends, that I am half inclined to be angry with you. I have wrong seeds, and sad rubbish, and wrong plants sent m 3 often and again, and so many of my acquaintances have suffered similarly that in my own and their names I implore you to devise some means to protect mention many parties who are considered first and very flippant replies to my notes regarding their mis takes, and withaut ever getting any redress. I really think if a number of us of the weaker sex, as you men please to term us, were to devise some means of intercommunication by which we could make each other acquainted with the names of those tradesmen who play us tricks, and those who treat us fairly, (a kind of pronective assoeiation) we might put a check upon such Anemones this season, and 1 ordered double scarlets the ought to be whipped. Pray tell me what to do in rature. I have run down here to recruit my spirits and temper. Put something in your Paper (which I always rear attentively; though it is in part very hard and difficult to understand,) to cheer me, or I can never put any confidence again in the nurserymen, who seem to Ivertise for the sole purpose of entrapping those who to their little gardens for pleasure and amusement I am sure if we gardens for pleasure and amusement able terms, it would greatly tend to encourage us, and Hesica Hastings [If our fair Jessica, Hastings. [If our fair correspondent is in rubbi-h, she should expose the name of the person in
the West of England who swindled her. We cannot possibly take any responsibility on account of the doings advertisers ]
Brcad.-Combine the Wheaten meal with water saturated with carbonic acid gas, in the proportion, for small quantities of water so saturated, of half a pint to ful of ealt may be mired op with the meal, or the salt may be employed alone. For experimental use, \& common oval bottle of soda water may be poured into a pound of meal, mixing the ingredients briskly together at the same time; but, for ordinary domestic use, late years-for example, Gailard \& Dubois' gazogene. Omitting the first expense of the gazngene, the fabrica ion of the carbonic acid gas thus costs literally next to nothing; and, for the cleanly and asfe confection of unfrrmented bread, is vastly preferable to every form of
acid and soda, baking and other powders, whatsoever. H. McCormac.-My experience in raising bread is as ollows:-Various kinds of baking powders used for this parpose evolve large quantities of carbonic acid gas when they come in contact with water in the dough. contain unwholesome ingredients. I have mostly used Borwick's German Baking Powder," which may be had at almost any chemist's or corn chandler's. It neither imparts a peculiar taste nor colour to the bread, nor
does the dugh require kneading. Full divections for use the dugh require kneading. Full directions for The Crystal Pa'ace Show. We have received several omplaints respecting the arrangements on the last to forward them to the Secretary of the Crygtal Palace

Company. We have alsu other communications befor In justice to the Crystal Palace Company, we beg contradict the statement made by your correspondent, a 0.390 , respecting the prizes given to exhibitors in the Hiscellaneous Class', for we noticed particularly that
every subject worthy of merit received an adequate every subject worthy of merit received an adequate
prize; and amongst the successful competitors were ourselves with a collection of Exotic Ferns. If he will
turn to the schedule, it will be found to contain six urn to the schedule, it will be found to contain six
pizes only in Class XXVII., and we are certain that double the number were awarded by the censors, who elve well selceted for each department, and the exhibitors geverally expressed their full satisfaction with awards have bee 1 advertised is simple and comprehen sive; mo much so, indeed, that no 'Exhibitor' need complain.

Hybridising Pelaryoniums.-I am working the rough leaved Geranium \({ }^{\text {a }}\), Unique, \&c., and have got a promising thing or two. I am just now trying to get a rise
out of Hising Sun by fulgidum. The importance of cross-breeding cannot be over-rated. I believe that Geraniums rarely produce improved eeedlings by their own pollen. They are generally reproductive of them selves or of their lightest coloured parent. Three weed not far from eapitatum, yet the high colour which does not always descend will strongly affect the p:oduce of another sort. Much observation and registry needed on this quart of Peas sown in a shallow box, 15 inches wide by when aboug, at any time of the year, and cut of with little salt mats an tops of Jerusalem Artichokes cut off about 6 inches long, and boiled like other greens, make a capital dish, which partakes in some degree of the flavour of the root. Boiled Watercress also makes a wholesome and delicious dish. It must not, however, be over boiled; for impaired constitutions it is invaluable In April and May late Potatoes should always be peeled some 10 or 12 hours and steeped in cold spring water it mas es the Potato nearly as good as those dug in October The proper way to make a cup of good tea is a matte of some importance. The plan which I have practised for these 12 months is this. The teapot is at once pot, and is boiling water, then the tea is put of it used; the leaves gradually absorb the water and as gradually sink to the bottom; the result is that the tea leaves are not scalded, as they are when boiling water is poured over them, and you get all the true flavour of the tea. In truth, much less tea is required in this way than under the old and common practice. James Cuikill, Camberwell, London

\section*{§orietics.}

Caredonan Horticultural, May 24.-On this occasion prizes were awarded as follows, viz.:semiduplex, præstantissirr a, Calceolaria violacea, and Struthiola stricta; second, Messrs. Dicksons with Azaleas indica alba and Halfordi, Boronia tetrandra and Tropæolum tricolorum. Stove and Greenhouse Plants, first, Mr. Fowler, Glenesk, with Cattleya Lockhart, Arniston, with Azalea Murrayana and Camer, Rhododendrons, first, M Cameron, Trinity Cottage, with R. Queen Victoria; second, Mr. Fowler, with Miranda. Cape Heaths,
first, Mr. Lockhart, with Linnæoides superba and ventricosa grandifiora superbs. Best trained Climbing Plant, first, Mr. Blair, Mavisbank, with Tropæolum tricolorum; second, Mr. Douglas, Falcon Hall, with the same. Azaleas, first, Mr. Cameron, with A. lateritia alba and prestantissima. Cinerarias, first, Mr. picturata, and optima; second, Mr. M•Farlane, Barnton, with Barsina, Bessy, Lady Gertrude, and Queen of Beauties. Pansy blocms, first, Mr. Henderson, Cargilfield, with Sir C. Napier, Mary Taylor, 8on, Cargifield, with Sir C. Napier, Mary Taylor, Minerva, Pandora, Sir R. Napier, Flower of the Day, Minerva, Pandora, Sir R. Napier, Flower of the Day,
and Bride; second, Mr. Reid, with William, Minerva, Royal Standard, Mary Taylor, Jeanie, Miss Walker Lord Raglan, A. B. Gough, Royal White, Lord Dunfermline, Louisa, and Miss Talbot. Pelargoniums, first, Mr. Cameron, with Glowworm and Forget-me-not.
Fancy Pelargoniums, first, Mr. Forrest, Glentarkie, with Countess of Ross and Annete. Herbaceous plant first, Mr. Crombie, Cramond, with Dielytra spectabilis second, Mr. Smith, Clermiston, with Anthericum liliago Alpine plants, first, Mr. Falconer, Canonmilla Cottage, with Maianthernum bifolium, Ramonda pyrenaica, Houstonia ceerulea, and Androsa villosa; second, Mr. Mrarlane, with Dianthus ceesius, Sedam Dickson \& Co's. prize for the four newest and best Azaleas was gained by Mr. Cameron, with Gledstanesi, Prince Albert, magnifica purpurea, and Melbourni. On this occasion, the following prizas were offered by the office-bearers of the Society, viz. :-Two Sovereigns gained by Mr. Lockhart, with Aphelexis humilis,

Azilea grandis, Cereus Austini, Tetratheca verticil Ir Blair Beaumontia, and E. intermedia; second lorenia asiatica, Gardenia radicans, Ardisia crenulata, A phelexis macrantha purpurea, Tropæolum triculorum, Maxillaria Dieppii, Eschynanthus apeciosus, Pimelea Maxillaria Dieppii, Aschynanthus apeciosus, Pimelea The best collection of Ferns was sent by Mr. Falconer the kinds being ss follows:-Allosorus crispus, Asple niom Adiantum-nigrum, fontanum, marinum, Rutapleraria, septentrionale, Trichomanes, tand viride; Athyril m Filix-fœmina and vars. crispa and monstrosa; Blechnum boreale; Cystopteris montana and fragilis Lastrea dilatata and var.; Filix-mas and var. cristata, igida, Tl eypteris; Onoclea sensibilis, Osmunda regalis Polypodium vulgare, calcareum, Dryopteris, Phegopteris and alpustre; Polystichum Lonchitis, aculeatum obatum, angulare, vars, angustatum and proliferm Scolopendrium vulgare and var, undulatum; Adiantum pubescens and pedatum; Lomaria Patersoni, Woodsia obtusa; Acrostichum alcicorne; Niphobolus sinensis ; Pteris tremula, hastata, chinense, serrulata and fo tundifolia; and Struthiopteris Pennsylvanica ; zecond, Mr. Blair, who produced Adiantum affine, pubeacens, assimile, formosum, tenerum and hispidulum, Polystichum proliferum, Asplenium viviparum, Polypodiam crassifolium and angustifolium, Cyrtomin falcatum, Pteris longifolia and rotundifolia, and \(\Lambda\) spidium exaltatum. Numerous productions were placed on the tables or exhibition only. From Messrg. P. Lawson \& Son were Pimelans, variegated leaved Vine, and a collection of Coniferre, including Cupressus Laweoniana, and several new speeies of Cupressus from North America; from Messrs. Dickson \& Co. Rhododendron formosm, and Heaths; from Messrs. J. Dickeon \& Sons, Rhododendron Dathousiz in flower, blooms of a hybrid Rhododendron named Countese, Erica sustralis rosen and Daviesia latifolia; from Mr. Handasyde, Thuja gigantea and other Coniferæ; from Mr. R. M. Starl Cinerarias, Alpine Plants, and rare Ferns ; Mr Methven, Rhododendrens, imeluding a superion variety named Stamvellianum album ; from Messrs. Downie \& Laird, Cinerariss, Mimuli, and Pansy blooms ; also a seedling Pansy named Duchess of Wellington-a yellow ground with broad dark belting of superior size and quality, for which a Certifiaste of Merit was awarded ; from Measrs. Cunninghame, Frater, \& Co., Viburnum saaerocephalum ; from Mr. T. H. Douglas, Cinerarias; from Mr. Forrester, Aurienlas, and a promising seedling, of neat habit, stated to have been raised from seed of an Alpine Auricula fertilised with Primula ciliata purpurata; from Mesars. W Ballantyne \& Sons, Pansy blooms and Cinerarias ; and from Mr. Black, Pansy blooms, including several seedlinge. From the garden of Sir W. Gibson-Craig Bart., were flowering branches of Ribes Hookerianum and the Himalayan Apricot ; from C.K. Sivewright, Esq, a plant of Azalea lateritia superta (in six-inch pot), covered with large and fine flowers ; from Mr. Pender a dish of Strawberries and early Ann Peaches ; from Mr. Melville, a basket of varieties of Tropseolum Schuurmanianum and Collinsia bicolor alba; also specimens of Melvile's Incomparable aud May Cauliflower Broccoli; from Mr. Stirling, Anemone Poppiana and other rare Alpines ; from Mrs. Carstairs, 25 heads of Aaparagus, weighing 43 oz ; from \(\mathrm{Mr}_{\text {. }} \mathrm{J}\).
Porterfield, 14 stalls of Rhubarb , weighing 40 lbs .

Shakupere' England ; or Sletches of our Sacial History in the Reign of Elieabeth. By G. W. Thornhary 2 vols. 8 vo. Longmans.
It was a good idea to take a point in the History of England, and to work out minutely our social condition at that tima. Nor could a better period have been chosen than that selected in the volumes before us. I is not everybody who cares about court intrigues, political schemes, or the history of trade, or even mintar and naval glory; but all desire to know how their for fathers lived, ate, drank, dressed, and employed them selves, what sort of houses and gardens they occupied how they were furnished how people amnsed themseve and all the ather little details which make up the roans of man's existence in society Of all this and much mon Mr. The Mr. Thorabury undertakes to tell as, satisfactory manner. Antiquarians will, doubtless, find errors in his narrative, and discover faults beyond the reach of ordinary eyes, but it eannot be denied that his picture of the Elizabethan worid is eseentially true if not so in every minute particular. The long extrat from the anthor's pages which we gave last week wil have prepared the reader to expect mach entertain. from the volumes themselves, nor will he be ait appointed.

Of the gardening of the 16 th century no very exalted opinion has been formed from the fragmentary account that have reached us. Its worst features are probibly those selected by an anonymons writer on Elizabeth Gardening in the third volume of the Journal of thed by Mr Sy Mr. Thombury in his account of Hawstead How the seat of Sir Wm. Drury. It appears the the Pyracantha was employed then, as now, to cover ing account: "Theprivygarden was ourrounded by abric
our quarters, with a Yew in the centre, and 62 fruit end was a fine arbour, redolent with sweet urees and
trees on the wall. The great orchard was cut into one flowers. The garden-plot near had fair alleys of turf, great square and one small trianyle fianked with 283 and others paved with smouth sand, pleasant to walk on Cherry and other trees. The privy orehard containe
39 fruit trees. In the housekeeper's yard stood 39 fruit trees. In the housekeeper's yard stood pigeon house ; in the great orchard an aviary, where
doves were kept." But the principal account of them is taken from Lord Bacon, from whose description w borrow a few passages.
"The borders were bright in all seasons, though half our present flowers were then unknown. In December and January there were fragrant herbs and evergreen Pine, Fir, Rosemary, and Lavender, white and blue Periwinkle, Sweet Marjoram in warm places, and in stoves, Germander, Flag, Orange trees, and Lemons, and Myrtles. At the end of January and February came the flowering Mezereon tree, tha yellow and blue Crocus, Primroses, Anemones, the early Tulip, the
Hyacinth, the Fritillaria. In March before the first Hyacinth, the Fritillaria. In March before the first
bwallow, the Violets, the Daffodil, the Daisy, the Almond and Peach trees, the Cornelian tree, and the Sweetbriar. When Winter melted into tears and died while April wept, there rose from the tears of that holy
and repentant sorrow the Wallflower, the Stock Gilli. flower, the Cowslip, Flower-de-Luce, Lilies of al natures, Rosomary flowers, the Tulip, the double Prony, the Jonquil, the French Honeysuckle, the Cherry blossom, the Damascene Plum tree, the White thorn in leaf, and the Lilac tree. In May and June Honeysuckles, Strawberries, Bucloss, Columbine, the French Marigold, Flos Africanus, Cherry in fruit Ribes, Figs in fruit, Rasps, Vine flowers, Lavende flower, Sweet Satyrian, Heria muscaria, Lilium con vallium, and Apple blossnm. In July Gilliflowers, Musk Ro-es, Lime blossoms, early Pears and Plums,
Genittinys, and Codins. In August rich coloured fruits, Pears, Apricots, Barberries, Filberts, Musk Melons; and in flowers, Monkshood. In September Poppies ; in fruits, Grapes, Apples, Peaches, MelocoIn October and November, Services, Medlars, Quinces, In October and November, Services, Medlar,

For a princely garden about 30 acres of ground was required, the whole being divided into three parts, of green, and the third a heath. The green at the entrance required 4 acres of ground, 6 to the heath, 12 to the main garlen, and 4 each to its two wings. The green about 12 feet in height of carpenters' work on eith about 12 feet in height of carpenters' work on either Borde, by whieh you might enter the garden on hot days Borders of coloured earth in various shapes were no unfrequent, and were generally between the garden and
the house. Bacon's model garden, with its recurrent the house. Bacon's model garden, with its recurren
flowers and 'ver perpetuum, was a square, and encom flowers and 'ver perpetuum,' was a square, and encomarches reared on wooden pillars 10 feet high and 6
broad; over these arches were hedges 4 feet high, broad; over these arches were hedges 4 feet high, supported by wooden frames, and over every arch a turre figure with broad plates of round coloured glass gilt, for the sun to play on: and this hedge was raised on a gently sloping bank, 6 feet high, set with flowers. On either side of the garden square were to be side heath should not be seen through the arches. Within were figures cut in Juniper, although Bacon liked not such children's play; in some places were fair columns upon wooden frames, and little low ledges and pyramids. In the very middle stood a mount with thre winding ascents to alleys wide enough for four to walk abreast. The hills were 30 feet high, and erowned by a banqueting house with ehimneyso Nor were fountains, the beauty and refreshment of a garden, ever
forgotien. They were of two sorts, the jet and the basin ; the latter were of ten 30 or 40 feet square, and Were sometimes used as bathing pools. They were always paved, and had, like the others, marble or gilt images ; they were erabellished with coloured glass, and encompassed with low rails. The water was kept in perpetua! motion, and the basin was cleaned daily, lest the watd grow muddy or discoloured, in some place feathers, drinking glasses, and canopies; 'pretty things to look on,' says Bacon."
entered thronens at Theobald"s (Lord Burleigh's) were entered through a gallery painted with a genealogy of
the kings of England. They were encompassed by a moat, hedged with shrubs. They sbounded with labyrinths, jet-d'eans, white marble fountain-bowls, and wooden columns and pyramids. The sammer-house in the lower semicircle contained statues of the 12 Cresars, and a touchstone table. The upper part of the house was set round with leaden eisterns, in which, slthough fish were kept, were used in summer for bathing. little bridge joined this to another arbour, which contained an oval table of red marble. In the Hampton Court Gardens the Rosemary was trained to cover the Wall, a praciice that surprised foreign visitors
It seems that the Paradise of Paradises was in those days to be fivund at Kenilworth. Laneham, a "gossiping" writer who saw the place, says:
north of the eately castle: north of the etately castle: a pleasant terrace, 10 feet trim Grass, ran besid, ever under foot and fresh with set with a goodly show of obelisks and wall. It was white bears of stone, raised upon goodly bases. At each
as the sea shore when the wave has just retired. The enclosure was divided into four even quarters: in the midist of each, upun a base of 2 feet square, rose a porphyry equare pilaster, with a pyranidal pinuacle 15 feet high, pierced and hollowed and crowned with an orb. All around was covered with redolent herbs and fowers, varied in form, colour, and quantity, and mixed with fruit trees."
It must be confessed that these arrangements are if there was not something stately and grand in the best Elizabethan gardens, which harmonised better with the manners of the time than the picturesque style of the present day. Everything, indeed, was rectangular or circular, but right angles, circles, and segments of ye of taste than the crooked, writhing, twisting, long tailed, short-tailed, frightful desigos that are to be founs in even this enlightened age.
To country life a long chapter is devoted; and it i one of Mr. Thornbury"s best. The days of "good Queen
Bess" were not days of universal content as imagine. On the contrary, grumbling had already established isself as a part of an honest Englishman' character.

In the country the farmers and labourers chafed a the frequent new inclosures, which they said made lan desrer, and turned tillage iuto pasture so fast that one naan only lived where threescore had once obtained
subsistence, and one plough worked where a dozen had been scen stirring ; labourers' food rose in price, and mechanics' wages were reduced to starvaticn pitch. Less prentices were in consequence kept, and many iucreased, and the idle and the discontented grew daily more numerous. The merchants complained tha only London was thriving. The country gentle men, on the other band, declared that inclosure ncreased the number of cattle, and kept cor dearth of food. Craftemen replied to all this by declaring that it was never a merry world since gentle meld turned graziers, fhrl a mime scarcely find mest and drink for their'
 demanded hi her find hirer prices, landord demaded higher fines and hoger rents, many wer riven to give up their households and to tabe chamber in London, with a lacquey and a page in the place of som 10 stout serving-men, and 20 or more other helps. In far as 200 marks had done 16 years before.

With all these complaints the nation grew ever day greater, wiser, and richer ; there can be no doubt that these evils did exist, but their effects were less
universal and less permanent thau these Jeremiahs could foresee, and were produced by transitory and inevitable causes which indicated progression. There were, however, constant riots about the new
inclosures. Plays were written acainst them, inclosures. Plays were written against them. Ben that seemed so dangerous and hurtful. Old men almost wopt to see arable land which had given many poor men a living, fallen suidenly into one man's hand; where corn and cattle had been reared, there was now only sheep; and instead of 200 cottagers, half a dozen shepherd's people who dreaded 30 years' more inclosure however, the far-seeing could net help observing that Essex, Kent, and Northamptonshire, the favourite counties for inclosures, were also the richest ; and civi lawyers held it as a maxim, that tenants in 'common' were not such good tusbandmen as tenants in 'several ; but the more prudent, nevertheless, lamented to see poor men unjustly deprived of their common righta article the inclosers rephied, that wool was a grea that of commerce, and made England rich; an interest of the many: that corn was cheap, and that pastures increased the number of elothiers:"

But we mast conclade. That much of the above wa well known to the student of our social history before Mr. 'Thornbury's volumes appeared we readily concede. But since the world is not made up of stadents of social on that account.
The Young Housewife's Book, how to eke out a mall inoome (Groombridge), is not a book at all, but receip the thin pamphlet of 30 .pages contaming a few it beipts and nome good advice for poor people. Har it, but to charge sirvence, the representation in a peor man's family of a quarter of a day's hard work, for what ought not to cost more than a penuy, is a strange way of showing practically " how to elke out a small income.

Mensss. Longmans have issaed a tiny edition of Moors's Lalla Kookh, Inisk Melodies, Songs and Ballade, in three minute volumes, each of which will lie in the waistcoat pocket. We may best describe them in the words of a young lady, who seeing them on our table exclaimed, "What dear little books !" Such volumes will carry the musical cadences of Moore everywhere; would that some enterprising publisher could find an author capable of teaching the masser how to read poetry
musically.

Garden IVIemoranda
Kivap Hill, Near Woking.-It is impossible to overrate the beauty and grandeur of effect which
Waterer's nurseries possess at the present time. Nearly 25 acres of Rhududendrons and hardy Azuleas of every conceivable tint and shade of colour may here be found now in full bloom. They have been pianted in masses in beds and borders, the latter sloping in some instances like the stage of a greenhouse, though not so steep, down to the margins of the walks with which they are interspersed, and literally banks of flower. Handsome standard Rhododendrons of great age and size are also liberally scattered over the whole extent of space just mentioned, and as may be imagined the display they make is striking in the extreme. The soil here being sandy peat is peculiarly well adapted for plants of this kind; they cherefore thrive and flower annually in the greatest profasion, and never have they been better than they are
this jear. Althouch peat suits them beat, this year. Although peat suits them best, however,
Mesgrs. Waterer affirm that they will grow and flower Mesgrs. Waterer affirm that they will grow and flower
very well in other soils, provided they are light and open, but that if stiff and heavy they are all the better for being mixed with leaf mould, or charred vegetable refuse. A great point, they add, is to plant sufficiently thick to cover the gronnd, and so afford shade to the

Many seedlinge are just now flowering for the first ime. Among the beat that have received names are Warrior, a deep purple with an immense head of bloom; Champion, rosy pink, compact and good; Mrs. Stevenson, rosy salmon ; and Combii, salmon pink. Of older William Downing, a showy and excellent kind. Prince Albert we saw here in really good condition.
It is not Rhododendrone that thrive here; all kinds of nursery stock do equally grow with wonderful vigour and rapidity, and snon form handsome specimens, nhich though large are continually transplanted, to keep their roots within bounds ; they are therefore capable of being removed to other place with eafety. Pinus macrocarpa may be seen here in the shape of a tree 40 feet in height, aud we counted on specimen of P. nobilis 104 cones. Seeds of Araucaria imbricata, numbering upwards of a hundred thousand, have lately been received and sown here; they occupy many cold pits in which the soil (loam) has been put in, levelled, and the seeds set small end downwards. We also noticed numbers of small plants of the new Cr . pressus Lawsoniana.

Weeping trees form a distinguishing feature of this nursery, especially Beeches, of which there are some fine specimens. We also \(r\) morked a few noble trees if a very dark variety of purple Beech, which if freel introduced into parks and pleasure grounds would tend in a remarkable degree to vary and beautify thei
appearance. a variety of Laburnum (Waterer's) is likewise just now in perfection, white the common kind is getting out of flower. This therefore, independent of its superior beauty and sweet scent, is Whentention for its late blooming habit alone. 5 feet eeping Yew, grafted on a common one about stem and head spreading out horizontally gave it the form of the letcer T. Tree Pæonies and other flowering plants are liberally distributed about the borders; orming altogether such a show of bloom as is rarely one's good fortune to see.

Royal Nubsert, Slough. -Since our last visit to this establishment, which may be stated to be the head quarters of floriculture, Mr. Turner has enriched his already extensive collection of Tulips by the additio of the principal part of the stock of the late Mr Groom, of Clapham Rise. We have been in the habit annually of calling attention to the best varieties in the last-psmed collection, but on visiting the nursery recenty, we coness that the same had. could scarce \(y\) be recognised in the better soil and purer air of Slough, which, comparatively speaking may be said to have made new flowers of many of them. These, in addition to the finest "strains" of ail the established varieties, we meed not say have made Mr. Turner's bed of 180 rown, or 1260 roots, one of the gayest floricultural displays of the kinc anywh be met \(1 n\) featherer Mr Sander son, and J. F. Wood. In flamed bizarres, Lord Raglan, Prince of Wales, Vivid, Everard, and a flamed variety of Dr . Horner, which is very distinct from the feathered kind. In bybloemens, Maid of Orleans. Duchess of Cambridge, Abbot's Gem, and Ratley's Queen were con spicuousły gond. In flamed bybloomens, Princes
Royal, David, Thalia, Muzidora, Pandora, and Bloemart were among the best. With roses Mr. Turner's bed was richly furnished; Battersby's Gem, Heroine, and Aglaia were beautifully feathered, and this good old Kivd was equally fine in a flamed state. Tadere were
also King of Saxony, Lady Peel, Lady Stanley, Anastasia, and that good old sort Triomphe Royale with many others in their best condition. It unnecessary to speak of the collections on habit of goniums grown here, as those who are in will have noticed the great beauty of the specimens grown and exhibited by Mr. Turner. Here we remaraed Admi rable, a flower of fine form ; Lord Raglan, brillian scarlet; Wonderfud, Meteon, Una, a very free bloum ing white variety ; Serubhier, Fair Ellen, and Governor

General, which should be in every collection. These
were all very fine. In addition to large plants we obWere all very fine. In addition to large plauts we obConspicuum, Mr. Hoyle, Spotted Gem, Mr. Beck, and Queen of the Fairies. These are all distinct varieties, spotted in the under petals, of fine form and free
bloomers, fully equal to the luest of the continental bloomers, fully equal to the lest of the continental kinds in point of attractiveness, and far superior to
them in form and substance. One of the best Geraniums we have seen is a seedling, well named King of Scarlets, as it is by far the most brilliant scarlet with dark upper petals we have yet met with, and is a free bloomer. In a house devoted to seedling Fancy Pelargoniume, we noticed some very fine seedlings; one of these in particular, named Emperor, was remarkable for size, form, and marking. margin, and maroon spots on the lower petals with white ground colour. Jenny Ney is also a finely formed lower and a free flowerar, of a bentiful rose and white colour; and Helen Faucit is a fine bright variety large and smooth bright coloured kind was named King of the Fancies, and Corminatum is a flower of fine form, and a free blonmer. One of the best and most attractive is Mrs. Colman, which is very bright, with white centre and margin, and will evidently make good exhibition variety; Countess of Abingdon is also a good rose coloured kind. Two dark varieties were
distinct and fine; one of them is named Sir Joseph Paxton, maroon and white, and the other General Pelissier, which is a great improvement on Advancer. These seedlings are all free flowerers, many of them are new in colour and finely shaped. During the present month the Pelargoniums ants are grown exter sively here, but a great many of the new things are not yet in bloom. We however noticed some fine Petunias Majestic, Major Domo, and purpurea alba were beautifully marked kinds ; so also was Marquis de St. Inno cent, a new contiuental variety, bright crimson in
colour, striped with white ; this looked as if it would be colour, striped with white ; this looked as if it would be
a good bedding variety. Imperial, the new double white variety, was also in flower, and is certainly well worth attention. Among new Verbenas now blooming were Mrs. Holford, a fine white variety ; Loveliness, fection; Nymph, a good light continental variety and Blue Bonnet, which seems to be a good bedding lind. Kinghorn's General Pelissier Geranium was in which has been given it. Some of the nigh character Geraniums were also in flower, but Alma promised to oe the best, the colour being very bright, with moother forage than the blin shrubby Calceolarias was just coming into blossom; bservable among them was Hawk, a very attractive spotted kind of decidedly shrubby habit. There were also several other distinctly marked kinds, as well as
selfs, some of which were of new tints, and all of shrubby habit, adapted either for bedding purposes or for culture One of the most desirable is King of Yellows, a very dwarf variety, rich orange yellow, and very free; Orange Boven, bright orange brown, is an excellent bedding kind; Goldfinder, a small-flowered variety every collection; as should also Spotted Gem, rich yellow covered with reddish brown spots, dwarf in Sultan in habir, but dwarfer and more shrubby, rich crimson; and Eclipse (Rollison's) the brightest colour of all the crimsous, but apparently a bad grower to show that Brilliant, Admiral Dundas (Henderson's) optima (Hopwood's), Admiral Dundas (Ivery), optima (Bousie), Sir Charles Napier, Emperor of the French Duchess of Wellington, Oliver Cromwell, picturata, and Lord Stamford, are among the best. Planting out Dallias has by this time been completed, the plants having been grown on in pots for the purpose ; Mr. Turner considers this plan much better than planting out very early.

\section*{Calendar of Operations.} (For the ensuing week.)

\section*{plant department.}

Conservatory, \&c.-It is a very common practice in the management of this and other show houses to
huddie the plants thickiy together in order to produce a dense mass of bloom, but this should never be done with hard-wooded plants, especially at this season, when they are starting into growth, and most things if they aro to be of any further service require a fair share of
light and air while in bloom. Valuable specimens of hard-wooded things, particularly Heaths, should be frequently examined, turning them partially round in order that their shoots may be equally exposed to the light, and if anytling appears to be suffering from confinement it should be removed at once to more airy quarters. Should house will require a liberal supply of water to keep them properly moist, and the soil about strong growing plants should be occasionally examined to see that it is not too moisure absorbed by such things at this season is much greater than inexperienced persons are apt to imagine.
Now that many of the inmates of the greenhouse can with safety be removed to the open plant ground, where
they will do quite as well or better during summer than
under glass, there will be no necessity for crowding the specimens left, therefore see that every plant stands guite clear, so that all its parts may be fully exposed to light and air. In placing greenhouse plants out of doors care should be taken not to rashly expose them
to bright sunshine, particularly if they are at all tender through having been kept close or are in a growing state. Indeed the plant ground slould be so situated
that the plants will not be exposed to the midday sun, for few things in pots will do much rood if exposed to the full force of ancinally used furnish a supply of flowering plants for the summer and autumn decoration of the conservatory, some have the things in a fit condition for removal to the conservatory when they may be wanted there, for until the weather becomes warner than it bas hitherto ween plants muston no account be removed from a without some preparation. And plants that have been grown in the stove should either be removed to an
intermediate house or placed in the coolest end of the stove

\section*{forcing department.}

Vineries.-Borders that have been lately uncovered should be carefully examined, and if found too dry give liberal soaking of good strong manure-water from the ever, to mix the manure-water with sufficient warm water to bring the temperature to from \(70^{\circ}\) to \(90^{\circ}\). Take advantage of bright days to admit air freely where the Grapes are colouring, and avoid moisture in the
atmosphere by removing all plants from under the Vines. Attend carefully to young Vines recently planted, keeping the soil about their roots in a healthy moist state, maintaining a moderately moist atmosphere, and
shading if necessary until the Vines get a fair start. Melons.-Where the fruit is swelling endeavour to keep the soil in a nice healthy state as to moisture, avoiding either extreme. Give air freely whenever the weather admits, and use every means to preserve the foliage in health. Keep the Vines thin, and prevent remove any decaying leaves immediately they are pereeived, which when left only serve as numiser a good crop in "dung frames," and if any of the frames which have been used for getting up the bedding-out stock can be spared for this purpose the beds should be made and the plants got in without loss of time. Very little artificial heat will be necessary at present and the bed should not be made to heat too strongly otherwise there will be time lost before the plants can be safely put in.
The beds should be made high enough however to allow of applying a lining if necessary later in the season, but this will be easily managed by making the bed some two feet high with any useless material which will not ferment, and placing upon this sufficient well worked stable dung to afford a gentle heat.
flower garden and shrubberies.
The weather during the last ten days has been very favourable for the newly planted-out stock and well prepared plants are rooting into the fresh soil freely, those who delayed planting out until the first week in June,
and were then prepared with strong plants in good and were then prepared with strong plants in good
condition, will probably have their beds covered before condition, will probably have their beds covered before
those who planted out earlier ; should the weather continue dry and warmo, however, the plants must be regularly attended to with water, for it will not do to leave hem to take their chance because they have made a ew roots since planting out. Daily waterings will not however be so essential now that the plants have made some progress at the root, as the increased root action will balance the extra drain upon the system of the plant resulting from full exposure to sum and air; but the soil must be well supplied with water until the beds are airly covered, by which time, if the soil is deep and poistus it should be, the plants will find sufficient moisture in the soil. See that everything liable
to be injured by a sudden storm of wind is well secured by pegging or staking, as may be proper, and keep the surface soil about all recently planted
things loose and open by frequent stirrings, which will greatly assist in promoting rapid growth. When there is a large demand for cuttings for spring propagation, a number of plants of each variety proportianate to the probable demand for cuttings should be selected from the reserve stock, potted in finch pots in light soil, and plunged in the reserve garden. These, with very little attention, will make nice stocky plants in course of the summer, and there is no risk of losing hardly be said of autumn-rooted cuttings of many things and by repotting and placing them in growing circumstances early in spring, each plant will furnish a large number of cuttings sufficiently early to make good strong plants before planting out time. Young specimens of ornamental shrubs and trees which it is
desirable to get to grow rapidly should be thoroughly soaked with water at once, especially Coniferous plants.
hardy fruit and kitchen garden.
Trees that have not got fully established since replanting will be benefitted by mulching over their roots, which will prevent rapid evaporation, and keep the soil in a healthy state as to moisture. And the same attention will be useful to trees on shallow borders, especially
Peaches and Nectarines, which are very subject to the
attacks of mildew if allowed to get too dry at the root in
summer. Where it can be procured, summer. Where it can be procured, a thin coat of hals rotten leaves should be used for mulching, and in the case of trees inclined to weakness a portion of good rotten
dung might be mixed with the leaf soil, and would be of great service in strengthennig the trees would be of up the war upon the insects until they are entirely eradicated, and give timely attention to the stopping of cross shoots, \&c., on pyramidal and other trees which it is desired to keep in form. Those who are fortunate enough to have a heavier crop of fruit set than the tree are likely to bring to perfection should thin at once, order to secure fine fruit with a prospect of a next season. See that there is plenty of Peas planted for furnishing a late autumn supply, and also attend to keeping up a succession of Freuch Beans, Spinach, and all kinds of salad. Where it can be done, Lettuces should be planted on a vorth bor thi season, a is difficult without more walerng at can always be afforded to have them crisp and tender in hot weather,

\section*{The Ggricultuxal Gatett}

SATURDA Y, JUNE 14, 1856.
We can obtain room for a report of the discus sion at the Central Farmers' Club last week, ON Breaking up Grass Land, only by condensing the addresses of the several speakers here. Mr. Wood of Ockley, Sussex, the President of the Club, who read the opening paper, commenced by enumerating the exceptions which were universally maintained notwithstanding the prevalence of the idea that notwithstanding the prevalence of the of pastare That these exceptions are numerous enough the following list will testify. Mr. Wood said :-
"If hand is conveniently situated for receiving the drainage of \& town, or for being turned into a wate meadow ; if it be so steep and hilly as to make it difficult or expensive to cultivate; or if it be on chalk or
other rock, with so little depth of mould as to render
it unfit for the production of root crops or corn, in al
such cases it would be undoubtedly wrong to bring i into cultivation. Again, when Grass is speciall required, as for mileh cows, to a certain extent, in the neighbourhood of towns; and for meadow hay, as in the neighbourhood of London; or where, from the height or exposed position of the land, the climate is of such a nature that Wheat cannot in ordinary seasons come to perfection, unless this objection is counterbalanced by extraordinary applicability of the land, for the production of Swede Turnips or other crops, these cases I regard as exceptional, and as not bearing on the subjects immediately before us, and probably there may be several others of like description, though it would be profitless for me to enumerate them even if they ceurred to me.
That there is a large remainder of our pasture lands to which the question for discussion fairly applied no one can deny, and as to all of this Mr ood took it for granted that the owner was in favour of continuing it in Grass, while the occupier Thas for breaking it up
This difference of opinion is easily accounted for The breaking-up of Grass land endangers the landlord's chances of rent, from the tenant not farming the land so as to keep it in a condition to command the same rent as it had previously done in Grass, and which by good management and liberal manuring may be done. In fact, he runs the risk o having the land thrown on his hands, both from the tenant allowing it to deteriorate, and also from the circumstance that there is more competition for Grass land than for arable, because the latter not only requires a -larger amount of capital to do it well, but also requires that capital to be invested for a much greater length of time without any return apon it; whereas a tenant can always for several years obtain good crops from fresh broken-up land, without being at much expense for manuring it, and consequently he incurs no risk of loss from hard-cropping, at all events for the first seven year fis occapation.
The question, however, has to be decided on a comparison of receipts and payments under both systems of management, and this Mr. Wood gives in the foliowing terms:-
"For grazing stock upon the second or middling stamp of land in my own district, paying, say 35s. for rent, thus,
Keep of a two-yearling steer from May 1 to Sept. 17, Ditto of 5 sheep through the winter at 6 .

Total produce
tal costs
Two crops \(\ldots \ldots \ldots\)
Total proits per annum
"I therefore make the total
Grass and to ampunt on an acre of Grass land to amount to 22.1 s . to pay for time, skill, judgment, capital, and risks. I will now proceed to estimate the profit on the same stamp of land in cultivaI usually adopt myself, vizion and management that alternate white and green crops, and taking Wheat twice in six yeare, though I must remark that when Wheat is likely to sell as high as has lately been the case, I have substituted Wheat for Oats, and grown it every other year. My rotation of crops is as follows:1st year, winter Beans ; 2d ditto, Wheat ; 3d ditto Tares or Mangel Wurzel ; 4th, ditto, Oats ; 5th ditto, seeds; 6th ditto, Wheat."
We do not give the calculation in detail; it may suffice to quote the results on the whole six years of cropping, which are as follows :-

This gives as the annual average profit on land culti-
vated ...
On comparison of this with the estimated profit Grass lands (both of them a great deal too high, according to ordinary and average experience) we af arable land, and on this Mr. Wood comes to the
pasture lands. The difference of proft io break up cient to pay for the increased landlord's capital in extra buildiugs and the increased tenant's capital in cultivation. The conclusion at which Mr. Wruod arrives may be perfec ly correct, and probably i. o over a great extent of Grass lands in thi country; hat the figures which lead him to it Ten shillings an acre extra rent will well pay for extra buildings, and 28s. extra profit is ample payment for the tenant's extra capital. Mr. Wood' paper concluded with remarks on the possibility of dispensing with hay and Giass in tl e feeding of cows and cattle, and on that kind of green land which would pay best to bring nader the plough.

The sabsequent discussion elicited the general pinion that land worth \(25 s\) s or even 20 s. an acre as pasture should not be disturbed, Mr. PaYne, how wever, contending that when land was worth less than the larger sum per acre it became a question whether it ought not to be broken up. We conclude with an extract from his address upon the subject :-
He lived in a neighbourhood with a large proprietary, ani where the breaking up of inferior Grass land had bepn carrien
to a great extent. In acase in which 100 acres of pasture \(\mathbb{W} A \mathrm{~s}\)
oro broken up, on a enld tand farmicl of 300 acres, the pand havius
een that
 doubled his produce. Takine into account the straw which
the land newly broken ap prod oced for six or seven years
aterwards, without extraneons assist afterwards, without extranenus assistance, the breaving up of
Girass land materially benefitted the land previously in arable, and which had perrhaps not grown sanncicint too manure insel
hefore. Happily they could now obtain artificinl manures
 nothing could be more beneficial to the soil than the tenantis
breaking up inferior descriptions of Grass land. One reunlt
was, that the tenant was enabled to grow a much larye quantily of Clover. Farms thus treated had mach larie nne-thrd more sheep than they did before, and it was, in
his opinion, a national benefit to break up inferior pastures. But his opinion, a a ational benetit to break up inferior pastures. Buy
before allowing the tenant of breaz up a alare quantity, he wou'd
and
 he should entertain no doubt as to the sicceess of the process.. He
should be sorry if proprietors thought that all that farmers
 in it (laughter). He wanted to convince landlords that it would
be a great benefit to them to have inferi, ,r pasture lands briku
up. The land of which he had previnusily spoken was a tenacious
clay in a conld district. The first step thwards making such clay in a cold district. The frevt step turards making such
land useful was through drainage. When that was accom-
plished, there were two modes in which the land might be bro land useful was thorough drainage. When that was accom-
plished, there were two modes in which the land might be brought
into tillare. One to plongh in the turf, another to pare and
burn it. In his opinion the latter mode was the to int
burn it. In his opinion the latter mode was the bost, becanse it
exterminated all the invects which were so prejudicial to farm-
ing, whilst where the turf had been ploughed in, for four or five ing, whilst where the turf had been ploughed in, for four or five
years after the farmer was pestered with the wireworm and
other insects. He was confident too that -in the first five or six years, at all events-the return would be greater if the turf
had been pared and burned, than if it had been ploughed in,
The shea produced by burning worked down into the soil, The ashea produced by burning worked down into the sofl, and
very much improved its condition. Three or four years after and was couverted into tillage, he bad seen ashes ploughed up that the presence of ashes in the soil materially assisted the growth of the crops. He was rather surprized to hear Mr. Wond
raise a question as to the expenses of labour. Every one he snew who had broken up lard of the description mentioned beld he did before ; and he contended that, considering the artificial manures which were now within their reach, the cheaper corn
was, the more they ought to grow.

Of all the privileges conferred by the possession of land there are none more important than the rights appertaining to property in water, indeed the alue of land itself depends to a much greater extent than might at first be thought on the available means of water supply. So true is this that in this country every stream, however small, is a property of importance, and consequently its pollution o unfair abstraction is rigidly guarded against by legal enactments, and hence, therefore, opinions are sought and evidence procured to guide verdicts of uries, decisions of arbitrators, or votes in Parliament.
Now, as it has before been shown that water upply is a matter entirely depending upon geolocical details, it follows that in all questions affecting it guidance should be sought by not merely a surface examination but a careful investigation of facts often at a distance from the point in dispute, but which facts can only be supplied by a study of the structure of the earith's crust. And we cannot better exemplify the truly practical nature of the science of geology than by reviewing the facts a pariamentiry inquiry relative to the wate upply of a large town, in a case where the rights of water as affecting land and the structure of the substrata as affecting the argnment come out in strong relief.
The borough of Cheltenham is for the most part fuate on deep sand beds reposing in undulations las clay, a condition which ensured the storing ap of every drop of water which fell in the shape of rain, as it would percolate through the porous
sand and be retained in the impervions clay, affording a supply of a good and wholesome water or the accommodation of a limited population. We here use the term " limited," as the wells sunk into his natural reservoir depended for their supply pon the amount of rain and the extent of the sand area, and hence afforded the most simple example What is meant by a spring
Now, as the population increaned the drain upen
his source of supply necessarily lowered its level, Which eventaater in lowering the wells until many of them were even sunk into the chay itself, and as uch as salt, lime, and ours, were made in it the greater the amount of impariies with which the water became charged. In this position of the case powers were sought by a water company to divert some small streams* running from the western slopes of the Colteswold hills, which rise high to the east of the town, into ? reservoir for the use of the imhabitants, and as this from the smallness of the streams did not 80 materially interfere with the rights in that water - yond what a reasonable compensation would meet, he powers sought were obtained. Of late yearl however, the supply from this source has been found inadequate to the increasing wants of the inhabitants, added to the increased demand for water required by the Board of Health, and in this state of affairs Parliament was asked to sanction the diversion of a powerful spring, the source of one of the largest tributaries of the Thames, and therefore rising from the eastern slope of the Cotteswolds. To this, however, the landlords, farmers, and occupiers of lands on the stream to which the spring gave rise raised an pposition founded on the following facts:
The strean turned a large number of mills, the first of which was within a couple of hundred yards rom its source.
On its banks were some elegant seats of country gentlemen, to the beauty, fertility, and residential importance of which the stream in question was absolutely necessary

The agricultural interest in general was much concerned by the niver flats being occupied by imivated meadows, a point of great importance, as from the elevation and aridity of the stony Cotteswolds the sheep farmers in an elevated and exposed and consequently late growing country were, in the Grass of the irrigated meadows, supplied with that early spring feed which enabled them to compete with heir neighbours in more fortunate circumstances of land and climate, and thus it was argued that the whole of the hill district, the heights as well as the intervening valleys, would suffer from the abstraction

These arguments, which were foreseen by the company's engineer, were proposed to be met in the folowing ingenious manner, which would indeed have proved all that could have been desired, but that the geological facts of the case showed that it could not be realised. "It is true," said the engineer, "we wish to take from the source of your iiver a daily supply of one million of gallons of your water, but this shall be done in such a manner that you will be at no loss, but rather be benefited thereby."
Now the plan proposed was that of a compensation reservoir, which may be briefly explained as follows:-At a convenient spot a little way down the stream it was proposed to make a large reservoir to be supplied by the water of the stream, and when this was filled the withdrawal of the required million gallons for the daily ase of the town from a spring yielding two million of gallons should commence ; and now there comes in the compensation system, as in seasons of a short supply of water, or in times of drought, while the million gallons a d dy were being taken from the spring, a million gallons were to be daily supplied from the compensation reservoir for the requirements of the dwellers down the stream. This arrangement, it was contended, would ensure an equable flow of water in the river and so nicely balance demand with regulated supply that a benefit was to accrue rather than an injury. This proposition it will be seen was founded on the assumption that the district under review was subject to a periodical glut of water, but the geological evidence founded on a knowledge of the structure of the strata was as follows:-
The water gathering beds are the porous strata of the onlitic limestone, into which rain percolates as rapidly as it falls.
These rocks may therefore be considered as forming the drainage area of their district.

As these oolitic rocks rest upon the impervious clays of the lias, the latter rock affords the satershed for the springs.
Now, as the percolation through porous rocks of any thickness must be gradual, so springs from it are maintained at a tolerably equable rate, and a large superabundance of water cannot be at any time expected. On the contrary, where rain falls directly on impervious clays sudden floods are the result, porous strata thus giving rise to spring vious strata cansing floods and inundations, in - These streams issue from the top of the lias which creeps high up in the hills, and being capped by the porous ooltic made spring water.
which case such water can be stored for future use, supervene if dry weather be of long continuance. supervene in the case of the Cotteswolds, it can never be said that we have too much water, as any tempn rary increase is gladly made use of for the purpose of irrigation, and therefore the geological structure of the country is opposed to the theory of compensation reservoirs-a systern which in a clay district might fully answer the intended purpo
upon these grounds the application failed. tinually arising for the consideration of the owners and occupiers of land, it follows that the science which enables one to deal with them in a proper manner must be one of an eminently practical nature, and as such it give.s us great pleasure to find that geulogy forms a prominent feature in the educational schemes of all places for the instruction of those who are to have to do with land; thus
lectures in the class room, and such practical field operations as making maps of different formations or sections of strala occupy much of the attention of properly educated agriculcural stadents, whilst in the Government School of Mines the principles of a science are taught, of which if some of our plain farmers only knew the advantages, they would at once consider it as altogether removed from the regions of science on account of being so eminently practical.

DRYING GRAIN AND HAY CROPS, \&c., BY HOT AIR.
Tue clond which hangs over America, the inundations in Franee, the aspeet of the corn market in this country, have led me to reflect on the evils of a deficient greater misfortune can ocur in a fresent, year. No industrial point of view. A deficient harvest may arise from the seasons or from imperfect agriculture-or a combination of both. As respects agriculture, it is no doubt in a more improved state than at any former period in these kingdoms, although far from what it may
be. My conviction is that agriculture is yet only in its infancy, and that the produce of the soil may be sugmented, profitably, to an extent little yet thought of As respects the seasons, they depend on a power higher than that of man; but I cannot help humbly thinking that the energy, skill, and forethought of man may do much more than has yet been accomplished, to guard against some of their had effects on the all important produce of the earth, as respects the food of man and his various wants.
As resjects grain crops and hay, I have long been apressed by the idea that some artificial means might whether in harvesting grain crops or hay, wut I never, could see my way to the practical aecomplishment of this end. A recent notice in your Paper has arrested my attention and suggested the application of an inge the 17 th of May, a description is given of a simple and economical means of applying heat to garden structures. For these purposes a moist heat is required, for the purposes I contemplate a dry heat would he required, and can, even more readily, be had. My idea is that grain crops and hay may be subjected, under cover, to the circulation of currents of dry heated air, and that very rapidly all moisture may be removed from them, to await the demands of consumption. The invention to which I allude, and by which I trust these ends may be accomplished, is that of Mr. Hazard which, by a simple and economical process, generates and circulates currents of pure air, heated to such a regulated temperature as may be required, and which can be made to fill, and circulate in, any given inclosed space. I will assume that a barn of some size shall be fitted with an apparatus of this kind, and that the crop of a Wheat field or hay-field shall be brought into it, is successive quantities. The surplus moisture can at once be dis-
pelled and driven off. Thus the process of the best harvest can at once be axtificially performed, and thus there necd be no more damaged grain or hay from the
fields, the produce of which is so treated. My belief is that it would be an economical process (I forbear to go into detail on that point), and that its results would amply compensate its expenses, but fair trials and experience could alone conclusively decide that point.

One result, however, is clear, that the quality of the produce so treated, with good management (whieh must highest. Pure, though heated air, would alone be used ; oo bad taste could be imparted, and as respees grain, is clear hat whed called dip and athe Wheat would at once be rendered hard and fit to come into consumption; the exact degree of dryness might be regulated by the intentions of the grower, whether to sell or to keep. There would in the process be no similar effeet to that of "kiln-drying," by which a taste is imparted; it would be a mere dislodgement of water, the degree to which the process was carried boing completely under control. In the same way as regards

\section*{surplus moisture wwuld alone be driven u?}

It cannot be expected that such a process - the mere mention of whith will be starting to many-could be adopted except by degrees; but if it be not suggested or attempted, it can never even be tried ; and such is I hope, my justification in desiring to make known the scheme and system which have occurred to me to be practicable and likely to be advantageous. If proved to succeed, it would soon spread; there would be no obstacle on the ground of expenditure, which would be moderate compared to the object. It would
applicable in the first instance to farms of some size and where a stenm engine exists in cunsexion with th barn, the facility would be the greatest for the experi ment or the practice.
I have seen the system applied to the seasoning of Wood in the simplest manner, and with beautiful and perfect success. 1 am informed that it is applied with
geat effect to the drying of the netted worsted yarn pie paratory to weaving, in which the quantity of wate expelled is very great relatively to the substance of the yarn. It has seemed to me impossible not to stretch purposes of a far the applicadian of the system that racter.

My impression is that the same system might be applied to the curing of Oak bark, an operation requiring great vigilance and more skill than is frequently applied oo it, the sole desideratum being to expel the surplu moisture and to retain the natural substance and
qualities in an uninjured state-but I forbear to say more on that separate subject. I have intentionall restricted my statement to generalities, which can
readily be followed by more detailed statements should readily be followed by more detailed statements should such come to be required. Many difficulties and objections will no doubt anticipate, but as yet \(I\) see of them I already anticipate, but as yet see none has weight it will no doubt be worked out, as man have before it which were at first thought chimerical and as this will no doubt be by many peisons, those especially who are disposed rather to stand still than to go forward. My opinion is that this is the age in which e ought to go forward - not less in rural than in other affairs. T. F. Kennedy, Londo:1, June 8, 1856.

\section*{THE PARIS AGRICULTURAL EXHIBITION.}

Tre award of prizes was at last officially made known on Friday morning by fixing the plates to the stalls of the fortunate animals; we purposely use th word fortunate, for in many instances success seems to have been rather the resul of luck than the award of merit. As it is, some of our best animals in the Palace are either passed by in silent enntempt or ridiculously stigmatised with a mention homorable, and that, when competing in classes where there are so many as eight prizes given.
It is always a most invidious task to find fault with disappoinin of judges, it looks so much like mere selfish that it is with of our own interests or predilections, make a few remarks on this suhject; but when we see suc' breeders as Lord Faversham, Mr. Douglas, Mr. their animals, some of which have gained prizes in our own "All Englan \({ }^{1}\) " and local shows when competing against our best breeders, passed over, we have reason to express our regret that an exhibition so remarkable and so important for its probable influence on the progress
of agriculture on the continent, should have been marred by so flippant an exclusion as that of which we complain.

The reason alleged is over-fattening in the animals it is the old vexed question rehashed and served again We must confess at once that we have this on rumour alone, and a'though we have it on a most reliable authority, yet we should have abstained from making any remarks on a mere surmise, had we anticipated anything like an explanation from the judges ; but as they have not thought fit to give any reason fur their deeds, we feel at liberty to make any remarks we choose on the the best animals in the Palace.
In the programme distribu ed in England, there was a small paragraph stating that animals considered to fat by the judges should be disqualified, or something to that effect. We suppose it was with the anthority of
that warning that the French judges exercised their superior judgment, and ventured to decide the exact point where fleshy quality ended, and over-fattening commenced. The reason alleged for the objeetion to high condition in breeding animals is that it makes them barren, and this is at once taken for granted, without stopping to inquire whether this rule admits of no exception. Bat experience tells ws that her are a great number of good animals-in faet, we may that was not in good condition-which notwithstanding their high condition are regular breeders, whilst on the other hand, we daily see animals poor in every respect, poor in condition, wretched in quality, defective in every point, and withal utterly barren. There are others which, when in a low condition, proved barren, and which when put upon a more natritious diet and made actually fat, were made to breed.
We do not mean to say that a very high condition does not in some instances interfere with bresing, but
we contend that where a rule admits of so many excep-
 have to decide the respective merits of animals in so absolute a manner. Propensity to fatten is always concomitant with symmetry and other good qualities in animal, it is in itself a most important poiris of in improved breed, beesuse it is from that cause that recocity of development arises; why then blindly condemn the demonstration of that precious quality, when it can be proved that it has not been attended with the alleged evil of barrenness? It seems to us that the got ars should arrive is that very combination of high condition and fruitful breeding, which in several instances in this exhibiticn has been visited with ignominious coadembation.
Before we speak of the successful competitors, let ue at once record an incident which reflects great honour on frighful calamity that has just scattered ruin, desolaion, and death in various parts of France. Never in the memory of livivg men had inundations been so disastrous in their effeets, and made so many victims. With the view of alleviating those evils and helping the thousands of wretehed inhabitans whoe property and homes have been swept away by we pitiless tide, Mr. Jonas Webb, Wr. Towneley, Lord Faversham, Lord Hill, Lord Clancarty, Lord Talbot, rish, and Seoteh exhibitore, has commeuced a subscription list, which we hope will reach an amount worthy of Engliah generonity. among the French, for nothing tends more to cement union and mutual esteem than sympathetic doeds of charity.
On Thursday last a grand banquet was given by the French judges and the members of the agricultural press, to the foreign judges and other distiaguished agriculturists. Some four or five speeches were delivered, the first and last of which were alone remark able. Mr. Evelyn Denison spoke in remarkably good French, and his beautiful sentiments were most min delivered by Marmly cheered; the last speech was known in England. Useless to say the speech of that gentleman was wo
On Mpplause.
ay night Mr. Jonas Webb gave a dinner to exhibitor about 20 to mong lion werel and Belgium. The Scotch aiso have had several fetes under the able management of Mr. Maxwell, whose exertions generally on behalf of the Scotch exhibitors certainly deserve the highest praise.
On Monday the prizes were given in one end of the galleries, which had been tastefully decorated, and turned into a spacious hall. Owing to the great number of prizes to be distributed, only those who had gained gold medals, that is those who had taken the first prize, were admitted into the hall, the others are to receive attached to the building
Originally only four prizes were offered in each class; but when the return of entries was made, and the number of the animals ascertained, a greater number were given in proportion with the quantity of animals exhibited. Thus the short-horns had 8 prizes in the respectasses, and in the 2 cow and heifer classe respectively. Some of the Scotch classes had so many as 11 prizes to competo principal prize-takers were Mr. Charies Yowneley, who had the protin every class 1 . C h prize for aged buls, for Master Butterfy; ist prize for heifers, and 1st prize for cows. Next to him comes Mr. Ambler, who takes the lst prize for young bulls and the 3d for heifers, Lord Monk taking the 2d. The 3d given to Mr. Oliver for a heifer bred by Mr. Douglas, of Athelstane, whose animals, notwithstanding their acknowledged merits, were disqualified for being \(t 00\) fat, although there were others in quite as high a condition, to which prizes were awarded. By a strange anomaly Lord Faversham's bull and Mr. Douglas's animals had to understand such an act of inconsistency, for either those animals were rejected as being too fat or they were not-if disqualified from competing for prizes, whyshould they be commended
In the cow elass Mr. Charles Towneley was awarded the 1at prize, the 2d to Mr. Douglas, the \(3 d\) to Captain Ball, the 4th to Lord Monk.
In the Herefords class only foar animals were exhibited, and had to compete for six prizes Mr Fisher Hobbs, who out of the four snimals had three to his mame, gained the lst prize for a very good bal and the 2 d for a very good heifer, and we must asy exhibited, Mr Hobe's two bulls and heifer were very good specimens of that breed, and would have gained similar di
In the Devons Mr. Turner as usual kept his ground, carrying the lat prize for Lulls and cowa; but this class, like the Herefords, was but imperfectly repressnted, as far as numbers went at all eventa.
In the sheep classes there were many very good animals exhibited : Mesars. Landay and Turner in the Leicesters, Mears. Jonas Webb, H. S. Hayward, and Rigden in the Southdowns, and Mr. Beale Brown in
the Cotswolde, carrying the principal honours Mr.

Druce was also awarded prizes for crossed breeds of
Down-Cotswold, which demonstrated in a very remari able manner the excellent results of that crossing.
In the pig classes, Captain Gunter's breed was mos conspicuous for its success, the principal prizes being carried by animals bred by him.

Having thus given a short summary of the prizes awarded to Englishmen, we will now proceed to give an ides of the magnitude of this exhibition by recording the numbers of the animals exhibited in each class, both English and foreign.

The short-horn breed was represented by 140 animals, bred in England; these were divided into four classes-yearling bulls and heifers, aged bulls and cows; to these 30 prizes were offered, 8 for each class of the males, and 7 for each class of the females. In the class of young bulls there were 25 animals, in the heifer class 27 ; the old bulls numbered 36 , and the cows 43 Besides these there were other short-horns bred in France, to which prizes were also awarded, and which competed separately among themselves. Of these short-horns in the exhibition. There was also a class of half-bred snimals, the result of the crossing between foreign breeds with short-horn or other huils; to these 21 prizes were given, and out of that number no less than. 19 were carried by animals crossed from shorthorns.
The Scotch breeds were most numerously and beautifully represented. There were in the Ayrshire class
18 bulls and 60 heifers and cows to these 19 prizes were awarded, 8 for the males and 11 for the females. Besides these 78 Ayrshires there were 17 bred in France, forming a distinct class, making a total of 95 nnimals of that breed. The black polled Angus numbered above 40 head, to which 13 prizes were offered. the West Highlands 30 head, competing for 11 prizes. The Irish Kerry breed had 23 hend, to which 8 prizes were offered. Altoyether the United Kingdom including the Channel Islands, contributed about 400 head of cattle.

The prizes for Ayrshires are taken by Mr. Kirkwood, of Killermont, Mr. Evans, of Carnock, Mr. Stewart, of Strathane, near Auchenberger, Mr. Porteous, Mons. E. Bonnemant, Mr. Rennie, and Mr. A. Dunlop for bulls ; and Sir M. Stewart, Mr. Gardiner, Mr. Porteous, and Mr. Dunlop for cows. Several of the animalis have been sold at prices varying from \(50 l\). to \(100 l\).
The prizes for Polled breeds are taken by Messrs. M'Combie, Walker, Watson, and the Earl of Southesk. Some of these, too, have been sold at high prices.

The Dutch breed had 40 head; the various Swi tribes of cattle amounted to 228 avimals, pretty equally divided among the Friburg, Bernese, Schwitz, Eastern Switzerland, and Unterwald. The Tyrolese and Austrian breeds numbered 62 head, and the long-horned Hungarian, Moravian, Gallician, and Bohemian races, about 50 . There were besides 4 buffaloes from Hun-
gary; Saxony contributed 12 head, Denmark and Holstein 32.

France, as may well be imagined, exhibited all her breeds to great advantage in point of numbers and merit ; the heavy big boned Norman breed mustered 61 head, the beautiful white Charolais about 40 ; the other breeds, such as the Manielle, the Garonese, Breton, Limousin, Parthenaise, \&c. \&e., about 100 more so that reckoning the pure English breeds also exhibited by France, there were about 500 head of French breeds. So the exhibition of cattle censisted on the whole of the xtraordinary number of 1300 animals
The sheep of all races and countries are also very numerous. England exhibited 250 pens; Holland, 24 Austria, 100 ; Saxony, 28; other foreign states, 18 . France exhibited about 200 pens of her own breeds, including also other breeds introduced from foreign countries. So there were altogether about 1200 sheep, 500 of which were exhibited by France, 400 by Great Britain, and the rest by other European countries.
In the pig classes there were 171 animals, 72 of contributed by France there are no less than 65 from Eiglish breeds.
In the poultry classes there were 474 pens, containing bout 1400 birds
There were 2107 lots of implements of every kind and shape imaginable; 317 were contributed by the United Kingdom, 3 by Australia, 88 came from Belgium, 51 from Denmark, 5 from Holstein, 2 from the Roman Duchy of Luxembourg, 33 from Holland, 1 from Prussia, 5 from Saxony, 36 from Switzerland, 4 from Wurtemburg, and no less than 1430 from France Among the prizes awarded for implements are those for general-purpose-plough and for heavy-land-plough, to for heward; for light-soil-plough, to Messrs. Ransome for heavy and light ploughs, to Mr. Howard; for Grosskill, for sowing machine and for seed and to Mr. drill, to Mr. Hornaby ; for water drill, to Mr. Dray ; for dibbling machine, to Mr. Garrett ; horse hoe for corn, to Mr. Howard; winnowing machine, to Mr. Thompson engives to Barrett \& Exall and Hornsby \& Son for porkable threshing machines, to Ransome \& Sons and to Mr. Barrett; for corn-crushers, to Mr. Iurner ; for root-entters, Messrs, Ransome; one-horse carts, Mr. Law ; for drain-pipe machine, Mr. White

The agricaltural prodace numbered 4635
these 120 only came from England, 480 to various On Tuesday, after distribution
On Tuesday, after distribution of prizes, to which only those who had gained gold medals were admitted, the diatribution of this immense assemblage of animals and things began in earnest, and high time it was; the
distemper known in France by the singular name of cocotte was prevailing to an alarming extent, scarcely was there an animal that escaped-some were even seriously affected by it, and this made exhibitors the more anxious to remove their cattle.
Towards the close of the Exhibition, the gales became brisk, and although very low figures had to be submitted to in general, yet several animals fetched a good price. We should thifing of the English exhibition have remained behind. There was a great demand for Ayrshires which fetched a very high figure, but the short-horns were the favourites. Mr. Ambler's Grand Master was the property of M. R. dela Tréhonnais, were sold and the property of M.R. de la Trehonnais, were sold even
before the opening of the exhibition for \(300 l\). Several fetched prices ranging between \(80 l\). and \(150 l\)., and we fetched prices ranging between \(80 l\). and \(150 l\)., and we
should think the average of the sale of short-horas should think the averag
would come to about \(60 l\).

At the moment we write these lines the Industrial Palace, but a few days since so full of life, noise, and activity, is all but silent and deserted; most of the stalls are empty, the Swiss cattle bells and the rustic horns of the herdsmen are gone to awake other and widely different echoes, the immense nave is stripped of its gay flowers and green shrubs, and nothing remains but that impression which such a removal must necessarily create. And now from that Palace, where so great a lesson has been taught to European agriculture, men from all parts of the world have gone back to their distant homes, carrying with them new ideas, a better judgment of things, and in many instances elements of improvement in the shape of animals, implements, and seeds, which before were unknown in their respective countries. This is a great practical result which alone would suffice to reward the exertions of those who first conceived, and then so completely and satisactorily achieved this great undertaking.
Paris, June 12th, 1856.
THE BRITISH FARMER AT THF FRENCH TMLE SHOW
'Tis over there in Parrus as I've a ben to zee,
The Cattle Show in what they calls their Pally Dangdoostree; They French be clever fellers, of that there bain't no doubt,
Tis in the Shonseleasy, their public pleasure grounds, Where company, refreshment, and all sarts o' games abounds, And well it is wuth zeeun, the truth I'll own to you,
Not only for the beastices but the beauty on it too.
Wi' flags o' differ'nt colours upon his outer part,
They 've stuck their Pally woaver and made ung gay and smart Likewise wi' sbrubs and vlowers, adornun' the way in,
The purtiest shrubs and vlowers as I thinks I ever zin.

Inzide wit turf and gravel walks they'd got the ground laid ont, And trees, and shrubs, and fountains, which was summat like to
spout,
[strung, That I thought o' Cupid's Gearden as you hears of in the zong.
Then there was molten imidges and statchies for to zee, And now I s'pose you wonders where the beastices could be
To the bullocks, cows, and oxen, the stations as was gave,
They was beneath the galleries and round about the nave.
Their nations, names, and breeds, weren't wrote on papers like
But on shields adorned wi' flags, and trimmed wi' imitation
And lots more flags hung And lots more flags hung woaver 'em, and garlands, likewise

There was Yorkshire, there was Durham, Sussex, Jersey There was Hereford, and Devonshire, as fine as e'er was grew; And French; zum on 'em pretty good: zum wasn't gaod for mutch

The pigs and ship and poultry was lodged in pens outzide
Inever thought a Frenchman in his pig could take a pride Bancied uobody could breed a good fat hog but we

And there was purty creeturs too-another kind and sort, They poked the pigs wi' parasols to make 'em squeak and snort How they did giggle, to be sure, and laugh to hear the row
'「is rum to zee a purty gal a playnn wi' a zow.

To zee the voreign herdsinen and shepherds drest so gay, Twas raly quite as good, mun, as gwiun to a play; And carter-chaps, 'longzide'em in smock-frocks and corduroys
The talkun and the babble was wuss than any mill Them Frenchmen and Frenchwomen, their tongues is never still They gabbles, scresms, and chatters, till your head is in a maze
I missed one sort of animal I reckoned I should vind,
Which I thought as how a Frenckman ate as often as he dined, And gasts they had, and rabbits-but of they badn't got frog

In purtiness, and all that there, our Zmithfield club they beat, They be better hands at ornyment, their trimmuns is the chief, But the leg \(0^{\prime}\) m utton we grows best and rears the primest beef.

ROYAL AGRICULTURAL OF ENGLAND,
Special Council, June 11: Lord Portman, President, in the Chair.
Fonezen Srock. -The period for receiving entries for
was further extended to the 28th Jame. The French Commissioner of Agricalture informed the Council of the intention of the Emperor of the French to pay all the expenses attending the transit of cattle to be expecimens of improved short-woolled sheep from the Inperial bergeries.
Assizes.- The President informed the Council that
the Lord Chief Baron of the Excheguer her the Lord Chief Baron of the Exchequer had kindly post-
poned the holding of the Assizes at Chelmsford, the week of the Society's Show, for which they had bee fixed, to a subsequent date. The thanks of the Connci were ordered to the Lord Chief Baron for this mark his kind consideration, and of his recoguition of the national objects of the Society.

Weekly Council, June 11.-Lord Portman, President, in the Chair.

Agricultural Chemistry.-The following Annal Report of Professor Way, Consulting Chemist of the Society, was read :-
In accordance with the usual custom, I beg to present to the
Chemical Committee a report on the untuations of the laborator
 laboratory during, this. period for memtiers of the Society a
reduced rates is 241 . They are as follows:Soils
Marls and limestoves

Animal and vegetable products
Oil-cake
Waters
Miscellaneous
\(\overline{241}\)
This number is almost identical with that of last year, bu inasmuch as my report in May, 1855 , embraced only a period of 11 months, the number of analyses during the past year falls
short to some extent of the previous year, although double what
it was in 1854 . It is probable that the changen, in the list of
charges which will be proposed to the Conncil on the sth of June it was in 1854 . It is probable that the changen, in the list of
charges which will be proposed to the Council on the sth of June
will, if adopted, cause a considerable increase in the number of will, if adopted, cause a considerable increase in the number of
those members who are in the habit of taking advantage of the
laboratory. The great bulk of the analyses above mentioned are, as will be seen, those of guanos, superphosphate of lime,
and other manures. I amm gratifed to he able to report, that
although no doubt abundance of interior min although no doubt abundance of interior namures are still to be
met with, their general character is yearly improving
which mater met With, their general character is yearly improving, a result tion on the part of the makers, byt above all, perhaps, to the
consciouspess on the part of dealers that their manures whll be
in all probshility subjected in all probability subjected to the searching ordeal of chemica
anasys. During the past year I liave at the request of the
Couril made several examinations and reports, amongst whic Couricil made several examinatious and reports, amongst which
may be mentioned the various mineral and other subotances
collected in the Pucific, and forwarded from time to time by her Majesty's Government to the Society.
In the spring and summer of last sear I delivered as usual
three lectures on different subjects, o of which, "On the
 published in the Journal of the Societs. Ttee made in Octobe Pursuant to a resolution of the Committee made in Octobe
last, I have since that time been engaged in an examination oo
the waters of land drainage, and have obiained remults which the waters of land drainage, and have obiained results which
believe will prove very interesting to the agricultural public
The full details of this inquiry have been proured for public tion in the next number of the Society's Ju fural; but I may perbaps here mention that in the course of the investigetion it became necessary to institute a new method of determining such metho
desideratum
desideratum, and the question lagd attracted the attention of
chemists in all countries. After several nuonths 'abour I suc-
ceeded in devising a method by which extretnely nainute quan-
tities of nitric acid could be estimated with tities of nitric acid could be estimated with great accuracy. It is
true that very lately, and simultaneously indeed, the same thing
has been accomplished in stance only proves how very much such a process was required, and practice
I am enga
I am engaged also at the request of the Committee in an inves have already obtained some interesting results, they are no have already obtained some interesting results, they are
sufficiently advanced for publication. (Signed)
15, Welbeck Street, May, 1856.
Members' Privileges of Chemical Analysis.-The Council, on the 4 th of June, 1856 , tixed the following rates of charge for a analyses to be made by the consulting chemist for member's of the Society,
who, to avoid all unnecessary correspondence, are particularly requested, when applying to him, to ruention he kind of analysis They require, and to quote its number in the subjoined scie speci-
The charge tor analysis, together with the carriage of the seme must be paid to him by members at the time of their mens, must
application.
No. 1. An opinion of the gennineness of Peruvian guano
2. An analysis of guano, showing the proportion of moisture, organic matter, san
alkalire salts, and ammonia
3. An estimate of the value (relatively to the average of samples in the market) of sulphate and muriat of ammonia, and of the nitrates of potash and soda An analysis of superphosphate of lime, showing the proportions of moisture, organic matter, sand, solu ble and insoluble phosphates, sulphate of lime, and ammonia
n analysis (sufficient for the determination of its
agricultural value) of any ordinary artficial manure agricuitural Value) of anf ordinary artificial manure
portion of magnesia, \(108 . ;\) the proportion of lime portion of mag
Lime magnesia … including carbonaite, phosphate clay sulphate of lime, and magnesia with sand and
9. Partial analysid of a soll, including determinaifions of clay, sand, orgnnic matter,
Complete analysis of a soil
11. An analysis of oil-cake, showigg the proportion of moisture, oil, mineral malter, albuminous matter, molsture, on, mineras woody fibre;
and wor
sugar, in the aggregate
12. Analysis of animal prodacts, rofuse substances used
13. Determinatlon of the "Mardness" of a from 10 s . to
13. Determination of the bailinge. ... and of water
14. Analysis of water of land drainage, and of used for irrigation
15. Determination of nitric acid in sample of water.
N.B. The above scale of charges is not applicable to analyse
male of manures. The address of Professor Way, the Consulting
Chemist of the Society, is 15, Welbeck Street, Cavendish Square, Chemist of the Society, is 15, Welbeck street, Cavendish

Communications were received from Mr. Parr on the tility that would arise from an extensive distribution of the schedule of Professor Way's chemical charges for nalysis ; from Mr. Fuller, M.F., on disease among his wes in Sussex from inflammation of the udder; from Messrs. Prentice, of Stowmarket, detals of their charges or Asphalte Flooring; from Mr. Thurlow on the pods Ir Salter offering to communicate his views on the Mr. Salt,
Lord Portman, Lord Walsingham, Lord Lovaine, M.P., Mr. Lawrence, and Prof. Way, made interesting tatements on Portland Cement and Asphalte Flooring and on the character of the Locust-tree pods as food for ve stock.
The Council adjourned to Wednesday next, when Prof. Way would deliver a lecture on his additiona researches on the Composition of the Waters of Land Drainage.
Bath and West of England, June 5.-This Society has been holding, during the past week, its annua meeting at Yeovi, where a large display of implement and live stock has been exhibited, and a great gatherin of West of England farmers has been attracted by them The show has much increased upon those of past years The exhibitors of implements during the five years of he Society's existence have numbered as nearly as pos ible \(50,60,70,80\), and now 97 , at the successive meetings at Taunton, Plymouth, Bath, Tavistock, and Yeovil. A great majority of them are local manufac turers, though the great firms that are met with at shows wherever held, as in England, Scotland, Ireland, and even France, are present hers also. The trial of implements included ploughs, subsoil ploughs, harrows, drags, scarifiers, cultivators, reaping machines, haymaking machines, and many others. The heavy land implements were tried on an exceedingly stiff soil where six horses were needed for some of the ploughs, the furrows eing, however, enormously deep.
The cattle show included about 350 head of stock Devons, as might be expected, predominated; 57 of the 87 cattle shown being of that breed. Leicester sheep gain occupied the same relative position to the breeds o sheep; 73 Leicesters were shown, 19 Cotswolds, 34 Horns and mountain Sheep, 43 Hampshire and othe tow pi The Prize list for Devon Cattle, to which considering the locality the greatest interest attacked, is as follows:-

Class 1. For the best Bull in its fourth year, 122, ' to J. W Bullen, Esq, Crediton; 5 , to Mr. Andrew Hewish, Stoodleigh
Tiverton. Highly commended, Mr. S. H. Coram, Trull, near Taunton. For the best Bull, not under three years old, 12l., t Mr. John Bodley, Stockley, Pomeroy, Crediton; bo, to aur. Class 3. For the best Bull under two years, 1856, 87 , to Mr. T
Webber, Tiverton; 4l., to Mr. Edmund Coles, Stone Farm Webber, Tiverton; 4l., to Mr. Edmund Coles,
Yeovil. Highly commended, Mr. Wm. Gibbs, Bishop's Lydeard
Commended, Mr. Richard Corner, Torweston Farm, Williton. Class 4. For the best Cow in calf (or in milk, having lhad a
calf within six months next preceding the frist day of the calf within six months next preceding the first day of the
exhibition), \(8 l\), ot o Mr. William Gibbs, Bishop's Lydeard; 42 . ,
Mr.
Meo. Turner, Barton. Exeter. Highly commended. Mr Walter Farthing, Stowey Court, Bridgwater. Commended, Mr
Thomas W. Follracre, Durston, Mr. John Bodley, Stockley Pomeroy, near Crediton. Class Foffer, in calf or in mill, under thre ears old, \(8 l\), to Mr. Thomas B. Warren, of Shillingstone, Dorset 42., to Mr. Thomas Miller, Castle Farm of Sherborae.
 Bullen, Esq., Crediton, Devon; 4l, to Mr. Thomas Miller, Castle

\section*{Notices to Correspondents.}

Butter: Doubty. We had cows on Grass last year, and their cream and butter had the scrid taste that you complain of. We and put into every gallon of milk before it was churned, and milk was bronght in from the cows. The cream was put to
stand in boiling water for half an hour, and frequently stirred stand in boiling water for half an hour, and frequently stirred year bad passed. So certainly not till after this season of the butable, not to our treatment, but to the natural alteration of the pasture, which is full of Buttercups at this season. Candie Guxternge: ALady Philosopherl assumes as a fact that Egas: othady. The Rev. W. D. Fox bays, "The recipe given much preferable, indeed a perfect one, is to take eggs when exactly perpendicular in a board pertorated with holes for the legs at the four corners, about 3 inches long. This will enable them to be piled one upon another to any extent, as they are
filled. Eggs put in thus fresh from the nests in August and September will keep till winter as good as fresk ones, not only
for cooking bat eating. The temporature of an Apple roomi here frost and autumn heat are excluded, is right for them. have eaten them and seen my friends do so at the breakfastdently recommend this plan, which I think I originally conied Brex Moss : An Old Subscriber calls attention to the importance of the Irigh Moss; dissolved in 10 times its quantity of water
and boiled, it makes an excellent drink for calvea, superior to Liss: Bfary Ann. The disease appears to be inflammation of the the tail, and the bowels moderately opened with a dose of salta Whitfield Farm: Carolus. If you will favour us with your address we shall be happy to give you a note of introduction.
The farm is no longer a public example farm. - As usual, many communications have been received too late We must also begined the indulgence of those correspondents, the insertion of whose contributions is atill delayed.

MESSRS. E. G. HENDERSON \& SON'S NEW CATALOGUE FOR THE PRESENT SEASON
Is now ready, and contains descriptions of the most approved novelties in cultivation. The following selection they beg particularly to recommend :-
NEW VERBENAS.

\section*{SAMUELSON'S}

\section*{REGISTERED BUDDING'S LAWN MOWING MACHINES} PLEASURE GROUNDS, LAWNS, BORDERS, BOWLING"GREENS, ETC.
```

To cut from 18 inches wide, for a boy to work,
Up to }30\mathrm{ inches wide, for max and pony

```

THE REGISTERED IMPROVEMENT renders unnecessary the great care requisite in the handling of these machines on the old plan; all that is now required can be done BY AKY Uxamilisid Lasourale, who has only to push the machine before him. The Registered adjustment insures a clean and perfectly level cut jof any required helght, and preveuts the kaives from catting fato the soil, how ever uneven the ground may be.

1!Copies offretestimonials will be forwarded, post free, on application to the manufuctarer.

The above may also be procured at the principal Agricultural Im plement Depots in London; of Messrs J. Veitce \& Son, Exotic Nurseries, Chelega; in the Agricultural Department, and on the Lawns of the Crystal Palace, Sydenham; and of all respect able Ironmongers \& Seedamen in the country.

B. SAMUELSON, Britannia Works, Banbury.
T.„GREEN'S NEW INVENTION IN LAWNMOWING AND: ROLLING MACHINES,
SOLE MANUFACTURER, iRON AND WIRE WORKS, NORTH STREET, LEEDS " REGISTERED JULY 24, 1855.-No. 3739.
T HE ADVANTAGES OF THESE MACHINES sapersede all others by having without any change of Wheels, or addtung the old fastlioneel Roiller, as in others: will also cut either wet or diy, and by the simple adjustment of a thumb serew, in front, can be raised or lowered to ont Width they cat: thay will turn in very litite room, Rand cut at, fhe a small one in front, they roll the made much stronger than the old machines. The bottora Blades are so constructed that therg parca tear up the groand; they are only drawn, and not puyhed and drawn as fa other machinot consequently do not require half the power to work them. The three first sizes can be worked hy one poncon with eave; the two later whthe pony or doalley.
Hyinother LISIST OF PRICES (NET CASH):-

Testimonial from Joshua Majur, Esq., Landscape Gurdener, Tinostrop.
 your highly inproved Mowing and Roling Machine. The one sent for my ingpection and trial (eutting a breadth of 24 iesthes) wass nicety. So conplete and simple is the invention, that amateur gentlemen, and even ladies, may work either the 16 or 20 inch size with ease and pleasure, providing the Grass is not too long. For exten ive places I should say the 24 inches would either of the smatler sizes would be bewt. I congratulate you on wonr very valuable inventions, when beds, \&c... are crowded. surpames, and must eventually sapersede all otherr, for it is not only free from fitricecy yad essy to the workman, but extremely exy puaithen in its operations, and consequently must prove s great saving in the mmangement of Gress lawns, and a great boon to

Other Tatimonials may be had on application to the Manmfacturer.
The above Machines are warranted to answer the purpose as descriled, or may be retarned
London Alama: Mearsa, Comtai \& Hallen, 76 , Oxford Street; and Messra Burgess \& Kkr, 103 , Newgate Gireet, and may be had of all principal Ironmongers, Nurserymen, and Seedsmen in England ; also Mr. Cuarles

I TYLOR and Sin'S REGISTERED GARDEN - SYRINGE,-Small vize. for Amateur use, 2Is. euch. Large size, for Gardeners' hse, 25s, each. Extra for water can be deposited in the pot withnut wetting the leares, 10 s. By a simple arrangement this Syringe is rendered mor effective than any portable Conservatry or Garden Pump en or
offered to the public. It is equalls adapted for Garden or offered to the public. It is equallr anapted fot Garven
Conservatory use, and is capabl of discharging twice as mit water in a given time as anty other Syringe mwin use. The arrangement consists in atraching a small flesible suction tube to the barrel of the Syringe, thr ugh which it is filled with water at every discharge of the previnus contents. Hy thia means rendered perfectly easy, it having; indeed, no work to do, tbe barrel being previously fult of water. Being thus made selfsupplying, a great saving of lat. ur is effected; and the necessity of stopping to fill the syringe at every discharge being done awsy with, the direction of the water can be mainaion, is it in not
length of time. It is perfectly cleanly in its action, possible for any water to get on the outside of the barrel, whic! is a well-known inconvenience attendant on the use of ever other syringe. Its construction is perfectly simple, snd cann filling ut of order: the gronnd in hall vaives and itring und To be hail f any respectable Ironmonger or Seedsman in town or country. J. Tycoa \& Sons, Manuffeturers of Horticultural Apparatu: Wrwick Lane, New gate Street, London.
N.B. These prices do not include carriage, package, or expense of delivery in the country

"The work is in itself almost as pleasant an object of contemplation as the things it treats of."-John Bull.
The work is got up in good style, has many well-executed engravings and colonred plates, and forms a sitable book for the
drawing-room table." Civil Engineer and A Achitals arwing-room table. - Civil Rnineer and Architect's. Sournat.
it is bothing could be more sensonable than this elegnt book; it is beanafifilly liliserrated, and, as a present to those whom we
love or esteem, we do not know anything more appropriate." love or esteen, we do not know any thing more appropriate."-
Cotage Gardener
"Aquarinme, Ward's Cases, Avirries, Fernery, Bees, RockWork, Garden scenery, Foantans-in fact everything delightful, Wf the work coincide haspefily, volume. The matter and manner in turn well illustrates
ond "the orere." - Natarualist.
"Here is a book which we can honestly and cordially recommend to all lovers of Nature, ay treating in a slimple, pleasant
way of the Vivarium, Ward's Cases, Aviary, and other rustic way of the Vivarium, Ward's Cases, Aviary, and other rustic
adornments. Mr. Hitberd's book, let us add, is embellished with remarkable taste.'
"A charming book, elegantly bound and illinstrated ; the subjeta exeellent practical character; in fact it is a perfect gem." an exeellent practical
Floricullural Cabinef.
"An extremely pretty volume, nicely illustrated. The most cultivating his wilquaintance with those portions of the nalmal
and and vegetable kingdoms which may keep his love of nature alive in the city. It is, indeed, no small privilege to find how mueh
may be done, even in the crowded street to kpen may be done, even in the crowded street, to kpep us in communit
cation with a plant, abird, an inhabitant of the watera or the
air. We bold such object air. We bold such objectet of observation very preciouss, and the
book which teaches us how to preserve thent is much to book which teaches us how to preserve thenn is much to the
estagmed as a household friend." -Genteman's Hagazine. "A more elegant volume for the purpose of its publication it is mpossibe to meet with. In every feature the book is invalu-
able. Its binding and illustrations are as charming as itt tents are interesting." - Bell's IVtekly Messenger.
"It deals with those elegancies which charm the eye, and by the aid of which the humble cottage may be converted into a fury "The coloured engravings with which the volume is embel.
lished are numerous and well executed ; in fine all adm the pieturesque in rural scenery will find in this work most Valuable instruction as to the measas by which art may be om-
ployed to develop and complete the beanties of ployed to develop and complete the beanties of nature."-Jorning

\author{
SATURDAY, JUNE 12,1806
}
mgetings for tee ensuing weex.

At length the British Pu'lic has been able to see what may he done with water appiied to ornamental purposes, and we may now hope that the Airty discreditalle syringes which here and there disfigure our places of common resort will be require I to cease their squirting. Oa Wednesday the wonderful fountains in the ground of the Crystal Palace were for the fist time limonght into play, and with a degre of success which must have been as rratifying to Sir Joseph Paxtos as it must have been disagreeable to those whoforesaw nothing but failure in this vast undertaking. It was a grand riumph of art and science.
The water works at Sydenham may be described as belonging to two different systems. The first; which has been long in action, includes all the jets and fountain, and hasiny belonging to the high level or terraces and adjouning stations. The second, which was displayed on Wednesday, includes a pair of beantiful water temples, a long line of cascade
flowing from each, and a prodigious series of jets, possessing various degrees of strength, and deriving or rather lakes, covering the lowest level of the grounds The number of jets thus distributed is nearly 12,000 , discharging about 120,000 gallons o water per minute. It was impossible that such deluge of water should fail in any hands to produce grand effect; when directed by taste and distributed over many acres, its appearance could not be other wise than perfectly magical.

Fortunately it was one of those brilliant afternoons in which a few passing clouds were just sufficient to mitigate the heat of a June sun, and the ground was dry enough to invite thousands of gaily dressed visitors to scatter themselves over the hittle too much wind drew down the valley and scattered some of the jets into mist, as we fear not a few of the fair spectators discovered to their cost ; but although the effect was somewhat impaired, especially about the water temples, yet the general result was superb. First the little jets on the terraces displayed their water plumes, and might be thought to dance with joyous anticipation of what was to come. Presently afterwards a cloud f spray appeared round the water temples, and was shortly succeeded by a circular sheet of water
streaming down their sides in its progress over the cascades to the scene bides in its prome a pause The Royal carriages passed slowly over the winding roads and round the lake, the gay crowd running from all directions to catch one other glimpse of the features they love so well to look upon. The station of the august party is finally taken up, and in an instant the surface of the tranquil lake bursts all kinds sparkle and dash into fantastic furns, and on either hand a vast torrent struggles perpendicularly toward; the sky, sighing, and surging, and panting, like some fierce columnar water god endeavouring to force his way upwards from a subtercrowd of attendants, clustering round his base, and giving solidity to the space he stood upon. The author of Undine should have been present to describe the scene. The Times relates what happened in more sober langaage than we can "mand:-
The effect was little less than magical, and for an hour afterwards charmed alike the eye and the ear. The large fountains in the lower basins, and the circular one situated on the plateau, depend solely upon the water for their effect, and not at all upon architecture or sculpture, like the smaller fountains on the terraces, with which visitors which they contain is made obedient to the hand of the artist and shoots into the air, forming innumerable devices of great beauty. Around the circular basin, and in some parts of the larger ones, it becomes a liquid hedre, or plays in a network of jets, while in the centre and over almost the whole
surface of each of the basins it throws up sparkling showers in all shapes, to various heights, some breaking into misty spray at an immense elevation from the surface.

What that elevation may have been we will not renture to compute. To us it appeared that the usual height of the principal jets was equal to that of the galleries in the Palace itself; but we also thought that when, as if with some vast effort and renovated strength, a sudden heave propelled the witer to the highest, it must have gained the level of the crown of the nave.

Nor was this a sudden and violent operation. passing away after the display of a few minutes' brilliancy. On the contrary, we should say that at the end of half an hour the scene had hardly lost any of its grandeur ; and certainly none of its beanty.
We cannot now stop to describe in homely terms the manner in which this great result has been brought about. To that we may return hereafter, when we have procured an exact authentic account of the arrangements.

Next Tupsday the Fellows of the Horticultural Society once more assemble to consider what course to take with their Garden, and, as we trust, to come to some final decision upon the subjuct. It is
certain that the subscription, upon which some gentlcmen confidently reckoned, has not reached much more than 30010 l , alth ough \(50(00 \mathrm{l}\). is the smallest sum that is required even to make an attempt at maintaining the Garden. Under such circumstances it seems that there is but one course to pursue.
No one who has been present at the meetings of the Society held during the spring can entertain a duubt that a large number of the most influential
members disapprove altogether of the attempt which
it has been proposed to make ; many of those who have sent in their subscriptions have done so from an unwillingness not to contribute to an experiment which if successful might possibly be of permanent atility ; and the result is that out of 750 member only 195 have signified their willingness to be parties to the maintenance of the Garden at Chiswick.
The reason is obvious. They are convinced that such an establishment would be discreditable to the Corporation unless maintained in a state of complete efficiency ; and they are also persuaded that to so maintain it is beyond its possible pecuniary resources.
We therefore suppose that the Fellows will by this time have discovered that the course recommended by the Council six months since is the only one which is practicable. This recommendation was to relinquish the Garden at Chiswick, and after realising the property there, to form a small experimental garden in some more convenient place means being at the same time taken to reorganise the Society, to readjust the rate of subscription, and to take in future a more scientific direction, garden exhibitions being abandoned, at least for the present Were this done the Society would be in a safer pecuniary position than ever, and it is reasonable to suppose that the public would gladly give their support to an institution which, abandoning show for practical utility, could exist with a more moderate income produced by a less costly scale of annual subscriptions.

Doubtless there is a part of the public which has for many years contributed to the funds of the corporation merely for the sake of the brilliant displays at Chiswick, and which with no real love of horticulture, has for personal gratification alone associated itself with an institution chartored for the promotion of horticulture in all its branches. portion of the Fellows mav be expected to fall away when that which attracted them to Chiswick is withdrawn. But there is another and a greater public,
poorer indeed but more in earnest, which attaches as much importance to the production of a Cablage as of Camellia, and which would willingly aid an instiution that applied its funds exclusively to the improvement of the art of gardening. It is out of that other public that the Horticultural Society must reconstruct itself, if it is to exist. Should that Society has done its work and is no longer wanted. If that is really the case the sooner the truth is declared the better, so that the corporation may retire from the field with honour while able to do so
This at least is certain, that the action of the Council should be left perfectly free and unimpeded after Tuesday next. We have never objected to the discussions and proceedings which have now endured for half a year. But it is time to put an end to them. The legally governing body is the Council, which is responsible for its acts, and which is not only as
much interested in the welfare of the Suciety as any one possibly can be, but is alone able to judge correctly of the manner in which its affairs can be most advantageously conducted. If there is to be a continual interruption to its proceedings on the part of some half-a-dozen Fellows its action is paralysed, and the solid interests of the Society are placed in serious danger. We therefore trust that gentlemen will be satisfied with the experiments that have been made, although they have not terminated as may have been expected. When more than threefourths of the Society tacitly signify their dissatisfaction with the maxims proposed by the promoters of recent schemes, it will surely be felt that such schemes ought to be abandoned. Let the general meeting then on Tuesday resolve unanimously that the Council be authorised to take such steps as in their opinion the interests of the Society demand, even although they should involve the relinquishment of the Garden at Chiswick and the realisation of the property contained within it.

\section*{New Plants.}

\section*{177. Rhytidea bicolor.}

GEx. yov. Liriscerss: Brodimir proximum, perian' hio inflato
corruato basi
diverabo
Among the novelties exhibited by Messrs. Veitch at the May show in the Crystal Palace was a eingular bulb, with narrow leaves much shorter than the stout seape, Which was terminated by several longstalked umbellate pendulous flowers, deep crims in except the limb, which consisted of six short sea green revolute nearly equal
segments. The tube of these flowers was obovate, sli, htly three cornered, much wrinkled, with three pairs of gibbosities at the base. Immediately within the throat arose three firm roundish apiculate concave scales or barren stamens ; and between stood as many broad thin oblong anthers two-lobed at either end and opening were distinctly adnate To the filaments of these anthers
were no hypogynous
ofales ; the pistil was exactly thm of Brodicea congesta. We find nothing like it in books,
or in our herbarium, and therefore propose it as a new or in our herbarium, and therefore propose it as a new marks above indicated. It is a native of California and perfectly hardy.

\section*{PLANT DISEASES}

The rapid increase within the last few years of what may be called plant diseases is remarkable, and it is much to be regretted is to a great extent inexplicable. Since the advent of the Potato murrain how many new orms of disease have presented themselves among culmated plants it would not be easy to explain. The vine midew, like the Potato blight, has brought thousands in and Melon chlorosis has baffled, and does baffle at the present moment, the skill of many of the most intelligent and enterprising gardeners in the country, and not only in Great Britain butalso upon the continent, and I have reason to believe also in Anerica. The spot among Pelargoniums is an old grievance, which a few years back deprived the writer of 6000 plants in a few months; then again, we have what is called by Mr. Fish the "palsy"
among Calceolarias, a disease which has been rife for among Calceolarias, a disease which has been rife for several years past among the high-bred herbaceous hinds, and from which Messrs. Henderson suffered very much; now it has spread to the original species and shrubby kinds, and I fear is contagious. A nobleman's gardener told me a few days back he had been obliged to give up the growth of Calceolarias, both as pot and bedding plants, as he found it quite impossible to keep them healthy. One of the great London nurserymen has lost an 18 -light pit full of plants this spring, all bedding kinds; and I know another gardener health in February could not muster 500 to plant of at bedding tio, and what is wase, many of the plants when bedded out go orr, Mr. Flemiog and many other successful growers having last season lost many hundreds after they had become established, and were fully in bloom. Again Salvia patens, to-night a strong robust healthy looking plant, is to-morrow a withered mass, hundreds dying off in the same way. Petunias, Verbenas, Lobelias, and many other plants used for the flower garden are similarly affected, and chlurosis.
Nor are these diseases confined to tender plants alone; Carnations and Picotees, Pinks, Heartsease, and simlar soft herbaceous plants also suffer, and even a cultivator as renowned and careful as Mr. Turner of Slough lost two or three years back an immense quantity of young stock.
To what are these ailments to be attributed? As is justly remarked the most skilful and the most careless cultivators suffer alike, and plants which a few years back would grow anywhere and under very ordinary treatment now cease to yield any profit to the cultivator. In the kitchen garden Spiuach has long become an uncertain crop, Caulifower is falling, Parsnips are spotted, and Onions are constitutionally what they used not to be. To recur to the question at the head of this paragraph, is it the wearing out of species, the use or rather abuse of highly azotised and stimulating manures, or are certain plants becoming sick of the soil where they have been grown for years, and only require a change of soil and climate to induce their pristine vigour? I am no believer in the wearing out of species, but I am quite convinced that many plants if kept too long on the same soil deteriorate very appreciably, and I am equally certain that over feeding and careless seeding exercises a very deteriora ting influence on plants which are increased principally from seed ; in fact diseased parents produce, as a diseased offspring, but to such a state of gambling ha the seed trade descended, that it matters little how seeds are saved, so long as they can be procured quantity. Some years back when writing on the spo Pelargoniums, I endeavoured to inculcate din only from healthy parents and avoiding highly enriche only fro has pares a taken plan With regard to chanze of soil and climate every farmer knows that if he does not follow a systematic rotation of crops, and if he does not change bis seed, obtaining it from a different soil and a distand part of the country, his crops soon deteriorale, aing ultimately become worthless; but in flower gardening the same bed is occupied by the same plants year ather year, and yet we wonder "that they do nothey did; the \(\mathbf{s}\) sil is sick and tired of them and they of the soil, a radical change is necessary, and I think an annual exchange of cuttings, I taking my friend's in Bedford shire and he mine from Hiats, would do much to improve the constitution of our plants, and to the crease their blooming an 1 growing qualities. With the fitur kinds of Calceolarias (bedding kinds I speak oally some such change is indi pensab e, or themselves out of deteriorate, until at last they will throw themslace already. cultivation, as they have done in one place ind if \(I\) send away they become healthy, but if I receive his healthy plants with his good soil to pot them in they are How week in my garden before they become diseased.

Mr. Fish asser ts the "palsy" in Calceolarias is, or will my hard water from the limestone and my neighbour's
soft water from an open pond account for the difference? There is, I think, some reason in this suspicion, for being very badly supplied with water, I always find my plants show the most disease when I am compelled to use that from a hard-water well, though I take care to expose it to the action of the air for some time before I use it. Now, for Melons and Cucumbers I find the following general rules, the result of an extensive series of experiments, the most suitable to prevent, or at any rate to moderate the virulence of the disease
lst. Use simple and well aërated compost, consisting of turfy loan, turfy peat in the proportion of three parts of the cormer to one of the peat, adrob cow dung to each pot or hill of plants.
2d. Maintain \(\mathrm{a}_{0}^{\circ}\) nice, bottom-heat of \(70^{\circ}\) to \(80^{\circ}\), but endeavour by free airing of the house or pot to promote a slow, steady, hardy growth, and if in houses do not stop the plants until they have attained the length of 8 until the plants are thoroughly established, and then avoid leaving too many fruit on the plants at the same time
3d. Use soft water the heat of the bed or plunging material, avoiding hard by all means. If liquid manure becomes necessary, prepare it by putting 1 peck of fresh cow-dung, 2 oz . of common salt, and a lump of lime to 20 gallons of watêr. Mix it well over night, and s.
4th. Ventilate as freely as you can, and endeavour to keep the plants as hardy as possible. If the plants flag, shade them with Serim's or Haythorn's netting; indeed a shade of this kind kept on constantly through the summer will do no harm. Avoid extremes of temperature, a cool moist heat especially on warm nights is provocative of disease.

If these rules are observed no one need fear the disease much, but if you allow the plants to carry fruit before they are thoroughly established, you deserve to pay the penalty of your indiscretion. I have mentioned charred cowdung to be used in the compost; let me explain; it is thus prepared. Collect the dung dry from the field, or dry it artificially; then procure a bundle of straw and some small sticks, such as old layer of the dang, then more straw and sticks, and so on, until you have charred the lot. The ohject is more by exposing the dung to heat to destroy the insects and ovaria generally deposited in it, than to convert it into charcosl. This, however, will be found an excellent manure to use for many sort-wooded plants, especianly charred it may be used quite as safely as if three years old, which is not the case when recuced to a friable state by slow decomposition.

In concluding these remarks let me impress upon gardeners the importance of getting their seeds saved over as wide an extent of country a18 possible. Three
of the very best gardeners in England, they were brothers, lived respectively in Kent, Shropshire, and
Devonshire. No men produced such fine vegetables, and why? Their seeds were always running the round of these three counties, and hence were annually in a fresh soil and climate. Let the seed trade pay attention to this fact ! Quis.

VEGETABLE PATHOLCGY.-No. CXXVI
503. Parasite (Phrenogams. Bioomrape, Mistletoe Balanophorce). -The Dodder after it has germinated throws up a slender cord which attaches itself to some
neighbouring plant, and if suitable toits nature, lives upon neighbouring plant, and if suitable to its nature, lives upon
its juices by means of suckers (adventitious roots) sent out from this stem. There are many plants, however, a Thesium, Rhinanthus, Orobanche, and possibly the Balanophoree also, which after germination attach one of their rootlets to the root of some Phænogam, which penetrates to the young wood and thus imbibes the or less absolute, but at any rate a large portion of nutriment is always derived from it, though a part may occasionally be derived from the soil. Mr. Mitten was 1 believe the first to point this out in Thesium, but Gardeners' Chronicle, 1848, p. 636), Cnspary, and others, insomuch that the cultivation of many of these plants is now a matter of comparative facility.* The disturbance caused in the matrix is very various in degree If it is only annual, destruction is almost certain. At
Florence it is a difficult matter to cultivate Peas on Florence it is a difficult matter to cultivate Peas on
account of a species of Broomrape, and in our own country, especisily towards the south of England, Beans, Clover, and Hemp occasionally suffer material damage. If the plant is biennial, the iojury though still consider able may not be so great as to destroy life, and with strong perennial roots there is simply a great amoun of dietortion without absolute destruction. The parasite in such cases often extends gradually at the base beneath the bark, at the same time swelling out, to which there a corresponding swelling in the matrix. As this is lies, the of longer life than the paraaite, when the latte leave a distorted cup marked with irregular plaits, the in the Beral species of Orobanche are raised successfully from seed in d. \(\mathbf{1}\). Preusm 8tanter, 1853 zur Beforderung des Gartenbane
tissues of which are singularly deranged. Specimens
parasite-nests are figured in Gardeners' Chronicle Dec. 3,1853, resembling very closely the cups produced Balanophorice though produced by various species Loranthus. The former are in great request in Thibet, where they are turned into cups which command a great price when the tissues are arranged in the
most approved fashion, while others are worth only most approv
504. The seeds of Loranthus, Viscum, Myzodendron, and other Mistletoes vegetate on the branches, to whic they adhere either by the slime contained in their outer coat, or by feathery appendages which are a modificatendrils he slime and curl round the twigs hite the in contact with the alburnum, where it can profit by sap already elaborated. The derangement of the tissues of the matrix is more or less, according to the particular species of parasite, but in all cases alike the tree suffers 504 degree from the stranger
504. The vascular system of the matrix and parasite are often incorporated so intimately that it seems as if the vessels went from the one into the other. This is
however I believe a fallacy. The vascular tissue in the young parasite is like other tissue of the kind, formed by a transformation of its cells, induced by the neighbourhood of the vascular tissue of the matrix. The case is in fact very like that of adventitious roots and buds, which are always formed in the neighbourhood of vascular tissue. \(\dagger\) That the vascular system of the two are at length perfectly incorporated appears quite cersomething of the same kind takes place as regards the trachere in truly parasitic insects. \(\ddagger\) A good figure of the parasitic nests formed by Myzodendron will be found in Dr. Hooker's Antarctic Flora. M. J. B.

\section*{ENTOMOLOGY}

\section*{THE ROSE-STEM BOEING SAW-fLY}

Numerous, to a surprising extent, are the evils to which the Rose fancier is subject. The green-tly whilst the caterpillars of many moths and saw-flies feed on the leaves, either openly (for the most part) or inclosed in moveable cases, formed by themselves from portions of the leaves, and consequently more difficult of detection, whilst a few insidiously burrow int the substance of the leaves, forming tortunus darkcoloured galleries, within which the caterpillar feeds unsuspected and at its ease. The bud is assailed as soon as it makes its appearance by the caterpillars of which fasten the young leaves and buds into a mass which fasten the young leaves and buds into a mass
within which they also "take their ease in their own within which they also "take their ease in their own
inn." All these insects are, however, more or less visible to the observant Rose fancier; but the insect whose proceedings we are now to describe is far more obnoxious, as it completely conceals itself until the mischief which it effects is completed, and its presence is only made known when the bud which has escaped cultivator, suddenly falls down, on the slightest breeze,

just as "when rude hands the twin buds sever." The cause of this sudden and unexpected breakage of the stem is a small caterpillar or grub of a species of saw-
fly which, having entered into the stem of the bud at fly which, having entered into the stem of the bud at
one of the eyes, has eaten its way downwards, conone of the eyes, has eaten i:s way downwardi, con-
uming the pith of the plant, and forming a cylindrical urrow down the centre 2 or 3 inches long. It is during the month of June that this mischief is chiefly effected. I have found the larve in this position on the 3d of June in the stems of the buds, but during the winter also they may be found in the pith of Rose snags and dead Rose stumps, resembling in this respect the small black caterpillars of a Tortrix, whose history I rust to complete for illustration in our entomologica pries. A larva which I have fcund in the midde of February in its cocoon in a dead Rose stump, and
which had burrowed about an inch deep into the pith, which had burrowed about an inch deep into the pith,
closing the mouth with a fine web, and whieh is repreclosing the mouth with a fine web, and which is repre-
sented in the accompanying figure, was of a pale green sented in the accompanying figure, was of a pale green
colour, with fine 1 lack hairs scattered over the body; It is on this account that buds are formed in the axils of
in heavides the thorn, are often found in one axil.
the head yellow green, with a fulvous patch tu fromt the legs pale yellow, and the back with a darker line down the aiddle; the eyes were black and the jaws dark at the ips; the legs are 22 in number. Reaumur has figured his Rose larva in his fifth volume, pl. 10, fig. 1.3, but has given no description of it. Bouché, the Berlin horticulturist, who has so carefully investigated the natural history of garden insects describes the larva as cylindrical, dark green above, with a pale dorsal line, and with the sides and belly greyish green, a double row of black dots along the sides, the head dotted with black and the eyes and orbits pitchy black. This description, according to Dahlbom (Clavis Nov. Hym. Syst. p. 35) is made from a larva which has not yet arrived at its penul. timate change.
From the statement of Bouche it would appear that in its young state in the autumn the larva feeds on the leaves of the Roses, and that on the approach of winter it burrows into the stem to hy beruate, but as 1 liave seen the parent fly depositing its eggs on the Rose leaves in the first or second weel in May in fine early seasons, and have subsequently found the young larve in the bud stems. I am inclined to believe that like the Gooseberry saw-fly this insect goes through several generations in the course of a season, and that the young larve will indifferently eat the Rose leaves or burron into the twigs. The perfect insect is the Tenthredo cincta of Linnæus (Emphytus cinctus of modernauthors) the body of the male is entirely black and glossy, that o the femule is of the same colour, but is distinguished by having a white band across the middle of the abdomen. It is this sex which is represented in the sccompanying igure, the cross lines showing the natural szo. coxe of the hind lage fine the wings are glossy, slightly stained with brown, with a black stigma on the fore margin of the anterior pair. They are very active in the sunshine and appear in the perfec state in the month of May. The Rose cultivator will hardly need to be reminded of the necessity of carefully examining such of his Rose twigs as droop or break of in the manner above described, in order to search for and destroy the larver. As to the destruction of the perfec insect, it is not difficult to those who know it, as it is of
considerable size, and easily to be observed on the Rose considerable size, and easily to be observed on the Rose trees in the su
eggs. J.O.W.

\section*{Home Correspondence}

How to encourage Cucumber Plants to root. - The remarks by a corresponuent in a Number mode of encouraging Cucumber and Melon plants to root freely, have induced me to trouble you with th results of my experience in the matter. He propose to introduce double earthenware tubes into Cucumber and Melon beds for the purpose of encouraging the growth of healthy roots. It does not setm very clear to me what advantage there is to be gained by the introduction of earthenware tubes, or indeed any soit o tubes, for as it is the air which is continually circulatiog around such articles imbedded in the soil which attracts the roots to their surface, and notany virtue in the articles themselves, the same results are insured when the soil contains a considerable amount of charcoal in a rough state I will endeavour to describe the method I adopt to increase the preduction of strong healthy roots, but it will first be necessary to give a slight sketch of the house in which my plants are grown. It is 28 feet long by 12 feet wide inside; 9 feet rom floor to ridge; the path, 3 feet, is in the midde; the beds on each side 3 feet wide by 1 foot deep from siate covering of tanks to the kerb; partitions of \(\frac{1}{\frac{3}{3} \text { inch deal divide the beds }}\) into 4 feet spaces, the allowance of room for a single plant, the whole resting on a series of bric arches. The pipes for heating the atmosphere pass round the house, between the bed and outside walls, The ventilation is conducted by opening as series o sliding ventilators in the walls, connected to a horizontal rod, which moves all at once. These apertures are below the pipes, so that no sooner doen coming in contact with the folinge. Additional air is crovid for the the whole length and provided by a number of circular iof of a short intervals along the municating with 4-lich dran from each side, having a number of grate. Those in the path are never shut in summer, and the air from them keeps a comfortable feel in the hose even when the thermometer rangen aboal and which, in all forcing houses, should dever be list sight o Before planting out 1 put 2 inches of broken ties on the Elates by way of drainage, then 2 inches of chopped tur then 1 foot of soil, composed of two parts turify sand. loam, one part leaf mould, and one part rotten cow dung adding a few pieces of rough charcoal. The fire is then lighted for one day to warm the bed through. The plants are now put out, and a good watering given They are trained on a wire trellis 1 foot from the glass and are stopped when they reach the first wire, after which they are trained very much like a Vine, having three rods, on the short spur system. When they have obtained a good hold of the soil, and the roots make their appearance, the whole surface of the bed is covered with layer of Moss obtained from woods or old stumps of tree I procure the Moss as free from Grass and other plants as possible, In about eight days the roots begin to appea
 nehes of rold Mushroon refuse, to which is addled a year; but when the roots again appear through "cover with ano her layer of Aloss as a finish. In water---which, even in the hottest : cuthrr, is neverne essary aner than onee a week, or three times a fortnight I nse mature-uater preparcel in the following manner:60 galon cas! is sumk in the ground level with the
noface; another of the same dimemsions, having a sinch 1, inserted about two fett from the hottom, is placed anngside. Into this tub is put one peck of soot nnd nie peck of lorse droppings tresh from the stable.
Ine tub is then filled to the hrim with rain water, and t'ie whole is well stirred and alluwed to sett'e for a week, after which it is run off into the bottom tub, clean, and fit for immediate use. The tup tuty is mumin filled and is ready by the week dondowing if wanted. it receives is the small quantity of hut watir necessary to raise the temperature of
 struciure are, I think, threefold. Frst, its capacity for retaining a great quant !y of monisture among its thick layers, and thas kee, inf the routs of the plants constantiy humid, therel \(y\) resdering frequen: litele wateringe unneceseary: Se:nd, in kepping the amosphere day and night chargoll with that degree of lumidity without which it is useless to attempt to grow the Cucumbertonathing like perfectin. And, thirdly, it gives a neat cheerful appearance to the honse, which never fails to please the y e howevrr frequent the visits. We syringe freely with tepid rain-water three times a day. The temperature of the almosphere ranges from \(65^{\circ}\) to \(70^{\circ}\) at aight from June till letoher wilhout the aid of fre-heat; the buttom-hat being kept steadily at \(70^{\circ}\).
By the above treatment I can always induce the plants By the above treatmeut I can always induce the plants than those deep in the snil, as they are farther from the direct influence of he 1 hy air and moisture-agencies, the importance of which cannot be over-rated. prefer good old sorts of tried merit, of from a foot \(t\)
lt
4 ards of tha day, and although i have neve. measured my Irops by the yard I have alonys plenty of Cucumbers. I think many exhant their panis hy sisijecting them to very hii hand dry temperatures. They neither remain so long in bearing, nor do they proluce the number of
fruit, to say nothing of their liability to he eaten up with thrips, anider, de. The temperature here in winter is seldo'n bigher than \(5: 5^{\circ}\) at night in fine weather, and in very hard nights I have had it from \(35^{\circ}\) to \(40^{\circ}\), and no
injury done. I think the luss fire-heat at all seasons injury done. I think the less fire-heat at all seasons
the better, proviled there is every command of air and moisture. W. Watt, Aswavly Park, lincolnshire.

Blight cured by Sulphur. On Thursday, the 12th June, the Vines ins vinery here appeared affected by a sudden blight (the leaves slirivelled and burnt as by a siroces), so eeverely as to promise the eventual total failure in prectecting fruit. Sulphur was directly applied without, and after, a syringe washing. This appeared to do litte good. Last year this process, a tho:gh it seemed to check the blight, completely failed in saving any portion of the fruit. Sulphur was then placed on the floor and turnt, and this seemed to arrest partially the progrens of the blight. Then the thou ht occurreat of sprinkling water on the heated flue, and sulphur upon that. This caused a heath-giving vipour to rise, but it was found that the water poured upon the hot flue dried up ton rapidly. The thousht then cime into the mind of the experimenter to sprinhle the aster, and next the sulphur upon the eold Hue, and then
gradually to warm the flue. This, along with keeping gradually to warm the tlue. This, along with keeping fur as yet appears) perfectly. Each night this method has been followed, and now new leav \(t\) are growing,
and the whole crop louks beautifully healthy, and the whole crop looks beautifully healthy.
From this may not the inference be drawn that the c vil effects of hilight, of all deacriptions and in all places -in trees on 1 alls, or stamdards, and in Hop groundsmay, by timely and proper employment of water, fire, alozether avoided : :llher prart checked, mitigated, o tion sub Dio smay lie a maiter of difficulty, and prove 0: less virtue? 'The virulence of that exceedingly binus, novel distmper, which so (almost) unaccount Ley last year affected the otherwise ordinar.ly little exeitable minds of many wo thy Hop factors-sulphure-
plabbia-would probably also yied to the gentle "alterative" thas humbly presented for exhibition the ir main cause of d shke to the application of sulphur to the foliage of the Hop lo-ing, in creat part, obwinted ly its cahin; the form here mentioned. It is for you to hy Yine cmp dserves e-pecial notice for his ingenuiky He is at labourer in my enuloyment, his name Semur amps. II Clintom, Colomel, Brèkuey, nectr Ruyston, Alorts Ho, tisu? tural Frauds.- Will you (on permission) favour me with the abdress of your fair correspondent siguing herself "Jessea," as I am anxious to learn the name of the prariy whos suyplied the Grass seed for her cond not le deacribed. I certainly did not lime and of e gerien engine, but about the same proportion aljoiving meadow, whuch was elficiently prepared by the romoval of the surface, tevelled dowa and sown
selected for lawna, and which "had given the recates satisfaction to half the nobility and gentry of the kingdom"-in evidence of which, testimonials (how are they obtained ?) from numberless sources were lit,erally and gratuitously given with the seeds. I seld you-s I se it the party supplying the mixture-a ap ceimen of the products of this celebrated sample of the West of Encland Lawn Seed. (Have you ever seen a lawn the Wes? of England?) The most provoking part of
my mishap is (independent of an outlay for prepara tion to about the same amount as your fair friend that the meadow and the other adjoining meado pieces have from close feeding a far finer swatii now than the piece talren into lawn. I may.mention the same party supplied me with small samples of "new and superior" Mangel and parden Car rota, boih of which completely fuiled and require re-sowing. The "weaker sex" do indeed, with justice, demand a champion; and though none so good, so powerful as yourself, I, for one, if permitted, woul favoured with any notice by your fair oorrespondent, she may at once regard and install me, if it be he pleasure, as honorary secretary to the "Ladies' Pro tective Floricultural Association" (and an honour shall esteem it), to which may be attached the con distion that I shull only hold office so long as my service merit their approval and (above all price) their smiles. There is now more than ever great need of some underatanding amongst amateur gardeners; the trasi and rubbish advertised as new and handsome annuals of fine and improved varieties of bedding plants-usque ad nauseam-should be peremptorily dealt. with, and an article, quarterly, from your valuable pen, stating that which is really good and that which is not, would prove sufficiently protective to all parties, to the strong as well as to the weak-headed, "Cautions to amateurs in Gueir selections of flower-seeds and bedlling plants. Guarded by such a leader if they go wrong the faut floral public will have been discharged. Thomas Ingle, M. D, The Villetta, Emeworth, IIants. [We are unacquainted personally with the facts now allered; but
this we do know, that any thing more diograceful than the "fine selectod Grass seeds" frequently supplied
horticultural impositions
IWolfshane or Momlishood.-I notice that the A conitum N:pellus is coming into blonm, and it would be a good lime to point out i's dangerous properties. It is unfor tunatey very common in the neiphbourhood alonusi'e a patch of Parsley. The late fatal accident at Dingwall has mate it well known by hearsay, but is surprising how few know it by sight. This I therefore repeat would be an excellant time to direct atten-
tion to it by a short description in your columns, accompanied by an advice to unite in a combined at ack on it thronghout the country. Many people appose it to be a kind of Larkspur, and think it too pretty to be destroyed. Having suffered from its poisonous effects myself, I would gladly do anything to Lawson tilliam B. Smith, of Peter Street, Wes'minster.
Fumiguion.-I am obliged to "H." for his oourtenus and prac ical reply to my question relating to this sub ject, atd I big to inform him that I have no objection smoke, nor have I any difficulty in deatroying the insects there by the ordinary modes of fumigation. Therefore I wish an answer to my question on entirely different pensive article in the most economical and effective manuer. And surely with the amount of science w posstss at our command we ought to know something effect in an operation of every day occurrence than can be given by even the most experienced gard ners ; consequently the chemist who would answer the following questions would confer a general benefit :What is the name or nature of the substance driven off hy the burning of Tobacco that proves so destructive of tained, is it The na ure of that substance bein \(\leq\) ascer (or the cost of callection Tobacco only, or may it be had There is everything in favour of the latter supposition, "H some plants (the Elder for instance, as mentioned by "H") produce the same effect as Tobacco in solution and would probably produce the same results in burn ing. At all events, a knowledge of even these, as facts nodes of fumi of no small magnitude to the community in general. J. M.

Gardeners' Benevole ut Institution.-We have recently claims of three articles in your Paper urging the public. So far so good. But there is another point equally or even more important than that to which would directattention-it is the difference of claim for
election as pensioners (which the polling papers exhibit) exisctiong as pensioners (which the polling papers exhibit)
exin different candidates. After perusing the list, and observing which two were the most likely, accurding to their present position, to be elected in uly, Ifind one candidate 63 years of age (in his fourth application), who has never subscribed, numbers \(52{ }^{\circ}\) cation), a subscriber for eight years and 83 years of age
only amount to 142 . In the ru'es we find these worde "the oliject is to give a decided proference to those persons who have been contrihuting to ass'st others." Io we the avove system of voting appears inconsisten tan en fin that it has tendency indirectly to injure the institution. I admit however, that there are many (as your curresponden ohserves too truthfully at page \(40^{\circ}\) ), "who havin families find themselves ill able to subseribe even.on guinea annually." In such cases I would sugpest the uropriety of publishing their claims more fully than has hitherto been done. The widow of Jemes Arnold, who subscribed 8 years, appears also to have a strong claim upon subscribers. W. C. E., G oucester. [ We have - letter upon this subject tra warkin

Peaches and Nectarints.-Some time ago I placed four Peach and one Nectarime stones in a pot, aad all have grown about 12 inches high; but on shitting them found only the halves of five stones. This I do not understand. Will you entighten me on the subject. Diamond. [The oiher liaives must have been over louked.]

\section*{三ocietice}

Royal Botanic, Regent's Park, Jume 18.-This Society's secoad exhibition took place on Wednesday last. The day was cloudy but dry, the exbibition a good one, and there was a large attendance of visitors.
Stove and Greenhouse Plants were numerons. O groups of 10 plants the best came from Mr. May, gr. to them were Dipladenia crassiucda, beautifully clothed with flowers of unusual briliancy; Ixora javanion, fine bush, every branch of which was furnished with a great bunch of orange-coloured blossoms; some huge specimens of Aphelexis, Epacrises, and Pimeleas deletia specinsa in full growth and well flowered; the pale yellow Allsmanda grandiflora and a large bush of Dillwyia clavata, loaded with rich brown and yellow Pea-shaped hlossoms. Next in point of merit stoed Mr. 'Taylor's collection from Streatham. It contained Adenandra fragrans; Aphelexis spectabilis grandiflora, literally a ball of blossoms, 2 feet in diameter ; Pimelea hispida; and a charmingly flowered Ixora coccinea dition: Epacris miniata and Pimelea Hendersoni. Of other plants in this class Mr. Barter had Roella ciliata, covered with handsom blue blossoms, and not possessed of that rustiness of ap pearance which usually belongs to this plant. Dipladeni orassinoda, Statice arborea, and Allamanda grandiflora from the same exhibitor, were also excellent specimens of good cultivation
In 12 Stove and Greenhouse Plants the first prize was awarded to Mr. Cutbush, of Barnet, in whoee group were beautiful bushes of Aphelexis, Polygalas Heathe, and Statices. Messrs. Fraser hat Statice Holfordi, Pimelea Hendersoni, Rhynchospermum jasminoides, and the bright red-flowered A zalea refugens. In collections of 10 Stove and Grennhou-e Plants Mr. Carson had an excellent example of Mussænda frondors: well furnished large white foral leaves or bracts the most showy portion of the plant; two beautiful Ever lastings, two Allamandas, two Polygalas, and two handsome Azaleas. Mr. Green sent an adnirable specimen of Epacris miniata beautifully flowered, the latter hanging down in profusion from the undersides of every hoot like !ong rows of coral drops tipped with white. The same exbibitor also sent charming plants of Allamandas, Azaleas, and Everlastings. Mr. Dods' collection, as far as display of flower was concerned, whe rather past its best. Phænocoma proliferum was, how ever, in good condition, and so was Aphelexis humilis rosea, a fine kind with large showy blossoms. Among Mr. Morris's plants we observed well flowered example of Hoya imperialis and campanulata, the latter as sweot scented kind furnished with numerous bunches of greenish yellow saucer-shaped blossoms. The coup also contained a good Stephanotis floribunda from Messrs. Roser, Williams, Morris and others. Among them were Aphelexis macrantha purparea, Erica Cavendishi, Eriostemon buxifolium, Abolis floribunda, a handsome greenhouse shrub; Lxom coccinea and the sweet scented Stephanotis. Mr. Hamp
showed Relhania squarrosa, a yellow flowered plant seldom exhibited, and Mitraria coccinea.

Tall Cacti were shown by Mr. Mortimer and Mr. Green, and a beautiful setdling, a cross from Cerens speciosissimuc, came from Mr. Davey, of Colney Hatch. dach petal was of a beautiful violet colour with a. wol defined rib of red down the centre, thus prod
pleasing and rather striking contrast of colours.
Orchids were neither so numerous nor in such good condition as we have seen them. Of groups of 20 the best came from Mr. Geduey of Hoddesdon. It contained Galeandra Funcki, a greenish yellow kind, with brown streaked lip; Lycaste Skinneri, finely flowered Phalsenopsis; Cattleya Mossige, Harrisonim, and sur perba, tbe latter a rosy purple kind with deep crimson
yellow-streaked lip; Calanthe Masuca, a fine plant, yellow-streaked ip; Camanthe Masuca, a fane plan the rare Aerides nuaculosum. Among Mr. Woolley's plants; which were next in point of merit, were Dendroreed; and extremely pretty, especially when seen so finely bloomed as this plant was ; also Barkeria ppectabilivy
foll of flower as it could hold; Cattleya intermedia and superba, the latter with two blooms on it ; Saccolabium guttatum, the white
Sobralia macrantha.
Of groups of 12 Orchids the best came fron Mr. Keel, gr. to J. Butler, Esq., of W(iolwich. It contained as specimen ore was more orange thau usual ; Dendrobium tortile with conspicuous sulphur coloured trumpetshaped lip ; and the rich arange blcssomed Lælia cinnabarina. Mr. Clarke, of Hoddesdon, had Epidendrum macrochilum, with large white lip stained with purple the Wallich Phaius, and the little straw coloured Oncidium straminerm.
Of collections of 6 Orchids there were several. Tie best came from Mr. Grix, gr. to A. Palmer, Esq., of Cheam. It contained a large and remarkably fine
Aerides odoratum ; also a specimen of A. crispum, with Aerides odoratum ; also a specimen of A. crispum, with
macnificent branched spikes of pink and white flowers. Mr. Carson sent Dendrochilum filiforme, with long pendent tails of small green blossoms; Saccolabiun Blumei, with three very fine spikes of bloom; and the
variety of Bearded Lady's Slipper called superbum. variety of Bearded Lady's Slipper called superbum.
Mr. Dods rroduced Anguloa Ruckeri, two beautifu'ly fowered Stanhopeas, and Cattleya Mossix. Mr Morris sent Acineta Humboldti ; the singular looking Maxillaria tetracona, and the deep brown and purple flowered Epidendrum Hanburyanum.
Roses in pots from Messrs. Lane and Francis formed an interesting feature of the exhibition. Mr. Lane's Persian Yellow was oharmingly flowered, and so was Miss Glegg, a small white ind. Other well known kinds, such as Paul Perras, Duchess of Sutherland,
Louise Peronny, Great Western, and Souvenir de MalLouise Peronny, Great Western, and Souvenir de Mal-
maison were also equally "well done." Messrs. Paul had some handsome cut Roses.
Cape Heaths were contributed in good condition by the usual exhibitors of them. Among the differen varieties were tricolor Wilsoni, and other sorts belonging to that class ; metuleflora, dentioulata moschata, depressa, ventricosa grandiflora, Cavendishi, propendene, Bergia
Of plants having fine foliage, Mr, Parker and Messrs Henderson sent colleetions, in which were Ferns, some pretty Lycopods, including L. Martinsi, a variegated
ydrangea, Caladiums, Rhopalas, and variegated Orehids
Of novelty there was hitte or nothing; Eucharis grandiflora and Grevillea longifolia received prizes. The n flower.
Ferns were farnished by Mr. Fletcher and others Among them were good examples
and Hymenophyllum Tunbridgense.
and Hymenophyllum Tunbridgense.
Pelargoniums were plentiful and made a good dieplay Mr. Turner's plants were all that could be desired, bot as regards growth and bloom. The sorts were Astrea,
Lucy, Queen Eleanor, Esther, Painter Improved, LeoLucy, Queen Eleanor, Esther, Painter Improved, LeoSanspareil, and Carlos. Mr. Dobson was second. In the Amateur class Mr. Nye, gr. to E. Foster, Esq, was first. He had Attraction, Edith, Purple Perfection, Golden Fleece, Enchantress, Fair Helen, optimum,
Seraskier, and Carlos. Of fancy kinds Mr. Turner's were the best. They consisted of Erubescens, Criterion, Lady Hume Campbell, Celestial, Evening Star, and Pertection. In the Amateur class Mr.
Bousie, Stoke Park, was first with Electra, Criterion, Bousie, Stoke Park, was first with Electra, Criterion,
Charles Dickens, Cassandra, Triumphant, and Barbette. Of other Fancies, four plants more than four feet in diameter were shown by Mor. Thomson, of and were exhibited to show that Pelargoniums can be grown without such appliances. They were not
sufficiently advanced in bloom; but as regards growth sufficiently advanced in bloom ; but as regards growth they were as compact and bushy as if the ordinary attention to staking had been paid them, Of new
Pelargoniums Mr. Turner sent Snowflake, Omer Pacha, Pelargoniums Mr. Turner sent Snowflake, Omer Pacha,
Admirable, Lord Raglan, Wonderful, and Phäeton. Of Seedling Pelargoniums Mr. Turner sent Prince of Prussia, a brilliant scarlet with dark top petals; Williams, a kind with dark upper petals, white throat and pink under petals, streaked with erimson; and Mr. Beck, rose, with spots on all the petals. Of Fancies were General Pelissier, a pleasing flower; Heten Faucit equally showy but with more colour; and Emperor,
flower of the Hero of Surrey class. Viola (Hoyle), flower of the Hero of Surrey class. also a pretty variely, harge, showy, and of a new shade also a pretty variety, harge, showy, and of a new shase
of colour. Alma (Turner) is a charming variety of the variegated class ; it is a glowing scarlet, dwarf, and has a fine foliage.

Petnoias worthy of notice consisted of the double white Imperial and Marquess de St. Innocent (Turner) a purple sort, striped with white like a Carnation.
Calceolarias were shown by Mr. James. The sorts were Brunette, Fandango, Beauty, Marie, Commander in Chief, and Duchess of Northumberland, Of slirubby linds Mr. Turner produced the following :- Eclipse, brownish red; Hebe, yellow; Hawk, spotted yellow ; flowering yellow, slightly spotted; and Orange Perfection. Some good unnamed seedlings of the herbaceous class were shown by Messrs. E. G. Henderson.

Of Fuchsias there were some admirable plants beautifally flowered from Mr. Bousie and others. The varieties were not different from those named by us on

Mesers. Tyens,
Mesers. Tyso, of Wallingford, exbibited some beantiful Ranunculyes. The following were the best in their
collection of 100 , viz, Exhibitor. Sincerity, Imperial,
Meeliness, Renovatur, Festus, Calilornia, Enchanter, Meekness, Renovator, Festus, Calilornia, Enchanter,
Pertinax, Suaviter ; also fine specimens of Naxara, Eliza, Pertinax, Suaviter; also fine specimens of Naxara, Eliza,
Gomer, Commodore Napier, Marquis of Hereford Gomer, Commodore Aapier, Marquis of hereford, nation, Sir J. De Grehme, and Sabina.
Of Pæonies and Irises Mr. Salter sent handsome collections of cut blooms.
Pansies were not shown in very good condition. Messrs. Dobson had Satisfaction, Maris, Alphems, Royal Albert, Duke of Perth, Sir J. Paxton, Yellow Climax, Ariel, Lady Carrington, Pomona, Rhoda, Aurora, Pompey, Mrs. Douglas, Lord Duufermline, Wonderful, British Queen, Mary Taylor, Cbarles Wonderful, British Queen, Mary Taylor, Cbarles Newcastle, Lady Emily, J. B. Gough, Sir J. Franklin, Beauty, Miss Tallot, Seedling, Miss Nightingale, Emeror, Fearless, Earl Mansfie d, Memuon, and Jubilee Mr. Stark, of Edinburgh, had among athers a singular variety, named Mazepps, in which each petal was half
purple and half white. It looked as if it might prove purple and half white. It
The fruit, as usual, excited a good deal of interest. There were upwards of 30 Pine Apples. The heaviest Providence weighed 8 lbs 10 oz ; this was from Mr. Fleming, of Trentham, and obtained the lst prize. The 2 d prize was awarded to Mr. Gillham, for a finely formed and well finished fruit. There were saveral ather good specimens, but they were either over or under ripe. The Queen Pines were very superior, and mostly from growers in Wales. Mr. Jones and Mr. Burn obtained the chief prizes for handsome fruits averaging 5 lbs We observed a wery good Lemon Queen from Mr Sunes which weighed \(6 \frac{1}{2}\) lbs., but it was not nearly ripe and therefore received no a a ward.
The lst prize for Black Hamburgh Grapes was justly awarded to Mr. Fleming; the bunches were not extra-
ordinary for size, but they were finely coloured, and ordinary for size, but chey were finely coloured, and class, but none of the others passed mediocrity. Mr Hill, gr. to R. Sneyd, Esq., had first-rate examples of Black Priace, which were rewarded accordingly, Mr. Turnbul had the best Muscats ; they were, bawever, deficient in that fine golden yellow which they should poasess when in perfection ; but this perhaps must not be looked Wor in June. In the Frontignan class Mr. Forber, Baillie and Mr. Clarke were equal. Mr. Turnbull ex hibited three bunches of a seedling Black Grape, luut the Judges deemed it so like the West's St. Peter's as to make it no award.
The prize Peaches as usual came from Mr. Snaw, gr辟 Mr. Drummond were seennd with Royal George. In this class there were 19 extibitors and 13 prizes awarded.
The Nectarines were generally very good and beautiThe Nectarines were generally very good and beauti-
fully coloured. Mr. Davis, of Oaklill, was lst, with Violette Hâtive; Mr. Ayres and Mr. Mitchell were good seconds with Elruge. Mr. Monro exhibited severa boxes of this fruit
An extra award wam made to Mr. Burn for an excel ent dish of Apricots.
For Plums Mr. Fleming was 1st, with Goliath. In Figs there were five or six competitore; Mr. Snow and Mr. Riehards were equal with "Browa Turkey." Mr. Bousie had very good May Duke Cherries, which wes Smilh showed very superior examples of British Queen and Sir Chas. Napier Strawberries, for which the Judges gave an extra award. Mr. Bailey had good example of Admiral Dundas, a new sort in the way of Britis Queen, but coarser. Among others shown were Sir been ripened nut of doors
been ripesed nut of doors.
Of Melons there was a
Of Melons there was a fair display; Mr. Ruffett and Mr. Bailey obtained first prizes for Hybrid Green flesh sorts and Mr. Dawson was first for a Searle Hybrid. No second nor third prizes were awarded for
Scarlet-fleshed sorts, as they were very deficient in flavour.

Among Miscellaneous Fruits were Plum trees in pots from Mr. Fieming ; on one tree of Jefferson, abou 2 feet high, were a dozen of fruits. Mr. Tillyard had a nice dish of White Currants ; there were also Straw Britisi Queens and extremely well flavoured.

\section*{fontices of saoks.}

The Ferns of Great Britain illustrated, by J. E. Sowerby The Descriptions, \&cc, by C. Johnson. 8vo, with 49 plates (68. uncoloured). - The Fern Allies, by the of Areat Britain and their Allies, dec.; by Anne Pratt. of Great Britain and their Allies dec.; by
8 vo , with many plates (12s. ? litenotinted).
We place these three works side by side, for the pur pose of drawing attention to a circumstance which w think deserves some mark of reprobation. The two firsi are published by Mr. Sowerby, a most respectable bookseller. The latter is an opposition volume got up within a few months after the completion of his worls by the Society for Promoting Christiau Knowledge. We do no presume to enquire whether an application of funds subscribed for religious purposes to the publication of works having no bearing upon religion is proper ; that is a poin to be settled between the Society aud its friends. Neither need we ask whether it is consistent with Christian feeling for a wealthy assaciation to take the bread out of
the mouth of its neighbour. But we have a right, and
it is our duty, to protest agaimst this benz done by meaus such as have been resorted to in the present instabce.
Upon conparing the Society's plates, ill executed as they are, with those of Mr. Suwerbr, it is obvious that they have been in several cases purloined from that gentleman, without the slightest acknowlelgment, and as we have reason to believe without any permissio having been granted. This is most especiailly glaring in the case of Polystichum Lonckitis, Gymnogramma leptophylla, Asplenium fontanum, and the Hymenoit is connected with such blunders on the part of th dranghtsman as attaching the magnified leaf of Hymenoph. aniaterale to \(H\). tunbridgense. To be sure a notice is now introduced into the book informing the public that "The artist wishes it to be understood that he has pur chased permission of Mr. J. E. Sowerly to copy from the work lately published by him, entitled the Ferns of Great Britain, illus rated, cervain celtuils of the Plates, including the figure of the rare phant, Gimatiogramma teptophylla." But this was not done, as we are intormed, till legal proceedinss had been threatened, and even then was conceded with the worst possible grace. We presume all this has taken place without the knowledge of the Society for Promoting Christian Knowledge, and is the mere act of some of the gentlemen entrusted with the management of its affairs. But it is on that account the more necessary that the attention of the supporters of the Society should be drawn to so reprehensible an application of its funds.

\section*{Garden Merroranda.}

Royal Butanic Garden, Regent's Park.-The exhibition of American plants held here under canvas is as fine, if not finer, thisseason than ever we have seen

Individually the plants are literally masses of bloom, and the three colleotions (which are supplied by Messr8. John Waterer, Standish and Noble, and Baker, coming into flower as they have done al at one and the
same time, have produced a display, the effect of which same time, have produce

Decidedly the gem not only of Messrs. Waterer's contributions but of the whole exhibition is the Rhododendron called Lady Eleanor Cathcart, a brilliant shlmon pink with a dark spot in the upper petals. This noble specimen, which is at least 12 feet in height and as much througb, has been and still is covered with flower, and looking over the whole show from whatever point of view one will this plantnaturally attracts atenvion. Fifty guineas, we were informed, were refased for this plant the other day, when it was in perfeotion. So much for its value. Next in point of merit, though much smaller in size, may be mentioned John Waterer, an intense deep crimson, with immense heads of bloom. Of the same class but different as little in shade is other deep crimsons worthy of especial notice were atro-sanguineum, Vandjck, and Blandyanum. The latter was, however, nearly out of flower; Loopardi, alilac, is beautifully spotted, and Sherwooniamo is alan worth attention. Blatteum, a spotted deep lilac kind, shaded with violet, has great heads of flower which, from their diversity of colour, make this variety one of the best of its class. Celebrandum, a singular looking kind, has blossoms of a deep port wine colour. Leferreanume is pink co'our and conspicuously spotted upper petals. Brayanum, as we have stated before, is one of the best of brillant rosy pink sorts. Geranioides, a spole pest of the bluish lilac varieties. Waterereanum, in the shape of a huge bush loaded with bloom, was at least 14 cet high, and as much through. Rnseum elegans, coloured kinds the best were per-picuum, gloriosum, and delatissimum fastuusum, a well known showy double lilac, was not fully in flower; Laciferum, French white in colour, was extremely delicate; Gretry is in the way of Blatteum, but paler; album elegans makes a pretty standard, as does also maculatumgrandiforuma, a rosy pink kind spotted and pale in the cencre. pink shaded with vioset pretrily spotted; and Sir Colin Campbell, an extremely handsome rosy pink kind with light In Mr. Baker's collection ponticum album was in excellent condition; Catambiense bicolor is also a most striking; Mammoth, a profuse flowerer, is rose when it opens, but changes to a delicate pink ; Altaone of the handsomest of its clase, as is also Tuwardianum, a rose coloured sort with finely shaped flowers; album superbum is a good white, and the same may be said of nivaticum, though the latter is nota large kind versicolor is distinet and pretty, as is also bicolor, a rose sort, is delicately spotted; and anoong dark varieties, atra-purpureun and erectum deserve notice. The semi-double Hyacnth florum we did not see in perfection, but we noticed a double lilac sort equally pretty called Vervaneanum. Kalmioides has peach-coloured
blossoms and foliage not unlike that of the broad-leaved Kalmia.
An as yet little known Belgian kind called concessum Nuble's pink flowers with pale centres, and is excellent both in shape and substance. Fleur de Marie, a rosy crimana
kind with paler centre, is also transparent and beautiful Maid of Saragossa is a good pink; Reedianum, an in-
tense rosy crimson, is also late and good; Nobleanum bicolor makes a handsome standard; Ariel is a rosy salmon, and conchiflorum, a charming little pink kind and a most profuse flowerer, although not reinarkable for good shape must prove a favourite. Duc de Many other sorts deserve notice, but the above are few of the more striking.

Messrs. Rollisson's Nurefry, Tooting.-Some new span-roofed houses have recently been erected here scarcely say this nursery contains a large collection. Other improvements in the shape of a new show house \&c., are also, we belicve, contemplated. Several pecies of Aerides, Cattleyas, and "ther Orchids were tained them we remarked a small group of Nepenthes, later them had pithers open or wame house of them had pitchers on them. In the same house was also a good plant of Angiopteris
evecta, sent to Messrs. Rollisson by their colevecta, sent to Messrs. Rollisson by their colgrowing in a temperature varying from \(52^{\circ}\) to \(64^{\circ}\), near eet abuve the level of the seal an elevalion the coole houses Rhododendron javanicum was in bloom, severa shoots of it having produced large and fine trusses of orange flowers; this was the best variety, of which Messrs. Rollisson have a fine stock. Among other remariable plants was Meyenia erecta, an Arrica chrysops, but of better colour, and altogether more beautiful. This is said to flower freely; to have it in perfection, however, it should be grown in what is serves. Of Indian Azaleas one named perfecta elePans promises to become a favourite. It resembles finely spotted in the upper petals, A. crispiflors is finely spotted in the upper petals. A. crispiflora is also a beautiful kind, with brilliant pink flowers, the edges. A coloured representation of it has been civen in the Botanical Magazine, t. 4726. A. Eulalie is ee it in flower. The Australian Hedaroma (or Gene tylis) Hookerianum, a greenhouse shrub of considerable beauty, was not in bloom. This is the same as the Genetyllis macrostegia of the Botanical Magazine Among new evergreen, shrubs supposed to be hardy introduced by Mr. Henshall from volcanic mountains in Java, where it grows at an elevation of 10,000 feet above the level of the sea. It forms a close bush thickly set with dark green leaves, and oaded with deep crimson flowers. Among AchiIt has lilac blossoms of medium size, charmingly atreaked and blotched in the centre with purple Of Gloxinias we remarked some beautiful kinds, mo:tly apright sorts like the old Fyfeana. The best were G. virginalis, carthusiana, Rex ignis, Mars crerulea, A uricula, and Helen of Orleans. The flowers of the last are Miue edged with white, and extremely pretty. Gesnera are purplish-lilac with white throat. Among Geraniums was a very pretty horse-shoe kind called Gloire de Douai, the flowers of which are white with pink centres. We also noticed the double White etunia Imperialis, which is sweet scented and valuable In a
n a had got out of health. Their leaves were affected by scale and soot fungus. The plants were therefore cut Well back, and what shoots and leaves remained on them
were thoroughly c'eaned by means of soft soap, sul hur, and tobacco water. After that they were repotted, shaking all the old soil from their roots, and now, although not placed on bottom-heat, but merely kept warn by shutting them up early in the afternoon and syringing them occasionally, they are breaking freely and promise to make good trees.
Out of doors American plants were in bloom, and ree Pæonies, Among the latter one named Triomphe very showy.

\section*{Calendar of Operations.}
(For the ensuing week.)

\section*{PLANT DEPARTMENT.}

Conservatory, \&e.-At no season should the plants be crowded in this house, and this is especially to be arcided at the present time, when mildew is active and most things in such a state as to be speedily injured by it. Endeavour to grow every plant well, and to
bring nothing but fair specimens here, and then there will be no temptation to liuddle them together for the purpose of making the one bide the defects of the other. case of soft-wooded stove plants, or such things if the grown in a season, it is not of much importance while in bloom ; but all valuable specimens of hardwooded plants should stand quite clear so that every part may receive plenty of light and air. Indeed, most conservatories are so constructed and managed as to be
reen reenhouse hard-wooded plants, as Ericas, Leschenaulias, \&e., and if these must be brought here they should while in flower be placed near the glass in the cooleduring the house, where air can be freely admitted weather is warm will greatly assist in preventing etiolation. Such things as are well known to be im patient of a confined atmosphere should on no account the least unsuitable, for fine specimens are not arown without much time and care, and many of them do not soon, if ever, get over an injury which at the time, save o the practised eye, may be hardly perceptible. The Camellias and Azaleas for early flowering will have set
their huds, and should be removed to a sheltered shady situation out of doors, for if kept in heat they will he ap to make a second growth, which must be avoided, as is he case. Give wering sossible sttention to plants for autumn and early winter flowering, as Lilium lancifolium, Chrysanthemums, Salvia splendens, Globe Amaranths, Tree Carnations, Searlet Geraniums, Cinerarias, Gesneras, Begonias, Euphorbias, \&c. ; let these have plenty of pot-room, good rich compost, a mois tmosphere, and plenty of space for the perfect deve opement of their foliage, regulating the temperature according to the nature of the plant, and they will make very rapid progress. Selago distans is an exceedingly useful winter flowering plant, requiring merely a cold pit to grow in and flowering through a long season But we have nothing that surpasses the Epacris, the hould not oming Ericas, and Cytisus, selection A mong comparatively new in makicoraphis Ghiesbreghtiana is a really good thing for the decoration of the conservatory in winter, as is also the blue Conoclinium and the singular looking Thyrsacanthus rutilans is firstrate for a rather warm house, but we have not found it to nswer for winter use in the conservatory. The atmo shere of plant houses can hardly be kept too moist at this eason, but it is very easy to err in the opposite direction herefore sprinkle every available surface frequently nd syringe growing stock lightly twice a day during and ventilate freely in order to secure compact growth.

\section*{FORCING DEPARTMENT}

Pineries.-Where the bottom heat is obtained from an or other fermenting matter it will be necessary to the heat, but at this season it will be safer to surface with a few inches of fresh tan in a rather dry state than to turn the bed, mixing the fresh materials, which often cause too strong a heat; and at this season there is much more danger of erring on the side of too much han too little bottom heat. Give every attention to keeping up a succession of fruit. Perhaps the most certain method of doing this is by securing and poting a number of suckers proportionate to the demand, at hort intervals during the growing season, therefore oing this eping up a regu'ar supply of young plants, grown plants which have failed to fruit at the desired time. We have frequently seen gardeners allow the number of arge plants to increase, so that there was little room eft for the young stock, which suffered accordingly, and isappointment came in due course. Do not let the rowing stock suffer for want of pot room, or through ryness at the root, and affcrd them a moist atmosphere, syringing and shutting up early in the afteruo in, so as to give the house a good steaming. Recently potted plants, especially if they were much pot bound before being repotted, should be kept rather close and shady, with a thoroughly moist atmosphere, and very carefully attended to with water until they appear to have taken to the fresh soil. Vineriks.- In the case of fruit intended to be kept as long as possible, the berries shou'd be thinned, so that they will hardly touch when fully swelled, for it is scarcely possible to keep Grape Be purticularly careful of the are severely thinned. e particularly careful of the foliage of the Vines inmust to furnish a late supply of Grapes, and if plants must be grown in the house, see that they are not infested with black thrips or red spider, for if either ot hese pests is allowed to gain a footing on the Vines, the foliage will probably be greatly injured, and then there will be no chance of keeping the Grapes in good must be encouraged with a brisk tere ripe. Musca setting.
flower garden and shrubberies.
Now that the bedding stock is fairly cleared off and growing freely in its summer quarters there will be more space and time to attend to the propacation of favourite hardy plants, and no time shiuld be lost in getting a good supply of cuttings of such things as it may be thought desiralle to increase, for the propagation of attenting nut stock for next season will soon require Queen . If not already done, sow Brompton and a bit of light rich soil, and never, selecting for them become dry until the pland never letting the surface there is no time to be lost if these are to be had strong for blooming next May, and at that season we have for bioming next May, and at that season we have
nothg more beautiful nor half so fragrant as well grown plants of the latter. Do not omit to put on a slight hot-bed a good stock of Pink pipings, and also see that livening the borders next spring. These have
horists, but they are deserving of the hands of the forists, but they are deserving of extensive cultivaYoung shoots when they can be the flower garden. Young shoots when they can be procured will ront reely under a hand-glass in a shady situation, and if rapidly during the autumn, and may be transplanted apidy the flower garden when the frost cuts off its present occupants. Persevere tr. Keep down weeds and let neatness prevail every.

HARDY FRUIT AND Kitchen ga rden
Black-fly is sometimes very troublesome on the late Cherry trees at this season ; it is however easily got rid hy dipping the ends of the shoots in tobacco water, cong the trees a good washing with the engine than the usual method of syriuring more is. a more certain remedy, and much \(\mathrm{l}_{\mathrm{tss}}\) tobacco water is required. Lay in the young shoots of Peach and Necarine trees, stopping any that may seem to be taking a decided lead, and endeavour to secure an equal state of prowth all over the trees; also persevere in stopping he breast wood on all trained trees, whether wail, espa. ier, or pyramid ; and proceed with nailing as expeditiously as circumstances will admit. Get Carrots, Onions, \&c., thinned.

## The Agricultural Gajette

 SATURDAY, JUNE 21, 1856.In a former paper on $W_{\text {EFDS }}$ we pointed out that Nature had been so prodigal of means for the preservation of even the commonest species, which indeed are so common in virtue of this very fact, that it behoves all those who would successfully cope with them to make themselves acquainted with their habits; and this not as in the nature of a general law but as a subject purely specific, each species having its peculiarities, an appointed time for its appearance, and the perfection of its seeds-
some affecting one soil or accompansing one crop, dofs it not follow that the first isolited colonies their habitats, whilit others are to be met with everywhere; so that Nature mast have in such cases provided ex:raordinary means for the continuance of its specier, and it necessarily follows that ei her the farmer is not acquainted with these in all their bearings, or if so his means for the destruction of his enemies are not equal to their powers of reproduction.
In order therefure to exemplify our views on this subject, we cannot do better than devote a brief space to the examination of the nature and babits of two o our commonest and confersedly most mischievous weeds, namely tha Tussilago farfara, Coltsfoot and Leontodon Tarasacum, Dandelion. By so doing we shall furnish our readers with a lesson on the importance of cultivating their powers of observation, whilst at the same time we shall show that every act should $b=$ the result of that careful
thought by which the acquisition of facts should ever be accompanied.

The Cultsfoot is a perennial plant, with creeping underground stem-the rhizome of the botanist-larse coarse leaves, which succeed the flowers, the latter causing it to be placed in the natural order Compositce, the heads of flowers being compounded of a multitule of florets, making a compound flower by their union. The florets are followed by the seeds, each of which is armed with a feathery down-pappus-hy means of which it is capable of being wafted from one place to another by the slightest breeze.

Here, then, we see that in the Coltsfoot the farmer has to deal with a plant whose underground stems sufficiently provide for its increase at the starting point of any individual plant, whilst its floating seeds afford hundreds of chances of establishing new centres on fresh places of his own or
his nei hhbour's laud ; and if we look more carefully into the processes connected with the per fecting of the seed, we shall see that in endowing this plant with a creeping habit, Nature has not neglected the other and more general mode of pro pagation by seeds.
The flowers appear as early as the first week in March, first by a single head growing here and there afterwards others nake their appearance, until fron a single ruot as many as 20 flower scapes may arise these grow quite upright, gradually unfolding until the star-like flower is fully exposed to the rays of the san, this being necessary for ripening. The pollen or fecundating powder having performed its functions, the involucre closes tightly over the dying florets, and the flower droops its head, by which the involucral scales act as tiles to the roof, under which the seeds begin to swell, when in order to ripen them these heads again gradually assume the upright position, now $\in$ xposing the seeds to the heat of the involucre graduatly falls back, or becomes reflexed, leaving the seeds with their now expanded papuus, or full fledged wings, in such a position that a puff of wind can in the readiest manner sweep them all away. Now, with the ripening of the seeds the
leaves have hegun to push forth, and as these grow fast into a broad and flat surface, this and the whirened heads of ripening seeds soon attract the notice of the farmer, which the less conspicuous yellow flowers had failed to do, and consequently the hoe is put in action to destroy the pest, which is fast overgrowing the young crop, but it must he obvious that its use at this time, though it may prevent the perfecting of the la'er flowers, must assist in the most perfect sowing of the seeds of the earlier flowers, and if we bear in mind the fact that each head of flowers may perfect 150 seeds, and that there may be from 12 tos 20 heads to each root, we shall see that if one head has heen allowed to ripen its seed there is ample guarantee for the continuance of the pest, and we shall therefore not be surprised at a large colony of Cultsfoot appearing where but a short time since we could only observe a single root. We have seen in three years Colts-
foot completely covering a field, where oripinally there were hut a few centres of single plants. From an examination of the natural history of this plant, then, it appears that, in order to keep ourselves from propagating it we should carefully watch the appearance of its first flowers, as ky u-ing the hoe then we despoil these, of which, by an opposite process, we usually sow the seeds, and at the same time cat off the heads of what would otherwise be their successors; and at this time we do the further good of preventing the growth of leaves, by which means we cripple the enlargement and extension of the rhizome.
But farther, knowing how the latter spread, and that the arual method of ploughing only divides the plant into a maltitude of cattings which, by the
after processess of harrewing are scattered over the fold: and will grow wherever they are left,
though sometimes a troublesome and expensiv operation, yet being the more so the more it is required, will prevent after expense, and indeed be cheaper in the end.

The history of the Dandelion is much the same ss that of the Coltsfnot ; its stem, however, is not of the creeping kind; but though a kind of tapendowed with such wonderful vitality hat unless cut off very low down it soon reap pears with several heads or buts instead of one
The progress of its seed development, and the The progress of its seed development, and the in the Coltsfoot; its flowers, however, are blooming throushout most of the open part of the year, and each head that ripens may perfect as many as 170 seeds, and in a plant which we counted in August last year, there were 12 heads of flowers at one time o that allowing these plants to seed in only a partial deures, it will soon augment in spite of much ork to prevent it.
Here, then, in these two plants we have proof of the wonderful means used to the great end of their propagation, the knowledge of which in all their details is of vital importance in checking their increase. Does it not follow from these instances hat weed plants cannot all he treated aike, and that hoeing and other acts connected with them should be done at such a time and in such manner as the peculiar kinds of weeds pertaining to different districts, soils, and crops may indicate, in order to which much observation and inquiry is necessary? Hitherto many farmers have heen content to virw weeds a necessities, which they thought themselves clever if they only confined to certain limits; but notwith tanding their wonderful powers of reproduction, we can see no reason for the $r$ constant growth and suc cession, except that from the small amount of knowledge which those who have to deal with them possess of their natural history, they sow as muc with one hand as they destroy with the other.

Heavy crops of Grass, hazardous weather, and demand for labourers everywhere, unite to make wages very high; and the prices paid for mowing
are unusually heary. We should be obliged by information on this point from those correspondents in the several counties who have been kind enough to answer similar inquiries on previous oceasions.
Six shillings per acre is being paid in the county of Surrey for mowing natural Grass, and $6 s$. to $8 s$ per acre for mowing Clover? What are the price paid elsewhere? Information on this point will be useful both to labourers and farniers.

## THE WATER DRILL

Within the last few years the practice has arisen o sowing along with the Turnip seed either liquid manur or water in which guano or other soluble manure has heen mixed. The prac ice originated, we believe, Berkuhire. His drill consiste, beside; the ordinar arrangements for delivering the seed in rows, of a tank, buckets, or permitted to escape by open cocks, so as to pass in equal and uniform quantity down the tubes into which the seed is delivered, this being thus washed into the ground. In the southern and aidland counties of England, where a dry May presents often a great indrance to the euccessful brairding of the Turnip expected, provell of great assistance wherever it has been tried.
We have hefore us a letter from the inventor, dated Jan. 7 of this year, in which he states that he has drilled upwards of 100 acres or Turnips annually with it on his oun farm, with very successiul re-ults. He says, that in large districts of Turnip cultivation his states how a constant implement ocially valuable for sowing Cabbage setd, as on three acres of Cabbage plants, when it was used, the result has heen extra.rdinarily good. He expects indeed to grow early Cabbage ly this plan, so as to feed them as early as A pril. And the circular issued by the manufacturers of his machine contsins testimonials to its value equally onclusive
Perhaps, however, the best testimony that has yet heen given is that of Mr. A. Kuston, of Chatteris, in the Isle of Ely, whose expr-riments with it may be lest introduced by the folowing letter, with which we have been favoured by himself.

 I testaded last year by putting the Colisesed inthe huanure. This I tested last year by putting the Coleseed intu the cistern with
the lifinid, and sowing in that way on 24, rowzon one field, aod as
inany in another. In both. these canes I had a very level and regular plant, thus showing that if the Cintes.ef a were depel and
so equally in the row, the manure mast necessarily be the same
 rapid early growth of the plant. When artiniaith manures are used,
they must, be dissolved meceessarily to some extent bef. re they can
supply the food to the plant: and in a dry summee they mim
supply or upnn a dry soil, it frequently rocurs that there is not
sinficient moisture in the coil to dissolse the manure.
and consequently the plant does not rective tlat impetus in growth that it otherwise weuld do. Now, the artificial manure
being put into the cistern with the water, is, rendered much more beneticial, because its mist fertilising portions beerme quickl dissolved, and the crnsequence is you have a rapid early gromi
of the plant, fur its action upon it is ammediate. And this
liinhly important, especially upon soils like my uwn, whete it hishy mportant, especially upon soils like my uwn, where it it
always difficult to secure a gow plant and early grow th in con
sequence of drought, or flr, or snme of the many other pests sequence of drought, or ffr , or snme of the many other pests to
which our young plants are exposed. In two or three difierent instances I hare sown land with Colesped when the sril has been have found the liquid drill quite as monech superior to the do
drill as where they were used on a moil in a dry and dusty clearty showing. I think, that the success of the water-drill
very greatly attributable to the action of the water very greatly attributable to the action of the water upon the
manure. I can grow full good crops of (coleseed with a moderat quantity of superphosphate of lime, without yard manure, but for very clearly slow that the water-drill nccasions a much more
rapid early growth, as I lave shown it always is so; ynd my observatinn and experience enables me to say that this growth is shown in my published paper, reveal thig quite satisfactorily.
Mr. Ruston's experiments, referred to above, are wel! worth record. He has described them himself in the agricultural periodicals of the day, and we shall capy he tabular statements which he has given both of 185 nd 1855. At the London Farmers' Club, wher Mr. Spooner introduced (1854) the snbject of hiqnid manuring for discussion at one of its monthly meetinis, Mr. Ruston stated that he was about to maso set of experiments with Mangel Wurzel, and test the conaparative merits of dry and water orills; and this was done daring the season of 1854, which was onfavourable, as the drought of August and September very much checked the growth of green crops, so as to hide any advantage or difference at the brairding of he seed due to the use of either kind of drill. Nos. 4, , and 6 , in the following Table, were the hottent land those sown with the dry drill were a total failure.

The above is as perfectly conclusive on the value of the water-drill, as any experiment of any one year's duration in agriculture can be. The last column is calculated at 5s. a ton for the produce. But we have now two years' experience, for Mr. Ruston in the following tatement tor 1855 perfectly corroborates the other
He says that since the previous year its use in mis neighbourhoud has been preatly extended; and opinions relative to its value on fon soils have undergone a thorough change. Many who last year regarded it with a good deal of suspicion and apprenension, have since been led to acknowledge its merits, and have prononnced favourably of its effects where it has bean submitted to a trial. The table appended shows ful particulars of the different triais made this year by Kuston, the whole of which were made with Mangels

He says that this year he made a precisely simiar class of experiments with Coleseed, and although be cannot furnish actual results, as such a crop cannor tested by the weinhing machine as the Mangels cant號 30 to 50 per cear more feed than the dry drill, all other things beiag equal. "I ought also to remark," he eays, "that al those several experiments, as well as those of the Mangels, were inspect d and carefully examined by several practical farmors resident in the neighbouracy of and they can bear testimony to the perfect my हtatements."

Upon reterring to the table below, it will be see that in Nos. 1, 2 and 3, there is considerably less pro 5 duce per acre from both drills, than in Nos. This arises entirely from the fact that in Nos. 3 , the soil is of a very hot gravelly nature, queltly much less adapted for the growth of Mangel (an Nos, 4 and 5 , where the subnoil is cool and mor and the land necessarily much less affected by drough But notwitstanding this, Nos. 2 and 3 are so But notwitstanding this, Nos. 2 and 3 are greatly superior qualy 1 feel it important to offer, th

of the tho drms are in
peculiar circum-tances.

his experience on the subject, in the "Jurarnal of the English Arricultural Society,"

His experiment was made in 1852. Mr. Pusey sars
"Asat nurannual trialof implements the delivery alone of the manure by the different drills can be tried, it
seemed to me that it might he of use to farmers, if I tried the comparalive effect produced on the crop by the ordinary drill and the water drill. Accordingly, after feeding off some vetches towards the end of July, I put in two arres of Turnips with Chandler's water drill and "ithin five clays, four acres more with a prize Turnip drill made by Hornsby. The ground was almost wet, so that the water drill had no advantage on each; it was rathe quantity of manure was the sime in -6 cwt. of super hosphate per acre. The water drilled Turnips took the lead, and kept it in a most extraordinary way till December, when the weighing
took place, and the following result appeared:took place, and the following result appeared Water-drill d, nith 6 cwt. of superph.os
Dast-drilled, with 6 cwt. of ditto $6 \frac{1}{2}$ torrs.
I cannot account for this enormous difference: I never saw so great a difference before, and should not exfect it again; but af:er some years' experience of the two drills I have determined to abandon the use of the dust drill in flat drilling, and to use the water-drill only For there is, firstly, the advantage that you can drill in dry weather, at once ; secondly, that the manure is better diffused in the soil for each plant to feed upon thirdly, that you save the expense of the ashes require 4s. per acre; fourtily and lastly, that much less labour of horses and men is required with the water-drill, especially now that by means of a gutta percha pump, costing 4l., which can be purchased with the drill the boys who drive can fill the water carts also. I find
the comparative labour as follows:-

|  | UST DRILI. |  |
| :---: | :---: | :---: |
| Horses. | Men. | Bo |
| 4 in drill | 2 |  |
| 1 fetching ashes | 4 |  |
| 1 supplying drill | 1 |  |
| 6 | 7 | 2 |

Horses
WATER DRILL.
in drill
fetching wate
0 with drill [in carts
2 filling and driviny wats

It is only fair to add that Mr. Spooner, of 'South ampton, has invented another form of liquid manure drill in which the manure is delivered in the form of dry powder $j_{1}$ the same manner as that in which manure $d_{i} i l l s$ generally act, while the liquid is supplied by cocks from a ranti of clean water. No cumbrous difficulty allered of that mode of delivery, that in the case of only half soluble manure, water is delivered at one time, and sediment at another, is overcome.
Mr. Spooner has received many testimonies, from those who have used his machine, to its fitness and suc cess. He tells us, that he has this last year 28 tons of Mangel Wurzel and 12 tons of Carrots per acre, in
alternate rows, from seed put in by means of his wateralternate rows, from seed put in by means of his water-
drill at one operation with water and dry artificial manure, without the use of any dung whatever. U course, unless the water, seed, and manure had all reen evendy distributed, so as to secure an immediate
Oairding of the seed, this result could not have followed.
On the whole, we sulmit that the experience here recorded will be taken as a very tfficient advocacy of Turnip and Mangel Wurzel seed in the drills.
Mr. Chandler's drill is made by Messrs. Reeves, o Bratton, near Westhury, Wilts. Cost $2 i / l$. 10s. tur Mg four or five row Fowle, Waterton Iron Worlis, Andover. Cost 35l. IUs From Rendle's Farm Dircetory.

## Home Correspondence

On brcaking up Grass Land.-Grass lands must be divided under at least three head $\sim$, viz., of down lands, old pastures, and good meadow or grazing land. The advanages arising from the breaking up of old pasture land appear so numerous, and the disadvantages so few, that I propose to confine my observations chit fly to the benefit
likely to accrue to each class of the community by the cultivation of land of various degrees of quality. There are advantages arising to the labourer, the farmer the landlord, and the public, from increase of employment, of profit, of ren', and of food. In consider-
ing this highly important sulject, we are required to prove that converting pasture land intn arable will increase the employment of the labourer, will increase the quantity and value of the food produced from the land, will increase the profit to the farmer, and aiso increase the rent (consequently the profit) of the r or grazing ground :-1. Let us consider the quantity of food wrill feed from that hand, the quantity of cattle tha management of the calt'e and the land. We will suppose that 100 acres of good past re land will supply ufficient fond to keep 33 nxen or cows the whole year believe it is generally allowed that if a given number of cattle are kept on a farm wholly pasture for a year,
that half (ir nearly so) of the farm must be mown to profuce sufficient fodder for the cattle for 24 weeks in winter, when little or no benefit can he derived by their being allowed to graze. For instance, we will suppose that 30 cwt . of hay is mowo per acre, which I think will he allowed by pasture farmers to be a fair average crop, 50 acres will consequently produce 75 tons of hay; now 1 have ascertained by experience that full grown oxen on cows will consume 2 cwt, of hay per week, provided nothing else is given, so 33 cattle, which is the given number, at 2 ewt. each per week, will require 79 tons of 50 acres will not give more Grass than will be required by the 33 oxen or cows during the rest of the year, including the after Grass of the land mown. That this and 1 have gained this information by practical masmuch as - 2. I will now consider the amount of labour required on this farm of 100 acres of pature land. First, the cost of making 30 acres of hay, ricking, thatching,
sco, 1 esumate at 16 s. per acre, equal to 37.10 l . stail allow one man only to pertorn the whole of the r -maining work of the firm, which I imagine will be sufficient. I am supposing that the catte are allowed to graze in the summer, and in the winter are foddered either in the fields or yards. I am also presuming that the cattle are fatting, and not liept for the purpose of yielding milk; in the latter case the one man would reguire at least two women to assist in the oferation of 100 acres We have now come to the conclusion, tha ood apon that land is

## Wag s of one matres of hay, at 15s. per nare... $£ 3710$ <br> Weag s of man for 52 weeks, at 10s. per week <br> Making a total of <br> 2600 6630

I have not allowed anything for horse labour, as 158 ner acre for the hay masing includes that expense. I farm endeavoured to show in a few words that from a can be realived, aud only a small amount of produce is required ; that consequently such a system of farming cannot be heveficial to the fandlord, inasmuch as he cannot by liberal cultivation clauses and improvements enhance his rent; that it cannot be beneficial to the tenant because he is unable ly the employment of capital, indusiry and skill to overstep the bounds of that beaten track in which his nncestors have walked for centuries; that it cannot be beneficial to the labcurer because, as has already been seen, so small an amount of labour is required; and so sumblis the amount of produce gained, that it must tend to.adnance the price of provisions, and consequently tend to advance the poverty of the labourer. That it cannot be beneficial to the rublic is self-evident, because we have already shown that the landlord, teant, and labourer suffer, and surely t may be said in the lasses of these three degrees of men the public at $\ln$ rge partake. $E . \boldsymbol{H}$.
The Improrement of Settled Estates. - Those who are acquainted with the farming of England will readily agree with me that much has yet to be done to enable farmers to raise corn at a protit, should we retum to the low prices of the first four or five years of ree may very generally be said to be but half developed from the want of better buildinge, draining, clearing, and other improvements that are neeogsary to enable farmers to make the most from it. eapital may be brought to effect these improvements, without diminishing the landowner's income, would e most accepiable, and more particularly so to the owners of settled estates. Acting ou this idea Mr. Humbert, of Walford, has for the dast gix monthe been urging on the attention of members of Parliament the mportance of passing a general act to allow the owners of settled estates to charge their properties for a limited number of years with an annual rent charge in repaymeut of money expended in their permanent improvement, hut strange to say he has failed in bringing many into his views, notwithstanding that similar powers have been given to several companies and the principle is rorking well; and four n.l. ate years been advanced in this way in draining alone, benefit of the estates. That it is generally permanent benefit of the estates. That it is generally hopeless to expect large outlay of capital on cettled estates without some such security must be evident. The owners
unless in possession of other means are seldom disposed unless in possession of other means are seldom disposed $r$ perties however are may be the returns, for they oo often have to look to the savings from their anmual income as their only means of providing for younger children, and cannot afford to spend these in the inarovement of land to benefit the heir at their cost, or heir tenure is too uncertain to induce them to make he outlay, and it is to this we may ascribe that so much land in this country lies half cultivated, or in unpiofitable wood or pasture. Were the owners alowad to charge their land with the repayment of the ost of such permaneat improvements by annua payments, and permitted to sell the rent charges so reated, they would find no difficulty in bringing any of capital to the improve British capital that now goes into foreign achemes from the want of such legitimate employment at home, would be freely lent to landowners to increase the production mivh own country, and in this way the landowner might have his estate improved, free of cost, (tor the tenaut would freely pay the reat charge, with the certainty of the income being increased as the rent charges ceased. The heir would receive the estate mproved, and the country would get the benefit of the ncreased employment given to the labourers, and the enlarged production that would result from the greaterritity thus created. Hewitt Davies, 3, Frederick's Place, Old Jewry, June 17.
The Hay Crop of 1856. -The extraordinary and most opportune fall of rain ( 6351 inches) in April and May, atter the great aridity of Fehruary and March, has brought the meadow and pasture Grasses to such a con dition of excellence and abundance that, if the presen forcing weather continue during 10 or 12 days, the metropolitan counties will probably witness the making and harvesting of a hay crop so vast as to not only supply the deficiency of 1854 and 1855 , but to furmah an however, "must depend upon the will of the Highost

It is nut our ouject to induce any great confilience in
prognostics ; but some reference may be safely made prognostics; but some reference may be safely made th
the equinoxes of March and September as indices the weather that may be expected to prevail during the following summers and wiuters. Exceptions there are and must be to this and every other rule; but who ever can refer to the weather summary of the late estimable Gilbert White, in his "History of Selborne," comparing the calendar of each month fiom 1768 to 1792 with he dats of experience and more recent thbles, will scarcely doubt that euch as the weather has been within two or three days after the transit of the equinoctial line o it will remain, on the whole, during the following ummer or winter montha Some years agn, the developments of the Oak and Ash tree, as to compara ive precocity, were supposed to preindicate th:e characer of the following summer. In 1844, one of the driest seasons within memory, the spring Grass and fodde crops were nearly unproductive, and as the summer retained the same character, no rain having fulten til the end of June, many were constrained to feed their cattle upon the green boughs of trees. In that year paper appeared in one of the Cambridge journala announcing, as a long noticed fact, that in any year when the Oak expanded its buds and became coothe ively leaves, while those of the Ash rewarly and warm congenial to husbandry and farm crop." This theory produced great sensation, and assuredly was verified to the letter in 1844; observant persons, and some of grea rudition, paid much attention to the subject, and inormation was sought far and near ; Mr. Sturgeonthen a bigh electrical authority-stated that the various objects which constitute the vegetable clothing of the and are never precisely the same electric condition
An Oak and an Ash tree, for instance, are not endowed
with the same degree of electric force, one being positive

## the

the former. This may be the fact, but it explains
nothing as to points in question. Let us then inquire
what was the real state of these two trees just before
the late coldest weather of May pave place to the warmth of the present date. Both had protruded leaves before the 29 th , but unquestionably those of the Oak were far better defended, and more regularly developed. In April, 1854, prior to the visitation of the 25th night the hot weather of Easter had clothed the Oaks with complete verdure, yet every twig was utterly stripped midnight. The summer proved glorious and prolific and the preceding equinox had been favourable
these lines suggest inquiries after facts the writer's de ire will be attained. J. T.
Skin Diseases of the Dog.-Adverting to the meeting of the Royal Agricuitural Society on the 3d April las, the proceedings of which are reported in No. 15 of the
Gardener' Chronicle, will you allow me, through the medium of your columns, to appeal to the kindness of the gallant officer who sat as chairman of that meeting and beg of him to favour the public with the recipe he alluded to as heing a most valuable remedy in slin diseases of dogs ? Like the gallant Colonel liso am lover of doga, and it vexes me sadly to see how min are plagued with fleas in spite of the care bestowed in keeping them clean in spite of the care bestowed in to which them clean in every respect, The scratchin caused by the aburaly reit to alay the irritation caused by these abominable little parasites creates sores
which appear al ways to have a tendency to run into which appear always to have a tendency to run into
mange. Hoping that the distress of my canine favourites may plead my excuse for thus calling for aid
Drying Hay -I have just perused the letter of Mr Kennedy in this day's Chronicle on drying grain and hay crops. I think we have the means at hand for trial of what he suggests already, if our leading Ho rowers could be induced to try it, vid their dr, in kins, for if Hops can be dried by hot air, which is fact patent enongh, I think the same means miuht b brought to bear with any of the Grasses and cereals. At any rate it would be worth the trial to see what migh be done on a small scale. Although Mr. K.'s suggestion is very good one, it becomes a question of a serious character to be brought to bear for a lurge crop, still for bad season something of the kind would be admirable and a step in the right direction. $H$. H., 19, St. James' quare, Westminster.
Ricks on the Sea Coast.-Why don't farmers living near the sea coast, or exposed places, do as they do on the coasts of the Mediterranean to preserve their hay tacks from being blown over when half cut, which is in.ply to let two poles, or only one, into the ground on the lee side of the stack and in it. I shall try it on my
hill, 500 feet above the sea. Somerset.

Yearly Tenancy and Farm Leases. Lecture by Mr J. D. Ferguson, of Bywell, to the Hexham Farmers Club. J. Grey, Esq., of Dilston, President, in the chair. Journal Office, Newcastle
This little track reports a lecture on a very important subject which tells us very satisfactorily-
"1s', how it is that a tenant at will has not a fair chance of doing either justice to himself or his farm and, in what way generally a yearly tenancy of a farm often militates against the interest of the proprietor as well as his tenant; and $3 d$, in what way enants-at-will or those holding their farms merely from year to year, are not so useful to their country in a general sense as hose having leases.
Then, on "Farm Leases," it states "in what way ewant, when the one grants, and the other accepts, a ease of a furm for a term of years.
On these several points we shall make a few xtracts :

A tenant at will cannot do justice either to himself or his farm, for "It is impossible to expect that he hall lay out his capital in the permanent improvemen another person's property, without security that he o is heirs may at least reasonably expect the yearly in derest on the capital he has employed in the cultivation of is farm. For a landiord to expect that his tenant shall expend considerable sums of their own in draining, fencing, or building, without the security of a lease, to my mind, tantamount to his asking each of them for he loan of a sum of money, without any secur y or eceived it and few indeed I apprehend would be willing to lend their money in that way.
2. A yearly tenancy militates against the interest of the landlord as well as the tenant. "Every landlord is of course anxious that his farms should always be kept in good condition, lest, in the event of his tenant resigning possession of his farm, he should lose money nce-lerting in a nd a write gree 1 sund bery, a new bargai previous to Martinmas, if the entry is at May-day Now, if the price ofarm produce is looking up in the market, the landlord is naturally and reasonabl anxious for an increase of rent, probably beyond wha his tenants had before paid, and on the other hand, i farm produce has come down in price, then it is also his ent lass than form rly. All this, then, begets a constant and unseemly bickerin from year to year between a landlord and his tenant, which a lease would entirely prevent. It follows, then that in order to carry out what I think is perfectly fair on the part of the landlord, stringent clauses should be insisted on, which a tenant, having only a yearl interest in his farm, has often decilled objections in greeing to, because he subjects himself to consider sufficient reimbursement. Now, a lease for a number of years would cure all this, because a tenant knows very well if stringent or severe conditions are insisted on in the lease, of laying yearly on his fields a certain quantity of manure or lime, he, or his heirs in the vent of his death, are the only parties who shall reap the benefit.
. Cecants-at-will are not so useful to their country as those having leases. "They do not so freely expend heir capital or cultivate their farms with the same pirit and energy as those having the security of a lease, and this no man can be surprised at, for although the and ord may be the best of men, and may in every espect act the part of a most honcurable and consider ate landlurd, yet no man can tell when he may dispose or excamb part of his property, when a change may come over his circumstances, or when death may put an end to his kind intentions, and hinder the fulfilling of any promise he may have made, and, therefore, the tenant farning from year to year is naturally reluctant to lay out any capital of his own in improving his farm,
indiffertantly culuvated fields are oftem scanty in the extreme when compared with the crops of the vigorous
tenant who has the security of a lease, and who judiciously expends his capital in giving employment and otherwise permanently improving his farm, which his landlord (though perhaps willing) bis not tho ueans to do.
On the form of lease recomnsended as fair between with such than Mr. Fero among his to meet he above paragraph will obtain for him.

## Miscellaneous

The Beet Sugar Manufacture.-"Our largest agricul. ural establishments are employed upon the Beet. the department of the Pas-de.Calais, one single oot every year, feeds 1000 head of cattle upon the pulp, and in this way produces sufficient manure to grow upwards of 3000 quarters of corn: there is noth.ing of the kind in England upon such a large scale. In the department of the Oise, a company is established at Dreales, with a capital of 30,0001 ., for carrying on a similar oncern; last year they grew 1200 acres of Beet from hich they made sugar and alcohol, and with the pulp ed I do not know how many an 100 quarters of Wheat, and after disbursements and receipts to the amount of several millions of francs, divided, so I have been told, 15 per cent. upon the amount of the shares. The State has its share of these pays to the revenue for duty upon the homegrown sugar nearly a thousand franes (40l.); and yet sugar is lower in price than ever. Such are the wonders achieved by modern chemistry. And now for the everse of the picture : beautifur as this crop, thas andth part of the soil, and may hordly te extended Hitherto it has may in the exteded half of France ; it answers only in the rich, fresh, fraiche) deeply cultivated lands. It requires $\mathfrak{t h o r m o u s}$ apital to begin with, and of entimes to be renewed, for he e-tablishing of sugar houses and distilleries, and, what is still more serions, the outlet for the produce is hat Beetrot spirit obtains favour ; hould the disease isappear, this branch of production will stand a chance t least of being seriously interfered with. As regards he sugar, there is no certainty hat the price will not till further decline, and it is not to be compared, for importance of consumption, to articles of food. The as

## Calendar of Operatioms.

feasible reason that I have heard here is, that supposing the
estimate to be taken too high, then prices would fall in anticipaestimate tomndance; aud if taken too low, the the importers
tion of abund would set to work more eageriy, and so bring down the price it is impossible to arrive at any thing near the truth, forgetting that the thing is done in indiyidual cases every year without
much error, and the more general the system becomes the nearer the truth it will be. $G$. $S$.
WESTER Ross, June
No. Within the last four werks there has fallen a quantity of rain uncommonly large for this season of the Vory' cold and easterly. In the early part of last month the weather, fortunately, was very favourable for preparing the since that time this work has proceeded very slowly and very uasatisfactorily. Sowing of Swedes has been tinished generally and they are now appearing above ground thick and regulai grubber, and harrows have been wrought with all alacrity, and to great advantage. Sowing of common Turnips is $n$ im proceeded
with and in 10 dass will be all but completed. The quantity of manure applied to Turnips seems still on the increase; for it is acre 3l. worth of purchased mannures. The season appears to have been favourable to the brairding of Potatoes, as they appeared
above ground about a fortnight earlier than usual, and already above ground about a hortnight earlier than usual, and abready
few field; have been hed a jirst time. They are close brairded, and seem strong and vigorous, Autuma-sown Wheat on dry
soils never looked hetter; indeed, we are at a loss to know what soils never looked better; indeed, we are at a loss to know what
some crops will come to ; whether they will lodge early, and be some crops will come to ; whether they will lodge early, and be
of little or no use, or whether they will stand erect to harvest, and yield a return more abundant than any we have not look so well, and Oat and Barley until a few days ago
looked as if they were half drowned, and seemed quite unabie to keep pace with the rapidly advancing Wheat. Now, however, ihey are coming away in good earnest, and there to every. The hay crop ps heavier than it has been for years, and the pastures afford a sufficient bite for stock. Cattle, fat and lean, are in god demand, und prices are again remmenerating. The
rise in wages of day labourers and half-gear servants has stopped, rise in wages of day labourers and half-gear servants has stopped,
but as there is abundant employment at lair wages contentment generally prevails.

## Notices to Correspondents.

Bars Floors: Jice. If you mix broken glass up in the mortar for the barn forr it will puzzle the rats. But a well made conBors's Scytres: $G S$. in answer to our note at page 397 says :"The one that I had was not radially grooved at the joint great defet will le cured by it. But there are many more to be remedied. Tue method of attaching the iron to the wood at
the heel leaves it so weak that no man would venture into a heavy corn fild with them. For lawn mowing they may do,
but no better than the others; but for farm worik they will not Cha, to say nothing of the price Chafr-Cuthing and Bruiding Macarin: T. For the former
apply to Richmond and Candler, of Salford, and for the latter to Turner, of Norwich; or you may apply to any of the com-
mision agents, as Burgess \& Key; Dean, Dray, © Co. \&c. DISEASED FLock: Corrcespondent. We fear we shall nct have an opinion for you in time for publicatinn this week, but if you

such stuff ant covered by it, the volatile parts will be retained and the soluble parts will not run to waste. This is better than
adding gypsum. nf its office.
there is an an in a recent number of a Canadian paper there is an account which may serve your purpose. We quote
the following passages :- Mr. Heath, of Ludham Hall, says,
"You wish to knvw the weights of some of mar prize Herefords. A two years and ten months steer (four quarters, beef only)
weighed 92 stones ( 1280 lbs., 141 lbs , to the sine the gold medal given for any breed of all ages in London, 1850 . Winner of 302 . in London, 1851 . One three years and nine
months old, 126 stones ( 1764 lbs ), winner of second prize of $15 \%$ The nest Hereford I showed Was at Birmingham, 185, , two
vears and eleven monthe old, winner of the gold medal and $30{ }^{2}$. if brught him home again, and showed him the following year in London; he won the first prize of $25 \%$, and, had he had
justice done him, would have won the gold medal, 1854. showed at Birmingham a Hereford, the same year, winner the gold medal and 302. These two animals were twins bred by Mr. Thomas Carter, Dodmore, Ludlow ; the former weighed
129 stones (1906 lbs.), the latter, 183 stones (1862 1bs.); their 129 stones ( 1306 lbs. ), the latter, 183 stones ( 1862 lbs .) , their bought them the end of October for $50 l$, sold them December, 1554, forth $120 l_{0}$; they won me in money $75 i$, and the two medals are worth $40 l$. for old gold. These two Herefords made me in
all 245l. I showed a heifer, winner of first prize of 100 , at Birmingham, four years and ten months old, weighed 96 stones
( 1344 llbs .) I showed in London, this year, winner of first prize of 252. . sold him for $65 l$., three years and elevea months,
weighed 128 stones ( 1792 lbs .). A steer I showed in the young class in London, 1854 ; he had not a prize awarded to him. I
showed him this vear at Birmingham, won the gold medal showed him this year at Birmingham, won the gold medal and
307 .; sold him for 67 l. 10 s . ; he weighed 136 stones ( 1906 lbs .) Was three years and eleven months old! Mr. Heath breeds ear; lambs for the London market, feeds the ewes the same
year, buying in the fall-a practice with many graziers in
England. Mr. Rowland of Buckinchamshire sas s. England. Mr. Rowland, of Buckinghamshire sass:-'I havz measure, have been the exhibitors. I was an exthibitor for some oxen, which weighed from 260 to 270 stones, 8 Ibs. to the stone Leominster, says:- - In December last, isold to the agent of his steers for 13
extra mon $y$, and gold and silver medal at Birminghim, was 18 scores p'r quarter in her beef (1440 lbs.). The only reason great size. I contend that the weight is the proof. Now, Mr. Wood's shorthorn breeders show such proofs as above. Mr. Wood's parer: Anon. The Paper may probably be obtained Street, Black'riars. We will publishan extract next week on Renovating Old Pasture. Mi G $F$. You had better sow the Clovers and Italian Ryegrass on all solls, and on heavy while on light soils Festuca latus might be sown along with the comnon Clover and Rye-
Srass. land reclaimed from heath. It will not perform the office of Wratwora : C. Willkinson. Pressure during the growth of the mainly relied upon, but there is no certain remedy.

## PAGEAND CO.'S COMPOSITION FOR THE DESTRUCTION OF BLIGHT

hOP, ROSES, WALL-FRUIT TREES, CUCUMbERS, MELONS, VINES, sTOVE AND GREENHOLSE PLANTS.
Extra Strong, 4s. per Gallon, sufficient to make Four Gallons fit for use. Ten Gallons and upwards, Carriage Free to London.
A FTER FIVE YEARS' EXTENSIVE USE by the most eminent Gardeners in the Kingdom, the uge for destroying every pest to which Plant and Fruit Growers are sulject (without injuring the most delicate flowers or foliage), and promoting a luxuriant growth.
The greatest indication of its value is its adoption by the NURSERY TRADE as the most efficient and economical means they can emplos, manty or whose opinions will be found recorded in a Pamphliet of Testimonials, which may be obtained of the Agents; For List of Agents, see Gardeners' Chronicle of April 12h, and previous Numbers.

Pamphlets, with instructions for use, free by post on application to

SAMUELSON'S
REGISTERED BUDDING'S LAWN MOWING MACHINES PLEASURE GROUNDS, LAWNS, BORDERS, BOWLING:GREENS, ETC.

## To cut from 16 inches wide, for a boy to work,

 Up to 80 inches wide, for man and pony
## 

THE REGISTEREDIMPROVEMENT renders unnecessary the great care requisite in the handling of these machines on the old plan; all that is now required can be done BX ANY UNBgiLLed Labouger, who has only to push the machine before him. The Registered adjustment insures a clear and perfectly level cut of any required height, and prevents the knives from cutting into the soil, however uneven the ground may be.
Copies of Testimonials will be forwarded, post free, on application to the manufacturer.

The above may also be procured at the principal Agricultural Im plement Depôts in London; of Messrs. J. Vertcre \& Sox, Exotic Nurseries, Chelsea; in the Agricultural Department, and on the Lawns of the Crystal Palace. sydenham; and of all respect country.

B. SAMUELSON, Britannia Works, Banbury

## T. GREEN'S NEW INVENTION IN LAWN MOWING AND ROLLING MACHINES,

SOLe MANUFACTURER, iron and Wire works, Norti street, leeds. REGISTERED JULY 24, 1855.-No. 3739.

 wet or dry, snd by the simple adjustment of a thumb serew, in front, can be raised or lowered to cut width they cut; they will turn in very little ronm, and cut at the same time. All the working parts tear up the ground; they are only drawn, and not pushed and drawn as in other machines, one person with ease; the two latter with a pony or donkey. The three first sizes can be worked by

Testimonial from Jishua Major, Esr. Landscape Gardener, Enostrop.
To Mr. Green, Leeds-Sir, As I always appreciate public and useful improvements, I most gladly give my testimony to your highly improved Mowing and Rolling Machad althourh at the time of trial the lawn was wet it was
 with ease and pleasure, proviling the Grass is not too long. For extensive places I shnuld say the 24 inches wonld of most suitable; for even in undulatngy ground two persnns mis work it; but in flower gardens, when beds, \&c., are crowded, ither of the smaller sizes would be best. I congratulate fou on your viry valutble inveition, which in my opininn, entirely
urpasses, and must eventially supersede all others, for it is not only free from intricacy and easy to the workman, but extremely ex oeditious in its operations, and consequently must prnve a great saving in the management of Grass lawns, and a great boon to the public.-I am, Sir, your most obedient servant, Josmea Major.

Other Testimonials may be Rad on application to the Manufacturer.
The above Machines are warranted to answer the purpose as described, or may be returned, London Agents: Megers. Cottam \& Hallen, í6, Oxford Street; and Messrs. Burgess \& Kef, 103, Newgate Street, and may be had of all principal Ironmongera, Nurserymen, and Seedsmen in England ; also Mr. Carales Garrood, Superintendent of Agricultural Department, Crystal Palace, Sydenham.

## WATERPROOF PATHS.

THOSE who would enjoy their Gardens during the A winter months ghould construct their walkeof Posta, EMENP CONCRETE, wich are formed thus:-screen hich gravel of which the path is at present made from the lnam whic
is mized with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorvorate the whole well in the dry state befy applying the water. It may then be laid on 2 inches thick. Any
labourer can mix and spead it. No tool is required besond the pade, and in 48 hours it becomes as hard as a rock. Vegetand rerest frow through or upon it, and it resists the action hol it, To give a fall from the middle of the path towards the sideso ${ }^{\text {ThS }}$ The same prenaration makes first-rate paving for band

## The ©arwentrg Chromile．

SATURDAY，JUNE 28， 1856.

In another column will be found a report of the meeting of the Horticultural Society last Tuesday． We find with no small satisfaction that the Society has done us the honour to adopt the advice we last week presumed to offer，and that the free action of the Council is at length secured．An attempt indeed at obstruction was again nade，but the learned gentleman with whom it originated could find in the whole meeting but one supporter，and that one we believe was owing to an accident．Let us hope that the rebuke was felt．

The course which the Council are prepared to take is explained in their address to the meeting They will do their utmost to preserve the Garden， by selling the House in Regent Street，and so reducing the jncumbrances of the Corporation； they mean also to make a further appeal to the pablic in the hope that some at least of the sub－ scriptions which have been conditional upon raising 5000 l．may be placed at their disposal when it is seen that London property will be insufficient Measures will also be taken to diminish the rate of subscription and to increase the privileges of the Fellows．But the Council reserve the power of relinquishing the Garden if it is eventually found necessary to do so ；and that power is expressly con veyed to them by the resolution passed on Tuesday Among other topics introduced into the address was the announcement that an application had been made to Government for the rooms in Somerset House about to be vacated by the Royal Suciety． There can be no doubt that such a concession on the part of the Treasury would be not only a very proper but also a popular measure．For certainly few chartered scientific bodies can have greater claims upon Government upon the ground of public atility ；while an official recognition of the meritorious efforts of the Horticultural Society during half a century would contribute in nosmall degree to assist in the reorganisation which is contemplated by the Council．

As there seems to be a temporary cessation of communications respecting the Cugumber Disease， it may be well to make a few general observations while we have breathing time．The first point is to distinguish accurately between the several dis－ eases with which Cucumbers are affected．1．The red spider arises in general from keeping the frame too dry，a fault which is injurious to the plants in more ways than one，as it prevents the formation of new roots and is fatal to those already formed． 2．Mildew arises generally from a dry soil and damp atmosphere．Where there is proper ventila－ tion the gardener will seldom be troubled with it in his frames；but should it make its appearance， his only remedy is sulphur either crude or in solution．As the sulphur acts by the pro－ duction of sulphurous acid，which kills the mould which constitutes the mildew，it may be expected to be efficacious for that purpose and for no other．The gardener must divest himself of all notions of blight falling from the atmosphere，and recognise the real cause of the mildew；viz．，the rapid growth of a little monld in consequence of circumstances favourable to its growth，and he must then apply the proper remedy，with a view to meet the especial case before him．3．The little Vibrio first discovered in specimens forwarded by Mr．Bailey， of Nuneham，causes gouty swellings on the roots，in consequence of which the plant itself becomes diseased．But little is known at present on the subject．Experiment should be directed to find some substance which，when mixed with the soil， may be fatal to the Vibrio，and yet may not injure the tender roots．4．The Cucumber Murrain：－ $\boldsymbol{\Lambda}$ great deal has been said about the question whether this may be considered a constitutional disease， or merely one induced by bad treatment．If， however，it is reflected that the Cucumber stood the test of years under very indifferent management without any such affection；that dif－ ferent seedlings from the same packet of seed，all saved from a single fruit，exhibit very different con－ ditions；that it occurs under every conceivable form of treatment ；that it is capable of modification and alleviation under careful hands；and that no change of soil or avoidance of forcing manure affords com plete security，it seems highly probable，in spite of a few facts which seem to tend in a contrary direc－
tion, that the disease is strictly constitutional. The use of hishly nitrogenous manures has, we believe,
brought on a delicacy of constitution which mav be brought on a delicacy of constitution which may be cumstances in the seed of plants which have been too highly fed. The other theory is certainly untenable, and we shall be obliged if we give up the former to have recourse to the supposition, without a particle of proof, that there is something in the constitution of the atmosphere, as for instance a comparative paucity of ozone, which has of late years disposed plants to become diseased. Such assertions are in fact tantamount to an unwillingness to confess our ignorance. They are easily made, and incapable of being deliberately argued, unless we were in a position to compare the precise condition of the atmosphere at the present day with that some five-and-twenty or fifty years ago.
Mr. Ayres' communication (Nov. 10, 1855,) requires and deserves an especial notice. He has not confused the different diseases, and his remarks as to the Cucumber Murrain arising from improper soil deserve attention. These, however, have already been in great measure answered, and his remark that strong liquid manure always aggravates
the evil, is confirmatory, so far, of its tendency to the evil, is confirmatory, so far, of its tendency to
generate disease. The absence of lime in the soil, except in the form of magnesian lime, would be worth more consideration if the disease were not equally virulent in districts where every pan of water is so impregnated with carbonate of lime as to leave on drying a white spot upon the leaves. Iron is so common a constituent in the soil, and of much value as regards the cause. His strongest point is his assertion that he has raised plants rom old seed and seed derived from variou quarters without any security. We can our-
selies confirm his report as far as French and Belgian seed go, but forcing manures have been used on the continent as well as amongst ourselves; and it is well known that the strongest of all manures is frequently applied in a liquid state in China, from whence also he obtained seed. At the
same time we are quite ready to confess that it is very difficult to conceive how Cucumber seed should in general have deteriorated, which according to the constitutional theory appears to have been the case. Experiments however have yet to be made to show how seed derived from a supposed untainted quarter would fare, if strictly confined to wholesome loam, free from nitrogenous manure Mr. Ayres' practical observations as alleviations of the evil, whatever be its cause, deserve the attention of all cultivators :-1. Not to allow the plants to overbear; 2. To give immediate attention whenever the slightest untoward symptom appears; 3. To avoid all highly nitrogenous manures, and above all to confine the roots within pots, not allowing them to penetrate into the manure beneath, at the same time procuring that sort of loam which is most congenial to the plant. The latter point is of immense importance. The old gardeners were especially careful as to the soil, and we are sure that a little more caution in this respect would in great measure modify the evil. Our advice is still, save seed from the healthiest plants, and in a year or two we feel confident that every one who takes that course and avoids forcing manures will have a more healthy stock than his neighbours.
In addition to the diseases which affect the Cucumber, we have to call attention to one which seems to have been but little noticed by ease, or simply a symptom of a diseased condition perhaps adnits of question. However this may be, the matter is well worth consideration The affection consists in a strong hypertrophy of the peduncle, in consequence of which, as in an example before us, it is drawn out to a length of 3 inches or more, while fertilization never takes place and the fruit itself does not swell but gradually fails. It seems always to be connected with the presence of rich manure, and is believed to be one form assumed by the Cucumber Murrain, a notion which is supported by the fact that the base of the Cucumber in that disease is so often nourished to excess while the upper part fails. It is desirable to be in the possession of the experience of large Cucumber growers on the subject, as also of the
comparatively diseased condition of plants which are planted where none of the heat is derived from fermentation. It would be interesting, moreover, to know the result of growing Cucumbers in good maiden loam without any mixture whatever of animal manure, whether in solid or liquid form. It is, however, obvious that such experinients must be
conducted with great care, and the results from time to time accurately noted, to be of real value. If well conducted, they would be calculated to throw much light upon a perplexed question. M.J.B.

WITCHES' BROOMS ON SILVER FIRS.
welfarest every one who takes any interest in the welfare of young Fir plantations has had reason
to observe a very beautiful little orange-coloured tungus with a profusion of spores contained in a delicate colourless sac which year after year appears on some individuals of the Scotch Fir, till they at length in many cases fail altogether. This is the only species of a small but interesting group of parasites which has at present been recorded as occurring in this country, but I believe I have now before me a very
curious diseased condition of the Silver Fir which will eventually prove to have been caused by another species.
It was stated in this Journal (Oct. 2, 1852), on occasion of figuring a fine parasite which had been discovered by Dr. Thomson on Abies Smithiana at an elevation of 8000 feet amongst the northern Himalayas, that the Silver Fir in the Vosges mountains nd in some parts of Germany was subject to a disease which totaly alters the character of the tree. This
fungus is Ecidium elatinum, aud its effect is to produce in different portions of the branches bunches of deciduous shoots which are known in Germany under the name of Hexen-Besen, and in France under that of
Pàneurs de Sotré (Balais des Sorciers), names equi-

valent with that of Witches' Brooms. It is also called rance Rebrousses. A specimen Hindy forwarded Lamb is, I believe, though I have not seen the fungus. As there is no good description in any book with which I am acquainted gome further notice will not be superfluous.
The diseased part, though terminating a branch, does not appear to have arisen from the central bud, as the axis is not continuous with it. It consists of a fascicle
of branches irregularly whorled and divided, springing rom a buib-shaped swelling, resembling somewhat the swelling caused by $\dot{H} y z o d e n d r o n$, but not like that conisting of two distinct lissues which ultimately separate. These branches lose their leaves every year, and in spring put forth pale yellow buds, which at first sight would lead one to suppose that the fascicle is entirely parasitic. One or two withered leaves alone remain upon the specimens, which are about one-third of an ach long, and of a very different texture from the normal leaves. The bark on the gouty knob from which the fascicle springs is five times as thick as on the unaffected part, and rather rugged of decay in the form of dark irrejular patches of decay in the form of dark irrejular patches
which are more or less superticial, or reach to wood itself, but do not penetrate into its substance. These dead spots, which are indicated by cavities or rugosities externally, are taken possession of by Acari and the woolly Aphis, which may perhaps aggravate the affection but do not cause it. The tissues of the knob are more irregular than usual, and show admirably the spiral structure of the wood-cells. I could not trace he shghtest appearance of myceilum. The leaves on the branches immediately below the knob are not deciuous, but their form and size are materialiy changed and what is very curious the silver marking beneath is scarcely visible. Though the buds of the diseased part had made some progress, those on the evergreen branch ere very smat
I have the promise of further information in the course of a few weeks. Neanwhile I take this opportunity of giving a much reduced figure of the general appearance, which may elicit information as to the occurreace of this affection from other quarters.* In summer the Witches' Besoms are known at a distance by their red brown tiut and bushy habit. Some trees are so infested by them that it is with great difficulty only that they struggle for existence. The figure represents he Sussex specimen, from the gouty base of which a slice has been taken to show the daris patches in the bark. M. J. B.

- Specimens of N. elatinum are publisbed by Mongeot and
Nestier, No. 285, and it is figured by Albertini and Schweinitz

VEGETABLE PATHOLOGY.-No. CXXVII. 505. Parasite (Phoenogams. 2. False Parasites),
We have hitherto spoken of those Phrenoganos only which derive their nourishment wholly, or in ony part from the plants on whicla they grow. But there is also a vast tribe of False Parasites which live eutirely on the trunks of trees without however being nourished by their sap, besides multitudes of plants which merely run over the trees or cling to them by tendrils or other clasping organs, without throwing out the semblance of a root. The common Clematis or Traveller's Joy is a familiar example in our own hedges and thickets, where it often as effectually smothers and stifles the plant over which it runs, as if it were excluded from
light and air in a closed room. In Tropical forests however, where vegetation is so much more rapid and luxuriant, the effect is in proportion disastrous. The original trunk may be overrua with hundreds of these false parasites which in their turn are infested with others till the whole forms an inextricable mass or actually pulls down the original tree by its weight. It is a curious fact with respect to some of these climbers, as for example Cassia quinquangulata, Rich.,* that the same species according to circumstances may either grow freely, forming a tree, or run over neighbouring plants in the shape of a scandent shrub. In the latter case the structure of the stem is sometimes altogether differeut from what it is in the former, insomuch that the two might be supposed not merely to belong to different species, but to different genera or natural orders. The ducts in these climbing stems are frequently extremely large, a necessary condition when it is considered to what a strong degree of compression they are often subjected.
506. Those plants however which most fatally compress and throttie as it were the plants on which they grow, are those which run up the stems in the form of a close spiral. Where they are merely annual, growth is perennial, and slower than that of the matrix, after the climber has borne all the distension of which the spiral it forms is capable, the wood between the whorls begins to swell, and at last more or less perfectly closes over the false parasite, forming those curious spiral stems which are eagerly sought for by
the manufacturer of walking sticks. In such a case if the stem is not entirely destroyed, which sometimes happens, the growth is effectually checked, and vigorous timber is never formed.
507. These plants however merely use the trees as a support, without throwing out any roots, except those by which nourishment is derived from the soil. But there are hundreds of species which have no roots except those which are aërial, or which run amongst amonggt those of other false parasites. Sone of these plants plants prefer such situations, though they by no means
live on moisture derived from the air, because they have Iive on moisture derived from the air, because they have
just the degree of exposure to light which suits their just the degree of exposure to light which suits their hatits, and because the soil in which they grow is thoroughly drained. Others however do not depend at all upon the soil, but derive in many cases the all alike, whatever be their habits, tend ultimately to the same end of overwhelming the plant which supports them.
508. Beside these however there are many plants, as Ivy, Ficus stipularis, \&ce., which throw out roots wherever the stem presses close against the substance which sustains them, which act merely as supports by dilating at the base like suckers where they canno penetrate, but which if occasion offers, enter into it, and administer nourishment. Such roots however ueves imbibe sap from the plant to which they cling, but where they indeed convey nutriment, it is in the form of in organic fluid, and whatever matters it may hold in solution. These plants, like other false parasites which have been mentioned, may prove destructive by mere luxuriance, where their rate of growth is greater than that of the plant which supports them. butit has been often que then questioned, growter they faise parasito is inerior that of the supporter, they are really injurious. The question is one importance, as the beauty of trees is often greaty increased by the accession of plants like Ivy. Now there can be no question whatever about their being
perfectly harmaless in respect of exhaustion by means of perfectly harmless in respect of exhaustion by means of their abundant rootlets. It is not however so clear whether they may not be injurious in other ways. The first effect is probably beneficial as they protect tho trunk from cold winds, the effect of which on vegetaition may be seen by the comparative facility with whicl which is chully from Nor in warm genial day, or the they form a complete network waver the trunk, and as the parts of which it is composed increase in the thickness the network loses in great measure its powers of extension, and the trunk is in consequence strongly compressed, and the expansion of the tree in some measure impeded. We believe however that the injury due to this circumstance is greatly exaggerated. At ary rate if Ivy isnot to beallowed a place on forest treesitsinaient. destroyed at as early a period as cay be convere the When it is once established, the injury due to sudden rencoval of the warm screen upon the compression. M.J. B.

## HAZARD'S SYSTEM OF HEATING.

I venture to affirm, from the experience I have had of the successful operation of this system of heating and ventilating, that for simplicity, economy, and efficient adaptability for warming and ventilating every kind of horticultural structure it stands unrivalled, and that it is destined at no distant period to supersede every other plan now in ase. You have said, and truly, in your columns, that "If there is any one thing upon which we have insisted from the very commencement of this Journal more than another, it is the necessity of finding some method of admitting warm damp air to the interior of glass houses, copiously, and at will, without having recourse to the dry cold blasts which find their way through ordinary ventilators-tbat the interior of a wathouse should feel the breeze as freely and as constantly as an orchard house, and that without some stantly as an orchard house, and that without some power of this kind, good gardening is impossible."
Now Hazard's system, I aver, has conferred on us this power.

Again, in your No. of the 17th ult., after paying ust tribute of respect to the memory of the late Mr Meek, you proceed as follows:-"In short, he clearly saw, that if it could be accomplished, the true way of heating the air of a plant house must be not by radiation from pipes, but by warm currents driven or drawn in every direction; and further, "to keep warm air in active motion in plant-houses we have always desideratum of modern gardening: there is not a

less, we were wasting, on ordinary occasions, an average of $420^{\circ}$ of heat up the chimney. The extractor I placed in the dip of the flue 3 feet from the boiler, and by its absorbing power it arrests fully two-thirds of this truant heat, and renders it available by turning it into the houses for economical purposes, and this has produced such surprising results. And so immediate and complete is the sympathetic union and diffusion of the hot air with the atmosphere of the house, that when the hot air was issuing from the grating at $192^{\circ}$, 3 feet above it bad fallen to $70^{\circ}$, but what is most surprising of all I generally find that the temperature is higher in those portions of the house farthest from the hot air ventilator than in its mmediate neighbourhood.
The accompanying plan and section show the paten pparatus, with its appendages, as applied to the heating and rentilating a lean-to house 45 feet long, 16 feet wide Parli, 14 feet high. James Davidson, Gardener, Welford Paric, Newbury, Berks.

## Home Correspondence.

The Bark Trade.-A letter of mine on the subject of the sale of bark appeared not long since in your Paper under the signature of "A Country Gentleman." Sub clinton," who stated that hed in your Paper signed "H. Clinton," Who stated that he should be glad to commanicate with me on the subject. I have since received a
conmunication from Colonel Clinton, who is anxious
practical man who dnes not endorse that opinion, and
all which now remains is to show how it can be effected. I perfectly agree with you, and I beg leave to add tha Hazard's system without an inch of artificial radiatio surface, with its cold air drains communicating with the external atmosphere at will, its hot air ventilators with their evaporating tanks above or below, the grates and dry air ovolving their warm and damp, or ho all its constituent gases unimpaired, and sweeping with its July breeze every inch of the internal ares of the house to the vigorous and healthy development of every plant with which it comes in contact, thereby almost, if plant with which it comes in contact, thereby amost, if gardening," and renders it, in my opinion, the most atural and most efficient system of heating and ventila ing horticultural structures that we yet possess.
The apparatus itself is simple in its construction easily kept clean, and is by no means liable to get out of order, and from the action of the cold air drains and the distance the hot air pipes are from the fire they never get hot enough to burn the air when rushing hrough the hot chamber in which the pipes are en closed, on its way to the interior of the house. The uel best adapted for working the apparatus is coke, or the Welsh stone coal and cinders
We have a heat extractor, with its appendages, applied o the Vineries here. I may mention by the way that the Vineries were heated in the first instance in the most efficient and substantial manner with all the most approved modern appliances of hot water. Neverthe

pungs to be used at will.
that it should receive publicity in your columns, I therefore subjoin his letter, with a request that you Ch (if you see no objection) publish it in the Gardeners so follows. " The case of bark wonderfully resembles the case o Whe case of bark wonderfuly resenoles the case $0_{2}$. Wheat, but in its treatment how different grown, 'fielded,' 'cured,' manipulated by the producer, grown, fielded, cured, manipulated by the producer, and miller, to the baker, and "the system" is 30 ingeniously contrived that the producer of Wheat cannot throw in the teeth of the baker, at least, the charge bark-produce - sellers must make sgainst the tanners and bark buyers. These individuals, on the other hand (in the case of bark) according to the actual system, go to the producers, and say, "We must "shave " your (corn) bark, i.e., take off it therefore we can, and will, offer you just as little as we please, and if you will not take our price, you must throw the bark away.' From the results of this atate of thiogs it is surely not very unreasonable that the producers of bark shonld try to relieve themselves, without entertaining the slightest wish to encroach upon that the wishing to appear so presuming as to suppose that anything I may say shall infuence, in any way, the whole mass of bark-produce-sellers of England; therefore I
humbly venture to propose that such persons, or ther representatives, shall be invited to assemble, either in London or more properly in Birmingham, where a committee might be formed that should consider the subject and mature a plan-the best that might present itself-with a view towards putting this part of the business of buying and selling on its proper footing. H. Clinton, Royston, Herts."

Rosea with Green Centrcs.-I have a Rose (standard) in my garden which would not blossom. Thinking it might object to being pruned, I left it alone this spring and trained the shoots over s hoop; there has been an abundance of buds, but hardly one perfect flower, all of the latter having a protruding green centre. Some of the leaves have large dark blotches upon them. My ubsoil is a wet clay, bnt I take care to give Roses nearly 2 feet depth of Dartford loam. Can you oblige ne by suggesting the cause of the complaint, and a remedy? C. F. [It is usually believed that green centres are caused by the application of strong manure to the roots of Roses. 1
Larix chinensis.-Can any of your readers inform me what is the Larix chinensis of Miller's Gardener's Dictionary! The cones are described as being larger than those of the L. europæa, ending in acute points, and the cales as being prominent, like those of the Scotch Fir. The kind is said to have been sent to England, as a Pine good to keep up banks. J. D.
Gardeners' Benevolent Institution - As I have no doubt that Sir Joseph Paxton is a reader of your Paper, I herewith, through the medium of the same (if you will have the goodness to oblige me in giving it place in your next), take this opportunity of raising my feeble voice by returning him my sincere thanks for the able manner in which at the last annual meeting he advocated the cause of us poor gardeners who are subscribing members of the Gardeners' Royal Benevolent Institution. I fully concur with him-and I think that every member will do the same - that giving the males 20l. a-year and the females $16 l$. would be better than the present practice, at least I think that it would be the means of inducing more to become subscribers. But the great point is this: since I have been a member I have solicited many of my brother gardeners to become subscribing members of the Institution, but only in one instance have I been successful. With that exception the reply has been, "What is the good of subscribing to such an Institution when we see that many who have never subscribed one shilling to its funds are reiving the penion, or rath the fruits of other people What Sis Joaeph Paxton justly people in war am sorry to say, who although filling respectable I am sory to situations get very low wages, and therefore as a class fow are enabled so lay by anything for old aze, and again they are generally married men, and many have ostruggle hard to save one guinea a year to keep up their annual subscription; but that is not all ; for instance, there are now no less than six candidates on the list for the pension on the election which is to take place in July next, who have never subscribed to the Institution. I do not know who are on the committes or I would lay the case hefore them, but as it is I trust that these few remarks will come before some of them, and if so, receive their warmest consideration, for truly it is a hard case for a hard-working man who has been subscribing for 9 or 12 years to support the charity to see another man who does not belong to our fold "s allowed" by the committee to step in before him and partake of his hard earnings while he himself is shut ut at least for a time earnestly beg that the , mo le bho mittee will mind if 1 don moth come to nim, and so I dot namill has been done on that head has been uju It well known that when the day of adversity arrives thore aro many ready enough to become candidates for the support afforded by the Institution, notwithstanding that they have never contributed their amaal mite to its fund. As a subscriber I would suggest to those who have votes at che ensuing election to give them to subscribers only, and that preference should be given to those who have subscribed the greatest number of years. I have always done so. Surely this is nothing more than ustice, and no reasonable person can object to it. What is there to prevent the committee coming forward st once with some bye-law to effect that object ? Or it may he asked, do the committee consist of nurserymen? If o, perace is to "them a conveience; but surely common prudence tells ns that if a lo ${ }^{\circ}$ belt they ought to
 "Charity begins at home."- $\boldsymbol{A}$ Working Qardener.
Melons - For the last three years I have failed in bringing Melons to maturity, notwithstanding that my gardener has every requisite. The plants are reared and blossom, and bring their fruit to the size of large bulbs in perfect apparent health, but as soon as the first Melons approsch the usual size to ripen the plants decay, the foliage goes and dies off, and leaves nothing but shrivelled stalks and uaripe Melons which of course do not come to maturity. I find on inquiring at the gardeners around that they know of no euch instance as the failure of the whole plant and stalks just as the fruit is ripening. I find that the soil of the bed in which they are planted is barely 18 inches deep, and the soil is loose sandy mould and loosely lying round the roots, whereas I am told that the soil ought to be deep suil for Melons, and well and closely packed, and trodden in at the bottom of the pits. My gardener,
however, insists that 18 inches is quite a sufficient depth min. You will oblige me by say ing what you think the caust ot this is, for it is not one sort only but every sort that is
lired that fails. Has it anything to do with the watering? $A$. W. [It would seem that the soil is lie fruit. Probably the soil is not deep enough strong enough, or perhaps the water is deficient in uantity or quality. Try cowdung water.]
Hing very badly, as from the under sy Vines are enclosed leaf you will ptrceive all is not right. Can you tell me what causes the injury, and give me a remedy in your next Saturday's paper. My own opinion is that the border is by far too damp, being within 10 feet of a mill dam, and when the water is not
liept very low it rises almost to a level with the border. R. B, Stroudwatcr. [Certainly. Your Vines are dropsical ; they cannot digest the water they are forced to imbibe, the effect of which is the p mpled puckered
state of the leaves. If you cannot get rid of the water state of the leaves. If you cannot get rid of the water
try what free air and a high temperature will do for you.]
Honticultural Frauds. - Having read the swe eping accusations of your fair and medical correspondents against seedsmee and their wholesale frauds, would you allow me to give my own experience in laying down a pleasure ground. I am not going to be the champion readily admit that some of them practiso shameful im positions upon their customers ; but in the cases referred to it is surely only fair to put the saddle on the right horse. I know nothing of the " wretch who supplied the rubbish" to your fair complainant, hut as he may be as innocent as the party who supplied me, you may be doing him no more than justice by publishing the following facts. Three years ago I built a house for ny family on a field of 7 acres, which had been lying in meadow over
20 years. About half an acre around the house Ilaid out in pleasure ground. For the purpose of elevating the terrace on which the louse stands as well as to make sure of getting rid of weeds, I had the sod carefully repared the soil by digging deep, breaing the clods, and removing all stones. When ready for sowing, which was in the spring of 1854, I had it sown with a proper proportion of the following mixture, viz., Cynosurus cristatus, Poa nemoralis, Poa pratensis, Festuca pra-Rye-grass, all of which I knew to have been imported direct from Germany with the exception of the Ryegrass; the seeds 1 know were perfectly pure and correct to name, for 1 not only examined them carefully
but had a portion of them sown on garden ground, which had been some time in cultivation. The pleasure ground was soon beautifully green, and I rejoiced in anticipation of the fine velvet sward which I would have in a year or two ; but judge my surprise when, in the with tufts of Cocksfoot, Yorkshire Fog, Goose Grass, Rib Grass, besides a wonderful assortment of Docks, Thistles, Dandelion, Ragweed, \&ce, \&c. The disappointment, as you may conceive, was very great after all my trouble, but I could not for a moment blame the seed, as what I had sown in the garden ground was as fine as possible, and is now a beautiful sward, Was as fine as possible, and is now a beautiful sward,
like an old well kept bowling green ; it is therefore possible that your correspondents who complain so on dirty land, notwithstanding their own opinion to the contrary, and that the seedsman in the "west" may be entirely blameless. As for the failure in the Mangel and Carrot which the Doctor complains of, I suspect if same misfortune is very general this season, arising from the harsh dry weather which prevailed so long in spring. As a proof of this I may mention that I sowed a portion of a field with Mangel upon the 15th of April, when the weather was soft and rainy; the reMay, at which time the wind was driving from the east, and the soil was quite parched : the early sown jortion came away as thick as Cresses, while the other, sown from the same seed bag, has proved almost an entire failure, and I am now making up the blanks by dilbling in plants taken from the successful part of the field. Besides the fuilure cansed by the dry withering seasan, I learn that the worm is attacking the
Mangels who'esale, and that whole fields which had shown an excellent braird have now become sickly, and the entire crop is dying off. When on the subject of Mangel seed it is perhaps it retains its the extraordinary length of time which shell, in which the kernel is embosomed. The following is the result of a trial made this season with the various kinds: 100 seeds of each were sown in a flower-pot, and an were treated alike; the Long Red produced lu9 133; and the Long Yellow, 147; the first three varietifs were all of ine growth of last year, whereas the
Long Yellow was 10 years old, it having been the Long Yellow was 10 years old, it having been the
growth of 1846 ; this pxperiment not only showed that many of the seeds produced doubles, but if kept dry we need not hesitate to sow old seed; besides, I find that tie older the seed the fewer plants run up to flower stems. In consequence of the thickness of the shell of
Mangel seed a good deal of moisture is required to vegetate it, and cultivators should be careful never to
will be grateful for the information thus conveyed to
them by a correspondent who although he withholds his name we may say is entirely to be relied upon. But Mrs. Jessica's complaint was that choice lawn seeds were not sent her ; and
specimens she sent us.]
Necturincs.-Calling the other day to see Lady Southampton's beautiful gardens at Whittlebury Lodge, found Mr. Ayres gathering fruit to pack for London Thinking the Elruge Nectarines unusually large I asked Mr. A. to measure and weigh one of the largest, and he dimensions were 9 inches the largest way in girth, and 8 inches the other; and the weight was within a Peach 7 ounces is a very fine fruit; but a Nectarine ounces must be a monstir. A Lucokcr-on.

## Eacirtic.

Crystal Palace Horticultural Show, Jume 25 \& 26 -Un this occasion the plauts were arranged differently from what they were in May, and certainly more effectively. The great mass of the exhibition was this time accommodated in the centre transept, while the iruit new plants, cut flowers, and miscellaueuus subjects were the nave, in the direction of dive crystal fountain woth sides of the transept in front of the Orange trees, and as close to them as they could be placed were stagefuls of Heaths, Variegated plants, Azaleas, Roses, and fuls of Heaths, Variegated plants, Azaleas, Roses, and least 30 feet in diameter, raised up to a point on which was set a pretty specimen of Nortolk Island Pine, sup-
ported by noble examples of stove and greenhouse plants, and right and left cf this, midway between the ou side benches, were stagefuls of Orchids and Ferns, while all the salient points were neatly rounded off and sur mounted by statuary. This kind of arrangement we need not repeat was a great improvement on that of former exhibitions; hut still in our opinion it falls short of what might be effected with such materials out of doors under canvas. The exhibition itself, with the exception of the fruit, was not so good as that which
was held here in Biay. The weather was however fine, and there was a large number of visitors, according to the daily papers 14,214 on the 25 th, and 13,66 on the 26 th.
Of collections of 20 Stove and Greenhouse plants Mr May, gr. to H. Colyer, Esq., had the hest. It contained
noble specimens of Everlastings, I xoras, Kalosanlies, which are now everywhere coming into bloom; Allamandas, Dipladenias, Heaths, Clerodendrons, Pimeleas Rondeletias, Vincas, and an example of the Stag's Horn Fern Platycerium alcicorne. Mr. Taylor, of Streatham had much smaller plants, all belonging to nearly the same enera, to which may be added Azaleas, of which he had a plant or two still in good condition. Mr. Rhodes sent some pretty Statices, and a charming specinen of the white Pimelea Neipergiana.
In groups of 12 Stove and Greenhoure Plants the best came from Mr. Green, gr. to Sir E. Antrobus, Bart. It contained the gay-looking Kalosanthes minista, Gardenia Fortuni, with blossoms like polished ivory, and so oweet as to fill the air in their neighbourhood with fragrance; the fine Epacris alluded to in our last
report of the exhibition in Regent's Park, and some extremely well flowered Allamandas. The next group W. F. G. Farmer, Esq. In this the Allamandas, which are extremely showy at this season, were scarcely so
well in flower as could have been wished, but he had excellent Everlastings and Azaleas, more especially A. Gledstanesi, which was quite a pyrsmid of bloom. Among Mr. Morris' plants, which were placed third, was a pretty specimen of Stephanotis.
In the collection of 6 Stove and Greenhouse Plants contributed by Mr. Roser were well-grown examples of Erica Bergiana, Aphelexis, Epacrises, and Leschenaultias. Mr. Williams, gr. to Mies Trail
sent Kalosanthes and Everlastings in good condition. sent Kalossnthes and Everlastings in good condition. Messre, Veitch. The back xow of his group contained Dracena Draco, the variegated Arundo Donax, Livistona Borbonica, very fine; Musa zebrina, and the pale green deeply divided leaved Aralia pulchra. In the second or middle row were Maranta Warczewiczi, Croton pictum, Dieffenbachia picta, Maranta zebrina, the beautiful Cissus diveolor, Croton variegatum, and Pandanus argenteus variegatus, while in front were Coleus Blumei and pectinatus, the former blotched, the latter streaked and mottled with brown ; Maranta vittata, the red and brown Dracona terminalis and ferrea, Ananassa sativata variegata, a variegated variety of the white leaves. These, as well as the next collecWhite leaves. These, as well as the next collec-
tion from Messrg. Jackson of Kingston, were rastefuly set up, and taken as a whole the
effect which they produced was wonderfully fine. effect which they produced was wonderfully fine.
Aroorg Messrs. Jackson's plants were Araucaria excelsa, Solanum variegatum with hage leaves veined with purple, the variegated Aspidistra lurida, Cyeas revolata, variegated Pandanus, Aralias, and Cordyline australis. Messrrs. Lee, of Hammersmith, contributed smaller plants of the all but hardy Dracena indivisa, Caladium pictum bicolor, the red hairy-leaved Begonia splendida, Marantas, and Crotons. Mr. Morris ex-
hibited two beautiful plants of Cissus, Caladiums, hibited two beautiful plants of Cissus, Caladiums, a variegated Solanom. In other groups farnished by

Messrs. Bassett, Young, and Parker were variegated
Tall Cacti were shown in good condition by Mr. Green. The varieties were Epiphyllum aurantiacur. speciosum coccineum, the beautiful rosy pink variety of peciosum called elegans, and other better known sorts. Of Ferns there were some charming collections, the hest of which came from Mr. Fletcher, gr. to Dr. Young, of Kennington. It consisted of Polypodium spectabile, Nephrolepis Davallioides, Lomaria magelanica and discolor. Alsophila Colensoi, Asplenium Belangeri, Platycerium grande aud alcicorne, Gymnorramma lanatum, two small-leaved Gleichenias, and Davalia tenuifolia. Messrs. Veitch \& Son also had fine plants of Platycerium alcicorne and grande, Davallia solida, Gleichenia microphylla, Dicksonia antarctica, three Adiantums, the pretty Gymnogramma ochracea, Thyrsopteris elegans, a very handsome kind; Neotopteris vulgaris, and a Davallia. Mr grown Ferns, among which was a fine plant of Gymnotranma ochraceum. Mr. Sim, of Fout's Cray, showed 60 British specimens, among which were some remark. ably fine varieties.
Of Lycopods Messrs. Basselt \& Cutbush had wellgrown plants of viticulosum, Galeotti, inequalifolium,
uncinatum, umbrosum, Wildenovi, and the small apodum and lepidophyllum.
Orchids were in tolerably good condition, but not very numerous. Among large collections the best was from Mr. Gedney, who furnished various Cattleyas, ncluding the handsome C. Harrisoniæ, Odontoninssum citrosmum, Calanthe Masuca, Epidendrum verrucosum, and a handsome Bearded Lady's Slipper. Mr. Woolley sent Stanhopea tigrina, the
White Phaius, Sobralias, Phalænopsis, Aerides, Cypripediums and Lobrastes, Mhalænopsis, Aerides, first prize for a beautiful collection of 20 plants. Among them were Anguloa Ruckeri, with two large brown spotted orange blossoms; Oncidium pulvinatum and phymatochilu:n, Aerides Lobbi, a capital plant o fine species with lum, Lelia purpurata, an extremely fine species with large white flowers and purple lip Vanda tricolor and suavis, Saccolabium guttatum and Blumei, Phalenopsis, Odontoglossum hastilabium, the pinkish-lilac Barkeria Lindleyana, several Cattleyas, the best variety of Odontoglossum grande, and the handsome Cypripedium barbatum superbum with flowers streaked and mottled with brown
Of Orchids in collections of $12, \mathrm{Mr}$. Bassett, gr. to R. S. Holford, Esq., had some pretty plants, consisting of Aerides, Cattleyas, Cypripediums, and Dendrobes. From Mr. Clarke also came a group both wel Among Varieg
Messrs Variegated Orchids, which were furnished by Messrs. Veitch \& Woolley, were Physurus argentews and pictus, and Anæctochilus setaceus, intermedius, xanthophyllus, and Lowi.
Pitcher plants were well shown by Messrs. Veitch,
who contributed who contributed Nepenthes lævis, sanguinea, Rafflesiana, lanata, ampullacea, and phyllamphora. A group of nearly similar kinds was also shown by Mr. Gedney
Azaleas were produced by several exhibitors; but they were evidently past their best. They formed, contrasted well with a fine foliage opposite which they were placed.

Cape Heaths were numerous and more varied than usual. They were exhibited by Messrs. Williams, Roser, Peed, May, Cutbush, Jackson, and others.
Among them were good plants of Shannoni, obbsta, Savillean', Westphalingia, gemmifera, Massoni, florida, odorata, ventricosa magnifica, elegans, and different varieties of tricolor. Mir. Glendinning had the new kind called Spenceriana, a pretty sort with a good habit and transparent glossy pinkieh lilac blossoms. Of New Plants Messrs. Veitch had two Hoyas ; one named longifolia had long narrow leaves and creamcoloured flowers, the other was in the way of carnoss. The same firm also sent an Aerides with a large bright purple lip; the pink-blossomed Rhododendron Princesg Royal which has been shown before; Wartzia anrea, a yellow-flowered annual; a Thibaudia with creamy blossoms barred with brown ; and a handsome Kalmia calied picta, a large spotted variety of latifolia new plants not in bloom this firm furnished Theo phrasta imperialis, a plant with leaves some
long and 8 incles wide ; Aralia japonica, Myras microphylla, a plant with aspect of Boronis serrulata; and Rhopsala Jong of hast large bandsome folinge. Mr. Glend fower the henswick Nursery, sent of plants Rhamnus, from which it was etated the greea dye China was produced ; and a spiny contleaved Onsg from the North of China, esid to be hardy.
Of Miscellaneous plants Messrs. Veitch sent amsill flowering examples of Philesia buxifolia, Sonerila mas garitacea, Leptodactylon Californicum, two Niduare ald yellow"fruited Capsicum, the beautiful Gesnera Dontitesi laari, fine plants of Wellingtonia, Begonia Thwsites Ixora Lobbi, and a pantul of the singular cook
ing Ouvirandra fenestralis. The same firm also ing Ouvirandra fenestralis. The same firm also
showed a beautiful specimen of Lapageris trained in the form of a parasol, whuse fringe wa represented by a row of rich crimson Neville a fine plant of Peristeria fuscata, and Jackson, of Kingston, the white variety of Agap
purple Pentstemon from Oregon, and a rosy pink Rhododendron called maximum caucasicum. Messrs. $\mathrm{R}_{\text {. javanicum. A group of miscellaneous plants, shown }}$ by Mr. Parker, embraced Lycopods, Ferna, Palms, and Orchids. Among the Ferns was the handsome Pteris
aspericaulis. Other miscellaneous plants consisted of aspericaulis. Other miscellaneous pla
Gesneras, Achimenes, and Amaryllids.

Roses in pots were furuished by Messrs. Lane, Francis, and Rowland. They were well flowered ; but as the day advanced the heat, which was great, very
much impaired their beauty. Boxes of cut Roses from much impaired their beauty. Boxes of cut Roses from so numerous as we have seen them.
Pelargoniums were plentiful. The only collections, however, in first-rate condition were those from Mr. Turner, of Slough; next in point of merit were Mr. Dobson's. In regard to Seedlings list prizes were awarded to Spotted Gem (Turner), Prince of Prussia 3d prize to Miss Foster (ditto); King of Scarlets (Turner), Agnes (Hoyle), and Messrs. Veitch, Lee, and Kinghorn likewise showed soms good kinds; some of the sorts from the latter exhibitor we Hope to notice hereafter. Pinks finely laced were shown by Mr. Turner. The best were Adonis, Mr. and Mrs. Stevens, New Criterion, Purity. James Hogg, Sarah, Cardinal, Purple Perfection, Rival, Mr. Hobbs, Sovereign, and optima.
Fruit was shown extensively; but with one or two glorious exceptions it did not exceed mediocrity. This were for the most part unripe white Grapes, which good, and there was a Providence which weighed 101 lbs . from Mr. Fleming, gr, to the Duke of Sutheriand at Trentham. Mr. Fleming, also exhibited a miscelwhich a first prize was justly awarded. It consisted of Which a first prize was justly awarded. It consisted of
Black Hamburgh Grapes, large both in bunch and berry Black Hamburgh Grapes, large both in bunch and berry
and extremely well coloured, two Providence and two and extremely well coloured, two Providence and two
Queen Pine Apples, two Cashmere Melons, two dishes of Cherries, one dish of Early Orleans Plum, and a dish of Ingram's Prince of Wales Strawberry. Mr. Nichol, of Oxton House, Devon, and Mr. Munro, gr. to Mrs. Oddie, also exhibited collections.

Of Pine Apples, the best came from Mr. Fleming, Mr. Povey, Mr. Burn, Mr. Barron, and Mr. Jones. The Queens from the last-named exhibitors were most excellent specimens of good Pine growing. The best Black Jamaicas came from Mr. Davis,
Grapes of the Black Hamburgh kind, well grown and in all, respects beautiful, came from Mr. Fleming and Mr. Smith of Norwood, and excellent bunches of gr. to R. Sneyd, Esq. Of Muscats, Mr. Clarke of Hoddesdon and Mr. Turnbull had the best ; kut Mr. Davis and Mr. Taylor also showed good bunches. To prize was justly awarded, and good bunches of the prize was justly awarded, and good bunches of the
same sort came from Mr. Blake. Mr. Hill showe excellent bunches of Black Prince. Mr. Turnbull had a seedling St. Peter's, to which the judges gave a prize, and a seedling white Grape from Mr. Carpenter also
received an award. It was stated to be a cross received an award. It was stated to be
between the Black Hamburgh and Sweetwater.
Of Grapes "in pots, Mr. Forsyth had capitally fruited specimens in the form of arches, and others badly coloured came from Mr. Page of Streatham.
In Peaches, Mr. Snow was again first with most excellent examples of Noblesse, but good fruit was and Munro, gr. to Mrs. Oddie. Messrs. 1lavis, Ayres, and Hill had the best Nectarines. The sorts were chiefly the Elruge and Violet Hâtive

Of Figs, a capital dish of Brown Turkey came from Mr. Snow, and Mr. McEwen of Petworth also showed good frait.

Cherries both black and white firgtrate examples came from Mr. Fleming, and Mr. Ferguson of Stowe also showed good fruit on the branches, and in a model of the house like the letter A, and was constructed of wood and glass.
Of Plums the best came from Mr. Fleming and
Mr. Munro ; the former also showed examples of them Mr. Munro; the former also showed examples of them
in pots from an orchard house. Messrs. Lane likewise in pots from an orcha
Strawberries, in the shape of three excellent dishes, were shown by Mr. Wortley and Mr. Cothill. The latter were Black Prince from the open ground, where it has been ripe some time.
Of Melons, green-fleshed, Mr. Dalrymple and Mr Tegg had the highest flavoured ; and the best scarletflested, a small kind, came from Mr. Bailey, of Shardiloes.

Horticultural, June 24.-A special general meeting was held by adjournment from May 1, for the purpose o determining whether the Garden at Chiswick is to be fetlowined or not; Colonel Challoner in the chair. The collowing report from the Conacil was read:-

- The wishes of the last Special General Meeting have been complied with. The subscription for raising the $80 m$ of 5000 . for the purpose of trying the experiment of maintaining the Garden has been kept This sum has been promised by 200 out of the 750 Fellows of the Society, and by 29 strangers, and is in

5000l. being provided. The Council had hoped that the to would be the foreranner of complete success; to secure wheh they put in action advertisements, circular
letters, and personal applications. Since, however, the public has not sufficiently responded to the appeal that has been made the time has now arrived when actio must take the place of discussion, and the Society must decide upon its future course.
"It would undoubtedly be a grievous calamity if the Garden which has now at the cost of so much money been brought to its present state of efficiency were to bound to exhaust all other resources before they irre vocably consent to surrender the lease, and realise the property at Chiswick.
"While, therefore, they announce the failure of the subscription, they the necessary funds by mere voluntary subscription, they must also add that it seems to them
advisable to vealise other property before determining to break up the Garden; and they have therefore takien into consideration the possibility of selling the lease of the house in which we are now assembled, and finding a
place of business elsewhere. It is true that the proceeds piace of business elsewhere. It is true that the proceeds
of the sale of the house must be applied to the discharge of the securities of the corporation, unless some ne arrangement-can be made with those who hold such securities, and that little immediate relief would be
experienced by the measure; but, on the other hand experienced by the measure; but, on the other hand,
the Council hope that if the Corporation delt were seriously reduced, a part at least of the subscriptions already announced would then be allowed to go to the whintenance of the Garden, which they were obtained shall have and that such further sum as may be required might security of the Garden and the remaining upon the property

It is true that by the sale of the house in Regen Street little improvement may be effected in the income of the Society, the annual cost of new premise being equal to the balance of interest payable for the debt secured by the house itself. The Council howeve think that under any circumstances something ma be gained by the exchange. They also observe tha charge in Burlington House to the Linnean and Chemical Societies, as well as to the Royal Society which removes from Somerset House, thus recognising the claims of other chartered scientific bodies to similar accommodation. Under these circumstances they cannot but entertain a hope that an association which has exhausted itself in works of the greatest socia value, by encouraging improvements in the all im new esculents, and new ornamental plante, will have its claims favourably received by her Mnjesty's Govern ment, and they trust that an application which they have preferred for rooms in Somerset House or elsewher be much diminisled if this most desirable , hject could be attained, for the interest now paid upon our fixed debt would then become available for carrying out tle purposes of the Society.

The Council, however, feel as strongly as anyone the indispensable necessity of augmenting the fixed income of the Society; in the absence of which all plans for securing the permanence of the institution must be a least precarious if not abortive. It is not to be donbted that the present rate of subscription is too high; and necessity of a considerable reduction ia the annual sub scription. If practicable $2 l$. 23 . would be better than $3 l .3 s$, as $3 l .38$. woul 1 be than $4 l .4$ s., the latter sum being still paid by those only who desire to retain privileges commensurate with such an amount. it scription, that others will consent to Bphit their present four guineas into two, and, should further prepared to propose some of the methods sug gested for effecting this reduction of subscriptio with as little immediate detriment as possible. They trust that eventually the change will have been found exiremely beneficial ; but this can only be the result of
time. When, however, it is seen that the action of the Society continues in vigour, that its means are steadil applied to the advancement of horticulture, and that al which is wanted to increase its utility is increased funds, the Council confidently believe that friends encugh of gardening are to be found in this great country provide amply the means required for such important whatever changes may be effected the Council would in no deyree curtail the existing privileges of Fellows ; on the contrary, they would desire to extend them by rendering the library more attractive, and by giving the Garden the most scientific and practical character
"Many observe that the Society has become too much an association for the purposes of Exhibition ; and that objects of display have absorbed means that would have been better applied to practical horticulture. In this view the present Council in some measure concur; but it must be remembered that the urgent pecuniary necessities of the Society first caused the system of exhibiting to be estaolished, and that such necessities have never ceased to exist. And even now it is the belief of many gentlemen that the exhibition of plants must be the mainstay of the Society. The im-
portance of exhibitions is incontestable, for they afford the readiest means of displaying progress, lut it becomes daily more doubtful whether exhibitions such as those connection with this Society. They are springing up everywhere ; the last Number of the Gardeners Chronicle contains advertisements from Sydenham, Maidstone, Regent's Park, Hereford, and Watford - excellent symptoms of the progress of gardening, but not favourable to the re-establishment for the psesent of exhibitions at Chiswick, where our bad position incapacitates us from contending with places more favourably situated. The Council, however, do not altogether abandon the idea of holding exhibitions in the Garden if it is preserved ; on the contrary they would be glad to revive them should a favourable opportunity present itself; but that revival would involve a material change of plan, and would have to be made with a view to the gratification of the Fellows and their friends rather than that of the become more become more exclusive, but they need not be the less agreeable and instructive on that account. Nor would
they be less useful if converted into social reunions rather than indiscriminate public assemblages. The progress of gardening might be demonstrated by the contents of the garden itself, and by the contributions of those who cultivate plants for their own sake, and not with the special object of occasional display.

Such are the views of the present Council ; they have horticulture the hope of charter and the personal wishes of the Fellows, so as to secure the permanence of this great institution. What may be possible under future and altered circumatances an only be determined as clanges progress ; but the Council trust that the wiew they tare such as justify them in asking the mean action in the absence of which no public affairs can possibly be conducted.

Whatever changes may be contemplated in the privileges, proteedings or constitution of the Society must, under the charter, be incorporated in the bylaws. And as no by-laws can be valid undi certain scence of the eeen complied een signified in general mestings summoned for the purpose, there will be ample opportunities hereafter for a full discussion of whatever new arrangements the Councll may think that the interests of the Society require."
It was moved by Mr. Blandy, seconded by Mr. Spencer, of Jowood, that this report be received and adopted. After some conversation, in which General ir Au ustus Dalrymple, Bart., asked for further information, which was given by the Chairman, this resolution was carried unanimously.
It was then moved by Colonel Challoner, seconded by Mr. Blandy, "Mhat this meeting, after hearing the statement now made authorises the Council to take such measures for the reorganisation of the Society as they may consider advisable, even though those measures should involve the relinquisliment of the Garden at Chiswick and the realisation of the property, or any part of the property therein."
A discussion ensued. Mr. Bladdy, on the part of the Council, after ably exposing the fallacies and inconsistencies of Mr. Godson, stated distinctly that although the Council were most anxious to preserve the Garden, and were ready to make any sacrifice consistent with the honour of the Society to effect that object, yet they could give no unconditional pledge upon the subject. The first consideration was to take care that the Corporation should be able to meet its engagements; that secured, the Garden was also safe. The Chairman also replied, in answer to an inquiry from Mr. Gadesden, that the intention of the resolution was to enable the Cnuncil to give notice at Michaelmas to quit the Garden should it be unfortunately found that auch a measure In answer to a question from Gieneral Sir Augustus Dal-
rymple, Bart, the Chireman entered into further explanation
of the view of the Council, end directed the following letter to be read:

was unavoidable. Mr. Godson alsann the meeting, but being listened to with impatience and having no amendment to propose, was calle to order and resumed his seat. Col. Challoner's resolution was then carried with only two dissentients, an the meetiug se, arated after unamimously voting th

Clifton Horticultoral Exhibition.-Horticultural sncieties in the country have many difficulties to contend with, one of the greatest of which is that the subscriptions depend too much upon intending exhibitors in their respective neighbourhoods, and that conse quently if the schedules and prizes are not prepared according to their fancied interests, so that they may always win, riey withdraw their support and withhold their productions. The true way to succeed is not simply to secure impartiality of judgment-though this is very important-but also to encourage competition from distant localities. There are hundreds of plant growers who think their pets very prodigious until they see them placed in juxtaposition with better ones.
The horticultural meeting now under notice is held in the gardens of the Clifton Znological society, the managers of which being independent of individual interests are enabled to take advantage of the best lessons within their rearh. They have formed their schedule on the Chiswick models, and retained London judges. On Thursday, Jume 5, they gave away nearly 200l. in prizes, and the show was one of the finest we have ever seen out of the metropolis.
The Orchids were entirely the production of the county, and very good, especially the first 12 (prize 8l.) from Mr. Bassett, gr. to R. S. Holford, Esq., Weston Birt, and those from Messrs. Garraway and Mayes.
The Ferns and Lycopods, especially the latter, were The Ferns and Lycopods, especially

The collections of Stove and Greenhouse Plants contsined many fine specimens and were in excellent order; and the Azaleas were noble plants, well grown, and loaded with blossom.

The collections of Ornamental Plants were well done, especially one of 50 plants from Mr. Tanton, gr.
Cape Heaths are unfortunately losing favour or less fortunate in cultivation than they were a few years back; everywhere we observe a falling off in quantity and quality compared with what was usual some few years back; the plants at Clifton were as respectable as
they are generally seen, and amongst them were some good specimens.
The Pelargoniams were abundant and well flowered they were not, however, so well up to the London standard as many other subjects. The Fuchsias were generally mood, especially the first collection, which was exceedingly fine.

Half of a large tent was filled with Calceolarias, which are evidently grown well and extensively in the district ; this may also be said of Pansies. Roses were exhibited well grown in pots, and also as loose bunches the latter formed one of the most attractive features in the exhibition ; they were very select, and truly fine wenty-four varieties exhibited by Messrs. Pullen, of Westbury, near Trym, were excelleut, and a similar little behind them. The Society wisely determined to give encouragement to every class of exhibitors and offered prizes for British irerns in eighteens, and
collections of wild flowers. In every case the schedule collections of wild flowers. In every case the schedule
was well responded to, and many extra prizes were merited and awarded; in the whole five large tents were well furnighed in aldition to the reptile house, which was devoted to Orchids, Ferns, and Lycopods. Upwards of 8000 people visited the gardens during the sternoon. The fruit and vegetables were entirely local, and did credit to the cultivators.

## frotices of 3boks,

The Fly-fishey's Entomoloyy, with coloured Representations of the Natural and Artificial Insect, and a feo observations and instructions on Trout and Grayling Fish-
ing by Alfred lonalds; with 20 coloured Plates. ing by Alfred Konalds; with 20 coloured Plates
Fifth Edition. By Piscator. London, Longmans. 8vo., 132 pp.
If Dr. Johnson could have lived to these days he would have hardly ventured to make his well-known savage remark upon the brethren of the angle. In modern times some of the profoundest philosophers, the most carned antiquaries and naturalists, rever. and practical wen of business have taken to the apor with an earnestness and zest searcely bestowed upon become a stady, and early editions of Izaac Walton are as eagerly bought up as those of Shakspeare. The work before us has reached a fifth edition, a sufficient proof of its value, founded not only upon the very precise vature of the instructions for making tackle or all of experiments which the suthor undertook, with great ingenuity and patience, in order to investigate the habits of the trout, and especially the nature and extent of its senses of hearing, sight. taste, and smell, and more particularly on the excellent representation which the author has given of the various insects which serve these fishes for food throughout the year and th ac similes of them as manufactured by the angler.
We have, in fact, never seen better figures of any
nsects than are here given, especially of some of the
fully rendered. The smaller figures are, hosever, much less satisfactory

The author of the work having emigrated to Aus ralia, the present edition has been editer! by "Piscator," whe takes great credit for having revised the nomenclature of the insects, and ascertained the specific names of all effected we can hardly conceive, since the original specieffected we can hardy conceive, since the original speciof the writer of the present notice cver since the publication of the first edition of the work, 20 years since ; and it is quite impossible to determine the smaller Ephemere and Trichoptera by such figures as those given by Konalds. A lappy guess has been made in many cases, and it is evident, from Ronalds' observations, that the fish does not scrutinise the specific distinctions of the artifcicicl fly presented to it. An odd mistake has Leen made with No. 24, which is a small Perla (chloroper.a), order and family are given correctly. It is also untntomological to speak of "larver when in the Nympha state.

## Calendar of Operations. <br> \section*{(For the ensuing week.)}

Plant department
Conservatort, \&c.-This house should now be gay with such things as Achimenes, Clerodendrons, Allamandas, Gardenias, Stephanotis, and other showy plants
from the stove, for without the assistance of these it is hardly possible to produce a first-rate display at this season ; and if the house can be lept rather close many of our most showy plants will be more at home here while in bloom than they would be in the stove; and the length of time which they retain their beauty renders it very desirable to grow them largely for this purpose. To do these justice, however, the house should be cleared of Ericas and such plants as are soon injured ly a close confined atmosphere, so as to be able to keep it closer and moister than would suit these, for very ew stove plants will do any good in a temperature that stock here will now be growing very rapidly, and must be afforded sufficient space to allow the perfect development of the foliage and the forma-
tion of compact handsome specimens; the atmosphere of this house can hardly be kept and the plants should be sprinkled overhead morning and evening, and every available surface kept constantly moist. A slight shade will be indispensable for tender plants in active growth for a few hours on the forenoons of bright days; but this should be used as sparingly as is consistent with the perfect safety of the foliage. Plants that are known to suffer from the direct action of the sun's rays should be placed in a shady part of the house or kept together at one end wher they can be shaded without interfering with plants that require plenty of light. Mealy bug and black thrips come, and the utmost diligence must be used to keep these pests in check

Vineries.-Attend to the fruit has been cut in order to preserve the foliage in a healtly state as long as possible. The laterals is cut, but they must not be allowed to shade or injure the principal leaves. If there is any appearance of red spider give the foliage a good washing with the engine directly the fruit is cleared off, and repeat this as long as there is a vestige of the enemy to be seen. Give prompt attention to the thinning of the fruit in succession houses, for like many other jobs this is most easily and expeditiously done when taken in time. Look well to the state of the borders where the fruit is swelling, and give a thorough soaking of tepid, goold strong manure-water wherever the soil is found to be at
all dry, and aim at having the borders in a healthy all dry, and aim at having the borders in a healthy
state as to moisture where the fruit is about colouring, for a healthy root action has more to do with the colouring of the fruit than many persons seem to suppose. Young Vines planted out this season should be encouraged to grow freely, and as the roots will be near the surface see that they are not allowed to suffer for the want of water, and in the event of hot drying weather a slight mulching over the roots would be usefui. Do not keep the laterals too closely stopped, as the more leaves, \&c., the Vines are allowed to make his more freely the roots will run in the border, and this deserves attention the first season. Praches.-
Spare no pains to maintain a most state of the atmo. phere where the fruit is swelling, syringing freely, and shut up early in the afternoon, but give sir sufficiently early in the moruing to prevent the least risk of scorching.
fe-sow er garden and shrubberies.
Late-sown annuals should be thinned out as soon as hickly they spoil cne another, and never mate hal the display plants do that are allowed plenty of space, and which are grown strongly from the first. Attend o staking such of the herbaceous plants as require it before they get blown about and injured, and do not hudde the stems together as is ton frequently done.
The early flowering bulbs, as Tulips, Hyacinths, Turban Ranunculusts, \&c., will now be ready tor taking up, and should not ke lett, in the ground after the decay of the foliage, as if wet weather occurs they will be making
fresh ronts, which weakens them for next season. On light dry suils American planıs will be greatly bene the finer specimen kerping the roots moist during the growing season Attenn to the proparation of the better varieties of P'entstemons, which are exceedingly useful plants : also see to laving a rood stock of the border Picotees and Carnations, which are invaluable for cutting, and although now disearded from the parterre, shoulid not be verlooked : cuttings of these, if put in before the wood gets too hard, root as freely as Pinks.

HARDY FRLIT AND KITCHEN GARDEN.
Proceed with nailing in the young wood of wall trees, and see that they are perfectly clear of insects ; also stop any gross shoot, and endeavour to secure a fair suppiy of bearing wood all over the tree; gross shoots that were stopped early in the season should be divested of all the laterals except one, or if they can be spared, removed altogether. Keep the breast wood on Pear and other wall or espalier trees closely stopped in and attend to thinning the fruit where the crop is too heavy for the strength of the tree. Lonk to preparing strawberry runners for forcing next spring ; if not already done a good breadth of Brussels Sprouts should be planted on very rich deep soil, for if not got in at once the crop will be but poor, and it is very desirable to secure a good supply of this most useful winter green A fair supply of Savoys and Broccoli, \&ce., should also bo planted at once ; continue to plant out Celery as ground can be spared, and keep it well supplied with water Cauhfowers and other strong growing things will be greatly benefited by an occasional watering with manure water. Keep the hoe in action on dry days, cut Box edgings in showery weather, and endeavour to have all neat and clean.
STATE OP THE WEATHER AT CHISWICK, NEAR LO NDON,

This histest temperature durng the above period occurred on the
1si2-therm. 97 deg.; And the loweat on the 3 , th, is $39-$ therm. 3 d deg.

FRIDAY, 18- The General Show Yard open to the public from each person. Graeral meeting it evening; admissinn 1 , bution of the Foreign Prizes, in the Shire Hall, at $100^{\circ}$ clock

## President - I.ord Portinas.

Cattle-Mr. Woodward; Sir Stafford Henry Northcote, Bart M.P.; Mr. Jonas.

Impper Poditry - Mr. Joseph Cooke, Maynor of Colchester
Finance-Colonel Challoner, Mr. Fisher Hobbs.
Sach ornest-Mi. Henry Wison.
Receipts and Admission to Suow Yard-Mr. Raymond
 Mr. Brandreth
Gexeral Arrangement of Show-Mr. Brandreth Gibbs.
London, June 28, By order of the Conneil, ${ }_{\text {Jume }}$ Hudson, Secretary.
By the Regulations of the Society, all persons admitted to the Show Yard, or other places in the temphrary oechpation or th
Society during the meeting, shall be subject to the rules, orders and regulations of the Council.
Pavilion Dinner Tickets and Subseriptions at the Finance
Department of the Shce Yard. Pavilion Dinner Tickets, Department of the Shcw Yard. Pavilion Dinner Tickets, price
10s. each (inclnding one pint bottle of wine) will he sold at the Finance Department of the show Yard on the Wednesday and the forenion and 3 in the afterroon, each daty.
Subrcriptions due to the society will be reeeived by the
Finance Committre, at their department adjoining the puhlic Finance Commitree, at th
entrance to the show Yard.

## The Sarifultural $\mathfrak{G a j e t t e}$

 SATURDAY, JUNE 28, 1856.THE following suggestion deserves all the pub licity we can give it. Anything which facilitates communication between employer and labourer is of great puhlic value, and never more so than now when the harvest season has commenced, and large bodies of people have commenced their annua migration from the over-populated to the agricultural districts. Our correspondent "T. Go" of Clitheroe writes as follows:-

Travelling in Yorkshire about this time last year I met with three or four mowers on the Shiple Station, who had come out of Cumberland in search of work and seemed at a loss which way to turn to find it; and it occurred to me that if the persons who wanted mowers, hay-makers, or reapers were to send
to an authorised person at the nearest railway
tation stating how many of each or of either the were wanting, this person (say the vendor of books on the station) by a conspicuous device, which when once known would be inmediately seen by the men in search of work, might advertise this want o everybody who passed tbrough the station, who, f no device was exhibited, would see at once that they had no occasion to stop there, and if it was shown they would learn by inquiry where the employment was to be obtained.

The remuneration of the agent should be obtained both from the employers and the workpeople by a regular tariff, to be fixed at a low rate after consideration (a low rate would be more remunera tive than a high one), say $2 d$. from each workman, and 4d. Ir $u m$ each employer for evely workman so sent.

I rearet that 1 have not sent this suggestion sooner, as hay time will be fairly on with any improvement in the weather, but it only occurred to me again to day on seeing my own mowers at work, and one of them who is very inteligent, and who has travelled a good deal in search of work, tells me my plan is a good one.

If this plan were to become general, and a low fare fixed, far more would travel in search of work this season and in the barvest. The same device should be adopled at every station or mistakes would be made, say a white flag. The plan once organised could not fail to benefit both labourers and employers."

An interesting report was this week presented by Dr. Lethebr to the City Commissioners of Sewers on the subject of cow-houses in the city. It appears that there are now 19 cow-houses containing 195 cows within the city boundanies. Though great improvement has latterly taken place in their management yet "the ventilation of the premises is often very imperfect, the paving is bad, the drainage incomplete, and the wet fodder and the manure are sometimes stowed in the same shed in which the animals are confined. This not only does injury to the cows, but it also exposes the milk to the chance of becoming tainted with putrid manations.
That all these are unavoidable consequences of the circumstances in which the animals are placed appears from the confined space in which they are rowded.

The space which is allotted to each animal in the cow-houses of the city is, as nearly as possible, 760 cuhic feet, though in some cases it is not more than 300 feet. This includes the entire area of each shed, as, for example, the space occupied by the passage, \&c. Now, when we consider that a cow consumes the oxygen of about 1000 cubic feet of atmospheric air in 24 hours, and that the carbonic acid produced by it vitiates at least five times as much more, it must be evident that unless the venilation of the sheds is maintained in a very perfect manner, the animals must breathe a very foul atmosphere, and must endure a great deal of discomfort.'
The other points to which the report refers are 1) the small superficial area apportioned to each animal-not more than I yard by 3 upon an average (2) the food supplied to them, grains " the staple article," "an unnatural food," and necessarily herefore exerting an injurious influence on the health of the animal ; (3) unequal intervals of time between the milkings, 13 or 14 hours at one time, 10 or 11 at another; "this irregularity excites irritation in the gland, and products of a diseased nature are thereby secreted ; (4) the quality of the milk, which is the result certainly of all these can as well as, possibly, of adulteration in addition : hem all. "I find," says Dr. Letheby, "t that it is suhject to great variation." The cream is sometimes 12 to "13 per cent. of the milk, and sonetimes merely a trace, and that of the worst description." The imoression that water has been added is confirmed by the fact that while a gallon of good milk contains about 9100 grains of solid nutriment, the poor milk of London furnishes only from 6800 to 7000 grains of it. On subjecting the milk to microscopic examination it appears that while buttery particles are ometimes present in due proportion, at olhers there has been "a marked diminution in the richness of the material, and occasionally the presence of diseased products-products which are very analogous to common matter, and which indicate a disordered state of the secreting gland."
These details are of great importance to country as well as city readers. The producers as well as the consamers of milk are interested in knowing the conditions of health and prodactiveness. That it is hardly possible to ensure them in the city, where starding ground is so valuable, is apparent from the gradual decline of cow-keeping within its bounds. By far the larger portion of the milk consumed is imported from the country, and
the sooner all of
those who drink it
$W_{\text {e }}$ hope next week to give in full the results of the Agricultural Examination lately instituted by the Societylof Arts: at present we can only refer to it for the purpose of intimating that very few can
didates appeared for their certificate. One of "Proficiency" was awarded to Mr. Joseph Pollard, Hitchin Mechanics' Institute. The Institutious in union with the Society of Arts are chiefly confined to towns and manufactaring districts, and are a very imper fect means of introducing agriculturists to such an arena as was last week offered to them. We hope that another year a larger number may present themselves, and thus enhance the distinction which success confers. On Tuesday last the Society
held its anniversary meeting and annual dinner at the Crystal Palace, where a number of very able addresses turning chiefly on Sir Charles Fox and Mr. Wren Hoskyns spoke especially on the relationship of employers and employed, referring with great effect to their own personal experience in confirmation of what they said. The experience of such men has been various enough and sufficiently extensive too to give their opinions all the force of a general law.
They were perfectly agreed that "to do as you would be done by " in dealing with those w? on you duty, productive of happiness to those who observe duty, productive of happiness to those who observe and resulting in the best and therefore the most economical performance of the work to be done, whether on the farm or in the shop.

As to the drainage of the Aldershott Camp, about which considerable discussion took place in this we learn that the authorities have at length place the whole of the necessary works in the hands of Messrs. Girdwood \& Thompson, who are wellknown agricultural engineers. We understand that while the great principles of agricultural drainage will be adhered to ly these gentlemen, still ther are special circumstances-such as the trampling of troops and horses and the passage of artillery i wet weather-which render other arrangements necessary over and above what are usually resorted to in ordinary land drainage.

HOME FARM MANAGEMENT.-No. V.
$\mathrm{ON}_{\mathrm{N}}$ the appointment of a properly qualified manager to take charge of a newly established home farm, there are several duties that will call for his attention before
the regular farming operations can be entered upon. The nature of these duties shall depend, to some extent, on the season of the year at which he enters on his charge, and, as far as may be practicable, that should in every instance be the beginning of October. It is in a
great measure owing to the winter exertions of the farmer that superior summer crops are obtained. Now, if a farm grieve enters to a new charge in spring, summer, or any other season except that of eary good it may be, will be neutralised for the first or second years by the ill-judged preparatory operations of others Ocober is the beginning of the farmer's year, and should service the beginning of the farm stewars season on the charge of a new home farm, he proce this once to get the stock of horses, cattle, and implements put into satisfactory order. A descriptive and priced in rentory of the stock on the lands at the time is carefully made, and the details of each class entered in the book under its proper head. New animals and implement art then purchased as may appear advisable, and these also are recorded in the inventory lists, according to their priees. By this means the ground work of an fforded for afterwards detee stock is laid, and facilities clear profits of the farm by the year, and from the time tis entered upon till any other period of its history.
The selection of suitable workmen is the next matte farm overseer. If the farm he is to have the management of has been in the proprietor's hands in previon years, it will be judicious in him to act with great cau-
tion in regard both to the old workmen, and to longestablished customes, even though he consider importan changes necessary to his ultimate success as a manager. respects, and bring everything to his mind at once, he will very likely soon find himself in a disagreeable position, with even his employer against him. Too hasty reforms in the established order of things on a home farm are
he reformerous, and if not $\epsilon$ nding in the overthrow of materinlly weaken his influence for a time any rate, very eafer to enter gradually on a course of reformation where two to some disadvantages, thand submit for a yesr or down st once. But in beginning operations on a new home farm there is no evil of the kind referred to, to be
complete freedom in selecting his workmel, and if he this matter with ureat caution and discrimalat The s: stem of judging of a farm servant's qualifications merely by the breadth of his shoulders and the size his hands is essentially a bad oue, and though man enant farmers apply no other tests in engaging thei different measures. He ought to hire no man until has been ascertained from his previous employer and rom other quarters that he has a good moral character 8 honest, sober, industrious, a fair workman, and is
civil and obliging. A man of this kind may be trusted, and will work as failhfully for an employer who is nobleman as he would for the poorest farmer in the Ling dom. With a staff of labourers having these qualificahons the manager of a farm will have no difficulty in erting hins wishes carried out in the daily operations and in that way the probability of his success is greatly ncreased. Indeed, the skilful selection of servants is manager can undertake. It was the first Naporm utuitive discrimination of character fhat Napoleon's many talented generals qualified to carry out his views, and even in home farm management a tithe of that reat man's perceptive faculties, conjoined with considerable amount of inquiry in respect to the
antecedents of those who wish to be employed, would bring about the most satisfactory results. Why, eve in a whole district of surrounding country such care as his in the choosing of workmen for a single home farm would have most beneficial effects. It would tend t raise the standard of attainment, and excite a prope ambition in the minds of young labouring men. T what other cause can we attribute the insolence and re ardlessness of many workmen at the present day to heir employer and his interests, than to the fact that they imagine that without any certification of good character they may get a new master whenever the please ! The farther removed the labourer is from that state of dependence which borders on pauperism th will it be for his employer, but there asrings from a consciousness that he has done the duty of his station, and that insolent behaviour which almost denies a master's right to interfere in the ever on his superior for a certificate of good character not dependence at all. The man is supposed to ear his right to a testimonial, and if he has been at this pains, surely it becomes his master to certify the fac without supposing for a moment that he is in the circumstances doing more than simple justice. Were all employers-including both farmers and farm manager -to act faithfully towards each other, and only recommend those who really deserve to be recommended, ou farm servants would soon become a very superio class of men, and be in every way worthy of the confi dence of their masters. Here is a wide field for a grea moral reformation, and if reform is to begin anywhere, thould be on example farms. Let the persons in charge of such farms therefore do all in their power to encourage good conduct and industry in their workmen Let them aid them in the pursuit of knowledge by the establishment of libraries and reading rorms for their use, and let them by every justifiable means excite within heir breasts a healthy ambition to rise in the wart. Above all, let them care for their moral culture, and in uce them as far as may be possible to observe the The efforts of way in which it ought to be observed and ceneral characm steward in improving the moral should in particular be directed to the children on the he take care that they are all educated an counselled as they should be, they will soon spring up rustworthy and valuable gervants.
But it may be said, "What has all this to do with home farm management ?", Much every way, I answer Any experienced farmer knows that he is largely de pendent on his workmen for success in any of lis operations. Now, if the physical powers of these men are regulated by properly constituted and well trained minds they become skilled and faithful worterg and their employers are gainers to a greater or smaller exent in consequence. On these purely selfisli and secular grounds-though others might be stated with has a home farm will find iteman and gentleman who manger to do manager to do everything in his power to elevate in the moral and social scale the labourers that are under his charge.
It is a very general complaint in some districts-particularly in England-that intelligent farm labourers capable of carrying out their masters' wishes are not to be got on any terms. There is perhaps much truth in his, but certainly the evil is not nearly so great as is thought to be. If the right men are selected for the work, and a few good hands imported from some other district where the labourers as a class are better inormed, good manazement will sonn make a very grea While strict rue qualifications of the staff of workmen duties ares elforcing an observance of neceseary duties are absolutely indispensable in taking charge whe workers on a farm, yet there are cextain principles which ought to be remembered by those entrusted with this charge. They should keep the fact in view, for example, that it is not by sabjecting their men to ver long hours that most labour will be accomplished-tha
that perpetual grumbling will do evil. This is not the tish farm manager to get his workmen to accomgive them a pleasure in amount of labour. He should can appreciate their exertions to please showing that he can appreciate their exertions to please him. Their daily
duties should rather be performed with a feeling of con fidence that an extra effort put forth willingly of confidence that an exira efiort put forth willingly to prond approval, than with an impresaion resting notico minds that though they do their utmost to ion, yet they will never succeed in drating satisfac. temselves either sindly look or an approving smile Be assured that neither the labourer's head nor his heart is insensible to kindness, and his hands will not ail to testify his gratilude to a master who treats him as he deserves. If the reverse of this is the case, there is something wrong in the course of treatment, or otherwise the man is irremediably bad, and for that he may
 has been placed. J. Lockhart Morton.

## EXPERIMENTS IN THE FERMENTATION OF

 MANURE HEAPSA hear of sods and weeds containing about 40 cartloads was put to rot, and allowed to remain two or
three months. There being a large proportion of earth in the heap, it was employed op ontents of two very large cesspools which received the drainage of eight 10 -roomed loouses, and had not been emptied for 17 years. The odour given off by the accumulation was most sickening, and large bubbles of gas generated by the decomposing mass were constantly breaking upon the surface of the water. The soil residue was mixed with nearly its own bulk of the soil and sods, and was thus rendered so free from smell as to be carted past a texrace of houses in the daytime vithout a complaint. About 35 loads of refuse was emuyed. With this heap was mixed in a few weeks its own bulk of horse, cow, and pig dung, which soon formed a black homogeneous mass almost odourless. It gave off no perceptible gas, and proved in the end a Sowerful a manure as could safely be applied to land nearly 6 fet long with a corresponding crop of tuber and Early Shaws at 2 ft 6 in Crom row to not be dug the second week in July without firs hat it was the best they men who dug this crop state II. Four cwt of pigeon dung was mized year. weight of soil and kept for about five months exposed to weather. It was once turned. No smell of ammonia was perceived during that period, nor would est-paper indicate escape of ammonia save when the heap was turned. A very slight odour was then perceptible, and by careful management a feeble reaction could be detected by the test-paper. I believe the influence of this was superior to 4 cwt of the best uano applied in the usual way
1II. A person in the neighbourhood had accumulated he blood from the public slaughter-houses for many weeks. At the time of which I spealk the mass consisted of more than a dozen tons of black coagulum which was putrefying in a hole. The stench given off could be melt for half a mile in the direction of the wind, and every one was loud in denouncing the effluvia. The most sceptical would have admitted the formation and escape of phosphuretted hydrogen had he been kept a ew minutes on the lee side of the mass. I purchased his and had it carted within a hundred yards of a number of good houses. It was placed to the S. W. so that he offensive stench might be borne on the wind to the nhabitants, and was left a day uncovered. Complaints were numerous, threats of legal proceedings were mades and when sufficient attention was thus roused to call persons' thoughts to the mode of destroying the effluviA quantily of earth about equal to the blood was throw omplaint we cure was instantaneous, af the stuff was left tor a fortnight where it was first placed. No gas paper.
. From the same person was purchased at the same time about 20 tons of slaughterhouse refuse consisting of the partially digested food taken from the insides of animals which were killed, and of waste pieees f skin, flesh and hair removed in dressing the carcaseb for sale. This was carted to the same fleld as the ormer, and, like it, was left uncovered to arouse alla tion, which it did most effectually. Several tons as aight soil were added to the heap and the whole wa covered with earth, when rom it than from an equal quantity of dry sawdust efficiency.
V. Forty loads of sods from an old pasture were laid to rot and frequently watered with'steepwater' rom a maltikiln. The latter is a substance abounding in nitrogen and earthy salts from the Barley. With hese were mixed as much Cabbage and green refuse as ould be accumulated, amountiog to about 16 load. From this ordinary tests could detect the escape of either ammonia nor sulphuretted hydrogen. Four tow of waste wool containing agood deal of oil were then a as a body consisting of much nitrogen and sulphur, known for its generating great heat when moissition The same feetid oding obtained, 13 tons of mixed horse, cow, and pig dung were added, and then, aiter
sisted of materials which were as likely to evolve
ammonia and give cff offensive odours as anything we can conceive. No smell however being perceptible,
and no leartion aqpearing with test-paper, a festher moistened with hyilruchloric acid was employed. This was held over all parts of the heap and at the lee side
of it and then away from it in the air, but no difference could be perceived in the two cases. was then taken to the neighbourhood of an old fashioned manure heap* containing some fifteen loads, when the white wreaths gave a lesson which is may be hoped will be dissipated.

Thave avoided laboratory experiments as much as possible in this essay, because I know the objection be here mentioned in the hope that others will repeat it, because it is more convinciog than a thousand arguments.
A quantity of the heap. Experiment $V$. was digested With water and gave a light brownish solution neutral then mixed with caustic potash to test the tresence and then mixed with caustic potash to test the presence of mmonia. None was given off, but a brown flocculent substance collected upon the surface of a perfectly clear white fluid. This was filtered and the brown substance burnt, when it evolved ammonia copiously. It also ave off ammonia slowly when exposed to the
Here then was nitrogenised matter in the form of as true a salt as the muriate of ammonia which the farmer buys of the manufacturing chemist for manure. Moreexpel it. It was perfectly soluble in potash could not fore ready for plants to take up as food. In manure thus fermented I have little doubs food. in manure adequate remedy for weak atraw upon well furmed land and that the economy of nitrogen will lead to an increase of grain can hardly admit of doubt. In short here was what Nature makes when she decomposes substances in the earth, a perfect manure according to Ve highest authority.t
VI. The account of these experiments would hardly be complete uniess it were extended to note the value of green vegetable matter as a manure, and a peculiarity of its fermentation which seems to have been doubted or denied. Ploughing in a green crop is thought to enrich the land in carbon by the fermentation in the soil of what is ploughed under. Gathering green egetable matter into heaps is regarded very much in plants." Mr. Stephens has some residue of decaye this kind under the head of "composts," and Prof, Johnston appears to lean to the same view. The latter gentleman has however one passage which it is imposrations are patirely posed to it Ho rays "a ser rations in substances in general do not decay so rapidly, and emit of Agricultural Cliemistry," p. 205 . The "Element of Agricultural Cliemistry," p. 205. The words "in
general "are in italscs, and are clearly meant in some measure to qualify what is stated. But, if the passage mean anything, its signification is that with very few exceptions the fact is as stated.
Having considerable doubt of the fact I resolved to vegetable matter made whenever possible. It has been placed in small heaps such as a barrowful, and in large ones of 2 or 3 cartloads, and comprises Grass, Cabbage Radishes, and weeds of every kind grown in the neigh bourhood. I have tested more than fifty heaps composed chiefly of different weeds, and in no instance bave failed in getting turmeric paper strongly browned When held in the vapour given of by the deconposing pubstances. The "ate a distance from my one or two barrowsful perceptiule at a distance from my one or two barrowsful of weeds fermented in the open air, but neither would
it have been from an equal quantity of ordinary manure under the same circumstances. It was however * Potatoes manured with this heap yielded little more than
half the crop of those manured with the other half the crop of those manured with the other.

+ Value of Manure of Heap $V$.-Experiment I.-Part of this
heap was employed for Potatoes. Forty pounds' weight of
"
 inches from set to set, upon land of fair quality and in goo relative to the crop:-Arerage field 31 fold. Sets 51 packs
Cof 240 lbe.) each per acre; $31 \times 51.170$ packs per acre.
Present price 10 . per pack; produce $=850$ per acre. This
experiment is not offered for more than it is worth. Part of this large produce is undoubtedly due to peculiarity of manage neasoning applied to a field of or a farm. rods of ground will justify
the quantity of manure kept on much, if anything, above an average. But even after ever employed nust have been better than common. Savoys wer planted letween the rows of Potatoes in the last week of Jun 1and, of mediowng appears beyond obelilection :land, of medium quality and in fair condition, was ploughed an
planted wirh lork Rygent Potatoes, half on the 3d and half o
the 11 th of May. The sets were of the ordinary kind purchase as 11 th of May. The sets were of the ordinary
as wantel. Drills were made by the plough
apart, and the sets planted about 15 inches fro
the row. The rows ran east and weal
distinctly and easily perceptible if the nose were placed had just been taken, and I am moluced to suspect that the want of this precaution led to the statement I have uoted from that just'y high authority Prof. Johnston. + One Experiment upon a larger scale was most
notable. Three or four cartloads of waste Radishes notable. Three or four cartloads of waste Radishes veeks, and when they were removed (June 25, 1853) nearly the whole mass was rotten. Upon coming up to the labourer who was set to remove them I was
surprised to find him standing back from the heap with his eyes watering and apparently just recovering his reath. My own nose however soon told me the reason, for the quantity of ammonia given off was such that it was impossible to breathe with the head held closely over the heap. One or two other men who: melt the From believed I had mixed "hartshorn" with the heap. matter did I ever ulserve an equal escape of ammonia. Unfortunately I am not able to state what other gases were given off. I left the spot to procure the means of finding that the man had marde an end of his "nasty job" nd had removed the mass to an adjacent dunghill. had omitted to tell him to leave it till I came back
With a kncwledge of these facts I have no alternative but to differ from the high authorities I have named, and may venture to express a hope that chemists will investigate this subject in the field and not in the laboratory.
is a significant lint to farmers to accumulate s much of the green refuse of their farms as possible, and to furment it with so much soil as ammonia and other valuable compounds with which the decaying plants abound. Rev. W. R. Bowditch in the Journal of the Royal Agricultural Societs.

## Home Correspondence.

Wheat in Two Feet Rows.-I feel gratified by the indly feeling evinced towards me in a late article by the Hardys in your Paper. I should have been happy to have given them all the credit they could wish for
in their adopting into their practice the culture of Wheat in rows 2 feet apart, had I been aware of it, or if it had not escaped me, since it is a plan I have long drocated. It is a mode of tillage in which I am onuch interested, and I think one which ought to be of some consideration with agriculturists in general. I do not mean in limiting the distances of the rows to 2 feet will on most soils be found to answer, as will secure a standing crop, and will permit of working the intervals through almost the entire growth of the crop, thus to

heap, when a wreath of white flume arose, wheh wus easily
visible at 200 Fards" distance. Two men at work in the next
field were attracted by the "smoke," and " contrdn't think how the
reen lump of muck could catch fire," and they actually laid hereen hump of muck could catch fire," and they actualiy laid
grewn their tools to come and see. I subsequently asked them
down fari off the "smake" could be seen? One said half a mile the how far off the "smake" could be seen ? One said half a mile, the the subject will probably weigh more with practical men than the subject will probably weigh more with practical men than
the mist elaborate analysig. I am not at liberty here to say
anythng relatire to the incalculable damage done by weeds: but
it is to be hoped that farmers will draw the inference which it it is to be hoped that farmers will draw the inference which
does not seem easy to miss. I may perhaps be excused for
adding a caution to those who feel dispoped to investigate thi adding a caution to those who feel disposed to investigate thi
subject for themselves. They should keep as munch as possible
on the wind ward side of the heap, and in manipulating with the fluid should choose a place where a draught will carry from them
the evolved gases. Notulthstanding every preanition qgains inhaling the gases given off, I was made ill by them for more
than a week, and my eldest child, , boy of seven years of age,
was seized with all the aymptomis of typus after smelling (in the
open arr) the contents of a bottle to which a strong acid had just open sir) the
firm Redishes, - An experiment was made this year (1855) to con this purpose, as it cassed the formation of an unasual quantity o
woody fibre, and thus diminished the propartion of sulpharised and nitrogenised mastter, and retarded drcomposition; neverthe
less when the mass (abont three cartloads) was rotting, the results were identical with those of "ast year. The man who
removed the half-roten mans said, "Eh, yon things do stink
ther fair took my hreath when I flung em into the cart." If no polite this is certainly emphatic. Some Radishrs were dug into
the land upon which they grew, and examined from time to time When an individual Radish was pulled out of the ground about By breaking through the euvelope of wondy fibre and shielding
the root from the wind by the hand, the gas given off by the the root from the wind by the hand, the gas given
decaying interior would always affect turmeric paper.

- Wighteoll and ashes form one of the principal manuses in this
establish that successive fallow with crop in every year as will by its continuous operation on the soil make up
for the anmal exhanstion of the crop. But I am parfor the annual exhaustion of the crop. But I am particularly well pleased by their adoption of that distance
of 2 feet on so large a scale as several acres. It is a dislance I was led at first to adopt from an experiment of so far back as 1819 or 1820 from its giving on ordinary Ifound heavier return than any greater or less diatance. I found then that my rows at distances of $22 \frac{1}{2}$ inche and 30 inches gave a heavier acreage retern than at any less distance, while, in the rows, these distances gave the same produce; thus I augured that $22 \frac{1}{2}$ inches were sufficient in ground of medium fertility. The succeeding year's experiment with Wheat-the first was with Barley-gave also a return of higher produce at 2 feet than at 5 inches: since
then several experiments have sussained these first ones by showing that crops at working dis tance, that is 2 or about 2 feet, were more productive than broadcast crops. It was then at a distance of 2 feet that, at the time of the Potato failure, I suggested through the periodical press the cultivation of the land supposed to be exhausted by the successive crops of Oats, and ler-waste, in the expressive language of the country-to recover its fertinty by the unassisted operations of natural causes. I arged wherever 1 cond thi tillage, but although the press favoured it by a very
general promulgation and approbation, though my letter were copied from paper to paper, effect; the general ignorance of husbandry as a science in all classes, the insignificance of the projector, the want of practical experience on any considerable scale, with the prevailing torpidity, all militated against it and although it offered the means of replenishing our coffers, of restoring the abundance which the loss of the Potatoes bad deprived us of, of giving to a starving people a bellyfull of a food superior to what they were accustomed to, and by leaving untouched the produce would have at once restored that equilibrium which has taken so many years to bring about, and which is not yet recovered, for we are yet in Ireland consumers 'o a very great extent of foreign food (Maize), yet I believe though througt was Jonm in 1848 and 1849, I urged its consideration on the Royal Agricultural Improvement Society of Ireland. Ruin and depopulaImprovement Society of Ireland. Rum and depopala tion prevailed for want of energy to make an easay, an effort, and to this day the supposed exhausted land, as often as it becomes son , is left waste in weeds and rubbish, unproductive of aught but what its sabbatical years may throw up; the productive fields having to bear the weight in rent and taxes of the unproductive ones. I then rejoice that the Hardys are successfully, and on a tolerably large geale carrying out the plan 1 have urged in vain, as it may reach Ireland and engage the attention of our farmers The Hardys hold me now on the right scent, but I fear not only they but every one else will bold me but a slow hound, since I have not ron down my game in 36 year, out my farming has been but desultory, thanks to my circumstances, which have not permitted an unremitting pursuit on a scale that would have effectually provea my views. Although advocating a general distance of 2 feet between the rows, yet I am led to suppose from an accident in an experiment ten years ago, that in highly manured land this distance may be much more feet, and fiom hence 1 infer that sufficiently wide interfeet, and fiom be left between double rows of grain to admit of green crops; on this plan the mode of tillage might approach the Lois Weedon by somewhat increasing the for with 2 rows the grain would be less likely to overhang. There is an experiment I should like to try were I so situated as to permit it, of sowing Wheat or other grain in wide strips in fallow drills, alternating with wide strips of manured green crops, never changing their places nor applying manure to the grain cropa should pxpectre largely and constantly applied to the ground on which the green crops were grown would cause them to be very productive, and that the Wheat would be also benfid by the underflow of the of the manure and is on the inorganic mattera the man. in the sol. There m. exist such may exist the would not a power of appropriating their proper eemen could assimi each might thus take up those which they coll late. It might facilitate this underfow of ultimate products to the Wheat if, in artificially drained land, the drains were made in the centre of the grain stripa. The Hardys deserve every credit and every one's good wishes for the spirit with which they are carrying out their experiments; 40 acres of experiments in various soils under the care of such men must afford valuable results. I am proud of their notice as 1 am in that of all men who seek to multiply the products of the earth to the benefit and comfort of their fellow-men. Surely in Ireland, if not in England, we want stirring up. Surely it may be possible to make the average crops equal to the good ones, if not to the best. Surely the availing ourselves of the natural causes of fertility will econonise our manures and probably render every farm self-supporting; no system can be good, noue perPeter or Paul may be very well for those who can Peter to pay Paul may be very well for those who can
rob Peter, but is very sad for the poor fellow himself and certainly not good to those who depend for their

Bread on the wealth alike of Peter and Paul ; the plan
of high farming is therefore false, for it is huilt on the poverty of low farming. J. M. Groodiff, Scrably.

Wirecoorm.- In common with most persons farming new broken land, we are somewhat troubled with that
terrible pest the wireworn; I therefore took in hand to terrible pest the wireworn; I therefore took in hand to experiment upon them. The result I subioin.
think it may be of service to my brother farmers, and choose to give it insertion, do so. The experiments were made with guano, kelp, blood manure, nitrate o soda, potash, lime unss. In mat mat placed about a teaspoonful of each; in one hour every wireworm was dead. Now all the above named substances being to a greater or less extent fertilisers, it ap pears to me that by a jucicious application to land infest with the worm a double advantage may begained assisting the crop at a critical period and crippling enemy. By the aid of a powerful microscope I coul lime to proceed from blisters ; but of the others 1 could discern no outward cause. Out of the above substance I should prefer to use either guano or fresh slacke lime, because from their light feathery nature they are very inquisitorial, seeking their way into every nook and cranny; st all times applying it to the fresil turned o the surface immediately seeks to hide himself by bureowing from his natural enemy the rook, and thereby avoiding the warm coat you are providing for him The heavy roll should be used immediately ate sowin eather permitting. Sravyer Spence, Ilainault Forest.
Dimensions of Short hor: Cattle.-Seeing recently query from one of your correspondents respecting the of my bull Grand Duke 2d (12,962). Although he is a)t a prize bull, never, I believe, having been shown, he is a noble animal, combining with his ample proportions the fine quality which is characteristic of Mr. Bates's stock:

> Leng th from
of the tail
> Length from shouider point to hook bone
> Heikght
> From
> From behind ap to the ground
> From middle of the knee to the ground
> Do. acres the
> Do. across the loins
Width across the hock

The main points shown by the foregoing measurements are his large size, his closeness to the ground, and his looking at him, that his legs from the knee to the ground were so short that har they been represented so
In a picture it would have been deemed an exaggera tion. The chief portion of his height is made up as it ought to be-of the great depth of his frame. Size is
frequently desirable in cattle, while disproportioned length of leg is always to be deprecated. Grand than fat, it being an object to prevent 80 larye an animal from growing too heavy. Were he fat his dimensions would be enormous, If the owners of bulls would follow my example and publish the dimensions of first-rate animals, the comparisons thus suggested would be interesting and useful. At the ensuing meeting of the Royal Agricultural Society, any person wishing to measure Ag other stoc their owners to do so. I may, in conclusion, state that the live weight of my bull is ] ton ] quarter, and that have recently let him for the remainder of the season Mr. Lees, near Coleshill. On a future occasion I may perhaps send you the dimensions of my yearling Wood, Holly Bank, Burton-on-Trent.
Cost of Mowing.-You ask for information as to the price paid for mowing at this time in the localities of Or several correspondents. I beg to inform you that paid for mowing natural Grass; 5s, 6 d . has ise instance paid for mowing a very heavy crop of Clover which was bought by public auction at $7.2 .2 s, 6 d$. per acre. I believe the price is now rising but it hes no hitherto ranged above what has been paid during pass
years. The crops are good. C. F. Humbert, Watford.

## Foriptios

royal agricultural society of england. Weekly Council, June 25 : Mr. Miles, M.P., Viceresident, in the chair.
Parasites in Domesticated Animals. - Profeseor Simonds, the Veterinary Inspector of the Society, deli In the former part he had explained the pecularities of parasitic insects producing annoyance to live stoch on the external covering of the body, or passing into the interior passages through the mouth. In this por-
tion he dwelt on the natural history and characteristics tion he dwelt on the natural history and characteristics
of those more insidious worms which attack the internal of those more insidious of worms which attack the internal
on canal. He explained the varied forms of animated structure which these creatures assumed, the successive transformations through which they passed, and the Hisount of injury in each case which they produced. His lecture was illastrated by coloured drawings highly to the recent resolution of the Council the lectures de
livered by the Veterinary Inspector will he put hy him
into manuscript aid submitted to the Journal Cominitee or publieation. - On the motion of Mr. Raymond Burker, seconded by Mr. Scott, the best thanks of the
meeting were proposed to Professor Simnds for his interesting and valuable lecture. Mr. Miles, on puttin the question, which was carried unanimously, would take care that Professor Symonds' suggestion or a distinc under the notice of the Publication Committee. He passed a high eulogium on the clear manner in which the Protessor had rendered the scientific details of his ferred to the absence of rot in sheep fed on the water fereadows in Devonshire, where no staynant water land water meadows, where the water was stagnant, an n which sheep were put a certain time before being given to them.

## Farm Memoranda.

Messrs. Hardy and Sov, Seed-Growery, Maldoy

## "Milisha the son of Shaphat was ploughing with twelve yok onen before hin and he with the thentith, nid Elijath passed liim and cast his mantle upon him." 1 Kings, xix. chap.

Mr. Editor,-In the whole range of your reading or experience have you met with a description, or seen an nspired writer for oure equal to this penned by the hundred years before the Christian Era, or two thousand seven hundred and fifty years from the present time? I will answer for you that you have not, nor has any one of the numerous readers of your valuable journal.
Elisha, who was worthy to receive the mantle of th prophet Elijah, was ploughing in his field, or on his farm, with 12 yoke of oxen before him and himself with the twelfth. We boast, or modern farmers boast of their Roys and other agricultural societies and armers excelled all modern ones in the calture of Cereals and Pulse as much as ancient sculptors, painters, and poots excelled all modern ones; and it is quite was the real food of plants, and what their seeds were composed of, equally as well as the profoundest anaytical chemists do at the present day. If any one
doubts this, let him attentively read the books on doubts this, let him attentively read the books on
arriculture handed down to us from those ancient times; and let him carefully reflect what immense ities and countries teeming with inbabitants were upported by the farmers alone of those countries, and without foreign commerce or foreign guanos, and he will, however humbling it may be to his pride, be forced admit the truth of what I here state.
Is it not wonderful that every man of modern times who attempts to improve the agriculture of ments, by which means alone improvements can be made - immediately becomes a marked man, and the butt and ridicule of the whole agricultural vorld? Tull experienced this in its most rancorous xtent; and Tusser is reported also to have met with nothing but ingratitude from those whom by his practice and writings he was so anxious to serve ; but especially the experiments are made on a small seale only, and he experimentalist do not occupy 500,800 , or 1,000 eres of land, then all the agricultural world are up in arms against him, and it requires no small quantity of It has fared thus exactly with the Messrs. Hardy, father and son, two men who ought to be held in the highest honour by every philanthropist of this country, and especially by every proprietor of land whether he possess thousands, or only one solitary acre. These men, who possess two farms abutting on each side of he south-west road about a mile from the town of Maldon, are by their skill and practice approaching he ancient farmer Elisha than any other men I have read or heard of, but they have shared the fate and persecution of all
who dare break through the trammels with which custom has surrounded them. Bear in mind that Elisha, when the prophet threw his mantle upon him, was himself with the twelfth yoke of oxen, unskilful man would have been at the van and not in the rear of his army of ploughmen and ploughs and oxen, and an idle man would have been riding into the field on his horse or mule, and giving his ploughmen a look only; but Elisha was at work, and he had all his men at work before him, that he might see that every one of them did his work well, that is, ploughed deeply and thoroughly, knowing as every
skiliful man knows, and every farmer ought to know, that thousands of crops of corn amually come to nothing from \& want of the ground having been
thoroughy ploughed or dug before the seed was put thoroughy ploughed or dug before the seed was put
into it. Elisha therefore in Palestine, on his large arm, and the noble Cincinnatus I must also instance in Italy, with his occupation of six acres only, for he had no more, I have no doubt, as they were preeminently wise men and preeminently industrious withal, took especial care that their lands should be completely cultivated before they sowed the seed, which was to produce some thirty-fold, some sixty-fold, and some a hundred-foid, otherwise the increase of crop, above the quantity of seed sown, would have been perlhaps not

English agriculture produces in this lonasted country at the present day. But to return to the Messrs.
Hardy, whom I have now several times visiter Henever I have are now several times visited, and them exactly as Elijah found Elisha, that is, at work in their fields among their workpoople, sometimes ploughing, sometimes digging with forks, and sometimes putting in the seed for the crops, and sometimes setting aside a few square yards or rods of ground on which to work out their experiments. They reside about 30 miles from myself, and hence I do not see them so often as I could wish; but the last time I was with them was on Trinity Monday, when I found the ather at his farm in a Wheat field in the midst of nearly a dozen workpeople forking out Couchgrass, and the son was at his farm also among workpeople
hoeing Peas, and both in their shirt sleeves. Should it be said, as I know it will be, that there nught not to have been Couchgrass on the farm, I myself agree
that there ought not; and I am satisfied that next year here will be none; but Mr. Hardy only became tenan of this farm last Michaelmas, when, as several persons cold me, from a long period of shameful farming it was the foulest and most exhausted land in that neighbourhood ; but notwithstanding its poverty and the Couchgrass, there was in that field as fine a crop of Wheat growing as I think is to be found in the county of ssex
Now a common farmer, on taking that farm, would have said he could grow nothing on it until by fallowing he had been able to cleanse it from Couch and other veeds ; and he would have said rightly, but Mr. Hardy must have a crop of Wheat notwithstanding the poverty and foulness of his land, and he knew how to produce
one, and to cleanse his land during its growth. But one, and to cleanse his land during its growth. But
could common farming have sccomplished this? Cer could common farming have accomplished this? Cer
tainly not; but the Hardys are no common but very uncommon farmers. They are, as the world ought to know, as Elisha and Cincinnatus were, that is, thorough cultivators, and thin-seeders. Their farms, as I have said, abut upon each side of a h'gh-road near Maldon, and a stranger may at once know them as he rides o walks along the road by their garden-like appearance, desge luxuriant crops in them. This year, 1 think, Messrs. Hardy have six fields of Whear, the quantity seed drilled varying from half a peck, and to convince his neighbours of the folly of thickseeding if possible, has 2 acres drilled with 2 bushels The se
The seed, of course, was put in in rows, and these vary in width between each from 1 to 3 feet asunder,
and it was in a field of Wheat of this kind wherein I found the elder Mr. Mardy, in his shirt-sleeves, among his workpeople between the rows, forking out Couch, land having been previously horsehoed.
Maldon is but a few miles from Chelmsford, from which there is a railroad, and of course trains; and the object I have in writing to you is to recommend gentlemen who may visit the former town at the show, to get into a train and inspect these farms; and should they do so, they will see as fine Wheat as can be grown rom 4 quarts of seed only, as well as others from peck to 2 and even to 4 pecks; they will see the plot also of 2 bushels an acre, which, although I myself have not seen that plot, I will pronounce to be the worst on the whole farms. I write thus confidently ecause Messrs. Hardy pursue my plans exactly, and lie best crops 1 ever grew were trom on an average I peck of seed per acre, and I never exceeded either
for Wheat, Barley, or Oats, or Vetches, half a bushel. I add, also, that Maldon is only 6 miles from $M$ Mechi's at Tiptree Hall, and the Messrs. Hardys arms are only 7 miles from Mr. Mechi's; and further add, that, should any gentlemen follow my ecommendation, and visit these farms, if they will use my name, and I hereby give them authority to do so, the Messrs. Hardy, who are real John Buil Englishmen, will show them every attention, and explain to them very operation perfurmed on what I shall here baptise the real Model Farms. George Wilkins, Parsonage, Wix, June 21.

## Miscellaneous

Breaking up of Arass Lands.-It is my decided opinion that, as a rule, it is a practice extremely injurious to trong quality. I think many of our old pasture lands re deteriorating from want of management. I have land which at one time I thousht I must break up, it was becoming so bad ; but I adopted another plan ; my arm is a feeding farm; I soon found wherever I had cattle eating the Turnips on the ground I had beauun
herbaze. If any of our friends have lands good in herbage. It any of our frieuds have lands good in quality but in a poor condition, if they will pasture will
the winter their sheep upon it with I'urnips they improve it. Land of good quality ought not to be brought under the plough unnecessarily. With regard to those lands, of which one gentleman has said they would not keep a goose, the Ggrand thing is to apply bones if the land is suitable. I do not know a field in Cheshire that, when well drained, would not bear bones. The effect is miraculous: I could refer to a farm where bons applied to land of that kind produced an effect byond all description. From beng amongst the poorest it became among the very primest in tho county. Therefore I think it is a matter well wormy that ld Gration whether it is desirabld be broken up and old Grass lands of good quality should be broken up and
brought ander the plough. I think it would be
unfavourable to the advancement of our Cheshixe agricult
Chester.

## Calendar of Operationg.

Berwickshire Merse Fabm, June 21.-Our Turnip sowing i now all but over. Conlidering the splendid prospect of an eariy
spring and a fine tilth, the season has been unusually protracted
The first heary lains in the end of May caught us soon after we commenced gowing Swedes, and rendered fallow-work impractic able for a fortniylt, besidt compriling us to wrok much of the
prepared land over again. Ever since the weather has been exceedingly changeable, scarcely a night without showers, an often very heary, which has compelled us to work the land in small breaks, frim han $i$ to mouth as it were, a method far from economical of time. some, imteed, losiog patience, drilled up their land without further labnr, but in very indifferent ordar as
to both quickens and clods. Fron the appearance of their traird, howeser. it sepms probable that those who were more patient wave been verg partial, annunting to total destruction on some farms, while on others they are aitogether unknown. On the advantage of the dry season to begin early, and were pretty well through befire the rani came: what renained after that perio early sowing is andesirable, owing to the danger of shooting 12th of May. The few experimental patches of Mangels that are tried here and there are somewhat blankए. as is nsual with that Where the soil is suitable they sometimes produce large retur m \& few only, chipfly for the spring feeding of cows. Potatoes looz strong and healthy after their first cleaning. They were plante early, but not to any extent, owing to the debression of the
market this spring. The grub has been very destructive amonn, market this spring. The grub has been very destricive amin, weather. We have been doing what we could to keep them practicable in dry weather only. Fallow Wheat on clay land, (Where nuly it is grown) was almost destroved by the severity of
the winter, and cannot be a good crop. With us the Cereals ara growing rapidly, and threaten over luxuriance. Beans looik ten days since we begun to cut Grass. Owing to the failure of Red Clover the practice of soiling, which has gained ground of late years, will be very limited this year. Pastures were almont demand for grazing cattle at our great June fair, so much so
that the Yorkshire dealers were said to have lost from 12 . to 22 . a head or such as they were able to dispose of. Since we have git kid of superfluous moisture, Grass has grown strong and
$\mu$ lenty for all stock. The crup of lambs is uncommonly good, has been experienced from scouring. The bulk of the fat hogg in the county were sold in April, and the remainder in May, so that there is searcely such a thing as a fat sheep to be seen now
The comparatively low price of lambs all along has offered no The comparatively low price of lambs all along has offered no yards are well cleaned out, and but few will reap the beneft of the high and rising grain markets. J. T.
BURNET: Notices to Corresbondents.

## T. GREEN'S NEW INVENTION IN LAWN MOWING AND ROLLING MACHINES,

SOLE MANUFACTURER, IRON AND WIRE WORKS, NORTH STREET, LEEDS. REGISTERED JULY 24, 1855.-No. 3739.
THE ADVANTAGES OF THESE MACHINES supersede all others by having 1 a sraall Wheel in front of the Grass Box, consequently will mow verger and round flower beds, without any change of Wheels, or admin the Grass any length required; and having tmo Rollers behiod, and a small one in front, ther roll the width they cut; they will turn in very little rom, and cut at the same time. All the working parts made much stronger than the old machines. The thetom llades are sin constructed that they cannot
tear up the ground; they are nnly drawn, and not pushed and drawn as in other machines, consequently do not require half the power to work them.

LIST OF PRICES (NET CASH):-

Testimonial from Joshuce Major, Eir., Lanclscape Gavclenen, Knostrop.
To Mr. Green, Leeds - Sir, As I always appreciate public: and useful improvements, I most gladly give my testimony to drawn on flat ground with ease by one yerson, and although at the time of trial the lawn was wet, it was cut with the greatest nicpty. So complete and simple is the invention, that amateur genclemen, and even ladies, may work either the 16 or 20 inch size whth ease and pleasure, providing the Grass is not too long. Fur extensive places I should say the 24 inches would eithor of the smaller sizes *ould be best. I congratulate you , ul yur very valuable invention, which in my opinion, ontirely surpasses, and must eventually supersede all nthers, for it is not only tree from intricacy and easy to the workman, but extremely exjueditious in its nperations, and consequently must pruve a , sreat sariug in the management of Grass lawns, and a great boon to the public- 1 ani, Sir, your mostobedient servant, Josmea Mailur.

Other Testimonials may be had on application to the Manufacturer.
The above Machines are warranted to answer the purpose as described, or may be returned. London Agents: Megere. Cottam \& Hallen, 76, Oxford Street; and Messrs. Burgess \& Kex, 103, Newgate Street, and may he had of all principal Ironmongera, Nurserymen, and Seedsmen in England; also Mr. Caarlea Garzood, Superintendent of Agricultural Department, Crystal Palace, Sydenham.

## Exira for Telescope ruthe as plants on stame at a hurght water can ber depuited in the p

By a simple arranyeme
effective than any nortable
effective to the rublic．It is equall ry or fardan Pamp ex Conservatore use，and is capable of discharging twice as much
Water in a given time as any other Syringe now in use．The arrangement consists in ateraching a small flexille suction toh to the barrel of the Syringe，through which it is filled with Fater
at every discharge of the previous contents．By this means the Syringe is always charged，and the pull－up stroke of the piston rendered perfectly easy，it having，indeed，no work to do，the barrel being previously full of water．Being thus made seli
supplying，a great saving of labour is effected；and the necessiry sopplying，a sreat saving of iabour is effected；and the necessity away with，the direction of the water can be maintained for any
leagth of time．It is perfeetly cleanly in fis action，as it is not posaible for any water to get on the outside of the barrel，which is a well－known inconvenicioe atteraant on the use nf ever other syringe．Its construction of the pround in ball valves and fittings used for filling all other patent Srringes being entirple supersedeu．To be had of anv respectable Ironmonger no Seedsman in town or country．
J．Trion if ：ons．Manufacturers of Horticultural Apparaius Warwick Lane，Newgate at include carriage，package，or expense of dellivery in the country．

## The Saramerge chrontle.

SATURDAY, JULY 5, 1856.

While every one is eager to remedy the nuisances attendant upon the Thames and its foul waters, men are strangely forgetful of the atmosphere that rests upon its banks. Commissions exhaust
financial and engineering skill in impracticable devices for securing a separate sewerage ; but not a voice is raised against the avalanches of soot that pollute the London air. Nostrils are in the ascendant, and lungs are forgotten.

It is however by no means clear that Father Thames is guilty of all the offences laid to his charge. It is the fashion to abuse him, to say that he is muddy and stinking, and the sink of all that is disgusting and alarming; to lay cholera at his door, and fever present with pestilences yet to come The clamour is too attractive to subside; for it furnishes a topic upon which deodorizers, and drainers, and patent manure makers, and great engineers are never weary of descanting; to say nothing of the satisfaction of always having pectre within call. No one seems to that the duty he performsis that which Providence has assigned him. That he carries off our foul rejections is most true, and we ought to be grateful. Nature provided him for the very purpose, as she provided all other rivers,
which are the natural drains and scavengers of every country. And it is far from certain that high level drains and low level sewers, aided by a million horse steam-power, will do their work hall so well. Let as hope they will not render an evil half imaginary wholly real.
In our eyes there is an evil of greater magnitude which should first be dealt with, and that is the nuisance of chimneys and their soot. Recent legislation, it is true, has done much to abate the mischief, and London owes Lord Palmerston a heavy debt of gratitude for what he has caused to be effected. It is impossible to deny that the atmosphere in which we exist is of as much importance as a river on which we merely look. Whether we will or not the first is incessantly pouring down our throats; the second will only do so when we dive beneath its surface. The dose of the first is inevitable, of the last is as we please. Yet we hear little of the pestilent chimneys that are permitted to poison the air of Lambeth, or of others whose sooty craters still emit their contents as often as the eye
of the informer is withdrawn. Let any one go dows to Vauxball Bridge and look to the potteries on the right bank. The last time we had the misfortune to be there a south-east wind enveloped us in a fog of greasy soot. Well may a correspondent of the Times call the nuisance "atrocious." No word in the English language so well expresses the fact.
This we submit is quite as much in need of reform as the Thames at flood or ebb; and a fortnight's resolate struggle in the police courts would extinguish it, with this advantage, that the cost of the extinction would fall upon the persons who commit the nuisance. We have not far to look for instances of the effect of a soot-charged atmosphere upon health. Our friend Broome, the clever Chrysanthemum grower in the Inner Temple Garden, shall speak for himself. After complaining to the Times of certain factories near him which set Lord Palmerston's Act at defiance whenever they think nobody is looking, and describing the effects of soot upon his plants, he proceeds as follows :-" There is another and far greater circumstance connected with these gardens than the vegetable world ; the benchers and members very liberally, at a great sacrifice of comfort and expense, allow about 200 families orders to walk in the gardens the whole year through. They also throw them open to the public after $60^{\circ}$ cloc in the evening, and on Sundays, on fine evenings, we average from 10,000 to 11,000 that pass in the course of the evening; the majority of these are poor little sickly-looking creatures, penned up in the close lanes and alleys round the neighbourhood not old enough to get to the parks (as they would be tired in going there). I will tell you what they put me in mind of when they get on the lawnlittle dog that has been tied up all day and let loose. They roll and tumble about, kicking up their little legs on the Grass; it really does my heart good to see them; and I must confess that out of such a number of little creatures, and no one to look after them except the cfficers of the gardens, I rarely have a flower placked or a branch injured Picture to yourself these poor little children walking and rolling in clouds of smoke for three hours; what good can such an atmosphere do them, inflating their little langs with beastly smoke such as it was here two years back? When they came out they looked pale and tired; now they go out with their little eyes sparkling with joy, ranning and jumping like so many kitens, refreshed from the change of air, and pleased with the treat. And ali this is caused by suppressing the smoke nuisance."

Undoabtedly Mr. Broome is right, and we hope the gentlemen in the Temple will see to the final suppression of the smoke in their own neighbourhood. It would be an example of public spirit which others might be expected to follow.
It is not indeed merely because of the health of the neighbourhood that the factory-chimneynuisance demands removal with a firm hand. The Temple Gardegs themselves, one of the most agreeable places on the banks of the river, owed their once faded state to the evils of soot, and date their revival, such as it is, from the period of its partial suppression. What does Mr. Broome say as to that? nner Temple 23 years When first entered thei service the Temple Gardens were sery celebrated for white and red Roses, and I was surprised in the city of London at the Rose blooming at all, being a plant more sensitive to smoke than any other of the vegetable kingdom; still the old Provence, Cabbage, and Maiden-blush bleomed here beautifully. There were then only two steamboats on the river Thames, that went to Richmond; bat, as time rolled on, by degrees old Father Thames became crowded with them every three or four minutes, and as they passed the gardens they vomited out their clouds of smoke on to my poor Roses to such an extent that at last they ceased to bloom, and gradually began to decay. To add to this nuisance a forest of high chimneys sprang up on the south side of the river; these, if possible, were worse than the steamboats, enveloping the garden in smoke night and day; all sorts of vegetation began to dwindle, except Chrysanthemums. Some fine old Lime trees used to grow and bloom beautifully; they ceased to bloom and almost to throw out a leaf; but, thanks to our legislators, they passed an act to make these abominable nuisances discontinue. Such has been the result of this, that I am happy to inform you, this year my poor Roses that have been in the gardens so many years are now fast recovering their health and show that they will not cease to blow, for I have a great many white ones coming, and red also, and the plant bids well for healthy wood for another year. The poor forest trees also are making shoots much better, although the spring has been so unfavourable to regetation in fact, everything in the garden is greatly improving in health and vigour. My Stocks have not been so
fine for years past. I don't want you to take my opinion on it ; come and see, and judge for yourself. I challenge contradiction to this statement, and this is all through suppressing the smoke nuisance."
What is true of the Temple Gardens is true of every other place in this huge metropolis where soot is permitted to escape in large quantity. It is soot which ruins the plants in Whitehall Gardens, Buckingham Palace, and St. James's Park, and in every other Square, Garden, or place within its reach. It surely behoves all who value their health and comfort in London to set their faces resolutely against further submission to the evil. As to Lambeth, lying South West of the new Houses of Parliament, we seriously recommend the potteries there to the attention of all who desire that stately pile to retain its beauty, or the interior decorations their freshness, or the surrounding neighbourhood its health. Owing to some sort of dexterous management the potteries in Lambeth have
hitherto managed to claim exemption from the operation of Lord Palmerston's Act; but we see that this exemption is about to be withdrawn by a new act of Parliament, and we most earnestly hope that the moment the act shall have passed they will be compelled once for all either to consume their smoke or to blow out their fires. It is insufferable that a neighbourhood should be poisoned in order that a few manufacturers may be enabled to divide greater profits than they could gain if located elsewhere.

The accompanying figures represent a singular example of malformation in some unknown tree. Our untiring correspondent, Mr. Skinner, has sent it from Guatemala, but was unable to ascertain the plant that had produced it. He regarded it as a branch, the extremity of which had been accidentally arrested in its progress, and so compelled to grow down upon itself. In which had been provided for forming the wood of the

lengthening branch, having found itself unable to mast which is not made by clamping planks adrance directly onwards, took a lateral direction forming layer upon layer of almost horizontal fibres, till at last, the force of development being expended, the malformation resulted in a cup-shaped woody head. It however seems probable that some mechanical obstacle, such as a ligature passed round the branch just below the sammit, was also present and prevented a descending formation of wood, so contributing to the appearance in question. The object, singular as it is in mere form, has a higher interest on account of some considerations to which it naturally gives rise.

In the first place, the growth being stopped, where were the leaves which must have produced the wood? The specimen having been found without its bark this question can only be answered conjecturally. It is, however, almost certain that leaves existed in the cup itself, as is indicated by small scars, one of which on a level with B in the right hand figure evidently represents the seat of a once active bud, and several such scars are visible both outside and inside the cup.

But the most remarkable feature in the specimen is the spiral arrangement of the fibres of wood. The stalk is evidently constructed with fibres arranged spirally, but that peculiarity is most especially evident in the cap, which at a shows unmistakeable evidence that the long spiral turn of the stalk is suddenly exchanged for a very flat spiral running round the cup. A careful examination of the cup itself, inside or outside, and at either end, brings out the same fact, viz., that every fibre which constitutes the specimen is firmly directed in a strictly spiral manner.
This brings to our recollection some examples of spirally formed wood, which we had almost forgotten. Some years since a Pear tree, which had been felled and thrown aside, gradually lost its bark, which rotted off, when the wood cracked into a multitude of spiral fissures having as low an angle as about $45^{\circ}$; unmistakeably indicating that the deposit of wood had been going on in a closely
generally supposed to be the natural direction. In those knaurs, too, which schoolboys knock out of the bark of Lime trees and other trees, and which botanists call embryo buds, every rudimentary undeveloped bud is surrounded by closely packed fibres spirally arranged. Nor, indeed, is this entirely absent from the logs of Lignum vitæ to be seen in hardwood warehouses.
But these cases, striking and unusual as they seem to be, only represent a universal law. We believe that the woody fibres, or longitudinal structure, of all plants whatsoever is spiral, and that the cases now brought under notice are only the ordinary state in excess. Look up at an Oak, the rents in the bark which indicate the course of its fibres all lean slightly one way, and represent a long spire; look at a scaffold pole, or at the fine "stick" set up in the rosary of the Crystal Palace, or at any ship's same spirality is still observable; the teth of Musses, the elaters of Liverworts, the tubes of Lichens and some seaweeds, and even those animalcular procreative bodies which escape al] research except that of the most lynx-eye, observers, each is spiral. It is impossible indeed to look without a spiral tendency manifesting itsele wherever the eye is directed, whether in external organs manifest to the bluntest perception or in those recondite structures known to none except the eyes of higher intelligence.
Why then this peculiar attribute? Why is the solid timber spiral ? and the microscopic cells and tubes spiral, and reproductive organs spiral, and everything that is weakest as well as strongest spiral still? Is it to make the weak strong and the strong stronger? We believe so, as seems to be proved in those weak tropical climbers which singly lie prostrate, but which when two or thres come together and twist into one column stand erect like the stiffest trees of the forest. This is however a question for future discussion. We content ourselves with producing the Guatemala mon. ster as a demonstration of a universal law. $\dagger$

## New Plants.

178. Coryanthes Sumneriana
C. hyprehilio galeato apice acuto antice puberulo unguif equair, mesochilio eplicato intus levi epichilio sequali, epichilii mat-
gine patulo lobis lateralibus uncinato-ácatis.
1 live Brib
A native of Brazil, where it was found in the province of St. Catharine's by a collector in the service of our correspondent M. de Jonghe. Purchased in June, 1854, for the Bishop of Winchester, it flowered at Farnham Castle a week or two since. It is next akin to $C$. maculata, from which it differs in the flowers being chocolate-brown without any spots, and in the form and proportion of the parts of the lip. The helmes (hypochil) is slightly acute, and slopes gradually from the crown, instead of being curved inwards in front, in the way of a Phrygian cap; and the neck (mesochil) is quite as long as the bucket (epichil), the lateral labes of whose points are between hooked and siateral lobes are nearly straight or slightly curved. Mr. Lawrence, the gardener at Farnham Castle, infornis us that the the gardener at Farnhim for nearly 18 inclies, and fowly bent down when the two flowers became too healy for it to support their weight. We venture to name this fine addition to the most remarkable genus amoog Orchids after the Rt. Revd. Charles Richard Sumner, Orchids after the Rt. Revd. Charles Rlichard samner,
Lord Bishop of Winchester, a most enlightened patron ol scientific horticulture, and the possessor of one of the best and best cultivated collections of Orchids in Europe.

VEGETABLE PATHOLOGY,-No. CXXVIII.
509. Parasite (Cryptogams). Parasitic Cryptogams have almost the same relation in respect of therr para sitism to the plants on which chey prey, as Parasitic Plaenogams. Like them they are divisible into two principal groups, true and false parasites. The false parasites may, however, in some cases, in consequence of their ultimate effects when once established, be as fatal as those which are more immediately or directly injurious.
510. Before we proceed to the consideration of the more prominent species which are injurious to plants, it is requisite to make a few observations. A very large portion of fungi grow on decayed or decaying animal or vegetable matter. It has therefore beent doubted whether it is possible for any fungus to establish isself upon an organism in perfeet health. But fungi are noi upon an organity parasitic Cryptogams. There are truly parasitic the only parasitic Cryptola and Lichens as well as fi. Elachistea scutulata, Algze and Lichens as well as fungi. Himanthalia lorea,
for instance, is so incorporated with Himer the common seaweed known under the name of seathe common seaweed nown that it is impossible to say where the tissue of the one ends and that of the other begins. The parasite moreover bears two kinds of fruit totally different frosi those of the seaweed on which it grow*, so that there call be no more question about the one not being a modincation of the other, than there is of the Mistletue being of an entirely distinct nature from the tree on which it grows. The same may be said of those parasitic Lichens wid infest the fruit of many other species. There is the most intimate confluence of the respective tissues wim complete difference of essence. In neither case is here any pretence that the paracite was esanblished on a plant already diseased.
511. It is a well known fact that if the spores of Tilletia caries (Bunt) are dusted on perfectly clean Tilletis caries (Bunt) are dusted on perfe There was, grains of Wheat, the produce will be diseased. treated, than however, no more disease in the was applied, therefore in any other grains, till the Bunt was applied, Wheat. whatever may be the action upon the infested Wence of it is quite certain that the disease is the consequan way the application of the Bunt spores. In the se which the Grape mildew may be communicated to leave of other are perfectly healthy, both of the Vine and o in the plants. The effect may be to set up disease imately tissues wherever the mycelium comes more intimaise, in contact with them, by means of puckers or otherw the + We must endeavour on some other occasion internal strucclose cond the well known spiral arrangement of teares or ent appendages of the axis.
but the disease is no less the consequence of the fungus; than the silkworm murrain is the consequence of the growth of spores simply dusted on the caterpillar. In the same way disease is produced directly by a host of fungi upon tissues perfectly healthy before they came in eunthets, with such plain and incontestible facts before cur, that there should be a disposition anywhere to deny the possibility of moulds growing on perfectly healthy tissue, and consequently of their being the cause of various diseases to which the animal or vegetable world is subject.
512. If, however, there were room for doubt, every pretext for dishelief is done away by the fact that when chemical substances in in consequence dies, the disease applied, and the mould in consequence dies, the disease of the plant is arrested, though it is plain that if the
disease was in the first instance independent of the disease was in the first instance independent of the parasite,
513. It is to be hoped, indeed, after all that has been published on the effects of fungi, and of the different ways of propagation which exist in the same species,
that the fact will now be recognised that fungi are capable of communicating disease. We may in certain cases mistake the real habits of the species. We may attribute disease to the presence of fungi, where the fungi are merely developed on matter already diseased ; but with proper pains and a competent knowledge of the species of fungi and their habits we shall not fall into such mistakes. We are not to suppose in every case where fungi are present that they are chargeable with the evil, though they may possibly aggravate
present. Frut, for instance, when perfectly ripe, is ready to undergo another series of phenomena which however be suspended for a time, bat the slightes external injury admits the spores of some of our common moulds; they germinate, live at the expense
of the cells they traverse, and finally the whole mass is of the cells they traverse, and finally the whole mass is mucedinous matter. In this sense Dr. Hassall is perfectly right that decay is produced by mould, but the mould merely took occasion of the injury to establish itself, and the exigencies of its mycelium completed the mischief.
514. There are abundant cases in which it is necessary that the cultivator should be able to distinguish accurately between decay aggravated by or immediately arising from the presence of parasicedy ; in the other he can only paliate evil, which in many instances may have gone so far as not to admit of remedy.
515. Having once established the fact that diseases 5i5. Having once established from fungi, the remedy according to circum. stances may be either a preventive of anticipated evil or a cure of evil already existent. in the other. It is probable that the spores of Bunt would not be destroyed by crude sulphur, and it would
be dangerous to app!y strong metallic poisons to growing plants, as the remedy might be as bad as the disease It will be necessary therefore in practice to remembe this distinction. M.J. B.

## Entomologit

The island of Mauritius is at the present time afflicted with one of those visitations which from time to time occur in different parts of the world, in which myriads of injurious insects perhaps never or but very rarely aeen before are produced, destroying the desolation and alarm among the inhabitauts. It appears from the report of a committee appointed to investigate the subject during the course of last year, that with the view of regenerating the various kinds of Sugar-canes grown on the island a cargo had been imported from
Ceylon, and it is conjectured that it was in these canes Ceylon, and it is conjectured that it was in these canes
that an insect was introduced which, from the habit of that an insect was introduced which, from the habit of canes, has received the common name of the "Cane borer," and which is the offspring of a moth belonging to the section 'l'ortrices of Latreille and genus Procerus of Hiubner, and which is specifically named P. saccbariphagus in the report of the Commitiee before us, published in the early part of the present year.

The eggs are deposited among the green leaves of the cane, and the young caterpillars are found on the healthy canes at the axils of the leaves. They, howheart of the plant, destroying the cane in a frightful manner, by forming burrows in the stem filled with excrement, and which shortly have the effect of completely disorganising the functions of the vessels, so that crystallisation will no longer take place, and the cane is not even fit for the making of rum. Having reached its full size (when it measures 12 or 14 lines long), it leaves the interior of the stem and forms a loose silken coconn among the dead leaves of the plant, and the noth makes its appearance in about 15 days, which with 9 days in the egg, 31 in the caterpillar, and 4 or 5 in the perfect state will give about 60 days for the entire transforma tion of the species, so that in the course of a year (as the broods appear to be consecutive) there are five or six generations. The caterpillar has the head covered with a black plate, the neck is also covered with a paler coloured plate, and the body is furnished with a
points connected laterally by a pink baud, and the perfect insect has the wings silvery grey, powdered with ferruginous

The following is a summary of the suggestions which, at the request of Dr. Ulcoq, a large Sugar cane planter in the island, I have submitted to appointed to report upon the subject.
The natural history of the borer presents several points of great importance, showing the difficulty of attacking the insect in its natural state and position. The fact of the larva being an interna feeder of course prevents the application of remedies of an external kind, such as are used for the destruction of aphides, scale insects, \&c., either by syringing the plant with an offensive liquid, such as tobacco water, infusion of quassia, and the like, or by suffocation by the fumes of sulphur or tobacco; in like manner poisoning or disgusting the insect by the vegetative absorption by the plant of liquids which would injure the racticable. and affecting the plant appears equall sceptical as to the alleged benefits arising from adding seeptertion to 30 of water one portion of pentasulpide of calcium to 30 of water in which the cuttings of the cane tops for planting have insect throughout the season, as many as six generations in a year having been computed, renders any attempts in a year having been computed, renders any atroy the perfect insect on its arriving at the winged state almost hopeless. The only suggestion which would make on this head is that it should be ascertained when the earliest brood of moths appears in the spring, and that during the week in which they appear saucers of burning oil should be placed at nightfall near the canefields, in order to attract and burn the newly hatched moths. This remedy however (which has been found of very great advantage in France as applied to beneficial by all the cane planters adopting simultaneously.
The burning of the worst infested canes, as well as very particle of the tops, leaves, and dry straw which have fallen to the ground and do not pass through the mill, appears to me to be the most advantageous of all

the plans which have been hitherto suggested for the destruction of the insect in large quantities.
The treatment of the cuttings made for fresh plantstions seems to require especial care, since the instinct of the parent moth teaches it to deposit its eggs on the young and tender parts of the plant, which are precisely those which are selected for these cuttings. The immer sion of these cane tops in water heated to at least $120^{\circ}$ to $125^{\circ}$ Fahrenheit whereby the borer is destroyed, is a process which, although in skilful hands it may prove effectual, is very liable to be attended with arager $m$ effects in unskilful, and it has suggested in nine day from the deposition of the ege, it would be very advan from the deposition of the egg, if the cane tops could be placed for a fortnigh tageous or three weeks in a greenh be kept well saturated with whe fumes of prussic acid. This would unquestionably the fumes of prussic acid. it has been found practical in England to adop* this plan, using a considerable quanity of bruised Laure leaves for the purpose of evolving the fumes of the prussic acid. It may alsn be suggested that if the cane tops were laid or planted in trenches, kept well moistened with water, the destruction of the insect would to a great extent be effected, and I cannot but think that the sudden development of the borer in such vast numbers so soon after the introduction of the plants from a different locality is owing to a different mode of treatment, such as crowing the plants in a drier soil, which would have the effect of giving a greater energy to the powers of development of the insect.
The repeated observations which have been recorded the sudden and periodical sppearance of certain species of insects in vast numbers lead me to infer that * 1 caunat, however, but think that if a very careful examina tion of the canes were made from day to day with "intelligence as in phll similar investigations), a careful planter might make great progress in getting rid of the insects by examining the
axils of the leaves for the eggs and young larye, by cutting out those young larva which have only just penetrated into the
cane, and by cuting down and burning the canes worst infested. intelligent perseverance in clearing a large greenhouse from intelligent perseverance insects has een ately resorded in the Gard. Chron.
he present invasion of the borer in Mauritius is only a emporary one, which even if left in the hands of Nature within would in the course of a season or two bely similar to the present haver limits. A cancated to us by the elebrat Indian botaniat, Dr. Wight, who was for ame year ampar India Company in uperintending the Cotton plantations at Coimbatore in uperintending the Cothon plation f the plants from the United States they were attacked of the plants from the Uass than three-fourths of them y an insect, and not less than three-fourths of them were killed ; since that period, however, wingect has not tion of a stray individual
again made its appearance.
I presume the insect now infestiog the canes in the Mauritius is identical with the borer of the West Indian Sugar-cane described by the late Rev. Lansdown Guilding, in the Trans. of Soc. of Arts, xlvi., 143 , under the name of Diatrees sacchari (for which memoir be received the gold Ceres medal of the Society, which, however, appears to me to be identical with the Phasen. saccharalis of Fabricius, Ent. Syst. III., pt. ii, p. 238. It appears that the West Indian canes are never entirely exempt from this dreaded pest, which occasionally destroys whole acres, the larvse burrowing into the stem in the same manner as the borer of the Mauritius.
The accompanying wood-cut represents part of the stem of a cane with two burrows of the borer, also the larva itself and the moth, copied from the plates attached to the report above mentioned. P.S. Since the above was written I have been informed by an intelligent Jamaica cane grower that the borer was very destructive in that island about 15 years since, and that its ravages were greatly checked by the refuse being allowed to accumulate upon the grounds, fire being then lighted to windward which soon cleared the grounds, the old roots subsequently throwing up more vigorous shoots. J.O.W.

## EXAMPLE OF BOTANY IN VILLAGE

## EDUCATION

In reply to your proposal to print the papers shown ou by "B.," you are perfectly welcome to do so. But llow me to preface their insertion in the Gardeners Chronicle by stating the way in which they were obtained. If you think it likely to be of use, I will send you a few notices explaining the plan on which I have proceeded. The experience $I$ have acquired aince I sent you a notice on this subject, some four or five years ago, has amply convinced me that systematic botany migh be conveniently adopted for educational parposes (as distinguished from merely instructional) with the children of country parishes. Here it has been taugh as merely atter-school work, restricted to volunteers the lessons given at uncertain intervals, and withou books. I have no hesitation in saying the results have been decidedly beneficial. Observant faculties have been strengthened, reasoning powers expanded, the in teliectual and moral status improved. If the plan were a little more systematized, as I hope to see it, and schoolmasters and schoolmistresses adequately qualified for carrying it out, we should find it a most important adjunct to whatever means may be employed for raising the intellectual character of our agricultural population.
It was in order to give "B." an jdea of what some of our village school children know about the wild flowers of this district, that I prepared two blank schedules No.1), and carried some specimens of "Geum rivale" to
the school. Whilst the rest of my little friends used the school. Whilst the rest of my littie friends used their slates, the observations of the two most proficient,
were iuserted by themselves on the blavk schedules, were inserted by themselves on the was and spelling. They were then asked a few questions, which had also been previously prepared, and their replies were noted down verbatim. They then had specimens of "Geranium pyrebicum" given them, and were told to prepare aschedule (No. 2) for themselves, and fill it up.
To show their replies more distinctly, whatever is here given in italics was either written (in the schedules), or spoken (in answer to the questions), by the two chil dren, oue of whom was 14 , and the other 13 years old

## : Home Correspondence.

Gardeners Benevolent Institution.-As the next election of this Institution approaches, the anxiety of the friends of the cand dates for the pension naturally inshould be elise question whether any but subscriber stitutional repugnance to "appear in print" is great and would not have been overcome, if I had not seen "A Working Man," who says, he writes through your committee, or he would have laid his case before them, If he is a subscriber, this information is fully afferded him in the papers which are annually transmitted to him. However, 48 he has chosen the Chronicle as the channel in which he may state his reasons why a sabacriber should alone be the recipient of the charity"s to his argoments. Many years ago, before I became a subscriber, I was more than once solicited by the Secretary to become one, but declined on the ground that I knew of no person who was a clamant for the pension, and if I was to start a candidate, living in the north of England where there are few subscribers, I never should be able to elect him. At last however put on the list, and whom I had lown 20 je had been a foreman in a London Nursery, and for whom I had a great regard, and I became a member at once for the purpose of assisting him. It is this feeling of our if done away with will destroy it, or very much im air it done away with will destroy it, or very much impair
its usefulness. It has its origin with the wish of each megber to assist some particular candidate whose suffering and destitution he is either acquainted with himself, or from the statement of a friend. Do away with this feeling, and make it a law that subscribers only, and first those who have subscribed the most, shall be eligible to the pension, and the Institution becomes a benefit clab, and whea one pensioner dies the committee have only to meet pro forma, and elect his suecessor, on the principle of priority or seniority. All
interest in our exertions for an election are then at an end, and the society will soon find its strength annually and rapidly decrease. By the exertions of myself and
other friends of bliud Robert Hodge, whose case we
have taken up, we have added 16 new subscribers of 21 s .
have taken up, we have added 16 new subseribers of 21 s .
sabscription not to be considered as that of the poor can-
has no preferential claim-God forbid. If there weriber candidates unknown to myself or friends of equal moral merit, and whose distress was on a par, I would at onee give my votes to him who had most assisted the charity,
the bounty of which he asked in return. "A Working Gardener" (and I know of very few who are not so in one way or another) closes his letter with what he calls the old adage-"Charity begins at home"; but he quotes it incorrectly-it is, "Charity should begin at
home," and if it does not begin there, it hesins home," and if it does not begin there, it leesins
nowhere. It should begin with our own fanily, friensis, and neighbourhood, and after that extend its horizon with its means. In the course of my canvas for votes riend was not a subscriber, but I have not found one of those I solicited to become members of the Institution refuse for the reason assigned by "A. Working Man," viz, that the "fruits of other people's labours" are enjoyed by those who are not entitled to them. The great cause of so few working gardeners subscribing is, as Sir Joseph Paxton said, the low and inadequate wages they receive; they prefer running the risk of distant and contingent evil rather than submit to a privation immediate and certain. Does it not occur to "A Working Gardener" that if the gardeners as a body were to subcribe, on the principle he lays down, they could carry any one hey might propose? But if they do not do 80 ,
surely he should not complain if the uninterested sup. porters of the charity should now and then wish to nominate one. "A W orking Gardener" says something of the "present practice being to them a conven," and of the "present practice being to them a convenience," ce. To this I have only to remariz, while I remember poor blind man I am interested for never "paid me penoy." I accidentally came across him, and I cannot conceive a case which should more excite the sympathies of our nature than his-a kind, good, and moral man, struck blind in middle life, doomed tor the remainder of it to eat the cold crust of casual charity. I have to apologise for this long letter, but I was incontinently ing Gardener," which, if unanswered, are calculated to injure the charity we are all so desirous of supporting. I am glad to see the claim of candidates who are subscribers to this Institution supported. I protested against the principle on which Blair was elected in preference to
those who had supported the Institution, and $I$ am watching with interest the result of the wext election for with Alexander Gregory numbering on the last against Joseph Jeffreys' 142 votes, who had subscrihed eight years, his fifth application, there seems little chance. I, with many others who with difficulty can spare a guinea, am sorry that there is not some preference given at least to hose who have subscribed above half the term of years. Why not let their votes count double?-for it seems, as your correspondent in last week's Paper hints, that nurserymen have great interest in getting in particular parties. As regards the ensuing保, have been solicited by two to vote for has Quigley, who never subscribed to the Institution; but to those who had moment to anything so unjust others. I have given my votes, as I always do and will,
although I know nothing of thern) until they are Arnol f gardeners as a body would only follow this rule, the charity would meet with more encouragement from that to become members, but I am ashamed to say it without gaining any one, It is grievous to see men in good situations raising paltry excuses against subscribing thei salary I don't pretend to say ; we have all ways enough for it; but there should be in the subscribing to this charity the pleasing satisfaction that should we require in our old age a helping hand it will not be refused us or our widows. That we may never require it is the wish of all. The great age of Joseph Jeffreys, 83, with who has never sulscribed to the chaity, will be natele by many a hard-worbing and subscribing gardener.
Water Lilies.-I
Water Lilies.-I have more than twice as many flower on my Water Lily this year as usual, owing to our Why do we not hear of hybrids between the hardy and tender Nympheas? Somersef.
Gooseberry Caterpillar.-The following is a certain remedy for this pest. In a mild day wet the affected bushes with water from a syringe or watering-pot, and with a pepper-box sprinkle over the wetted leuves some white Hellebore powder. The caterpillars will soon be deatroyed if this is carefully done, and be seen lying on neithernd in scores Hellebors is poison, but 1s. $6 d$ a pound, and may be got in any drait. It costs only The whole expense, including labour, need not exceed \$d. per bush. For the last 12 years I have seen it used every year with complete success. J. Lockhart Morton, Lasswade, Mid-Lothian.
Carbonic $A$ cid Bread. - Wheaten bread or flowr may be set up with carbonic acid gas and water, as 1 have directed, or the carbonic acid may be indirectly saborned" as folliws :-N'lour or whole meal, 1 lb . bi-carbonate of soda, 40 grains; sugar, one pinch, i liked; salt, one pinch. Mix thoroughly, then add
water, half a pint; muriatic acid, 50 drops. Knead thoroughly but quicily, and bake likewise in a quisk
oven, or on a hot plate, with a double cover. Aaybody oven, or on s hot plate, with a double cover. Aaybody
may grind their own meal in a 30 s . mill. Rotating ovens are sold throughout London, while double covers for hot plates have been secently patented tity of meal or flour, the acid, the soda, and the water may be multiplied by 10 , and so on for any larger quantity. Brown or whole meal bread will require one-fifth more water than white bread. The preceding receipt is for white bread, so one-fifth more water will make it suitable for brown bread. That ia to ay, for making 8 lbs . of whole meal into brown bread 5 pints of water will be required, whereas for 8 lbs . of flour, 4 pints of water will suffice, and so on for larger quantities. When the acidulated water is added the acid combines with the soda and turns it into common salt, while the carbonic acid gas escaping baking soda, costs at the druggist's 4 l . per lb. The muriatic acid is equally cheap. Once weighed, the ingredients may be afterwards measured. The resulting bread, whether brown ( $r$ white, is simply delicions Henry M'Cormac, M.D., Belfast.
inform me where I may find large he correspondents ma individuals of this Oal, bearing, healthy and well-grown bliged. I shoull a, bearing acorns, I shall be greath of the trees of most proportunity of visiting som August, and of satisfying proming description in July or the species, and thereafter when the acorns are ripe should myself or by some trustworthy, hand gather the acorns for sowing in my own secdbeds. As I have the Ordnance Map of as much of England as has been published, a reference to that map by any corresponden who is kind enough to assist me will make the locality Forest.]
Crystal Palace Fountains.-Unless I misunderstand the meauing of the paragraph which you insert from the Time in your article upon the new water fountain at the Crystal Palace in the Chronicle of the 21st Juee large is a palpable mistake in it. It is this. WTh large fountains in the lower basins, and the circular on stuated oa the plateau, depend solely upon the water fo their effect, and not at all upon architecture of sculpture like the smaller fountains on the terraces, \&c. Now does this mean that the effect of the fountains on the terraces is heightened by the proximity of the statues and architecture on the terraces, or by the sculpture and architecture belonging to the fountaing themselves? a if the latter is meant, as I read it the report is erroneous, unfortunately no sculpture or architectural design adds beauty and interest to any of the garden fountains: This is what I bave always considered the great desideratum at the Crystal Palace-some tasteful design for constantly playing fuuntains, for which Rome, Parie and most continental towns afford admirable examples -appropriate designs which may add full effect to th play of the water, and when dry may form pleasing oruament to the grounds. I have mentione this to the authorities, Lut though they quite agree wit me, they say at present it cannot be afforded. I woul rather at first have spent money on these than which can only give pleasure for half an hour. At Paris you may see those beautiful fountains in the Place de la Concorde and elsewhere playing all day long, and the same with other continental cities, but is Loudon except those lovely dumb waiters in Trafalgar Square and two or three other nearly as fine specimens, we have I believe nothing in England that we can call a handsome public fountain. How delightful is the sight and how grateful the sound all who are near fountains in hot weather can fully appreciate. We look to the Crystal Palace for models of taste to follow, and the noble gardens require but the animation and charm perfect. Even the fountains within the building searely ever play. I will only add the hope that when the ever play. I will only add the hope that when the
company is in funds something more worthy of the place and of the national taste may be found than to my humble taste the most extraordinary and incongruous compositions pointed out to me as appropriate in the gallery over the entrance to the centre transept. A ew perbuasive words in your columns may bring about manent fountains of graceful and appropriate design in the gardens, and at any rate the daily performanco of the fountains in the building. Bircelyyrge
Welon Disease.-In your impression of the 30 th wil. I read an article by "A. W." upon the failure (for the ast three years) of his Melons. He has, he saya, inquired of gardeners around him, and finds that they know of no such instance as the failure of whole plands and stalks just as the fruit is ripening. It is gratifying "A. W." is not a solitary iustance I can fully testiff, as for the last three years my Melons have failed precisely the same as "A. W.'s," although my treatment has been different from his. Instead of 18 inches of loose sandy mould lying loosely round the roots, I have 20 inches of rather stiff loam mixed with cow-dug three years old, about one-xixth of the latter to fivesixths of the former, pressed as firmly as the hand will do it all over the bed. The wacer I have ased greenhouses into a cemented cistern, where it undergoes greentiones into a cemented cistern, where
fitration. What can be parer for the purpose I

Mot In watering I have carefully uvolded extreme and where the cause of failure lies 1 am at a loss to bottom heat at the time they begin to fail. My pits bottom heat at 5 feet 6 inches wide by 12 feet long; I fill them aro 5 feet 6 inches wide by 12 feet long; I fill them
with well prepared stable manure, which gives a bottom with well prepared stable manure, which gives a bottom and I fiad it impossible to apply linings sufficient to and I fiad it impossible to apply linings sufficient to heep up the heat in the middle of the bed without
scorching the roots near the sides. Am I right in my option as to the cause of failure? C.D., Wood Hall, Essex.

Weston Plower Show.-The Weston people are 30 l . in debt from last flower show and are begging for subscriptions to make up that sum. When I tell you that out of $252 l$. eollected, only $64 l$. odd were allotted to prizes, you will not be surprised at the remaining fourfifths going to pay exorbitant bills of the tradesmen of the place. Printing, $286 .!$ for the use of held, $5 l$, one Somerset. [If there is no mistake here, such charges ought not to be allowed by the committee. The first and third are outrageous-as they are stated.]
Melons, dec.-I perceive by your last impression that
A Looker On" at Whittebury Lodge has got his eyes on some very fine Nectarines, and no doubt as Elruges they were very fine, as the weight (6 oz.) testifies.
But as an old Peach grower I must open a "Looker On's" eyes by stating the fact that I have for many years sent Peaches to my noble employer's table which certainly was a " monstrous fine fruit" ${ }^{2}$ " Paddy would eay. So much for Peachcs. Now for Melons. I see one of your readers ("A. W.") is in trouble about his dying off before bringing the fruit to malurity, and only hasten their dissolution in such uncongenial soil. ho ever heard I defy any one to produce a Melon fit to be seen on any
such soil ; in fact, the stronger or stiffer the loam the such soil; in fact, the stronger or stiffer the loam the
better for Melon growing. I have for many years grown my Melons in loans so strong that when I want grafting clay I invariably go to the same heap of loam, and I may just mention that in this strong adhesive lbs. weight, and the quality unsurpassable. L "A. W." try the very strongest loam he can get, and he will have plenty of Melons. An Observer. [This advice about soil is certainly quite right; and we dare say meet the question, which is how to keep the Melons on novo, not how to manage them hereafter. We still eny try cow dung.]

## Eorictize.

LIMNEEM (Anniversary), May 24.-The Presidetit in the chair. The King of Portugal was elected an honorary member. The following new members of Conncil, viz., Prof. Bentley, L. L. Dillwyn, Esq., Prof. Owen,
J. Woods, Esq., and J. Yates, Esq., were elected in the room of R. C. Alexander, Est, G. B. Buck on, Estl, C. J. F. Bunbury, Esq., J. Curus, Escl., and W. Spence, Esq. T. Bell, Esq., was re-elected President; W . Xar-
rell, Esq., Treasurer ; J. J. Bemnett, Eqq, Seretary; and R. Taylor, Esq, Under Secretary. The President nominated F. Booth, Esq.. R. Brown, Esq., Prof. Owen, and W. Yarrell, Esq., Vice Presidents for the year in favour of the Society. The Secretary reported that in favour of the society. The Seccetary reported that foreign member had been lost by death, and eight others had withdrawn, and that twenty fellows had been elected.

June 3.-The President in the chair. Mr. W. Penney was elected an associate. Mr. Westwood made some the Sugar Canes in the Island of Mauritius. It was stated that this iosect (of which as many as half a dozen broods are perfected in one year,) by burrowing in the Canes has greatiy diminished as well as deleriorallowed on the means of destroying the insect, and thereby preventing its ravages, in the course of which it was suggested that the best remedy seemed to consist in burning the whole of the Canes not fit for use, as well as the refuse, after selecting and preserving in situations beyond reach of the insects a sufficient number
of sond eyes for the purpise of propagation. There was further read a "Note on the Development of Fungi npon Patna Opium," by the Rev. M. J. Berkeley. of the petals of Papaver somniferum, agglutioated with an impure opium paste, known under the name of to whom they had been communicated by Dr. Macinuon from Patna, in consequence of an affection to which the opium calese have been subject for the last year or more perfect cale showed abundant mycelium of Penicillium with neeklaces of spores of various sizes, but withou any symptom of consequent decay. The shell from the unsound cake was infested with Acari, and there were perfect a condicion. There seemed also to be a mixture
of the spores of Aspergillus with copious sporangia of Earotium herbariorum, which is now recognised as
form of the fruit of that genus ; besides which ther

Were litie heaps of white matter, consisting of minute infant spores of some mould resembling the yeast fungus, In the former case mould was present, but not in such abundance as to do mischief; in the latter, mould pre dominated, and was apparently the cause of the deterioration of the opium. Mr. Berkeley suggested as remedy, that supposing the fabove to be the true ex planation of the deterioration, the opium cales should be subnaitted to sulpharous acid (the vapour of commo sulphur), as soon as any mould appeared on them Mould, he observed, certainly has the power of destroying the virtue of many drugs, and why not that of opiom?
June 17.-The President in the chair.-A Specia General Meeting was held for the purpose of considering a proposal from her Majesty's Government ton House, in conjunction with the Royal and Chernica Societies; when the following resolution proposed by Dr. Hooker, and seconded by Mr. J. Forster, was umanimously adopted, viz. : "That the Council be authorised to place itself in communication with the Councils of the Royal and Chemical Societies with the view of carrying out the proposal of the Government as to the occupation of Burlington House." At the ordinar meeting which ollowed, J . Wainwright, Esq, was Hicks, M.D. 2. "On a new apecies of Peziza, bein the full developement of Sclerotium roseum of Kneiff, by F. Currey, Esq. The genus Sclerotiam, the autho observes, is one which has long occupied a doubtful position among fungi; and after having been bandied about from one family to another, the opinion has been gaining ground that the Sclerotia are not autouomous productions, but only the mycelis of other fungi, which being arrested in growth, whilst retaining their vitality, await only a favourable season for attaining their full development. In numerous instances they have been ascertained to produce fungi of various kinds and belonging to widely different families, but there is still a vast number in which no such subsequent development has been traced. Any new case in which the full development is observ thus becomes iuteresting to mycologists. Mr. Curre had observed a case of his kmd in the Sclerotiun roseum, which a Rushes and Ballushes, and is of an oblong eylindrical form rounded at the end, and from $\frac{1}{8}$ to $\frac{1}{2}$ an inch long In April last whilst searching for Aigge in a pool on
Paul's Cray Common, Kent, he found an elegant Peziza Pauls Cray Common, Kent, he found an elegant Peziza growing on the last year's stems of a species of Rush,
probably Juncus conylomeratus. On close examination probably Juncus conglomeratus. On close examination this was found to be not attached to the surface of the
Kush, but to issue from its interior, causing a iongitudinal fissure ; and on splitting open the Rush, tubercular body became visible, which proved to be Sclerotium roseum, to which the stalk of the Peziza number grewing from each Sclerotium varied from two to 13. Mr. Berkeley has given to this Peziza, which proves to have been previously unknown, the M.S nane of P. Curreyanum. The paper was accompanied or undescribed fungi lately found in the vicinity of Malvern, Worcestershire," by E. Lees, Esq. This paper, whe was act of the plants noticed, consisted pricipaly, or at least the habits of several supposed new species of British the habits of several supposed new specless of British
fungi of the genera Agaricus, Cantharellas, Polyporus, Thelephora, and Mitrula.
The following circular has just leen issued. Linnean Society, 32, Soho Square, June 24th,
1856 . At the Special General Meetivg of the Society, held on the 17 th inst., it was unanimonsly resolved:That the Council be authorised to place itself in com munication with the Councils of the Royat and Chemical Societies, with the view of carrying out the proposal of House sideration the best means of meeting the expenditur necessary to be incurred in connexion with the removal including not only fittings and furniture for the apar ments in Burlington House, but also the cost reinstating the Society's present honse previons to the expiration of the first seven years of the lease; which regether (as far as can be at present estias ; wid require about 800\%. As there are no existing funds from which this expenditure can be defrayed, and as it appears to the Council that it would not be deairable to add to the estinated sum by a general subseription, and confidently trust that there will be mo difticulty in obtaining it for so important a purpose; especially when effected in the annual expenditure of the Society. this confidence they submit the accompanying first list of subscribers, and earnestly recommend the subscription to the members. It being very desirable to ascertioin as speeduy as pectully requested. Bennett, Secretayy. The subscription to June 28 ch amounts to $410 \%$ and includes the namea of Thomas Bell, 50l. ; John Joseph Benuett, 20l. ; George Bentham, 202.; Robert Brown, 20..; Sir William Lindley, 20l; Richard Owen, 10h; Willian 'Wilson Lindley, 202;
Saunders, 206":

## ふottces of 3ooks.

On the Variation of Specier, with especial reference to the Insecta, followed by an Inquiry into the Nature of London: J. Van Voorst, 1856.
IT has often been remarked that entomologists seem to have been overwhelmed by the richness and diversity of their subjeet, and have very seldom made the same use which botanists have done of their multiform facts, in regard to geographical distribution, elarsification, and other high branches of natural science. We have in this work of Mr. Wollaston's an admirable exception to the above remaris. The author has almost devoted his life to natural history; he has visited Madeira four times in order to collect and most carefully to observe the insects in their native home. His great work on the Insecta Maderensia, beautifully illustrated by Mr. Westwood, affords a truly magnificent testimony of the author's zeal for science. Mr. Wollaston in the present volume generalises the results of his long-continued observations, and brings into play his accurate knowledge of the land mollusca of Madeira. The main result is that species, when inhaliting an island or any distant oc.ality, vary considerably more than the great majority of naturalists are willing to allow. To those not conversaut with natural history this may appear a trivial point, but undoubtedly it has a direct bearing on questions which every one must consider important, namely, on the first appearance or creation of organic beinge. Mr. Wollaston argues in great detail (but we wish sometimes for even more detail), from finding a regular gradation of intermediate forms, that cextain inseet forms are only varieties, and not true species; but these varieties in some cases differ so much from each other, hat had only a few specimens been collected, they would undoubtediy have been considered specificaly distinct. From such cases the argument is carried on by analogy to other closely allied forms. Some naturalists think that the whole fabric of natural history is in and these wi.1 hail with thankfulness Mr. Wollaston's work We do not wish by this remark to undervalue the discrimination of the nicest details ; we object only to the raising of minute points, even when strictly inherited, 10 an equal scale of importance with physiological differences, and differences of habits of life.
Although Mr. Wollaston admits a great amourt of variation, he strongly denounces those who doubt whether there is any essential distinction between species and permanent varieties, such as Mr. Woliaston
himself freely admits. He allows only a "legitimate" ansount of variation ; but the reader may search in vain for a distinction between legitimate and illegitimate variation: it seems hara justice to denounce any one for breaking a law, which is not and cannot be enunciated, aud which even the lawgiver himself does not seem always to know (p. 33, 39, whether or not he is breaking.
In repard to the causes of variation, Mr. Wollaston butes but little to the direct action of climate, more o the effects of the neighbourhood of the sea, and most of all to isolation. The effects of isolation must be why mere at present as empirical; for itity tion, and consequent interbreeding the anthor attributes that limintion of whizh is frequently charactor hat dimination mize whell iavour of his view; at the same time it must be owred that breeders, for instance of short-borns, will probably be surprised to hear of ill effects being attribut to the interbreeding of some 20,000 or 100,000 individuals, living on an island 30 miles in length-a perfect conti-
One of the most remarkable facts discovered by Mr. Wollaston in Madeira is the frequently wingless condition of the beetles; out of 550 Coleoptera there collected, no less than 200 are more or less apterousa truly surprising proportion. It particularly deserves notice that several of those genera which have winged species on the continent have wingless species in this Dodo and Solitaire of Mauritius and Bourbon, and of the A teryx and other great extinct wingless birds of New raiond As in the eaverns of North America and of surie the beetles and other snimals which na of syra, Ahe in eyelse whin min islands of Madeira, Mr. Wollaston thinks that the islands of Madeira, Mr. Wolaston of flight would be of litsle ase, or even injurious to them, as when once on the w.ng they woald be very liable to be blown out to sea and thus lost. Not only are many of the truly endemic beetles here apterous, but Mr. Wollaston firmly believes that some of the actualy same species, which are winged in Europe, are wingless in Madeira. The tendency to diminution in size altributed by the authos to interbreeding, is thought to be sometimes overborne by the supposed haw of compensation or balancement by which increase of general size has been gained by the loss of the organs of flight. But we think further ouservations are wanted on this head; and we would venture to suggest to the author to collect, if possible in mollis in its winged, half-winged, and quite wingless mondition, and compare each series in regard to general size.
The final chapter contains a valuable, but perhape
somewhat too metaphorical, ciscussion on classification,
or the relation of groups to each other. There are several other interesting subjects, especially gengraphical distribution, treated with much ability, but on which we have not space here to enter. Under a discussion on the powers of diffusion which different species possess, there are, as we believe, sime quite unparalle facts given, namely, the existence in abundance of cilias Helix, on certain hills in Porto Santo, and nowhere else in the whole group; this same species and the same warieties being found fossil in the ancient superficial calcareous beds (which include several extinct species) in the same identical localities where their living descendants now flourish, and nowhere else fossil or recent in the Madeira group.

Finally, we can confidently recommend this work to the attention of naturalists as very instructive, and as eminently suggestive - than which we can hardly yive higher praise-for on the abstruse questions here discussed, we may aimost say with jesting Pilate, "Wha is truth?" We believe that Mr. Wollaston by the present work and by his Insecta Maderensia will have ven of those who will, either in going less far o farther on the probable amount of variation, most differ from him.

## Garden Memoranda.

Mr. Salter's, Hammersmith. - During the last few weeks there has been a grand display of Chinese Pæonies at this nursery. Mr. Salter's collection of these gorgeous flowers is perhaps the most extensive in the country, comprising as it does all the finest English and continental rarieties, and they have blossomed unusually well this season. No one who has not seen hes flowers can form any idea of their great size and beaury
Several of the sorts measured quite 8 inches in diame ter, and they have colours varying from pure white to citron, blush, rose, and crimson. The finest we noticed centre; Humei alba, blush. Buycki, dark rose . diflora nivea plena, very large white; Anemoneflur difriata, yellowish white; Papavereflora, Hush and white Reevesi plenissima, crimson ; Melbourne, rose with a buff centre ; Reine Hortense, rosy lilac with white centre elegans superbissima, rose with salmon centre; Pottsi, crimson; P. plenissima, dark crimson yellowish white; rosea plenissima, rosy piuk; Vic toire Modeste, blush ; sinensis odorata, rosy crims $n$ triumphans Gandavensis, blush and citron; prolifera
tricolor, white and lemon; lilacina superha, rosy lilac ; tricolor, white and lemon; lilacins superha, rosy lilac ;
Gloria Mundi, pale rose and citron ; amabilia, sulphurcoloured; Maria, rosy crimson; virginalis, white Walneriana, pale rose and white ; edulis superba, dark rose; sulphurea superba, sulphur tinyed white; Reine des Franchais, white shaded with delicate rose; CharDuchesse $\mathrm{d}^{\text { }}$ Orleans, rose and blusl. Collections of cut flowers of these beautiful varieties Crystal Palace exhibitions, and we need not say were universally admired. When planted sufficiently near ponds to permit their large and showy blossoms to be reflected by the water, they have a charming effect.

In another part of the ground we observed a planta tion of singularly marked and variously coloured wer Pansies. A mong the more conspicuous of them
Orpheus, kronzy purple edged with yellow ; Dandy Dinmont, yellow and purple with a yellow border Celestial, white, shaded and margined with viole Cerberus, purple and brown ; Paul Pry or Mazeppa, purple, broadly tipped with white and very striking; Panaches, rose, striped maroon; Model, rose striped with purple; Butterfly, purple, mottled with yellow ; Aristo, purple striped with lilac and rose; Bobo, silvery lilac; Leopold, purple mottled with yellow, Jonas, yellow - Pirate Queen, mottled purple with a yellow edge ; Judy, violet, bordered with white; and delicata, red striped with lilac. Of these Mazeppa, though long in cultivation under the name of Magpie, is particularly worth attention. An extremely well marked bloom of it was shown at the last exlibition in Regent's Park by Mr. Stark of Edinburgh.

Indoors were several new striped Petunias, which have a very gay appearance. Among them were
Madame Lemichez, lilac striped wih white; Marquess de St. Innocent, dark purple striped with white and really very pretty; Madume de Pruines, black striped purple ; Ernest de Lepineau, pale lilac striped white Imperatrice Eugénie, violet striped with white maculata, mottled rose ; gloriosa plenissima, semidoable blush with green edges and centre; and Hermione, white spotted Ceranium named Unique Rose d'Amour, pale rosy peach spotted with lake, trusses large and produced in great profusion.

## Calendar of Operations.

## (For the ensuing week.)

PLANT DEPARTMENT.
Comsentatory, sce.-The beauty of most soft-wooded plants here may be considerably prolonged by the use of weak manure water, which shou!d be given as
often as can be done conveniently. Indeed such things as Achimenes, Clerodendrons, \&ce., may be had in ful
beauty from June to October through being liberally supplied with manure water, but care must be taken not to give it too strong, especially at first. Kepp the atmosphere as moist as can be done, but avoid damp at nights by leaving sufficient air on to cause a gentle circulation, and spare no attention that will keep the pants clear of insects. Stock for autumn and winter howering will now require some care to get it sufficiently forward to be useful at the proper time. Chinese Primulas, especially the double varieties, if at all back ward, may now be placed in a close frame, and shauled from the sun, when they will be found to make satisfactory progress. Cinerarias for early flowering should also be potted and started at once, chonsing the strongest suckers for the purpose, and placing them in a close shady frame until they have become rooted. They re sometimes attacked by thrips, but if they are kept cool and moist, and smoked occasionally, no danger eed be apprehended from this or other pests, and they will grow vigorously. Cold Pirs. - The stock here will now be growing treely, and should be examined
frequently in order to see if all is right; for plants growing rapidly speedily suffer from neglect in waterin or from the attacks of insecte. Examine young spec mens that were potted early in the season, and shift a once such as require more pot room.

## FORCING DEPARTMENT

Pineries.-Such varieties as are at all liable to spoil the bottom before the upper pips are coloured should now be hept as dry as possible inmediately they show the least signs of colouring, keeping the atmosphere also as dry as can be done without injury to the rest o the stock. Vineries.-Grapes intended to hang through the winter should be thinned very freely, and, if necessary, they should be gone over a second time, leavin them so that the berries, when fully swell-d, will scarcely touch ench other. A moderate crop only should be let on the Vines, hor, to ensure success in keeping Grapes fresh and in good condition till next March, the Vines must be in first-rate health ; ve satisfied, therefore, with a moderate, or rather light erop, in the late house. Kee the atmos there of houses where the fruit is colouring in active circulation, using gentle fires by day, with abundance of air, and leaving a little air on at night, to prevent damp. If red spider appears inclined to be troullesorne, wash the pipes, $\&$ e, with a mixture o soot and lime, and if the colour is ol.jectionable, add more soot. Figs. - Trees that have been kept dry whi: ripening the first crop, and are now cleared of this, appearance of red spider, the leaves should be thoroughly appearance of red spider, the leaves should be thoroughy
washed with the engine. Give manure-water to trees showing a heavy second crop, and keep the atmospher moist hy frequaly sprinkling the passages and bord \&c. Keep the sllouts thin and regularly tied, so as to avoid confusion, and expose all parts of the tre equally to the light. Where the fruit is ripening atten to previous directions, and keep the atmosphere and borders as dry as can conveniently be done. Assis trees in pots by giving them a liberal supply of manure water.

## flower Garden and surubberies

Go over the beds frequently, and keep the young shoots of Verbenas, \&e., nicely rezulated and penged own until the ground has got fairly covered, after which fight dry soils two or three applications of weak manure water given at intervals of a few days and when the ground is moist, will greatly assist in getting the beds covered without loss of ime. See that Dahmas, HolyRemove decayed fluwers and seeds from Roses, an give autumn flowering varietics plenty of pannure wate in order to keep them in vigorous health and to secur plenty of "blooming wood." Such as are budded on the Dog Rose must be kept clear of suckers. Buddray cloudy. be proceeded widn when he weat liberal washing with the engine, or syringe them with Tubacen water. Mildew sometimes becomes troublesome after this season; it may however be kept in check by applying sulphur to the parts affected the moment males its purance, first wetting them with mak in order that the sulphur may otick. Whith required proceed with propagating herbaceous plants, in order to get this kind of work out of hand and the glasses, \&c., at liberty for other purposes. Take advantage of slowery weather to give the walks and lawns a good rolling, and endeavour to keep the Grass short and neatly mown.
hardy fruit and kitchen garden.
Where Strawberry runners are in good condition, stock for forcing next season may now be potted, and placed in a close shady frame until it has got established. Prepare ground for fresh plantations by heavily manuring and trenching it ; or if land cannot be obtained at once, select the strongest ramners and plant them on a shady border in richs soil, to be transplanted with balls next mouth. During this month Asparagus beds can hardly have too much manure water from the stable or farm-yard tank. On light dry soils salt may be applied with advantage, but this should not be used on strong stiff ground, as it keeps it wet in winter and rots the roots. Finish planting out the priacipal crops of Broccoli and winter greens, and proceed with planting out Celery as ground can be spared for it, using plenty of manure and keeping it liberally supplied with water. Attend to staking late Peas, and keep the ground moist about those in a forward state, giving them a thorough
soaking occasionally with water, which will help to prevent mildew. See to keeping up a supply of salad Spinach, \&c., and sow a good bed of Cabbages for winter use.

SATURDAY, JULY 5, 1856.

## 

The suggestion made last week on the facilities which the Railway Companies might afford both to employers and to labourers during harvest time needs to assume a more practical form before it can le made useful.

Among the points tending to a common under stauding on the suliject are the following: -
(1). There ought to be a meeting in London of those employiug the Newsvendors on the several lines to consider (subject to the approval of the different Railway Cumpanies) what should be the remuneration, payable both by masters and by men, for every labourer thus engaced, and to deterniine on some device, which should be universal, to indicate at each station the office where information on the subject may be bad.
(2). The Railway Companies ought to issue harvest tickets, which, like excursion tickets, would enable the holder to stop on the road without forfeiting his ticket, or even to go on (if time did not allow of his obtainirg a fresh ticket) by paying the difference between the place for which he took his ticket and the place he stopped in. For

## instance-

If he took his ticket from London to Richmond he ought to be allowed to get out at any of the intervening stations (Breutford, for example) without giving up his ticket, or he ought to be allowed to go ou to Windsor by paying the additional fare from Richmond to Windsor. How far this might suit the views or arrangements of the Companies we cannot of course tell, but they have already recognised the principle in their excursion tickets. These harvest tickets ought to be of a completely different character to all other railway tickets, so that the porter at each station would see at a glance that there was no imposition.
(3). All the employers of labour wishing to en courage the plan, should at once send to the nearest station to say how many persons they were likely to want, and if this were promptly done it would give the vendors of books an idea whether the matter was worth their notice, and the rail way companies and telegraph comparies ought to give them facilities for making the plan known by the circulation of hand-bills, posters, telegraphic messages, \&c., at a very low rate; bat if once organised it is our opinion that the system would become universal, and would be found of immense utility both to employers and workpeople.

The vendors of books at the several stations appear to be the most proper persons for agents; they are generally intelligent and quite alive to their own interests, and on the arrival of a train at each station it would be the easiest thing in the world for them to add to their usual cries of "Times!" "Punch !" \&e , those of "Twenty mowers wanted!" "Fifty hay-makers wanted!" "One hundred reapers," or "Twenty Hop-pickers," as the case might be.
The newsvendors, if once they organised such a system, would no doubt give it great extension by communicating with each other by rail or telegraph (provided facilities were given for so doing), and would also pay and receive commissions from each other for intelligence, or workpeople sent to the station where they were wanted. T. G.

Magnificent harvest weather has succeeded magnificent growing weather, and there never, probably, was a better crop of hay in process of being better "won" than is now heing gathered in throughout southern and central Euglant

A warm fortnight has improved the promise of a good Wheat harvest which most districts give-and it will be earlier ready for the sickle than was generally expected. We shall, as usual, give daring the next few weeks reports from correspondents in the several counties, and shall be prepared early in August with a general report on the probabilities of the harvest, which will then be capable of more confident prediction.

The reports of green crops generally intimate the attacks of fly as being unusnally mischievous among the Turnip fields, and the blanks among our Mange plants as being unusually numerous. These have in many instances been filled up by transplanted Kohl Rabi or sown Turnips, and where they stil exist transplanted Mangel plants still fun nish the means of filling them when the soil agrain becomes mointened with showers.
The past season has distinguished most remark ably between the energetic and inactive cultivator Showery and dry weather have alternated at such short intervals that the one has always been exactly suited while the other has been just too late. The agricultural diary of two men alike in the circumstances of soil and weather which have affected them, but differing thus in personal character would during the spring of 1856 show with even greater clearness than it $g$ nerally does how much the latter exceeds the former in its influence on personal experience.

We publish in another column the questions put by the Auricultural Examiners to the candidates for the Certificate of the Society of Arts at their late annual examination in connection with the Mechanics' Institutes of the country. Only three offered themselves for agricultural examination the certificates at the disposal of the examiners were of three classes, viz, Excellence, Proficiency, and Competency; and one of Proficiency was awarded. Our object in publishing the questions put is to add that we shall be glad to receive answers to them from any of our readers : and we shall be happy to present a copy of this Journal free for five years to come to the writer of the best set of answers that we may receive during the month of July
It will be interesting to our readers to learn that among the four silver medals at the disposal of the Society of Arts for Papers read during the current session, two haye been awarded for ayricultural papers; one to Mr. Wren Hoskyns for his paper on the Agricultural History of the past 15 Years, and one to Mr. Bailby Denton for his paper on the late Results of Land Drainage.

The recent publication of a remarkable balarce sheet before a Bankruptcy Court furnishes an extraordinary illustration of the need for personal superintendence in agricultural investments. Large sums spent in the purchase of estates, added to large sums spent in alterations and imp ovements were confronted by the present value of the estates so altered and improved, ludicrously smaller than the cost by which their present state had been attained

The landowner was, in tlis case, not a landlord sarily occupied by large busiress transactions, and could not be devoted to what never will succeed without it. Land improvement in order to be profitable must be carried on directly by those personally interested in its success, and capable of giving undivided attention to it. This is as true of an English estate at present as it has been of a West Indian one since labour has been paid for there and produce has been unprotected. In neither case will deputies or even principals, if they be distracted by other cares, make profitable managers.
That success, however, does attend personal attention and the same energetic business hahits as are needed to secure it in commercial pursuits when they are devoted to agricultural improvements may be proved by many instances. We do not know of any more striking than the case lately noticed in our
columns of Mr. Fowler's estate on Dartmoor. Here, in a climate where grain will hardly ripen-one of the exceptional cases therefore queted by Mr. Wood at the late discussion on breaking of Grass lands-Mr. Fowler, a Liverpool merchant, placed himself in 1847. The purchase of a portion of the moor was followed by the erection of farm buildings and a house, the enclosure of the land, and the cultivation of it. Green crops grown most successfully fed cattle under shelter, and the land, most of laid down again, yields enormous crops of Grass. Six weeks ago fields worth in 1847 not 2 s . per acre let
for summer grazing for nearly 60 s . And now a bleak and barren moor is rapidly becoming pleasant country residence, while the balance present value against original cost and subsequent outlay will prove as great a contrast to the balance against the unfortunate bankrupt in the case we have just referred to as any o
sgricultural progress could desire.

## DESTRUCTION OF WEEDS

The subject of your leading article a week or two back on "eradicating weeds" is of vaut importance,
and claims especial attention of all agriculturists, and if and claims especial attention of all agricultuxists, and if circulated through the columas of your Guzette it would prove one of the greatest achievements of the present
day. Permit us to observe that if we wait till manual labour alone effects it, amongst thick crops especially, hey (the weeds) will not, and cannot ever be got rid labourers are to work and their masters are to pay them. Having ourselves taken two farms last
Michaelmas of 100 acres, completely run out with weeds of almost every description, we ought not to have year, but confined ourselves solely to crop the first year, but chnined ourselves solely to the extirpating position, was our first consideration; lut having too pottle capital to employ to farm the first year without a crop, we had recourse and applied ourselves energetically crop, we had recourse and applied ourselves energeticaly each other, on the common stetched land, in order to clean it as effectually and cheaply as our own humble
means and circumstances would allow us. thus admitting room for the common scaritier, horse hoe, Bean line, Tumip hoe, hack hoe, and all sorts of hoes, either wide
ones for the interstices between each row and the furrows, or narrow ones for cleaning the rows of corn Which are, or rather ought to bave been, planted early,
and as singly and uniformly as possible; and this is how all corn might and ought to be planted to ensure the best of crops, whatever thickness different cultivators may think proper to adopt their seeding. (We contend not cuer 1 bushel per acre.) We have had till operation extirpating the weeds, and hoeing the furrows, and "double-tomming" them up as a fini h , a single small horse ding as than 20 men could possibly do in the same space of
time, and shall be able to perfect the cleaning of all the spaces by hand lahour, chiefly by women and boys (for Want of men) at all cunvenient times, with large and the sickle, hoven up to the time that the corn is fit for the sickle, thus destroying most of the weeds, which wonld otherwise and under ordinary management have
been allowed to run to seed. The result is that the most of the weeds are demolished, and the fecundity of the grain plants is assisted, and standing thin, as we profess to grow them with most advantage, they are waving majestically in the summer's breeze, as noble examples to larger establishments. We believe that if this system was persisted in repeatedly for about four years, very few weeds would remain to trouble any one, and that grain crops could be grown successfuily, profitably, and bountifully for a series of years
on the same ground without so much exhausting on the same ground without so much exhausting
the land as, in the common course of cropping. Unfortunately, however, the usual tenure hence the successes of some persons who have land of their own, over others who have it not so, or who hire it under restricted leases.
privile for that every good farmer ought to have the
consider this as one of the greatest hindrances to gond farming or gardening. It may probably le here observed by some that this constant stirring of the aoil so deeply between the rows of corn only encourages the surface weeds to germinate more readily and quickly and the hoeing to injure the rootlets or fibres of the corn. Then why not set about more earnestiy clearing them off again, if the aim is to detroy them and thei posterity? and rest assured that every time the land is
stirred it admits air and atmospheric fond to the ronta and blades of the corn, and that it then make resh rootlets, \&c., which take a firmer hold of the land, and prevents its falling or lofleing. (Rootfallen corn is oceasioned chit fly from its being thick at an early stage of its growth.)
If the land we have recently taken were nur own, or had we no restricted leases, and had we had sufficient capital a the first and when woul not hed bitated eacrificus our wear, we shou hat seasol ; but wuld have adopted the following course:-First, as som as we became in possession at Michaelmas, we would liave set about cleansing all the ditches deeply, and examined all waterfalls, would have felled the timber and Xollards, plashed all the hedges to one uniform height, woul have pared all the banka, and ploughed up all the wind burned a!l torether at the very first opportunity that dry weather offered, and carted the thousands of load of burnt earth thus supposed to be accumulated all over the barren fields (which must now be done by bits and We would have pext year, de., if ever at ail).
and small coppices of timber a she corners of the fields on the short lands as shades for catte, for we have nn idea that this is the all in this country. Such little groups or coppices of ing and picture sque effect stuided all over different dis tricts, and were there a mandate for such a scheme it our humble apinion it would not be amiss; for without ultimately be seriously felt in this country, or we may be too dependent on foreign uations for it to suit our own interest:
After this we would have effectually drained the entire farm, and then lave ploughed it all subsoi
fashion, regardless of weeds for the present, and after it had been thus exposed to the fronts of winter, prepa ratory for a summer's fallow, we would then have
taken the first opportunity of dry wenther in eari, spring for using the scarifier, broadshare, harrow horse-hoe, \&c. \&ce, and thus by constant scuffling and uffig an the Couch Grass, de., which was not brought to conquer, have rednced it to a perfect tilt as fine as possible, and rolled it down tight, would ther have left it all till the first rains in summer had brought all the surface seedling weods into action, when we would have repeated the whole operation of ploughing, scarifying, horse-lioeing, broadsharing, scuffling, harrow upsetting every field and every acre clean-fallow like. It being now Midsummer there would have been but litile to fear of constant rains to hurt. Then we would have waited the next rains, and till the next crop of surfuce there would have been nought else meanwhile, when set all hands to work nith Parkes's steel forks and eradi
cated every patch of Twitch or Couch, Dueks and such
like perennials, which no summer fallons can or do
ever exterminate. Thistles we believe are biemnials, and all bieunials may be desiroyed in one year by con stant cutting below their crowns if they are not allowed to seed, or urrpagate by uffsets at their base. Sume persons say Thistles do not seed; this is not the case,
but their seeds lie dormant a whule year before they will germinate, neither will they then, unless exposed to the surface of the soil, like all other buoyant seeds, as Carrots, Dandelions, \& c. Then for the last operation we would have transversed and upser all again would bave admitted of for conveying the surface water into the drains and ditches." Assuming thus far to have been completed at about Midsummer, we would then have let all the land lie dormant again for six or eight weeks longer rolled down fine for another crop of weeds, and then with all possible despateh, no later than the last week in August or first week in September, have ploughed all in again with the greatest precsion and exactness, every stetch in uniform order, scuffing, \&c., into a perfect bed preparatory for the reception of the

Nucing such thin crops thus treatel reducing such thin crops thus treated too much in
winter, nor in spring. No, no ; they are, like ourselves, winter, nor in spring. No, no; they are, ihie ourselves,
more fond of tender food, and will rejeet phants when ough and old and stale; neither do rabbits feed on thein so freely as when thry are young and tender, and the phants themeelves are thus more able to resist rost and other vicissitudes than those sown much later. Selected'sted we find by experience is far preferable han sowing promiscuously any that comes first to hand, and half a boshel is quite sufficient to secure the best of crops; 3 pechs we consider ton much or nore than 3 bushels quite an abomination. Whatever thickness, however, wur friends choose to admont, we recommend all to grow their own seed (if they will not their general errps) on the thin principle, or procure it of some one who has done so, as by repeated growing it thin and ingly in its natural state without any artificial means hatever in the shape of stinulants, it certainly improves its labits, and every year produces larger ears and finer corn, whereas by growing it thicker than it is naturally inclined, by various stimulants it becomes decenerated more or less, and is suliject to diseases of various kinds. This rule applies erqually to all kinds of corn, and to all hinds of sceds. It is a rule invariably with us, when we desire to lieep a true stock of any one kind of seed, to grow it on puor land without dung ; but when we grow for quantity we act contrary and sometimes have dearly to repent of Potas is especially exemplified in the case of he diseases of various kinds cettuinly stack precocities most, and such crups as have been stimulated with trong foods, such as liquid manures, guano, \&ce. for forcing abundant crops large in size, \&e. It extends oo to animal life; the fattest beasts for in-tance are by no means the most free from disesse. And even the human body suffers premature death from glutiony and xeessive drinking. Hurdy and Sun, Secd Growers, Maldon, Essex, June 29.

6. Explain the increased efficiency of bones as a manure ob
tained by treating them with sulphuric acid. 7. Give reasons for the greater value of the manure from full grown facting beasts as compared with that from young stoek in a store con-
dition. 8. State the way in which the warmth and quietness of fition. 8. State the way in which the warmeth are fond quietness of the process by which the addition of rennet induces the cosgula tion of milk.
additions made of late years to the number of our agricultural implements. 2. Name those crops the cultivation of which has feew ears. 3. What is the most important improvement now generaly adopted in the management and cultiratiou especially
of clay soils? 4. Ihencribe Mr. Smithis (of Lois Weedon) systern
of cultivating Wheat and state the perience of its success receives its explanation. 5 Name such recent geological discoveries as have been already nsed, or which promise to be made of use in agriculture. 6. Deseribe the culti-
vation of Italian Rye-grass, its probable produce under giver. best suited.

## MANUFACTURE OF SUPERPHOSPHATE OF

 LIME.Long as bones have been employed as manure, and long as their difficult decompossbility in the fresh state has been known, it is but recently that endeavours have been made to secure a higher and quicker return from done at first waselimary treatment. All that was wards the assistance of a previous fermentation to destroy the toughness of the cartilage was employed; a view to various forms of milis were made use of with present day present day sulphated bone-dust and the fine bone-dust undoubtedly bones dispute for the preference, and both are well prepary better than the earlier bone-dust. Both, when well prepared, contain a great abundauce of fertilizing ingredients, and both are in a state of extremely fine division, in which they may be immediately assimilated by the plants; when equally well prepared, one is only to be preferred to the other upon considerations of cost.

Chemistry has little to do with the preparation of the steamed bone-dust; the steaming is a simple process, requiring no chemical knowledge, and "several analyses have shown that during their steaming, the bones primcipally lose fat and but little gelatine. Although it is placed beyond a doubt by numerous observations of practical agriculturists, that steamed bone-dust is sseimilated by plants in a tolerably short time, the sulphated bone-dust still deserves the fullest consideration especially until the manufacturers of the former manure can prepare it in sufficient quantity for the general requirements, and more easily soluble than the sulphated aterial.
A chemical preparation of the bones by treatmen with sulphuric acid furnishes a manure that must be preferred to the steamed bone-dust, because the phosphate of lime contained in the bones is converted
into a more soluble compound, and at the some time a echanical disintegration of the bony tissue takes place
Unfortunately these good qualities are scarcely to be met with in most of the samples of sulphated bone-dust whieh occur in commerce, for either only the finer parts of a coarse bone-dust are converted into super phosphate, whilst the coarser fragments, as might be expected, have escaped the action of the acid, or the whole mass of bone-dust is indeed penetrated by an excess of acid, but the acid phosphate has again been converted into the neutral salt by slaked lime or soap-boilers reruse, so that a cons a ugelese manufacturers who dry the acid bone-mass with coaldust or peat-charcoal, and thus render it pulverisable, dust or peat-charcoal, and thus render it pulverisable, sulphuric they not ouly use a considerable quantity of suphuric acid, but also dilute their manure, and thus increaee its weight too much for distant transport. The best process yet employed consists certainly in kneading the bone-paste, prepared with an excess of sulphuric acid, with bone-charcoal, which would otherwise be iacapable of empluyment, and drying the mass; of course, however, a product of this kind can only be prepared by a few manufacturers, and cannot be brought into market in anything like sufficient quantities. Its manufact

The following method is free from this limitation, and at least equally favourable in its results; the author recommends it from his own experience.

As the complete soution of 155 parts of phosphate o phuric sulphuric acid $\left.\mathrm{SO}^{3}, \mathrm{HO}\right)$, about 104 parts of English parts of fuming colthining a little water, or about 90 parts of fuming sulpluric acid, but the bones, including average 55 to 60 per cent. of ashes containing 50 pe average 55 to 60 per cent. of ashes containing 50 per breaking up 100 kitogrms. of bone-dust (taking into English sulphorbonate of lime) the quantity of ordinary English Bulphuric acid required cannot exeeed 36 kilogrms. Many English manufacturers use as much a
quantity is excessive, and ueedlessly increases the price of the manure. Less acid even may be used by ponfin ing its action to the cosrser fragments of the bone dust, as these will longest resist solution in the soil.

By the ordinary process the very reverse tak place ; the whole of the bone-dust to be prepared is treated at once, or by degrees, with sulphuric acid, and the minute particles are first converted into super phosphate, the other portions fullowing in proportion The size, the largest fragments remaining untouched. The author therefore recommends the separation of the dust from the bone-mills by means of three or more sieves into dust, the particles of which are under 1,2, and 3 millims, \&ce. The coarsest fragments are then first treated with the whole of the sulphuric acid, and the other portions are added in the order of their increasing fineness.
The calculation of the quantity of sulphuric acid to be employed in this case has nothing to do with the entire quantity of the bone-dust, but only with the portions Which require disintegration, such as the fragment whose smallest diameter is above two millims; the particies passing through apertures of one millim according do not require it ; the intermediate portion coarsest fragments have been If 40 kilogrms. of th coursest fragments have been sified out of 100 kilogrms
of bone-dust, they certainly only require 15 kilogrms. of English sulphuric acid, and if 25 kilogrms, be employed, there remains an excess of acid sufficient for 26 kilogroms. of finer fragments.
employed, there

The sulphuric acid requires an addition of water, as English sulphuric acid contains only 20 per cent. of water ; and not only is water lost during the operation but 155 parts of phosphate of lime fix at least 20 parts of water in their conversion into superphosphate, and time marts of sulphate of lime formed at the sam of water may parts of water. Nearly half its weigh It is advisable only to add the water after the coarsest fragments are soaked with the sulphuric acid and to pour it in in small portions wh constan stirring, as in this way the heat evolved by the mixture is favourable to the operation. The application of heat is unnecessary, and after standing for 24 hours the fragments of bone are completely softened, and may be crushed with the fingers. The finer particles are now neaded into the paste, which is left standing for some by before the addition of the fine dust, after which, by leaving the mass in a dry place, the moisture soon
disappears. An increase in the quantity of water disappears. An increase in the quantity of water
facilitates the kneading of the mass, when the arrange. ments of a manufactory are such that hot drying places may be made use of.
By the treaiment of 100 hilogrms . of bone-dust in the above manner with 25 kilogrms. of English sulphuric acid and 13 kilogrms. of water, about 130 kitoyrans. of superphosphate of lime are produced. This is certainly dearer than the same weight of the ordinary sulphated bone-dust, but possesses the same efficacy as 200 to 300 kilogrms. of the latter, and is therefore comparatively cheaper, without taking into consideration the greater facility of transport.
In extermal appearance the preparation is a whitishgray, crumbly, or pulverulent mass; in dry air it does not become moist, its taste is scarcely perceptibly acid, The may therefore very well be kept in sacks.
The advantage of the process just described over 1. The acid acts most powe
hich is most acts most powerfully upon the portiou 2 Only a merycult of solution
2. Only a very small quantity of sulphuric acid is required; and -3. The unnecessary increase of weight is avoided, and distant transport is thus facilitated. Chemical Gazette.
AGRICULTURAL STATISTICS OF EUROPE.

$$
\text { Division } 3 \text {-France.-Conclusion. }
$$

The agricultural statistics of France have been s recently lrought before public notice by the translatio of M. Léonce de Lavergue's Essay on the Rural Eco nomy of the United Kingdom, compared with that o France, that allusion to them is hardly necessary. A recapitulation of some of the leading facts will, how ever, be requisite for the purpose of drawing some comparisons between the productive powers of the several European states included in this paper, so far at least as agricultural produce is concerned.
France. -The soil of the empire of France is dis tributed under the following heads:-

Total cultivated $\cdots$... ${ }^{\text {neultivated and waste }}$ Iands

| Eigglish Acres. |
| :---: |
| $9,880,000$ |
| $7,414,000$ |
| 1940,000 |
| 14880,000 |
| $7,410,000$ |
| $14,820,000$ |
| $12,350,000$ |
| $7,410,000$ |
| $49,940,000$ |
| $19,760,000$ |
| $103,40,000$ |
| $27,170,000$ |

Total ... ... ... ... $130,910,000$
pres is stat improvement and of being brought into cultive of Inclusive of woods it will be seen that the area of cul ivated land at the present time exceods one hundred million of acres, The woods occupy about omo-seventh

The princip
estimated at-

About [one-sixth of the crops is required for seed. the manufacture of Beet-sugar, which is generally used the manulacture of Bet-sugar, which is generally used froughout the country.
France is also rich in other agricultural products she raises annually large crops of Madder, Tobaceo, Rape, Olives, and various fruit and vegetables.

The farm holdings vary considerably in size, bat by holdings."

Let us now review what has been atated in the present and two former divisions of this paper, and see in what relation these nations, whose statistics we have been examining, stand with regard to this country and to
oe another.
In the first place we shall find in the following table the proportion of cultivated land to each inhabitant in details the countries named, in the years for which the details have been given already :-

## Russia

Pronsia ...
Sazony ...
Hanover
Wurtemburg
Austia ...
Belginm
France

Although these proportions are net all for one particular year, they may yet be taken as affording a fair approximation of the relative amounts of cultivated land in the countries alluded to. Russia, from her enormous berritory and comparatively small population, stands at the head of the list ; and this should not be forgotten in comparisons between this and the more densely popewhat room Russia has for an increased population
According to the returns furnished to the Census Commissioners in 1851, the extent of cultivated land to each inhabitant in Great Britain was 1.38 acres. This mount appears small when compared with the proporsuperio some of the continental states, but then the superiority of English farming makes up in a great measure for the small extent of the laud. What would contiment, or what would not the inhabitants of those countries be able to produce if they farmed on Britiah principles ?

It must not be supposed, however, that those countries which have the largest proportion of cultivated land produce the largest crops, as will be seen by comparing the annexed table with that already given.

| Countries. |  | Wheat. | Rye. | Barley. | Oats. |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Propurtion to each Inhabitant. |  |  |  |
|  |  | Bushels, |  | Bushels. | Bushels. |
| Russia | ... | 10.0 |  |  |  |
| Prussia | ... | 1.8 | 59 | 1.7 | 69 |
| Austria | ... | 22 | $2 \cdot 9$ | $2 \cdot 4$ | 3.9 |
| Belyium | ... | 3.1 | 3.5 | 1.8 | 42 |
| Holland | ... | $1 \cdot 1$ | 2.2 | 1.1 | 21 |
| France | ... | $5 \cdot 4$ | $1 \cdot 3$ | 0.8 | 24 |

In the previous table it will be observed that the pro portion or cultivated land in Belgium to each inhabitan the agg 103 acres, and yet the relative proportions of the aggregate of the four principal kinds of grain are as great in that country as those in Austria and Prussia in which the extent of cultivated land to each inhabitan is double that of Belgium.

An interesting feature in the last table is the mean it affords of pointing to the descriptions of food used in each country. According to English ideas people who are fed upon black bread or oaten cake are regarded as a species of slaves, and this table will help as to discover from the proportions of Wheat and the other grains, what probability there is of the population of any of these countries occupying so low a social position
It is to be regretted that we have no English returns nor for some time any chance of getting them, at all events not till 1857), to compare with those of these countries.
Taking the population of England and Wales at 18 millions, and the average consumption at 6 bushel per head, both below the mark, we should get a sum of 13 million and a half quarters, and deducting four millions of quarters for fortign Wheat imported, there would remain nine and a half million quarters for the produce of England, or 4.2 bushels per head. M. L. de Lavergne estimates the produce of England and Wales at 13 million quartere. It is difficult to say how near these estimates approach the truth, but however close hey may be they never can compensate for the want of official and authorised returns.
In conclusion, we may reasonably infer that the ffects of the Paris Exhibition of last year and the cattle show in that eapital during the present summer will be to spread the English systems of farming, of breeding, when foreignems, who are already possessed of good agricultural chemists, get these into their hands they It will be needful for us, therefore, to advance also

## Home Correspondence

The Covo Parsmip-Heraclèum sibiricum, var. gigan-eum.-Of our antediluvian fathers we are told on good authority that "there were giants on the earth in those days," and without intending to take part in a discussion
which has puzzled alike divines, philosophers, and geologists, and on which, as Sir Roger de Coverley sageiy observes, "much may be saill on both sides," is very clear that, in the animal world at least, there did exist a race of creatures widely differing, both in shape and size, from anything to be met with in the present day. A visit to any of our museums or genlogical are we to find the tribe of mastodon, mammoth, megatherium, ichthyosaurus, and others of their kith and kin, but as fossil reliques under glass covers, or as old friends with new faces in the gardens of the Crystal Palace? But, whatever may be the dereneracy of either men or animals in these our days, it does not appear to me that the observation can fairly be applied to the modern in the Gardeners' Chronicle (Ap. 12, 1856), of the Blue in the Gardeners' Chronicle (Ap. age or country was ever known to proluce timber trees of
the height of 300 to 350 feet, and from which planks were obtained 145 to 160 feet in length, 20 inches broad, and six inches thick ? I fancy ton that it would be no easy matter to parallel another case referred to in the same paper of one of these trees whose total length was 318 feet, and which netted in money 2452 . 12s. ! Much undersold ton, according to the statement. Pacsin, from the forest to the garden, I might here enumerate Victoria Regia, or cigantic Water Lily; but I hasten to the more immediate object of this comrnunication, to ich is, to direct your attention to the Cow Parsuin (Heraclèum giganteum), not so much as an ornamental gaden plant, though this alone well entitles it to our available for cattle fond by field culture. My first introduction to this plant was by a few seeds sent me about 25 years ayo by my late excellent friend Mr. London, and I have cultivated it both in Norfols amd Gloucestershire ever since, besi ies distributing seells
and plants in various quarters. Indeed, I may say, that when once a plant his hlossomed, there will he no fear of losing the stock; for humdreds of seedlings are sure to spring up beneath and around the old stem of thi plant. Mr. L. used to say that it afforded him mort amusement than any other in his garden, from tite rapidity of its growth and the great size to which it attained. By the bye, in this latter point, his opinion seems to have been varied with his experience; fin 8 feet as the maximum height of any Heracleum, in his "Supplement to his Enceclopredia of Plants" (1841) he says, "When growing on deep loamy soil an fiberaly supple. The correctness of this statement I amable to confirm, as the following dimensions of a plant in the garden of this house will show. in shial merely observe that it aid; for it has had no 0 her moisture thans what fell from the heavens. The soil is, as recommended by Mr. Loudon, a deep loam

## Circumference of stem near the trioul Phrsnip.

## Weidth of di., avernge ...

Now in contemplating a plant of the above marnif cent proportions, one is naturally led to inquire how it 8 that all this immense mass of vegetarion should be suffered to run to waste, as oue may say, and that no attempt, at least none that I am aware of, should have very name would indicate its adaptation to something beyond mere ormament, and yet this is the character it holds in common with 16 other virieties of the same family; the rest, making in all 30 in number, are described by Loudon as simply uninteresting, with the exception of the Gum-bearing Parsnip and that $s$ honoured with an $m$, for medicinal, as its characterisrather the height of such a Brobdignayian crop as this, of 12 feet, I cannot but think that, reduced as it would be by field culture to something like 4 feet, or under very favourable circumstances a foot or two higher than this, it might be turned to account as green food for cattle, pigs, \&c., nor why the
giant of the garden should not, under proper discipline, be made to serve a good purpose in the field. From his high station in the former case, recuce him by drill to the ranks, and this his seeming degradation will be his surest passport to promotion; for in the vegetable as in the snimal world size and weight are not the sole criterion of excellence; we esteem an ox, sheep, or pig, not for his over fatness but for his tendency to fatten under circumstances in which an animsl, not go back this tendency, would stand still if not absolutely and I see no reason why the Cow Parsnip should not have a fair trial in the field as well as the Prickly Comfrey, the Bokhara Clover, or any other similar enormities. Samul Taylor, Weiton Parade Gloucester

## June 30 .

Chops in Cheakire.-I anticipate a very excellent crop
of Wheat. The first ear that I noticed fairly shot was 16 days agn, and the growth since then has been remarkably rapid. During the past week it has grown 6 inches ; the average height to the top of the ear will perceive from remarks in your last publication that Whest is rather backward. The Grass crops are likely to prove very good; there will be a considerable quantity hous d to day. Mangel Wurzels have missed to a considerable extent, and the vacancies have been filled up with Turnips, which are generally looking very well and nut of harm's way of the fly. Potatoes are very luxuriant and are yielding a yood crop; they are creat portion of them down just as they appeared above ground. Great Budzorth
Conn Averclyes-Ludy Day. - For the information of your agriculiural readers, I beg to state that the avirage prices of Wheat, Barley, and Oats in Fingland and Wales for the 52 weeks ending the 22 d of Harch, 1856 , was as follows, viz.

## $\begin{array}{llll}\text { Wheat } & \ldots & \ldots & 75 \text { s. } 4 d \text {, per Imparial Qnarter } \\ \text { Babhey }\end{array}$

Charles M. Willich, Actuany, Unirergi/y Life Asurance Society, 25, Suffolk Street, Pall Mall, June 30

 dent, in the chair.
Fivances.-Mr. Raymond Rarker, Chairman of th Finance Committee, presented the monthly report on he Society's accomints; from which it appeared that the urrent cash-balance in the hands of the bankers was 2097.

Geann Substitutr.-The Committee reported the esu't of their examination into another claitn which

## eqyired.

Forkign Jurors- On the motion of Mr. Evelyn tie was ordered for a gold medal of the walue of $10 \%$. to be presented in the name of the Society to 31 Frenen $G$ wernmuant aud to ach the foreign jururs in shoulit attend the Chelms'orl meeting
Impicmext Jengrs. - Culonel Challoner, Chairman of he Amplement Cumintue renurted the comuletion f the list of Julges of Implements for the Chelmsford Tetimg.
Member of Couvcil.-On the motion of Mr. Fisher Hobibs, seromded by Mr. Jonas Wethb, Mr. Edward Pome, of Great Jolier, Dorsetshire, was unanimously
elected a member of the Council in the place of tise late Mr. Hamplen Turner, deceased.

Commacatioss.- Fimm the Earl of Clarendon in reference to the Polish Cattle Disease and Bat Guano from the authorities of Bath and Salisbury; and from the Directors of the Gobelin Tapestry Works i
France were laill hefure the Council.
The Council aljourned to their special meeting a
Chelnsford on Fridny, the 18th instant.

## Miscellaneous.

The sheep state of (Crect Brotrin. - The sleep of the Briti-h Istes are befieved to number atont $35.000,000$ England alone piastses ahout $2 \overline{7}, 000,000$; Scotian, arerording $t$, the nuticultural statisties of lint, has culatms the sonmonny as worth 30s. ahent, the sheep stock of Britain is worth $52,000,0001$. sterling. The fe a riculural importance, for they not only materially emhance the tertility of the soil and afford a good return to the farmer, but also largely contribute to the feeding and clothing of our population. Abuut 10, not, 000 of sheep, weighing on an average 80 lhs furni-hes $800,000.000 \mathrm{ths}$ of muitom, or on an average rather mure than half a pound per day for
each individual in the three kin, each individual in the three kingdoms. The muttou
at $6 d$. per poumd is worth $20,000,000$ l. sterling. Professor Low estimates that, allowing for the deficien weivht of the woul of slaughtered sheep and lambs each fleece nverages $4 \frac{1}{2} \mathrm{lbs}$, and the tothl annua produce of wool will therefore be $157,000,000$ lbs. Fixing the value at $18.30 l$. per lib, the total yearly value of the now this large home growth $40,000,000$ ths, are annually received from Australia and about $10,000,000$ or $12,000,000 \mathrm{lbs}$. from the Cape of Good Hope and British India. Fifty years ago these countries exporled scarcely a pound of woul. A hundred years ayo the flocks of Great Britain were
about half as numerous as they are now. $M r_{0} F_{0}$ Dun.

Compostion of two Manures produced by the Precipitation of Sevorge Water.-" Numerous attempts have been made to bring the valuable constituents of sewage water into an available condition, and the methods propused for effecting this object have been extremely varied. By far the greater number of patents taken for the purpose have consisted of various plans for precipitating the valuable constituents; and though chemists have frequently pointed out-as has been very distunctly done both by Professor Way and myself-that
cannot be precipitated by any process whatever, excep as are altogether precluded by their exprnse, still patents are constantly being taken for soing wha impossible. The two analyses which follow may were produced by experiments on a scale sufficiently arge to test the value of the process, and the result are described as having been most perfect, and in every way successful. The exact mode in wh ch the precipi tation was effected has not been d+scribed to me; but this is of little importance, as the insiunificunt va'ue of the product is the point to which I wish to direct attention.

Water
Organi

## Orsanic matter Phosphoric acid

Peroxide of irmand alumina
Sulphate of lime
Carbonate of lime
Sund

Ammonis
$\begin{array}{ll}1000) & 998 \\ 113 & 0.6\end{array}$
A very trivial examination suffices to show that these substances are of rifling value. The first, which is the best of the two, and contains 2 prr cent of phosphoric method used for determining the price froves to be worth only about $16 s$. per ton, and the froves to be worth only 7 s ; yet these aid similar uhstances are gravely declared to be rqual in value to ive works hqve gen nronosed for manufacturing them. The absurdity of such uroposals is sufficiently olvinur, but it may still he ured that the quantity of valuable matters which inint thus be amually saved from the sewage of a large coswn would be very considerable ; and this view is no drunt correct as an absiract quesion, although in practice it could not be economically carried out. Granting that the precipitation could he effected even at numbinal cost, it is indubitable that unly a small ropurtion of the constitcents of the sewage could be resained, and, slier precipitation, a large expenditure whild be required to bring the precipirste into a marketable cousdition, and the censt of transjort would be solnrye, in comparison with its valte, that it could neighbourhood of the place of manufacture. This qurstion I have discussed on theotetical grounds in a previous number of the Transactions, and i adduce the xperiments now given as a confirmation of the opinions then expressed. In the particular instance before us, the expeese of manufacture would undoubtedly greatly xceed the value of the manure, and as the whole rocess is represented as much chraper and more effectual than any yet proposed, these analyses may be
talsen as a pretty conclusive proof of the futility of all taben as a pretty concluaive proof of the futility of all processes for the precipitation of sewage water. I have sern no rrason to alter the opinion expreased in a pre fious number, that if sewage is to he enployed at mean to assert that $t_{1}$ is can be done with profit, that being qurstion which engineers, and not chemists, must decide cost of the wot necessary for carring it out." Dn Anderson in the Transactions of the Higlland Society. Ductoring Clover Seed - The practice of "doctoring" Clover sueds was carried to such a fearful extent scme years ago, as to be wade a subject of inquiry before a commitree first wet and then of burning sulphur; while the bright hlue colour of the red variety was improved by being shaken in a bag with indigo, or "with a prepraration of logwood tinctured with a little copperas, and sometimes with
verdigris." Not only was old seed improved in appearverdigris." Not only was old seed improved in appear-
ance by these means, but often the germinating power of the best seed was completely destroyed. From 6 to 3 lb . of seed will generally be found enough to 80 w mixed with Rye-grass, if the seed was good; but as we are quite uncerain of what we are purchasing, we would recommend a much larger quantity to be sown Some have recommended as much as 24 lb .; while others, amongst whom are some of the best farmers in the Lothians, never sow less than 16 lb , either of red Clover alone, or mixed with white and yellow. White Clover should never be sown in fields intended to be cu for hay, nor red in fields intended to remain in pasture more than one year. We should never forget the principal use of red Clover, either as green fodder for cattle, or for hay; and in our enteavours to prodace heavy crop, we should guard against raising a coars plant. Uur object will be best attained here by havipg as many plants as possille; for the thicher the plants the finer will be the stems: while a ylunt here and there will be sure to produce a coarse woody stem, which is never so well relished by animals; and hence the great advantage of thick seeding. Quarterl Jousnal of Agriculture.

## Calendar of Operations.

Border of the Fens, June 30.-The hay harvest is progress ing fast; most people speal with satisfaction of the Grass crop, one time they were led to expect it would be, still the yield will be heavier than it has been in this neighbourhood for some yess and the quality good, as the whole of last week was charsto large by beautiful summer weather, hot and drying so that iation. quantities of both hay and Clover were secured in hine ofacir Clover
early, too early we thiuk, with a view of getting a better s-cund
crop, but in more than one instance we have ohserved the first
cutting to be so immarture as to run to ether and slirink inter a light fuzzy swathe, and make nothing of a stack compared witl what it would have been by keeping the mowers out anotuer appear-the plant should be in full "bottlr," the stalk wel gathering as much of the foliage as possible, indeed, the wither
ing of the lower leaves is commonly the criterion for cutting but it must be borne in mind that the loss of leaf is sometime bastened by thickness of plant, or wet wearher, and that a mixture Grass seeds will also affect materially the time to begin. The fine weather has been of inestimable benefit to the grain crops place last week; the nights being very warm also aided in bring ing the corn forward; much of the Wheat is in full flower, a:id looks already buld and healthy, the straw strong, and the eara large. Barley has improved greatly, although an unu*ua umbols well P Peans have hitherto by this time much of thetr fragrant blossom has douhtless "set and gone into pod. Potatoos and Peas also appear good; Turnips bave corne up qufficiently plentiful, but the fly has been bus most certain time for sowing in mid-eastern counties Mantue are variable, and although we have seen several good pieces, ye it must be admitted that much uncertainty prevails in obtaining aplant of this useful root, and when the plant is up much atteltion is required to free the young. Mangels from weeds, to thin We have abundance of keep for the stock, which in some measure accounts for the limited supply of fat animals to our marketa and makes it probable that presently we sball be compensa'ed b a liberal quantity being brought forward of unusually excellent ing the weakness which so generally seemed to attend their first appearance this spring. Labour has been more plentiful of late weeds have been excessively troublesome, and all spare hand have been urgently wanted to assist in their reduction, not extir pation, for weeds will grow on food land in good heart. Wome
receive $1 s$. per day, and gangs of children, including the gangman $12 s$. per score of twenty per week [query day]. Mowing cost from $3 s$. to $4 s$. per acre; men's weekly wages, 13s. and $14 s$, pe
week. Very ittle old corn left in stacks. J. W, Peferborousgh. SouTh HANTs, June 30 .-We have abstained from sending to the Wheat crops. The warm showers did not restore to bigour the sickly looking Wheats as imagined; they are set up and "straight as a poker," and now are shooting forth ears short ifferior Wheat plant, and on the other land on good deep loams pected from the early grossness of the "flag," are not so fine as in former years. Some farms have only one fair piece of Wheat
and even on others the crop was throughout of an indifferent should occur. 1st. Many the last three years past have been sow ing to Wheat all their best fields, and now those not so fertile have to take their turn in the rotation. 2d. Even where the land sowing hard of white crops one after the other to force from the for the sake of present prices as the tenant farmers have land doing the last three or four years; how can they expect a Wheat crop? Peas, Wheat, Oats = Wheat, Peas, Tares (ripened), Wheat Again, some have Wheat, Tares, and Wheat again, and miserable at looks. The wire-worm was also very destructive in light lands Mangels a failure in some parts, in others very fine; the baulked best, drilled on the flat a failure. Turnips are largely sown, bu he fy has commenced its ravages. The hay crops abundant in places, in others light, even on good tarms; much is safely day too sonn, as is often the case when housing their Wheat Farmers, like soldiers, require courage and coolness on the daj fattle. Somee are reputed clever in obtsining fiue crops, and equally expert in spoiling their treasure. Barley and Oats look
well, especially the early sown; the later are somewhat scorched by the late intensity of the heats. There is not a rick of Whea to be sean on many farms, whilst on others one solitary rick
guards the threshold of the "rick-pound." This is reserved for harvest wages, and thatch, so tradition informs us. Many fres manires are introduced, but nothing surpasses properly prepared abundant, and look well. Guano-dressings of 8 to 4 cwt . per acre insure a fine plant. $X Y Z$.

VALUABLE IMPROVEMENTS IN MOWING MACHINES. BYROYAL

LETTERS PATENT.

Under the Patronage of Her Majesty Queen Victoria, and His Majesty the Emperor of the French.

## ALEXANDER SHANKS AND SON, ARBROATH, FORFARSHIRE.-PATENTEES.

A. SHANKS And SON, while soliciting the attention of the Nobility, Gentry, and Gardeners to their at the same time respectfully solicit notice to their MACHINES, the completeness and superiority of which are now well known, at the same time respectfully solicit notice to their new H.A.ND MACHINE, specially adapted for mowing small lawns, verges,
around flower beds, \&c., and which has now undergone a trial amply sufticient to enable the Patenteps with all confidence to offer it as the cheapest as well as the most eflicient and complete nachine extant. The improvements effected by the Patentees enable the machine to be worked with perfect ease by one person. It requires no change of wheels or rollers in mowing verges; will cut close to the edge of flower-beds; has great facilities for quick turning, cutting and rolling at the same time; the length of the cut can be effectually regulated in a few seconds by merely turning a screw, and being sumple as well as complete in its construction
the machine can be easily worked and managed by a comnon labourer. The nachines are fitted with due regard to strength and durability, and consequently not at all liable to get out of order. The worl is executed with great rapidity, and in a manner vastly superior to mowing with the scythe, while the simultaneous operations of rolling and close cutting greatly improve and beautify the turf. The Rolling and Mowing Machine is now in common use at all the Royal Gardens, Windsor, Kew, Buckingham Palace, and Osiborne. Illustrated Price Lists forwarded on application.
N.B. A. Shanks \& Soy finding that their Patented Improvements are pirated, beg to caution the public against purchasing A. SHANKE \& SON also supply Fleming's SALTING MACHINES, for destroying Weeds, \&ces on Gravel Walks, Court Yaris, \&c, particulars and prices of which will be learned on application.

Testimonial from Joshua Mujor, Es\%., Landscapc Gardencr, Frnostrop
To Mr. Greex, Leeds - Sir, As I almays appreciate public and useful improvements, I most glady give my testimony to your highly improved Mowing and kolling Machine. The one sent for my inspection and trial cutting a breadth of 24 inchess) was drawn on flat ground with ease by one pirson, and although- at the time of trial the lawn was wet, it was cut with the graek
nicety. So complete and simple is the invention, that amatenr gentlemen, and even ladies, may work either the 16 or 20 inch size
 with ease and pleasure, providiag the grass it not persons may work it; but in flowar gardens, when beds, ece., are crowded, either of the smaller sizes would be best. I congratulate you on your very valuable invention, which in my opinion, entirely surpasses, and must eventually supersede all orhers, for it is not only free froni intricacy and easy th the worman, on a great boon to peditious in its operations, and consequently nust, prove a great 6
 Other Testimonials may be had on application to the Mamuforeturee:

The above Machines are warranted to answer the purpose as described, or may be retumed.

## Che Carionerg Chromitle. <br> \author{ SATURDAY, JULY 12, 1856. 

}No one can be surprised that an article on Village Botany in our impression of Saturday last should have attracted much attention. The facts that it discloses would be remarkable even if they related to an "Academy,"" Institution," "Establishment," or any other place of education dignified with a high-sounding name; as the result of a system of training little peasant girls in a small village school they deserve very serious consideration. For they show conclusively that it is possible to instil into the minds of the young and plastic, be their condition in life what it may, ideas of something beyond A B C and the dreary spelling-book.
That natural history, and especially plants should have peculiar attractions for young people arises ont of the nature of things. The mere fact of life being present in them identifies them with our own proper nature, and gives them a charm which noabstractions can possess in an equal degree. The plant grows and changes its nature like ourselves; it produces its young, it has its season of infancy, yout h, maturity, and old age. All its forms are beautiful ; it ministers to our wants, or our pleasures; it creates fear by its danger, it allares by its gay colours or pleasant fragrance; it excites admiration by its infinite variety of form. All these qualities are unattended by a single disadvantage ; no susceptibility is hurt by the imaginary cruelty attendant upon some branches of natural history, for plants have no feeling ; no cost is incurred in their study for they surround us everywhere; no difficulties belong to surround us everywhere ; bi
their investigation, for their parts are large enough to be visible to the quick eyes of children; there is nothing disgusting in their habits or in the manner of seeking them.
If then their attractions especially secure for them the love of the young, their value as a means of disciplining the mind should also recommend them to the attention of the old. Botany has a high value undoubtedly if limited to the distinction of aseful from useless, or dangerous from harmless plants. It is something for a child to know garden Parsley from Fools' Parsel, or Monkshood from Horse Radish ; but it is more for its mind to be trained to habits of method and order, and its eye to minute observation. For if these qualities are once implanted in our nature they become habitual yields to no branch of knowienge in its adaptability to this purpose if properly taught. Even the exploded Linnean arrangentent may be tarned to explodea lho by those whave the skill.
The difficulty is to find teachers. We do not mean that among our villages is no sufficient number of persons enough acquainted with plants to be available in some degree. The want is rather in their not knowing how to teach such a subject. Really good teachers indeed are rare in all branches of knowledge, and most especially in Natural History. The Hitcham exan ple is however conclasive as to possibility. The papers published last week show that a child's mind may be trained by
akill to a familiarity not ouly with the technical distinctions which constitute the foundation of
botanical classification but with the unusual terms cultivating Orchideous Epiphytes are less understood emploved in systematical botany. It is seen that Greek and Latin compounds are as easily retained in the memory of childhood as any other words. This, we fairly confess, takes us by surprise, so contrary is it to our own anticipation or experience. The fact is, however, incontestable.

All will wish to know by what means such results have been obtained, some in the desire to imitate the example of Hitcham and some from mere curiosity. They shall be told. The minutir by which Prof. Henslow has achieved success shall be revealed to them. He has had the kindness to promise a detailed account of every step to be taken in the educational process; and this very day has commenced his task in another column. To that and succeeding articles we refer our readers with an entire conviction that with the same zeal, the same skill, and the same method they also will carry a most vital improvement into village schools. Let us hope the example will also rise.

Now that epiphytal Orchids are beginning to be more commonly cultivated in continental gardens, the attention of the French has been directed towards their peculiar manner of life, and the conditions most favourable to its healthy maintenance. At a recent meeting of the Imperial Agricultural Society of Paris, Mons. Payen introduced the subject with an account of some experiments he had tried.
Till now, observed this learned chemist, these plants were thought to derive their food exclusively from the gaseous matters of the atmosphere and from pure water containing no mineral substances. This was so contrary to the laws known to prevail among other plants, in all which inorganic matters are invariably present in some although variable quantities, that the question appeared to require solution. These à priori considerations had there fore led M. Payen io infer that Epiphytes, even houses suspended from mere wire, must contain in their tissues mineral compounds, some with an organic base or acid, others completely inorganic, and that their distribution through the various organs must take place, not accidentaliy, but according to the particular requirements of the plants, just as he had found them in species which derive their food chiefly from the soil.

This view has been completely justified by the result of the new examination to which Epiphytes have been exposed, whether they grew on dead or living wood, or whether their roots had penetrated among layers of moss or developed freely in mere first result of these observations was communicated to the Horticultural Society of Paris on the 13th of March last, and gave rise to objections to which M. Payen has now replied. How, it was asked, can Orchids which grow and flower suspended from a single wire, and are never supplied with any but rain-water, possibly obtain a supply of inorganic matter? especially when it is remembered that rainwater suits them far better than any sort of pumpwater; and that in their native countries the first oots by which Epiphytes are attached to trees or dead branches soon lose their power of growth, and are gradually replaced by new roots floating in the air.
To these arguments M. Payen replied by remarking that rain-water is not completely free from mineral matters, that the particles of dust at all times floating in the air cannot but perform an important part in the nutrition of Epiphytes, that the dead roots which accunnulate at the base of such plants must assist in detaining such dust and in giving up their own mineral contents to the water whieh washes and gradually dissolves them. Moreover ho was of opinion that minute particles of leaves, of flowers, of pollen, of seeds, falling from the meighbouring trees would assist in feeding Epiphytes, and enabling them to grow with a degree of vigoar proportioned to the food they receive. The fact of mineral matters being actually present in the tissues of such plants was moreover a conclusive reply to those who believe that they are incapable of obtaining them. He added that some experiments in which he had been engaged along
with M. Moquin Tandon seemed to show that the roots of epiphytal Orchids fixed to pieces of wood or bark, derive a portion of their food from those supports; for that by means of coloured fluids, especially Orchall, they had been able to demonstrate the power in such roots of imbibition, sufficiently showing that they cannot be mere organs of attachment.
We are led from the report of these proceedings to conclude that in France at least the principles of
cultivating Orchideous Epiphytes are less understood trusting the growth of such plants to what they can find in the air. On the contrary, it is well known that although some will exist if suspended from mere wires, yet that no vigour is attainable under such circumstances, and if Orchids are to be grown well they must have their roots in contact with earth or its equivalent, such as decaying loss, dead bark, or especially coarse peat. By such sub-
stances the inorganic matters demanded for the maintenance of such plants are gradually given up in sufficient quantity. It is moreover to be remarked that there is no evidence, that we know of, to sustain the assertion that the first roots produced by young Epiphytes die, and are succeeded by roots floating in the air. This we believe to be a complete mistake. On the contrary their roots naturally seize upon some support or other, wherever it can be found, and cling to it with the tenacity of life. Branches, old walls, the face of rocks, or their own stems and roots, offer these plants supports of which they greedily avail themselves. Even the East Indian Vandeous Orchids, the most aërial of all the race, form no exception to this statement. Importers of Orchids, and indeed the botanists who have merely had the pportunity of studying herbarium specimens, are miliar with this fact. Nor is it to be forgotten that the superficial area of roots by which such plants cling to their supports is often excessively great in proportion to the leaves and stems to be
fed, as if nature gave them a power of enlarging their feeding surface in proportion to the difficulty experienced in finding food. Treniophyllums, Chiloschista, the leafless Angureks are notable examples of this, to say nothing of Oncidiums, whose pseudobulbs are often seated upon deep beds of roots,

For ourselves we entertain no doubt that the nutrition of Epiphytes is essentially the same as circumstances than might be supposed. In thei native haunts they find decaying bark, dead leaves, the dust carried everywhere by winds, and the dejections of birds, from among which there can be no difficulty in extracting the mineral food required in aid of what air and mere water can supply.

For the information of those who are interested in experimental researches into this carious question we extract the following passage from Professor Edward Solly's report on the inorganic constituents of plants published in the Transactions of the Horticultural Society, new series, vol. iii., p. 53:

The inorganic constituents of Epiphytes were next examined. As many of these curious plants, which grow on the stems and branches of trees, derive nourishment chiefly from the air, and seem to flourish equally well whether the roots enter the soil or hang freely in the air, it was interesting to ascertain what proportion of earthy matters they contained, and whether it varied under different circumstances. It appeared probable that the quantity of inorganic matter which they contained would be smaller than that in most plants, and that the quantity present in those which grew only in air would be less than in those whose roots entered the soil. It was found, however, that the leaves of
Orchidaceous plants contain about as much inorganic matter as those of Cabbages and other similar plants, and that there was but a trifling difference evident, whether the plants had their roots in the soil or in the air. The proportion of earthy matter in a plant of Catasetum grown in soil, and a plant of Bletia grown wholly suspended in the air, were-

Catasetum bulbe
Bletia bulbs
Catasatum lear
Bletia leaves
$\begin{array}{ccc}\text { Water. } & \begin{array}{c}\text { Organic } \\ \text { Matter. }\end{array} & \begin{array}{c}\text { Inorganic } \\ \text { Matter. }\end{array} \\ 8869 & 1269 & 62 \\ 8809 & 11609 & 82 \\ 8055 & 1791 & 164 \\ 8000 & 1868 & 162\end{array}$
Though the whole quantity of earthy matter presen in the plant, as shown by the proportion contained in the dry leaves and bulbs, was nearly similar, very considerable difference was found in the nature o these substances; a proximate analysis gave-

It is to be observed, in connection with these figares, that although the Bletia had been grown saxpended in the air, it had originally been produced eloped in earth, so that the earthy matter ntained in it may have been, and probably were air was commenced. And this objection applies to all such experiments, which are necessarily made under similar circumstances. To have real scientific value the Epiphyte should have been born, grown, and wholly formed in air if that indeed were possible, which we greatly dorbt.

## New Plants

179. Glosocomia ovata; aliàs Codonopsis ovata Bentha Wahlenb. clematidea" schrenk enum. plant, 38." aliàs This is a half hardy herbaceous plant, with pretty nodding bell flowers, seated on long slender stalks, and accompanied by an intolerable hircine smell. The accompanying figure shows a side view of one flower, and the appearance presented by another when seen from above. Their general colour is a delicate mill

blue, but the colours within the base of the corolla are arranged in an unusual and extremelypretty manner. In the centre stands a pale blue circulabstigma; beyond that, at the base of the corolla, is a deep chocolatebrown pentagon, the angles of which are opposite five bright orange-yellow curves. Between these curves and almost touching them are as many light green sockets, from which spread the same number of strawcoloured stamens. At a short distance beyond tale orange-yellow curves is a ring of short delicate pale lilac rays, and still further off, corresponding with the points of the anthers, is a deeper ring of darker lilac rays. The whole forms an uncommon and beautiful pattern, of which artists might take advantage

We cannot reconcile ourselves to merging this genas in Wahlenbergia ; it is not the same as Codonopsis, and must therefore fall into D. Don's group called Gloso comia. The present species is not only Himalayan, as we learn from Dr. Royle, but is also found on the mountains of Soongaria, whence it was brought by the Russian traveller Schrenk. That it is the $G$. clematiden of that botanist is proved by the specimens, raised in the garden of the Horticultural Society, from seed communicated by Dr. Fischer.

## PRACTICAL LESSONS IN BOTANY FOR
