The Times only last week, in an articte on the report of the Educational Commissioners, said, "The landowner (with the exception of the farmers) are mor parsimonious in giviug their inoney for edscational purposes than any class. SJ the farmers give less to this purpose than any one. Can it be wondered at, if ve get so little return for our money? - for it takes from as nearly all those that would be our best labourers, and does not make those that are lelt us any better These boys at the age of 10 or 12, or prrhaps before
bexin to show their gooll or bal propensities; the good bys are encouraged and petted by the schoolmaster clergyman, and the ladies; they think it is a pity that so gond ami clever a biy should be a labourer on a
 tor him, and they generdly succeed. I dou'c blame these philantiropic people; they are to be commended but I think they ousht not to blame ut if we are no so liberal. We can't afford it ; a good labourer, next to a good wife, is the best thing a fumer Las, and it is therefore unlikely that faramers will give their money freety to support a system that
most useful things they have.
I nin now speaking of the education of the labourers as it affects their masters. But how does it affect
themselves? - does it make them more contented themselves? - does it make them more contented
and hapny? are they better on earth or neare! to Huaven? I have great doubts if the happiness of insm kind is in proportion to the knuwledse thry possess or the position they hold; I am not certain there is not as mu.h happiness fourd in a cottuge as in a piltce E lucation increases respusibilities, for the wisest man that ever trod this errth sad that where much id
given, much is requirel; and that it is easier for a given, much is requirel; and that it is easier for
canel to pass throurh the ese of a needle than for rich man to enter into the kingdom of Heaven. But did not come here to preach a sermon, or to gere
lecture on education. I only wish to speak of that ns that reading, writing, and arithmetic is all the schooling necessary tor a farmer-sinrely it is all that is necessary or a laboly then, and I don't think that even this is ahsolutely necrasary for a good labourer, for I have
somenow as good labourers as a farmer can wish to be master of, who can neither read nur write. I am nut going so far as to say that knowledge does our labourery harm, but the ecucation they get at our parish schools does them, as labourers, no good. I doubt if a boy who is kept at school till he is 14 ever becomes an expert arm labourer. I have said that formerly the development of the boys physical powers was all now his mental capacity is alone cultirated, to the neglect of the former. Perhaps it may he thought that no preparation or training is necessary to make a plough.buy, but I tell gou that it is, and that a boy of 14 who has done nothing else but go to achool, where he has been spending seven hours each lay and 11 each night in ber, is no por plough-boy is fit to take his place in his class at echool.

I will tell you what our boys are expected to do, and what they do do if they stop with ns. They are called nt 5, are expected to be up and get their breaklast,
into the stable, harness their horses, and off to work hufore 6. The boy who has been used to lie in bed
and breakfast at 8, cannot do this; he cau't eat at 5 , he must go till 2 before he gets his dinner; he has been as hungry as a hunter all the forenoon, but hefore 2 he is as tired as a dog, and cannot eat his dinner; but eat or not eat, he must go to his stable to bait, water, clean, and litter his horses at 8, or
before he gets to his supper, sud then to the stable ugain till 10, often half-past 10, before he gets to his hed. The next day the same routine. About the third morning he overlays-that is, he does not get up when alled; the penalty for that is to be pullerl out of bed by his heels and started to his long yoke without breakan. At inght he is found by his mate asteep it the atable, the cande burning and the horses unatcended
to. This is considered an unpardonable offence, and the prohability is that he is well sonsed with cold water. The poor boy chnnot stand this; he goes crying her boy shall not put up with such treatinent, she will seep him at home first; so she does, and allows him un the streets to finish his education there, and surprising how fast he progresses, for in less than a week he will learn to swear, and before a fortnight he will lie will go to a public house and buy a piut of beer, and if he can't get either beer or tohacco he will spend his auplensant remarks to every fenime that passea by
But perliaps you think that no boy could do the work that is required, but I tell you they can; and in ormer times, when they were prepared for it, they did it, and more; but the boy then began at 10 to go strength increased so did his work, and so did his appeplace between his father and master :-"I say, master, that boy of mine begins to bite precious hard, I should he terribly glad to get his legs under your table." I don't know, Master Jones, do you think he would be man enough for allworks boy?" "Man enough Oh, yes, he is man enough, I am sure, if you will but
try him; he is older than I was when I came to live second boy with your father, and if you will but try him I'll take care he does; if I once get him out of my house he warn't want to cone back ayain; he will pleased as the father; he knew he would not have more work than he had had, and a great denl more to eat; so the bargan was struck; the boy commenced bis duties with a light heart and a cheerful countenance. as blithe and as gay as the lark o'er his head. I dou't say he was quite so musieal; he inight keep neithpr to sing paims at church, and I can ansure you, Mr. Cbuirman, there was not more fault found with psalin singing in those days than there is now. I don't say our schools they are not much improved now. It must be admitted that our farm servants as a body are rough and uncouth, do many things that we wish them not to do, and leave undone some things that we wish them to do; but we have them to work, and if they work well we look over many things we should wish were different. Much has been said to us farmers about the conduct of these our yearly servants; I think sometimes more than they deserve, and moch of their rougb uncouth manuer has been laid to the want of education, Their rough side seems always to come first to
atrangers. When you mix more closely with them yon will find more good points, more originality of thought, more of the milk of human kindness concented under thear rough exterior than you ever thought they pos sessed, and we must make great allowances for their 14 and 24 Do all other classe do right at that age? Is education a guarantee for correct conduct at thai time of life? I doubt it. I think that some of our
greatest men in the land, our atateamen, our admirals, our gencrale, our judgen-ab, and our parsons too; wnuld

## did at that time of lif

Well, in the course of time, these young men get married; that generally makes a wonderful improvement in them, as it dues in all mankind; it civilises them, makes sone of them comparatively polite, and all of them more thoughtful. Oue Sauday morning, a
few years siuce, on my way to clurch, I met one of few years siuce, on iny way to clurch, I met one of
these young men who had been in my service some years. He accosted me by putting his hand to his hat tud saving, "Good morning, sir;" I returned his salutation and said, "Good morning, Belsey; why, your are married, are yon uot?"-"Yes, sir, I aın!"-"Well, I thought so, for I never saw you put your hand to your hat, or say 'sir' to me before. Well, what do you want now?" The man smiled (for I spoke kindly to him), aud
said, "If you please, sir, I want you to give me a job." -"Well, I daresay we can find something for you to do if you are here at 6 in the morning." The man came don't think he will whilst I want a labourer. I think be is here to-night, and can vouch for the truth of that statement. There is a great deal to be done by a little judicious management even with farm labourers. They are not insensible to acts of kindness; there is gratitule among the beat of them; and with nothing that you
give them do they seem so pleased with, so grateful for, and for which you get so good a return, as for a goo jug of beer. I have said there is gratitude in the best of them, I wish I could say there was in all of them, and as I see more here to night than I have ever seen in this room betore, I will take this opportunity of saying, that mothing is more pleasing to a master tban soe a man who has received $n$ favour show his grati tude by his conduct, and nothing is more annoying than ingratitude to every one, and an ungrateful fellow does
injury to others as well as himself. I always speak an injury to others as well as himself. I always speal a
much as I san in the plural in preference to th singular nu:nbrr. "[" and "mine" are words I never use when I speak to my men, and I much preter hearing them sny, us, we, and ours, to he and his. I think it looks well between master and man when we do this and that 'ours' are good horses, "our' corn yields well, o we shall get 'our' season done next week, \&c. \&c.
I have said enough about Education here to make some of you perhaps think I am altogether npposed to as regards agricultural labourers. Your infant schools to teach and instruct the young I don't object to, i you don't keep the little ones too long at it, and cramp their limbs when they ought to be at play. Yuur Sunday schools cannot but be good where sound moral
and religious instruction is imparted, but I do not think any of your schools do more, or so much good, as the
village evening school used to do, when the lads used to assemble after their day's work was done. They went to get iustruction then because they thought they wanted it, and they valued it the more bectuse they had to pay for it, and the thinge they learnt there were in some way comected with their work. If they had ploughed an acre and a half in the day they would
find out at night how far they had walked to do it; if a field was 30 rods long, how wide should it be for an acre?-if their wages were 67. or 7l. a year, how much was that a week? There was no strictness nor much discipline in these schools; bad language was not allowed, and a portion of Scripture was usually read before they separated. Well, I lhave said that I have known gooi agricultural labourers that could neither read nor write, but there are three things which are essential to every labourer-that is, honesty, sobriety, and industry; every man who possesses these, thougu he does not know his alphabet, will be a good labo trer, and what is more, he may have a good master, fo $r$ he can choose his own. Honesty is indispensable, for no man will keep a thief if he knows it; it he finds out a man to be a thief he will at once discharge him, it he does his daty to himself and society, for he may as well break his leg as keep a thief. If you have a drunkard about you, you may as well have the gout; you dou' perhapa disclarge him, for when sober he is oue of the beat, and promises every time it shall be the last: but Le is no more to be depended on than the gout-the fits are sure to return, and often at the most inconvenient season. But I am inclined to think that the azy man is worse to have about you than a drunkurd or a thief; the thief robs you, you find it out, discharae him, and get him punished. The drunkard vexes you and punishes you and bimself, but the idie man if he does not steal robs you daily ; and thongh perhaps it is not so bad as breaking your leg, or having the gout, yet he is such a continual source of annoyance that you may as well have a perpetual toothache.

Well, 1 have taken so much time with farming, farmers, and labourers, that I have little time to speal of the female part of our community, but I must suy a ittle now, as I wish this to be my last as well as my Arst lecture on things connected with farming.
There is no need to say anything about farmers wives, for they are thiugs of the past. I know of oaly one left, and she is old and worn out; when our good old neighbour Mrs. G-is gone, where will you find another? 'Then the farmera' daughters, I cannot ay much about them, it would be very ungallant for me to do so, for many of them are very pretly girle highly edueated, very ecomplished; can play, eing

Italian; but I don't know one who can milk, charn and bent the butter-ill fact which I suppose accounts A., Y., Z., and other furmers that I se: here, remba.
ins so long single. But now, with regar.i labourers girls, I have said how it is rearitted
farmers that the schooling of our boys dieat then hittle good-we believe it has quite spoilt the pirs sense of our labourers does not show them the con no tion is at a discount, and honest and intustriuts I cot at a premiun-but education is like a lottery, it give thew pr.zes, hut a wast inally more blanks. But nuin
there are prizes it will, hke all games of chance, han its supporters; no matter how rash or visince, hin scheme, particularly when the tickets are giver $f$ persons will always be found to accept then. If thee iss, let hay advertise; there will of a liurur applicants, no matter how little the sala requirements are; plenty are rendy situation. If you want a lady's maid, you will en' get one, for our parish schuols fit the girls for hel and imitate their mistresses.
giving large wazes, and allowing requara a monh, distresses of the kitchen, you will get one, and ken spoilt, never interlere with her perquisites and her cousins to visit her as often as she pleases; b you want a scu!lery maid, you may do the work yourch Now, if this is the cuse with the gentry, what in merely to lools forme females shun and serven they would a peatilence; girls that cell themedr respectable will never go us servants in a larm-huma there is a nother situation to be had. We sometin inquire at a registry office ( 1 thing we nuver d formerly), where there zre luts of manes, but ther aner is invariably, oo we are obliged to put up with slatterns luat ot people wou't have, auless we make an effurt and give double the amount of wages we for:merly did, hich we cannot afford now; but we do sometimes do
in the hopes of getting sumething useful aud respectable. What is the result? Wiy, we get girl that is fit to read novels, to reall the newspatp nstead of doing her work, to spend a large portion of her tinne in writing her love letters, and will read youn whenever she has an opportunity ; she thinks herself com petent to set an examule in politenesa to the whole humen hold, and thlaugh at her mistress becumes she does mol This we attribute vary as taken place in their education lately; these gi are great copyists; they endeavour to initate the superiors in everything us regards dress; if the fatbio is for ladies to wear bounets not larger than oystersber hey must have one too
treet with one of another kund, you can but nen
new fashion, or whether it is an old bonnet hudside before ; but be this as it may, you conclude that it in positively ugly that it cannot become fashionable ; in the course of a few weeks you will see every gir in village has one like it stuck on her head, turned front, with flowers in the midulle. This mitation is not confined solely to dreas ashioned farmers think it wrong that these girls art taught so little at school that is likely to be noveral them as a servant, wife, or mother; can they mat bed or couk a Putato? how few of them can kuit a stocking, make a shirt, or do plain neenle wal they can embroider and crochet, and can scarcely the streets without crochet needies in the Well, poor things, I wont blame then, if ther taught no better! They have, as I said, a p to copy their superiors, and whell ornanental work becomes as fashionable, that the frot ot a parish cannot attend a village concert ons wonderel at that these poor girls follow the I am frequeutly asked wiat becomes conntily girls? Persons would not ask this quent judy for themaselves. A very large percentage of anto the towns and subsist and exist in a way not name; a great many of them (more than
quired) becone needlewomen and dress-maker go into country towns, and try to get a living needle. They fiud the market overstocker with the: it is impossible for them to live honestly and many then proceed to London, where bad worse, and the feelings of humane Chrstions harrowed with the recital of reformaturies aver with them; societies are formed.n of by to Australia, and yet good female more wanted in furin-houses than 1 o af thing as a country milkmaid dow theor parish. ee plenty of 35 years ago, I think I could ortune by exbibiting her as a curind gad one
not time to exhibit her, if 1 athould and
be ap to the British Museum, and I have no nd laughing eye, would attract more tion, and be more ad
i you could find there. I: wha puibish farming, therefore I wish it to be clearly molerstood that all I have said about education is inlentood apply to farmers, farm servants, and farm How it has affected other branches of I have no experience to justify me in unities of judging than I have. I thank Metur opportunities President, Ladies, and Gentlemen, for the ativecond good humour you have exhibited during the time I have occupied.

## Home Correspondence.

The Trald of Sussex Farm.-It is very pleasant for matear farmers "to draw up a scheme," as they say seright side, but he is a bold man who rushes into ant with it; as bold as the Irishmau at a fair who drags is coat on the ground and challenges any body to stamp Your correspondent from a weald of Sussex grief if he tries it, the main feature consisting getting beasts fat at two years old. Now any one mpuinted with the subject knows well that it cannot e edone, except, perhaps, with a few picked Short-horns; bo mill certainly not meet with the stock to do it at in fins in this county of Sussex (from which I, too, olld st the resring fairs from 12l. to 14l. per head, which terild make a woful difference in the balance-sheet. His helary, too, is only sufficient to keep them in good store condition, as pointed out by another correspondent : to achive hiaproposed object he would have to feed highly from the first-the more so that Grass land at the rent bo mames is not suited for fattening. This would involve anotiny of at least $5 l$. a head beyond his calculation nis be half fat, and instead of getting his 5s. 4d. per wone, he would have a difficulty in getting the tathers to take them at about 4s. $8 d$, and their
veight would be from 5 to 10 stones under that he estimates. Another amateur has, I see, taken pon and paper in hand to improve the "scleme" to trong in arithmetic, which must gentleman is not that he could not eat his cake and have it too. He proposes certain changes, such as buying yearlings the land required for their keep the first year, and frowing thequireon 23 acres of Wheat, but in making out hat ate her calculates not only 260 . for the Wheat, sured: now "the the keep of the calves for one year General said of the very magnificent," as the French is in not war ;" neither is charge at Balaclava, "but yer correapondent must beware of false lights. It tp in mind, why don't I prescribe? - but I have drawn * will no doubt your correspondent in time. If he maceeds in getting his house supply from the dairy, Manitry, keep of private horses, and some lusty bacon, ${ }^{9} 100$; and this I am than 99 amateur farmers ou Jan farming his myself in the position of the gentle sbalance shg his own land, who triumphantly produced Then asked, "But what have you allowed for rent p" trgot that!" $H$, from his stilts, with "Oh dear, I Mgot that!" ## The Quarterly Journal of Soience. No. 5

Marsh's on Man and Nature and work on Entozoa, Mr and characterised, are of agricultural interest. The following is a passage from the review of the last-named book on the control of sand hills in motion:-

The control of dnnes by man is effected either by forming them originally by artificial means, by protecting them when natural, or by removing them when that can safely be done. In some places a mere artificial wall will give rise to a broad belt of dune. Thus, in 1610, a wall of three or four miles in length, thrown across a tide-washed flat between the Zuider Sea and the North Sea, occasioned the formation of rows of dunes a mile in breadth, and altogether excluded the sea. Similar results have been obtained by mere plank walls and screens of reeds, Where dunes already exist, they can be prevented from advancing by planting certain Grasses, creeping plants and shrubs, the Arundo arenaria being the most valuable. This plant grows to the height of about 2 feet; but its strong roots and their rootlets extend 40 or 50 feet through the sand. The looser the soil the better it thrives, and as soun as the sand ceases to drift it dies, its roots fertilising the sand and helping to form a vegetable mould for forest planting, pasturage, and ultimately aruble land. The leaves of the Arundo are nutritious food for cattle and sheep; its seeds feed poultry; cordage and twine are made from its fibres; it thatches weil, and its roots are good fuel. So many valuable properties sometimes check its main use as a safeguard against the drifting sands. The Beach-grass is an American representative of this plant. On the French coast upwards of 100,000 acres of land have been "Oflaimed; and in other parts of Europe a very large area.
Of trees to succeed the Arundo, none is better than the Pinus maritima, where it will grow. Its resins yield, according to the French returns, a clear profit of 20s. per
"As the plains and dunes of sand on the European coasts are estimated to amount to at least 20,000 square miles, it is evident that much yet remains for human agency in this matter; and as moving sand is iuvariably mischievous, while fixed sands rapidly become profitable, the subject is one of extreme practical importance.

## Farm Memoranda.

Balinabreice, Bbecein : Waste Land Reclamation -I entered as tenant of the farm of Balnabreich a Martinmas, 1859, upon a 19 years' lease. The farm extended to 258 acres arable and 23 of pasture, besides a considerable extent of land under wood, at the yearly for the woodland: a portion of the woodland I was at liberty to improve. Immediately on getting possession of the furm I began to improve the woodland, and by Martinmas, 1860, I had, by trenching and draining, reclaimed 57 acres 9 poles, and made it fit for The tr
The trenching cost $675 l .15 \mathrm{~s}$. $7 \mathrm{7d}$. The expense of
learing the ground of tiee roots and stones, after the wood was off the oriund roots and stones, after the servants and horses, I estimate at $4 l$. per acre, amounting to 228l. I have paid for cutting and filling up again 557 chains of drains, 77 l .4 s . $2 \mathrm{~d}_{\text {o, }}$, and for tiles for the same, 70l. 15s.
All the above work has been done at my own expense, without any assistance from Government grant or any promise of help from the proprietor.
The land thus reclaimed, with the exception of $7 \frac{1}{2}$ acres, was a regular forest of wood, with a black or yellow soil lying on a clay subsoil. The $7 \frac{1}{2}$ acres was a thorough swamp or bog, with several pools in it, asd a good deal of wood in different places. The woodland was formerly let yearly for pasture at a rent generally of about $2 l .10$ s
The removal of the stones and of the roots of trees was a work of considerable difficulty ; and the drainage of the $7 \frac{1}{2}$ acres of bog waa very difficult indeed. It was so soft that it was scarcely possible to pass over it without sinking throngh the surface, except when planks of wood were laid for the purpose. On cutting below the surface the soil was found in so liquid a state that it was necessary in many places to carry a quantity of the surface near the spots where the drains were to be put, and to throw over this as much of the under surface as would lie without running back into the drain. After allowing the drain to be in that state until the soil that had been thrown ont became somewhat firm, I proceeded to dig as deep as the sofiness of the ground would permit. I then laid in a 5 -inch pipe with collars. After a time I removed the pipe and deepened the drain as much frrther as possible, and then relaid the pipes and collars. By this time I was pretty well through the soft loggy surface, and was reaching the top of the gravel. Two or three weeks where I got a great quantity of water, as much as filled a 5 -inch pipe for a leader, and by putting in branch drains into the bog I got it at last thoroughly dried.

Almost another 12 acres required drainage, but by going $3 \frac{1}{2}$ to 4 feet deep I always found, as before, a good open drawing bottom below the clay.

In spring, 1860 , I had about 20 acres of the newly trenched land under crop; but owing to the backwardness of the season and the state of the ground, which
was mych poached with dragging off the tree-roote and stones, the seed was late in being got in. Where eariest sown there was a good crop; but the later the sowing the crop was always the poorer.
I used 6 bushels of Oats and $2 \frac{1}{\frac{1}{2} \text { cwt. of Peruvian }}$ guano per imperial acre. I considered that the crop guan guano, and labour in laying it down, and gathering and
In autumn 1860 I had that were on the surface
In autumn 1860 I had all the ground cleared of roote and stoues so far as I was able. A number of the roots were so large that they could not be pulled out even with three or four horses, so that I allowed them to remain, and sowed round about thein for two seasons; and in the end of harvest 1862, when thes had become much lighter, 1 had them all removed Many of the stones were of such a size that they had to be blasted with gunpowder in order to render them manageable.

In spring 1861 I put the whole of the trenched ground into Oats, and had a very fair crop all over except on 10 or 12 acres that had not been drained. I used 6 bushels of Oats, and 2 cwt . Peruvian guano, and 1 ewt. blood manure per inperial acre. I estimate the average produce at 3 qrs. per acre.
In autumn 1861 I had the whole of the trenched land ploughed, with three horses in the plongh. Being exposed to the frost all winter, it was well pulverised, and in spring 1862 I had 46 acres sown with Oatswith 6 bushels of Oats, and 3 cwt . Peruvian guano per acre. I estimate the return at 4 quarters and 6 ijushels per acre, worth 7l. 2s. 6 d . Eight acres, after carrying two crops, were sown in Turnips. The ground was ploughed like the rest in autumn with three horees; in spring I gave it 50 bushels of lime per acre, on the frosted surface, and a double timng of iron harrows. then drilled the ground without cross.ploughing or grabbing, and then iaid down with 15 bushels of mixed bones and 2 cwt of blood manure per acre. There was a good crop of Turnips, worth 6l. per acre. I tried six drills at the rate of 15 yards dung and 8 bushels bones per acre; but I could not distinguish the difference but by the marks after growing. I had also 3 acres in Potatos laid down with 3 cwt of gaano and 50 bushels of lime. This was a very grod crop, and quite free from disease
When I entered on this farm at Martinmas 1859, there was a very poor crop of Turnips, all diseased with finger-and-toe. Part of them were valued to me at 2l, per acre. In a short time they were nearly all gone, not a single cartioad heing left on an acre. On iny entry, and ever since, I have plougbed the land intended for Turnips next season as soon as the harvest was finished, as deep as three horses were able to do with a large plough, and allowed it to remain in that tate till the proper time for laying down the Tarnips. never cross-plough or grub, but have always given from 50 to 60 bushels of lime to the acre, according to the nature of the ground. I then gave one or two double turns of heavy iron harrows, then raised the drills, and then put the circular harrows over them.
In 1860 I had no dung for the Turnips, it being all required for the former Turnip-field which was to be 16 bushels mised accordingly gave for the Turnips 16 bushels mixed bone-dust and $2 \frac{1}{2} \mathrm{cwt}$. of blood or
Turnip manure per acre, and put on the dung next spring before ploughing tor the Barley. In 1861 I pursued the same plan, using all the dung I had for the field after Turnips. In spring, 1862, I continued to work on the rame system, but had as much spare dung after manuring the land that had been in Turnips as went over nearly all I had for Turnips, at the rate of 20 yards of dang per acre. The remainder was laid down as in the former two years. Since following this system of liming, I have never been troubled with finger-andtoe amongst my Turnips on any part of the farm since I began to labour the ground in the way I have described, and have never had a single failure of the Turnip crop. The farm has now been wrought on a five-years' rotation for the last 20 years. I am now changing into a six years' rotation-viz., three crons of Grass, followed in succession by Oats, Turnips, and Barley. The farm had become almost incapable of growing Turnips.

I may mention, in addition, that I have expended upwards of $350 l$. in the drainage of the land formerly in cultivation.

the above communication. - We add that the desoriptions the other day of the prize $\mid$ "Or the nuethods, the first is the surest for a crop, and the "ine farms of the Manchester and Liverpoul Agricultural Society were taken froun recommended, notwithstanding the admitted evil which some nopt :o 4 the lately published Journal of that Society.]

## Miscellaneous.

Pea Soup.-An excellent soup can be made with 1 pint of Peas, 5 quarts of water, four large Onions, sticks of Celery, three Carrots. Whis and cut the vogetables in pieces, and fry them in any kitchen fat, with two tablespoonsful of brown sugar; then put the whole into the water with the Peas, and all the bones saved for the purpose, and more meat if the soup is desired rich, and a salt herring or a pig's foot is an excellent addition. Boil the whole five hours.
The Schrreder Brome.-"The Schroeder Brome is a perennial Grass of extraordinary productive power, lately introduced into France. A Frenchman speaks of having experimented upon it for six years, during which time it never fell off, either in its constitution or its yielding property. The early period at which it c mes forward is an important qualifica. tion. The first cut will be ready in March, if the last crop of the preceding year has been taken in good time; it comes in even before Rye. Four, and in some years five cuts may bo obtained in the season, and either in the green or dry state it is superior to any other kind of fodder, espeeiully for milch cows, but all graminivorous animals are fond of it. This Grass forms the ear and the seed with great rapidity ; this is the case with every cutting, when the ear and seed are fully developed, though not quite ripe, and the ears of the first crop have been able to be taken off sufficiently forwarl to be used as seed when dry, and after wards to mow the herbaceons part. Any soil almost seems to suit Schrceder Brome, but it appears to do best on fresh land; without doubt the best land will produce the heaviest crops, but it would he difficult to tell on what kind of soil this Brome will not grow. This Brome lasts about six or eight years without any diminution of produce or appearance of dying out. One of the peculiar merits of this plant is that no weeds will thrive under its culture; it comes up quickly and grows very rapidly; it |though we have not had a great deal of does not require to be sown thick, but rather deep. It is as green foril that this $\mid$ sowing, and Peas that should have been pant is especialy usefal, but when conproperties of the plant when in its areen state but it is greatly decrensed weight. It is is greatly decreased fin meadow hay. The straw is very lian and although a The straw is very heavy, pigs will eat it without being cows and Schroeder Brome wout being cut. The able food for cows, as it greatly increarethe quantity of milk and makes the cream very thick, and the butter made from it has a finer flavour and keeps well, even if the weather be very warm." From a Freneh Journal.

Calendar of Operations.
$M_{A R C H}$ - We give in this page plates f Sandy, Black Poland, Potato, and Barbachlaw Oats, to which reference was made a fortoight ago.-In the press of other matter occupying our pages to daz. we cut only shortly refer to the other points on which English farmers are now engaged.

Barley sowing is now proceeding all over the southern counties-Annat, Chevalier, and Common English Barley are the best sorts, and 10 pecks is a mufficient quantity
Spring Wheat too is still being sown, especially the true Triticum cestivum, a bearded Red Wheat, which bears sowing even in April.
Clover and Grass seeds are being put in: and on this we make the following extract from Morton's Fasmers' Culendar:-
"1st. Clover may be sown broadcast and harrowed in at the time the Barey it drilled; a pair of light harrows at the same time following the drill-machine, to cover the Clover soed.

2nd. It may be sown before the roller, when the Barley is just above the roller,

3rd. It may her or tor or horsc-hoed in when the corn receives either of bi.0oe operations, if the farmer is in the practice of giving them.
place in a wet season, of thes growing so luxuriantly, of the Cotr the Barley. The second tuecedsent if rain follows in due time, and perhaps, generally succeed, if the mes ventured to harrow it in, whide thanere safely do. In the third methiod it one: succeeds, but it also often tals. it necessary, in many cases, to hor is Barley.

In any case it is best sown w : a handbarrow covering 5 yards in winio and if this be set to sow one half of iw quantity per acre that is wanted 4 . made to cover the ground twice, thir an a will be more perfectly done. If fise seeds be sown with the Clower, another sowing will be necessary : the same tool set for Grass seevis. is covered in by a light harrowing wis either the bush or web harrow, of lig?: seed harrows of the cominon kiud, wat rolled. Of the sceds sown at this saes we have-1. Trefoil sown 14 to 10 : per acre alone in some districts as m
of the earliest foods for cwes in sprixg. It is ploughed up atter a for folding, and a crop of Turnips ing is taken. 2. Red Clover or Come ( 10 lbs . to 15 lbs . per acre) sown oftan itself as affording a hoavy first eut hitain the summer for forage-coming in fos this purpose after the Trifoling ime. natum. 3. Various mixtares of Cloven, as for instance, 10 lb . of Red Clome, 4 lb . of White Clover, $4^{\circ} \mathrm{lb}$. of Thati. The Red Clover is a large seed, the White Clover a mueh smaller oure, sothet 4.13.) of it contain as many seeds as 1015 ot the other; the yellow-blossomed Trot is the largest seed of the three. 71. : I have found to yield a first, second, i: third ent during the summer-the her cuts containing, however, more of th. White and Yellow Clovers. The Alvte Clover is coming into use parily ds a substitute for the White; it is equa? ! perennial, and has arger labit of growth."

West Sussex: March 13.-At laet we hope spring weather has come, and we are able to work upon the luni; rain, yet it has been euough to, prowers in some time ago are only now beive sown, and we slall now have our hands full. The weather has been rather cuid, and the spring crops, such as Petches Rye, \&c., ou which we must wore than usually depend, are backward, aud from the same cause the roots are disappear cis fast, and we shall find it dimal get through the next six weeno, mus is so dear, and it so cheap, we can allor to be more liberal. Perhaps at o ordinary time has mutton been so dear so now ; at our last week's market. brought from 6s. to 7s. $6 d$. per stwoe a 8 lb ., and there was a fair supple, abi the quality generally good, rather inil tham asual supply of rowes fed. And in price and best cake fall, thit will be more corn-fed meat now las been before. It has this year buta, used so much and with go good resu... that the fear of accidents through wi... plant looks well and thick ou the gronn. but not forward. All kinds of stues art doing well, and lambs will be reail? doing well, and alis for Easter. ${ }^{\text {s }}$
 it comes so much many crosebrebee been a good thany market, bsi compared with mutton they sold badlv, though for the mest they have been of good quality. has not beeu very plentiful, nor whets very first-rate quality, and has has beer so dear as muttoll. Pork for $=$ abundant, and the price , per 81 li .
about $4 s$. $4 d$. to $4 s .6 d d$. about $4 s .4 d$. to $4 s$. $6 d$. per and the: great many have been ef distase amm has been a good deal of dist. in. tw. them, and many have died. month disease has been we that it onf amoug cettle, so much so, hat makr: hardly been sale to take ary to nuale: and bring theus back. in nut su ence to this disease, I do ning ind in what way the preventing ons:
(II) Barbsenlaw Odt. affected with it being taien to market conld be a hardthip to any them its got over in perhaps a week or fortnight, aud it would be only to keep $t$
and looger, and this we may hope would prevent its greding. Surely any animal labouring under an arctions so spread that disease farther. $G$. S.

This NEW IMPLEMENT must necessarily supersede Syringes and other devioes of the kind, for it will be found much more effective in ts operation.

A LADY CAN WORK IT FOR HOURS WITHOUT FATIGUE.

## CAUTION.

Imporsist to rue Puric. The extensive sala of the Hydropult has excited the cupidity of so-callod respectable, but in reality unprincipled Manufaturers, who are now palming on the Public worthless iraitations of the Hydropult, and through their connec tions are enabled to place said devices on exhibition, and for sale, in many of the principal Ironmongery and Sced Establishments throughout the city and provinces. These devices resemble in many respects the IHydropuit in appearance, and are chlculated to deceive the unsuspecting. The Proprietor therefore lssues this Cilution, and respectfully intimates that parties wishing to purchase the 1 Iydropult whould exanine the machine ofered for sale, and see it it has attached thereto a label, with the following words:-"Tho Hydropult, Voss's Patent, manufuctured only by Grimites a Browitt, Birmingham. Caarles Powrbor Button, Proprietor, 142 and 143, Cheapside, London." Onless this label is attached, tho Maohine is not the Hydropult.

## GREEN'S PATENT SILENS MESSOR,

## NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES,

by special apfointment, sole manufacturer
to her most gracious majesty the queen.

as recommended by the judges of the royal horticultural society's show held jult 20 , 1894 .
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all eases of competition. The Judges at the Royal Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteration, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messers. T. G. \& Son hem to state that, owing to the great demand for their MACIILNES in past years, they have been unable to execute orders with that deppath due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust to be in s position to send off all orders the day they are received.

Parties if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box ; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.
To cut 26 inches
" 28 "..
.. £13 00
" 30 " .. .. ..
$\left(\begin{array}{cccc}\ldots & 15 & 0 & 0 \\ \ldots & 17 & 0 & 0\end{array}\right\}$
Leather Boots for Donkiey, 18 s.

The 26, 28, and 30 inches can easily be worked by a Donkey, or by Two Men, on an cren Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Carriage Hore and, as the MACHINES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the MACHLNE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening: the cutters being steel on each ith when they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the MIICHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inesperienced person, in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Porth in Ingland ; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally:

SATURDAY, MARCH 25, 1865.

MBETING POR THE ENSUING WRRK.

We have already intimated (see p. 147) that the soientific men of Germany propose to discuss in the Congress which is to be held at Erfurt, in Soptember next, certain questions relative to plants and their cultivation, which are more or less deeply agitating the mind of the thinking portion of the horticultural community, whether professionals or amateurs ; and it has ocourred to us that it may not be without interest to our readers, nor even barren of results so far as the discussion itself is concerned, if we ourselves throw out a few thoughts and suggestions on the several ques tions which are to be raised, and which are in brief as follows:-(1)On DABWIN's theory, as it relates to the production of new races of plants by selection; (2) On the most important operations in the production of regular trained trees; (3) On the best means of modifying difficulties arising from diversities of nomenclature and terminology (4) On the history of the development of some important flower; (5) On the choice of picturesque plants for ornamenting buildings; and (6) On the implements which during the last 10 years have most promoted horticulture. To the first of these propositions we now address ourselves. The remaining questions will be discussed as opportunities may from time to time arise :-

No more striking proof could be afforded of the hold. which "Darwinism" has taken on the attention of practical men in Germany, than the proposal on the part of the Directors of the Horticultural Congress of Erfurt, that the application of Darwin' Cungress of Erfurt, that the applicationuf Darwin's
be offered for deliberation to the savans who are to assemble in that town. The exact terms of the subject proposed are - "On Darwin's theory, especially on the production of new races of plants bs selection." Nor indeed is this the only subject of discussion which relates to the theory of evolution and natural selection, for the fourth question, "The histary of the development of same important flower, as the Stook, Aster, \&c., from the first beginning to the present condition of its varieties," admits of no other treatment than as an example of this same theory.

It is with the first only of these questions that we have naw to do, or rather with only the latter half of it; and we hope that in this we shall be followed by our Eirfurt friends; fur there will be little chance of their ever getting to the practical consideration of the "pruduction of races by selection," if they commencin discussing a theme of such hot diepute amongat Germans as the "Darwinian theory," under all, or indeed under any of its aspeots, more or less controverted as these are. For in Germany, as with us, some believe in the oreation of speoies by variation, and attribute a separate origin to each; sorue believe in natural selection, which others hold to b a myth; some believe in the struggle for existence, and that plants grow, not where they like best, but only where other plants will let them; others believe that each species occupies a territory assigned to it from its creation, and iu which it would never be disturbed but for man, or from the effects of his unnatural interference with the so-called laws of nature. And lastly, there are some who go all lengths with Mr. Dinwin, and others who rank him with hair-brained speoulators in every particular of his theory.

In the "production of races by selection" two principles are involved, both of them practically acted upon by every gardener, though bat little regarded by most either in their soope or effect. Firstly, what is a race, and hov is it that we have such things as races at all? Secondly, what is the gardener's function in producing races by selection ? Is he in its exercise assioting Nature and thus accelerating natural operations; or, as is so cummonly supposed, defe ating Nature, and forcing her to produce what, but for his agenoy, she never could have produced.

The term Race is in systematic botany defined as a variety that comes true from seed;" it is thus the middle of the three terms, viz. Species, Race, and Variety; though as every one allows that races are nothing but permanent varieties, the sequence of terms in order of development should be sipecies, Variety, Lace; and further, as, according to Mr. Darwin's theory (under which the terms of the Congress require us todiscuss the question), the offispring of a race booomes a species by the same process of selection as that of a variety becomes a raco-it follows that we have the closed genetic series of Species, Varieties, Races, Species. This is not, however, in a scientific sense a series returning into itself, for according to this theory the last produced species always differs specifically from the first, or parental.
Now, as these terms all express oomparative and not absolute differences, it is impossible to frame any but arbitrary characters for the u. In scientific botany the two extremes, or $\mathrm{S}_{i}$ ecies, are the only ones universally reoognised. What by common consent are called species are groups of individuals supposed to be dessended from a common parent, differing from each other by one or more conspicuous oharacters, and which d, not mutually cross, or if crossed, do not produce a permanently fertile offspring. It is true that the matter of common descent can never be proved ; that there are many groups of individuals of which some botanists regard the differential characters as conspicuous and specific, and others as inconspicuous and those of varieties only; that many plants which conspicuously differ may still be mutually crossed and have fertile offspring; and that there are a few that resemble each other so clusely that no one calls them species, and jet which cannot be so crossed ; but so long as the great majority of known plants are resolvable into groups of individuals which are recognised as distinot species by the majority of botanists, the term spocies remains good for such groups in practice, whatever theory of their origiu is adopted.
Such then is the generally acce ted definition of a species, but in regard to what are races and What varieties no streh agreement amongst botanists exists, exc pt in theory. In practice it is impossiblo to distiuguish then except their history is known, and amongst wild plants this can hardly ever be traced. The gardener
howerer, who does know :the history of 80 many races, has a very definite idea of what he calls such as distinguished from varieties; and to the bardener's view we shall next address ourselves.

It is often assumed that the different Diseases which exist in cultivated plants are due rather to the ignorance or carelesspess of the cultivator than to some cause over which he had no possible control. Gardeners are therefore frequently blamed by their emplogers, where all possible pains have been taken, and where there has been no avoidable deficiency of knowledge or experience. Some of the most formidable aftections have been of exotic origin. There is good reason for believing that the Potato disease was prevalent in South America long before it reaohed this country; and we had some years since an opportunity of proving that a curious disease with which a collection of Camellias was attacked had been imported from Italy. So 38 regards at least one affection of Orohids which depends on the growth of a parasitic Fungus, it is highly probable that it was imported from abroad, and it is possible that some of the other affections to which they are subject may be of a similar orimin.
Major Trevor Clarke has kindly sent us two leaves of a species of Cattleya from Bahia, which are affected by a form of spot which we have not litherto reen in Fingland. They are sprinkled on either side with otbicular superficial white dises, about the tevth of an inch in diameter, most of which have in the very centre a minute reddishbrown granular speck. Similar specks are sometimes scattererl about, and a few seem to become dilated, and ultimately more or less completely obliterate the paler dise.
Should such an affection ever prevail in our houses, which is not impossible, its appearance on plants imported from their native country is now recorded, and we shall be glad to receive from other quarters samples of morbid appearances, especially suoh as may not be conceived to arise from close paoking or a long voyage. M.J. B.

## Ws learn that the Royal Horti-

cultural Society is to be represented at the Corgriss at amsterday by tho Rev. M. J. HerkeLey, who goes as
chief of the deputation from Eugland. We are also informed that Capt. Cockerell to the office of Assistant-Secretary
to the Society, to the Society, resignation of the Hon. E. Portman.

## The Prizes

 offered last year by the Royal Horticultural Society for British Her. baria have nowbeen a warded, and 26 Silver Medals are to be distributed or the best collections from as many counties of Great Britain and Ireland. Gold Medals for the best out of the several county collections have been assigned to Dr. ST. Brody (Gloucestershire), Mr. Joshua Clarka (Essex), and Miss Lydia E. Brcker (Lancashire); and the Gold Medal offered for any new species fonnd wild in the United Kingiom has been awarded to Mr. Joshua Clarke for Erucastrum inodorum. The locality where this was found, was a large heap of sand from a railway cutting through a chalk hill, between Saffron Walden and Warden. A few plants of the Erucastrum, with hundreds of Erysimam cheiranthoides, were found apparently wild on this sand-heap. Mr. Berkelery regards it as merely a form of Brassica Erucastrum, and quite as much entitled to be considered indigenous as many other plants admitted into our Flora, though probably accidentally introduced in the first instance.

- In digging up a border at Kew a few days since, one of the workmen met with a bryght yeliow rowdery stbstance in some abundance, which was mixed up with the sandy soil, and covered the roots of a little shrub. At first sight it seemed to be something quite new. At least nothing of the kind had ever iccurred in such a situation, but on close examination it was clear that it was the Sepedonium mycophilum, in a very anomalous position. As the Fungus is parasitic, it became an object of interest to see to what it owed its origin, and on cutting into the lumps of soil little brown leathery particles were observed, which on examination were found to be filled with the oblong spores of some Boletur. The riddle therefore was soived. From accidental circumstances the Boletus
had never barst through the soil, and the parasite was developed in a subterranean position. When occurring in ordinary condition on Beable smell; but, as the accompanied berfectly inodorous, the specimens in question the decaying Fungus rather than the parasite. M. J. B.
- We regret to have received intelligence from Berlin of the death there, on Saturday last, of Sir Robzrt Schomburak, lately her Majesty's Consul at Bangkok, and celebrated for his travels and scientific investigations in South America.
- It will be seen by an advertisement in another column that the Weymouth and Dorset Horticultural and Floricultural Society contemplate offering this season a prize for Roses, value 20 guineas, to be called the "Radclyffe Prize." Schedules, it is stated, will be ready by the 10 ths of May. Let us hope that liose growers generally will ably support this Society in its landable eadeavour to do honour to a name justly great among Rosurians, not only in Dorsetshire, but elsewhere; and that a large and fine exhibition may be the result of so liberal an award.

## GRAPES FOR THE MILLION.

An ingenious coutrivance, called Wells' Portable Folding Ground Vinery, with slate bottom, on which Grapes are grown and ripened in the open air, without the sid of artificial heat, has just been submitted to our inspection. By the annexed representations it will be seen that it closely resembles Mr. Rivers ${ }^{\circ}$ Curate's Vinery; but it is an improvement on that form of case, inasunuch as one side is hinged at top and moveable, thereby enabling cultural operations to be performed under more advantageous circumstances than when the under more advantageous circumstances than when the
whole case has to be moved in order to inspect the Vines. When not in use, owing to the ends foldirig on to the side frame as they do, the whole can be stowed away into a comparatively amall space. It may, in fact, be folded together perfectly flat, one Vinery, consisting of two lengths of 7 feet each, occupying a space of only 7 feet long, 21 inches wide, by 9 inches
rapidly. taking off about hall the they have had has been produced, thinning the number of bunches the no syringing, no watering, has been stopping che shoots a red spider or any otber blight is to boired; and D Wells states that he has himself producen." Mr, average 20 bunches, fully ripe, in each of his on Vineries, during the autumns of 1863 and 1864 , no other attention than that mentioned in thin quotation. One Vine alone yielded 40 bunches;
The advantages which are claimed for these Vineries as follows:- lst, they are so made that one side can be opened and laid flat on the other, exposing the whole of the interior at the pleasure of the caltivator; 2 d , they are extremely portable, six Vineries when fing together forming a square of the same area Vinery when open.
Examples may be seen at 25, Bishopsgate Stroe Within.

## MR. W. PAUL'S LECTURE ON SPRING FLOWERS,

Delivered at South Kensingtor Manoh 21, zous ThE subject which has been proposed for my Lecture, ud There is so nutuch poetry in those words-Spring Flowere, the I find it difficult to refrain from indulging a sentimental mood The first flowers of the garden and the first warblings of the grove, are inspiring themes to the dullest fancy, sadd to the ieast sensible of the stirring of the poetic muse. 1 am boll confess this, undaunted by the recollection of the ensastiona of Hamlet and Horatio in their m
before the Castle at Elsinore-

Hamler. The air bites shrewdly-it is very cold.
Horatio. It is a nipping and an eager air-
undaunted too by what our great humourist, Hood, has uill iu his poem on Spring

Come, gentle Spring; ethereal mildness, come;
ob 1 Thomson, void of ryme as well
Tas reason, How could'st thou thus poor human nature hum-
There's no such season
Let others eulogise her floral shows, From me they canuot win a single stanza;

deep, and may be placed in any outhouse or shed, or under the stage of a greenhouse, until wanted again in the spring; or it may be advantageously used for protecting joung crops during winter, or for raising early Peas, French Beane, \&c.
A Vine is intended to be planted at one end of each Vinery, which is made about 14 feet in lengtb. Slates

slightly raised in the middle form a dry clean bed, along which the Vine is to be 'ed horizontally ; and in order that there may be plenty of ventilation, the framework is to be set on bricks placed at certain distances apart for the ingress of air. This contrivance, the end of which is an equilateral triangle about 21 inches in the side, occupies, as will be seen, little room, and can be managed perfectly without a gardener. It is intended, in short, to assist amateurs with but a few square yards of ground to grow their own Grapes. Strong Vines planted now in them will, it is stated, ripen fruit next autumn of a size, colour and flavour, equal to those of hothouse Grapes, $i$. $i_{i}$ provided the season is favourable.
Concerning contrivances of this sort, Mr. Rivers says f my Ground Vineries this season (1864). In four of viz., Trentham Browing four varieties, one in each Vinery, Sweetwater, and Lack, Black Hamburgh, Buckland are 100 bun, and Lo Bruxelioise. On these four Vines are 100 bunches, their berries now (August 10) ${ }^{\text {w welling }}$

Which is tenarkh
in the early menthy of the year might have a garden of gay spring flowers with evergreens-green, variegated, and berry-bariog Such a garden should partake of the romantic aud picturequu -wood and water, rock and dell-rather than of the trim and formal. I would gather the Primroses, Violets, and other hedge and wayside flowers, and intermix them wit exotics as flower in spring, and are found suitable to why climate out of doors.
 it is not desirable to give up \& portion of the gardel
for the exclusive use of spring fowers. Be yit
There is still no reason There is still no reason why spring flowers shou planted th the ordinary beda of the flower garden aud removed what the season arrives at which it is customary to phan Polargoniums, Verben fiowering plants. Or they may evergreen beds or borders which exist in most flower garden and thus the general garden will be made gay and intere. For the sake of during the other seasons of the sian sabject as well as to assist the memory in the recollection of denid I propose to arrange "Spring Flowers" under two heads:1st, Hardy Spring Flowers, or such as bloom naturally out doors in the months of February, March, April, and Mas And 2ndly, Greenhouse and Hothouse Syming Flovert, of sactions of glass.

Of flowers which bloom naturally out of doors in spinin Buibous plants form a very important class. Tulip, ani Crocus, Snowdrop, Snowflake, Scilla, Hyacinth, is simple. Theof Narcissus take the highest rank. Their culture is stmplof doof may bo planted in beda or borders in the garden

The Indian Azalas is another spring-flowering plant of rare
beauty, which, like the Camellia in one respect, merely beauty, which, like the Camellia in one respect, merely
requircs protection from frost in winter. At Digswell Rectory.
near Welwen, a plant of the white variety lived in the open air
through several winters. No one who has attended the flower-
shows of this metropolis-for which our country still stands
unrivalled and alnne-can fail to have remarked the rich and unrivalled and alone-can fail to have remarked the rich and Azaleas are of easy culture. Grafted plants are best soil they prefer is sandy peat, which should be firmly pressed
in well-drained pots. A moderately close, warm, moist atmosphere during the season of growth assists in the formatio doors and slightly shaded from the sun during the summer
months. A minute insect, the thrip, is a grest pest ito this
plant, and requires checklug by the frequent use of tobacco plant, and requires checklug by the frequent use of
smoke.
In addition to these we have Heaths and Epacrises, delight in a peaty soil, and require careful watering and little hear, Acacias, correas, cytisuses, Verontcas, and sundry stove
and greenhouse plants; and last though not least, many rare
and beautiful Orchids. The latter are usually made the object
of special culture of special culture, and their high prices have hithertn ikept
them in comparatively few hauds. Therr culture is not, as is supposed by some, difficult ; and as they become more plea
tiful they will doubtless enter largely into the purposes of
in-door spring gardening. There remain under this head in-door spring gardening. There remain under this head of doors, but which if sown in May, June, and July, and grown
under glass, will bloom freely and beautifully during the spring months. Such are the Chinese Primula, the Cinerari
Petunia, Schizanthus, Stock, Mignonette, and the like.
In conclusion, I would venture a few remarks on the art of Forcing. Although all forced flowers are not naturadly spring onter so largely into the decoration of our conservatories and The art of "forcing" consists in ascelerating the period of perfection of fruits and consists in azcelerating the period of nevertheless requires an amount of knowledge, care, and
watchfulness, which thoroughly test the capabilities of the culti-
vator. By forcing, the fruits which ripen naturally in autuman vator. By forcing, the fruits which ripen naturally in autumn
are brought to perfection in spring and summer; the flowers of summer are induced to bloom in winter and in spring. light as posssible. A low night temperature should also be
ligsisted on. Plants unduly excited or overworked by a high pemperature during the day require tins restorative emperature. A difference of $15^{\circ}$ or $20^{\circ}$ between the maximum
of day and night temperature is seldom too much. The syringe
must, be used freely every morning and evening when forcing in order to prevent the exhaustive effects of hot dry air, and
the quautity of water sprinkled over the plants and house must be greater during sunny than cloudy days, and in
proportion to the increase of teniperature. It is well to lower the temperature of the forcing house when the plants have arrived at that stage of development at which the flower bude by this practice, but then the flo
developed, and the colours are stronger.
A great deal might be said on the preparation of plants for
forcing. Those of us who are accustomed to deal with plants in this. Whay know well that we may change the flowering
season of almost any plant. For instance, the Rose which
soll naturally blooms in summer, and rests in winter, may be made to of systematictreatment the seasons may be completely reversed. Cold and dronglt are the agencies by which we effect this; in view by the use of the other Plants have two periods of
rest, night and day, and summer and winter; and a plant that is made to rest in summer will surely work out its course by plant if removed from the open ginund and forced one year, and then returned to its former position, will bloom at an eariier period than its fellows which may have been left undis-
turbed, so great is the force of habit, even among plants. On these grounds then is the practice of forcing based.
I have only to enumerate a few plants which experience has shown to be well suited for the purpose of forcing:Fuchsias, Pelargoniurns; A zaleas, especially the Ghent varieties, Double Pink Japan Cherry; the Double-blossomed Cherry, Plum, Peach, and Thorn, in their kinds; Lilacs, Kalmias,
Prunus trilobata, Rhododendrons, Roses, Syringas, and Prunus trilobata,
Viburnum plicatum.
Viburnum plicatum.
Such of these plants as are grown in the ground out of doors should be transplanted from the ordinary nursery rows one emission of fibrous roots below, and the formation of flowe buds abore ground during the following summer. Late in October dig up the plants, pot them, and place them in the
forcing-bouse early iu December. Every successive year less heat will be required to bring them into full bloom at a given date, or if the same amount of heat
I add a brief synopsis of the most interesting and attractive spring flowers, many of which have, however, been already

## Home Correspondence

Small Birds.-The destruction of the young buds on Gooseberry and Currant trees by sparrows at this season may be easily prevented by means of the following simple and inexpensive remedy:-When the gardener prunes the trees, let him take a reel of common black sewing cotton, and lace it backwards and forwards and across in all directions amongst the twigs: this effectually keeps the birds off. I have ndopted the plan for several years with success, and have found it a great protection to young Peas. E. R.Both Mr. Ingram and your correspondent "J. F." are, I think, far too lenient towards that audacious little rascal, the house sparrow. I don't object much to any of the other small birds, although we cannot keep fruit here without netting it; neither do I mind a few sparrows, for I like to see and hear them; but it is the large number that is so annoying. Scarcely anything seems to come amiss to the sparrow in the way of food, or materials for building its nest ; for here, as with Mr. Ingram, he begins feeding upon the Peas from the time they are out of the ground till they are fit to gather. Next to them comes Beet, which he will entirely eat up if left alone; then Lettuce, Spinacb, and Endive-I should not have had any of the last three fit for use for the last two summers if they had been left to the mercy of sparrows. I have now a bed of Endive with scarcely a leaf on it, and Spinach and Lettuce nearly as bad; even the tops of the Cabbage leaves and Broccoli have been attacked this winter. Generally I find that white cotton drawn from one side of the piece of ground to the other, and placed from 12 to 18 inches apart, and a few inches above the ground, keeps them away; but sometimes this fails. Also a sprinkling of soot, as long as it adheres to the leaves. My experience is the same as that of "J. F." with regard to Gooseberry and Currant buds; the bullfinch takes the Gooseberry in preference to the Currant, but the sparrow takes whichever is most convenient to get at. Sparrows are also almost as troablesome in the flower garden as in the kitchen garden. In winter and spring, Pinks and similar things are often quite spoiled by them. Last June I had some beds of Verbenas, Nierembergias, and Petunias nearly destroyed just after they were planted out by those pests. They took the tops away wholesale to build their nests with; they also almost stripped the Gazanins of their leaves. J. Bryan, Heydon House Royston. [If country sparrows are bad, we fear London

## sparrows are worse.

Duchess of Buccleuch Grape.-I purchased one of the "21s. planting canes" of this Vine, which was growing in an 8 -inch pot. Instead of planting it out I forced it in the pot, and it has now on it shree bunches 15 inches long, set and thinned. The Vine showed seven bunches at first, but wishing to see what it would prove to be, and to give it as fair a chance as possible I reduced them to three. I have no hesitation in pro nouncing this to be one of the best new Grapes late! sent out. Even if plants that are offered as fruiting plants at $42 s$. had yielded such a crop I should have been well satisfied, but that such a small Vine shoulii do so is surely worth notice. R. N., Asuarby Park Gardens, Falkingham.
The Weather.-The thermometer in my garden, placed 1 foot above the surface of the ground, stood at $17^{\circ}$ this morning at $60^{\prime}$ clock; it is one of Negretti and Zambra's best instruments. Another thermometer on a wall sheltered from the wind, and 5 feet from the ground, stood at $19^{\circ}$ at the same hour. We have not had the temperature here so low at this date within the last 25 years. Henry Doubleday, Epping,

## March 21

Royal Albert and Champion Hamburgh Grapes. I cannot conceive on what grounds Mr. Poynter considers these two kinds of Grapes to be identical, for in my opinion no two varieties can differ from one another more than they do. Champion Humburgh, or, as it is sometimes cnlled Black Champion, is well known to bo an early Grape, producing a rather thin and delica'e
tunt, whel often turns sellow before the fruit become ype. On the other hand, Bayal Albert is a very strong grower, making large dark green foliage. which retains until long after the fruit is perfected; requires some two months longer to bring its fruit to uaturity than any of the Hamburghs do. As to the introduction of this variety to Kent's Green, I beg to reiterate that it was through Mr. Jones it was sent there in the year 1890 ; it was planted out in 1841, and produced its first fruit, one small buncls, in 1842. I can also inform Mr. Poynter that Mr. Collins never grew Champion Hamburgh during the 20 years he was sardener at that place. John R. Cox, Gardener, Crown East Court.
chinese Silkworms Feeding on Oak Leaves.-The China Correspondent of the Times of Feb. 16, states an the silkworms at Newchwang feed on Oak leaves instead of the stereotyped Mulberry, and naturaily produce a much coarser thread; but the Chinese utilise it to a comsiderable extent. It is intermixed with cotton, and used for fabricating silk cloth of a rough evture. Two crops are produced-the latter of which is taken to the coast in the early part of Noven.ber shortly before the navigation is closed by ice. Of the guantity produced accurate information has not been obtained, but it is evidently considerable. From one aley, which is however one of the most productive about 80 cartloads are taken away annually; each cart carries 10 baskets, which each contain about 15 cubic ceet ; that would give about 12,000 cubic feet of loosely piled cocoons from that one valley. The production in the whole region could, it is said, be quadrupled in a few years if the entering of foreigners into the trade ould give gufficient inducement to the cultiva
Forcing Memoranda, February, 1865 :-
tors. Mr. Mrjor, :the manager of Messers. Jardne Mathieson's silk factory at Stanghae, is of
opinion that, notwithatanding its coarseness, the ilk could be used with advantage in manufacturing he coarser kinds of salk in Europe. The yield is intinitely less; inasmuch as 20 lb . of cocoons only give 1 lb . of silk, againat 5 lb . or 6 lb . which are reeled from a similar quantity of Chinese cocoons. It is then another useful purpose,-namely, to strengthen and restore the breed, which, in Europe, is almost, if no quite lost and in Clina is greatly deteriorated Mr. Mijor has had much experience in silkworms both in Europe and China, he having been engaged in siik farming in the south of Italy many years before he went to the East, and his opinion that a cross between the Newchwang worm and that of China and Europe might be effected with advantage, is therefore worth consideration. Kang-ni, the second Emperor of the reigning dynasty, appears to bave made the firs experiment of feeding silkworms on Oak leaves, about 200 years ago; and specimens of the cocoons obtained re to te seen in the Museum of the Chamber of Commerce at Lyons at the present day, having been sent home by the Jesuit missionaries, who, under that Enperor gained so prominent a position in China. It is eviden that since then the worm has thriven and multiplied The fact, then, that a species of silk work in China feeds n the leaves of an Oak, though of much interest, is not altocether a novelty. Put what is the Oak? and what there known of the Chinese and Japanese Orks? Among Mr. Fortune's plants sold by auction last year vere some pretty balf-evergreen Oaiks, said to be apanese, but they also come from China. G., Feb. 16.

Vamer.

Among other subjects of exhibition were several collections of Chinese Primulas, among which a roys-salmon-coloured kind called carminata splendens deserves attention on account of its colour; some wellflowered Cinerarias came from Mr. Weatherill, and Crocuses, Narcissi, and Lilies of the Valley from Mr Wm . Paul ; these were all well grown and flowered.
A list of prizes awarded on the occasion will be found in our advertising columns.

Royal Hobticultural: March 21.-The nemlfite stituted fortnightly meetings, on the plan adverted tobs us the other day at p. 219, bid fair to be as successina South Kensington as those of Regent Street were in day gone by. On the present occasion not only were con. siderable numbers of highly interesting subjects exhilbited, but the attendance of visitors was uncusallis large. The excellent way in which the proceedings were conducted, too, must have been highly gratifyim to all true lovers of horticulture. In the first plase the Rev. Mr. Dix pointed out the different objects to which Certificates had been awarded. The Rev. Vr, Berkeley then gave a short discourse on what presentod itself of interest in a botanical way. Mr. Batewn alluded briefly to two cut spikes of Dendrobium shom by him, one the well-known D. densiflorum, the otem the new D. luteolum, which he said was not lam remarkable for the beauty of its pale primrose-coloun flowers than for the length of time they remain beauty. Mr. William Paul then gave a very interesi ing Lecture on Spring flowers, which will be found at p. 268 .

The following candidates were elected ordiny Fellows, viz:-
Mrs. G. Arbuthnot, Mrs. F. C. Burnott, J. Cater, Esq; ; Mas ; H
 Pocock, Mrs. Pym, J. Soarigbt, Esq. ; Mrs. F. Cqurepona
Tyler. S. Vaile, Esq., and J. Scott, Esq. ; and as.
March 21 (Floral Committee).-Mr. Williams furnished Dracæna limbata, Yucca quadricolor, Imalle phyllum miniatum, and a nice collection of plants. Mr. Parker had the handsome pa owered Rhododendron Countess of Haduing beant gr. W. Wilson Saun Laq., Pelargoniad dwarf horseshne-marked South African Pelargegting the Gladiolus-like Diasia iridifolia, and other in plants. From Messrs, Windebank \& Kingsbury ampton, came fine Chinese Primulas, bo 241. double, raised from seed, as noticed at p. eitch contribated a large collection of plan mon plant of Cephalotus tollicularis, the white-blossoum Cytisus filipes, Azalea Qucen Victoria, Rhododends
Princess Helena, Lomaria L'Herminieri, which when young are of a beautiful red colo vors-white flowered Cymbidium eburneum
blomemed Siphocanpylas；and Urceolina aurea，with handsome green the same establishment also came the Iree Eern，Dicksonia Youngii，the singular Anthuriam Siberzerimum，with brilliant scarlet inforescence， rarious Lady＇s Slippers，Acacias，and empanal From Mr． bandsme－leaved species of cane a variety of Eleagns japonica，with leaves handoomely margined with golden yellow；a curiously erouted rariety of Nephrodium molle；Arisæma ringens parpurate of Imantophyllom miniatum，remarkable for example size and deep colour of its flowers，the result of cool treatment spring flowers．
Awards－First－class Certificates were glven to Urceolina

March 21 （Fruit Committee）．－Some very fine Muscat of Alexandria Grapes，still in good preservation，came
from Mr．Tillyard，gr，to J．Kelk，Esq．；various Apples from Mr．Ingram and others；and a valuable hardy－ looking seedling Apple，named Lord Burghley，from Mr．House，of Peterborough．To the last a Certificate was awarded．
A collection of Vegetables，consisting of Celery，
Onions，Beet，Endive，Mustard and Cress，and blanched Onions，Beet，Endive，Mustard and Cress，and
Chicory，came from Mr．Earley of Digswell．
Though unconnected with the meeting just reported， it may be mentioned that in an enclosed compartment at the top of the Eastern Arcade，there is now on view a continuous exhibition of Spring Flowers，from Mr．Wm．
Paul，of Waltham Cross．It consists of Rhododendrons and other forced shrubs，arranged with much taste， and so intermixed with spring bulbs and other interesting plants as to have a gay and striking effect．
So fine a display of floral beauty during this cold snowy weather is a sight not to be overlooked，and is one which we are sure must be appreciated by all lovers of gay flowers．

## 非20tices of 2600天多

Le Jardin Eruitier du Muséum．By Prof．Decaisne．

## （Continued from $p$ ．152．）

Pêche Pucelle de Malines．－Leaves serrated，gland less；flowers large；fruit middle－sized or large depressed globular；skin thin，highly coloured next the
sun，whitish on the shaded side；flesil yellowish white， sun，whitish on the shaded side；
rayed wita deep red at the stone，from which it parts freely，excepting occasionally a few alightly adhering fibres，melting，very juicy and sugary，and rich．Ripe 10th to 20th of August in France，end of Angast and commencement of September in Belgium Land about mildew．The fruit must be gathered before it is too ripe，otherwise it becomes mealy．It is said to hav been raised at Mechlin by Major Espéren．［By its
leaves，flowers，and fruit it most resembles the Madeleine de Courson（the Red Magdalen Miller）．It differs from the Royal George in
the latter well－known Peach it has serrated
leaves and lighly coloured fruit；and Peaches having these characters，such as the Royal George， Royal Charlotte，and lied Maydalen，are，like
the Pucelle de Malines，subject to milde r：but it is not more so than others of its kiudred．It is a fault inseparable from the class．Nevertheless we cannot for that fault dispense with the varieties of this class，of which the excelience in other respects has been so long which the exceience in other respects has been so long
established－during several generations of the present dynasty，and long before in France．Besiles，it is a fault which can be remedied，unquestionably，if checked in time；or if the mildew cannot be effectually cured
after it once makes its appearance，its very appearance after it once makes its appearance，its very appearance can and should be prevented，if due precautions be taken．］
Peche Pavie de Bonneuil．－Syn．Bonneuil de Fon－ tainebleau．Leaves deeply serrated，glandless；flowers large；fruit middle－sized，roundish，greenish white；a clingstone；flesh white，tough，very sweet，but with little flavour．It does not riper in the climate of Paris
and against a wall before the end of October or begin－ ning of November，and then it may be kept for a con－ siderable time in the fruit room．It is therefore only question for England ；although it might be useful in some parts of tive Colonies which are too hot for tho freestoue or melting Peaches．］The tree contiuues to vegetate very late in autumn．
Poire Mussette．－Fruit small，or middle．sized，long， like a horn，straight or crooked；stalk sla rt，or none skin yellow．Flesh white，juicy，crisp，swectish，astrin－ by Dom Cl．Saint－Etienue in 1670；and notwithstand－ ing its inferior quality it is still sold in great quantity in Paris．Provost gives it erroneously the mame of Musette d＇Anjou，which belongs to a totally different variety
Poire Sucrée de Montluçon．－Fruit large turbinate， broad and flat at the eye，which is deeply sunk in a regular cavity；stalk moderately thick，and about $1 \frac{1}{2}$ and specks more or less coloured．Flesh melting， sugary，rich with slight perfume，and a Crassaue flavour．A very good fruit．Professor Decaisne says he is indebted to M．Joseph Grandin of Moutluç in，a very intelligent amateur，for a knowledge of this excellent Pear．The tree which produced it appears to have been observed about the commencement of the
present century by a person named R＇veliet，and propagated under the name of Sucré Vert，for whinh another gardener substituted very properly that of Sucrée de Montlue m，The tree is excessuively vigorous； and its productiveness is unequalled．M．Grandin sent several of the fruits in 1862，and they were nearly
large as finely grown Duchesse d＇Angouleme Pears．
Poire Jansemine．－Syn．Canette de Brucouge， Jeannette，Mouille－bouche（of some）．Fruit small or middle－sized，roundish，pale green．Flesb half meiting， rather gritty，otherwise a good early Pear，ripening in August．The tree is vigorous，and a great bearer ；but notwithstanding this，on account of its grittiness，it cannot be recommended；and there are macy bet
also good bearers，which ripen at the same season．
Poire Defays．－Syn．Duyeuné Defay．Fruit middle－ sized，roundish，with projections surrounding the inser－ tion of the stalk；skin smooth，yellow，washed with orange red next the sun．Flesh very white，fine， melting，sugary，perfumed but not musky．A very in 1837 by F，A．Defays，at Champs Saint Martin，near in 1837 by F．A．Defays，at Champs saint Martin，near usually written．
Poire d．Ange，－Syn．Ange d＇Et6，Desse，Notro－ Dame，Petite Verdette．Middle－sized，turbinate；stalk long，rather siender ；skin green，sprinkled with grey dots．Flesh greenish white，juicy，but very gritty ； juice sugary and agreeably perfumed．Season，August or September．A very good fruit，［but its grittiness is an objection］．The flesh of the Puire dAnge uinally presents a siugular character at its extreme maturity，
that of becoming very brown withont softening and keeping thus for several weeks；its flavour is then like that of baked Peara．Prof．Decaisne believes that a Pear cultivated in Lombardy，and in Venetia，under the name of Pera Morota should be made synonymons，judying from the form and the character which it presents at maturity．The Poire d＇Ange is met with in several of the small provinces near Paris，such as that of the Orléanaise；in Brie and in the Hurepoix it is called Muscat Vert，Petite Mouille－Bouche，and at Orleans， P．Desse，or P．Dosse．The French authors，Merlet，
Duhamel，Noisette，and others，regard it as a variety of the Salviati．
Foire de Marsaneix．－Fruit small，round，or Berga－ mot－shaped；stalk long，slender ；skin covered with cinnamon－brown russet，like the Rreaking，juiej，very granular．A stewing Pear． Season，end of December．The following information has been furnished by M．le Comte d＇A bzac de Ludouzet， and by M．de Lamothe
Society of Périgueux ：－
＂This Pear originated in a parish in the canton of St．Pierre，called Marsaveix，from which it takes its name，situated in a woody country about 10 miles from Périgneux．The tree is very hardy，and bears abundantly in the open country，but it is generally
grafted in hedges on the common Hawthorn（Cratæzus

Onyacantha), in order to draw some profit from the enclosures, which are also made to produce some other fruits, such as Modlars, dec Under theee conditions the Pear-tree in question does not grow high, and it does not last much more than 20 years; but it is easy to replace it by grafting on the Thorn as before, and thrs can be done at little expense, and the produce is cutnparatively abundant. This mode of turning the Manges to account is much employed of Poars succeel very well grafted as above, but none are longlived. The P'uire de Marsmuix is now found in great quantities near P'érigueux, being considered. for our climate, the best kitchen Piar, and there are some connoisseurs who possess reripes by which these Pears when cooked are remlered truly delicious." [Pears may be grafted on the Whate Thorn without injaring the hedge as a fence, if due precautions are taken. The top of the l'ear tree should be commenced immediately above the height determined for the hedge, and the
branches of the Pear shoull be pruned so as not to branches of the l'ear should be pruned so as not to
overhang the top of the hedge. If this be done, and the sides of the hedge dressed sloping, both Pear-tree and Thorn-hedge will grow, without the former destroying the efficiency of the latter.] ||

## Garden Memoranda.

Lafeen, the country lalare of the King of the Belgians, is sitnated athout three miles from Brusseis, It is a plain building, but is gaid to be elegantly furnighed. It was built for the Austrian Governor of the Netherlamls bifore the Freuch Revilution, and is famous as being the place where Napoleon planned his disaatrous Russian compaign. It is reached from Brussels by a rond lined with tall Lombardy Poplara, called the cllée Verte, and is situated on a considerable eminence. The approach to the Palace is through a handsome pair of iron gates. A circular niere of Grass, with a basin about 50 feet in diameter, having a large jet in the centre, is encircled by the carringe drive to the front entrance; and on the left of
this is the waik leadlug to the pleasure garden, which is lad out in an irregular form with large masses of such plants as Kerria japonica, Pyrus japonica, Lilacs, slirubs.

In this garden is placed the Orangery, a building and adnitting ligist only by the front sashes, the back and ends beng of brick. It is heated by four large upriLht stoves, and contains about 100 Urange trees, many of which are of large size, but none of them in robnst health. Must of the trues are very old, ani trained much in the same way as those at Versailles and extra hargu-sized sperange treas of the Sweet Bay in good health, and sime few trees of the Pumegranate. A walk to thee weat of this le th, to a mixed garden o fruit trees ami flowers. The beds for flowers are chit out on the Giass, and Standard Pear and other ruit between the flower beds. The offect Grass patis and ment, hewever, is not gro I. This garden was doubtles originally a kitchen aad fruit garden, as many of the old standard fruit trees remain, although now quite worn out. Th:e flowers gencrally consist of herbacerus
plants and annuals, aminrst which some very large masses of Diclyiraspectabilis are conspiruous.
A walk through the centre of this garden leads to the Thant hom-es, consis ing of twostovesand an Orchit house will lest phants are allowed to grow tagether in the coltivations. Thay consist of Franciceas, Euphorbids Allammis and such like, with a lew sucenlents. The Orehnh hosuse emtainasome Cittleyas and Vandas, with Sthnopeas, Maxilherias, Phams Wallichii, and many other inferior things; but like the stove plants indecate a total absence of good multivation. Two pits for Pine and a small pit for balf-hardy plants nake up the kitchen garden of about an acre. Thais however, we suppose, could not have been the only kitchen garden beloug to the establishment, but was the only one
The park adjoining the Palace is extensive and laid out wilh much skill; we believe by the late Mr. MacinBelgians, at Claremont. This beatutitul park in open to the puble on cestain days. A Githie memortal Belgura is bing erceted to the late Queen of the is also a cemetery here wherein lie interred the remaine of the celebrated Madame Malibran. $\boldsymbol{F}$.

## Miscellaneous.

The Currant Grape. - The istes of the Ionian Sea, once known as the Republic of the Seren Istands, and bountitul supplies of the useful drind Currant for the ir rich or mellow wine. This article of domestic import
the the staple of modern Greek commerce, is the fruit of a species of Vine bearing so close an affinity and resempassing notice. In form Grape plant, as to deserve a to the eye of the casual observer it lpresente little or no apparent difference, its berries growing in nimilar
bunchet, which look exactly like miniature black Grapes. The word Currant is a corruption of Corintis imported, and it has similarly impressed its name for the fruit on most Earopean languages
Currant Vine is an exceedingly tender plant, requiring the greatest care in its cultivation; $y$ pt in the end well repays the cust and parience besto wed upon it. In is extremely fastidious in its selection of the soil and temperature suited for sir years it bears no fruit at all, and does not yiell a full crop before the 15 th eason. It thrives best on the southern shores of the gults of Coriuth and Lepanto, and on the ancient Peloponnesus. The only other places where Currants will grow are three of the more fertile of the Ionian isles, for they resist every attempt at transplantation in other countries of similar temperature or latitude. In Sicily and Malta the cattiugs passed into the ordinary Grape, and in Spain they would not take root at all ; even at so short a distance as Athens recent similar and perse vering attempts signally failed, yet the fertile and lovely island of Zante is nearly buried in the profusion
of its inaumerable plantations. Denman's Vine and its of its
Frwit.
Preservation of Pollen.-M. E. Faivre calls attention, in the Bulletin of the Horticultural Society of the Rhone, to a new case of the preservation of the property of fecundation in dried pollen. It is clearly a matter of considerable interest that we should have the power of impregnating plants with strange polleu conveyed from a considerable distance. Pollen of Gremera ciunaburina was gathered at Lyons on the 5th of January. 1862, and was kept in paper for a year, free from moisture and not exposed to the light. In January, 1863, some grains were employed for the impregnation of G. cinnabarina of the same variety as that from which the pollen was derived, and succeeded perfectly. The remaining pollen was then sent in a letter to Paris, and being submitted to an attentive examination, we doubted for a moment of its fitness for the parpose, as the grains were wrinkled and dry, They swelled with difficulty when placed in water, and the substance which came from them in consequence of their rupture did not exhibit the strange molecular movement which takes places in normal pollen. On the second of April however, notwithstanding our apprehension, some of
the pollen was used in the Jardin des Plantes by the hend-gardener, M. Ouley, and the operation was perfectly succossful. On the 17 th of April many arly had set, and their development proceeded regulast. It $w$ as intended to try the pollen a third time La Belgique it does not appear with what result La Belgique Horticole.

## Calendar of Operations.

## (For the ensuing week.)

Tire cold north-easterly winds, frost, and snowy showers which we are now experiencing have had the effect of keeping blos=om buds comparatively safe within their winter coverings. Increased sunshine in the middle of the day will, however, doubtless soon induce them to unfold. Plenty of mats, canvas, and other materials for all purposes of protection shoul therefore always be at hand, in order that they may be ready in cases of emergency.
flower garden and plant houses.
Show houses should now he gay with Camellias, spring bulbs, and other eaviy flowering plants. Stock exiausted by forcing shonld be pliaced in a pit or
frame by itself to regain its lost vigour. A bottom heat of $80^{\circ}$, with frequent syringings, will in due time restore it to perfeet health and put it in proper order for ancther season.
Campleids - Keep such as are making growth well syringed; they should not have much air given them at present. Should black-fly appear on the young shoots, which sometimes will happen, a good syringing with tobacco water will soon destroy it.
Cinerarias.-Kemove to a cool shady house such as are required for a late display. Weak liquid manure may now be given liberally, say two or three times a week. Look weil to seedlings, and select such as have the most circular outline well defined colours, and place them apart from the more common Pri
ng to previous instructions. Midsummer and late (uwerny wants, aud also seedlings, will now resuir attention; let each shoot be tied to its proper place, and everything in the way of crowding the plants rould be avoided
PrNES, - The effect of frosty winds is already in pome instanees becoming disagreeably apparent. The plants having been firmly pressed in the soil, and the beds top-drensed, little rexains to be done for some
time. If, however, the wenther colt waterin Tulis.- Protect moraing will prove of advantase Domo, or mats, while unfavourable weather lasts. Stir the surface betwoen the bulbs as moon as it is in the best state for the operation, i.e., between wet

## Royal Agricultural Society of England.

R OYAL AGRICULTURAL SOCIETY of ENGLAND.

## The Agricultural Gatette

SATURDAY, MARCH 25, 1865.

As the next Monthly Meeting of the Council of the Royal Agricultural Society of England a precedent of the very gravest importance may be established-one which will affect the whole future histors and management of the Society; and it becomes the duty of every member of that body to consider wel' the question which will then come before him for decision. The Committee appointed with reference to the " education of those who are dependent on the cultivation of the land for their support" (the promotion of which is declared by the Charter to have been one of the objects for which the Sicioty was incorporated) have decided by a majority to recommend the Council to give a large sum of money in prizes to the sol:s of farmers or of members who mas pass with credit the examinations annually held by the Uaiversities in different parts of the country in Reading, Writing from dictation, English Composition, Arithmetic, Geography, English History, and the rudiments of Faith and Religion; also another large sum of money to be awarded by the same examiners as prizes to the sons of memhers or of farmers who shall send in the best papers on Mathematio:. Mechanies, Chemistry, Electricity, Magnetism, Light an! Heat, Zoology, Botany, aua Geology. Their decision professes we believe to have been guided by the conviction that arriculture is no exception among the various arts and occupations of life as to the great professional advantages which attend upon a good general and scholastic education.
It is not at all likely that they will find any one on the Council or any intelligent man elsewhere who will in the least disagree with them on this point. A grood school-training will benefit the future farmer as much as it will the future manufacturer. Every person will readily admit the truth of this. The committee will however, we confidently believe, find a large majority of the members of the Society who, notwithstanding this opinion, entirely differ from them as to the poliey of appropriating any portion of the funds of the Societr in the manner which they recommend.
There is ground in the educational field nearer the completion of the agricultural edncation, where it is mueh more certain therefore that any efforts made will have an agrioultural effect, on
which the Society ought to labour; and it only needs that they require from any candidate for their rewards and honours here a certificate that he has credifaliry passed the Cniversity tent of a geberal education in order to gaiu all that geniral result whi h the plan of the Committee contemplates, while the direet professional result of the professional examinations which ther mirht conduct would be so much clear gain in addition

The case of those who oppose the decision of the Committee is (1) that the Sucietr is a professional body, incorporated for strictiy professiunal objeots, and bound to labour with an aim simply towards the profitable (in ecery sense profitable) inerease of the agricultural produce of the country-(2) that " the education of those who are dependent on the cultivation of the land for their support," which is named as one of these professional whjects, $m$ ans therefore the professional training of the actual or intending farmer-(3) that in order to promote this professional training, examinations in that "Practice with Science," which is the guiding motto of the Socisty, should be instituted, and suitable rewards should be oflered for those who may pass these examinations with distinction-(4) that in so far us a good general education affects the professional status which alone can properly come under the eve of the Society, it will be promoted by distinctinn of this kind attached to the professional standine towards which alone the Society's examinations will be directed-but that (5) if it be considered desirable that the Society should exert any dircet influence upon this important preliminary general cducation, that influcace can be exerted with perfect efficiency, and without any expenditure of moner, by the simple expedient of repuiring from the candidates for the professional distinctions which the Society will grant, a certificate of having already passed the test of a fair general middle elass education.
The whole caso is perfeotly, and as it seems to us unenswerably presented in Lord Fortescue's memorandum on the subject, which was laid before the Council at the last meeting, and which we here republish :-

- The Education Committee, in their report, have pmeesded on the principle that it is the duty of the Royal Agricultural Society to encourage general education rather than apecial agricultural training, or, at least, that they can, with easis ad
eficiencr. do the one, and with difficulty-if at all-eflect the rither. They *cc ndingly recu umend 200L, out of the $300 \%$
asked for, to be given in prizes for prociency shown in general subjects at the examinations held by the two gereat universities and by the Colleze of Peocemors, but nnly sinl. for
special knuwledge of any sulyjects hearing at all himety namin griculture. I am fir from malervalnime fla, dilv-grawing cluding ste stu machiners) is apmicothlo to agriculture: still. I
 regards improvement in stociz or improsemunt incultivation: mean such men as Bazewell and the late LnTi LRICEsTER ; and I suspect that surch subjects have hrcessful exbibitors of ofock, and of the practical men who have made mont money by farming, from the foundacion of the Society down to the prewent time; for both these have generally contented themselves worked out by the study and experience of others, instead of personally striving after the acquisition of purely seientific
 that the subject of middle-class education has hem for more numerable speocbos, pamphlets, articles in m(-W-l.apus, revews, and magazines ; now that \& Royal Commission lisu heur appointed upon the subject, and that middle-class schouly and colleges are springing up in all directions, on every variets of
principle, to supply this newly-recognised want, I fcar the
Council may expose itself to zouch hotile eriticlsm, both for What the report propoeen the Society should do and also should

It is hardly possible that the concurrence of Lord Fortescee, one of the most earnest labourers in the field of general education, with Mr. HoLLAND, who has longest and most efficiently of any oural education, can fail of influencing the Council aright.

We publish during this and next week letters on this sabject from distinguished agriculturists in 18 or 20 diffierent counties, which well deserve the attentive study of those who are interested in this subject. In particular let us refer to one of the last upon the list to-day, written by Mr. Paget, M.P., who may be named along with Lord for-
trascue und Mr. Holland as having lung laboured most successfully at that union of general and professional education which is carried on under what is called the half-time system.

Tirf Yorkshire papers report an interview hetween the representatives of the Wakefield Steam Plough Company and the magistrates upon whose report Sir George Grex had issued his order forbidding the passage of loconight and 6 A.M., in a certain district in that county. Although several of those who had signed that report now declare that further oonsideration of the subject has convinced them of the baseless character of the danger which they had anticipated, yet the Benoh generally remained unconvinced that the arrangements offered by the Company for diminishing the alleged danger were sufficient, and refused to interfere for the removal of the order which the Secretary of State had given. It is to be hoped, however, that this difficulty, which otherwise bids fair not only to ruin the Wakefield Steam Plough Company, but altogether to put a stop to steam power on hire for agricultural purposes, may be removed by the passing of the Bill just introduced by Mr. HolBill, repealing certain sections of the Locomotives Act, 1861, under which the Secretary of State has acted in the recent order he has issued, declares that every locomotive propelled by steam or any other than animal power, to be used by the owuer thereof either in his own person or by his servants, on any turnpike road or publio highway, shall be worked according to the following rules and regulations:-
(1). At least three persons shall be emploged to drive or conduct such locomotive, and if more than two waggons
or carriages be attached thereto, an additional person
shall he employ or carriages be attached thereto, an additional person
shall be emplonyed, who shall take charge of such (2). One of such persong sla
signal the driver of such precomotive when it shall be necessary to stop or slacken the speed thereof, de.
(3). The drivels shall keep upon the off side of the road, and give as nuch space as possible for the passing of other
(1). The wiistle shall not be sounded for any purpose whatis upon the road.
(5). Every sick loconootive shalt be instantly stopped in any other person with
haud requiring it.
No locomactive is to be driven more than four miles an hour along any pubic highway, or more than two miles an hour
thenghaties town or vo village. 61 . and 10. are levied for infraction of the Act.
Existing restrictions as to the use of steam engines withtn
25 yards of roads are not to apply to locomotives used for ${ }^{25}$ yards of roads

We cordially hope that the reasonable provisions which the Bill contains for ensuring safety in the presence of this new passenger along our road which the exigencies of modern agriculture have
called into existence will be deemed sufficient called into existence will be deemed sufficient
and that the power which a few timid resident in any district now possess of putting a stop to What has become a most important branoh of rura industry, may thus finally be abolisied.

## THE GERMINATING AND CULTIVATING OF

 CEREALSI sHould not again have troubled you on the
former of these subjects, had not your respectable and
the results of the experiments on the germinating of Wheat, which he made in the autumn of 1863, and added to them the results of some further experiments he has made on the germinating powers of Barley, both beyself have made, especially on the growing of Wheat, and to the experience of those who are called, but and to the experience of
erroneously, thin-seeders.
But your correspondent, in the first place, gives, in the article under review, a summarised table of the results of the experiments he made on 42 samples o Wheat on the alove date, which are as follows

## In 10 samples the seed failed from 52 to 92 per cent

The thes on to cive us a Table of the Germina He then goes on to give us a tion of Barley, and which he introduces with this which the former had to bear," and which I rather hink refers to some strictures which I myself made when the "Table of Germinations of Wheat' was first published in the Agricultural Gazette. Let me here observe that I have a high opinion or the these xcellent qualities of the gentleman who made thes xperiments, and I feel certain that he would not puhlish to the world any matters which he does not
conscientiously believe to be true; but I beg most conscientiously believe to be true, botit, to ask him to repeat his experiments, and if he will do so $I$ fee certain that he will find the results wiil ba very different from those of his former experiments ; he will in fact, find that Wheat of any kind and of all kinds is as well able to reproduce itself as is any other grain, and that the organs of reproduction of it are as perfect and nearly as active, as are those of other cereal seeds and I assure him that I do not write this from opinion only, but from practical experience and the results of experiments; but were I to confine myself to opimion only, I might ask, Why should the Creator have made Wheat, the staff of life and food of man, less perfect in its kind than is Barley, the food of hogs, or Oats the food of horses and of dogs? But I ask no such
questions, knowing full well that if man were so treated questions, knowing full well that if man were so treated
there would be a wise and sufficient reason for his being so, though I could not discover it.
But I repeat, I make the statement I do from facts obtained from long experience and carefully made experiments. From long experience I write; for let me inform my readers, that I commenced my agricul tural training, or I may write, I obtained my know ledge of farming from near 50 to 60 years back on an estate of nearly 2000 acres, and on which, what is now erroneously called thin seeding, the Tullian system of husbandry, which is founded upon it, was better practised than I have seen it on any other estate or farm since, whether great or small. On that estate 1 single peck was occasionally put upon an acre of land and never on any account whatever did the seed excee 4 pecks an acre, and very frequently very much less, and the crops never failed to be as fine as crops could be grown; and, my respected readers, should you donbt the truth of what I am writing, as probably you will, I have abundance of proof that I am stating nothing but facts.

But those brilliaut and never-failing crops, my friends, were not produced by thin seeding only but on that estate the land was always really cultivated, and never to a less depth than 9 inches, and often one plough following another brought up the soil to the depth of 12 inches, and then followed the roll, scufler, scarifier, harrows, and then, when a complete seed bed had been comminuted, the drill, which was then first used in that part of the country, put in the seed, and never more than 4 pecks an acre of either Wheat or Barley were put in, and sometimes, as I have said, so little as 1 peck was used, but that was dibbled in by the hand.
Let me therefore ask, if Wheat were so defective of the germinating principle as our worthy experimenter's "Tables of Germination" would lead us to believe it is, would those magniticent and never-fniling crops have been produced year after year as they were from such small, nay, almost homoopathic quantities of
seed? Impossible, or the crops must have failed-been seed? Impossible, or the crops must have failed-been homcopathic crops as well as bomœopathic seed I have been in my parish of Wix, now 28 years: and I will be as brief as I can. For 17 of these years I rented two small fields by the side of the little glebe I held in my own hands. The fields were horribly fonl when I took them, and so the first year I fallowed the larger to get out the Conch-grass, \&c., and during the year I ploughed it 11 times, and scarified it os many, getting out mountains of Coucl, \&c. Did I burn them? No, I did not; I was at least old years younger then than 1 am now, but still too
disate into the atmosphere by active combustion what would become by fermentation or slow combustion the exact food I should want for ray Wheat crop; and 80 , having become delightful mould, it was all carted on the land for my second Wheat crop. 13 times Wheat, once Barley, and twice Clover. For the Wheat I never exceeded 2 pecks of seed an acre and I had generaliy a little of the land done with much less; but the average yield of the 13 crops was 44 bushels an acre, and one year (1847) the yield was
55 bughels an acre. Now this
here ask if my seed had failed to grow (and I together) even to the 10th or 20 til part thiral respectable experimentalist informs ns what that respectable experimentalist informs as Wheat
does fail to grow, should I have had 572 bat crop from $6 \frac{1}{2}$ bushels of seed, or 44 bushels bunelo of 13 years out of 16 from half a bushel of seed acre for One year, also, in the other of my rented fiells, I hat 7 quarters and 7 bushels of Barley ant acre from lem than 3 pecks of seed, and which I sold for 46 siilling a quarter, and the maltster who bought it afterwants sent me word that it was the best Barley he had eres seen. But, again, at the front of my lawn I have plot of land, the eighth of an acre, which was last reat with Whert for the tenth time in succession, the seed being dibbled in, seed by seed, in rows oxactly one fos apart each way, so that one seed only was to eas 144 inches of ground. Now, in that plot so seeded fir 0 years in succession there was searcely a gap from seed failing to grow, and long before harvest the or was as thick on the ground as it could grow, as many gentlemen who saw it, and with astonishment, can ber witness, yet it was not the best crop I had grown, bry still the yield averaged about 1200 -fold, and some ron: produced 2000 -fold.
But so much for my practice, and so much in faron of the productive and germinating powers of When: proved by it, and here I might come to a close, but my
readers I hope will excuse me if I give tiem a shor: history of some experiments I hive lately made, and purposely to test the vital powers that there are different kinds of cereal seeds; or perhaps it will b sufficient if I merely give the results of them, and the are these, namely: out of more than 20 aamples Wheat planted in rows in my garden, and as many fower-pots placed near a window in a tool house, freely did they all germinate, that not more than :
seeds in 100 tailed to grow. I have also both Wieas and Barley growing in vases on my chimney.piees forming to me interesting and pleasing ornaments, and in these it seems that almost every seed grows. true that Barley grows quicker than Wheat, bet think not more certainly; but those gentlemen who may be disposed to seed their lands reasonably, that with about two pecks of Wheat and three of Barles. will never find their crops fuil from a lack of seed-that: is, if they deeply and thoroughly cultivate their lands, put them in good condition, and put in their seed e nature and conmon sense direct, seed by seed, and $n$ ² by children's handsfull and metal capsfull, as is the common custom; and above all, let them not non the primitive tool imported from the centre of Africh called the pre-Adamite "drags," a model of which was exhibited by a swarthy son of the desert in bil Arab's tent at the Great Exhibition of '51.
And let them not trust to quackery of any kino such as wetting and drying their seed before uning in; or, if they must quack, let them get their seed chama by some strolling gipsy, who will tell their fortanes the same time, and for the same expeuse. But, w have often said before, let them trust to the resol For in my fields, and I no more wat my seed than 1 m horse-shoes over my stable door to keep witches from riding my horses to death. Nor, my respewal readers, need you fear to sow rationally, that is thin lest it should cause your Wheat
Alderman Mechi is a thin-seeder, a one-peck m sometimes, and so is Mr. Hallett; ;and the Rev. S. smim is a two-peck man, and I am a two-peck man, and atme more-and whoever saw mildew in our fielas? bs have I seen thick-seeders' crops nearly roe but never did I see it where two or tire, Wir Par. acre of seed only were
somage, March 11, 1865.

## AGRICULTURAL EDUCATION

1. Bedpordshibe - The education of farmers in my neighbourhood is of the ordinary desecriphen unfortunately it is not thought necessary know much of art and science, and very mad schools in which they are trained are ut their after calling in life, failing to prompt or ability to judge for themselves. There tural training school here. sidered
training and the study of agriculture father's labourers plough, sow, and reap. who are intended for agricultural pursuitas portion of their time in so-calle Good sound training should be givea suction branch of agriculture are imparted.
trade or business a man has special trainin duties required of him. In farming goes at it in the dark, but by degrees he sees dar got his Luton.
2. Berkshire.-The great necessity that existo : I think, for a better class of the endowed grammar schools, whe educated, and where those whose
tho general insaruction imparted to the whole school particular branches-for instance, where those who areco farm, could gind, and read somewhat of the theory of agriculning hnd, and feel quite satisfied that farmers as a clas have largely participated in the general progress of the nation, and are rapidly becoming far more intelligent an mot to avail themselves of their advantage and as to professional education, let there be colleges or schools here and there, where youths, whether the sons of larmers or others, can ácquire a scientific know ledge of agriculture, i.e. where they could acquire tha imennt of elementary knowledge of chemistry, botany, ount when situated on a farm acquiring a knowledge practical sgriculture. I believe, generally, this pust be acquired on a farm; there are some who will nake almost any circumstances subserve their interesta, oot so men in general. I think scientific knowledg apperiments might be attached to each colliege, bat no 3 frrm in the ordinary way, $i, e$. for profit. It leads to These colleges should be founded by companies, and the ast might be various, according to the means of thos Lo send their sons, or rather that persons of differen menns should be able to select those suited to their cirg having some established on lower (30l.) and some on higher (80l.) terms, or as they do at the Universities, the addition of scholarships, exhibitions, \&c., would stil further help,-lst, Nothing can supply the lack of good ome parental training-the best foundation, under general education is wanted in large or public schools; and 3 d , the opportunity of acquiring a scientific know ledge of agricultare previous to practical training on the ather's farm, or away from home, as means and other
circumstances seemed to render desirable. At present, there is no doubt, three or four years of the most impartant period of a young man's life (destined for farming parsuits) are spent in a most desultory way; no hee market table is too often one of the chief educator of the smaller class of farmers, and the young men have very contracted notions as to what is for their real lords find this in the demand for houses of a very different character to those which prevailed even 30 rears ago. Let our agricultural societies give all posion but euragement to special or prea lion but bave nothing to do with schools for the
lucation of youth generally. After all a good home training in early life is the best security; this, combined with industry, tact, and good common sense, is pretty ure to enable a man to make his way. The minds o arm sons are very sensitive, and are for their own interests as they are as well able to manity. E. W. Moore, Coleshill.
3. Buckinghamshire.-My belief is that the present generation of farmers are far better educated, better money-making as their pront, though perbaps not so of boys of 10 to 14 years of age, sons of well-to-do tenant my opinioushoriag that theiry parents valuea good educs. of men in the I feel confident that there is no class theroselves how to educate their children than the with the england, and I think that all this meddling a great education of the sons of agriculturists is taking tion for a youth with the class. My opinion about educathis: that the boy should be taught in the best should be kept ather's means will permit of ; that he limimelf competent, into the hysteries, if he considers see daily young men who have been sent to good but netl, expensive schools, who write a good hand, spell vernation, express themselves well both in writing and conevery promise of being active in business, give hioroughly appreciating the necessity of exerting their
reanires bodies to keep pace, as far as their position I bave no faith increasing intelligence of the country. Whose mind has been developed by a good sound practical education will learn more in two years at jears at lectures and classes, \&c.., at agricultural
rolleges. One boy may large grazing farm, another in follow his father in a heifere select bulliocks and shle land. The knowledge and marikets, and learnt on the spot by attending fuirs nomledge as beinill not in my opinion be as usetul 4. Cuybridarssrrbs.--I finished my education at
Wealoy College, Sheffeld, which was of a generul rather than of an agticultural character, and veneral rather
after my arrival at home the scrious illness of my father compelied me to take almost the entire manage
ment of his farm business (about 600 acres). By reading, observation, and inquiry, I had to acquaint myse I could ; and that has been the course I as well as quently pursued. has been the course I have subse would have been a great boon, and would have imparted information which it has taken many long years to acquire ; and on some points-of agricultural chemistry to wit-knowledge would have been obtained, whic
can only be secared as the result of direct teaching Doubtless, with ordinary intelligence and perseverin application, many of the principles which govern moder agriculture may be understood sufficientiy to enabl tiem to be applied successfully; butgreater cost, both of time and energy, than would the case, were ther studied under the immediat direction of competent teachers. Successful and economical agriculture at the present day requires not onl what has been denominated practical knowledge, bu also that which is theoretic and scientific. Theory and practice ought never to be divorced. It is a right and necessary alliance. To know the right thing to apply in the right quantity, in the right place, is to possess a knowledge which must result in immediate pecuniary benefit. What immense losses have frequently bee sustained for the lack of this knowledge-a knowledge which science and practice combine to impart. I feel every day the necessity of a more thorough knowledge hat I of the more scientitic branches of agricultare and be able with greater success-because les Chatteris.

Devonshirk. - The usual education of the farmer's son is the parish school. Some few may
attend the Grammar School in the town, but those who are most likely to be brought up to succeed thei rathers generally go to work at home, and have rather less of education than their brothers, who may be brought up to trades. The young man generally goes beyond attending markets and fairs, to fit him for gaining a livelihood on a farm, that the labourers do not equally enjoy. There are hereabout so few men who have had an education fitted to call out the higher powers, that I much doubt whether I could say generally for the district that the farmers as a class re better in this generation than the last; the best armers we get are men who have not been bred as armers, but who, being shrewd business men, have aken to farming in atter life. The farming of this istrict, however, depends 50 much more on stock and its management than on agricultare in its more little land becomes to a certain extent a jobber, as he ays he picks up the rent outside the fences, and no doubt by tact gets along; bat possibly if you were to a how much produce his farm makes he could give no neighbour's loss, What has been his gain is his bargaining, and so long as this prevails we cannot expect any great advance in the farmer as a class especially as the furms are so surall as to make all these things a mere temporary shift, involving no large principle. I should say that a lad would be ikely to succeed who had, until 17, a good sound general education, embracing as much general knowledge, as much mathematics, and as much good moral training
as he has power to embrace; then as to special as he has power to embrace; then as to special
training I think that unless he can have reading and lectures, or both combined, and with practical observation on the land from time to time, so as to combine the two in such way as to render what is going on on the farm reasonably interesting, and what he learns hy book or lectures reasonably applicable to the work, he
is not likely to derive much benefit, for I have seen many young fellows in farms where they were placed to be taught, who really, though they might see the operations of the farm, had not their minds directed to the principles upon which the work was going on, and merely whiling away their time hunting, shooting and so forth, the school training being maetly lost, and nothing more than indolent and careless hubits acquired. But it may be in many cases out of a man' power to get to auch an establishment-in that case perhaps it may be well that before he attempts any regular course of reading or attending lectures, where there is no farm for him to carry on both cases simul taneously, he should see somewhat of farming in orde that he may understand the terms used, and generally the use of words applied to the subject, so that he may the more readily comprehend what he hears and reads afterwards when he cannot have the farm to refer to
As to the question now pending before the Committee of the Council of the Royal Agricultural Society of England, I think that to stop after making young men fit by their general education, which may have been tested by other means, and to give premiums to the sons of persons connected with the Society or with
farming, is an entire perversion of the subscriptions, because, though their fathers are connected with th land, the sons may be merchants, tradesmon-in short, done, it may be, most credisably, but they have not done and it may be are never intended to do anything fo agriculture: and should the Society choose to divert
3001. or any sum in that direction, it is an entire mis appropriation of funds given for the advancement of agriculture- it ought to be protested against. If the spirit and the letter too of the Charter is to be carried out or even attempted, it should be by encouragement of the particular knowledge of the business and science of agriculture. $\boldsymbol{X} 1$.
6. Drvors - I am well acquainted with the views of agricultural knowledge, with sound general education, is likely to be more useful than Greek or Latin, \&o As soon as the youthe return from achool, abont 15 or 16. they assist and make themselves useful on the farm, if they are selected for farmers ; and I believe that the nons of farmers are better educatod in evory wade to their fathers; and I also believe the attempt made to induce farmers to go beyond what they consider useful will prove abortive. I may here state to you that the poorer classes, when sent to the village school, are taught what unfits them for after life nstead of such things as sewing and knitting so, for the girla, and for the boys, reading, writing, and arithmetic, and all beyond this is an injury rather than a good to farm labourers. George I'urner, Exxeter.
7. Duriam. - Farmers' sons, and others intending to be farmers, are now in this district as well educated and brought up as any other class of men. There are all the brabudanco suitable for farmers sone, where ncluding algebra, co school, are generally bouud for three or five years either to their own father (if he has a farm), or otherwise to some well-known farmer or agriculturist in the neigh bourhood, where they are supposed to learn all the requirements necessary to be a farmer, in order to enable them to manage a farm of their own. I am most decidedly of opinion that farmers' sons are now, taking them as a whole, better educated and more alive to the interests and advantages of a good cound and practical education than any previous generation, and as a whole they take advantage of it; and I believe that there is now no fear (owing to education) of the march of improvement in agriculture being stayed, as pursuits are advanced by experiment and illustrated and improved by discussion, so agriculture is in nowise an exception to a rule so useful and so profitable. have always been impressed with an idea that a youth sent to school to learn the ordinary brauches of an English education, ought, previous to leaving school altogether, spend two or three years in some (what I his future life would form an every-day study, and where the mind would be able better to comprehend and understand agriculture in all its phases, both as a science and an art. Whereas at an ordinary school he cannot, as the mind is constantly being taken to something else to learn, and thas there is not improved that constancy of mental action so necessary to all scientific pursuits. Whatever may be the nature of education in other respects, it should always be a matter of chief consideration to imbue the youthfal mind with a deep ense of religion, to teach the duty we owe to God and man, and to impress upon all persons the benefits to be derived from habits of temperance, indastry, and forethought in their journey through life. The inculcation f these moral and religious daties constitates the groundwork of all good education. Robt. B. Dixom, Land Agent and Valwor, Darlington.
8. Gloucrstrrshirb: The Cotswolds.-First: The usual education of the sons of farmers in this district (as far as I know), even of those intended to be farmers, has, I believe, generally, no special relation to their future avocations as farmers I know of no chools in his district in which any special instruction to fit lads or their futare occupations as farmers is professed to be given (except, of course, the Cirencester Agricultura College). The young men on leaving school generally stay at home, and are engaged on the farm, picking up what knowledge they can from their observation o their father's and their neighbours' proceedings, and oubtless not a little from the discussions at the farmers' clabs on agricultural subjects. Looking back rom any point of view embracing a retrospect of ion, in general intelligence, and in social standing is enormous, and the advance is still progressive. Comparing the present generation with their fathers, the mental and moral improvement is very striking. Many the young men now seem quite alive to the necessity of a higher tone of education and mannors, and also to the acquisition of as much sound scientific knowledge as hey can procure. I must add that my observations are intended to apply solely to our hill farmers; with those of the vale my knowledge and acquaintance have been very slight. Possibly pastoral and dairy employments may be less favourable to the development of the mental powers than active agicultural engagementa A.I. Fewster, Nailsworth.
9. Glouctistersambe-I do not see why the education of a farmer should be different from that of any other man intended for any other businesa, All he re quires is a good sound education ; a little Latin and

French is not amiss, though not absolutely necessary The misfortune is that you cannot get leas than 50l. or 60 . per annum, which is more than an ordinary renting farmer can well afford. $\mathrm{M}_{\mathrm{y}}$ notion is that a boy ought not to spend many years at school. I left myself before I was fourteen, and Wrent at once to assiat in every operation that might be seeing the cattle foddered properly, lending a helping hand. I have never found a boy in the way after leaving school ; and should quite despair of his making a man of business unless he had to mix with everything that moved before he was 16 or 17. Of course he ought to have access to proper books to amuse and time at achool. A little knowledge of chemistry may be of use, though I have never felt the want of it, nor have I ever seen a chemical farmer cut much of a figure. Of course in trying any new manure or feeding stuff one would not go into it deeply at first, bat feel the way gently, marking the results. This, chemical is a mach analyses, which are not entirely to be resed on in every picked up by degrees from observation and experience. All the learning in the world will not compensate for that; and I believe that a youth brought up on a farm of two or three hundred acres is more likely to excel in business than as though he were on a very large holding; as, in the latter case, matters are too widespread and wholesale to be within the compass of young mind. The most successful farmers of my sensible men, who can buy and sell judiciously, and attend well to their business. $\bar{X} 2$.
10. Gloucrestershire.- I consider the present tenant farmer, in point of education, social standing and real intelligence, to be far saperior to the past generation of farmers ; of unassuming mauners and little exterior show, he is too often looked down on with slight and contempt by his professional or mercantile and
trading neighbour, who himself perhaps possesses but a very small share of the other's sound sense and real intelligence, and employs less than one-eighth of the capital in his calling. The present farmer fully recognises the great value and necessity of education in nerve, and practises much seledenial to find the means to suitably educate his son intended to be a farmer, but herein lies a difficulty. In this philanthropic age, whilst the parish pauper's child gets comparatively
good education provided for him, the tenant farme with increasing heary parochial and county contributions, higher rents and labour, with diminished profits, is obliged to educate his son at the present schools, which, deriving no help from any endowments are much too expensive to allow the pupil to remain sufficient time for sound edacation. I think the papil should be prising a good store of arithmetic; land surveying and mathematics, the principles of chemistry and geology, deem not indispensable if a hindrauce to other studies but a knowledge of French (and perhaps German) might be useful to facilitate the rending of continental publications, foreign correspondence and foreign easy foreign farm produce. The above, combined with good moral training to form right principles, should, I conceive, be a fair groundwork for the embryo farmer to act on; after this his own common sense, energetic farmers, must work out the practical solution. $\bar{X} 3$.
11. Hants.-The same meansare available for the sons of farmers as for the sons of tradesmen, and commercial and professional men, but these schools being for the most part situated in towns, the residents of these cost by sending their sons as day scholars, whilst farmers, from their isolated position, are necessarily .obliged to incur the additional cost attending boarders. Amongst the higher classes of farmers an equally liberal edacation is afforded to their sons as that to the sons limited or straitened, the effect of the extra expense of living operates injuriously in limiting the time devoted to education. There are numerous excellent schools in this neighbourhood, and in this coanty, where the sons might be well and sufficiently educated. I know of no schools exclusively intended for farmers' sons, and 1 think it most unnecessary that there should be any, for cialismost of the country should be rubbed down by the smoother habits and mamners of the town, besides which, if a farmer has many sons, not more than one on an average becomes a furmer, the others serve to fil schools for the education of farmers' sons would, I con sider, be extremely objectionable, and the expense the unavoidable expenses of a country life. Schoolmasters are by no means too well paid, but it would be much better if a more moderate sum was charged
for boarding (et ceteras done away with allogether) and a much higher sum apportioned for education
itself, Then the state might very properly step in and promote middle-class education oy providing free of cose maps, books, and stationery. This, I think, would bt much better than ruining the present schools by establishing others on lower terms, sapported or charitable assistance. Farmers have no special claims for special assistance in the way of education other than those which the midde classe have generally, and Agricultural Society to interfere in the which are subscribed for other and for special purposes. The poor are for the most part educated by charity, and so are the rich to a very great extent, inasmuch as the Universities of Oxford and Cambridge, \&c., nim supported quite as much by the enormous bequests made in days of old as by the payments made by the students. The middle classes are debarred from availing themselves of the universities by two reasons, unless they intend their sons for the Church. One reason being the great expense of living rather than the various special subjects required in the study of the various professions. Still education is afforded cheaply for wealthy people, and the expense is diminished perhaps one-half by means of eleemosynary aid. It is this, I take it, which affords almost the only claim of the middle classes for publicassistance in the way of education. The cost of respectable and substantial middleclass education as boarders may be considered, boarding included, to range from 302 . to $60 l$. and $70 l$. per annum in this neighbourhood. As a rule there is no great reason to complain of the education afforded, and as a class those engaged in tuition are, I think,
well worthy of their hire. The education given to the sons of farmers is much superior and is much more appreciated as compared with that of 30 years ago. The usual mode pursued in the education of the farmer in the south of England is, after leaving school at the age of 15 or 10 , for the lad to remain at home on his futher's farm if he is the son of a farmer, or if not so, to become a papil to some agriculturist of repute for several years. This latter course is often pursued by
young men who have passed several years at Cirencester, where, although they have had excellent opportunities of stadying the sciences connected with farming, yet generally find themselves deficient in that practical knowledge necessary to secure success in a business only moderately profitable. I do not conaider that the devoted to common middle-class education, but I think aid might be very advantageously afforded to such establisuments as Cirencester College, where special agricultural knowledge is taught, and I am inclined to think that assistance might also be given to Farmers Clubs, so as to enable them to secure good lecturers and good books for the use of farmers sons and pupils. W. C. Spooner, Eling, Southampton.
12. Hunimadon. - We find amongst farmers very various degrees (as of material condition so) of
intellectual attainment; from very high to almost zero: and so far as I have observed, I believe that the educational status of the son generally speaking is in pretty strict proportion to that of the father: the rising generation cannot of course but in some measure actual education, intellectual training, schooling of the son is proportional to that of the father; e.g., if the father can barely read and write, the utmost intellectual ambition of the father certainly, of the son probably, and do be satisfied if the son could read and write weh, father farmer were a well educated man we shonld generally find the education of the son proportional to the father's own intelleetual condition, and consequent appreciacion of education. To speak of farmers in-
tellectually and educationally as a distinct definable class would be not only contrary to fact, but it might at the very outset of the move you contemplate, provoke the opposition of those amongst the farmers of England who are conscious both of their own appreciation of education and also of their complete ability to take from the education of their sons without hint or help from any one. There is however a large number of
farmers whose own education has been almost nil whose capacity of appreciating education, and whose notions of the edrcation of their sons are in etrict proportion to their own mental condition; for the sons of these farmers there is doubtless a great want of good schools. The existing schools are-lst, the national sehools: these, as being intended for labourers, and being partly eleemosynary, the farmers will not avail themselves of; 2dly, the old grammar universities and the so-called liberal professions, and moreover expensive, are out of the reach of the kind of farmers under consideration; 3rdly, there are the countred commercial schools scattered about the country: they are started chiefly as a means
of livelihood, kept by men who regard school. seeping as a commercial investment, and who, except quite accidentally, have no aptitude whatsoever for the work of education. The utmont professed to be taught in these schools is reading, writing, bookdrawing, and perhaperimental land measuring, a little drawing, and perhaps, to make the prompectus a littl
palpably inferior to that provided in our best Neatice schools. It is for this class that schools are Nation and in our endeavours to supply this want I think following points should be kept in view:-1st masters-the educational staff-must be gentle men of liberal, generous minds, who can appreciato mportance of their calling; and who, in all their in course with their papils, will exercise a generous, libem humanising manly influence on them. 2 d , the echold must not be class schools-not for the sons of farmens only; this certainly would tend to produce a parmens exclusive, "caste" habit both of mind and chamen, 3 d , the education (at any rate for the greater portion of the school life) must not be professional, but general humane; a training of the head and heart with the express object of making good, well-informed, reliant citizens; a general sharpening of the mental tools, and elevating of the moral habits a training repeat, to turn out good and capable men. Preparatio for any particular work or caling-for the applicatio
of the faculties to any specific work-should be defero as long as possible, in the case of those whose edac time, at the longest, is but short; for this purpon the schools there might be special classes for elder pupils; but probably a better plan (if specific prote sional training be needed for farmers) would be to har agricultural colleges, where the student of agricilto might spend a year, just as the medical student acquit his professional training by walking the hospital But I should be disposed to think that, with mental faculties fairly roused, and got into play, the the particular calling of a farmer, would, by books, his own observation, \&c., be very well able to dispense with any specific agricultural training; and, if soc training should be advisable, it would probably be bet got by an appenticeship to some well chosen meter the art. I should expect, I must say, an Agriculturn College to prove a failure; there is not demand enon for it in the nature of the case. 4th. There is the cast of the education ; it must not be high-to fir it hig would be fatal, suicidal, considering both the material and mental condition of those for whose sons the education is intended; men (at any rate the farme portion of them) whose means could not afford a costl education for their children, and whose appreciation o education is besides very low. I believe masters the right sort-men of liberal education and generou feeling-could be found who would undertake the work But the works sake, at just a living reminath not a commercial investment but a free gift; to fulf their proper object, the schools could never do more than just support themselves; to be made widel available for the class intended to be beneited by utmost generosity and self-denial for at any rate a long time to come. It is an iuvesting age; a speculating age; large dividends and high rates of interest wero never more in request, but still, if you can schools for the one class in England who need drate in this matter most of all, I should hope the sciew would not fall through for the want of $£ \mathrm{~s}_{0} \mathrm{~d}_{\mathrm{o}}$, eren though the money inter

commercial, professiona, and tradesmen sear their own into an office, or apprentice them to learn their own busineseses if farmers were to do the same. In the fe instances 1 bave gnown 1 , fion of farmers is far superio in education (but not in wealth) to the last. We may not have many classical scholars, but we have many not bave many clear-headed business men, as
Which I may state that most of our poor-law unions in this part of Kent have a farmer as chairman of the boaru of guardians. The same may be said of the anely an ricultural district. We have many magis tintes who are ex officio members, and some of them rery regular in their attendance, but the chairman and the rice.chairmen of both boards are farmers. These ar ficte, and will show you better than an opinion, that the education of farmers has kept pace with that of tiuer classes. There are near me two farmers who may be mid to be well-educated men; but I think neither their farms nor their balance-sheets would prove that
their education was beneficial to their farming. $X$. 5 .
14. Nobth Lincolwshirb.-Very few of our young men go into other counties tho learn farming, but stay men stiok to the practical part pretty ang men stick to the practical part pretty well lat 1 am sorry to say among the larger and mor fond, and far too sonn to like hunting better than the regular routine of the farm. No doubt the present particularly the smaller farmers, though many of the more respectable class of last generation were wel
d men, and their social standing has not so mucl as in some countries, ln my opinion, give a boy fair education after he comes from school; it greatly, up, bistogether depends to get to know the whole practical part of If industrious he may succeed in business. would have him learr the manual labour of the farm o as be would be able to correct a man when he was
rong, not to filld fault when a man was doing
This is not the case at pre f field sports before they know anything about the asiness they are intended for. As to my own school elucation I am sorry to say it was very meagre,
laving left school when I was a little over 13 years of

My father left the north of Wiltshire in the year and took a large farm in this neighbourhood (1100 acres), he yielding to my own inclination of going work upon the farm instead of going two or three jears to school, which I ought to have done. For five years I atuck well to business, rising early and early to
rest, At that time my father took the present farm apwards of 900 acres I am now on, leaving an elder arm of 460 otwer. My father likewise has another our time without moch work occupation enough for I started business for myself at Aylesbury, where I have I attribute my success in business, under the good providence of God, in the first in my youth, following that up with tolerably indus-

## 15. Livconsshire, - There is a rumour spreading that

 Whether of prizes for middle-class educational students. Proved; but it is said that the Committee on the conech a course at the next monthly meeting of theThe popular movement for the better educamiddle classes cannot be too highly commender. It will be the means of doing great service io support it, consistent with truth and honesty. But
the funds of the Agricultural Society of England are subsal advancement, and purpose of promoting agriculmiddle classes. What in the name of common sense the sons of the clergy, or the sons of those engaged in
commerce and employtnents connected therewith, $i$. e. the middle classes exclusively. If any of their sons are studying
agriculture, lot to appropriate a recognition of such may be right pervers promosing middle-clasg shilling of the Society of the intentions funds, and is acting in contravention propriation of such funds for educational purposes is to
contine them to contine them to agricultural students, and to give such be deemed expedient. It may be right, and it onay be
dexirable for the Royal Agricultural Some
to movement itself with the middle-class educational flass students to agrinations, or the admission of any middlecourse to the chance of agricultural honours, \& \& . ; but azricultural students calturalstation may embrace very much that middle corituralstudient may embrace very much that an agri-
fessedly studying agriculture hess the student is pro prize as an agricultural student, and for the Royal Agricultural Society to give prizes for proficiency in any department of learning, agriculture excepted, is
decidedly wrong. I am an old member of the Society decidedly wrong. I am an old member of the Society
and feel greatly interested in its prosperity. I hope nothing may be done to mar its onward progress. Th funds are by no means so large as to admit of an misappropriation. I have always thought the Society wondrously stingy in the prizes offered to essays and reports; almost any editor would give as much for the matter " as the prizes amount to. Then we have no poultry show. Many ways could easily be pointed out as a laudable and useful appropriation of the Society's funds, but none to equal in usefulness a libera provision for agricultural education. Only offer a series of honourable distinctions, either in prizes or diplomas or both of good order, depend upon it, the stimulas would soon be universal. I hope you will urge the men of business who are on the Council to atten the next meeting, to watch closely, and if needful frus trate this folly of the Committee on Education. O. F.
16. Norpolk.-There are several good commercial schools in Norfolk, besides those of a higher class, and some of the grammar schools appear especially devoted middle-class education. Supposing the lad in tended for a farmer to be, as he generally is, the son of a farmer, "the special training" he receives is all
imparted by his father. The young man lives on the arm and helps in the management, and soon become a bailiff to his father. By this means he obtains a good practical knowledge of the working of that particular arm, but he has no opportunity of perfecting himsel in scientific agriculture, or even of knowing much of There can be little doubt, that as far as education and general intelligence are concerned, farmers of the present day are greatly in advance of the part genera tion. As sound practical farmers, I don't think they are much improved; but of course their knowledge of the principles and science of agriculture must be greater. What is wanted in the general education extended knowledge of the common things of nature nd art. Surely the study of plants and animals, of chemistry and mechanics, must be of more use to farmer in after life than the rudiments of Latin and Greek. Although I can't fully appreciate the advan tages of a first-class education (having only received a ery poor one myself), yet I can in a measure compre bend the elevating inflaence it imparts to those who have time to thoroughly perfect it. But farmers' sons eave school at 15 and 16, and should therefore employ all their scholastic days in the attainment of really use ful knowledge. I take it to be a great advantage for all boys, but especially country boys, to be educated out o cheap, the extra expense is very trifling. Independently of the boy losing his rustic manners and his country dialect (two tiresome things to get rid of), the develop ment of those ideas he possesses, and the acquisition of sundry new ones, will surely resalt from being educated in a new locality. If the echoolboy has during the last few years been well educated at a distance from home, like after training on his father's farm will be more doubt a year spent at an Agricultural Coliege, or with . would be beneficial. But the practical part of agricul-
ture can be learned in the best and cheapest manner at home, provided always that the lad attends to business, and does not devote all his time to pleasure My individual experience is simply this: I was sent for and when I was just'I5 I left school, and passed the next five years in learning farming at home. From 20 to 28 I was engaged in managing farms and estates in various parts of the country, and I fancy in those eight years I gained more information, and a better know ledge of practical agriculture, than I should if I had passed my whole life in Norfolk. I must express my decided opinion that the proposed expenditure of 300 by the Royal Agricultural Society for general educational rewards, in which no proficiency in agricultural knowledge is required, will be a decided misapplication of the funds of the Society. Clare Seveell Read, Plumstead House, Norwich.
17. Norfolk. - The sons of farmers in this county are frequently but too superficially taught. We have no schools where a good and sound education can be had at a moderate cost. There are grammar schools where classics are the leading feature, with terms from 60 to 70 guineas per annum; but the schools chiefly supported by tenant farmers are generally of a low type, the terms averaging about $25 l$. per annum, concertificated National masters. Some of my neighbours have sent their boys at an early age to our leading grammar schools, but have been obliged to remove them, owing to their not being taught, or well grounded in the rudiments. We lave a Free Grammar very important agricultural district. This school is richly endowed, but as the free boys are only taught Latin and divinity it is not supported. No doubt but
the prosent education of farmers is in advance of our
forefathers; but still far from satisfuctory. I know foretathers; but still far from satisfactory. I know
young farmers, educated at our grammer schools, who can neither spell properly, nor speak nor write mportont. What does the young man generally do after leaving school? If the son of a small farmer, be goes to work on the farm, and becomes a practical man If the son of a large or well-toodo farmer, his time i too often divided between idleness and pleasure. It has mis impression that farmer8 make a grea mistase in the after-training of their sons; while every sion haung man who learns a trade or enters a profes the farmer's son when lertain amount of drudgery ride, probably takes out a licence to shoot, or keeps orace or two of greyhounds. This is all very well in doe season, and far be it from me to deny young men such invigorating and harmess pleasures, but let them first know something of the practical part of their business. drill drill and all other work of skill. There is nothing coither degrading or demoralising in work; on the young farmer can set pis men operations of husbandry, and be equally at homeas a lecturer in the club room. Alas! how many there are of my own class perfectly useless in either sphere. It is true there are inany young farmers around us who are excellent farmers, possessing great tact and judg ment in their business, and enterprising withal, but not sufficient education to take their stand in this ocial position to which in other respects they are so well qualified. And I would here allude to that great oss of moral power amongst us ae a class for want of higher order of education or intelligeuce-see our abortive efforts to get a repenl of that unjust imposition the malt duty. Would the manufacturing aud com If farmere knew how to set about it they would be certain of success, but the mass, with a fow exceptions, are an easy apathetic non-political body who will not nor cannot be aroused. It is impossible to organise them eren for their own good, hence their helpless and lmost powerless position. But oducation to a farmer vithout thorougla practical training is but too often of ittle value, hence we find the majority of our successful nd money-getting farmers are comparatively uneducated. It is said that agricultural labour is so cheap that it does not answer a farmer's purpose to make his boys work, bat all who understand the business of farming know that but one master is needed; employed or to be allowed to lounge about in idleness, employed $\theta$ 路 to be allowed to lounge about in idleness,
we all the too probable ;result: besides, no farmer (and I speak from experience), feels so much delight in his business as he who was taught in his early days to follow the plouga. Being one of a large family and needy withal, my education was far from coatly, commencing at five years of age under the tuition of an old dame in the village (not to be compared with our present parish school mistreases). In due course I was placed under the care of the village schoolmaster, and finished my academical career at the age of 14, a sort of finishing touch having been given at very cheap boarding school, where I believe I got a pretty fair knowledge of the English years' apprenticeship. I was taught to turn my and kind of work on the farm. At the age of 17 such was my ambition that I took my place as an able hand in the harvest field: when a year or two older could plough, drill, mow, to prove how such work developes strength and activity, I have many an evening (after my day's ploughing) gone to a cricket club four miles distant, and when too dark to see the ball finished un with foot racing or wrestling. At 21 years of age I took the full matagement of the from. I would here explain that my father died when we were all very young, and hard struggling it was for years after to maintain our position. I carried on the farm for the benefit of my family till the youngest was of age, and with some success, being able to divide a little sum amongst ourselves, and starting on my own account in the farm with 500l and a borrowed canital of 2000 l more, as security for which I could only give a bill of sale over all my effects. Saffice it to say I bave not been un successful, but attribute that anccess in a great measure to that thorough practical knowledge obtained during my apprenticeship. Had I been brought up in idleness and placed in bnsiness with ample means, I should probably have come to grief, as many others have done. This is a brief history of my agricultural career. To conclude, I do most certainly adrocate a more sound and intellectual system of training for the sons of farmers, to be followed by a thorough practical know ledge of their business. The former can only be obtained by the eatablishment of large public agricultural schoors or colle terms ay not exceoding bo bear $X 7$ moderate terme sar not exceeding 40 h year. X. 7.
18. Norponr, - The course of edncation pursued in the present day is quackery; that is, whether a youth is to be a shopkeeper, a linen-draper, or a farmer, he has to go tbrough the same routine of
learning. Another thing which strikes me forcibly at this time is this, that if farmers could be induced to paty more attention to their danghters education in baving them domesticated for farmers' wives, it wonld be much
better than tenching them masic and other accomplishbetter than teaching them masic and other accomplishments suitable in their places, but not exclasively. Norfolk, I believe, is peculiarly circumstanced at this liberty to choone whether he should keep a dairy or onis bullocks and sheep; for this reason-not one out only bullocks and sheep; for wises, particularly young of forty of the farmers wives, particulat have any idea about the management of cows, farmers, have any idea about the management of colt where are we to get a good servant? That is the question. Every farmer is asking you at Michaelmas, and often during the yeur. Some of our large farmers employ a gang of young lads and girls, and white they do that l'll be boand for it we shall have no modest, cleas, and domestic servante. W. $\boldsymbol{H}$. Taylor, Wymondo cleas,
19. NomThamptosithirn-I think it is diffealt to overrate the advance made by the actual generation of For 20 years I had no difficulty in keeping far ahead of all the farmers around me, bat now it is not so. The general cultivation of the neighbourhood is very much improved. Some of my own tenants farm their land as well as I can, and they adopt any improvement as soon as they are satisfted that it will pay. Some of the beat of them have been labourers. I send a copy of a paper which I read some years aco at the Social tion to agricultural labourers. I continue the system, and year by year am more thoroughly convinced of its advantages. Now, the result on the boys is that they are more orderly and industrious and very much more intelligent. They will underatand an order given and carry it out. They do not lay asidu their books when
sehool is done with. Thon who continue in farmers' service have given gatiefuction, but their education evables many of them to fill more locrative situations with credit, and I have never had a single complaint of their comdmet in after life, My schootmaster sent his son at 15 years old to work on my farm, because he saw how well the half-time succeeded with the labourers' boyn, and be always has rejoiced that he gave him the opportunity. His intention was to fit the boy to become a b:iliff, and I think it an excellent foundation for a working bailiff's education. To apply this to your, query, I would say that the farmer's son generally should continue for two or three recommend that he three days a week at scliool and three on the farm at work. I think that the intelligence and observation which are developed in the labourer's son would be still more marked in the farmer's son. I do not think that scientific knowledge is very necessary in the ordinary tenant farmer. If he has a tante for it I am quite sure that he will be able to gain it after the preparation which I propose for him. His usinal place is not to lead, but to observe and follow the most profit.
able aystems which he sees around him. Cirencenter is the place in which a Etervard or land agent may acquire the science he ought undoubtedly to possess. He ought to learn chemistry and geology, enough to know the peculiarities of the estate on which he is to operate, and to appreciate the opinion which he may obtain from professional men as to manaring, soilng, draining, \&\&. He should be a light in the country whose advice would be looked up to and example followed; but an education such as he requires is beyond the reach of the bulk of temants' sons; and I think gives a man nearly all he requires, while in a wilderness where so many things are new, Bcience will be mot valuable assistance to a farmer. You will gather from What I have said that 1 have long taken a great interest in this question as applied to the substratum of our agricultural population, and I shall watch its pregress and receive with pleasure any light which you may be enabled to throw upon it. Cherles Paget,
20. Sennex. - The general education of furmere' sons intended for farming in this neighbourhood is principally entirely passed over. There is a College at Hurstpierpoint, also private schools at Lewes and elsewhere. Upon leaving school the boy is attached to his father's farm, and entirely under the direction of his father. If his means are small the boy follows the plough, and otherwise works with the labourers, which associates him with low life, and often unfits him for good society. If the family of the boy is in better circumstances, then he mixes with better society, and often neglects
hin daties, to the no small chagrin of the father, who hinds it difficult to fix his son's mind on the operations of the farm. I believe that the preeent race of farmers are not so well informed upon the general working of the land as the last generation, but we possess many appliances which formeriy were unknown. I account
for this want of practice by the manner of living, which is more pleasurable and more expensive than it formerly was, owing to the mind laving leeen withelrawn from the lower avocations of farming by education, or rather business of cultivating the soil. The only men who
probit by a good and liberal education are agents estates, but do not confine their mind to farming. it is necessary to produce more evidence of the necessity of practionl lnorledge in farming, I may say that I know of practical nowledge in arming, may say that kge of 22 , who is capable of conducting a large farm to advantage unless entirely trusting to an experiencerl bailiff. Even at a maturer age, few who are liberally educated can mavage of themselves. These experienced men to whom they trust are spruag up from a class of indigent bat pracial policy adopted by the so-called (but impro perly) polttieal economists. With regard to the breeding and grazing department we have few living anthorities, and none equal to Bakewell, Buckly, Price,
Tomkins, Stone, Chapman, Stolses, my late father, and Tomkins, Stone, Chapman, Stokes, my late father, and study, confined to the natural bent of the mind; no assistance was then at hand, but that which on imparted to the other, being the result of a wellconsidered practice. In conclusion, I am quite prepared to prove my assertion, thal any education which entices the mind from the avocations of a farm, must in evitably weaken the object, and mislead the practitioner dingham.
21. Yorkshire - The sons of farmers in this neighbourhood who are intended for agricultural pursuits are for the moet part sone phools, which are both numerous and respectable, and when he leaves
school he is presumsed to be able to read and write correetly, to have a certain amount of information respecting arithmetic, surveying, the keeping of agricultural accounts, and to understand the rudiments of botany and chemistry. He is immediately set to work apon the farm, to harrow, plough, and other things as his strength permits. He generally continues with his father until the age of 23 or 25 , when he is put upon a farm on his own account. Many farmers in this neigh-
bourhood take agricultural pupils. I generally have three or four who stay for two or more years, and work at anything they prefor, keep an account of what is doing on the farm, and attend the markets with me. The present generation of farmers in this neighbourhood are both far better educated, and much more anxious for general information than the last. Forty years ago the tenant farmers could read very imperfectly, kept very inaccurate accounts, and never left their homes except to market. Now, every farmer of 50 or more acres of land takes at least one newspaper weekly, atteads some club or reading room, and is ready to take part in any discussion that may arise at the market dinner table on agricultural subjects. I remember the time when any order, however absurd, sent from the landlord or his steward would be implicitly obeyed. Now, it would be read over, contenant farmer patitioned against and published in news papers. With regard to the kind of education suited to the tenant farmer, I am of opinion that every boy should be educated upon a broad basis until the age of say 14, When his attention should almost be exclusively directed to those sciences which he will be called upon to bring into practice when he enters upon the work of a farmer: accurate hook-keeping, some knowledge of mechanics, especially tasion and draught, anaiysis of soils and of the subjects most useful to tenant tarmers. John Outhuaite, Bainesse, Catteriok.

## Home Correspondence.

Dr. Mackenzie and the Malt Tax.- I have read with aotonishment the article in your Paper of Saturday last on the malt tax by Dr. Mackenzie. It is full of
egregions fallacies. It contains one truth, however, namely, that the Dr. "looks at the malt tax in a light by which few care to examine the question." The remer the better, for the "light" is moonshine. He and malt. Were they the memorable ones conducted and malt. Were they the memorable ones conducted
upon two cows by Dundas Thomplson at the instance of the frovernment in 1846P - on "two cows, onea white one, quiet and steady", and the other a brown one, "fitful in her appetite" and temper, and which experiments are remembered chiefly for their worthlessnces? If so, let me supply Dr. Mackenzie with the experience of a practical farmer. Mr. Hudson, of Castleacre, says :I grow 3000 quarters of Barley annually; if allowed to malt coarse Barley, and feed with it, I could save
2l. 12s. per beast by it as compared with Barley." 2l. 12s. per beast by it as compared with Barley."
Experience for experience I prefer that of the practica farmer to that of the theoretical doctor. Farmers have been often blamed for not listening to the teachings of science, but they are justified in their reluctance to listen, when scieuce, in the person of Dr. Mackenzie, talke such nonsense as the following: "To make 5811 guarts of beer, about, 350 lb . of Barley have been usad, of sound nourishing Barley food, all now reduced to one pound" "! Was there ever such balderdash! "Unless all chemists are mere impostors," says the Dr., "almost, the whole of the nourishing principles of the Burley are utterly destroyed by fermentation." The Dr.'s teetotal truth.
man, and refer him to Paul, who says "Bo tercperate is
all things." Yes, temperate in aspertion as all things." Yes, temperate in asoertion as well as is
drinks, and the Doctor was very intemperate drinks, and the Doctor was very intemperate when $b$ nutritious properties of Barley are utterly deatroyed fermentation. Professor Johnstone writestherefore, is food as well as drink. A little beof eato with it makes up the deficiency in with makes up the deficiency in glaten as compen with milk (the model food); so sophically put together, at once to mose misi sustain, and to stimulate the bodily powers" (cthen, of Common Life, p. 301). Again, that the Doctor sees things "in the light" shine when he alleges that "every chemis: and physiologist admits that alcohol does not contiuin vestige of nourishment, but destroys digestion an devitalises the blood."
Mackenzie will allow him to be a chemist). - Alo stands high as a respiratory material. Its use enable a dispense with starch and sugur in our food Again, "Some temperance families, depriving thei servants of beer, gave them compensation in moner but they soon found that the monthly consumption of bread increased so strikingly that the beer was thin paid for, once in money and a secoud time in brend
Dr. Moleschott, another distinguished German chemit Dr. Moleschott, another distinguished German chemit little and drinks moderately retains in his tisses and blood more than he who under corresponding ci stances eats more without taking beer." So mech the rash statement of "every chemist," \&c. Now, fo the physiologists. The learned writer of the "Physiolognt of Common life," says, "There are few facts better e and power that wine and beer increase the actirit waste," p. 175. The great physiologist, Dr.Cirvention himself a temperance advocate, alleges that in some cases " malt liquors constitute a better medicine thens could be administered in any other form, and aff the only means of procuring the digestion of amount of food which the system really requiras
I think the above statements show that the light which Dr. Mackenzie views the malt tax, dramatic glare derived from teetotalism, or some othir such delasion. Every man who has in a state exhaustion partaken of a glass of unadulterated al knows that it is mutritious, in the right sense of the word, and true acience teaches that other mation beside flesh-forming matter, is required for crent who possess brains and a nervous system, whatever suffice for others, who are constituted differeniji. man was ever more opposed to the $\sin$ of dral ness than the brave Havelock; "his sainta," said his Gener upon," and yet, what do we read respecting attack on Cawnpore? -they had no meat for 48 houns and happily "some porter was served out; no one who heard their cheers as they marcum aubsequently came into close contact with the could doubt the bous of the stimila Such facts as these are worth a thousund cl theories which teach us that bran is more nutritions than flour, and horseflesh than ox-beer. Dr. Mackeana then deliberately informs us that he desired the to curse those who had not done so great an those commit who convert Barley into beet. regard such curses. Beer is the poor man's mine and we know Who ordained wine glad the heart of man." As good a man
Dr. Mackenzie, and a better one than Solomon, did niv consider that its temperate use would "destro, tion or devitalise the blood," but advised his frien -" Drink no longer water, but use a little wine for the "mach's sake, and thine often infirmicies, iniquitor time is not distant when the repeal of to realise ia Malt Tax shall euable the toiling labourer to hath not only caused the Grass to grow for cathent hath also

Kew Poisonous to Cattle.-Of the poisonom of the Yew upon some animals there case in point, tending to prove the dangel
of the Yew, occurred here the other day from Loughborough, seven miles from leaving his horse in charge of proximity to a Yew hedge, which he iucautions howed off. After driving about four miles the alowe ; sefor of sluggishness, and was with reel, and before the gentleman could alight and died instantly. When opened an stomach was found to contain a quantit was the immediate cause of deati perfect health. In this instame the an empty stomach, which would no here had some sheep inclosed in a his garden, in which were growing sheup broke down the fence and pext day- being that several pext day-this occurred during No fact is more certain than tod fro
stanee liare not been so killed. We have here large with iron fencing, over which the cattle reach the wrauches and keep them as neatly cropped as :hey were out with a pair of shears, and in no inI do not see any good reason for supposing Yew more fatal at one season than another, although there appears to be adocided mystery respecting its Wadlend, Kingaton Hall, Derby.

ing and ing and feoding; and when the breeding and rearRoyal Agricultural mociety and of to the shows of the cat an reatural Society and of the swithitield Club,
should a farmer be expected to be up with his business
(now rising to a science), without a profeesional educs (now rising to a science), without a profeesional educa-
tron, any more than auy otber man? The farming interest appears to be coming awake to this importint subject, to juilge from the numerous advertisements in every agricultural jourual, either from pupils be paid, as in the learned professions. But the agr caltural college of which we have nometimes talked situated somewhere hereon the Silarian formation, would doubtless be the thing for Wales, the experimenta farm attached to it being sitnated on the soil, and subject to the climate of the country in which it taral society to the whole of South Wales, in such way as to give the whole of the sonthern principality would bring auch a varied display of atock, implement and machinery under view, as cannot be secured by mall society; and such large central soeieties are now the order of the day. Mr. Buckley at Carmarthen.
Cottages.-1. Double cottages are to be preferred, standing within their garden piot. 2. The angles should be north, south, east, and west. '3. The garden The privy at them a sixth to a quarter of an aer The privy at the extreme end, with the pigstye.
drain from the back door to the privy shoald oarry sur
face drainage and house slops to the privy : and thenc face drainage and house slops to the privy; and thence not thatch, are to be used. 6. A back as well as a front door: windows on three sides. Both sashes to open, vhere sashes are used; both casements, where there are duuble casements. 7. The day-room to have in its chimnoy an air-tube on separate flue. The floor to be made with a boarded centre, and hard flags or tile border, set in concrete. The floors to be raised 6 inche ireplace, with boiler attached, and a well-trapped sink 8. Three bed-rooms: for parents, boys, and girls Height of rooms to be 8 feet; the top of the windows to reach the ceiling. A fire-place to be in one roon at east, a ventilating tube in the other two. 9. The front romi and bedrooms to be approached from a
porch. 10. Where rows of houses exist, a washohouse porch. 10. Where rows of houses exist, a wash-house garden. 11. The privy in every case to be removed as tar as possible from the water supply. Dr. Acland
Calves House. - You may prefer a calves'house darkened intend rearing calves either as heifers or for beef, $t$ should not be dark. Indeed, in that case it is better that the calves be kept in a yard with a shed. In this shed there may be shallow troughs, containing a little cut Mangel, sprinkled over with meal, and some small netted bags of hay should hang within reach and unde shelter, which the calves", may suck and pull at. One or more frames (hurdle fashion), wide enough to stretch across the shed, may be slung from the roof, and pulled ap out of reach when not required; those are let down into their places twice a day when the calves are fed
These frames, about a hurdle high, contain openings These frames, about a hurdle high, contain openings 30 inches or 3 feet, into which the head of the calf is placed when it gets its milk from the pail, and in this way the two advantages are secured -(1) of feeding hem without any contest at the pail; and by keeping them fixed in their places for $\mathbf{1 0}$, minutes after feeding (2) of hindering them from sucking one another, which they are very apt to do. The cow byres may be made as described by Mr. Newlands, our best agricaltural engineer (at p. 805, Vol. I. 'of Morton's "Cyclopedia of Agriculture"): and it your farm is arable as well as pasture, and the cattle are to be fed on roots as well as hay during winter, the cow-house may be made as there represented: the section showing Turnip-house, gang way for the feeder, manger, standing ground for the
cows, gutter, and a space of about 3 feet 6 inches between it and the wall as room for cleaning up, bringing litter, \&c. The pigsties should be made with a lean-to roof, high enough next the wall to allow of a gansway for a man, and the divisions should be perfectly separated so as to hinder draught. At the end of the gangway may be the boiling-house. The cow byre and open shed should be the north rauge, and the pigsties the east range of a rectangular yard, Room
for six cows, say 24 feet as length of the byre, and an open shed of other 15 feet, will saffice on the north open
side.

## Calendar of Operations

March.-We have referred during past weeke to Oat and Barley, and Grass and Clover seeding; also to the management of the ewe flock at this season. This is of cuurse only a small portion of what occupies the attention of the farmer. Sainfoin, Vetches, and Parsnips magy be sown in March, and Potatos may be planted. The operation of paring and burning, as the best way of breaking up old turf for a green crop, may be carried on. The operation of hoeing in the fields of Wheat and witrer Beans is commenced. The roller and the harrow are in use on Grass fields, and aleo when the land is perfectly dry on young Wheats.
Dairy Operations are commencing; the milk is however still, even in cheese dairies, devoted aimost entirely to butter making. the quantity being lardly

On Weed Sowing, directly in foul crop seode, and indirectly in foul manure where the straw used in cattlo hair is of weeds-also from the murseries of weeds in waste places, we extract the following piece from

From the regularity with
From the regularity with which weeds are sown from all these sources, it is no wonder that so many men have come to look upon them as a necessity. Let, however, more correct knowledge become general as regards the nature asd habits of woeds, and processes of weed destraction be devised in accordance therewith, and we feel quite sure that our enemies will be kept in abeyance.
" Early Hoeing of Woods is necessary to this end, for that weeds are often multiplied by the very processes employed to get rid of them there can be but of creeping forms, such as Coltsfoot and Cubdivision sowing seeded weeds in hoeing. A few reasous back wo had a dirty piece of Beans containing, amongst other plough three circular pataner of Coltor ploughed and scuffisd, and the next summer Coltsfoot was tolerably evenly spread over its whole extent. The creeping root of Couch is in this way cut into bits by the ploagh, and thougt much be picked off the surface enough of it usually is buriod in some instances to increase the evil, and in all to ensure its continuance.
"As regards sowing weeds by boeing, it may b remarked that it is too mach the practice to treat all weeds alike, and so attack them all at once in a regule tion time of hoeing, and thus as some will be in seed while others are progressing to that point, though wo may deatroy the latter, yet at the same time we sow he former. It cannot be too atrongly urged that a different soils and districts presont weede of different species which do not all arrive at their most mischievon point of growth at the same period, so the only possibl way in which to effeot the destruetion of all is to kil them as soon as they are fully formed, and before they blooin. During March therefore, the hoe should be a work in dry weather among young Wheats. Patches or Coltsfoot should be carefully forked out, and no bloom allowed to seed."
Paring and Burning. - The following is another stract, condensed and abridged :-
This is one of the occasional works of early spring There is no better way of breaking un old sward especially on adhesive sofld. And even on lighter woils of there be a large extent of Grass land to be converted into arable, it is best after feeding the Grass hard down the previous autumn, to break ap at least one-half of it by paring and burning. If one-half be ploughed under before winter, it will yield large crop of Oats provided it be tolerably free from wireworin; and ir the other half be pared and burned, the ashes spread will ensure a capital crop of Turnips; and thus at starting you have halt corn and half oattlo food, and can continue the system yon have begn.
The paring (breast ploughing) will cout frome 158. to 208., according to the character of the sward but it may very well be done, as by Snowdon's paring plough, by horses. The turf is harrowed over roughly, and tiled by hand to dry. Fires are lighted every 8 or 10 yards, and a heap begun at oach, and covered over dily or rather nightly as they need. The burning vill cost 12s. to 158. per acte; and the ashes may be spread for $3 s$. They shoul! be ploughed under with as shallow a furrow as possible, rolled, and after rain, harrowed, and then cross-ploughed at a rather greater depth. The Turnip seed being sown in rows upon the fat, will grow luxuriantly with po other manure.
But the burning of the soil of arable land is also carried on in early gpring and in the antumn with good frect, especially on calcareous clays. It is adopted for three distinct purposes. It is used for the purpose of destroying an exoas of vegetable matter in the soil, being however then confined to comparatively limited districts-those of fens and bogs-ami even there it is dying out as its object becomes attained, so that in meny districts where the peat was 6 feet thick, the plough now takes hold of the clayey bed on which it rests. It is adopted, secondly, for the purpose of bringing a turf quickly into tilth, and there its oljeet is now so much to dissipate vegetable matter as merely to destroy its fibrous structure, charring rather than burning being thus the object aimed at. It is employed, thirdly, for the purpose of exposing clays and calcareons soils to just such heat as shall produce certain mechanical and chemical effects that are desired.

This last purpose is gained by the process of stifle buruing in calcareous districts, and by burning in heaps with fuel in stiff clays :-"Mr. Beaumont describes his practice on a farm of Lord Mansfield, which was a poor clay, at a rent reduced by the poverty and consequent incapacity of its tenants to 10 s. per acre when he took it in hand, and hin first stop was to barn enormous quantities of this clay soil. He telle us that in 1853 he put 10,000 cubic yards on 100 acres of land with an extra ordinary result. Ins straw was quedrupled in bulk, and the grain doubled in value; an excellent Turnip crop was attained. A large herd of cattle was kent during the winter in the fold-yard, and a famous heap of mauure renulted for use in the following spring After another year's experience, during which nearly as much burnt earth again has been put on, the valuation for grain crops has been again raised from 7001. to

Beaumont put the cost of the process at 6cl. per cubic yard of the clay measured after burning; filling. spreading, and applying, 2d.; fuel, dec., $1 d$. . ; so that $4 l$. per acre covered the cost of putting on 100 cubic yards. Dung Heaps sbould now be turned and commingled. Those intended for the fields where Carrots are to be
sown should be the first. This operation will cost $1 d$. per cubic yard, measured before turning. Six inches of the soil on which the heap lies should be thrown up with it. Dung heaps, too, will still be forming in fields for Turnips, \&c., being carried out from the yards whenever time and weather permit. And among other occasional employment during March, there will be the threshing of grain for the market, or for the supply of straw, and the completion
of all work connected with fences and roads. Stones should be picked off any fields, whether in Grass or corn, over which either scythe or reaping machine is to go this year.

## Notices to Correspondents.

Birds v. Insects: France. Tho following is the passage you allude to, it it contained in a petition addressed some years
ago to tbo French senate:-Aginst insect enemies man is ago to tho French Senate :- Against insect enemies discern
powerless. $H$ is eye is not oren sharp enough to discer many of then, bis hand too slow to catch them. But God has given him in the bird a faithful ally, who wonderfully accomplithes the task which man ia incapable of performidg. This providential mission of birds for a long time was consildered a proetizal exaggeration; now, thanks to tho lathours of modern naturatists, it ranks as one of the best domonBooks: A V. It is rarely adulterated except with things which add to ita weight. $A$ bushel of good guano, filled in without prossure, should not exceed 73 lbs. in weight-it may vary from 69 to $73 \mathrm{3bs}$, and the lighter the better, provided. on an admixture of sawdust. If heavier than 73 lbs . per bushel, it has been adulterated with carth.
Manures, Limberd CAEs, to. : Cor. The manure trade is now very brisk, and judgiug from the large deliveries required by
dealers, a very exteusive trade is expected this season. The dealers, a very exteusive trade is expected this season. The following is Mr. Purser's report:-Guano remains at last year's price, nitrate of soda firm, Bones are scarce, and com-
mand high rates.

Robert Hogg, Ll.D. and F.L.S., Rev. H. H. Dombrain, A.B.,
Shirley Hibberd, Esq., F. R.H.S., Thomas Rivers, Esq. (the eminent Shirley Hisbet), and other well-known gentlemen, recommend the Hydropcl, as ax ixpaluable Gardex Iaplement.
The Hydropult will draw water horizontally, if necessary, through Two Hundred Feet Suction Hose, and force it through Delivery Hose to an altitude of One Hundred Feet.

## THE

GREENHOUSE AND CONSERVATORY HYDROPULT.
A NEW AND BEAUTIFUL IMPLEMENT,
Weighing scarcely 5 lbs.
AND SPECLALLI ADAPTED FOR USE IN THE GHEENHOUSE AND CONSERVATORX.

## Price 35s.,

Complete, with Brass Cylinders and Copper Stitrup, 27 feet S
and 3 feet Delivery Mose, Strainer, Rose, Jet, and Fan.
This NEW IMPLEMENT must necessarily supersede Syringes and
other devices of the kind, for it will be found much more effective in ts operation.
a lady can work it for hours without fatigue.

## CAUTION.

Ixpontant to the Peblic.-The extensive sale of the Hydropult has excited the cupidity of so-called respectable, but in reality unprincipled Manufacturers, who are now palming on the Public worthless imitations of the IIydropult, and through their connections are enabled to place said devices on exhibition, and for sale, in many of the principal Ironmongery and Seed Fstablishments through out the city and provinces. These devices resemble in many respects the Hydrrinult in appearance, and are calculated to deceive the unsuspecting. The Proprietor therefore issues this Caution, and respectfully intimates that parties wishing to purchase the Mydropult shoturt examine the machine affered for sale, and see if it has attached thereto a labol, with the following words:-"Tho Hydropult, Vose's Patent, manufictured only by Grifyiths \& Browitt, Birmingham. Ciarles Pomeroy Betron, Proprietor, 142 and 143, Cheapmide, Londion." Unjee this lebel is attenchec, the Machine is not the Hydropalt.

Prospectuses, with Testimonials, on application.

## GREEN'S PATENT SILENS MESSOR,

# NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES. BY SPECLAL APPOINTMENT, sole manufacturer <br> TO HER MOST GRACIOUS MAJESTY THE QUEEN. 

as recommended by the judges of the royal horticultural society's show held july 20, 188 .
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judges at the Royal Horticultural Society's Show, held July 20, 186t, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteration, which has been done, and Messrr. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& Sow beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that despatch due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust to be in a paition to send off all orders the day they are received.

Packing Cases are charged at the fullowing low rates, viz.: for the 10 and 12 inches Machine, $3 s$; ; 14 and 16 inches, $4 s$; 18 and 20 inches, 5s.; 22 and 24 inches, $6 s$. Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to provent them from getting damaged; if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKEX MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.
To und 26 inches

The 26, 28, and 30 inctas can easily be worked by a Donkey, or by Two ALen, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 iarhes by a Carriage Horse ; and, as the MACHLNES make no noise in working, the most spirited animal can be employed without fear of its rumning away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening: the cutters being steel on each side, when they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the yacHive will cut equal to new. Artangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in Ragland; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

# SHANKS' NEW IMPROVED PATENT LAWN MOWING, ROLLING, COLLECTING, and DELIVERING MACHINE for 1865 

patronized on five separate occastons during the season of 1864 by HER MAJESTY THE QUEEN.

Alexander Shanks \& Son are gratified to find that in the large and increasing demand for their celebrated MACHINES, they receive a conclusive proof that their merits are every soason becaming more appreciated by the Practical Gardener.

A. S. \& Son, in introducing Improvements into ote: MACHINES, have been careful that the adrantes in point of durability, simplicity of construction superiority in the work executed, which have all alonghm peculiar to SHANKS' MACHINES, should still remis

HAND MACHiNE.

1. S. \& Son have a large stock of their MACHINES realy for the ensuing season, and as they have made large additions to their Manufactory there will bo delay in the execution of ()rder:

LIINK's P.ITENT L.AWY MOWERS are in daily use in the ROYAL G.IRDENS at KEW, WINDSOR, BUCKINGMAM PALACE, HAMPTON COURT, asbory and B.AIMORA, ; in the GARDENS of the ROYML HORTICULTURIL SOCIFTY at KENSINGTON; in the GROUNDS of the CRYSTAL PALACE COMPASY SYDENHAM; in VICCORIA PARK; in BATTERSEA I
merits have been fully proved and their succeas established.

It is now generally admitted that Buildings of any kind can be more effectually Warmed hy Hot Water than by any other means; but as so much depends on the way in which the Apparatus is fixed, it is of the greatest importance that it be done by experienced men.

## J. JONES \& SONS

are prepared to estimate for warming, to any extent -
greentolises conservatories vinemtes нот hounzs FORCNE PITS PBach fouses
pine stoves orchard houses CHUROHES CHAPELS schools readive rooms
lecture halls MILLIARD ROOMS HALLS and passagss bathe factories offices

WORKSHOPS warfinotses trying rooms chllars COACH HOUSES harness rooms
 working.
It is equally available for the AMATEUR'S GREENHOUSE, or the longest range of FORCING HOUSES; for the smallest Chapel or largest Church; for Private Offices, or those of Public Companies.

It is admirably adapted for DWELLING HOUSES, as coils of pipes can be placed in any part, for warming the various rooms. One or more Baths may be heated from the same Boiler, and a constant supply of hot water obtained in any part of the house.

For WAREHOLSES and WORKSHOPS this system of Heating is unsurpassel, as it is not only the means of keeping goods dry, but it also adds to the comfort of the workpeople, and thereby effeets a saving in labour.
J. Jones \& Sows recommend Boilers of all kinds being set in Brickwork, if possible; but Tortable Boilers can be supplied, if required.

Materials.-All Materials supplied will be of the best quality.
DELIVERY.-Boilers of various kinds, and Pipes and Connections, being always in stock, can, at a very short notice, be sent to any part.

FIXING.-The Fixing will be done by experienced men, fully capable of finishing properly any work they may undertake; and J. Jones \& Sons are prepared to guarantee the effectual working of any Apparatus fixed by their own men.

ESTIMATES.-Plans and Estimates will be sent, on application.

J. Jowes \& Sons have lately fixed their HOT-WATER APPARATUS in or near the following places ; and the working of the same has in all cases given the greatest satisfaction.

## PHOSPHO GUANO.

PHOSPHO GUANO, in its natural state, is found on trap-rock islets within the Tropics. It was discovered in 1854; and its existence was made known in August 1856, by Dr. Voelcker, at the Cheltenham Meeting of the British Association for the Adrancement of Science, when he read a paper "On the Remarkable Composition of a New Variety of Guano, called Columbian or Maracaibo Guann," pointing out its peculiar fitness as the base of a highly-concentrated Phosphatie Menure.

The valuable and peculiar qualities of this Manure, now well known as PHOSPHO GUANO, immediately attracted the attention of the leading Agricultural Chemints, who pronounced it to be greatly superior to all other Guanos as a manurial agent.
PHOSPIO GUANO contains in its natural state nearly double the quantity of phosphoric acid found in bones and other substances from which Suporphosphates. ${ }^{\text {a }}$ prepared; and Lienig states that by using PHOSPHO GUANO the farmer conveys to his field 26 per cent. more phosphoric acid than by a mixture of equal parts of Parris. Guano and Superphosphate of Lime; while "the advantage for the improved quality of the soil appears still more in favour of the PHOSPHO GUANO, if the quantity. soluble phosphorio acid is taken into consideration."

Onc of the most important advantages of the PHOSPHO GUANO is its uniform composition, and in this particular it is equalled by no other Manure; for with searelly exception, they all rary greatly in different samples, even when drawn from a comparatively small bulk.

The effert of the application of PHOSPHO GUANO to both Grain and Root crops has borne out, most truthfully and satisfactorily, the character given to it by Lirsie uin Foexcker. Whether used to assist the growth of Grain or Roots, or applied as a Top-dressing to Grass lands, it is found to produce, beyond all other Manures, the greame amount of the food-propertios of the plant, and that with a marked superiority of quality. The beneficial effect of the PHOSPHO GUANO on the second and third jear's emp is also very markel; and in this respect it is mequalled.

PHOSPHO GUINO, being a very highly concentrated Manure, requires, before being used, to be mixed with an equal weight of wood ashes, sand, or dry earth, 60 ast insure its equal distribution. Treated in this way, it becomes the cheapest Manure in the market.

Eutract from Report of Baron Lrabic, dated 11 th Septomber, 1863.
"Phospho Guann surpasses, most certainly, by its more correot and constant composition, the best sorts of Peruvian Guano; and of its superior efficacy than be the slightest doubt."

Pampletets, containing a full description of the Phospln Guann, its History, Nature, Properties, \&c., may be obtained on application.

## In continuing the remarks on Darwin＇s Theney

 commenced at p．267，we have to observe that a Race，as commonly understood amongst horti－ colturists，is an individual（or group of individuals） with a well－marked character，which differs from a variety in being mora permanent or true under cultivation，whether from seed，or by division，or both．It is further usually assumed，that a rariety will produce offspring whose characters are those of the parent of that variety，which offspring reverts， as it is called，to the original condition of the species， but that a race will urdinarily not do so．Whether this is in any great degree true or not，is a matter of doubt．There can be no question that the offspring of a variety frequently does not show the distinctive characters of that variety，and it is hence often hastily assumed that it has reverted to or resumed all those of，the parent of the variety but in a multitude of instances it will be found that the offspring of the variety not only differs from its parent in those characters which consti－ tuted it a variety，but in still others from the parent of the latter，and perhaps as a general rule it will always be found to be so．For to what do we owe varieties at all，except to the fact that，contrary to the general belief，in organic nature like doos not produce like．Let the offspring of a parent be ever so numerous，no two of them resemble in all points，either one another，or their common parents，or any ancestor whatever．Certain parental features are retained in varying degrees and proportions，either little changed or so bleuded as to produce an apparently new character，foreign to both parents ；bat there is no known instance of the individuality of the parent being so fully
transmitted, as that the son whall be confounded with the father, or that the ancestral portrait shall pass muster for that of any member of the sucoceding generations of the family. Perhaps indeed thers is no more wonderful and inexplicable fact in nature than this-that the innumerable sons of men have all differed from one another, and continue to differ, however numerons they become. Why the offspring of our first parents should not have been all preoisely like one another and their parents, and so on through all succeeding generations, and why we should never find even two preoisely similar individuals, are hitherto unexplained faots, with whose explanation we have nothing now to do, and to which we allude only to show that every individual is in reality a variety, and that there is in truth no such thing as a bona fide reversion to all the parental We may thus regard variation as a centrifugal force, ever tending to sunder the noembers of a family, and as such it is an instrument at the
disposal of the gardener or breeder, whereby he makes (as it is called) races out of varieties, and even educes forms as dissimilar as species out of races.
It is now an admitted axiom, that to selection alone must we look for the establishment of new races of our existing garden plants, but before going further we must oleariy define what we mean by the production of races. In ordinary parlance it would imply that the gardener had the power of furcing a plant to give birth or origin possessing a wished-for character; and such we know to be a very prevalent opinion. We believe it to be in the main an unfounded one, and would invite all thoughtral gardeners to follow carefully the arguoents we have to produce against this opinion, but not to accept them without inquiry and observation. Putting aside the results of hybridising or crossing, which are foreign to the present disoussion, and of the permanence of which there are many doubts, a gardener has no recognised means of causing a plant to produce seed of a quality other than it would naturally produce. By
administering proper food to the parent, and atherwise treating it judiciously, he may indues it to produce more, or larger, or more healthy seed but no treatment that we know of will influence the parent to produce seed that will grow up into plants differing from that parent in any desiderated particular of colour, form, or arrangement of either foral or foliar organ. And yet this is what the gardener wants to do, and this desideratum,
thanks to Nature's bounty, he actually obtains i he perseveres long enough.
To produce new varieties of plants then is the undeviating course of Nature-to take advantage of this faot and to accelerate its operation, by so nourishing his plants that they produce more healthy seed, and in larger quantities, is the gardener's function. The more seed the plant gives, the greater amount of variation will there be in the first generation; and the more finding the germ of the quality he desiderates. But in all this he is acting upon no certainty; be is only multiplying his ohances.
The operation of selection is too well known to require any elucidation from us; bnt a practical question of great importance remains, which We hope will be well discussed at Erfurt, viz.,
what are the limits to the amount or kind of change that a gardener may expect to effect by continuous selection; and under what conditions may he with most confidence expect certain desired results. For instance, we suppose that we know to obtain a lilac, blue, or violet Rose or Camellia; and yet there is no theoretioal obstacle to our doing this. Whites, damasks, blushes, striped, and parti-coloured Roses have appeared obedient to sulphur and " cloth of gold " races, exist nowhere but in gardens. It is not as if all these colours were never present in one genus, for we have them all in Gentiana, and probably in many others, nor as if colours once supposed impossible did not sometimes appear, for we have such a case in Fortune's yellow Camellia-but we have hitherto no rationale of the operation, no "handbook of selection." And yet with regard to obtaining hardiness, scent, size of flower, amount of doubling, and all other qualities, tolerably safe if not certain clues, which, if found, would lead to success in producing these qualities when wanted; and we doubt not that these clues are to be obtained through a searching scientific
study of the individual and general characters of all the congeners of the plants to be operated upon. And here Dabwin's theory oomes in aid. If it be true that all the species of a genus are, through natural selection, the descendants of a common parent, then the operator may expect to find character peculiar to one species of a genus appear ing in the offspring of another species of the same genus, if he multiplies it sufficiently, and the nearer the species are specifically, the greater will be his chance of success. To initiate an inquiry into the charaeters of the genera of cultivated plants in reference to the operations of the oultivator in produoing races, would be a splendid work; it would inauguratean epoch in scientifio horticultare, and as suoh we recommend it most earnestly to the atteution of the Horticultural Congress at Erfurt. Should we not find the subject so treated by them we may recur to it ourselves, and offer suggestions for its elucidation.

Ir a report of a meeting of the Botanical Society f Edinburgh, which will be found at p. 222, are some observations by Mr. M ${ }^{\top}$ Nab, on Coniferous Plants from home-grown seeds, the tendency of which is to indicate that in our climate some at least of the choice Conifers of America are so far degenerating, that plants raised from seeds ripened in this country are rapidly dying out in certain situations. Of the latter faot there is no room for question, and the writer seems to have good and sufficient grounds for his conclusious. The subject is undoubtedly of considerable importance. We are just favoured by Mr. C. W. Strickiand with a note, here subjoined, in which another cause is indicated for results similar to those pointed out by Mr, M'Nab. Mr. Stricimand writes:-

A few weeks ago a paper was read at a meeting of the Botanical Society of Edinburgh, for the purpose of showing that some of the more recently introduced Firs, especially those from California (such as the Abies Douglasii and nobilis), when grown from English seed turned yellow and sickly, and generally within a few years died altogether. There may be some such tendency; but my experience of these trees leads me to think that other causes are very often to blame. I have found these kinds of Fir exoeedingly capricious as to the soil in which they will grow. Neither the Douglas Fir nor the A. nobilis will live upon an oolitic soil. They turn yellow and die, exactly as is described in the paper referred to. But they will both thrive upon the sandy loam, which belongs to the beds of calcareons grit. Now I have a number of plants of the Douglas Fir, grown from English seed, which were dying as fast as they could do on the oolite, and which I removed to the soil which suited them; and these have quite recovered, and are now of a deep green colour, and growing vigorously. The same appears as if it would be the case with two plants of A. nobilis, which I last year treated in the same manner for the same reason. What has become of the Arboricultural Committee of the Horticultural Society? This is surely a subject for it to investigate."
Have these results been noticed elsewhere, and under what conditions? We shall be glad to publish any observations which observant readers in different parts of the country, and in localities with different geological conditions, may be able to offer. The subject may indeed be specially commended to all who are interested in arboriculture.

The lovers and friends of Hnticulture are reminded, that on Tuesday next, the 4th of April, nccurs another of the Tursday Scientific Mretives of the Royal Horticultura Society, at South Kensington. The successfal commencement of these meetings we have already had the pleasure of recording. For the future it rests with the Fellows themselves, and the growers of New or Rare plants, whether they shall be maintained and as far as may be improved-the former gracing
them with their presence in sufficient numbers to them with their presence in sufficient numbers to that visitors shall not come to be disappointed cither as to the number or quality of the plants or flowers pre mod for their examination. We understand that amongst the many other objects of interest that will be Odontoglot (the Odonday, may be expected a beautiful Odontoglot (the Odontoglossum gloriosum of RexchensGrenada imported by Messrs. Low \& Co. from New Grenada; an extraordinary Dendrobium (D. senile) introduced from Moulmein by the same firm, and which is covered with white hairs, like what is popularly pedium (C. concolar) if it lasts so long, from Mr RUCKRR's garden; and some pots for Orchids, on a new principle, from Mr. Batmanan.
-We invite attention to the Cum Show which is to take place on the l6th of Nomery next at Bristol, under the auspices of the Chrysanthemum Society, as announced in our tising columns of last week. It has beet our adre. to us that certain classes for cut blonms pointed or themums, in sets of 24,12 , and 6 , are specially inten to indace metropolitan and other distant take part in the show. Mr. Hobbs, the Honom Secretary, is ready to give all necessary information

The scientific world has to deplore the re loss of Mr. H. W. Schotr, director of the gardenas the order A ander in regard to which $M$ Soations os regarded as a high authority. It may borors mo regarded as a high authority. It may be added thy the death of Sir R. SoHOMBURGK, which we
last week, took place on the 11th of March.

We understand that the Cologre Exaibition which is to be opened by the Crown Princz or Prussia, is postponed from the 15 th May till the 4 of June by his Royal Highness's desire.
notice of intention to exhibit may be given up to 1.st of May, and articles will be received from the up to the 25th of May. By this arrangement committee think it will be possible for the exhibit
at Stettin, on the termination of the Stettin Exh tion, to forward their articles to Cologne; and that will perhaps be also possible that the articles exl at Cologne should afterwards be sent to the Dreaden Exhibition. Besides Gold, Silver, and Bronze Melle prizes will also be adjudged,-one of the value of 10 , for the best steam plough; one of $75 l$., for the traction engine; and one of $75 l$., for the best fire-engine. Land, fuel, and water will be supplied he the trying of the steam ploughs and engines.

Two of the finest Nrw Palms shown at th Brussels Exhibition last year were the Sterenmh grandifolia and Reqelia majestica, mentioned appears, were of garden origin, and will not stand; fu Mr. Wendland, who is a learned authority amongt these princes of the vegetable world, has recentry L'Illustration Horticole characterised them unde ther names, hoth being regarded astypes of new genen. The Stevensonia is to be henceforth Proexicopio rium secereliarum, and the Regelia is to be Vrbschi? FELTIA SPIENDIDA. Both appear to be natives of the Seychelles Islands, and both are remarkable for the broad bifid foliage they bear, at least in their adolema state. A very beautiful ingure of the Verschaffeltia is giv in the number just issued of L'Mlustration Hortione

## KITCHEN GARDEN PLANTS.-NO

Ter Pea.
In the first batch of Dr. Maclean's new Pens sent
by Mr. Turner, was a very dwarf variety calle
Engleeeded badly in circumatances adrotre proper development, it was very promising. now to be lost sight of,

## in his list.

. ore, with the history of Peacome For many ye he has been engaged in the laudable work of
gemss of dwarf wrinkled Marrows as early as Sangster No. I, Lut fossessing at the same time the hardihood productiveness, and flavour of the late wrinkled kinds fin order to attain this result, he commenced hybridisjug Beck's Early Dwart Marrow variet:es, making selections with praiseworthy persistency, up, til some valuable early dwarf wrinkled Marrows have uatil some ralualt. Dr. Muclean's first 'ruits were two popular kinds, known as Harrison's Glory and Harrison's Perfection, both round Peas, the first of a green colour, the latter white. As these proved spare croppers in cold and late lucalities, they are gradually giving place to better sorts, though for the former there also Dr. Maclean's, and is now, though not an early variety, as popular as ever. After the lapse of a little but manting that fulness of flavour wrinkled Pea, of its successors possess. A variety known as Dwaf Prolific, combines earliness, flavour and profir to acquire a wide-spread popularity. Among others there appeared Epicurean, somewhat later than Adrancer, Mons. Soyer, Essex Rival, Sea-green Wrinsled Marrow, Princess Royal, Queen of the Prince of Wales. These have been selected from
nearly 100 seedlings, which passed into the hands of Mr. Turner. Of these, Little Gem, Prolific, Advancer, Princess Rogal, Prince of Wales, and Wonderful, seem likely to become staple Peas. Prince of Wales and Fonderful are both dwarf white wrinkled Marrows, the former the earliest, but both very productive, and possessing a rich flavour. Princess Royal is a round White Pea in the way of Harrison's Perfection, but
greatiy superior to it. The others have either become lost, or they have failed to gain position, though poseessing some excellent qualities. There is scarcely any regetable that has to encounter so much prejudice 25 a new Pea, especially from large wholesale houses. fair trial, as the dry summer was unfavourable to it. It is later than the others, coming into bearing about With time as Veitch's Perfection.
With regard to rotation of crops, Dickson's Early Favourite, which originated in a selection of some point of earliness. It grows about 4 feet in height and produces pods in profusion. Of other "second early" varieties succeeding this, or in some localities preceding it, there is Prizetaker, or Rising Sun, a good Belection from Bellamy's Green Marrow, likewise
known in the Midland districts as Leicester Defiance, and Noble's Green Marrow. It is a variety extensively grown in Yorkshire and other districts for purposes of exhibition; its dark green pods deficient in flavour, but it is a good cropper. Champion of Paris, or Paradise Marrow, likewise known as grows about 41 feet, and is very productive. SomeWhat similar to the foregoing, although not quite so large or 80 tall-growing, is the Ringwood Marrow, a itamediately after Sangster's No. I; the pods swell out before the Peas attain any size; they therefore appear fit to gather before they really are so. Along ties and so generally liked as to bo cultivated everywaere, comes into bearing Fairbeard's Nonpareil, callivated ; white Knight's, but one that is seldom rariety ; also Fairbeard's Surprise, a round white Bisiety; a sport from Champion of England; and Pea, Pea. These are again followed by Burbidge's Eclipse Flack's Victory and another good dwarf Pea; and by arknowledged to be the same, though the original difference was in favour of Victory, which was a little Pruseian, a variety productive than Imperial. Blue Woodford Dwarf Green mach grown by cottagers, and as far as the order Green Marrow also rank in this class last was selected Batt's Wonder concerned. From the The Woodford Marrow is of it can be obtained. invaluable fordry situations, and even when apparently
The Blue Scimitar diciously tender when cooked Pea thousands of acrestially a market gardener's supply the different mares of it are annually grown to nder ordinary field markets throughout the country the peas are largect to high culture it pods freely, and selections are large and deliciously sweet. Careful leading wholesale houses, made from this variety by into a small and indifferent stock quickly degenerates Tery much grown in the gatively worthless type. It is If England. garded as being identical, now also comerilly
bearing, with Veitch's Perfection close in their wake Hairs' Mammoth is a variety somewhat impatient of defect supplied by the more robust form of Veitch' defect supplied by the more robust form of Veitch'
Perfection. It is of hardier habit, and can stand varia tions of climate and soil better than Hairs', and it i altogether one of the best Peas in cultivation. For late crops it is unsurpassed. It should always be sown late, as in its earlier stages of growth it is impatient of check from cold, and I have known cases of the crop ailing in consequence. Dixon's Yorkshire Hero, from the trial I observed, did not appear to be the improve
ment on Veitch's Perfection predicted; but then it ment on Veitch's Perfection predicted; but then it England at least. It is dwarfer than Perfection, and promises to be a good cropper, but it will require a moist climate and genial weather to bring out it qualities. It should not be condemned till it has stood the test of another season's cultivation. Quo.

## OUVIRANDRA FENESTRALIS

This is the Lace or Lattice-leal plant, so called because the leaf resembles lace or fine latrice work: in fact, it is not uulike a skeleton leaf of the Iudia-rubber plant (Ficus elastica). The Ouvirandra is one of the most extraordinary productions to be met with in our
gardens. We are indebted for its introduction to this country to the Rev. W. Ellis, who collected it in Madagascar, and introduced it about eight or ten years since, along with many other fine plants. As in the case of other aquatics cultivators were at first at a loss as to its proper treatment, but perseverance has enabled us to overcome the difficulty, and to find out
how to manage it.
The most convenient vessel for its growth is a large tub, some four or five feet in diameter by two feet deep. This should be placed in a tank, and suusk in the water to within two inches of the top of the tub, as wing one side to be a trifle higher than the other temperature of the water should range from $80^{\circ}$ to $86^{\circ}$ -not lower. The tub should be filled with clear rainwater, previously warmed. The best soil is good rich stiff loam, which has lain in a heap outdoors for at least 12 months, and has been frequently turned over to sweeten it.

A good time for potting is the spring, but it may be done at any time when the plant is growing freely. Take an 8 -inch pot, place a piece of tile over the hole, and fill the pot with the loam, which should be rubbed fine. Then make a lole in the centre of the soil to receive the plant, and after placing it, press the soil
firmly arcund it. If the plant is small, the pot should stand on another inverted in the middle of the tub, so as to bring the leaves within five or sir inches of the top of the water. The bottom of the tub should be covered to within two inches of the top of the pot with broken potsherds, washed clean. Over these should be added white stone or spar, to the level of the pot, but this should not be carried higher than the soil the plant is growing in, as it is liable to interfere with the
young leaves. The white stones appear to increase the transparency of the water, so that the plant can be seen to greater advantage.
Every evening a large water pot should be filled with pure rainwater and placed in the tank to warm, and on the next morning (therefore daily), this quantity of
water should be poured into the tub towards the side in order to swill off any filth that may have collected on the surface. This will also change the water sufficiently for the well-doing of the plant. Great attention is required to keep up a uniform temperature In the water, which should be as near $84^{\circ}$ as possible the temperature of the house may be kept so as best to suit the other plants grown in it, for the Ouvirandra being several inches under water, will be protected against sudden atmospheric changes.

When the plant is of sufficient strength it should be takea out of the tub and placed in the tank. The tub should be emptied and washed clean, and then replaced in the tank and filled with rain water, which should be previously warmed. If the plant requires a shift it should be repotted, and then placed at the bottom of the tub; for when the plants are strong they like deep water.
As a precaution, I would advise that when the plants require changing or repotting, the temperature of the house should be at least $80^{\circ}$, the atmosphere humid, and the house well shaded, as the Oavirandra is very impatient of exposure. Should anything settle on the leaves-as from the water not being quite clean, take a pipe ayringe, and placing it under the leaves, syringe gently upwards; the plant should be handled as little as possible. When first introduced, it was thought is not sufficient to keep it growing it will do so. When grown in glazed or glass pans, or globes, and placed on the shelves of the house, the plants are liable to suffer house. Theyarealways zubject to be attacked by confervæ, which is a great enemy to them, as it is almost impos ible to clean them without injury.
1 may mention the size of the specimen grown nuder the treatment now indicated. It measured 12 feet in ircumference, or 4 feet in diameter; and Mr. Ellis leaves in its native country. Thos. Brown, Tooting.

## Home Correspondence.

Grapes for the Million.-Your accomnt of Mr. Wells patent iuvention forgrowing Grapes on the ground under glass, reminds me of a plan which, upwards of 60 years ago, was annually followed by the old gardener of a near ro, was annually followed by the old gardener of a near
reletive of mine. He had no houses, but the beautiful arge bunches of Black and White Grapes which he uruished eve i up to Christmas, I well remember. The Fines were trained so that two leading shoots were carried to the right and lett on the ground, and as they lengthened they were pegged down firmiy. From these two horizontal stems, others about a toot goart were trained upwards 7 or 8 feet against the wall, and fastened by strings passed through little fixed rings for staples. As boon as the Grapes began to show the lightest colour the rods were untied and brought down into two-light Cucumber and Melon frames, which in autumn could be well spared. Damp mown Grass was sprinkled on the surface of the soil, and air was given freely; diluted stable drainage was liberally sapplied to the roots of the Vines. And for the Grapes I know reat praise was bestowed on the old gardener, who had ived for upwards of 40 years at the Manor liouse Some thin guaze material was so fixed on the frames that no wasps con!d enter. In many instances this plan miglet even now perhaps be followed with good results. I believe that the two stems trained and pegged down rooted at several pointa in the ground giving additional vigour to ihe growth of the upright canes. T. J., Emsworth.
Winter Mushrooms. - The following is a list of the quanities of Mushrooms which have been produced in the Mushroom house here from a bed 8 ft l long and 4 ft . 6 in . Wide, from Jan. 18 th to March 6 th :

460, Bhowing an average of 22 and
Robert Stokoe, Gardener to H. C. Marshall, Esq, Weetwood Hall, near Leeds, Yorkshire, March 13.

The Knowsley Pine Stove.-The subject of the transmission of heat from: one body to another is one closely connected with the duties of a
gardener, and as I an a young gardener, hoping, before I am much older, to take in hand the management of a garden establishment, I should be exceedingly glad if some one of your contributors would decide the apparently doubtful question as to the completeness of the heating arrangements in the Knowsley Pine stove "G. H." appears to "throw cold water" on the system of "buttom-heat," \&c. while we young gardeners were in ecstacies with the plan asitstands at p. 125 . "G. H." states, by implication, that the roots of the Pines will be destroyed (steamed) by evaporation from the pipes which pans through the rubble beneath them; but my tutors have given me to understand that steam at boiling point is simply a moist gas-like matter mixed with air, which, when passing through rubble colder than itself, will deposit water, which would run off, leaving behind a portion of its heat. On the rubble is placed a finer material (it ought to be firmly rammed down), and upon this the tan or plunging material. Now, I am told that this finer materiai resists the steam in a similar manner to that in which the Davy lamp resists the ingress of carburetted liydrogen, or fire-damp, that the steam merely domps the first under coating of fine material which resta on the rubble, and that the heat imparted to the Pine pots, though originally steam, is then a dry heat. I shonld like to know if 1 have been wrongly informed, and whether the roots of the Pines would be cooked like steamed Potatos. respecting this, ehortly
Physalis.-One of your correspondents mentions (p.223) the frequent occurrence of Physalis pubescens at the Cape. I think that this genus requires further examination. Don (no conclusive anthority) places $P$. pubescens and $P$. peruviaua in different section, stating that the former is annual, the latter perennial; but on reading the descriptions of the plants they seem in other respects identical. Then, again, $P$ edulis is said to be a variety of P. peruviana, and Messrs. Carter send out seeds of the two varieties is worth ascertaining, as one of the three sorta, if there be three, yields one of the most delicious preserves known. If the roots are contirsed in pots, or if planted ripened in very arid sunny place, the frnit may be the open air in England. Under glass vould, of course, succeed, and pos might grow ander tho
where these cover the roof. If so, it would utilise many other wise useless spaces. The preser
to bo boiled much longer than nomal. S. $B$.

The Royal Horticultural Society and the Flower Shows.-I am pleased to find that you were satisfied with the meeting of the anch attendance of Fellows, and should imagine fuch a good attendance of Fellows, and siourd. So many that they were equally pleased with yourself. So man
could indeed hardly have been expected, seeing that it could indeed hardly have been expected, seeing that
was a cold windy day; but dopend upon it, if there is display interesting to the public to be sern, and the public are led to expect it, they will not fail to pay it a poblic, there will be no lack of plants or of visitors. have, since the last meeting, met several Fellows who have regretted that they were not present, so that there is evidently no lack of interest when the right thing is pat forward, thongh people soon get tired out when there is nothing to interest them. Many ladies and gentlemen become Fellows of the Society solely on account of the shows, for the sake of inviting their country friends Most people like to see something good in the shape of fowers, especially flowers which they have never seen the chance of sueing such at these meetings during the spring and autumn months. In summer there are the lurge shows, which bave bsenf for many years a grea attraction; but I fear there will be a talling off if $w$ do not adopt some different arrangements as regards various objects exhibited. There is no doubt w have the finest plants that can be got together. N coltivation and wher pluced ourred, as regar heir good effect as regards a blaze of bloom; but the public seem to require something further, and that is a greater
variety of objects, which might be secured without adding much to the working expenses. There plenty of materina to be had. If some clange is not anade in these great shows, tkey will not be held Flower shows are like other amusements-there must be something fresh to attrnct the public, and satisfy different tastes. Some prefer Orchids, some Pelargoniums, some Heaths, Roses, or Fuclusias, \&c.; and it
is only within a few years that Ferns and Fine-foliaged plants have had their many admirers, especially amongs the ladies. We cannot have better guides than they they are critics of most refined taste. I have heard them say-" if we could only get the managers of the greatshows to introduce some of the Tree Ferns among the stiffooking flowering plants, what a fine contrast would be presented by the feathery fronds elevated on the stately stems of the Ferns, showing themselves above the gay flowers helow." Let us take the last May show at the Regent's Park, for example: this was the firiest show banks, is just the place one would prefer for a flowe show, if some alterations, easily made, were carried out This that the banks were not the same year after year regards flowers. The bauk of Orchids was grand; and so were those of Azaleas and Pelargoniums-all fine things in an exhibition, and such as we cannot do with er wanted-such, for inatance, ss Dracrnas, Palms, Cordylines, Tree Ferns, \&c. If such as these had been introduced amongst the grand Azaleas that were shown, the stiffness and formality which were complained of would not have been apparent Plants are too formal when, as in these, hardly leaf is to be seen, but the formality may all be put
out of sight by introducing freely large elegaut Tree Ferns. The managers of shows should give more en couragement to such glorious exhibition plants as these and then they would soon be brought together. Such plants ought to be at the disposal of the officers, so that they may be placed in positions where they may yield the best effect. The more variety we get, the more admirers we shall secure for our shows, and that is jast what is required. B. W.
Climbing variety of Rosa devonionsis.- It may be interesting to know that this most beautiful of all Roses, so raccessfally and most vigorous and robnst growt morn, is $t$ established plants, measuring from 18 to 20 feet in length in one season. It is a most abundant early and late bloomer; in favourable situarions it commences to flower in May and continues to produce its most beau November; and it retains its foliage all the year. is very hardy, having withatood the severe winter of 1860-1. In this locality it grows and turives in almost any soil or situation, even in thickly built parts of the aity, amidst the smoke and dust of which it thrives this variety, that there is scarcely a villa residence this neiglabourhood where one does not find this Rose and no amateur considers his collection perfect withou it. Its blooms are of large size, some of them peasuring 6 inches in diameter, and their shape is mos perfect. It 18 in fact one of the best light-coloure
Duchess of Buecleuch Grape.- Surely your Corres pondent at Aswerby Park has come to a prematur conclusion respecting this Grape. It may be all that he states in its favour, but the fact of its showing so
many bunches does uot prove its excellence. I could mad your Correspondent reserved his decision until his bunches were ripe, and found them free from "erack ing," his opinion might then have been of benefit to gardeners. Vitis.

## Societies.

Royar Hobticultural: March 18 (Weekly Show .-Messrs. Lee exhibited at this meeting a hand some specimen of Camellia Madonna; also some Lind, Leeana superba, and other Camellias, together with Lyeasto cruenta and Skinneri, Dendrobium nobile, with Lycaste cruenta and Sknneri, Mr. Bull came Brahea and five standardium barbatum giganteum and villosum, Dracemas, and a fine specimen of Platycerium alcicorne. Messrs. A. Henderson sent miscellaneous spring-fowering plants, among which were Gastrolobiums, a Grevillea, Rhododendron ciliatum, and farnisbed five dwarf well-bloomed standard Azaleas suitable for dinner-table decoration; the Rev. G. Cheer contributerl cut blooms of Anne Boleyn Pinks; and Mr. Boyce, Stockwell, Chinese Primulas. Mr. Brown, gr to Mrs. Ashton, Elmdon Hall, exhibited some fine Easter Beurré Fears from a small tree on a south wall and Mr. Melville, Dalmeny Park, had two heads o ' Improved Nilan Sprouting Cabbage," a cross from the Brassels Sprout; also a green-leaved Seakale, said be easler to blanch than the purple kind.
March 25 (First Spring Show).-It would be difficult o conceive anything more interesting or truly beautifu than the fine exhibition of Hyacinths, Tulips, and various other early-flowering plants that took place in the Society's Garden at South Kensington on Satur day last. The whole of the enclosed portion of the eastern arcade was literally a blaze of spring flower of the most charming descriptions, thus connecting the Society's fine conservatory, and its gas flora decorations, with Mr. William Paul's continuous exhi bition adverted to last week, and producing as a whole a very fine display. Unfortunately the day was mos unfavourable, rain pouring down heavily nearly the whole afternoon.
Hyacinths especially were unusually abundant In the class of 18 varieties were spikes of flower which were justly the admiration of everybody. Conspicuous in Mr. Williaın Paul's collection were Von Schiller Macaulay, Solfaterre, Koh-i.Noor, and Miss Nightingale, all various shades of red; King of the Blues, dark arge, and fine; Garrick, Van Speke, Charles Dickens, and Grand Lilas, paler shade of blue; Feruk Khan and Prince Albert, both nearly approaching black; and in blush and whites, Tubillora, Gigantea, Seraphine Grandeur à Merveille, and Alba Maxima. Messrs. Cut bush's collection contained two very conspicuous white eyed kinds-viz., Lord Palmerston and Argus. Rober Fortune, a new purplish-puce coloured variety, was
likewise shown in fair condition by Messrs. Cutbush, who had also Haydn, another of what may be called the mauve cluss, and Ida, yellow, bearing an excellent spike.
Awarle.-18: 1, Mr. Willism Paul ; 2, Messrs Cutbush.
Groups of 12 Hyacinths from amateurs were excel lent in their way. Mr. Young, gr. to R. Barclay, Esq.,
Highgate, had well managed examples of Mimosa (violet blue), Macaulay, Von Schiller, Van Speyk, Grandeur a Merveille, and Madame Van der Hcop, the ast with large fine bells, which are, however, arranged somewhat thinly on the spike, as is the case with pearly all kinds with very large bells.

## swards.-12: 1, Mr. Young ; 2, withheld ; 3, Mr. Higgs

Among Hyacinths in sixes were some extremely fine examples of good cultivation. Messrs. Cutbush had Von Schiller, Macaulay, Duke of Wellington, Sera ion, as were also Argus, Queen of the Netherland tion, as were also Argus, Queen of the Netherlands,
and Grandeur a Merveille, from Mr. Young; and Solfaterre. King of the Blues, Alba Maxima, Couronne de Celle, Ferul Khan, and Ida, from Mr. Wm. Paul.

Of Hyacinths stated to be grown in windows, several collections were shown, some of them equalling both in point of growth and flower those produced under more avourable circumstances. All were in pots, with the glasses, and considering that it came from a window in the neighbourhood of Brompton Road, together with the dark unfavourable weather we have had, it certainly did that young lady's cultural abilities credit The Whites were the best, as they have been every where this year, but the Reds were also fair examples of good glass cultivation.
Awoarde. -6: 1, Mr. Barthete; 2, Mra L. Young; Equal 8,
New Hyacinths, though promising, were not in condition to admit of their merits being properly ulged. From Mesors. Cutbush came Thorwaldsen, marbled pale blue, Cuvier, pale blue, with indigo stripe white variety; Hozarth and Gertrude, rosy pink. Mr. White variety; Hozarth and Gertrude, rosy pink. Mr. Warcelain blue, with fine spike and bells; Beauty of Waltham, rosy pink, with white eve, compact in the
and Leviathan, rosy tinge. Doubtlasge white bells, having shall have acquired more age, these varieties greatly improved as regards size of spike. beemat Mary of Cambridge, Beauty of Waltham, and Leriatho appear at present to be the best.
Awards.-6: 1, Messrs. Cutbush; 2, Mr. Wm. Puol Large collections of Hyacinths were exhibited bot of Hammersmith, also contributed an Mr. Macintao in which were some fine kinds. In Mresting grosen tion we remariked Garibainds.
Queen of thased Garibald, a fine deep crin whites the Netherlands, one of the finest Malakoff in itspoir, primrose yellow; and D tinctly striped with bright red. Mesars. Catbanh had many beautiful kinds.
Early Tulips were shown in great perfection, both welves and in wollections of upwards of a hund Messrs. Cutbush and Mr. Win. Paul. The best hin exhibited were White Pottebakker; Roi Pepin, dlaked with red; Keizer Kroon, yellow and red ; rose - Res, criuson and yellow; Proserpine, viol Standard Royal, and Vermillon Brillant. Ampor double sorts New Yellow Tournesol, the old Tourna and Duke of York, red and white, were the filuat. the Amateurs' Class were also some good Tulips.

Crocuses were exhibited in splendid condition by $y$ W. Paul and Messrs. Cutbush. Mammoth, white, ma by far the best of its class; Prince Albert oceupied similar position as regards blues; Cloth of Silver $n$ the finest striped kind; and Golden Yellom appeme still to be the most useful yellow. Good collectiona came from amateurs.

## 

Roses in pots were shown by Messrs. Paul \& Sow mid Mr. W. Paul. Among those of the former m Verk fine examples of Maurice Beraarda, him Rothschild, Charles Mr. W. Paul's were John Hopper, Prince of Wale Senateur Vaisse, with several fine blooms, and numerou buds of Anna Alexieff. Several boxes containi excellent blooms of these and numerous other varieide came from the same exhibitors.
Camellias, in the shape of plants, were not in ints. rate condition; but of cut blooms there was a it display. The latter came from Mr. Trussler, gri. . Kay, Esq., Hoddesdon ; Messrs. Lee, and Mr. IT Paul. Among them were several good examples old Double White, Fimbriata, Elegans, Donckena Colvilii, Eclipse, Jenny Lind, a beautiful blush mirm Ir Buta, \&c. The best single specimen came for th ir Bull ;
Awards.-12: 1, Mr. Trussler ; 2, Messrs. Lee ; 3, yr. Whe Miscellaneous Collections of flowering plants fom Messrs: Lee and Bull. Among thom Medinilla magnifica, with fine spikes of flowers, Banc pinnata, Hedaroma fuchsioides, one or hone Dendrobium nobile, Camellias, Azale, all well gror Imantophyllum, and several other piants, an tolenb and finely in bloom. There were moreorlett and Wm. Paul ; Chinese Primulas and Azaleas from b Todman; a splendid collection of Cyclameas Messrs. E. G. Henderson; Narcissus from Citbush; six fine plants of tree Mignonette craiicali standards, from Mr. Higgs, gardener to Mrs. Bro hododendron Countess of Hebled orsnge-s Azalea Stella in fine nloom from Mr. Veitch; a nenti ailled stella, tine bloom, from Mrdinary spotted.dent filled plant case from Mr. Bull, ordinary spa Aucuba, in fruit, from Mr. Laing; Horse askets glasses, fromers from Mr. Lacking and Greeves; and ornamental flower-pots, bask Etruscan ware from Messrs. De la Famille des Solanacées. Par M. Alphonse
Milne-Edwards. Paris, 1864. 8vo, pp. 140, 2 tab. lith
This is one of three competitive treatises presented
by Mesprs A. Milne-Edwards, G. Planchon and D. Cauvet, in the Natural History Section at the Upper have Been two only
The family of Solanads is of great importance in a of valuable articles it furnishes for the Materia Medica; and if it supplied no other contribution to the
nutriment and futriment and luxury of man than the Potato, which is also as regards human economy. To the botanist it is especially interesting, because of the marked family the great uniformity of character, though as in all depart from groups there are individuals which orders sometimes comtain typecies while neighbouring was the habit than essential distinctions. The subject E.l wards' treatw chosen for a thesis, and if M. Milne mouch wris' treatise, which we notice, first, does not contain conscientiously drawn up. Besides the two plates, a
quantity of well executed figures are intercalated the text, which add greatly to its valuc.
The treatise is divided into three parts, the first of which is introductory, passing in review the general charactors of the order, its natural affinities and classification. The second is devoted to a notice of each separate genus, and the third to the medical and economical history of the plants which it contains.
M. Milne-Edwards adopts rather the arrangement of Endlicher than of Dunal, rejecting entirely the Nolanaceæ as altogether abnormal
"The arrangement proposed by Endlicher," he says, " is based on characters of the first dignity; it appears to us far more natural, and we propose, with only a few modifications, to follow a similar path. We do not indeed pretend to present in a manner altogether irreproachable the affinities of this family; for the
moment we wish to establish in a natural group definite divisions, whatever may be the value of the definite divisions, whatever may be the value of the
characters on which they are based, we end always in forming divisions more or less artificial. Strict lines of demarcation do not exist in Nature; the characters melt gradually the one into the other, and according to the manner in which they are grouped, they suffer a series of moditications more or less important. It is impossible in the same family not to recognise the existence of a certain number of typical forms with Which a series of derivative forms is connected; but
between these last the differences are slightly marked, they are attached the one to the other, and are allied equally to the forms derived from one or more other types from which we cannot separate them, so that if we wish to state in the most exact manner the analogies and differences of any group whatever of the vegetable or, indeed, the animal kingdom, we must search out these types, study them deeply, and then examine by what series of characters and inter

We have, for example, almost exactly the same type of fruit as that which is so general in Solanads in such
plants as Verbascum, and Celsia; while in Nicandra wo have at times a plurilocular capsule, in Datura a capsule opening by four valves ; and in Lycopereicum, by a strange hypertrophy, the berry which was at first typically bilocular becomes spuriously multilocular.
M. Milne-Edwards divides the Solanads into two
sections, the first of which bears berries, the second sections, the first of which bears berries, the second
dry fruit, and in each there is a small exceptional group which has a straight instead of a curved embryo.
The principal species in each genus are noted, but of one or two remarkable ones we can find no notice, as of the Brazilian Cherry (Physalis edulis), the Tomato of the Cannibals, or the Apple of Sodom.

The third, or more purely pharmscentical part, gives an account of the several alkaloids peculiar to the order, their uses, and modes of preparation. It is curious that while atropine," daturine, hyoscyamine, solanine, \&c., are all quaternary bodies, consisting of carbon, hydrogen, nitrogen, and oxygen, nicotine, which is liquid at an ordinary temperature, is only ternary, oxygen being absent.

Solanum nigrum is cited as an economical plant, the leaves being boiled in some parts of France as Spinage. We should, however, be sorry to partake of them without their being particularly well drained, and even then it would be with more or less of fear and trembling.

On the whole we consider the treatiee, which is pleasantly written, a very creditable contribution to our knowledge of an order with medical man especially, to make himself well acquainted.
Des Solanées. Par D. Cauvet. Strasbourg, 1864 4 to. Pp. 152, tab. lith. 6.
This treatise is divided into two parts, of which the first is purely botanical, while the second treats of the Physiology and Toxicology of the natural order. The part ?which is at all general is comprised in about 13 pages, the classification being confessedly borrowed for the greater part from Dunal, the Nolanads ihowever
being rejected. The greater part of the first section is devoted to M. Cauvet's pet study of the arrangement of the leaves and nature of the ramification, to which the six plates are dedicated. The whole is very care fully and cleverly worked out; but, excellent as the matter is, it reminds us inevitably of the deal of sack to a half-penny worth of bread.
M. Milne-Edwards in his treatise briefly adverts to this subject in the following terms:-"At first sight Solanads seem to present great differences in the
arrangement of the leaves upon the stem, but if we seek, as M. Naudin has done, the law of chese varia tions, resting on comparative organography, we find that the normal disposition of the leaves is quincuncial. In some species this arrangement is observed during the whole life of the plant, in others it exists only in an early stage of growth, or, what amounts to the
same thing, in the young shoots. The primary axis same thing, in the young ore the plant has reached its full growth, and vegetation is continued by the appearance of many branches, which in their turn are soon displaced by others. These branches are ordinarily two in number, and according as they are developed equally or unequally, there result equal or unequa dichotomies, and if one of the two branches always becomes abortive, this abortion taking place alternately
to the right or to the lefr, the leaves become doubled.
M. Canvet has traced out the morphology species by apecies, and shows clearly that the dichotomy or
forking in most instances annonget veretables does not arise from most instances annongst vegetables noes not of the axis from its original course by the formation of a branch with which the leaf is often confluent. so as to mask the real disposition.
The subject is however one of the most abstruse in botany, and minute details are quite unfit for a popular
Journal. Journal.
The second part of M. Cauvet's thesis treats at considerable length on the narcotic and other poisonous properties of Solanads, and is extremely well done. The following curious matter amongot others is stated of strespect to opium, while speaking of the smoking of stranonium.
"Our excellent friend and colleague, M. Berquiez, from an eminent chemist in London, who prepares morphine on a large scale. There was once a prowhich contrived to give to the opium the exact appear. auce of that from which the morphine had nut been withdrawn, and it was supposed that it would he just as acceptable to the opium smokers. After trial, however, the drug was completely rejected, as they
could not obtain in the slightest degree the desired effect. Morphine, therefore, is a necessary ingredicut in producing the narcotic vapours; and if the may those of Datura. "As far as
As far as we know, neither morphine, nor any of alkalies as well as daturiue, we inay perhaps admit the carrying off of particles, mechamically as it were, by the vapours of which the smoke is composed."

We mentioned in the notice of M. Mine-Edwards treatise that the leaves of Solaum nigrum are sometimes used ns Spinach, and M. Canvet records a no less remarkable circurnstance, that the young shoots of Lycium, the Tea plant of our cottage gardens, are sometimes eaten as Asparagus.
In neither of the treatises do we find any details as to the development of the embryo, and perhaps this was not to be expected, as M. Chunvet states in his preface that the time allowed was too short for many original researches, though it was long euough not to justify a mere compilation.

Catalogues Recrived.-Louis san Houtte's (Gand) Catalogue des Plantes de Serres et de Plein Air, is, as usual, full of interesting subjects, amongst which we notice the rare pitcher-bearing Dischidia Wallichiana, plenissima-Ambroise Verschaffell's (Gand) Plantes Nouvelles gives brief descriptive notices of new plants to be sent out this spring-among them the curions Amorphophallas nivosus.-Louis de Smet's (Gand) Prix Courant, 1865 , is worth consulting amongst other things for its long list of Agaves and allied plants, as well aย Cacti--Brnce \& Co.'s (Hamilton, Oanada West). Seed Catalogue, prepared for the climato of America, is much like our own English liats, giving a selection of the best sorts, and directions for cultivation. One of the chief specialties is a list of hardy native Grapes.mple selectione of the chief florists' flowers, both old ample selectione of the chief florists' flowers, both old
and new varieties. Hoyle's Pelargoniums, and the white Azalea Louise von Baden, are amongst the latter, - Eugène Verdier fils aind (Paris) $₹$ Rosiers Nouveaux is a brief descriptive list of selected novelties rigin.-J Linden's Catalogue des Plantes Erotiques contains descriptions of Mr. Linden's novelties for the present season, among which Rogiera gratissima, of present season, among which a coloured plate is given, will probably be one of the most useful. Franciscea Lindeniana is highly spoken of; also Løelia Wallisi, which with the aspect those of $\mathbf{L}$. purpurata. The enumeration of tropical fruits and officinal plants is a marked feature of this list.-Vilmorin - Andrieux et Cie.'s Supplement aux Catalogues, and Casalogue des Plantes de haut Ornament pour les Jardins et les Squares: the first a list of novelties in differeut departments, the second a descriptive list, with several woodcate, of foliage plants for the summer garden, may be consulted with advantage. Salvia splendens compacta looks as if it should be a fine plant also for indoor decoration.

## Garden Memoranda.

Messbs. Cotbush's Exhibition of Hysontis.This has already been open to the public for a fortnight, and as the flowers are atill in excelient condition, wo underntand that it will be kept open for a week longer. All therefore who have not yet seen this charming display of early flowers should lose no time in doing so, for a more interesting exhibition it would indeed br dufficult to find. The arrangement is similar to that of former years, the Hyacintha bemg placed on a greenhouse slielf in front of a raised bank of other ?lowers, consisting of Heaths and Fpacrises, Canelliaa,

Deutzias, 1Fristemons, Rhodudendrons, Tulips, Fairy Roses, and Sulomon's Seal; the whole edged wit Crocuses, Cychmens, and Moncone over domble-flowere pieties, which, with the exception of a few favoured farictes, wo to be out of tashion, we have her varieties of all shaties of colour, in excellent condition, and so placed that tine different colvur contrast strikingly one with unother, ion, its bells being large and fine, and of great substance. Among oller varieties, Solfaterte and Florence Nghtioliobert Forture claims a first rath, being brighter in colour than Hadu, which is nevertheless still a useful a)wer. La Françise, bluath, is another new variety, which bida tair tos be an improvement on many in its class. Amoug Whites, Fur Mide of Demmark is the purest of a! ; but, all things considerent herlaps, Mont bill is the best. Querna of the and Grandeur à Merveille are, however, all fine kinds. To Blues, the new kind called Cuvier (pale blue with a dark stripe down the centre of each petal) is a valuable addition. Thorwaldsen is fowering bette ston mast by no means be overlooked. The last is, however, more mauve than blue; and, as with Argns the bo'd white eye in this variety will ever render
it a favourite. Dark-nearly black-kinds are still confined to Prince Albert, General Havelock, and Von Humboldt. Ida is by far the best yellow ; and Duc de Malakof the best buff; this last is generally though not always charmingly striped with red. Of other knds tue hame is legron ; and for further information respecting them we must reter to
shows pablished this week and last.

Nartisxi are so, much alike that it is almost useless to refier to them by mane. There is here, however, a goon colluetion of thron, and those who have leisure will dondthons firn amach interest in insperting them

 A colloction of Eorly Tulips ai wie end of the exhi botion atcracts, and ileserveily, in teh attontion. The hest annf them are Couleur ('ardmal, Cramois
 stripad liand in which the colons are chear and dist inct Mingere Lainante, Mrs. Myore, Verminlon Brillant, and Tournesols, Imperator, and Duke of Yort

Other houses contain Vines in pote, large supplies of plants smitable for purposes of ordinary decoration, and thorsands of hedding materials, among which are Mrs. Pollo k and Noseray P'elargonimms in abundance.

Out of diwn't is a frod stock of Roses, fruit trees, and shrubs, together with a selection of Conifers best nursary is beingerban gardens. The whole of this laud it Finchley has just been adiled to it.

## Miscellaneous.

(oultivation in Servic.- It 15 diflicult to realise the fact of the existence in thecentre of Europe, in the nineteenth century, of a country in so primitive a condition as Servia. Wallachia and Moldavia were not long since in the same rule state; but recent events have brought those Damubian countries more into communication with the Cest of Europe, and they have acquired some of its superficinl civilisution. The spirit of improvement has penetrated thene ricu provinces, and a thousand ships are now yoarly freighted with the produce of their teenning san. The day has passed when a Boyer would revily, as one is said to have done on being asked why his conntrymen did not cultivate their fertile prairies, that "it would be a pity to spoil so fine a wilderness." These vast plains, for ages abandoned to the wild Juxuriance of Nature, now wave with magnificent crops of Wheat and Maize. Very different is the aspect of Servia. There almost all vegetation is spontaneous, and the marvellous fecundity of the soil displays has yet, described and classified its flora; no artis las yet gazed with rapture upon its wood-capped hills, rushing torrents, and long-drawn vales, A very small portion of the soil of Servia is culti varul sinme travellers estimate it at a sixth,
witeres only at an eighti. Although situated to the south of Hungary, the productions of the comitr resemble rather those of the north than of the sonth of Eumope. The Olive is unknown, althougk it thrives in the correaponding latitudes of France and Italy. In the district of the Lower Morava Wheat is partially cultivated, but chormous numbers of swine are every where reareal, and they rove through the forests in atyle of almist primitive wildness. The cup of partienlar kind of acurn-the Vallonia of commerceis in extensive demand for taming. A recent traveller value nf which was estimated at to 000 l . Inch of Servia in fact resembles a new settlement in North America, where belts of wood alternate with patches of cultivated land, and the stumps of charred trees remain Indian Corn, the stabblen which, as in Canada, is planted Indian Corn, the stabble serving the purpose of manure.

The whole process of agricultnre is at present almost that of a newly-settled country, aud there is but little scientific farming. The Fig and the Mulberry thrive scientific farming. heard of no attempts to rear the well, but we The llum abounds, and from it is distilled
silk worm. The the common spirit of the country. The Vine covers the 3lopes of some of the hills, and especiatly in the ueigh bourlood of Semandria yields a good wine, which is retailed in the sunall inns of the country for 3d. per piut, but may be purchased wholesate of the been intro 2d. per quart. The Vine is said to liave been introducea Glavour by any in Europe. Many of the wines are havour by rough and astringent, but others are exceedingly gond, particularly that known as Negotin, of which the Servians are justly proud. This wine also possesses the repelling name of "Turk's blowd," and it has acquired a high reputation in Hungary. In Servi custom still prevalis with reference to it, which strongly marks the old hatred of the people to their Tahomedan rulers. Whenever a bottle of it is opened the first person who tastes it affects an air of surprise and "What " this?" A second, having likewise tasted is replies solemnly, "It is Turk's blood;" on which the first rejoins, "Then let it flow freely!" Quarterly Review, Jan. 1865.

## Calendar of Operations.

## (For the ensuing week.)

Owing to the winterly weather which we have been xperiencing, veretation is unusually late. Most matters conuected with cultivation however now begin to claim attention. Recently transplantel trees and shrubs ought to be carefully inspected, for failure is often cauzed by cold drying winds setting in before the plants have had sufticient time to replace their lost riven in dar siomal waterings shonlt therefore be uniform state of wenther, ant to maintan a more formed fibres, spread, where it can be i me, a thick mulching of roiten leaves or chang over the gromat as fire as the roots exteud This, if okjectionatle on aceount of its appearance uight he hid by some covering, as that of Moss, or in some casces even ordinary soil. When the plants are some cascs even ordmary son sheltered from drying wiuds, and even shaded from loot sunshine by tuiaporary scruen of maics or other suitable material. As a matter of course, large trees which have been recently planted will before now have been firmiy not be displiced, or their roots strained or broken.

FLOWER GARDEN AND PLANT HOUSES.
TBTCus. Weak liquid manure now once a weok will strengthen the trusses; give plenty of air whenever the weather is at all favourable, and fumigate occasionally.
Azaleas.-Give young growing planis liberal shifts a good fibrous peat with a little white sand suits them admirably, but for stronger growing kinds a small portion of loam may be used with advantage. Give air freely in fium wenther, and attend regularly to the stopping, thinning, and traiumg of the shoots. Large specimens will now require more water
d.i.ctola ris. - hay plants struck during the winter should be repotted iuto 4 -inch pots to succeed the first plants. If not so large, they will make compact handsome bushes for purposes of decoration.
Carnations and Picotees.-If there is any green fly ou the plants, give them a gool smoking with tobacco or tobacco-paper before taking them from the pit in which they have been wintered.
Cineramis.-Plants intendel fur exhibition should now be kept as near the glass as nay be convenient fumigate, so as to have them thoroughly clean before coming into flower, and sulphur such as may be affected with mildew.

Dabiras.-Cuttings struck now will be found to make fine plants ; therefore propagate freely.

FORCING GARDEN
Cemerries.-If the fruit of these has set too thickly t must be thinned, leaving sufficient for a fair average crop.
Cucumbers. - See that the plants do not fat overthern to bear heary crops at any one time. If you wish them to continute in a bearins stace for a lenerthened perion, give them a gool watering occasiondly with liquid maure. Surv some Short Irrickly fur Cherkins
Teaches - Tho night temperature should not exceed $60^{\circ}$ in the early house, until the "stoning" of the fruit is completer
Pinfs.-lulunt stock will now be in rapid growth take care to give air freeiy if the thermoneter can be kept above $60^{\circ}$. In the afternoon however, syringe and shut un at $10^{\circ}$, if possible for a couple of houre P'nes swelling will, of course, now require liberal waterings of warm liquid manure
Vines.-Those whell weros started early will now or sonn have Grapes in their last stage of swelling See therefore that nothing is wanted in order to have them in first-rate condition.
hardt pruit and ritceen garden
While the weather is so unfavourable, wall trees should be covered at night, and during hail and snow storms; on ordinary occasions the covering should b
ramoved during the daytime. ttacks of green-Ay, which, if allowed to get ahead seriously injure them. Syringing occasioually mutio tobacco-water is the kest remedy
Beans.-Earth up transplauted oues, and put in another crop if those last sown are fairly up.
Calliflowers.-Sow for an early autuwn supr ${ }^{1}$
Celery.-That sown early in boxes will soon wan pricking out. The old plan is very good, viz, to tont me very rotten aud mellow dung on a firm botto On this, the plauts, pricked three inches apart, produce many fibres, and will remove with the tromel in balls, with the most trifling amount of check. The chief reason why Cele:y ruus, is that luxuriance of growth is succeeded by a sudden check.
Mustard and Crless.-Sow at the foot of a souich Mu
wall.

Potatos.-Continue to plaut as the winter crops of Borecole, Brussels Sprouts, and other greeus aro cleared away
Spinach.-Hoe between the rows of autumn cropa If the ground is poor, a good soaking of manure-mater will increase and prolong its produce.
Strawberries.-Get beds and borders of thees weeded and otherwise cleaned before the plants hare rown inuch. Where appearances do not require to be studied, a thin mulching of long stable litter will be found to protect them from cutting wiuds, and to encourage and strengthen their growth. .

## mbetings for the ensuing wbek.

IT is manifestly proved by the letters on AGricultural Education which we have lately published, that the risiug raee of tenant farmers are both better educated than their fathers, and more alive to the advantages of a superior education than their prodecessors were. There is universal testimony to this fact from every county in England. Mr. Fewster, of Gloucestershire, whose memory extends over two generations Mr. Gray, of Northumberland, whose professional life has exceeded half a century, and many others of our correspondents of almost equal experience, who prefer to remain anonymous, agree with the younger men who have writtea from Norfolk, Yorkshire, Lincolushire, and elsewhere in perfeet accordance here. The tenant farmers of this country are indeed far from being one class-they extend over a rery long stretch of the sucial scale, including every step between the rark of the agricultural labourer and that of the independent country gentleman; and to talk of anything but the merely professional education of those who are dependest upon the cultivation of the land for their suppart, $a$ if it were one thing-definable and recugnisable, and capable of being stimulated or promoted as such-is clearly a mistake.
It is however plain that the general educational standing and intelligence of all the c!asses within the wide limits here presented, has been greatly raised during the past 20 or 30 rears: and that the various schooling which is within the reach of these classes has produced a wonderful improvement upon all.

And there is another thing which is also plainly made out-one which is almost as universally attested-characteristic however, prubably, rather of the higher than of the lower of the many classes included within the ranks of tenant farmers, and it is this-that there is not among the rising go-neration of them so much of the detailed practical and professional knowledge on which farm profits hinge as there used to he. It is a striking assertion in Mr. Eluman's letter (p. 278), that he
does not know a young man in his neighbourhood able to manage a farm without the aid of a bailff. And his testimony is not solitary on this point. Those who have taken the pains to read through the letters we have published mast have luarncd there, what we have all olserved in actual country life, that there is very generally now-a-days much litisurely and idle time tos often lost between sehool days and the aotual tenanoy of a farm and entry into independent business. The consequence is that a greater extent of land is every fear coming int.) the hands of men, who, with larger capital than has hitherto been invested on it, and with greater resouroes in manures and stock aud cattle fouds than have ever hitherto been known, jet do not possess that persoual aud practical kuowledge of their business which the former tenante had. There is a "rent" difference, it is said, between the words "go" and "come" in agriculture, doubtless arising out of the eomparative unproduetiveness as well as the greater costliness of operations ordered but not directed. And the country generally as well as the individual tenant suffers from that inferiority on the score of practical skill and professional ability with which the rising generation of agriculturists is in danger of being ohargeable.

One point more appears plainly from these letters; and wo may appeal to the experienoe of every country neighbourhood for its truth-that agricultural succese depends more on prufussional knowledge and plodding industry and moral worth than on scientific attainment or high eduoational status or refinement. We do not by this assertion mean to disparage any of these latter ingredients in the oharacter of a well-educated professional man; but whether the assertion does or does not amount to any such disparagement is of very little moment-for it is unquestionably the truth.

The letters we have published agree with every man's personal expr-rience in prool of this. It is industry, not chemistry-kindliness and firmness, promptitude and skill, in directing lahourersquickness of observation amung live stock and in the fielu-professional knowledge and busiuess habits, and good character-not high scholastic attainments now profound soience, that makes the successful farmer and the trusted neighbour in oountry life. Look at letter No. 17, last week, atd at what Mr. Clare Sewell Read has written in the same page on this subject, both from Norfolk. In No. 14, too, there is the opinion of a man of long and successful experience, on whose opinion perfect reliance may be placed. It is to these and many other such that we confidently and unhesitatingly direct the agricultutal student for a sound judgment of the kind of equipment he needs for the altainment of professional success. This however we do, let us repeat it, with no desire to disparag: a good and scientitic education, which is professionally serviceable, as well as independently to be valued for mere mauhood's sake, i. e. for its personal and extra professional intluence.

But it is not to agricultural students that we address these remarks. They are written in the hope that the decision of the Royal Agricultural Society of England, as represented by its Cunncil, may not next Wednesday he what its Educational Committee recommends. Farmers are already all alive to the advantages of a good scholastic educa-tion-they are getting more and more alive to these advantages every day-they have during the curreut geteration been gaining and gathering in a harvest of these advantages more rapidly than any other professional body that ean the named. It is not here that any interference (which as Lord Fortescue observes would after all be the mere folluwing of an already established opinion) is desirable. Moreover it is nut here, as has over and over again been proved, that a strictly professional Societr has any right to interfere.

On the other hand, farmers' sons, owing perhaps in some measure to a higher style of seholastic education, and the altered tastes which are thus acquired-owing also no doubt to the greater wealth and higher social standiner of the body to which they belong-are in real danger of growing up with a less practical and perfect professional education than their fathers had. There is a long interval between school and actual business occupations-and this interval is less industriously filled than it used to be. There is much time wasted which onght to be professionally employed. It is here that interference is wanted; and happily it is here that the interference of the Royal Agricultural Society of England is called for by its Charter as interpreted by the whole analogy of its past history. Let the Society offer rewards through the University examiners, as the Education

Committee desires it should, for the attainment of a mere school rank, and it will be stepping aitogether nut of its proper field, on to ground where everything is already urged to energetic action, and where no help is wanted. Let it offer rewards through its own professional examiners (to those who have already passed the test of a sufficient general education) for professional aequirements and attainments, suoh as by induetry, whether in the field or in the class-room, may be achieved: it of its labours; and it will be applying whip and spur where urgency and stimulant are greatly needed.

We hope that Mr. Holland's views to this effeet, backed as they unhesitatingly are by Lord Fortescue, will guide the deoision of the Counoil next Wednesday; and that, having concluded to eonfine the direot action of the Sooiety on the educational field within the professional circle, some practicable plan may thus be devised for promoting "the education of those who are dependent on the cultivation of the land for their support.'

Let it be borne in mind, however, that in the opposition which is offered to the general education scheme of the Committee, there is no intention of disparaging the importance and necessity of the firs'-class preliminary sohool training to which it would contine the Bociety's attention. We cordially agree with all that the writers of the admirable letters, Nos. 12, 24, 29, and 30 upon our list, have said on this point.

The opposition to the Committee's scheme arises out of the facts that (1) a full grown convietion on this subject is already prevalent where it is benring good and useful fruit; farmers are already quite alive to the advantages of good schoolingdirect interference of the Society here is to be realised without any such appropriation of the Society's funds as the Committee'recommends, by the simple expedient of requiring from the candidates at a professional examination a certificate of having already passed elsewhere the test of such a preliminary education as is desir-able-and (3) that as it is only on the field of prohas any right to labour, so it is here especially that a growing need exista of that rein and spur which the Society's examinations and rewards would offer and apply.

We are happy to announce the class list in Agriculture of the University of Edinburgh for the Session 1864-5, because, besides the merely class distinctions which it records, there are prizes included in it which ar
The following are the men who have this session taken honours:-

1. In Ordinary Class Examinations. (First-class Certificates.)
Christian Carl Jacobsen, Denmark.
Patrick George Craigir, Scotland.
(Second-class Certificates.)
John Brown Kennedr, Scotland.
Georgr Kent Walton, Warwickshire.
2. Highland Society Prize of 6l. and 4l, to be given in Books.

## 1. Cibistian Carl Jacobsen

We are glad to say that Mr. Jacobsen had already distinguished himself at the Royal Agricultural College, Cirencester, where during the past two years he has been a successful student.

The Bill for reclaiming the Maplin Sarids and Dengie foreshore, and for enalling the sewage of North London to be utilised in South Essex on through the Committee of the House of Commons A very feeble opposition has been offered to it and although the Marquis of Salisbury and the London Corporation, and Mr. Ellis, all professed hostility to the measure, yet no evidence, except for the promoters of the Bill, was called. And this was so complete, that the adverse criticism to which the plans of Messrs. Napier \& Hope were subjected, was received with obvious impatience by the Committee.

Mebres. Hewans and Bateman deolared the adequacy of the plan in an engineering point of view;
Professors Way, Voeccker, and Odling, and Mr. Lawes declared its consistency with the known chemical laws and facts bearing on the subject. Mr. Campbell, of Rugby, and Messrs. Boyce and Gillespie, of Edinburgh, related the agricultural excerience on which the plan is based.
willingness to use the sewage when is brought near them, and Mr. Petre and Mr. Hope be
testimony to the financial merits of the scheme.

The proof led seemed complete, and it is hardly likely that any further opposition, whether in the Commons or before the Lords, can now stiy the progress of the first great measure which has been proposed for solving the great sosial and agricultural difficulty of modern times.

Mr. Corbet, Secretary to the London Farmers' Club, writes to the Times about the Bill relating to Union Rating introduced by Mr. $\nabla$ nlificrs. He declares that farmers are not hostile
The sabject has continually come under the consideration of the members of this Clui, and invariably with a strong majority, if not altogether unanimous opimion, in favour of some system of union rating. In March, 1847, it was resolved at the conclusion of the dis-cussion-
"That, for the several reasons stated, it is inportant that the law of parochial settlement should bo immodiately and wholly abolished, and relef administered in districts so largo
as uot to continue any restrictions on the agricultural labouras unt to continue any restrictions on the agre the choice of
market, or afford any motives to influence
labourers for the gake of diminishing the share of any future labourers for the sake of dimin

In March, 1850, as the result of another meeting, the resolution adopted ran thus :-
"That the extension of rating and nettloment to unions In November, 1856, at a meeting called to consider the moral and social condition of the agricultural labourer, the introducer of the subject went for the abolition of the law of settlement as a means for improving the working man's condition; and in December, 1861, there was an almost unanimous opinion as to "the desirability of abolishing parish and substituting union settlements in the agricultural districts." All these meetings were very fully attended, aud, having had many other opportunities of ascertain ing the feeling, I quite concur with Mr. Wariter in the belief that "there is not a farmer in the country but who has already formed his opinion on the subject, and that it is not on the part of the farmers generally that we find any objections raised to the measure." On the contrary, the agriculturists as a body have long been endeavouring to obtain that extension of settlement now about to be granted.

The Bill for rendering owners of vicious dogs responsible, to which we referred a few weeks ago, was on Wednesday last read a seond time before the House of Commons. Mr. Fenwick, in moving it, said that at present there is no remedy as against the owner of a dog for injuries to sheep and cattle, unless it can be proved that the dog has been in the habit of worrying sheep or cattle, and there is often great difficulty in obtaining that proof. The information he had received led him to believe that in almost every county in England very considerable injury is inflicted by dogs on sheep and cattle. In his own county, according to returns received, no fewer than 962 cases of suoh injury to sheep alone have been recorded, and in no instance has any compensation been obtained. The grand jury of the county, Poor Law Guardians, highway authorities, and agricultaral societies have petitioned in favour of the Bill. It was read a second time without opposition.

## agriculitural EDUCATION.

[The following are in continuation of last week's publication.]
22. Bucrs.-The doings of sons intended for farmers atter leaving school are varions. Some get upon the
outside of a horse, ride here, there, and everywhere; attend races, hunt, fish, and shoot, as well as look after all sorts of amusements; and in fact do everything except what they ought to do. And some, as soon a they leave school at rrom 14 to 16 years of age, not only on all busy occasions ; and in this way get actual practice which gives them a thorough knowledge of what work is. Besides this they watch over and tend their father's stock, and thereby get a thorough knowledge of what atock is, as well as knowing how to tend it in health and in sickness. The present generation of farnuers in this neighbourhood is of much the same style and character as the last generation, not more intelligent educated, and that's all. I am of opinion that the standard of our universities for the local examination of their junior candidates is one that ought to be aimed at; and of their subjects arithmetic is the most important. When it is considered how few there are who attempt to pass that examination in comparison with the number of youths at school, we may fear that there are not near so many as there ought to be who reach that standard. I do not put much faith in special or professional training till after this period. After this the special education should begin. This should be by constant practice, by most diligent and carefu
all there should be a regular and continuous rem
kept of all occurrences, experimenta, and obserm William Smith, Woolston.
23. North Drvon.-I should specific localities and looking broadly Britain, our present race ten over Brum sufficiently educated for their position. I ain eis small ones ( 60 acres and under) are. At present men are an honest, industrious, resolute, never-fis race, unaspiring, but hopeful and happy drudges; hedge sometimes, and fullow over the large farch him occasionally in some crops, ind in wan't; landlords at rent day; "can read any Enolno: without much spelling;" can write a little, but are at figures, as the curate knows when he receives fortnightly bill for dairy produce, and so theye year afterfyear-but give these men what you wond a good English education, and as small farmen the spoiled. C., North Devon.
24. GLoUCes'mbshire--I should say the usual for a farmer's son to leave sohool, if intended for farmer, is at from 15 to 16 years of age, and for most part after this time his knowledge is oltained his fathers farm. Of course it is matural for the to prefer loome; he has more freedom, and if in to be industrious and painstaking, is pleased is opportunity of being of use and adding to the gem fund; if to be careless and idle, he feels thas more easily shirk his work there than elsewher,
can be more his own master. The father, also, notur can be more his own master. The father, also, natum and hopefully looks for help from lis son whe leaves school, and is tempted to believe that the $b$ will soon come when he may leave some of his dutint him and enjoy more leisure. He has also anothen ducement : at home, his son will be, or at all event hopes he will be, of service to him-that is, that lism services will be of value to him, whilst to send from home, to learn what he believes he co him as well at home, would be to involve a neediess: unjustifiable expense. This explanation of the raser for a farmer's son being taught his business at hom, for a farmer's son being taught his busimess at hom looking around, I cannot help feeling perfectly awren that there are a considerable number of ellerly men farmers, whose intelligence, address, and style altogel. are superior, or, at all events, in still more cises tiy to their sons or younger relatives who are following same business. Why is this? I believe from the home tuition of the latter, and until mes method is found out to stimulate them to men exertion at home and a different course of
adopted to that generally taught in schools farmers, as a class, will not hold that position in social scale to which they are entitled, considering capital and intelligence required in efficiently cirt. out the working of a farm. Naturally the ! whether actively engaged at work, or in su the work of others, is too tired at night to pleasure in keeping up the learning he has sequine school; he may possibly read some agricuturai now and then, but not often; bred upon a farm, iut so much about it, and seeing to its management en day, he seldom cares to learn farming by book ns. called, and so some whiles away the evening; and as to the dayluat believe that as a rule both father and son woud sider time wasted if occupied in book work. by the adaptation of the mind for inal science not give him that share of aid which it when combined with, what he may already have vation and experience. Again, from continualls versing with the labourers and speaking them, the farm youth who neglects his studies at by habit becomes confirmed in provincial manner of speaking.
finds himself at a loss tor the ability to argue, that address which he requires in his interc the world as he grows older. I will now give my idea of your last question-How of farming? First of all : what ought no stitute a thoroughly efficient man farmer? My idea is, that be must lav practical knowledge of his business in all its brame added to this he should be well acquainted wiok cultural chemistry, which, besides its commou enable him to judge correctly adopting the different theories which may time be brought before his notice; preserving the one hand from prejudice again udicious improvements suggested by implicitly advice offered by scientific met certainly have a knowledge of mec $m$ master of several different kinds of and the entirely ignorant of their structater inco principle of mechanics, is
loss than he is probably
entomology would be interesting
ciples of geology and of veterin
whilst to be thoroughly acquainted
all its bearings is another absolute
hould possess anowledge of characte
mployer
best endeavours to manage his labourers in such a promote good feeling and barmony between employed; tifferent men require very different for different men require very different he should, as all other classes should, Christian to make its principles his rule Now, how are we to educate a son should follow our business as a farmer the age of 10 or 11 , no to which that at the age be has been taught properly at may suppose he has been taught properiy at English and religious education, La anatomy, and mechanics should be taught and into as the lad grows older, and is found of understanding and taking an interest in the be completed at from 15 to 16 years of age, at ime be should be enabled to enter for 1 year or rear at most a farming College, somewhat similar to basiness, experimental and practical agriculture, and parish law, should be vigorously pursued; mathematics mar or may not be continued there, but I hold its stud habituate the mind to correct reasoning and to refle a. The youth, by this time 17 or 18 years old, now to his home, not however to be separated
from his College; let various prizes be com by such home student, and examinations kept from time to time, and if not fortunate enough to guis a prize, let a medal or some other mark of distincThis itimulus would, I think, be sufficient to incite a youg man to stady, yet at the same time would obtixing that practical knowledge of agriculture which to successfal isue to his labours, We hear of comisming schools in each county? as spoken of by Mr. Edmunds (I believe) in his lecture on the subject at the Farmers' Club, so that we, as a class, could have
our sons properly educated at a moderate cost; I believe that farmers would avail themselves of such schools if they coold be found, but at the present time the terms of schools capable of teaching what I have farmers. W.J. Edmonds, Southrope, Lechlade.

## 25. Gloucestershire: Valo District.-The farmer in this neighbourhood generally send their sons till and then for two years to a boarding achool to finish at a cost, including extras, of about $50 l$. a year. After wards, those intended for farmers are set to work on ploaghing and sowing, reaping and mowing, buildin and thatching ricks, hedging, ditching, and draining, operating selling stock and corn, and any other become required in the business of farming, antil they $a$ to trying new plans, bake practical farmera, provement that fill "ma "two earg of corn grow" "im From my own observation great progress has been made in farming in this county in than formerly, being thereby better fitted to have rodern improvements and carry for wan fear that English farming will extract from oduce. J. C

consists of instruction in reading, writing, summing, and mensuration. There is no special education in schools for the sons of farmers. When the younc man leaves school he begins at once to attend to farming bu-iness, usually at home, under the superintendence of his father, as the shepherding, breeding, rearing, and feed ing of stock, the tillage of the farm, the planting and sons have a much better tae markets, than 40 years ago, when I was young; and consequentiy are more intelligent, and take a higher social standug. The child intended for a tenant farmer ought to become efficient in the following particulars, viz, in reading writing (so as to be legible), summing, grammar-he
ought to be able to measure and estimate stone quarsies, heaps of manure or ashes, hay and corn stacks (ronnd or equare), timber, brick or stonework, carpenters' work, roofing, \&cc., for cottages, houses, or agricultura buildings ; also earth worke, embankments, levelling for drainage, \&c. together with plan drawing for all
these purposes. After he has gone through the above general education, add six months instruction at veterinary college. Doubtless a special education has
its advantages, but it is beyond the reach of the ordinary its advantages, but it is beyond the reach of the ordinary tenant farmer. T. B. Dring, Claxby, Spilsby.
28. Norfolk.-I have never heard any complaint as to the want of good schools in this county. I believe there is one or more in every market town in the county where farmers' sons can learn all they require. Boys intended for farmers should be taught, in addition think the grand point is in training boys three or four years after they leave school in all the practical parts of farming, so as they know and can do all the different sorts of work upon a farm, in order to be able to set the labourer to work in a proper way. I think that there is more fuss about the education
29. Northumberland.-In reply to your querie about agricultural education, I would say generally that the present race of farmers are much in advance of their fatbers in that kind of knowledge which is the fruit of early education and mental culture; in proof of which I send a retarn (of membership, \&c., which I have just obtained from the Secretary of the Hexham Farmers' Club, of which I have been President from its commencement till last year, when the wear and tear of 30 years wamed me that it was time to retire from the discharge of many public duties which my position or inclination had imposed upon me. In the early part of this century, few agricultural societies existed, and farmers clubs for the purpose of discussion on practical
or scientific subjects were unknown. Now we find such institutious abounding all over the country. The Tyneside Agricultural Society and the Hexham Farmers' Club originated at the rent-day dinners with the tenants of the estates under my management. At first the members of the Club were very few, but its discussions and addresses soon began to excite a wider interest; its numbers gradually multiplied, and its library, which was a much desired olject with me, increased to its present dimensions, Papers are read Club, except in time of harvest, and mainly by practical farmers. The existence of such a Club in a rural district, comprising 221 members, with a library of 489 volumes, besides several agricultural periodicals, is a strong fact in proof of the better education

We've fallen on better times; men read and think
Our good forviatiers used to ight and drink.
At least 8 it was with the dwellers on the Borders, the cultivation of whose fields and stock is now thought to be somewhat "exemplary. Although the county Northumberland stands tolerably high in the scale of agriculture it is by no means well supplied with schools of a higher order than such as are found in all the villages. This may be accounted for in part by its proximity to Edinburgh, affording to the tons of moderate terms, an education more formed on the study of mathematics and the natural or physical sciences than of the classics, which, however desirable as a training of the mind and a foundation for the acquirement elegant and extended knowledge, is not so essential o so immediately svailable in the agriculturist's line of life. The progress of modern agricultural improvement is greatly indebted to the discovery of new manurial substances, and success in applying thealene to the description of soil to be operated apon, and the kind of produce to be raised. Knowledge of that kind is much better acquired in the public education of Elinburgh than in any schools in Eagland, except in the College for the especial object of agricultural instruction. The knowledge of chemistry and of nimal pathology. can never be of ention Yousk, what do gouth intended for farmers do when they leave school? That admits of most various answers, and yet it is often the great turning-point which stamps a value or otherwise on the future character. Some who have the means may be allowed to travel a littie, at least in their own country, and find an opportunity of observing
numerous meetings of agricultural sucuetios in this day firer attractions and concentrated means of gaining such become sportsmen and idlers, who can talk better than becime sportsmen and idlers, who can talk better than
they can act on farming matters-thougli I would not they can act on farming masters-though I would not
indiscriminately censure sportsmen, for I never saw a real energetic leader in a fux hunt who had not the material to make him a lealer in more dignified pur suits, if occasion roused him to exertion. Some, of indolent habits and listless mind, content themselves with what they have learnt, and take to the quiet opera tions of the farm, seeing that their fathers have got on with little elucation, and are satisfied to do on with little elucation, and are satisfied to do
likewise. What I have enjoined on the sons of farmers of not the highest class has been, on leaving chool, to use all industry during the day in perfecting them in the use of all implements and machinery found on the farm, to be able to show how work sloould be done to others, and to employ the long evening hour in reading useful books, such as the library of the Club contains, under the assurance that the cultivation of the mind is essential to the good cultivation of the land. In cases where men have raised thembelven to occupy farms, from a lower condition, by industry and carefulness, but without education, the example and stimulus are wanting to their family, and the benefit of education is not appreciated. In such cases the improvement and progres in education are slow, but every thing is tending to its general advancoment: and I aun by no means satisfied that it will be accelerated by egal enactments or public provision. I have had much to do with the management and inspection of village achools, and have invariably found that gratuitous education is least valued and least efficient. Schools, varying in character and expense, suited to difforent grades of society, have been greatly multiplied in the country during the last 50 years; and it is unquestion able that education and intelligence have advauced in a corresponding degree among the middle and lower clases of the agricnltural population. J. Gray, Lipwood House.
30. Northo Mberland. - The present generation of farmers are better educated, are more alive to the benefits of education, and have better opportunities of conferring these advantages on their sobs thas any previous generation. I thiuk, however, there is still a want of good middle-class echools throughout the country, and that more advance has been made in the provision of means of education for the working classes than for the middle classes; but the idea of singling out farmers as a class, and insisting on schools specially for them, appears to me aimply absard, and whatever the charters of the national agricaltural societien may on the subject, I cannot see that it forms any part of their duty to take the education of the farmern sons under their charge. As to the special kind of education required for the sons of farmers who intend to fullow their father's profession, I do not think there need be any specialty in their education more than in that of their brothers intended for engineers, lawjers, merchants, or any other profession. I do not suppose a man will make a better lawser by having been made to atudy Blackstone when a boy at school; no more will he make a better farmer by being obliged when a scluol-boy to study your Cyclopadia. Till they are 15 or 16 I would give them as good a general education-English, Latin, and mathematics-as I could attain to ; such an education as shall not merely teach them to read and write, but to think. Fifteen is as soon as they can really decide what profession they are to follow, and if they should show an earlier inclination for farming, you may rest assured it will be by their carrying on their own especial education every hour they are at home. If possible, I would prefer that they should get their general education at achool with other boys and be at Lome at night. After their school days they should have a couple of years of red work at home, putling out hand and learning practically the work they will aftermards have to superintend and if this is relieved during the winter months by attending agricultural, chemistry, and nataral meience classes either at a univer aity, or wherever they can be most conveniently obtained, it will further ezercise the mind, and greatly add to the interest of their work. After a couple of years at home, 12 or 18 months in the office of a country lawyer in good practice is of great advantage to any young man, from the business habits he there acquires and then, when his mind is formed, and be has sutficien znowledge of his profestion to appreciate the difference he will see in the farming of other countios, he of the best farmed districts of the kiogdom, which will greatly tend to rub off the prejudices one natarally and unconsciously gets in favour of the customs of one's own neighbourbood. This training would, I think, give a young man as thorough a knowledge of his protession as he could have till he fairly embarks in it for himself. I am not aware of any new means which are desirable to attain this end; and the additional means required are more good middle-class schools. There are always able and intelligent farmers to be found who will receive pupils, and there would be more, did said pupils more generally show a deaire to learn their business. But from some unaccountabie canse, farming, which to those actually engaged in it is a most difficult profossion, in which we are always learning, is, by outsiders, loosed upon as the most simple thing in the world, and
which any one can follow with success, and pupils very frequently have the aame idea, and fancy all they have form, when perhaps they learn to their cont what it is. Thomas T. Dods, Hexham.
31. Northumberland.-In this, as in other counties, the present generation of tenant farmers are much better educated, in every way, than the preceding, farmers are now seeing the advantages of $\Omega$ good education, and, as far as their means will allow, are conferring these advantages on their sons. Lastly, I think that boys intended to be farmers should receive a sound general education when at school-that schools and schoolmasters should have as little as possible to do with the "special and professional" training of a home, on a farm. G. $L$.
32. Oxpordshirse-My impression is that farmers sons do not want a special education provided for them, but that a good general education is all that is neces-
sary, for which purpose there are sufficient schools in existence at 6 l. . per year opwards; but as all farmers cannot afford so high a price it is very desirable that they should be provided with good middle-class schools, of which there are too few in the country. A very satisfactory one has lately been established in this county at Bloxham by the Rev. J. Edgerton, a late that the farmers of the present generation are better educated and more alive to the advantages of a good education than the last; but one cannot but regret that the youth of the present age who intend making farming their pursuit, too often and too quickly settle down to their cigar, their $g u n$, or their horse after leaving school, instead of turning to any practical ase the education they havo received. I consider a knowledge of the veterinary art, chemistry, geology, botany, entomolngy, and meteorology to be essential, and may be acquired by any youth in connection with his legitimate occupation in less time than is frequently devoted to the former, with such helps as may generally be obtained in the nearest market town. It is very much the practice with most young men to attend one or more markets a week; how profitably could an hour or two of that day be spent in attending a class or lectur n one or other of the before-named subjects, instead of devoting it to that which is neither elevating nor satisfactory. John B. Spearing, 4, St. Giles, Oxford.
33. Shropshirk.-Let it be understood that my remarks have reference only to my own district (which rather a peculiar one), and perbaps would not be In reply to your first question, there are no schools In reply to your first question, there are no schools young farmers beyond the common rudiments of learning; and I regret to say this is all the education they
get, having afterwards to fight their way at the tail of the plough; and this is not confined to those who may claim the want of means to do otherwise by their who have ample means at their disposal. To your second question, I am sorry to say I cannot agree with you in the cheering opinion you give of the rising generation. Except in a few isolated cases, there appears to me to be very little if any improvement as tant approach closely connected with the cultivation of the soil. With regard to your last inquiry, which is of vast import ance, I shall speak with great deference to the opinion of others. There is no doubt up to a certain point the where time and money is no object, this should be pursued to its completion; but for the great bulk I am trongly of opinion that special education should commence at a much enrlier stage than is generally thought necessary, taking it for granted that school education has for its object the preparing of the mind for that obtain. I am of opinion that the mind might be as effectually expanded by being tanght those things in which individuals are likely to be occupied in after life as by classical lore. And why may not animal and vegetable physiology, animal pathology, botany eology, chemistry, barn mechanish, But the after opportunities of young farmers are of the greatest importance; for however good or appropriate a young man's education might have been, unless he is fortunate enough to be associated with those of a like kindred spirit, he is very apt to forget the training of his youth, and relapse into the habits of his less fortunate neighbours. What appears to me the great thing wanted in this district is some magic wand to insti into the people a wish or desire for education, and then A large majority, "ignorance is bliss." Evan Davies, Patton, Wenlock.
34. Suprolk. -There can be no doubt that the ppreciation of education and the facility of acquiring have inmitely advanced in the last half century. We opened immediately, the "Albert School and College
for the Middle Classes," interded for 300 pupils at the charge of $25 \%$. per annum for board, lodging, and
education. At Woodbridge the same thing is occurring. "The Seckford Charity School," rebuilt on a much enlarged scale. A few years ago, the "Foundation School of the Ipswich Corporation," underwent similar change. At Aldborough a good school has been erected, and a classical master appointed, at
Helmingham, under the patronage of Mr. Tollemache, a good middle-class achool has been erected, and one at Stradbroke under the Rev. J. C. Ryle, and the church wardens as corporation. There are no schools professing attention to agricultural education in particular nothing of the kind of Mr. Nesbit's agricultural chemistry, or the Cirencester educational farm. I have no predilection for a farm and school establishment; the field of observation might be circumscribed, and the same daily round and the same peripatetic lecture must become stale and unexciting. Let such farmers as can afford it send their sons early to a good boarding school, and acquire what they can of every mental accomplishment; then a year or so to such a man as Mr. Nesbit for agricultural chemistry, to be followed by a course of lectures at University College, making acquaintance with animal and vegetable physiology in particular, with natural and moral philosophy, the principles of various sciences, their ramifications and practical application ; afterwards to a large farm from home, and another and another in distant localities, taking with them their standard scientific and Latin books. We have many on our Suffolk light lands who can do this, but on our heavy lands they are few and far between; let the less favoured classes imitate such a course as far as they can. On our heavy lands the occupations are smaller, and the majority of tenants of such farms cannot afford to pay 25\%. per annum to our new college. Their boys, if not within walking distance of the village school, ride upon a donkey, taking their dinners in a canvas bag slung over the shoulder; the girls have such small extra indulgences as are at command. "But braw lads and buirdly hizzies are reared in sic a way as this is." After such schooling the sons take their practical knowledge by working on the farm ; if several sons, some are apprenticed to trades. I do not see that by legislation, or by contributory association, any alteration can be made so universal as to affect the position of the middle classes in general or the sons of small farmers in particular. The penny postage, cheap literature in general, and the penny newspaper in particular, the electric telegraph, cheap and rapid travelling by steam, free trade, and international visiting are giving us repetition of the primal blessing-" Let there be light, and there was light!" These are directly and indirectly opening out the powers of the intellect, and are making the privileged stickler for effete stereotyped systems look a jealously at tha acquirements of the middle classes as the farmers did at the better educa-
tion given at the pauper establishments. Geo. Edvoards, Pramlingham.
35. Suproxz.-The occupiers of land in Suffolk vary n style and position, from some who occupy from 20 to 100 acres, working on the farm themselves, throug every gradation of holding $200,300,500$, to 1000 acres,
and employing a moderate but more often limited capital, and filling all positions in society, from that of the peasant to that of the independert gentieman The smaller holders avail themselves of the village schools, those of greater estates are educated to the age of nine or 10 by their mothers, sisters, or by a nursery governess; many of those of the middle class spend two or three years at a boarding school, called com mercial, where for payment of from $28 l$. to $35 l$. or $40 l$. per annum they are pretty well grounded in reading spelling, writing, and arithmetic, with "geography and use of the globes;" in some instances a little mensuration. The first four are attained with a fair degree of moderate proficiency; but for junior clerks in an office I prefer the attainments made by tolerably acute boy at our national British and foreign and free schools in the town. Young men are mostly apprenticed to shop at home to learn farming, a little hunting, or shooting where the opportunity and means offer; it is only at home that such have any special training for gaining livelihood on a farm. And at the present time it needs very special training indeed to afford him much saying, after having had a wide I have no hesitation in saying, after having had a wide range of opportunity for ouservation, that a very marked improvement has been manifest in the style, habits, intelligence, and social standing of the present generation, as compared with the past, say 20 years ago, and I think this is still progressive. I attribute this in some degree to th improvement in the lower class of schools, to the mor correct appreciation of the value of practical English
education, of the necessity that boys should work eincation, of the necessity that boys should work
either in trade, or farming, instead of hanging about home for the remote chance of being put into a good farin after having been half spoiled by the leisure and pursuits of gentlemen; not a little to the stimulus afforded by their companionship with such of the other cembers of the family who have been engaged in thade in towns, where they have had great facilities to development to which their taste, or the requirenents of their respective engagements, may direct them

I would rather have a boy come to my office havi
good general education, upon which I might and graft the specialties of my business, than hare mind filled with such theories as I fear he have mistaught at a school, where if he has to leave at his short term. X. 8 .
36. WARWICKSHILE.-Sons of farmers in thia n bourhood usually receive their education boarding school, from about the age of nine
their parents consider they have acgnire knowledge to qualify them for activa daired education embraces the peneral active datie school and a little classical learning. On leaving the young man is either placed under the instru some practical farmer of supposed ability, under guidance he observes the usual routine of farm ment, or he takes an active part in the duties of training (cenerally) "to fit him for no other on a farm." There are countless instances whe son's intelligence or social bearing is in no superior to his parent's; but speaking general present generation of farmers is far in advance last generation in education and therefore in gence. I doubt if there be any means by succeugh efficiency may be certainly conferred for successtul discharge of all the duties which deroin a tenant farmer." This end can only be attained not certainly) by a sound general scholastic edoe followed by the student witnessing and partaki the active duties of real agricultural life. As no royal road to arithmetic, neither is there to sucen practical farming; no professional training for agricultural learner can be safely substituted for act personal participation in the every.day employmen a well-ordered farm. "Practice with Science" is soo doctrine enougb, bat Science without Practiee here has, nor ever can, lead to satisfactory resalts to
teuant farmer. J. C. $\Delta d k i n s$, Milcote, Stratford-m
37. Yorkshirs.-The great proportion of farmine are from 250 to 300 acres, although there are serm farmers holding from 400 to 600 acres. The genent of farmers here have been educated in country (pinn or endowed grammar schools, some of them having han y year or two at a better achool to finish. On larim this school the young man in many cases leam business practically, by taking the looking after so particular part of the work on the farm, as the till or the stock at home, and learning from obsernim attending markets, \&c. My opinion is that the firm of the present generation are considerably supaire those of the past-more intelligent, better educated, occupying a higher social position. I also thind th tenant farmers are generally wide awale ato benefit of a good education for their children. think an outcry need have arisen on the sugject culty in choosing a school exactly to your mind fin think, if even special establishments farmers would still select other schoois tuey
think more suitable. None of our best young fur think more suitable. None of our best young gatn have been at Cirencester from this neighbour

## Home Correspondence,

The Weald of Sussex Farm.-Dear Mr. "H. OD bala with you that it is rather a bold thing wall bolance sheet to the press, but at the same who apper sorry to see sarcastic remarks made on one and and meet these critical times by encrgetic meab therefore I come to the rescue
"Leisurely" by endeavouring to prove that inis. possible to bring out oxen at two years old fit market, without their being wbat you term phe animals. I am not an amateur, or a fancy suor breeder, although I generally succeed in has wa plain-spoken, clod-hopping farmer, satisfied pay my rent, and make both ends met
the year. After this preamble I will giv of my own experience, and simple facts Tervkesbury fair \& Moore sold for me br aut the Short-horn breed, under two years old them brought 23l., and the other 20. 5 not fed in any extravagant manner producing show animals, but merely during their short life, and indeed lived so last summer, the dry season having the pastures aud Vetches, and when tapy of w the stalls in October, they did not look which all sporting men know is a grest p been managed when calves as I shall preem ear-old heifers, and indeed one of win ; and they were certainly n three altugether. Their companio Yon suy mpinion thable
eurly to maturity; it appears to me very probable that such might is too much the practice to starve growing cattle, bat it is very uncomplimentary to the Sussex farmer to insinuate that gnod calves are not to be met with in your county. There is one of "Leisurely's" projects Which does not appear number of calves he proposes to reat ; I mean his 12 cows, and the manner of so doing; by malting each cow rear four calves, mifching each two rery late in the season, which is always a disadvantage, and besides which they would come in for the fageend and the cow's milk, which if richer in quality would be less in quantity, whereas the earlier ones would have more than was necessary for them. I would suggest that 24 calves only should be reared from the 12 cows, adopting the following system, which I have practised myself for several years with the greatest success. My four cows rear eight calves. I allow the calves to suck thair mothers a few days or a week, after which they lure new milk from a pail three times a day for a fortnight longer, when I begin gradually to lessen the quantity of new milk and to replace it with skim milk, adding boiled linseed, and shaking a handful of Bean flour into each calfo portion. By the time they are five or six weeks jelly and Bean meal increased as necessary, according to the quantity of akim milk there may be for them; by the time they are three months old I find they do no care much for their drink in the middle of the dry, a hy that time they will eat a sufficiency of other things, sand at four months they are weaned from it entirely. I have read many boons on the rearing of calves, as wel as prize essays on the subject, and have reaped much
valuable information from them, but have always been surprised to find no one advocate feeding these young creatures more than twice a day. It is acknowledged by all that no calves are so fine as those which run with their mothers, in which case they will suck every hour. Then why not take Nature for our guide, and follow her dictates as nearly as we can? What can be more monstrous than to keep a young sucking animal 12 hours without food? Who can have heard them bellowing an hour or two for their supper before they an get it withont thinking that he also would be woefllly hungry if he had not had a good dinner at lo'clock after an early breakfast? $L$. C. S.

## Eacietirs.

Kirescors,-Mr. Dodsons lately read the following paper:-Can an alteration be made in the Systems of maintaining an increased quantity of stock? After bome preliminary remarks, he said: Doubtless to is become the topic of topics, more especially to those occupying thin light land; the amount of other produce (consequently success or otherwise) depending in great measure on the amount of stock kept.

1. Description of the District.- The following are of the system applicable and mostly pursued in this district.
The farms for the most part are arable; the soils, althongh
nerying chioly dry, and better caloulatod for carrying
abep than sut
 most suitable and natural description for for light her system could, as a large portion of the produce under straw of the different corn crops, think, more than slmost any other branch of his business.
find three different systems of farming are the four, fire, and six-field rotations farming are practised: feld (or fire, and six-field rotations of cropping. The four-
hnowerally termed the Norfolk), is the well ar furthon by keeping the seeds down corn; the five-field Joar after. Wheat; Sainfoin being grown under each of the
rotations. The quantity however I think varies more according
to the at the exprigences or necessities individual occupier rather than demand. The adoption of either of these modes modes pursued be (and purt the five-ield is much circumstances. I find for the menerally followed than either
of the others, and on thould be the best for maintaining a full quantity of stock igreen and root crops, and consequently less for corm. matter before of Rotation- In order to place the the probable amount of food likely to accrue under each better as at present managed, so as to enable us the Wetter to arrive at the best course to follow

Wure or feed consider if any extra application of artificial intermediate crops, de. taken, so as as to increase the
micunt of food, and thus enable us to keep and main-
in an extra quantity of stock. Wo will suppose a farm
toc acres of arable, with an addition of some 40 acres

 ${ }^{45}$ each having in Sainfoin say. The 60 acres, leaving ought to be Barley, seeds, and Wheat. From what I 340 acres

## We will now proceed to consider the amount of stock that

 its supply. For the purpose of simplifying the matter, I will sheep keep; then, after deducting a certain quantity of the first case (a) 100 tons. leaving 112 tons, which with the 20 tons of hay left as food for heavy stock, the 1275 tons of ronts, with70 tons of the hay, would carry 633 sheep for 281 weeks,
allowing them 23 lb . roots and $1 \frac{1}{4} \mathrm{lb}$. of hay each dails. the 112 tons of straw, and the remaining 20 tons of hay would run cattle for 28 weeks. The 70 acres fed and the after-Grass wonld
run to 20 Jb . Grass daily each for 400 sheep for 23 weenss. (b) The
5 -field ( 1050 tonsof ronts and 5 t tong viz., 23 lb . and $1 \frac{1}{} \mathrm{lb}$. daily). would keep about 522 sheep
28 weeks, leaving 63 tons of hay, which, with 100 tons of
straw, allowing 75 tons 28 weeks, leaving 63 tons of hay, which, with 100 tons of
straw, allowing 75 tons for littor, sc., will be 28 weeks' keep
for 84 beasts at 1.3 lh summer feed at 20 lb . diily, 515 sheep fre 23 weeks. (c) The sixfield. 85.5 tons ronts as before, the ronts would carry 425 sheep
for $2 S$ weeks. consuming $46 \frac{1}{2}$ tons of hay, leaving $38 \frac{1}{5}$ tons to the et ceteras. This would be $10 \frac{1}{5} \mathrm{lb}$. straw and $6 \frac{1}{2} \mathrm{lb}$. hay
daily for 28 weeks for 69 beasts. The summer keep would be 23 weeks' keep frr 428 shicep, at 20 lb . each daily. -The four-
course would thus give us winter keep of 28 weeks for 33 shecy, and 23 weeks in summer for 400 sheep, and winter 8 weeks' winter keep for 522 , and 23 weeks in summer for 28 weeks' winter keep for 425 sheep, and 23 weeks summer fo taken no notice of the pastures, but will consider them as
furnishing come hay, and to maintain a portion of cattle and as Vetches, \&c, in monsequenco of there being circumstances alike in each case. I do not moan to say my calculations are purpose. The great drawback to the four-course shift is the keep to maintain a heavy stock during summor, and the great
disparity in the winter and summer supply; in fact, I do not do I find it followed to any extent. Again, I do not hold winter and summev supply is much more equal ; it will not
carry the quantity of istock, and the taking of two whit
stravs crons in succession is too senurging, and not to b sanctioned unless backed by a very liberal application both on artificial feed asd $m$ inure, consequently I think the five-field,
which is the system (as I have before intimated) for the most part practised, cannot well be done away with.
3. The 5-field Course of Cropping.-I shall therefore confine my remarks more particularly to this than the others, pointing out where I think addition, alteration, or modification may be beneficially made.

First, considering the effect likely to be produced by manure, The root orop undoubtedly of all light soils is the mainstay and foundation of the succeeding crops in the
rotation-I will therefore deal witil this first. The prenaration of the land I need not enter on, as doubtless most suited to the all. Autumn cultivation however should tent of manuring is where I suggest an alteration. In the first place, 1 should reserve the farmyard manure for the seeds, growing the roots solely with artificials, applying 5 cwt .
superphosphate, 2 to 3 cwt guano, or 8 to is bushols of bones for Swedes, the bones being the most certain in dry seasons,
costing from 3.2 . to 37.15 s . per acre-the greatest quantity I should recommend. A snmewhat smaller quantity might do full dressing,
at a cheaper expense.; By this per ton; the manure being the only extr average instead of 15 . Next in importance are the artificial
Grasses. Here improvement may be effected : first of all, every the seeds-a fine surface, mellow, and somewhat firm seed-bed is the best. The seeds should be good and clean, true, and o
the best sorts of their kind (for these vary considerably), and to in some measure obviate the difficulty of obtaining a plant Alsike and yellow, sowing on one-half the brake $1 \frac{1}{2}$ bushel o Pacey's Rye-graes, $t$ bushel Cocksfoot, and 2 lbs . Timothy.
with S lbs. of red Clo other portion substituting 6 lbs . Alsike, and 7 lbs . of yellow or Hnp, or a like quantity of milled Giant Sainfoin might

Artificial Food.-There is another means of increasing and keeping up a full quantity of stock, and by some advocated in preference to the foregoing, viz., expending a large amount in artificial feed.
This, I acknowledge, may be done to a considerable bulky food is necessary, and which in the winter salyon But the difficulty keeping and maintaining cattle enough during summer to convert in the winter season the straw of our cereals into good
manure. Bear in mind I do not deprecate the use of artificial produce on the farm, the better prospect will there be of artificials ; for our ruminating animals must inave sufficient to in some measure appease the craving of a large stomach. Now cation of manure wnuld in some measure supply this ; the 230 average) to consume 140 lbs each dailv, Fould furnish nearly 23 weeks' keep for 23 head. Supposing allnwing 1 cwt. instead of $1 t$ ewt. daily, makiug up the
deficiency with 2 lbs, of cake, we migh: keen 28 head rathe more than 23 weeks, whilst the 700 tons of roots (which migh be all spared for the yards), would run to 1 cwt. each for the
S4 beasts for $2 S$ weeks. These 1 am confident, pulped and S4 beasts for $2 S$ weeks. These I am confident, palped and
mixed with chaff, would do them better than 4 lus. cake daily, the cost in the former caso being, at the price I put on tho price of cake, 2 s .9 ll , which would be a saving of 18 . a weck, or four-field-the obtaining a plant of seeds, and I presume from similar reason. the frequent repetition of the crops; but then
5. Alteration of Cropping.-Now, if the expenditur I have suggested appears too extravagant, I think an alteration might be made for the best by keeping, say one-third of the seeds down a year or two longer.
This. if reducing the; quantity in corn, would give the same proposed has been an increased expenditure in carrying ou the present systems rather than any alteration; if in prefervarious ways, but I think net to any advantilge, and muat be done by increasing the acreage of stock feod producing crops the seeds three or four years, or at any rate a portion of them, say one-third; this if allowed to remain but one year would half of the increase by manuring as in the former case. Or we
might extend the course thus: lst year Wheat; 2d, might extend the course thus: 1st year Wheat; $2 d$,
roots; 30 , corn; fth, eatch crops, portions first to Rye. winter Oats, or Barley, and Vetches, to be succeeded corn; sixth and seventh seeds, allowiug an equal portion for
Sainfoin: this for 400 acres would be 50 acres cach. There Would, therefore, be three corn crops in the seven years, making 150 acres, which would execed by 10 acres the old
system. The food for stock would be much the same. Allowing system. The food for stock would be much the same. Allowing 1125 tons roots, $187 \frac{1}{2}$ tons of straw. 100 tons of hay, and 815 Grass, Rape, de. There would, however, be a little extra outlay for a portion of the fourth year's crops; it would likewise
create more labour, and I question if it would accommodate horned stock so well as the ouner, but it might sheep. Again, there is less hay; so on the whole would not carry more
stock; therefore the only prospect of any advantage wouid as that would only come onco in seven sears, instead of five. If this system was adopted I doubt not it would be (in fact,
should be) similarly treated with respect to a liberal application of artificial dressings as in the former instance, to be
attended with any beneficia! results. Whichever system is followed, my remarks are equaliy applicable : if the four-course
there is then the greater necessity of liberal treatment. With respect to the six- crop of corn was wholly consumed on the farm, in addition to a full dressing of artificial manures, and the usual importation of artificial feed; then no
6. Grass Lands.- With respect to the pasture and sheep walks, as regards the former I do say it does not get that attention it deserves.
This land is occupied by its natural plants, and is consequentiy the more likely to repay any reasonable outlay
for manure and good treatment, and which, if judiciously
applied, I believe many applied, I believe many of then would supply food for double
the quantity of atock than they now carry. A compont

## 3 a bictos．

The Journal of Agrioulture，and Traneactions of the Highland and Agricultural So
No．88．W．Blackwood \＆Sons
We refer to the present interesting Number of this
Journal for the purpose of extracting a passage from Dr．Anderson＇s report on the Edinburgh sewage wate and sewaged soil，of which we were not aware the othe week when writing on the Craigentinny meadows．The quantity of ammonia present in the sample of Edinburgh mewage examined amounted to $8 \frac{8}{4}$ grains per gallon， Which is above the average of samples at Rugby．The
＂The soil irrigated is of two kinds：1st，that in the neighbourhood of Lochend，which is a loamy soil capable of producing in its natural state excellent crops of all kinds ；and 2d，of a perfectly barren sand．The first of these has been longest irrigated，a part of it having been under sewerage for nearly 200 years，and all of it for at least half a century．The inferior soi lies on the low ground towards the sea，and 30 or 40 years since was a barren tract，covered with ecanty herbage，full of can
＂The two soils are very different to the eye．That from Lochend is a fine black loam，perfeatly uniform in quantity of organic matter．The other is a nearly quyer of black soil，containing a considerable the Graes．The samples for analysis were obtained by digging a hole 10 inches deep，and catting a slice 2 or 3 inches thick from the side，and mixing the whole carefully together．The samples were dried at $212^{\circ}$ and contrined

Organic maattar

## $\begin{array}{r}\text { rochen } \\ 19.28 \\ 5.22 \\ 1.38 \\ 0.62 \\ 0.26 \\ 0.29 \\ 0.49 \\ \text { trace } \\ 0.67 \\ 0.37 \\ 1.03 \\ 0.63 \\ 4.58 \\ \hline 6.28\end{array}$

they throw on the differences between the two soils．It is evident，in fact，that the Lochend soil has been greatly changed in its composition by the action of the sewage，and the quantity of organic matter，and of all the valuable plant food，materially increased．We haval not，of course，the means of contrasting $\begin{aligned} & \text { analysis．the exact composition of the soil before it was }\end{aligned}$ irrigated with that it now possesses；but it may be safely asserted，from the known composition of analogous soils，that it would not have contained more than a fourth，certainly not above a third－of the organic matter，ammonia，and phosphoric acid now present in it．There has been produced，therefore，a very marked increase in the quality of the woil，which could only have been brought about by many years＇irrigation．The other coil has been much less affected，and may be con－
sidared as being still，to all intents and purposes，a sand， which can ouly be maintained in its present state by the constant addition of valuable matters ；and there can be no doubt that if it were left to inself for some years it would revert to its original sterility．It is worthy of notice that though it is nsually supposed that the quality of the soil to be irrigated by sewage is a matter of little moment，provided it be sume the fluid the experience of Craigentinny does not support this view，for the naturally good soil brings in its irrigated state about $8 l$ ．per imperial acre more than the interior sand．Part of this difference may be due to the fact that the Fisgate Whius land，being farther from th sewers，gets only the worst part of the sewage，but this cannot explain it entirely．
On the last quoted sentences we would ask wheller the higher price obtained for the best plots is owing to their being more productive through the summer，or to the mere fact that the produce is earlier，and that spring keep in the first weeks of it is especially desirable and valuable
We may name as among the mbjects occupying Dr． Anderson＇s nen in the present Number of the Trans－ actions，the account given by him of experiments on the fertilising effecto of uric acid as a manure． This，it will be remembered，is altogether ignored by Liebig in his recent extraordinary estimate of the agricultaral value of grano，although acknowledged by him in his equally extraordinary estimate of the agri cultural valce of sewage water．It is satisfactory to former and risht in the latter instance．The following are the conclusions to which Dr．Anderson arrives：－
＂From these experiments it appears that the guano ath－that is，the mineral matters of the guano when applied alone to the Wheat crop－are entirely withont effect，the produce where it is used being identical with that of the Nothing plots．In every case，however，the nitrogenous manure has produced a very marked increase in the crop，and little difference exists in the action In guano，the uric acid，and the sulphate of ammoni then follow the guano－ash and sulplate of ammonia while the guano－ash and uric acid stand third，but the difference is very small，and less than 5 per cent，of the crop between the two extremes．In Section $2 d$ ，the guano－ash and uric acid stand first，then the guano－ash and sulphate of amronia，while the guano itself is tiird．

The conclusion to which these results therefore lead is，that there is no difference whatever between the manurial effect of nitrogen in the three different forme in which it has been used in the experiments．＂

## Calendar of Operations．

Apris．－Potato Planting．－The last week in March or carly in April is as good a time as you can choose．If cultivated and manuxed in autumn，the planting of the sets alone is needed now．Perhaps the best plan would be in that case simply to plough the land over，and plant the sets a foot spart in every third furrow When the land has been thoroughly tilled and mauured before winter，and left in ridgelets 26 inches wide，the intervals in these ridgelets may now be horse－hoed，and the sets planted and covered by eplitting the ridge with the plough．When the cultivation has been done since winter，lyou must open up the land as just described in drills sbout 26 inches wide with the doable mould－board plough，spread the dung in them olant the sets on it，and cover up all by splitting thes drils again．If Potatos follow a mannzed green erop thon two cut．of guatio may be cown broudcast orer all per acre before covering up the sebn－no other manure being ueod．
Even，howner，where farm maxnre is meod abundantly，guano will sometimes prove a profitable Ia the
It may sulf of a Potato there is now ample scope． called Regents，of which probably by much the largest acreage in Potatos now consists－the Fluke，a large flat kidney recently introduced，and acquiring rapid popularity－the Axbridge Kidney Potato，of excellent quality，and retaining its quality till late in the year－ Stratton＇s Kidney，a prolific and early kind－SGoden＇ your lind in．it is necessary that having chosen experience of your neighbours if your own is not sufficient，and by the prevalent choice in the market，
that you should put them into the ground as possible after the middle of March，planting mil dried and Potatos as sets，which should have kept in pits during winter，moved as severity of the weather was over，and kept frost）on floors，not more than two thick if pomible noved，if necessary，so as to hinder any eproati： any breaking of the sprout until they are platel sorting sets for planting，it is woll rather to ohocm larger of the middle size than the smaller，and crops have been raised when the distance bur large sets in well－tilled land has been as mach man wo feet from set to set in the row
Manures．－On this subject we condense a pues Mr．Lawes，published some yeara ago：－

Manure for Wheat．－On the heavier description land two to three owt．per acre of Peruvian gom the best manure for this crop．It shonld bo broadcast before the seed，and harrowed in． sometimes mired with twice its weight of commons by which，as well as by ashes or other mattere，at equal distribution through the soil is attained． lighter soils the best farm dung is the beat manure the Wheat erop

Manure for Barley and Oats．－When either of crops follows a root crop which has been partition Wholly removed from the land，a mixture of equal Peruvian guano，or nitrate of soda，or sulphate ammonid，with superphosphate of lime，may be o with advantage．About one cwt．of the guano，mitri or sulphate，and one cwt．of superphosphate of lim wi． 1 generally be sufficient for an acre．The man should be sown before the seed，as recommended Wheat．When one corn crop follows another， after Wheat，about twice as much of the artio mixture should be used as under ordinary tim stances．When corn crops require to bo manure to employ；one to one and a－half ewt．por boing used．

Manvre for Meadow May，－To Grass land mown hay，from 8 to 10 toms of rotten dung should be app． once in about every four or fire years in the month
November．The artificial manures most nuishble Grass land are Peruvian guano，salts of ammonich nitrate of soda．When eíther of these mannres is alone，the following quantitites may be applied：

## Peruvian guano．

One cwt．of nitrate of soda，mixed with one ath superphosphate of lime，is also a very good manure； a mirture of equal parts of Peruvian guano，amoni applied at the rate of two cwt．per acre，is parhupt most generally useful

The best time to apply the artificial manures is fin the end of January to the middle of Febraary；if t application is delayed much later than this，nitate

## soda is the best manure to employ

Manure for Mangel Wurzol．－The best duny command should be employed； 10,15 ，or even 20 to per acre being spread after the land is drawn in rum and previous to their being split；and two to thir cwt．of Peruvian guano，mixed with twice it mege common salt，should be strained by hand on the tuy the dung．

Manure for Potatos．－It is the general praction dung heavily for Potatos．Although the crop mit not be so large，it is probable that if Potatas of taken after some other crop well dunged， dang being applied directly for their grow this p would be less liable to diseasc．Supposin
adopted，three to four cwt．per acre of mixture of Peruvian guano and superphosphate of h． should be used for the Potatos．
Manure for Turnips．－Whens Swerdes，or conn Turnips，follow a corn crop which had been mann by farnyard dung，the roots may artificial manures alone．From two and three cwt．of superphosphate of lime should
with the seed；and in the case of S wedes（e sown late，or if the land be considered dition）from two to three cwt，of Peruviau be ured in adilition．If the presering tons been manured by dung，seven
phould be applied，two and
the dung used be poor，two cwt．
be strained over it in the drills． sown broad ast after the ding is spread，either whe or mixed with guano，as the case may manures do not react injuriously upon each of mixed together；but the guano is
to the young Turnip plant if broug with it．Hence，when guano and supe drill，tw lime are mixed together，and sown by bethe berven mauure and the seed．

This NEW IMPLEMENT must necessarily supersede Syringes and other devices of the kind，for it will be found much more effective in It operation．

A LADI CAN WORK IT FOR HOURS WITHOUT FATIGUE．

## CAUMION．

Inportant to thr Public．－The extensive sale of the Hydropur has excited the cupidity of so－called respectable，but in reality unprincipled Manufacturers，who are now paiming on the Public worthless imitations of the Hydropult，and through their connec－ tions are enabled to place said devices on exhibition，and for sale，in many of the principal Ironmongery and Seed Establishments through out the city and provinces．These devices resemble in many respectit the Hydropult in appearance，and are calculated to deceive the unsuepecting．The Proprictor therefore issues this Chaion，an respectfully intimates that parties wishing to purchase the Hydropul should examino the machine offered for sale，and see if it has at tached thereto a label，with the following words：－＂Tho Elydropalt Vose＇s Patent，manuftctured only by Grifistas \＆Browitt Birmingham．Charles Pomeror Botion，Proprietor， 142 and 143， Cheapside，London．＂Unless this label is attached，tho Machine is not the Hydropult．

## GREEN'S PATENT SILENS MESSOR,

# NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES, 

BY SPECLAL APPONTMENT, sole manufacturer
to her most gracious majesty the queen.

GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judeseat Royal Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight altentiz which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& Son beg to state that, owing to the great demand for their MACIIINES in past years, they have been unable to execute orders with that dendth due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust toben: position to send off all orders the day they are received.

PRICES OF HAND MACHINES.

| " | 16 | " | . | - | -. | $\cdots$ | 610 | 0 |  | " | 24 | " | . | . |  |  | 90 | 0 |  | " |

Packing Cases are charged at the following low rates, riz.: for the 10 and 12 inches Machine, 3 s ; 14 and 16 inehes, 4 s ; 18 and 20 inches, 5 s ; 22 and 24 inlahe Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stew them away, when not in usc, to prevent them from retting damast if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

The 26, 28, and 30 inches can easily be worked by a Donkey, or by Two Men, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Carrige Br and, as the MACHINES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening: the cutters being steel on endis
 the MACHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The above MACHLNES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shiping ${ }^{2}$ in England; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

# SHANKS' NEW IMPROVED PATENT LAWN MOWING, ROLLING, 'COLLECTING, and DELIVERING MACHINE for 1865. 

Patronized on five separate occasions during the season of 1864 By

Alecander Shanks \& Son are gratified to find this in the large and increasing demand for their abinted MACHINES, they receive a conclusive proof the their merits are every season becoming more recieted by the Practical Gardener.

A. S. \& Son, in introducing Improvements into their MACHINES, have been careful that the advantages in point of durability, simplicity of construction, and superiority in the work executed, which have all along been peculiar to SHANKS' MACHINES, should atill remain.

SHANKS PATENT LAWN MOWERS are in daily use in the ROYAL GARDENS at KEW, WINDSOR, BUCKINGHAM PALACE, HAMPTON COURT, OSBORNE SHANES 1 ; in the GARDENS of the ROYAL HORTICULTURAL SOCIETY at KENSINGTON; in the GROUNDS of the CRYSTAL PALACE COMPANY And BALMORAL; SPDENHAM; in fully proved and their success established.

PRICES-including Carriage to most of the principal Railway Stations and Shipping Ports in the Kingdom.

MANUFACTLRED fur the AGENT, in LONDON ; NEWTON in CARTMEL, LANCASHIRE; GLOUCESTER; COVENTRY; ABERDEEN, and PAISLET 0NLI in order to supply the Neighbouring Districts, and to save purchasers unnecessary expense in Carriage

These PITENT GLASS IIULSES' are composed of simple parts, :and may be lengthened and arranged to form the boundaries of Gardens; they cost less than Brik II: and insure a certain erop of Fruit. As Portable Structures they may be removed and refixed at little expense; and though calculated for Gardens of the highest order, then froin their cheapness, desirable for Market Gardens, where they may be made to cover any extent, as also for Suburban Villas and Cottage Gardens.

When the HOUSES are not required Portable, improved Iron Gutters and Supports are now supplied, rendering the structures most permanent and durable.

\section*{TESTIMONIALS.}

\section*{Grosvenor \(\mathrm{H}_{0}\) use, May 19, 1863}
"Tho Marquis of Wesimunster writes, in reply to Mr. Ifereman's note, to say that he has much pleasure in informing him that the Glass Houses for Peaches, \&c., which he constructed for him in Dorset, 1860, have fully answered their purpose, and prove very satisfictory."
" 5 , Prince's Gate, 8.W., May 18, 1863,
"Sir,-I am happy to be able to inform you that the Lean-to Roof which you sent to me at Bryanatone is moost successal, and I arm quito satisfled will repay its oost.

Mr. S. Herexax."
"Yuurs \&e., Portnas."
" \({ }^{27}\), Grosvenot Stuáre, May 14, 1563.
" Sir,-1 have much pleasure in reporting to you that 1 am quito satisfied with the Patent Glass Houses which jou furnishied in 1861. My gardener at IIackness is of opinion, as far as his experience of them up to this moment goes, that the system of ventilation which you adopt is quite equal, if not superior, to any other system which he has yet tried.
" Mr. B. Kiemonw."
"1 remain, \#c., [Sir] Jogx V. B. Joziurroxe"
* Woodcote [Newport; Salop], May, 1863. "Mr. Cotes has much pleasure in stating that he considers the Glass Lights put up by Mr. Hereman o be a great addition to the Woodcote garden, and shall be always ready to testify as to thoir effciency." "Mr. S. Henmax, \(\boldsymbol{T}\), Pall Mall Frat"
"Belgrave, near Leicoster, May 20, 1863.
' Sir,-The Lean-to Ifouse which you supplied to me in 1860 has fully answered my expectations, The House is planted with Vines, and Figs on the back wall ; there \(1 s\) no artificial heat, and, though last year was a most unfarourable one, some of the bunches of Black Hamburgh Grapes weighed mor than a pound, and ripened well for the season.
"The material and construction of the house have proved highly satisfactory.
"Mr. Hewneam."
"Yours de., AlyRy Elurs."
"Johnson JIall, near Eceleshall, Staffordshire, May 11, 1863.
\(\mathrm{Sir},-\mathrm{I}\) have had in operation for several years, Lean-to Vineries mado with your 14 feet sashes at an angle of about 60 degrees, the lower or front wall being 3 feet high. Nothing can be more simple than their construction; the mode of ventilation is excellent, and entirely obviates the annoyance and brenkage causerl by movable sashes, and I feel much pleasure in recommending these structures.
"Mr. 8. Hxamun."
"Yourn \&c., Howard Lyon,"

Shoaimar, Acton, W., May 14,
"Shi,-In reply to your lotter of the oth inst., 1 am happy to say that I was so very well with the Lean-to Houses erected by you in my garden three years since, that I had anotbeep last November

Mr. S. Heriyyan."
"I remain, \&e., Shuoks Rman"
"Wath-upon-Dearne, near Rotherham, May 1 N
"Dear Sir,-The three small Glass Houses you sent me answer admirably. The Leantu 16 feet sashes covers now about 25 healthy and strong Vines; last year the produce and qusity y frutt were surprising. * * I recommend every one who is so fortunate as to take plewinfil garden, and who can afford the expense, to erect one or more of your cheap 'Hothouses in : Million'-a never-faling source of proftable amusement.
"I have other more costly and extensive glass structures, but, having regard to their cot efficiency, they boar no comparison with those I had of you.
"I am surprised that market gardeners do not adopt thom more generally.
"Mr. Samurl Hrremas."
"I remain, \&c., G. P. Mroman"

"Mrs. Baugl has much pleasure in informing Mr. Hereman that her Orchard House sperfo" every way, and answers admurably for the culture of fruit trees in pots. Mr. Hereman to at himy make whatever use he wishes of these few lines, is Mrs. Baugh thinks it a pity these honses sho: be more general in this growing place."
" Inverary [Castle] Gardens, May 91 , IVis
"Dear Sir,-1 have much pleasure in bearing testimony to the effciency of the Luantur Honses which you crected here for covering in Peach and Fig trees. Although our wall is if fet the fruit sets regularly over the whole surfuce, and, with the command of ventilation theve holsisis fruit can be forwarded or retarded at pleasure.
"Mr. S. Herewan." "I remain, \&c., Johm Caiz" [Gardener to His Graco the Duke of Ardel
"The Grove, Stanmore, Hay 12, 150
"Dear Sir,-I am happy to inform you that the Glass House supplied by you ausher on expectation. I am using one division for Cucumbers, and the other for bedding-out planta, wa thrive remarkably well, being so near the glass, and having a thorough ventilation, which your mut: of construction so amply secures.

"Without any pretence to high finish or elaborate workmanship, which in such structures represent a mere waste of money, they are perfectly well made. The arrangement is as simple as ingenuity can render them. No rafters obscure the light and make them cumbrous. No sashes have to be pushed up or let down by ever-brablui lines and weights, or by expensive mechanical contrivances; and yet all the ventilation requisite in such buildings is as perfectly secured. * * * * It is their mit portability that must give them a peculiar value in the eyes of the public. If we hire a house for two or three years, and are enthusiastic enough to fix up a greentruat remains the absolute property of the landlord at the end of the term. But, if instead of fixing up we drop down one of these Hereman's, we pack it up and remore it alt with the watering-cans, wheel-barrows, and other implements."-Dr. Lindley in "The Giardeners' Chroniche," Juby 28 th, 1860.

\section*{PHOSPHO GUANO.}

PHOSPHO GUANO, in its natural state, is found on trap-rock islets within the Tropics. It was discovered in 1854 Ind its existence was made known in August 1856, hy Dr. Voelcker, at the Cheltenham Meeting of the British Association for the Adrancement of Science, when he read a paper "On the Remarkable Composition of a New Fariety of Guano, called Columbian or Maracaibo Guano," pointing out its peculiar fitness as the base of a highly-concentrated Phosphatic Manure.

The valuable and peculiar qualities of this Manure, now well known as PHOSPHO GUANO, immediately attracted the attention of the leading Agricultural Chemists, who pronounced it to be greatly superior to all other Guanos as a manurial agent.

PHOSPLIO GUANO contains in its natural state nearly double the quantity of phosphoric acid found in bones and other substances from which Superphosphates prepared; and Liebict states that by using PHOSPIIO GUANO the farmer conveys to his field 26 per cent. more phosphoric acid than by a mixture of equal parts of Perurif Guano and Suporphesphate of Lime; while "the advantage for the improved quality of the soil appears still more in favour of the PHOSPHO GUANO, if the quanitrl soluble phosphoric acid is taken into consideration."

One of the most important advantages of the PHOSPHO GUANO is its uniform composition, and in this particular it is equalled by no other Manure; for with scarcely \({ }^{\text {y }}\). exception, they all vary greatly in different samples, even when drawn from a comparatively small bulk.

The effect of the application of PEOSPHO GUANO to bnth Grain and Root crops has borne nut, most truthfully and satisfactorily, the character given to it by Lientoss Voelcker. Whether used to assist the growth of Grain or Roots, or applied as it Top-dressing to Grass lands, it is found to produce, beyond all other Manures, the grase amount of the food-properties of the plant, and that with a marked superiority of quality. The beneficial effect of the PHOSPHO GUANO on the second and third yarts - ? is also very marked; and in this respect it is unequalled.

PHOSPHO GUANO, being a very highly roncentrated Manure, requires, before being used, to be mixed with an equal weight of wood ashes, band, or dry earth, si fe. insure its equal distribution. Treated in this way, it becomes the cheapest Manure in the market.

\(\therefore\) Phospho Guann surpasses, most certainly, by its more correct and constant composition, the best sorts of Peruvian Guano; and of its superior eftiacy them in be the alightest doubt."

> Pamphlets, containing a full description of the Phospho Guano, its Histary, Nature, Properties, fic, may be obrained on application.

MOETING FOR THE ENSUING WEEX.

}

We are often applied to for information respect ing Diseases which affect a single plant in a large house, and which can only be accounted for by local causes. We have now before us a very curious ease in which a quantity of Nectarine and Peach trees of different varieties have been attacked at the sam time, to the perplexity of very good judges who have examined the matter on the snot. It can soarcely he expected that we should be able to do muoh better, without the advantare of a personal inspection; we think the matter however too interesting to pass it by without some notice. Specimens of five varieties before us, cunsisting of the Elruge, Downton and Violette Hâtive Nectarines, and the Violette Hâtive and Royal Ceorge Peaches exhibit wellgrown healthy shoots with clear deep-creen leaves, from leaf-buds, accompanied by flower-bearing shoots, some perfectly and some imperfectly ripened, in which the flower buds are either totally abortive, or where they have expanded, are weak arid more or less blanched; while, in the few cases in which the fruit has set, it soon withered. In one case, that of the Royal Geurge Peach, we observe a palid
grumous wash on the smooth trunk, consisting of irregular oblong bodies proceeding from a slender hyaline stem, the nature of which we cannot determine. On examining the soil, which consists of loam mixed with burnt earth, and apparently an admixture of very rotten leaf-mould, at first sight there is nothing to attract attentiou; but in the loam are some tough clayey lumps, which when bruken asunder show a thin filmy shining substance, which under the inicroscope shows delicate threads and fungons particles of no very definite form or character, but which are likely to be extremely mischievous.
Such is all that the specimens exhibit, except a very little of the common black mould which grows wherever there is damp, but not to such an amount as to be of any consequence whatever.

On looking at the history as detailed by ou Correspondent, we connothelp thinking that a fatal
error has been made if iwn én wi nus. Dhe ywatit

 they did equally well, and bure a small quantiry ot freat ecth, lat* "ot sue ! a qual:y s w lat be at ull ! jari,ns. In tlat autimn!, ! wryer, I! 'at
 duan abd ohe-purt spent Mushroom lied, to whoch Was added a protion of some mbotame called Eeun mical Manure, and in list there was evident mischief, for the plants bruke much in the same way as they have done this year. There wis clearly some suspicion about the top-dressing, which was remuved, and replaced with a lichter compost, and some fruit was ripened. In Midsummer they seemed to be recoveriog, and it was supposed that the mischief was remedied. In the autumn they received a similar tup-dressing with the omission of the artificial manure, and the irces are now in a worse state than ever, though the roots are extremely active, and throw up abundance of makers. In another house, where the treps at first were in an unsatisfactory stute, the artificial manure was never applied, and they are now all that oan be wished.
We conceive that it was wrung in the first place to employ so dangerons an article as suil from a spent Mushroum lied. Experience shows every day more elearly that funcrous spawn is a purnicions and uften fatal though sumewhat mysterious intluence on platsts. In a ease morcover which we repurted some time ag ; where the graft perished, as we believe from spawn derived from old decayed roots, the stock sent off buds in every dircetion.
In the seoond place we do not consider it judicious to use in tureing-houses artificial manure, of the constituents of whioh we are ignorant, without sume previous knowledge of its mode of action, or of the precise quantity which may be used with safety

The evidence in the prevent instance is indeed rather against the manure than the Mushroom soil, and it is possible that the raschief was agravated by the fimy matt. \(r\) in the luam.

It was remarked that the shoots of the diseased plants were of an unusually deep green. It is very possible that this, which seems at tirst like rude health, may real:s be a symptom of internal disenue, for it frequently happens that where a plant is infeated with fungous matter the chlorophyll, on which the colour of the leaves depends, assumes a deeper tint. It is intended, we believe, to destroy the plants altogether, which is a wise step, for there is little hope of their recovering their health after two years' successive affection.

It may be observed, though we have not precise indicatiuns respecting a quantity of Vines, which it should seem, however, had something of the same treatment, that they partially suffered, but have recovered, and appear at the present time likmy to prosper. Fuul flay was at first suspected, but this nution may we think be set at rest by the fact of the trees putting out such strong shoots. If any mineral puison had been used, the leaves in all probability would have withered, and there wonld have been little vigour about the routs. It luoks much more like a casp of over-feeding combined with fungous poisnn. II. J. I3.

In a very interesting paper on Wrindow HorTrcu゙lture, read hy Mr. Jofn Bril on the 29th ult. at a meeting of the Siociety of Arts, and printed in the societs's Jnurnal, wr find a contirmation of the utiluty of the Iron Eluwer Stands, of which some account was given at \(p .461\) of our last volume. Mr. Beis. has sow fur sume time had experience of their use, and that experience has been favourable. We are therefore glad to give prominence to his remarks thereupon, at the same time recommending the entire paper to the notice of thos. who take interest in this subjeot of Town Gardening. Mr. BriL ohserves:-

F Formerly, a few separate puts of fluwers were all we saw at windows, contined by perhaps a bar of iron for safety. Then asme the wuoden Misronette and flwer boxes, which now for some years we have seen in terra cotta als", prettily wrought. And now we find commonly about, in the best, parts of London, receptacles of a larger size and more elaborate decoration, on the window-sills of our largest houses, and faced with the beautiful tiles of Messrs. Minton and others of our hest manufacturers. Having myself been for some years a window gardener, and my plants thriving better at my windows than in my garden below, it ruturally suggested itself to me to provide receptacles of a still larger size; and my windows being French casements, opening outwards, I could
not have them on the sills. I therefore projected these receptacles further out, so that the top of the earth contained in them sho
be level with and not above the sill. had these made in iron by the Coalbrookdale Iron Company, so as to contain as muoh as two barrowfulls of garden mould, besides 2 inches in depth of fragments of flower pots bruken small for drainage. These are capable of perfect support by various means, as I have tested; but l think the best and completest is where the receptacle or window garden is made iu one coasting with the window-sill, which being let or fixed into the briekwork at the base of the window, like other window-sills, only a little further in, the whole ffair becomes perfectly seif-supporting, to the extent of five times the weight of earth that can be put in it. By this means also no damp can enter the wall, and the drainage is provided for. Practioally there is no appreciable drip, the mass of earth in common cases absorbing and evapo-
rating the moisture. But in the case of Ferns, rating the moisture. But in the case of Ferns,
and any plants requiring a superabundance of and any plants requiring a superabundance of shape hung over the sides, eatch the drops from the two drainage holes, which are amply sufficient, inasmuch as there are two inohes of drainage all over the bottom of the window garden, and this runs off the superabundance into the drainage tins, whioh may thus from time to time be again emptied into the window garden. These al so evidently afford safety at uursery windows ; they are capable of being glazed wholly up the window, or partly up, as may be seen in front of a house in Picoadilly, and they might be even heated by pipes, \&oo. ; but in all eases, evidently the first point is to ohtain a firm substrueture and support. In this kind of iron window garden I have had much success in raising plants and flowers from seed in the usual way; and also when bedded out, when they have thriven with marked luxuriance.

With early bulbs in these window gardens I have not had such marked success. Although they are in full bloom now, they are little better or earlier than those in my garden below, and by no means show the same superiority as the Geraniums and summer plants. This \(\bar{I}\) attribute to their exposed and unprotected position during the winter, high in the air ; and thus, perhaps, the same quality and airy situation which favours the later plants acts adversely to the early ones. The window garden, indeed, is attacked directly by frost, below, in front, and at the sides, as well as at the surface of the contained earth, and this year with its alternations has been a trying one."
To avoid the disadvantage just referred to, Mr . with mate, both below and at the sides, allowing the matting to lap over at top; and in this way to retain the advantages, while avoiding the disadvantages of the elevated airy position of his window gardens.

\section*{GROUND VINERIES.}
\(P_{\text {ray }}\) allow me space to disclaim being the inventor of the Ground Vinery as implied in your remarks at p. 268 , and to state that the hinged Ground Vinery, of which you gave a figure, not only "closely resembles" the Gronnd Vineries, now very common, but is in every respect, except the hinges, the same thing. It may, perhaps, interest some of your readers to know the origin of this interesting structure; with permission I will, in a few words, give it.
In the summer of 1858 I happened to be on a visit to Dr. S. Newington, of Ticehurst, a gentleman full of horticultural enthusiasm, and of a lively inventive mind. One fine summer's morning he took me into bis garden to show me "something quire new in Vine culture, and likely to lead to the culture of Grapes by the acre." I was accordingly introduced to a gla-s ridge standing over a furrow; it was proposed that a ylass, and supported by bars across the furrow, so that the bunches of Grapes should lang in it; and to promote their ripening the furrow was to be lined with slates or tiles. I was much interested with the invention, and more so when I learnt that my arrival was awaited to propose some method of ventilation, about which the owner and his gardener conld not decide. Curiously enough hinges were proposed, to allow of the opening of the roought, bring on having the glass in a separate frame, and make the Vinery too expensive for the poor man (Dr. N.'s principal motive in inventing it), or as the
term is now, "for the million," I objected to it. By a lucky thought the idea of low ventilation came to \(m\) mind, and 1 immediately called for some bricks, placed them as in your figure, p. 268, and the ventilation places no other ventilation is required. In or about the year 1858 I made my first Ground Vineries, which from
my having a curate as a warm-bearted friend, full of
vivacity, we christened the "Carate"s Vinery." I found aiter the lapse of two or three vears that the bunches after the lapse of in the furrows, although they ripene well, yet in moist weather were inclined to mould. I therefore filled up my furrows, and covered the surface with slates, pegging the Vines down through the interatices; the Vines are still there, and seem to improve every year in fruitfulness. The berries are not flatlened, as some people supposed they would be, by lying on the slates, but ripen thoroughly, and are always of excellent flavour. I ought to mention that birds are apt to creep in at the ventilating apertures, as are also field mice, in the month of October I generally place some netting to keep out the former, and poison the latter.

I admire very much the hinged Ground Vinery. For those who do not mind the extra expense, the con venience of lifting one side for the purpose of praning and gathering the fruit, rather than tilting up one side of the 7 -feet length, (although it can be done with one hand), is most agreeable. I can, however, see but little merit in its portability, for this reason:-In winter the Vinery should remain over the Vine, to keep off the injurious effects of frost, and rain, and snow; in spring and summer to protect its young shoots, and bring it forward; and in autumn to ripen its fruit, so that it can never be stowed away-it is always wanted. With regard to the extra expense incurred by having hinged Ground Vineries I have no idea, but I can give the cost of the improved Ground Vinery now used here, not only for Grape culture, but for cordon culture of Pears, Peaches, Apricots, and Plums-with all these the glass should be over the trees all the year. The simplicity of their manufacturethe method invented by my son-is almost amnsing.
There are no cross-bars, but merely a frame; in the top bar, \(a\) (see figure) is a groove half an inch deep; in the bottom bar, \(b\), is a groove a quarter of an inch deep; in the bars at each end, \(c\) and \(d\), are grooves half an inch deep. The pieces of glass, which should be cut so as to fit, are pashed into the upper groove, and let fall into the lower one; when fitted in, the two end pieces are pushed inwards, so as to drive all the pieces into close contact. A little putty is required at the bottom to prevent water lodging, and some at each end to keep the pieces from moving laterally, and the Vinery is completed.*
In the sketch of this barless Ground Vinery which I annex, the straining posts \(e, e\), of oak,
winter the Ground Vinery is most convenient, becinn
it is so easily covered with straw, which mill the most severe frost. [It is when adopted feep purposes that portability may be an adrant have had Lettuces ever since the middle of \(p\) with nice white hearts and very tender; and mention by the way, that Wheeler's Tom I Lettuce is a capital variety for winter and early Thosi Again, these structures are excellent for early sprise. Again, these structures are excellent for early Stras.
berries, for Cauliflowers, for early Peas berries, for Cuuliflowers, for early Peas, Frearch Preans. in ghort for 9 whole genus of garden crops.
In forming Ground Vineries of
In forming Ground Vineries of any onnsidenais, length, it must be recollected that only one at eatersis should be closed. I have just formed one for corth trees, 84 feet long, in 7 -feet lengths; and I have corena to think that in the course of a few years, if twe a Vine culture, one Vine would fill that length. indeed one Vine of the Trentbam Black whid Ihm reached 28 feet, and from its vigour I hope to see it 100 feet long; the 7 -feet lengths of Grond Vineries will be added to the present structure year to year. In a light rich soil nad cood climent can see no end to the extent to which Grapes mers grown with the aid of glass applied in this simple mor so that in every respectable cottager's garden -at 1 in the southern districts of England-we may hone see Grapes ripening under Ground Vineries mado it home by the intelligent and well-to-do labourer. "Portable Folding Ground Vinery" will find patrons, but the simple Ground Vinery as invented Dr. S. Newington is par excellence the poor muil Vinery, or the thing "for the million."

Very recently we bave applied the Ground Ving principle to growing Grapes at the foot of walls mith tolerably warm aspect, such as S.E., S., or S.W, that every wall may have a footing of ripe (irapes,

The mode of operating is as follows:-Take half the span of a Ground Vinery of the dimensions I hme given, and it will give you what is calied by garden a "light," 7 feet long and 2 feet wide place mon bricke along the front of the wall, about 20 inchesorn from it, exactly as they are placed uniler Grood Vineries. Pave the space from inside the brith is the wall with tiles or slates; plant Vines 14 feet and about 9 inches from the wall; peg them down on the slates or tiles through the interstices, and milt pieces of deal two inches square, one at cach end, to your light, so that when it rests agaiust the wall then is a space of two inches between it and the wall: the place your light on the bricks and let it rest gguat

4 inches in diameter and 30 yards apart, are driven into the ground to a depth of 18 inches; the supports of slight iron rod, \(f\), are flattened at top, and have Chole through which the wire \(g\) passes; ' these supports are stuck into the ground to some 8 inches in depth, and support the wire at a height of about 9 inches from the ground-galvanised wire of the thick ness of laid cord is the proper size. Trees to be trained to the wire shouid be lateral cordons with two branches on a stem 9 inches in height. The sketch shows a Pear tree of this form, which is managed on the cordon system of rigid summer pinching. Peach trees are planted and managed after the same method, for they produce fine and well-ripened fruit under Ground Vineries; from being close to the eurth, and yet free from the effects of rain and cold winds, these latera cordon trees will give the finest of fruit. It is presumed that Pears, from the constant radiation of moist heated air from the earth, will equal in size those from the south of France.

The cost of the frames of these ridges, in 7 -feet lengths, made by Mr. Rivett, Stratford, Esesex, is 668 per dozen, so that the cost of each Vinery ( 14 ft .) will stand as follows, or something approaching to it. Frame 11 s ; glass, 56 feet of 21-0z., 4ths (this sbould be bought in quantities at 20 s . or 21 s . per box of 100 feet; it is foreign glass, but it answers well for Ground Viveries), 11 s. \(8 d\). Slipping the glass in is a very simple operation, and can be done by any clever labourer; but we will say for painting and glazing, 3 s.; tiles (24) for paving, \(28.6 d \mathrm{~d}\); bricke, 1 s .6 d . ; total cost, 1 ll .9 s .8 d or a 14 -feet length, in which two Vines may be grown for three or four years, and then, if one is removed, one Vine 14 feet long may be permanent; or 7-feet lengths may be added aty of Grapes grown, 7-feet lengths may be added at intervals to the
14 -feet length, till a long and fraitful Vine, such a never has been seen in England, may delight the eye of the cultivator.

It is really encouraging to find that we can have a species of garden frame 8 feet wide and 100 feet long, for something over 10, for it must not be forgotten
* Width at base, 3 foot; depth to upper edge of ridge,
20 inches; levgth of slope, inclnding bottom and top bars,
24 inches.
the wall. You have thus a lean-to Ground Vinery. apertures at bottom between the bricks are for the ingress of conl air, the space at ton for its egrefs mie heated. The appearance of a wall of fruit trees \(\bar{\prime}\) glass and Vines its foot is of fuctine in hundreds of pounds of Black Hamburgh Grapes \(m\) I thus be grown for a very small outlay. I must omit saying that the top of the light should astened to the wall with two light hooks and sanp and in exposed places a stout peg should be driven the ground at foot to keep it firm.

To conclude, I have reason to believe that in th cooler parts of England and the warm Scotland these lean-to Ground Vineries woul Grapes better than the span-roofed or ridge vin think it is quite probable that 4 -inch brick say 18 inches in height, against which such sashes as I have described might be placed, would pip Black Hamburgh Grapes very far north if a warm and sunny aspect be selected. At any rate the exper ment is inexpensive, and well adapted to the pockets those who like Grapes, and yet cannot Vinery.
I commenced this article meraly to disclaim invention attributed to me. I have been led on int much more than I intended, and so I ree foll addres man ual signature I ought to

\section*{AUSTRIAN WINES.}

As the popularity of the Austrian wines is ncreasing in England to know something about the Vine emplosed I ble monufacture. The particular wine Vobslan manufactured at Vöslau, near VienLa, by Schlumberger, the principal wine producer Thrgent proprietor of Vineyards in the Vösla which is been ato that district from Portugal about called even now Portuguese Vines-but called even now Portuguese Vipes-bure situation, soil, and treatment are said to have such a favourable change npon the fruit of

Vine that it is in dewand not only for wine-making? hine alen for purnoses of deseert. I have applied to Mr. Schlumberger for informath farnithed me with the following particulars. "The Vivdrau Vine," he states, "has the excellent roperty of posseasing a hardy constitution, and readily alopts ibeif to alis light, open, warm soil, which is no mater logres, and from which heavy rains pass of wean 'r. In henve soils and damp situations it grows as-equan 1 Yits bearing pronerties in such situations are Fn h deteriorated. This Vine is more robust and ratrone aud rambling. and the pith unusually largebeoce the necessity of \& ary sitaation to bring it to "The berrien of this Grape are large and are ornamertell with a flve deep bloom; the bunches are loose mocedingly agreeable to the palato-in fact suitable gilike for table use and for wine-making.
"The wine is of a brilliant ruby colour, and in quality fill and strong, without that sharp astringency so common to most other red wines; ar possice.
"In England this Vine appears to be deserving of special attention, for I am convinced that it will rucceel well in the open air in the southern parts of
that conntrr, and in particularly favourable situations that countrr, and in particularly favourable situations;
tmined against walls, when properly treated, it will Field rich and fine fruit. The only fault the variety har onnsiste in its delicate and thin skin, which is apt to hurst in rainy seasons, in which case the berries soon become mouldy and spoiled. To prevent this, the Fines to protect the Grapes from wet, similar to
that noed at Fontainbleau and Thomery, for covering the fimous Chamelas Grapes grown so largely for the Paris markets,
"The Vorslau Grapes, in addition to their easy growth mad cheap culture, surpass in fine natural flavour Which are mostly flat to the taste and thick-skinned, and during auturun would form an ornament and a delicinus dessert for an English dirmer-table.
"The south of England being situated under the same degree of latitude as Rüdesheim, Marcobruan, and
Steinberg, all fannous for Rhine wines; and besides having the great advantage of milder winters than the mountainons districts of Burgundy, Voslau, Tokay, otatod, that many localities might be found in the Numen counties quite suitable for the cultivation of the Voslan Vines in the open air, and that excellent
Grmpes for the dessert might be obtained from them." The wine produced from this Grape is now in the Lnndon market, and may be had of Mr. F. Andres, of 12, Mark Lane, Mr. Schlumberger's agent. As to its and Gazelte of Fa . 18 may sive Nome further "The red Vöslauer, the lowest quality, costs 151. pere a nnod stont, full-bodied, serviceable, and, I believe, an eennomical wine, as its stoutness renders it more satiscomplaint of thinness, coldness, sourness, or poverty.
It is a god sound wine, with just roughness enough
to he clean." I hone roon to give some account of Mr. Schlum-
berger's Champagne, which is finding great favour
amongst a fery who her amongst a few who have used it since \(1862 . E\).

\section*{Home Correspondence.}

Correspondent by your Paper of the 11th alt. that your write a series of papers on the esculents of a kitehen garden, and he commences with the P'ea. His remarks seem sensible, and I quite agree with him as to the
different character obtained for the Pea, or any other vegetable, from the "locus in quo" and "quo modo" they are grown; and his experimerts will be valuable if he can prove the similitude of vegetables of any kind under different names, so that our Catalogues may be weeded of a host of Peas,
Broceo is, Caibages, \&c., with all sorts of names, Broceo is, Caibages, \&c., with all sorts of names,
which on coinparison are found to be identical. But "Quo" must be especially careful that hie experiments are conducted with Peas or any other vegetable of the genuine variety, otherwise they will be of little value.
For ingtance when I rotice that he states that "Charlton. For ingtance when I notice that he states that "Charlton. designations given to an old single-blossomed Pea," I feel how grossly he must have heen deceived by whoever supplied him with the seed. No one that I know of has double-blossomed Peas, differing totally in habit of growth, foliage, time of flowering, and podding from the Early Kent or Prince Albert Pea, which latter were introduced some years ago by the late Mr. Cormack of New Cross, and are now very difficult to be obtained perfectly true. I believe however that I have preserved the stock, and I should say that on a fair trinl, grown aide by side, they are from three weeks to a month earlier thap either Charlton or Hotepur, now going out of date, and differ very little from Dillistone's, except that I consider them a better Pea, and certainly quite as early. I intend to have the respective merits of some
of these Peas tried at the Royal Horticultaral Gardens at Chiswick, which should be considered the true test ground of all England.-In the secord paper of "Quo" upon the Pea, printel at p. 292, I regret to have to notice a further list of mistakes. states that Harrison's Glory and Perfection were the fruits of Dr. Maclean's hybridising Beck's Early Dwart Gem with the best Marrow varieties. This
is quite erroneous. Dr. Maclean had nothing whatever to do with the raising of these Peas. They were raised by Harrison, of Romney, who raised Alliance and Climax, wrinkled varieties of the same Pea, at the same time, and hence they were called by his name. Why should Dr. Maclean adopt it? Again, Hairs' Dwarf Manmoth was not Dr. Maclean's, nor bad he anything to do with the iutroduction of it. I do not believe that Dickson's Early Favourite conld have
been selected from the late Auvergne; nor can Fairbeard's Nonpareil be considered very dwarf at 5 teet high. Batt's Wonder, with its fine scimitar shaped pod, is totally different from the Old Woodford in his fondness for "Old Woodfords," which to most tastes are poor enough when young.
of the thousarids of acres of Seimitar Peas is what the French would call a little trop fort, and I quite differ from him with regard to the comparative merits of Hairs' Mammoth and Veitch's Perfection, as if he had a true stoek of both sown side by side, I believe he would be much pazzled to decide which was I have written this little "quid pro Quo" off hurriedly to save the post, and will only repeat that a true and correct description of the origin, similitude, \&c., of
Peas or any other vegetable would be most valuable Peas or any other vegetable would be most valuable; more harm, than perhaps "Quo" is aware of. \(A\) Seed Merchant.

Abies Douglasii.-Lately I have seen a large quantity of this tree propagated from layers; the plants are now from 6 to 10 feet high, and they not only retain the flatnese of the original branch layered, but are all more or less tortuous and bent both in their leaders and laterals. It is affirmed that this is the general habit of A. Duaglasii, and that seodlings obverve the same peculiarities (or ceforwities) of habit. fa my seed, of large size-I have universally found A. Dou-
glasii, when raised from sced, to grow with a stem from root to tnp as straight as an arrow, equally so with Abies peetinata, A. Khutrow, \&c., and the luterale radiating with admirable regularity and symmetry. Morenver, I have sean flagmasts, which were grown abroad, of great height. and momels of tapering and perfect straightress. Scalpel. [Spedlings are usually perfectly atraight and syminetrienl. Some Firs pro. nagated from laterals will throw up a leader from the hase if bent over, but we are not aware if the Douglas Fir will do this. Can any one say if it will?]

Royal Hobticultural: April 1 (Weekly Show).Wr. bull furniohed on this occasion a small collection of Camellias, striped Azaleas, Merlinillt magnifica, small plant of Alucasia Lowii, Bertolonia margaritacen, Arısema ringens purpuratum, Anthurium leuconeurum, his fine Imantophyllum miniatum, Suuromatum gatter tum, Cineraria Attraction, with a broad white ring margined with bright rosy purple; and specimen plants of Astrocaryum mexicanum and Latania rubra From Messrs. Lee came Camellias, Medinilla, and Boronia pinnata; Mr. Catleugh, Chelsea. contributed Cytisuses, Pelargoniums, and Azalens; Lady Caroline Legge sent a small plant of Hymenophyllum tur bridgense ; and Mr. Coysh, gr. to E. Wrod, Eaq. Rugby, three plants of Dielytra spectabilis, in fall bloom ; also eeven Azalene, all in excelluat condition; together with Statice Holfordii, and very gond plants of Adiantum caneatum and prbescens, Mr. Kilminster gr. to Mra. Seaton Laing. sent three stands for dinner table decoration; also a flower-basket filled with white Asalens, Camellias, Deutzias, and other spring flowers Messrs. Lacking \& Greeves again contribated flowarbaskets, bouquets, \&c. From Mr. Meredith came beantifal Bleck Alicante Grapes atill in excellent pre-
servation, although they were stated to have been ripe for nine months, proviog this to be one of the best keeping Grapes in cultivation. We also remarked Orange, Adams' Pearmain, and other Apples.
April 4.-Another fortnightly meeting for scientific discussion took place at South Konsington on Tuesday last, and was even more brilliant than its predecessors, the subjects of exhibition being more varied and interesting; while Fellows and their friends attended in perbaps greator num which these meetings have been held. J. J. Blandy, Esq., presided; the Rev. Mr. Dix pointed out, as before, the different objects to which certificates had been awarded; Mr. G. F. Wilson, F.R.S., of Gishurst Cottage, Weybridge, alluded to the more remartable kinds of fruits exaio. M. J. Berkeley, who, through indisposition, was unfortunately unable to attend) delivered a higlly instructive lecture on what was present of interest in the way of Orchids and other plants. He commenced by requesting Colonel Scott to read an extract from a letter received from Mr. Berkeley relative to a peculiar double-flowered variety of Chinese bank \& Kingsbury of Southampton. On examination this variety was found to differ from most other monstrous forms of Cbinese Primrose. Each stamen was replaced by a more or less imperfect flower, of which some of the parts were like ordinary petals others resembled complete florets, while others again were merely bollow tubes or threads. Among Primof flowers, viz., pin-eyed and thrum-eyed. Mr. Dar. win, it was stated, had shown ihat these flowers are of different degrees of fertility, according as they are impregnated with the pollen of similar or different flowers. The thrum-eyed, unless carefully impreg-
nated, are also held barren, but if fertilised with the nated, are also held barren, but if fertilised with the
pollen of the pin-eyed flowers they yield a mach pollen of the pin-eyed flowers they yield a much
larger quantity of seed than the pin-eyed flowers impregnated with the thrum-eyed. Now artificial impregnation with pin-eyed flowers is much the easier process; but the comparatively poor amount of seed is
against it. It would be very interesting to ascertain whether the best flowers in a florist's point of view some from thrum-eyed or pin-eyed, and positive information on the point would be very desirable.
Mr. Bateman then directed attention to three kinds of Cypripediums exhibited. The word had been tia aslated, he observed, by some gallant classic, Venus
Slipper. He hoped that Venus did not, slattern-like, wear her slipper down at the heels; but all the species he had seen seemed to indicale that she did. Thirty years ago he said there were only two Cypripediums in the country; now there are at least 20 distinct species in cultivation, aud, judging from -specimens in
Dr. Liudley's herbarium whath Dr. Liudey's herbarium which he had lately had an introduce from South America, vieing in beauty with even the very handsomest of those we now possess,
C. hirsutissimum from Mr. Yeitch, and auother Bornean species, C. Lowii, introduced by Messrs. Low, also shown by Mr. Veitch, came under review,
as did also a crean-coloured kind never exhibited before, from Mr. Rucker. This was stated to differ from all tropical Cypripediums in colour and beauty of leaves, which are empurpled beneath and charmingly marbled above. The credit of discovering this fine species belongs to Mr. Parish, an Indian inissionary,
and it was stated that a figure of it would shortly be published in the "Botanical Magazine," ander the name of C. concolor. It was remarked that a collection of the different kinds of Cypripedium alone would afford much interest. All, or nearly all of them, are plants that will succeed under cool treatument; and persons fond of Orchids, yet nawilling to embarklargely in thair culti-
vation, conld not perhaps commence with a more suitable section of this glorions class of plants. Of Odontoglossums, a beautiful Orchids from New Grenada, Mexico, and Pera, daily rising in importauce, several kinds were exhibited. Aunony them were O. Pescatorei, a superb species,
which Mr. Bateman said Mr. Anderson, of bank, had grown with as many as 100 flowers on a spike; O. pulchelium, whose snow-white blossoms
form beautiful ornaments for dark hair or dark silk dresses, was also shown by Mr. Rucker. O. gloriosum, now in llower for the first time, was exhibited
by Mr. Low. This, it was stated, is one of the many fine plants collecied in the neighbourhood of Bogotá, and Mr. Bateman observed that it promised to be one of the most attractive of the genus; wild specimens showing sometimes as many as 100 Howers on a spike. Another inportant plaut from Bogotá, Odon-
toglossum Lindleyanum, thus uamed by Dr. Reichenbach in compliment to Professor Lindley, was also shown for the first time on this occasion by Mr. Rucker. It
has narrow-petaled yellow-spotted flowers, quite distinct has narrow-petaled yellow-spotted flowers, quite distinct from others in cultivation. Of Cologyne cristata,
specimen was exhibited by Mr. Veitch; but being a small plant it gave no adequate idea of its real beauty hundred spikes of flowers on it, for with Mr. Day and others it becomes literally a cataract of white blossoms. Which lat for weeks, indeed for months, in beauty at a in demand for bridal bouquets, and the white and gold
colour in the flowers of this and other species render them very suitable for suss of plants likely to be nseful in thas respect, as does also the beantiful and darable Phalenopsis amabilis. Of this fine plant it was related that when the late Duke of Devonshire saw the first example of it in blossom in the collection of Messrs. Rollisson, of Tooting, he was so struck with its not wish to part with it he would take no denial, but handed a blank cheque to Messrs. Rollisson to fill in whatever sum they chose to consider it worth. They put down 1002., so that what cost pounds then, thanks put down importations may be now bought for shillıngs. Dendrobium lituillorum and the Moul mein D. senile, mentioned in our last week
Number, which when better known it was said would Number, which when better known it was said would
create quite a furure amung Orchid growers, next engaged attention, as did als) a cut spike of the New South Wales D. speciosum. This noble species, it was observed, was some 20 years in cultivation in this country before it flowered; the atmosphe:e of Orchid houses, until comparatively lately, had always "been so warm and moist that luxuriant growth was encouraged at the expense of flowers. Cultivators have, however, become alive to the importance of more sensible treat ment, and the result has been that this beautiful Dendrobe now flowers as regularly as the least shyflowering of the race. A small boxful of cut Orchids from Mr. Day was next examined. It contained Dendrobium Farmeri, a Lycaste from Mexico, a Cattleya from Brazil, a pretty Leptotis, a Cologn and Oncidium nubigenum, which has spikes a yard long from a snowy altitude, teaching ns this lesson-that vast number of beantiful Orchids grow in a tempera ture not higher than that of an ordinary greenhouse Other plants to which attention was directed, were the beaatiful Brazilian Chytroglossum Maria Leonez; Hepatica augulosa, a new species stated to be perfectly hardy, and forming a tuft of large deep sky-blue flowers of great beauty; and a new Phycella, remarkable for the intense orange-scarlet colour of its blossoms. The last two plants cane from Messrs. Backhouse of York. Mr. Bull's high-coloured Inantoplyyluw mini atum, adverted to on a former occasion, together with Polygonatum verticillatuon, and Bertolonia margaritacea, with leaves sprinkled, as it were, all over with pearls, next came under notice, as did also a pretty looking striped-leared Lily of the Valley, from Mr. Salter, of Hammersmith. Concerning the fruit of Ficu Cooperi, the same specimen of which, mentioned by us
at p. 294, was shown again, Mr. Bateman said that at p. 294, was shown again, Mr. Bateman said that
although, as we all know, Figs are wholesome in general, yet some are known to be poisonous; it was desirable therefore, to ascertain to which class the fruit shown belonged, and he hoped that some zealous horticulturist, pro bono publico, would eat the fruit in question, in order to settle the point as to whether it was poisonous or not : The Fruit Committee, he
remarked, although it was their duty to taste all fruits sabmitted to their inspection, had lacked the courage to put the matter to the test. Examples of what were called Branch Orchid Pots, an invention of Mr. Bateman's, were submitted to the meeting. Of these we hope to give some account hereafter. Cut Camellia blossoms, shown by Mr. Blandy, and cut spikes of the Mr. Rucker, were distributed anong the ladies present
Concerning the Tuesday meetings, Mr. Bateman stated that they had no connection with the Saturday shows, at which miscellaneons plants were invited, Tuese anything new or carious should be sent to the ruesday meetings, which had been arranged to take pace ery
The following candidates were elected Ordinary
Captain
Captain Duncan Baille, Sir Wm. Keith Ball, Bart. ; J. C

April 4 (Floral Committee).-A large collection of beautiful plants was contributed on this occasion by Mr. Veitch, who received a First-class C'ertificate for the charming Maranta Veitchii, and a Special Certificate for an extremely well grownand finely-flowered example of other gulnr looking Anthurium Scherzerianam and other plants. To the beautiful new sky-blue Hepatica Messra, and brilliant orange-scarlet Phycella from Messrs. Backhouse mentioned above, First-class Certificates were awarded, and similar marks of distinction concolor, Odon upon the new yellow Cypripedium glossumalluded to by Mr. Lindleyanum, and Chytroto S. Rucker, Esq. 'The handsome Odontr. Phcher, gi sum, specimens of which were sent both by Messris. as did also. Day, boll received First-class Certificates gentleman. From Mr. Willim, from the last-named genteman. From Mr. Williams, of Holloway, came were Colocasia longiloba, and prominent among which amabilis, prettily marked with pale yellow, to both of which First-class Certificates were awarded.
From Mr. Green, gr. to W, Wilson Sal came the yellow-blowomed Cyrtopodium Andersonii, a
dulifolium, a famous plant for the ornanina alife hanging baskets; Miconia flammea, and Citan
 growth. To the last two First-class Costify Collections of Tulips, Hyaciaths and for the oibare from Messrs. Cutbush, who, besides a Special Cerci class Classes of plants just named, also zeceive if La Françise, described iu our columans Cuvier Special Certificate was awarded to Mr interesting group
of plants
margaritacea, and chuin with prettily divided fronds. To Mr. Sulter sing awarded
of Camellia of the Valley, and a collection of cut bl Esq. was similarly favoured. The latenam-: nearly lost scarlet-flowered Salvia, Regla (?), one of y Hartweg's early introductions to the Society's gardey
from Guatemala. Various beautifal examples from Guatemala. Various beautiful examples of Hote:
(Spiræa) japonica were furnished by Mr. Veitch i it a perfectly hardy plaut, bearing handsom leaves, and numerous airy panicles of white bepger which, when induced to develop thenselves a earlier than they otherwise would do forcing, have a striking and beautiful effect. The fith grown New Holland Pitcher Plant formerly exhibith and the brilliant violet-blotched Azalea Stelia ran both reproduced on this occasion. From Mr. Turne of Slough came cut specimens of the new Ram
Pierre Notting and Madame Victor Verdies, very fine.

April 4 (Fruit Committee). -The 1st prize off for Dessert Apples at this meeting was carried of Mr. Rulfett, gro to Lord Palmerston, Who contribtbon main, Pearson's Plate, Nonpareil, Golden Harrey, 1 Sturmer Pippin. A 2 d prize was awarded to 11
gr. to W. Wells, Esq., Redleaf, also for fairly-kep Mr. Ingram, gr. to J. J. Blandy, Esq., co for which a 1st prize was given. St Chapman, gro to His Highness Halim Pw was assigned a Special Cortificate for beantion ling Oranges and Lemons, two unknown fruits fro Upper Esypt, and fine dishes of Harly Handsworth Ashleaf Kidney Potato, planted in the latter end
November, and dug on the 1st of February. Poand November, and dug on the 1st of February. Poh it was stated, are not generally grown in Egypb; from Mr. Chapman's experience win there with adm-
opinion that they might be grown opinion that they might be grown the thing of importance with regard to the is that he had never seen them attacked by the Pown disease.

The Apiary ; or Bees, Bee-hives, and Bee-culturd. Alfred Neighbour. Kent \& Co., Paternoster Geo. Neighbour \& Son8, 149, Regent
127, High Holborn. 1865. 8vo., pp. 132. It has become rather the fashion of late, for indirinals to write and publish books relating to matters an nected with their own trade or profession-d purpen advancing the interests of their business. are by suppose that a man becomes tolerably well acquain We need not go far for illustrations. Who can tade the catalogues of some of our most celebrated nam men and seedsmen without finding a vas useful and interesting information? have the "Book of Perfumes, by septimand there pe. In referena a host of others of a similar cuaractas it has been compiled with the view of supplying tion, and " full and detailed replies, sume all ordinary inquiries " on matters conne a "that of furnishing instructions useful to apiarian, or, at least, valuable to those to gain a much wider acquaintance with th of bee-keeping than is now usually something beyond the encouragement interesting amusement for the leisurely social importance of bee-keeping as a sourco profit for small farmers and agricuted as
These are the avowed objects of the have now to see whether the results have p first. We wish the author every su vours to advance the interests of seallent bee labers, and to promote a has made us very dubious of the accrue from any advice that may quarters. Still there may be exce that among those most amenable
> apiarian, gardeners form the most numerous body Severtheleas, the ohject is a most laudable one, and if the edncated country gentry, who may be interested in bee-keeping, would exert their influence in promnting an improved system among their poorer prighbours. But great circumspection must he used in not urging or attempting too much ; the changes reenmmended must be most simple in character, or failure have enlarged on this point, not so much with the view of finding exception to the expressed object of the anthor, as to point out that it is a rock on which many tianising apiarian, going about among cottagers and inducing them to adopt his more scientific modes of management, will work an infinity of mischief. We through the well-meaning but mis-judged efforts of through sucts man.
With respect to the other objects of the book, we think the author has been successful in the task he impised upon himself. Mr. Neighbour has, for many
years, been a practical bee-keeper, and has had opportunities of thoroughly testing the value of all the directions for the scientific management of the apiary which he has given. The introductory chapters natural history of bees, their habits and peculiarities, thongh the fillowing sentence is rather in error:suljects, is a stayer at home; generally speaking klie only quits the hive twice in her ife,", that is, once on the
day of lier marriage, for the purpose of meeting with drume, and again when leading off a swarm. Now, it by in mpans certain that queens are content with one matrimonial excursion, even if it has proved a successfn one. and it is well known that the same queen has lea slight error is of little consequence, and is probably a mere oversight.
We find a very
We find a very good description of the varions hives, ziven. It would be out of place here to expatiate a length on the resplective merits of all these. For our
own use we should avoid Nutt's Collateral Hive, but it adopted at all, we should prefer a much larger centr hoz; the size as given is far too small. 'Taylor's Amateur Shallow Box or Eight-bar Hive is a very good one likely to prove a favourite with the public alway own use, we should prefer the stock live to be con. siderably larger, with fewer windows, and with large glass as a super instead of three small ones. The Cottagers' Hive, and Taylor's Improved Cottage Hive, are both excellent, and may well find a place in any apiary. The Unicomb Observatory hives are very gocd, particalarly the one after Mr: Woodbury's pattern By far the best hive described, however, is the Bar and rrame Hive, made either of wood or straw. Full and
clear directions for the manipulation of these hives in general management, and in their use for the formation artial swarms, are given, and this comprises one The moot aseful and iuteresting portions of the book. Then we have various bee-houses described; but as a structed to not partial to the use of large sheds conaccount of the "impressed stocks. There is also an comb." These were first introduced to English to the scientific ormany, and are very useful adjuncts Bar and Frame lives. To quote Mr. Neighbour,
ultaner in the managent of the Renuine wax abial partition walls for combs are sheets of They receive about the substance of thin cardboard. hety receive rhomboidal impressions by being pressed between two metal plates, carefully and mathematically the sared, and cast so that the impressions are exactly An inspection the base of the celis of a honeycomb. division of the a opposite cells is made by a thin atance of wall common to both; now, the subpart of an inch, whilst the be only the 180th an inending are between the 30th and 40th part an inch, more than four times the thickness of the be vain to stthe bees themselves. It would indeed approaching their to furnish sheets of wax at all oheets are quite as thin as they can be to bear the hives. We find is requisite for fixing them in the advantage; the bees speedily the thickness is no dissahitial sheet, so as to suit their own notions of the they use the surplus then, with admirable economy, by the cells. After a sheet has been partly worked at nud observe the interesting to hold it up to the light it contrasted with the thal transparency of that part of labonred upon. When it is
than 14 lb . of honey" are required tell us, that more and elaboration of a are required for the secretion be difficult to form a just estimat of comb, it will not - which thus furniahes cheap and excellent Wo We believe quite 20 lb . of honey are requirer for every
assiestance to our industrions favourites, \({ }^{3 \prime}\) But the
greatest advantage to be derived from the use of thes artificial sheets, is in our opinion to be fonnd in their ase as guides for straight and well-formed \(\mathrm{c} m\) ms in the The hart of the supers generally
The part of the book treating on the formation of Artificial Swarms is very useful and interesting ; but it operation of "driving," or forcing bees to leave the domiciles, is also well treated on; and as ail hee keepers, aiming at any degree of excellence as bee masters should know well how to effect this operation easily
commend this portion of the boak to their notice.
There is a short account of the "Ligurian or Italian Aln-bee," which is very good sol far as it goes; but we
should have been glad to have seen a more extended and complete description of this variety and its introduc tion into England. We, ourselves, may before long have something to say on this subject; for, as we may here announce, we propose, on the suggeation various correspondents, to devote some space weekiy under the superintendence of a practical apiarian, communications and inquiries for information an invited.
In conclusion, we can safely recommend apiarian beginners to procure this useful mannal; while to bee keepers generally, who have their hives made under makers, the book will also be found a useful guide to the better methods of management.

\section*{A Fen Words on the Choice of a Microscope. B
J. J. Plumer, Eaq., M.A. Pp. 31 . Johu Ciuurchil \& Sons, New Burlington Street. 1365 . \\ This is really a most valuable pamphlet to all who an} thinking of investing money in one of these beautifin instruments. The writer reprints thid, with revision from the "Quarterly Journal of Microscopical Science.
He has no interest in the matter, but a siucere desire to save others from the snares into which he himself fell and to enable those who would set up a microscope for themselves, to reap, by a short and royal road, all those benefits from that de
It apper acquire
It appears that since the year 1850 at least eigh mpnrtant improvements have been introduced. Each of these is discussed, and the would-be purchaser is
urged to be satisfied with nothing short of "the best microscrope stand that the best optician can supply.' This gives a pleasant sense of security and complete control over all the adjustments. But the cost of such an instrument complete is 60 guineas. Still Mr. Plumer recommends the best stand, with a couple of useful ohject glasses, rather than an inferior stand with dozen.
Usually each great maker prides hinself on some peculiar excellence, and these merits can only be comwill have his special advocates. On all these matters Mr. Plumer gives most valuable information, and tells us what he considers best, and why. Then he gaes on to speak of cheaper, but still very excellent instru ments at 20 to 30 or 40 guineas, and so on down to \(5 l\). For instruction and amusement, but not suited for scientific research, a microscope may be had as low as three guineas, and even at a guinea.

Nothing can be better than the advice to purchasers There are five illistrations representing microscones

\section*{fflorists' frlomer\%.}

The Pansy and its Culture.-As so many persons fail in cultivating this plant successfully, and as this is a good time for planting them, a few hints on In ir culture will perhaps be useful to many readers. In the South of England, where the heat is greater frequently than in the North, it is best to seleet a shaty situation where there is a free circulation of air. If such cantot be found, then place them elsewhere. but always where there is a free admission of air. Any garden soil will suit them, but if poor, a moderate supply of very rotten manure slould be dug in, and the Pausy revels in leaf-soil when mixed with the April at the latest. Many persons do not earink in Apring at the latest. Many pershich is a very great mistake, for the plants should be established before they have to endure so much hot dry weather. These remarks are intended for those who have not planterd. but autumn planting is frequently practised in the South, and is best, simply securing the plants from injury from wind by pegging them down, and surfacing the bed with a mixture from underneath the potting bench, run through a coarse sieve, or just making up a mixture of common soil and leaf-soil for the occasion. In the South it is most easy to winter them out-of-doors
in this way, if slugs are looked after; but the real work of preserving them comes on with the hot June and July weather, when, as Pansy growers know to their sorrow, the plants seem to melt under old Sol's influence, and plants which were in full liealth in the morning are prostrated before night. I fiud the best pants a rose-put watering in the evening, and then atir the surface early in the morning, and give
a slight top-dressing of the soil I lunve before alluded to This keeps the roots moist and cool ; and by keeping the slonots well perged down, this necaticnll surfacing reely, not shents and bonng centre shonts to rout the autumn jielding a farge supply of heathy young plants, withnut the trouble of puttirg in cuttings. Just take up the plants, pull them to pieres, and plant the young rooted short pieces. If the wea:her is very scorching, a few branches of Evergreens
stuck into the soil ammagst the plants will help to keep stuck into the soil ampugst the plants will help to keep
them cool. In the North here we have great advantages in the cooler weather of summer, but we have terrible disadvantages in some district in the severe Finds we get, especially the colld cast and west winds of February and March. I dare not trast my plants, of which I annually grow thousands, ort of dunrs, but take them all up in October or November. After treating them in the manner I have recominemded, viz, by them to pieces, throwging out, we take all up, puil them to pieces, throw away all old growth, and plant in cold frames all the young rooted pieces. These 15 inches of the glass, and with about six inches of good soil ; the plants are near to the glass, and are ke, 't as dry as nossitble ir wet weather, and as hardy au ree ventilation can mike them.
Pansies will stand any amount of frost, if dry, but frost with damp \(n\) o well - In fact more, far more Patisies are lost from damp and neglect, than by frost. With suelh frame treatinent here they do well, making
stocky plants for apring planting. We keep them well stocky phants for apring planting. We keep them well
aired and very liardy, nuer onvering the glass witla mats or other covering, no matter how severe the weather, but, as I said hafore, keeping them as dry hs possible and looking well after the removal of dumping foliage. Cuttings can be put in at various times throngh the stmmer und r hand-glasses, or in cold irames under A nor th wall, kerping them close for a fortnight or so, hut wooking after damp.
A batch of seed sown in a cald be lept up from secd A batch of seed sown in a cold frame in Angust or
September, or evenlater, the seedlings planted ont as soon as they are really, will in ther Smi hand many dis. tricts in the North anil Milland Counties, give a grand displyy in April, May, and June ; and mother batch of seedlings from seed sown in April or May will yield another diaplay from August till 1) ceenber. The Pansy is most casily cultivatud by seed, makes very strong plants, and bluons profusely. 1 often feel sur-
prised it is not universally used for making flower gardens brilliant from March till bedding-out time, when a few shillings worth of seed will do it with so little trouble. I believe many thin's there is so much trouble with the Pansy they fear to use it; but such fears are groundless. The Fancy Pansies are very benutiful, and beds of seethngs of these and the English kinds mixed give an endless variety of colours, and require to be seen to be fully appreciated. Here we fill beds with thrse seedlings in spring, for I dare not plant out such sinall things until all fear of the frost throwing them out of the ground has passed away, and the beds give dense masses of flower through the sumner and
autumn. It will be as well to state that in very hot dry weather the Pansy suffers sometimez from attack of the Black Aphis. The monent this appears they should be washed with tobacen water, and the plants must be kent freels syringed and growing freely. W. Dean, Bradford Nursery, Shipley, Yorkshire.

\section*{Garden Memoranda.}

This place is fanous for its Orchids, Mancerster, of which are now in bloom, due regard having been paid in forming the collection to have a far proportion of sorts that would flower all the year romed. This puint having been efficiently carried out, the eflect produced, even during the whole of this adverse spring,
has heen striking in the extreme. The following list of kinds now in great beauty will show that they embrace almost every shade of colour, from pure white to the innat brilliant scarlet.
Of Dendrobiums there is a fine display, consisting of different varieties of 1 . macrophyllum; the new primrose chloured D. luteo'uin; the golden 1). chryso toxum in splendid \(\mathbf{c}\) indition; the beantiful D crepida-
tum, with pure whate petals and sepals, tipped tum, with pure white petals and sepals, tipped
with delicate mauve, while the lip is richly blotched wi'h dark orange; and the charming D. mar ginatum. The collection moreover contains (). densiHlorum, D. Paxtoui, D. albosanguineum, D. primulinum, and the ever-flowering D . nohile, all in fine blonm. Likewise Odontoglossum Plasienopsir, a glorious kind, one flower on which measured \(2 \frac{1}{2}\) inches in length and \(2 t\) inches in breadth; O. pulchellum, with 10 fine spikes of bloom; and O. cordatum, the last a beautiful
and rare species just coming into flower. Odoritoand rare species just coming into flower. Odonto
glossum læve has likewise a spike 4 feet long, with 40 flowers on it. Among other sorts of Orchids in bloom are Chysis bractescens, Oncidium sarcodep, a fine variety of Epidendrum aurantiacum, F. macrochitum, the ivory-white Cymbidium eburneum, Coologyne elegans, 4 plants of Luptotes bicolor, covered wit' lawers; Cypripedium barbatum, and uther varieties of Lady's Shpper, as C. Lown, and C. hirsutissimun
Lycaste Skinueri, embracing at least 10 distinct and beautiful varieties; Trichnpilia suavis, with 19 bloseoms
and Vands tricolor and V. tricolor insignis, the last richly ornammed with nusually large spots. Of Phatompis grandit ria there are siverat plants in flower, and o P. Sichility
finely into great beaty With a few trifling exceptions the whole cullection of Orchii's liere is in splendm health, no spet or other pest bring perceptible -a matter for congratulation considring the untavourable winter through which we have but now just passe!? G.I.

\section*{Miscellaneous}

The Late Mr. M'Leay. - Intelligence pas been recoived of the decease, at his residence near Sydney,
New South Wales, on the 25th of Janury last New Somel Wales, on the 25th of Janura last, of the
distinguished naturalist William Sharp MrLeay, E*q. A.M., furmerly of Trinity Collerge, Cambridge, whose Writingo, 40 years agn, produced quite a revolution in the opmions of \(z\) inlogists as to the relations of matural wha the firet to point out elearly the distinction previnusly overhooken, bet weeu those near relationship arismer frum the direct affinties of animals, infer se, in respect to their general chatanters, and thouc mor
remste reemblanees which reaulted from a uniformity in lint one or very tew characters, which he distinguished by the name of amalogies ; thus a butterlly and a moth are related tozether by affinity as members of the same nriler, whil-t a butterfly and an ascalaphus (one of the Sguze.winged thes) are only related toget her by analogy in em:serquence of both gosvessing long, slender antenne terminated by a kuoh, and yet the ascalaphus had actua distinct order of insects. Perceiving, moreover, the difficulty, or rather the impossibility of arrarging the done, in a right line, Mr. M'Lopay adnoted a circular system of arrangoment. by which means the series returned into itwelf at any point; he, morenver, considered that every group of animals contained five primary and five suhordinate, or osculant, types; and Chat ntlonish the arangement of these five primary jet Huir relative positions were twated and provell by relations of analozy existing betwerm the pringipe the which we:e developed with amuzing shill in the "T To Fintumolngices" the first part of which appeared in 1819, the second in 1821. This work was followed by Varions memoirs, published in the "Transuctions of thi views set forth in these writings were adopted and develoned by various naturalists of eminence.

Science Cossip.

\section*{Calendar of Operations.}
(For the ensuing veelf.)
Brignt days have come at last, and the genial showers which accompany them are already producing a visible mprovement on out-rloor vegetation. Beds and borders will require surface stirring and raking, lawns should be mown, and walks swept and rolled. Dead branches, if any, on trees and shrubs should be removed, and everything done which will be likely to render flower gardens and ornamental grouuds as en jnyable as possible, after the long, dreary, cold weather which we have experienced.
flower garden and plant houses.
Great care should always, but especially at this season, be bestowed on the operation of watering. applinnch, too little, or an injudicious mode yery fine-rosed pot, and slight applications of water, at intervals, close on the heels of potting, is the best way, as a general rule, to penetrate the mass, and to cause the particles of soil so to arrange themselves that atmospheric influence shall be somewhat modified, but by no means intercepted. This advice has reference chiefly to newly-potted stock in pots ; but equal atten tion must be paid to ordinary conservatory specimen plants. This is the period too for the free use of liquid manure, but take care that it is perfectly clear, and not too strong.
Orchids.-Growing plants should now have a some what larger amount of atmospherie moistnre than was
allowed them when the days were sunless, together with a liberal circulation of air early in the conorning, shutting up close betimes, and taking care to observe moderation in the use of fire heat, iu order that a pure atmosphere may be enclosed for the night. See that
growing Dendrobiums have liberal supplies of water, and plants on blocks frequent syringings.
Priakgoniems.-Plants intended for early blooming will now want watering freely; be careful that enough is given at a time to penetrate the ball. Sufficien artificial beat must be used to admit of air being given reely", every day. "While the weather is "bright maintain a moist growing atmosphere by sprinkling the paths and floor of the house two or three times a lay. Attend regularly to the tying and training of the shoots as they progress. Some of the autumn potted plants may be stopped for late flowering. The surface of the soil should be kept clean, the plants kept free from decayed leaves, and above all things keep a diligent watch for green tly
Stocks.-Sow now in heat, either in well drained pans or bozes of light soil; make the surface level and shooth, pressing it lightly, and if the soil be dry water freely some hours before sowing. Sow thinly, and cover very lightly with fine sandy soil, placing a piece of glass on the pan or box, and shading from bright sunshive. The seed may also be sown in a cold frame, or under a hand-glass, and a'so on a warm sheltered border early in Mar.

\section*{FORCING GARDEN.}

Cucenbers and Melons,-Sow for a crop of autumn Melons. Those who have nothing but dung beds to grow them in will find this a good time for doing so ; successional plants of Cucumbers must also eceive attention
Mresfroncs.-Take care to provide a moist atmos phere for these. Beds made after this should possess more moisture in the manure than those made early in the season.
Pings.-Attend to regulating the air, heat, and atmospheric moisture, as directed last week. Fruiting houses or pits should now average \(80^{\circ}\) by day, and about \(70^{\circ}\) at night; \(85^{\circ}\) or \(90^{\circ}\) may be allowed, however, from 3 velock to 5 in the afternoon. Dung pits must not be so warm hy \(5^{\circ}\), as the plants in them aro more liable to become drawn.
strawberress.-Plice these near the glass and give plenty of liquid manure ; also keep up a moist warm rowing atmosphere until the fruit begins to colour. There will be oo difficulty in getting fruit set after allowed on all favourable occasions ne glass, and are Wines.- Where crowlerd, some of the lanee of air. be removed in the earliest house, where the Grap are beginning to ripen ; not, however, to throw sunight immediately on the berries, but in order to promote a perfect secretion in the principal leaves, with a organise heighten the flavour of the fruit, and to organise plump buds for the ensuing year.

interesting to the readers of the Agricultural Gazetto to be infurmed what sort of weather we mayexpect in the quarter on which we have entered. The last guarter was stormr, cold and dry-the rule of zio-zir \(w\) uld have us anticipate the present to be about to be still, warm and wet, but the rule of zig-zag, though it may work very fair results in some cases-as for justanoe, shall we saj, in distributing eren-hauded justice at Quarter Sessions!-will betray us into very great matakes if we trust to it in meteorology.
But it will probably be said-have we not a means of forecasting the weather of the cowing summer by the indications which the rernal equinox through which we have ju-t passed supplies? This is no new idea, though it has been put forward ayain of late and urged upon us with much pretension. There was a book which contained many odds and ende of professed soientific knowledge published towards the end of last century, which eratained some rules fur progrosticating the coming summer from observatione made at the equinox. They ran something in this way. "If during the 18 th, \(19 \mathrm{th}, 20 \mathrm{~h}\), or 21 st of 14 rech astorm happen from the N., N.W., or N.E., the following summer will be tine five times ont of six; but if during these days a storm arise from the S.W., S., or S.E., the summer will be wet." And this is much the sameas any old sailor will tell you:-" "A fine day, your honour."-" It is,""The sun's crossing the line with an easterly Find."-" Well, and what do you think of that?" -"Ob! "To shall harp a fine summer, your honoup!
Now, any one who knows the anatomy of a sailor's mind will not think it strauge tif find such persuasions firmly fixed there; but it would be hard to say what peculiar virtue there is in the sun's changing the name of his deolination from ronth to north to influence the weather of the sueceeding six months, that that hur whould have a potenoy whiah is refused to the saveral days preaciing and following the equinox-when Nature m the northern hemisphere is plainly foeling the cticets of sunshine shed down at a fast increasiny anyl
Such frognostications as are above aliulded to suit very well with the opinions of weatherwise persons who trust to their memories unly; but they vanish quickly before the inexorable records of soience. "Inis year the sun was hid behind dense olouds on the 18 th and 19 th , whilst the Find blew from the east, gradually rising in strength, till on the 20th it had become a fierce gale, which swept clear the face of the heavens, and on the 21 st had backed towards the nurth with a perfectly clear sky; on the g2d the wind was blowing strongly from dead north, with the sky still almust clear.
Let those readers of tho Agricultural Gazetts who put faith in theee signs as affecting the coming season, learn to expound the riddle they offer, and then regulate their operations in the field accordingly. Fur ourselves, whatever be the field work of the season, or of the day, we mean to follow, in the spirit, an old English rule whioh is always safe to "eot upon, and shall endesvour at least" to "make our hay" when the sua bhines." J. S., S.

Dr. Voefcere give a very interesting discourse last week before the Eiaglish Agricul? cural Society on the value of potasi as a manure and the consequent agricultural value of cerctin mineral beds lately discovered in Germany, Which costain a large per-ceatage of potash salts. Putash is almost as soanty in soils as phosphorio auid, Thile it is required in much larger quantity bis plants. It is needed not only for itselt bat for if services as a rehicle of other substances.
for instance is taken into plants by its meañ's. The value of woul ashes as a manure his long known, and their eftect has beea due chielty tw the potash whioh they contain. In additional sinurce of it has been long desired, and this ha; at lonjth been obtained in the salt miues of Strassfirth, Where a great thickness of putash-bearing minurs beds are traverse 1 before the miae reachos tho
enormous doposit of pure rock-salt (chloride of sodium) which there exists. Various exteactaid potash salts are obtained from these proliminary beds; some of them deliquessent muriates, bur one a sulphate selling at about \(8 \%\) a ton, of which large quantities are likely to bo imported into this country for agricuitural purposes.
The 'following are Dr: Volrcacen's romarks on the probability of its usefulaess in English soils. Ho said:-

What we require for the present, iss an extensive series of experiuments with these crude polask shts on
crops and on soils more likely to be benefited thar other crnps arown upon soils which, like clay, contain as a rule a gond deal of potash. I would suggest for practical experiment the following crops- I would especially recommend potash-salts for light sandy soils. Those soils are generally deficient in potash; and I am not at all sure that a good deal of dibease in Turnips and root crops generally is not due, in a measure a least, to the almost exclusive use of superphosphate of lime, which some farmers male as a manure on their light land. The disease in Turnips is far less con spicuous on light land when only lalf a dressing of superphosphate is used and half a dressing of common farmyard manure. In farmyard dung and in liquid manure we find a considerable quantity of potash and on light soils I believe potash must be supplied in some way or other. It is on light so am not prepared to say that Clover sickness is in every instance caused by the absence of potash; but certain it is that potash must be present in the soil, or the crop will not grow luxuriantly. Potatos likewise require a considerable quantity of potash; and as they grow well when liberally manured on sandy soils, there is a greater chance of potash becoming exhausted when under the cultivation of Potatos than when corn crop re grown. The analyses of Dr. G. Grouven, of Saiz munade, prove that undess there is potash, present in eason it is that I would especially suggest extensive trials with potash-salts for root crops.
The orude mineral as imported contains about 20 to 24 per cent. of sulphate of potash, and Dr. soils for Turnips, Potatos, and Clover, (1) alone at the rate of 3 cwt. per acre ; (2) alone, in comparison with 3 cwt . of common salt per acre (3) mixed with superphosphate of lime, 3 ewt. of and superphosphate, 3 owt. of each.
The German discovery will stimulate inquiry here. It is to be expected that the saliferou marls of Cheshire and Worcestershire, geologically identical with those where rock-salt is found in Germany, will on examination be foued like them to contain potash-bearing beds in some part of the series which our salt mines traverse.

Last epring the Committee of the Royal Society for the Prerention of Cruelty to Animals offered a premium of 500. for a Vermin Trap, "which, without inflicting torture, should either secure, vermin alive, or instantaneously destroy them", and ander the following conditions:-
"The invention must be simple, inexpensive, certain, and fit for ose in game preserves.
Upwards of 120 competitors forwarded about 200 traps, or modeles, or drawings; and an exhibition of these ingenious contrivances took place at
St. James's Hall, Regent Street, on the 26 th of May last, and subsequently during four weeks a the Royal Horticultural Gardens, Kensington.

The judges agreed, with regret, that the collection did not contain one trap which fully answered to the conditions of their advertisement, though there were many inventions or improvements upon old traps likely to become of service to game preservers. They declined therefore to award the donations amounting to \(10 l\). to three of them, and directed that honourable mention should be made of others as follows:-The first prize was given to the old steel trap provided with India-rubber gums to hold an animal without injuring it; by the Rev. Mr. Baker, Hargrave Rectory, near kimbolton. The second to a box trap, through passage, with large treadle, eleverly connected
with doors which close the ends; by Mr. JoHs Hancock, of Brunswick Mount, Nottingham The third to a Wheel Pitfall; the animal treads upon one blade of the wheel and falls into the pit earrying the wheel round until the next blade closes the opening; by F.E. Hooper, Eeq., 29,
Kildare Terrace, W. Many of the exhibitors are desirous to have another trial of their skill, and it has, therefore, been resolved to hold early this Spring another Exhibition, and invite a competition for the premium still remaining in the hands of the Committee, particulars of which may be had of Mr. Colam, the Secretary of the Society, at 12, Pall Mall, S.W.

It will be seen from the report of the Council Meeting in Hanover Square last Wednesday, that the report of the Education. Committee has been adopted by a large majority; and that the efforts of the Society in conneotion with the seventh object specified in its Charter, are thus to be confived to the promotion of general education in country districts. Had Mr. Dint's propuail to admit reporters to these Muathly Cuuncils, which,
by the way, has been refused, veen adopted pre-
fous to the past meeting, we might have learn how it is that the Council has come to think it right thus to neglect the daty of promoting professional agricultural education.
- Oa Wednesday evening last Mr. HoLland's "Locomotives on Highways" Bill was read a second time.

VALUE OF LAND IN LONDON.
THe great city! the heart of the commerce and finance of the civilised world!"-at least so said the late Baron Rothschild, and he must be accepted as a great authority on such matters-a city guarded by 640 Militia, and near 2000 Riffemen! My agricultural friends will naturally think that all this implies an immense area of space. How surprised, then, will they be when 1 tell them that the City of London 10 poles! Into this small space are crowded daily more than 800,000 persons, snd at night about 130,000 repose there. To these must be added un countable vehicles and animals of every description. Land everywhere in the City is dear, but especialy so Royal Exchange, and other commercial points. shall astonish some of my country friends when I assur them that the last cheap thing I heard of in Lombard Street was sold at two millions and a quarter per acre say 70l. per superficial foot, or 630l. per superficia yard! and still the price is rising. Inagine paying an annual rental of \(25 \%\). odd for a space not much larger than a full-sized tea-tray! The old idea that London is pave wore 70 polden sovereigns on each superficia foot. Well may citizens choose to live out of town, and only do bnsiness in the City, when one first floor in Lombard Street lets for 4500 l. annulatly, and another for 2800 . Vast indeed must be the transactions
these costly floors. Mighty steam, by rail and by sea, and the wonderful telegraph, have made Londou those floors come, gliding along the telegraphic wires, business conversations and hard bargains. Far awa countries, at every point of the compass, are hourly challenged on business matters. Once tedious months are now compressed into brief hours. Men's busy and unchecked by wind, tide, or time. Well may the resigned agriculturist, who must abide Nature's protracted course, sigh for the quick returns and abundant profits of keen commercial men having all these advantages. In conclusion, let agriculturists (I mean landlords and tenants) learn to concentrate and in tensify, with a view to increased profit, following the example of the busy occupants of the mos powerful, loyal, respectable, and charitable city in he known world. Agriculture has much to learn and many prejudices to unlearn ere she takes rank with commercial progress and enterprise. Our half tilled, half-stocked, neglected, and dilapidated estate must present a very different appearance if their owners and occupiers desire to do justice to themselves, the food consumer, and the country at large. There is plenty of money in this country to effeet all necessary inprovement, if the desire for sach progress can be twakened. That it may and ultinately will be,
the wish and the belief of J. J. Mechi, April, 1865 .

\section*{AGRICULTURAL EDUCATION.}

88 Col ducation in the present day, I can boldly affirm that of the better class of farmers' sons is very superior to what t was formerly; but the middle and lower classes are considerably behind persons of other vocations, in consequence of the scarcity of suitable schools. This is the result of my own observation for very many years. I fear the kind of education in this county is not at all adapted to effect the successful lraining of the various facultiee of the mind so as to afford the lads the skill, intelligence, and judgment required by the practical agriculturist. I think if schools purposely for the
education of tenant farmers' sons could be established in various localities, where practice could be combined with the usual routine of scholastic education, it would be a very considerable advantage, especially if competent lecturers could occasionally visit to interest and instruct the youths. M. Michell, Tregoose, Truro.
39. Devonshire.-I have not the slightest doubt that both in intelligence and education the present generation is far beyond the last, more especially in the desire for good schools for their sons ; and judging rom those living near me I should say the supply is by degrees becoming equal to the demand. Of course, the Agricultaral College is a very useful supplement to this course, but then only a sinall portion of our tenant farmers will ever in my opinion avail themselves of these institations-more frou the time required than from the cust. In giviug my opinion of Che result, I shuald say from observation that though the education obtained is uot of a high order, still, look
best; bat one cannot help seeing that the attroctin ness of the pursuit tends to distract the thoughto from
books, and difficult as it always must bo duly appreciate learning, in their must be to make bon so. X. 9.
40. EAST Lothisn.-There are no schools in district where agricultural education is given. Formanty
farmers sons intended for farmers, after gething middle-class education, ofteu attended for a semiong agricultural class of the University of Elinburgh, op their time at other classes, and writing in on office to acquire a knowledge of business and acem Which farming so sparingly affords. At the knowledge of business is more and meglected, \(n\) There are however some farmers who keep the at thone after leaving school, trusting to their ap knowledge in the best way they can. Ther nothing required for rent-paying farmers beron ordinary education; with this, youths of energy educate themselves in any particular brancin knowledge they may have a turn for. Young farner ave often too much unoccupied time, and mere and refinement has a tendency to prevent acquiring a knowledge of the minatizo and deudgatie of their profession so essential to profitable mandyene East Lothian is essentially a corn-growing district ew of its farmers are aware of the cereals having and female organs of generation, and still feme then where to find them. Taking the farmers of this conn collectively, the past generation in character, position, and intelligence, stood higher than the pan But the word "intelligence" is here used apart from p fessional intelligence. The recent advances in drai manuring, \&c., and the spread of agricultural periode have done much for the tenantry of the prean While the inhabitants of East Lothian generally hen of late increased in wealth, refisement, and intellis farmers have fallen from their relative position Shirnersff.
41. Hereford.-The farmer of the present day general intelligence, and social standing. The opp enities for obtaining those advantages have vel increased during the past quarter of a century, at during that period I believe no body of men have mal greater strides as a body than the English farme towards attaining those desiderata. As rearar general knowledge, no body of men require to be bethe informed; the best groundwork for this is a good coo mercial education ; this acquired, he can, by steady a close application, learn sufficient of anatomy, boan chemistry, geology, mineralogy, and the use of mal cines for his general practice; but that he shall beome a veterinary surgeon, a botanist, a chemist, or geoloz: or any other sucia scientitic profession, is, in wi. beyond what is requisite, and indeed, if arriva would, I think, end in disappointment and retard successful pursuit of the more practical pari business. For whilst, by the study of anatomy, be wit render himself sufficiently acquainted with the amin. form to know when it approaches perfection, and quickly detect evil or injury, yet it is not absonnst requisite that he should be able to dissect ain the And so it is in botany: he may acquire a sufficient lue. ledge of the Grasses and herbs which grow and doin upon certain soils, and their value, or oniertathat hong purposes ; yet I do not see former, requires many years of close study and obsert tion. It is certainly no more requisite that he sloun be enabled to analyse the soil he cuitivates or cent he grows, than that the carpenter should be enabivir ascertain the constituent parts of the wood upon. Aud so with the use of medicines nect when and a general sno ledge of the effects of simule medicines, may freq avoid the necessity of professional attendance beyond that point the exercise of an imperfec nore advanced seientific knowledge, may as freq prove serious evil. I confess I really ditution chose intended in after life to fill thonis armers are to be specially educa study, Laud inels ing foregoing special branches to lay but unless qualified professional teachers a disappointment would be the result most certainly, as far as I can judge, the few, such teachers at
Baysham Court, Ross.
42. Lincolinshire.-The sons of respectable well-to-do farmers in this neighbourhooil not ar receive a good general educatio termed an have any very noted schools just farmers' sons are chiefly educats scattered up and down the country in accordance with the views and parents. Young men after leaving agriculture mers, where thein of heme, an practical part of husbandry ther their knowledge bas to be obtained b
farmens they go as papils to oue or otber of those who profes to receive and practice. I am decidedly of bural knowledge and praceation, as compared with opioion that the present generarmers in this neighbourthe past generation of tenanore intelligent, and enjoys a hood, is better educated, more intelisent, and enjoys a bigher social status. is now so mucho needed. Host of them have some bnowledge of classics and mathematics, and undersnowd the agriculture of Virgil, and have made loug strides atter getiing safely and surely over the pons asinork and to many reading and speaking French is an agreable pastime. As far as my own observation conbles me to form an opinion, I should say farmers' sons have a far better knowledge of classics and mathematics, of mentul and moral philosophy, and, if :ou please, of political economy, than they have of the requirement of the present day is professional education, and it needs to be thorough. A farmer ouglit to Lave an intelligent reason for everything he does, and mot, as this he must be educated accordingly. Alfred S. Ruston, Chatteris.
43. Lncolnshire- (1). Frequently farmers send their sons at the age of eight or nine years to a local school-generally to the various grammar schools in this
district, where the classical formy the principal par their education. Farmers' sons leave school about the age of 15 or 16. In most cases they return home to
their father or to some acknowledged practical agricul. tarist to learn the business of farming. As a rule the proctical part of farming cau only be thoroughly part in every operation on a farm. (2). As far as I am able to judge from my own observation, and by past generation of farmers, and to contrast them with those of the present, I am led to the conclusion that the general education and theoretical knowledge of
the present class of tenant farmers must be far in advance of the past. This of course must be expected when we consider the great advautages of the present day, through the numerous first-class publications upou nearly every subject, both scientific and practical, relating to farming. That the practical part of the
business of a farmer is in advance I do not believe. The joung men of my father's time, 40 or 50 years ago, were acustomed to ploughing, grooming their own horse, and attending to a certain quantity of stock-in fact, Now this is very different: not one in ten of the higher class of farmers would be capable upon commencing business of directing from his own practical experience beat instruction for a child intended to gain a livelihood forming would be to direct the mind from childbood to the observation of the laws and effects of
Nature, and to make it familiar with the numerous nperations that are taking place on a farm; by being acquainted with these, the youth when he goes to a chool (where the education is similar to that at the scientific part of his education with many incidents of bis past life, and so it would make a deeper impression. Upon leaving school the youth would
require three years' close attention to the practical Forking of a farm: and the due attention to all those collectively are often the means of carrying on a farin soccessfully. I am strongly of opinion that the course the county is conducted by the grammar schools of edacation of a farmer. We have no school expressly for the education of intending farmers; I think a that a dreation is very desirable, for I am of opinion spending areat deal of time is lost in an intending farmer bigh clasical much school time in the acquirement of 18 more nseful. Whowledge, to the neglect of that which
44. Stefolk. - The present generation of farmers and naturally thereforeve bed, more desirous of progress, aithough there is room for impreved than the past, as to the kind of education up to the time of leaving man of the middlor a farmer-or, indeed, any young in favour of the usuas destined to earn bis living-is large public schools, giving of study adopted in our and the high, geograply, and history, and less to Greek adrantagegher mathematics, which latter, useful and sn than the formey are, are certainly generally leas
England With the reputation which breeding amonongst continente agriculture and stock that her farmers speak only their native it is proverbial rivals the Belgian fent, and, contrasted with their close specist and professiunal training forme. As to the Ideem, lerfups antil the young into chemistry) is better, tup that profession: as the general training is very necesary, atd leaves him fit to follow any middle-class practical, and the special training is far better ctical, combined with theoretical, than theoretical

\section*{Edwands, Woodbridge}
45. Warwickshire. - As to the usual education of the son of farmers, the quality aud size of farms in this locality are very various-none what you would call large, consequently there is every grade or descrip tion of farmer renting them, from those barely one remove in intelligence from the ordinary labourer to the man of capital and general intelligence; and the education of their sons is as various as the quality of the land, ranging from the free day-8chool of the parish to the boarding-school where a tolerable general education is given. I am not acquainted with any schools which profess to give special training to the sons of farmers in this county. After leaving school a boy is generally actively emploged on the farm. In my opiuion, home, as a rule, is the best place for a young man to gain that knowledge which should fit him to get his living by farming. I beliave the past generation of fariners gave their sons grenter eilucational advantages than they had had the benefit of themselves, and I observe farmers of the present day who have the means are desirous of giving their sons a useful general education. As regards the cducation of their sons, no doubt farmers are placed at a great disadvantage when compared with the middle classes in towns, where, from the establishment of collegiate, proprietary, or other good day-schools, their sons have education than can be obtained in the country. Looking to the prospects of farming, I do think it highly desirable that good day-schools at accessible distances should be established in the country. The expense of boarding schools is more than many have the means to defray for a family, and dayoschools where a fair general education is given are very rare in the country to interest himself in the daily work of the farm, the better. I would not keep a boy at achool after the age of 14; but let him begin to make himself useful on useful general study during the loug eveuings of winter; then, as be arrives at manhood he will probably avail himself of those special publications which explain the principles on which successful cultivation of land depends. But the more I reffect the more the question expands, for how much in a farmer' business depends on causes over which he has no control, and how much on a well-ordered and frugally kept house, eepecially if his farm be partly or princi pally a dairy farm. So much for special training. I by no means deprecate general education-the bette informed a man is, the better position he is enabled to take in society, and the more aseful he will be in his neighbourhood-always supposing he makes a rationa use of his knowledge. J. H. Burbery, Kenilvorth.

EXPERIMENTS ON GROUND COPROLITES
This field used for the experiments in 1863 was one kindly lent me by Mr. Cuff, of Oxenford Farm, it being of a widely different nature from the one used on the previous occasions. The field was only partially drained, facing north; soil shallow and gravelly, and generally considered poor ground. The total extent of the field was 7 acres, and it was all well manured with farm-yard manure, at the rate of 15 loads per acre. The previous crop was Wheat, and the manures used on this occasion were only bone-dust, dissolved bones, and coprolites ground to an impalpable powder All the manures were well mixed with dry couch ashes before drilling with the seed.

Throughout the centre of the field 2 acres were drilled in with the ground coprolites in 28 drills; on either side of this we had seven drills (half an acre) of dissolved bones, and on the one side bone dust was drilled in 14 drills ( 1 acre). Unfortunately this side of the field was very wet, and this injured the effects of the manure considerably.
The following Table will show the arrangements of the plots, with the rate and cost per acre of manures used:Plot 1. \(\frac{1}{3}\) acre. Dissolved bones 7 drills. 8 owt per acro 21a Coprolites Dissolved b
Bone dust
The seed and manures were drilled in on the \(20{ }^{218}\) June, the ground being in capital order, and the weather fine. The first lot of plants that appeared were those manured with coprolites, consequently they came to hoeing before the others. The plot manured with bone dust did not show well from the commencement. The plants always appeared stunted in growth, owing to the wet land.

On the 23d of January, 1864, we measured out from each plot 4 half-perches taken from the centre and ends of the various plots. The following Table will show the result of the experiment, after the roots were cleaned in the usual way:
\begin{tabular}{|c|c|c|c|c|}
\hline Plot. & Manure3. & Dri ls. & Weight of 2 perches. & Per 2 \\
\hline & Dissolved bones & 7 & \[

\hline
\end{tabular}
great deficiency in the plot manured with bonedust is due to the uadrained ground, but there is little difterence between those plote manured with dissolved bones and those manured with the ground coprolitoes, although rather more favourable to the latter. I now beg to lay before you the result of experimeats on the same subject, which were kindly seut to me by Mr. Baldúvin of Glasnevin.
He says-"The erop wan Aberdeen Turaips, the previous crop being Oats. The land was preparad in the usual way. The field on which the experiment was tried in an open plain, free from liedges or p'anta.

"I regret no plot was left unmanured, but the ex. perimental plots were separated by a drill to which no manure was applied, the average weight of which would give 20 tons per acre."
In this experiment I consider that the coprolites have shown decidedly well, although it occurs to me that it would be better to try nothing but phosphatic manures against each other to get it a comparative value of coprolites. With this view I iutend to make experiments with bone-ash, Sombrero guano, and coprolites, all ground to an impalpable powder nud applied to a sandy soil. E.T. Kensington, F.C.S. [The result in No. 1 Plot is interesting in connection with the value of potash salts as a manure, referred to in another column.]

\section*{Home Correspondence}

Malt as Food.-Your correspoudent " J. H." surely cannot have read about the experiments as to feeding stock with Barley and with malt, brought before Parlia ment lately, and with the effect of entirely extinguishing the claims of malt 15 even equal to Barley. I quite agree with " J. H." that Liebig is an eminent chemist, and I beg he may note that the nonsense attributed to me,
as to 580 quarts of best Bavarian beer contnining exactly as much flestoforming matter as 1 lb . of bread, is in truth Liebig's words, and not mine. Yet, I doubt if "J. H." will show that here Liebig is in ercor, as ho himself will admit he was when, without due consideration, bringing forward the now entirely exploded idea of alcohol being of use in respiration, \&e. I admit that abstainers must (if they can get it) have more foud than those who drink fermented liquors, and also, that Mole schott's aud Johnstone's alcohol driukers retain in their tissues and their blood, many used-up parts of their bodies, which, without alcohol, God has ordered to be cast out, as the cause of disease when retained, and I think no person can wisely it be done with impunity. Surely "J. E." was in joke when naming Mr. Jolinstone as a sound authority in organic chemistry, or classing him along with Liebig,
Boeker, Lyon Play fair, Christison, Lallemand, Le Cann, ace, all of whom agree that alcohol is neither food nor force, but instantly destroys the digestive fluid of the stomach, and the blood with which it comes in contact. When Drs. Carpenter, Miller, \&c., prescribe fermented liquors, they do so as medicine, and not as good in health; but I notice that while every patient if posaible escapes from the continued use of any real tonic, order
him alcohol, and he will stick to it for life, whether in sickness or in health! I presume "J. \& " has never seen Dr. Lee's Analysis of Johnstone's fallacies in Mackenzie, M.D., Exileanach, Inverness.

Agricultural Education.-In your Paper of the 25th March, I find it stated by a writer on the education of Devonshire farmers ( \(p .275\) ) that "the best farmers we get are men who have not been bred as farmers, but
who, being slirewd business men, have taken to farming in after life." Here at all eveuts is something new under the sun: To be successful in a swimming. match, you must never see water until the day you coutend for the prize! Henceforth we must go to lom as to the and so the problem as to the best means of obtaining
agricultural education is solved at last, and what I am now about to write may be only wilfol waste of time and paper; still I hope you will give it a place in yout colu, ins as a few parting words contributed by an unbeliever. I must say then that my experience of Devoushire has been considerable, but I never knew a man not bred to farming succeed, make money, and
shine as a farmer there or elsewhere; I never knew a shine as a farmer there or elsewhere; I never knew a
man not bred to farming make money by farming, but I have known such men lose a great deal, and many notable instances could be mentione 1 of foolish attenpts of thi
house who had the temerity to play with edged toals of this description. A man may attain respectable eminence in various middles, callings, a cannot bjeme an agriculreached middle age, but be cannot beco must know turist unless he commences young. He must know vergetable and animal physiology to qualify him, and the fonmilation of this knowledge can be laid in youth only. It must grow with his growth, and intrengely in manhomi. An agriculturist at 50 is always making mistakes. He is afflicterl with the disease called "scinlism," which a certanial learned professor defines to be "the bad habit of knowing ahout subjects without really knowing the subject itzelf." He has had no mental training, he lackappreciation and discrimination; his judgment on acri cultural subjects is stagnant, and fails in that clearness, grasp, and polish, which early training give; he is always arriving at fulse conclusions, becuuse deduced Oak without tl e acorn, and no wonder therefore that in practice he fails-the wonder woul 1 be if he did not, for in rural aff iirs it will be found that Nature refuses to disclose her secrets to the man who has not trodden her courts when a boy. \(C\)., April 4.
Potato Culture.-In all the districts where Potatos are extensively grown this is the busy season, and it is order, owing to the unexampled winter through which we have just passed, aided considerably by the late severe frosts coming in such dry weather as the present. The ridging and planting has already commenced, and
all goes on satisfactorily. In the district from which I write, Potato culture obtains great attention. In fact it has become one of the chief crops of the neighbourhood, and its culture, both practically and scientifically, is much studied. Some of the crops obtained last year were enormous, for which fabulous pricess were received.
This y ear a large breadth is in course of culcare, for This year a large breadth is in conurse of culcare, for
which the best varietiea are sought after. The popular variety is the Dunbar Regent, and to keep up a correct stock of it yearly importations from Scotland are secured. The stock thas imported don't attain their full proinctive powers, from the change, till the second year after introduction; afterwards they begin to degenerate, but many years will elapse before they importations are so advantageous. The Fast Lothian cultivators obtain large quautities of seed Potatos from the stiff lands of Renfrewshire : these being planted on the fine red soils of East Lothian, i.e., the Dunbar
district, produce Potatos of the very best quality, scarcely to be equalled elsewhere; so that, being imported into this district, we have the changes from clay or very stiff loam to rich mild red land, and thenee yearly in this way lays the foundation for a large stock for ensuing years, for which a good demand is always kept up. The variety called Flakes is next in popularity, and in real quality for the table they are superior to Regents, but they are far more difficult
to cultivate to profit. The sets require to be larger, and in dry soasons sone must be cut. They require close planting, on account of their
tardy and scanty growth of haulm. They make the highest price in the market. Rocks, I think, come extraordinary productiveness. They are, however, very exhausting to the soil, owing chiefly to the large quantity of haulm produced, as well as the great weight of tubers. Snowballs and Dalmahoys are also freely grown, and Red Regents and Skerry Blues partially. Myatt's Seedlings and, a few other sorts have been introduced, but none are more extensively grown
except the above varieties. The mode of culture in this district is pretty nearly established, and bat slight deviations are made from it It may be stated thus: in the autumn the land is ploughed, and all grassy and rooted weeds are got ont by some means; it is laid up for the winter as winter ploughed, and well drained; as early as the returning season permits it is cross-
ploughel, and, if requisite, it is well worked and pulverised. At thie present time most of the lands that
bave been cross-ploughed are in excellent condition for planting, but this is owing to the peculiar season: never knew it to be so before. The planting i principally done upon the ridge aystem,
at so inches apart. As the rillges are drawn
out, fold-yard manure at the rate of from eight to ten loads per acre is carefully spread along the rows, followed by sowing about 3 cwt . of Peruvian popular manure. In the absence of fold yard manure an extra quantity of artificial manure is put on; many crops ate thus put in. Then follows the planting good Regent sets, 13 inches asunder at the bottom of the ridge or row ; good Fluke sets, 11 inches asunder Rocks, Skerty Blues, Red Regents, 15 inches asunder;
Dalmahoys, Snowballs, and free-growing sorts, about 12 inches asunder. The ridges are worked in the usual way, opening one on passing down, and closing one returning up. When the plants are just showing above particular growers take the trouble to cover in carefrelly with large hees by band, and with profitable results. Great cauth," should be ohserved not to put
them in when the land is "-et or works unkindly. The plants (sets) ahould be at all times covered with dust or

Filliams, Charles, Carrion-loral the Hon. A. N. Hood, 'hairman, presented the report, from which it appeared that the Secretary's receipts during the past month had been examined by the Committee, and by Messrs. Quilter, Ball, \& Co., the S ciety's accountants, and were found correct. The balance in the hands of the bankers on March 31, was 1241l. 19s. 7d., s000l. remaining on deposit at interest. The balance-sheet for the quarter ended March 31, 1865, and the state-
ment of subscriptions and errears, were laid on the table, the amount of arrears then due being \(540 l\). Discussions, - Mr. Thompson, M.P., Chairman, reported that the Committee recommended that the fllowing shall be the arrangement for discussions a Weekly Councils in the months of May and June
May 10.-On Flaz, by Mr. Beale Browne.
May 24,-On Irrigation, by Professor Voolcker.
June 14.-On Diseases in Piges, by Mr. Budd.
The Committee referred to the Council for decision whether the Index to the first series of the Journal now ready, shall be immediately delivered to members entitled to it, at an estimated cost of from 402 . to \(50 l\). or retained and forwarded with the August Number o or retained and forwarded with the August Number of
the Journal. The Council decided that the delivery of the Inder ehould be deferred to August.
Housin-The House and Finance Committees having considered the reference from the Council as to providing the; 'society with a new house, MajorGeneral the Hon. A. N. Hood stated that they had at present nothing to report.
Fevmoutie Mrewna.-Lord Feversham, Chairman reported that the Committee had ordered the usual advertisements to be issued, calling for tenders for the supply of refreshments in the show.yard. They recommended that a sum of \(50 l\). be appropriated by the local committee to bill posting in the four western counties. That the use of a building contiguous to the trial fields be accepted, on the condition that the Society insure it from damage by fire during the period occupied. That a sum not exceeding 50l. be granted to the local committee in aid of the erection of temporary platform for foot-passengers along a narrow approach to the Showyard. On the motion of Mr. Brandreth Gibbs they recommended that the colours for the rosettes of the prize animals shall be
the aame as those previously used on the cards, viz. 1st Red, 2 d Yellow, 3d Blue

This report was adopted.
Showrard Contract,-Mr. Randell presented the following report:-

The Committee have taken into consideration the arrangements hitherto made with Mr. Manning for the erection of the showyard, the moveable buildings required, and work not included in the contract, and are of opinion that it would be more satisfactory to the Council if the contract for these wrorks in fature were thrown open to competition.
"They recommend that a surveyor be employed, who sball attend the Plymouth meeting, examine Mr Manning's bills, both for contract aud extra work, and report thereon to the Secretary; obtain all the irfformation necessary to enable bim to perform the duties hereafter mentioned, in reference to the works required for 1866, and report to your Committeo at Plymouth whether it is desirable to purchase from Mr. Manning,
and if so at what prices, all or any of the folloning
portable buildiugs and other article:-Offices: : Dine portable buildiugs and other article:-0efices: Dime. tor's, Secretary and Concils 'comiplete, feterinary Storeroom for receiving yard, Yardmen's ronma, \(C_{i l}\) logue store, Post-office, Money changer's utize, \(C_{n}\). sulting engineer's office, Ladies' cloak roomy (2) Con All notice boards, Ropes fur rings, Cups and bue borm water, with any other moveable article chand for water, with any other moveable article which
always required. The Committee ask for authorim from the Council to act as they may deem expeding after receiving the report of the surveyor.

The duties of the surveyor after the Plymomis 1866, and submit them to the Council. thomyny approved, to make detailed specifications for then purpose of obtaining (by advertisement) tendera \(f_{2}\) the works required ; also to prepare aa agreement he eutered into with the party whose tender shen
have been accepted, see that the work is pronern have been accepted, see that the work is properiy
performed, prepare a schedule with prices for ali tikely to be required and which is not included in tae contract, measure all work and check bill for esin charges, make inventory, take charge of and accoons charges, make inventory, the Society's plant, and direct its removal inmandie ately after the Show to the place where the nert intended to be held-the Council having secured piece of land for the erection of one or more of the
offices, in which the other offlces and plant of the Society shall be stored.

The Committee recommend that a sum of \(2 \pi\) shall be given to a surveyor for his attendano Plymouth, and his railway expenses; and for the gm 1866 a salary of 1002.
(Signed) Edward Krerisons; Precilym" This Report was adopted.
Ratlway Arrangements. - Mr. Pain stated thes the Committee had been unable to induce the Compans to abate their chargen, or give greater facilities than those of last year.

Agriculivaral Eduoation.-The President hinin been summoned to attend a Committee of tho Fom requested to take the chair. Mr. Holland, M.P., presenting the report of the Committee as its Chind presenting the report of the seat that he, with several other memben dissented from it, and had signed a protest whe would be found at the end of the report. In adoption of the report having been movel by Lad Walsingham, and seconded by Mr. Thompson, MP, the following amendment was moved by Mr. Holheot M.P., and seconded by Mr. Lawrence :-
"That this Society is desirous of offoring Hm

down more land to Grass. It certainly would be in his case, as
he has too muluch already; but there may be instances of land
broken corn, that may advantageously go back to Grass; but except in the case of very rich land, as the alluvial solls resting on ay. such as the grazing lands of Loicestershire, accompanied
as they often are with flonded meadows that prnduce a great
bull of coarse hay. f Grass Jama cannot be worked to advantage without at least an equal quantity,
thirds of arable to grow forder and litter.

 firmer

\section*{III.-lmprovement of Worn-ott and Neclected}

The first point is to remave superflnous water. Wo cannot moisture. We may have, it is true, a considerable bull of watery bad herbage, and it is this fact that has led to an adea indeed in some instances it lass been ssid that drainage bas injured Grass land. This I deny as regards clay. Inctancos
may nccur in which drainage does nin
gidd -where the subsoil is gravel, for inatanca, and where the molsture which found
its way along the morna beda from higher land may have
actualls nouriahed, and only been in excess at rine for bo it remembered such water in not necessurily stagnais close drainiug ind such a onse, hy cutting off the weater hofore
it reaches the snils, may do harm, and 1 have heard of caso

Iraydon, and Mr Campbell's at Buscntt, and elsewhere, and conclnded y a reference to tho sulject of irrigation. We shall return to his valuablo paper next week.

\section*{3 x cuictus.}

Additional Statements by Mr. William Menzies in Support of his Plan for the Drainage of Toown. Longmans.
Mr. Menzies here answers some of the olijectione which have been raised to his plans since the publication of his recerit work on this sibject. Any plan of dealing engineering, and chemical consulerations which affect the subject, must, he says (1) br fren from musance, (2) conomical, that is rreating a profit by the utilisstion of the drainage water. (3) must prevent escapo of these waters into rivers (which by the way is implied in the first and gecond conditions), and (4). practicable.
On the first point Mr. Menzipg has given evidence to "show that a vast amount of fmenl matter remains putrefying in the drains of towns as they are at present cormed, in consequence of the prevalent syatem of trusting 80 much to the rain water for flushing
purposes, and that thing foul air of the worst kind is discharged either throngh the street gratings, which Ict down the surfuce water, or into tho houses, and that malignant disease is the result." And even if the modern system of thorough drainage of towns is efficient in daily carrying away every day's sewage and filth, yet the plan of open gratings and ventilation which obtains through them is most faulty.

In fact, if any engineer were to set himself the task of devising the best means of discharglng, in the midst of the population, all the stench possible from sewage drains in a town, it would be difficult for lim to plan more complete method than these gratings afford.
We have heard Dr. Bell Fletcher, of Birmingham, sources of pestilence.

Secondly, on the cconomy or profitableness of a plan for dealing with sewage, Mr. Menzies contonds that its dilution by rain water is mischievous.
"Water in itself is not a source of fertility to land. It is an excellent agent for carrying or developing sources of fertility, but in itself it has little or none. In fuct, an excess of water is ruinous and exbaustive, and any meadows irrigated with pure water would soon become worthless. The water must, if the fertility of the soil is to be kept up, contain a certain amount of ammonia or other substance on which plants can feed, and the question at issue is, 'what is that anount per questions of the chemical value of manure alone, bnt is a more comprebensive study of the state in which that mannre is, the cost of applying it, and the mechanical condition of the land, as to wetness and dryness, upon which that manure is applied. The common sense of every man will guide him in forming the opinion that,
if you dilute all the daily excreta of a human being in more than 25 gallons of water, or six times what would fill an ordinary stable pail, the extreme limit of dilution is reached that land generally could bear to advan tage. In summer and in dry weather all will go well with that amount of dilation; bnt in winter and we weather, when vegetation is dormant or the earth is saturated at any rate, then it is immense advantage to
reduce the sewage water to the minimum ; or, if I am reduce the sewage water to the minimum; or, if I am acting for years, of thorough underground drainage, are wrong.'

On this last point we do not think Mr. Menzies right. It is stagnation not excess of water that is the
the woter meadow is so strong，wo do not think so much as our author appenrs to do，of those difficuities in the way of samage atilisation which dilution creates． Of course all the instances of a the dificulty which he quoten，are real examples of the asificu dilution is an anticipates；and we admat chat extile to any satisfactory ution of sewage except on Grass lands．There，however，we have scope enoug！ for obtaining all that we can expect to obtain for dius for 100 to 200 tone of sewage nuder the best ncheme for turning it to necount．

It is not at all likely now－a．days，that any plan con－ templating a diminished water supply and water－use per lead of any town population will be allowed；and although we entirely agree with Mr．Menzies as to the mode in which the sewage is to be applied to the land， and aleo as to the difficulties which dilution puts in the way of its use on arable land，yet it seems plain that wo must deal with the question as we find it，and so ascertain the best way we can of turning sewage to account diluted with the rainfall as well as with the water mpply．It is into the question of the economical ntilisation of suek newage that we have to enter， motwithatanding that on one of the last pages of this pamphlet we find it stated：－

I think I need scarcely enter into the question of econnmical utilisation in the fields，as every one can bee that to have provision made for irrigating with euch excenses of rain－fall must be out of all reason，and that 25 gallons per head of the population is quite enough to provide for．The real principles to be acted on I believe nre，after having fixed quantities of sewage－
which I should like to see reduced to 10 or 15 gallons per head－then to put as much water in summer upon a limited area of as porous land as possible，so as to leasen the enst of supervision and dibidy ；mid lessen the chance of over－baturation of the land．＂

\section*{Miscellaneous．}

Waste Land Reclamation．－The following may be quoted on the authority of Mr．R．Smith，of Emmett＇s of a Turaip crop on Lineoln Heatl，and on anewly broken ap moorland in Exmoor．
Comparative Cont of Cultivating ain Acre of Hill Land，at anh
elevation of 1000 fet，agutinst an Acre of Lincoln Heath，both
belng prored fon werntip．
himoonir heath，Tunare Faliow．＊
By rent and parochial rates
By three ploaghings，at 88 ．

Ungeclankid Wabte（Dry Land）．
By paring and burning
By one ploughing， 88,

By Bent and rates
By sowing Turnip seed
The weight of the ront crop woult in all probability be in favour of the new land．The ashes resulting from the burning of this thick coating of indigenous plants are found to be powerful agents for the produc－ ton of roots，but little good is really effected without the aid of lime to mix with the fibrous earth，beyond the growth of a Turnip of inferior size．
Smith thus describes the system of farming by which this high moorland may be most proftably cultivated． When the farm is sufficiently advanced，I much prefer the followling courte of cropping，for elevated lands ：－ First year．－To pare and barn the natural herbage for a root crop，and apply \(2 \frac{1}{4}\) tons of lime per acre mixed in with a moderately thin furrow of siil，say 21 inches；this will produce 20 tons of Turnips per
acre，at a cost（as previously stated）of \(4 l\) ． 10 s．－say \(5 l\) ． per acre，or at the rate of \(5 l\) ．per ton．Second year． Formerly I adopter the plan of sowing two Turnip crops in succession，for the reason that the second one was an inexpensive and convenient one，and enabled me to clean the land more effectually before sowing it down with Grass seeds．My present plan is to seed out omitting the corn crop at this stage of culture，and until the new fibrous soil shall have had its frolic，and become more fixed and consolidated for the growth of corn．When these Grass seeds are sown，it is both desirable and proftable to add half a dressing more lime（ \(1 \frac{1}{2}\) tons）for their enjoyment and that of the farm stock when depasturing them；still it is an extra outlay of capital，that must be considered with reference to other expenses when so many other works are waiting to be performed，and these alike with enast＇s capital．Thus，after the Turnips are con umed（chiefly upon the land），the land is carefully ploughed，cleaned，and sown with artificial irasses \({ }^{\text {and }}\) These young Grasses will be ready to stock by the ond of June，and if allowed to get well established，they will usually fatten full ten sheep per acre；and if care

\footnotetext{
The \(\begin{gathered}\text { bgures here given were given to the writer about eight }\end{gathered}\)
}
weeten and recoter themselver，they ther remain clear nflnite value up to Christmas．the owes and lambs， from the ear of Soptember for a still hetter plane a help orer the inclemency of the mont Which they become first－rate pastures for the latteniug of any class of stock，and maintain their comparatise an elevated country goes very far to conquer the climate and enable the farmer to maintain a large nud healtby flock of sheep；in fact it may be said to form the key stone to the whole structure－without it
in danger．＂Burn＇s Outlines of Farming．

Close Parishes，Labourers，and Farmers．－Amongs other things the honourable member for Northampton－ shire refers to the charge that＂large landowners，by keeping close parishes，contrive to shofllo off their responsibilities to the shoulders of their poorer neigh bours＂－as there is no question whatever but they do The fact in not ever denied，but，with a passing compli－ ment to the landlords generally，is taken gor gis and we reach to results in this wise：－＂You heard pitiful description of the poor laboarer，weary and way dails with having to walk several miles to amble centle daily work（cheers）．He could tely twald（＇On， oh！＇and＇Hear．＇）If the labourer had to compete with other lubourera who lived on the estate，no doubt he would be injured；but this was not the case．The tenant－farmer，his employer，was no doubt injured，for he only feceived three－parts of a day＇s work instead of a whole day＇s work－the services of a partially－tired man in the place of the services of a wholly fresh one．． We will not attempt here to exactly define the meaning of＂twaddle；＂but if＂twaddle＂means trath，if ＂twaddle＂means stubborn fact，if＂twaddle＂means a matter of common occurrence，then is Sir Rainald Kuightey well justifled in the nse of this slang phrase， for hundreils or thonsands of cases might be cited，as cases were cited in the House on this very evening， showing that the labourer l＇as to walk iniles daily to and from his work．It is the master，however，we are tnld，that is injured，not the man；although seriously as we doubt such an assumption，we will take the case as thus put，and so proceed to learn that the farmer who has been making such a noise over the matter receives ample compensation already for any such lose of heart，and strength，and sympathy from his servant． And in what form does the tenant receive this？Sir Rainald shall say，for there is not one man in a thousand who would ever guess how be gets his own part of a day＇s work－is taken into consideration，and the tenant－farmers paid a smaller rate in consequence． Woll might the House receive such a statement with a chorus of prolonged \(O-h s\) ！when farms are systemati－ cally raised in rent where rates are low，and labour as a consequence difficult to be obtained at its best．Mark

\section*{ane Express．}

Deadly Effects of the Yero Tree．－One day lately three Krloes，pasturing in a field on the estate of Mark Sprot，Esq．，of Riddell，Roxburghshire，were allowed to browse on the branches of a Yew trees，and in a very short time all the animals gave symptoms of being poisoned．Shortly afterwards one of thom died，and a part of the carcase was thrown into the dog kennel at Riddell，when one of the dogs which had eaten of the fifsh was anddenly seized with illness，and dide on the following day，Edinburgh Courant。

\section*{Calendar of Operations．}

ApRIL is one of the busiest months in the agricul－ tural year．Dairy farmers and arable farmers are alike fully oecupied．It is the seed time of Parsnips，Carrots， and Mancel Warzel，and Grasses among green crops and of Flax，and Barley，and Oats，and even Wheat （although the cereals would all have been better sown earlier）among seed crops，and there is a great deal of work in the arable felds it preparation for the later fallow crops，Swedes and Turnips．
Carrots．－The following is quoted from Mortons

\section*{Farmer＇s Calendat．}

The corn stubble should havo beer cleaned，well tilled，and manured in the autumn；and if stirred by the grubber protty taken berter s Tur the seed．Sometimes，however，Carrots are
taken fed off by sheep；and there is no have been consumed early in the apring，and the land ploughe
and Abont six 1 o．of seed should be procirred for every ace：aud ion
ow whll to mix them for a few days with damp sand，and the Carrot seend．The whole may hy sown cin well rolle， 1 lant with

\section*{GREEN'S PATENT SILENS MESSOR,}

GREEN'S PATENT LAWN MOWERS have proved to be the hest, and carried off every Prize that has been giren in all cases of competition. The Judgeste. Royal Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteraty. which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& SoN beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trut to bin position to send off all orders the day they are received.

> PRICES OF HAND MACHINES.

 Parties providing themselves with Lawn Mowers are recommended to purchise the Cases in which to stow them away, when not in use, to prevent them from getting damper if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONTKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitaible for attaching to ordinary Chain Traces or Gig Harness.

The 26. 29, and 30 inches can easily be worked by a Donkey, or by Two Men, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Cartige for and, as the M M IINES make no noise in working, the most spirited animal con lay employed without fear of its running away, or in any way damaging the MCEINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantame of self-slarpening: the eutters heing stel on end when they become dull or blunt by rumning one way round the cylinder, can be reversed again ard again, bringing the opposite edge of the cutter against the bottom bladi, the MACHINE will cut equal to new. Arrangements are made that the cylinder can be rerersed by any inexperienced person, in two or three minutes.

The abore MACHIYES are made from the best materials, and of superior workmanship; are delivered Carrage Fref to all the principal Railway Statinns and Shippinf in Fugland; are warranter to give aatisfaction, and, if not approved of, can be at once returned unconditionally.

\section*{HOT-WATER APPARATUS,}
with truss's patent pipe joints.

\section*{T. S. TRUSS, C.E.,} 53, GRACECHURCH STREET, LONDON, E.C.

Br means of these Joints the work is executed in less than half the time required for Socket Joints, and Dy ons can at any time be made, or the entire Apparatus removed and erected elsewhere with the greatest alteratit a considerable saving in cost is also effected
Thility. A Joints have been used for several years, giving entire satisfaction, and may be seen in use at the Roval Horticultural Society's Gardens, Chiswick, and many other places in Horticultural and Public Buildings. They an' also exhibited at the Society's Gardens, South Kensington.

For a few prices, see last voek's Advertisement.

\author{
SATURDAY, APRIL 15, 1865.
}
mbrtings for the ensuing week.
TousdAy, April 18 R Royalithorticaltural (FHoral and Frule

We have received various communications with reference to the Pine Stove at Knowslex, of which a description and section were given at p. 124, and upon which some further remarks by the writer of that description will be found at p. 341. Our correspondent "G. H.," prognosticates (p. 150) that the heating arrangements will be found defective, and not calculated to ripen Pine Apples in winter, adding that good Pines cannot be ripened without an atmospheric heat of \(90^{\circ}\), and that the Knowsley house, with the pipes shown, would fail to keep up this amount of heat daring five months of the year. It would take, he adds, nearly three times as many pipes, to ripen Pines from the end of November till May. With regard to the bottom-heat, he observes that the pipes are intended to send up moisture into the rubble and tan above, and so to the roots, which are not more than a foot above them; and he argues that this would be something like cooking Putatos by steam.

With regard to top-heat, taking the seotion of the house as represented, we may estimate that there are about 34 square feet of glass in each foot run ; consequently as there are six pipes, tach foot in length of the house has 6 feet of pipe. In other words, there are fully 6 square feet of surface of pipe to 34 square feet of glass, or upwards of \(5 \frac{1}{2}\) square feet of glass for each square foot of surface of pipe. Now, if a heat of \(90^{\circ}\) were to be maintained solely by means of these six pipes, we do not think they would be sufficient at all times in winter. But there are eight pipes below the surfaoe in the beds; and though it is difficult to say how much heat may be imparted by them to the atmosphere of the bouse, we may estimate that as much will be constantly given off as would arise from a surface of metal pipe, or any other substance equal to that of the area of the beds, and at their tem-perature-say between \(80^{\circ}\) and \(90^{\circ}\). The surface of the beds is 1400 square feet, all but the area of the end paths opposite to them. This is more than double the surface of pipe for supplyiog atmospheris heat. The surface of the beds may not bo
quite half so hot as that of the pipes, but it is twioe the area; and although it does not follow that the heating effect arising from their radintion will be in the same proportion, still unquestionably it must be verr considerable, and must aid greatly in maintaining the temperature of the honse.

As to the "four rows of pipes intended to keep sending up moisture into the rublile and tan above, and so to the roots," the writer of the article in which the house is described does not mention any such intention; he merely says the How-pipes-for the surface-heat, be it ubservedhave large eraporating tronghs. Hot-water pipes of themselves will not give out, nor keep sending up moisture. By their heat they will cause vapour to ascend from where it may exist nonongst the rubble in which they are imbedded, and that rapour will be condensed on any surface colder than itself with which it may come in contact, and it will be absorbed by soil or other porous substances not already saturated. But if the heat is kept up, eraporation will still go on, and the routs of the plants will either ultimately become parohed if moisture is not supplied, or if this is done, and the heat at the same time raised far above that whioh vegetation could bear, they will beeome " "ooked." These extremes, however, can be easily avoided,no more moisture need be given than the roots of the plants reguire, and no more heat than is necessary.

One correspondent thinks that eight pipes for bottom-heat, and only six for top-heat, is out of proportion. Mr. Merentri has had kreat experience, and must have been aware that fewer pipes would have been sufficient to heat than he could require; but he doubtless wished to avoid the cooking system, and therefore we suppose he has allowed a large amount of pipe in order that the desired quantity of bottomheat may be obtained from a large surface without any part of it being heated much in excess of a safe temperature for the roots, or that which would not raise the heat of the soil a wout them ahove \(90^{\circ}\)-the temperature which " G . II." mentions with favour ; but if it dues not exceed this his Potatos would be long in cooksing. It may be thought, however, that the heat from cight rows of pipes with less than a foot of clear space between them will so accumulate as to be adeyuate for any culinary purpose. But to wait for this would be like waiting ly the side of a river till all the water should have run past, before attempting to cross ; for the water, though oonstantly passing, would be as constantly coming on. So with respeat to the supposed accumulatiou of heat from the pipes; it would be constantly generated, but it would also be as constantly dispersed.
As, however, no portiun of heat can possibly be lost, it may fairly be asked-what would become of it? At least, we may be certain that in this case it must pass in continuous succession from one adjoining particle to anuther till it reaches the surface of the soil, and from the soil it must pass into the atmosphere of the house, and thus assist in maintaining the temperature of the latter. By this diffusion of heat the soil is prevented from becoming over-heated, whilst at the same time the exposed pipes are assisted in odequately maintaining the atmospheric temperature. That they would do so without the heat radiating from the beds, we however think needs conlirmation. On the average, perhaps, they would, but in the oase of sudden and nevere frosts probably more pipes would be neoessary; and this is exactly what "J. A." suggested.
Another correspondent, (p.293) urges that the tiner materials placed over rubble in which such pipes are imbedded, would resist the steam or vapour raised by the pipes, and that the plants would consequently at length suffer from dryness; but he is certaiuly wrong in inferring that these finer materials would resist the steam in a similar manner to that in which a DATy lump resists the ingress of oarburetted hydrogen, or fire-damp. For a DAVY lamp does not prevent the ingress of earburetted hydrogen. On the oontrary, the wire ganse oorering of the lamp permits the ingress of the gas, and permits the mame to be burned; but the dlame is mo much cooled on coming in contact with the wire that before it can pass outward it is extinguished, and consequently oannot ignite the carburettod hydrogen outside. '|

\footnotetext{
We have more than once had occasion to mention Mr. Bowi's atrain of Mimuluses, obtained by a lucky croes between M. cupreus and one of the garden varieties which were furmerly much grown, which show an infinite variety in the spotting und speckliug of their of maculons. We have now to notice another perfeotl
}
new otrain from the same source, a veritable duplex Moneif-flower, a thorough hose-1n-hose, as though the calyx, justifying the name, had tarken
mimicking the corolla. This remarkable curiosity i to be sent out in the course of the spring. the samples before us, showing some three or four different styles of spotting, the corolla exactly resembles sume of the forms commonly known in gardens as Mimulus maculosus, alluded to above, but instead of the calyx being of its usual form and green colour, this organ is converted into a coloured and, like it brightly coloured and handsomely spotted.
Of course, looking at the Mimulus as a florist's flower, this new feature is a dofect, inasmuch as it to constitute a perfect flower; but regarding as a decorative plant, it is a very great advantage. N one can doubt or dispute the beauty of some of the fine varieties of Mimalus, but the defect of the plant
from a garden point of view is, that the flowers drop too soon: the beauty is not enduring. Now, leaving out of question altogether the fact that here the orna mental part of the plant is at once doubled in quantity, there remains the very important fact that be the
corolla ever so fleeting or evanescent, when it falls the plant to all intents and purposes still remains in flower. The calyx is virtually itself a flower, as far as ornament is concerned, and this part does not fall like the corolla, but lasts as long as its substance will endure. We are informed that this new Birain,
which may be distinguished as the DUPLEX Mimulus, bas sprung from Mimulus maculosus, which it quit resembles in its colour and markinge. Its great merit is that the flowers, as represented by the outer of the
two floral whorls, remain persistent for a period hitherto unknown amonget Mimuluses.

The challenges which has been given by the Royal Horticultural Society to the gardens of the Sovereigns of Europe, for a Comprtimive Exhibirion slready favourably received by France informed, been Turkey, Hanover, Greece, Belgium, \&c. The compe Turkey, Hanover, Greece, Belgium, \&c. The compewhich'is fixed to commence on the 9 th of December. On this occasion, besides the Gold Medal for the best collection of Fruit and Vegetables produced in the garden of a Sovereign, Gold Medals are also offered for the best collection of Fruit and Vegetables grown hy any Botanic or Horticultural Society in any part o tive collection of Fruit and Vegetables from any of the Colonies ; and for the best and most complete represenColomies; and for the best and most complete represen
tative collection from the Presidencies of India; while Certificates exchangeable for Medals are to be given for separate exhibitions of Fruits and Vegetables, either
fresh or preserved, from all parts of the world. This should produce something of interest.

According to the Building Newas, Mr. Morris, the architect, has proposed to the authorities to try
Terrace Gardening in Trafaigar Square. H advocates the formation of a new terrace to the south fied by the introduction of suitable plants, sbrubs, and low-growing trees, and the portion about the fountains, now the peculiar gymnasium of vagrant
urchins, being, if necessary, laid a foot or so under urchins, being, it necessary, laid a foot or so under
water. Portable trees, such as adorn the walks of the Tuileries, would be placed on the Pall Mall Terrace, as well as within the enclosed areas of the National be altogether unlike anything which London yet offers, and, although not a single foot of soil would be laid bare, the works of architecture and sculpture would be relieved and harmonised by the presence of horticulture. There in no great horticultural obstacle to this introduction of terrace gardening for the people, bat the trees must be portable, and will need a reasonable
amount of care and skill to keep them respectable amount of care and skill to keep them respectable; the site stands in need of improvement.
M. Sismunda has found on a fragment of a boulder of gneiss in the Turin Mysenm, the imprint of an Equisetnm, which M. Brongliart has determined to be a new species, Equisetum Sismondæ, nearly allied to this new fact, observes a writer in the Reader the scientific importance of plant evidence, though not diminished, has changed its venue; for, inotead of indicating a determinate geological epoch, it
shows that in spite of geological catastrophes which have taken place since the coal period, the climatic conditions proper for plant-life have been perpetuated in the localities whence such evidence is derived.
directed attention our correspondents have latterly of young Orchard trees, as distinguished from the haphazard mode of planting and leaving them to their fate. The idea finds an echo across the Atlantic. Even in iortile America, as we learn from the Cultivator, there Orchards that have, in decided difference between the those that are sown down in Grass. The observant traveller is speedily convinced that it is necessary to pay vigorous growth. Here is one erample in a thrifty
garden is beside the Orchard. The trees are a dozen years old, and the land is kept highly manured in both cases. Those in the garden bear liberally, while those in the Orchard, which is in Grass, and the trees themselves not half the size of the others, givelery half fruit. Those growing in the Grass look while those in the garden look healthy and dead, while those belong to two neighbours. One is tbrifty and vigorous, giving liberal crops of fruit; the other looks
half starved and stunted, and many trees are dying. When examined it is found that the former has been sept cultivated; while the latter has been sown down to Grass. The conclusion drawn from these examples, is that a young Orchard needs cultivation just as much as a field of corn or a crop of vegetables.
- In a memoir on the oulitivation of the Car NATION, contained in La Belyique Horticole for chromo-lithographic plate, the following statement i copied from Le Bulletin de la Société du Cantal, 1846, as a means to ascertain beforehand what seedling plants are likely to prove double, a matter of some
importance, as the young scedlings require considerable importance, as the young seedlings require considerabos which will prove single or merely semi-double:-"The young plants," it is said, "which show at first only a single leaf, yield single flowers; those which show two semi-double flowers and finally, those which develope a the time of germination four leaves, have double flowers.' This statement is reproduced, without confirmation,
however, by M. SERINGE, and is probably unfounded It would be a matter of interest if some raiser seedling Carnations would ascertain the truth or false hood of the statement, and report accordingly. M.J.B.

\section*{A NOVEL PLAN OF FORMING VINE BORDERS.}

Although good Grapes are grown in all parts of the country, still instances of failure occur; and even if that were not the case, many people every year erect Vineries and commence Vine growing, and such persons are anxious to obtain the formation of their Vine borders, and in other points connected with the management of Vines. Therefore, I presume that contributions containing practical suggestions from those who have had some
experience in gardening will still be in a measure experience in gardening will still be in a measure In almost every situation in this country it advisable to prevent the deep penetration of the roots of Vines into the subsoil, by forming in the first case a floor or concreted bottom to the Vine border and building up the materials composing the border upon it. This precaution is imperatively necessary when the subsoil consists of clay, and if not equally so in light or rocky soils, is nevertheless very much to be borders outside the Vineries ; and the suggestion wish to make to those who have borders still to construct, is to deviate a little from the commonly observed procedure of flat even paving, and to mak them in the manner of steps, so that the irregularity

of the bottom of the border will give different depths to \(i t\), an advantage which I shall presently explain.
Trees in a wild state distribute their roots in th soil in which they grow so as to reach all the avail able nutriment of the space about them. Some roots generally penetrate deeply into the eartb, and others spread and ramify throughout the richest soil of the surface. These surface roots experiencing the warmth of spring before those which have gone deeper into the earth, send the first flush of sap to the opening buds. The roots in a Vine border of uniform depth, say of 2 feet, are equally and immediately influenced by external heat, whether of the sun or by artificial means, and there is a simultaneous root action, and in consequence a more rapid growth than is necessary in the early stage of growth of the Vines, and a falling off in the supply of sap when it is most required by the fruit. An even shallow border is open to othe objections, as it is liable to be dried up during a ho and arid season-as many gardeners during the last two seasons can sufficiently testify.
I once had the opportunity of seeing the manner of growth of Vines in a Vineyard in France. An excavation in the rocky soil on which the Vines grew showed a certain number of surface roots spreading through the superficial surface ail, and others were seen pene trating the disrupted strata even to the depth of 6 feet Remembering this, in the last Vine border I made, I gave an irregular depth to it by forming, in the manner above mentioned, the bottom of a series of steps, and
giving the whole border increased depth. I also giving the whole border increased depth. I also
employed a large quantity of stone in blocks imme diately over the concreted bottom of the border, and distributer pipe-tiles throughout the rubble. desired, as will be seen, to have by this arrange ment two sets of roots-those amonggt the stones and angles of the stepes, and beyond the first vivifying
pour up a supply of sap at the stoning period; through the surface soil of the border, reads speadir affected by the warmth of spring.
As I have before remarked, it is never adrimbl subsoil, although in sunny Frunce Vineply into th eeding roots uncontrolled very deep in soad the or rock. We in this country have less heat an moisture, and my experience of deeply and mor oots is that they gradually perish, and that ahniti of the berries ensues. But a modified a
he lesson I gained from the wild Vines has icstion resulted so well, that I give the suggestion to readers. Wm. Ingram, Belvoir

\section*{DOUBLE-GLAZING:}

The advantages of double-glazing are at leat fou fold, but before proceeding to describe them it mas well to state in what the principle of doableglenin ill marry be a double glane roor; pletely. 2. It is absolutely necessary that the mon between the two glass roofs should be air tight in then encloses a body of air which becomea a onductor of hea
The roof is constructed with ordinary wooden ratien 4 feet apart, with three light iron sashes between. The 1 in gas is common 21.0z. per foot. It is put in soon rafter being about 6 inches in depth, 5 inches of be rafter is outside the inner glass. On these projectio rafters the outer roof rests. The outer roof consisits simple framed sashes 4 feet wide, which for the om venience of moving are made in two lengths. Theym glazed with the same kind of glass as the sides, vis, the ine ribbed glass called Hartley's rough plata. Them as to be easily removable
Thus the inner and outer glass is from 5 to 6 incher part The distance is not important: either 4 ar inches will do, but it is of the utmost importance the the glass should fit closely, so that there should be wo circulation of air between. The glass is carried app within one foot of the top of the ridge, which foot fitted with wooden shatters for ventilation. The Pirr bouse is 48 feet long, 60 feet wide, and 21 feet high. Two rows of 4 inch pipe are sufficient to hatioll tit large body of air
The advantages of double-glazing are these:
1. It prevents any excess of heat by day. Io be summers the heat has never gone up higher than \(N\) while with a single roof any one hot morning mokil have run it up to \(85^{\circ}\) or \(100^{\circ}\).
2. It is a great protection from cold by night in cubic contents of the house is 46,000 feet. The heatius power is only 430 feet of 4-inch pipe, or about 1 fon pipe to every 100 cubic feet of air. This quan pipe in a single roofed house would only jast
frost out, but with the double roof the temp rarely goes down below \(48^{\circ}\). The cstimate shows a \(14^{\circ}\) of heat. The loss of heat is very slow weather. It would take three mights or and 36 hoon bring the heat down from canse the same reduction were the fires to entirely. With a single roof this reduction would place in six hours. It is a great comfort to know the If the fire was neglected or an accident hap, the boiler, the plants would receive no damage. radiation and condensation in bright cold wen ither by day or night. In ordinary honsee, moisture forms a requisite of good plant ing, no matter how freely we use the syringe evening, we find the house dry in the morniog
from the great condensation of moisture on which moisture runs off when thus condensed. double roof there is very little condensation roof, the blanket of non-conducting air bene wo roofs of glass preventing it, and conseq ion takes place on the plants themselves, exactly ing ta tases place on the plants themselves, exacluse has a double roof and sides, are in the morning fully covered with dew, like a plot of cabo May morning. Is not this the perfectiod wis growing? There is another fact connected is the curious fact that there is a steady increase of temperature in the house accord ascend from the floor to the roof, day
in the Fern-honse hardy Ferns and grow below, while tropical Ferns, grow near the roof. In ordinary houses tender plants from near the glass in severe but in this double-roofed Fern-house saving of fuel is 20 per lones but this is a trifle compared value of the plants grown in The effect is astonishing, aud would growers in general. Caution is needful not mach water as is done in single-roofed honses.
* A resumé of the descriptions of the doublegg con the
of Thomas Bewley, Requo, of Dublin, read at tarih
4. It secures the almost total cessation of annoyance from insects. Formerly these pests avounded, now they rarely appear, and asily got rid of. From this fact it may be inferreal that when plants are grown in condition of atmosplere favourable to perfect health, they are but little liable
A remarkable instance of the value of double roofs to A remarkable instances occurred in January, 1864. There occurred four days and nights of hard frost, the tbermometer not rising the frost began an accident \(18^{\circ}\) at night. Je heating apparatus, and all the water ran out of the pipes, and the accident could not be repuired until after the \(3 d\) night of frost. The temperature was about \(56^{\circ}\) in the morning when the feat was only \(3^{\circ}\); the following morning, or after 48 hours, onls \(3^{\circ}\) more; and in the 3 d night \(2^{\circ}\) more were lost thus making a reductiou of only \(8^{\circ}\), from \(56^{\circ}\) to \(48^{\circ}\), in therase Nothing was injured ! a striking proof of rould have been frozen, and the loss would have been immense. With double-glazing, gardeners and employers may in severe weather sleep in peace
Another year's experience has fully confirmed all the drantages before narrated. A market gardener at Colney Hatch Las grown Early Cucumbers for Covent Garden with great success, and with saving of fuel. The plan his long been in use in Russia. I will conclude by inquiring whetber in other countries on the wiat results? Robert Warner, Broomfield.

\section*{Home Correspondence.}

\section*{The Knowsley Pine Stove.-One word with reference} to the practical question of heating, raised by my remarks on the Pine Stove at Knowsley. Many of your the principles of heating, and "G.H."" who set the ball solling, amng the number. A glance at the woodcat will show that the pipes which supply bottom-heat are surface-heat ; and, as is well known, particles of water after they become heated rise to the highest point consequently the flow pipes that furnish atmospheric the same surface at the low level. This heat finds its way into the atmosphere unimpeded, and the large eraporating troughs that are fixed to these pipes are in my report ( p .125 ) that "the addition of two pipes more for surface-beat would more evenly balance the Wottom-heat," And so in all probability it might; but power-occasioned by the position of bottom-heat pipes, well conceived and carried out. The "cooking" process spoken of is a simple absurdity, for in the first place the pipes are at least 30 inches from the roots of the plants, as any one can see for himself, and the hat is dispersed the at although there were such a possibility as raising the water to the boiling point, the non-conducting heat should be from \(5^{\circ}\) to \(10^{\circ}\) higher than surface-hea for successful Pine culture, and reasoning by analogy assist the bottom heat ould fermenting material know very well that during summer the Pine requires develop the flavour ; but we to finish up the fruit and ful cullivator of Pines subjecu his fruiting house to a that "G.H." alludes any time during the five months of such an extent as the woodcut and in a house reprecesents, where there will always be more or less ees, certain to produce resalts of the absolute madKind. The practical success of the scheme was amply Fould have satisfied recorded in the noticealluded to, and \(M_{r}\). Freeman satisfied ordinary minds; but I may add that trath than ' \(G\) rites: "Nothing could be further from the now (March 4) before the end. I have 60 Pines to cut sour readers have taken in quantity." The interest which apology for again referring to the matter. \(J\). \(A\) be my byelares of the Royal Hortioultural So Society I have been of the revised bye-laws of this call your attention expecting that some one would No member of the Council shall, which reads thus :pecunidry reward of any money prize, medal, or of which he is article belonging to him, or to any firm interested." There is no in the profits of which he is revised thene bye-laws had in wiew simintlemen who bot the case, in of case of directors of public companies, different. As I read this bye-taw, it Society is totally Who may. wing any spirited member of the Council Council our great business nurserymen excludes from the xhibitors ; and also all gardeners, who mostly bring some.
thing or other to these exhibitions in the course of
the season. This may not be any serions loss in the case of the latter, as they can seldoin be of much use on the Council ; but it is far otherwise with the gentlemen and nurserymen. It must be a love of horticultural pursuits that in most instances recommends a gentleman to this post; and if he pleases to go to the expense of £rowing plants for purposes of exhibition, they do not come under the tead of goods supplied to the com-
pany; they come to be judged by independent men, and if they are fortunate enough to get a prize it would not repay the outlay. In many instances this prize goes to the gardener, he bearing the expenses of the transit! and I should like to know if it ever repars him for tne anxiety, labour, and outlay, unless he is very near the place of exhibition. This is of malbimportance to the gentleman, who can carry his plants
elsewhere now-a-days, but he is naturally more pleased to see them, and point them out to his friends, at the Society of which he is an acting member. I am of interests of the Society. J. Fleming, Cliveden. [It is no doubt a bad law, for its effect must be to keep away either good plants or good men.]
if such it may be called, found unusual-sized tuber, which I met with whilst upon a visit to Mr. Fitt, to W. Wilshire, Esq., The Frythe. The tuber enclosed is but one of many formed upon an ordinarily grown specimen in a 32 -pot, many of them being larger than botton enclosed, and the whole forning a mass at the forced the whole ball up some 2 inches above they rim of the pot. The only cause for this growth, as far as could be ascertained, was this-that the pots were placed in pans, flled with water. Will the:e tubers produce next season, plants in strength proportionate to their size? Or are they, as their very aqueous appearance would Nature inply reservoirs of nutriment, a provision season of dearth ? W. Fappert of the plants in a are quite similar in character to those of O. Deppei, only they are much smaller. See Transactien Horticultural Society, second series, iii. 31. They are merely fiesby roots, not fit for planting, for which purpose the bulbs formed round the crown should be used, and these should be planted shallow. With good culture this sort might perhaps be as productive as O . Deppei.]

Abies Douglasii.-Several years ago I planted at Boynton three or four plants of this Fir, grown from They will be 20 feet high or more. I have not seen them very lately, but they have had a true leader for many years, and the upper half of them all is as symmetrica, or very nearly so , as that of a seedling would be, but for 6 or 7 feet from the ground they still show the one-sided character of a plant raised from a cutting. I have not the least doubt that like other Firs nearly allied to them they would have thrown up true leaders from near the ground if they had beeu bent down when young. C. W. Strickland

\section*{Foreign Correspondence.}

Exaibition of the Sociéte Royale Nébrlan datse potr l'Encouragement de l'Horticulture - The Exposition Universelle of this Society was arrangements were much the same as those at the Brussels Exhibition of last year, of which a full account was given at p. 412 of our volume for 1864, the various collections being broken up as soon as the judging had beert completed, and distributed with a view to producing the best effect, by which means both Belgium and Holland, with their limited materials, are enabled to produce far better shows as regards effect than we do in England with our grand exhibition plants in almost unlimited quantities. The present show was exceedingly good in many of its features, especially in the interesting departments of Floral Decorations, Camellias, nna New Plants, the latter being well repre sented from the establishments of Messrs. Linden of Brussels ; Messrs. A. Verschaffelt and J. Verschaffelt, of Ghent; Messrs. Groenewegen \& Co., of Amsterdam ; and Mr. Veitch, of Chelsea
The show took place in the Palais de lindustrie, fine building of iron and glass, apparently put up in a scale of the Palace at Sydenham. The chief fault of the building, as a place for exhibition, are the narrow-stepped and too upright staircases leaddancous and any time, but especioll dangerous-strong objections at any time, but especially when, as "was the case in this instance, there is a
crowded company. The bnilding has four entrances, a transept with a large central dome, and an arched nave extending from the dome in opposite directions. It is neatly ornamented on the outside, and the inside has a very good appearance. There is one gallery ranging all round the building, and two in the dome. The the plants, was very charming, the whole plat of of arrangement being more lovely sight indeed than that presented to view, in the dark shining green of the Palm leaver, the graceful airiness of the Tree Fern fronds, and the
characteristic clegance of the Dracemans and such hike plauts, intermingled and enlivened ns they were with
flowers of all hues, can hardly be imagincd. It was fowers of all hues, can hardly be imagined. It was from England. Resides this principal area, there were two large ronins filled with plants, and arranged with admirable effect. On Friday, the opening day, carriages with the clite of the land thronged to the sathering; and on Saturday, when it was open to the public early in the morning, it was crowded throughout the day. It was gratifying to see the people of Holland taking 80 deep an intereat in a horticultural show but then it is to be remembered that the Dutch were always patrons-and not patrons only, but practisers of Wednesday last; Wednesday last; and it is but juat to state that every thing about it was well planned and well carried out. The whagers must liave been gratified to sce the manner in which their invitatiou was met, both as regards com pany and plants. Some of the collections had, indeed, ome handreds of miles; and it was surprising to see in the case of a few of the Orchids which weredamaged by cold. The entries amounted to over 800 , and they were well varied, nearly ali the classes of tender as well as hardy plantz and fiswers being filled.
Though glass houses are what we should call somewhint scarce in Holland, there is no doubt that plant are well grown there. Soma of the Epacrises, Pimeleas, and others were as well cultivated as wo have ever soen them, and the flowers were finely coloured. Ferns and Pulms are also exceedingly well grown, and we asm some good Orchids, and Orange trees well covered with fruit. Some of the Oranges were, however, grown on think is bad taste, as the Orange forms so much mor beautiful a tree when grown with a bus'y head.
Wre have already mentioned that, as was the case at Brussels last year, the whole of the plants were re-arranged after the awards had been made. This one day being custon at the great continental shows, is admitted; and it is surprising what an effect in produced from the variety o. suljects at command surprising, indeed, as contrasted with the stiff formality of our English shows, from which, though it has nearly ruined them, the managers seem afraid to diverge.
At Ansterdam the floor of the principal area was laid out with broad turf edgings like a geometrical garden, with beds of earth for the pots to staud on: bmall edgings of wood around each. bed, and good broad paths of some 14 feet wide, sn that the company could promenade at ease. On entering the trausept, there appeared a group of standard Bays on each side, In and flowering plants, tolerably well arranged except that the centre was too stiff, and slould have been occupied by a fine Palm which wa standing close by. Around this were ranged flowering plants, such as clumps of Roses, Camellias,
and Aztleas, well grown, aud affording a good yariety of colour. Acacias also were usefully iatroduced as regards colour. Dwarf Ferns were grouped between the flowers, variety being secured by two fine specimens of the green-leaved Encephalartos Altensteinii, a fiue specimen of the Tree Fern Dicksonia antarctica, and a splendid Fan Palm. These priucely plants were produced by the Azaleas-the tro latter good for so early in the season At the end of the transept was a noble Palm, Pbocnis dactylifera, the finest plant we ever saw, and on eack side were many other fine-foliage plants, fringed with the graceful foliage and showy yellow flowers of Acacias, and in front of these a fine display of Azaleas. There were also standard Orance trees, and two fine Tree Ferns, Cyathea excelsa, and Cibotium Schiedei with its graceful light-green fronds.
To the right of the transent was a broad walk, with fountain, the sides tastefully laid out in beds filled with flowers and foliage plants. At the two ends were fine groups of Azaleas, and on each side Agaves, Ferns, \&c., divided by four Dracæmas about 5 feet high clothed to the pot with foliage, two of them indivisa, the others linieata and Veitchii Next, a broad walk round the fountain, and fine groups of Ferns, with Cibotium princeps and Schiedei, two of the most graceful of the race, set on pedestals at the back, while in front was a fine plant of Platycerium grande in first-rate health, the stag'shorn fronds of which proved a great attraction to the visitors. On the opposite side was a grand specimen of the rare Alsophla contaminans (glauca) one of the finest of Tree Ferns from its feathery gracefu habit; and along with it Angiopteris evecta, Cibotium Schiedei and Cyathea excelsa, another splendid plant of Platycerium grande being placed in front. Oa eithe side of this bank of Ferns were showy flowering plant backed up by Palms, Banksias, \&c., with Acacim and Camellias in front. Then came a fine collection of Agaves, Aloes, Yuccas, Draceenas, \&e., the most conspicuous being Agave filifera major, univittata, and schidigera, Dracæna indivisa, and Yucea quadricolos and variegata. On this side came another group of flowering plants, amongst which Rhododendrons were conspicuous. These were backed up with Tree Ferlis and other foliage plants. On the other side was a fine collection of Palms, containing Seaforthia robusta, a
fine Latania Vertechaffeltii, Areca Verschaffeltii, and a grand Latania borbonica, one of the most noble in its class, which looked well towering over Camellisas Mathotiens alba was the finest in the exhiCamellias; bition, the flowers of large size and of good Jorm;
Mathotiana, was one of the fineat reds; and Jenny Lind also was very fine. Epacrises were a conspicuous feature of the show. At the end of the building was a fine well-arranged collection of Conifere, with Araucariz excelsa \&a a centre. On one side of it was a collection of well-bloomed Rhododendrons, giving a fine display of coloar; on the other some good Camellias, Boronias,
collection of Agaves.
To the left of the Transept the space was laid out with walke, fountain, and groups of plants in a similar way, bat the kinds of plants were varied. Amongst them were Cyathea deal bata, with its silvery fronds; of Variegated Orange; some splendid plants of the Myrtle-lenved Orange laden with fruit; Agave filifera longifolia and Parmentieri, with their handsome threadedged leaves; Cordyline indivisa; some beautifal collections of Epacris with fine spikes of finely-coloured flowers, admirable plants for exhibition on account of the variety of their colours; Cycass revoluta and circinais; Dion edule; Agave dealioata; a \({ }^{\text {Beancarnea }}\) glauca; Yucea aloifolia variegata, which looked well amonget the green-leaved plants ; Pandanus utilis, and a good collection of Cyclamens.
At the back of these were ranged the Hyacinths, the Whole length of this part of the nave, raised up at the back and the pots hidden with moss. In front of these was' a broad walk, and then a splendid row of wellgrown Orange trees in fruit. On the other side of the other bulbs, which made a fine display. The bulbs, however, were not grown so well as we see them produced in London, the flowers not being so finely developet. The climate way have something to to
with this, the winter being longer and colder, and the climate damp, which makes them naturally later, and we know that forcing is not good for thein. There was not one good new Hyacinth except King of the Blues, which is a grand variety, producing bold spikea of fine colour. The collections consisted nearly of the same kinds as those we are accustomed to see shown in ondon.
The galleries were filled on the sides with groups of Begonias, Cacti, Cinerarias, bulbs of all kinds, Tree
Violets, and some handsome Fritillarias, with their drooping bell-कhaped spottel flowers. These we ought to encourage more than we do at home, for they are very handsome spring-flowering plants. There was also Lilum Brownii, a charming species with its large white flowers. Here, too, was placed a group of Ardisia crenilata, clothed with shining deep. green leaves,
laden with coral-red berries, and having a very fine appearaucice. There was a large collection of Primulas, the double kinds good, but the singles very poor, being
plain flowers deficient in colour. There were some collections of hardy variegated plauts, and also a collec. tion of Ivies. In the centre were placed the Vegetables and Fruit ; the former conssisting of Peas, French Beans, young Carrots, Broccoli, Seakale, Lettuces, Radishes, There was a gooil assortment of Apples and Pears very bad Grapes; Strawberries in pots, bat indifferently grown; fruiting Pines in pots, but rone good; and Vines in pots, but like the rest badly managed, and the fruit quite green. There seemed to be wanting some lessons on the culture of Fruits in pots. W.
To this account we may add some furtber particulars from the prize list, reserving a few comments on some of the special subjects of exhibition, for another ccasion :-

\section*{Societics.}

Royal Botanic: April 8 (Second Spring Shov).A brilliant little assemblage of gay spring flowers was gathered together on this occasion ; and, the day being warm and urusually bright, the many excellences which they possessed, both in the shape of form and colour, were brought out to good advantage.
Roses, especially a collection in pots from Mr Vm. Paul, were wonderful productions; the plants individuaily, both as regarded size and amount of bloom, having more the appearance of specimens set up at the early summer shows than in the middle of April. Conspicuous among those from Mr. Wm. Paul were Celine Forestier, a beautiful yellow, in fine condition; Juhn Hopper ; Princess of Wales, rich crimson; Pierre Notting, dark crimson, slightly shaded with violet Mrs. Wm. Paul, a glorious high-coloured variety; Jules Margottin, Beauty of Waltham, Madame Derreux Donville, rosy lilac; Paul Delameilleray, glowing crimson; Senateur Vaisse, General Jacqueminot, Vainqueur de Goliath, dazzling shaded red; Madame Clemence Joigneaux, rose shaded with lilac : Madame de Camba cérès, Madame Boll, Madame Caillat, bright rosy rej; Madame de St. Joseph, Souvenir d'un Ami, Victor white hybrid perpetual Alba roment, a good White hybrid perpetual ; Alba rosea, beautiful, buff richly suffused with farvn. Mesars Forl \& Son, plants, though smaller, were also good examples of skilful cultivation. Among them were President, Madame Willermoz, Lord Ciyde, Anna Alexieff, Alba rosen, Maurice Bernardin, and Le Rhone, the last a fine rich high coloured variety. The same exhibitors also contributed good cut Rones in boxes, in which were Lord Clyde, Lord Herbert, and Senateur Vaisse, all in fine condition; as were also Peter Lawson, Francois Lacharme, Enfant de Lyon, a pale sulphrar Tea; Safranot and Madame fawn; on the last, especially in the bud state. Mr. Wm Panl likewise contributed the bud state. Mr. Wm.
white, delicately tinged in the Vigier, alba Rhone, finely incurred. Handbook of the British Flora. By George Bentham, P.R.S. President of the Linncan Society. Parts
XXIII. - XXVIII. 1864, 1865. London: Lovell Reere \& Co.
We have already on two occasions noticed this excellent work, and have now to congratulate our readers on its saccenful termination. The Parts before us comprise with those vascular Cryptogams which come within the prescribed limits of the author. In scarcely any genus is a nice discrimination of species more necessary for to be but little subject to variation, but which in menlity, when taken as a whole, and followed out through the complete geographical range of the species, presents Nerbaps as many puzzles as those genera which are more confessedly perplezing. It is now many years reconciling the species which occurred in our rambles through districts which swarmed with varions forms,
with che figures and characters of authors, and we now wo at a glatce how completely our perplexity would have vanished hall we had such a guide before us.
It is not to be oljected to the author, that without reason or due consideration he has wildly demolished a host of yood species proposed on sufficient grounds by
other labourers in the same field. This is far from being the case, and it is but fair to let him spear for bimself on this sabject.
"The great reduction in the number of eupposed species adopted in the Handbook bas been severely criticised and strongly condemned by botanists of themselves to the investigation of the Flora of Europe anthor has more than ever reason to believe that the author has more than ever reason to beleve that the
line he has adopted is in strict conformity with the views of eeveral of the first botanists of the day, who reference to the forms it conoidering each species with extent of its area. There is no doubt that in the case of a large number of commou and widely-spread plants, Brambles, Hawlweeds, Willows, \&c., there are namerous races of greater or less permanency, which are being studied as such distinct, and well worthy of being stadiod as such by those who have leisure and which should by no means be neglected by the botanist who would be thoroughly grounded in his the general advance ; yet it is believed that with gradually spreading, that the raising these races to the and that it is at once more them an undue importance, tically couvenient, as well to the general botanist in the higher branches of the science as to the mere superbeial ainateur, to retain for the meaning of a species the In thesed by the original principles of Linnæus."
not hesitase sentiments we entirely concur, and we do be more detrimentess an opinion that few things can science than the practice of proposing a branch of apecies which arise and practice of proposing a number of lightest pretension to any enlarged notions of the to follow out the various forms whithout an attempt atsume through nearly half the circumference of the
glolie. We of a species such as with some interest at a deep study apecies, because of a single favourite into fifty-three within which a species may vary shows the limits of permanence, which certain characters may assume; rate afford one some amusement: it would at any anxiety for purposeless subdivisions, howerer much plausible in the way have cost to frame something the veriest hairsplitter mand Wichuractera. After the genus Salix, pen a little, anii he would do content to rest upon his tion which Mr. Darwin has the matter for deep reflecobservations of dimorphispsened ont in his wonderfol materially modify our notiona of thed, and which must Which the vegetable kingdom is compoed individuals of
discipline, to be led to seo difere as mattor of menta important that he should observe resemblauces as well and we believe that a far higher towe of thonght will be ensured by a proper combination of the tro than by the most acute discrimination of distinctive characters.

\section*{The \(\mathfrak{A x i a y}\)}

As the time of the year approaches when the majority of bee.keepers, who have been so fortunat as to find themselves possessed of strong and healthy wionter, after the perils of \(n\) long and inclement winter, look to their multiplication by the usual mean of Natural Swarming, it may not be out of season to
give our readers the details of a plan by which many advanced and scientific apiarians dispense with the anxieties and nucertainties contingent upon waiting for their apiaries in a high state of prosperity. This is effected by carrying out the principle of AbTIPICIAL Swarming. It is now our object to explain how this can be most successfully accomplished. We will suppose the apiarian who feels inclined thus to try his
hand, to be possessed of some little skill in the manipulation of bees and the interior of their hives; or at any rate to be one who is ready and williug to learn.
There are some persons so circumstanced that the inconveniences attandant on natural swarming-the necessity for keeping a watch on the hives for days and weeks together, and the difficulty of having the swarm properly hived during the busiest part of the day-are so great as to render the keeping of bees to them
almost impossible. There are mome labouring under these disadvantages who will nevertheless have thei apiaries. By attempting to prevent the issue of any upply, Working their hives for honey alone, and oceasiong any deficiencies in their numbera by the keepers contrive to rub ols, having, bowever, continually to bear the disappointment of finding fine swarms to have issued and been lost from their best colonies. know one beekeeper who, last summer, thus had tin
lament the loss of six swarms, the majority of which emigrated from hives which were filling large supers, and which had abundant space afforded them.
It is doubtless known to the majority of our readers that the same egg which, if deposited in an ordinary workercell, would become developed into a common worker or neuter bee, will, if deposited or nurtured in a royal coll and by a different course both of treatment and of food, diffe transformed into a creature possessing very different functions. Acting on this knowledge, a queen may be removed from a hive, leaving no royal cell
whatever, in course of progress or othervise. Provided there is comb containing eggs, or very young worker arvs, the operator need be under little fear for the loss of his stock, always supposing that drones exist in or near his apiary. On discovering the loss of their queen, the bees usually become very excited, rushing over the combs, and in aud out at the entrance of their
hives. Gradually the excitement cools down, and they proceed to the adoption of measures for rectifying the great loss they have sustained. Some eggs or young grubs of suitable age are selected, the cells adjoining which are torn away, and remodelled into those suitable for royal larvæ. Food, which varies very considerably from that which is supplied to worker larvæ, is profusely given, and in a much shorter time been allowed to been the case if the worker grub had been allowed to be developed into a neuter, a perfectly ormed princess emerges from one of the cells. Why character, should thus effect such a marvellous change we may not, if we could, now stop to consider.
The scientific operator in bee-culture will not always choose to wait for the chances and uncertainties attending natural swarming. He sees a way of ncreasing his stocks to an extent utterly impossible by following the old system. To carry out the principle of artificial swarming to the greatest advantage, however,
the bee-master must have his hives constructed with the bee-master must have his hives constructed with noveable frames or bars, by which the interior can alway is very important that every frame or bar shall fit any place in any hive in the apiary. In describing the necessary manipulations, it must be borne in mind that we are now speaking of hives managed on this principle. be taken from common or other hives.
We may be supposed to have a strong colony in a frame hive, A, from which it is desired to force an artificial swarm. On a fine day each comb is lifted out and examined, in order to discover the whereabouts of the queen. When found, the comb, with her majesty, and the bees adhering to it, is placed in an empty box, B. The combs in A are brought together, so as to
allow of no empty space in the centre of the hive, for a rule, queenless bees are very apt to construct drone comb, which, in that situation, would be decidedly the stand of A prosperiyges the returning placed on old stock A is removed to a distant garden at once; or having confined the hees to a cool dark room for newrs, at the end of this time it may be located in a new position in the same garden. The bees, after the
discovery of the loas of their queen, will soon come
mence the formation of royal cells, usually fixing on very young grabs for the parpose. In 12 or 14 days "queen arrives at maturits, and on gaining ber liberty in the other eadeavours to destroy all her rivala vigilant, calk. The careful operator may, if he be timely removal of the superfluous royal celle, and these may be made available in the formation of other artiticial swarme By the adoption of this system a great
saving of the time and rosources of the hives deprived of queens is effected, and an astonishing number of warms may be matle.
The following plan will, if carefally carried out in all its details, be found very successful. Some manll boxes are provided, capable of co:ttaining four of the same frames or bars only ; these are styled nuc'eus boxes. Astle smoke may the pufter stock hive is taken of (a viously, if liked), a side comb is first extracted, and examined to see that the queen is not on it; this comb put down by iteelf. The nezt comb is taken out. suitable age, is slipped down into the brood ualy occupied by the frame firat remo-ed. When comb suitable in every respect is found, vigilant search muat be made to ascertain if the queen is on it If not to be seen, it is advisable to look through the stock until the queen is discovered, so as to be certain with the bees clustering on it, is now placed in the nuelens box, and a few hundreds of bees, chicfly very young ones that have not yet taken theer first flight abroad, are brushed off some of the cambs into the nucleus. Two comba, either empty or contnining honey, are added; the bees are confined, and the box takien within doors until the evening. Proper ventilation must be afforded to the prisoners. Thin nucleus may atand in any position in the apiary. As in the former cass, an empty frame mast be given to the ofd stock, the place of the comb removed or may occupy the side, the others being pushed up together.
The nucleus should be examined in a few days, for the double parpose of ascertaining whether royal cells have been commenced, and also if there be a sufficient population. If the bees are very few in number, the same stock may be visited, and a brood comb, in Which the young bees are in the act of emerging from the celle, may be selected, which, with the bees clusterng upon it, having again ascertained that the gueen is not among them, is aidded to the nucleus, and placed in jaxtaposition to the brood comb "previously given. bees may be brushed brood comb being inserted, the rames, and the whole confined for a few hourn. When the royal cells are sealed, if there should be more thin wo constructed, the surplus may be carefully cut out nd fresh nuclei formed. To effect this a comb conaining brood in an adranced stage of development is selected. An aperture corresponding in size to the ells, is cut out, and the lutter carbedy ryyal cell or the utmost caution not in any way to bruise or injure the cells containing the royal embryos. Bees must be obtained as before.
It will be obvious that a great saving of time is thus effected, as the queens in the two nuclei will issue orth nearly at the same date. Or these superfluons royal cells may be advantageously used in being fixed as in the caves from which the queen has been removed, plan to raise nome royal cells in a nucleus prior to any general making of artificial swarms, as an immense help is afforded to the colonies deprived of their queens by substitating sealed cells from which the young princesses are nearly ready to emerg
or return the queenucleus bozes. These small swarms, is soon as the queens begin egg-laying, may be shifted
into boxes containing seven, eight, or more frames or bars, and again strengthened with brood combs from any hive in the apiary. No adult bees should, how. ever, be added, or the lives of the queens may be put in jeopardy. It is desirable, when possible, that a frame containing empty worker comb should always be slipped into the space from which the other was removed. The old queen will usually, in a very few days, have filled the empty comb with eggs. Thus are her enormous powers of fecundity encouraged and
stimulated to the utmost. This mode of procedure that is, of raising queens in nuclei, and gradually building up the diminutive swarms into populous stocks, has been found very succeesful, and is by no means difficult of accomplishment with hives suitable for the urpose.
It a swarm of considerable strength at starting is deaired, the object may be effected by removing half the frames, with the queen and clustering bees, which are placed in a second box. One of thess is allowed to to a cool dark place, or to a garden at least a mile dis. tant. Care must be taken that each division possesses a sufficient population to properly cover and nurse the brond, or a great deal of it will be sacrificed, prohably to the permanent injury of the hive. This rule must always bo borne in mind by the operator in the forma which artificial swarme may be made, but they need not now be particularised. Enough has been said to explain
the rationale of the syatem as usnally carried out with he improved frame or bar hives, Nay we most success to explain how artifial swarming ofth ordinary hives and
fully fully
boxes.

\section*{Miscellaneous.}

Cultivation of Broomrapes.-About ten yenrs since Herr Tittelbach published a pamphlet in which lie of Orobanche. He has enntinued his experiments since leaving Schooneberg for Berlin, and he now informs us that the seeds of annual species must be sown at the same times with those of the plants on which they are parasitic, or a short time after. Thus, for example, the seeds of Orobanche ramosa must be gown with Hemp seed, those of O. Ricridis with the seeds of the Ox tongue, \&o. The perennial species succeed, if the strong roots of the mother plant are exposed in autumn, and Durien du Misismnenve, direetor of the Butanical garden at Burdeanx, has equally succeeded. The peremia species furm the first jear a sort of scaly bulb, filled with nutiitious matter, which produces the spikes of flowers the following spring. Orobunche Hederm, which has long heen culcivated at Paris, afford a good example. Several species also are cultivated at Lituvain. The young plapts are at first indepondent, but soon cultivated ins pots it is well to scatter the seed principaily in the circumference of the pot, whence it is wasbed down to the roots, which rum eapecially over the inner surface, La Belgique Horticole, June 1864,
Wow Kind of Gunpowder.-We learn from the Artillery, bas recently paterated a now bind of gun powder, which possesses some remarkable peculiarities. It consists principally of wood reduced by very ingenious process to very minute cylinders or grains, and ateeped in a solution of nitrate of potash and nitrate of birytes. The explosive effect of thin new powicr is stated to be as great as that of gun-cotion while it does not possess the great disadvantages of the latter substance.

\section*{Calendar of Operations.}
(For the ensuing vopelf.)
A HOTHER week of uniformly fine weather has had a highly invigorating effect upon vegetation, causing deoiduous trees to progress comsiderably towards leafing, and Almond trees to push suddenly into full flower. Under such circumatances wall trees will require strict attention in the way of proteetios. It not alrealy done, half har.ly shubs must now have any remaning purtions of wintor covering still on
them removen. duy dead piecos of wood nay also be prumel off, and everything oonneoted with them ren dered neat and clean.

\section*{ploweb garden and plant houses.}

Bonides the permanent ppeolmens in Oonservatories, many choice plants in pots will be required to keop a succassion of gay flowers throughout the summer Amumast the finest for this purpose are Brugmansias Erythrina Crista-galli, Thunbergins, Achimenes, Ipo mœав. Heatha and Pelergouiums. Let these have all possibie attention, and bring thein forward in severa ats, so that one set may succeed anather.
Achimenes, - A suacession of these fatended to flower late, should now be placed in heat. forme of those of former suceessiops may be potted for hanging vasea, tor which A. longiflora and cupreata are particuilarly adapted. Pans or broad shallow pota are preferable for their general oultivation, and, as they require flower, lat the drainge be very perfeet, that they may be freely watered without runging the risk of stagnating the aoil.
the harily varietios of sould now the more showy of places, which ustally exist in herbacons beds and in the edges of clumps and borders in the Shrubbery
Brddina Plants.-Lose no tiwe in potting uff, of prieking out into frames or bozes, young entrings as soon as they are sufficiently rooted, and seedlings a soon as they will bear handling. As the potted of be gradually inured to the open air. The hardier kinds if in puts may be set upou a bed of coal a hese, or plungel in the open air, and protected at night by ther light mater if plungen in old tan, ashes, or some will be saved, and the plauts will be in a better state than they otherwise would be when the plantiug out The mont economical plan however in to plant them out in framee, and, at tho proper seacon to remove them to the beds with good belle of sofl Ctteahed to them.
Cavilulas.- Plants which have just done flowering
should be kept a little warmer than usual till they have morle their wood and set their flower-buds. A. growing then of \(\mathrm{n}^{\circ}\) will suit them while they are require repotting or bottom-heak. Whether they impection; but if they are mot repotted, a little weak
guano water given them no
to prove of service to them.
prove of service to them. Dolyanthoses.-As soon as these and Primroses
have done bluoming, they should be removed from the beds, of which they have been the ornament, in order that the ground may be prepared for its summer order that
crop. The plants which are taken up should be parted and planted in some nice loauy soil in the parter and plante gatereden, and shaded with evergreen reserve garden, wates till their roots are re-established; in this ituation they will prepare themselves for a repetition of their duties next spring. Those who do not posseas a stock of these useful plants cannot perhaps commence to get one together at a better time than this.
Trorfolems and Convolytucses.-It is a good plan sow Tropeolum aduncum or Canary-Hower, Couvoltulus maior and some other half-hardy climbing annuals, in a frame, in such a manner that they can be easily in a frame, in such a mannent situations at the usual eason. The best method is to lay some tarves into the frame, with the grassy side downwards. After beating them till quite flat, the seeds should be pressen into the smonth surface, 2 to 4 inches apart, and chen covered with a little light soil. When ready for moving the borders, cut the turves with an edging-iron into mall squares, containing one, two, or more plants in arh. In this way they will experience little or no chock, and will start into the newsoil with much greater reedom than if they had been confined in pots.
Violets.- These are cverybody's flowers, and therefore well worth a little attention. A frame of light rin compost, consisting of loam and leafmould f their the phade of a north wall, should be prepared are more easily preserved from the ravages of red spider, which will certainly attack them if thay are exposed to scorching sunshine. In this frame the offsets from the old beds should be planted about 4 inshes asunder, and the sashes placed over them till they have begun to form new roats. The best varieties for indoop ar are the Neapolitan and the Tree Violeto

\section*{forcing garden}

Fras.-These require an abundance of air, with free oxposure to light; and without these essentials, plentiful crop of geod fruit need not be hoped for. moist atmosphere, nud a liberal supp!y of water to the oots are also necessary; and if the roots are confined within rettonable limits, every alternato watering during the swelling of the fruit should bo of liquid manure. As the fruit begins to ripen, however, the atmosphere should be kept rather drier, to prevent its rotting; and in damp dull weather, sufficient fire heat should be used to permit the superabundant vapour to esoape. Let the later suocessions be brought on gradually at ferst, in a temperature by night of from
Melons.-Drcessive molsture mist be carefully avoided during the setting of the fruit; and as it is an easy (matter to thin the latter after all danger o damping is over, it is a good plan to allow more to se than will be ultimately wanted. Remove the blossoms as soon as they fado, and do not allow more male blossomis to expaud than are required, as they tend to weaken the energies of the plant. Seeds should now be sown of some of the best kinds for preserving
Peaones.- Let all very vigorous growths be stoppe soon as they have made six or eight leaves, in orde to divert the flow of sap into the weaker shoots Avoid a bigh night temperature, or the fruit, thoug ripenel considerably earlier, will be obtained at sacrifice of size and flavour.
Pines.-K \(\quad\) ep up a brisk day temperature to frul Which in now swolling, and admit air freely, so that circulation may be produced. If the latter be not attended to, the plauts will grow weakly, and have an unhenlthy drawn-up appearance ; and, with regard to Iruiting plants, the orowns will increase in size, instead of the fruit itself, which will be watery and deficien in flavour Take advantage of every fine afternoon to ywinge the pite, and elose them for two or three hours before sunset. Remove all gills and useless suckers, that the whole ouergy of the plant may be occupied in perfeeting the frait
Vinks,-succeasional Vines which are just starting may be indulged with a gond heat, and "particularl Muscats which were ripened late last year, as the woo of such is not generally so well matured as that of the earlier foroed Vines; and unlens they aro encouraged by a temperature rather higher than usunl, until thel blossoms are failly set, the shows for fruit, however strong they may be to all appearance, not unfrequently prove abortive. Attond puactually to the stopping and training of the ahoots, and thinning of the berrie ou the Vines, in the earlier stages ; maintain a moist atmosplere by evaporation where the berries are swelling, particularly in fine clear weather like the present, but this must be moderated as soon as they begin to change colour, and air must be more freely given.

\section*{hardy pruit and hitcien garden.}

Lime is well known to be useful for destroying snails and slugs; it is, however, not always at hand in a quick state. Cinder ashes riddled to the size of Radish seeds all dust being excluded, will therefore be found a good substitute. These strewed over young erops when just efficient protection, A handful of good to bo an
prove to be a ready mode of manuring a weak Beans. - Put in succession of these as requied let few French ones may also now be sown on a border
Leers.--These are fond of moisture, the therefore, for this crop should be double dug 18 us inches deep, and the manure laid into the bott the treach, which should be previously lo fork.
Onions.-In most places young crops of these be fairly above ground. The soil between the ? hould therefore be well stirred, an operation whit may now be performed with advantage, ground is comparatively dry
Raspberries.-Thin suckers from these as earis can be done, leaving four or five to each stool SpINACH.-Sow mome round Spinash for succe. Stpawerpries
and planted with -A sloping bank should be prepres as soon as they can be obtained for fruiting in tember and October ; plant three in a prateh, at in'er covered with slates when the plants are establishet

\section*{The สgricultural Gatette．}

Is appropriate connection with Mr．Winkiss＇s amusing letter on Agricultural Education in another column，and also appropriately in con nection with the seed time ot the jear，we give the fullowing Table of numbers and weights of grains，Clovers，and Grass seeds．For the samples of Wheat，Darley，Oats，Rye，Beans，Peas，and Vetches we have to thank Meesrs．Lawson，of Edinburgh．For the Clorers and Grass seeds we have to thank Messrs．Sutton，of Reading．
It will be seen what great variety，almost as two to one，there is in the uumber of grains of Wheat to a bushel．A considerable variety oxists also in the samples of Oats examined．There is in ordi－ nary farm praotioc，neverthelem，in general，so much of unreasoning routine that the same number of lushels of seeds are thrown in per acre－with－ out regard to the double of half number of seeds which those bushels may contain．These differenors explain to us the extraordinary dis－ crepancies existing between the following Table and those published by Mr．Rewder of Plymouth，Mr． LAWSON，and others，giving the number of seedr in a pound of some of our commoner Grasses． The figures given here are unquestionably true of the samples we have received now from Messrs． SUTTON，and the differences between them and those already published in our culumns，ought to make the practice of seeding land more a subject for thoughtful oonsideration than it is．The same formula may，according to them varieties and disorepancies，bring forth double the number of plants in one case as compared with another．
Of course we are not going to recommend any alteration in the practice whioh has hitherto been found successful in laying down land to Grass－but it startles the reader to ind that the bushel or two of Grass seeds and 10 to 12 lb ．of mixed Clover，which he is directed to sow for that purpose per acre，must Renerally contain at least \(30,000,000\) seeds，or 5 of 6 to every square inoh of the furfacs sown．Surely it should be possible so to deposit the seads of the plants we grow as to enature the growth of a larger proportion than can at
present germieate under the existing plen of cowing millions of eeeds par care．

The followiog are the figures we have obtained by connting：－

We give the utmost prominence to the folluwing letter on Agriculitural Entcation by Mr． Ilson，of Edington Mains，Berwickslire．
Mr．WILson is one of the foremost of Scottish agrioulturists－one who has taken perhaps a larger part than any other in the discusaion of suoh ancial queations as properly come before agricul－ tural sucietics－and no ono is betier knowa or more hiphly eatoemed in the agricultural world． It must certainly strengthen tho cunvictions of those on the Council of the Royal Agricultural Suoiety who have signed the well－enalderel rrotest published last week against the couree regarding education whivh the Council has resalved to fullow，to find that the leading agrioul－ turiats of Eagland and Sootland are unani－ mously with them，so that even where there is the strongest disposition to louk on sucial well－being as having a hisher claim to our regrards than nere rofessioual status，men like Mr．Wilson，of Edington Mains，are in entire agreement with them．＇Yhe fulluwing is Mr．Wilson＇s letter：－
In this diatrict the usual practice of farmers has beon to send their boys in the first place to the parish schoole， and then－say at 10 years－either \(t_{0}\) sime che of the boarding schools or frammar schools which are to be
found in most of our provincial towns，or to Eilinburgh， found in most of our provincial towns，or to Eilinborgh， where，as you know，there is ample choice nf excmmen with writing，arithmetic，and gengraphy，such boym are usually taught Latin and Mathematics，and frequently Frencls or German．Thas the time is occupien untal the are of 14 to 16 years，when a few are sent for a session or two to the Ediaburgh Univeraity；but the majority are put for two or three yoan into iome counting－houne or chambers，where they may acquire a knowledge of accounts and of actual business，and where they are subjeated to the wholemome discipline of constant acoum pation during full and regular hours，and of prompt
obedience to the orders of superiora. The places of business selected for the purpose are various, prefereuce seems to be given to the chambers ond, where the whole accounts and business involved in the manage. the whole accountranety are conducted. Many youthis ment of landed properts branch banks which are now to get into the numerous brauntry, and many more into the counting-houses of grain merchan's, manure actories, and similar places. After a couple of years or so spent in this ;way the young meu either go home to assist their futhers on the farm, and so to get their practical training, or it may be they are boarded for awhile with oome farme.
Although I can remember many farmers of a past generation who were ns well educated as any that 1 see around me, and many who had earned a prominent social position by their energy and success in business, still there can be no doabt that the facilities for obtain ing a liberal education are far greater now than here tofore, and also that they are mose generally taken advantage of in the farning community than at any former period. It is right also to say eo their day who are conducting their business in a style not hitherto equasled, and who in social habits must excel the eneration that preceded them. Let me also remind you that there are important means of professional ednention now available through agricultural periodicals and associations, and the facilities of travelling by railways which are peculliar to the present generation. The elfects of these can be seen every day in the rapidity with which any improvell agricultural practice is made known and generally alopted now.

Such, then, is the mode of general ellucation and professional training which intelligent and observant farmers, availing themsolves of such means as are at their command, have been led to adopt for their tons, b in the main a successful mode. But in rny humble opinion it would be a decided improvement if our young farmers lad the benefit of spending a couple of years in some well-equipped agricuitural collegeo The fite at
time for such a course would probably be after two or three yeara had been spent on the farm in acquiring a thorough knowledge and expertness in its various opera tions. I cannot agree with those who think that our such colleges; but I do think that they can and ought to give efficient aid in calling the attention of farmers o the value of that professional training for their sons which such institutions afford, and in encouraging them to take advantage of it. Let it once be known that
there is a demand for such education, and the means for supplying it will not long be wanting. Holding these views I cannot but deplore the course which a party in upon. They might do munch for agricultural progres by urging and encouraging the more thorough profes They are about, Ifear, to dissipate the funds and influence intrasted to them for this purpose in a futile
attempt to farther common school education. John Wiloon, Edington Murins, Bervickshire, 4 pril 10, 1865.
Two excellent lectures were last week given by Professor Colmaman, late of the Royal Agricultural College : the one on Grass land improvement before the London Farmers' Club, the other on Cattle Foods before the Society of Arts. Both of these are topics just now claiming the special attention thus given to them ; for on April 3, when Grass lands were the subject of discussion, the lecturer might have said that never bad the pastures of the country been so bare as they have lately been; and on A pril 5 the cattle food discussion might have been introduced by the assertion that there is at this moment less food for live stook in all the Southern and Midland counties than has ever hitherto been known. The half hay crop and soanty green crop of last year have been far earlier consumed than usual, and straw and purchased foods have accordingly had a much larger share in the maintenance of cattle and sheep than ever hitherto. No one is better qualitied than Professor Colbman, by practical as well as soientifio knowledge, to treat this subject nsefully, and we accordingly bave in the Journal of the Society of Arts (April 7) one of the most instruotive papers that has been ever written, on the aotual and relative serviceableness of different foods, both home-grown and imported. We hope hereafter to give the substance of it in our columns, and meanwhile we extract two or three short passages of immediate interest:
1. The Palin Nut Kerinel Meal is a gritty nueal, of a brownighWhite colour, with black specks, which are portions of the
arin of the lut. The fatty matter maybe seen by rubbing a
portion between the fingers, aud is evident to the taste, it haviag rather a nutty fiavour. Mesides containing from 20 to
25 per cent. of a wery feeding oil, we have 15 per cont. of fleshforming materinal-about equal to good Barley meal flosh-
15 per cent. of wrody fibre, and a considerable amount of ash. Which, when noized with uther materials, will prove ail
economical food, and this view has been fully confirmed by
practical experience. It has been tried for catile, shee ald pigs. The effect on mili it remarkabie, increasing the quantity
\(\underset{\substack{\text { 2nd } \\ \text { hnd } \\ \text { hare }}}{ }\) apocially the richness of the produce without affecting
have used it of the butter. The dairgmen in Leicestershire
reason Cæsar did there were none. not me coudition of its inhabitants at the the country and by the Rowans, would lead us to suppose slieep in a domesticated state, could hardly be supported. The ancient Britons are described as in a state of semi-barbarisin; wearing little And such rare instances as exist of surviving ve
their raiment, show, accor.ing to Dr. Bird, material of which it was made was not wool, Althougis the sheep has been the companion but \(b\) all ages, yet do we not discover that it has bee domesticated by men in such a condition
viliz ation as the aucient Britons lived in.
In England, then "a forest island" without draiman and in many places a morass, the sheop could
have flourished, and to give an idea of the enemia in sheep must even in the 10 th century have had quote the following lines:-

\author{
The sallow kite. \\ With swarthy raven \\ And the hoarse vulture, \\ The consume his prey, \\ And that grey beast, \\ The wolf of the weald."
}

Anl Buffon's remarks would induce the same clusion:

\section*{"Nevertheless, if one considers the weakness and stupidis
the sheep; if one reflects at the same time that this ant
without the means of defence, cannot even find mady without the means of defence, cannot even find mfoty
flight: that it bas for its enemies all the loensts rif jin-
which seem to seek it by preference, and to devour it
satisfaction; pnd besides that this species is not very producher satisfaction; s.nd besides that this species is not very produchic and that each ind to imagine that from the begnoning
shall bo tempted
sleap was cmanded to the guardianship of mian-thit it
his protection in order to subsist, and his care to man since in fact we find nos wild sheep in the descrts when 1 .
does not govern, and the lion, the tiger and the wolf reinn ly ', does not govern, an these animals of blood and carrage lise mod and cruend multiply much more than sheep; and that findly
lif we abandon at the present time in our land, the numenoun
if flocks of this species which we have caused to multiply s
greatly, they would soon become destroyed before our yon
and the entire species annihilated by the number sad wont and the entire}

These considerations, it is presumed, are enought how that the then inhabitants of our island had not th same uses for sheep as a more civilised people would herf. They made use of the flesh of swine and cattle as food and those who did use raiment covered their bo with skins, and thus the sheep was not required cithes for its wool or flesh. The state of the comerty. abounding as it did with wild animals, "the bear an the wolf, and beavers," * the enemies to sbeem its condition as a forest or a morass, and what is o reater weight, the fact that no bones of sliee are found in the burying places of the ancient Britom must go far to prove that if any sheop existed in thi country at the time
However, after the Romans, "the civilisers af ord" invaded this country and introduced the atr and luxuries of life, we soou get evidence of tho conclusive kind that sheep existed and were valul as they always had been, by civilised peope u abuep factured at Winchester and Gloucester by the Sonm. Indeed to such an extent, that at Crencester, Tram informs us in writing on Cirencester informs and to the good coudition and tention was paid to the good condition by the pro prietors of the adjacent houses; carriages witn to burdens were prohibited, and nothing thrown out before the shops, except a fult cloth out to dry." (Fosbrooke's Translation.) statement shows the importance and anch comonent clothing trade at Cirencester, of thio Christian en probably early in the first century of tho sheep esitit From these facts it will be apparent that su in this locality at this early date, and this is prian the earliest information wo
the sheep in this island.
Having thus proved the early existence of thace th the Cotteswold hills, one would hinis is mati history from thil early period; busiderable difficulty, for at this time of war considerable difficulty, for higher moment desolation even matters
chronicled with accuracy.
by ascertaining the state
favourable or not to the growth of the sheep; knowing the tastes and habits of the inlabitand lived in that locality, as well by tracing the of sheep and the establishment of the art of mand turing the fleece, get proot more conchatful his depended upon the assertion of one doubtral
If we take for granted that the sheop, domesticited animal of the ancienits origin quarter oit the globe may we look for its orig circumstances that point to their importatio the Phonicians, or somewhat later, w the most probable, by the Romans ; and wear present improved Cottesword Camden says England to the original type.

253s, a fat wether
From these prices it will be seen sheep were what
appears to us exceedingly low in price and did not of popul that attention which they, with the increase Having, we have subsequently done
Having, we think, shown that sheep have flourished the very seat of the the history of this country on sheep, and indicated their probable origin, it is neswold taais to follow them from this period unto the present
time. Until within race or breed was anknown. The scientific breeding of fundamesticated animals was not discovered. The improvement of the of all succensful efforts in the dnces like," was not known and the hereditary proappeared to acquired habits would doubtless have Will be hereafter shown, the sheep of the Cotteswolds the early date conspicuous notice either by their wool, in the district, or the early \(u\) anactures were established their wool, more (particularly after the of the sheep or It may hany other sheep in this conques.
 Fold district ate to the existence of sheep in this Cottesof this country. on the Cirst pla
are almotteswolds, new and impomains which abound lated mont yearly discoyered shortant sites of which founded bere. To buch a people, adranced in civiliss
tion to far bejond whith the Romans ande, theep for their wool and flesh wnient Britons soil (for it was here cleared to whilat the nature of the many parts of the country), would have allowed them in
ample range, and lying high and dry, whilst the country was mostly in the state of a forest or a morass,
would have provided sanitary conditions that would have given the sheep a place of healthful existence Even at the present time, although the country is cleared, enclosed, and drained, sheep cannot in some places be kept because of the disease called the rot. Thus we have the most important and indirpensable requisites for sheep flourishing on the Cotteswolds at this remote period in a people that knew their value, both for the raiment their wool would give, and also for their flesh for food; and the locality was suchs as permitted the healthful existence of this animal.
Accordingly, writes a most trustworthy authority, "there is abundance of historicil evidence to prove that Gloucestershire was the earliest trading district for native wool in England. While London was only
bargh, Gloucester and Winchester had become importarit cities in consequence of wool and other traftic being carried on. Gloucester had its trade companies one was established in London. There is no doubt that cloth making was carried on at Gloucester in the Saxon era, for the Saxons chronicle that when royalty and its attendants visited Gloucester, the citizens presented the King and his nobles with clothing of their own manufactare, a fact significant as illuatrating the advanced state of local trade at that early period (Goding). J. M. R.

AGRICULTURAL EDUCATION IN ESSEX.
There canuot be a doubt but the education of farmers is very inadequate to their requirements; and that consequently the farm lands of the United Kingdom produce the very wretched returns they do of Wheat, according to the inquiries of Mr. Cuird a little over 10 -fold, but whichever was nearer the mark, it proves, as clearly as figures are capable of doing, that the British farming of the present day is as low as it was in times past. And my own convictions are, that if farmers were adequately educated, and trained to their profession as other men are to theirs, the lands of Englaud would be made to support all the inhabitants of England, but from a lack of such education and training, if it were not for the manufac turers by means of commerce exchanging their manufactured goods for foreign.grown corn and other articles of food, England with all its wealth would be neariy
depopulated by dearth and famine ; of this there cannot be a doubt in the mind of any man who is capable of thinking on the subject.
I am aware that comparisons are not plessing, but compare the education of a manufacturer with that of a farmer, and the professional training of a manufacturer with that of a farmer, and it will at once be seen why the former makes the princely
fortune he does, and why the manufacturers, as a body, can eupply all the wants of the world with their goods, whilst the farmers, as a body, cannot supply
half their own country with a sufficiency of bread But we hear continually speechmakers and writers lauding up to the skies the wonderful perfection to which farming in England has now attained, a perfec-
tion which produces 9 buskels of Wheat for every bushel of seed sown, and which enables farmers to allow the essence of the manures they make in their own farmyards to run into ditches and brooks, and ton for foreign manuren, the best of which for a per manency not being equal to their own; and much that they purchase, and at high rates, not being worth carting on their lands; and many other proofs of perfection might, if space permitted, be easily produced. But their sons to the best echoole, pay reasonable terms for their education, which is always a liberal one, and then, when their schooling is finished, the boys are placed in the factories and practically learn to perform every operation their business requires to be done-or such was the training those received and underwent Who have been chiefly the means of raising the power given them the overwhelming inflaence in the State which they now possese, guiding and controlling almos everything; but of this to give one example only, namely, Mr. Gladstone, who in his own single self Las the power of taxing all his fellow-countrymen, and to any extent he pleases, and as to the farmers, so completely has he all of them in his power, that they dare not even use a quarter of Barley of their own growth without first putting into his budget the sum of he dares not attempt, or through brotherly affection he does not attempt, to make the manufacturer of woollen cloths pay the same sum, or any adequate one, before his cloth is made into a coat, or the cotton manufacturer before his wife has a gown made of the calico he makes No such thing - but why does he not? because with him the tool each uses is the same, namely, edication; and so with them it is, if you tickle me, Toby, I will tickle you; but Mr. Gladstone will not tickle a farmer unless with a currycomb, or mome instrument of the same

Bat why not tickle one as well as the other? or
case, olher? The remoon is transparent in the latte to and it is this: because he dares not; for were he to carrycomb the hides of the manufacturera, or eren attempt to do so as he does those of the farmera, he would not be Chanceilor of the Exchequer 21 hours afterwards.
It is quite clear, therefore, thet it is odacation in general, but not always, but in general neverthelens, that lifteth men from the dunghill and setteth them among princes, or it has been education that has enabled commercial men and manufacturers to pomens the almost despotic power they now do in the affairs of our country, and it in the lack of it which renders farmers oo mere cipters, and in reality to have no power in the state at all. But have not farmers-and here I mean both laudiords and tenante, but chiefly those who live by farming, and not those who character, and juctions-have they not a higher character, and justly so, for general intelligence and improved conduct than they formerly had? Most
but this in tweso respects they are very much improved but is the conceqen caused by improved education the age in which we live, and this extends through all ranks of men, from the highest duwn to the lowest, or if there be an exception, it is in the lowast. Thus in iny remembrance a drunken country geutlemaus wa not very uncommon, but now one is very uncommon, Indeed so much so I do not recollect the time when by wine man in the rank of a gentleman intoxicated by wine; and the same may justly be said of farmers, tuan whom a more nober race now scarcely exista, and as to their labourers, judging from those of my own parish, they are nearly as sober as their mastere, as I ave not seen a drunken labourer in my parish for several years; but when I first came to it most painful were the druaken neenes I had continually o witness.
But still these happy effects liave not been caused by auy improved education or training among farmers and their sons, but from various other causes, and I will mention two, but them only. Thenew poor laws bring farmers as guardians into the company of well educated gentlemen, magistrates, and clergymen, and athers of that class as \(x\)-officio guardians, and this co-mixing at least once a week with the well educated and imperfectly educated ogether, and the polished manners and less polished, must have a very excellent, general effect onsociety atlarge, and enpecially on farmers, who in the country are in general guardians. Railway travelling, aloo, in my opinion, has in the same way a very beneficial effect upon the middle ranks of society, as by it those ranks see much more of polished society, and are brouglit into more social contact with it than they formerly could be, though it may at the same lime rather tend to the levelling But; but still on furmers the effect must be beneficial. But still the education of farmers, and their training for the profession they have to follow is, in my opinion, woefully defective. For example, what is the oducation of their sons? Just the same as is that of boys in union workhouses and national mehools, and very frequently not so good, as they are taught nothing more than boys in such schools are taught, and in general what they do learn is not so perfectly. And when farmers' sons leave school and return home, what training have they to fit them for then profession? None. Formerly, 30, 40,50, and more years since, the sons of farmers were sent into the fields with the labourers, and there practically to learn the varions see a farmer's son at be done on a farm ; but now, to mowing, is a rare sight indeed. But manufucturers? sons are compelled to practically perform every opera tion required to be done by them, just as the operatires themselves are. A divine, barrister, lawyer, physician. surgeon, \&c, must undergo a severe training before he commences to practise on his own sccount. But all the preparation a young farmer receives is to follow in the track of his father who had followed in the track of his father, and so on until you get back to when Adam delved and Eve apun, or to that enlightened period when we are told gorillas and not men cultivated the earth, and when the pre-Adamite drag was the improved machine wherewith cereal and pulse seeds were put into the ground. But to give an ex ample or two between the training of manafacturers and that of farmers, if yon mek boy of the former soon after he has left school how mauy cloth which his father makes, he will at once inform you; but if you ask a young farmer how many seeds of any kind of cereals or pules, you might as well ask a young man-milliner, for the boy had never thought about it, and all he knows is that his father puts in baskels or sacks of seed an acre; but how many seed these bushels and sacks will put into each square foot of ground the young farmer again know no more than the young manemilliner, or the gorilla farmer did, whose fore fathers, according to the Development theory, were the only husbandmen the earth possessed until acident rubbed off their tails and reduced their feet into hands and they becamemen, invented the preAdamite drag, which until lately was a tool in great vogue in a certain part of Gloucestershire, and by which a man is enabled to get into the ground seven found to beed than men of common inteliects had Wilkiws, Wix, near Manningtree.

PAINLESS EXTINCTION OF LIFE.
Ir you will have the kinduess to permit une a little space, I should like to make a few notes upon the letter of my friend Mr. Hibberd. Mr. H. says: "That the eating of blood was prohibited by that law in these most tue, bat are we we are not; and if Mr. H. will refer to my letter, he will perceive that I took my stand rpon bigher ground than the Mosaic lav, ard quoted the command as it was given to Noah, 857 years carlier than those repetitions of it we find in the Levitical than ; and as the whole human race were included federally in Noah and his three sons, it is only fuir to federally inde that whatever injunctions cr commands were laid upon them, were intended to be binding upon the whole of their posterity. The positive nature of the command, given as it is without any kind of qualifica. tion, precludes everything in the shape of hestation as its reception an a Divine command; and its unmistakable plainness is such, that there is no room left for equivocation as to whether we will receive it in its entirety, or not. It may be remarked, that all the more force attaches to the command, because it seems to have been the only one given on the occasion, and sure He who gave the permission thing for food, has the most perfect right to accompany this permission with the adjunct, "But flesh with the life thereof, which is the blood thereof, shall yo not eat," without having either the reasonableness or goodbe remarked, that the command forbidding the eating of blood is analogous to that by which the first buman pair were forbidden the use of the fruit of the tree of command resalted in such woful consequencea. That the breach of the law forbidding the eating of blood is not lightly estimated by Him who gave it, we gather
from Leviticus xvii. 10, where, although the offence is not made cognisable by any human laws, He takes the case of the offender into His own hands. Hence we find, "And whatsoever man there be of the house of Israel or of the strangers that sojourn among you, that eateth any manner of blood, I will even set my face against that mool that eateth blood, and will cut him off from among his people." In whatever the sin of eating blood may consiat, it is certainly not a sin by a man against his neighbour; there seems to be great wisdom therefore in the arrangement that God shonld deal with the
delinquent himself, and are not His eyes still "open apon all the ways of the sons of men; to give every one according to his ways, and according to the fruit of his doings." (Jeremial \(x \times x i 1.19\).)
For the purpose of encouragement, I think it is at present unnecessary to mention the repetition of the
command as given to the Jews, further than to say, that as they were selected from among the nations for the purpose (among other reasons) of showing an example of perfect obedience to all the requirements of
God's law, in contra-distinction to the idolatry and general depravity of the surrounding nations, it was upon their attention. Hence we find, that there might every moral precept (as well as every ceremonial direc tion) was committed to writing, now for the first time, and the Levites were commanded to bring them periodically before the attention of the people.
I therefore paas on to the New Testament phase of the question. My friend Mr. Hibberd sayg, "As for sent the remaining prejudices of Jewish convertsnothing more." If Mr. F. will refer to Acts Iv. he will find that the subjects brought before the attention of the assembled Apostles appear to have been lengthily, freely, and calmily discussed, and the result he will find to be that the converts to Christianity were entirely exonerated from the observance of every merely Jewish
observance. But let ud note what really was said and done there. Peter said, " "Now therefore, why tempt je God to put a yoke upon the neek of the disciples, which neither our fathers nor we were able to bear? * *" After Barnabas and Paul had spoken, that we trouble not them, which from among the Gentiles are turned to God: but that we write unto them, that they abstain from pollution of idols and
from fornication, and from things strangled and from blood." Mr. 'H. Will not Bay that the two first items in this sentence were not moral obligations Gen. ix. 4., shows the fourtil item to be of equal obligation, and, by parity of reason, the third also, although not expressly mentioned to Noah. And, further, we find, that when the Apostles did actually Write, so anxious were they to impress the minds of the converts that their salvation did not depend upon the obwervance of any merely Jewish rite, that we find seemed good to the Holy Ghost and to us, to lay upon you no greater burden than these necessary things; blood and from meats offered to idols, and from tion, from which if ye keep yourselves, ye shall do

The only question then is, whether this apnstolic decree hath been since repealed; and this will best
produced by the advocates for eating blood: which I
come now to examine.
Home Correspondence.
"First, then, it is said that this decree of the Apostles was only temporary, to prevent giving offence to the Jews, in the infancy of the Christian religion; and, consequently, the reason of it is
that cesation is a virtual repeal.
"In answer to this, I desire it may be considered In answer to the, mentioned for abstaining from lood do not equally extend to all ages and nations of the world; and if they do, it is evident this injunction of the Apostles bad no peculiar relation either to the infancy of the Christian relgion, or to the people of the Jews-unless it be thought that the Jews are the only people in the world who are obliged to abstain he author and giver of life; or that this nation only were entitled to the atonement made by blood; and, fo, how came sacrifices to be instituted immediately fter the Fall? And how came blood to be prohibited to all the sons of Noah, before there was any such thing as a Jew in the world? This pretence, then, seems very ill-founded." (Revelation Examined with Candour. Dr. Delaney). I really find the subject so full of interest, that I feel afraid of trespassing too much upon your space. I must, however, remark upon the atatement I made in a formor letter: it was not always that the flesh of animals was permithinks I am "probably wrong," if he will turn to Gen. i. 29, e will read thus:- A. given your every herb bearing seed which is upon the the fruit of a trearielding seed; to you it slall be for meat." This before their expulsion from Puradise. After which, when it might be supposed that their physical nature was somewhat deteriorated, and they ould require more substantial aliment, we find it to have been most explicitly directed, "Thou shall eat the herb of the field" (Gen. iii. 18).
The possession of flocks of sheep, \&cce, by Abel, Jabal, Sc., can very easily be accounted for, because these were required for sacrifice, it being an unchangeable principle from first to last, in God's moral government of mankind, that "without the shedding of blood there is no remission" (Heb. ix. 22), and the difference be ween clean and unclean indicated those anmals proper for sacrifice, and those doubt, having been clearly made known on this law, no
Further, Mr. Hibbend says: "Suppose, for instance, we tind that the blood is not the life; what will Mr. Chitty and those who hold similar views say to it ? Well, I congratulate myself, and all who, like myself, re mure conversant with the spade and the pruning knife than the pen, that the researches of scientitic men from time to time do prove to us, and strictest philosophy. And that blood is the life of the Hesh, Dr. Hunter clearly proves by experiment, as mentioned in my former letter. I cannot tell precisely where he will find the detail, though I have been examining by proxy his ponderous volumes at the corrin fusenm, for many days past ; but Do. \(J\) of a chicken experimented with, and as having become distinctly and decidedly vascular (page 16 of the volume mentioned in my former letter). The quotation I gave was from Dr. Clarke, who prefaces that statement and number of similar ones, with "To support this carefully read and compared the statements of the great anatomist. Still further, Dr. Hunter remarks : I shall now consider the simple act of coagulation abstracted from canses. Coagulation I conceive to be in operation of life; and I imagine it to proceed exactly upon the same priuciple as the union with particle by the attraction of cohesion, which in the blood forms a solid, and it is this coagulum uniting with the surrounding particles which orms the union of the first intention, for union by the first intention is no more than the living parts when separated, whether naturally or by art, forming a reciprocal attraction of cohesion with the intermediate
coagulum, which im mediately admits of mutual intercourse, and as it were, one interest." (Works, Longman \&
, London, 1835, page 34). There appears to be a perfect fitness therefore in the prohibition to eat blood. It may not be eaten, not simply because of the positive command to that effect, but because it is not adapted to the purpose of natrition, and I think it will be dificult for either Mr. Mr Cormack or Mr. Hibberd to persuade those plain and candid people who, receiving without hesitathem in a ten-fold degree when confirmed by the light of science, cannot vory easily be convinced that there is any waste of nutritious food in pouring out that forbidden.
Only once more, let me ask my friend Mr. Hibberd to black-puddings, they may eat them without violating any law of God." Such teaching is undoubtedly in opposition to one of the most distinct commands to be for my very the volume of Inspiration. Apologising Hill, March 8

Agricultural Education.- As to the usual edncatio custom to send them when about nine years old, or soon as they are considered sufficiently stron, or a3 chool in the neighbouring town, and I much fear thay has not been the custom to make very mi nquiries respecting the school; the argument rer often made use of is something aiter this manne
"Oh! A. B.'s sons went there, and they farming, s, I'll send my boys." There the and there they stay until they are about 14 or 15 old, when they remain at home, and are supposed acquire the training that is to fit them for gaining livelihood on a farm. These country sehools pary some boys acquire a really good grounding them. some boys acquire a really good grounding, at oth
they are pushed on too fast-supposed to know erer thing, literally know almost nothing. In the princip towns, e. g., Dorchester and Weymouth, there are a education is imparted, but the acliool II good some mention in particular, as it is supposed to be chi the benefit of the sons of farmers, is the Don County School. I believe the encorragement the moters of it have received has exceeded their tions, considering the short time it has been existence. 'This fact, too, proves that the farmers at
alive to the advantages of education profit by them. I believe education, and ready farmers in the countr of Dorset present generation in every sense of the word. My own opinion respectio the best education for the sons of tenant farmen is this,-start the young boy at the neighboum school, but when he is 11 or 12 years old send him a large and well-known school, where he may acquire good classical and general education (the Dorset Coonts School, to which I have just alluded, appears to these advantages); in he can her much the better at the age of 15 or 16 I would have him removed to an Agricultural College, where, then, his time and energiee be more deroted to apecial and profesiona training. If instead of, or after, residing at an ag cultural college, he should be placed with a goo
scientific and practical farmer, it is in my opinion great point that the man with whom the youth is reside, of whom he is to learn, and from whom he acquire a certain tone-it is of the greatest consequen that this man should be himself well educated; though his professional knowledge will be actually th first consideration, still he should be able to see som thing besides a farm, do something besides furm, and talk something besides farming; this last year of thi is a time of vast importance, and then a young man may acquire or lose that tone which makes him a deaimble member of society, as well as that bearing which mate him honourable and respected in his business. W.J. 2 On Killing Animals for Food.-Something has beem aid upon the best and most humane manner of kilin animals for food. The present system of deprivi them of existence, whether by bleeding any ing first, if properly done is so rapid, that ecarcel ny other plan would answer the purpose so doubt be instantaneons, but a failure would inflict more tortare on the poor brute than the usual opertion now in practice; clloroform, to dull pann, might be nased in some cases with advantage, jel the ang trusting this deadly liquid to ignorant hands, might light relief afforded to the animal about to be kill The blow given by either the poleaxe or knife is a quick and deadly, and the loss of sensition so rapia, prolongation of agony can only be caused by careles ness or barbarity on the part of the butcher. Hom ever, there are other matters connected wire to be looked into, and may be considered more cruel as producing greater amount of suffering than their destruchiomefu experienced men; take, for instance, the the iega and way in which dumb brutes are beat about the egs have t here ble to chang stand for hours, crowded together, unable to amon their position, with aching bones, and wirs. Into mhe disgusting to quench their burn often thrast bef laughter! If means were adopted to mitigate the horrors, the last blow which releases them frems vould be a trifle in comparison to the wavage men and boys. Children are naturally inclined orment insects and small aninals : pensity, allowed to grow with thei
visionary plans to shorten the last mome sheep, and pigs, already extremely limited of a skilfu butcher, is useless. Wod further make understand, that "the merciful man is mercifu beast," and alsc that those who do not shom even to animals,
after? Falcon
Labourers Cottages.-A strong argument in for of the motion discussed in the House or all purp relating Unions into large parioor, is the
ander the new system, of obtaining better accommodafor labourers' cottages within a reasonable distance their work, in which the separation of the sexes can e observed, instead common decency, to the disgrace nimals, regardess the demoralisation of the people. There are reformatories, ragged schonls, refuges, parochial schools, reading rooms, tea-drinkings, penny mandings, dc., all excellent, an be anticipated from such almble institutions when the great majority of those tho attend to receive sound teaching, kind advice, and abtantial assistance, go home to ive in a state amelein of immorality in their parishes; guardians min of the increase of illegitimate children in the Dions. Statistics tell of the fearful amount of irankenness amongst the elder members of the working classes, and also point out the early depravity appearing in children of 14 or 15 years of age. These are truths thich cvery one must know who is in the habit of ising with and visiting the family of the United Kingdom, capable of alleviation, but wickedly neglecterl. In common convereation, when persons lament the sad seglect of public worship, and suggest an organised preached every Sunday in the Church, the people bave an opportunity of attending, it is their own fault if they neglect their duty. It is true the beantiful services of our Church are read, but often so indistinctly to be neard only a few feet from the reading desk. Then follows the sermon, not very intelligible to the the weak voice of the officiating minister does not half all the building; mechanicel religion is not the thing we require the substance, not the shadow. Falcon
Ireland.-There appears to be something faulty in the constitution of the majority of the Irish peasants, rant, when common exertion would raise them on the ocial ladder, or at least enable them to provide their families with many comforts conducive to health and cleanliness. Here, women and children are often in rags, which a few needles full of thread, and a button conomy on the kart of the wore industry and soap and water, would add to the respectability of the bouchold arrangements, and teach the children habits 0 cssential to their happiness in after life. The be farmers and labourers is disgusting - not from necenity, because there is no means of removing the dirt, neither is it from the scarcity of material for mending and constructing roads. Nor is there any rooms appropriated to domestic purposes. Nevertheless, all the above objectionable things exist, showing care leseness and idleness to be a common failing of Irish men and women. There is usually a natural desire in the breast of the human animal to advance his prospects in life under adverse circumstances, even
those almost beyond the control of man. But when adrantages are to be obtained by the simple practice of and employed prudence, it is a mystery that employers tunities offered, and pick the sruite upon the oppor Dor is the extraordinary apathy pervading the agricul praiseworthy to be accounted for. Of course there are perhaps increases the astonishment that average farming is not rather the rule than otherwise. When master and low, and little money passed between principal food of the laboutos with salt formed the ridnals for the moral and physical character of indi things presenting a darkened aspect. However and steam navigation give a facility of inailroads between the markets of England and Ireland, bene manner countries if carried on in a business. Tike insurer, Knowledge and capital are the requisites read saccess in agricultural pursuits. A man may to Arricultural Society have the reports of the Royal soount of practical experience into the bargain, and arailable be powerless to enter upon a farm without a chance of taking banker's, though he may have iakland or Ireland 200 acres of the best land in bablinuptey to thith to carry on trade would end in farmo.

\section*{른}
progress a diminution, bearing hard upon the
tenant. From what little has been said, it may be inferred that many obstacles stand in the of satisfactory farming in Ireland, a tew of which may be enumerated, viz., small hol lings; the want of capital the absence of independent resident families and large landowners-in fuct, a money-spending population to consume the produce of the land within reach of the farmers; a profitable market on the spot, instead of sending away, at a heavy charge for carriage, grain premises, and returned to the land in another shape Emigration is not caused by there being no room for more hands to till the soil, which, in many cases, is only half cultivated. The real cause is obvious: men cannot starve at home, and though work enough might be done with advantage, yet the farmers have not the means, if they had the inclination, to employ labourers. Much of the land therefore remains, during the winter,
impervious to the sun and air, and loses the fertilising properties of the atmosphere, so essential to insure vigorous growth. Balcon.

\section*{Farmers' Clubs.}

Framlinghas.- How to Remedy or Ameliorato the present Deficiency of Hay and Roots.-A paper
on this subject by Mr. W. Raynbird, of Hengrave, was lately read, from which we extract as follows :-
- Climate and Continental Practice.- We are too apt to complain of the faults of our much-abused climate, yet it is worthy of attention that when from any cause it deviates from approach either in cold or dryness to the continental, we have great cause to regret the change, and find that to contend with. Thus, take into consideration the severe cold, so destructive to vegetable life, that occurred a few years back. Severe as it was, it was merely an accidental approach to the Russian or Northern climate. Let us think for a moment what would be the result, not only on our agriculture, but on our position as a nation, of a winter that should compel us permanently to house our flocks and herds, that should almost confine ourselves to our houses, and that should drive nearly all our agricultural population out of employment. And until the fact was enforced by such a drought as we experienced last year, we were apt to forget that to our insular position, and consequently moist climate, wo owe our heavy crops of roots, our fine crops of hay, out green meadows,
and our flourishing herds of ozen and flocks of sheep, in which points we excel all continental natione. Las year we had the continental climate, dry and sunnyresulting in continental produce, corn crops of fine quality; but this more than counterbalanced by meadows burnt, and our root crops reduced to continental standard. We can now readily understand how it is that the Turnip is little grown and less iked on the continent, for a few years of such weather would gradually convert our best Swedes into ill shaped small roots, in fact into Rape, from which it is thus suffered the effects of a continental season, it is probable that we might learn a few lessons-at least take a few points from the ordinary management of our neighbours. Skimming over various accounts of continental modes of feeding and fattening, I extract
the following, which may serve to amuse if not to edify
Italy: Piedmont. - By the best feeders extraordinary care is
taken. The cattle are tiod up in stalis, bled once or twice,
cleaned and rubbed with oil, afterwards combed and brusked
twice a-day. Their food in summer is Clover or other green
herbage; in winter a mixture of Elm leves, Clover hay, and
pulverised Walnut-cake, over which boiling water is poured, pulverised Walnut-cake, over which boiling water is poured, are also given. In a short time the cattle cast their coats, and
grow smooth and flat. Flanders.- In the dairies the summer
feed is paturage day and night. In winter, hay, Turnips,
Carrots, grains from the breweries, cakes of Linseed and Ripe-
seed, Bean and other meals, and the white Carrots, grains from the breweries, cakes of Linseed and Ripe
seed, Bean and other meals, and the white drink mentioned
below. The food for one cow in winter, for 24 hours, is straw,
lS lbs., Turnips 60 lbs. Some farmers boil the Turnips for one or other opertion is necessary to obviate the risk of the
animal being choked, where the Tumips, as is usually the case
in Flanders, are of too small a size. In lieu of Turnips, Potatos,
Carrots, and grains are occasionally used. Bean straw is the
ery

her
its Buckwheat. Germany: In Prussia and Saiony cows and
heep are housed and fed cn Potatos and chopped straw. Many
Cabbages are grown and made into sauer kraut, with a less
proportion of salt than when propared as food for man. This sometimes boiled w
gency of some sorts
especially for sheep.

Can we learn anything practically from these modes, differing as they do so much from ours? I think we might. We might learn from Flanders how to econo mise food by boiling, though our more equable climate does not, like the continental, require shelter from the
heat of summer and the cold of winter. We might the a lesson from the Piedmout system, in keeping satisfactory to learn that this oiling and brushing is not the whinsy of an amateur, but the practice of armers, although only foreigners. I think, too, that we might introduce the Walnut-cake with advantage, and that we should find it safer, and as nutritive as Cotton-cake. From Flanders we may learn how to economise our root-crops, and may also take a useful hint from their system of white drinks, either soured or fresh: they must be more nutritive than mere Water. The German use of sauer lraut only proves to
us that their climate is too us that their climate is too severe for keeping them any other way; and their practice with this, and with Potatos and straw, shows us that both sheep and cattle
may be fed without hay or Turnips. in England only use the or Turnipe. As for leaves, we tunately However, in cases of emergency, they might be useful : and we already know how beneficial arushed Gorse or Furze is for feeding, on the poor land on which it abounds.
. Existing Means.-My paper naturaliy dividesitself into two parts-the first, how to make the best of euch means as we now possess and can procure ; the next, how to provide against fixture similar emergencies, any, in particular, whether wo could now supply And first, how to make the best use of our present And firs.

Let us mentally retrace our steps through a few years, and we shall perceive how great the additions to our feeding materials have been. Probably some of the senior members present may remember when Linseed-cake itself was considered' as an injurious fattening material, one creating blubber rather than fat, and the meat resulting fit neither for the digestion nor the palate of gentility. The metropolitan papers have hardly yet forgotten to taunt our graziers on this point, although (in the eastern counties, at least) there is hardly a beast but what is more or less cake fed. Be this as it may, those comparatively young may call to mind the time when Rape-cake was only thought fit to manure Wheat, and when Looust Beans, Cotton cake, Indian Corn, and Egyptian Lentils were alike unimported and unknown.

\section*{Did we so please, our fattened stock might be far more
independent of home produce than our population. These last must purchase our milk, butter, and fresh meat; but in nothing has the great advance in the principles of foeding
been shown more than in the increased calue} whetber given dry, or steamed and fermented, and mixed the difficulties caused by the failure of hay aud roots would have been immensely increased. Had it bcen our practice to them solely for litter, we should prolably have still wasted year proved a real succodaneum. And fortunataly the fine
harvest and the continental summer has produced straw crop which, with the exception of Buaus ind ot late
Peas, is unequalled in quality. 1 have said that tho
modern use of straw in feeding originater, and is pracised mainly in the eastern counties, of which Suffolk
is not the most backward. A few remarks will prove
this. Mr. Mechi's emplosment of it might have been deemed
an amateur's experiment; but when we see the practice of
stich men as Samuel Jonas, who stores up whole barns full of an amateur's experiment; but when we see the practice of
stheh men as Samuel Jonas, who stores up whole barns full of
straw cbaff (cut by steam-power) to improve by age, and of
the late Mr. Phillips, of Santon Downham, near Brandon, who large scale, and when we consider how many of our suffolk for hay in successfully feeding horses, cattle, and sheep, we
must allow that a real and great advance has been made. How must allow that a real and great advance has been made. How
this straw can be rendered more zutritious by admixture is a
problem that has been solved by many agriculturists. Thus
some have practised making a kind of soup or tea of Lineed,
pouring it over chaff, and allowing the mass to remain a short pouring
tione before using, to cool, incorporate, and ferment. Some
(and among them I. think I may mention Mr. Welton, of
Wick ham Market) have Wick ham Market) have employed diluted treacle for this purslight fermentation to take place before using and allowing. Nor must
I omit the pudjing system of the late Mr. Warnes, of
Finningham-the feeding with Linseed compounds, of which the late lamented Chairgan of this Club exhibited so fine an
example at Broadwater. As the details of this and of the hearers, aud are (if I may be allowed to mention it) fully methods which may possess greater novelty to us, and be
equally worthy of our attention. And, first, I would refer to
Mr. Horsfall's system of feoding cows, as detailed in tol articles in the Royal Scciety's Journal for 1856 and 1857.
Those pepers are woll worth careful pornaa. I quote from
then merely to show how much use Mr. Horsfall made of
steamed Bean-strew chaff, an article fin steawed Bean-straw chaff, an article often used merely as litter was to give 5 lbs of Rapecake and 2 lbs . of bran to each cow,
mixed with a sufficient quantity of Bean-straw, Oat-straw, and
shells of Oats, in equal proportions; to supply them thre shells of Oats, in equal proportions; to supply them three materials are moistened and blended together, and after being well steamed, are given to the animals in a warm state. The circumstancos) or in to the Field of milk, thoged to give to getting 2 lbs. each per day, others but little; it is dry, and mixed with the steamed food on its being dealt out separately. Wh

Or rathor never 1 L a ton in favour of the rise of treacle. The malt and
eubatances, especially for stock out of condition or off their feod. It is a coneldorable object to obtain so excellent a sac-
charine product for an article of our own growth, as our molst quantity is the ordinary food. But as an arthele of common wo without admixture I thanks it boars a highor price in proa food, and certainly not 60 improving to the mauure. The
guection often arises, What is grined or lont by the canvernion of Barley into mall? This I will show in a few worde. From

Showing that about 20 parts of the starch in Barley is converted into sugar and gum, and that in our malt only one-sixth part
is of a mocharine nature, the rest being unconverted starch, gum, to. The quostion then is whether we could not procure this maccharine substance far cheaper and in a more concentratod trom in the suape of zonlasses or Locust Beans? and of
this I think there is doub. Next we must inquire what
Barley loses in wolght by the process? From Mr. Lawes's careful oxperimentg matters at abtates at 13/ per cont., and the loss in minera and kiln dust, he found that thero was only a lose of 0.22 of mineral matter, and 36.3 of nitrogen, instead of \(18 \frac{1}{3}\). Ho also
fornd that the amount of nitrogen in malt duet was oneninth as much as wrs contained in the whole amount of malt feeding qualities, and to Barley in a dry state. However, Mr. Iindson, of Castleacre, Btates, as the roult of his experience, 14 lb . of ofleale or I peck of Barley meal, more flesh than boosts of 60 stones weiglat, with the mame quaptity of hay and wedey. It in probable, Dr. Voelcirer, the eminent chemist, accharine analysis sliows. An infusion of malt (as brewers well know) changes a large quantity of stareh into gum and ugar, substances more easily digestible. This action, it is probable, takes place in the stomach of the animal just the in the food is converted into soluble substances, and digested, tiastead of mueh of it paesing through the body. If this is the eave, we ought to mpply the mait in smasl quantitios, and advantage use the fafusion, or wort, poured on chaff. 8 ome continental experiments, in which sionll quantitian of malt ond to an extruondimary degree, seem to prove the correctness of starch to sughr, and of the result of the acetic and vinons fermentations, in relation to cattle and stock feeding, has not yet recelved the attention it desorves. The amount of sugar in our conumon crops may be taken thus: Mangel and Beat,
10 to 12 per cent. ; Carrots, \(6 \frac{1}{2}\) per cent.; Turnips 2 to 5 per Wheat as food, probably all present will remember the in-
tereeting lotter of Mr. Frere, the Editor of the Royai Agricul-
tural Soetety's Journal, advoeatigg the use of Wheat and of bis, published on recently as January 2. cormborates. his prac Grectte. ] Cheap pa Wheat in, Ito. 1 of this year's Agrinultural have jet followed Mr. Frove's plan, other feeding articlos being till cheaper and safer to use. Bome jears ago, when Wheat was nearly as cheap, it was extensively used boiled in the foeding of hogs. If we examiae the manufactared foods, I think we too dear in price, vis., 16 s. and 258 . a cwt., slthough no doubt they could hardly be afforded cheaper with the commitaion anding of the proprietor gives a guarantee as to their genuing boda? With an Ameriesn grist-mill it wruld prepare his own bods? With an A meriean grist-millit it wruld bo obey, and a ingrodent fer capcharine matter) finto a toeat, a cheap foo
 and sheep at Hengrave, vie that we are now naing for cattl the new matic mixgure, wis., equal portiona of Boan-monl, of mad fatty mettor, mad containing tworv than double the

3. Putwre Emorgencies.-My next heading to this paper was, "How to provide against future emergencies;" but I must here be very brief, and must confine myself merely to hints, trusting that my correct anything that may appear erroneous.
In the first place it miast be asserted that there is 10 crop that has more onten
The fly, the caterpillar, greater losses, than the Turnip crop
The tly, the caterpillar, and the grob have alike destroyed it
and the too frequet cultivation, and, perraps, the selceting

 for them on a large soale, as most of the Brassica tribe ar
subject to the same diseasen Bue But, expensive in their cultivation. We mast still cultivat Turnips, but we must learn not to place too much dependenc
upon them. Perhaps we might grow with advantage the example; porhaps even the Jerusalem Artichoke might be
usefully grown on \(a\) small scale. It is a garden plant, we
know, but wo also know that a garden plant-nay, what was eonsidered a mere flower, the Lupine-has been a real boon t
our light lands since its introduction by Mr. Crisp a few year
back. In fact, I know of crnps that have been as valuable a the land they grew om. In liell of some of the worst of our
pastures, it would, I think, be very beneficidl to grow some use the produce principrally for soiling. Of these plan
Sainfoin takes the first place, and I have no doubt it woul aucceed on all mixed soils that contaiu calc rrenus matter by Arthur Young ou poor land, and perhaps the Prickly very useful on small occupations. ©mith, jun, observed lat year he foressw that there would be a great scarcity of hay, aud he took the pre-
cautinn tomix straw with his hay, and he found that plan to
answer, for the striw was as palatable and soeet as the hay, and he cut it up with all the Pea and Bean gtraw he grew on
his tarm, mixed with Barley etraw, to make it go as far as his tarm, mizel with Barley straw, to make it go as far as be them cacs thre quarters of a peck of meal, consiating of a
third each of Indian Corn, Barley, Peas, and Beans. He also gave them all the chaff he could make them eat, and about two or three peck-skeps of roots, whilst there was always a rack
full of Barley straw before them, and he found them eat it
greedily this year. chaff, horses and cattle ate it in preference to anything else,
and did very well on it. He had no convenience for steaming, it, but that ho lad no doubt would much improve it by small people who kupt cows that if they had Bean straw they gave a great deal more butter than when they had hay. This
car, when thero was so great a scarcity of hay, treacie was
very adrantagcons. The London darymen bought the very
vorst hay they could get, and had a mixture of treacle aud hot Worst hay they could get, and had a mixture of treacle and h
Water in a large tuh, min which a trues of hay was dipped ;
was then allowed to drain, aud given to the cows. They fou deal of treacle in that way. He give each animal a pint or wanted to be consumed, that they made the "toa" strong or
r. Goodwy belleved that the fallure of a root crop wa no injury at all, becanve ho had almays found that the shortes the root crop the better the health of his sheep. When he had
Mr. Barmes (Framilingham) reminded Mr. Goodwyn that When there was a heavy root crop there wras a whe season, Mr. Barives (Kettleburgh) waid his plan had always been economise the roots by cutting up the straw. At the presen better than if they had more Beet. He grazed them to from

Science and Practice in Farm Oultivation. By Prof. J. Buckman. No. 4, Howo to Grow good Corn. R. Hardwicke, 192, Piccadilly.

We bave here chaptars on "the Nature of Corn;" on Wheat and XEigilops on the Wild Oat ; on the sup. posed origin of Barley and Rye; on the Blights of Com crops ; on their Insect Enemies s on Manures ; on Thin Seeding; and on Harvesting. There are thus collected a number of short and suggestive references to many topics of great agricultural interest. And without giving anything like an exhaustive or fully detailed agricultural account of the several subjects named, the book, which is coning out in a series of shilling parts, will do geod eervice in the agricultural world by directing atiention to what is often buried out of ordinary sight under lifeless routine.

The Quarterly Jowrnal of Science. No. 6.
J. Churchill \& Sons.
The Chroni J. Churchill \& Sons.
The Chronide of Agrieultare in the present number of
"Locomotivia on Fighetes the Malk Tar agitation, the

Cottage Building, and Baron Liebig on Semegs is the topice of the past quarter
Besides the Quarterly Chronicles of Bcianea, th Sournal contains a number of very interesting paper on more general subjects; and we cannot imagine periodical more likely both to gratify and atima the curiosity of thoughtful and intelligent menata whom certainly we have a large number in the men, \(d\) tural world.

Uniformity in Land Drainage. -Take any two cana nd yet it must be admitted that the particulam is rich these cases resemble one another are mach mportant and influential than those in which won differ from each other. They may be respectively aud sand, pasture and arable, with an annual fall of espectively of 25 and 50 inches-but in both cases living plant capable of sending its roots som feet downwards and around it-a stationary nevertheless, whose food must be brought to it p
to grow-a plant incapable of absorking anytlin o grow-a plant meapable of absorbing anythin In both cases you have ind soil-there are no such things as non-porous clats, they have been called-a soil which in virtue of thin porosity holds water-a soil containing matter soly in water; and which in virtue of the quatity
internal surface, so to speak, which ity porosity c apon it, possesses, in propartion to the fineness of particles and the smallness of its pores, an increasiag uower of attraction and retention over the water which it holds. In both cases you have rain-water raversing the air and dissolving soluble matter out of i, cquiring thereby greater powers of dissolving what soluble in the soil-falling evenly upon the land, an lodging on and under the surface of it-carrying ait upable also of evaporating from the soil and so producing cold-capable, in virtue of its fluidity, of running thrugg the soil or over it. In all these particulars all soit in all cases resemble one another. Their differenes are differences of degree, not differences of kind, Aud the rules of practice which the land drainer filds efficient under one set of circumstances prove very generally efficient under others, Nevertheess, there hardly a speaker on the subject at agricultural meeting to insist upon the propricty of adapting his practice the circumstances of bis case. Some soils are clayo amifurm to a great depth, others are a patchwors clays and sands and full of springo-others are wir upon a subsoil built of alternate layers of rock earth-what an absurdity, he justly says, to lag
down artificial rules which shall apply uniformly orer tracts of country where unifurmity is not the natorna rule. Of course there is a certain truth in this, and the gridiron plan, as it is in derision termed, consistagy of parallel drains at regular intervals and uniforu depth, is not universally applicable; nevertheless, the cry against this uniformity 18 now extravagaat; have uever yet seen the drainage plans of a drainage engineer-the map on which all his outery against gridiron uniformity of parallel lines, represeal in inany, at all events, of the fields of the espane, pattern of just as good a gridiron as any man miph His practical good sense had, now lie standing his outery against theoretical uniforvals him to adopt parallelism of drains at intural facility of the soil for danitting the passage of water througe it. And we must not forget one tolerably wir fanture in the natural conditions of the chae an Mortom's rater on the ser

Calendar of Operations.
Aprit-Mancel Wurvel.-The latter end of th month is the best seed time for the crop. Wo Nuthen the following, somewhat abridged, from Seed List:-

A good distance for Mangel is \(\&\) foot 6 inghes from 10 . This, and 20 inches from plant to plant in tha obtained when the drills are 3 feet apart. T of sowing is with the drill. If dibbling is care must be taken not to get the seed half an inch below the surface, or various minate freely, but comes up at various seeds most deeply the surface, and thus producing an crop. For this reason land intended for firm b be plougbed early, and settled down should need is Bown. After sowing, the land shouly be roll especially if it is light or the weather be de Moy be lown from midaie of april to midac earlier sume and of April is best. is liable to be and run to seod. As the wether at the sowing is so uncertain, it in good poliey to sow thickly sure of a full plant.

The following is a letter from Mr. Adking of to a friend who had applied to him for
"3y practice in preparing the soil for growing Yangel is so similar to your own that one description of the operation might serve for both. Wheat is anway the preceding crop. The farmyard manure, previously drawn and slightly fermented in a heap, is proad and but at any rate soon enongh to ensure a frost is the thorough disintegration of the surface deep mongh to form a good bed of free mould. So soon in Anongh as weather permits the land is well harrowed as dep as it will work freely. By this plan the moisture retined, anil thereby the seed induced to vegetate. deeper cultivation and evaporation the soil is often endered so dry that the germination of the seed is ependent on rain. Many a plant of Mangel has been int in a dry spring by giving the land what you so rell describe ns 'the orthodox amount of spring . Hase,' instead of permitting it to remain in the state Thich a Warwickshire farmer would call 'stale furrow.' T.e seed (abont 7 lb . per acre) is drilled on the flat at aginclies from row to row, and deeper than is usually mommended-fully an inch. As soon as the thistles I dig them to the depth of the plough, and the cultiration of the crop is the usual one of repeated ein!s by hand and horse labour. When the rows neared there was not ap on the whole are it as a little Swede Turnip was mixed with the Mangel see l we have had difficulty to avoid leaving a lew of them, and consequently there is a sprinkling of iredes amongst the other roots."
Incerne. - The present is the seed time for this crop. It drilled in rowe about 12 inches apart ( 15 to 18 lb . fer acre), on any deeply tilled land in good heart. Land mith a calcareous subsoil is to be preferred.

}

Alexander Shanks \& Son are gratified to find that in the large and increasing demand for their celebrated MACHINES, they receive a conclusive proof that their merits are every season becoming more appreciated by the Practical Gardener.
A. S. \& SON, in introducing Improvements into they MACHINES, have been careful that the adrantase in point of durability, simplicity of construction, superiority in the work executed, which have all along been peculiar to SHANKS' MACHINES, should still remain.

SHANKS PATENT LIWN MOWERS are in laily use in the ROYAL GARDENS at KEW, WINDSOR, BUCKINGHAM PALACE, HAMPTON COURT, OSBORYE BAIMOP SYDENHAM ; in VICTORIA PARK; in BATTERSEA PARK ; and in many hundreds of the principal Gardens in the Kingdom, as well as abroad, where ther merits have been fully proved and their success established.

PRICES-including Carriage to most of the principal Railway Stations and Shipping Ports in the Kingdom.

His ExCELLENCY THE LORD-LIEUTENANT OF IRELAND
HIS EXCELLENCY THE BELGLIN MINISTER
HIS GRACE THE ARCHBISHOP OF YORK
THE RIGH'T HON. LORD PALMERSTON

Shanks' Patent Lawn Mowers are warranted to give ample satisfaction, and if not approved of may be at once returned.
15 A. S. \& Son beg to intimate that their Warehouse at 27, Leadenhall Street, is the only place in London where intending purchasers of Lawn Mowers can choose jom stock of from 150 to 200 Machines. All sizes are kept in stock, whether for Horse, Pony, or Hand Power, and orders are executed on the day they are received.

\section*{GREEN'S PATENT SILENS MESSOR,}

\section*{NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.}
bY SPECLAL APPOINTMENT, sOLE MANUFACTURER

TO HER MOST GRACIOUS MAJESTY THE QUEEN.

GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judges at the Royal Horticultural Society's Show, held July 20, 186t, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteration, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Mesgrs. T. G. \& Son beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that despatch due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust to be in a pocition to send off all orders the day they are received.

PRICES OF HAND MACHINES.

Packing Cases are charged at the following low rates, viz.: for the 10 and 12 inches Machine, \(3 s_{0} ; 14\) and 16 inches, 48 .; 18 and 20 inches, \(5 s\).; 22 and 24 inches, \(6 s\), Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damaged; if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONREY MACHINES, including Patent Self-delivery Box ; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

The 26, 28 , and 30 inches can easily be worked by a Donkey, or by Two Men, on an even Lawn, the 30 and 36 inehes by a Pony, and 42 and 48 inches by a Carriage Horse; and, as the MACHINES make no noise in working, the most spirited animal can be employed without fear of its runuing away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening : the cutters being steel on each side, When they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, when the MCHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The above MACHINES are made from the best materials, and of superior worlmanship; are delivered Carriage Free to all the principal Railway Stationa and Shipping Ports ia Rugland; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally,

THOMAS GREEN and SON,
SMITHFIELD IRON WORKS, LEEDS ; 2, FARRINGDON ROAD, HOLBORN HILL, LONDON, E.C. 19, EDEN QUAX, DUBLIN ; and HADWIN'S BUILDINGS, TITHEBARN STREET, LIVERPOOL.

by her majesty's royal letters patent.

ORMSON'S
PATENT JONNTESS TUBULAR BOILER
HAS NOW GAINED the highest standing H reputation for Power, Efficiency, Safety, and Eoonomy of Fuel. There is not a single joint exposed to the action of the fire, which renders these Boilers far
moore safe than any other Tubular Boiler ever invented.
May be seen in successful operation in the Gardens of many of the Nobility and Gentry in Eagland, Ireland, and Scotland.
They are made of various sizes. Prices on application.
HENRY ORMSON,
Stanlet Brider, King's Road, Curlsma, B.W.

\section*{ROYAE GARDENS,}

CRYSTAL PALACE GARDENS,

In again submitting these MACHINES to the notice of purchasers, Messra. Swmermos \& Co. Wish to state that they do not make annual changes in the principle of their LAWN MOW EIt8. Experience has fully proved that the genoral derign on which their MACHINES have been built for many yearg past is the bost, and their attenius has been given therefore rather to substantial improvements in manufacture, reduction of the draurht, and increase of durability by the use of malleable iron in place of all metal, than to the production of ephemeral novelties. Their LAWN MOWERS are superior to all others for lightnean of draught, elegnece, and efficienoy circumstances of ground and weather, being self-cleaning, and not liable to derangement in the gearing.

Illustrated Price Lists, with Selections from several thousand Testimanials, free by post on application.
SAMUELSON and CO., BRITANNIA WORKS, BANBURY.

\title{
LAWN MOWING MACHINES FOR 1865. J. B. BRown \& CO., 18, Cannon Street, City, e.c. \\ greens machine \\  \\ gaizairds Machine. \\  \\ SHANKS' MACHINE \\  \\ THE MOWING MACHINE IS NOW SO INDISPENGAHLE, THAT NO ONE WHO DESIRES TO HAVE A WELL-KEPT LAWN (AND FEW THERE ARE WHO DO NOTY, WOULD FOR ONE SEASON BE WITHOUT ONE.
}

\section*{These Machines Mow the Grass, Wet or Dry, on Laws wnown or otherwise, in a much neator manner than the Scythe, and at Half the Exponse.}
J. B. Bnows \& Co., as is well known, having had their name prominently connected with LAWN MOWING MACHINES, and having constantly bestowed ila attention to creTr pecnliarity of detail affecting the successful working of all the various LIWN MOWERS, have most probably sold more of these MLACIIINES Ahan any ath:
 hearty satistimetion. They have always a ated on the whe proper principhe of selpeting the best Machine, the one they conld confidently guarantee, and then prominently phen: it befone the public, und sparing nu paius, nur cypense, in pushing it into notice. These well-directed efforts have, as might be expected, been attended with complete sum.... The number of LAWN MOWERS they sold during last season was much larger than they ever sold in any season previous.
J. B. B. At Co. have resolved not to place before the public solicit an extension of the ronfidense which has always been so ki, what. confide their orders to them tu select it really gooll and uzeful Machine for them-oi.. That it wo to its work well, is easy and pleasant in working, and may at all times be dpecads:
 business thus kinilly rintru-ted to them, they would bere t. assure their friends and the public, will be faithfully executed; and in order to insure more perfeet fonfidenee the

 have mot careful attention in every respect.
** Owing to the carly preasing demand for LAWN MOWERSS, even before the season commences for the New Mowing Machinez, J. B. B. © Co. would eoterm it a enat fivour could orders be forwarited to them with as !ithe dely as pusible, say to be exeruted if so desired at any time named.

\]

Thyre is nothing more agreeable, and, we may add, more instructive than a cool and good-natured di-cussion of any subject connected with natural history between men whose only desire is to discover truth, in order that the discovery may be applied to the art of plant culture in our gardens, In a Leading Article at p. 1034 (1864) we drew the attention of our readers to M. Porte's observations upon the habits of Phalænopsis Schilleriane, and supported his ohservations by our own experience regarding the situations in which P. amabilis is usually found growing in the Philippine Islands. We stated that the latter species is commonly met with growing on the branches of the Mango tree, in the cleared parts of the woods near the cottages of the natives, and sometimes on the tops of very tall trees where it is fully exposed to the sun.
Our correspond-nt "R. H." who resided for some time in Jamaica, lirings forward other examples to show that lipiphyts Opehids are frequently found luxuriating under the direct rays of the sun. "Trees at the margins of woods," he says, "were evidently their favourite habitat". Amongst the glories, however, of the lowlands of the West India lelands, mast assuredly stands first the luvely Broughtonia sanguinea, the location of which-with my preconceived notions of how Orohids grew-struck me as being remarkably strange, being none other thau the nearly perpendicular scarped face of a limestono rock, facing the south-west, and in a notoriously dry district where rain very seldom fell." Anuther talented orrespondent, Mr. Gosse, corroborates the ahove stitement, and gives ather examples of Orchids which appear to delight in situations where they enjoy the full blazs of the sua. Amongst these Ie names Oncidium luridum, Brasavola nodosn, an Ionopsis, and others. There is, therefore, no doubt that many species of this beautiful family of plants grow naturally in exposed situations, and not under the dense shade of tropical wonds, as many persons, at one time, supposed they all did.
We crme now to the practical part of the subject, and ask if it would be safe to follow Nature in our mode of cultivating theze plants in our stoves. We may answer the question by asking another. Can we do 80? Have we the same amount of sunshinc, or can we give the s.mb atmosphere and the same sensnns as our favoarite plants enjoy in those sunny tropical countries which Nature bas destined to be their home? With all our knowledge and skill we cannot accomulish this; we can follow Nature, it is true, but we must always be left at a considerable distance behind her. However well we may ba able to cultivate Orchids in our gardens in this country-and we do certainly bring them to a high state of perfection, as the magnificent specimens seen in many collections and brought to our Exhibitions abundantly testify-yet most travellers will support us when we remark that few of these plants are so vigorous and robust under cultivation with us, as they are met with in their native habitats. No one has ever seen the Phalænopsis amabilis in this country in a state to be compared with the specimens found growing in the Island of Luzon, The large plant which used to be one of the "Lions" in the Chiswiok Garden for many years, gave bat a faint idea of the size and vigour of the species in
its own home. When that plant was tirst obtained it was necessary to reduce it mach in aize in order hundreds of bluasoms. Ant what is true as regards this Phalænupsis is equally true as to the majority of Orehids-however healthy and vignrous they may be under our artificial treatment, we can never expect tos have them in the state they are met with in those countries to which they are iudigenous. It follows, therefore, as a matter of course, that as we cannst gire them all their requirements in an artificial state in this country, it may prove injurious to cultivate, without shade at certain times, even those species which are known to luxuriate in the tropies inder the sun's rays. And here experience and close observation are necessary in order to enable the caltivator to determine how far he can copy Vature in ono way when he oannot do so in overy other respect.
As bearing upon the subjoct under discussion, we have great pleasure in drawing it attention of all Orehid growers to the excellent arlicle on "Orehids and their Cultivati n" (p. 76 ) by our
 "whether eniphytal ur turrestrial, when eaved us in an netificial strmeture, and subjeatel to an atmos? when beat imitated, require more or less shalo from a smerhing sul. The very plants that will thrive od dor a variety of circumatmess in suo urnis to similar treatencout, hore. It is well enough to know-indeed such inturination is most Valuable- the ramge of temperature, the degree of all plante under onltivation; but it is not sn desirahle for gramers to imitate to the very letter
 remarks fire the reasons we have given ahove, and
offer them the cameful omsileration of all whe ure inter st l in the calivation of Orohids in Earope.

Il: Anderson thrings forsurd particular inshated to pre the truth of his theor?. Ife less, ate growing in their native country pretty example 'R. M.'s' allusion (1S6t, p. 1061) tu Bronsi toniz sangninea and sum: other spmits nut
named, whish grow in Janaioa, 'exposed to the light and heat of the sun.' Bring these hom', hower \(r\), tie them upon bloks, get them as well cluse to the glass, in the fore if a lull merilian sun, in the months of June, July, and Augrast, and what is the consequence? Lialpratua goen that your artificial olimar, fiils t.? provide the
necessary food for assimilation, the leaves ret soorcherl, the piant siekens, and unless remedial meanures be resorted to it may die." Exactly so, the plants want that vigrur which they have in their native cuuntry, and they will nut bear the exposure.
Although many of the tribe of plants to which we are alluding, and which seem to prefer light and sunny situations in their native countries, may not bear, withont injurs, the full blaze of sunshive in an Engliah huthouse, yet we must take care not to run to an opposite extreme by placing them in dark houses, or by giving ton much shade, particularly at certain seasons. Orchid houses ought to have plenty of light, as much as we can give them in this climate. If at certain seasons our plants require shade, this can easily be given by canvas or other substances. We quite agree on this point with our correspondent Mr. Anderson, Who says, "no plant is more impatient [than the Orehid] of shade during a season of rest, and in assertion, if correct, demonstratos beyond doubt the propriety of using the most transparent glass at command, so as to have light in abundanes when light is required."
It, than, the knowledre of the natural habitats of Orchids be not a perfect guide to oultivators in this country, it is c-rtainly of great value to them. What the possessor of such knowledge has to guard against in applying it io, to take care not to use ton freely in cultiration one of the natural con litions which his plants ergoy in their native country, if he is not able to command all the other onditions likewise. But a enltivator with the kunwledge in question has an imnieuse adrantage over thase who do not possess it. The earliest that growers in this countre have to confes habitats of their plante, particularly of those kinds
now called "Cool Orohids," is to be ascribed the loss of many well-known valuable species. \(F\)

Amowa hardy Conifers there are few which can rie in beauty with the charming Cepressts Lawsorians, which in its native cuuntry, Calitornia, is said to reach 100 feet in height. In such trees the branches are stated to bend upwards towards he endike an ostrich feather. The top sh ot droops like that of a Deodar. The spray is most graceful, resembling more that of a Fern than a Conifer. In the south of England, at least, this handsome Cupressus is now in full flower, and our object in referring to it is to point out how much its
beauty is enhanced by the thousands of male blossoms with which its brauches are stinded, looking like so many garnets set in a field of green. Into how many beautiful combinations might not these light and feathery branches, laden with their sparkling treasures, be woven by the ekilful artificial decorator? For orna menis for bonnets, or even in a natural state for inter
mixing with borquets, nothing could well be more inixing with bouquets, nothing could ppearance would be equally effective. The female towers are paler and therefore less striking. It may cones, which succeed the flowers in great abundance, and froon which seelling plints my be raised in any mantity. For cutting from, therefore, an operation which it r.mdily submita, abundance of plants inight easily be obtained
- Professor Vogeri has recently laid before the Acadmy of Sciences of Manich a preer on the Taansformation of Ayplon by Germention. The expeare and detail; the special observations here referred tn being made on Potatos. The change of the starch began when germ nation first showed itself. In thint 10 weoks it had completely disappeared black soil, and had been reduced to 44 per cent. in sand. a reference to tio traugformation of starchinto sug ir he gerieril results were, that in the first begimning only sugar was found; this in the progress of the
growth of the plant became inappreciable, in consequence of the conditions of the nutrition and the developinent of the plant.
- The beanty of the Dielytra spectabilits is now well known; and perhaps it is not too much to say
in its favour that no better hardy plant has come to us rom the far East. Hitherto, however, we have only been familiar with the pink variety -a variety, nevertheles, which, grown as a hardy perennial in the coninental gardens, assumes alnost a crimson hue. A wite variety was, it appears, raised on the continent me two or three years since; and in the spring for the first time under the name of D . spectulilis albus, but it was ton we.kly to judge of introduced to this comntry, has agan brought it inder our untice, and we are glad to be able to record What it proves in bo a goad addition to the group of dants to which it belongs. The flowers are white, not pure white certainly, though they open nearly so, for they become a little tinged with blish as they gitt old, bitt reatly white by comparison with even a pallid condition of the old plant, and quite white enough to make the D. spectabilis albe useful for growing as a contrast, We may get from it a purer white herearter, but in the meantime this is well wrorth having. The stems are pale green, not tinted with red.

\section*{PRING FLOWERS AND SPRING GARDENING}

I mad once thought of inflicting a list upon the reader, but lists of syrmg flowers have been given a thousand times in garden literature; and it is perhaps not so much a knowledge of choice and beautiful spring lowers that is required in the first instance to be spread among our gardeners, as a scheme which will encourage them to grow plenty of the more easily obtained and popultr spring flowers, and then the taste or adding an odd "good thing" will soon develope tself. The system of filling the beds which contain the bedding plants in summer with spring plants in and uncatisfactory one, because, as a rule the pery best our spring flowers show very little of their heauty when treated in this manner. For instance, how vast the difference between established plants of Alyssum saxatile, the perennial Iberises, \&c., and those that we frequently see where this twice-a-year mutilation and cirried ont, and where they look in fact but he ghosts of what they ought to be, and in consequence

Nuw I would have thousands of spring flowers in very garden in the country; but this plap of making a nmmannal efiort to fill up all spices accupien by chitid of the year, thona art like inny annther yonth, a pre nota fallure, cherciless March -like the late thrown awiy by a aercitess March-like the late memorable out

Therronded by the bright Draba Hepatica, to be when well done, is one of the prettiest sod most telling little plants that pass muster in the 1-inch high corps of vegetation. This garden, I repeat, thould not displace a single bedding plant, nor should it be near the bedding garden, if possible. It would be it be rearined for such an association. William Robinson.

\section*{NEW MODE OF HEATING.}

Escocraged by your reply to the inquiry I ventured to make on the subject of heating horticultural buildings (1865, 「. 1204), I now send a rough sketch of a supposed ground plan of an orchard house, 42 feet lopg and 18 feet wide, span-roofed, and of ordinary heignt, and of the mode in which I propose that it should be heated. I assume that the same system night be applied to honses of various dimensions.
I propose that the entrance door shall be at the sise, in order to admit of a furnace being placed at one end and the chimney at the other end. a brick flue of
12 inches square passing up the centre from the firmace to the chinney, with an air drain, also of 12 inches square, on each side, the air of which must necessarily become heated as it passes along each side of the contre flue; the flues to be executed with the very bent firebrick and tiles, with the best workmanship. I have ascertained by an experiment made for another
purpose that the air can be heated in such flues to might ever be required, in order to diffuse a moderate might
From these air drains I propose that earthenware pipes of 3 or 4 inches bore (in fact, superiur draining tiles, with spigot and faucet ends, but ouly waced one into the other, and in no way cemeutell) shall be conducted on the floor of the house, under the beds, and inside the outside walls (as indicated on the plan), having perpendicular upuast pipes along the inside of the outer walls issuing into the atmosphere of the house, the pipes with the open joints imparting heat to the border, and bottom heat to the plants, modified as wanted, and sending up from the numerous joints warm air into the body of the house,
It is thought that this system of diffusing heat in the border and throughout the house could readily be regulated and modified, and be entirelyunder control, by the regulation of the furnace, and stopping the apertures of the perpendicular pipes, more or less, and in the simplest manner.
The whole of the bricks, tiles, and pipes would become heated and retain and give out heat in any required degree, and experience could alone determine their exact action and regulation.
Thus far it would only be dry heat; but water applied to the surface of the house and border, and especially to the tiles (having a breadth of 3 feet up the centre), would speedily be converted into vapour. But it will be seeu that in the bottom of the air draink it is proposed to place a second tile over the actual bottom tile, continuously alung the whole length of the air drains, leaving a cavity such as may be found sufficient, in fact a shallow trouth, which would of course acquire the heat of the other bricks and tiles,
Frgurr I.-Ground Plan.

Reverenoms to Figures.

 flue an uir drain built in brick side walls, I foot square. Nos \(1,2,3,4,5,6,7,8\) mark the line of 8 rows of 3 innec nipes, spigot, and fancet, not cempented (i.e. open at the joints), but with an angle
curre upwards at the pint
 being brought from the air drain onl the side of the flne. I, a well, say 10 feet deep, into which water
frim furnce pit shall sirik, and into which water from ouiside the honse may bu brought; a pump
being placed on well, so that water can be had for air drain, and fur wateriug plants.
this trough to be supplied with water at one end, speedily filling the whole length of the trough, and eing vaporisel according to the degree of heat applied. through the pipes and would be moistened, passiug up troong the roots of the plants, and into the general atmosphere of the house through the perpendieral pipes. Here also house through the perpendicular
for \(10 l\). or 127. , which, compared
water apparatus, is a small sum.
It might be au improvement that the square \(F\), representing the base of the chimney, should be placed inside instead of outside the honse, as its height would be about 12 feet inside, and the whole he it frums
the shaft would thereby be retained in the hoise the shaft would thereby be retained in the honse experience also practice could alone determine the regulation of it seems to be ab rious that \(n\)

long time would
mith required to ascertain safe miles of 7 ft in
directioderation in all particulars, ond action, beginning Sueh is a
reference to the in description of the arrangement in the arrangement be at all adequate herewith; and if mode of construction is simple to its oljecets, the Whele materials consisting of tiles and bricks made of sitire-clay and earthenware pipes of the same Flotre iII- - Seotion of Flue and air Draing
 loog, migot and faucet inints, open pipes 14 inches hould of smaller or inches in the bore, so as to suit that it is sufficient for houses of moderate size, seeing com the bordered to place them at short distances The whole constrund the inside of the outer walls. appose of workmansichip and materials. For at a small that the whole. could be done

A wooden framework might be along the central flue and frains, so that their beat should not be unpleasant
to the feet in walking along thom.
The entrance mo the house is placed at the side instead of the end as is nsual, in order to admit of the furnace being \(p\) aced at one end and the chimney at the other, the flue thereby rumuing straight up the midule of the house. There seems to be no inconveni ence in the door being placed at the side instead of the end, although the short passage from it is a small loss of space.
Such are the ideas which have occurred to me in consequence of an experiment I have lately made in converting the arched cellar of an ancient eastle into a Mushroom house, and a place for raising Seakail although a little different for these purposes. I have persuaded myself that the scheme I propose might be made very useful for the growth of fruit under glass, in orchard houses; and probably a vineyard under glass, upon Mr. Rivers's plan, of Vines grown in the inside border, perpendicular, and fixed to iron rods would succeed. By the means I propose, Vives might have bottom heat, diry or moist, and an atmosphere tempered in any way required, and all compatible witu the freest ventilation.
If the heat were too great, the cross-pipes might he omitted, and the heat made to depend solely on the air drains and the pipes along the whole outside walls of the house. Heat.

\section*{DESSERT ORANGE CULTURE.}

On Christmas Day, 1864, I had the pleasure of ndiding t.u uy dessert, Stint Michael's, Tangiurine, and Mallese Moil Or, nger, all from my Orangrelmure, and alson some flue fruit of the first and second irom Conent Garden; the third sort I combld not procure, as they hail not arrived. N w came thit mos: interesting period in after-dinner chit-chat - comparisun. The Saint Miehael's from "the Garden" were very fine fruit, but their flavour was flat, and not at all first-rate. The Tangierines, culled in Covent Garden Mandarins, were juicy and good but not rich. The home-grown Saint Michael's were plump, crisp, and bursting with j'ice, their flavour much more aromatic than the foreign ones. The Tangierines from the same house were rather over-ripe, but very rich. The Maltese Blond, from trees growing alongside the two varieties above-mentioned, were scarcely ripe, but their flesh was of that deep red which has given them thicir disag:eenhle name, and peculiarly crisp, jnicy, and aromatic. After due deliberation the family jury gravely deended that Oranges of finer quality can be grown in Enpland than any mported; their superiority comsinting in that enispuess amd high aroma which imported Uranger have not, probathy from then being always gathered before they are fully ripe
Home-grown Oranges are no novelty, for Evelyn (I quate from memory) tells us in his Diny, that in Felruary, 1660, he i" ate as good China Oranges as ever he ate in his hfe;" these were from his neighbour's Orangery, and since then good home grown Oianges have been caten hy many persons. Still, oddly enoukh, no one has ever attempted to systematise their culture, owing probably to the cheapness and fine quality of those imported-a fact not to be disputer', fur imported Oranges in spring for two months are of gleat excellence. Still, this ought not to deter cultivators, for are not finer Peaches often offered for sale in Covent Garden than are grown in private gardens? and the sane with other kinds of fruit, yet they are not eaten with the zest that one feels for fruit from one's own garden, for have we not watched them and taken pleasure in their growth? So is it with Orange culture, and as far as I have seen, there is no fruit cuiture calculated to give equil pleanure. One wrent source of satisfaction is the agreeable semi-lropical climate required to cultivate aucceasfully Oranges an fruito bearing trees.
There is no doabt but that the Orange is a tropical tree, if jurged hy the perfection its fruit attains in the West Indian Islands and in South America, but it may be grown in Eugland in great perfection in a climate we may for convenience sake call remi-t ropical, i. e., a temperature sveraging froin \(45^{\circ}\) to \(50^{\circ}\) in winter, and with sun heat from \(80^{\circ}\) to \(90^{\circ}\) in summer. One great necessity is constant warmth to the roots of the tree.
Before I describe the method of culture which is so succeasful here, I may as well state that dessert ()ranges may be grown in a couler temperature, hut, they are then more slow in ripening, ani are not recin and ful. flavoured. Tangieriue, Mandariu, and st. Michatl's Oranges, if grown in a ronservatory or greenhousp, will hlossom some time in Blay or June, and their fruit will in most cases ripen the following eumimer. In a heated Orange-house the trees blossom in Fubruary, and ripen their frnit the followig autum, up to Christmas, the delicious little Tangierine leading the van, and generally ripening in Octobrr, just hs the last Peaches are finished. As far as my experience has gone, thas sort is often confounded with the Mandarin,
apparently of the same race, but witl: larger and mure flattened fruit; and if I may julge from the surts I have received from Malta and China under that nume, the tree has larger and thicker folinge, mot on pinted as the Tangierine; the latter is more juicy than it, and has a richer flavour. The method of cultivating dessert Oranges here, is to a certain extent orizinal, for I find none of the gardeners' bols mention it-in fact no horticult ural writer secma to heve thoushat it feasiule excrpt McIntorh. who ricommends Oraige tre es, if cultivated tor their frait, \(t\), be trained on a trellis under glass, after the mamer of Peach trees. Thomp. son, in his Garleners' Assistant, seems not to have thought of d.ssert Urange culture ; and so, as with orchard-house culture years ago, one has to advance without the experience of the pust.
The Orange-lunse here, in which many of the trees were lately in full blom, and some of the St. Michael's with ripe fruit on them, is a span-rooted structure 60 fert by 12 , heated by eight 4 -inch hot-water pipes. A path is in the centre, and on cach side is a raised border of slates, on which are placed the trees in pots. The slates form the ronf of a shallow beated airchamber, formed by placing iron hars across from a 4-inch brick wall, along the side of the path to another wall running along the side of the house. The slates should have a lap of 1 inch , and be bedded down either wilh mortar or clay. 'Iwo 4 -inch hot-water pipes are laid horizontally ainng the eentre of each border close to the gronnd, alad the slates wlaced on the iron bars 80 as to be abont 3 inches from the pipes; the warm air is thus regularly diflused over the whole molersurtaee of the slater, makinge warm flof of a tembirature \(h 0\) m \(70^{\circ}\) to \(80^{\circ}\) the year through. The width ot this heated foor mast depend upon the width of the honse; if it be 12 feet wide the central path should be 3 teet wide and each border \(4 \frac{1}{2}\) feet wide; if 14 feet wide, each
border should be \(5 t\) feet wide. For houses of these widthe two 4 -inch pipes to heat the foor in each chamber, and two on each side next to the outer wall to heat the surface air of the house, will Span-roofent houses oderate-sized gardeus, but for large establishunents houses of 20 and 24 feet wide would form Orange gardens of great is mate, and wide heated hurses, if a broad central walk is mate, sude, sixteen 4 -inch chambers for the trees on each silfe, sixteen 4inch and four on each side to heat the air of the louse. In such large houses the trees may be planted out with excellent exect, bume number of pipes, for root-heat is oue of the necessaries of dessert Orange culture-the sine qua now.

I have thus far thought it requisite to point ont what may bo done in this interesting dords state what is and what has been doue here. Finding last summer that the roots of my trees becane too dry on the bare warm
slates, each pot was placed on a lafer of cocon-nut flates, each pot was placed on about three inches thick-old tan or light mould would do equally well-and in these little mnands the trees all the past season have continued to flourish. vivid is tho green of their yonng leaves, so fragrant their flowers. The root-heat has uever been discontinued, but about the end of May he water was turned off the pipes that heat the air of the honse, as
the weather wa hot, and not turned on again till the end of July, when extra heat was required to ripen the fruit. Much, however, must depend on the nature of the summer: if cloudy and wet, root-heat and surfaceheat may be discontinued for some weeks, hut rout-heat never. The great charin of this Orange-ripening climate is its refreshing airy warmth, for in sunny
weather abundance of air is given from low ventilators on each side of the house.

As usual when much pleasure is derived from any peculiar mode of culture, mach care is required. The subatance, probably some species of Fungus; this must be washed off with a sponge and warm water. Again, that most intolerable pest, scale, is always on the qui vive, and so rapid in propagation, that as a young German who is here stid the other day, "they gre danghters
and grandmothers all in one day." There are many efficacious nostrums to kill this persevering enemy, but after trying all, we have come to the conclusion that byringing the trees once a day in the wiater-avoiding the blossoms-and twice a day in the summer is \(n\) preventive; and carefully watching the trees and
picking off every scale as soon as it can be seen is a sure cure. A sharp-efed boy soon becomes very
sharp in finding scale, and if kept under they give but little trouble; the constant syringing seems to make them feeble and unhappy.
Will regard to the varieties of Oranges to be cultivated, we have yet much to learn. There are in the Azores some 50 or 60 sorts cultivated, many of them said to be very distinct in Havour, and of great excelof placing on our tables Oranges of our own growth, varying in colour, size, and flavour. At present the three sorts of which we have no doubt are the Tangierine,
the St. Michael's, and the Maltese Blond, which when gathered dead-ripe is found to be full of its delicious juice. This kind requires the warmest part of the summer be warm and sunny, it will ripen about Christmas. A well-arranged Orange-house will give ripe fruit from early in October till June, commencing with the Tangierine, and ending with the Maltese, reminding one of the length of time Grapes may be gathered from one Vinery.
Although I have confined myself to describing how dessert Oranges should be cultivated in a house devoted Vinery or Pinery they may be grown successfully.
What I wish to convey is the beauty and interest in fine health. It is indeed such a sorrrce of pleasure, in fine health. It is indeed such a sorrrce of pleasure,
that I feel I can give but a faint idea of it; it is perpetual summer, a realisation of the Gardens of the Hesperides. The trees are evergreen, almost everblooming, and are most certainly an ever-giving source \(T . R\).

\section*{Home Correspondence.}

Exhibitions and Membership of Conncil.-I am eorry to differ with Mr. Fleming, but it appears to me that it is a wise rule that Members of Council should not a schedule he is naturally led to form it in accordance with what he is himself interested in, and therefore strongest; it is like the old story of the kind-hearted lady of the house who would always help her guests to what she preferred and not what they liked. Surely exhibition, in the case of a person who stands so high in his profesion as to be melected to the honourable position of
a Member of Council of the Royal Horticnitural Society,

\footnotetext{
 woather.
}
is not so absolutely a question of pounds, shillings, and pence as to make it necessary to add money to the in that feeling by the expense incurred by such firstclass men as Mre Veitch in reference to foreign shows, where the prize is a medal and the bonour; and yet the expenses attending such a meeting are far, far beyoud the cost of a few vans for a London show. I think a person in such a high position as Member of Counci
ought to show in the same manner as a juror in the international exhibitions - "Not for competition Mr. - being a Member of Councill" D.
Melon Jwdging.-No class of fruit perhaps is more difficult to judge than Melons, and 1 have no hesitation hased a mere lottery; it is indeed hardly possible to select the best Melon shown from among perhap the handred which are staged sometimes at our great London exhibitions. It is true that the judges are at liberty to cut and taste them; some howver are passed over in consequence of their the name appearance; others are overlooked because a first-class variety; and a third gromp, no doabt are disregarded for other reasons-but even admitting that they have all been tasted as well as cut, what with some being iuferior, some good, and some middling in flavour, the mouth gets sadly out of order before arriving at the hundredth or last specimen. Melon judging as I have stated therefore becomes quite a lottery. I do not say however that this is always the case, for there is no rulel without an exception. Some prizes must be awarded, and although there are many losers, still there must be some winners. Having been at various exhibitions myself, I can faithfully assert that Melons which have been awarded prizes by one set of judges would not have got any award at all from others. So much for taste; and as every man's taste is not alike, how is it possible to believe that the best Melons always obtain the proper prizes? I do not for moment insinuate unfuirness-quite the contrary; is some standard to guide us; to judge by taste alone is not sufficient, for I have seen Melons awarded lst prizes at our great exlibations so ludicrously small that I should have been ashamed to have sent them to my employer's table. Indeed, at Malvern some years ago, I saw a gardener actually take Melon (Queen Anne's pocket variety, I should imagine) out of his waistcoat pocket, and place it on a plate for exhibition. I am of opinion that moderate size and weight, thin skin, thick melting flesh, and handsome ap-
pearance, should have the preference over small size In one respect Melons are like Potatos; some varieties are good in certain places, and under some particular course of culture, while the same kinds in other places are poor and insipid. Some three years ago we put up new Melon-house at Osberton, which answers admirably, the crops in it being very abundant. In this house I have tried a great many of the Melons now in
cultivation, and from experience I have come to the conclasion I have jost stated, viz., that the same variety, under different conditions, varies very much in havour. Empress Eugenie, Scarlet Perfection (Downie \& Co.) and Brambam Hell, with me are three splendid Melons. In modern books I find Melon lists so overburdened with names, that in the case of beginners it would be a difficult thing to make a selection of any one particilar variety; how different is this from years gone by, when my father was gardener to the late Marquis of Camden at Wilderness Park-the favourites The Princess Alexandra is a valuable late Melon. It is quite a distinct variety of green-fleshed, the outside having a rich yellow appearance while Irowing, and it may be termed a very handsome variety. I have now grown it two seasons; the first year I serth
it to table on Christmas Day, New Year's Day, and old Christmas Day. During the past season I had it ready at Christmas, and should have had fruit much later had not an alteration in the heating apparatus prerented my last crop of it from coming to maturity. Now, I doubt if there is any other good variety of Melon known that could be sent to table so late in the sensor, So-called winter varieties I consider generally only fit for cattle. Although I do not think it very remarkable to send Melons so late to table, I make the statement just recorded in order to encourage othern to try this variety where late Melons are in requisition. As a summer fruit, too, it is exceilent, and it is certainly one of the best late-keeping varieties in cultivation
with which I am acquainted. Eidroard Bennett, Gr. to G. S. Foljambe, Esq., Osberton Hall, Worksop. Violets.-Two dear little childrea insisted, the other day, on my wearing eiglt or 10 of their Violets in my button-hole. Coming home some two hours after, I threw the Violets into my water-jug, and left them there till the morning. I took them out crisp and saturated, but almjet scentless; on going, however, to wash in the water they had floated on it was decidedly perfumed by them. I wish, therefore, to inform your laxury in store fore is thus an innocent and delicious luxary in store for them, and one which will be avail. Subscriber, Bathe to come, and at no costo An Original

Exhibition of the Societte Royale Némul. datse podr l'Enoouragbment de l'Hobtiounole -(Continued from \(p_{0}\) 342).-It remains to deacriby One of theso had a Latania borbonica and a Date Pulm on either side the doorway, both very fine specimen. On a large central table were ranged crnamental s'ands raised on pedestals, and filled with choice Ferna. Belon them on either side of the table, was a magnificent dus play of bouquets and floral decorations. The bouquetu were very tastefully made up of beautiful flowers, com
prising Orange blossoms, Violets, Orchids, Roser Camellias, \&c. The large decorations for the table, tngether with wreaths and head-dresses for ladies displayed like the bonquets the most exquisite tasta The first prize wedding bouquets were thus made up a central white Camellia was surrounded by saccoses circles of Orange blossom, white Azalea, white Lilcy and white Camellias, with a dash of green amongat first and third rows of flowers; they were shown M. W. A. Zalme of Gravenhage. The best of the dinner table decorations had crimson Roses with Honeysundlil above, Pansies below, and golden-veined joisila anil incongruous side pieces, came from M. Ant. Bernard Paris, The end of this room was well set Palms, Tree Ferns, Pandanuses, Dracæna,
and on each side were flowering plants. latter Amarvllids of the Hippeastrum conspicnous There were several fine collections and among theri some most distinct and beantifil varieties, such as Jean Paul, a splendid crimbon, beaui fully veined, of large size and fine form: Elfride, lighter green centre with crimsoll tips, veined with
colour, and fine in form : Fidelio, of splendid form, with a creamy-white centre, veined and tipped wid on, Etoile du Nord, green centre with crin fine in form; Arnoldine, a very fine light beautifully veined with crimson; Mademois lotta Patti, fine form, light ground veined with son; Laura, a very distinct and beautiful rela flower: Prince Guillaume, fine scarlet, oistincw would all be worth adding to our collections in we thonl and, indeed, it is much to be desired that see more of these fine plants produced home shows. On the same table were some bat Rhododendrons, finely spotted, but being earis many of them were not suited. F our ch wer fine early decorative subjects. Further on adition new Azaleas, many of them very st Hollande, our collections. One especially, Roi de Holland, the form, and of a rich scarlet, were the exbibition.
with good petals, flesh colour striped with pink Tucari, a light red, also of fine form; fine peach colour; Bella Romana, flest cic Wi Prussis, in the way of Princess the well always welcome Taltevaredo. In this hall was a accommodation in the way of seate, always most necessary adjuncts to agathering of Another hall leading from this
acommodation of tender plante, such as Orchids an of the season. This was arranged with three tables ferns at each end. Among the latter were: Alsophila Ferns at each with a stem 7 feet high and a head of its ovely fronds 10 feet across; Alsophila radens with a feet stem, the finest plant we have seen; ancimen handsome Ascofeltii; Theophrasta imperialis 10 fee igh, with noble dark green leaves; and a very fin yras revoluta Here was a collection of Anthurium nith their dark green foliage; the curious cut-leaved化 glossy-leaved Pandanus elegantissimus,
Of Orchids there were some fine single specimens, monget them a noble Vanda tricolor and a Vanda in ignis, each with seven spikes, the last named 6 feet high M. Linden had a very creditable hy 5, ineluding Cypripedium hirsutissimum with 8 fin Hoome, C. villosum; Lycaste Stinneri a pale variet rith 7 flowers; Phalænopsis Schilleriana; good plants Vanda insignis, tricolor, and Cathcartii, the latter ith yellow: it is soldom seen, as there are we believe onl cour plants in Europe; Ada aurantiaca, curious from its apricot-coloured flowers; Miltonia cuneata, a rare plant worth a place in any collection; and a few others. yold during transit, no that he could only show a group nopsis Schilleriana, amabilis, and grandiffora; Cattleya Tery different thing; Dendrobium albo-sanguineum ad the beautiful Cypripediums, villosum and hirsufour collections, some of them very well grown ind comprising A. Lowii, good; several large masses Petola; intermedins, xanthophyllus ; javanicus, very nre; Veitchii, well grown; Lobbii, argenteus, and a god variety of setaceus. Nome were grown under
bell-glasees, others in cases; some were planted in chopped one and sand, in which they seemed to root very freely.
of New Plants, which were numerous, some thinge which will be acquisitions were shown amongs both foliage and flowering plants; but in our opinion the jodgment was fanlty. This was especially the case howed the lovely Maranta Veitchii, a plant far uperior to that which was placed first; the latter popalar, while the former will be a favourite for year 0 come. Among the other novelties M. Linden had Maranta roseoopicta from the Upper Amazon, with
dark velvety leaves beautifully marked with red ; this will prove an requisition among foliage plants. Another Maranta, eburmea, was in the way of vittata, but not Was a handsome plant with light green leaves having though M. Linden says it is quite distinct. Also Urospatha Caladiam ; and \(U\) arroshaped variegated leaves like a way; bothe from the Rio Negro. Aralia Mitsde fol. variegatis was a lovely plant, small as yet, but the leaves were of a beautiful variegated silvery colour inter mixed with a little green. Remijia candida was not in Jasmine in foliage and bud. Franciscea Lindeniana was to bo a fine plant, the colour very bright. Echites mall state. Cas too much like nutans in its present worth growing as a climber; Sphærogyne cinnamomea medium with white flowers, and Derdrobium inter

Mr. Yeitch showed some fine things, among enutifully mottled leaves, which with its dark green ionked for by Ferps distinct, which will make good greenhouse marked a species of Sonerila, with dark green leaves anrea (or pendula) a tine Amaryllid, with ; leaves like tipped with green; Selaginellasp. in the wellow of lowers
tyallii, folly variegated Schismely to be a favourite; a beautieartiful silvery markings; Bertolonia paler colour, with dark-coloured foliage odged with a drons Princess Alezandra and Princes and Rhododendesirable greenhouse shrubs, the former with white, the aloo had a splendid plant of Aure flowers. Mr. Veitch What iosine thing thied the leaves nicely variegated. We can get it berried like this! for shrubberies when already adverted to novelties, Verschaffeltia splendida regale, in the way of princery distinct Palm. Cibotium the noblest of Ferus, princeps, but distinct, and one of oticd atem, and Dieffenbachis gigantea, with a
green leaves niceiy bito

plant, but too small to judge of its real merit, Dieffenbachia nobilis, with large green leaves marke with yellow, very distinct; Dracæna lentiginosa, also distinct. M. A. Verschaffelt also showed Abutilo vexillarium, a promising free blooming greenhouse plant, with yellow and scarlet flowers. Messrs Groenewegen exhibited some interesting plants, but nost of them were too small to give a fuir idea of their value-among them Cycas pandanifolia, a promising plant; and Syphonium divaricatum, a Caladium-lik plant in the way of Lowii, not so dark in the foliage, but likely to be a good plant. Mr. J. Verschaffelt had Agave schidigera ignescens, but the plant was too small o show whether it would prove superior to the A schidigera itself; also a variegated Camellia, which pro mised to be good. Several interesting plants came fion the Leyden Botanic Garden, including Cyrtandra discolor, with largish leaves of a bronzy hue.
Mary other rare plants were exhibited, such as Agave Verschaffeltii var. princeps, a very fine compact dwar grower of a glaucous colour, with long black spines Yucca striata, with glaucous leaves; Aralia Sieboldi urea variegata, a promising plant with green and yellow leaves; Pandanns ornatus, with green leaves and white spines at the edge; Amaranthus versicolor, dark green plant marked with red, nromising as an edging plant for the flower garden ; and Zamia grandis, very distinct species of its noble family. A collection of Billbergias suggested that this family of plants deserves to be grown more frequently than it is, being not only distinct from other familiar things, but very orna mental with its coloured bracts.
Outside one of the entrances was a fine collection o Coniferæ, including a very large Wellingtonia; Abie Nordmanniana, amabilis, and Pinsapo; some splendi plauts of Thuja gigantea and aurea; Araucaria imbricata, and Cupressus Lawsoniana. Close by were some fine Hollies, both variegated aud green; fruit trees in pots, promising well for bloom; fine specimen Boz trees, green and variegated; and many other hardy lants and trees.
The managers deserve the best thanks of horticul urists for the spirited and successful manner in whic this exhibition was conceived and carried out right place. We ge rigat men were in the attendance of visitors, numbering \(799 b\) on the first day and 11,538 on the recond. The building in which the how took place wae built in 1863 for an internationa exhibition, at a cost of \(200,000 l\)., and when the adjacent ground is laid out, as is intended, as an ornamental garden, the whole will be a credit to the country. W.

\section*{Eacieties.}

Roval Hobmedurural: April 15 (Second Spring Show).-Roses, both old and new, cut and in pots, were contributed on this occasion in considerable numbers, and in excellent condition ; of miscellaneous
stove and greenhouse plants, two well varied collec tions were exhibited; and among new planta were one or two striking and highly interesting acquisitions. Azaleas came from Mr. Todman, gro to Rn Hudson Esq., of Clapham, who received a first prize for good examples of Criterion, Triumphans, Eulalie, The Bride Dr. Livingstone, Princess Mathilde and Coronata To the same exhibitor was also awarded a first prize for a single specimen of Duchesse Adelaide de Nassant, a
brilliant salmon-coloured kind, boldly flushed in the upper petals with violet purple.
Conspicuous among Roses was a magnificent plant of We rea Rose called President, from Mr. Wm. Pa, ornamented with some two dozen noble expanded blossoms, each measuring nearly half a foot in diameter of a deep nankin colour, richly suffused with bright salmon. To this was awarded, as it well deserved, a first prize. The same exhibitor also received a first prize for a collection of nine Roses, among which were Beauty of Waltham, Paul Ricaut, Marquise de Foucault, Souvenir d'un Ami, Madame Willermoz, Celine Forestier, Victor Verdier, and Charles Lawson, the last one of the most suitable of all Roses for po culture. Messrs. Paul \& Son contributed a second collection, in which were Virginal and Madame Alfred de Rougemont, two light-coloured Hybrid Perpetuals; of these the last is by far the most hardy and vigorous, but the blossorns of the former possess so charming a tinge of rose in them, that despite the less robust habit of the plant it will always be a favourite. New Roses were shown, both by Mr. Wm. Paul and Mesers.
Paul \& Son, to whom prizes were awarded in the order in which the names stand. Foremost among the dif ferent varieties were Pierre Notting, rich violet-shaded crimson, faultlees in shape ; and Madame Victor Verdier, bright rosy crimson, both excellent additions to the Hybrid Perpetual class; as is likewise Kate Hausberg, a showy large bright cherry. Duke of Wellington is as bright and effective as General Jacque minot, but as shown it did not appear to bo very
double. To light-coloured Hybrid l'erpetuals, a class of Hoses at present much behind the crimsous and scarlets of that section, Madame Emile Boyau, rosy blush, large and showy, in a step in the right direction nort of more globular outling. Princem Mary of Cara
bridge was shown again, and on this occasion in rather better condition than at Regent's Park
Cinerarias came from. Messers. Lacoy, Marcham, and Cox. In addition to kinds noticed at Regent's Park (see p. 342) we observed Adam Bede, rose self: Eclipse, white, with broad rosy crimson edge; and Miss Eyles, rose, with white ring round the disc. With the exception of Lord Amberley, which was exhibited again by Mr. Marcham, no seedlings of particular the Day, shown. One, however, named Flower of the Day, white, broadly edged, with purplish plum, between which and the white was a well-defined ring of red, is worthy of notice on account of the additiona ring of colour just named, a feature as yet detected in only a very few varieties
Pansies, both in pots and in a cut state, were fur nished by Mr. Hooper, of Bath; and a few badly Butcher of Camberw Polyanthuses came from Mr . Among Camberwell
Among new plants were some charming Japanese tusoides amœen, which, although shown and described by us before, was reproduced on this occasion in much more beautiful condition than we have ever yet seen it; along with it were two others from the same country; one of them named P. cortusoides grandiflor had large drooping saucer-shaped blossoms, pinkish lila outside and pale inside; the other, which was named P. cortusoides alba, was considerably lighter in colour than either of the preceding; to each of them wa awarded a First-class Certificate. Rhododendron Princess Alexandra, likewise shown by Mr. Veitch, re ceived a similar award, as did\}also a useful lookin orange-scarlet flowered trailing Manettia named micans The same exlibitor likewise had Azalea Stella and Anthurium Scherzerianum, both still in excellent con dition. A small-flowered Azalea named Etna, remark able for the high colour of its blossoms, was shownamong others by Messrs. Smith, of Dulwich; and Mr. Cooling of Bath had cut blooms of his Verbena called Annie which is one of the best of the red and white atriped class. J. H. Vivian, Esq., Singleton, sent cat bloom of Rhododendron Thomsoni, and a variety of campanu latum; the lilac-flowered R. Fortunii, and a cream coloured sort named Princess oî Wales, came from Mr. Sandbach. The garden of the Society furnished finely grown plant of one of Mr. Weir's Peperomias with ample bright green leaves overlaid with a beauti fully silvery variegation
Among Miscellaneous Stove and Greenhouse plante from Messrs. Lee were Ixora Griffithii, beautifully in Hower; Acacia Drummondii, Dendrobium Dayanum and others; Beauty of Reigate Azalea, Tremandm ericifolia covered with lilac blossoms ; Hedaromas and Camellias. Mr. Bull's group consisted of Palms, Ferns, among which was a noble mass of Trichomane radicans; Orange trees ; various red-leaved and other Dracenas; Camellias, among which was the beautiful ort called Countess of Orkney; Araucaria gracilis, and other plants. Mr. Beadon, North Stoneham, furnished very pretty small blooms of Camellias from plant growing in the open air, and Mr. Bartlatt had Lily of the Valley, and one or two Cyclamens.
April 18.-Another fortnightly meeting for solon tific discussion took place at South Kensington on Tuesday last, and was in all respects highly successful Werkeley favoured the meeting with a few comments Berkeley favoured the meeting with a few comment
on such points of interest as presented themselvea on such points of interest as presented comselven Apples from Mr. Rivers, unusually high-coloured and an excellent state of preservation, concions and by keeping them cool during winter, the temperature of the cellar in which they were kept never being allowed to be higher than \(44^{\circ}\). Fruit of the Loquat (Eriobo trya japonica), from Lady Dorothy Nevill, next occupied attention. Among the different plants exhi bited win an example of Nardoo (Marsilea macropus) on the fruit or sporangia of which Wills' and Burke' expedition is reported to have chiefly subsisted during its disastrous explorations in Central Australia Spores, it was stated, were allied in their nature to the pollen of Phænogams, and it was remarked that cakes made of the pollen of a species of Typha were sold in the bazaars of the East. Allusion was then made to some pretty variegated Yuccas shown by Mr Williams, in reference to which it was stated that i grown in heat and afterwards removed to a cooler temperature, the variegation comes out much more parfectly than under ordinary treatment, in consequence of the chlorophyll being better developed in a cold than in a hot atmosphere. In reference to Gymnogramma Parsonsii, a plant of which was exhibited, it was stated that spores taken from parts of this or other Ferns in the normal condition usually produced seedlings in a normal condition, while spores taken from abnorma portions of the plant produced pla persica, from Mr Bull, said to be the Mustard Tree of Scripture next came under review. Mr. Berke toubt as to this that he eatertained some doubt as to this
being really the plant alluded to in the parable or the name of one plant was sometimes in course of time transferred to another ; thus the old Primrose was our Daisy, and the old Eglantine was certainly no Sweotbriar. Dr. Royle, who had bentowed much
attention on the plants of Scripture, however, considered that under notice to be the trive Mustard tree of Scripture. By the Lake Tiberias, where the parable in question was spoken, it certainly attains the stature balance of evidence was nevertheless in favour of the Mustard of Scripture being the same as our own.

Mr. Wilson Saunders then related his experience in reference to the growth of Aloes, which he stated under liberal treatment acquired a mize and beauty unknown to plants treated on the dred are ustally subjected. Mr. Saunders' which they are usinaly subjected. interesting group of Aloes and other plants, to which a Special Certificale was awarded. The same gentleman also sent a leaf of Remusatis vivipara, remarkable for its striking colours, large size, and short time which it lasts in persection, into growth, it expands and acquires solidity in two or three days, but in six weeks the plant dies down.
Major Trevor Clarke, who has one of the finest colleotions of Cotton plants in England, then gave a short
account of his mode of growing them under glass in this country. For cultural purposes, he remarked, our great Cotton family may be diviled into two distinct races-one ofcupying the eqatern, the other the
western world. each being again divisible into two sections, viz, early and late flowering sortso. The early kinds of the soun A werican type, cossypina barba atated to be the true Sea I Iland Corton, with bright yel!ow tubular blossoms, the Tigyptian apparently an inferio type of the same, and the rougher leaved New Orleans To this type may also be roferred the magnificent robust-growing Vine Cotton, and lastly the sort called be found in the cultivation of this section, the seeds of which should be sown as early as February and even January, in order th get the plants up strong and woody before they begin their work of reproductiondepends. A light soil, he said, suits them beat at first; but when they have become established they being favourable, they will be found to grow with great vigour. Red spider, to which they are liable, must be kept in check by the maintenance of a mois atmosphere, If only a pod or two on each plant the exception of the Vine Cotton, which well deserves pots of tolerably large size, the great requisites early sowing, potting in 10 -inch pots, sphere while growing, which induce firm wood, short luterals, and well-filled pods. Plants treated thus will come into flower about Midsummer, and will continue flowering and ripening till late in autumn. They may then either be thrown away, or retained for a second
year. They will remain dormant all winter, and may be cut down to the firm wood in spring. Late sorts will show a flower or two in November, and perhaps set a fruit, ripen it imperfectly, and then growth in the spring. These require to be sown somewhat later than the early sorts-say in April in 10-inch pots the next year. The sorts comprised in this category were said to be the green seed family of the Weat Indies, with its allied race the Mexican Gulf Hill Cotton; the l3ourbon, the Kidney Cotton (Pernambuco Cotton). The great Oriental family G. indicum, requires more heat than any other. The drainage should also be good, as this tribe is impatient of too much moisture ; the soil light. The small sorts in this family make pretty stove plants, and are
well worth cultivation for their well worth cultivation for their beauty alone. The
very interesting Assam sort of Dr. Forbes Watson, and the valuable Dhollerah Cotton were stated to be quickly flowered, and to be both distinct and remarkable plants.
A collection of plants mised from Jungle earth im ported from India was exhibitod by Major Clarke, a method preferred by him to that of importing the usual 'collections' of Indian seeds; but their young condition rendered it impossible to say to what genera they belonged
imbricata, the Monkey puzzle, barked of Araucaria uformed, by rabbits; others, however, considered the Araucaria in question too formidable a subject to be attacked by rabbits, and suggested that the real depre dators might be squirrels. Mr. Graham stated that rabbits were at fault they might easily be kept off by
painting the trees a certain distance up with train oil painting the trees a certain distance up with train oil asafoctida, 'and sulphur, a misture whichlhe had
effectual in all cases in'which he had applied it.
The following candidates were elected Ordinary Esq. Addison, Mrre. Birt, Mrs. Blair, Mra. Brown, E. Dgson

Slougb, contributed on Comisittee).-Mr. Turner, o group of Azaleas, for which he was awarded a Special
same exhibitor likewise came two seedling Auriculas, to one of which, named Godfrey, a First-class Certificate was awarded; the other, which was named Harry, received a Second-lass a Fertificate for a new Bougainvillea, with brick red coloured hracts; this was believed to be a cross between B. glabra and B. speciosa, examples of both of which were furnished by the same exhibitor. To Mr. Ball was awarded a First-class Certificate for two of his new hose-in-hose Mimuli named M. duplex Andersonii and National, of wh
some account was given by us last week at p. 339 . variegated Sempervivum from the same exhibitor received a Second-class Certificate. From Messrs:Osborn came a pretty little Bletia from Japan, for which a Firstclass Certificate was awarded. It was believed to be identical with the Chinese B. hyacinthina, and if so it may be considered all but hardy, Mr. Leach, Clapham, having grown that species for years in an open border at the bottom of a south wanl, with no other protection than that of some ashe placed over the roots in winter. To Messres. Low Son,was awarded a Special Certificate for an interesting ollection of Orchids, among which was a fine variety of Dendrobium Dalhousianum, which received a Firstclass Certificate A similar mark of distinction was also conferred on a new Heath imported from the Cape by Mesare. Low, called E. fragrans, a handsome kind with pink blossoms arranged in whoris round the shoots in the way of suaveotens. Mr. Marshall, of Eufield, received a First-class Certificate for a charming collection of Orchide, in which was a prettily flowered exninple of the new Odontoclossum Bluntii, which was stated by Dr. Reichenbach, who was present, to be quite distinct from O. Alexandræ. This received a First-class Certificate, as did also Gymnogramma Parsonsii, from Mr. Parsons, gr. to W. J. Blake, Esq. Messrs. Backhouse, of York, received a Firstclass Certificate for an extremely brilliant velvety deep criunson Anemone from the mountains of Greece it was named A. fulgens, but it was stated that i was probably a variety of \(\mathbf{A}\), stellata. From Mr Williams, of Holloway, came an extensive and beautiful collection of plants, to two of which, Amaryllis refulgens, and Pteris serrulata angusta, Second-class Certificates were awarded. The same exhibitor also received a Special Certificate for a charmingly-flowered example of the rich orange scarlet Sophronitis grandiflora, which, when wel grow and flowered as this was, is one of the mos interesting of all small Orchids for hanging blocks. A
Special Certificate was also given for a truss of Special Certificate was also given for a truss of magnificent blooms of the fine Bhotan Rhododendron Nuttalli, from the same skifful cultivator. 1 . Veitch Primulas mentioned in another column; and a Special Certificate for a fine collection of other plants, among which were Rhododendron: Princess Alezandra and R. Henryanum, Cattleya Dominiana, a magnificen specimen of the ivory white-blossomed Cymbidium eburneum, and Leolia elegans. From Mr. Ayres Nurseryman, Biggleswade, came some Seedling Conifers, apparently Retinosporas, to two of which First-class Certificates were awarded. Azalea King of the Doubles, and other plants were contri small group of highly interesting plants, from Messrs A. Henderson \& Co. was a handsome specimen o Oreopanax dactylifera, the young leaves of which when just expanded are unusually pretty. From Messrs. Jackson, of Kingston, came two varieties of Pelar gonium, said to be good sorts for forcing; and one or two other plants were also shown by other growers.

tralia; communicated by the Secretary. of South Am,
March 16. -G. Bentham, Esq., President, in is
Chair. Isaac Anderson Henry, Esq. Chair. Isaac Anderson Henry, Esq., J. W. Morm The following papers were read: -1 . Notes on lichent collected by Sir John Richardson in Arctic Americ By the Rev. W. A. Leighton; communicated by
Hooker.-2. Palms of East Tropical A Dr. Kirk. The Palms of this region, so far as B Explored, were stated to belong to the genera C Elæis, Phœnix, Borassus, Raphia, and Hyphæne.
Cocos (nucifera) was stated to be beyond 60 miles inland, but Dr. Kirk had met ran few trees bearing fruit at Zete, and at a distance
300 miles from the sea. The Elæis of the Cen Lakes of Tropical Africa was identified Cent guineonsis, though the author thought it probe that further research might establish its distinctne therefrom. Seen from a distance the Oil Palm ha Date having a Pala drical stem 30 feet high, surmounted by a cromit feathery fronds. As yet the Elæis is only known from the ide of Africa. The African Burassus has of the enter by authors under the name of B. æthiopum, from B labelliformis, on account of its fewer flowers in ead catkin, its swollen stem, and its geographical pooil many flowers as the Indian; the swelling of the stem, seen in many Palms, is iu this case, although nestem, from universal; and many other African trees bave reuniteud also in Asia. On these grounds the antho largest of East African Palms, sometimes attain 80 feet in height, such a tree at 5 feet from the gronn having a girth of about 6 feet. The ventricosity of stem most commonly takes place at from \(30^{\circ}\) 40 feet from the ground, and when it occurs
to mark the first flowering of the plant thickest part of the stem is at the base, abore this it quickly diminishes in the first 5 feet, reaching the minimum girth at, 20 feet, and above this aga in thickening owards the ventricose part. The wood was dencribed as hard outside, and soft and pithy within, but when kept dry durable and resisting the attacks of termiter Both negroes and elephants suck the outer coat of the ruit, which has an agreeable smell and a nue the albumen is eaten, and the young shoots are cooked as a vegetable and esteemed both by the natives and the Portuguese. Palm wiue also is made from this pecies. Of Phœnix spinosa the split leaf is made fine mats and caps. The fruit remains long attac to the tree without ripening, but the green bunches carlet hue, and their astringent pulp at the a time becomes sweet. The Hyphænes were pointer as difficult to subdivide into satisfactory species, 80 being dichotomous, as the Doum Palm some cylindrical throughoat, and some
Dr. Kirk limits the Zambesi species to these cea, a maritime plant, with dichotomous atem, p. fruit, and oblique ligule; H. crinita, an inla ligule; and H. ventricosa, a new species from Central districts, with ventricose stem, spherical and unilateral ligule. H. thebaica was stated to di rom H. coriacea in the form of its fruit, which is lara at the base than at the apex. Of H. coriacea there ar wo forms; oue 30 feet high, the trunk many divided, and one much smaller, seldon divided m than once, and often occurring as a bush witha Anomallay Hills, in the Madras Peninsula, by R. H. Beddome; communicated by Dr. Thom80n Anamallays rise to an elevation of neare sea, their base being about 1000 leet above the sax being found between 1500 and 2500 feet ele ome trees occur measuring 20 feet in circume hen These forests are dry and comparatively open, being annually swept by fires. The moist forest racts, and has quite a different vegetation, Urticaces, Anome being plentiful, their trunks covered epiphytic Orchide, and Ferns and Balsams abonade while the chief under-growth consists of

Dr: Webster's Complete Dictionary of the D. Dn and Language. Revised by C. A. Goodrich, D.D., in Noah Porter, D.D., Frofessors in \& Daldy; 12 Parts, pric.
Judging from the single Part which is before ns, work promises to be an extremely cheap, val in most comprehensive dictionary.
small type, with three columns now usual in works of this kind, the firs n capital letters, but are printed in a larg type to catch the eye. Two or three shese are coodcuts adors nearly every page. These are "amphora," "ampulla," the Egyptian go
ac.; in some cases, however, less discrimination has dan " anvil" or an "ass."
The programme sets forth that "care has been taken to preserve those obsolete words which are found in the writiugs of such authors as are such words. There is a ionily we find a great vulgar tongue: a "blow ont," for a tance, is a significant bat not very elegant expression. The popular writers, both of England and Anerica, conciseness of definition are a merit, Dr. Webster' Dictionary may lay claim to that merit in a high dugree, shis deservedly popular work within the reach of our luumbler classes, who ought to possess a good dictionary of their own language. We may notice that the pronunciation with the single exception of the nasal sound which orcurs in the French words bon-bon and bon not. This is a sound very difficult to the Buglishman's organs of speech, and we dou't know how express it in English letters, but certainly it mast pot be pronounce

The Astronomical Observer. A Handbook to the W. A. Darby, of Manchester, F.R.A.S. Pp. 104 4.0. Robert Hardwicke, Piccadilly. 1864.

Theer ferm pages possess a very high order of merit, and will be most-welcome to the small class of persons for whom they are written. Unlike the Nautical rorld, and is in the hands of every sea-captain, this bandbook is intended for professional and amateur observers, who wish to direct their attention to the very interesting nebulæ, clusters, and double stars, which are to be found in the heavens, if people only of such objects, with directions whereby the possessor of a properly mounted common astronomical telescope proper place, in its own proper constellation. We have the beat authority for speaking in high terms of "The Atronomical Observer,
In the Introduction Mr. Darby states concisely the views of the early astrono ners Pythagoras, Euclid,
Ptolemy, Copernicus, Kepler, and Newton; and then Ptolemy, Copernicus, Kepler, and Newton; and then
the labours of modern observers, whose names need not be mentioned. He explains the use of an ingenious Iris Diaphragus, and the proper adjustments "of an rith a noble quotation from Sir John Herachel to this
"The stars are the landmarks of the universe Every well-determined star, from the moment its place grapher, the navigator, the surveyor, a point of departure which can never deceive or fail him ; the 3 to be a test for every instrument invented by man, yet equaly adapted for the most ordinary purposes; as a navy to the Indies; as effective for mapping down the intricacies of a petty barony, as for adjusting the boundaries of trans-Atlantic empires. When once its place has been thoroughly ascertained and carefully racorded, the brazen circle with which that useful work was done may moulder, the marble pillar totter on its cratitude of posterity, himself survive only in the transfuses all its own exactness into every determination instruments, it for a groundwork, giving to inferio to the observation even to temporary contrivances, and cinion attained originally few weeks or days, all the prehbour, and expense."

The second volume of Harvey's Thesaurus Capensis, plants, indigpensable to students new or rare S . African brought to a close with the 4th number recently part are Zahnongeria Wyleyana, a graceful in the present with pedatifid leaves, and great ovate sinuately-toothed cyphala, almost the new Asclepiadaceous genus Sarcofrom which it the donble of Sarcostemma viminale, and four species of in its singular cup-like corona; though they would be worth cultivating which look Gmbels of lardi, winear-lanceolate leaves, and great of Lindley is figured undate flowers. The Epiphora Lindleyana, the author under the name of Polystachya any distingrishing character in the structure of its Since our las supposed to be the case.
following subjects have been Butanical Magazine, the polourndrum dichromum a mabile, in its pages :addition to the from Bahia, and a most welcome pinnate a light margin.-Morenia fragrans a crimson pinnateleaved small Palm akin to Chamællorea, and to deniana, Wendland has given the name of M. Linhoase plant from the collection fine succulent green-

Esq. It is supposed to be Mexican, and stemless, with
horizontally spreading, distantly horizontally spreading, distantly spined leaves, and a
scape 14 feet high, with numerous subglobose fascicles of green flowers distribuied along the upper part. These fine plants seem to be making their way again into popular favour.-C'celogyme fuscescens brninea. a rare Moulmein Orchid, with yellowish flowers, laving the lip stained with reddish brown.-Manettia micans, a fine hothouse climber, introduced by Mr. Veitch from Peru; it is stouter in labit than M. cordifolia, and bears drooping leafy panicle-like lateral branches of bright orangeored flowers, even more ornamental than in the favourite species already mentioned. Ariscema papillosum, a tuberous Aroid from Southern India and Ceylon, with pedately-parted leaves, and green flower spathes. The large tuberous roots are used as a medicine by the Cingalese, and are sometime called Snakeroot.-Alocasia Lonoi picta, which, how ever, appears to be the Culadium (?) Veitchii described in our volume for 1859, p. 740, and considerably dif-
ferent from though bearing a certain likeness to A. Lowii itself.-Lrelia prastans, a beautiful dwarf Orchid, with large flowera, related to what is often called Cattleya pumila.-Iresine Herbstii, the crimson-leaved plant recommended for summer bedding, and named it Belgium Achyranthes Verschaffeltii. The plant has flowered with Mr. Herbst, and the terminal panicles of yellowish green contrast strikingly with the colour of the leaves,-Aglaonema marantafolium maculatum,
the blotched-leaved white-spotted Aroid, which has been repeatedly shown under the name of A. commutatum, - Acropera armeniaca, with apricot-coloured flowers, and the most ornamental species of its singular genus. -Billbgrgia olens, a Bromeliad, with short erect crimson floral leaves and purple flowers, almost hidden in the heart.-Astelia Solandri, a greenhouse Liliaceous
plant from New Zealand, with long linear-subulate two plant from New Zealand, with long linear-subulate two
or three-ribbed leaves, and yellowish panicled flowers.Cattleya quadricolor, a beautiful New Grenada plant with white flowers, having the lip beautifully varie gated with yellow lilac and purple. Mr. Bateman, by whom it is described, concludes that there would seem o be a hich probability that the six so-called specieslabiata, Mossiæ, pallida, Warscewiczii, Trianæi, and Wageueri, are in reality varieties of a single form that spreads itself like Epidendrum ciliare and cochleatum, over the whole Orchid growing region of tropical America.-Masdevallia tovarensis, a charming dwarf white-flowered Orchid from Columbia, with its smaller dorsal and larger confluent lateral sepals all caudate the minute petals and lip almost lost in the cup-like base of the connate sepals.- Monochotum dicranantherum, a small shrubby Melastomad from the lofty Andes of South America, a foot to 18 inches high, with elliptic lanceolate leaves and small rose flowers, the atems red and" the upper half of the plant consisting of a series of small flowering panicles, collectively forming an oblong multiflorous large panicle." It flowers in
October.-Ariscema Wiactiv, a South Indian species, with roundish tubers, quinate leaves, pale green incurved spathes, and the spadix ending in an exserted subulate appendage six inches long, curved below, but erect above.

\section*{drlorists' \(\mathfrak{f l l o w n t s . ~}\)}

The Hollyhock. - I was much gratified at noticing at p. 319 a column devoted to florists' flowers, contain ing an excellent article on the Pansy, by the well known grower and judge, Mr. Dean, of Shipley, the harbinger, I trust, of many more interesting contribu-
tions from our principal florists and amateurs, on the treatment and cultivation of their several favourites As example is ever better than precept, I lose no time in offering my mite in the shape of a few jottings on the Hollyhock, a flower which promises next to the Rose in a few years to divide with the Gladiolus the suffrages of the floral world. In the few hasty remark I am about to make I address myself entirely to beginners. Old friends of the flower need no such hiats. Would only they would favour us with a little
of the lore experience has taught them. The season is travelling on so fast, and planting-out time is so near at hand, that any suggestions on the propagation and treatment of the plant during the autumn and wiater months would be now out of place; hut should no other friend of the flower favour us with his advice
on these points, I will gladly give the results of my on these points, I will gl
own experience later on.
The Hollyhock can be had in bloom from the end of July in the south, and beginning of August in the north till the frost sets in. Old plants and summer and early-struck autumn ones will be at their best about the middle of August; in succession to these those struck in early spring will come in; and fo blooms for the later shows in September, cuttings put in to strike the first half of March will answer. As no flower has so much work accordingly. Let the ground be well trenched to the depth of 2 feet, and plenty of manure put in.

As to the manner and disposition of the plants the most effective plan is to have them in an alternate double row; the longer the rows the greater the \(2 \frac{1}{3}\) feet between ; if set rather wider apart it would be better for the strength of growth, but the nearer the
more telling they are at a distance. When intended
solely for exhibition, I grow them in solely for exhibition, I grow them in a square piece, in For 4 feet apart, and a yard between the plants. or garden decuration I usually bad a double row, but lately have planted out about a hundred of the best and most effective varieties divided into three rows, a jard apart all ways, aud over them, when just breaking into bloom. I have an awning extended; the supports of Larch, 10 feet apart, and the roof as light as possible, wade principally of tiling laths. A friend, at my recommendation, intends this season having 8
double row of a bundred each, with a background fergreng bunured each, with a background Pelargoniums, Calceolarias, \&2. This bed, when at its best, will be gorgeous in the extreme.
Having tried early and late planting, I think "that generally the second week in April is the basi time for placing out the first lot; and the planting may be continued till the middle of May, as the plauts in \(8 u c c e s s i o u ~ b e c o m e ~ r e a d y ; ~ b u t ~ b e f u r e ~ p l a u t i u g ~ o u t ~ a l l ~\)
nust be well hardened off. Wher flower-pots should be placed over them ou, hrg they are well established, or have outgrowis their protector 3. When the plants are about 6 to 9 inches gigh, if at all spindly, they ought to be tied to smali sticks as a temporary stay, and when they have
attained to about 12 inches, the proper stakes ought to be inserted a few inches from the plants, and driven well home : they need not be more than \(2 \frac{1}{2}\) to 3 feet out of the ground. When old plants are grown, only one stem should be allowed to go to spike. A little water ouly is advisable at first, but as the season advances they can scarcely have too much. From the quantity they and their cousins the Dahlias can mbibe they may be fairly enlitled aquatic or rather amphibious plants. As mulching is strongly recommended by most of the great authorities on the flower, I have
tried it at various times, as well as for Dahlias and Roses, but have now given up the practice. No doubt it is beneficial, and conduces to a healthy and vigorous growth, but it is neither seemly to the eje nor pleasant to the feet, and is withal very untidy. From the moisture causing the mulch to abound with worms, the blackbirds and thrushes are ever at work, with a perpetual scratching.
If that gardener's pest the red apider, to which I regret to say they are sadly liable, should attack them, they must be well syringed, particularly the under part of the leaves. During the growing season a little liquid manure or weak guano water may occasionally be given. Should strong winds prevail when the plants are about half grown they maust be carefully watched, and stakes of greater length set diagonally across the weakest as an extra temporary support.
At that period their growth is very rapid and succulent, and in a high wind they are very liable to be broken short off. As the season advances the spikes become more woody and fibrous, and will then resist the strongest gales
I have frequently been asked for a list of the best varieties, but a satisfactory selection is difficult to give unless the principal object of their cultivation be first known. Like most other flowers, the varieties most telling for garden decoration do not find the most favour on the exhibition table, though the Hollyhock, after all, in this respect, has the advantage of mosi extended cultivation of this noble flower is its expense, caused principally by the difficulty of its propagation Now varieties generally come out at from \(10 s, 6 d\). to 158 , and unlike Dahlias, when may dimish but gradua shilling the next season, in value. Some varieties are so shy in throwing out cuttings, and these so difficult to strike, they become scarce and dear. Nevertheless the flower has made such rapid strides during the last few years that very fine selections can now be obtained at a moderate cost. But I must reserve lists of varieties and any further remarks for a future opportunity. Edvoard Hawke, Willingham Rectory.

\section*{Ufe Aptary}

Ter system of Artificial Swarming, as detailed in page 343, was that best adapted for being carried out with improved hives or boxes. We have now to consider the best mode of effecting the same objects with the old-fashioned common straw hives. It is well, if possible, to commence about 10 days before it is intended to operate on the stock hives, by raising some royal cellis in a nucleus, as described in our last This is by no means necessary, but a very great gain of valuable time is aforded to the parent stock from which the bees are to be driven. We will imagine the bee-kceper to be in the possession of three stocks of bees in common hives, which we will call A, B, C. It is important that the condition of a hive, from which it is desired to force a swarm, should be as nearly as possible the same as that of one which will be ready to throw off a natural swarm in the course of a few daya That is to say, the population should be abundant drones should have made their appearance, and there should be a large quartity of brood in all stages of development.
a fine day should be chosen for the operation, and there shonld be a large proportion of the adult bees on the wing to and from the hive. Gently lift up. \(\mathbf{A}_{\text {, }}\)
blowing a little smoke in at the bottom, which will drive the bees up among the comber Invert the hive on a bucket, place an empty gtraw hive over it, and secure the ellgen with a cloth, to prevent the escape of bees. Now jlace an empty hive on the old stand, to act as a decny, or to amuse the returning foragers. Gently heat the sides of the fuithin a few minutes the or the hands, anil gencrally witt of ascending into the hees may be heara in the the case, the cloth may be empty live. Thin being the cabees upwards may be removel, and the progress of the bees upwards may be
watched. When hey have all ascended, the hive with the driven bees must be placed on the old stand, allowing thise in the deeny bive to unite with them. Then, if royal cells are available, carefully fix one or two amosig the cembs; but whether or not, proceed as soon as rossible to remove a populons hive \(C\) to another part of tho garden, and stand the driven stock A in the will, after hovering about a little, settle quietly in \(A\), numl, providell no royal cells have been added, will very son commerce their conatruction, and the transforma tion of worker grabs into royal princesses. These ing out fiom the broud-combs, will soon again render A very populous.
In about ten days after forcing \(\Lambda\), proceed with \(B\) in the same matnmer, this time removing \(A\) to another atand, and potting B in ltsplace. There need now be no diffienlty in the procuring of spare royal cells, or
young queen for the purpose of fixing in B. Soon after this, C , the first live transposed to afford a population for \(A\), will have become full of bees. A swarm may be driven from it, and it may be placed on 13 's brood and carrying on the stock. The hives are now exactly doubled in number, and this ought to satisfy every aplarian who denires to posuess etrong colonies in the best condition for collecting honey. But if his object should the the greater increare of his stocks, he may go back over the bame course again, taking care not to weaken his colonies too much
The foregoing plan Is available where there is more than one hive at disposal; but if it is intended to force a swarm from a single stock without assistance from any other, a very difterent plan must be followed Proceed as before to expel all the bees from the hive,
having placed a decoy hive on the old stand. When the bees have ascended into the empty domicile, tie a coarse cloth round the bottom of the bive and remove within doors until evening. Restore the old stock to its proper position, returning are still flying about unsetted This will ensure suffectent population. The new swarm may be located in a purt of the name garden as far as posoible from the place the old hive occupled; or, all the better
if it can be taken away a distance of more than a mile.
It will be seen that thls plan is in accordance with many of the pripciple which operate in natural reasonably be expected in the course of a few daye, there will most probahly be a suffiency of royal larva were absent at the time of the expulsion of the bees, will be in almost all respects analogons to the return ing bees, which remain to people the hive after the departure of a natural swarm
-To those who desire to atock any favourite hive on an improved principle, this plan may be very advantageously adopted. If the preservation of the straw bive be not desired, all the bees may be expelled from driving, and the bees united to those already domiciled
dita in the new hive. This is a much better plan than that of attempting to transfer combs and bees from common hives to boxes, which is so often desired by apiarian novicea.
It is not possible in the space of two short papers to treat the sulject of artificial swarming as it deserves. We theretore invite inquiry from our apiarian readers Who may desire further information on this, or on any other subject connectel with The Apiary.

\section*{Garden Memoranda.}

Mr. Williams' Nurbray, Holloway.-A mag. nificent tree of the Bhootan Rhododendron Nuttallii 2 now in full bloom in Mr. Williame' noble show-house,
or rather Conservatory, at the entrance of his new Victoria Nursery, Holloway. At preseut it has no fewer than 100 fully expanded blossoms on it, each of Which measures 6 inches in diameter. They are of a delicate white culour, flusbed in the throat with lomon, and they possess the good property of being deliciously ragant. Such a tree, laden as it is with its multi tudes of huze trampet-shaped blossoms, is worth
traveling miles to see; and all who are fond, not only of Rhododendrons, but of other flowering shrubs and plants tantefully associated with Tree Ferns, Aloes, aud the kinds of Yucca, of which Mr. Williams has perhap in paying collection in the country, should lose no time of Oichi his establishmont a visit. The rich collection bloom, will also afford muoh interent and variety, and
will well repay inspection.

\section*{Miscellaneous.}

Raflesic. It is well known that the greateat flowe In the world is that of Raffesia Arnoldi, which is parasitic on the roots of certain species of Cissus in the isles near the Sunda Strait, especially those of Cissus scariona. M. Tevomann has tried, in the garden of Buitenzorg in the isle of Java, to sow the plant which produces these gigantic flowers on the roots of Cissins, after having made an incision to divide the bark. The experiment has been perfectly snecessful, and at the end of 18 months, M. Teysmann has had the satisfaction of seeing many flower buds of Raflesia burst from the roots, whose size varied from that of a Pea to that of middle-sized Apple. From the observations which the Dutch gardener has had an opportunity of making on spontaneous Rafflesim, these buds will require a year or more before expanding the flowers, which are frequently not less than a metre in diameter. It has also estub lished this singular faot, that the parasites spring some distance above or below the point at which the seeds were insertnd. We may then hope to obtain in cultivated state this remarkable vegetable, whose discovery at Sumatra by Dr. Arnold in 1818 was quite n event in the scientific world. La Belgique Horticole, June, 1864.

Vegotable Flamnel in now largely manufactured in Germany from the Pinus eylvestris. A great number separating the fibre from the oil. The fibre, locally called wold-wold, is spun, knitted, and woven into variou fabrics. It is said to be highly efficacious in restoring the function of the skin to its normal condition Athewerm.

\section*{Calendar of Operations}

\section*{(Nor the onsuing toeek.)}

The weather, though bright during the day, still continues cold at night. Calceolarias and other bedding plants pricked out in turf pits to harden must thereore still be covered up at night. Any protection that may bave been afforded to fiue specimens of Standard Laurustinus, or other shrubs, should however now be wholly romoved.
flower garden and plant houses.
Thorough.dress ail beds and borders; prepare stations on lawns for extraordinary specimens of ornamental plantn, as large Fuchsias, \&c., putting draiagge in the bottom, and good turfy and mellow compost above. Trim and prune all climbers on out-door trellises, or conservative walls; and prepare stations for plants to fill up blanks. Cold pits will now be occupied with some of the early struck stock, hardening for the lower garden.
Annoals. - Half hardy sorts should now receive attention. The best method of raising them is to sow hem in pans or boxes now, or in a bed about 3 inches thick, of light soil, placed on a gentle bottom-heat, furnished by means of atable manure or vegetable refuse, and protected with a frame. Water sparingly, and give plenty of air when the plants appear; thin ont or prick off in small pots, and be careful to get the plants well inured to the weather previous to planting in the open border, and also to give water as may be necessary, after planting, until they become established.
Azaleas.-Specimens now in full blossom must be shaded from bright sunshine. Plants that have been kept in haat to bring them into flower will now require pretty liberal supplies of water. Great attention should be paid to ventilation, particularly in guarding against cold currents of wind. Young plants wil grow rapidly if shifted and placed in a moist warm temperature ; see that they are clear of insects.
Calceolarias. - Those intended to make large speci mens will have received their final shift. As the season advances, so must the grower be more watchful to keep down insects. A very mild moist temperature is the best suited for the Calceolaria at this season.
Camellias. - Plants that have done blooming should be placed in heat to make their growth ; shift any that require it; syringe them daily. Water freely plants now bloom, and occasionally with weak liquid manure.
Cnnerartas.-These should now have all the ai possible on every favourable opportunity, avoiding
cold draughts. Pick off decaying leaves and blooms, and look well to mildew.

\section*{forcing garden.}

Cucumbrrs,-Get those intended for ridges hardened forthwith, preparatory to turning out, and let trenohes be prepared for them. A trench thrown out 8 feet wile and 2 feet deep, and filled to a foot above the gronnd level with such materials as litter, Grass mowings, or leaven, with a little hot manure, al When complended, will make an excellent bed, When completed, raise mounds of moil 3 or 4 feet apart, Fics - rece the hand glasses.
Figs.-As the seasou advances gradually raise the lemperature of the house. Syringe mornings and afternoms. Keep a moist atmoephere. When the borders require watering, give them a good soaking. Piants in pots and tubs should have some weak manure water occasionally
Praches axd Nmerarines.-Continue to keep the noots to well tied-in in the early house, and be careful not to get them orowded. In disbudding, the bearing shoots except the terninal should be divented of al

When a deficiency occurs ln any part of the tree, thom
may be tied in. Ventilate freely in may be tied in. Ventilate freely in fine weather, and be carefut or twice daily, and keep a moist aon. Byrine thowing plenty of water on the moist atmoesphers by Pings.-See that good mellow turfy soil is re de under cover for the shifting process; also mateari or thorough drainage, such as broken crocke mind ones, charcoal, \&u. Use clear liquid manure swelling fruit, when necessary; and keop up a lindy heat, with plenty of atmospheric moisture
Vines.- Late Grapes, such as West's St. Peter Lall Downes' Seedling, Black Damascus, Muscate, io nill now or soon be breaking. Let disbudding, tyim ing, acc, be duly attended to, according to pie ples luid down for the earlier house

\section*{HARDY FRUIT AND KITCEEN GARDEN}

Disbudding wall trees should be commenced ear!s expended in producing eupertlunus wood. In the final regulation of the shoots do not allow more is push into wood than con be conveniently trained in When working at wall trees avoid treading upon the soil; a plank and a few bricks moved alung as the work proceeds will obviate the evil just natned, and will yield more comfort to the workmau.
Letruces.-After this time it is best to sow tinee where they are to remain. Drills for them shoold bo drawn 10 or 12 inches apart, and a fow seede dropped in at intervala of about 8 inches asunder; as soon en the plants are fairly up these patches should be thinned to one plant
gTATE OF THE WEATHER AT CHISWIOK, NEAR YOMDOM. For the Week ending April 19, 1860, as observed at the Horticulturai Garian

EXYARD, Swan Place, Old Kent Romd, Londod, S.TH of March the field of 24 acres was cropped in the fullowing manner, with alteruate stetches of eight rows each of Mangels aud Swedes.

\section*{Swedes.}

\section*{Mangels. Swedes.} Mangels.
Bof re sowing we applied artificial manure in the manner to be described. Fxperience has amply taught the great value of bonestly prepared artificial manures, and where these are really manufactured by respectable men, of which
in the present day we believe there are not few the farmer's money in not unwisoly apont apon them. Our experiments were performed with a special madure, prepared by Mesars, Proctor \& Riland. And now for the experiments themelves.
The field of 24 aores was divided as fullow: -
\(\square\)
1.- 6 acres in which the artificial manure, 3 cut. to the acre, was drilled with soeds.
2. 6 acres, in whieh in extra drewsing of rotton farm-yard manmre was used, but no artificial.
3.-10 acres with artifieil manum, at the rate of 3 cwt . per acre, sown broadcast.
4.- 2 acres, without any extra farm-yard for artificial manure, but sown apon a froab ploughing of the land.

24 acres.
With regard to No. 4, we should state that there two acres in nearly the middle of the field were met apart at the imstanoe of the bailiff, who joined issue with the neighbouring farmers in deprecating the value of artificial manures in this land he had no st faith in this trade stuff-one more ploughing was worth it all." Well then, these two acres were ploughed and rolled and drilled with the rest, and the result of the four plots was as follows:-

\(\because\left|\begin{array}{c}\text { Or BWEDE. } \\ \hline \text { Tons. } \\ 20 \\ 17 \\ 23 \\ 0 \\ \hline 17.1\end{array}\right|\)
\begin{tabular}{c} 
Or Manolin. \\
\hline Tone \\
21 \\
10 \\
\(\frac{85}{10}\) \\
\hline 10
\end{tabular}

The best of these results is not very favourable considering the nature of the soil and the care and expense in the oultivation. Still for 1864 they contrasted favourably with those of farms for some miles around, and we may state that had it not been for the destruction caused by the caterpillars of the Noctua, 824 of which were hand-picked from three rows of Swedes of 324 yards each, we should in all probability have had no bad orop for the average of seasons.

The Plot 3, then, will be found to be muoh better than Plot 1, a result which is quite in accordance with Profemsor Vorlcera's teaching, and our own experiments and observations, namely that the best rosults from manures oan only be obtained by their being intimately mixed with the soil. Here then the sowing the manure broadcast upon the well-tilled soil, and the subsequent drilling and harrowing in the seed, and the subsequent rolling answered well; whilat powerful manures in the drills with the seed, though they may stimulate it into germination, will yet cause much to die prematurely; and as the fibrils spread they seek in vain for that gradual and equable supply of nutrition whioh we many coneoive to be as important to a plant as to an animal.

As regards Plot 4, it was simply a failure, but it served to show what might have been the fate of the whole field had we only followed Practice; but having taken Science to our counsel, we think that to the union of science with Practice, we are indebted for our happient results.

Now, on reviewiug the action as herein desaribed, we mast confess that while it shows us the advantage of experimental ferming, jet it is plain that the man who onls aots in every porition what he has been taught in one, must ever bo experimenting, whilst he who acts upon principles, all of which are generalisations from observed facts, is not after all the wild experimenter he is sometimen considered. \(B\).

We promised our readers some time ago a descriptlon of the Wheats shown at the Agricultural Hall, Islington, in December last, by Mr Patrick Shirreff, Haddington, who has longest and most persistently and intelligently of British agrieulturiste directed his attention to the improvement of our cereals. This allootion of British Wheat was grown at Maddington in 1864, under a parity of circumatances and for the purpo:e of comparison. It consists of 72 varieties, 43 of them having been selected and raised by himself, the latter boing diotinguished by an asterisk
The Wheats were shown in nine cases, contalaing eight compartments each, and having a medium sized ear, sample of grain, the name, and length of straw of each variety. We shall commence our
desoription on the left side of Case No. 1, and proceed in this order to the end of the colleotion.

Oase 1.
1. Ambert.-A handsome lightred beerded our, with tranolu. cent roddish grain. stime 4 foet 6 incheo 2. Hunter's -A White ear, tapering at the apox; grain
hitish-brown, elongatod and glosey. Straw of oot 10 inchens Sinith's:-A bearded white ear; grinn whitith, tapering at

4. Pomen-A white ear, brownith graln. Straw, \& foet 5. Shirrefob Beardsd White* - A handeome whito-bearded
 preseod eye. 8 traw, 4 feot 7 inches.
 d And Atraw, 4 feet 7 inches.

Cabe 2
9. Ifondens:- A boarded whito ear, with large white grain. 8trim. 4 freot 7 Inches.

Mungonvell's".-Ear white, with browninh grain. Seraw, t 9 inchos.
- - A white ear and white grain. Straw, 8 feet.
w. - Ear white, with white glosay grain. Straw,
13. Pringleit \({ }^{4}\) - A bourded white ear, with white grain. 14. Truntomilenn. - A white ar

Strnw, 4 foot 21 incheat 16. Trump - A whitish oar,

paron, extra fine grain. Straw, 4 feet 7 inches. 69. Rennie's*. -A semi-woolly beard
white and fine. Straw, 4 feet 6 inches.
70. Muirton Re. \({ }^{*}\). - A handsome short-bearded olose-set red ear; grain red, smallish, and extra fine. Straw, 4 feet 8 inches.
71. Aitehell's". white and very fine. Straw, \& feet 7 inches.
72 . Huills. - A bearded red ear; grain white and small. Straw, 4 feet 7 inches.
We place these desoriptions on record here, but it is manifest that the few words giving an account of each variety are altogether insufficient for its identifioation, and a great serviee would be rendered by Mr. Shirreff, than whom there is no one more competent to lead us out of the labyrinth of synonyms which confuse all plant descriptions if sets of well-established varieties of Wheat and Oats and Barley were placed by him in the hands of our leading Agricultural Societies. Perhaps we rather ought to say good service would be done by the Societies if they would commission Mr Suirrefe to undertake a task involving so much labour and responsibility.

In such a collection every grower of Wheat could solect a variety with grain, ear, and straw, to suit his fancy, but there would be nothing to determine relative value beyond the appearance of the samples.
The number, combined with quality, of quartern loaves from a given quantity of Wheat may be taken as the best measure of value, but to test in this manner all Mr. Shirreff's new varieties is too much to expect from a private individual. Judging by the samples, Shirreff's Bearded White (5), Gibson's (7), Hepburn's (8), Drans's (66), and Niellis (68), deserve attention from their fine grain and uniformity of type.
Of the woolly-ear or rough-chaff varieties, Thomson's (33) and Mrtchell's (71) are highclass Wheats, and have no resemblance to any of our rough-ohaff varieties in cultivation.

Amongst the red kinds, Shirreff's Bearded (21), Aconbury (23), Peter's (28), and Muirton (70), will favourably compare with the old sorts.

Órmiston (67) and Riciard's (50) are particularly attractive, the latter being, so far as we know, the most successful attempt at crossing cereals in Britain. Hitherto this Wheat has come true from seed, and its large white grain and stout straw are remarkable features.

Mr. Strafford will on Tharsday next (April 27) dispose of a portion of the herd of purebred Short-horns belonging to Mr. BowLy, of Siddington, near Cirencester, Gloueestershire.
We condense the following from an account of the herd in Bell's Weekly Messenger:-

In advertising for sale by public auction on the 27th of this month 37 members of his valuable herd of Shorthorns, Mr. Bowly is anxious to have two points clearly understood; that his sale is a genuine sale of entire families, not merely a selection from families-and that if personal, feeling, rather than considerations of what seemed to him due to the public, had regulated his determinations, many of the number which appear in the catalogue would have been retained at Siddington. The animals are disposed of for no faults; indeed, one, Sunbeam, in whom symptoms appeared which rendered her future breeding at least doubtful, was withdrawn from the list, and is put aside for fattening. The public may rest fully assured-and those who know Mr. BowLy personally will-that no trap of any sort, direct or indirect, is laid for them; that the sale is literally and in the most comprehensive sense of the term a bond fide sale; and that parties purchasing will be dealt with by Mr. Bowly precisely as Mr. BowLy, the cases being reversed, would desire that he should be dealt with by them. This we have great satisfaction in saying, because we know it to be true. In the whole range of Shnt-horn breeders, there is not a man whose reputation for truthfulness and honour rests upon a more impregnable foundation. With the exception of four females and one bull, all the lots offered for sale were bred at Siddington. Of the females 16 represent three families; the Lady Byron family alone consisting of 11 females. Lady Byron and her daughter Ada were purchased in 1837, and have proved a most successful family, possessing irreproachable constitu tions, and being regular breeders and good milkers.
Many of the tribe have been sold to go to Australia
the whole lot, and some of them are admiferent auimal in "With the exception of Lots 1 and a nimals offered by Mr. BowLy represent (Cows), the the blood which Mr. Batrs's distinguished peor less a breeder has made so famous. Eight of the position 29 are by 4th Duke of Oxpord, the grand the 22 female did so much for Mr. C. W. Haryer's bend that Earl of Walton, a son of Kibiclevington hix by Eabl of Derbis; one by Imperial Oaford, now by property of Mr. Hegan; tiree by 7th Duke or Yubr many - not fewer than eight - are three-quarten BATES, having two final BATES crosses in succearten several are as near as may be three-quarters ; and all that are old enough to breed, with one exception are bulled by 7th DUKe or York, undeniably ane the finest sires of the day. Some of the bull of even still more strongly impregnated with Bures bued EARL or Walton, but for a slight dash Burs biod EARL OF WALTON, but for a slight dash of Chent
blood, is entirely Batrs; 4th BARON O Dlood, is entirely Batrs; 4th Baron Oxyord, adod Tertios, and 2d Bates Tertius (incompry Batrs ppellation), seven-eighths. Two of the bulls, me add, are by 4th Duke of Oxford, and nine by 7th Duke of Yore.

ALBERT MIDDLECLASS COLLEGE, SUPFOLK
I Hopr you will permit me a space in your columnt describe the reception of the 150 boys into this College, selected as the eldest of the number nominated, have this day witnessed in my official capacity. Mond number of younger lads will be admitted nex accommodation of the College; this fact proves at one the public appreciation of such establishments, and the soundness of the opinions and advice of the late mack lanented Prince Consort, whose aim it ever was to induce every class to improve the education of the rising generation. The parents paid the school fees for one term in advance; this system of pre-payment pre. cludes all possibility of contracting bad debtes, to the detriment of those who pay punctually. The boys just admitted are all purely of the middle class, that is, they are the sons of farmers, business, and professional men. It is impossible, sir, for me to tell you how gratibed l felt at seeing these parents come forward so ghady 4 the very first commencement of this Institation, with the fullest confidence in the judgment that had directed the movement. It was also a great pleasure to witnom the intelligence and cheerfulness of the boys themelves, who seemed fully to appreciate the feeling which hew placed them there, and I have no fear but that they will by their perseverance and good conduct rendes themselves worthy of the great advantages offied them. It has already been announced that the pabic ceremony of unveiling the statue of the late Primom Consort will not take place till the end of the preiens term. Then will be the fitting time to sketch noore fully the history of a movement which affords such splendid memorial to this great and good man; cannot, however, conclude this brief account withool signifying my high approbation of the judgmen displayed by the Governors in their selection of their architect, Mr. J. Peck; their head master, Rev. Abert Daymond, and their matron, Miss Burrell. Mr. Peck work is now near completion, and I cannot too highis compliment him on his great success. Ifeel that public tribate is due to the very liberal and parserering spirit with which he has personally superintended, 10 only the erection of the building, but also the arraws ments for water, light, washing, cooking, and heatigy and in short, all the furnishing details of the mening ment. Mr. Daymond's work is but just commenimel
but I am perfectly sure that he will show himel but I am perfectly sure that he will show himan
worthy of the honourable preference of the Governom and prove, like Mr. Peck, the "right man in the riad place." Rd. Garrett, Hon. Secretary, Carton . Saxmundham. [We have received a second let from Mr. Garrett, just as we are go

COTTESWOLD SHEEP.-No. II.
Having in a previous paper identified and tracel these sheep, both by their wool and its mannica the from the earliest times, we propose to con pre history, Which will leave no doubt descendants original sheep of the Roman period, and perhy type from which all our domesticated sheep bave sp.

In the Saxon period Alfred was expert at spiand Edward the Elder "sette his sons to scole daughters he sette to woll-werke." " Confessor's time at Cire
It seems, however, that in these early days the and the wool of the sheep were the
flesh not being held in much esteem.
At the time of William the Conqueror, writes Godias
At the time of William the Conqueror, writes a fulling mill existed at Cockleford, that, Dugdale, according to the same Templars, had fulline military monke, the Kna a parish in the mil of the Cotteswold

The practice of "falling" would imply, acoording our notions at present, that the wool gromm theme hills was at this particular time
wooliced jeseription. In our day a "fulled" material would making what is now better known by in making what is now better " nown by wibllen goods, in contradistinction from the "comber's" wiverial, which is not "fulled" or "milled," and which mool is in request. We make no attempt at present to mool is in requeste this apparent anomaly, but content ourselves Tith the fuct of "fulling mills" being in use at this remote period, as showing adat the manufacture or wool "mill" to accomplish the purpose which was previously done by the hands ans feele sheep kept on these be formed "Goding's History of Beverstone" in the 13th century: -"The quantity of sheep, nearly 6000 , kept at Bevertone is remarkable, but it is accounted for by Fosbrooke, on the ground that sheep rearing formed part of feudal duation." Again: "Hugh Despenser was seized, a his death, of 59 manors and 28,000 sheep. Bennett. Cirencenter had two markets in Friday, chiefly for rol, for which commodity it is the greatest market in nogland." Atkyn's Hist. of Glowcestershire. one of the many struggles with his turbulent Barons md retaking it, was once more deprived of it by a old and curious stratagem. We learn that two of the John do Ralum, covered with cloaks, and riding upon at the weat gate, and that being admitted they leaped from their horses, threw away their cloaks, and appeared is complete armour, and baving obtained the keys from the effighted warders, threw open the gates and let in thir ambushed followers. It is clear, therefore, that as ordinary matter of business, and consequently the Inde in wool was in fall operation. Gloucester, a century before this time, had trade companies formed,
50 it is evident that either in the Roman or Saxon mes the conversion of wool into cloth was known and proctived. The immense quantity of wool cultivated rent from the fact that 30,000 sacks of our native Cotteswold wool was the annual quantity granted from this county for the King's household. He gave the Thole of one year's grant to his Queen Philippa, in aid of discharging her debts and of in part paying the
som due thereof for bills on her wardrobe. Goding's Ancient Trade of Wool and Cloth.
About the 14th century the Florentines imported largoly into this country.

mation in which these shee all periods the high esti-
breeds of sheeption relating to the origin of the present
As mana is the creat which we are tempted to offer a
ment, and the skill of them. Soil, chmate, managecause great changes in their form and appearance. The question is, were the original sheep of this country of the long or short-woolled breed? The whole of the evidence, duly cousidered, we are of opinion goes very far to prove that they were of the long-woolled sort, and the Cotteswolds are the oriziual type from which decidedly the long, and, in all propability, the short or middle-woolled sheep sprung. Dyer, in his "Fleece," writes:-

\section*{If any wool peculiar to our inle}

Is given by Nature, 'tis the comber's lock-
Our information upon this branch of the inquiry must necessarily be derived at least previous to the 15 th centary, from the uses to which this wool was applied, for at this early date, as we before said, distinctive breeds were not mentioned. The feature which distin-
guished the long from the short wool, was the power guished the long from the short wool, was the power
of "felting" "or "combing" which the wool possessed.

Felted," "fulled," or " milled" cloth indicates a fine description of wool. It is a well known fact that the fibres of wool are made up of small serratures, the which, when properly treated, lateh into or interlock with each other and cohere, and thus form more or less a felted material. Its power of perfectly fibre; the short or fine-fibred wool laving the greatest number of serratures, is by this means the better adapted for making woollen cloth, whilst the longwoolled having fewer serratures is not so capable of being worked up into a "fulled" material, but essentially adapted for worsted goods, and is therefore called "combing" wool
The fact of there being "Fullers" at Cirencester in "fulling" century, and also the frequent mention "fulling" mills in various parts of this county at very early date, besides that at Winchester, where cloth was manufactured for the Roman army, has been thought by some to imply that the sheep of this country were of the Short-woolled type.
This we hold to be fallacious. It may be correct that the wool of that time was shorter and finer in the taple than it now is. For when we bear in mind that the management of sheep was little understood; that the food (for there were no artificial Grasses nor roots) upon which they lived was of the coarsest hind, with little or no winter proviaion of forage wherewith to keep them-knowing also the effect of food in promoting the growth of wool-there cannot be a doubt but that the wool borne by the long.woolled sheep under such circumstances must have been very much finer in texture than that of the present day
Again, notwithstanding the stimulus given by Edward III. to manufacturers by causing the jmmigration of numbers of Flemings, who were then known to be the most expert in the art of cloth making, yet the English manufactured cloth was of the coarsest description. So that, as the wool was ther, and therefore better adapted for cloth, and no difficulty in believing that the cloth made a the period we allude to was from the long-woolled bread of sheep. Indeed this view is fully confirmed by the fact that the ancient family of the Cripps at Cirencester, within the memory of men now alive, manufactured cloth largely from the Cotteswold wool to supply the army. As a further proof of the long-woolled sheep being the original breed, we quote from the "Farmer" Library "

It thus appears conclunive that the long-woolled heep were the original sheep of this country.
Improved husbandry, greater attention to the breeding of sheep and the manufacture of a finer material in cloth, from the middle of the last until the commencement of the present century, so altered the character of the wool by increasing its length and coarseness as as to causer fear at the time lest short wool fitted for the woollen cloth trade should be lost, for even the short-woolled became longer, and liable to lose its "felting" qualities, so that, strictly speaking, no ehort-woolled sheep are grown in this country, but for the fine broad cloths the manufacturer has to depend upon the wool from the merino breed supplied originally from Spain, and latterly from Germany, and to a great extent from Australia. Indeed Sir Joseph Banks and Lord Somerville, as also King George III. took a lively interest in the introduction of the merino breed into this country; and under the aaspices of the late
Samuel Lysons, Esq, of Rodmarton, the experiment was tried by a Mr. Day, of Tarlton: but they were unsuited there, as elsewhere, for the climate, and soon disappeared without leaving a trace behind them.
The Southdowns, Lincolns, and Leicesters, have all, at various times, had their patrons upon the Cotteswold hills, but the extreme cold of the winter season soon banishes them, and notwithstanding that those who come from a distance to farm on the Cotteswold Hills often bring with them other breeds, a change to the

Cotteswold sooner or later follows, beca
inexorable climate and poverty of the soil.
Daring the great rage for Leicesters, about the latter end of the last century, they were used upon the Cotteswold hills more frequently in experiments than any other atrange breed, but they soon shared the fate of all others, and at the present time a Leicester sheep is not heard of among the Cutteswolds; indeed one of the oldeat flocks (that of the Garnes') can be traced back for a century and a half without the elightest admixture of any other blood besides that of the Cotteswold, and this date would carry us back long before the Leicesters were heard of, and a comparison of specimens of this flock which are known to be quadulterated, with others of a more recent date, shows at once that the present Cotteswold sheep are pure from the admisture of other breeds. Their appearance at any of the agricultural show exhibits a marked and unmiatakable difference from nay other variety of sheep
Having thus pursued our inquiries from the earliest period of history, it is now necessary to deal with the more practical and essential part of our subject - the present value of these animals in supplying fleeh and clothing for this and other countries to an economic advantage.
It is somewhat remarkable that so peculiar a race of sheep should never bave fhad a great patron to extol their good qualities, and who could thereby, regardless of expense, attach to them a name and prestige by bringing them prominently before the public. Yet so it is; for whilst a rage was created in favour of the Merinos by Lord Somerville and Sir Joseph Banks ; for the Southdowns, originally by Mr. Ellman, and these could count amongst their patrons no end of dukes and lords Also for the Leicesters under their inventor, as it were Mr. Bakewell, followed by the most eminent agriculturists of the day-the oldest, and, as we think, the most valuable breed of sheep have been left to force their way by their own inherent merits.
Until Disraeli noticed them last autumn, we have never heard of any one likely to cause a rage for the Cotteswolds, or of having patronised them previously.
The Cotteswold sheep have therefore continued in the hands of the tenant farmer, who uses them for the From
From what we gather from recorded history and tradition, the original unimproved Cotteawold sheep was a large flat-sided somewhat leggy animal, with long heary wool. J. M. R.

\section*{GENTLEMAN-FARMING.}

How is it that the gentleman-farmer usually com plains of sustaining a loss by farming? It may be conceded that the complaint is heard sufficiently frequently to make the inquiry a useful one. There may be some instances in which the complaint is no well founded, no adequate accounts having been kept, and loss is only surmised and feared; no satisfactory account having been kept of what has gone into the house and stables for consumption, or what may have gone to the workmen or servants in part payment of wages. I refer to the butter, cream, milk, egge poultry, pork, mutton, beef, Wheat for flour, Oats and hay for the carriage or riding horses, which may not only redeem the loss spoken of, but really leave a profit to the farm.

But to come to the question: doubtless in many cases an accurate nccount has been kept where the It cannot 'be disputed, of course, that the builk of ordinary farmers who continue on their farms from year to year, paying rents and taxes, and supporting themselves and families, do not make a loss, but must realise a profit to that extent at least. Some, how ever, do move ; for it is known that they save nooney, and that a few have even amassed fortunes. I do not intend to intimate that farming is a lucrative busines: it is not usually so. The fortunes made are quite the exception to the rule; still there are
many, happily, who improve their circumstances by farming; and they may be met with in most districts of the country. The great mass of farmers, however, probably do no more than make a bare living; but is not the reason to be found in the very inadequate capital and the appliances employed ? and the consequence is that they have to wait for the slow proces of Nature, to supply [in some sort the deficiency. What other business can be succesefully carried on without adequate meank? The result is usually even more disastrous when attempted; for Heaven assists the farmer in the ordinary processes of nature, supplying to some extent his want of capital, by so far renewing his land by the fertilising elements derived from the atmosphere and other processes as to enable him again to break it up at intervals without bestowing anything upon it. In; this way the land is
ploughed and robbed, and kept down to poverty point.
Farming, then, it will be allowed, is not necessarily a losing game, and there are, no one can doubt country gentlemen who have gone fairly into the business, either for recreation or to acquire that kind of knowledge that would enable them to improve their estates, who have kept accurate accounts, and have been able at the end of each succeeding year to
show a balance sheot exhibiting a fair amount of profit,
and probably in an increased ratio, an their land has risen in condition, and their stook improved in quality and condition by judicious breeding and botter keop. llow their tenanta and neighbours an inspection o the detail of such accounte, with every information the detail of such accounte witd not only be very conectod thime but tend to silence those common and very injurious remarke by which they endeevour to satisfy and console one another; such ne, the squire's crops are always fair aud usualy good, we must acknowledige, and his atock is handsome and very improved, and his farm in good trim; but no thank to him, money will do anything in that way. No doubt he loses scores, if not handreds, a year. I have heard aeighbour So-and wo may then But if the money, and he is a pretiy good judge. the sheet it balance is really on the wroag aimetive or cood the mpearance of the farm of stock, for it is true anything of that kind can be done with money. Such farming hould not be followed, for it must do much more harm then good. Much leen should it be held up af a model: for in doing no it would be holding out a falso ight that might lead mome frail bark apon the rocka, A farm without a satisfactory balance-sheet is certainly wome than unelese
To purvue the inquiry, then, I would ask-if farming properly carried on doen and must in the nature of thinge give a profit, how is it that the complaint is so frequent from the gentleman-larmer that lebour under come important disedvantages, which I will ondeavou to point out; at the name time, I think he possesses some advantages, whic The fire disaduantage I shat endeevour to be brief. The firit disadvata is, whersas the ordinary farmer is continually in hia business direoting and oconomaising all its operations, and frequently giving a considerable amount of persona labour, the gentleman-farmer is ouly occasionally on his farm, and does nothing (or very little) in the way of personal labour. This "ocoasioually," however feel so much interest in their farms and stock as bestow a large share of their time and attoution to them, and arrange a sufficient superintendence when they are absent. Where little personal attention io given to the farm, the personal interest will usually devolve upou a person usually called the farm bailift, who is in fact, the farmer, and who should after charging the farm with a fair rent and the pay ment of all outgoings. If he professed to be a model stock, or arrangements, however couvenient and per fect, will compensate for a defective balance-8heet. is employed that the employer retains as much interest in his home farm as to have plans and ideas of his own repecting it; and it is very natural that he should. bailiff, who, I need hardly say, will have the good sense to respectfully give way, and who will of course, so far but no further, be exonerated from the consequences.
The next disadvantage I shall name, to which the gentleman-farmer is lisble, is that of an excess of payment for labour. He cannot alvay apportion his people, like the ordinary farmer, and there will be more or less of doing nothing, or of misapplied labour, which is atill worse. The labour on a farm should always be directed to a profitable return, ar copting a certain amount of what may be called dead work, necessary to keep the farm in good, tidy finished and , such as hedging, ditching, repairing roads, \&o, tomptation is strong to go beyond mere effectiveness, and even to the ornamental in these. In the latter case the extra cost should be charged to the estate account. Perhaps the female labour will be the most difficult to mamage, and this will be a considerable item where a rotation of crope is carried on, and roots come regularly into succession. To the pruise of the Wolah women be it spoken, that they are ever ready branclees of the family. A. large Norfoll as the male was lately staying a little in this county, and favoured me with a call, noticed this with approbation, and remarked that it was not wo in his county-that they could procure but little work from the women, and none at all after they were married; for, naid he, they spent all their time in carrying about their babien, and gossiping from cottage to cottage. How convenient, especially now that male labour is so dear, to be able to muster a good number of women and girls to
despatch the work, not ouly during the hay and corn harrest, but occasionally
mixing artificial manures, singling \(S\) swedes anil hangels, and weeding them two or three times after the horse hoe, then topping tailing, and storing through the winter. Ail this work comes to so large a sum that it has cometimes rather'surprived mo when making the annual nceount ; but it cannot be
done without, and therefore must be looked well after, or the gentleman-farmer will have great work without a in it. They should neverterd, and one who knows man with them how to manage them; will be done. I speak advisedly, not half a day's work. To single or weed a root crop, ood number of girls, so as to despatch the worl ; each takes a separate ridge and they wort in a row, none being allowed to remain behind, and a man follows with a dibble in his hand, filling up the blanks with Mangel, Kohl Rabi, or Cull work is doing, or to give it out in piece work, the plan to follow is to remain with them for a given time -say an hour (any less time will do), and measure, and that multiplied by nine will give the number thes should do in a day. I then step the whole length of number of ridges in the field, which, multiplied together, will give the number of yards in the field or piece, and divided by the number of yards that should in dhe field he day, will give the number of day If, for instance, it is found that there is 20 days work, whole field in two days. The real value of the work per acre may be found in the same way
The tables, with prices of work per acre, given in aricultural books, I have found to be of little use to employ a number of girls. As I said, they will really sometimes not do half work, for tis chatter chatter, chatter, all day long. I have been perfectly surprised (when near at hand and not seen), and wondered What in counch more accustomed to leave home on journeys of business or pleasure than his neighbour the farmer; and, however careful he may we in arranging and allotting to each their work, there out care and foresight the loss or misapplication of labour will be considerable. And how difficult to provide for every contingency !-change of weather, to wit. On large farms, or estates where much labour is employed, a room or outhouse with a fire in it, where or other food, will conduce not only to their comfort, but will on that account really assist the work, inasmuch as they will return to it with more spirit and under a hedge, or sitting on a log of wood in the cold, Where "dairying" is carried on to any extent, an unproductive one will be a sad drawback. In fact, a large part of the proluce of the farm-the Grass and hay-will be lost. Such a state of things should not
be tolerated even for a week. There must be either very defective management or pilfering-perhaps both I know by sad experience that the whole of the dairy to keeping up the full amount of produce and the safety of it afterwards. May I just intimate what that proiry should not average less than 250 lbs . per cow per annum, on a farm with Grass land of moderately good
quality, and where roots are grown for winter feed and the cattle of medium size, such as Ayrshire, Alderney, or good Welsh. On rather inferior soils should not fall below 200 lbs . per cow. i know many years invariably exceeded an average of 300 lbs. per cow per annum. His cattle are Alderneys. The gentleman-farmer is rather apt to give fancy prices for his cattle and other stock, and may be a little out of of the principles of breeding improved stock, and the exercise of judgment, it will probably be a profitable hobby; for well bred and conditioned animals alway meet with a good and ready market, and frequently I know extra prices as breeding stock.
I know long lectures are by no means acceptable here, and I shall do little more than name some of the disadvantages under whioh I conceive the gentle-man-farmer may labour. Does he not frequently seep a larger assortment of expensive implement however, be party form requires? This, may however, be partly for the benefit of his tenants and neighbours; and for their make, too, as woll as his
own, he may experiment in the use of artifial and chemical manures, and lose something in that way but, on the other hand, each of these may turn to profit. Is it not to be puspected, too, that he sometimes suctains loss from the misapplication or waste of expensive food in the feeding or fattening of animals, mocording to Mr. Benting, sugar is of much a fattening nature, if the gentleman-farmer finds himself gettin too stout he can leave off him sugar and give it to his fattening animals, to their mutual advantage. But the gentleman-farmer is not only addicted, as I intimated just now, to biy dear, but to sell cheap. He frequently does not go to the fair or market himself, but sends his stock or produce by a mervant, who, if we ailow to be honest, and not even open to take a gratuity or
favour his friends, may think ho has done well in realising his manter's limit, although with vigilance he
have to
But I must not, and need no
sources of loss: the holes in a riddemerste forthe but they are numerous, and will let may bo menl through. A. want of practical knowledge, and a good nately too often the

\section*{disad vantages ;}
provide against them, they will be considerably lessene or entirely overcome. But the gentleman-farmes is His superior education, reading, and leisure probably have enabled him to acquire muok meent information, to acquaint himoself with the nature of the cils of his locality from the geological strate on hin they lie, and their chemical composition by analrin ascertaining what elements they want to add to their fertility, or to neutralise anything that mas be injurious; or information valuable to him in the acquiring and breeding of improved stock; or as to the best principles of drainage as applied to his land If he farms his own land, and has succeeded in briogin to a higher state of productiveness, and so raising nnual value, the same course may be more o applicable to the other parts of his estate; probably 'it is here that he will derive the greatat advantage from having himself become a praci Leicester, for example.
In conclusion, let me very briefly recapitulate the gentleman-farmer is liable to such excessive expes diture under the heads of labour, implements, manures stock, \&c.; ; if he is addicted to buy dear and sell
cheap; and if, after all, he has, through bad manage meat or neglect, poor crops, deficient dairy produ and inferior and ill-conditioned stock, no wonder the he complains of sustaining a loss, and sometimess heavy one, by farming. But if, on the other hand, notwithstanding some extra unavoidable expenditure, he is, by good management, resulting from an attee.
tive practical knowledge of the operations of his tive practical knowledge of the operations of his farm) harvests of corn and hay-say worth from 81 12l. per acre ; to carry on a productive dairy, produo ing from 200 to 300 lbs . of butter per cow per annum; nd breeds, rears, and feeds stock of various kind hat command a ready market from its superior quality and condition, he will doubtless be able the on the right side of the sheet, and into balance on the right side of the sheet, and inv
bargain enjoy all the pleasure and health to be derived rom such an avocation, and all the luxury, too, table well supplied with all the fresh producher gentleman-farmer can vie in the point of actual with the intelligent, thriving tenant farmer, who by his bueiness, who is always in it, observing managing, economising, and turning everything to best account. If he is desirous of competing widu he must follow the tenant farmer's steps - he must like a farmer, work like a farmer, feel the Carmo and screw like a far

\section*{Dr. Mackensie and the Malt Tax.-If the Dr.} o whose writiags Dr. Mackenzie refers me be itinerant lecturer on teetotalism, I beg ho to blinded by what Bacon calls "the idol of the Den be capable of forming a correct opinion upon the sal in question. To refer to Dr. Leea on such a quessin would be like referring to the Pope for a paskin
opinion on the Immacalate Conceptiou; or af opinion on the Immacnlate Conceptiou; or ast of port Jew his opinion of the nutritions properties of out tissues to be retained in the system which sbou the be thrown out. As a medical man he knows well the wearing on the proper use of good beer checks the wearinger and is to the poor labourer a fir than tea. I am no partisan. I therefore quote the recent writ rienced observers on food of the present da Edward Smith, Fellow of the Royal Society, who experimented largely upon himself and othe the por (the italics are his own),
before the Philosophical Society he says:-"Beers especially suited to those who have deticient power assimilation, as well as defective force or the lian It is universally admitted that the Tartars become a degenerate race since the tea-drinking nation, and pa
diseases have doubled in Engla has become general; but I prefer to of more able men than myself, and clude my correspondence with \(D\) quotation from a work published by Dr. Erasmus Wilson, Fellow of the of Health of London, but afterwards remarks as follows :-"Improper food prod true, and I believe it to be so, the subject is wo attentive contideration ; and to give it mo
pablicisy time that whinch belongs to a medical journal， have ventured to print the address in a separate form it would seem ass if the rast beef and medicine of ou of old Eng the soul of our existence．＂Thus does science confirm what pontical secononge have long tanght－ erperience，and namely，that the products of our own cultivated fields hould not be taxed for the unfore ready admission of foreign and injurious beverages．The vital energies of the English as a race are Mrot so wingorous Brow，one of the noet neute observers I have ever known，asks，＂May mot the enervating effects of tea have something to do with this recadence．contributed to the cases of paralysis oy the lowering effect of thy theine，and by the aro am I that green teaacts as a virulent poison to J．\(H\) The Repeal of the Malt Tax．－The agitation for the repeal of the Malt Tax which has at last set in，though
it may be at the eleventh hour，is at least sufficient cridence that the farmers are in earnest in their ndeavour to shake off such a burthen，which so long as ricultural community inasmuclugrace to the whio agricultural nearly 20 years having elapsed since the great octrine of free trade becaune established，nearly every other tax in relation thereto having become altered，
modified，or altogether repealed，and yet the odious Malt Tax remains in full force and existence． correspondent in one of the excellent letters you have ttention to this matter in most expressive terms：－ ＂And I would here aliude to that great loss of moral解 amongat us as a class for want of a higher order itempts to get a repeal of that unjust imposition the Malt Duty．Would the manufacturing and com－ burthen？If farmers knew how to set about it they exceptions，are an easy，apatbetic，nonpolitical body，who will not nor cannot be aroused．It good；hence their helpless and almost powerless poition．It is a gratifying fact that the agitation 0 erlist the public journals more or less in favour and it only requires a spirit of determined energy and perseverance to crown the labour with success；and here exists not the slightest desire on the part of the party question in the House of Commons．It is frue that attempts have been lately set up to disprove the feediug quality of malt as compared with Barley，
and that beer instead of nourishing the body has a coukrary efiect of devitalising the digestive fluids of the stomach，or some such twaddle．Who cares anything ow do they what value are such experiments，and credolity affecting the agricultural body so great as to T Trade，contrary to their own experience，and of beef and mutton，and to become a park instead expended annually in the face of the many millions porter alone－which，according to the theors of and medicinal teaching，is not drink but poison！It is not necessary to suppose for one moment that such sugges－ dismissed with the observation that the difference in occupation must be taken into account，and that while horses and carrig be very proper for those who have matter and carriages at command，it is quite another acter when proposed for those who toil many hours rguments used and bodily exercise．What were the the Corn Lawe？That the duty on corn had practically countries of shutting out the supply of food from other known Eogland did ed her increasing population．thereby granting to the the effect of a kind ot monopoly which virtually had ruelty and injusting the price of bread，and became a alter their population．The farmers must submit and \＆c．，\＆c．Now of farming for the good of the country， the rales of common sense and justice，but what the clamone chlains of is simply this：that while such a urged with respect to the the bread，so little has been tae palmy days of farming，when Young wrote＂that things，a bottle of furnished with plenty of plain Whether there a hogshead of it in his cellar．＂I doubt stocked is this many farmers who have theirther woullars axurious living；but it certainly to indulge in such world－with while called upon to compete with all the competition and increasing wealth in the cone country，
reducing the and entailing asmer＇s profits to the lowest possible ebb， rearing of increased stock to keeps up the feeding and
his land－there should still exist a tax which has the portion of his produce for feeding his cattle in its most approved atate；contributing to tho injury of the pablic by helping to form a tax on meat，and lastly，forming reach of the hard－working，hard－earning labourer．W．N

\section*{§ocietity．}

East Lothian：The Best Mode of Feeding Sheep．－ Mr．Harper，of Snawden，on this subject，referring first to the recent discussion on the alteration which prices the opinion of Mr．Douglas and others，that more profit would be obtained by deviating somewhat from the present system of cropping，and keeping a greate breadth of land in Grass，said：－My object in rising is to deprecate any sudden or violent change of cropping as now practised，so far as regards the lower part of this county．Its being intersected by a railway whose
termini may be said to be London and Inverness－othe termini may be said to be London and Inverness－the
dryness and earliness of its climate－the richness of its soil－the heavy crops which in a favourable season are obtained－the great demand which always exists both for seed and flour from its cereals－the comparatively high price which the red soil Potatos Hlway peculiarly adapted for the present system of cropping Coming to the subject more immediately before us， would say，so far as regards the lower part of the
county，that all stock should only be kept and fed of within a twelvemonth．Of course there are excep－ tional cases，such as Fenton Barns，where there is good deal of links and waste land．I do not car mended by Mr．Hamilton Nisbet；Hampshires，as recently introduced by Mr．Shirreff；or Cotswolds－ although I do not fear that our own native breeds will atill keep their own ground．The nature of the land itself is more adapted for feeding than breediug，and when so much attention has hitherto been paid to the growth of the cereals－feeding as against breeding will generality of the farmers of this county，I would say that hoggs would be attended with less trouble than ewes，because they do not require the aid of so Oats used must depend largely on the number of sheep，and the quantity of Turnips．Not less than 1 lb ．of these per day will be found to save Turnips．At any rate，they shoald be supplied with leaving the Turnips，both in the way of preparing them for the butcher，and of teaching them to eat thi beform being put to Grass．By neglecting this last
vear，I found some difficulty at first on putting them on young Grass，in getting them to eat calk．Hoggs thus fed，should be ready for the market shortly before or after being clipped．If the markets be gooll，and i thers is a prospect of the Grass failing，the greater number may be sent off，thus easing the Grass and pre paring it for another flock of lambs．But the choic between drait ewes and hoggs，or older sheep，must of course depend on the judgment of
Mr．Durte，Barneymains，said ：In many districts with which he was aequainted，they were enabled to keep an extra number of sheep from the nature of the country They had a great quantity of land which it was neces sary to break up and drain，and they turned it into
young Grass and for producing Turnips，and were thus able to keep a large number of sheep with great profit In this county they had no room for this，as they had not much unreclaimed land．The place to which they must look for the greatest increase of sheep in the county was from the hills－from the land that had not as yet been ploughed．The question，how．
ever，which the Club had to discuss was－how could they，arable farmers，keep more sheep？He thourht there was just one practical way that suggested itself as to how that could be done；and that was by increasing their growth of Grass and Turnips，and they could increase the Grass by growing less grain，and the Turnips by growing less Beans and Potatos．Of course the Potato growers would be all up in arms and say， ＂No；we caunot decrease Potatos＂一that was to say，
if men made money by them ；but a number like him－ seif had not made much money from them，and there would be no difficulty in restricting their breadth． There were few men that had bad the fortune to grow Beans who ever had had much frow them；and by turning the Bean brakes into Turnips they would have a great increase of Turnips for their stock．Instead of
remaining in Grass for only one year they could pas－ remaining in Grass for only one year they farm by the 8 －course shift instead of the 6 －course shift．In a 400 acre farm they might＇have 150 acres Grass， 100 Turnips， and 150 acres grain．He did not mean that they should give up growing grain altogetber，but he held that，as a rule，if they grazed their land well for three yeare they would grow as much grain in the three yeare，
as if they had 200 acres of grain；and get Grass through rotation on the 150 acres，so that they would not have much less grain after all．Then，again，the they would have an increased number of atock kept

An imperial acre of good Grass would keep an ox a
seacon of 24 weeks 24 tons of Turnips would keep two beasts（at 10 cwt ．per week）for the same time 9 bolls， 6 stones of Wheat（at 18 stones per boll），would keep one beast， 8 bolls 16 stones of Beans（at 19 stones per boll）ditto ； 5 qre． 8 stones of Barley（at 56 lbs．per bushel），ditto； 7 qra，Oats（at 42 lb ．per bushel）ditto each animal eating 7 stones of grain per week．That showed that two acres of green crop kept as many cattle as three acres of white crop．They could keep same as with Turnipe on 14 lb ．of corn and straw，the same as with Turnips，but supposing they put these together，they could keep a great deal more cattle with Corn and Turnips along with Grass，than they could if they were to feed them upon any of these articles alone．That proved distinctly the question before the Club，that they could keep more cattle and sheep by ncreasing the Turnips and Grass than by the present plan，and that they conld do so profitably．This year －Wheat， 13 rrley，and Oats－and fed the cattle with these principally mixed together，and he found that it was much better to do that than to spend money phareign produce．Besides the suggestion he had thrown out that they might increase their Turnips and Grass by diminishing their Beans，Potatos，and grain he would diminish the grain a little further，Instead
of sowing all his lea with Oats，he would sow some of it with Tares，and Mr．Hope had been talking of Tare being a substitute for Grass．He did not think thin
should be done at all，but le thought the Tares migh be made an auxiliary to the Grass，and that they conld come in when the Grass in the county was giving way．作解 be foring so used then that he would sow the Tares．Then they had roots of different kinde，and other articles in a smaller way，such as Rape，Cabbage and so forth，which could be gone into to a smal Grass into hay，they might cut it green and top－dress it highly（he found，however，that they must give the stock also a good deal of cake in soiling，or they would not do as well as pasturing cattle）and thereby eep a great deal more stock than even pasture．He was practising that himself．Whenever he had got good Grass he let it lie three yêars．He used to be a great Bean grower，but he had only 10 acres this year．
He thought that means could be taken for practically and profitably increasing in the county the namber

Mr．Hope said he certainly possessed a considerable extent of grazing and link land near the sea（but it was not part of Fenton Barns farm）and this he partly used for rearing lambs，which he kept for hoggs，disposing of the ewes fat in autumn，a plan which he recom－
mended to the consideration of the Club at the meeting when they discussed whether it would be profitable to seep an increased number of sheep．He did not think it was right to dogmatise as to the best way of keeping increased numbers of sheep on any particular farm That must be left to the owner，who must judge for himself，though certain principles or facts might be piniod which shorming thei opinions．What Mr．Durie had said was quite true that to keep larger numbers of sheep you must on
most farms have more land in Grass．This in the first place diminished the amount of the annual gros produce of the farm；but in the next place，if the sheep were fed with caire and corn as they ought to be a white crop after three years old Grass would not too lururiant and ludge．He took a crop of Potatos after his old pasture，with a little guano only，and they paid well．He was one of those who began early
to plant large breadths of Potatns，and as yet he was not disposed to dispense with this crop． But he did not say they could go on even in that way，to be as well paid as in lengthened rotation，say for eight or 10 years，and號 liked to have a portion of every kind of crop；and in regnrd to Beaps they were a very valuable crop，and had paid him handsomely for several years past．This last crop they had left him more thau Wheat，though his was owing to his having Tares mired amongst them，for which he obtained apwards of 60s．per quarter．It was impossible to keep profitably an increased quantity of atock of any kind without a more liberal use of grain and feeding cakes for both sheep and cattle．In place of having all his cattle on full Turnips and feeding for the butcher，he had a portion on cake and cut straw，and this winter it had been meal and cut straw．If in spring there are any Turnips to spare，a few are given to them pulped．This saved a lot of Turnips which are devoted to teeding sheep．The cattle thus wintered top the Grass fed with sheep and keep down the Rye－grass，and are in forward condition for feeding off the following winter．It improved the pasture to have a few cattle grazing with the sheep． cattle for feeding，but he thought if they kept them for 12 months before they fod them，they would obtain more profit
Mr．Soot Skignine maid：With regard to this day＇s discussion he felt somewhat disappointed．He stood with many people in this position，that they tried the style of farming Mr．Harper recommended－the old East Lothian style on the low ground－and found that
now it wonld not pay. Ho had always beers ashame I to
say how much he lost from furming every year, as the inference to be dramen from it would be that he oould not farm. But having now farmed during a large portios of two leases, and having made a handsonce profit every yenr by the arrt, he was the more patitled to say it whs not her fonit at he was if worse every year of the sicond lease; and it he was to go on as Mr. Harper recommendet, with no change in the system, he suw no prospect but that of which would como at last, and be could only hope he would not be quite reined when it came. He had made one effort to merease the quantity of his sheep this season. They were aware that in the lower part of the county, there were sandy soils in which the farmers gemerally grew Dalmahoy Potatos, and sold them at abont 20l. or 24l, an acre on the ground. This had always been rentricted they could not compete with them. He had tried it last year, though he was certain that if he had planted Regents, he would have had 5l, an acre more than be got for the Dalimahoys 8 but the object was to get what was called a stolen crop, and cow the groun
the Potaton were very highly manured with about 15 tond of farmyard manare, and about 6 cwt, of a lusurimat crop of Mape, which he would use for his owe in autuunt when the rams were first introduced to them; and then a epcond crop either for hogge or ewes and lambs is spring, after which he lo hopad to increase the amount of food for ing. In regned to Beane, he had heard before that Mr. Hope, who had now left the meeting, had made profit of them; but the fact was it wre not it required a particular moil to follow that husbandry. He did not think he comld do it. They mast have the moil very fine and free from amoual wecils. It was done on the bruglish system. That was by gowing them close together. It, was a sort of cultivation that was
local in its application. Kuhl Rabi he had tried, but found it a total failure. Mangel he had tried to perhaps a greater extent than any man in this country, a fine crop, but since then it had dwindled away and was very urecarious. He would advise mobody to cultivate it. The inducement to grow it was to get a great deal of milk, and to get food to be used in May for ewes and lambs. But the fact was that their climute was too cold for Mangel. He saw in a newspaper that anew variety of Gourd had been grown with success in several parts of England, and that \(i s\) had produced a heavier crop per acre than either Mangel or Turnips, of gourds grew well in geotland; this species might require more heat, but it was worth trying. Speakers who were to follow inight take up the matter of artificial fond which had not been discussed, and it membere might have tried. They know that chomistry Binwed that Rnpe-cake and oilcake were nearly equal, tormer. He had given up buying Cotton-cake, because though sheep were fond of it, it had made the wool come off on every occation he had nsed it, but perlaps it was more muituble for cattle,
Mr. Sadezr, Ferrygate, said he thought it would be a great advantage if they could follow out the plan adopted in England of having a combination of two crops of Tares-a crop of winter Tares to be eaten off by sheep, followed by a mixture of Tares and Rape-thas having two crops of Tares in one year, while they lett the land in rich condition for Wheat. But before they were able to consider that cystem and follow it out in would take nothing out of their pockets-to abolish the ground game. He was proud an any one could be to geo his landlord shooting over his farm, hat when he thought of the struggles they had to pay their rents in these times, and the faet of their crops being eaten up by ground gane, he thought they were sulfering an injustice-an injustice which would not continue. heard from Mr. Skirving, who had had long practice in farming, as to the result of their operations, things must change in some way or other. If they could get game. they could still engage in the pursuit of pheasants and other birds, which were not so destructive to the Mr. ion suris then moved that the result of the discus"That an increase of the acreage in Grass, Turnips, and Tares is the best way of keeping an iucreased number of sheep."
Mr. Akirving moved that the meeting do not put
aeir opmons in the form of a motion.
Mr. Bkirving's proposal scemed to mpet the wishes of the majority of the members of the Cluh, and it was

Royas Dublis: April 19.-The Spring Cattle Show opened to-day. In the gbeence of a full report this
week, we oztract the following particulars from the "imes :-
Nothing can be better than the accommodation which this Society is now enabled to give for an tural Hall was ereoted some time ago, which has been used wore than once for exhibitions of industrial art. More recently an immense structure, the Shelbourne Hall, supported by iron pillars and covered with glass, has been arranged for the recepts the agricultural department of the Society's operations. The Shorthorns are placed in the Agricultural Hall, fat cattle, sheep, and swine being consigned to the Shelbourne Wall. Hand machines and the smaller classes of agrioultural implements are placed in the galleries of the in the courtyard. There is a portion of the building sot apart for poultry and various other productions of the farm. The prizes are worthy of the society, and excite by their value and by the honour of winning them a very spirited competition. The "bluc riband
of the Show is the Irish Farmers' Gazette Challenge Cup. Thie prize was originally presented by Messres W. S. E. Purdon, the proprietors of the Irish Parmers \({ }^{3}\) Gazotte, to be awarded to the animal in the breeding classes of neat cattle which, in the opinion of the judges, possessed the greatest merit. For several years it went throngh a variety of viciesiturles of owner
ship, but was at length permanently won by Coione? Towneley, of Towneley Hall, Lancashire. The gallant gentlemon, who always took a deep inte rest in the prosperity of the Society's shows, determined that this cup should be replaced by a date with which the name of tho Irish Farmers Aazette should be associated, and accordingly he contributed the sum of 100 guineas for this purpose to which the 8 nciety added 50l., thus raising the value to 155l. In 1864 the plate was ewarded to Mr. Thomas Batler, of Ballycarron, Golden, county of Tipperary, for his Short-borned bull Soubadar. This time it has been won by Mr. Andrew Mulhoiland, of Bllywalter, Tanuary 11 1862. This bull also won the bronze medal and 10l. for the best animal in the section. The Irish Railway Challenge Cup, of the value
of \(150 l\)., is the result of the joint subscription of Irish rilway companies, It is to be swarded, in the terms of the conditions, to "the best bull, of any hreed, over two years and under five years of age, Committee of Agriculture, hy a certificate from the owners of the cows, that the bull had got 20 calves within the 12 months preceding the show." Mr
Thomas Brnes, of Westland, Nloynalty, carried off this cup last year by his Shorthorned white bull Dr. M'Hale the Sbcond. This year it has been won by Drpender, the same bull that carried off of the firm of Ganly, Sons, and Parker, the Ganly stock salesmen, also presented a challenge cup, valued at 60 l ., for the best yearling hull, of any breed, which was won in 1864 by Mr. W. Talbot Crosbie, of Ardfert It wrs carried off yesterday by the Short-horned ruan bull Brichtant Lamp, calved March 13, 1864 the pro perty of Mr. Anderson, of Grace Dieu, Waterford.

\section*{Farm Memoranda.}

Forti Mountate: County Wexpond, - A few
ears ago I reported in a short notice circumstances relating to the reclamation of mudlands from the town of Wexford. The scale of very large, and the successful results have been ilready correspoudingly great. The details of some reclama tion of high-lying land of very opposite qualities frorn those of the soil which has been wrested from the encroachments of the sea, and under wilely different courses of management, may not be useless.
In the southern portion of this county there in a range of rocky lill, dignified in the local geography hundred feet in of Forth Mountain, though but a few hundred feet in height above the sea level; it extends however between four and five miles in the entire length, from its low extremity at the southern spur, Whence it tends towards the north-east, and thence diverges towards the north-west.
This portion is very picturesque, especially in its detated conformations on the summit, where three the other eminences: from this part of the range are seen the town and harbour with the beautiful environs, and the windings of the river Slaney, with mankione, villas, woons, plantations, and verdant meadows all along its course to Enniscorthy and farther, with a remote Leinster, which boasts of the altitude of in 2600 feet.

Immediately below the 'Three Rocks' there is a nury
pretty little demesne (with a suitable hone) ing that view, on what was 30 years ano comsasid surface of stones, which were removed by \(\mathrm{M}_{\text {r }}\). Jefluree whose wealth enabled him to conyert a bargen ben the ornamental ground. But my businems is not mill with the plain and practical. Until plain and practical.
Until the last survey of Ireland the paroohial limite and no previously existing lan district were undefiond lands around these hills or on them, barn thocs occupancy by squatters, who built huts and clearei ittle land for Potatos and Oats. Several familem acquired comparatively large possessions by actire industry, and purchasing the assumed righte of smal occupiers, of whom many emigrated when the fracchise Potato failure. Yet even now the effects of the on the extensive oommon is considerable. The perhaps still bear the distinguishing appollation a Lords" and "Commons;" the owners of 20 or 31 acree Many of the latter lived (and some still dwell) cabins of a miserable description, widely apart, alnoons naccessible to strangers, and preferred as locations rom their solitude and difficulty of access. Therema whens one clancellor of the elisquar a ohambe in which some of the operations of the Mint were beiog carried on.
At the commencing period of the famine, Aldermen Richard Welsh became possessed of about 60 acres of the lowest spur of the range, which, with an unbroken frontage of a mile in length, and an aveng breadth of 600 yards, from an excellent high rome Which runs parallel with the crest of has presented a surface of boulders, small rocks, and
stones, which had periodically slid down from tho precipitous heights, or attained the possession of the ground which they so lately covered, at the un. caused these hills to arise. Mr. Welsh humanely ywn erapl, yynent to any of the surrounding labourers whe sought it, in freeing some of this tract from the rocks and stones (of quartz, green stone, and clay slate, and conglomerates uuknown to my defective geology) means of orow-bar, pickazes, and spades, The coet
this was from 8l. to 10l. per eore. The larger stones were used to malce admirable fences, 5 feet in heights and from 2 to 21 feet in breadth, not only on the rud side but for dividing the land into fields of regiles form, for farm buildings. Where clearances mare thus and kind sheep pasture, or drills of Swedish Turups are now visible from a considerable distance. Pasaing along this new and cheerful-looking farm, there are I few neat cottages belonging to meohanies and labourer or two, who possess a few aores caad, ad seem to have taste for improvement. Well-buil boundary fences senarate their properties from thas of Alderman Welsh on one side and that of Mr. ORelly on the othor. The latter individual, who is an adming able type of the class of practical farmers occun Mr. Welsh's method 30 acres from boulders and stunes partly covered with heath at the average gained a good loamy soil from 10 to 18 inches dopph which is about to be manured with lime, and copp with Barley, Oats, Potatos, and Turnips ; portion of Wheat and Rye is experimentally somin. m this land will be in due course laid down under Grad for sheep feeding, and after a few years put should anotieer rotation of tillage if heath or furze allotment, freehold farmers, long established have holdings of 30 or 40 acres, reclaimed by dom and patient industry, but not possessing thos niforaty of enclosures, which are conspicuously shown on th lands above described.
But Mr. O'Reilly's present work, and proepective operations in draining, clearing away irregular servo unsighty fences, and forming new ones, more comment. He nccupies an excellent a few trees and other evidences of reclama preceding standing, which he purchased from theuntai whior and occupier, 30 acres more of mproving from defective, though not tivated or neglected state. He has also aequir session of a tract of lowland adjoining land towards the south, on a lease of farms he has the opportunities, without which high rents, uncertainty of tenure, debt, want of capital, or obligations of any landlords interpose between a tenant's dility to The pleasant consciousness of being the owo of but apparently barren land, led paper as or imitation [under similar advantigen] what would be considered an proportionately great for the extent of recla attained, to undertake the work wish
etarving labourers was the motive impulse which acmuated Mr. Welsh's first operations on such an unfromining field for in lad not a certain perpetuity of interest in the Leanits of imprarements obtained. Fortunately for the public, this gentleman, who has large means at command and holas two or taree large ta , cannal indulging it. If he have an irregular fence, it will soon he made straight and perfect; or an undrained field, it gill soon be rendered dry; or anything out of order, ind it will quickly be set right. But this fgentleman notdepending for income on the profits of husbandry, and aithough the amount of the capital he has employed on the' mountain would probably have fruc: fied more surely on the reclamation of low land frms moderately rented, and with a lease of even but 21 renrs, Mr. Welsh, has no reason to regret his purc'ase ou the hill of Forth. The farm there is as it were a creation of bis. But Mr. O'Reilly's case is quite different in important points. He is a farmer, living os hushandry; he has no ships or commerce to cinrey frech capiral to him if his farming bo unsuc cossful. The experiments, therefore, which man 80 croumstanced has made in mountain cultivation under great natural impediments, if successful, stand out in work will prosper. Such a pultivator is invaluable in a district which pre-eminently calls fur one who will afford a go dd practical mode. forth which require but thorouth draining, subsoiling. and in some parts an easily effected clearance from tones, in order to be rendered altogether fertile, as may be expected from the evidences afforded by frequent patches of darlz and friable mould cultivated for Potatos and Oats by freeholdera of the Commons, or by tenant farmers in the plains below
The perverseness of human nature in not nsing opportuuities when in our power, for accomplishing things which are equy, and yet in desiring to do things which ane diffente, is exemplified in the oonduct of the frmorn who will pot draiu Iands whioh from their poaltion iuvite the operation, and the indusbrious oul invitors who will almost remove mountalus to obtain a lurfice of earth.
I have a little more to say of Mr. O'Reilly. Thirty ycars ago he was employed by Mr. Dargan, to whose alents, enterprise, and patriotic liberalities Ireland is deaply indebted, as a clerk and superintendent of works at a canal connecting Lough Neagh and Lough Erne, in the north of Ireland, which were undertaken by Mr. Dargan, who also undertook the embankment of slablands in Lough Foyle, where he succeeded in
reclaiming 1800 нeres ; Mr. O'Reilly thus gained useful experience. Alterwards he became under Mr. Dirgan's patronage a muperintendent of wailroad work, and of a pier at Arklow. Subsequently Mr. Dargan tion as a superintendent of the Compauy' arb reclaiming the sloblands of Wexford harhour. His opportunities of nequiring skill in such pre emiventiy qualifiod him for hig present occupations a making farm improvements, and conducting their perations in detail.
He has a very good farmhouse on the south side of the road above referred to on a part of the Common long sinee in cultivation, but only in course of thorough draining and other improvements since he purchased down to the enuth ; this much larger farm also slones Wown to the enuthward, inviting thorough drainage, for ments under the Land improvemeney from Fivernaraiable fund. Again, besides thet, he has an he has lately obtainei? from Mr. Redinond, MP, 8 lirge farm-all declining to the south-at Ho veill drain, subsoil, for the term of 990 jeare The oneouraing subsoil, and refence all of \(i t_{0}\) his oneouraging and now effective Aot provides in erample of this most finacial facilities, and the firtury will this most deserving and industrinus Ereat and hetle farmers its stimulating effect on the hay soil in the vicin occupying a shallow and wet the great will appear that this improver of land has rent free to a cone of being (by purchase howevtr, \(m\) miderate and fixed rent for the remainder, ander very thay be said to ped rent for the remainder, which he Tho frecilities possess in perpetuity.
Improvement Act forded by the amended Land stain and otherwise improve lang capital wherewith to stood and made full improve land, if rightly underof the freeholders to whom will I hope induce many a plied, and a large to whom my observations have pers of great and smatl fortion of the owners and occu\({ }^{10}\) avail themselves of thrms throughout the country, for gned to promote. I wish there were strong grounds ara penoluteal from thmber of those lind occupiers who ct leases of satisfictory proposed benefits, from want mants and facilitites which danation and those encouragebut fow. Hany tenant forlt laudlords may afford, are and many landlonds ind farmers are dull and drowss thie note which summons in "lazy apathy," though hiroughout the land. Martin Doyls. progress" sounds

\section*{Calendar of Operations}

APRIL.-The work of preparing for Mangel Wurze and for the coning Turnip sead time is proceeding Such a remarkable clange as the last few days hav exhibit, in the weather is rarely seen, even in our changeable climate. The land is now full of warm rain, and the air alternately damp and snuny-all eanspiring to bring on one of the most rapid springs we have ever known. Lent corn is all in, Grass seeds are everywhere sown, the corn and Grass fields are all rolled and harrowed where necessary. Hoeing is pro ceeding both by hand and by machine among whent, and Beans, and Peas. Potato planting is about finished, and work in general is extremely forward. This at any rate represents the state of things in the southern counties. Young Clovers are generally very defective, Wheats are recovering fast.
Kokl Rabi may be nown, and it has proved itself a Turni crop in such season as that of last year, where Turnips were a failure. The following is a panage from Mr. Sutton's account of its cultivation:-

The principal morts are the large Green and Irge Purple K-hl Rabi. The cultivation may be described as nearly resembling that of the Turnip-the principal difference being in its earlier seed time. The land receiving as much artumn cultivation as possible, may be ribbed up and well dunged in the drills, the dung locing envered by the splitting of these drills before winter. If guano (two or three ewt.) anil superphos phate (dlen two or thren cwt. per arre) be spread broadoist over this lind in Maroh, and the intervale between the drills be then horae-boerl, and the ridgelets moulded up ngain by the double mould-board plongh, it will then be ready for the soed. Of this, three or four
poumds per acre may be drilled in the rows in April or March. The rows in which the dung was placed should be at least two feet apart, and the plants on beooming large enough are to be singled out from 18 to 14 inelion aparto The crop will in favourable seasons, on good adhesive loame, thus richly manured and well cultivated, reach 20 to 30 tons per acre. It is all above the ground, and it is thus admirab!y adapted for folding sheep upon it. The meed has hitherto been costly, and therefore it has been more common to grow plants in seed bed. Hulf a pound of seed on about two perches of land will furnish ample plants for an acre. The bed is prepared and sowed in March, and the land for the main crop is prepared either in drills as described, or on the flat, the manure being then ploughed in broadeastand the plants will be ready to traisplant in May. It there be a succession of sowings at monthly intervals, plants will be ready for trannfriring in May, June, and July respectively, and the crop will be ready fir con sumption in October, and on thr mogh winter. The plants my bo set ont, if on the llat, in rows two feet apart, to allow of the horse-hne being used between the rows. It is rather more costly \(t\), put the crop in by the drilling machine, because so much more seed is nsed per acre, which is scarce and dear a* present. This, however, will no douht cheapen as the crop comes more arg. ly into use, and the drilling of the crop wher it is to grow will probably ultimately be the usual plan of cultivation."

\section*{GREEN'S PATENT SILENS MESSOR,}

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.
by speclal appointment, sole manuracturer

TO HER MOST GRACIOUS MAJESTY THE QUEEN.

AS RECOMMENDED BY THE JUDGES OF THE ROXAL HORTICOLTURAL SOCIETY'S SHOW 日ELD JULY \(20,1804\).
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judges at the Royal Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteration, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Mesers. T. G. \& Son beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that despatch due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust to be in a poaition to send off all orders the day they are received.

\section*{PRICES OF HAND MACHINES.}

Packing Cases are charged at the following low rates, viz.: for the 10 and 12 inches Machine, \(3 s . ; 14\) and 16 inches, \(48 . ; 18\) and 20 inches, \(5 s\). ; 22 and 24 inches, \(6 s\). Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damajed; if returned, tro-thixds will be allowed for them.

PRICES of HORSE, TONY, and DONKEY MACHINES, including Patent Self-delivery Box ; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness,

The 26, 28 , and 30 inches can easily be worked by a Donkey; or by Two Men, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Carriage Horse ; and, as the MACHINES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the MACHINE.
Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening : the cutters being steel on each side, when they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter agaiust the bottom blade, whon the HCHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Ports in Ragland; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

\section*{EARTH CLOSETS AND COMMODES,}

\section*{(Moule's Patent.)}
mancfactured sulely by

\section*{WHITE \& CO.}

29, BEDFORD STREET, STRAND, LONDON, W.C.
The peciliar ddvantages of these Closets and Commodes over the ordinary
Hater Clonet are:-
First.-That the dendurising material (dry surface earth, or clay, or uther subsoil) is the best for the purpse, and at the same time is the cheapest and within the reach of all classes. Secondy. -The supply of such material to any house or premises may be much easier than the surply of nat: bs for ing pump, and low onk berng in bo Thirdly.-Its applieation by the means provided in these che is immediate and effective; so imme hate that th. fiensive stmell neced csaraty into the room of buiding in which thay ase and all escape of noxious gases are entirely prevented.

Fourthly. - The expense of these closets, in comparison with that of Water-Closets, is, as to the frst or:
 cead pipes to burst in fiwasty weather.
sistly:-In all large Establishments, such as Hispitals, Urion Houses, Schools, Gaols, and Asylums, a ren onsiderable sum may be saved aunually in the production of a valuatble manure

The efficiency of these Closets is so great as to be scarcely credible to those persons who either have not mol them or seen their mode of action
*** The diffirent forms of Closets may be scen at the address above; anel Prospectuses will be forwardell

\section*{JOHN Wariner \& SONS, London, Manufacturers.}
J. W A R A E R and suns Have much improved the construction of their (iARD)FN
ENGINES
in some important particulars fur this Season.
They may be obtained of the Trade generally throughout the Kingilom at the following prices:No. 547. WARNER'S best ENGINES, in Wood Tubs, and fitted with Wabner's Registered Spreaders--

21 Gailons, 5610 s
No. 547A. WIRNER'S strong ENGINES, in Galvanised Irou Tubs, well painted-

SHANKS' NEW IMPROVED PATENT LAWN MOWING, ROLLING, COLLECTING, and DELIVERING MACHINE for 1865,
}

\author{
 HER MAJESTY THE QUEEN.
}

Alexander Shaves \& Soz are gratiffed to find that in the large and increasing demand for their celebrated MACHINES, they receive a conclasive proof that their merits are every season becoming more sppreciated by the Praotical Gardener.
A. S. \& Sow, in introducing Improvements into ohe MACHINES, have been careful that the edremugn in point of durability, simplicity of construction, superiority in the work executed, which have all along bome peculiar to SHANKS' MACHINES, should still remen.

\section*{HAND MACHINE.}

SIIANKS PATENT LAWN MOWERS are in daily use in the ROYAL GARDENS at KEW, TINDSOR, BUCKINGHAN PALACE, HAALPTON COURT, OSBORYB, and BALMORLL ; in the GARDENS of the ROYAL HOITTCULTURAL SOCIETY at KENSLNGTON; in the GROUNDS of the CRYSTAL PALACE COMPAYY 4 SYDENHAM; in VICTORIA PARK; in BATTERSEA PARK; and in many hundreds of the principal Gardens in the Kingdom, as well as abroad, where theis merits have been fully proved and their success established.

PAICES-including Carriage to most of the principal Railway Stations and Shipping Ports in the Kingdom.

\section*{}

SATURDAY, APRIL 29, 1865.

Is connection with the Exbibition of Flowers, held under the auspices of the Royal Horticultural Society of the Netherlands, at Amsterdam, which has already been noticed in nur columns, was a Congress of Botanists and Horticulturists, truly described as International, for hardly a country in Europe was unrepresented. A large number of the most eminent botanists and horticalturists met in the quaint old city, to discuss matters conoerning their respeotive crafts.
It may be questionable whether much direct advantage to science or practice accrues from such gatherings, but there can be no question as to the indirect effeots. The Congress afforded an opportunity for botanists and horticulturists assem bled from every quarter of Europe to renew and cement old acquaintances, and to form new ones, Young botanists had the pleasure of meeting and associating with the veterans and leaders of their order, while practical hortioulturists came in contact with the leading men of their profession, Our readers, who may happen to know how ardently horticulture is practised in the Low countries, with what zeal, and with what success
will not fail to realise the interest of a gathering where so many of the clite, as well as of the rank were collected together.
On this ground we look mann the C'ongrese as one of the mont successful things connected with the Exhibition, and earnestly recrmmend to when own authorities a similar gathering here, when the proposed show takes place next year. There
is little doubt that with judicious management we could produce a show of thowers more extensive, and in many points superior to that recently displayed in Amsterdam, but we have to learn frum our Continental friends two great ponnts, the art of arranging the objects exhibited to the exhibitions more generally interesting than our own are, Quartz pebbles properly arranged may he made more interesting and effective than an ill-assorted heap of diamonds. Andif, as we presume few will doubt, it is in uur power to rival or excel our continenta show, why should we not try to rival them in a sei-ntifie Congress? We have botanists in England - botanists whose names, as we experienced in Amsterdam, are as well known there and as much respected as among ourselves. We have nurserymen of first-rate eminenoe, and we have gardeners of first-rateability and in great numbers. We hare all the materials for a Congress, why then should we not have one? We are not deficient in hospitality, nor would our fortign friends be disinclined to accept our invitation.
But we fancy we hear the cavillers any, "What is the good of the Congress? - of what value are the papers read?-are any practical suggestions thrown out?" Now, without in the least intending to admit that no direct practical value attaches th such meetings and suoh deliberations, we hold that any immediate effect produced by such gatherings is as little compared with the indirect and future benefits that may and will arise from the social githering of so many men interested in the same pursuits, and following the same occupations. Looking at the matter in a pure pounds shillings and pence view, will no benefit accrue to trade and traders from the meeting of merchants from all parts?

To revert to the Amsterdam Congress: of which we will now give a slight account. The meeting was inaugurated by an address from Professor Oudmanns, delivered first in the Dutch, then in the French language, for the henefit of the address of welenme and an explanation of place on account of its geographical position, its facilities for strangers, its services to Science in the it has afforded to botanists and horticulturists. Afterwards the varinus officers were appointed, and the meeting divided into sections, one for pure
Botany and one for applied Botany and Horticulture. The Botanical Section was presided over by Professor Fée, of Strashurg; theit of Horticulture by Professor Koci, of Berlin. Buth sections sat for several daja, and were well attended-the Horticultural Section especially. The speakers used the language most familiar to them, and their remarks, when necessary, were interpreted into Frenoh for the benefit of those unacquainted with the language of the speaker. A great number of topics were marked for diacussion, but, owing to the arisence of some of the disputants, the number actually entered upon was comparatively small. Upon some of these topics we may hereafter have occasion to write more at length, meanwhile we bripfly notice some of the matters proposed for deliberation.
M. Belforme, of Mptz, announced that he had observed \(t w n\) forms of Hemp seeds, the one elongated, the other spherical ; when sown, the latter produced female plants, the former males. If this observation be confirmed in the case of other dicecious plants, the results will not be unimpor-
tant. Professor E. Morrey, who formed an admirable Seuretary to the Botanical section, treated of variegated plants and double flowers. Professor Caspary spoke at some length on the very interesting question of hybribisation produced by grafting, adduciug in illustration of this litile
understood and must curious point, the Cytisus Adami, as well as certain Ruses and Oranges. He so to speak, having the chargeters of two distinct spoke on the various kinds of Cork Oak, and their distribution in Spain and Portugal. Mr.

Wapmer's oontribution on double-glazing for columns. A mere enumeration of the many subjects brought under the notice of the Congress would, however, have little interest for our readers. But we may mention, as showing the class of men which took part in these meetings, the names of Regel, of St. Petershurg; Fenzl, of Vienna Mrqoele, of Utreeht; Chatin, of Paris; Morren, of Liège; Kocr, of Berlin; Fée, of Strasburg Triana, of Paris; Caspary, of Konigshurg Willeonm, of Tharand; Passerini, of Parma Meissner, of Basle; Lemaire, of Ghent; Cohn of Breslau; Reichenbach, of Hamburgh; HassFarl, of Cleves; OUdemanns, of Amsterdam and many others.

As we were the loudest last year to condemn the proceedings of the Royal Horticultural Society when we considered them inimical to the interests of Horticulture, so are we ready to acknowledge the effirts now being made, to put the vessel on a safe and proper tack.
One great fault of the past no doubt has been a lavish expenditure of money on things not horticultural ; and a neglect of thnse horti. cultural aids which might have heen had for prized acoording to their power of advancing the primary object of the Society-Horticulture, but in proportion to the money they cost. When that great and good Prince, the late President of the Society, said, at the opening of the gardens"That which last year was still a vague conception is to-day a reality, and I trust will be accepted as a valuable attempt, at least, to re-unite the science and art of gardening to the sister arts of architecture, sculiture, and painting," horticulturists, one and all, were ready to put their shoulders to the wheel, and perform in good faith the part of the task assigned to them. And we hesitate not to express the belief that if the programme then and there laid down had been fairly carried out, the gardens would now he more creditable to the national character, and the state of the Society's exchequer more satisfactory.

But it is useless to dwell on the past further than to draw from it a caution in the future. The present change in the efforts of the Society has brought a change of programme, full of hope and promise. The revival of the scientific meetings is a large and important concession to Horticulture; and the glorious display of spring flowers which now set the gardens at Kensington aglow - the like which has never before been seen in London, if in England--are steps in the right direction. And be it remembered that these things have been
obtained at trifling enst. Again, the announoement that the Council intend to engage the services of a second practical horticulturist "to superintend the operations at the experimental garden at Chiswick," must be highly gratifring to horticulturists, and :ill surely bring a full reward.
S.I far then the recent proceedings are deserving of high praise; they have been well judged, well done, and should be held to in the future. But if the present Council would inaugurate a success, they must not stop here. A bolder policy is demanded of them. While the Society-or at least Horticulture as connected with it, has been standing still at Suuth Kensington, it has elseWhere been advancing; and only by long and rigorous strides, by a policy of invention rather than of imitation, can the lost ground be recovered.
Well! what shall that policy be? On glancing over the field before us many objects arrest the attention which seem worthy of being examined and weighed. But one stands forth pre-eminently. It is the hidden and unemployed horticultural talent, which those who are best versed in this science know well to exist. We call on the Council to collect into a fyeus the seattered rays of horticultural light, and if they do not care to assume the responsibility of directing them when so collected, to hold them in reserve till some skilful hand and inventive brain shall have puinted out how they may be turned to good and profable account. We know there are those who hold that things horticultural cannot be made remunerative, and point to the experience of the past as evidence of the soundness of this view. But we demur to this, and repeat, we seek not a policy of imitation but of invention. We do not what Cunncil to do what others have done, but what others have failed to do. Wouli a merchant expect to realise profitable results from his heads of departments, if he treated them as menials, or if before setting them to work he were tu biad them hand and foot? Or would he expect any branch
of his business to pay that was at onoe the fir
object of his professions, and the last of bi
thoughts? thoughts ?

We know further that there are thone Would persuade us that there is no spirit op lify
fire in Horticulture. But we hold the oe this. What mean the full and attentive arere of at Mr. Wm. Paul's opening lecture on "Spring Flowers," and at the resuscitated scieute" meetings? What mean the Horticultural panies, Horticultural sacieties, and Hortion clubs daily springing up amongst us? these reasonable and earnest endeavours to a into active existence this latent fire, to give embo ment to this spirit, and energy to this life may err in judgment, but remembering how man: far-fetched and expensive experiments have be: tried and fuiled, we say here is one lying clo the root of the primary object of the Society, ment be tried; the cost to the Society will be s and we have no doubt the increase of subscrion resulting from it will be great. Soaiety now numbers in its ranks somo
Fellows. But what is this from tho Great Britain? Sume of our have as many customers; and while thare many nurserymen, there is but one Horticulturn Suciety. Why should not the Suciety embraces wider range of class, and be made so inviting thr every lover of plants and flowers should wish join it? If we consider the increasing taste f this pursuit, there seems no reason why tos number of Fellows should not be raised to 10 : even 20,000. Amateur horticulturists with tuet? friends, nurserymen with their customers, an! gardeners with their employers, have the pofer of adding largely to the number of Fellows, but the Society must possess their confidence, beforu the? can be expected to stir.

In adracatiug these views we do not fongot that many of the present Fellows may have joined th
Suciets for the sake of the agreeable promenal which the gardens affurd, or for reasuns other tha? those springing from any strong horticalturat tastes of sympathies. "Far be it fram uis on ignor the rights of these. Their tastes are justly entilcd to consideration; and what we propose need notis the least interfere with the
One word more. We observe that the proced. ings of this Society are indifferently and irregulur! reported by that portion of the press which darm itself exclusively to the arts prid soienaes. We know not where the fault of this omission lies, bed doubtless the remedy is within reach. Hortionture is both an art and a soience, and as sua fairly entitled to this recognition.
- Some flowers of a seedling Caingse Primpois have been sent to us by Mr. Earlex, which prese: one or two peculiarities worthy or theses, which place the bracts are converted into leaves, not onit is the truss a very pecuiar appearance; divisions of
this the case, but, secondly, the five dive calyz in some of the flowers have also assumed the for of leaves, showing most distinctly flow nerves which distinguish their origin. of bers in the same truss, though the divisionsint true of the give only vary from 14 to 18 , a irregular nerfis going to the different divisions. A third pecaliarily consists in the production at the base, besides the truss, of single flowers, a circumstance
extremely common in some of the forms our ordinary Oxlip. It is in these flowers m ally that the sepals become foliaceous, exactiy after th mapner of a variety of the common Primposu variety is reproduced from seed,', and that flowers are generally solitary. The flowers themsel nes are large and of a deep colour, and the varie

\section*{CUITURE OR THE NUT.-NO. I.}

THE Nut enters so largely into the economy of the dacrt, and is found to be so useful an auxiliary during tre dull seanention of those to whom the suhject is not Inaw the adtiane of the principal points to be observed with a riew to its profitable cultivation. I am well convincer a profitable investment for sale in the market, anale a smaller scale for the suppiy of the desisert in .adividual tamilios, they are equally worthy of the proatast attention of the cultivator. ant always for very oftep indeed we find the trees planted any out-of-the way corner, and left to take their chance, uncared for, and only pruned in a senural way idea of subjecting them to a systematic
linits-any urse of pruning and management or or else they are planted as a kind of supernumerary crop, unworthy of a better place, in the intervening spaces between the rows of trees in A ple orchards, where, althoug frow the necessity of keeping them within bunds, yet, owing to the shade from the orchard trees,
and that deficient supply of food which invariably Siliws when two exlausting crops are planted on a apace which is only calculateld to bring one to perfection, ther seldom produce even half of what may be obtained from them under more favourable conditions.
bhow conditions are will best appear as we proceed.
I mould here observe that I am alluding to cultivation as taken in its broadest sense, and the principle is agalicable to many other snbjects besides that of the
collure of the Nut tribe. it is not to be concluded, becuus we are dealing with a tree which is very
gecommodating in its habits, and will grow and flourish wherably well under a variety of conditions, that when a gond site is selected, the trees carefully planted, and regularly and ssstematically pruned, that we have done
all that is necessary. On the contrary, we slall find that the ground must he well cultivated, and liberally
dresed-in fact farmed higis ; and there is no doubt on my mind, reasoning from much experience, that this niterr is in the long run hy far the cheapest, whether a large oue for market purposes.
The soil comes naturally as the first great consideratinn, and in reference to it \(\frac{I}{t}\) would observe that where planting for market sale is contemplated on a large
scale, it would be unwise to plant on any but a suitable nail, and what is of equal importance, a suitable subsoil. I: is quite possible in a gentleman's garden so to
improve soils uaturally unfavourable as to render the cullure remunerative, but there are so many minor conditions necessary to produce a fruitful state of growth, (and it is only hy attaining that fruitful state the proposed site, the results which would follow on the great ontlay necessary in extensive plantations anpointment will therefore be obviated by using the
and necessary canation in the first instance in selecting a Bite for planting.
The soil in which the Nut is found to attain the If a porons gravelly a deep loam on a dry substratiom bot toms have been found favourable when there is a sufficient depth of staple soil. I do not say but that mey may be found to flourish on soils which do not
comp up to these conditions, because, as I before laberred, the tree is very accommodating in it lonking at its cultivntion as a source of profit, and 1 of the subsoil, the above may be taken as a the nature necesary conditions, and means should be psed to points as posible
rubholl, because laid great stress on the necessity of a dry fratful habite of browth it to be the foundation of although they will cer
tainly grows ver lainly grow very well on stronger soils with even celay ang-jointed, and more inclined to producenern unfruitful wigrong woody grow th than slepder and fruitful
wils and subsoils arid gpurring. But then again clay prodnces on which the Nut tree flourishes well and fond upon analysis that althoughes, called clays they
contain upwards of stficient of this nature can be laid thoroughty dry by il, no doabt profitable plantations may be reared
minem. With regard to the necessary depth of soil, I consider alvatage, and it may be less, put in the latter case
much more attention will have to be paid to surlace
drexsing. In the preparation of the soil for planting, the first
ansider ation shonhll always be to ensure efficient druinage. If the anbsonil is sufficiently onsure enfficient
to carry on in a reasonable time all superfluous water, so
much the better farourable sites, and believe that know of many such
which drainage will not be an improvement, while drains ar as absolutely necessary. In all cases where use of a good depth of moderate sized stones to form the drains in preference to drainiag pipes. These may he used in combination with stones, if expense is no he used in combination with stones, if expense is no
abject, because they assist the free circulation of air through the drains, which is a point of great
impartance to what may be called the draught of the impartance to what may be called the draught of the
drains; but pipes alone are almost, if not quite useless after the lappe of a yery few years, because the roots are sure to penetrate the earth which is loosened in making the drains, and in this way to choke them.

The next course of preparation will be the trenching to the depth of two feet, or as far as there is good soil to work upon. If that is shallow, the bottom must be well broken up. This operation is rather expensive,
but when the trenching is performed in the season but when the trenching is performed in the season previous to planting, the ground may with great advantage be cropped with Potatos, and under such favourable conditions these will be (b)rring accidents of season or disease) a highly remunerative crop, which will cover expenses, and leave something for future perations.
The preparation of the young trees for planting in their permanent situations is a work of time, and ought always to be done in nursery heds. I am aware assert that the suckers should be planted in their permanent places at once, and be trained out in the required form, but I cannot but consider this as a very great disadvantage, inasmuch as to make it pay expense the ground must be heavily cropped with other produce, and I hold that this can only be done at in loss both to the crops and the trees. I am not at all trees intended to occupy a space of ground permanently, and should only recommend it in connection with heavy manuring, so that the trees may reap a little benefit; and then only under great pressure for want of space. Therefore, if the ground intended to be planted must be cropped, why, let it be done in a
regular course without the trees, and let them be regular course without the trees, and let chamibe
brought forward into a bearing condition on a limited space in nursery beds.
For this purpose select strong well-rooted suckers, and remove with a sharp knife all the buds on the stem to the length of 12 or 14 inches from the base, and head back the shoot at 6 inches above that height. This should give four or five shoots to form the base of the radiating branches. They should be planted 18 inches in the rows 2 feet apart, and the plants at 18 . from the irst year of growth remove all suckers, both any side shoots which may have started below the main branches. These latter must be shortened back to 3 inches, after which the gronnd slould be pricked up and mulched with rotten manure. During the second year of growth these shortened shoots oughit to
produce a sufficient number of strong shoots to form the base of the main branches of the future tree.
And here I must observe that a free circulation of air amongst the branches is a very important object to be secured, and therefore they must not be crowded; and more than that, the centre must be kept quite open. Now as Nuts, in common with most other trees, poserese
an innate tendency to fill up in the centre and grow upright, the work of training must be commenced during this period of their growth, and whilst the shoots are youny and pliable. On a small scale they may be tied out equally to stakes thrust into the ground, but in large beds this would be tedious, and nearly the same end is attained by cutting off all the shoots which point to the centre of the trea; and by taking care that in all future pronings the shoots are shortened to an outside bud. John Coxo

\section*{POINSETTIA PULCHERRIMA.}

Ornamental flowering plants are much needed through the winter months; and on account of its glowing scarlet bracts, resembling a crown of scarlet It is a the Poinsettia inay be considered one of or size from 6 inches to 6 teet; but plants from 12 to 36 inches high prove very useful for decorative parposes. July is about the time the old plants should be started
into arowth. This will be done by placing then in into growth. This will be done by placing them in
strong heat, air, and light, apd by giving them sufficient water, and syringing them once or twice a day. When they have made shoots three or four inches long, take these of as cuttings, removing them with a little heel, as in the case of a Dahlia cutting, and having some dry sand at hand in which to place
them immediately, so ns to stop their bleeding. These cuttings are to be potfed into small pots, "ingly, in sandy peat, each baving a little silver sand in the centre to receive the catting. Then they should be plunged
in strong bottom heat, under large bell-glasses, or in a glass frame. Sbading will be requred to keep them from shrivelling. When they are rooted they shond be taiken out and placed in a rrace whitted, and they nust be syringed over head two or three times a day, to keep them rom flagging. In three or four diys they will be sufficiently rooted and
hardened to be olaced in the stove, with a little shade and in about a week or ten days they shoold be
repotted in 4 or 5 -inch pota. They must liave vent the soil from -only just sufficient to prehe placed at the coldest end of the They should now can receive at the coldest end of the stove, where they only to prevent them from burning sufficient shade say from 5 to 6 inches in height, they slunhld be removed to a warm greenhonse or frame, giving them plenty of top air every warm dav, and at the same time allowing sufficient distance from plant to plant to prevent them from drawing. Ab soon as they require re-potting, give them their final shift into 6,8 , of 9 -inch pots, these being u-eful sizes for the purposes of decoration.
If a large specimen is requined for any particular object, selfect as many of the strongest plants as will fill a large pot without over-crowding; and after potting them keep each plant tied out so that it may have plenty of space for its development. A specimen grown in this way will generally produce larger bracts than an old plant cat hack and grown on a second time.

When the plants become manure water occasionally. They shonk never be allowed to get soddened, nor on the other hand must they be permitted to get too dry. Ahout the heginning of Oetober they will have formed their flowerfor after they should be removed back intor the Rtave, vers littlo in heiphts at plenty of heat and moisture to bring out their bracts o perfection.

As the plants pass out of flower let them go dry, and in this state they may be stored away beneath the atage. The best soil for them is fibrous sandy loam and regetable mould. The pots should be well drained. There is a variety with whitish bracts, I' pulcherrima alba, not so showy as the searlet, hut usetni as a growing. Thos. Brown, Tooting

\section*{KITCHEN GARDEN PLANTS.-No. III.} The Pas.
THe varietiee of Knight's Marrow Pea, viz, the tall and dwarf white, and the tall and dwarf green, are
either fast dying out or else they are gradually becoming superseded by later introductions. They ha acquired a famous history, but as regards distinctive character, "their glory las departed." Occasionally, true stocks of the original types may he met with, hit often, Cbampio the tall and dwart green tinds ; while Britisp Queen varieties.
Among" "tall-growing late Peas," as they" are sometimes termed, the earliest appears to be the Victoria,
or Waterloo Marrow, which ls also known as Thurston's Reliance This is a prolific cronper, producin fine and well-filled pods: the Peas are of a good flavour-in height it reaches from 6 to 7 feet. There was once a variety knowa as the Tictoria Marrow, which grew only about 4 feet in height, with seeds hardly so large as those of the tall growing kind, and yet, to the best of my recollection, both were identical in other respects. I do not know whether or not this to be the only representative we have of the roundseeded Peas classed in this section.

The late wrinkled Marrows are often classed according to tio seeds white, olive, and ore peas posseas characteristics common to thosz whose seeds in a dry state differ from them in colour. I shall not therefure adhere to this arrangement, as it might leai to raistakes. As,
when sown tongether, these late kinds invariably come into bearing about the eame time, I will confine my remarks to their respective merits, apd to comparisons of them with other sortc.
One of the beat, if not the best, of all the tall wrinkled Peas is Ne Plus Ultra, a variety which seems to suit all climates, and that eatigfies to the full the wishes of every grower of it. Its average height ig
about 7 feet; it is very prolific, bearing a urofusion of large grenu pods weli fil ed with Peas of exceilent flavour. This variety is in great demand in the London and large provincial markets. The colour of the pods, the tenderness of the Peas when cooked, even when somewhat old, added to a mich llavour, atways com-
mand for it a good price. Whea dry some of the Peas are of a pale olive colour, the majority however are white. To this excellent Pea I assign a marked individuality which it is likely to mantain for years to
come. Round it cluster a number of synonymas, some of which shall be noticed presently.
British Queen is another Pea of this class, which has very large white seeds when in a dry state. Its height is also about 7 feet; the pods are large and well
and the flavour rich and fullo This, too, has its quoth of synonyms.

The third representative Pea is the Tall Green Mammoth, the seeds of which aro entirely olive or
green when dry. It greatly resembles Ne Plus Ultre in habit, but it is generally considered to bo inferior to Payne's

Payne 's or Jeyes' Conqueror partakes of the character of Ne Plus Ultra, and is considered to be identical
with it ; at all events the latter is oftep eupplied for it.

Geueral Wyndham is another form of Ne Plus Ultra but perhaps a little later when sown at the same time Except in reference to this point its character appears to be the same in every respect.
Chaupion of Scothand. though very much like it, was not so good as British Queen when grown by its side; the latter is commmily sent ont for it. The same may be which, did not fill well in the pod. Competitor is but the "other self" of Tall Green Mammoth in growth; the same may be said of Sutton's Berkshire Hero. Ward's Incomparable and Great Britain, when true, are like T'all Green Mammoth in character, while the Ary seeils resemble those of British Queen. Strathmore Hero and King of the Marrows appear to be identical they do not grow quite so tall. They are great croppers, and the Pens are of delicions flavour. Bunyard's Kentish Hero and Raper's Champion of the World are nearly, if not quite, identical in character with Ne Plus Ultra; the seeds of the former also resomble it, while those of the last are almost entirely blue or
olive. Carter's Yictoria and Carter's Wonder of the World appear to resemble British Queen ; the last was an inferior stock of its type as I saw it last summer.

Some other new Peas are announcer, such as a blue Early Emperor; Princess of Wales, said to be a very Maclean; Albert Edward, a tall ernanation from Dr. early as the Euppror, and growing 5 feet in height Harrison's Royal Blue, a dwarf and perfectly distinct variety; and Caractacus, a first early, sent out by Waite \& Co., of Holborn. It is to be lioped that some record of these will be made public, as at present the Pea lists are far too plethoric, nad a judicious weeding would be aa acceptable benefaction. The simple ain of theee papers has been to conduce to such a result, that have characterived them. Quo.

\section*{Home Correspondence.}

Churchyards and Spring Flowers.-I beg to thank your Correspondent, Mr. Robinson, for his articie
published at \(p .362\), and I will look out for the short and selfet list which he promises. Popular feeling will not now, I believe, support the clergyman in taking in the butcher's sheep nad cattle at - per head, to eat mounds of the graves; and there is some hope that flowers, if planteil over the remains of departed 'triends, may be left undiaturbed till the surface mast be removed to make way for another occupant. As a Welshraan
I love to see the graves decked with flowers on Palm Sunday, which falls never earlier than the 15 th of March, nor later than the 15th of April; and, if I new how, I would carry my scheme ont permanently win rowted plants instead of with fading Our rector is very fond of Church decorations, and the
squire's shrubberies and his own are hardly sufficsent readers give me a list of evergreens shrubs that may bo kept low to plant 01 each side of the rhurch, in the
space (say 6 feet to 9 feet from the walls) which ought to be kejf clear of graves; distinguishing perhas those shrubs which are hest adapted to each aspect till in the intervals. I have glready made a trial of planting in the turf Crocus vernus (which I found Wild in a neighbnuring pasture), Snowdrops, Daffodils,
Garden Crocus, Tulips, Jouquils, Snowfakes, \&ic. The first-named three plants will, I expect, come up and muitiply year after year, as I have observed them frequently in pastures and orchards. But the rest, I have been told, become more rare yearly, and finally disappear altogether. Can any of your correspondents tell me whether the case of iny friend, who told me
this, was an exceptional case? And, if not, how I can this, was an exceptional case? And, if not, how I can
preserve the bulbs year after year with the least dispreserve the bubs year after year wither
turbance of the turf? \(A\) Parish Clerk.
Royal Horticultural Society's Scientific Meetings.I was delighted with the last I ruesday meeting. What a clange in a short time! It reminded me of the past, o see such gorgenus flowers, for some of the Orchids besides which there were some new plants were good; extreme pleasure of having met these is entirely owing to they would have faded meetiogs, for in all probability round. It is gratifying to see brouge the shows came good old things that have nearly beent in this way country. On this occasion there were several plants extreme interes!, of which I will mention two or three 1 was particularly struck with a fine specimen of Aspasia lunata, with eight expanded flowers. There ivory-white blossoms, I should think the finest ever xhibited-at least I have never seen one so fine. Tuen the glorious flowers of Sophronitis grandiflora! What and the contrast that-the white Cymbidium eburneum, \(t\) and the glowing orangescarlet Sophronitis! These Aspasia I believe worth coming to see; and as to the years. Again, I say, it is pleassant thus to meet old of scenes and time no mind agreeable reminiscences persuaded this change in the right direction will bring
back to the Society many of the old Fellows, and these on their return will probably bring new ones with them. We do not often see a Society \(r\); and the only if things are carried on in a proper way, wher way is to have at the have some knowledge of horticulture, as well as being able to talik about it. There are plenty to do the talking part, but we lhave latterly had few to take to the practical part of the work. \(B . W\).
Pear Trees in Pots. - I certainly agree with "T. R." When he recommends alt first 8 or 10 years of thei existence as pyramids, even if there are no "glass roofed sheds or orchard houses" for the protection of their blossoms. I would, however, plunge them in the open ground. With such trees there is no more risk from spring frosts than there is in the case of trees planted in the ground as standards and on trellises, and the certainty of a crop of fruit is much greater. Trees kept in form; artificial food can either be supplied to them or withbeld. They can be conveniently moved from one place to another at any season, whether they are at rest or in blossom, withont risk of injury. Nice compact pyramidal trees, 18 inches or 2 feet in diameter and 4 or 5 feet high, bearing a couple of dozens 4 dozens, and are again studded with blossom buds), are very ornamental, and would not disgrace even conspicuous places in arboretums or shrubberies contiguous to a gentleman's mansion About 100 are grown in 13 -inch pots here; this is the sixth season they have been cultivated in that way, and they are now fine healthy well-furnished pyramids. About 50 were planted in the ground when the other

were potted - the former are trained along with Plums, Cherries, and Apples against wooden walls, 4 feet high. This last mode of growing Pears has not proved satis factory here-50 in pots have furnished as much fruit in the year as 50 in the ground have yielded in five. It only fair, however, to state that some of those in pots are grown under glass, but those out-of-doors in pots have never failed to yield a crop. The treatment they receive is similar to that recommended by "T. R" They get no surface dressing, but they are regularly watered twice a week with liquid manure from the farm-yard tank, from the time the fruit is set till it has done swelling, and the trees are syringed every atternoon, Sundays excepted, at about 5 o'clock, from March till September. Peaches, Nectarines, Apricots, Cherries, and Plums are all treated in the same way. Apricots are the only kinds of fruit that have failed here under pot-culture; they, however, promise well this season. Fruit trees in pots, when plunged, in the borders of an Orchard-house, or in the open ground, speedily ront through the bottom of the pots. These roots require cutting off once at least every season. If the tree is in fruit and firmly plunged the operator is apt to break The side shoots or shake the fruit in lifting a heavy pot. The accompanying contrivance is used here for lifting the tree out of the hole, and swinging it while the operator cuts off any roots there may be through, afterwards lowering it into the bole again. This quite obviates any danger that may arise from lifting by the hand. The chain is drawn a little too long, but Renantherade short if desired. J. H.
Renanthera coccinea.-I bave at present this beautiful plant with 24 bloom 3 open on it, and in the course of aine or ten days more it will be in full flower. Has is ever blossomed at this season before? It showed bloom cold the same time last year, but I had it standing in el Vinery, when one of the severe frosts about New aso soek got inside and killed the flower spike, and than 2 feet further from the plants, which were more The latter was not in the glass than the Renanthera. tion of the fowot injured in the least, with the excep. was not morer spike, although the top of the plant Smith, Gardener than 3 inches from the glass. James near Manchester. Criokets-H0.
these-to me-tow can I most effectually get rid of Cucumber and Melon pits this season their depredations have been so great an to nearly ruin my crope although

As soon as the first flower opens they wereatticher mences at its centre and epens, Mr. Cricket com styles; the young fruit the stane stamen means of much attention I howevindies and dies, they are progressing nicely. My enemies fow s.th ever, I find, attacked even. My enemies have, bith ever,
fruit, thereby giving it a cankerous scaling along th which destroys its value. I trust, therefore appearmon body will kindly assist me with some advice in matter. J. P.
Calceolarias.-At p. 368 it is stated that laria cuttings ought still to be covered at nioht is a mistake, as they are better without cover. Th will stand almost any degree of cold; what ther Iter rom is damp. I tried some experiments this surs winter that proves this; I put a quantity of an old glass ligh wall, only lea leaving the ends open. They are ver them trongest and healthiest plants I have, and I did lose one. H. T., Nuneaton.
Ground Vineries.-I find that what have bee humbly called 10 -feet lights here for at least 10 yem are now honoured with a patent, and fine named ind grow Grapes in, nor have they had loose bricts for oundation, but they have a 9 -inch deal to rest upon they are always in use for Early Heas, Dwarf French Beans, Winter Lettuce, Ridge Cucumber, da balieve my late master, T. White, Esq., was the fintt nvent them ; and if Mr. Rivers will look over or say 1855, he will find the measurement of them I well remember the eulogium he passed upun them the time. I think his plan of glazing an improsemet but the hinges a move in the wrong direction. Jo Morris, Gardener to T. G. G. White, Esq, Mano

Lady Birds.-U
Lady Birds.-Unusual quantities of there pretty They are busy hunting for aphis on Roses, Gooseberng
harly and Currant bushes; and I observed quantities of them crawling about long before vegetation had commened to furnish them with any food. Last year theg snarmed in countless numbers in the Grass fields, and everywhere amongst bushes where aphis abounded. An interating experiment may be made by capturing a few and letting hem loose on an infected shoot of bush. It is astonishing how soon they will set to work and devour the green fly or any kind of aphis in their way. William Tillery, Welbeck.
New Zealand Spinach.-Catalogues direct this to be raise in leat, or sown in the open ground so lates May. Here it always sows itself, aud appears at the and of March, being fit for use in May. The planu are generally killed by frost in winter, and the remains exposed on the bed, when a little covering it cast over it in February ; occasionally, even this are is neglected, and sometimes the old plants survive and expand themselves considerably. It has kept possemsin of a border near a wall looking west for yeare. most useful ard wholesome vegetable, and superior to any Spinach [?] The purchased seeds from whied thas tock sprung, were grown with difficulty in heat. protusion with which the seed grows naturally seems
connected with exposure to the rain in winter, blice causes the hard shell to decay. H. C. B., Dungarish Co. Waterford.

Black Varnish.-Allow me to inform your Corien pondent who requests information respecting a pariah for hot-water pipes that I have for years usel quantity of Hill \& Smith's black varuish for paintal iron fencing, and as it has a glossy appeara
answers well for that purpose, I determined for painting the pipes in a cange of nersly-erectiod forcing houses. It was also applied to the forming the covering of a large tank for supplive water to the same houses, the tank being jaime and so formed as to have a
pass through the water to warm then auturn time, the houges were soon filled with bedding plants, Primulas althourg the smell of tar was hardly perceptible, the plants soon showed signs of suffering-Primulas would sonn have been killed. Wok and pain pipes with a thick coating of whitewash mad strong fresh slaked lime. Next day this app Was washed and scraped off, repeating
of painting and scraping off several times. over the tank was taken up and replaced the house was sweet again. If, therefore, respondent's varnish was the same as min uses the same means as I did, he will Holl, I can from experience cautiou every one a use of black varnish in any shape. I put up water apparatus in iny vineries, and co the parts were gas-tar After killing all that year of Grapes, and all my flowers, I tried means to remove it, but without effect. I thecess
 to pieces, made a large furnace of 1 or 2 cartload coal, and heated them red-hot. This I found to only effectual care. \(\boldsymbol{H}\). T.

\section*{Foreign Correspondence}

Cisehona Cultivation at Darjeeling.- Dr. Ander wou, who is in charge of Cinchoua cultivation at Dar;ediog, has addressed to the Secretary to the Government of Beugal, a very favourable statsment of the progress made since July, 180 . He hasalsg besides an account of the operatious of the month, a tabular scatement of the progress of certain carefully measured plants of different species of Cinchona grown in the pround, in the open air, without shelter of any kind, in ive plantations which have been formed at dier the elerations aboviary we make a few extracts :-

In July, 1564 , the in glazed frames at carried on in conservatories, and in glazed frames at Lebong. The suocess attending the small open-air plantation at and December, of all the Cinchona plants from Lebong to Rungbee. The frames also, about 40 in number, sere taken to Rungbee and were filled with the smellest plants, while all the lately rooted cuttiugs, but which were still in pots, were transferred to opendir beds formed in parallel lines oun a geatle slope. botween each plant, each bed being about 200 feet long.
Three such beds were filled with young plants of Cincliona officinalis by the 15 th of December. It was to expose them fully night and day. The plants in these beds will be grown to yield cuttinge. It is atended to keep 20,000 plants of each species for this purpose. After this number of stock plants has been short time in beds situated near the ground to be per laneutiy planted. After remaining two or three the plants will be placed in the permanent barkyielding plautations at a fixed distance from each officinalis exist at lunghee, so that the number of stock-plants of that species bas been almost attained. These stock-plants will be allowed to grow for some time before cuttings are taken from them to form bark-gielding plants. The number of the other species that all the cuttings obtained during the next five monthe at least will be added to the number of cutting yielding plants.
The reports of the value of Ciuchona Pahudiana are so conflicting that it does not appear advisable to
abandon entirely the cultivation of this species. Sir Willian Hooker, in a letter of the 8th January, 1865, writes that some well-known chemists seem to think more fasourably of it now, and that Professor Miquel lias informed him that Cinchona Pahudiaua and identification, which are the same. This important ago by Mr. A. A. Black, of the Royal Herbariuin at Kew, on my forwarding to Kew flowering and fruiting
branches of Cinchona Pahudiana from Java, adds nothing to the commercial value of this plant
On the Goveroment plantation at Darjeeling contained on the 1st of February, 1865, of C. succirubra, 4780 C. mierantha, 944 ; of C. officiualis, including varieties, of 30,163 .
Drom Anderson adds a table showing the rate of Dowje of the different Cinchonas at Rungbee near plantation (altitude 5500 feet), the growth of C and ofC Pabudi January was from \(\frac{4}{4}\) to \(\frac{3}{4}\) of an inch; add C. Pahudiana from \(\frac{1}{4}\) to \(\frac{1}{2}\) an inch. At 4350 feet the od fromen to grew respectively from \(\frac{1}{2}\) to \(\frac{3}{4}\) of an inch of an inch, C. mierantha from \(\frac{1}{8}\) to 1 inch, C. ofticinalis from \(\frac{4}{4}\) to \(1 \frac{1}{4}\) inch, and \(C\). Pahudiana from grew from \(\frac{1}{4}\) to it of an inch. At 2500 feet all four species to \(1 \frac{1}{4}\) inch grew from \(\frac{1}{4}\) to \(1 \frac{3}{4}\) inch, C. micrantha from Pahudiana from \(\frac{1}{4}\) to \(1 \frac{1}{2}\) is from \(\frac{1}{3}\) to \(1 \frac{1}{2}\) inch, and C . \(\frac{1}{4}\) to \(1 \frac{1}{8}\) inch, during the month

Entonorogroal: March 6.-F. P. Pascoe, Eeq., in remarkable Mr. F. Bond exhibited some specimens of a
ro Gall, found on a Willow flown high, near Cambridge, which resembled a fullbeing prematarely developed in extremities of the twigs persiatent through the winter. Whorle, and continuivg Sulfolles of Vanessa Urticæ and Coleas Edusa, taken in Wood pair, blotched with dusky wings, especially the the white raarkings a variety of Apaicura Iris, wanting Profenor Westwood made somper side of the wings. Irodes pluages and sexual distinetions in the Dog-tick, memoir. He by Dr. Schiodirected attention to a remarkable the author introduced somently published, in which a parallel between of Coleopterous insects, and Latreille to the disparagement of the of Fabricius and
entomologists, an opinion which Professor Westwoo considered erroueous. The President also opposed I) Schiodte's views. He further read some notes in opposi tion to the practice, daily gaining ground, of overthrowing generic names which happen to possess a greater or less similarity of sound with other generic names previously established; and Professor Westwood went so far as to consider it unadvisable to change generic names, even If absolutely identical with the names of genera kingled in other classes of the animal or vegetable "Trichonten Mr. McLachlan read a paper entitled species of Caldis flies, comprising 124 species, arranged in 43 genera. The President amumiced that, as an inducement to the study of Economic Entomology, the Council had resolved to offer two prizes of the value of five guineas each, to be awarded to the nathors of observation, on the amatomy economy on tobits of a insect or group of insects especially serviceable or obuoxious to mankind, to be illustrated with figures of the insects in their different states, and (if the species be noxions) which must detail the result of actual experiments for preventing their attacks, or the destruc tion of the insects themselves. The memoirs must b sent to the Secretary, at No. 12, Bedford Row, London with fictitious signatures or mottoes, on or before the 31st December, 1865, when they will be referred to Committee, to decide upon their merits; each must be accompanied by a scaled letter, endorsed with the fictitivus siguature or motto adopted by the writer, and enclosing his real name and address. The prize essay to become the property of the Society, by whom they will be published.
April 3.-F. P. Puscoe, Esq., F.L.S., President, in ils new President exhibited a Bolboceras, pear and new, captured by Mr. Odewahn, at Gualor by digging it out that place. The Fresident had also hima roads nea aimilar economy in the Fresid had also himself noticed a simailar economy in the French species, B. gallicus.
He also drew attention to a letter which had appeared He also drew attention to a letter which had appeared
in the Athencume relative to the IRose-like galls on Willows, exhibited by Mr. Bond at a previous meeting suggesting that these galls afforded an explanation of the supposed medireval miracle of the Willow blossoming like a Rose at Christmas. Mr. F. Moore exhibited in collection of Lepidoptera, collected by Captain Lang in the North-Western Himalayus; also two moths from Darjeeling, the bodies and wings of which were covered with slender elongated Fungi, found by A. E.
Russell, Esc. Mr. Janson also exhibited a large Russell, Esy. Mr. Janson also exhibited a large
collection of Lepidoptera from Bengal and the Hima layas, including some very fine new species, collected by the last-mamed gentleman. Mr. William Wilson Saunders exhibited several interesting species of galls collected in Syria by Mr. B. T. Lowne. The President mentioned that in crossing Monte Moro in July last he had observed on the surface of the snow many smal cylindrical holes, the size of a wine cork, at the bottom of each of which was generally found a Dipterous or Ichneumonideous insect, which having fallen on the surface of the snow and become chilled by the cold, had probably gradually sunk, the hole being caused by the radiation of heat from the surface of the bodies of he insects, an explanation which, however, was no considered satisfactory by some of the members
present. Professor Westwood made some critical remarks on the recently published memoir on the Chigoe by Dr. Karsten, contending that the generic synonymical name Rhynchoprion ought not to be by hirnself nearly 30 years ago. Mr. Bates read a momoir containing descriptions of 16 new species, from the Amazon district, of the interesting genus Agra, of which the number of known species now amounts to 140 .
Acclimatisation of Great Britain.-A general meetiug of this Society was held in the Council Room of the Royal Horticultural Society at South Kensing ton, on Monday last, Mr. Edward Wilson, V.I. in the chair. After having stated the object of the ineet ing, the chairman called upon Mr. B. Waterhouse Hawkins to read the correspondence which had led to the receipt of a letter from Lieut.General Knollys, conveying the gratifying intelligence that H.R.H. the Prince of Wales had graciously consented to become the President of the Society. The following resolution was then put from the Chair :-" That the Acclimatisation Society of Great Britain glady availing themselves of the distinguished h.R. . conceded in the acceptance of H.R.H. the Prince of Wales of the Presidency of the Society, proceed to elect
his Royal Highuess to that office, and he is hereby his Royal Highuess to that office, and he is hereby
duly elected." This was carried by acclamation, and the usual vote of thanks having been given, the meeting separated.
Miss Burdett Coutts has kindly presented a medal to
the Society to be awarded for distinguished services.

\section*{Notices of Books.}

Canada: its Defences, Condition, and Resowrous. By W. H. Russell, LL.D. Bradbury \& Evans.

This book makes its appearance at a time when more than common interest has been aroused on the subject of Canada, and for this reason alone it will doubtlens
be eagerly read; while the name of its author is quite sufficient to ensure its bein. favourably received and
studied. studied.
Dr. Russell's powers of observation aud description are so well known that it is needless to divell on them suffice it to say, that although his stay in Canada was but short, forming, in fact, mereiy an episode in his American visit, yet his book is full of interest for the general reader, and contains many valuable hiuts to those who seek more particular information on many subjects. The special point to which he turned hi attention was the state of the defences of Canada; and he makes very clear and uncompromisiog statoments with regard to the defenceless state of what ought to be strong points, aud also on the apathy displayed by the Canadians; although they are at the same time credited with a strong attachment to Englanu, and an aversion to the American rule. From the fact of their former successful resistance to the Americmans, Dr. Russel draws a hopefu! augury for the future ; but it evident that unless they bestir themselves in fortifying their at present weak points, although victory ma ultimately remain with them, yet the contest must be severe. Let then be warued in time
It is well known that although Canada lien in a more southern latitude than Fughand, yet and as the vinate in winter is far more severe that seasone visit of Dr. Russell was made during that season, we meet with many vivid little phetures
of the delights of sleighing, skating, Se. The anount of suow seems to be something of which we in England can form but a faint idea; the street are described as being piled with it, and those who drive into the country appreciate the difficulty of "making tracks" in a desert of universal whiteness. Four months of slow and frost are, however, com pensated for by warm and fine summers; and, as in all extreme climates, plants grow and ripen with a rapidit unknown in more equable regions. Many of ou readers doubtless remember the varied riches di played in the Canadian Department at the Internatioua Exhibition of 1862.
The following is Mr. Russell's account of the agri culture of the country :-
"Notwithatanding the long winter, Upper Canads yielded, according to late averages, 21 bushels of winter Wheat and \(18_{\frac{1}{2}}^{2}\) bushels of spring Wheat to the acre Lower Canada, where agriculture has not received the same development, yields a smaller proportion to the acre, but the Wheat is of excellent quality. In Uppe Canada the yield of Oals is about 30 bushels to the acre; in Lower Canada it is 23 bushels. Barley is a little less in Upper, and about the same as Oats in Lower Canada, and Indian Corn is about ns much a Oats. The Putato yields from 125 to 176 bushels per acre."

Horticulture flourishes equally with agriculture :-
From the head of Lutke Ontario, round by the Niagara frontier, and all along the Canadian shores o Lake Erie, the Grape and Peach grow with luxuriance and ripen to perfection in the open air without the slightest artificial aid. The island of Montreal is dis tinguished everywhere for the fine quality of its Apples and the island of Orlens, below Quebec, is equally celebrated for its Plums. Over the whole of Canadu the Melon and Tomato acquire large dimensions, an ripen fully in the open air, the seeds being planted in the soil towards the latter end of April, sad the frui gathered in September. Puapkins and Squashes attai gigantic dimensions; they have exceeded 300 lb . in weight in the neighbourhood of Toronto. Iudian Corn Hops, and Tobacco, are common crops and yield fai eturns. Hemp and Flax are indigenous plants, and can be cultivated to any extent in many parts of the Province. With a proper expenditure of capital England could be made quite independent of Russia, or
any other country, for her supply of these valuable products."
Nor is Canada less rich in mineral treasures than in the products of human industry
"Save and except coal, the want of which is to a considerable extent compensated by the vast stores of forest, of bog, and of inineral oils in the Provinces, Canada is very rich in many minerals of the firs mportance. Iron is deposited in exceeding abundance in the Laurentian system ; lead, plumbago, phosphate of lime, sulphate of barytes, and marbles are found in the same wide-spread formation of gaciss and lime stone. The Huron system of slate, \&c., contains copper, silver, and nickel, jaspers, and agates. The Quebec group in the east promises to be equally valuable. The basis of metallic and ochreous pigmente every description of marble and slate, miuerals, and substances useful in chemistry, in arte, in agriculture in architecture, are scattered throughout the land rom Lake Superior to Gaspe.
Possessed of so many natural advantages, is it to be wondered at that the population should have increased so rapidly that "Upper Canada exhibited in 40 vear hearly four times the increase of the United States in 50 years !" and this, althongh "the Germans and the Irish have rather sought the United States. The emi gratiug powers of Scotland are rapidy decreasing, and the few English who emigrate prefer Australia, New which sulfers from the early neglect of the Home Government, the studied aspersions and misrepresentations of powerful agencies, and the ignorance of the
poorer clases who seek to improve
going forth in search of new homes. be visited as being remarkably fine. Let his account Montreal seave as a speciusen. "The quays of Montreal are of imperial beanty, and would refleet credit on any city in Europe. They present a continaons line of cutatone from the Lachine Canal along the river-front before the city, leaving a fine broad mall cr esplanade between the water's edge and the houses. The public buildings, built of solid stone, in which a handsome limestone predominates, are of very great merit. Cburches, court-houses, banks, markets, hospitals, collegea, all are worthy of a capital; and these would
present a very different appearance to an invader from present a very different appearance to an invader from tusignificant Montreal of 1812."
The question of defending Canada appears for the present to be settled in the affirmative; and it chould be seems a pity that such a magnificent country is probably merely a question of time; sooner or later, colonies inevitably drop off and assume their inde pendence; but, as Mr. Russell urges, what a different aspect such a disunion would present when accomplished in amity, from what it would do if brought on throngh disagreements and quarrels, by which the colonists nn alliance with ita rivale,

The Summer of 1865 : founded on the Vernal Equinox. With Osservations on the Summers of England. By
Thomas Du Boulay. London: Rogerson \& Tuxford. A pamplilet, pp. 16.
Since 1860, the author has annanlly given a forecast of the summers founded on the characters of the respective vernal equinnxes, or the state of the weather
from the 18 th to the 25 th of March. He has laid down as a general rule in his previous writings, that "aus
ordinary equinox is followed by an ordinary summer, and predicts it; and an extraorlinary equinox predicts, and is followed by an extracedinary summer, and one like it in character."- "It is not likely," Lhe says, "that many noctial weather just passed through, to be what is quite usual for the tiine. There may be some grounds for viewing it in its main characteristies, as simply an
exaggeration of the weather which prevailed about the same period of last ytar, thus implying for this year the same probable result as for the last, viz., general dryness and fineness in the weather, and early maturity
of crops." So one is bound to conclude, if there is any trath in the rule above referred to. But he goes on to say, "this is uot, however, the light in which it is gesult of a great aërial movement in the higher regions of the atmosphere, paising over nearly all Europe." The author comfesses that he has had very great difficulty in coming to a conclusion as to the light that
it (the vernal equinoctial weather) throws on the probable future, because ho has never seen its real parallel before; but thinks it right to speak without It is considered then, to be sit
It is considered then, to be significant of a summer back the crops for their full time of maturing and housing, into the period of the autumual rains. The whole period of their growth will be probably rendered unkindly for them, by the presence of unwonted great dryness, and at a later period by much wet. great dryness, and at a later period by much wet.
Night frosts, also, and boisterous winds are contingencies which certainly threaten danger, whether they cone to pass or not;" but we may be allowed to ask how these can certainly threaten danger, when in the next sentence there is an adjunct implying uncertainty as to whether they may be experienced or not. According to our author "the whole season is whether it is present at all tim and blighting by cold, as night frosts, violently contrasting with the heat and that would not day. A sort of season seems to promise that would not be kindly for anything." This augurs productions of exotic origin. Nevertheless some of the best grain crops ever known in England have been produced under the influences of cold nights and very warm days. In coming to a conclusion on the subject, the of summer should be dry or wet; the balance is thought to turn in favour of wet." Mr. Du Boulay's forecasts are evidently entangled with doubts and fears.
E. At p. 463 of our volume for 1864 we pointed out that the summers do not invariably take their characters If inch of rain fell in the equinoctial week, and the month of May, June, July, August, and September, Which that period should typify according to the author, ought to have been excessively wet, but instead
of that the weather on the whole was fine, and the quantity of rain was less than usual. In that year the The neat year, of the forecast completely gave way. of that year was remarkably dry, for in the whole month woek not androdinch of raiu, and in the equinoctial summer and a short crop must have been predicted
What followed? In June there were only four dry
days, the amount of rain for that month being nearly
five inches, or double the usual quautity; in July the supply was ample; in August and September the quantity was again much above the average. In short, the five montlis typified to be exceedingly dry on the coutrary to be excessively wet previons season, typilied by the equinoctial weel to bo previous season, typitied by the equinoctial week to
very wet, proved to be excessively dry. These two very wet, proved to be excessively dry. These two
suceessive seasons were in fact diametrically opposite to what they should have been according to the rules which the suthor of the forecasts has laid down. This year he seems to speak more doubtfully than usual on carefully perusing the pamphlet, we are left in doubt whether the summer will prove good, bad, or indifferent.
The Chrysanthemum: its History and Culture. By
Juhn Salter, F.R.H.S., with coloured illustrations
and engravings on wool. London: Groombridge \& and engravings on wool.
Sons, 1865.8 vo pp. 75.
When Mr. Salter discourses on Chrysanthemums, it is the Orncle that speaks. No one we beleve could be tound more thoroughly competent to give the "complete history of the Chrysanthemum from the period of Is first introduction into England in 1764 up to the present date," Which is what is here promised, for
it has been with the author an almost life-long study; and no one with Chrysanthemum sympathies about him could read the account given without finding much both of instruction and of interest. We content ourselves with stating that Mr. Sulter's is a good book; and with the further remark, that on the ponts which he has thought necessary to the full development of his subject, the uninstructed reader may turn to his treatise with confideuce, pass on to glean a few historical scraps from its pages.
To begin at the beginning: in 1764 a plant of the small yellow Chrybnuthemum was growing in the Apothecaries' Garden, at Chelsea. In 1789, M. Blancard, of Marseilles, imported three varieties from China, ne only-a purple-reaching Francelalive. To him, therefore, belongs the honoar of introducing the largeHowered variety to Eusope; in 1790 this purple variety
found its way to England; in 1795 it bloomed at Mr. Colville's nursery, at Chelsea, and was afterwards figured in the Botanied Magazine. Between 1798 and 1808 eight varieties were introduced ; in 1820 twelve distinct varieties were known in England ; and in 1826 forty-eight sorts were growing at Chiswick. Up to this time the varieties were all imported, but in 1830 seed was saved in the south of France, and a new race of
varieties sprang up, and soon became numerous. To the Chevelier Bernet, of 'Toulouse, belongs the l:onour of having raised the first European seedlings, and some of these are still prized, as for example, Maréchal Duroc, Insigne, Christine, and Chevalier Domage. The first bonâ fide English seedlings were raised in Norfolk by Mr. Shurt and Mr. Freeston, 30 years ago. Then followed the Channel Islands; aud eventually, Mr. Salter himself, at his nursery at Versailles, produced a series of fine varieties, culminating in 1817 in one called Queen of England, acknowledged to be the finest Chrysanthemum extant. Since then the varieties have increased amazingly in number, and a high general standard of quality bas been reached.
The second and third chapters are devoted to the garden culture of the Chrysanthemum; the fourth, fifth, sixth, and seventh, to specimen growing, including the production of standard plants; the eighth to growing cut blooms for exhibition : the nintin to sports the tenth to classified lists; the eleventh to a most useful, succinct calendar of operations; and the twelfth to an alphabetical descriptive list of varieties known at the present time. For these various matters, the reader must consult the book itself.

The Chorale Book for England, with a S'upplement containing English Hymns with appropriate Tunes. Longma
Some few years ago a clerical gentleman, well-known for his musical talents, was asked for a hint on the training of a village choir. A grim smile flickered for a moment in the corners of his mouth, as he delivered the following oracular response:-"Ascertain what have been the favourite hymns and tunes in your parish church for the last few years, and-banish them." This advice seemed harsh, but it was founded in good sense, for choirs will get into mannerisms and vulgarisms, which there is no hope of curing, and to these they cling most obstinately.
An excellent Chorale Book wau published tome time ago, bearing the distinguished names of Miss Wink worth, Dr. Sterndale Bennett, and Otto Goldselmidt The tunes in it were new to English congregations indeed, one-half of the tunes were expressly stated to be "original." Moreover, the words were necessarily new, being translations from the German. Our clerica riend would have cbuckled to see his advice so literally followerl. Many persons, however, regretted thi banishment of hymas which they had known from childhood, and the old tunes which had at least the charm of early association to recommend them. To meet. their reasomable wishes, the choicest of there hymns are now published in a Supplement, with the in accordance with pem being very slightly altered taste. The Supplement to the Chorale Book will now
be very generally considered the best part. It nat
be had separately, the congregational editionn
Supplement containing 66 pages, at the price of it.

\section*{The Irrationale of Speecr, Loug, man \& \(\mathrm{C}_{2}\).} This very able paper on Stammering is repr....
rom "Fraser's Magazine." Tre writer, wito himself "C. K.," begins by directing water, sito its
marvellons facnlty of speech wilh which endowed. He observes that children perfuran man difficulty, and long bafore their little train of ve supposed to reason: and when people tell him a man possesses the faculty of imitation;" so far fors being satisfied with such an explanation, "C. K." is man known something of the missalke not, be has linne with thankful heart he tells the world that this paing arniction may be cured.
It seems that a shrewd, observant undergradua when at Cambridge, set himself in carnest to try at
cure his stammering friens, and mat with success that he made that art the study of The profession barked at his presumptuous intrnis but Sir John Forbes and the great Liston were b have with sauch pleasure witnessed. Mr. Hunt's proces for the removal of stammering. It is fornded on cura physiological principles, is simple, effecaciona, and an attended by pain or inconvenience, \&
Mr. Hunt, by dint of good sense, patience, and severauce, made many discoveries, and determined tir his son and assistant should enjoy the advantage of thorough surgeon's education, which the father nere had. Dr. James Hunt has made the cure of stammerin the ergon of his life.

Books Receiried.-The Geological Magazine, Patb 5, 6, 7, an l 8 , edite 1 by T. Rupert Joues, F.G S., and Henry Woodward, F.G.S., contain original artices on subjects of geological interest, reports and proceding of societies, and reviews of books. That of Mr. Marsh's
book, called "Man and Nature," treats of the inertable result of destroying forests in Canada, the draining lakes like that of Haarlem, and the fixing of sand pin by planting. Mr. Hunt's "Mineral Statistics of Gr Bricain" gives the consumption of eaal for housebnli purposes, manufactures, iron works, and exprth, Valued altogether at more than 20 millions sterlog Some papers relating to the thermal springs of Batt. and read there last year, are noticed. Reviews of Prestwich "On the Geological Position and Age of S.W. of Enclut-bearing hers, nnd ofe" and of Pol Desor on the Lacustrine babitations of the Neufedate. Lake, will be read with interest. We regret to intior the death of the veteran geologist Professor Silliman. of Yale College, at the advanced age of 8\%The Wild Garland; by I. J. Reeve. Part I. Price 60 Pitman, Paternoster Row. Go lden Chin, spreading habit; leaves broad, flat, rounded with a deep yellow edge ; flowers deep corise-scariot.
With green disk: flowers a bundant, bright scarlet, Appears Two marks were awarded to Golden Harkaway, a dwarf rariety of the series with the leaves marginate and not zonate.

\section*{Tye Aparary. \(^{2}\)}
"An Amateur" writes: "I have two stocks of bees in common straw hives, one of which is tolerably strong, and the other nether weak. Pollen is carried in by the bees of both hives, so I presume breeding is being proceeded with. I have purchased two Woodbury frame hives, and am very anxious to have them stocked at once. I therefore intend to transfer the bees and combs into the new boxes, but do not know how to carry out the necessary operations. I should be much ol.liged if you would inform me,-first, if there be any serious objection to my attempting the transfer: sesond, how best to proceed in the, I must confess, to me formidable affair."
In reply to these queries, we are much inclined to say, do not attempt the transfremee of bees and combs into your frame hives. To "an amateur," the necossary manipulaticus are not easy: though to the more experienced apiarian they are byno means very formidable. With the most skilful thure is a considerable amount of risk, and owing to the waste of material consequent on the fitting of combs, varying in size, into the frames, the result is often that the season is very far advanced before the transferred been become numerous and prosperous.
We should advise the bees being allowed to remain as they are, until after they have thrown off swarms. Let the swarms be hived as usual into the frame hives. If it is desired that the straw hives should be done away with, exactly three weeks after their swarms have issued, drive out all the bees from the old stocks,
and unite them to their relative first swarms. The
reason for waiting three weoks is that all the brood may have been hatched out, so that as little may be lost as possible.
But as "An Amatour" has almost determined on descrpting the transference, we will endeavour to describe the proper mode of proceeding. In the first place we should be inclined to unite the two colonies of bees into one frame box, one of the stocks being a weak one. If the weak stock be placed in a box by itself, vearly the whole summer will have passed before the bees will have recovered the effects of the dis turbance, and filled up all the vacaut places.
Let every article that can possibly be required be at hand; these cousist of a large knife, the curved about 4 inches long, to bend strips of stout zinc, about 4 inches long, to bend over the frames, for keeping the ermbs parallel with the centre of tho frames; some strong binding wire and thin laths of deal for tightening combs, when too shallow, up to tho bars (Mr. Neighbour, in his useful Mamal, recommends tape for this purpose, buic we have never tried it); a basin of water for rinsing the hands; feathers for brushing off rny bees that may be about the combs; and any other articles that may bo table will be necessary; a loosect. A large deal 16 inches by 10 will be found very thin board of about 16 inches by 10 will be found very useful for turning over the combs, so as not to loosen them in the frames. The timid operator will not forget his bee-dress and gloves; for the last, India-rubber gloves will be found very useful.
Having everything in readiness, drive out all the bees from the straw hive, in the manner detailed in our last Number at p. 368, placing the hive containing the bees on the old stand. Then remove the stnck hive to a place likely to be free from molestation by robber bees, where the operation of the transfer is to be carried on. Carefully cut ont the combs, placing one of these on the small board; mark with the frame cutting it rather larger, so as to ensure as tight a fit an possible; secure from shifting with the zine clamps, or if not deep euourh to fill the whole frame, draw \(u_{p}\) the comb by means of the slips of wood surtained by the binding wire; and pare away any unduly thick comb. If some of them are crooked, they may be flattened by gently warming before the fire, and applying gentle pressure on a flat surface until tho combs become sufficiently cooled to allow of being handled. Care must be taken not to bruise the colls which contain the brood. Having attached in the frames all the combs that can be made available, place them in their proper position. Then gently lift up the hive which contains the expelled swarm, set down the new box in its place, remove the cover, and with a sharp concuseion between the hands dislodge all the bees on to the upper surface of the frames; they will quickly descend among the combs. The cover many be gently slipped or pushed on (it must not be placed right down on the top of the box, or many bees will be crushed), and the hive allowed to take its chance. Two days afterwards the hive must be visited, each frame lifted out, any points of union or too projecting parts of the combs must be pared away,
and the supports and clamps may be removed and the supports and clamps may be removed
from all combs which have been firmly and properly secured by the bees. If any are not so secured, the supports must be left for a day or two. No irregularity of comb should be permitted, and they must be pared away wherever they have been in too lose proximity, and have been united by the bees.
So far "An Amateur" has been instructed how to
proceed with a transfer of a single stock. As he is circumstanced we have recommended him to effect a anion of the weak with the strong, which may bo done as follows:-Drive the second hive and fix the combs in the frames in the way already described. Place two of the brood combs in the second frame box, and disodge the bees among them. Insert the largest and best of the remaining combs in the box first operated
on, putting all the brood near the centre. A few on, putting all the brood near the centre. A few
hours, or the next day after, the second box may be examined and the queen secured or destrojed, the combs with the bees clustering on them may be transferred into the box, making room for them adjoining to the other brood combs, It is better for the two hives to have been located pretty near together, or some bees will be lost from returning to their old stand.
A little smoke puffed in among the bees at the time of uniting them, and inserting the brood-combs, may generaily be used advantageously; and sometimes a little sweetened water flavoured with peppermint prevents much loss of life from fighting. or we well to inspect the hive in a day combs, and more especially to ascertain that the queen is safe, and has not been sacrificed during the excitement consequent on the forced union. It is very likely that the two stocks made into one and transferred into a frame hive, will, should the season be pretty favourable, very quickly fill up all deficiencies, and bo in a condition for working a large-sized super; whereas, if they were shifted into separate boxes, neither would be sufficiently populous to take full advantrge of auy fine honey harvest. No greater mistake can be made by apiarians, who look for ample returus of honey rather than an increased number of swarms, than that of hesitating to unite weak stocks either to each other or to more populous colonies.

\section*{Garden Memoranda.}

Mr. Wiluink's, Axsterday. - At a abort distance from the The building in which the Horticutcural Exhilititinu touk place, by the side of tho river anstel,
stanils a mulstantial mansion belonging to this gentlestands a subistautial maxsion belonging to this gentle man. It is lacked by trees, whicu, taken in connec.
 for it fiue collectiou of U.chils aud Ferus; the later is stateil to be the best in Holland. M. Williuk has rown Tree Ferus for several years, and it is astonishing to see the rapid growth they have made ; some of tho stems are 6 feet ligh. One house coutained a surrrising number of specimens, exyuisitely arranged. Thising Luiluber of specimens, exycuisitcy being lofty, the larger growing Ferns The building being lofty, the larger growing had
were placed at the baek. In this way they had were placed at the back. In this way they had
a good effect, their graceful fronds towering above the smaller growing kinds. The houses are what are termed "lean-to's." The first is swall and used for propagating and growing a few cool Orchils. Among cbellum and grande; and Oncidium Plillipsianum, an oxtremely useful kiud for winter aud spring flowering. Associated with these were several plants of the lovely Pogonia discolor, with velvet-1ike leares, and bauutifully grown. Cultivators here seen to have hit upou the correct way of propagating this plant, viza, dividing this country, but it isest. neverthelelass well worth seen in tion. It wonth thrive along with Aneectockili, in the name material, with the erception of a little peat, which should the mixed therewith.
Among Ferus there was a grand plant of Alsophila contaminans, with lofty stern and exquisitely graceful foliage, 10 feet in length; A. australis, very fine; Cibotium Schiedei and princeps, two of the best Ferns that can be cultivated in a cool house; Platycorium grande, with fronds resembling a stag's-horn issuing from a flat block on which it was growing; the rare Memsteha Karsteniama, a line-looking lern, with a tall stem ; a beautiful new Marattia; Angiopteris evecta, t, wether with splendid specimens of Alsophila raleni, imf (roniophlelium subanriculatum, the last with drooning fronds more than 3 fect in length, and a fine luru for cultivatiug in baskets. In this house
were likwise a few Urchids. The next house conwere hivwise a few Urchids. The next house con-
taincd a collection of miscellaneous grcenbouse plants, for which there does nut exist so much fondness on the Contineut as with us.

A span-roufed house with a stage up the centre, and a platform on each side and end, contained Orchida It is not, however, so well adapted for their cultivation as it might be; the heating is defective, there being
too few lipee; strong fires have therefore to be kept too few lיpes; strong fires have therefore to be kept
up, in order that the house may have the right temperature. Ihis prodnces a dry heat, which causes many of the leaves to shrivel. The pipes used are of cupper, about 3 inches in diameter, and only two pass ruunt the house. If these were removed and three rows of 4 -inch iron pipes substituted, the house would then be much more suitable for the plantie. Notwithstanding the faulty heating apparatus, fine plants must linve been bestowed upon them in watering to keep up a vice growing, atmosphere. Among kiads in Cower were Cypripedium villosum and hirsutissimum everal flowers ane plant of ropedium Lindeai, with high; Aeriles virens. and suavis, V. tricolor, 6 leet with beautifully variegated leaves. Along with these were moreover Aerides roseum, a plant which takes a long time to grow into a fine specimen; Loelia superbiens, well grown and apparently free-flowering; Saccolabinm curvfolium, and Cypripedium Schlimmii, a very rare and difficult plant to cultivate, in excellent condition.

In the centre of this house were hanging in baskets some fine Orchids, among which was the new Phalæ. nopsis violacea, on a block, but not in good health. Under the Orchids were grown a nice assortment of Ferns, which had a pretty effect, and were in a suitable situation, the moisture arising from them being of benefit to the (Urcinids. Among tise Ferns were the beautifully variegated Doryopteris nobilis ; Hymenodium crinitum, With its broad distiuct hairy leaves, 2 feet in height; Cibotium Schiedei, and some beautiful Lycopodiums, of which there is here a good collection.

Ansectochili are well grown in this establishment they are kept under glass in the Orchid house, and appear to increase as freely as a Pelargonium They are cultivated in Moss, sand, aud charcoal, and are not kept so cloze as is often the case with this class of plants; indeed, we are of opiniou that with us they are generally too much coddled. If, on the contrary, people would fullow the plan just recorded, they wouls M. Willink has lis potting-shed thrive much better. Mouse, but instead pottiug-shed adjoining his Orchid house, but instead of having it at the back, out of the way, it is placed at the entrance. To Orchid-houses fere whould always be a glass lobby for climbers and a few hardy plants, 80 that the inner door may open into the house; this would be of great beneft to tender plants, by preventing the ingress of cold draughte, and cold. Ferns, which seomed to be starting very freely; they were well shaded with trees in mummer, which is very
requisite for this class of plants. Roses were well cul tivated here, as were also fruit trees, such as Pears Apples, \&e, which do surprisingly well in such a
datun country. Their stems are green with Moss, but they promise, neverthelese, to produce a good show of they promise, neverthe stand thoy are stated to bear abundance o fruit, and of good quality. They have a hot summe to ripen the wood in, which is of great advantage them. \(W\).

\section*{Calendar of Operations.}
(For the ensuing week.)
Derivg the present bright warm weather the ventilation or rather aêration of glass houses will demand increased attention. In summer, more especially, it is the one thing which requires to be secured in order to render our artificial climates natural. Under an unskilful system of aëration ill health, with its
attendant evils, is sure to present itself, rendering the attendant evils, is sure to present itself, rendering the
best directed cultural efforts in other respects abortive. When it is remembered, in short, that the two great operations of leaf feeding and perspiring depend very muth upon it, its importance will not, we think, be disregarded. The planting out of bedding plants is another matter to which attention must now be directed, in order to prevent disappointment hereafter.
During the months of April and early in May the skies are often so propitious, that we cannot but believe the winter has quite departed. With warm nights and sultry days we banish every thought of frosts and bleak winds; all hands are set to work to decorate our flower beds during the summer, and we flatter ourselves that we shall have a long and wrilliant display of floral beauty. But north aud east winds return, night frosts re-assert their iron rule, and a few hours blast the labours of a whole winter Be therefore in no hurry to turn delicate plauts out of doors for a week or two yet to come.
flower garden and plant houses.
Climbing or trained plants while growing will require constant attention in the way of thinning and stopping. Air must also be freely admitted, and pot plants, especially fine specimens, should be allowed abundance room. Maintain a moist temperature, and see that nothing suffers from want of water. Inspect carefully young stock, especially that for blooming next winter.
Early-sown Chinese Primroses and Cinerarias may be had in flower in October and November. Out of doors mowing, rolling, and cleaning will require attention.
annoals.- When these are large enough to handle, they must be thinned. If the plants are allowed space they will develop themselves properly, which cannot be the case when they are crowded together. Such kinds as Nemophilas, Clarkias, Eschscholtzias, Erysi mums, and others, which are not only beautiful but well known, may be freely thinned out.
Carnations anid Picotees - Before the plants have made large roots place sticks to them. When deferred some of the roots. Attend to watering, which must always be done effectually, taking care that the soil does not shrink from the sides of the pot, so as to allow the water to drain away without benefiting the roots.
Dahlias. - Soil for these should be rich and well worked, preparatory to planting out. See that the young plants do not get pot-bound.
Pinks.-Place small neat sticks to these, and top dress the beds with good decomposed manure.
Polyanthuses. - Shade and moisturo are absolutely necessary for these at this season. Save seed from the est-formed flowers.
Ranuxctlcses.-Water between the rows-notoften, but when it is done, let it be well done. Keep the beds free from weeds, and occasionally flood the walks round them.
Tclips.-Early varieties will now be in full bloom attend to them with water, and keep the beds in which they are growing neat and clean.

\section*{Forcing garden}

Melons. - Where early fruit is swelling, the soil should be kept in a properly moist state, and every means should be taken to preserve the foliage in perfect health. Keep the Vines thin, and prevent their being encumbered with useless laterals; remove any decaying leaves at once, as these when left only serve as a harbour for insects.
Pines.-Where these are grown on the planting out system, it should be remembered that the soil ought to be entirely renovated once in three or four years; the time for this operation miust be left to the judgment and convenience of the cultivator; bat if all or nearly all of the older plauts in any pit have perfected their fruit, such is an excellent opportunity for the purnose, and this is a very favourable time of year for the operation. The younger plants (which have been put in, one after another, as vacancies occurred) after being well watered, may be carefully lifted with balls, and set in a close shed while the soil is being changed. But if any remain of those which have already shown fruit, they may be left standing, with a small mound of earth about their roots. Or if they are not very far advanced, they may, for appearance sake, be removed with balls to the back row ; as they do not suffer if it be carefully done. The soil should consist of about
two-thirds of rich turfy loam, with an admixtare rials. The plants of the birements of the other mate. before the soil is put in for the second oue ; planted remaining rows proceeded with in the sarne, order th none of the soil be needlessly compressed. soil is moderately moist, it will be better to mill men water from the roots for a few days, to ullow ti piants to make an effort of their own ; and until they u. thoroughly re-established a moister atmosphere we be kept up, and the pits shaded rather more than usuri
sines.-A Aberal supply of air is the best preventit berries should be cut away than from those intendes for earlier use, that the bunch when ripe mag bang ooser. This will detract a little from their appearano but the free circulation of air amongst the berries mi" do much to preserve them from injury in damp weather.
hardy fruit and kitchen garden.
Water where necessary, and keep down weeds among growing crops
LETPUCE.-Prick out or sow as wanted; when oid crops are done with remove them, and manure and dig the ground.
ovenings, has been found highly weneficial on domp evenings, has been found highly beneficial to these. Thin out, and hoe between the rows.
Peas.-Continue to sow for successional crops
Potatos.--Stir the soil between the rows, and eanth up as requisite.

Radishes.-Turnip-rooted and others may be soma now. The Black Spanish where liked is best for winter use.
TURNIPs.-Sow for successional crops. The sionball, Orange Jelly, and Stone, are excellent.

\section*{The agricultural Gatette.}

Mr. Alderman Mechi has been good encugh to forward to us for publication a letter which he has received from Baron Liebig on an old subjectthe Exhaustion or Englise Soil. It has been written in consequence of the assertion in an anonymons pamphlet on the sewage question that facts belie the German theory on this subjeat. And, very fairly recommending Eaglishmen not so to deny the pomaibility of danger as that when it really oceurs they shall be found like the ostrich, hiding their head in ignorance, the writer gives an example of what he considers to be an illustrative fact on the question.

It appears that since Dr. Scenerdoer commenced, 10 years ago, as Agent of the Rhenish Agricultural Society in the Grand Duchy of Hesse, to lecture on the principles of the so-called Mineral Theory, 57 depots of artifieial manures have been established within an area of " 25 geagraphical miles square," whioh we suppose to mean 25 geographical (German) square miles, or nearly 340,000 acres. During 1863, 90,000 tous of artificial manure, more than 5 cwt . per acre over the whole of this area, were used, which is 3600 tons per German geographical mile, 10 times as much as Liebic calculates it. In consequence rents have risen so much during 10 years es to represent an increased capital of \(10,000,000 \%\), over the district-equal to 30l. per aore in gross, or at least 20 s . per acre in annual value.
This is what Luesco considers "a proof that the state of agriculture in a land is really improving," We have abundance of ruch illuntra-
tions in this oountry. Mr. R. Scot Sxibvino speaks, in the current Number of the English Agricultural society's Journal, of 10 years' experience in East Lothian, which at the commencement of the periol was the model district of the island the historian then being able to speak of perfeot agricultural prosperity. In 1855 farms were let at an increaso varying from 20 to 100 per cent. upon their former rental. Sinoe then, notwith \({ }^{\text {standing man }}\) lower prices for grain and Potatos, indeed rather perhaps in cunsequence of them, the quantity of purchased manures has largely increased. In 1853 a leading farmer, Mr. Hore, of Fenton Barns, is quoted a purchasing \(1 l\). worth of manure for every acre he farmed, but now, besides a large increase of artificial food consumed by stook, the manure bill hes risen upon all the best managed farms to nearly 2h, per acre.
Mr. Henderson, of Long Niddry, states that on 750 acres he expends annually from 1200\%, to 1400l. on portable manures, and \(1000 l\). on feeding stuffs, together nearly 70s. an acre. Moreover tho wages during the past 20 years have been nearly doubled. On farms where, 15 years ago, the monthly acount for female and casual labour amounted to \(10 l\)., the charge may now do safely estimated at \(30 l\).
The plants oultivated, the live stook kopt, the implements employed, all bear witness to a more energetic agriculture; and together, they form a body of testimony greatly superior to that which is afforded by the two items of manure aud rent which are roferred to by Baron Liebra. And East Lothian is but one of many similar districts. W cannot, indeed, show 340,000 acres in ope plot applying 5 cowt. per acre of artificial manure over the whole area, but taking purchased cattle food and manure together (and we look upon the former as an even more substantial fertiliser than the latter) the expenditure over a much larger area on the whole is even greater per acre in this country than that which Dr. Sommetner, as quoted by Liepia, describes.
There is however sufficient inconsistenoy in the statement whioh the letter convers to make us somewhat doubtful of its real meaning, and wo should be glad to know whether the faot stated really is that by the use of \(\delta\) owt. of imported manure per Eaglish aere, rents have risen 20 s during the lat 10 years.
The atatistical inquiry which Liento recommends is one of which the importance has been often insisted on in these columos. And we should be heartily glad to see it prosecuted here, whether it should diminish our self-esteem or not. There is a prospeet this year, we believe, of somo inquiry of the kind being undertaken by the Government.

Meanwhile it appears that in the Rhenis' Provinces of Hesse it is possible to hird an example of agricultural progress \&atisfactory to the great German chemist, notwithstanding that it seems to depend solely on that use of artificial manure which as seen in Eegland is enoutrage on common sense, a proof that Joun Brli is blind, so that in bis ignorasee he robe and ransacks the rest of the world, hanging on it 'as a vampire'' for that of whieh in his cesspools and sewers he has abundanoo at home. We should be glad to have the full statissios of the agrieultural manure question in Englaud, and of the seware question in Mesue, in order that a full and fair comparison of the two agrioultures mflyt be made.
The following is Liebig's letter:-

\section*{"Mwnichi, April 10, 18ū̃.}
"My dran \(S\) Ir, \(-S\) nue weeks ngo I received
pamphlet The Agricultual Value of the Sewiow pamphlet 'The Agricultural Value of the Sewnere of
Lo mdon,' (Edwd. Stanfonl, Charing Cross) in whish is the following paseage to which I should like t. direct your attentiona --'still more recently Biren limbra authoritatively stited that the anil of England under the modera aysten of farming is beconing innuwerishe l, and reduced to the state of barrennee which milactar the Roman State in the latter days of the Empines but, challenged to puist out a single ezample, he has remained silent, facts being noturiouly opposod th the
Professor's theory? With regra to the coudition of Professor's theory.' With regard to the comditiju of the English soil, 1 am well aware that Engliah opinios is but too disposed to belleve it supremely satisfuctory gation would greally shake the plensant reliance, und gation would grealy shake the pitions I intended was thint in ctse of a rent or only probable clauger it is meveredly nob wise to act like an ootrich, which, to avoid a throutening danger buries her head in the sand. I shall try to enake 3 on understand by an example what kiend of fuet ars to be regarded as proofs that the state of agrieultare in a laval is really progressing, I tramseribe from the official report of Dr. Schserder, publishod in the Angeburg Gazette of July 3d, 1864, No. 185 :-
«s I have been employed, sage
the service of the Rhenish Agricultaral Society (Grand Duchy of Hesse) since 1854, and it has been my dury to hold lectures from time to time in every parish of the province, and my chief endeavours have been mineral thenry, and the instructions required for its mineral application. Since that time in the little province, but 25 geographical miles square in area, province, but 50 dere are now 57 dets of artificial manure, 39 of which are under the control and supervision of the Agricultural Society; whilst during the year 1863, 90,000 tons of artificial manures, of superplosphate, were sold from them, making 355 tons, or 7100 cwt . for a mile square.
- In consequence of this large importation of manure, the land rent, on an average of 10 years, has risen to such an amount as to represent an increase of capital of \(120,000,000\) florins, or \(10,000,000 l\).-or, for a square mile, of \(5,000.000\) flozins.'
"The population of the Rhenish Province of Hesse represente 9595 persons to the mile; in Eogland proper it is 8076 . The country greatly resembles England in its physical character.
"It England, with an area of 2359 geographical in the proportion used by the German province, the quantity would have reached \(8,500,000\) tons.
"Taking the amount of imported guano and other manure used in England proper to be 400,000 tons, we
get an average of 5 tons to the square English mile, or get an average of 5 tons to the square English mile, o
something leas than 28 lb . per acre. something leas than 28 lb . per acre.

This simple statistical fuct shows how very small conparatively is the augmentation of the conditions of fertility in the English soil by the importation of suffered by agriculture by the waste of town sewage is notorions, and may be found far exceedng the amount
made good by importation; and thus the inevitable conclusion remains, that as a whole the soil of England, instend of gaining, must actually decline in productive power.
"In the presence of such facto, and with a population coutimully increasing, it is I think an imperative duty
to look an actual or probable peril in the face, and not to wrap it up by empty plirases. Let an evil be but once recognised, and 1 feel convinced that the English people will of all men be the readiest and most fitted
to meet and overcome it. to meet and overcome it.
"I am, dear Mr. Mbchi,
"Yours very sincerely,
J. von Lirbig."

We published last December (p. 1210) the letter of a clergyman to his parishioners, proposing that some of their Winter evenings should be spent by men, women, and children, at home, in handiwork of various specified kinds; the results to be colleoted in the following Spring for show and sale at a Parochial Industrial Exhibition.
The Rev. R. E. Blackwhll, of Amberley, Gloucestershire, by whom the scheme was originally proposed, now reports its entire success. The problem he has desired to solve is how labouring profitable employment at home during the winter months, under the circumstances in which each is placea, and with only the tools which each may possess. Penny readings, lectures, music, \&cc., are all very well in their way; but it seems to him, and to many others, that to these there should be addenda, and in particular that amusement should be obtainable at home. It is not a wholesome thing that labouring men or their wives or children should look for pleasure invariably away from the home and family.
The Amberley exhibition, the result of the winter's work thus organised, which has been held during the past week, has been a very great success. There have been more than 200 contributors to it in a parish of, we should imagine, not more than 600 or 700 inhabitants. The catalogue before us includes needlework and knitting, from specimens of darning and patchstockings up to counterpanes-all manner of toys, kites, dolls, boats, models, draught-boards, \&c.articles of utility, mats, rugs, baskets, gardentaste and beauty and general interest, paintings, sculpture, cullections in natural history, \&c. In some instances, examples of professional ability, as specimens of cloth, of boots and shoes, of more frequently the articles exhibited are specimens of the work of leisure hours, as where a learned man has sent a cabbage-net, the clergyman a fleet of small ships, a woollen manufacturer many beantiful specimens of ivory turning, and the buby mother of a family of nine a little book-ment-a subject quite in keeping with the whole seope and intention of the exhibition, which has been to strengthen and refine the family tie. And
that this object has been most enoouragingly servei worth of things thus made within a small parish during the winter evenings have been sold at this exhibition. So good an example cannot fail, we think, of being generally copied.

On Wednesday evening Mr. Holland's Locomotives on Highways Bille passed thrcugh Committee with very few alterations. A clause giving power to towns of a certain population to make such regulations within the matter, notwithstanding the facilities and directions sanctioned by the Bill, is to be added before it pisses through the Commons.

\section*{THE COTTESWOLD SHEEP.-NO. III.}

Erratux: In the first article by "fy. M. R.," on the Cotteswold
sheep, a mistake has been made in describing the bones sheep, a mistake has been made in describing the bones
found among ancient remains. Instead of "reindeer" bones found among anciont remains. Instead it should have been "red deer's" bones.
Notwrrastandina the high estimation in which the Cotteswold sheep were held up till the latter part of last century, it would seem their popularity was for a obtained from the public by the Southdowns, and especially the new Leiceaters of that day.

Always in the hands of tenant farmers, who pursue farming as a business, and without any great patron who as a "hobby" or "fancy," regardless of expense,
might bring them before the world, the Cotteswold sheep, when left to themselves. remained obscure on the bills of their native home until the desire for agricultural improvement manifested itself in the establishment of agricultural shows; for notwithstanding that few of the Cotteswold breeders care about or exhibit specimens of their stock, yet we imagine it is to these exhibitions that the rapid dispersion of the Cotteswold
sheep is mainly due: else we cannot conceivo low it is possible they could have been known and spread so widely as they are at the prosent time.
For, wherever they are exhibited, their immense size, grand appearance, and perfect furm, not only attract the attention of agriculturists, but form the great feature in every show where sheep are exhibited to the general visitors.
Doubtless, therefore, it is their,appearance in public that has regained for them the high stanaing they formerly had. So slow, however, were their just claims of being recognised in high places, that it was Battersea, that there was a distinct class for the Cotteswolds at our National Show. Whatever may be urged against the competitive trials as applied to live stock, in effecting their improvement by agricultural exhibitions, there cannot be a doubt but that an immense improvement has taken place in the live
stock of this country since the prize system has been adopted.
At the same time we by no means think that the present systen is perfect, for it still only repredegree artificial - an nnimal may be brought to without the slightest regard to cost, or to the natural state under which the same class
of animal has to exist when in the farmer's hands. Besides, if we mistake when in the farmers hands system induces an incorrect standard of excellence; for in order to win prizes the aim seems to be to get a small-sized animal with small bones, not showing, even in the males, that coarseness and masculine appearance which we hold to be desirable as most suitable to propagate stock adapted to our variable climate. We then overload this somewhat tiny and delicate animal with fat, and thus obtain prizes. The consequence is, that this prize animal is used for the name he has secured; and as "like produces like," the offspring, not indulged by high feeding, but having to seek for their living on scanty pasturage, exposed to
cold and wet, become constitutionally weaker than their forefathers. On the evils attending over-feeding every portion of the agricultural press enlarges, but we incline to the belief that writers are often ignorant of the cause of this obesity in show animals, and therefore attach blame in the wrong quarter, and apply the wrong remedy
Coeding, but if the breeders of stock all blame of high feeding, but if the breeders of stock could as well dispose of their stock without being thus made up, doubtless they would do so, and thus save the cost of the extra food as well as get rid of the extra risk of life and barrenness that too often attends the preparation of stock for the show yard or even for ordinary sale. Breeders, like other manufacturers, only produce the goods they trade in in that form that best suits the tastes of purchasers. It is therefore a delusion to
suppose that the breeders of animals are in fault for the excessive fat we see on animals exhibited at shows and for sale. Whoever saw at the Royal show a prize awarded to a poor animal? Consequently it is the pubis at these bhows that are responsible, and the the good animal when in stock condition from the pampered and trained ones
Benides, the present system doas not onswer the
end desired. At present it is indispensably necesser
in order to give beast in order to give beast or sheep the chance of succeses,
that it should be trained in the most arti from the time it is dropped, quite expense or trouble.
So far are these means from
the hardships of indifferent feeding and inclame seasons, and supply the hungry stomachs of the peont at large, that one has no hesitation in arcipoople the reasonable conclusion that they are defective. Ere amongst the Cotteswolds it is frequently remarked Eren the show system has had the tendency to reduce the sheep in size and hardiness by making them smallor in the bone, and to carry less lean meat
These considerations convey our conviction thet the prize system does not accomplish the object nasmuch as it does not give the cost of obtaining the
result attained.

It has often
rcumstanced, with a short supply of antry is nom together with a people whose tastes incline them freer use of meat than formerly, whether the Govern th or agricultural societies should not take into bands the experiment of ascertaining the animals tias: give the largest amount of valuable food at the lenes expenditure. The show system only tells us what mas be done with an animal most artificially treated, and vithout the most remote relation to cost.
Whereas, it seems to us what agriculturists and the public wish to have, is the animal that will yield the most meat with the least cost for food. Important J. B. Lawes as bearing upon this branch of the sulje still they lack confirmation by being repeated; they were all tried under similar conditions, wherit to make such experiments of the greatest they should be made to assimilate as near as posible to the ordinary conditions under which th aninals experimented upon are kept in the matu tate.
Neither was Mr. Lawes in all particulars corroctly informed, inasmuch as he speaks of the Downs
hardier sheep than the Cotteswolds; whereas the \(C\) teswolds are infinitely more hardy than the Downs or Cross-breds. It is unfortunate that in these valuable experiments by Mr. Lawes, the breeds of sheep were not tried side by side and in one season, insteal of extending over two or three years, because the difference in prices in different years vary, and it is particularly unlucky that when the co
were sold, the market was exceedingly heary
Nevertheless those experiments of Mr. Lawes, as detailed in the Royal Agricultural Society's Journl, Nos. 29 and 35, are by far the most valuable dats we have in elucidating the economic value of ourdifferent breeds of sheep, for with the exceptions just enamerated, all the conditions under which these experimentw were made, were equal, every morsel of food being
charged to each lot of sheep, and the returns accuradely ascertained.
It would, however, be tedious to attempt heve to give the whole of those elaborate tabulated statements by which Mr. Lawes arrived at his conclusions, and therefore we only note those facts which are connectad with the subject of our remarks.
These experiments were commenced at Rothamstail in November, 1850, and ended April, 1853. sheep experimented upon were Hampshire Donm Sussex Downs, Cotteswolds,
The grand results of these experiments show then th omparison with the Down aheep, "the Cottesmodids consumaed the least food to produce a given amon of increase.
In regard to the wool borne, "it appears that the long-woolled Cotteswold sheep gave more than hal in Sussex sheep."

Again, "taking the items of comparative intern" somewhat in the order in which they stand in this thane lated summary, it is seen that of the six lots that furt been experimented upon, the Cotteswolds give bjed he largest average weekly increase per head as much more than either Sussex, Leicester, or that bred sheep, and nearly one-fourth mors that 0 Hamphires, which are second in order increase per head per week."
With respect to the wool, it is seen thest the long woolled Cotteswolds and Leicesters gave the greate weight both per head and per 100 lb . live weig a ani animal. Next in order come the Cross breds, order lastly, the Hampshire and. Sussex Dowus.

\section*{THE LOW PRICE OF WHEAT.}

Is appears by official returns that the imports of foreign wheat about five millions of quarters a-year for (20D) averagea until the close of 1860. The great servenal yeare swelled the imports of the next three increnso was owing principally to our deficient harvest of 1860 and 1862, and to large crops in some of the of fie? exporting countries. The crops in America, which arc in geutral far more variable than our own, had beco sumndut up to last year, when thay were variously esverage of the previous four years.

Autithatanding our great harvest of 1863, foreign artivals liave, until last year, continued on the same large scale, and with the usual effect of over-production upuis un markets. This condition of the corn markets appears to be passing away. Tlee crops of 1864, as the Agricultural Gazette, were on the whole deficient but the Wheat crop was reported to be an average in nuantity, and more than an average in quality.
The rapidly declining imports wheat indicate reducel stocks in several exporting countries. But for the present the general opinion of buyers scems to be that the heavy stocks of Wheat, in the hands of oue own growers, will insure a continuance of the present low und unremunerative price. This appears to be the general opinion, or perhaps I ought to say, the general feeling, since an opinion is supposed to be founded on ascertained data, or on a previous traid
There are no direct means of calculating, even with approximate accuracy, the average crop of the country. millions of quarters of Wheat, be correct, it follows that when importations as crage 6 millions, the crop of the United Kimedom would be 18 millions, after deduetion for see.l. During the three months of the present jour that importation of Wheat have almost ceased,
third of the crop of 1864 ; twice the quantity of the estimated surplus of the crop of 1863, remaining on hand last harvest.
With respect to this much-talked-of surplas-if so large a stock of old Wheat was held last July, when prices were 6s. per qr. higher than they are now, it caunot be expected that the growers will part with the present superior quality at the present price.

Admitting the fact ct large stocks of old Wheat last harvest, there is 110 reason to suppose that present stocks are sufficient to prevent a serious rise in prices, if the prospects of the growing crop become unfavour able. And under no conceivalle circumstances is it probable that the surplus, such as it now is, ean come iuto consumplion at the present price.
Then there is a weight in the oppsite scale, which probably balances the "great surplus" of 1863 . I refer to the enormous consumption of Wheat in stock feediug On this point there are no accurate data; we must again be guided less by conclusive judgment, than by ceneral and vague impressions. Low prices of grain ani dear meat have done much to encourage the uso of home prepared food. Wheat is now used to some extent by almost every farmer for feeding stock. Being 40 per cent. lower in price than Linseed cake, there is, in point of economy, no comparison between the two,
Animals deprived of their usual supply of succulent egetables, are better satisfied with Wheat, as a substi ute, than with any other sort of corn. Peas and Beans, which are always largely used by those farmers who like to feed their stock with their own produce, were almost as great a failure last year as the root crop.
The steam engine is at work here five days a-wee preparing food for stock. One of the most useful lachines driven when I watch this mill at work, grinding 40 qrs. of corn, chiefly Wheat, in 10 hours; and reflect how many other farmers, under pressure of the unparalleled scarcity of roots, and stimulated by the high price of meat, have put the new grist mill to the same economic use, I cannot but feel that the consumption of Wheat this way must be beyond all precedent.
If our estimated 28 millions of sheep, eight millions of cattle, and four millions of pigs, have, like some
other popolations, acquired a babit of ealing Wheat instead of Citmeal, live, \&e., the effect on its con sumption wili prove chormous. To what cxtent this has been the case it is impossible to julge

The owners of thresting mathities in this district consider they have less than their usual work in pros. pecto Millers and merchants say this may bo true but at the same time, they lave a strong feeling that farmers have only threshed out their stacks for the straw (lor chaff and litter), and that much of the grain is in their granaries. I wish as a farmor I could foel that the straw was the only portion of last year's crop ad need of
Few farmers of 900 acree heve safe and safficient storage for 100 . qrs, of grain. When Wheat is kept by farmers it is, as a rule, kept in stack; and it is not an approved practice to thresh it and keep it "lymon ati.
The fact seems to be that five or six millions of the Wheat threshed in ti:c last four months have not been stored, but cousumed by man, nud a large, luat un Enown, quantity has been given to stock.
Onc example may be notice hire of the way in which the foreiga trade" becomes interrnyted, or diverted into new channels. Fgypt, instead of exporting corn largely as heretofore, now grown Cotton instead of corn, no? imports the latter to a con-iderable amount.
England derived from that country in the first neven months of \(1863,401,000\) qrs. of Wheat, and In the corresponding period of 1864 only 84,650 ara
These various considerations (and chiefly the broad facts of erormous consumption and declining importa tions) indicate the rapid subsidence of what may be called the recent Wheat-flood. A cessation of ample foreign supplies is not predicated; but there is no reason to expect a continuanco either of the excep tionally abundant importations of the last few years, or of the present unsatisfactory price of Whent
The fullowing statistics compiled from official papert will throw more light on our subject:

\section*{population in 1861}

Finglayd and Wates
fcotland
Ircliand
\(20,119,496\)
\(9,102,294\)
\(3,162,994\)
\(5,749,967\)
28,980,757

The average price of Whent fur the 19 years since 1846, was 58es per qr. In four years ouly has the average price approached its present low level, viz., in \(1850,1851,1852\), and 1864 ; and in two of those years, '00 and ' 61 -there was a considerable \(r\) ise between March and August. H. Evershed, Gosfield, Halstead, Essex, March 11th, 186.

\section*{AGRICULTURAL WANTS IN IRELAND.}

Eychishmby who truse for their information regarding Ireland to the conflicting statements of, and and and conductors of Irish newspapers, must be lod to conclude, that in as far as the gencral interest of the Bitish empire is concerned, it would be better to as was more that out of the map of the world, or, newspaper, to than once insinuated by the Times 24 houra immersed under whole island. for at least Ocean. We are said, by those whers of the Atlantic a lot of incaprry to say not "without reason [!], to be When incapables at home, but equal to any other men often sought to be it This libel, for such it is, has been successfully the be gairsaid, but seldom more "An Irish Landlord" a late correspondent of yours, I can now only speak from to by his letter, of which Paper containing it to Americ memory, having sent the man who had to America, the writer is an Englishto tee conquered combat, and all should be glad country have I could naine in various parts of the those adopted by, and are doing by meaus similar to reduce to three in bum. By such means, which I will Ireland, no matter how much, the whole "wants" of They are (1), security much, and variously magnified. (2), the capital to to apply it judiciously. All the the skill necessary Tranting the ot insure success." If any one of them be
the other two will. be found useless. . How
can they be all secured? Simply by unity of action. Let me now suy a few words on the means of securing each respectively
(1.) Security.-The time is most opportune for obtaining it. Our new Lord-Lieutenant tells us we can have it by "self-reliance." Sir liobert P'eel enggests an excellent panacea, in as far as it goes, in the general drainage of land; whilst pari passu with these, one of the most able and astute lawyere, oue of the most upright judges, and one of the greatest political economists of the age, the Hon. Judge Longfield, tells us what, though already well known to many, cannot be too often repeated

When a tenant takes a lease of a farm which he finds he cannot cultivate properly without an expenditure in making drains, feuces, and buildings, which in England would be defrayed by the landlurd, he does suffer a grievance, and has a just cause of complaiut. If, and this is what generally happens, he declines to urake improvements of which the landlord is to reap the benefit, he suffers, and the country suffers by having the operations of an energetic tenant crippled, and the productive powers of his land undeveloped fur want of those improvements which the landlord will not, and the tenant under the stute of our laws and customs cannot, permaneutly make.*
But the legislature has been too timid; it has done too little, for fear of doing too much; it has done no good, for fear of doing a slight mischief. At present a landlord frequently cannot afford to make the neeessary improvements in his estate, and if the cetate is in settlement, he cannot enter iuto a valid coutract with a teuaut to allow him the slightest compensation. This ought to be altered.

No settlement should be eanctioned which would produce a result contrary to natural justice. I would give epery landlord, however limited or incumbered his estate, might be, power to contract to givo his tenant, at the expiration of his lease, compensation to the fuil value for any improvements he might place upon the land. F'or many years the policy of the laws appears to
have been intended to induce landlords to be indifierent to the character and circumstances of their tenants." That is a true picture of Ireland, given by a most trust worthy witness, and the simple remedy of a wise upright man. Now, Bir, if the Engiish people fee that interest in the prosperity of Iroland which should be mutually felt by all, they will take up this question and sid such Trishmen as have influerice in the Parliament and know how to exercise it, and have a imple law passed for the sale and transfer of landed property in Ireland, beneficial to both landlord and tenant; it will afford the necessary security for the judicious investment of capital. liut where is the capital to be got? There is plenty of it even in Ireland, but it will not be so invested, because of the absence of such security. Yes, capital is sent out with Englith capital to all other parts of the world, to be Enveste.l in imphovenents where security exists investel in imporements where security exists, althuygh in no place could such an investment pay higher mate of interent than in many other instances than that uoted by your Correspondent "An Irish Landlord."
He has shown you an increased rent of 58. an acre, merely on good farming, without reference to any ther improvements. We have in Ireland in round numi ers \(15,000,000\) acres of arable land; some much better and some worse in quality than the land he describes. But for illustration let us suppose that is land is a fair average of the whole, and requiring no extraordinary outlay in drainage, subsoiting, bog or nountain reclamation, and assuming, what is a fact, that by judicious management, such as he has adopted, the value of the land can be enbanced 5s, an acre, we vill have \(3,750,000 \mathrm{l}\). or an interest according to the upposed present rental of Ircland of 25 to 30 per cont. If, in addition to this, we take into sccount the draingge of such parts as require it of this arable land and which, to my cortain knowledge, fully amounts to \(6,000,000\) acres, and estimate its increased value at the low standard set down by Sir Robert Peel of 10 s . an acre, we have an increase of \(3,000,000\). more. If we

THE G ITRDEXERS CIRONTCLE AND AGRICULILRAL GAZET'I
go furcher still and reclaim the now comparatively valueluss, beciuse neither arable nor even pasturt
lasu worthy the name of arable, we have 6 , vou, orn acres more. I am prepared to prove, as I have iu forsuer lottens hinted at proving, what 1 know from practical experience, that buch lands by jusiciun clamation can be or iu all 4,500 nofll, and ultimately we will have : . By t e ter managemeut on lauds as they are

\section*{By rectaining the waste or nearly worthless land}

Making a total of
- nearly the computed rental, or perhaps fulls the prid-up rental of all land in Ireland.*
Lemp one say to we that this calculation is assumptionally speaking thus I speak but the sentiments of every practical and scientific mun in the isiaud capable of judging such watters correctly. Yes, and it is well known to capitalists in England as well as in Irelund and Sc stland.

Skill.- Believing that a more extended and an ample security wust be given, because without imminent danger to the nation it cinnot much longer be with held, and feeling, as I have reason to believe, that capital will be fur/hcoming, of what avail will either o' both mited be, if we remain without the
tkill jurlispensably necesmary to be applied with both? No use in the world, for, no watter how good the security, or how abundunt and cheaply obty all atternpts will be not ouly useless, but mischievous, if the parties seeking to take advantages of such accommodations lack either the scieutific or practical skill
required to develope our vast, but dormant agricultural resources.

Can we count on having within our rench the acquire. ment of such akill? I feel quite cunfilent we can, if the National Board of Elucation in Ireland be not crippled or circumzeribed in their operations by a if you will, of our Irish representatives, or the jealousy of penuy-wise and pound-foolish English members. And it interests the Scoteh members too, as many of their by the prusperity of Ireland. We have in Ireland now for the first time every hope of having agricultural education what it ought to be. The Commissioners of Education have given a good earnest of their intentions to have it so, by appointing Mr. Baldwin not alone as Inspector, but better still Director of such education,
than whom they could not find a man anywhere more fit

I have watched with more than ordinary ansiety the course adopted by the Board of Education from its formation, but more especially since the year 1843. I perfections and carefully noted its faulte, and to a degree perbaps greater than was done by any other man such pruceedings even with a degree of jealousy which your readers could not, nor is it now neceson this all-import Commissioners of Education be not luoved by the causes already alluded to to tie down Mr. Baldwin with "red tape," their agricultural uperations will be well directed; and that if an adequate security be given, capital for investment will be furthcoming, and ample skill provided for its economical application. Edward Curroll, College Hotel, College Street, Dublin,

\section*{PAINLESS EXTINCTION OF LIFE.}

If your readers are not weary of this discussion, it is quite time it was closed for other reasons. One or the customs of polemics bas been duly honoured, and the tation of mine. "I took my stand upon higher ground than the Mosaic law," and dealt with the case as it was put, and I endeavoured to present a spiritual interpre tation of Gen. ix., 4. It is therefore only repenting himself for Mr. Chitty "to call attention again to the command given to Noah. Another custom of polemics tulate myself, and all who like myself," \&sc.; which I take to mean that my friend supposes himself the sole possessor of a feeling of veneration for the Divine Word, and as sharing with gardeners alone a perception of the "accordance of our Bible with the soundest and strictest philosephy." I ahall avoid giving occasion for any further expression of this sort, by saying all I have to say at once, and there, so far as I am concerned, making an end of the matter.
In order to prevent confusion, it seems desirable to group my observations under three heads-1. The Testament; 3. Physiological Consideration the New Testament; 3. Physiological Considerations.

The Commanul to Nockh.- It dues unt appear reasonable to

 in Ireland, because of Exchequer a higher source of taxation

thay be rendered 'the flesh with its life in the blood,' whilst
there is life in the blood, or whilst the creature is living; the
meaning iss, that a creature lesigned for food should be
properly killed, and its blood let out; that it should not be
deroured alive, as by a beast of prey; that raw flesh should
 fleth with hut the blood might be eaten, so blood properly le
out, and dressed or mixed with other things, might be taken

Abert Hiddle Class College, Suffolk,-Permit me agiu to trouble you with a few liues as regards the ations in my letter of last week have been realised. an were received on Monday last. The total number in residence is unov about 270 , and in the course of a fes days every ber will be occupied, there being previnted by illness or some other legitimate cause. The prefect success of the Institution thus far may be lonked upon as a great fact. Nothing could exceed
tho enthusiasin with which parents brought their sons for the purpose of securing to them an education equal to their wants-one which will pat them in a fair way to adorn the position in life which they occupy. This aval themselves of the advantages here offered, eminently proves how great a desideratuın has now been supplied, and we cannot too earnestly hope that all our expectations with regard to it may be fulfilled; and that other counties may be stimulatel to follow the noble example set them in Suffolk, and provide for the youth of the middle classes generally, the means of obtaining a sound and practical education at the lowest poasible enst.
"Frlcon."-Your correspondent "Falcon" appears to be on the wing, up and doing. First, we find him soaring across St. George's Chanuel and looking down upon the Irish peasantry, but finding so much listless apathy and indifference amongst them, he just touches upon their poaltry feeding contentedly in the rooms appropriated to domestic parposes, he appears to be satisfied with his birde-eye view, and without pausing to notice the better part of Ireland, starts off again to England, rarting his talons into the unhappy clergy who are no
fortunate enoagh to possess a strong voice, and in great measure attributing to them the cause of any vailed upon to extend his flight "Falcon "may be pre. vailed upon to extend his flight from the farm labourer's coateguard servico bitations provided for men in the one small sitting-room, and sometimes a very small pantry, and if in any way he can "be down" upon a gond example, make them open their eyes and set a gond example, he may effect even more good than by
trying to make the clergy speak out. The miserable stare of the habitations of speak out. The miserable evil, and to that may undoubtedly be attributed a crying is als immorality to which "Falcon" alludes. There is also one other thing to which I would draw "Falcon's" errand ; when he next starts on his philanthropic birds which worry the farmer at seed time? -or can he from his lofty position and quick sight, put us up to presaing those wretched can be kept away, without years old into this cruel service? I thoroughly crows hind the custom of using children as scarekiows hinders their education more than any other nether profit by the Sunday school nor the day school well grounded, and too, when they are of an age to be their services is very small. Perbans "cy receive for kindly put on his cory small. Perhaps "Falcon" will segest some remedy; if so, he will indeed acquire The Cother for it. W, J. P
ontributes an Colds.- Your Correspondent, "J. M. R.," he, bowever, states that article on Cotteswold sheep theep being sent to the "fuliing mill" is an "apparent chiefly used os a in print of fact, though long wool is of staple allowing of its being on account of its length "finlline" worsted, there is no difficulty a small even equivalent "milling," or "felting" it : these are more generous food There can be no doubt that the imerease the length of stapled to sheep has tended "coarger", diameter of the fibre, rendering the wame the finest Tre fine wools of Germany, from which sheep of the Merino brs are made, are the proluce of exposed even forino breed, Eept eparely fed, and never

Weather. But the reason that these wools make the
finest cloth is not that they "felt" better then foarser wool, but that the fibres being so fine, there are more ends of fibres presented on a given surface of the dressed cloth, thus constituting a more even
velvety face. C. P.——In your Number of April 15 , the spuse of the quotation from Namber of April 15, the Victory" is much murred by fourth line instead of "mb," word "rib "neb," being the old Saxnn for "beak." The fine "The swarthy raven with horny nib." A. L., Monkstown, Dublin, April 22.
On Consoliduting the Surface of the Soil for the Wheat frosts during autumn, winter severity of protracted fears generally entertained therefrom, summer weather on the approach of April set in with unusual splendour, and the last weeks invigorating sunshine, with hut
few clouds intervening to intercept its beneficial influences, also with but little frost by night, has so completely warmed the earth as to give new life to all nature and vegetation. The pastures particularly present an enlivening green, so much needed for cattle, from the scarcity and dearness of provender, owing to last year's failure of crop. All kinds of fruits being backward, may from their very lateness be said to be benefited, and are now past danger from frosts. Above alt, the Wheat plant has renovated to a remarkable
degree, and all are apparently progressing favourably, promising a precocious, if not an abundunt harvest. All that need be feared at present may have been planted too thickly for the best of results. Also that the contmued frosts having rendered the surface of heavy land too puffy, for the late-sown especially, may encourage the wireworm to commit its ravages during this and next month. Under those unfavourable circumstances it will be more liable to be rootfallen after coming into ear than in seasons when the surface is more encrusted, thus diminishirg the produce and sample even on the best of lands. The only remedy I can suggest is to provide by possible means to consolidate the surface of the land date; and not later, lest the blade be beginuing to spindle into ear, and thereby much misehief shonld be incurred, as has often been the case from the expedient not being performed earlier. Notwithstanding that the Wheat plant unmistakeably requires a deep and sult mouldy subsoil bad for its rosts to soft or puffy surface, or rather it often puffers, in wet and stormy seasons especially, from many calles this puffy surface is beneficial to keep in moisture. I know of no specific expedient to prevent a soft or puffy surface of land for the Wheat better than planting it rationally and singly as to thickness, also as early as
circumstance.i will admit of it, thus giving it the best chances ot ronting deeply in strong tillered stools before Christmas. The land is then rendered more hard on the surface by autumnal rains. The writer has some Wheat at the present time in two varietiee, the dwarfest and most gigantic extant, planted in single grains, at 1 foot apart, on 1st September, or at about 2 quarts per acre, branched 80 cousiderably, and 80 completely covering the ground, as to astonish all beholders except himself, and promising to be in full ear by the time next month is out, and producing from 20 to 80 perfect ears on each plant or stool, or 1000 to 4000 fold, as he has before oftel grown them - a contrast froun 15 or 20 fold generally grown. From past experience in similar crops, he doubts not but that each plant has roots which have been searching for, and partaking of pabula for their winter's support and sustenatice during the severest part of the winter 3 feet in the subsonl, whils those planted late have roots scarcely 2 or 3 inches deep, which, being sown too thickly, will be not able to stand up with a heavy and perfect ear, should an unpro pitions, wet, and boisterons summer prevail. Experienc has taught me, a correspondent writes, that the or horse-hoeing of Wheat, is a fallacy, and is no essential to its welfare, more detrimental than other wise, inasmuch that it causes it to tiller too late in apring or summer, as every time the ground is stirred deeply (not so with most other crops, but far otherwise), which cannot mature, and which spoils the sample. It cannot however tiller or branch too much; but it should be before winter, when all ears will be more perfected and able to stand all vieissitudes which may
tollow. The object of hoeing fleetly must not be lost of, which should be simply, but determinedly, to scrape off as it were from every inch, all seedling weeds, and for nothing else, but for finding full employment for th labourer, and producing a sample tree from filth, and to
free the land of obnoxious seed weeds in after years. Experimenter, Maldon, April 12.

Sewage of Toons. Third Report, and Appendices, of Dhe Commission to Inquire into the best Hode of to Beneficial and Profitable Uses. Her Majesty's Stationery Office.
We notice the publication of this volume full of most elabnrate and detailed reports of experiments at Rugby, Edinburgh, and elsewhere. that our readers may learn where they may obtain fuil and trustworthy information on a subject which is occupying 8) much attention conclusions at which the Commissioners arrive as the result of their long experience. The following is the substance of the Report to the Treasury which his been issued :

Since the date of our last report (Augnst 1861) we
have through a committee of our number, conaiating of experinents which were nudertaken in 1861 on the application of sewage to lam. The report of that the three years 1862.4.

Your Lordships will observe that these experiments have not bean contined \(t\), the application of sewage in
different quantities to lind, but hive extended to the consumption by cattle of the produce so obtained, and to the prolnction or meat an I milk, and have been acer.n. panied by a cireful record of the qua intities and market value of th: products, and by mmerous analyses o Ghe sewage before an I after irrigration, as also of the
Grass and of the milk.

It appears to us that these experiments have solved many of the difficulties which have hitherto attacherl to the questionof the agriculturalapplication of sewage, and that they leave no reasonable doubt of the practicability advantage of sn employing the sewage of towns. to all kindred experiments and inquiries which have been going on else where.

As the results of our labours, extending over eight years, we have confilence in submitting to your lord. ehips the following eanclavions:-
"1. The right way to dispose
"1. The right way to dispose of town sewage is such application that the pollution of rivers can be

Agriculture, Ancient and Modern, a IIstorical Account of its Principles and Practice, exemplified in their
Rise, Progress, and Development. By the Old
Rise, Progress, and Develop
Norfolk Farmer. J. S. Virule.
The four numbers of this work which have appeared ince the beginning of the year, include the remuinder of the Part VI. on Farm Implenents-Part VII. on Drainage, Manure, the Dairy, Irrigation, Soils, Seeds, There is a somewhit unintelligible mixture and occaThere is a somewhat uninteligible in the arringement which has benat adopted. Part YII., for instance, discusses a perfect medley of \(t\) pecs, and is followed by a series of sections in which the details of the whole field haviag been discusse 1 in more general terns befure. We are glal to find the Old Norfols Farmer doing istice to a fellow-countryman of his own, whose merits s an agricultural chemist have not had full justice done to them. Mr. Grisenthwaite, then a young chemist at
Wells or Lynn, published his "New The ry of AgriculWells or Lynn, published his "New Thesry o Agricule
ture" in 1818, and forestalled in it many of the discoveries which have been attributed to Liebig. His work, of which a second edition was published in 1830 , is well worth reading still. The application of special manures
fonnded an an examination of the ash of the planta conltivated, was well understood by the author long before it wat discussed by the many writery on the theory of agriculture, who have published during the past quarter of a century.
In the "Part" describing the work of the several seasons, many a detall is givell which had been omitten in the previons systematic discussions of the several topics which from week to week during the former years occupy his attention. And the practical character of the work is thus redeemed.

\section*{Miscellaneous.}

Poultry at Paris.-IVe described the great poultry competition at a late monthly dinner of arriculturists at Paris. The competition was then adjourned in onn the relative merits of the competitors, and the whole affit had to be "eaten" over again. Certainly this Parisian agricultural "mess" seems in luck's way.
Thus the solemn business at the last meeting was to taste and ponder over fat fowls from the districts o Normandy and the Bresse, and precautions were taken nable the competitors in inentical connitions, so as to Some breeders of TInd un fols applied aldo for leav ivals, while M. de Bénague songht to demonstrate the delicicy of the flesh of young Southlown sheep
M. Leopold Javal, who had promised sone nysters from his property at Arés, in the Arcaelion basin, added to his present sone eels taken from waters on his ate, and M. Leonce de Livergne also tonk measure frecuring one of those famnus leporides-a half strongly disputed. Finally, the associated pro prietors of Bargundy resslved to show the delicacy
of wines taken directly from their cases. A party o 79 were exact at the rendezoous, there being a fair sprinkling of press men among the rest; M. de Lavergne presiled. The nyaters, eels, and wines were pronnunced excellent, but with these we have not much to do. The sheep seut by M. de Behague was firund o be of capital quality, very tender, and at the same more than eight or nime months old, and it weighed in aet meat abont 45 lb ., the rates of net product to living weight being 53 per cent. The pirty were much struck with the produc inn in so short a time of mea of such quality, and the fant appeared favorabable to the improvement of old French breeds by their alliance to M. Roux, of Angoule na , to obtain from him a leporide. The animal arrived in time to enable it to be tasted The flesh was very white, without any taste of game, and was more like veal thin anything else. But the great featare of the dinner w 1 s , of course, the fat poultry. There were no less than 46 birds on the Léspld de, Hen; 12 Norinana, sentint hy the Cimmte de
Kergorlay; and 16 from H nulan. It was HI Beninion Kergorlay ; and 16 from It udan. It was M. Beumier mayo of cranhais, in the sime et-Oise, who or ranisen among the principal Houdan breedera, rewarded at the at Patexhibition of fat fowlo at the Palace of Inlustry at Paris, the repregentation of a district which is prouil dissements of The ciuton of Hondan and the pron the dinner also by several " considerable" agriculter
M. Barral, in giving some information on the in products of which were in competition with encts showed that official statistics drawn wi ench of snce on the proluction of Frencia poultry.yard \({ }_{3}\) exceedingly inexact. Thus it was stated in stacistics that the production of Houdan fine while some data collected by M. Delafouse shat the fowls sold annually in the markets nf \(H\) und Dreux, and Nogent-le-Roi were of the followino nlan, Drelux, and Nogent-le-Roi were of the following valn total \(240,000 \mathrm{l}\). The speciment of the three breat roasted, and severed colld and warm, each bres submitted as nearly as possible to the same cult régime. All the guests were enabled to taste th? order to make a corions accompaniminta; and he tabulated, five heall of each breat were weing
The weight of the Bresse birds averaquel 3.0 inigh \(k\) gramines ( 50 kilogrammes inke an Eiglish cut), is of the Houlan birds 2.382 kilogrammer, and then of Norman birds 2.144 kilogrammes each . Tunin was then taken after they had been prepared \(\mathbf{r}\) asting, and the average weight of eac, limed found to be as follow: - - Bresse 2. 1.25 kiluram Houdan 1.904 kilogrammes, and Norman 1.765 kil grammes. Finally they were roasted under nimi conditions and circurnstances, and when they cooled they were weighed again. The result wiat tin is amexed:- The averare weight of each of the Bra
 ilogramines, and of the Norman birds 1.262 kilogramme It resuits from these very careful and curions testa th the trimming oceasioned a loss of 20.99 par wellt. in Bresse fowls, of 20.32 per cent. in the Houd in fow and of 17.55 per cent. in the Norman fowls. was that 52.5 L per cellt. in the c.ise of the Bean fowls, 44.32 per ceento in the Houdan fowls, and ful \(^{2}\) per cento in the Norman fowls. The Narman foris coortingly, always weighed less than their hat it will be also seen that they lost less weigh well in the dressing as in the roasting process. Bresse fowls probibly give more fat-we say
only becure this fat c ould not be collected. lis a notable value, Astestines. A guest from the sonth regretted absence; from the dinner of the fowls of that pir Erance, which, according to him, have a very super favour to all coming froin the centre and north. Tire fowls of the Bresse wero much remarkel for the whiteness and delicacy of their flesh. It was unanimour? admitted, also, that the flosh of the Norman biris ial remarkable flavour. The Houdan breed has theatrantin of furnishiny fowls of very great precocity: thustineyme pullets, known under the name of poulets à la Rein ppoar in the Paris market at the commeneemphis April, althongh they are hatched between lheremher and January 15. Fifteen weeks suffice to emable theos to attain their development, and the fattening required oring thein to a perfect state only lasts is or an w. This fattening is effected with Barley flour min with milk, the birds allowed nothing to \(\mathrm{s}_{\mathrm{n}} 0 \mathrm{i}\) the cost for each pullet ranges from 1s. op 1s. 3d. The price of Houdan fouls, P chase l in the breeding districts, is the same as elling price on the market of the Val.e, auts rhis arises from the fact that fowl merchan skilfinl in utilising the accessory products. in Hondan fowls acquires every day greater import \(s\) is proved in the progressive augnent [13 1815 uties levid on the Houlan market. In 184 selling places in the market were rented at 2 and annum, while now they produce upwarda of thod annum, the increase being entirely due to products number of persons who come to offer their pasis sale. The repast was admirably servel, French toisis M. de Lavergne propmsed the well-known 11 the A la poule au pot, highly complimenting ducer who had curitributed to the sucess nurine greeable testing process which had been pultiration and especially insisting that the simple who contributes so much to to be for reguits of M. Barral then discreetly sumined ap the desirition veight? trinls made. He irsisted on he had fos seeking to conclude, from what superion asted, that this or that breed was their other. All the products tested were eac. nhat this ust the language to send every guest-especially a good dinner-on his way rejocins

Calendar of Operations
May. The Dairy.-The foll, winz published :many years ago in
ence to the work of Ma
The work of the dairy can now be conducted wit recularity. The calves not being expected to in ter it with it, as in all well-regulated dairies ensugh to do without murh mik. and the gdvantuge of pasturage, the che If any

or chesse for at least a fortnight, new milk always barinz a tendency to mate it heave. Cheese is now made wie a dry. ha a step in their progress at each meal more, adranering last, in four of five days, they come ap miking, thesses, anit are put rupon the shelves. They nt memerlly salted \(2 t\) hours after they are made, armath this is done by some at the enl of 12 hours the cheese after this is returned to the vats and put one cer the press, cure being always taken, according to \(x^{4}\) lat has been said, to put the newest cheese luwest in : te prees and the oldest uppernost. The brine, which Tomos trom it when in the last press before it is taken . \(\quad\) and pluced on the shelres for drying, is quite clear thr quantity is sinall, an l it ought to be put into the rennt jar perhaps every two or three days, which keeps in theese.
When the cheeses are taken from the salting-presses they are put on shelves in the dairy for a day or two, the the chese-loft to make way for the new ones, In the cheespres mon they are turnel once every day and in general in a month, or less in dry weather, from the tume they are tiken out of the vat, they are rady or ecraping. This is accomplished with a common knife, firat moistening the cheese with a wet flannel, and must be done cirefully all over the cheese so as to ate off the roughoess that may be left upon it from the cioth or any other cause, leaving it quite smooth on the morfice and sharp at the edges; the sooner this can be done the better. In order to get cheese into a state of formardness for the factor, it will only require wiping found the edges and an inch within them once a week fifer this scraping; and it should be turned over twice week, or even oftener in dump weather. Care should be tiken to allow the blue coat to remain on the top of the cheese; this blue cout is considered as sign of rich ness hy the factors. In some districts it is customary t) print the ontside of the cheese with Indinn rell this should be mixed with war.n water r to a thin paste and rubluet no with a piece of flamel, and shoulil be done imneditely after the cheese is seraped, before any grease arises uph it, and the same treatment should be alopted as if not painte.i. In most cases it is hefter t. mostpmene making thick cheuses which weig habout four or five to the cwt. till at least the month of June.
Fond for Cows. - The milking enws by this time may be turned to the most forward Crass in the richest pastures, and as their supply of this food must be rariable, dppending very much oa the season being a forward nue or otherwise, a gind dairy farmer should provide a supply of Rye or Italian Rye-grass, so that a Hhe given in the yards when the cows cone to be milked will give then abundance of green food, as it is found they refuse hay. Eiven when they have not a fall supply from the pantures, they will not readily make a good meal of dry food after tasting the green; and if it is not sufficient to satisty them, they roam about restless and uneasy, and of course fail to yield anything likea full supply of milk; and as the produce this month is considered very good in quality, the quantity it is by all means secured to be as great|as possible. It is of great importance that good water should be sapplied to dairy cows. A stream that has been some littlo while exposed to the sir after rising from the epring before running through their pastures, is considered the best water, and the drinking place should have the soil removed and filled with clean gravel or frand, 等 that the water may pass through pure and freb. Cows much prefer drinking from a narrow of mater thole, and are sty of going to a large surfuce of Water, though there should be abundant access and grem to and from the watering place, or the master Pood for damage the others in meeting them.
Pood for Calves.-The weaning calves shonld get fed now as described last inonth, the only difference being in the case of the older ones, which may be gradually this of a diminished quantity of Linseed or oatmeal; broome stronger and more able to for them as they rided for them. They should have a sunuy field to prom this may, with some Grass to pick from it, but through finelvocut it has been found that they do better on fhich cut Swey will or Mangel Wurzel and good hay, on Which they will reed plentifillly, having the moisture of Which, thountils or the mixtiure of Linseed or oatmeal, given a lietle marm diminished in qualily, should be cooler as the warm, though it should becoue gradually at this time calves get older. Should Gruss be supplied is) great looseneir staple food, it is found to proince perticnlarly linale in the bowels, to which calves are is very essential to thd carefully gurding against this They have been found to starting into strong growth. logether, on account to do far better in small numbers and lie constantly very their great disposition to feed laking any infeetions disore together; and their readily to what m y a aptions disorder renters careful attention denimable. A strong trifles in the rearing of calves very have neen A stroved th, healthy herd of dary cows, which When weaned proved to be far more useful and profitable at mirkaned, and broured on the farm than if purchased mill he thus obtaingto on the farm at almost any age, it nizht, in which to They should have warm sheds it has been found a very good plan to tion roots, and sive them their mill good plan to tie them up to and each one thon gilk, as it makes the animals quiet;
and if convenient to allow them to remain tied for short time afterwards until they like to eat their hay after having their liquill food, all the better; as it prevents their sucking each other's ears or skins, which is often productive of much harm.
Sroine-It is calculated that abont one pig can be reared on the sour whey for every two cows in the dairy. Supposing a dairy to consist of 50 cows, three breeding sows, reckoning that each one would have eight young pigs, might be kept, giving them a run in any rough Grass under orchand trees not much used for other purposes: their pigs receiving as much of the sour whey as they will drink, will make strong growing or at lue whey is much better for pigs fond when old, be used daily from the vat, which is as often getting replenished from the dairv, it makes a very wholesome drink for pigs, on which they will grow and do remark ably will. And as the pigs are small to begin upon it and do not drink so much as afterwards, a stock collects for their larger appetites, and this, with the wash which large farm-houses must supply, with garden refuse thrown in it in the summer in aldition, is found enough to keep the number of pigs mentioned, viz., about one of the age and description given to every two dairy cows in milk.

\section*{}
application of LAND: R. Land eannot be exhausted by the applicatiou of manure; the idea is altogether a mistake,
The exhaustion, if it takes place at all, is due, not to the manuring but the subsequent disposal of the crops grown. Ayply guano to your laud ; you cannot by that exhaust it, and neither can the heavy crops which it may thus be made to yield, provided they be consumed on the land azain.
Farmitard Dung: Stident. The following is an aiswer from hay, and 50 acres of roots, and all the straw, ure consumed at the homestead. This will result in a quantity of dung containing \(574,645 \mathrm{lbs}\). of dry matter, 53,040 lbs. of mineral matter. 9497 lbs of phosphoric acid, 10,236 lbs. of potash, \(12,209 \mathrm{ibs}\) of of nitrogen, or \(14,825 \mathrm{lbs}\). of ammonia.
But farmyard wanuro in the fresh state contains about per cent. of water, or 7 parts of water to 3 parts of dry
 bined with \(1,341,335\) lbs of water, making together 1,915,453 los. \(=8.55\) tims (or ant averago of abmit \(8 \frac{1}{2}\) tons for eacli of the luo acres of riot-crip) of fresht and inn porn whuld be as follows:-

This is the composition of the fresh rudecompnsed dung, calculated from the average composition of the matter which are supposed to enter into it.
allan Rya-Grass: Reader. "The Italian Rye-Grags is own brother to Couch," вo exclaimed a disappointed cultivator of it at the recent meeting of ararmers club. "Of alc the
plants culivated by farmer there is none which wil plants culcivated by the farmer thet, such larigo dressings of manure, as the Italian Rye-grass." That is the other dirtion on the subject. We pin our faith to the latter state Ment of the twn; and believe that thare ing nrondice can be Lnglish watricultriur frous which a larger promdice cau be cab: J. L. It is owing to the presence of minute insects ca le 1 acari, which birnow undor the skin and prednce ex
 promuces snres, and the animal loses flosh and becomes miseratele object. Powdered sulphur, 4 oz, fivh oil, \(120 z\).
 dr mercurid hemt aitn four times its weight lard.

\title{
HENRY ORMSON, F.S.A., HORTICULTURAL BUILDER and HOT-WATER apparatus ManuFacturer,
}

\author{
STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.,
}

Truly grateful for the very liberal and kind patronage bestowed upon him, begs most respectfully to inform the Nobility, Gentry, Nurserymen, \&e., that it in ti. determination to spare no pains to merit a continuance of their favours; and that he may be enabled to execute his extensive and increasing orders punctually, and at the lone possible cost (agreably with the bast Materials and. Workmanship), he has erectell a most complete set of Steam Power Mauchines, peruliarly adapted for the pary of his Trade.
 his business, by using only the wery best materials, by employing the most skilful and efticient workmen, and by the most moderate possible charges, to merit a foutinutu the patronage so kindly aud so liberally bestowed ou him for many years past.

In the BUILDING DEPARTMENT his object will be to adapt all erections to the partionlar purposes for which they are required. He will devote equal ath iti: to the plain, inexpensire, practical erections of Pits, Orehard Houses, Greenhouses, Vineries, de., as to the more claborate and arehitectural evections of Conservatories, Hiws Gardens, \&ec, either in wood or irou.

The HEATING DEPARTMENT always engages his special persoual attention, and he feels justified in saying that in simplicity, safety, durability, and ecenven of fuel, combined with thorough effertiveness, his systrme cannot be surpassed.

VENTILATION. - Knowing the absolute necessity for thorough Ventilation, he makes it a matter of first ennsideration.
II. O. having competent Draughtsmen and an efflcient Office Staff, he is prepared and will be happy to forward Plans, Estimates, and Specifications by post or othernie, in: to wait personally on any Ladies or Gentlemen who may desire to see him on their Grounds.

\section*{FIRST-CLASS NEW BEDDING GERANIUMS, \&o.}

\section*{which they are now prepared to send out}

\section*{BEATON'S HYBRID BEDDING GERANIUMS.}

The four following very distinct and splendid varietios which we
fifer were selected by us from Mr. Beaton's immense stock, only a propagate a sufficient quantity to allow of our wendere unable to
 have muuh peasure
Fe arreonadint are writy of equal notice, and will be as much in
request for deneral bedding purposes as the many introduced by us request for general bedding purpose
from so will-authenticated a source.

Beaton's Perfection (Beaton).
This is one of three rose-coloured Nosegay varieties selected at much softer rose, freer in growth, and of a more robust habit, attain ing double the size in one season, and producing its blooms in greate
profusion. It has a perfectly plain leaf, and throws the bloom wel up asove the holiage is well ladapted for single specimens in vases on
lawne, or for conservitory decoration, as well a general bedding purposes.

\section*{Premier (Beaton).}

A Nosegay variet f, colour intermediate between that of Lord
Palmerston and Lady Colum, with deeply marked zonale lea, froe robist habit, hrge trusses, thrown wel1 above the fol
desirablo bedding variet, alos fine veeo p pillar plant.

\section*{Forester (Beaton).}

A zonale variety, of extraordinary fine and compact growth, pro-
 with deep crimson townds the contre of the bloom. This will be a
mavourte variety for single specimentan and for centres of bedis.
Price bow, each.

\section*{Wild Charlie (Beaton).}

A plain-lenved variety, with deep salmon-coloured bloom, produced In great profusion in larye trusses, very free habit, and will be 8 first
class bedding variety; continues in blom intil very late in the
season.

\section*{New Variegated Tricolor Bedding Geranium} Sunrise (Carter).
A strong.growing tricolor-leaved variety, with well expanded large leaves. 1 ively green centre, surrounded by a deep zone of rosy lake,
margsined with clear sulphur ; trusses of immense vivid crimson scarlet coloured flowers; of a most free habit, and will undoubtedly be a
first-rate bedding gariety. We have much pleasure in oftering this firstrate bedding variety. We have much pleasure in offering this
beautiful variety (of which we have purchased the entire stock) for
the frat time to the puble the first time to the publich Price 78.6 d . each

The Set, I plant of each of the above, 21s.

\section*{New Tropæolum Double Tom Thumb.}
 same very dwarf compact habit as its parent, with prant. It has the centre; a most free bloomer, to 2 inches in diameter, well filled up in the as the Lobbianum varietiee. dozen, 18s. ; par 25,304 ; per 50,608 .

Nasturtium King of Tom Thumbs. The great usefulness and beauty of the Tom Thumb Vastu
are now very generally appreciated throughout the was

 of the blossoms, produces an unoqualled blaze of briltento plant must become a favourite, may be propagated amme on mivil
variety most freely from cuttings.

Price 18, bd. each ; per dozen, 12s, ; per 25, 208.

\section*{NEW CLOVE CARNATIONS.}

General Lee.
The above, of which wo have but a very limited stock, is undoubtac
the most splendid scariet variety ever offered, beink of mant noter habit, and producing immense blooms offten, ininhes in most nemetry Price 55. each.

\section*{Goliath.}

This is beyond doubt the freest and strongest-growing Caratim existence, the original plant having grown zeet in ingight and mo
4 feet in circumforence in a single eeason, and producod mont
 Price 5s. each.

SATURDAY, MAY 6, 1865
}

Is the splendour of the Orchids that were exhibited at South Kensingtin on Tuesday last is to be taken as a gauge of what may be expeoted at the Great Orchid Show that is to be held there on Saturday next, the latter must be brilliant indeed! Never before were the glorious old Dendrobes seen in such variety or beauty, and never-as may be gathered from our report in another page-were so many novelties in this charming family brought forward on a single occasion. This fact in itself might almost justify the bold step taken by the Council of the Hortioultural Scciety in departing from established precedent, and Jevoting one of their principal show-days to the illuatration of a aingle tribe. The day itself may perhaps not be very happily chosen, indeed there appears to be a growing disinclination on the part of exhibitors to the holding of any shows on a Saturday - but this drawback, which may easily be remedied another year, need not prevent full justice being done to a fresh and original idea, which will introduce an element of variety into what was fast becoming a mere matter of routine. Nor can it be denied that there were already nnmistakable signs of weariness on the part of the public, for whom three or four Societies conceived themselves bound to provide annually we know not how many "great shows," differing
from each other in nothing but the liberality of the prizes that they offered, or the locality in
whioh they were held. For all this there appeared Whioh they were held. For all this there appeared direation as that now taken by the Horticultural Suciety, and for which we diesire all the success that so bold an experiment deserves.

The tribe seleoted for their first essay in an untried field would seem to be judiciously made, for While no other family has a more steady grasp on publie favour, neither is there any that can hold out the promise of a more constant sucoession
of novelties for many years to come. Ere long the system of cool treatment will itself be found to have at least doubled the number of S . American species in oultivation, while on equal accession to our lists may be looked for from Afrioa, from various parts of India, and from the Islands of the Eastern Archipelago. When all these shall have been compelled to yield up their Orchid-treasures, an Orohid show will be \& very "greet" affair indeed.

A veby interenting paper on the Grmmination of Marsilece has juat appeared in Pbingsheim's Journal, by Herr Hanstein. A very little information on the subject had been obtained by HowMeISTER relative to the condition of the large spores before impregnation, and that evidently very imperfect, while absolutely nothing was known of the further development of the smaller spores which prodice the spermatosos. This gap in our knowledge of these Cryptogams has now been filled up by Herr Hanstern, and, as might be supposed, the different phenomena are much the same as those whioh have been observed in the allied genus Pilularia.

Our author received half a dozen sporangia from Australia of the Nardoo, which had supported for some weeks the members of Burke's expedition into the centre of New Holland, for which parpose they were adapted notwithstanding their harsh innutritious coat, by the quantity of starch, glaten, oil, and protein whioh enter into the composition of the spores. The species of the genus, which, however, vary considerably, are known indifferently under the name of Nardoo, and cover vast tracts of land, which are probably under water when vegetation is most active. The strong analogy between pollen grains and spores might lead une, "priort, to suspect that the spores might prove nutritious, and it would be interesting to
compare chemically with the Nardoo spores the pollen of Typha, of which little cakes are made and nold in some of the buzaars in Northern
natia.
The speeies whioh afforded Harstens most of his observations was Marsiles salvatrix, but and oceasionally it was not possible to determine precisely to which of the species particular spores belonged. This, however, was of the less consequence, as the mode of development seems extremely uniform in all the species which have at present come under observation.
The rapidity with whieh important ohanges take place, both in the larger and smaller spores, When sown is quite surprising, though both are capable of remaining a long time in a quiescent state if moistare is not present. The smaller
spores, according to the observations of HoFspores, according to the observations of HoF-
MEISTER, do not retain their vegetative power so lung as the larger.

The larger spores produce a fow hours after being sown, besides a number of cells immediately
beneath the cuticle, one large one in the centre, beneath the outicle, one large one in the centre,
which ultimately, after impregnation, gives rise by cell division to the young plant. Four cells are then produced at the apex, which form the arohegonium or organ through which the sperma-
tozoa are introduced. At first, however, there is no tozoa are introduced. At first, however, there is no
passage, but between the base of these cells and the central embryonic cell noticed above a gelatinous mass is secreted, which ultimately works its way between the four cells, and forces a passage where they meet in the centre.
In the meanwhile cell division takes place in the smaller spores, and each cell when perfeet produces a curious conical spiral thread, which is thicker at the base, and is clothed with
long cilia, and whioh is attached for some time to the mother sac. These make their way down to the embryonio cell, which after impregnation first hecomes covered with a distinct membrane, and then underanes a sratem of cell division, the result of which is the development on one side of a nearly horizontal root, and at the cellular mass. The first leaf is filiform, the three next are expanded above into a lanceolate lamina,
the fifth and sixth have the lamina bitid, the seventh and eighth quadrifid but stil verical, and it only in the ninth that the divisors. The rhizome, zontal, and form a sort of quatrefoil. The rhizome, off beneath. Even the first filiform frond has a ferm scattered stomates. These are the only details which are intelligible without figures, but the whole memoir is worth an attentive perusal. M.J.B.
The following letter on the subject of the Proposed New Road through the Gardens of Park Square, east and west, to which reference was made at p. 890 of our last volume, has been sent to us for publication :-

\section*{publication :-}

\section*{April 12, 1865.}
"My dear Sir,-Regarding the Park Square scheme, the point seems to me to be this-that it in no way interferes with pedestrians, but gives them the choice of a new road, besides those already existing-while to those who can afford to ride or drive, the loss of a quarter of a minute is inappreciable.
"If the Paving Board will only view the matter in this light, the grand effect to be obtained from opening out an avenued vista upwards of a mile and \(a\)-half in length will surely be sufficient inducement to go on with the seheme. Perhaps the best idea of what the result would really be is foreshadowed in the view from the drinking fountain down the Avenue towards the central smoking tower of the Langham Hotel at the end of Portland Place. Only the scenic effect the reverse way, owing to the spacious street in the fore-
ground, and theproposed avenue of intermediatebreadth through the Park Square Gardens (like a graduating link aiding the perspective) would be infinitely finer, and form a magnificent entrance to the Regent's Park, in strong contrast to the sneaking entrances so universally adopted in our parks, as if the parks were parks.
"Now the inhabitants seem willing to sacrifice a portion of their gardens if the privacy of the existing roads be secured to them as a compensation. In the extreme case of a person proceeding from the Portland remembered that there are outlets from Albany Street in communication with the Park, and, if necessary, a new one might be added almost immediately above the Park Square Gardens, near St. Andrew's Place. This would obviate all difficulties, and give London, as the Times said, 'a feature unsurpassed in any capital of Europe.'-I am, dear Sir yours very faithfinlly, "Markham Nesfield."

\section*{"The Right Hon. Wm. CowPer, M.P., \&e."}

We heartily wish the soheme success, as it seems to us not only a capital opportunity but a very inexpensive one, of realising one of the grandest features of metropolitan improvement, and enabling London to hold its own in this age of progress. We may further remark that as Regent Street is the handsomest street in the metropolis anything that tends to enhance its beauty is well worthy of very serious consideration.

Mrssrs. E. G. Henderson \& Son, of St. John's Wood, deserve the best thanks of the Royal Horticultural Society, and of all lovers of spring flowers, for the magnificent Exhibition of Tulips they have produced this season in the garden of the Society at South Kensington. Rarely is such a treat provided for the
inhabitants of the metropolis, and we are sonewhat surprised that the crowds that came to see the Tulip show were not nuuch greater than they were. If the exhibition is to be got up another year, we would suggest a different arrangement of the bulbs in order to render the colours more effective. On the present ccasion each kind had been planted in a row, and the colours of one row were made to contrast well with the colours of its neighbours, and in this way a bed of many colours was produced. Tastes, of course, differ, but we think a far better effect would have been probeds were aranced in this way and the differemee in the effect was most striking. This is the great charm which the Dutch gardeners at Haarlem use; those the bulb fields in the vicinity of that old town, are very enjoyable, and make an impression on the mind which is not easily effaced. \(F\).

We learn from a letter of Mr. Anderson, that the pikes are simple, the flowers alternating, aboat 1 inch apart, and that there are 4-6 on a spike. The plant is anid to resemble Pb . Lowii, but the leaves instead of being acuminate, are bluat and gieenish; while the fower is cream-coloured, with a very nice deep parple. violet lip, and some yellow and brown spots on the base of the lip and column.
The credit of introducing this little gem belonat to Mr. Low, through whose kindness we have haen enabled to examine a spike from the gardea of T. Dawson, Esq., grown by Mr. Anderson. We hare ince seen a plant with two fower epises in Mo Duj garden, grown by Mr. Stone. We feel highly ple to dedicate this pretty species to the Bev. C. S. Pa
of Burmah, who was its discoverer. H. G. Rchb. fl.

\section*{THE MITCHAM ILERB GARDENS.}

THE medicinal plants priacipally cultivated a Mitcham are:-Laveuder, Peppermint, Chamomile. Roses, Liquorice, and Henbane; large quantities o. Poppies, Rosemary, Squirting Cucumber, Bella quan and Pennyroyal are also cultivated; sud smaller Fur. love, Stramonium, \&c. The amount of ground hid out for the cultivation of medioinal plants varies envy year. The total acreage under cultivation at pssa is 736 acres, and comsists of :-

\section*{Roses (Roma callica and damascona) Peppernint (Mentha piperita) \\ Lavender (Lavanduia vera) \\ Henbane (Hyoscyamus niger)}

The sundries consist of :-Stramonium (Datur Stramonium), Horehound (Marrubium vulgare), Sarial Jumperus Sabina), Pennyroyal (Mentha Puleriunin Mallow (Althra officinalis), Spearmint (Mentua viruwe? Rosemary (Rosmarinus officinalis), Squirting Cluch Belab (Momordica Elaterium), Belladonua (Avpy (P donna), Foxglove (Digita oraveoleas), Celandine domium majus), Elecampane (Inula Helenium), Melissa officinalis), Wormwood (Artemisia Ab thium), Hyssop (Hyssopus officinalis), Tang tum vulgare), and others of less importand P The greater portion of the Lavender an Pepper is distilled for the oils.
quantity of C'hamomile, Rosemary, Peunyroy and Spearmint, was cultivated for they are now merely dried. The yo
varies with the season, and the soil on are raised. Scarcely ever does it acres tura out alike; hence different from Lavender is from 10 lb . to 12 lb . per acr grower informed me that it averaged from 12 lb . per acre. I have been assured by a dis zore than 24 lb . of oil ware obtained from some years ago, and that the plantimum yield four or five years; but the mars is about 1 acre. The Lavender plants are now re three years; and it is a singular fact, plants, that the yield of oil, growth, is scarcely sufficien and expense of distilling-the yield of oil from

The colomn last at South Kinsington fr

\section*{A tho moond yen's growth boing greater in} than either that of the first or frird years. The yield of oleson. The yield obtained by different ranees with tho 8 lb . to 12 lb . The effects produced grumers in firies of the soil are more striking in the asse of Peppernint thau in any other plant. Two sien distiied, cousiderable difterence in the rield of ,i, and froun that erop which had the most promising obpearance. It has been remarked by many growers, appeara at Carshalton and Mitcham, that Peppermint monts raised at Mitchana, and laid out at Carshalton an aljoining parish, yield a very different product when i.stilled, both in the aroma of the oil and the quantity in cilluge and cultivation, and that the superiority of the Mitcham produce is due to some peculiarity of the sill alone.
I axamined a sample of Chamomile flowers which the gromer informed me he cultivated entirely for distillaion, and which, ar dried awers, he bad a dificulty to dispose of I conld see no difference, further than that
the flowers were fuller and more expanded. It is not :mprobable that the oil receptacles might have an :mprormal development by manuring and particular ava. I do not believe that it is a distinct variety. The fiold of Chanomile flowers per acre is about 4 cwt .
Pennyroyal yields about 12 lbs . of oil per acre. So extemely variable is this plant in its yield of oil, that
one gromer informs us that he obtained only 5 ounces one grower informs us that he obtained only 5 ounces cultirato Pennyroyal for distillation.
The Provence Rose is extensively cultivated for the production of rose-water. Large quantities are also dried for the London markets. The Dawask Rose is cullivated by a few growers for drying, and is never distilled. During a favourable season 300 bushels of
Reses are producod per acre. If all the Lavender and Peppermint cuitivated were distilled, the amount of oil cupplied by Mitcham will be about 2190 lb . Ol.
Hentha Pip., and about 2060 lb . Ol. Lavand. : but as a Mentha Pip., and about 2060 lb . O1. Lavand. : but as a
considerable quantity of Lavender is "bunched" and inied, the rmount of oil supplied must be much less. Between 30,000 and 40,000 bushels of Roses are annually produced in Mitcham, and about 11 tons of Chamomile flowers.
Great care is taken in gathering and drying these flowers. The Roses are collected before sunrise. They are dried in ovens heated by air, and are maintained at a constant temperature of \(100^{\circ} \mathrm{Fahr}\). by a regulating arrangement. After the "Chamomiles are dried, they are "picked." This operation consiste in separating the darker flamers. The "bunched "plants are dried in open sheds, seeluded from the action of direct sunlight. 1000 to 2090 gallons. There is a peculiar fragrance and delicacy in the oil first obtained, which is decidedly wanting in the product which comes over towards the end. I find that a much less proportion of camphor exists in the Mitcham oils than in oils generally. The oils generally are of very light specific gravity, snd their refractive power is very great.
The soil of Mitcham is generally a good holding one, that is, retains moisture well, and is naturally rich. It varies in depth, even on the same estate, being in some places only a few inches, whilst in others it is manure to their Most growers supply large quantities of manure to their land, but evidently do not supply the elements abstracted by the growing crops, as the yield is continually diminishing. They do not lay out for mound. This is axins the same plants on the same desirable as the rotation of agricultural crops. Some srowers plant Potatos, \&c., after Peppermint; and, mint renewing the soil with manure again plant Pepperproduction plan is oonsidered highly beneficial to the praduction of good crops. The uncertainty of the produs in England, and the introduction of foreign produce have considerably reduced the annual producthan of Mitcham. A large farm, consisting of more with Lavender, which was a few years ago laid out ways, and Henbanpermint, Roses, Chamomiles, Caraproduction fenbane, is now employed eutirely for the than meet with cereal crops ; and most growers, rather a large meet with the disappointment of a failure, lay out tables proportion of their land with culinary vegereason, The flowers obtained during a very dry oil than the as the past, yield a larger proportion of summaer, but from the obtained during an ordinary luring the latter the combined effects of the frosts this year latter part of May, less oil will be obtained Lavender will be from 4 lb . to 5 lb . per acre. T. P. Warren, in Pharmaceutical Journal.

\section*{GROUND VINERIES. \\ Srici I wrote the article thus headed, and which} leat have given at p. \(31 \sigma\), I bave read, Mr. Bell's iich 31 let. If hered the meeting of the Society of Arts,
tifeir uses known (zround Vineries and tion to bis andience and given sume valuable instruc0 Ground Vinence and to the worid. A 7 -feet lenglh about 2 inches in diameter, close under the gable at
each end, to let off the hot air, would make the most
complete little greenhonse for the leads of the house if large enough, or for the courtyard and small garden if sunny, of the clever mechanic. It should stand on the bricks all the year round, except during severe frost, for the low apertures admit air free from blacks, and thus In severe frost the bricks may be removed, and the Vinery placed on the flat surface, either in the garden or on the leads. And now I have to point out the most valuable feature in these structures-the most severe frost may be kept out of them, if they are placed on admit the frost from beneath. To do this, old woollen cloths, carpets, and all such things may be heaped on-no matter how thick if the weather be very severe-and the frost most effectually kept out. The slow but sure
radiation of heat from the earth is kept in by the glass, and thus assists in keeping out frost.
In the country we use dry straw, which, if heaped on thickly enough, will resist the most severe frost, but straw is not adapted to small town gardens. I need not point out to that large class of amateur gardeners -the lovers of bedding plants-the great benefit they them during winter. No fire and its botherations are required-it is covering, and that only, which will carry them through the winter; in mild weather the Vinery should always rest on its ventilating bricke, and in frost be placed on the ground and thickly covered. If thus managed every small gardener may preserve his bedding plants.

The roof.gardener referred to by Mr. Bell in his lecture may make the Ground Vinery placed on bricks a charming little greenhouse, in which, during the
summer, he may have many gems. In giving the summer, he may have many gems. In giving the
description and sketch of the barless Ground Vinery (p. 316), I quite forgot to state that two corion trees may be grown in oue Vinery, side by side; I have planted two rows of trees, 12 inches apart row from ow, in one I have recently fitted up. I have reason gears, and then, if required, one row can be remored. years, and then, if required, one row can be removed.

anuex a sketch of the lean-to Ground Vinery ; the contrivance is only a few weeks old, but I can see that much may be done with it. It is glazed after the same method as the span-roofed; should be placed on bricks in front, and kept from resting closely against the wall by a block of wood 2 inches in diameter nailed or serewed on inside and at each end of the top bar a small hook and staple are placed outside the top bar at each end to prevent its being disturbed by a violent gale of wind. I may also add that although my span-roofed Ground Vineries stand on a hill much exposed to wiud, and have never been upset, but merely slightly displaced, there may be situations in which the wind would set them flying; in such places they sloould be secured by driving four short stakes into the ground, one at each corner.

The above sketch is a 7 -feet length of a lean-to barless Gromnd Vinery resting against a brick wall : \(-a\), is a block of wood 2 inches square, of which there must be one at each end; \(b, b, b\) are bricks placed endwise, 4 to 6 inches apart. To whatever length these lean-tos extend, each end should be closed.
It will be seen that the ventilation of these structures is strictly in accordance with Nature's law: the cool heary air enters below, becomes rarefied, ascends, in its upward progress gives life and health to the plant, and hen escapes by the vacant space between the upper bar and the wall ; the law of grayitation is taken advantage of, and the result is success. How different to the old mode一pullịg down a light to aërate a house! T. R.

from the Liords Comaissioners of the Adiand the Colonies, from the Lords Commissioners of the Admiandty, from molonies, of
from many of our Consuls: as also that we are under special
obligations to the Royal Steam Packet Companies and the obligations to the Royal steam Packet Companiles and
Peninsular and Oriental Company for facilities in transmitting peckages of seeds and plants free of expense.

\section*{Home Correspondence.}

Tiles for Blocking Orchids.-In the report of a scientific meeting of the Royal Horticultural Society held on the 4th ult. it is stated that Mr. Bateman has made "models of branches of trees in pottery" or orks. Every Orchid grower knows the annoyance of these latter, decaying so rapidly as they do in a damp house, and gladly hears of any substitute. Logs of the Cork Oak are sometimes employed, and these are more durable; but they are very difficult to obtain. I have
for some time used the flat slabs of cork, as imported, for some time used the flat slabs of cork, as imported,
\(1 \frac{1}{2}\) and 2 inches thick, cutting out pieces of the dimensions required. But even these begin to manifest decay in about three years, softening so that the suspending hook and the tacks to which the binding wires are fastened are liable to draw, to the peril of the plant. Mr Bateman further stated that Mr. Rucker had also employed pottery for Orchids in the shape of drain tiles. I beg to propose for consideration a form of the same than either of these. A mass of Dendrobium aggre gatum in my possession was, when I first obtained it clinging to a round block, probably a piece of the branch n which it had grown in the Indian forest. The bark had, however, latterly become much decayed, so a readily to separate in a sleet from the worm-eaten wood
as soon as the binding wires were loosened, retaining sufficient teracity to hold together, with some care in handling, yet so tender as to flatten out easily. I removed it then, and prepared to refix the mass on a new by 6 inches, and half an inch thick, I bored a hole with a gimlet near the middle of one end into which I secarely fixed a loop of strong wire for auspension. Then with a file I made a row of
notches, 1 f inch apart, along each edge, to afford hold for the binding-wire. The tile being thus prepared, I laid it before me on the potting-bench, placed ou it a thin layer of peat fibre, ou this a sprinkling of charcoal dust, and over this again a layer of course Moss. All this formed a convex surface, extending not quite to the edge of the tile on either side, on which I now spread out the bark of the old block, to which was clinging the Dendrobium (a mass of about 120 bulbs), with scarcely a root disturbed. Then, having a quantity of growing Moss, which we strip off in sheets from stones, and which I always keep by me, I spread suitable bits all around the edges of the bark, covering every spot not occupied by bulbs, and firmly wired-down the whole, crossing and recrossing the mass with copperthread, passing it through the notches at the edge of When finished, the plant was so frm that one could not tell that it had not grown there; while the Moss, when the whole liad been dipped in the tank and drained, almost concealed the wire, and presented the appearance of a natural growth. Thus I had my plant on an imperishable basis, of an agreeable hue (so much of it as could be seen, which was very little), and
of a porous texture, to which the new roots will doubtless cling, as readily and lovingly as we often find, to our trouble, they do to the interior of a flower pot when we wish to shift our Orchids. Mr. Bateman's simitations of gnarled blocks in
pottery would no doubt be very elegant, but I presume, being made to special order and pattern, they would ba costly, and would surely be very heavy. [No, not specially so, for they are made hollow.] Mr. Rucker's drain-tiles would be so unwieldy as to be suitable only for large houses and very large plants, and their weight, I presume, must be great. My tiles hang flat to the wall, are of no great weight, are very cheap, and are suited for small neat plants, whose area does not exceed the dimensions just mentioned. If they are wanted smaller, they can be cut with a saw almost as readily as an oak board; while the notching and the perforating are performed in five minutes. It would however, be an advantage, if the proposal be adopted by others, to have tiles made on purpose, of various sizes pierced with holes all round the margin before the burning process which would add very little to their cost will only add that I think the appearance of such specimens as I have treated in this way, much neater and prettier than that of those growing on split or round blocks or cork slabs. P.IH. Gosse, F.R.S., sand hurst, Torquay.

Black Varnish Paint.- Your correspondents, Mr. John Stevens and "H. T.," state that this ruins plants and Grapes in houses when applied to hot-water pipes; allow me, therefore, to record my experience in Co.'s Liquid Last January I applied Messrs. Tonge \& in the habit of using for Pain work (iron and wood), to some new iron pipes put up in a new greenhouse, and in an old Vinery. The plants were put into the greenhouse three or four days after the pipes had been painted. The Vines, of course, at the time were cut back; I found no ill effects what-
ever; all smell vanished 48 hours after the pint applied. The iron ought to be warm when paint was and the paint put on thin. H. M. Hammersley, Ridge.

Late Melons.-Mr. Bennett (see p. 364) states th. the Princess Alexandra Melon is the only late variety worth cultivation, as the so-called winter Melotiety
only fit for cattle. Surely Mr. B has some time in the woods at Osberton, or hougg for heard of the fine winter hybrid Melon exhibited S. Kensington, which is only one of a new race of varietit that will make its appearance next winter. Mr states that his hot-water apparatus got out of about Christmas, which stopped the supply; but winter Melons should be matured and cut by the winter October and placed in a dry room. In this way, good management, a succession of fruit of excellent quality !can be sent to table up to March, and then without trouble or expense in the dead of winter Potato Ned, Fulham.

Rhododendron Nuttallii.-This magnificent Rhod dendron is now in fine bloom at Well Head, nur
Halifax, Yorkshire, the residence of Halifax, Yorkshire, the residence of John Waterbome Esq. The plant is about 8 feet high and had 10 trum of bloom on it, some of them remarkably large, nit flowers fully 5 inches in diameter. The latter are of creamy white colour, of very stout texture, and with short wide tabe of a bright yellow colour inside, o taining black anthers. I have never before seen heard of a plant of the same size blooming so freely, an in such a state it is a most valuable conservatory shrab. it is growing in a pot in the spacious conservator in company with Glycine siuensis, G. sinensis alba, and Clianthus puniceus, now in full bloom. Close by ar fine examples in full flower of Illicium religiosum an Illicium floribundum, two plants now seldom me with in such good condition. Well Head is famonsfor its rich collection of hardy and exotic Ferns, new aud rare plants, and Orchids, and well deserving a visit any time. \(D\).
Aubrietia purpurea variegata.-A well and decidedly varregated form of this beautiful and popular spring flowering Aubrietia purpurea, one would imagine mat be a flower-garden gem. And such it proves to be on
making acquaintance with it. What a charming edging it will make, more particularly when it numerous blue flowers are
whitened compact foliage. \(R\). \(P\).

Garden Embellishment.-Fine-leaved and gracetally habited plants, Palins, Yuccas, \&c., mingled with con servatory Araucarias and specimen flowering plants make, if well arranged, a very pleasing indoor group 2 any season. A mid scenes like this one often wonders why a combination of varied and beautiful plants is not mor done with much less trouble and expense, and wher too, additional verdure and the absence of tubs ani walls would help to beautify the arrangement. have abundance of hardy plants to do it with; and tha it will be thoroughly well done yet, there cannot be tie slightest doubt, though sciolists in garden embellibh ment, sticking to rule of thumb, and with noligb the
ideas on the matter than those derived from tion "system" they mater mbout, may delicately and cloudily deprecating "any mixture" retard the mon ment a little. What has this system or "plilosopuy had to do with the creation of Mr. Bewleys
Fernery, which has astonished and delighted the of the gardening community, as well as the unlearned of non-gardening visitors? Other andus scenes might be mentioned, produced by an perhape divergence from the beaten path-convenient, param for the plodding operator, but tending not neasly gra dignified, and beautiful plants with which Nature hy blessed our earth. W. R.

Rats.-Ten pounds a year has often been pid ratcatchers who promised to keep the farms in rithe neighbourhood free of these vermin, but has been trie increased than diminished. A new plory man, woma or child, who brings a rat to the bailiff of the larger landed proprietor in the village, receives This sum at the end of the year amounted to 22.10 and all the farmers, \&c., are contented wis of cours and willingly pay their share. The rats wot be broug carefully disposed of, so that they could nom
time. Anna shawe, Bermit us to state the Carter's First Crop Pea.-Permil ublossom our First Crop Peas were fairly in
let of May, at our Seed Farm at St. Oasth ; they lat of May, at our Seed Farm at St. Ond are op
grown under "field" cultivation, aud inspection to any one who may wish to see them Carter \& Co., High Holborn.

Crickets.-I am acquainted with a cottage in thi village which was infested with these pests; so in worte that they were very destructive, eating holes stockings and any other articles of clothing
get at. The inmate of the cottage told me th quite got rid of them by placing bread and butter, with nome of Batley paste on it. This was put in the closet worth would poison thousands of these
worth would poison thousands

\section*{§ocictirs.}

Bosat Botasic: April 29 (Third Spring Show).Wich this very neat and interesting exhibition the Spring Shows at the Regent's Park have been brought attendance on this occasion, notwithstanding the wintry wind which contrasted keenly with the weather of the few preceding days.
The chiet feature of the Show was the Roses, of which admirable specimens were staged. In the competition classes, both Mr. Turner, Mr. W. Paul, and Messrs. Paul \& Son took the prizes in the order in mbich their names stand; and a good miscellaneous Turuer had a very fine plant of Gen. Jacqueminot, a good Souvenir de Malmaison, Lord Clyde in fine conbrilliant, and Alba rosea a beautiful blush-coloured Teabush of Souvenir d'un Ami ; and amongst the most noticeable in Hessrs. Paul \& Sou's groups were a Paul Ricant in charming bloom, Juno a handsome blush, and showed two lots of Cut Roses.
Next to the Roses the Azaleas were the most attractive subjects, though the plants were not large. A the Day, a striped white, showing fine quality ; Souvenir du Prince Albert, semi-double rose, with white margin, larger-lowered and better looking than we have pre-
viousy seen it, and likely to be a good decorative sort; Rusea albo-cincta, another fine white-edged rose; and Nadame Ambroise Verschaffelt, which, though rough
and thin, was, as always, bright and attractive. Messrs. F. \& A. Smith had a collection consisting partly of geedlings, in which several plants of Flag of Truce were prichard Cobden, a bright rose with spots, and of good form, but the plant was too small; while Galatea a light red, Beatrice a pale salmon, White Perfection
a greenish washy white, Mr. Marnock a deep orangea greenish washy white, Mr. Marnock a deep orange-
red, and Maculata a spotted red, were of inferior quality, the best of them having the defect of ieing whole-coloured, or without the spotting which gives
richness to those varieties that possess it. Messrs. Lane had a large group of dwarf plants of hardy Khododendrons ; Mr. Parker, of Tooting, sent six Haddington, a really fine thing, whose character is now Fell established; and Messrs. F. \& A. Smith a seedling Rhododendron cailed Queen of England, remarkable
for its large Lily-like bells of a semi-translucent white, very stout in texture, the tube about 4 inches long, and the limb as much in expanse, the leaves elliptic and lepidote, the flowers four or five in a truss, and the large number of stamens. Some very pretty plants of Pelargonium were shown
by Mr. Turner, including several of the spotted and French kinds. Mr. Wiggins, gr. to Walter Benk, Esq., also showed a very well-flowered group, mostly French;
and Mr. Weir, gro to Mrs. Hodgaon, The Elme,
Hampstead, had Hampstead, had a beautiful collection of Fancies.
Besides these, two Seedling Fancies were showa by Mr Turner, and gro see Fing First-class Certificates, nammely
Sunrise, a deep rich rosy carraine beavily belted Sunrise, a deep rich rosy carmine heavily belted; and
Sower per light rose with slightly spotted white lower petals, both remarkable for compactness and grown |than those beautiful plants are now generally seen, came from Messrs. Dobson and Mr. James of IsleWiggins and Mras, rather small-flowered, from \(\mathrm{Mr}^{\text {r }}\). from Mr. Parker. James; and half-a-dozen Amaryllids Miscellaneous
Bert. - and Mr. Wheeler, gr. to Sir F. H. Goldsmid the former Mr. Stone, gro. to Mrs. Foster, that from africana, the too seldom containing a magnificent Todea Mr, Adenaudra fragrans, and a fine Croton variegatum. Mr, Wheeler had a good Eriostemon; and Mr. Stone a group of Protms exceedingly. From Mr. Bull came among them Areca aurea, Brahea dulcis, Attalea excelsa, A few Auric, and Latania rubra.
Only exbibititor amonge shown; Mr. Turner being the Cambervell, and Mr . J ymen, and Mr. Butcher, anongst amateurs. Mr. Turner's flowers were, many George Lightbody, Turner's Mr. Marnock, Strong's Bell, and Negro, Chapman's Sophia, Solding's Jessie Mr. Turuer also had two lovely many beautiful flowers. yellow paste, and shaded bronzy plum with bright gained first-class awards a lighter red tint. These both maroon self, and Rerds; While to Master Hole, a Of novelt , econd-class Certificates were
Were shown. Mr. Bull hady mentioned a good many
well marked Aubrietia purpurea mariegate, athers, the
garden plant. also his curions Mimolus good flower Salvadora persica; a Rhododendron thibaudioides, with clusters of Correa-like cylindrical tubular flowers, orange with yellow tips; Primula intermedia, a purple-flowered Alpine in the way of ciliata; and Woodsia polystichoides Veitchiana, a curious pinnate scaly Fern from Japan. Messrs. Backhouse \& Son had four gems of the rare class, namely, Narcissus juncifolius, a dwarf yellow species; Andromeda hypnoides, with pure white bells Primula ciliata, a mass of rosy purple; and a dense cesspitose Primula called farinosa aca.is, with pink stalk greca, a good rock plant, with deep purple flowers græca, a good rock plant, with deep purple flowers.
Mr. Williams had the fine Palm Phoenicophorium seychellarum, already noticed by us; Anthurium magnificum, with cordate white-yeined leaves, very very like Mr. Weir's cordifolium ; Gymnogramma Parsonsii, the alatum, a good pinnate stove Feru for baskets, with a winged rachis and proliferous tips ; and a pretty maculate Smilax, besides one or two others less fully developed. A white-flowered Hydrangea, called japonica
alba, but apparently quite distinct from the garden japonica, was contributed by Messers. E. G. Henderson. It had cordato-ovate acuminate serrated leaves, and some of the outer flowers of the cymose inflorescence neuter, pure white, consisting of three serrated segments.

Royat Hormicultural: May 2.-At the fortnightly scientific meeting held on this occasion, such a magnificent display of fine plants was produced, and the attendance of Fellows and their friends was sogreat, as to
give unmistakeable evidence that the tide of success had set in in favour of the Society, and that its ancient popularity was fast reviving. Mr. Wilson Saunders occupied the chair. The Rev. M. J. Berkeley adverted to one or two plants exhibited at the last meeting; a cut specimen of an unnamed Ardisia, furnished on that occasion, he now pronounced to be A. acuminata var, decipiens of De Candolle. In reference to the Nardoo he stated that Dr. Hanstein had caused the sporangia to germinate, a fact which he had gleaned from an interesting paper by that gentleman published in Pringsheim's Journal (see p. 410). After alluding to the differences preseuted by seedlings raised from nearly the same parents in the genus Rhododendron, and speakiug of 1 l . thibaudioides, which has more the appearance of a Thibaudia than that of a Rhododendron, Mr. Berkeley made a few observations on the poisonous qualities possessed by the genus, stating that
R. cinnabarinum was one of the most virulent of poisons. The nearly related genus Gaultheria, the remarked, also contained poisonous species, though some of them furmished good esculent |fruit. The broadleaved Kalmia moreover was poisonous, and he added that birds fed upon its fruit were unfit to eat. Among other plants to which he directed attention was the Wellingtonia, a cone of which he exhibited from very young trees growing in the grounds
of the Marquis of Huntley at Orton Longueville, near Peterborough.
Mr. Bateman next. addressed the meeting, first in reference to Vaccineæ, and then in regard to Orchids. The former, he remarked, were plants hitherto comparatively hid in obscurity. They were inhabitants o New Grenada, Central America, being found in Peru, New Grenada, Central America, Japan, and the Indian Archipelago. They were not unknown to botanists and Endlicher's so to horticulturists. "Pcoppig stated to be the work which first induced Mr. Bateman to pay attention to the family, which was reported by Dr. Poeppig to clothe the Peruvian orests in a mantle of flame. So glowing a statement (which seemed open to doubt, but which, when the brilliant colouring of the young leaves and shoots is considered, is nevertheless perfectly true) led Mr. plants together, and he succeeded in obtaining many kinds, one of which (Macleania speciosissima, beautifully grown and flowered by his gardeuer at Biddulph Grange, Mr. Jas. Stanton) he exhibited. Dr. Hooker in his work on Himalayan Plants, Plate iv., figured V. salignum, which he had found growing along with the beautiful Rhododendrons of that Alpine region. Taking a hint from this fact, Mr. Bateman therefore commenced to grow \({ }_{4}^{4}\) his \#acciniaceous plants on the ground under glass, with Rhododen drons, but soon diecovered that mode of treatment did not suit them; that in fact, owing to their droop ing habit of growth, they required to be elevated, so that their branches might hang down, like those of Indian Dendrobiums, and he found that for the decora tion of brackets or niches in wails, where shade and than these tropical Vaccineæ, among the genera belong ing to which;'Thibaudia was one of the most important Another member of the family, named Cavendishia nobilis, in honcur of the late Duke of Devonshire, plant he believed not yet introduced, was also ad Mr ert to in high terms of praise, and he hoped tha would soon make an effort to obtain it.

Orchids were shown on this occasion in great numbers, and to these Mr. Bateman next directed
present, which, though fow in number, showed great diversity of aspect, and in that respect confirmed what was said on a former occasion, that this genus alone was well worthy of cultivation by those whose means did not permit them to grow Orchide on a more extended scale. He mentioned, in reference to C. caudatum, that the tails belonging to that species are not present in the flower buds, but that they length at the rate of from \(1 \frac{1}{6}\) to 2 inches a day until length at the rate of from \(1 \frac{1}{8}\) to

The different Dendrobia axhibited nest occupied attention. Concerning these, Mr. Bateman stated that when this charming genus first came under his notice, he considered D. Pierardi to be one of its most splendid species; by degrees handsomer kinds were introduced, and among others came Mr. Gibson's D. Devouianum, which 1r. Lindley iusignated the king of Dendrobes. What, however, he added, shall we say of D. Wardianum, which turns out to be quite different from D. Falcoueri obtusum, and to have glorious spikes of blossoms at loast 5 feet in length?
This truly must be a maruifcent This truly must be a magnifcent sprecies. After stating that D. macrophylium, anosmum, and Daypassed on to the Phalænopsis Liddemanning, Bateman at p. 410, which was exhibited for the first time at this meeting simultaneously by several growers. It was mentioned that Messrs. Low, who first had the Whole of the stock of this fine species, let it slip through their fingers, thinking that it was nothing elso than P. rosea, which it some what resembles. It has however much larger and finer flowers than those of plant; the little spikes furnished ach more rewarzable with two flowers on each, will, it was stated, probably produce when established ten times that uumber

May 2 (Floral Committee).-First-class Certificates were awarded to Mr. Williams for his fine Palm Phonicophorium seychellarum, and for his beautiful Fern Aspleniun alatum. The same exhibitor likewise received a Special Certificate for his tailed Lady's Slipper (Cypripedium caudatum) and other interesting plants. A similar marls of distinction wes con ferred upon Messers. Low for their fine collection of Orchids, in which were Dendrobium Dalhousianum, and D. chlorops, the latter with white starry flowers, To the same firm was also awarded a First class Certificate for the charming Philippine Phalænopsis Lüddemanniana, a plant of which was likewise shown by Dr. Pattison, of St. John's Wood, who received a similar award for it. For a little gem, Phalumopsis Parishii, from Moulmein, a First-class Certificate was awarded to Mr. Stone, gr. to J. Day, Esq., of Tottenham, who also furnished \& splendid collection of Orchids, in which was a magnificent specimen of Dendrobium densiflorum, with no fewer than 70 spikes of charming orange-yellow blossoms on it; also D. densiflorum album, like the last in all respects except colour; D. albo sanguineum ; and the rare D. eburneum, the last with 14 pure white flowers on it, exquisitely stained in the centre with red; Cypripedium Lorvii, with nine fully expanded flowers; one or two Saccolabiums, and other plants. For this fine exhibition a special Certificate was awarded, as also for the Dendrobe. Mr Lawrence, gr. to the Bishop of Winchester, furnished a beautiful example of Epidendrum prismatocarpum, for which a First-class Certificate was awarded. On W. Marshall, Esq., of Enfield, whom Mr. Bateman characterised as a rising star in the Orchid world, was conferred a similar award, for Dendrobium tortile roseum, one of the most beautiful of the distinguished genus to which it belongs. Mr. Veitch, in addition to special Certificates for the large and fine collection of miscellaneous plants which he exhibited, received First-class Certificates for the following, viz., Gym nogramma flexuosum; Rhododendron Henryanum, a hybrid of which R. Dalhousix is stated to be one of the parents; the orange-blossomed Saccoabium curvifolium; the charming Odontoglossum Pescatorei ; and Primula cortusoides alba, the last a pretty pure white addition to the fine Japanese Primulas described by us in former reports, examples of which were reproduced on this occasion. From the same exhibitor also came a well-flowered plant of the white Glycine ; Dracæna nigra, a"very dark-leaved species, introduced from New Caledonia by Sir Daniel Cooper; Bomaria Caldasii, a half-hardy climber, bearing manyflowered terminal umbels of orauge red blossoms; the canary-coloured Amaryllidaceous plant, called Urceolina aurea; Mr. Dominy's beautiful hybrid Calanthe; Odontoglossum gloriosum, and O. superbum; Lelia grandis; a fine plant of Olontoglossum nævium majus; Aerides Warneri; the spleudid group of inthurium Scherzerianum, formerly extionition; Marianthus Drummondianns; Azaleas and other interesting plants. To Mr. Buil two First class Certificates were awarded for Aubrietia pur purea variegata, and Woodsia polystichoides Veitchiana mentioned in another column. The same exhibitor also had Rhododendron thibaudioides, Anthurium cor difolium, and other handsomeleaved plants. From

Mr. Noble of Hagstot came examples of the double White-blossomed Clematis Fortuni and the charming C. Standishii, the last literally a mass of rich violetpurple blossoms, some of which measured 5 inches in For the introduction of these Clematises, to which a pecial Certificate was awarded, we are indebted to Mr. Fortune, and judging by their extreme beauty glorious future may be anticipated as they are stated to be hardy. Mr. Pilcher, gr. to S. Phalænopsis Liuddemanniana, and for the handsome Cattle 5 a amabilis. To Messrs. Backhouse wasgiven similar wards for Narcissus juncitolius, the pretty Primula iliata P. farinosa acaulis, and Andromeda hypnoides, described in our report of the Royal Botanic Society's meeting in another column. irr. Wm. Paul received a Special Certificate for examples of the alluded to by us last year (see p. 791). Mr. Lloyd, gr. to Mr. Caldecott of Rugby, received a Second-class Certificate for prettily variegated leaved variety of Pelargonium would be a useful plant for edgings and vases Mr. Turner exhibited Auriculas from his unrivalled collection now in flower at Slough ; also beautiful groups of Pelargoniums, Roses, Azaleas, and other plauts, for all of which Special Certificates were awarded. From among the Auriculas, John Leech and Meridian Second-class Certificate. These, with the exception of Meridian, a warm red-edged Alpine, will be found described in another column. From Mr. Parker came cut blooms of Rhododendron Countess of Haddington A group of finely variegated plants came from Messrs. E. G. Henderson. It may be added that some fine Knyperaley, where they are grown in great perfection by his gardener, Mr. Sherratt. Plants of Cypripedium caudatum and C. superbiens, together with cut spike of Dendrobium Dalhousianum and several other Orchids, were also sent by Mr. Cullen, gr. to W. WentWort Buller, Esq., of streto too late for exhibition The C. caudatum was grown in a cool house, and was sent as an illustration of what cool treatment will do for some of our most favourite Orchids.
May 2 (Fruit Committee). -The fruit shown on this occasion consisted of a well-ripened Queen Pine apple, a dish of Apples, and a pot of excellent Passion-flower Jelly, made according to the following receipt kindly furnished by Lady Dorothy Nevill, to whom the jelly in question belonged:-Peel and cut the fruit before it gets over-ripe; cover with spring-water; allow the
fruit to boil till quite tender; then strain through a jelly bag; measure the juice, and add half a pound of loaf-sugar to one pint of juice, the rind of four lemons and the juice of six, and a small piece of alum; then mould.

The Philosophy of IIealth. By Southwood Smith, M.D Eleventh edition, revised and enlarged. Pp. 395 Longman \& Co. 1865.
The Philosophy of Health was one of the first effort made to render the main truths of physiology familiar to unprofessional persons. It met with the most marked success-a success sufficiently indicated by this 11th edition. In his ordinary practice as a physician, the philanthropic doctor could not bear to witness the immense amount of misery and disease arising from a neglect of the most common sanitary maxims. He fel that it was useless to try and stem the tide of disease
by medicine, while the fountains of corruption were by medicine, while the fountains of corruption were
allowed to spread infection all around; so be turned Sanitary Reformer, and used all bis endeavours to rouse the country and the Legislature to a sense of responsibility in this matter. After a time it was very generally agreed that prevention is better than cure A machinery was set in motion which has done great things already, and will do more. Meanwhile modern thrown increased light upon the primary tissues of animal and regetable life, and the Dr. commenced rewriting a portion of his book, endeavouring still to learned, whilst thoroughly scientific in. all points Death stopped the venerable physician's hand befor he work was finished, and on his grandson devolven the tasic of seeing this latest edition prepared for the ress.
The Philosophy of Health is written in a remarkably imple, lucid, forcible style, by one who was evidentiy a master and lover of his subject, and one moreove who possessed the art of clearly expressing to others What he wished to lay before them. The first chapters beantifur organisation of animal and vegetable bodies ar is "the direct, the ordinary, and the gratuitons result of the actions of the human organs," are indicative of a He affirms "t that and pious mind.
He affirms "that every organ in the animal body is so constructed as to bring about, directly or indirectly, a state of pleasurable conscionsness or well-being; that
that in this, every such action, when natural and sound ultimately terminates." Now, that pleasure should be the result of the action even of the organic organs, Ithough one character by which they are distinguished is that they are unattended with consciousness, is singular nough, but Dr. S. Smithshows that by a special provision, consciousness is indirectly connected with the processes onsciousness is limited in extent indeed, and uniformly rerming point, but the extent aud th limitation alike conducing to the pleasurableness of it nature. In fact there are two distinct sets of nerves the ons is destitute of sensation, presiding over 11 the organic processes, and these processes go on ither an part, the other presiding without any exention our part Ther presiang over senation and voluntary motion. These two sets of nerves however communicate with one another, and pocess sor is it simple seusation, but pleasurable conscionsness that all is going on well and properly-it is in fact the pleasurable conscionsness which constitutes the feeling of health.
We must quote a few lines on a matter connected with this subject:-"Wholesome food is grateful; the satisfaction of the appetite for food is pleasurable. Food is necessary to the support of life; but it is not indispensable to the mairtenance of life that food should be agreeable. Appetite there must be, that food may be taken, but the act of eating might have been secured without connecting it with pleasure.

Pleasure, however, is connected with
first, irectly, by the gratefulness of food; and secondly, indirectly, by the due digestion of the food. And the annexation of pleasure in this two.fold mode to the performance of the function of nutrition is another case of the gratuitous bestowment of pleasure, another instance in which pleasure is communicated for itz own sake, and rested in as an ultimate object. Pleasures of this class are sometimes called low; they are comparatively low; but they are not the less pleasures, because they are exceeded in value by pleasures of a nobler nature. Organs of sense, intellectual faculties, social affections, moral powers, are superadded endowments of a successively higher order; at the same time, they are the instruments of enjoyment of a nature progressively more and more exquisite.
Dr. S. Smith's description of the complicated pro esses of mastication and deglutition is singularly beautiful. It is, however, too long for us to more than glance at
'Mastication, a rough operation, capable of being accomplished only by powerfal instruments, which act with force, is carried on in the very same spot with sensation, an exquisitely delicate operation, having its seat in soft and tender structures, with which the appropriate objects are brought into contact only with he gentlest impulse. The agents of the coarse and the delicate, the forcible and the gentle operations are in close contact, yet they work together not only without obstruction, but with the most perfect subserviency and co-operation.
"Without some degree of attention to the process of eating, and some distinct perception of its gratefulness, the food cannot be duly digested. When mastication is completed, and the next process, the first stage of
deglutition, has begun, the agency of volition and sensation ceases. Beyond this the function of digestion is wholly an organic process.

Mastication, a voluntary process, may be performed slowly or rapidly, perfectly or imperfectly, without erious mischief; bat life depends on the passage of the food through the pharynx with extreme rapidity and with the nicest precision. It is, therefore, taken out of the province of volition, and intrusted to organs which belong to the organic life, organs which carry on
their operations with the steadiness, constancy and xactness of bodies whose motions are determined by a physical law."
The last chapter contains an elaborate account of the nervous system, and in these the results of the later discoveries of modern science are embodied. There is a great abundance of plates, which are principally new. The work is, as we have stated, perfectly adapted for a popular treatise, and has the great merit of being such as the most refined ludies might peruse without the slightest discomfort.

The Nero Testament, illustrated by a plain explanatory Commentary, and by authentic vievos and photographs. Edited by Archdeacon Churton and Rev. W. Basil Jones, Prebendary of York. 2 vols,, small 4 to, pp. 796. John Marray. 1865.
A good and well-printed neatly bound portable Neir Testament, with a simple, brief, but trustworthy commentary, such as an ordinary reader of the Scriptures requires, and where the explanations may be found whout having to turn over a quantity of pages, has Mr.
Mr. Murray has just published a work of this kind in to meat withe-looking volomes, which are pretty sure persons for whose special use they are intenge class of pre two features of it which are especially deserving of notice : the farst, respecting the commentary itself the general arrangement; the second, respecting the akilful use of photography for giving Western nations
As regards the firs ry and customs.

Biblical student must work with his Greek Tentaon before him, and must be ready to consult a variety
authors, and to weigh their often ments with the against another. Rut this is not the with the ordinary English reader, who is quite satis bewildered by a multiplicity and would onls more unsatisfactory than the preceding. much prefer that the learned should settle mate criticism and interpretation amongst themselter that the general drift and result of their labours be gathered up in a few words for his instraction guidance. The object which the editors had in is extremely well expressed in the preface "It intended to supply a plain explanatory comm for private or family reading, that the reader miz find any difficulty in the sacred text, as it is rep sented in our faithful authorised version, remored elucidated by a brief paraphrase, a comparison of parallel passage, or a short inference of implied tr in doctrine or practice. It was desired especially avoid the fault which almost invariably besets m. lengthened commentaries-that of inviting attent: to the gloss rather than the text. It was wished the any chapter, or portion of a chapter, selected for dain reading might be found so far historically, criticall or doctrinally interpreted, as to leave the words of th
sacred lesson itself first and last in the
acred lesson itself first and last in the reader's mind.
This intention has been well carried out. The tert is beautifully printed, and the short commentary supplied in the form of notes, on the very page whe they are wanted. These are printed in smaller but rer clear and beautiful type, and contain less matter, an occupy far less space than the text. We have car-
fully looked at several important and difficult passge in the Gospels, the Epistle to the Romans, and tho 1st of Corinthians, and our impression is that they ny sound, clear, concise, and sensible.

The position and character of the editors will be sufficient guarantee to satisfy most people, that mattern of controversy and deep scholarship have been frutel with practical judgment, in a work which is intended
to be popular rather than critical. Archdeaoon Clurto be popular rather than critical. Archdeacon Chur
ton edits the Gospels, the Rev. W. Basil Jones, Pre bendary of York, the Acts of the Apostles and th Epistles. We observe that Dr. Smith's Dictionary af the Bible is occasionally referred to, and that the table of parallel dates is that which was drawn up b the present Archbishop of York.
The illugtrations with which tinese volumes at adorned demand a special notice. They are very nuat rous, amounting to about 120, and are taken, a ford them from pictures by Overbeck and Laborde, many from sketches made on the spot by the Rev. S. Malan, but for most of them we are indebtel that beautiful art which enables the photographar represent the scenery of foreign lands with absolu truthfulness. It was a happy idea, to say the le it, to think of familiarising the English reader mil those scenes which must ever have a peculiar by meas for the Christian, and to carry out the plan Hols Lar and see Bethlehem where the Saviour was born, Nazareth the scene of his early life, the banks of the Jordan, or the shores of the Sea of Galilee, which wem so often trodden by his feet; but all these locaitue still bearing as they, do the general natural aspect tu they wore in those days, are vividly brougut one's mind in the sketches of Mr. Malan, and the . more beautiful photagraphs of Mr. Graban.
say no more to recommend this work.

\section*{Railways. A Plan for their Reform}

The writer of this pamphlet says he was a member of the House of Commons when railway history begn and he then urged six standard points, vie gauge, 1 d . a mile maximum charge, \&ce. He vigoroun opposed the first Great Western Railway Bill, flatters himself it was the "hardest costliest contest" in the annals of such
thinks that the companies then needed pro thinks that the compauies then ners. Now, hom the case is quite altered, and the public neem tection against the exactions of a giganionable Most people will so far agree with The honourable gentleman stili sticks sux points, and is fortified in his opinions by the success of the penny postage, which the
always a hobby of his, and indeed forms the his pamphlet. From the postage statistics to draw analogies on which to found can onl apprag he candidly admits that the increase was \(122 \frac{3}{4}\) per cent. in the first year af of postage, and so much per cent. in the nese he assumes that the increase in the
gengers in the first year of a reduced fares would be 100 per cent., and so much year. So that, if the railway co
over three millions in the first year the reduction which he recommends, very soon right themselves, as has been the the Post Ofice. Again, he finds that the gives 21 letters to each individual in the kiagouli no does not soe why reduced railway
in a year.

Wo all admit that railway matters need reform, and wust have it before long ; but sureiy to ground such changes as he would mase in our gigancic railogy of letters and incerest upor is an abuse of arithmetic, figures, and postage,

In the Transactions of the Scottish Arboricultural Society (vol, iii. part 2) is a capital article on the Introdnction sud Cultivation of the newer Conifere and daction Forest trees, by Mr. Hutchison of Carlowrie, from which we shail endeavour to make some extracts abortly. The writer is of opinion that far too little attention is paid torboriculcural knowledge is at a low trees; and amongt foresters and gardeners. "A little more excouragement given when intelligent oversight and encecessful or skilful management are displayed, would, sin other branches of industry, give such an impetus to forestry as would place the science of tree-growing in the position which its importance to landed proprietors and its national commercial value demand."

\section*{Tye Butary.}
"I ruvs," says " J. B.," a correspondent, "read with much interest your Apiarian articles, and will feel obliged by a hitte more information respecting Bees but one hive, a large old-fashioned straw one, which is now very strong. I want to incrense them as much as possible by making them smarm. Can I turn to account some hives in which the bees died this spring? One is full of nice clann combs, with ever so much honey in them ; another in about half full of combs, with very little honey in them. They are both large straw hives. 1 suppose the operator must have his hands and face carefully covered when porforming the operations you describe, as the bees naturally., Any hints on the subject will be thankfully received."
If, as "J. B." says, the combs in the two deserted hives are tolerably clean and good, the hives can be there are no dead bees, forming a putrid mass near the crown of the hive. Owing to the long.continued in clement weather, many stocks have perished from damp mth many in the cells, and all in a state of decomposition. If such should be the state of the hives, cut out all the combs so tainted, but if otherwise, by all menns make use of them as they are
Our correspondent cau very advantageously adopt the plan of artificial swarming, having two hives already are perceived on the wing from the strong stock, the first artificial swarm may be forced. Follow the direcdifference: having only one stock to operate on, it bet neceseary to be particular to drive out every bee from the hive we will call No. 1. The The stock may be returned to its usual stand. in a conve the expelled bees may be tied up neath, and removed to a cool dark place until
evening. When nearly dusk, a cloth main the ground, two sticks dusk, a cloth may be spread on bees knocked out with one sharp blow on the sticks, be transfive into which it is desired the bees should two sticks placed gently over them, resting on the butt, these Soune bees may still be left in the empty bees will quickly find their way among the combs, and apiary. Should the their destined position in the in obtaining the operator by any chance have failed following day to their old bive. Even during the many will find the driven lot, it is probable that many will find their way back to their old home. bees to a distance of a mile or to send the expelled they may be brought back in a more; from whence al to be right, in about thr in a few weeks. Supposing hive No. 2 whs peopled thee weeks from the time the No. 3 may be proceed, the tenanting of the other hive of effecting this object. The experienced a piarian bis subsequent by the strength of the two hives in Fit bees from No. with the first swarm made, leaving a sufficient number, cells, to hatch to raise a queen, and it will hardly hive will now have A secon increase from it
No. 2. They may be be to expel all the bees from Thety combs, which will save anven into the hive of Btand, so swarm, No. 3, is allowed to occupy No. 2's paren stock, No. 1, is now are saved to it. The first part of the garden, and No. 2 is taved to another the brood, and raise foragers will return to hatch out this plan is thaise a queen. The chief objection to
seared in No. 1 may young queen which has been
of her matrimonial flights, and may, on the next with which she is familiar. It is not likely that any injury would accrue to herself, as she would return among her own bees, but as there would be no brood or eggs in the hive from which she came, no new queen could be raised, and the loss of the hive would be the

A third mode of effecting the desired object would be, in four or five weeks after No. 1 was first driven, when in all probability the young queen will have commenced her egg laying, to again drive out a great part of the bees, which, with the young queen at their
head, will form No. 3, into a nice stock. No. 1 must emain on its own staud, and the new hive, Nu. 3, had better be tied up in a coarse cloth and removed within doors for 24 hours. If this third plan is adopted for inding a population for No. 3, a swarm may very shortily be taken from No. 2 which will increase the piary to four hives
If the original hive No. 1 is sufficiently populous to llow of the first operation bein the season, a second edition of artificial swarms may be made later on in the summer when the first batch acrease is desired, the beome populous. If such an expect to obtain any honey harvest, but must be prepared to feed some of the later swarais very liberally hould the summer turn out an indifferent boucy year The later swarms would have no advantage from combs already built for their use. The two first artificial swarms, from being supplied with combs, will be in a state to afford an additional increase in a few weeks ives is required, we would recommend " \(\mathrm{J}, \mathrm{B}\) " to be satisfied with an increase of three or four only from the original stock. The apiarian with only one stock labours under a greater relative disadvantage than witi wo original stocks, as he cannot carry out the transposing system as detailed in our former paper: And again, he who manipulates with bar or frame hives has an infinite superiority over the former. He has the power of making available any supernumerary royal cells, or of forming small artificial swarms with a single brood comb and a few bees.
r. Bhould fear to carry out the foregoing instructions, he can probably attain nearly all he desires by trusting to the chances of natural swarms. Let the hive which is about half filled with combs, be tenanted
with the first swarm. If a second swarm should issue, with the first swarm. If a second swarm should issue,
let that be hived into the other. The first swarm will most likely throw off a swarm in about four weeks, which may be placed as usual in an empty hive. If there should be auy further issues the bees can be united to one of the other swarms. This will give our good stocks, with which one ought to be content. It is well to have the face and hands protected, at least during the early part of the operation of driving, but after being subjected to a few minutes drumming the bees usually are so subdued that all protections may effected without them. The best bee-dress is a simple bag of black net, just large enough to go over a broad. brimmed hat and be tucked in under the waistcoat collar. Sleeves of the same are neither required nor useful. The gloves may be of some woollen material, to which are attached the leg portions of woollen stockings or socks, to be drawn over the sleeves of the coat. The best gloves are those of india-rubber, such as are used by photographers. The only objection to them is that of confining the perspiration, and making the hands uncom round the bottom of the trousers. We should advise the beginner to be well protected, as the feeling of perfect security tends to confidence and the proper performance of all that may be required.

\section*{Garden Memoranda.}

Mr. Bull's Nursery, Chelsea.-Straying in here few weeks since, on the look-out for winter flowers and charms, I soon found myself absorbed in the con Here I found a little plant, itself as hardy as Waterress, which somewhere or other had taken a freak and become distinctly variegated, and by somebody or other had been sent to Chelsea, to be steamed and roasted at such a rate for the purposes of propagation as never before could have happened to our little friend since those days, ages ago, when the great flood of heat came down, softening and genialising our then ice-bound latitudes, and driving, all tiay subjects that liked to "take it coolly" to the hill
flower Aubrietia purpurea with a distinct marginal variegat on, which is thoroughly constant in the plante, fancther in the stoves, greenhouses, or cold pits. Only particularls charming edging this will pake, e.evated abore the the numerous blue flowers are Cruciferæ have afforded us some capital variegated and odging plants, but in most cases the colour of the flowers comes much too near that of the variegationhere we have a "true blue" for a contrast. As far a I could judge. it is likely to be most useful and all gardens.
parative paratively insiguiticant little planet of curs to bo much hated of starting novelties for the plant-house, so much has it been ransucked of late; and when one
does meet with a very "distinguished paity" like the Cyauophyllum or Splywrogyure, a shabby hitile suspicion will sumetimes come to the surface mit sas, "we fhall not wonder at your like ngain," but the ery is "still they conue," and a sad day it wall je for horticulturists when is otherwise.
But the "after ourselves the dehuge" peopice need bare little misgiving abuut a supply of new planta Whung our day and generation, ths may be scen here What fine-luoking batch of young plants are, these with large leaves, the young ones of a plensant reathath tint, the midrib in all the leaves of a bright reddish pink-looking very striking in the older aud greener laves, and almost every portion covered with short thick stiff hairs? It is Saurauju sarapigiensis, a plaut worthy of association with the Spherogyne and Cyano phyllum. Leaves on one older plant were 20 iuclaes
long and 8 to 9 across. With our good viaut growers long and 8 to 9 across. With our good plaut growers they will probably be more. Paciycentra Walkerii, from Ceylon, with sparsely ciliated leaves duated over with minute crystal-like spots, and the habit of a scandent Ficus, is said to Hower a:al "bract" in the way of Medinilla. Cupania undulata, frou South America, is a plaut with pinnate leaves, their edges very wavy-a graceful subject altogether. A new Spharogyne! and a very fine one too, with the stem densely covered with short woully matter, the leaves large, and of a light green, unlike the other species, is named S. cinuamomea.

Passing by a new Marauta, Tan den Heckei, several fine new Figs, and numbers of their companions in novelty, I come to a class of plantss said to be new to science-the genus Urospatha, of which Mr. Bull has a large stock-the species not yet named. They have creeping rhizomes, like some Ferns. There aro huudreds of rhizomes starting into growth, and au odd plant in leaf here and there, just sufficient to give one an idea of their distinct aspect. The leaves are of a firm leathery texture, mostly fretted and spotted over with pink ; in their present state not lare, but probably they are not nearly so quick-growing as tho Caladiuns, the more especially as they are leaves that remain on all through the winter. They are mostl of a aingular sagittate form-those of one kind
looking exactly like a cordate leaf that had been cut from its centre to the middle of each shoulder with a pair of scissors. In others the basal lobes beccme enlarged after receding from the apex of the petiole, and taper again into an acuminate point. The lobes in this and another species being much larger than the apical portion, seem to have the effect of causing the leaves to hang with the basal lobes downwards, so tha if distillation takes place in this section of the Arum family, it will probebly be by a double channel and a reversed outlet.
Here again is a plant! Its name is Bertolonia margaritacea, and it is furnished with leaves 4 to 5 inches long and 3 to 4 broad, of a purplish-olive colour, with a narrow gleam of purple along the ribs, somewhat of a Cyanophyllum hue, and on the leave are reguiar rows of spots of snowy whitenees, just exactly lize those on the best marked Soneria, but a much magnified Sonerila would hardly be so beautiful. If asked to indicate its merit, as is frequently done by laying down the number of miles worth travelling to see it, I would scarcely know where to stop. And this is an introduction of Mr. Weir's, whom I have heard accredited with sending home "nothing but rubbish!" It was sent out by the Horticultural Society at a stage when its beauty could not be seen, and bas, I believe, been lost by most people to whom it was sent-probably not being sufficiently established at the time. Did Mr. Weir introduce nought else, it is sufficient to make his journey remembered.
Many things, such as the excellent Cycas Riuminiana the Silver Palm, Calamus dealbata; the Weeping Willow of Australia, Dammara Moorei; the ivorystemmed Diefleubachia; a Japanese Ardisia, with exhibited last season, though all new, are yet passed by as comparatively old in thas place, in consequence of the advent of stull newer suhjects, among which is Allamanda Hendersonii, "hich is said to be a remarkably free-flowering kind, in addition to other distinc tions; a batch of new Dioscoreas, with silver-blotehed purplish leaves; and a goodly collection of Pandauuses, including P. oruatus, in the way of P. elegantissimus, but smaller and even more graceful ; l'. Blancoi, witu very long arching leaves; P. latissimus, the handsomest of the broad-leaved section; P. Vandermeerscbi, a dwarf, the broad-leaved section; P. Vandermeerscli, a dwarf,
graceful, light green species. Also Parynum macula.
tum, with delicate though distinot yello marblings ; and the fine Anthurfum cordifolium.
There are tubers beginning to grow of one species of the highly curious genus Amorphophallus, and another is soon to follow, but it is perhaps wiser to
see the plants developed before saying anything of see the plants them. Juigivg from the plate in L'Illustration Horticole they lo.k like gigantic arhorescent specimens Horticole Arum Dracuaculus. A spiny-leaved Hibiseus,
of the true H. ferox, is more a very ond Xanthosoma is
shrul.by Nettle; and whiat a ver shrul by Netrle e and
this, with a little attempt at a lenf, stuated on the this, with a the under side of the large normal leaves. These little hooded abortions occur regularly on o leaf, and give the plant a very singular character.
Among Ferns, of which there are many new here, Asplenium myriophyllum is one that will become widely spread, for its habit is exceedingly graceful and
refresbing many as are the lovely Ferus we have refresting, many as are the lovely rerus we have
seen ; and its divisious are very minute. There is also a seen; and its divisious are very minute. There is also a
new reeilling Cymmogramma like G. Wetenhalliana, but golden ; Ophioglossum palmatum, an extremely rare Fern, though known to botanists for a century and half; Lhartrea varia, a distinct and fine Fern; and a hrbrid between Pteris serrulata and P. cretica, calls P. gerrulata cretica varieg

Before leaving the stoves, howvever, I must mention a maculated Dracena called picta; a new Cyanophyllum ; and the fine Amaryllis procera, aleo called the Goiden Intania; ; some new Solanums in the "sub-tropical" direction-one, S. crinitum, said to produce leaves 2 to 3 feet across, Also the true
Mangosten, and the Mustard Tree of Seripture; and a Mangosteen, and the Mustard Tree of Seripture ; and a
fine lot of liohdeas, strinted and variegated quite dif. ferently from the common form-one, called R. japonica sureo-marginata, is twice the size of the old margined Rohdea, and quite erect and rigid.
\({ }^{T}\) The new Aucubas are at present one of the chief attractions here. The collection is a very remarkable one, and no doubt destined to work no amall improve ment in our shrubberiest. There are lalf-a-dozen wellblotched variegated varieties, several with the leaf, except a narrow margin of green, of a clear lemon yellow: and free and excellent looking varisties with.
out any variegation. Theese 1 ans inclined to think out any variegation. There 1 ans inclined to think reasonable to expect that they should thrive where the variegated form does "pretty well." Of these, Aucuba japonica macrophylla is a fine plant, with leaves of a lighter green than its very dark-hued neighbour. latifulia, which has also very large leaver, and promises spoltede another noble shruo: macuiata is a very fine tissima is a great-leaved variety, with one immense bloteh of clear yellow, and the remaining green portion lightly dappled over with small yollow spots; elegans
is rather deeply serrated, with a broad centre of yellow and dark green margin \(;\) sulphurea has the variegation suffused all over the leaf, and is quite distinct from the other strikingly-marked kinds; marginata has the is noble shrub. The form, almost sure to make noble sarub. The Himalayan, Fortune's, the normal male and female forms, and otner Aucubas,
are all here, Fortune's maculated male being a most are all here, Fortune's maculated male being a most than any of the other inales. Great as is the imme diate pleasure of introducing such fine plants, it is very little compared to what we should experience a dozen years hence when they shall have done much to embellish our islands. I have omitted the " mascula" in naning them, but almost, all spoken of are male forms.
I cannot now go over the florist flowers, but must mention a new strain of Mimulus, with hose-in-hose flowers; and so bid good bye to this fine collection of novelties. \(W \cdot R\).

\section*{Miscellaneous.}

The "Great Orchid Show."-Among gentlemen who are not nsually in the habit of exhibiting their plants,
but who are likely to be worthily represented on Saturday next, the 13 thin inst., wo me have heard mentioned the names of Mr. Rucker, Mr. Day, and other eminent growers.
Windoro Gardens-The idea of "window gardens" is now become general in London, and as it undoubtedly contribites to the cheerful aspect of the the bealthy state of the rooms within, it is well to afford every possible facility for this plan. The impedi ment generally is, want of width of the window-sill on thection to place the flower-pots; also want of some prointo the street. whethet rich or poor, world make a wide windlasses with an iron rail, it would be all that is required for a poor family to have the beover it would enable many a open window without fear of the little children falling out, which is ofted a reason for not opening the window Athewreem

\section*{Calendar of Operations.}
(For the ensuing week.)
Tex genial rains which have fallen during the last Teve days wili be of great benefit to outdoor vegetation. Indoors however additional attention to watering will be necessary, snd grent care will be required in its application especially to plants newly potted, in order
to keep the soil from becoming soodened and soured. When any plant is observed to be in that state, it should be shaken out, repotted in fresh soil, and more carefully watered for the future. But if this operation is to be of any service in any particular case, it must be periormed without delay, as roots are speedily injured and destroyed if allowed to remain in contact with unwholesome soil.

\section*{flower garden and plant housees.}

In conservatories and other show hnuses, Rhododendrons and Azaleas will now be in full bloom, and by judicious arrangement both borders and shelves may be
rendered extremely gay. If a few red and white coloured Azaleas in the shape of standards are intro duced among dwarf plants, either of the same or of other kinds, the general appearance of the house wil be greatly improved. Standard plants of Deutzia grathings of that description, will likewise be found useful for purposes of decoration, as will also forced Roses, the blossoms of the scarlet varieties of which are most bril liant. Highly dressed ground should be mown at least once \(a^{2}\) week after this period, for a well-kept lawn is always a pleasing object.
Annoils.-In the planting out of those which have been raised in frames, it must not for a moment be supposed that when they are placei in the ground they may take their chance. Choose if pos sible showery weather for the operation; it will save much trouble and disappointment. Dry and keen winds are seriously detrimental to plants of the description we now allude to; and the trouble of previously potting in small pots, and gradually hardening, will be amply repaid by their size and vigour during the summer ; for it will be apparent to every one, that the annual which can be placed where it is to flower, with a ball of soil and a mat of roots. will have great advantage over oue which has hardly a particle of earth attached to its fibres when planted.
Auricclas. - After these have done flowering they should receive all the air possible; they must also be kept clear of insents, and protected from heavy rains.
Camelinas.- Keep such as are making growth wel syringed. Should black-fly appear on the young shoots a good washing with tobacco water will soon destroy it
Carnations and Ptcoters.-If not already done these must now be staked in order to keep them from being broken by wind. Remove decaying foliage, if any, and water as often as may be necessary
Cingrartas.-Remove to a cool shady house such as are required for a late display. Weak liquid manure may be given liberally, say two or three times a week Look well to zeedlings, and place approved sorts apart from the more common kinds for seed
Dablias.- Let ground be put in order for these but do not plant out yet, more especially if the plant can be kept growing on without check. Repot, there fore, as often as the pots they occupy are filled with roots. Give them plenty of air so as to keep them hardy, as they should not be risked out of doors before the end of May.
Pelargonvins.-A slight shade will now be neces sary for a few hours on bright days; green fly is occasionally very injurious to them at this season, and therefore the plants should often be fumigated; tie and regulate the shoots according to previous instructions. Tulips. - Protect the best bed, if not already done with canvas. Stir the surface between the bulbs when it is in the best state for the operation, \(i\). e. between wet and dry.

\section*{FORCING GARDEN.}

Practess.-When the fruit is fairly stoned a sligh increase of temperature may be allowed, and water may be more liberally applied to the roots. The trees should also be well washed with the engine. Attend to train ing in the succession hotuse.
Pinss-Early potted suckers or young succession plants will soon have filled their pots with roots Where such is the case, give them a liberal stift When dry they had better be watered occasionally with weak liquid manure, i.e., after the plants shall have become sufficiently established to enable them to receive it with advantage.
Strawherries. - These will want abundance of water. They must not be allowed to flag by any
means, and if the weather proves warm and bright, they will succeed best in a compratively cool situation, where they will rarely be attacked by red spider, an evil to which plants forced late are liable.
Vines. - The fruit from pot Vines will now be cut, and in many places that upon permanent Vines will be ripe. Let it, therefore, be remembeted that a tolerable amount of dryness in the atmosphere is necessary, in
order to obtain good flavour. A free and wholesome circulation of air early in the morning and continued until evening, will be fonnd to increase both colour and
flavour. Be very flavour. Be very moderate in fire-hent until late Vines employed morning and evening until the flowers begin to open; after that it must be discontinued.
hardy fruit and kitceen garden
Thinning out and hoeing between progressing crope will now be the principal work in the vegetable depart. ment. As regards wall trees, disbudding, stopping, and
keeping down insects must receive attention keeping down insects must receive attention.
Broccolirs. - Where these are Broccolies. - Where these are turning in too
some of the plants may be removed before the hent ton far advanced, to a cool situation, so as to prolong the supply.
between the - Nows of growing plants should be well stirred up, and a little drawa to the stems of the plank COCUMBERS.-Stations should now be prepared for plants to be grown uuder hand-glasses.
Kidney Beans.-Sow for succession; a few may aleo be raised in pans to fill up vacancies.
Lettuces.- - Sow regularly for succession, and tie un cos varieties to enable them to heart
Radishes, - Keep sowing as often as may be thought necessary, both Turnip rooted and other kinds, and water
beds from which they are to lee drawn for use.

SATURDAY, MAY 6, 1865.
}
ybeting poa thb enscina wehe.
Wwownent, Xay iof Rosal Agri. \&oclety of Eagland-Noon.
The effects of manure upon a crop depend so much upon climate-upon the consequent interval between seed time and harrest-upon the consequent tendency to succulent and leafy or to hard woody growth-upon the opportunities afforded for a more or less easy solution and distribution through the soil-that the experience of one lccality is by no means necessarily an index or a guide to that of another. And when the localities are so far apart as the Lothians and the Southern counties, it is not at all certain that the results from various manures which the Scottish farmer obtains will follow the corresponding applications here.
Several members of the East Lothian Club have for several years carofuly prosecuted a number of comprative trials of various combinations of guano, superphosphate, bone dust, mulphate of ammonia, \&o., with and without farm-yard duag -ascertaining the results of each in the case of both grain crop and root orop ; and the annual comparison of the several trials, especially interesting to the farmers of the localities concerned, may be less usetul and instructive to Southern farmers. We are glad, nevertheless, to take the following particulars from the pablished report of the East Lothian meeting held two months ago, and espeoially from Mr.

Melvin's account of them, and of his own contribution to the general report.

The following are the results of three years trial on his farm at Ratho :-

\end{tabular}
Fer Imperial Acre.

It may be mentioned that the crop was WAUGH's Swedish Turnip, and that the field in which the experiments in 1864 were made had been in pasture for three years previous to 1861, in which year it was Oats followed by Beans in 1862, and Oats again in 1863. In other respects, as to soil, exposure, drainage, and condition, it was similar to the previous trial plots.

The following are the details of cultivation :Ploughed in November, 1863; erubbed 5 inches deep in the first week of May, 1864; again 7 inches on the 11th; harrowed smooth, drilled up into 27 -inch rows on the 13 th ; manure sown, dung applied, drills split. and seed sown on the 14th.

That which most strikes the Southern farmer on looking at these figures is the enormous quantities of the so-called "light" manures which the Lothian farmer uses. Nevertheless, the result of their application is declared to be profitable. Mr. Melvin values the Swedish Turnip as grown in his county at 10 s . a ton, which is a goorl deal more than it is worth as grown, for instance, in Berkshire or in Hampshire ; but it will be seen that in almost all the above instances the excess of Turnips due to artiticial manure was obtained at a lower cost than 10s. a ton. Indeed, as Mr Melvin states:-
"Of the importance of the application of light or hand manures, there can be but one opicion. Universal agricultural experience has settled that. The fact that 25 years ago a few hundred pounds would have paid for all these substances imported into Leith, whereas now it would require a quarter of a million to do so, is couclusive as to this. Mr. Harvey has estimated that 100,000 . is annually spent in your county on manures. Ou many farms, taking into account the manure maid and bought, this item equals the rent, and in certain cases exceeds it."
Mr. Melvin adds, -"In going over the experiments for the three years by Mr. Shirreff, Mr Smite, Mr. Rychardson, and myself, I find the following to be the results per imperial acrs:-

value deduct the cost of the manure from the
Whalue of the crop is perhaps the readiest way in
mating the value of Turnips at 10 s . per ton, we find that the following are the profits derived in each experiment:-

\section*{Resilets in Order of Profit}

6. \(3 \mathrm{cwt}. \mathrm{do}\).and 5 diesolved
5. \(3 \mathrm{cwt}\). do. and 5 bonemeal
3.
3. 21 nitrate of soda, 2 cwt. dissolved bones, and 2
\(\begin{array}{ll}\text { B. } 6 \text { cwt. Peruvian guano, } 2 \text { Bolivian } \\ \text { D. } 6 \text { cwt. do. } & \text { 2 B bones }\end{array}\)
C. 6 cwt.
do.
do.
2 B bones
. Sulphate of ammonia
A. 8 ewt. Peruvian guano
. Nitrate of soda and phosphates equal to 8 cw cw.

\section*{E. 12 tons dung and 4 Peruvian guano}

It will thus be seen that what they bring out is that 6 cwt . of Peruvian guano is the most profitable application in the Lothians; but the same resuit is also brought out with 3 cwt . of Peruvian and 5 owt. of Bolivian guano. It is clear from this, therefore, that natural guanos are more profitable than dissolved bones and the other substances named.

It is hardly likely that this would be found true here. There seems to be more need of ammoniacal manure in the North than in the South. We tind in the Southern counties that superphosphate is as effective for the Turnip crop as Peruvian guano.

HORSE RACING A MECHANICAL PROCESS.
Some subjects, it is said, require to be written the one half as an apology for the other half, and most probably our readers may feel disposed at first sight to conclude that the one we have chosen to discuss at this time belongs to the number. But be this as it may, we shall proceed as if the contrary were the case, on the ground that a horse is a machine, and locomotion a mechanical process. Doubtless, the horse is one of those domesticated animals upon whose merits a greater portion of the general public consider themselves qualified to pass an unhiassed judgment than upon any other. To determine the merits of beasts and sheep, on the contrary, belongs almost exclusively to the practical farmer. Very few of the manufacturing and commercial classes, or oven of landowners, will pass an unqualified opinion upon them. But the case is very different with the horso, for who is it that does not know the good from the bad? And the obvious reason of this is the simple fact that the horse is the obedient humble servant of all. Swiftness of progression is natural to the horse. Hardly has the foal got upon its legs than it begins to gallop, as if to prove the soundness of the proposition experimentally; and both in a domesticated and wild state the same normal characteristics are exemplified, not only in early life but throughout the whole period of his existence, so that there is more than a faint shadow of a reason for the old conclusion that his natural function is to carry the lord of creation (man) across the country at the gallop, either upon his back or in a carriage or chariot. In point of fact such was the practice of the early inhabitants of tho world, the horse being then almost exclusively employed for either the one or the other, or both these purposes as occasion required.

Mankind, however, have Luade many discoveries, and amongst others the application of the strength of the horse in hauling implements, \&c. Hence the existence of two methods of testing his utilitarian valuethe one by "a race," and the other by "a pull in a cart" or the like. In this paper we shall mostly confine our observations to the former, "horse racing" and some of its anomalies, from a mechanical point
of view.
Saddle horses, and those intended to run in harness, as in carriages, cabs, dog-carts, \&ce, have all to show drau mettie and movements in a race, and most draught horses, too. The plan is natural, and altbough some farmers who breed horses largely are opposed alongsid racing in a certain sense, yet when brought warket they are neighbour in going to or coming from hand in a "trotting match," as those who go the whip

The test as to which is the turf on the Derby \(D\) The test as to which is the best horse comes natinn as we have said, and therefore it cannot be halped, ? Walking, trotting, cantering mechanical processes differing very widely the from the others, and all who have any useful exper to las as fat animalo function is to walk, as farm horses, ought wot trotted or galloped; that those whose fusct. and that horses whose function is galloperi: seldom or never do well in harness. They are familiar with the fact that horses are subject to phye training, so as to excel in any of these several motive processes; but when we enter unan mechanical and physiological data upon which the facts are based, lack of information is cenem experienced -hence the opinions, prejudices, anomalies that arise about the improvement deterioration of breed, and so forth.
It is an established mechanical law that "speed cme only be gained at the expense of power"-other being equal ; and this law applies with equal force the mechinical consiruction of the horse as to that a any inanimate machine. Into the details of the nome mechanism of the horse we cannot enter, 2s the inquiry would do more than fill our limits as to Suffice it for the present occasion to say that the mechanism of a draught-horse, whose speed has hee physically trained to three miles an hour, is diffees from that of the carriage horse whose speed is then miles an hour; and that walking and trotting homa differ from the hunter and race horse, whose respectine speeds are, the former 20 miles an hour, and the later a mile per minute; and that these differences an recognisable by any tyro in animal meckanice, simply from the external anatomy and symmetry of tha hore. These degrees of speed the reader will readily percein are off-hand, even numbers intended rather to illo trate principle than actual plactice, save in a for exceptional examples to which they may apply.

Of the nature of the muscular power or contractio force of the muscles that actuate the levers or boan in walking, trotting, and galloping, comparatively little is known with that degree of certainty neceser to solve the physical question involved. So far asiti a purely mechanical process, it is subject to the estr blished laws of mechanics, every contraction an: elongation being attended with a certain amount tear and wear, so that the active muscles decrease power during the time of a journey. The amount a tear and wear in a given time is also as the velont or speed of the horse and quality of the musclethese and other "mechanical data involved are deter mined, but when we enter upon the chemico-physioi gical data, hardly anything couclusively can as yef b said that is worthy of credence. Authorities, it is tru talk of "irritability," of "electricity,"
action," of arterial action from the lungs, and so forth but when they have each and all told their respectin stories the reader is left about as enlightened as befor The probability is that there is some degree of truti in the most unlikely of them ; so that uutil discoverymare farther progress, the physical rationale mar b sidered a conjoint affair-an hypothesis which cient to exclude opinions and prejudices contrary the several branches of physical science thus invoi

The reader will perceive that these mechanical a chemico-physiological data support the views of th practical men who contend that the breder \&c, at Epsom, Ascot, \&c., are carryiug horse racia to an extreme injurious to the true type of the horse considered as the normal standard of his ra very sober share of common sense, to say all about animal mechanics and physiology, Turf th the the most enthusiastic moirited ani mile per minute is carrying the process of mile per minute is carrying the process training to acquire an increase of velocity
sacrifice of muscular power many degrees too it is, practically speaking, the experimental solutio the problem-how best eventually to conve locomotive symmetry of the blood horse into that hare, is borne out by the increasin weedy animals that everywhere abound. limit ought not to be set to physical training \({ }^{10}\) certain sense, that is to the greatest possible spe that can be attained for the express purpose 0 racecourse; but the objection does nut apply torse useful purpose to which the services of for iow required, and therefore it falls to the groun never intended that mau should minute! horseback at the rate of a mile per mitical refutativ:3 is perhaps a more conclusive practi a breedisurd theory of spead has never yot bet attained, the contrary beiug invariably result, which unquestionably proves of speed unnatural

The physical data thus taught by experience, है as gone, indicate (1) that the natural speed of to is sufficient for any useful purpose; (2) that to the speed beyond the natural nism or symmetry is sacrificed, togethe puwer, and cousequently durability
(3) that to inceral muscular poprer by
trinivg we also gain durability of act
speed, as in the case of the cray morse. It will, doubtless, be no easy matter to make these general conclume of our readers relative to the manageopinions horses, more especially as regards the im ment of horsen deterioration of breed, about which so provem has recently been said. But this suggeets the propriety of practical men reconciling their opinion and their differences by a closer acquaintance with the phrsical data in question, so as to be able to reace phys:cal changes in mechansmaduce them, and vice cersí to trace the effect produced by certain physical causes to ita ultimate result when change continues to go on by the unremit
In the controversy now being prosecuted relative to the deterioration of the breed of horses for saddle and carringe purposes, a common error fallen into is the attributing the deterioration of breed to breeding from inferior stock. This is manifest, for breeding from inferior stock is not the physical cause in question, the phyical cause being on the contrary that which matare of the fallacy; the very contrary of the dogma thus taught being true, the vis medicatrix organism to its original normal state. The deteriorating cause may be either the food, climate, or management, or two or more of these action
This fallacious dogma relative to the deterioration of breed is neither less nor more than a futile attempt to father our own misconduct on to the shoulders of this? Certainly not; and the following apposite case es negative proof will further illustrate its objectionable character. Thus, if for the sale of argument we assume that the opirionative dogma is true, then the ration as a matter of necessity must continue to go on until it has attained the minimum limit in this retro grade direction. But the contrary of this hypothesis is true, for the best blood horses obtained from the original stock, so that by breeding from them (a deteriorated stock), we have greatly improved the physical means, the blood horse may be advanced much nearer to his original standard of excellence than has yet been attained
Another error is to attribute to exercise in physical training what does not belong to it. Although exercise, for example, is essentially necessary to the growth o
bone, nerve, and a healthy normai state of the fluids as well as to the brawny development of muscle, it nevertheless follows that unless this exercise is natural, and the food, climate, and other conditions are also natural, the very reverse of physical training, and the normal development of parts will be the inevitable
result. In point of fact, the physical effect produced by exercise is the tear and wear of the several parts thus exercised as already shown. It is the greater thatulus or counter action that follows natural exercise that produces the extra development of parts, which

\section*{question.}

The only other error that we can individualise at reference to fallacious opinions as to the best food for horses. Thus, one thinks this mixture, another requirements of are equally far from the natural again, are agreed, and give consequently each idenfically the same kind of dietary, although the of diet are reryer conditions We have here aiference of erroneous practices, and it were difficult to say Which is farthest from the physiological requirements deteriorate breed.
If breeders would learn to distinguish between chemical and mechanical processes and causes, they be able to fail to discover their errors, and thereby physical data exemplified in the facts of the case. the arterial blood from the heart and the capillaries, and excreting fring the venous blood therefrom, also of returned into the system refuse matter unfit to be mechanical processes circulation. So far the four produced by their individual and joint action is a exercised. Hant of tear and wear upon the parts that follow, in which Nature, to fortify varts for a similar amount of exercise, makes the parts stronger.
It is the arterial processen arterial blood that supplies these chemical and these fresh materials for the reparatory work, is deficient of nood consumed. If the latter, the food, the parts subjectitive element, the deterioration of place. If the food is deficient of certain elements in portion of others, but contains an extra proof parts will also become abnormal ; and development be produced if the food and blood are natural, but
the exercise unnatural, as. When a race horse is forced his normal speed. To supply the blood with the his normal speed. To supply the blood with th extra tear and wear from rece-course velocities would render it abnormal, and thereby produce disease hence the apparent limit in this direction. At the same time, it is manifest that the blood does undergo breeds of horses. Thus, although in our present state of chemico physiological knowledge, we canno tell the difference between the blood of a thorough Clydesdale, yet there is manifestly a, difference, and that this difference has assumed a normal trpe capable of being transmitted to posterity in the latter cases of draught horses as in the former, the blood horse, is a although no progress is being made towards a higher velocity than that possessed by blood horses originally, even that must be left an open question, because we do not know what the normal speed of the blood horse s. The more useful and utilitarian problems, therefore, relate to the organisms best adapted for
walking and trotting, and also for galloping as walking and trotting, and also for galloping as
refuired by hunters and cavalry horses. That our present practices of breeding and physical training of farm, carriage, cavalry, and saddle horses are each subject to improvement is a proposition to self-evident to require a proof, In the case of the
blood horse, instead of sacrificing symmerry and durability of action to gain a few minutes extreme speed, let us endeavour to cultivate the natural speed by natural means, and the result will uuquestionably bo
a complete success. In the other examples of heavy a complete success In the other examples of heavy
draught horses, farm horses, carriage horses, cavalry horses, hunters, and saddle horses, there are three methods of improvement open to practice. First, to increase mechanical and muscular power and dirability by physical training at a sacrifice of speed. This applies to blood horses and other breeds of high speed. Second; the next is the common practice
of crossing breeds to gain either speed or mascular of crossing breeds to gain tither speed or muscular
power at a sacrifice of muscular power or speed as the case may be. And the third method is to work up our heavy farm-horses of various breeds to their origival type of a higher speed at a sacrifice of weight and mechanical power as to leverage, but with a gain
breeding and management of siwine.
by following is abridged from the valuahle paper lately read
by the Newcastle Farmers' Club
Is laying in a stock of pioss, little outlay is required they multiply very rapidly, are easily reared, and easily fattened, and if el ways be found at any of the large manufacturing towns, whither they may be sent by railway in a short space of time, and at a very
trifling cost; and if consigned to a respectable cattle salesman they are certain to be sold at market value, and the money remitted by the uext post.

I think few people who are in the habit of frequent ing the manufactaring districts will have failed to observe the great increase in the number of the pork shops which have sprung ap on every hand, when besides
these, almost every grocer, butcher, and provision these, almost every grocer, butcher, and provision
dealer drives a brisk trade in the ham and bacon line, and the general complaint among the pork butchers is, that they are badly supplied both as regards quantity and quality. These pork shops are a great boon to the labouring classes. Here they can at all times purchase in any quantity, from a flitch to an offal or penny slice of pork or bacon, according to their wants or means of supplying them; and they very much prefer the homefed and home-cured, if they get less of it for their money. During the spring of 1863 , when the provision markets were glutted with Anerican products, clean American sides of the best Cumberland cut, or the C.C. brand, as it is called, could be bought in Liverpool at 35 s. per cwt, and inferior brands at under 30s. per cwt., when at the same time our howe-feds found a ready sale at 56 s. per cwt. by the carcase.
The market value of a lot of fat pigs may be ascer. tained by weigning them alive separately, in the same way as sheep are weighed, and is easily done by placing them in a crate, and deducting the tare of the crate from the gross weight, when they will give from 75 to 76 per cent. of their live weight, according to fatness, and if very fat, with small bone and offal, they will give 80 to 82 per cent., while some of the small wreeds, when excessively fat, or what has been called "superlative specimens of obesity," will give over 90 per cent. of their live weight.

And I tell you that our cottagers, who have all their pig food to buy in from the miller and shopkeeper, do not consider that their pigs have done well, if with present prices they are not worth 107. eacb, at 10 months old. Many of them far exceed this, of which numerous instances might be given, but I shall confine myself to giving you one of them only, which, having occurred lately, is the la.t that has engaged my attention, and for the truth of which I can vouch.

A neighbour of mine, who is a small dairy farmer, killed his pig on the 2d Febraary last, it being exactly 49 weeks and two days old at the time, and it weighed

491 lb ., or 35 stones 8 lb ., and was worth, at market price, over 13\% at a little over 11 months old; but it had had a good deal of skim milk during the summer, and
had done well. And aithough I do not hold out hopes
and that every lot of pigs will average anything like that weigit, still it shows that with proper care and uttention pigs are capable of making a good deal of money in a short space of time, which is a matter of no suall importance at all times, and from which I think we may reasonably conelude that there is a fair prospect of pigs paying their way if kept on a more extended scale than has hitherto been adopted in the large corngrowing districts, which. if true, the next question that suggests itself fur our consideration will be.
1. Which are the best and most profitable breeds to

Iu selecting pigs for breoding purposes, wo profer such an
possess good size, combined mith activitwo nind a general
robutness of

2. Having expressed my opinion as to the principles whicls should direct us in the selection of pigs for breeding purposes, I will now proceed to make a few
zemarks on their after-management, and, in doing so, shall confine myself to a simple statement of our ever day practice, with some of the reasons which induced us to adont an. 1 continue it.
 may get strong enough to stind the winter; and if the young
sows bred in March have been liberally ferd, and allower plenty of exercise during the summer, they will be quite ready to take the boar in November, and bring their first litter at twelvemence or increase a stock of breeding pigs, and should not indorse the clam to eariy maturity in any breed of pigs, if they
were not unfit to rear a 1 terer of Ynung at 12 months old, If
young sows are allowed to run until they are 12 or 15 months young sows are allowed to run \(\begin{aligned} & \text { old before they are put to breeding, they are very apt tn miss } \\ & \text { their }\end{aligned}\) their. Way althgether, and we the, when gnung, and are kept regularly breeding, consequently we do not disappoint them butallow them to hring two litters a year. After their first
litter we keep them sparngly, except when suckling. Wher
they have weaned their spring litter, and bave taken the boar they have weaued their spring litter, and bave taken tho boar
agaiu, they are turned into a Grass field, in which there is a
large shed, with rails across the dow enfering. In this shed they sleep at night, or retire in raing

3. We usually let them remain on that diet until they want abous a week of farrowing, when they are taken to the breeding house, which, with your permission, will endearour to descabe by giving the dimensions
and partumats of one we have had in use for several and partaculars of one we have had in use for several
years, and have had every reasun to be satistied with it.
The lirceding house is 10 feet square, the floor is flagged,

4. Having lescrited the breeding honse and the boar house, it is wot my intention to enter further into the abject of pigceries, for provided they hare a dry, well has a south or a northern aspect, althouith, of course, we should prefer the former for choice; but as that is mostly required for other purposes, for which it is o?
more importance, we williugly cunc it, and proceed to describe.
The treatment of sots at fumbsing, and ciuring the time

Progress of English Agriculture.-I think you are unwittingly? doing harm to British agriculture by unwittingly? doing harm." No doubt we have many "patting it on the back.
brilliant instances of agricultural progress, but the painful fact remains that with about \(60,000,000\) ot available acres, landlord's measure, we are unable to available acres, \(30,00,000\) of population, and have probably
feed to, depend for the balance upon some \(20,000,003\) more of foreign acres, so that with our present general system of farming, it reçuires nearly 3 acres to feed each individual of the population, or the gross produce may be taken at about \(3 l\). to \(3 l\). \(12 s\). per acre This humiliating fact is discreditable to us as a nation, for I know that if as much food were produced annually hs on my farm (ard it is below the average of the kingdom in natural quality) our population could not cousume more than one-half of it. We ought, therefore, to feel indebted to Baron Liebig, or any one else who recommends a higher system of farming, and a greater use and economy of manure. There is really an enormous scope for agricultural progress, dependent quite as much upon the landowner as upon the tenant. In the mere management and shelter and feeding of our live stock, the system might be vastly improved as well as in a hundred other"ways, which I need not here reiterate, but which must be obvious to every close observer of our general agricultiral practice. I shall always look upon Baron Liebig not only as gigantic in mental power, but as one of the reatest of benefactors to mankind. J. J. Mechi, May 3 . P.S. I do hope that agriculturists will give up their absurd objection to statistical returns, so that we may really know our exact agricultural position and condition. Agricultural Education, Lincolnshire.-Some of the most successful men I am acquainted with have had but very little schooling, merely that of being able to read and write-not but that they were very intelligent and observing men in all matters of business, some of them men employing a very large amount of capital, but keeping no accounts, the only book they looked' to
beinc the banker's passbook. Our business being being the banker's passbook. Our business being mostly ready-money transactions, a knowledge We have no public sel in this district; the generality of the boys are sent to private academies, where nothing having a particular application to our business is taught. In the adjoining counties of Northampton and Rutland there are large schools at Ouncle, Oakham, and Uppingham, but from what I have kuown of boys educated there I do not consider they are better fitted for farmers than those who have heen in much humbler establishments. Farmers as a rule are the sons of farmers, and almost universally outain their instruction at home. In the cultivating of the soil they can get a great, deal of their knowledge from the operations of others, as well as from what they see at home, but in the more important part-the management of stock and the marketing the same-it depends very much more on those they are placed with. We are, I fear, too ant to take credit we are an improvement upon the past generation. Generally, I believe, there is more intelligence, a taste for reading and general information, which was not common to past times, but we have so many advantages compared with them it is only reasonable to expect it. Within my own time, say 30 years, there has been a ery marked improvement in the cultivation of the soil and the management of live stock, the application of artificial manure, the use of improved imple ments, all going to prove that as a class we are pro ressing in linowledge. Many who condemn us as slow in adopting what they term improvements, are apt to forget it generally requires a year or more to test what they consider so very evident. As to the education of youths intending to be tenant farmers, I don't see any reason for a specidl course of instruction, with the exception of a practical knowledge of surveying and eterinary, especiully the latter; the being able to are so very essential to a farmer who may be located many miles from a good practitioner. A taste for and knowledge of live stock is, I think, the most difficult part of our business ; if with this knowledge the young armer acquires the tact of being a good market man will have learnt his business thoroughly. \(X\).
Malt and Beer.-Uaing any substance which it is even fancied may chock the natural, God-appointed wearing out of our tissues, cannot be wise. God orders them all, in due time, to waste and be thrown out of our bodies, their place being supplied by new tissues. by God to renew these tissues, and form it into anb stance that he thinks will prevent such arrangements being carried out! I decline going into the merits or I do not use tea, but are quite foreign to the subject the more oumions but I will have nothing to do with
by every man of science, to show the entreating and receiving food from God, whity instantly and utterly worse than withhold from wich and others by destroying it, and thus invite the pelr, as Solomon did, to curse us. J. Mackenzie the peop Solomon did, to curse us. J. Mackenzic, M.D. Loss of Sheep from eating the Leaves of the Rhods
dendron.-An instance has lately come under the tion of the writer in which a number of sheep, betres 20 and 30 , were destroyed by eating the leaves of th above plant under the followisg circumstances. hundred Hampshire and cross-bred tegs had had some time the range of a large park in South Hamp shire; which, however, during the late severe weather was completely bare of feed. They were, however doing extremely well on dry food, consisting of com cake and chaff with a supply of hay, and they ba access to a pond of water. In the same field, durin: the last ten days, there were also twenty ewes which con sorted pretty much together. On the shepherd a fer weeks since visiting the sheep soon after daylight, be found several amiss, standiug apart, staggering abow: and coughing frequently, anu apparently attemptio to vomit. These last symotoms increased rapidly anc soon extended to other sheep. After a time they won: fall forwards, and in a few hours several died, 20. others were kilied to prevent this result. A part-mortem examination revealed a quantity of the leaves of ib plant in the inner or first stomach, partially masticated in all the affected sheep, and some portion in the gulle: There was no appearance of ulceration or of any violent. inflammation such as a mineral poison would produce, but there was considerable injection of the vesselso the gullet and larynx, and this appearance of ecchymosi was perceived in various parts of the body and slightls in the brain. The sheep had access to a large Rholo dendron plant near the mansion, the leaves of whic they had eaten rather extensively. And althongh is very strange that such should be the case, yet if We consider the remarkable bareness of the pasture, we can understand in some measure why they shosld have rushed promiscuously at anything green, when 3: another time they would not have done so, or if the had previously cropped a few leaves, probably fnot to such an extent as to be hurtful. The ewes, older and perhaps wiser, were not affected, which proved thas the injury did not arise from the dry food, as they he access to the same troughs. Many of the tegs wen drenched with Linseed oil and recovered. W. C.

High Parming roithout Manure: Six Lectures on Agriculture, delivered at the Experimental Rarm at Vincennes. Pp. 112. By M. George Ville. W. Oliver, 3, Amen Corner, Paternoster Row.
It is quite true that we have in this little volume six lectures delivered at Vincennes by the Professor of Vegetable Physiology at the Museum of Natural History, Paris-but it is very far from true that chese lectures describe a system of High Farming without Manure. That is, we presume, the mere catch title of the volume, adopted by Mr. C. Martel, the translator. The principle on which M. Ville proceeds, apparently, is to fertilise the soil to begin with, and thereafter to apply to successive crops only the special fertiliser required by each, and this, we are informed, he has ascertained by ten years' experiments to be nitrogen for cereais, potash for leguminous plants, and phosphates for roots. But all this has been long known here; and his plan is just that which is adopted by all good farmers. They,
too, try to leep the land in good heart; first, and too, try to keep the land in good heart ; first, and
chiefly, by economical management of the dungheap, and thereafter by applying nitrogen, as in guano, ammonia salts, nutrate of soda, \&c., to Wheat, and phosphates, as in superphosphate of lime, bone dust, \&c., to roots. The fifth lecture of the series is an interesting account of the several ingredients of a general manure and their natural sources-as of nitrogen in the air, in cubic nitre, in coal, and in sewage-of phosphoric acid in chalk, bones, so called nodules (a word which is used as if it was either the trade or scientific uame for the contents of the phosphatic beds below the chalk)also in coprolites and guano-of potash in sea water, in the waste of common salt, in felspars, \&c.

Uf the concluding chapter the following is the published analysis :
"Comparison of the new system with past traditions and practice- -The dunghill the manure par excellence-Analysis of essential fortilising agents: phosphoric actd, lime, potaspa, and
 between the quantitios supplied by the manure and that
carried away in the crops.- Kesults of the triennial rotation of carried -Resulty of the 日ve years efstem.-M Mean annual return
of the two systens.- Results of various cultivations.- Beat-ront-Colza-Advantages of the new system; ; maintains the fertility of the soil unimpaired, whatever crops are contiminusly
grown, without rotation. - Comparison of the quantities of the grown, without rotation.- Comparison or fhe quantities of the cultivation, compared with those of the new system.- Law which regulates the new system, which throws down the
the reaulte of ite edophtion in Franee - Cosclumion.- Resulte of the harcest of 1864, on the new syetem.
The four principal agents in a complete manure are phosphoric acid, lime, putash, and nitrogenous matters And the following passage describes the new agricultural system as M. Ville declares it to be:-
"Although the presence of the four agents of fertility
alt in the soil is decs parious cultivations are not the same the exigencies of vie quities of each of these agentswith regard to the quamities or its leading one.
" Thus, nitrogenous matter is the dominant agent for Wheat and Beetroots, potash for vegetables, phosphate of lime for roots, sce.
"Suppose we undertake the cultivation of a pieee of poor land. We begin by giving it the complete manure poor ader to create a sufficient provision of the four agent of fertility. We reise one or two crope of cereals upon this manure: then we continue the culture by giving to the soil, each year, the dominant element of the crop we propose to raiso.
"If we adopt a rotation of four years with such crops that, at the end, [the land] has received the four agents, we can continue thus indefinitely without ever requiring the complete manure. The same svitem is applicable o a fertile soil; only we may dispense with the first dose of complete manure, and commence imusediately by the dominant element of the first crop we desire to I
"If, on the contrary, it be desired to continue the same crop iudefiaitely, we content ourselves gencrally with the employment of its dominant ; but taking carc to resume the application of the complete manure, mmediatelg that a slight reduction in the weight of the erop points out the necessity for so doing.

By these simple combinations we are in possession of a new agricu'ture, immeasurably more powerful than its predecessor."
We are at a loss to know in what respect this is a new agriculture, or different from the aystem already in full practice here.

\section*{Farm Memoranda.}

West Buekland, South Molton.- The following is the report of the Rev. J. L. Brereton on Stocking Land in the Agricultural Society's Journal.
My glebe consists of about 30 acres of Grass land, which used to let at a rent of 55l. I bave farmed it for some years in connection with various parcels of and which I hare temporarily rented in the neighbourhood. The generai result has been that from keeping an extra quantity of stock, and particularly from folding sheep with corn upon my Grass, its value has been considerably increased. It would be perhaps a fair account of previous improvement to value its gross rent for the present year at about \(3 l\). per acre or 1002. In order to make myself as free as possible of tillage farming, I have for some time used sea-sand instead of straw as bedding for cattle. I have also nsed a compound meal (the ingredients of which subjoin*) as the principal accessory to the Grass and hay. The Turnips I bave purchased were all used for the sheep; none for the bullocks and horses. The Oat and straw bought were for the "stables. My practice has been to charge the whole cost (including labour) of the stables to the farm, and to credit the farm with 12s. per week for every horse used for riding or carriage. In order to increase my hay crop, I hired some other Grass land, the rent for which is included in the charge for fodder.

I am aware that the above statement is open to many challenges; but being an accurate account of transactions recorded and classified for my own satisfaction, and not for publication, it may perhaps be the most, suggestive form in which to put before your readers the gross result of farming on the principle of purchasing corn, \&e., to feed stock. I will add a few explanations in anticipation of some of the queries that may be raised. [These must be given next week.

\section*{Calendar of Operationg.}

Mar.--Arable Farm.-Wheats, if "proud," may be mown, taking care not to cut too low. Weed and hoe Wheat, Oat, and Barley fields.
Beans may require horse-hoeing and hand-hoeing this month. The ridge-plough or double-winged share with two mould-boards, may be safely worked between the rows, at the close of the hoeings. This operation slightly hills up the rowg on each aide; great care being taken to prevent much mould attaching to the stalks, as it causes them to decay. Although a few plants are broken down at the ends in turning, the earth so strengthens the crop, and the whole summer cuitivation is of such great benefit, that thin mey be reckoned an exceedingly profitable mode of growing Beans-especially favourable to the development and
setting" of a great quantity of pods.
atter being dil need horse or hand-hoeing in May, the latter being done with a heavy hacker, and coating 6.s. to 8s. per acre, and in an carly season they may be earthed up towards the end of the month. This is done with the double-mouldboard plough in horge husbandry, and if by hand with o broad hoe costi about 4s. per acre.

Carrots should be hoed during this month towards the end of it, between the rows; horse-hoc: where the ridge cultivation is adopted, and hand-hoest flat.
Mangel Wurzel should also be horse-hoed tow the end of May, and the ridges should then he clean with the hand-hoe, children following the and singling out the bunches. In doing this thet the best plant in the bunch, and saving it with the : kand, they tear all the rest away at a stroke with hat
right. Blanks may be filled with these plants ight. Blanks may be filled with these plants.
Turnip Culture.-Swelish Turnips should be ga during the early part of the month in Scotland, and in South England during the latter part of it, and : June. The land, after the cultivation already receire may be reduced to a sufficient tilth, and will probait? be sufficiently cleaned by once using the cultivator scarifier, which is to be followed by the harrows, and then by women to gather weeds, pick stones, \&c. Ti land is then to be ridged up in drills, about 26 inch wide; the dungcart passes up every third furrow the man behind it pulling out the manure as the hore proceeds, so that the load shall be cmptied in a learta of from about 50 to 100 yards, according as the quis tity to be applied is from 40 to 20 loads per acre. Tue filling of the manure may be let by contract; it may be let at \(\frac{3}{4} d\). per cubic yard. The manure thus deivered is divided, by a man who follows, amongst the three drills to which it belongs, and the share of each spread evenly by three women or boys following th man. If no guano, or especially superphosphate lime, has been mixed with the dung in the heap, nos is the time to apply it broadcast over the field, 80 than on the splitting of the drill it may be covered with the manure, and at the same time mingled with the earth which is to act as seed bed. In some cases bone: and artificial manures are all that the Turnip crop receives; in this case the drills may be opened a before, the manure sown by hand along the furroms and mingled with the soil by a horse-hoe following the sower. In either case it will be understood teat : order to avoid the loss of moisture, \&c., both from i.e soil and the manure, the ploughs which are at worn in the field, after opening up about 12 drills on whicis the dungeart or manuresower is at work, keep working roun and round the parties thus engaged, opening furross on the one side for receiving the manure, and clows them on the other side, thus covering their contents The sowing machine is immediately to follow all, som. ing from two or three pounds per acre in the North, where fly is hardly known, to as much as five pounes per acre where the crop has to run this risk, and whert we must sow enough and to spare. The only sale emedies for this scourge to trust to, are a good and rich cultivation and abundant seeding, which all tend to force the joung plant rapidly throngh the seison is ts darger. It is well to have 12 or 14 drills ready fict the sowing machine on the evening before you cow. mence sowing, that there be no loss of time in tal morning. When the seed is sown, it is advisable, it wi weather be dry, to pass a light roller over the groum 0 as to complete the process by keeping out tio drought; but when the ground is damp enough, of in threatening weather, this should not be done. A pies of common Turnips may also be sown this monib. ser an early root crop for consumption in Septenten Land that has been broken out of old pasture, wim received its first shallow ploughing in April, should cross-ploughed now, and may be again worked min rubber, harrows, and roller, until in sufficiently ilth for Turnips. It is advisable to plougle shallo boic the first furrow, and cross-plough deep afterwards, bote because the operation of reducing to tith he thus piecemeal, a few inches at a curface are o ashes which were spre land. Let the surface of pen book represent that on which the ashas we pread; the act of shutting it, which represents irst ploughing, buries them half the book's depth fro the new surface; and it will be seen that the curning the book over, which illustrates ploughing at double the depth 'of the first, he ashes at half the books depti from the exposed to the air. No doubt the ashes do uot any such definite position as this illustration -they are scattered through the whole signify-they are scattered througs than being of the land, but this is much better than beid be if below the whole depth of it, as they would begin with were turned under by a deep ploughing to bou this ani Crosakill's cl
month and Vetches durit
Rye, all through this month, and fattle, sheer part of it, will have been supplying cath bears thee and horses with food. The land which. In this ant crops is to be ploughed as soon as cleared. immediate all other similar cases, the roller follow the plough, to keep all the moist
Cabbages may now be drawn from the seed hee and transplanted in the fields, the lant having deep orepared, as for any other green crop, by deep planimi clean cultivation, and plentiful manuring Cabbager is best done in wet weather Orumhead C'abbage sellom requires 27 by 24 inches: on very rich or hight the distance between the rows maich three feet; and on stifif clays, whit, pulversation, as mual as coltivation during

Lucerme will furnish a suconsion of cuttings through the rummer.
Flas is to be carefully hand-weeded by women and children, who go on the land on their knees, facing ibe wind
Fences.-Holly may still be planted, if not all done Fences. - The roots should be puddled, and well witered. Keep all newly planted hedges clear from weeds.
Buclucheat.-One bushel of seed per acre should be fown in rows 13 inches apart, in the middle of this menth, on any light soil ploughed early in spring, and arifier and harrows.
Chicory.-Eaving well worked the land where it is cended to cultivate Chicony for its roots, and redueed it to a very fine mould, the seed may be drilled (\$ or 4 lb . per acre) in rows 9 to 12 inches apart.
Hemp.- Barly in this month, about two bushels of bright heavy seed should be sown on the land prepared for it-in rows about 80 inches apart.
Hope-The ground during this month ought either to be "becked" or dug a second time. About the nooond teak the bines, or young shoots, will be long cnough to tie to the poles. This work is performed by momen. Three bines are lesualy tied to cach pole with bina, two instead of three will be preferable.

Tiptras Hall Fark: May 1, 1865.-Crops: Whent, 19 acres; Derley, 114; Osta, 14t; Beame, 17\%; Peas to pick for market, 8 ; Red Clover, 13z; Italian RyeTrum, 12; Pasture, 15; Mangel, \(16 \frac{3}{2}\); Cabbagen, \(1 \frac{3}{4}\). Tares, 6 ; ready for Sivedes, \(1 \frac{1}{2}\). All the crops look moot promising, and a full piant. The Wheats have all Beans have been barrowed with heavy iron harrows, and are now being horse-boed. The Mangels were put and are now being horse-boed. The Mangels were put rock forward. The stock are doing well. We have 180 sheep and lambs and 52 head of calve and year. liagn The fat bullocks have been all mold. We have sold nome lambs to the butcher at 40 s. each. Our lambs have done well. During the severe weather ihey were properly sheltered. The ewes after lambing kept in the barn for some duys with their lambs. We have abundance of last year's Mangel, and have sold 20 tons to our neighbours at 18s. per ton; also sold a Clover stack for 902 ., not requiring it for our own use. This was the first cut off 9 acres. The root land was all heavily manured and trench ploughed before winter. The Bean land also well manured and ploughed before winter. The peck an acre of Wheat did not this yeal plant well, but it is now branching. Most of my Wheat at 1 bushel to 5 pecks per acre looks very thick, some too thick. J. J. Mechi.

Gloucestersinire.-The weather has been dry, the wind blowing mostly from the north and east. Yesterday, hnwever, it changed to the west, and with this change the atmosphere has become milder, and some sligint showers have fallen, but as yet there are no indications of much rain. Stock generally presents a very poor appearance, showing most palpably the effects of a night to three weeks since the mutton and beef sold might to three weeks since the mutton and beef sold Yow, howerer, the scarcity seems to be again felt, ard at Cirencester on Monday we scarcely ever kuew fat stock realise such high prices. Mutton sold at from \(9 d\), to \(10 d\). per 1 b ., and beef fetched relatively as much money. The Wheat plant has suffered much from what tre auppose the alterations of temperature during the months of March and the early part of April. But the beginning of March have become so thin as to be replauted. These remarks apply to a considerable percentage of the plaut. It is not the wireworm, neither heaved out what the Wheat plant suffers from-being heaved out of the ground by the land being frozen and hen thawed, so as to throw the roots of the plant above ground, but this season the plant seems killed in the ground. Spring corn planting has been done promising than usual success, and is looking very promising. Mangel Wurzel is being planted more seems fory than in many seasons, and all field-work baek by the cord. Fruit is blossoming well. Being kept arzue in cold easterly winds until this time, many hecause favour of there being an abundant crop, time by revere weather will not be cut off after this appointed there weather. Farmers are greatly dis have given them. Gladstone should in his Budget not the malt them any relief in regard to the repeal of articles of consumpty, however, one of the principal taxed to nearly its value.

\section*{Miscellaneous.}

Mesors. Sutton's Seeds.- A silver medal has been to Med by the Weatern Province Agricultural Society of Pans. Nutton and Sons, the well-known seedsmen, sent by them in Merkshire, for the colleation of seeds Exhibition. The Society, and exhibited at the Paar Conomic museum, and, with the aid of the Colonial
Botaniat as expounder, whe farmers, meeting cither at
the Society's rooms or at stated pleces in come of our country towns, may learn from actual observation the relative merits of all, and turn the knowledge thus Nained to good account. Prom the Cape and Natal News.

\section*{Notices to Correspondents.}

\section*{Canada Farming: h. G. Next week; mauy thank} Catte Condiments: Fecder. Mr. Lawes experiment was
described thus by himself: "The questiou is, how much
food does it take to poduce 100 ins ind described does it take to produce 100 ibs. inerease of flesh in an
animal? I found that, without Thorley's food, it required 274 lbs . of Clover chaff, 135 lhout Thorley's food, it required
of Swapeed cake, and 3524 lbs . of Swedes: and with Thorley's food, 285 lbs . of Clover chaff,
107 lbs , of Linseed cake, 3950 lbs ,
 Thorley's food; the one being 4236 lbe . without Thorley's
food, and the other 4409 lbs . With Thorley's food. That is to say, 200 Ibs. more with the condiment. The sheep bave not to give a tolerable idea of what will be the result. Taking a gross amount of food to produce an increan of 100 lh . o meat, I had it amount to 4536 lbs . Without Thorlay's food,
and 4676 lbs . with that food. The difference, you percaive, and 4576 lbs , with that food. The difforence, you percaive, of food is required to give the same increase of flesha when Thorley's foud is added. And this is the result which science
would predict. There is nothing in science to predicate that an articlo whioh hers groat tunic and stimulating properties is likely to inerease the assimiastinn of fond. You may make If, therefore, yuu regard these things as food for animals which are in good health, they are not to be recommendod
at all. Call them medicinem, f you like. I have no doubt they have considerable modicinal properties, and do enable animals to digest thejr food where otherwise they would not Cements
Ements:
: J Thomson. Lime and egg cement is frequently egg, dusting on some lime from a plece of muslin, and slack some freshly-burned lime A mush better mode is to siack some freshly-burned lime with a small quantity of powder, if excess of water has not been added. The white of egg used should be intimately and thoroughly mixed by
beating, with an equal bulk of water, and the slacked lime beating, with an equal bulk of water, and the slacked lime sdded to the mixture, so as to form a thin paste, which
sbould be used speedily, as it soon sets. This is a valuable cement, possessed of great strength, and capable of withstanding boiling water. Cements made with lime and blond, scraped chease, or curd, moy be regarded as inferior varieties of it. Cracked vessels of earthenware and glass may often be usefully, though not ornamentally, repairee by white lead
spread on strips of calico, and secured with bands of spread on strips of calico, and secured with bands of twine.
But, in pint of strength, all ordinary cements yield the palm to Jeffrey's Patent Marine Glue, a compound of Indiapubber, shell-lac, ard coa'-tar naphth3. Small quautities can be purchased at most of the tool warehouses, at cheaper rates than it can be made. When ayplied to china and glass, the substances should be cautiously made hot enough
to melt the glue, which should be then rubbed on the edges, to melt the glue, which should be then rubbed on the edges,
so as to become fluid, and the parts brought into contact ko as to become fluld, and the parts brought into contact
immediately. When well applied to the stem of a common tobacco-pipe it will break at any other part, in preference to the junction. The colour of the glue prevents its being used for china.
Great Cheese: Su neisets The following are the particulars -The inlabitants of West Pennard, a village near Glastonbury, Somerset, in order to evidence their loyalty, resolved in the parish, and, when ripe, should be presented to the Queen. In order to carry out this resolution, an immense Qat was construeted with the royal arms, and many other rich embellishments carved upon it. On the annivorsary of the Queen's coronation, about 50 of the wives and daughters of the subscribers assembled at the house of Mr. G. Nash,
with one meal's milk from 737 cows which were kept in the with one meals milk from to upwards of 20 hogsheads, and
parish. This amounted to occupied the contributors from morning to night to turn into curd. When finished it meqsured 9 feet in circum ference, 3 fect 1 inch in diameter, and I foot 10 inches deep. It was presenced to the Queer at Bucking Falace, February 19, 1841.
ORSES versus STEAM: \(X\). A team of horses, such as we have
in England for clay-land tillage, will weigh, with men and in England for clay-land tillage, will weigh, with men and
plough, at least two tons, and over every 10 inch width, from end to end of every field, this 40 cwt. must tramp or slide in the effort to lift and loosen (1) each 10 -inch atrip of earth. course a hardened floor is formed. What a contrast to the operation of Fowler's 4 -furrow plough resting on two large
wheels, and woighing altogether sonc 27 cwt., drawn once to every 40 inches width, by which a deeper and mor thorough ploughing is effected. In the former case every operation created the need of annther. The horses and the tool together hardened a floor, below which water could not penetrate; or if engaged in harrowing, they hardened the earth they were attompting to reduce to tilth, and so made another operation needed.
Ife of Seeds: Cor. In connection with the table of Seeds per lb., given some time ago in these columns, we now quote of samples. The following is a portion of their last report. In a table, which shows the results of the experiments made with Clover seeds, it is seen that

\section*{The Gardeness Chtomite.}

SATURDAY, MAY 13, 1855.

When inviting attention at p. 315 to Mr . Bell's lecture on Window Gardening, we purposely omitted to refer to a point of some importance in reference to Tows Gardens generally, with the view of returning to it at an early opportunity. The point in question is the advantage of elevation in the cultivation of plants in town gardens-not the kind of elevation we so commonly see in our mismanaged public squares, where a hedge or a groun of shrubs is set to starve on the top of a barren ridge or hillock, but a lifting up as it were of the surface of the garden to the influences of air and sunshine, without cutting off the supplies of moisture, as must too commonly happen in the cases to which we refer. Lat Mr. BrLL say what his experience has been :-"I mentioned elevation as favourable to the growth of flowers and plants in public places in cities, and I will now offer a few remarks as to the same situations in smaller areas as regards domestic gardening. Window gardening is most valuable, evidently, where there is no other space for the purpose, and as affording to almost every one who has a window the opportunity of horticulture on a limited scale. But in many localities, even without going far into the suburbs, there are small garden plots attached to the houses, and in alluding to them as part of my subject, I cannot do better than follow Miss Maling's observations, in which mention is made of the great advantage which arose in her experience from giviug elevation to the situation of the plants.
"I have already mentioned what occurred in the Horticultural Gardens from an elevation of only 4 feet, and I found the same advantage in my own, which is contracted and hedged round with walls and lime trees. Here, also, I placed an iron receptacle the same height against the wall on one side, in which I found Mignonette grow much more freely than in the borders near, and a Genists especially increased five-fold in the course of the season, during which it flowered continuousily. This led me to the idea of a general raising of all the beds of a small contracted
garden, so as to afford them a freer circulation of air and more sun. No doubt this is in some degree expensive, but in a small garden would be no great matter, and, I believe, would ensure the growth of plants and flowers in situations where foot of cievation gives an improved stratum of atroosphere. It is evident that something of this treatment is seen in the plauting and growth of flowers in large vases, and on trunks of trees sawn into blocks, aud on rockwork; bat in these cases not at all the same amount of earth or equality of drainage is provided for. In deep-rooted plants this plan would not be efficacious, probably, as they would hardly change their habits to suit this mode of culture ; but for most plants and flowers, such as are usually sown or bedded out in parterres, 9 inches, or at most a foot, in depth of earth, with 9 inches of broken pots below for drainage, would be sufficient. The receptacles for these, whether of iron, terra-cotta, or masonry, would be nearly flat-bottomed, and elevated on ornamental standards; and having made some little sketches of the general effect, although too slight to be used as illustrations, I conceive that the elevation of all the parterres of a small garden in a regular pattern in this manner, is capable of much elegance and convenience, as well as advantage to the growth of the plants. It would probatily be productive of some novel effects in appearance, and
would be without precedent, but so much the better for that.

I have spoken of its convenience, which would be particularly the case as regards lady visitors and lady gardeners. The crinolines would then find ample space to sweep under the parterres instead of over them, as they often do, to the detriment of the flowers in a small garden, where the walks were not originally laid out in contemplation of that remarkable personal embellishment. As regards stooping, also, it does away with the necessity of this, either for sowing, planting, tending, or examining the flowers ; and evidently their bloom and fragrance are more direotly available. Mignonette, for instance, when placed in the ground, you would hardly perceive the scent of in walking by; but raise it some 3 or 4 feet, and let it grow there, and it will welcome you with its fragrance whenever you go near. Thus wilt you be better repaid for your care, and the plant will be much obliged to you.

As it appears to me, this is a plan which might be well adopted in the suburbs, which the closer
and loftier march of bricks and mortar is now invading in all directions; and the thus raising the parterres in this artificial manner a yard or so in elevation, would be tantamount in effect upon the plants to removing them a mile or so into the
country. I aoknowledge that the building activity in my own neighbourhood gave rise to this idea in my mind, and although my little garden is by no means yet in the condition to require this general hoisting, yet I confess I hold it in reserve with some satisfaction for the possible time when I may think it expedient, for as far as I have tested the plan I have found it to be attended with success."
There can be no doubt that there is more in this question of elevation in its relation to town gardens than at first sight appears. What, speaking generally, are town gardens, with their party walls, essential to our English notions of privacy, -what are they but a series of pigeon holes filled with stagnant air and sooty vapour, and with more or less of their surface doomed to perpetual gloom. It is not reasonable to expect plants to succeed in these dismal prison-cells, from which Mr. Bell's suggestion, already
shadowed forth by Miss Maling in one of her eontributions to our pages, should at onee set them free. The first fime, observes Miss Maling il tried the plan of growing my plants lifted up from the ground, it was that there was a baok garden, deep down and well-like, in which not a thing looked out upon this 'dampery' room window my boxes fixed, raised above the level of the surrounding walls, the plants enjoying the free current of air that now passed round them. The way in which that garden throve attached me for life to this plan." And such will be the result, we venture to sar, with all who try it intelligently, avoiding the opposite evil of exposing the plants to the draughts or fierce air-currents, which form another of the malignant influences to which town-grown plants are mare or less exposed.

Ir the month of March last we had an opportunity of paring a visit to the Royal Butanic
hat we found it, as usual, full of subjects or grea ind trees. Amongst other things worthy of notice we were more particularly struck with the effect prodnced there in early spring by Snowdropg on the Lawns. The roots of this spring favourite had been planted in patches in the green sward, and it had barst forth into full bloom on the melting of the late snow. The effect was most pleasing at this early period of the year. believe the idea of using the Snowdrop in this way first suggested itself to Mr. McNab a few years ago, and his example is now followed in many other parts of Scotland.

It may appear, at first sight, that the scythe or mowing machine would eventually prove fatal to the Snowdrop by the destruction of its leaves. This, however, is not the case. The leaves are formed very early in spring, and have performed their functions before the Grass requires to be out a store of nourishment has already been laid up and the bulbs lie dormant under the sward unti the following year, when at the proper season they again throw up their leaves and stems, and burst into bloom. Any bulbs which require a summer to ripen their leaves or form their secretions would not be suitable for the purpose to which the Snowdrop is applied in the Edinburgh Garden.

In bringing this style of gardening to the notice of our readers, we may remark that our own taste would not lead us to scatter the flowers regularly or indiscriminately over the surface of the lawn We would rather have patches of them in nooks and corners of it, or on banks and under trees. In such situations they could not fail to be interesting and attractive. We are perfeotly aware that many persons object to having Daisies on the lawn and these persons would probably also object to having Snowdrops. Yet we cannot help thinking that in the positions we have indicated, the latte would be very pretty and very enjoyable, particu larly at a season when out-door flowers are rare.

Snowdrops, Violets, Primroses! What a strange fasoination these spring flowers have for the inhabitants of those kingdoms. The love of them seems to be born with us, -as children we love them, and prefer them to the most rare and costly exotic. And never is that love so strong as when we are far away from our native land We well remember a WARD's case full of Daisies arriving at one of the ports of the far East. How fair ones coveted them, and potted them, and shaded them from the intense heat of an Oriental sun, we will leave our readers to imagine, but we may mention one little circumstance concerning them-we mean of course the Daisies-that may excite the surprise of the florist, or perhaps cause some one to smile. Amongst them were double Daisies, having flowers of several shades of colour, but the one of all most sought after and most prized, was the little Bellis perennis, the wild Daisy of our English lawns. \(F\).
-We once more remind our lady readers that the prizes for Indoor Gardening, offered by the Proprietors of this Journal, are to be competed for on the 24th of June, and that notice of intention to exhibit must be sent to Sonth Kensington by June 19. The full particulars of the competition will be found at p. 100. We trust that our fair friends will not again, as last year, be faint-hearted, but will furnish abundan and convincing proofs of their floricultural prowess.

We learn that the Birminginay Rose Show, which is always looked forward to with interest by the growers of this flower, has been fixed to take place on July 6th and 7th. The prize list has, we are informed, been settled, and will shertly be put in circulation.

A discussion has been going on in some of the monthly Journals as to the advantage or otherwise of Heating Vine Bobders. As an argument against heat necessity for, or even the advantage of. applying and Alicautes slown by Mr. Ni. eredith of Garston, and the Barbarossas of Mr. Miller of Combe Abbey, all grown in unheated borders, are confidently referred to These are certainly strong cases; nevertheless one is ha "dly prepared to admit theoretically the disadvantage Grape Vineat to plante having the constitution of the Grape Vine, though the practical disadvantage may be ed forth in the remark of Mr. Wills, that piping in any quantity is ased under the borders, after moisture out of the whole of the bottom part of the border," and "when 18 inches or 2 feet of the bottom part of a Vine border becomes dry, how are we to get water to it?" But is not this rather snggestive of against the mode of applying the heat, than conclusive anat the use of heat at all?
recent Bore Journal of Botany statez, in reference to who was named Professor of Bothet it. Scellemen
of so advanced a nature as to have breng conss.t. unpleasant contact with the Charch party. Dr H stein, formerly Keeper of the Berlin Herbarium been appointed to succeed Dr. Schacht as Profemy Botany at Bonn; and Dr. Garcier has been appoin as his successor in the charge of the Berlin Herbarias,

\section*{SPRING GARDENING AT CLIVEDEN.}

Surisg gardening is a faet! Leaving the Great Western at Taplow Station, my eye was at once caught bra few beds in front of a very pretty cottage, gay as Whose in autumnal gardens, and far more chaste and Collinsia verna a charmingly-coloured and useful plant, and other beautiful spring-flowering thinge. This, I thought, is surely the cottage of the great spring gries miles away, and that I was admiring the spring grdening of Mr. Rogers, gr. to Mr. Noble, whose place has been so charmingly laid out by Mr. Marnock. common centre." and a capital hint of what one might espoct there. Yes, every garden-small or greataround Cliveden has what greater compliment could be paid to the ngstem pursued there, than that it should be so largely adopted by those who know it beet. Why, oreo, the very gate-keepers have their beds of Myotill stopped by the Atlantic and the German Sea.
I went to Cliveden with a not very flattering picture of epring gardening as carried on there, in my mind's istem as carried out elsewliere ; but I came back conveted, and fuliy convinced that as much may bo done in any place where a favourable soil exists. And when quite as congenial to the flowering growth, would be quite as congenial to the flowering growth, and health
of the phate employed; but that is not the greatest and most neceesary condition for them. What is manted is a dry soil, a well-drained soil, which will koop the aunuals and biennials in a ripe and hardy state during the winter season-after that they are safe; and of Mr. Fleming's book on Spriug Gardening which appeared in this Journal a year or two ago, it would be woll to bear in mind that where all this success pure sir. And so it will; and after considering that, I am confident the thing is practicable in eight out of twelve of British gardens.
I have not to deseribe Cliveden, for it has been done before, and had I the congenial task of fully describing its benuties, jong space and time would be required. orerlooking the river-there so much more beautiful than nearer London-and the happy country beyond, withont expressing his delight? Noble Lichen-
corered trees left to Nature's own arranging, and not thinned out and trained into proprieties by the forester-veiled from head to foot in many instances Yerr, as old along the brow of bit down here and there upon Poplars and other trees with globalar bunches of Mistleto by the dozen among their branches, with now and then a peep at upmards through a steeply rising," vistand making one feel Ou mountain side.
Aook the if thew trees on this ateep declivity of hill really and been thrown back again on their sides by the trees I have seen, springing curiously growing Yew
with instend of sendiug roots straight into the ground like tanpectable lowes, they radiate them from the base fur one with the othe ground altogether, and inarohing of Yow are wont to do, form a gigantic web-foot often
20 feet in diane The previding genive eneourating th loving care of our wild flowers, and Nature is of the "trim gardens." At Cliveden cutting of the "估位e interfered with as regards the stretch of Mr. Ruskin beautifully has it, that by no here took place the scene sungested by the plaintive
cry "Woodman cy "Woodman, spare that tree," but it is hardiry
poowible to wall "about the semi-wild places where
almoter almost every wild flow the semi-wild places where "Mower! spare that flower, touch not a sincle spract:" Nlow places are not mown at all, and the fle spray.
hawe of Primiot there. Others are not mown till the
drop are fully developed or quite at reat; and in othe places, where mowing is indispensable, the scythe is
carefully guided round a solitary bunch of Primroses, mass of Bluebell, or clance family of the wood Forget-me-not. Along walks dark and shady, thousands of
beautiful Polyanthuses, coloured Primroses from Devonshire, Asperula odorata, and many such plant are met with. Snowdrops are freely planted here and there; so are the Bluebells, as if the Bluebell was not sufficiently plentiful in the woods around. One sloping bank of great length, near the large flower
garden, is entirely covered with the common Bluebell ; and what could produce a more delightful effect?-for and what could produce a moore delightful effect ?-for
though the flowers are "as thick as they can stand," yet it is not the colour of the "massing system" you get, nor can it by any means be adduced in favour of Anemone leaves tone the "mass" down to the point of fascination. Anemone apennina is planted about the woods with a view to naturalise it, and I know of no plant better worth the tronble of treating thus. Mr . Fleming is actually fanatical onough to take a pooket full of seeds of his best things about the woods to scatter here and there, instead of keeping bis good things wholly in the gardens. I was delighted to see cared fors seal and abundance of Violets, as much of them. I was forcibly reminded of the words of one who loved Nature with his whole hearto

\section*{Fantastically tangled, the green hills
Are olothed with early blossonos through the grass \\  \\ The sweetness of the Violet's deep blue eyes,}

But I have no space to speak of half the beauties of the place, not even of its moonlight aspeet, for the evening of my visit was 8 lovely one, and the joy
experienced standing in one of the deep dells with a great irregular wall of noble trees around, and no view except that of "the clear moon and beauty of the beavens," with Mr. Fleming at my side, whispering a discourse on spring flowers, fearful of disturbing a posse of nightingales that sang in the woods around was the nearest approach to the seventh herven o ural felicity with which I have yet been blessed.
During a hurried run through the bouses I noticed considerable preparation for "sul-tropical gardening," which has heen done at Cliveden to some extent for a good many years; and a magnificent Bougainvillea. all flower, in a cool intermediate house, planted in a box, and allowed to root into brick rubbish in the floo beneath-mo further trouble taken.
Now for the gardeus. The Duke's garden is quietly enclosed unpretending little one just under one side of the mansion, the ground sloping naturally from it down a steep bank to a hollow, richly planted, Tulips planted in the Grass, just to mingle the wild and the cared for. Some of the little beds here contain the choicest mixtures at Cliveden. Among the best and most beautiful I will name oue of Magpie Pansy, edged with a belt of white Daisy, both literally a sheet of Lloom, the effect pleasing bey ond description Again, Primula Auriculain variets, moized with Tulipsand Primioses, and edged with Crocuses, Squills, and Arabio lucida variegata. I need not remarly what a continuance of spring flowers these mixtures yield. The anmes of the plants tell that. But the perfect bloom seen in an autumnal garden! For Mr. Fleming's Pansies are far easior of arrangement as to height, and carry their flowera much more " bravely" thau any o the summer plants. The same is true of the several
kinds of Daisies, and for a blus what can equal the wood Forget-me-nnt? Poor Purple King is a rag compared to it, either closely examiued or seen in the edged with a band of red Daisies around a centre of white Daisies, both a mass of hluom, with here and there through the whine Jaisies, but an inch or two benouth them, a fully expander flower of Gentiame acmulis. I became quite pathetic about this bed walked to and fro around it, and my motions must monkey when presented with a mirror for the first time. The effect of the fine flowers of the Gentian through the white was quite unique: you onty sam them fully when over the bed, and stepping back a few yards they gradually receded from sight altogether. There were many mixtures in'this garden, aud all good For instance, Tulips and Poet's Narcissus growing up here and there through beds of Iberis and white Pansy, to be out away when out of flower, which happens when the grocts of beauty from these beds during a few months
The mized border-"ihat antiquated affair" an it has been unwisely called-is well represonted at Cliveden, the plants all spring flowering, and arranged in very close lines, the leaves of Narcissi, Squills, \&c. giving the mass o! Waliflowers, Pansips, Silene, \&c., a very deeirable grace. The vases on the terrace were all planted with Pansion, as usual a mass of gower, and never have like the Pelargoniumes, \&c., in these, Mr. Fieming,

When your Pansies are gone?" Mr. F. shakes his head as he replies, "I can never fill them so charmingly
with any other plants." And thic apphics to all hia beds. He says he cannot produce the pleasing colours or satisfactory combinations with the flowers of summer,
that he does with those of spring. that he does with those of spring.

A lesson f
The efficet of a warr ribhon border benmath the terrace, with capital shelter and aspect, was of surpassing lovelinese. It is a slightly raised horder, With the edge covered by Iry, next the Iry Rassian Violet (past, and searcely noticentle) then a belt of
pink Dai \(y\) (about three rows). next a helt of white Daisy, then a line of Cliveden Yellow Prusy, then one of Cliveden Blue, and beyond it one of Cliveden dark, followed by Silene pendula, and behind all Waliflowers and Stocks: everything being in full and perfect bloom, every flower of the Pansies looking straight to the visitor, and the slope from front to back of liorder as nicoly graduated as if done with Minton's tiles-a raduation which is by no means easy to obtain with the later bedding plants. Small circular beds opposite each bay of this wavy border were filled with Anemone,
Tulip, Crocus, and Narcissus Tulip, Crocus, and Narcissus.
From the terrace the effect of the great flower garden stretching away towarde the river is very fine, year planted with a central row of Honeaty-which is one of the most ua ful plants employed hy Mr. Fieming -then a band of Wallfower on each side: nerto each side is white Myosotis, then a broad belt of silene pendula, and lastly, a beautiful band of Myosotis eylvatica. The most gorgeous offect aff, rded by auy
of the great triangular beds is that of a wide belt of a yellow single Wallifower raised by Mr. Fleming, spotted over by the flowers of Tulip Rex Rubrorumthe of in terrace looking as gorgeous as garden, Tulips red and yellow are planted and laft permanently-a good plan. A rather curious though most useful Silene pendula and red Tulip. The Tulips, I should add, are not planted thickly through the Silene or Walifower, eay about 18 inches apart,
or more : in the distance they look like balls of colour suspended over the groundwork. Tulips lyok far better mixed in this or indeed with any other plant, than alone. For loveliness of colour in this great garden I think the palm must be given to Myosotis ylvatica. There are immense quantitios of it in wide belts, and elaewhere in the place it is abundant; it is
good for cutting, beautiful to look apon, and the effect" from the terrace or from a little way off on any side in as bluc, aye as heavenls a blun as that of tho depths of a southern Bky. In large stone vases or by Wallfowers, and Alyssum, with Iberis, falling over are or mixtures of some other
 Daisies mixed, were very tarteful and attractive.
This system of beautifying our gardens when they ought to be most beautiful, so happily and extensively any other-except the system of nothinguess; is capable of producing most exquisite colouring-showy nough too for the loudest taste ; employs moreover should be adopted at once in all gardens wherever a light and dry soil exists, unless there is some epec al reason for
Robinson.

\section*{ORCHARD HOUSES}

Iy any man ever had conse to congratulate himself on a numerous progeny, Mr. Rivers must do so whem he sees th the father, springing up on all sium I will not enter upon the vexel question as to whether these houses are, or are not, preforable to walle. Suffice it to say, that they possese at least mome pecmliar antrantages, and can often be erected in places where a wall is an impossibility. But those who build them, often doubs whether it is advieable to add some heatiug apparatus, and a few lines tending to solve that doubt may not be without interest at the present time.
After some experience both of heated and unheator houses, I have come to the same conclusion as Mr. Pearnon, viz, that under ordinary circumatances an unheated house is preferable. If we define an Orchardhouse to be a glass structure for the better protection of hardy fruits, and for the production of those which re half-hardy; and if, in such a Btructure, Grapes and Peachas can be ripened as perfoctly without There need be mome special object beyond the where ripening of the abovenauned fruits, to induce any one to inenr not only the first expense of a heating apparatus, but the further contimueni cost of repars and fuel. In adimime and the ri-k of negiont mint unt he increash of Buides in a heated homse there is be lost sight otation-firat, to introduce plants which always a temptation-first, to int-rines phats intich are notly, to attempt a compromise between the requirements of those plants and the fruit trens. Such a compromise can hardly be effected without injury to the latter. When, however, there is a particular
demnud for somo one fruit, and a desire to prolong its season, or when the owner is away from home during the usual period of ripening, the application of heat expedient but necessary.
The writer, some years ago, heated a house for prolonging the season of Figs, and this fruit is pecnliarly suited to this treatment, because, with a little assistance, it produces two crops annualy. Assuming
that Brown Turkeys against a wall are in perfection from August 25 to September 20, it is easy under class, with moderate heat, to produce a first crop which shall precede this period, and from the same trees a second which shall succeed it. To do this, the trees may rest till 1st March. Fires are then lighted, but ois cold days only; and this treatment is conkinued until
settled warm weather in June. During the succeeding settled warm weather in June. During the succeut the months the sun's hea is sufficient. but about the of temperature, fires are recommenced and lighted daily until the begianing of November. At no period are the fires kept up during the night.
In regulating the heat in the three spring months, my object was to imitate the climate of Lisbon, which is about \(12^{\circ}\) higher thnn our own; and upon referring four years, the actual temperatures in the house during March, April, and May were \(55^{\circ} .2,62^{\circ} .6\), and \(67^{\circ}\) respectively, while the out-door temperatures at
Cbiswick were \(42^{\circ} .9,47^{\circ} .3\), and \(52^{\circ} .6\). The average daily maximum was \(17^{\circ}\), and the minimum \(11^{\circ} .8\) in excess of Chiswick, and this gives a general difference of 14..4. The number of fires each spring averaged 35, wo half days being counted as one whole.
The resul ripening about the middle of Juwn Turkeys commenced ripening about the middle of July, and was
nearly over when the out-door crop was ready. The second in.door crop carried on the succession until the beginning of November.
Insme the Brown Turkey as the best. For if in sweetness to the White Marseilles, and in delicacy of flavour to the White Ischia, yet for a combiation of desirable qualities, including hardiness and producfew plants of White Marseilles are useful, for they come in early, about a week before the Brown Turkey, and they often ripen a second crop even in an unkeated house. The Early Violet, though small, is very rich; and the White Ischia deserves a place, though it abundant crop. In Italy it does no more.
I may add, that in the Fig-house described above Cattley's Guava ripened perfectly, and though often classed as a stove plant, stood, on two occasions, a tem
perature of \(36^{\circ}\) without the slightest injury. S. B.

\section*{Home Correspondence.}

International Horticultural Exhibitions.-I am glad to learn from your leading article (p. 386) that you are of the same opinion as myself respecting Continental Congresses. I bave been au eye-n itness of two of them That held at Amsterdam this year, suggested to my mind many things that should be encouraged in this country. In fact we must set to work to reform our
exhibitions, for which we have materials to make a exhibitions, for which we have materials to make a
grand display. I mentioned the other day that we should arrange our shows in the manner pursued by our Continental neighbours, but the reply I received however a mistake, and if proper prizes were offered, plants hitherto hidden in obscurity for years would doubtless reappear. English perseverance is well known
both here and abroad, and when the proposed International Show takes place next year, as I hope will be the case, we must not be found behindhand. In
1851 we.had our first great "International Exhibition" of which the building that now stands at Sydenham, planned by one of our most distinguished gardeners, is have an International. Horticultural Congress? A queation suggests itself, viz, where is the money to come tiom to defray expenses? There will, however, I believe, anything is being carried out for the public good, there are plenty who come forward to lend a helping
haul. Let us hope that our efforts may be a to the country, so that foreigners who may come over to see ur, may return to their respective homes and say they their friends, "If you wioh to see things done as they should be, you must pay England a visit." as it in here; it is increasing anuually, and is likely all can have hothonses for glass being cheap alnost increases our love for plants. You are right in greatly that we have a large number of bstanists and first-rate turdeners. I have, therefore, no doubt that a horticul. of cood. It will bring persons of the same profession together, and from the tree interchange of thought, improvement cannot fail to result. How different was By a friendly intercourse with all nations, we shall never seen before. All therefore mush, as a matter of
course, feel interested in the proje
New Early Peas.-Having made several sowings in different situations of each of the new Early Peas advertised in your columna, it is a great satisfaction to us to find that Sutton's Ringleader came into bloom
several days before either of the nther new sorts, though all were sown on the same day and under exactly similar circumstances. From our observations of last season we have confidence that the podding and ripening will Reading.-I see (p. 412) that Messrs. Carter's First Crop Pea was in flower on the lst of May. I beg to
inform the growers of early Peas that the Brighton Express Pea was in flower here a week before that date, viz., on the 24th of April. M. B., Woodfield Cottage, Harrove Road. - I sowed a row of Messrs. Carter's earliest Peas on the 24th of Febriary last, and they began to show blossom on the 1st of May. The whole row is crop. J. W. Gidney, Windsor House, Phtney, May 11.
Farfugium grande.-It may be interesting to know that this pretty Coltsfoot has withstood the late severe
winter unprotected out of doors, in the neighbourliood of Manchester. D. C.
Lead Roofs. -If "H." (see p. 416) can without trouble lift his lead, he will find a great difference in the temperature by covering the whole surface under whole of my house with it some years ago; I have no doubt that since then it has been cooler in summer and warmer in winter. D.
Fruit-tree Weevils.-I have sent yon a few insects Which I have caught npon young fruit trees in the eating away the bark at those parts which have been cut with the knife in pruning, and in many instances they have also eaten away the bud. The remedy I have hitherto adopted is to pick them off with the aid of a lantern at night, when they can readily be found feeding upon the bark. Another method is to make the earth at the foot of the tree in which they bury themselves fine, and to place a clod upon it, under which they are found in the day time, though not very readily, as their colour so much resembles that of the snil itself. Have any of your correspondents been troubled with the snme peats?-and can you suggest any better
remedies than those just related? Richard Locke, Foreman, Kingsholm Nursery, Gloucester. [The insects which have done the mischief are the destructive weevil, Otiorhynens sulcatus. A very good remedy for their destruction is to spread a large white sheet on the ground under the trees in the day, and visit it after nightfall, by which time the weevils will have mounted the branches, which must be shaken; the insects fall
on the sheet, and must be collected and destroved. W.7
Spirca, Thunbergii.-I saw a specimen of this beautiful spring. flowering shrub in full bloom a few days ago at Messrs. F. \& A. Dickson \& Sons, Upton Nurseriee, Chester. It was about \(2 \frac{1}{2}\) feet in height, and about 3 feet in diameter, and was literally covered with wreaths of snow-white blossoms. This is apparently found in trade catalogues. and it is seldom to be found in trade catalogues: and yet for purposes of spring decoration it is unsurpassed by any other of the
genus. If gently forced, its long snowy wreaths of flowers would be invaluable in the conservatory, where flowering very early, it would form a good companion to Deatzia gracilis. It is perfectly hardy, having The thood withont injury the rigours of the past winter The well-known double-flowered Spiran prunifolia aore-pleno is also highly effective at present at the
nursery just named; the flowers are pure white with slight tint of green in the centre, and are formed in wreaths of from 2 to 3 feet in length. These are both Spiræas which deserve to be more common than they appear to be. R. D., Dee Banks, Chester.

Castle Kennedy Fig.-In the Fig-house at Castle Kennedy most of the leading sorts are grown, and all of them are doing well ; but the trees of the Castle Kennedy Fig have the most striking appearance, having an abundant crop of larger fruit on them than any of the others; or indeed, any variety with which I am acquainted. The present crop of Grapes, too, is very fine; perbaps no finer can be seen anywhere, and as for the pleasure grounds, Nature and Art bave done much for them They contain a large collection of Coniferæ and American plants. The Conifers in most of the avenues
of the Pinetum are from 20 to 30 feet in height. T. S.
Disbudding Peach Trees, In reference to Peach rees, wany say, "in disbudding dress off or remore every bud except the leading or terminal ones, and those at or near the base of the wood made last season or the fruit-bearing wood of the present year." So far good ; but there are doubtless some who may not know what number of buds ought to be left at the base, and it is not easy to decide this matter without seeing the trees. As a rule two should be left, one on either side and sometimea three, according to the amount of wall to be covered. Those most easily tied in should be selected; every bud that forms between the branch and be made, except (which is rarely the case) it can naked part of the tree, should be disbudded, and instead I removing every bad except those just referred to, between leave one or two, according to the length, year's growth, to form, and those at the base of lass
intended for this purpose should be such as grow in cannot be conveniently tied in. They shich, thenem about the third leaf, and the operation shonl formed two or three times during the season, principle recommended by \(\mathrm{Mr}_{\text {. Rivers in }}\) in pots. I have seen quite as fine frois in pots. I have seen quite as fine fruit grown use of tex that if that plan should not see so many long naked stemoderatio in Peach and Nectarine trees as we do bran Most people will, I think, allow that at pres advantage over tiedoin shoots, inasmuch as thas light and air, so essential to setting and ripening,
access to the tree. Some may say the no access to the tree. Some may say that none but en who have not had experience mut to disbud; but I hope that the remarks I have just made on the subjec may be of use to them. A. S. \(\boldsymbol{K}\).
Late Melons.-In replying
remarks ( \(p\). 412) it is requisite forr coraposim portions of my letter as bear upon the subject, and In endeavor to explain clearly what I have previond that "Princess Alexandra is the orted to haven worth cultivation, as the so-called Winter Melan only fit for cattle." What I meant was that' Prina Alexandra as a summer fruit is excellent, and the is certainly one of the best late-keeping Melons cultivation with which I am acquainted. I sent th variety to table as late as Old Christmas Day, and doubt if there is any other good variety of Melon knom that could be sent to table so late in the season; fit for cattle. In the second place that I must have been dozing, or I shonld hwo han Ken a fine hybrid Winter Melon exhibited varieties that will man one of a new I recollect perfectly seeing an account reptresent that such a Melon was exhibited last aotumn, an that is all I know about it. Surely people are not expected to write about subjects they hare merely heard of. The Melon in question has not been tried by me; perhaps it is not even yet distributed to the prblic. How inauy things have been highly spoten o when first exhibited that have afterwards proved wort
less? In the third place your correspondent thet that my heating apparatus got out of order about Chis mas, which stopped my supply of fruit. I wrote "I lur now grown this variety two seasons; the first jemh Old to table on Christmas Day, New Year's Day, an at Christmas, and should have had fruit much later las not an alteration in the heating apparatus preventel my last crop coming to maturity." Nothing is said this parazraph about the beating apparatus being of order at Christmas. The houses hereare warmed new boiler had to be set last autumn-dar three weeks we had no fires, damp got into the lithen house and spoiled the greater portion of the crop; thi was about the beginning of October. Tha set your correspondent right, and I trust for that he will read more carefully before he crit
He states that Winter Melons should be cut matured by the end of October and placed in room; this is my own practice, and that of respondent talks by good management of keeping succession of fruit of excellent quality which sent to table up to March. I hope he will eraid t tasted. Melons may possibly be kept up to the time, bat their reported excellence of quaility appenio me to be doubtful. N. Bennett, Osberton, Workson
Crickets (see p. 412). -The most effectual plia letting rid of these I ever adopted was to plange somi water, made to the consistency of thin cream, in the soil, leaves, or whatever the beds were made of, their brims. The crickets are attracted by the the of the treacle, and when once they a convenienc cannot get out. Where there was in any corner, ath or plunging the jars, I placed them ieces of turf, brick, or anything else about them, to enable the criciets to get into Which should be cleared of the pests they do the smell of it, it should therefore be replaced material. Another way is to lay down a or pieces of boiled Potatos, to cover them pot going to bed, a coarse rose on pot full of boiling water, with a coarse sotato overing is removed before the water is ap escape. Turpentine will drive them from nother, but I cannot say whether from brought to be burnt in the garden, ant erence the enemy is brought amongst ou I have destroved thonsands of these little p

Flower Shows. - Yousay we have two
reference to these, viz., how to srrang exhibited to the best advantage, and our exhibition generally more inter
alter cur style of plant growing, horticultural exhibi-
fions will ere long be anmongt things forgo:ten. tions will ere long be amougst things forgoten. some say it it imposs this I cannot understand. True, our continental friends take a long time to arrance their plants, but the operation might be effected in a moch shorter time, provided proper arrangements were mand appointed to place the plants-persons who can appreciate a graceful-growing plant with fine foliage as sppreciate a gracefuld is a stifly-trained flowering plant. Both are good in their respective places, and one in the other to increased advantage. I bave long winhed to see a change in our English flower hows, which are too brilliant to the eye to be looked on with pleasure. Some decided relief is needed, for when one part of this continual blaze has been inspected, why managers of shows do not bestir themselves slter the arrangement of them; the operation might be effected without adding much to the expense. The Cormality of our London shows is proverbial; even some of the country displays are much more interesting, as a greater variety of subjects is exh
cur metropolitan exlibitions. \(W\).
Phalcnopsis Liiddemanniana.-In your report (p 113) respecting this fine Phalænopsis you have omitted, at the Committee meeting of the Royal Horticulcural Society, the name of my gardener, Mr. apecimen (that held up at the meeting by Mr. Bateman) was beyond comparison the finest plant in the room, and in the highest cultivation. It had six leaves, three of then fully 6 inches in length, and two spikes of bloom, one with four flowers, two fully expanded, and the other with three flowers, one expanded. I ain sure you
will be glad to cor rect this omission, and as I mean to send the plant to the Show on the 13th, you will be able to judge whether I have exaggerated the merits of my meeting in question Bat, Blackheath Park. At At rariety superbum were stated to have been furnished by Mr. Veitch. They were, however, exhibited by Menrrs. Low, who imported them. Mr. C. M. Calde-
cotte's address, which is Holbrook Grange, near Rugby, was also omitted.]
Spring Flosoers.-I am glad to see you directing attertion to the more general use of spring-flowering plants. My terrace-garden, in spite of the late frosts, are obliged to shift to make way continue so till we other bedding plants. The best plants for spring ornamentation are the following, which may be easily prepared in the reserve garden or in cold frames till wanted:-1. Alyssum, yeliow, makes a most brilliant
bed; 2. Wallfower; 3. Common Pansies; 4. Virginian Stock; 5. Saponaria calabrica; 6. Nemophila insignis -the latter should be sown in autumn, and potted off beautifal. \(T\). \(P\).
Whortleberry Gathering. - The master of the National School near my residence, in the west of Somersetshire, having informed me in the beginning of August, 1864, that the attendance of the children had lately been very thin, owing principally to the "Whortleberries" Scotland), which had been unusually abundant, and that he lad been at some pains to inquire whether the parents were gainers by the "Wort-gathering," he month of July sums varying from 15s. to 27 s. One greater part of \(10 \frac{1}{2}\) years oheceived as much as \(25 s\)., the greater part of which was laid out in clothing for
herself. He could not therefore be surprised that they stayed away from school for the purpose. I requested him to endeavour to collect fuller statistics on the Eubject, and I forward you the result of his incquiries, This district, which is onl interest to some of your readers. in Somersetshire, extends for several miles westward, Ermoor, and is principally seated Nettlecombe towards wooded slopes and spurs of the Brendon Hill slate and lively scene; thegathering presents an interesting and lively scene; the gatherers, principally women and the varied colour of their garments, busily employed, the surrounding foliage, and the merry laugh and shout purchased in large wood or over moor. The fruit is men who come from a distance with donkey-carts, and Who are known as "Wort Jowders." They buy up the Taunton in end Bridgewater travel during the night to in the amd Bridgewater, returning for a fresh supply purchasers, or cosed of ; the rest is sold to local or in the shape of preserves, used daring the
winter Winter when butter is preserves, used during the is about \(2 \frac{1}{2} d\). ; and when the quart, bat the average price Toman will ; and when the crop is plentiful, an active menced in throm 8 to 10 quarts. The season com. weeks. The master of June, and lasted a month or six 98 to the number of could not get accurate information judging from our own small parish of Nettlecombe, he
go out at one time or another; and the money brought into the district by their industry must be very considerable, amounting in a good scason to several hundred pounds, and a great boon, where the average wages of agricultural labourers is from 78 . to 8 s. a week for
men and considerably less for women. N. C. Trevelyan Then considerably less for women. W. C. Trecelyan. excellent man served the late and present Duke of Wellington during a period of nearly 30 vears, and all who had the advantage of his acquaintance hnow that a better gardener, in the general accep Although 70 years of age, lived in this country discussion upon modern gardening or garden architecture with more than the enthusiasm of youth I have often been delighted to bear him relate anecdotes of his interviews with distinguished men, some of whom are now dead; he appeared howeve Loudon and Mr. Parkes the eminent draining engineer, whose experiments he greatly aided when the late Duke employed him to drain his park and garden at Strathfieldsaye. Finally, he was an excellent example for the rising generation of gardeners to follow. He
was a man of untiring energy, notwithstanding severe bodily affliction, and to the last he was most devotedly foud of his business. These remarks I am sure will be read with sympathy by all who publicly knew hin, and will beondorsed by a numerous circle of private friends. J. C. Dwerrihouse, Heciffield.

\section*{Foreign Correspondence.}

Verbena Dibeask.-United States: April 20, 1865 -In your Paper of March 11, p. 220, it is stated that in Verbenas. In America a similar evil has been very prevalent for these last three years, and being "Britisher" myself I feel a pleasure in giving my countrymen a little advice as to the best means of extensive florists in America. We therefore have a very large demand for Verbenas, and for two seasons past we have not had one worth looking at, which has been a great loss to my employer. Feeling satisfied that something was wrong in regard to treatment, I resolved that something must be done. In September I raised
1500 plants," and a similar number in October. All looked well until duil cold days set in, when black rust began to make its appearance. This led me to thinh that we were going to be as badly off for plants as ever. I had my stock on the lower shelves in the greenhouses. I then fixed shelves along the top of the houses, just ar enough away from the glass to keep the plants from touching it. The upper part; of the house is, I
need not say, warmer than the lower, and I feel satisfied that any sudden change or staguation in growth will cause rust. Verbenas, however, do no
require a high temperature; from \(40^{\circ}\) to \(45^{\circ}\) in winter are quite sufficient for fhem, and there shoul always be plenty of air given on all favourable I had 1000 Italian Verbenas, which I certainly thought were past recovery. I could not get even one cutting from them. These I put on the top shelves. I then got half a peck of lime in the shell state, added 1 lb . of sulphur, and poured enough boiling water over it to
thoroughly slack the lime and dissolve the sulphur The whole was in a barrel, the top of which I kept cold I added sufficient water to enable me to draw of 4 gallons of pure liquor. To a third of this I added two-thirds of pure water, syringed the plants with it If a week for three weeks, and the rust disappeared If there slould be any signs of its reappearing, do not neglect to syringe at once, bat let the operation be
performed at a time when the plants do not want performed at a time when the plants do not want
water; for if you water directly after the mixture has been applied, you wash the solution off. This process I found to be effectual ; the plants got clean and pro auced plenty of cuttings, which I put in the propagating bed, and as soon as they were rooted I turned of the bottom-heat for about a week in order to harden
the roots before potting. I use as soil two shovels-full of good old loano, one of peat, a gprinkling of well decomposed manure, and a slight spriukling of sand to keep the soil porous; then, after potting, I place them remove the tops, which serve for another batch o cuttings; the plants then make good stocky growth. I have now a honse 100 feet long, with a flat stage in it 6 feet wide, with some finely sifted mould on it to keep the bottoms of the pots cool and moist, and at present this stage is filied with as fine healthy a lot of
Verbenas as could possibly be seen in any conntry. If these directions are attended to, I feel sure that Verbena rust will vadish for ever. J. Robinson.

\section*{Eocieties.}

Linnean : April 6.-G. Bentham, Esq., President in the chair. T. W. V. Beckett, Esq., Capt. S. R. J. J. Rooke, were elected Fellows. The following paper were read:-1. Notes on the Flora of the Desert of Sinai, by R. Milne Redhead, Esq. These notes were collected during a tour in the East, in February, March,
and April, 1866, The paper contained some very journey, but does not admit of extrect. At che everything was then suffering from extract. At Cairo a most unusual occurrense. The Plantains and Suger Canes were almost destroyed. The desert was generally devoid of vegetation; while in the samdy wadys, which in rainy seasons are water courses, a variety of plants appeared more or less profusely-among them the Retem, Spantium monospermum. supposed to be the Juniper bush of the prophet. Near a pool of bitter Marah of Scripture, were âra, and supposed to be the of a prickly slirub, the Nitraria tridentata, the (ihishuw of the Arabs, which produces small oval scarl with a sub-acid flavour. The camels eat this plant greedily. At uight the air was laden with the delicious perfume of Mathiola odoratiseima. As regards Ferns, Adiantum Capillus-veneris was atated to grow abundantly at the Pools of Solomon, in an old well on the Mount of Olives very luxuriantly, also at Aceldama Ceterach officinarum on rocks and walls near Bethlehem: Cheilanthes fragrans in profusion at Beth Jala and in the valley of Himnom near En rogel; Nothochlana lanuginosa on rocks between Jaffu and Jerusalem Gymnogramma leptophylla on Mount Gerizim, and seen in Paleatine Danias-making in ail six species Western and Southern Shores of the Dead Sea, by B. F. Lowne, Esq.; communicated by Dr. Hooker.

April 20.-George Bentham, Esq., President in the chair. The following papers were read:-1. On Gripidea, a new genus of Loasaced, woith an acoomnt of
some peculiarities in the structure of the seeds of that some peculiarities in the structure of the seeds of that
family. By John Miers, Esq. and vegetable prodmets, He, from communications Mission. By J. E. T. Aitchison, M.D.
May 4.-G. Bentham, Esq., President in the chair. Mr. R. Milne Redhead exhibited dried specimens of plants collected in Palestine and the Desert of Sinai also specimens of Anassatica hierochuntica living and in the dry state. Dr. F. Welwitech and W. Woolle, Esq., were elected Fellows. The President announced that a new part of the Transactions of the Society, consisting
of Mr. Wallace's paper " on the Tariation and Geographical dietribution, as illustratod by the Papilionidæ of the Jalayan region," was now ready for distribution. The following papers were read :1. On Two Species of Guttifere. Hy Thos. Anderson, M.D. Auong the many rare species cultivated in the Botanic Garden of Calcutta, which have oscaped the devastation of the Cyclone of the 5th Oetober last, there were stated to occur two species of Guttiferes of considerable interest. The first of these, Calymaccion siamense of Miquel (Mammea birmanica, Anderson), the ame of encribed from livg specimens, under the Siamese make necklaces of the floman and aleo offer them to the images of Boodh. The second was a Garcinia from the eastern coast of Africa, and named G. Livingstonei. The author stated that it was remark. able on account of its very peculiar habit, and also though a true Garcinia, for sts departure from one or two of the characters of the genus. The plants were raised from seeds sent to Dr. Thomson by Dr. Livingstone in 1859. This year one small tree has produced a great profusion of pseudo-hermaphrodite flowers, and another has produced a few flowers of the same character. This fruitless flowering was said to occur among other species of Guttifere while in a young state, or at least during the first years of fi)wering, fat producing plants being those only that have arrived at full maturity. According to Dr. Livingstone the about the siza of a Walnut.-2. Descriptions of some new Genera and Suecies of Tropical Leguminosce. By G. Bentham, Esq.

Heat Considercd as a Mode of Motion. By J. Tyndall, F.R.S. \&c. Second Edition, with additions and illustrations. 8vo. 1865. Pp. xx. and 532.
This book, the first edition of which was noticed by us some time since, is far more entertaing than any novel. The hackneyed novel reader after the first page or two is perfectly aware of everything that is to follow, and either throws down the book in disgust, or after glancing at the last chapter roves from page to page,
extracting a drop of honey here and there if by chance extracting a drop of honey here and there if by chance
there is any to be found. In the work before us, which has soon reached a second edition, almost every thing is new and unerpected, and if sensational matter is wanted, there is enough to satisfy the most exacting cader.
It is written moreover in such plain and lacid language, and the illustrations and experiments are so neat and pertinent, that a reader of average abilities,
with common attention, can have little diffculty in with common attention, can have little diffeculty in perseverance enouga to follow the author throughout, or if he looks principally to the experiments, which in fact to the most observant relieve the strain put upon the attention by carefully following the argument tep by atop, it is quite impossible for him to help feeling something of the same delight with which they
were received by those who were eye-witnesses of their
exhibition. exhibition.
To most minds heat presents itself as something material, and the notion prevailed at one time amongst philosophers. Bacon, however, had a glimpse of the truth, and Locke, as our author remarks, stated a
similar view with singular felicity. Heat, he says, "is a very brisk agitation of the insensible parts of the a very brisk agitation produces in us that sensation frow whence we denominate the object hot; so that what in our sensation is heat, in the object is nothing but less distinctly advocated the same notion. There bave been other labourers moreover in the same field, but nowhere has the matter been presented in so complete and convinc
Wefore us.
Whall not attempt to give an abstract of the volume, which is far too full of matter to admit of our doing so within any reasonable limits. We shall content ourselves with giving almost in the author's own
words, which are as remarkable for energy as clearuess, some of the main points.
Heat, then, is not the clash of winds ; it is not the quiver of a flame, nor the ebullition of water, nor the animates steam as it rushes from the boiler, in which it has been compressed. All these are mechanical motions, into which that of heat may be converted; but heat itself is a molecular motion. This motion is propagated from molecule to molecule, and heat is thus conducted to neighbouring bodies, and becomes a source of power.
Thus stenu is merely the apparatus through the intermediation of which the atomic is converted into the mechanical motion. The moving energy is derived from the clashing atoms in the furnace. The motion of these atoms is communicated to the boiler, thence to the water whose particles are sbaken asunder, and fly from each other with a repel
with the beat communicated.
The motion, moreover, which is generated can reproduce its parent. Take up the curled iron shavings Which the planing tool has pared off; you cannot hold
them in your hand, they are so lot. Here the moving force is restored to its first form ; the energy of the machine has been consumed in reproducing the power from which that energy was derived.
When the mind is once faniliar with the dynamical View of heat as a mode of motion, the material theory which supposes it to be a subtle fluid stored up in the interatomic spaces of bodies, at once seems to lose every shaduw of probability, and still more when we
realise the fact of the exact agreement of the work which is actually done in any case with the amount of heat which is developed. "For every stroke of work done by the steam engine, for every pound that it lifts and for every wheel that it sets in motion, an equivalent quantity of heat disappears. A ton of coal furnishes Let this quantity of coal be applied to work a steamengine, and let all the heat communicated to the
machine and the condenser, and all the heat lost by radiation and by contact with the air, be collected, it will fall short of the quantity produced by the simple combustion of the ton of coal by an amount exactly equivalent to the work performed."
are discu:sed at large, but there are some matters are discu:sed at large, but there are some matters of
peculiar interest to the cultivator which we shall now extract, without particular attention to the context.
We should have liked to have given the whole of what is said about the formation of snow flowers, both clothes of freedoin, as they sometimes fall upon our with a lens if care is taken not to disturb them with our warm breath; or as they exist in ice, where with their central spot-like vacuuin they still more closely resemble flowers, and especially that particular form of Primula sinensis known by the name of clarkiæflora,
We must, however, refer those who We must, however, refer thos
the subject to the work itself.
We turn to matters of more immediate interest and Girst, as regards climate.
The vast influence which the ocean must exert as a moderator of climate here suggests itself. The heat of summer is stored up in the ocean, and slowly given
out during winter. Hence one cause of the absence of out during winter. Hence one cause of the absence of
extremes in an island climate. The summers of the island can never attain the fervent heat of the continental summer, nor can the winter of the island be so severe as the continental winter. In various parts of the Continent fruits grow which our summer cannot unkn; but in they cannot live through the winter cold. Winter in I Iceland is, as a general rule, milder than in Lombardy. A pound of water in losing one degree of temperature would warm about 4.2 lbs . of air one degree. But water is 770 times heavier than air; losing one degree of temperature would raise \(770 \times 4.2\) \(=3234\) cubic teet of air one degree. We see therefore at once how powerful the effect of the large expanse of Another be on the neighbouring atmosphere.
distribution of heated air from clace to modified, is the distinction to what is called conduction, a subject which 8 familiar to all who ever give the subject a moment's
thought, and heat is distributed in a similar way To choose however another subject of a rather Tifferent kind, we may call attention to the manner in which vital heat is preserved in woody plants by the crrcumstance that heat is conducted through various bodies with unequal energy in different directions. Heat for instance is conducted far more energetically in a direction parallel to the fibrons tissue of trees, or direction perpendicular to the fibre and to the concentric leyons while its effect is still less when perpendicular to the fiore and parallel to the woody layers, dicular so the fiore and parambined with the fact of the bark being a bad conductor, a tree is able to resist the bark being a bad conductor, a thiee would probably be prejudicial to it; it resists alike the sudden abstraction of heat from within, and the sudden accession of it from without. Thus again the tree preserves within it the warmth which it receives from the soil, fact is taken from Dr. Wells' Theory of Dew, which, as Mr. Tyndall says, has stood the test of all subsequent criticism, and is now universally accepted.
It is an effect of chilling by radiation. "The upper parts of the Grass radiate their heat into regions of empty space, which consequently send no heat back in return; its lower parts, from the smaliness of their conducting power, transmit little of the earth's heat to the upper parts, which, at the same time, receiving only a small quantity from the atmosphere and noue from auy other lateral body, must remain colder than the air, and condense into dew its watery vapour, if this be sufficiently abundant in respect to the decreased temperature." The vapour itself being a powerful radiant is not so quickly chilled as the Grass, as it has not only its own heat to discharge, but also that of the large mass of air by which it is surrounded.
We must however in conclusion turn to another subject, which cannot be omitted in a journal like the present, viz., the connection between heat as a mode of motion and promoter of vegetable growth on the one side, and the immense quantities of mechanical energy
on the other hand to which vegetable substances give on the other han
rise when burnt.
In the building of plants carbonic acid is the material from which the carbon of the plant is derived, while water is the substance from which it obtains its hydrogen. The solar beam winds up the weight; it is
the agent which severs the atoms, setting the oxygen free, and allowing the carbon and the liydrogen toaggregate in woody fibre. If the sun's rays fall upon a surface of sand, the sand is heated, and finally radiates away as much heat as it has received; but let the same beams fall upon a forest; then the quantity of heat given back is less than that receiyed, for a portion of the sunbeams is invested in building up the trees. Without the sun the reduction of the carbonic acid and water cannot be effected; and in this act an amount of solar energy is consumed exactly equivalent to the molecular work done. Combustion is the reversal of this process of reduction, and all the energy invested in a plant reappears as heat when the plant is burned; the oxygera again unites with its carbon, and an amount of heat is give: out, equal to that originally sacrificed by the sun to form the aretable.
It is time however to bring our extracts to an end, and we feel sure that the little we have given will
induce many of our more intelligent readers to go to induce many of our more intelligent readers to go to
the fountain head and see the grounds on which these striking facts are founded.

The recent Numbers of the Florist and Pomologist have contained representations of the following plants, namely:-Verbena Annie, a red and white striped
sort, and the most beautiful striped Verbena yet seen. sort, and the most beautiful striped Verbena yet seen;
Waituia grardifora, a very fine Swan River Everlasting with yellow flowers, and ranking with the best of the Immortelles ; Aucuba japonica, the green-leaved form in fruit; and three of Mr. Parsons' new Achimenes Rose Queen, Aurora, and Stella, the most advanced of the iupproved small-flowered race, rivalling the larger type in size, and outrying them in richness of colouring, which however is unfortunately not brought out in the illustrations. There are many capital papers in these
The Floral. Ifagazine for February figures Rose Bernard Palissy, one of the expanded class ; Petunias Jubilee and Charming; Azalea Fascination, a fine rosytinted white-edged variery, here shown too pale in colour ; and Fuchsias-Lucrezia Borgia and Fantastic. In the March Number are Achimenes - Pink Perfection and grandis, two of Mr. Parsons' varieties ; Verbena Popular with variegated leaves; ChrysanthemumsGolden Ball and Tenus, two of Mr. Salter's novelties; and Begonia Digswelliensis, a free-flowering pink-flowered hybrid. The April illustrations are Rose Maréchal Niel, a very beantiful yellow Tea Rose; Hovea pungens major, one of the finest of greenhouse shrubs; Varie gated Chrysanthemum Sensation, a white Pumpon with white-edged leaves; and Terbenas-George Tye, Charles Turner, and Queen of Pinks, some of Mr. Perry's fine varieties, but most unaccoantably stated to require a Cucumber frame for their cultivation, a statement which, as Mr. Perry informs us, is entirely without foundation. The May Number has figures of Odontoglossum Pescatorei splendens; Camellia Contessa di Gonda, pink with carmiue stripes; Byacinth Thor.

The production of Sports, that is to say of or leafy branches differing in some
from those of the parent stem, is from those of the parent sten, is on amo vated plants. Mr. Barnes has shown last volume to how great an extent Azal Azaleas. In like manner, as is wola the variegated kinds of the latter, this way, and other examples are not wative this way, and other examples ar
remarkable fact bowever is not so much after all that plants sport, as that sports are to a great extent permanent when once obtained, though the alteration parentage would never be suspected. Mr. Salter has parentage wouteresting remarks which we venture to quote, on the sporting of Chrysanthemums-another quote, on thich the tendency is very strongly developed, in his recent book on this popular flower, noticed by in his recent He observes:-
Sports are accidental changes in the colour of leaves or of flowers, and appearing without any apparent cause in an entire stem, or in a single branch, without in the least affecting the other parts of the plant. As a general rule, sports are much more likely permanently to retain aud perpetuate their changes when propagated from the bre the propagation takes place from seed; in fadt, in the latter case, very little, if any, dependence can oe placed on the result. Many plants are known to be subject to these diversities, but none to so great a degree as the Chrysanthemum ; and as the phenomenon has been going on for many years, it is but natural to conclude that the Chrysanthemum is particularly liable and favoured in this respect.
This mutability was observed so long ago as when the first importations from China took place, when it wis noticed that the buff, the sulphur, and the rose were more or less subject to it ; but these sports differed Fidely from those which occur in the present day, they are now, as, for instance,", in Golden Queen, Golden Trilby, Golden Cedo Nulli, \&cc., they were so uncortain and erratic, that it was extremely difficult to tell which was the original colour and which was the aport. The variety called Changeable Buff is a re-
markable instance of this, and has been known to produce on the same plant buff as well as rose-coloured flowers; another season the blooms from the same root have been entirely butf, while the following year every fower has been rose. The same mutability occurred wholly or in part to Golden Yellow, and after a lapse of time to return to its original colour, as is now sometimes the case with Formosum. It is to be regretted that although these and others having a similar ten. dency are atill found in China, they are no longer the possibility of england, consequently Iprecluding solution of the nature and cause of such diversified effects.

All varieties have not the same tendency to sport nome have it far more than others, and the most singular instance of a distinct change has occurred of
Iate years in Queen of England, which has piven no less years in Queen of England, which has given no original blush, two of them being produced from the same root daring two successive years. The first change was from blush to rose, the second to golden yellow, the third blush pencilled rose, the fourth to
ivory white, the fifth to pure white, the sirth to variegated foliage, to which might be added several Cedo Nulli, has undergone four changes; Dr. Brock, Cedree Nalli, has undergone four changes; Dr. Brock, In the majority of cases the sport has been yellow, from Which it may be inferred that they, like seedlings, are prone to return to the typical colour. As before usually appas become a theory with some that sports is the result that no one can foretell either the time or manner of their coming. Many instances might be acoarred in 18600f of thills; butfice. Two cuttings of Beverley buing been potted to grow for cut blooms, one plant pother were true white flowers, while those on the striped were golden yellow. In 1863 Dr. Brock gave a of the plants which was propagated, and in 1864 most bright yellow flowers. In 1863 Rose Treve produced beautiful white fowers. In 1863 Rose Trevenna gave the plants propagated from it continued to produce white flowers, while others returned to the original permanent until after a no sport should be considered renaons ; in til after a good trial during two or three way been proved many of the changes have in this the year following their appearance they have altogether At times the

\section*{The Apiary.}

As the month of May is a season of great importance the apiarian, a few remarks on Practical Manage MENT may not be out of place. The following some
what desultory hints are chielly intended for the benefit of those who may consider themselves novices in the art of bee-keeping. They are not brought out as new ideas, but simply as reminders of what masy be done to assist the bees for their own benefit and that of their masters.
By this time the majority of stocks that have sur vived the winter will pretty well show whether they favourable period during the coming summer. Those which are weak in ipopulation now, will be likely to effect but little either in the honey or the swarming line. If swarms are thrown off at all from such hives they will be late, and perhaps unable to store sufficient for their winter consumption. If honey be the chief object of the apiarian, he will generally do well to unite his weak stocks together, taking care not to sacrifice any of the brood. This operation is
very easily performed with frame or bar-hives, and so that no loss of brood need result, but is rather difficult to effect properly with common hives. Earlier than the present time all the stocks should have been visited and lifted from their respective floor-boards, which should beeither thoroughly cleaned, or exchanged for clean ones. This is a great help to the bees, more especially where they are not very numerous. After such a winter as the last, the accumulation of dirt and rubbish in some of the hives has been immense, no only entailing a very large amount of labour on the bees, but also tending to disgust them with their habitation. We have frequently observed a greatly in this way. Even now it may not be too late, par ticularly with those which are not very strong.
It should now be determined by the beekeeper whether he requires his hives to produce swarms or honey. If the former, he need do but little more than
watch for them as the time for swarming approaches. This time varies so much in different localities, that it is useless to lay down any rule as to when swarms may be expected. Usually the appearance of a large number of drones may be taken as a sign that the time is not far off. Hives should be prepared in readiness; this should not be left, as it too often is, until the swarm is actually on the wing. Cottagers will frequently take any old skep, from which the bees have died out, and which, perhaps, is actually falling to pieces Ifrom rottenness, for their first or prime swarms, intended to stand las stock hives; while for their second and third, or comparatively worthless swarms, nice new skeps or butts are obtained. Care little be taken that the hives are internally clean, ald be snipped away. No dressing is required, or if any be used, let it be composed of sugar-syrup or honeyand avoid all those horrid messes of herbs which are so
frequently applied, and which only cause the bees a vast deal of unnecessary labour in their efforts to ge rid of it. The entrances to these now hives should be cut in the floor boards; if any are already cut in the substance of the hives, let them be filled up and the hives reversed, so that they stand at the back, opposite to the proper board entrances. So soon as a swarm is tolerably quiet, let it be at once taken to its destined stand. The bees after settling in, very quickly begin to fly and ascertain the bearings of their new situation, 30 that if they are allowed to remain until evening o spot on the following day, and after losing much time in searching for their home, will perhaps fly back, not to their proper companions, but to the parent stock. It is recommended by some apiarians that the swarm should be put where the old stock stood, and that removed to new locality. This is done strength. It usually prevents the old stock throwing off any further casts. Where the chief desideratum is to obtain a swarm of great strength, and the prosperity of the parent hive is a matter of indifference, this plan is a very good one, but it is hardly to be recommended for general adoption. So large number of bees vacate the stock that there are not great deal of it dies or remains unhatched. It is
decidedly opposed to the natural habits of bees. A swarm usually comes off during the busiest working part of the day, when a large proportion of the population is absent on foraging purposes. Some of these, on their return, will join the emigrants; the res arriving too late, will remain with the parent-stock, barely form a sufficient number to cover the brood, and sustain the internal temperature, necessary for hatching it outo How then can it be expectod nat a every adult bee is thus compelled to desert it for the new swarm?
The hives with their new tenants should be properly protected as soon as possible. It is too frequently the custom to throw an old sack or some equally ineffective
material over them uatil the autumn. This is
injudicious, as they are neither sheltered from rain nor sun.
If it is desired that the swarms should be domiciled in boxes or improved hives, it is often the better plan transfer them the same evening into their permanent quarters. The way to do this was explained by us last week at page 415.
Where bars or frames are intended to be used, it is always desirable, if possible, to attach to them small pieces of clean worker-comb in the proper position This not only insures due accuracy, but is a very considerable help to the bees, and enables the queen to comemence her egg-laying much sooner than she otherwise could do.
Nety bives or bores should be painted; it is abso-
 such hives become much more affected by interna moisture. The outer coverings or cases, if any, wil equire to be painted. Avoid green or other dark colours: white or light stone-coloured paint is the best, as being cooler under a hot sun. Whatever kind of ample ventilation.

\section*{Garden Memoranda.}
abhton Coubt, the Seat of Sir J. H. G. Suytif Bart. -This ancient and noble demesne is situated in the county of Somerset, a county not less remarkable for it extensive pasture lands than for their great variety of surfacc. Near the ses, it is true, low grounds abound;
but the more inland portions of this fine south-western but the more inland portions of this fine south-western
county are decidedly hilly, and include severnl welldefined ranges. Among these are the Mendip Hills, between which and the town of Bristol hies this charming estate, which is now conuected with Clifton by means of the beautiful suspension bridge lately thrown over the river Avon. The higher grounds of Somerset in general exhibit strata of oolite and lias, the lower grounde new red sandstone.
The gardens and mansion are situated in the middle a remarkably fine deer park containing some
1200 acres, delightfully undulated and well-wooded Many of the Oaks and Elms with which this park is furnished are unique of their kinds-very old and of wonderful size, some of them having trunke rough and time-riven, measuring as much as 30 feet in cir cumference at 3 feet from the ground.
aren extensive lawn decorated with flower-beds, and ent off from the park partly by means of a sunk fence, and partly by an
ancient wall of peculiar form, against which are trained plants of an ornamental character. In a compartment of this garden, at a lower level than that just referred to, is a little circular basin and fountain, surrounded by Grass, on which are some very fine examples of Chinese Arborvitæ, Taxodiums, and other Conifers, under the shade of which recreation can be taken with comfort, ven in the bottest days of summer
Close to this delightful retreat, which has lately been somewhat opened up and greatly improved in
appearance, has just been erected a charminz rance of appearance, has just been erected a charming range of Chelsea It consists of larga Vineries and plant houses, separated from each other by neat corridors, the roofs of which are raised above those of the adjoining houses, so as to furnish variety, and in some measure to break up the sameness of aspect which so long a flat rown climera and that in the centre of the range has grown climbers, and that in the centre of the range has handsome stage well farnished with choice specimena which are inspected from a pathway tastefully paved with variouly coloured tiles. At the east end of this cange, and placed at a right angle with it, is a beautifu leau-to conservatory, 90 feet in length, the shelves and bed of which are a blaze of floral beauty, enhanced here and there by Ferns, Dracænas, and other plants remark ble for the beauty of their foliage
On the back wall of this house are such elimbers as Coboess and Tacsonias, \&c., and from the roof hang festoons of elegant evergreen drapery. The paths
consist of differently coloured tiles edged with Bath consist of differently coloured tiles odged with Bath
tone, and in the centre, opposite the princinal entrance, is a raised oblong square stage with the corners cut off, consisting of what may be called a series of bores, the front panels of which are made of Minton's ornamental tiles, surmounted by a white vooden kerb. These are filled with plants in flower nd the pots in which they are growing being hidden behind a richly coloured screen, the whole has an exceedingly good effect.
In the angle formed by the junction of this conservaory with the other houses has been erectod an Mr. erection of the honses here has been entrusted. It is octagonal in shape, with a glass lanteru at top, round the base of which are representations of a deer chase in imitation fresco work. The colour of the walls of this temple is light grey and gold, relieved here and there with bauds of a warm brown, and they are og arbour in sofas, and chairs, a fine view of the conservatory with its rich and judiciously varied contents can be obtained In front of these honses, all of which are efficiently
warmed with hot water in 40incli pipes, hidden behind arunmantal ion work, and planted with the beat kiuds of vinae, from mont of which good cropaner is a perfeet liaza with Pelargouiums and other beddiug plants. This is cut off from an ornamental garden at a lover level just completely remodelled, by a dwarf Yew hedge, which is placed along the top of a beantiful graspy slape. This lower garden is traversed through its whole length by a hroad gravel walk, whiah reaches the
higher level of the flower garden in frant of the mansion higher level of the flower garden in frant of the mansion
hy menam of a flight of Pennant stone attepe, of a slate colour, very hard and durable.
The kitticen garden, which is wholly new, is placed at some distance from the mansion. It contains nearly 4 acres within the walls, against which are planted thriving young fruit trees in well-made borders. Near the side furtheest from the entranoe are placed the glass houes in the form of a square, two large Vineries separated from ench other by a roomay corridor occupying the hack row, at right angles with which are two long spanroofed honses, forming other two sides of the square, the centre being filled up with rows of gpau-roofect pits, the whole having a compact and neatt appearance. These houses, like those already adverted to, have all hat water Irom two of their tubular boilers, which are reported to snswer most eatisfactorily. In the large houses the Vimes are planted inside, in excellent borders covered with a wooden platform in order to prevent them frum being trampled upon in the ordinary operations connecten with their culture. When necessary these platforms can be elevated so as to become stages or plants, a point of considerable importance in places Where plants are required in large numbers as they are French Bıans, and Strawberries, together with Vines and Peache's and Nectarines in pots, Pine Aoples, both in pots and planted out, all in excellent condition-a
f et which will be easily understood when we state that they are under the care of so skilful and experienced 4 Hardener as Mr. Dolds, who was so many years with Colonel baker, of Salisbury. Behind, i. e. on the north site of the principal Vineries, are the is fitted my in the usual way with slate shelves, one tier being placed above the other ; below the undermost shelves Sea \(\mathrm{K}_{1}\) il is f., rced under wooden shuttors, which fit over it sufficiently close to exclude light.
In pits under skeleton lights, on which mats or other caverifg are thrown at mght and in severe weather useful afte grown; and the saune contrances are and for many nther purposes. Strawberry-pots packed sideways in ashes form good side protections for these temparary shelters
Mir. Wodds' nlan of making manure water may not be
withont interest. In one case he has a large tank, divided in the middle, in which is a filter, the manure being put into oue computinent, and the clear liquid being ilrawh from another. fil amather matance he down into a furrel of water by means of a rope tuts is a pulley. In this way the manure is also kept from clear state from the bottom of the cask. Amateurs and others with little conventence will duubtless find this very useful mode of making liquid manure.
Insteal ot shating with canvas or other material of that character, it may be mentioned that the glass mixture of slim-milk and hot lime, daubed on with the point of a painter's brush. This has the appearance of ground glass, and it is easily washed off in winter when shade is not required.

\section*{Miscellaneous.}

Togetable Plannel (see p. 368).-Those of your readers who tuke an interest in the manufacture of vegetable flanel from the Pinus sylvestris, may like to have the alditional information that since about of which Pine lpaves are converted into wool, while in the other, for i:ivalids, the waters used in the manufacture of line wool are employed as curative agents. The prece-s for converting the Pine needles into wool was discovered by Mr. Pannewitz. In the hospitals, penitentiaries and barracks of Vienna and Breslan, blankets made from that material are now exclusively \(u\)-el. One of \(t\);er chief alvatitares is that no knd of vermin will lodge in tisem. The material is also
used as stuting, closely used as stuting, closely risemblea horsehmir, and is
only one-thint its cost. When spment woven, the only one-thinit ita cost. When spmon and woven, the
thread resembs that of hamp, and is made into jachets, spencers, drawtra and stockinus, flanel and twill for shirts, coverletz, body and chest warmers and knittingyarn. They keep the body warm without heating, and are very durable. The fantories are, lighted with gas made from the refuse of the above mauufactures. The Jar
of inspection des Plantes. - The permanent commissiou straction to examine into the state of the varions maseams of the Jardin des Plantes has just presented sum required to thefray docnment it appears that the ment during the year 1864 was 582380 of the establish-

308,380 fo; travelling 日xpensen, 25,000 f; , stock, 249,000 Regarding the collections the commissiou complains o the great wart of space, which has furced the adminiatration to exhlbit many apecimens in highly inconvenient places. The hothouses are also insufficient for the 974 plants possessed by the administratiou; the nurseries are well provided, comprising 4393 trees, 2534 grafts, 712 tubercles, 2335 perennials. The seeds. Galigmami.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

The purest of all pleasures may be derived from a garden; but in order that we may enjoy these in their fullost extent, high keeping and order must form one of its distinguishing features. Gardens frequently get into bad candition from the want of method in the management of the labour employed. We often find better dressed gardens where only one man is kept, than in others of greater pretenaions, and this is easily accounted for. The one man relies on no other person
to do the work for him ; he knows that if it is not done by his own hands, it must be left undone; he cannot fall back and lay the blame upon another. Of caurse, one man can only do one man's work; but those who have experience in these matters will understand what man of system can do compared with one of no system. The first rule to be observed, is to do everything in proper time. Suppose a few rows af Peas are to be
staked, or a row of Scarlet Runners, a box of Cucumbers or Melons that require stopping or thinuing; if these are left for a few days beyond the period when they ought to have been attended to, we well know the result; delay, therefore, not only tends to defeat the object of cropping, but it also so affects appearance and kindly growth, that the real interest which gardening pursuits afford is blighted in the bud. Therefore let proper season, remembering the old adage "that delays are dangerous."
flower garden and plant houses.
Out of doors work up arrears with all possible speed. Rolling and mowing should be proceeded with unremittingly. Newly laid turf should be beater and thoroughly rolled while the grouud is in a damp state, in order that an even and smooth surface may be obtaiued. Pot all stove or greenhouse plants which require it, in order that they may have the advantage of the next two months in which to produce a vigorous growth; and have time for ripening it before winter. Many ree growing plants which were potted early will now require larger pots, with which they should be supplied, unless it is wished to flower them in their prosent sizes, and somewhat earlier than their usual season. In the latter ease occasional waterings of liquid manure of moderate strength will be useful, both in maintaining the present vigour of the plants, and in assisting the future development of their flowers.
Azaleas. - Specimens now in full blossom must be shaded from bright sunshine. Plants that have been kept in heat to bring thenc into flower will require pretty liberal supplies of water. Great attention should be paid to ventilation, particularly in guarding against cold currents of wind. Young plants will grow rapidly if shifted and placed in a moist warm cemperature ; see that they are clear of insects.
Bedding Plants.-If it is wished that half-hardy plants should make rapid progress when plauted out, it is absolutely necessary that those taken from indoor protection should uuderzo a hardening process for at least a week. To be well established in their pots, and well hardened, is to insure success. Many, however, do not use pots after a certain stage of growth has been attained; on the contrary they prick out the struok outtings from their stare pois into beds about
3 inches apart, and hoop them over and cover with mats at night. Thus treated they lift with yood balls of soil, and when transferred to their final destination receive little or no check. Do not plant out until all danger from frost is over.

Tulips.-As seedlings expand they must be marked, either for trial a succeeding season, or to be discarded altngether; it is useless, for instance, to preserve tionse which have either ill-formed or stained cups.

\section*{FORCING GARDEN.}

Fics.-As the season advances, gradually raise the temperature of the house. Syringe mornings and afternoons. Keep a zoist atmospbere. When the Plants in prits and tubs slould have some weak iuanure

Mflons. - If there he and room to spare on lierbs or over bucts flues of houses "at work," some Di the Thes Meions may be placen theren in pots or boxes mellow turfy loam, out of which the loose soil has been separated.
Peaches and Neutarines. - Continue to kecp the shoots well tied in the early house, and be careful not to get them crowded. In disbudding, the bearing wood of the present year should be divested of all shoots excent the terminal one and those near the Whase (see an article in another colunnu, page 136.) Where a deficiency occurs in any part of the tree, more may be tied in. Ventilate freely in fine
noon. Syringe once or to close up early in the efter atmosphere by throwing plenty of watar keep a moin borders, \&c. Attend to the disbudding and the puth of the fruit in the secoud house
Pines,-Let shifting take place as soon as the phand have filled their pots. Give air freely to all groming
stock, and above all plenty of atmospleric Vines.- Let late Vines now breaking frets every attention in regard to disbudding, \&ce. The lithe borders, whether early or late. Litter in arou. menting state keeps the soil cool instead of itupurticy
warmth in the early part of summer.

Hardy fruit and kitchen gardm. Continue to disbud wall trees, and to keop them free from insects.
Broocoll.-If not already done, sowings of the be: kinds may now be made. Ward's Superb, a late form of Knight's Protecting, is a good late spring Thia Snow's Superb, as a winter white, and Mirehinson' Penzance for early spring, are also excellent.

Ond if a sufficient breadth has soon require thinning and a sufficient breadth has not been sown, a bed are thinned out of the principal bed. Make a sowing of the silver-skinned variety, moderately thick, in produce small bulbs for pickling.

DRINCIPAL EXHIBITION of the MECKLENBURGII

ROYAL AGRLCELTVLAL SOCIETY OR ENGLAND:

\section*{The agricultural Gazette \\ SATVRDAT, 1HAT 13 , 18e6.}

\section*{MEETLNG FOR THE ENSLING WRMK}

\author{

}

Thbin was a very interesting and instructive disensaion on Flax Culture at the Royal Agricultural Saciety's Ruoms last Wednesday. Mr. Beane Browne, whoowns land both infGloneestershire and Kerry, gave us his 10 years \({ }^{2}\) experience as a grower of this orop ; and Mr. MABSiale, of Patrington and Leeds, felated his experience as a manufacturer of it. Professor Coleman called attention to the diffeulties which ordinary agricultural routine pats in the way of its extended culture. Mr. MAGURE, M.P., stated what was doing in the county of Cork to introduce the Flax manufacture into the purely agricultural districts. The President, Sir E. Knzineon, gave a most practical account of the difficulties and probabilities of Flax oultivation in England, evidently basel upon ample personal experience in the county of Sutfolts. And from Professor Wilson we had a full sciontific resumé of the whole subjeot, with suggestions for altered management in many particulars.

Unfortunately the Flax-seed time is over for 1865; and Mr. Browne's discussion thus comes too late to be of immediate utulity, but we cannot doubt that his experience, and that of Sir E. Kbriscon, which we proceed to demoribe, will be influential on the erop another year.

According to the former, who has grown Flax on the Cotswolds, as well as on recentiy reclaimed peat lands in Kerry and Tipperary-a Flax soil Leed not be ealcartuus. There is plenty of lime in the Cotswolds, where they cannot grow good, i.e., sbundunt tibre; and, on the other hand, the Irish soils he referred to, whiah will grow nothimg else whatever until they have been limed, will grow a couple of g'od erops of Flax succeuding ove another immediately after their reclamatoo without any such help; and thns afford the means to the cultivatoc of buying a dressing of lime, ly which the soil is at once fitted for a regular rotation of erups. As to seed, the preference so generally alleged for Riga seed is altogether unfounded. Irish seed, a second or third generation from the Russian, is, in fact, botter than the fresh imported seed. The main difficulty in the

Way of Plaz oultivation on old arable land is its liability to being amothered by weeds; the remedy for this is to skim the land just before seed time. The best place for the crop in the rotation io aftor Whieat, on a well oultivated Wheat stubbio. If the seed be sown en a stale furrow the erop will be a failure owing to the weeds; but if the surfaee of the land be skimmed a week or so before sowing, this efil is greatly diminishod, if not altogether abated.

Flax should not be pulled till the seed is ripe. It may be stacked away at onee, and the eeed taken out in spring; this is best done by beating it with a flat beetle on a floor. Heckling removes the bolls, but they have to be beaten again to get the seed; and the whole prooess is done at ones if the Flax itself be beetled as is is laid on a level floor. As to machinery, there has been no improvement worth adopting during the past 10 years the old scutching stocks are still the best.

The failure of the crop in Ireland has been owing to the laok of local maehinery and the ungystematio way in whioh the retting and sale of the straw has been earried on. There is little use in attempting its eultivation unless there be a ready and systematio sale for the atraw to local Flax mills.
The profit depends prinoipally upon the okilfol handling of the straw after it has been grown the very same produce will yield fibre worth \(35 b^{2}\). a ton, or \(60 \%\). a ton, according to the manner in which it is manipulated. Another great obstacle to a protitable result for the small grower is that he is in the hands of the local dealer, who will not give a full market price. Mr. Browni's experience has been, that, taking one year with another, the erop taken after Wheat pays better than the Wheat which it suoceeds ; and in Gloucestershire during the past dry year, where the straw will be used for thatching purposes only, and the seed alone is sent to market, the Flax orop has paid 50 per vent. hetter than the Wheat crop.
Dr. Vowlcker, who spoke next, expressed the opinion that it was the presence of elay in excess in the Cotteswold soils, and not the presenee of lime that rendered thom unfit for growing Flax.
Professor Colmanar suggested that the subjeot of most interest to the English Agricultural Society was not the Irish experience but that of laglish farmers; and he pointed out haw, seeing that the protic depended upon the skilfal handling of the fibre, it was slmont impossible to bring the crop into the regular rontine of Eaglish paltivation, except where a rendy sale for the unworked straw was guaranteed by the establishment of local mill.
Mr. Magutre, M.P., desoribed the beginaing Which had been made near Cork in the systematic promotion of Flax culture by the establishment of such Flax mills, worleed by a Company with which he was corinected.
Mr. Marshatl referred to the Belgian experience in the growth of Flax, as well as that of England and Ireland; also to his own experience as a buyer of it from all countries. The climate and circumstances of the three countries led him to believe that while the best Flax was grown in Belgium, the next best ought to be produced in England.

Sir E. Kerrison, who has a large rettery on his property in Suffolk, told us that the cultivation of Flax had in consequence inoreased from 5 acres to 3000 acres in his county during the list few years. Loamy soils with clay subsoils are the best adapted for its cultivation, but the lighter class of soils are all available; and soil has more to do with the result than climate. A comparatively small raintall will suffice, and wherever Wheat and Beans will grow, Flax will flou:ish. It is, however, impossible to obtain a fair result unless the cultivator be near a rettery. In Ireland, where every little grower rets his crop in the nei hhbouring ditch, and dues it in consequence unevenly and imperfectly, no wonder that tibre cannot be produced of even or good quantity. But rutted in large quantities in properly constructed taulis, waether on Schenk's warmwater systern or on the natural plan as adopted in the Ly's in Belgium, the result is satisfactury. Thus, at Calue a Filax Cumpany has been established, and they are giving from 122 to 1\%l. an acre for the crop, and its cultivation during the past year has accordinghs extended three-fold; \(1 \frac{1}{2}\) ton of straw and 16 bushels of seed are a fair prosuce per acre. The seed ia capital fo d for either sture or fatting stock; mixed with Bean-meal it is mare vatuable than vilcake, and an ivstamee was given where 300 breeding ewes were kept in capital order without hay or roots for thirteen weeks on one bushel
of Linseed steeped and 1 bushel of meal daily along with out straw. Sir E. Krrrison expressed the hope that the restriotions which still in some districts hinder the growth of the crop may be removed. Flax is certaicly not a scourging crop except, perhaps, for itself; and, in faot, now-adays, with our unlimited resources as to manure, the words "soourging" and "exhausting" are no longer properly applicable to crop cultivation.

The discussion was olosed by a summing-up from Professor Wilson. Climate has less to do from the crop than soil, cultivation, and subsequent handling. Belgium, which produces the best Flax, is a drier climate than our own, and better Flas is grown in the drier east than in the wetter west of Ireland. Moreover the Flax plant is less of a "thirsty" nature than any crop we have. It is provided with a larger apparatus of absorbent roots in the soil than any other in proportion to the quantity of its evaporating surface in the air.

Professor Wilsos recommended the trial of a elose-cutting reaping machine on a properly rolled surface as likely to result in a better quality of the fibre; seeing that the separation of the root from the pulled plant is one great difficulty in the way of the proper handling of the orop. He believed that if the period were pruperly chosen, the crop might be cut and harvested in this way without the loss of the seed from shaking, and of course with a great saving of expenditure at harvest time.

The thanks of the Society are due to Mr. Browne for his address, and for the excellent disoussion which it has elioited.

On Wednesday of last week Mr. F. A. Paget, C.E. ( 18 , Adam Street, 1 delphi, W.C.), who has frequently in these columns discussed such questions of Engineering as agrionlturists are interested in, read a very instructive paper before the Society of Arts on the wear and tear of Steam Boilers, which is now more than ever a matter of great agricultural importance.
We select such passages from this paper as give the substance of the author's views on what is now a strictly agrioultural subject; and we have to thank him for the loan of illustrative wood engravings:-
1. On the Effects of Steam Pressure.- In calculating the worising strength of a cylindrical boiler, the plated are assumed to The former of these assumptions is seldom, and the second is never correct. There are two principal, causes that tend to exert impulsive strains on the sides of the boiler:-1. The
sudden checking of the current of steam on its way from the sudden checking of the current of steam on its way from the
boiler to the cylinder; 2 , quick firing, attended with too small boiler to the cylinder; 2 , quick firing, attended with too small
a steam room; and both may sometimea be found to act in combination.
Prom 1850 to 1864, 10 locomotive explosions causing a loss of

(Full iize crose mection of the furrowed longitudinal joint in the fire-box ning of boiler which exploded at Overton furrowns)
human life have occurred in the United Kingdom. The Board and more reports in the Bluebooks presented to Parliament, form the montecially those by Captain TYLer, R. E., probably on boiler explonions. Thin in more empecially the case with
regard to wear and tear cansed by the direct action of steam
unmasked by the effects of the fire, as the barrel and outside fire-boz of a locomotive cannot be sald to be under the dircet fire-box of a locomotive cannot be sail io be under the direct
aetion of the heat. Peraps the vation of the boiler
trough the motion on the line may inteneify this action, but ithough the motion on the line may intenaify ans action, but majority of the reports are illustrated by careful drawiags. Eighteen of the 40 boilers gave way at the firebox- 11 from
the crown of the inside fire-box being blown down upon the tube plates; seven from the shells or sides giving way. Twenty burst at the farren; and two may be ascribed to mis running off the line. Leaving outiall those which occurred a the freebox, as the majority of these might be ascribed to other influences than direct pressure, all the 20 explosions of
the barrel could be traced either to internal furrows or \(t\) t cracks, both running parallel with one of the loncitudinal joints of one of the rings forming the barrel. All the joints which thus give way were lap joints; and the furrows or the
cracks and the formerly greatly preponderate in number) occur at the edge of the inside over lap, sid, therefore, just a the point where the diminution of diameter caused by the lap joints would
(See Fig. 1.)
The plate at the channels shows distinct traces of lamination trrough the cross-bending, and it is probable that plate of a will crack through in much less time. Nor are these furrows found with only lap.joints. Butt-joints, with a strip inside the boiler, and thus destroying the equilibrium of internal
pressure, have been found to be attended with simillar furrows. pressure, have baen fine same charactor have been observed in locomotive
Germany.
2. On the Mechanical Bffects of the Heat.-While it is certain that boiler plates can assumee very high temperatures, even up to red heat, authorities diffor as to the diminution of ultimate strength Which is caused by heat, while its effect on the elas-
ticity of the plate has been scarcely attended to. The experiments on the ultimate tenacity of iron at high temperatures, conducted by BAODRIMONT, SEGUN, and the Franklin Institute, can acarcely be looked upon as of much value, for they were rary and permanent alongations wor to the elect of heat on the elasticity and ductility
Mr. Fairbairn observod no effect on the strength of plate
 tons at \(60^{\circ}\) F. 'f while at a "dull red" it was only 13.621 tons. Cagniard Latoor, found that at nominally the same tempe rature (rouge eombre), a bar of iron was reduced in strengtth to one-sixth of its strength when cold. This is much greater
diminution of strength than that found by Mr. FAIRBAIRN A part from other causes, this might easily be due to the fact that incandescent iron affords a different tinge during a dull day to what it does in a clearl light. In fact, the graet Impediment to all these investigations is the want of ajthermometer
for high temperatures: but M. TREMERY's result is perhaps more conformable with daily experience. Mr. Fatrbatrn' data would show that the ultimate strength of wrought iron
is reduced to about one-half; but M. TREMERY's result explain the generally instantaneous collapse of flues when red hot, and which have been of course originally calculated to a factor of safety of six.
A number of experiments by Lieut.-Colonel H. Clerk, of Wool wich, on wrought iron cylinders and plates, bear distinct evidence to a dilatation of volume in wrought iron, When nstance, 6 inchea flat pieces of wrought iron, each 12 inches cooled twenty times, one being immersed to half, and the other to two-thirds, its depth in water. That immersed one-
half contracted or became indented on the ends fully 3 inch; the other had similar indentations, but only to one-half the amount. They both turned up into the form of an arc," the cooled. Unio of which appeared in the portion heated and portions were not tried by Colonel Clerre. A succession o trials of the kind produced cracks in the metal, thus explaining how boller plates are cracked by imperfect circulation and by
cold feod-water let in near the fire; and, the thicker the plate cold feod-water let in near the ite ; and, the thicker the plate,
the more permanent diliatation of volumae and consequent the moore permanent diuatation of volume and consequen
danger. Mr. KikEALDY found that "Iron highly heated and
auddent if not afterwards hammered or rolled. This permanent dilata tion of volume must be necousarily accompanied with a dimi nution of specific gravity, thus affording another close analogy
between straining iron by loads in excens of the between straining fron by loads in oxcess of the mechanical
elastic limite, and straining by heat. LAJRHELIM found long elastic limits, and straining by heat Limzerkexim found long
ago that the pecific gravity of iron is diminished by strains in axcess of the limit of elasticity, and this result has been com. plotely conirmed by Mr. KIRR ALDid's numerous experiments in working through the often repeated applications of heat, o through too high a temperature. Iron rendered brittle by strains in excess of the limit of elasticity has been long popu-
larly termed "crystallised." Both thene states are gcomlarly termed "crystallised." Both these states are accom-
panied with a dilatation of volume and attendant hardness panied with a dilatation of volume and attendant hardness
and brituleness, and both seem to be referablo to very causes.
3. On the Chemieal Bffects of Red-hot Fuel.- Whatever physical
changes may be induced in iron by the bigh temperature which is not succeeded by the application o the impact of the hammer or the pressure of the rolls, it is certain that long-continued red heat leads to the loes of its metalice consintency. Its surface gets converted to a greater
or lens depth into forge scales, which, according to Berthirr consist of a crystallised compound of peroxide and protoxide of iron. The mechanical action of the gases-and ospecially of
the free oxygen contained in overy flame-forced at bigh the free oxygen contained in overy flamo-forced at a high
velocity by the draught past the more or less heated plates would also aid these chemical combinations-upan the same principle as fron filings, thrown through a gas flame, burn in descent lime is wom away by the flarne of the oxyhydrogen blow-pipe. These actions would take place with any fuel, even
with pure charcoal. But when mineral fuel, which mostl contains more or less iron pyrites, is used, there is much more danger to the plates, especially over the fire, in getting red
hot,
si the flames would then hold suluhurous acid volatilised sulphur a this kind is afforded by the fact that a piece of redehot iton plate can be easily bored through by means of a stiolk ol sulphur, the combination forming aulphide of iron.
Universal experience proves that the thicker the plate the exaer does it get red-hot; and these chemical facts also point
to the deeirability of a minimum of thickness. In fact, the wearing. away of tho plates through these causes, if mechanically neem. In Gerronany and France, poome of the best manufacturera shif make the plates over the fire of, for instance, inside flues, alightly thicker than anywhere else ; but the combined
chemical and mechanifosl aotlone of the heated fuel cause most Wear and tear in a thick plate, and thus justify American good charcoal iron are made only \({ }^{3}\) or \({ }^{\text {ar }}\), ire-box plates of and, with gtays four inches apart, givo good rewults under

\section*{4. On the Effects of the Feed-waler--The preseace of a coun

less less materials into a most useful chareoal, of the prepre fineness for mixture with bones and for any purpose of disinfecting; and it will deodorise the foulest
substances, absolutely and instantly a careful mixture substances, absolutely and instantly a cireful mixture
is made. In order to make it, all that is required is to set fire to a large heap of loppings of trees an elippings of bedges, and while the combuntion is going on to apply water, which, if properly applied, arrest
the burning of the wood at the point of charring, an before ash is produced. The smaller twigs will o course be charred before the larger are, nnd woter b applied at the proper moment for then, and this mus: be done to save the finer charcoal, the larger fragments not yet sufficiently charred, being raked and shovelled out of the burning heap and burued farther by a fresh supply of branches and twigs. In this way large heaps of charcoal can be made, by a little careful manipulation, from materials which are otherwise worthless, and which, as before stated, it usually costs something
merely to destroy. Charcoal is a lizatt and therefor bulky article, probably twice the bulk of bones; and the drier it is the lighter it is. In its use it is most important that it should be absolutely dry, and all its
pores empty and open; so that instead of being filled with water and vapour, they shall be open to absorb and reseive, with all their natural avidity to do so, all gases and liquids impregnated with matters of manuring
value. In a wet state it is of comparatively no value, but onder cover there is no difficulty in drying it, however wet it may be ir making, and may have become from exposure to rain. As to cost, that must depend on circumstances of locality, being able to make it
where the materials can be collected at little cost, and where water can be had and bucketed to the burning heaps with little labour ; a drain or a ditch can sometimes dammed up, so as to create a supply, at no expense. If the cost of merely destroying a quantity of suitable materials might be \(2 s\). or \(3 s\)., its conversion into charcoal in
convenient places would not cost more than \(4 s\). or \(6 s\). Such prices are assumed when the materials are reasonably at hand. If such charcoal were generally appreciated and wanted in parts of the cuuntry where such wood refuse did not abound, it might speedil become an article of manufacture in such localities as produced the raw material, and sent in a prepared state, like any other
might have arisen. \(K\).

\section*{RAW OR MALTED BARLEY FOR STOCK FOOD}
[The following account of Mr. Lawes' experiments is given ii AN effort has been made by the Board of Trade to ascertain whether there is or not any truth in the for live stock. The well-known agricultural experifor live stock. Mr. John Bennet Lawes, of Rothamsted, Herts, was commissioned to make a series of experi ments to test the comparative values of malt and report of the results of his experiments.
First, he took 70 quarters of Barley "of fair but not first-class malting quality," of which "one-half was malted and screened in the usual way." The otber half of this Barley was used raw. The process of malting increased the measure of 280 bushels by 10 bushels, but reduced the weight per bushel from 54 lb .10 oz . to
41 lb .10 oz ., making a total reduction of 100 Barley 41 lb .10 oz, making \(n\) total red.

A second lot of Barley " of fair feeding quality" was dealt with in the same way. The measure was increased from 280 to 281 , and the weight reduced from 100 Bariey to 7.8 marmers say it would best answer thei purpose to make into malt for their stock.

Experiments were made with milking cows to show the effect of malt on the production of mils; on oxen, sheep, and pigs, to test its feeding quality as com pared with Barley. The cows were selected from a 10 cows in each of two lots. The exact experiment commenced on the 21st December, 1863, "hen the animals were weigher, and it was continued for 10 weeks to the 29th February, 1864 Both lots received the same food as they had previousiy been fed on,-i.e., 5 lb . Rape-cape and 2 lb . Bean-meal per day, and a mixture of Clover-chaff, straw-chaff, and Swedes, ahich :averaged of Clover-chaff about 14 lb .
straw-chaff between 7 and 8 lb ., and of Swedes about 50 lb ." per head per day, except, that Lot 1 had 3 lb . of Rape-cake per diday replaced by 3 lo . of bariey; aud and malt-dust produced from 3 lb . of Barley. Tabular results in great detail are given, of which, as relating to the cows, the following is a summary:- "The 10 Barley-fed cows gave, during the 10 weeks, 10 lb . less increase in live weight, but 1067 lb . or more than 100 gallons more milk than the 10 malt-fed to be consumed for the production of 100 lb . of milk by the malt-fed than by the Barley-fed cows." As to the quality of the milly, a "mixed sample of the milk of each lot was tested once a week, morning and afternoon, by the lactometer, and that from the Barley.
variably showed the higher proportion of cream.

The oxen consisted of two lots of 3 years old polied

Sots, 10 in esel hint, so selected an to render each lot as nearly alike as pasilule. Thes, animals were fed on Clover-che!? an! Swedes ad limitum. On the 1st neember, 1533 , they were weighed, and the exact experiment commencet. Which was conimued for
20 weeks to \(A\) pril \(19,19 \sin\). During that period Lot 1 had 4 lb . of 13 arley of the 21 class above mentioned, and Lot 2 the malt and malt-dust produced from 4 lbs of the same l3arley. The results as to the oxen were, that bith lots "give more than an average amount of increase, whether reckoned in proportion to a given live-weight within a given time, or to a given amont of food consmmed; but the 10 having the umalted Barley ave during the 20 weets 408 lb . more increase in live weight than those having an equivalent of the same Barley malted. Less of every description of food was required to be consumed to produce a given amount of inerense in live weight by the Barley-fed than hy the malt-fed osen."
Five lots of Down wethers, consiting of 12 in each lot, were selected and weighed on the \(2 d\) of December, 1863, and the experiment was continued to the 20th April, 1864. They were fed under cover and on rafters, receiving 1 lb . of Clover chaff per head daily, and cut Swedes ad libifum. In addition, Lot 1 had unmalted barley, for 16 weeks \& \(1 b_{o}\), and lor four weeks 1 lb . per hoad per day. I oot 2 , malt and marl-dust, produced from equivalent manat refpectively, from the second quality Barley. Inot 5 had a mixture of Barley and malt, the duily weight per head being the same.

All five lots of sheep gave an average amount of increase, reckoned both in relation to a given liveweight within a given time, and to the amount of food consumed. Nor was there much difference in the result obtained with unmalted as compared with malted Barley. Such as it was, however, it was, upon the whole, in favour of the unmalted.
Pigs were bought and divided into six lots of eight each, and the experiment, as detailed, was continued for 10 weeks, from the 21th December, 1863, to the 3d March, 1864. The pigs fed on unmalted Barley, or on only a small proportion of malted Barley, "gave fully an average increase," but those fed on malted Barles entirely gave a defective result, "both in relation to their weight within a given time, and to the amount of food consumed. . . . . Where not more than onesisth or oneseventh of the total food was in the from of given amount of increase, than where the whole of the ad libitum food was ummolted Barley." The general result was, that with the exception of one lot of sheep, all the other comparative trials, whether with oxen, shcep, or pigs, the advantage was with the unmaited gainst it in the single instance quoted." The general conclusion drawn by Mr. Lawes from is more productive both of mill (of cows) and of increase in live weigat of fattening animals, than the amount of malt and malt-dust that would be produced from it. There is, besides, the cost of the malting process to be taken into account." For ordinary dairy or feediug animals there is, according to these experiments, no advantage in malting Barley, but the reverse. This agrees with the experiments made by Drs. Thomas and R. D. Thomson with cows and oxen in 1845-46, and by Mr. Lawes himself with sheep in 1819-49. Whether malt may be useful as a kind of condiment for young or weakly animals, or in making them up for exhilition or for sale, irrespective of economy, is thought by some persons to be another question. That for general and economical feeding purposes malt is inferior to rant Barley,

BREEDING AND MANAGEMENT OF SWINE.

6. And now, gentlemen, having freely expressed my opinion on the subject before us, and before I ask you to do the same, I will take the liberty of giving you a bit of advice, bearing directly upon it-not that I think there is any necessit, for me to do so; but, if in case there should be, it might be worth more than all I have said before-it is this, if ever you have an extra good lot of fat pigs, don't let the Long
Firm have them. These gentlemen have strong leanings towards fat pigs, and will be almost sure to find them out-they generally write from the suburbs of Londoa, Manchester, Liverpool, or Bristol, bat may
turn up anywhere at a distance, and a stiff price does not make them wince-tbey always want them for warded by railway, and will sometines quietly suggest that you will pay carriage, as a slight reduction on the great price they are going to pay. If you ask anything
about their banker, they will most likely refer you to their wine merchant, and cash down is the readiest way of silencing them.
And now, befure I sit down, I wish to say a word on behalf of the labouring man's pig, and hope, that where it is necessary to provide better cottage accommodation
for the agricultural labourer, a dry, well-sheltered sty for his pir, and a garden for growing vegetables will not be overlooked; for however much we may admire the pretty Rose bushes and Honeysuckles in the foreground, we are better pleased to find that the pig and the culinaries are not neglected, for we give a decided preference to that kind of teaching which induces the working man to grow two Cabbages rather than one
D.thlia, for the same reason that we are better pleased to find a well fed, home-cured flitch of bacon in his cottage, than that his taste runs on a fiddle or a birdcage; and we have known many farmers find it to trieir advantage in securing the services of an indus pig in the spring of the year, and a sack or two of meal, at market price, to fatten it on ; and for which he has paid with his harvest wayes, thereby keeping him out of the market and the miller's books. In many cases such acts of kinduess, which cost nothing, will go farther than any supervision, in attaching Lis zeal and devotion the interests of his employer, and which are as imperfectly represented by any amount of wages that tages that may accrue from the improved moral and social condition of his family, for there is a deep current of truth running through that homely expressed maxim which says, "It is a poor house where they never kill a pig.

\section*{Home Correspondence.}

Liebig on Agricultural Exhaustion-I have read with great interest Dr. Liebig's letter to Alderman Mechi, and your remarks upon it ; I wish to make a few notes upon the subject. There can be no doubt that the majority of farms in England being, it is oelieved, in the occupation of small capitalists, who not only do not purchase artificial manures, but what ie far worse, keep an inadequate quantity of stock, the quality of the land in their occupation, apart from the market price, is stationary, if not deteriorating. Living on the borders of Surrey, some 12 miles from any market town, in a district where the farms do not average 60 acres, and the mean unborrowed capital may be reckoned by as many pounds, it is not difficult to form an opinion on the subject, even if the new valuations (if any reliance can be placed on them) did not show that land, even in the hands of owners, is assessed at the same rents as it was 25 years ago! Still I demur with you at Professor Liebig's conclusions. It may be simply a proof of commercial prosperity when people are found who give a high price for land. Guano,
it is well known, does not permavently improve land-
and 80 with some other artiticial manurea. On the obs and straw are to be consumed on the land, if all be done, and stock kept commensurate with the fubt theory supposes a corresponding addition to the fer
of the land, at any rate sufficient, with the atmosphere in a well drained soil, with the aid deterioration. It is no proof, then, that land some 6000 years the world seems to have done them. All this is quite apart from the question fowns. J. P. \(\boldsymbol{H}\).

A Pet Lamb. - I went the other day to see a mid woman who has a tiny farm; Mr. H. gave her a lamb put into a "pightle" with a cow, and soon smelt ou: milk, and helped itself whenever it had a tanc woman wondered to see the lamb rowing mouster, and could not think what lad come cow that it yielded less milk than usual; at last began to suspect something was wrong, tor the , drivell snow ; so she set a watch, and soon lamb sucking, whereupon she separated them, and such work with them she did not know what to do. T cow was frantic and would neither eat nor sleen ran about like a wild thing, whilst the lamb co night and day, and the woman had to pet it and noe it herself. So there it is running about at the womas. heels quite a pet, and such a monster for its age ; 2 says it would break her heart and that of her chidre making money of she intends keeping it, and one d

\section*{Foreign Correspondence}

Farmina in Canada.-In your Paper of the 30. January last, under the head of "Foreign Correpon dence," you insert a letter addressed to Mr, Aldermo West, dated from the township of Dawn, Cunm writer sent you for publication. In inisis leter th with the country, that after many years of toil he ho utterly failed in his attempt to make a living by farn. mg and pay for his land as well, and that theusands of settlers in the same position as him self.
I have taken some little trouble to ascertain who 1 In Alderman Mechi's correspondent is, and I find that be is a lessee of the Canada Company, a very worthy mod respectable man in his way, but utterly unititad his previous training and habits for engaging contrast between his farm, which is in a noglected oncontrast between his farm, which is in a neglected
dition, with buildings of an inferior description, and t well cultivated fielas and buildings and unmistaieeb. indications of prosperity upon many of the farms arom: him, shows this conclusively. He has certainly been ge? fortunate on several occasions in the loss of his crops any cattle, but his neighbours have been exposed tho same casualties, and have had to contend mil similar difficulties, yet the evidences of general perity which now meet the eye, prove that, in spite occasional bad harvests and loss of soook, induatry, pe severance, and skill will in the long ran as cartan insure success in Canada as in any other part the world.
The writer of the letter, soured and disappointed, would seem, by his losses, has committed himmad tatements in reference to the prospects of smiain Canada, and to the capabilities of the country, whinare altogether erroneous.
In spite of occasional bad harvests, and the num hardships which settlers in a new country (mang hem totally unprepared by any previous tuad wit. heir new mode of life) have always to conteal the large majority of settlers have eilher them acquired, or are by degrees acquiring for them why and their children comfortable homesteast
but a few years ago was an unbroken forest.
As to the inducements which Canada ofers As to the inducements which Canadar of contro diction, that few countries present so many for agricultural settlers of all classes.

The Come of Cuada almost every part of the province suited to the of all classes of emigrants, the poor man capital. There are also wild lands of excion belonging to the Government to be had ocalities by way of free grant, and in aer acre, prices varying from 38 . to
In the older settlements, emigrants with capis will find excellent opportunities for inred improved farms, and mary a tenant farm in might obtain the freehold of a cleared fers real of whe for a sum equal to from thr
writer as to
Lastiy, the statements of time for bringing cultivation, profit on stock and liability ever they may accord with his own experience, do not fairly or xist the settlers have suffer from murrain and from the ravages of the fly
dor the het three years the harvests have not vilded the average of former yuch as agricultural combocka aro exceptio most favoured parts of the world are more or less liable to. I assert diatinctly that Canada doen offer an advantageous home to "the hard-working agriculturist" "the man of moderate means," and the farmer vith large capital. Each may find here opportunitie Sor the sequisition of land suited to his means, and all may look forward with reasonable certainty to comfort and independence in their adopted country as the Alimate reward of persevering industry and jadicious managementr. 4 Camadian, Mareh 25.

Bath and West of Eivaland.-At the last Monthly Meeting of the Courcil, the Hereford Meeting, which commences on the 5th of June, was represented by many respects to excel any former exhibition of the Society. The cattle classes, especially those for Herefords, are likely to be unusually well filled, and the fords, are likely to be unusually well filled, and the show of horses will probably be one of the very best
hitherto wituessed in the provinces. The entries of the more important agricultural machines and implements are considerably in advance of those at any
former meeting of the Society, and the demand for former meeting of the Society, a
shedding is unprecedenteally large.

\section*{Farmers' Clubs.}

Lownow: May 1.-Importance of Shelter at the Homestead. - The following is the conclusion of Mr. Bacisy Dinmon's paper read last week:-
It bas been advanced by several advocates of the covered pmstem, that in the construction of new homesteads it 18
ponsibe so do deaign the required accommodation as to avoid a
cunantity of the external walls involved in ordinary fonsiderable quantity of the external walls involvedin ordinary farte buildings, and thereby save sufficient money to pay for
the additional covering of the yards. If this were so, there rend be no difference in the cost of the two ssstems ; but practice does not support this view altogether, though the
nctual difference in the cost of homesteads with and withoat
conering covering, snitable for farms of 300 acreseand upwards is com-
panitively umanl. Let me here say a few words, which I bope
will dict the Whill elicit the opinions of those present on a very important Phint, materially influencing the question of cost. Irefor to
the space actually required for the health and comfort of
stock. The opiniongion
 in souare feet is found ample: but experiments have been
wande which show, howerer, that stock evill do quite as well on less pace, and tbat the maner, that stock will do quite as well on all the animals in them space given. In covered yards, where
stram
alike for shelter, econd where the posed to reen strek ; but in my own peet practice I amale always dis. epace required for that the horned stock of the farm, inc the mean in size acond two. year-olds, giving to each class a apace varying
mibetantial manger The. The cost of covering any space in a reat the rof but including internal supports, will wary from

the ind
 the crint per head will vary practice to allot to each animal, are siven with a knd irnen frames with slates). These figures there arped vard is may be constructed for less money. Indeed, Eirkjeathana, in which be gives article by Mr. Moscrop, of

nee can corroborate, rather than by isolated examples. It will be found that the covering of existing yards, having externa
walls ready for the roofing, will cost on an average in walls ready for the rooing, will cost on an average sil. per 100
square feet, or 18. per foot of surface covered; the extra cost
of covering yards where all is new of covering yards wbere all is new, and the arrangement for
covering is providecif for in the arch htect's design of the buildings, will aproximate very closely half that amount, \({ }^{2}\). e
2l. 10 s. per 100 equare feet, or \(6 d\). per square foot covered. T repay the cost of such covering in 31 years, with interest, require 6 per cent. on the outlay; and thus in the one case it
will require 6 s. per annuma per 100 square feet, and in tine othe 3s. per annum, to discharge the cost. Applying thisspecifically to a farm where the number of neat cattle of all ages kept 18
100 , and where it is desired to accemmodate 50 of that num 100 , and where it is desired to accermandate 50 of that num-
ber in yards under cover, it will take 5000 feet of surface to provide the required space, say 2 yards, 50 feet square : the total cost when a new covering is given to an existing yard will be extra co, and of covering when the oricinal buildings were de-
the ext
signed to reconer signed to recover it,
ment \(7 l\). 10 s. per year
It is not necessary for us to go into a scientific disquisition to satisfy ourselves that warmth of the body is essential to the profitable appropriation of food.
No animals can exercise thoir feoding functions with the fffect which all good stock farmera dosire if the food given
and heat. It is quite clear, however, that those farmers of the coldest winters, are not fully alive to the fact that warmth fiven to a far as a greaser quantity supplied to them when exposure to The necessary heat of all animals is maintained by respiration which in winter becomes more rapid in proportion as the tmnsphere abstracts heat from the body; and as reapiration the carbonaceous matter contained in food undergoes in the stomach, it follows that the colder the atmosphere the more food those animals require to keep up the necessary vital heat. To discuss this point would indicate a doubt of the first principles upon which auimal nutrition depends. It would be far
better, if it were possible, to give in figures the value of shelter better, if there possial resnits. But I am able to do very little in this way. I have pointed out what I consider are the effects of exposure in the stunted growth and the lean conditiou is most exposed; I Ihave referred also to the prevalence of epidemies in those districts, and I will now do my best to show
the advantages of coveriug to stock in a growing and store state, as well as to animals fattening for the butcher. Iam in which farming is concerned, no precise statistics of although I have written on the point to a considerable number of gentlemen who have covered yards. All my correspondents concur that thes are more or less valuable, but
none have tested their experience by accurate accounts. Ione have tested their expearion entive, by a careful experiment at the money value of coveriug for young stock, having in the wutumn of one year purchased a number of yearlings, which yard with sheddiug, and half in a covered one. Both lots were fed exactly alike, and in the following spring they were suld, and the result showed that the superior shelter or as covering from the making this difference, so that \(6 d\). per week each head repre sented the value of the extra warmth of a covering. You will probably have observed that Mr. Moscrop, in bis paper in the
"Journal," states that he gained pearly 18 . per weak return "Journal," states that he gained pearly 1 s. per week return
in his experiments with fat stock. His experiments were for

 horned kucks of anl geves. Though the followink extracts from
a lecter from Mr. Dent Dent, M P , explains more generally a letter from Mr. Dent Dent, MP, explains mure generally
than Ethstically his experience, \(I\) will venture to reat them.
as they nut ouly relreeent the views of many other geritlemen as they nut ouly represent the views of matuy other gertlemen
besides humself, and are expressed with all the force of a personal interest in the matter, but they serve to corroborate the
estimate I tave given:- I fear that I can give you no accurate statimties as thene money value to me of my covered yard. Ycan tell you how we bave used it, and mo what way 1 think it
has prover of great adrantage to me. Last year 1 put into it twelre bullocks, which1 did remakility well, hall going of in
January, the other hulf in Marcl. But this year I turnod the shed, which had been part of the yard whinen uncovered, into
five loose bozen and I found thet accommodate 115 good edzod bullocke instoad of 12 and I
aot my fat bullooks off a month moner than uual, sinco which time my \(2 \cdot\) year-olds have oocupied the yard, and are looking.
oxcoodingly well on pulped ronts and chaff with a littlo meal. The confort to the beasts in eeili wet weather I can scarcely then some or other of the beasts nlways is driven cut into tho about in every direction. Wo are now geting gutet the ninanure,
and putting \(f_{t}\) directly into the land, ridgod up for Mangol, and at a vors small depth it comes up rottod and sbort, and in the very best cundition. When the days lengt then, and the
sum becomes powerful, I often think the opon yard to the best, and I should like to take the cover off, as the young boasta do so much enjcy the warmith; but when I thke the winter
through, there can be no quention an to the comfort and luxury of a oovered yard. For feeding boanth, and for young stocl
alike, the advantage of warmth is untold. My oalven, which for mome winters ran in an opon yard, and which now oonupy
boxes containing three each, are worth more by a couple of poinds a hend in the mouth of Mas than they were in the opon
old. This fo partly from tho warmeth aeparatlon and classifcotion.". If your experifonco and know.
ledge of the lenefits of shelter shall enalilo you to support Mr.

 open yardo, excluding from our mindo for the moment the com-
plex question raised by large tillage strawe roducint fard plex question raised by large tillage straw-produciug farners.
1 have stated, upon the best information to bo botranned, that
1 and vard of covered dung is found to be equal in manurial
value to it yard of open-yard dung. it is also uniformly admetted by all who have fairly tried the two descriptions of
adung when properly mede that the covered dung sity dung when properly made, that the covered dung in always in
a fit condition for application to the land, while ene open yard
dur dung most frequently requires to bo placed in a h hoap to und orgo
fermentatation before it can be pread on the land. I may hero in covered yards. much otraw has boen littorod at orus time and thio dupg is mouldy and dry. But this defeot arisea from a deafro to "get
rid" of straw, In the hope that by increasing the littor moro manure will be madide, and the failhro which resmits is thereficio If the effect of civering is to make 1 cultic yard of dung made under it as productive as 14 yards of open yard dung,
and exch beast in the yard, taking the averago on a ae and size
will raise a layer of dung 1 yard deep, \(i\) e. 6 inches a month Will raise a lager of dung 1 yard deep, \(i\), 6 inchex a month cubic yards will be mado in every 100 square feet of surface
covered. The saving effected by this resalt will appar in several ways. First, there is the saving of straw, which if not consumed as litter becomes asailable as forder; sconnd, by the
straw thus saved being ueed as chaff nixed with other food, there is the saving of hay; thurd, the reluced quantity of manure
involves, as already shown, asaring in the cartage; and fourtb, trolves, as already shown, a saving in the cartage ; and fourtion
there is the advantage of always having the dung in a condition or application, which secures a saving of time and labour,
ofter at a critical period. Can these advantages be valued in the aggregate at less than 5 s. per 100 square feet of space coverea! If you concur with me that this is the least amoung
we can place to the credit of the covering as means of securing the best manure with the least expenditure of straw, we havo then, with the \(78.6 d\). due from stock an annual income of
12 s . \(6 d\). per 100 square feet on the credit side of the scecount. \(128,6 d\). per 10 equare feet on the credt side of the accuunt,
and a maximum sum of 68 , per 100 square foet on the debtor ing Hence the profit in the transaction is equall to the coost Where roogng is put Lo existing yards, and three times the cost place this little bit of book-lkeeping before you as a balanceresult of any dogmatical fancies of my own, and are presented with a view of elciting discussion of the most important of all view of it. Personall), I am of opining that the time will come pasture preponderating, and rainy districts, will resopt envered yards as a necessity, if they are to keep pace with the growing intelligence of the country; but when uttering this prediction it may bo intoreating as a matter of statistios tostaro instauces on the eastern side of England, in which the covered a-duzen cases in which covered yards exist in the western counties, where they are most wanted
It was my intention to have gone into the quertion of the time to ascartain the pinions of practical mon upon it, and I must therefore beg you to excuse the omlasion.
The following is an abridgment of the discussion which ensued upon Mr. Denton's paper:-
Dr. Voeicher had given some attention to the most profitable use of straw, both as litter and as a means of preserving the this question, they ought to bear in mind, in the first place, that in straw there resided little or no manuring properties-that was to say, straw contained very little nf chose manuring
constituents which conferred value upon the excrements of constituents which conferred value upon the exerements of
animals, and which give value also to artifial manures. In fact, straw, as a direct manurivg agent, was not worth carting posesessed a very considerable value as fond \(-\Omega\) ralue which he did not think was ever-estimated by the figures which Mr.
Bailes Denton had given them, namely, 37\% a ton. He thought that some rado of straw wero coneiderably above that value, as for example, Oat straw, and Pea straw which
was not too ripe. Straw bad an important nuechanical effect when not tro riped to the field, but it was questionable whether that effect might not be realised by other meane at a cheaper rate Ho beliovod it could. It was very well known that by mochanlcal meana, auch as deep ploughing, they could produco the same effect. In fact, ho thought the mechanical effect
of straw as a manuring agant had been over-estimated.

\section*{}
 Whencids, which had the power of preserving ammonia,
of and it fixel them with ssch force, that no chemical fixer,
and
such as vitrinl or givpsum, requirel to be used in the
preparation of farmyard such as vitrinl or gypsum, requireci to be used in the
preparation of ffrmyard nanure. Tris was cortainily a very
valuable property which straw digplayed in the manufacture of
farmgard manure

 perature of farmegard manure Was increasert a little abov
1so the desired effect ceased. He mentioned this particu-
larly, in order to give them a useful hint ato to what amoun
of straw they ouglit to use in the preparation of farmyard dun of straw they ought to use in the preparation of farmy yard dung
If they used too much straw in preparing it, there would no
be enough liquid, whether it were urine or raiufall; th If they used too much straw in preparing it, there would no
bo enough liquid, whether it were urine no raiufall; th
fermentation beeame too strong and the heat increased beynn the proper temperature, in consequence of which ammonia flew
off. It was quite possible by an excessive use of strawt to make
bad manure umdor coner bad manure under cover, as well as in open yards; it was
therefore a matter of practical importance to ocegulate properly the quantity of straw in the stalls or fatcening boxes. Ho need not spoak of the superior value of the liquid over the son to
oxcerementitious mattiors of duvg, for that was well known to
intelligent farmers: but there was a chemical point to whte he must be permitted to direet attention, and it was this-the
liquid portion of totten dung had a most active power of disliquid portinu of rotten dumg had a most active power of dis
solving the nince valunble fertilising matters of the solid excre-
ments of animals. They knety, for tinstance, that phosphate of Hito or the mater matial
duat depended-wne uble in pure water, but ho the liquid constituents of the selid exerements, they would now see an nditional reasson fro ireesvinge their liguld manure, for in so
doing thes wrild not only retain the fertlising matters in urine,

 was otherwise insoluble
Mr. T. F. Wrisor (Althorne, Maldon) said-The question
of Teatiation seemed to him to have a very close connection Whit the succeas and healthiness of covered bomesteadio or they woold thereby greatly increase the profit of farming.
Therefore any system that would asve an expenditare of food must in proportion be of immense advantage. Those
who heard Dr. Daubens's lectures inany years ago might rexaember
the ques
 by whiok that solrce of loss conld be avoided must be an
afdanatage to the farmer asaregarded the expence of feeding ani-
male. male. In reality, the whole question of profit in ferming was
very cloeely connected with economical consumption onf food. Henad been latoly watching the operationson a fi iend of his, who that exercise in an cpen yard was a materifial advantage, and he rollicking abont in the straw up to their knees, and searcely able on sume cold nights, with all the fond he had given them, to
keep themselves warm. It appeared to him that that was a perfect absurdity, involving as it did a great waite of food.
Mr. Bailey Donton, or any other gentleman who taught the
furmer to avoio waste of food by exposuare to a cold atmosphere, wonld no doubt be conferring an onormous benefit upon
that class. As regarded expense, he had put up a galvanised
covering as an oxperiment, and he really believed that if covering as an oxperiment, and he really believed that if a
ffrmer woro toplace a cortain number of animals in an open
jard, and the esmo nurber in a covered yard, and then compare the roeulto the greater rapidity of fatting the Eu that in fact at which har been expended in the coverine Bhed for notbing
Mr. Chating
Secturer soene HowARD (Biddenham, Bedford) maid:-The Chesbire farmers of turning out cattie in the winter months Now, he knew it was the practice of many breeders of short believed that the systen was a correct one. Where there was a sufficient extent of Grass land for the animals to walk they got exercise, and retained that coat on their skin appeared to him so desirable. The practice was carried condemned. Tbe question of the comparative value of covered yards or open yards ought to be considered, he thought, with they intended to fat of their animals before the spring, a covered homestead, was vers desirable ; but if they had young ther breeders in the Midland countionend mi. not like to and animals withont any hair apon them; and if they put an animal undor cover the hair very soon foll, and the animal much indebted to Mr. Bailey Denton for calling the attention of landed proprietors generally to the importance of providing who had a bad homestead ran a very unequal race with the Aub was confined principally to land-valuers and land-agents ouppoing suoh to be the case, it would make it of the greater importance that Mr. Denton should have lain his paper before us, or it depended in a great degree upon such persons whether
farmers have good homesteads or not. He lived in a county where they had the privilege and great advantge of good Grace the Dike of Bedford, who had not onls, as every one Mr. Joun Thoyas (Blatsoe Be fie best honleateads.
Mr. Joun Thomas (Bletsoe, Beds) assured the meeting that having been a farmer for something like 30 years, le had made done. He had what werstermed brexes for foeding stock; and bat is made in stals, mane in them was mueh botor tuan yards (the stock being feri on the same food). He could therevalue of manure so mamaged ; it was. at least 20 per cent. upon the ventilation, Which should always bo from the top,
upo
nod not from bel.nv. Mr. Congrove had told them, and ho pith Mr. Bair un them, and sheekness of coat. He bellieved
Wemained under that the best and strongest bullincke bullock finto the yard to starve. Ehence they drove the wealker
stockik would be forced to the conaluaion who studiad larme yand a gripter quantity of food is required to lyeep stock

probably were covered ; but the land there was chiefly arable
and what they breed or keep they feed. The north-western
counties, on the contrary, were grazing, and what they kep
they grazed oft in the summer. The cattle that did the bos
for the graziers came out of open fards, or what they called
"open hovels" in the Grass-tield, in which the animals could

\section*{roduced by hovels; but in his county they considgred th} food and advantage to the animals. The bullocks put into
these hovels consumed leas bay during the winter. The wou d go into the sheds at night, and leave them in the day-
time; and they always were found in such places in a batter
state thau by any other arrangement. He should like to ask Mr. B Denton a question as to the experiment he carried ont
with 10 bullocks in a covered, and 10 in an uneovered yar Mr. B. DENTON: I did not keep them till next summer. Mr. Conareve: Then I venture to say that those from the
covered yards did not fetck so much money as the others if The ChinRMan, in elosing the discussion, said he had
of boxes and some yards with three sides covered, and he found from experience that his beasts fed much better in the
boxes than auywhere else. The boxes were cleared out twice -ycar, and it took abjut 20 reeks for an ox weighing from 60
to 80 stones to make nine loads of duug, in a box. He had that came out of the yard, and it was exceedingly strong. The 20 weeks bullocks consumed daily a bushel and a half of good Tumips, from 10 to 121 lb . of cake, and from half to three-

\section*{Mr. Congreve : No wonder it is rather strong}

The Chairman continued: Something had been said about that respect, which was rather against the practice of pulping He had one or two cows which he was feeding on sliced
Turnips. He fed hie joung stock on pulped Turnips mixed same way. The result was that the milk decreased. The old plan of feeding with sliced Turnips was then adopted, and the
result was that the cows yielded the same quantity of milk as before. He would add that in a statement made last year, 1
think, by Mr. Hope. of Fenton Barns, that gentleman said Mr. B. Denron replied. In the observations which had been made that evening, nothing struck hin with greater wonder
than what fell from his friend Mr. Charles Howard. He (Mr. time ago, and seeing brought out from a covered building one of the best animals be ever saw. He well remembered Mr
Howard attributing its excellent condition to the covering it had enjoyed. As to the effects of covered buildings on animals not believe that if covered yards were properly ventilated the
stnck woul 1 become too tender. If properly ventilated he
believed it was impossible to make an animal ton tender when they had sufficient exerciso in the covered yard. He underatond Wr Congreve to say that as a grazier he would lave nothing
to do with animals which were brought up under cover by those
whor reared them. He (Mr. Denton), bowever, could tell him
that he often found animals produco very difterent skins under that he often found animals produce very different skins under his jard animals which had been treated exactly the same, Howard might tell him that he had not the right sorts, and

\section*{Farm Memoranda.}

West Buckland, South Molton. - [The following is the conclusiou of the report of the Rev. J. L. Brereton on Stocking Land, given last week from the Agricultural rociety's Journal.]
The Valuations. - The first of these was made by myself and my bsiliff, towards the end of 1863. It was atterwards revised, item by item, by the late Mr. George Burden, of Kerscott, who was esteemed as one
recent death, one of the beat men in North Dero Warkleigh, whose judgment and experience bore e farmer and valuer are recognised with areat both wis throughout the district. The standard of tien valuations is not, I believe, very different In that the excess of the later valuation is not io attributed to any exceptional rise in priees, bot the sheep to careful drafting and in bullocks, to the growth of young ath generally ioproved condition in stock, and to the liberal expenditure on food and attendance.
lly high if viewed in reference to the capitaplion ally high if viewed in reference to the capital rat represents the whole expense of supervision, atten ir on the stock, cartage of manure, haymaking, have, it is true, paid higher wages than the neighicon hood, but bave, I think, had a proportionate retura o heerful work. In attendauce upon stoek, it in course possible to reduce the cost of labour very that I see how very great improvement might be mody o my farm ; but I have been much occupied in the matters myself, and the importance of these things not always perceived, and very seldom euforeed b subordinates. It is the coachman only who is inte to see that all the harness is adjusted to the teme The uninterrupted attention required to etarr
economy either in a small or large farm is getrall economy either in a small or large farm is getram failures; in my own case, if I do not quite acknomlod
failure, I can see daily that my affairs might hare te failure, I can see daily that my affairs might hare beta much more economically managed; but my only wey. certain principles. I have thought that the tre economy of labour was to be found, not in lower razes ut in a higlier quality of workmen
The following analysis of my labour-bill mothe some explanation of the amount incurred

Weekly labour

 (hired)
Sand.-Passing to the next item of axpenditure, the principal manure purchased has been sea-sand. Ths uas been used as bedding for bullocks, horses, ani heep, instead of straw. It cost me 6s. 8d, per tor, as If have to draw it eight miles. .Speaking runght, think that for bedding purposes the ton of sand gom as far as the ton of straw, while the latter costs mi 308. per ton. Except in the stables, I do not like to wo any straw used for litter, though it has not bees eag to break through the feeling of the attendants that the comfort of the animals required its use. The oconomit however, of converting straw into cems so great, that 1 have perseve the sand ; and I think my bailiff and men would gear ally now give it the preference. The effect of the manure has been very striking: in the last very dry summer, 22 acres yielded fully 45 tons of hay: the quick action of the sand-manure has been noticed the neighbouring farmers; it has the ground rer. nat the slieep cau be pastured upo after straw manurn This distinction may depend upon the salt which contains. The remarkable healthiness of my s:ock, spite of the number kept to the acre, many persaps attributed to the free use of this sand ; thongu somedians is due to the high situation on the boraers subsoi and much to the healthy action of the slay

Quantity of Stock to the Aore.- The block kept on loes not of itself explain the number of she dates of in the 30 acres, because if doentiky of extra land, the purehases, or the quantity of ext in the ger charge for purchased food. But I think I can ay mim certainty that the average number of sbeep kopsonny the year upon the 30 acres has been 150 weeks there were less than this number, favour the hay crop; but after the hay the

According to thet throe weeke own judgment is, that by constently old and the scy the, the necessary rang. ge have trouble with their foet if they are tread the ground overmuch. But 1
forming yards to be asphalted, in

Bere thom alwars fed in very wet weather, allowing them the open pasture atine should be constantly at withe or mowing past year I was cutting Grass with work ; during the pase beginning of May to the middle she rachioer. In the epring and autumn the mown irass has been further cut into chaff, with straw for he brillocks and horses; but the sheep have had it arried to their troughs fresh cut.
The in lambs were with their mothers to the beginning of June: I then hired a piece of Clover for them for ning of Junth. On the 1st of July they came back to the lebe, and hare ever since been upon it in two pens, glebe, and and 32 rams. Since the 1st of July, the ewe lombs have been over about 10 acres of ground, in part lambs (the segthe intervening), in folds of \(\frac{1}{8}\) to \(\frac{1}{\frac{1}{2}}\) of an twice (the scytbe lambs have been kept rather closer. arre : the ewe lambs had about \(\frac{1}{4} \mathrm{lb}\). of meal eacin from June tolietober, then \(\frac{1}{3} \mathrm{lb}\)., and since Christmas \(\frac{1}{2} \mathrm{lb}\)., the parimum allored to ewes. The rams began with the same quantily, but were pushed forward more quickly, and from Cetober to the present time have been getting and froe more than 1 lb . each. On the day I write (Jin. 21, I have ascertained that the following are the actual ailowauces:-

\section*{}

Allendance on-
80 ewes.

\section*{32 ram inog \\ 37 ewe hofgs.}

143 sheep. One man's wages, 12:. a week, or \(1 d\). a week per sheep.
These allowances represent the highest cost of keep laring the year; and I find that they correspond ver'y rarly with the allowance at the corresponding period of last year. The bullocks are having 10 lb . of the ised food, and the horses 4 lb ., with hay and straw ciati, but no roots.
The following memorandum of the consumption of foll on the 14th of October will represent very nearly the average consumption of meal in the year:-

\author{
20 fatting ewe \\ 3? ram I Imbs
38 ewe lambs
6 bullacks
2 ditto .
5 horses .
}

Milk.-The charge for milk, 11 d . per gallon, is, I am told, higher than the average price of new milk. I have found that in buying or selling new milk in small Inaulities in this village, the price has been generally rerted into butter in my own family, and the skimmilk consumed by lambs, colts, \&c.., was charged to the farm at 3 d , a gallon, the price of 11 d . may perhaps be higher than the average, and so represent on ray balaue?-sheet an uureasonable profit. But if so, it explains itself.
The cows have generally been bought fresh calved, and milked so long as their milk seemed to pay for their food, and then fatted. We have thought that, fed upon meal, they lay on more fat while milking than when fed ou roots. In one case I fatted a cow and some sheep on meal and water alone, but without rery accurately noting the comparative cost. The cow, however, was considered to liave done remarkably well, and the beef was unusually juicy. Her allowance mas 12 lb . of food, with water ad libitum. I mean to repeat this experiment, and have ordered two cows just dry to be put on the same allowance; their cost rould be \(15 \%\). per day, besides attendance. My bailiff thinks the the require a small quantity of chaff in addition to the meal, in order to assist them in raising the cud; tut not for the sake of bulk, which is sufficiently suppingred by water-as nutriment is by the various arredients of the meal.
Roots.-The Turnips purchased during the year Lave cost about 12 s . 6 d . per ton, and about 150 tons been thournsumed on the glebe. This quantity had and more espeny bailiff necessary both for the ewes, eale, but I especially for the rams he was preparing for meal whink that the same money expended in wished to ld have 'gone further. I have not, however, ence ; though dept too abruptly from the track of expericase are sogh it is clear that the circumstances of the an l dean altered by the relative cheapness of corn precearness of cattle that the cautious observers of precelents may be more likely to mislead than the Tinles much I
some rersuch I think I can assert as to the result of 1. That it ing experi nents in the new direction:ciased food alon quite possible to feed animals on pur2. That alone.
eg. Liuseed, Pens, be the common grains and Pulse, for 1011 peed, Peaz, Bzans, Wheat, \&ce., may be made \({ }_{3}\). That then, which will fatteu any animal.
Fenogreck are those then of seasoning (Aniseed and \({ }^{2 n}\) additional cost of that I have used for five years) at aditional cost of 17 . per ton, appears to pay well in
the added relish and the improved condition of the animals.*
1. That doubiing the quantity of Linsced, though raising the price, probably gives quite a proportionite iucrease to the value of the mixture.
5. That by the use of this meal the farmer may fearlessly increase his stock without aduing to his acres; and yet, by that increase of stock, must greatiy increase the productiveness of his farm. This consider ation both euggested and replied to the following exclamat on of a neighbouring farmer: "Mr. Brereton, if you'm doing all this on 30 acres, l'm thinking what's to become of the landlords."
6. That the use of sea-sand as bedding will enable the farmer either to dispense with straw, or to use it more profitably as food; and that besides possessing, according to its quality, manurial properties, the sand acts as a purifier of the laud, and seems to allow of a closer herding of stock than might be otherwise safe.

That sheep may be folded on Grass with great advantage, if some shelter and dry treading is provided in adjacent yards during excessively wet weather; but the bullocks and horses do best in yards and sheds, the Grass grown after the fold being cut by the scythe and carried to them.

\section*{Calendar of Operations.}

West Sussex : May 8.-After many changes of weather we have at lnst got all that we can wish for. March was very cold and dry, April very warm and rather dry. May came in dry enough, and fears were begimning to be entertained that we should have * short crop of hay, but on the 4th we had a little rain, and on the 7 th it came down in torrents. and torain, and on the 7 th it came down in torrents. and to-
day has been clear and very warm, so that there is every prospect of Grass and corn, or at any rate of straw. Mangel has been all got in, and in good order, and now will soon be up; and Swedes may be put in soon if wished, but many dislike putting them in before the beginning of June, though last season thoso that had them in early hat the best, and they were the only ones that had any crop of Swedes, but early Turnips nearly all rotted. The Wheat can hardly be said to look very well; it is backward and patchy; where thin and regular the colour is goon, where thick it is rather yellow, but no doubt will improve with the weather that we have now got. Barley and Oats look very well, though in some cases the wireworm, as usual, has got at some of it, and the land being so light was rather favourable to its ravagos. Peas perhaps never looked better or cleaner; it is a characteristic of the season that all land is comparatively clean, and we never had an easier season to get through the work. Cittle are now being turned out, and there will be abuudance of food, and prices, that have never been low, will no doubt rise. Though our market has been well supplied with all kinds of stock, prices lave been high, and at the best they can leave but a small profit to the feeder, and wit'l our coast-land farmers times cannot be very good, as corn, which they have chicfly depended on, is low, and as they do not breed, but buy their stock, and prices lave been sohhigh, they could not make much of them. Bat with the stook farmer it must be better, as what he has lost iu corn he must have gained on stock.
Owing to the short supply of roots there have been fewer lambs bred for fatting hereabout, and as they have had more corn than usual they are all ripe for the butcher sooner, and will be sold off earlier, so that we may expect them to rise rather thau fall in price as the season advances. Our market last week was well supplied, and the quality was good, and sold at from 36s. to 41s. each. And mutton was in good supply and as dear as formerly. There have been few labourers out of work, though perhaps there have been fewer hands employed during the winter, and should the crops come on rapidly there will be more work than we shall find hauds for, aud reapers, mowers, and haymaking machines will have to come more into use from necessity. And by and by we shall have all the modern improvements in use, and the whole system will be changed. For there does scem something wanted when agricultural labourers got only 11s. or 12s. a week, while others are on strike because they cannot get from \(8 s\). to \(21 s\), a day. G. S.

\section*{GREEN'S PATENT SILENS MESSOR,}

\[
\text { AS RECOMMENDED BY THE JUDGES OF THE ROYAL HORTLCULTURAL SOCIETY'S SHOW HELD JULY } 20,186{ }^{2} .
\]

GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that las been given in all cages of eompetition. The Judgesat the Royal Horticultural Society's Show, held July 20, 1864, awardod them a First-class Certificate (no Prizes were given), and, at tho sume time, sugrested a slight alteraion, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& Son beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to exccute orders with that despatat due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust to beit position to send off all orders the day they are received.

> PRICES OF HAND MACHINES.

Packing Cases are charged at the following low rates, viz. fur the 10 and 12 inches Machine, \(39 . ; 14\) and 16 inche., 4s.; 18 and 20 inches, 5 s.; 22 and 24 inches fo Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damagai if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKEY MLICIILNES, ineluding Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

The 26, 28, and 30 inches can easily be worked by a Donkey, or Jy Two Mten, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Carriege Home anil, as the MACHINES make no noise in working, the most spirited animal can be employed withont fear of its rumning away, or in any way damagincs the MLACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening: the cutters being steel on ench ser then they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter againist the bottom blade, him the MACHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Parth in England; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

Mandfactured solely b

\section*{WHITE \& CO.}

29, BEDFORD STREET, STRAND, LONDON, W.C

\section*{The peccliar Advantages of these Closets And Comanodes over the ordinary Water Closet are: -}

First. - That the deodnrising material (dry surface carth, or clay, or other subsoil) is the best for the purp and at the same time is the cheapest and within the reach of all classes.

Secondly.-The supply of such material to any house or premises may be much easier than the supply of 0,2 by a foreins pump, and its removal after being used may be entirely without offence
Thirdly:-Its application by the means provided in these Closets is immediate and effective; so immediate ti . offensive smell need escape into the room or building in which they are used ; and so effective that all ferment: and all escape of noxious gases are entirely prevented.

Fourthly. -The expense of these Closets, in comparison with that of Water-Closets, is, as to the firt ant rifling, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are burst in frosty weather
Lastly.-In all large Establishments, such as Hospitals, Union Houses, Schools, Gaols, and dsylums, a i: considerable sum may be saved annually in the production of a valuable manure

The efficiency of these Closets is so great as to be scarcely credible to those persons who cither have n-t as: them or neen their mode of action,
** The different forms of Closets may be seen at the address above; and Prospectuses will be forwarded

\section*{JOHN Warner \& SONS, London, Manufacturers.}
J. WARARR and Soys
Have much improved the constrection of their GARDEN ENGINES
in some important particulars for this Season.
They may be obtained of the Trade generally throughout the Kingdons at the following prices:-
No. 547. WARNER'S best ENGINES, in Woon Tubs, and fitted with Warner's Registered Spreaders-

24 Gallons, \(£ 6108\). 14 " 5 10s.
No. 547A. WARNER'S strong ENGINES, in Galvanised Iron Tubs, well painted-

FUCHSLLS - The following aro Mr. Banks's special varieties for

CONSOLATION I ROSE OF DENMARK (156.)
Sover varieties, 10s, 6d. ench.
CENTAUREA RAGUSINA COMPACTA, 3s. Qd. each. - This Verf
 pact dwart hatit tit dinters from itse prototivese in in having horter
 nonst desiranle ard prominent distinction from the original
species consists also in its purer white leaf aurfaces, the under
as well as the upper one, by which it yields a very begutiful as well as the upper one, by which it yields a very beautiful
silvery feature and contrast with opposite dart green and
chocolatocoloured leaf-tints. It is aso pee from the wide spreading outline of the leaves observed in the mature summeer
growth of C . ragusina. This desirable plant by its greater adaptation for ribbon rows and marginal efrect in border culture, apart from its gnowy whiteness in warm aeasons,
will eventually supersede the older kind hitherto used in flower gardens.
NEW DWART BELTING VERBEAAS (Type "VIavke Cabhon"). The following varieties are comprised in the new rection of
Verbenas, hybridised with V . venosa, and distinguished by its
 the orriety sont out last season as "Yolvet Cushoin" Is the type
and which was univerally admired for its attrictiva features and

 by the production of a denaer growth peculiar to many perennial
 ARIEL | CORDELIA | HELENA | JULIET NEW DWARF TROPELOLUMS.
The following fine varieties aro seedling of 1868 , and have thus varieties hitherto uave been but the mere seminal productions from Well-1 nown kinds, and prematurely suld se distinct and permanent
in babit. These have the strain of T. elegans in constitution dwarf, compact, and vigorous gabit throuk hout the summer months, without deviation of growth or bloom, colour, or effect. The leaves
never rise above an average and uniform height, and the bloom being never rise above an average aud uniform height, and the bloom belng T. COMPACTUM COCCINRUM. - Habit of growth uniform with the foregoing, equally rigurous and compact; sterns tirted redi,
laves small dark green, obscurely pilose or haary on the under
surface ; flowers glowing scarlet self colour good formo, style of surtace; flowers glowiug scarlet self colour, good formo, style of
T. Eclipse, but larger, epanding uniformil and in profusion
forming very beautiful patches of 12 or more inches across, and producing o brilliatit teffect by a rich contrast to darker crimso varieties, or colvurs to match in extensive ribbon rows, betts of
margins, beds or borders 14 select fower gardens, or extensive
 continued succossion of blownt. Adnirably adapted for reserve early sutumamonths. Each 18 .; if 12 plants, os.; if summer and COMPACTI I LLTELM. FFormin a densely low and almost flevel
circuiar style of growth, from 6 to 8 inches an hoight, short jomnted and vigornus, leaves comparatively amall, , iggt, green,
stems slightly hairy, Howers brilliant orange-sellow, with picturesque crimion spots in centre, rising in profusion, just above-
the leaves. It is finely ad, pted for decorative effect in ter ribbom rows, and medium sized beds, groups, \&c. Each, 18.; if 12 plante, 98. ; if 100 plants, 50 s.
NEW LOBELIAS.
PRINCE ALBERT. - A beautiful dwarf beddng variety, in the bection of L. speclosa Paxtoni. havivg a better constitutional
habit for continuous grumth and bloom; its more robust and compact growth, with rich ylossy green doliage, is litarally covered
by its profusion of large bright azure-blue flowers with a conspicuous large white centre, thronghout the summer and eariy margins, and extensive front ribbon lines, this is the best variet PRINCESS ALEXANDRA. This is equal to the foregoin, 12 plast 98. growth, benuty, and effect forming o donsely compact habit
Fieiding a fine effect in cuntrast with the blue ones of unitor.n gruuth and uplasite colcur. As a white-flowered variety it is admarably adapted for extensive margns, ribbon
lines, and groups. For front effect to edgings of dwarf Heath, or approprate eplant; and the best white broad-lobed variety of L .

VERBENA LADY BINNING.-A first-class bedding variety, and the leading Hlywer for extensive decoration of the present year.
Colour a very brilhant crimson-tinted scarlet, with a ccn. splutuous creamy wiute centre; furmang a fine averagestized, full
oontred, and well-expanded truss. In bit of growth compact with a profusion uf bloum. Proved of the highest mernt by of the Royal Hurticultural society, and forming Commatte feature of attraction in Verbenas at the Oulton Park Gardens The Wellington Nursery, St. John's Wood, Londor, N.W.

\section*{CRETINGG FOR TKE ENSUING WEEK.
 Batcedar, - \(27 \begin{gathered}\text { Royal Horticultural (Weekiy Sbow at at } \\ \text { South Kensington }\end{gathered}\)}

The second part of the first volume of the Genera of Plants by Mr. Benteam and Dr. Hooker, is now so far advanced, having already been printed beyond the completion of Legaminose, that a few remarks in anticipation of its publication, illustrative of its peculiar character and objects, will not be considered ill-timed or superfluous, while many of our readers will be rejoiced to hear that they will have shortly another instalment towards the completion of a work whose importance is acknowledged by every competent botanist.
The theory of the stability of species, whether in the animal or vegetable kingdom, though till very lately almost an article of theological faith, has from time to time been rudely shaken, but has within a few years been still more forcibly invaded by the speculations of Mr . Darwin, whose views, whether altogether or only partially received, have opened the eyes of many a botanist and zoologist to a more just and philosophical apprehension of the mutual relations of the organised beings which surround us. So long as Herbaria or other collections of natural history were poor in specimens, and were made rather with a view to number than intrinsic worth, while the important bearings of geographical disposition were neglected, the theory was tenable enough; though even then the distinotions which separated one recognised species from another were often sufficiently slender to excite more than a passing doubt as to their absolute validity. But when specimens were procured from every possible locality, definitions which before seemed valid lost their apparent precision, such as it was; and it became at once evident that old notions must in great measure be
abandoned, and that not only the primary groups, but each suoceeding division, mast be defined rather by the predominance of great modification capable in particular forms of great modification thing like mathematical formulæ. Eren those geners in which the species seem at first most genera distinguished from each other by nature as, for example, Carex, present on a more close but general examination instanses enough of the poet's "endless seeming confusion." The transitions, indeed, in the genus just mentioned, are 30 gradual, and the relations of forms so intimately made them an especial study, have been compelled to confess that they hardly know where to draw the line of separation between species and species It is easy enough, indeed, to do this in almost any genus no \(\operatorname{long}\) as the materials are soanty; and instances might be quoted where a single specimen, in different parts of which the leaves or other organs have assumed a different form, has given rise to two or more spurious species; but those them, are compelled every day to take a still wider range. Examples might be given of startling unions of supposed species in the Flora of Tasmania, published only a few years since, but great as is the reduction effected in that excellent volume, Mr. Berstiak, when at work on the Australian Flora, found a decided to rears to redimate still further:
Our business is not, however, at present so mush with species as genera. These, at least, ought in the popular estimate to present marks of stability, if they fail to such an extent amongst species. But even here something will be found alike, though none resembles the other," and that the more natural the groups, the greater the difficulty of definition.
We are not, it may be ohserved, speaking now of such ill-grounded theories as those which are reproduced from time to time, respecting the supposed transmutation of Oats into Wheat or Barley, which spring up again with fresh vigour, though always refuted, according to the proverb as old as Solomon, "Though thou shouldest bray a fool in a mortar amongst Wheat with a pestle, yet will not his foolishness denart from him.'
Nor have we in view the inevitable proposal of such genera as Monachanthus and Myanthus, the fertile and hermaphrodite state of Catasetum, which can only be reduced to their right category When accident, or intuition like that of DARWIN,
has demonstrated their real significance. Nor, again, do we allude to the supposed origin of
Wheat from Agilops, but of things which lie much nearer the surface. Take for instance, ,uch a case as that of Polypodium rugulosum, which, when provided with an involucre, is Hypolepis tenuifolia, a fern which exhibits at least six widely different conditions of that organ, while Darea is confluent with Asplenium, and our own Athyrium Filix-formina, when destitute of an involucre; becomes a Polypodium.
Or if a general rather than a particular instance be more illustrative, take the natural group of the gill-bearing Fungi, for we know of none more exactly to the purpose, a group consisting of at least 2000 species. A study of 40 years has not enabled Fries-who is more intimately acquainted with them than any other botanist, and whose powers of judicious combination and distribution are acknowledged everywhere-to divide the large mass of Mushronms into anything like well-defined genera ; and even where particular groups present something like sufficient characters, the most distinctive occasionally fail, while in those genera
which differ most widely in the natare of their gills, there is such uncertainty, that the same species in different states might not only be referred to three different genera with equal justice, apart from natural habit; but the same specimen may exhibit distinelly in different parts, the character of the three genera, while individuals might be thrust entirely out of the group, and referred to annther primary division of Fungi, of which that which produces the Amadou of commerce is a wellknown example.
And such is the case everywhere, where the groupe are truly natural. Besides, it must be remembered that the value of generic distinctions must vary with increased knowledge, because it is more or less arbitrary. Some genera-as Rosa, Dalix, \&c.-are in themselves objective, and no Grasses, Umbelliferæ, or Compositæ, are subjective, and no two botanists agree about their limits,
because no two have the same mat
Still, in the present state of knowledge, if only or convenience sake, and to help the memory, it is indispensable that some judicious limits should be fixed, or else the "seeming confusion" Will become absolute, and we shall be able to take no comprehensive view whatever of the relations of natural objects, as they exist at the present arent or they have existed at different moment, of the formation of the earth. For, let periods origin be what it may, our business is to take such a view as may be consistent with truth, while it enables us to distinguish aocurately for the ecessary purposes of life, and for the due estimation of the relations borne either by groups or individuals to the various questions which may arise in the several branches of science. It is obvious, therefore, that a work like the "Genera" -which is at once comprehensive and particular, and whioh embodies all that is at present known as to the relations of plants-must be one of immense importance, if conducted on sound principles by authors for whose oonsciontious ve of truth and powers of accurate discrimination here is a perfect guarantee both in their character and publications, provided at the same time they re in suoh a situation as will enable them fully to carry out their views.
Now, it is quite needless to speak of their qualifications, of which no botanist of any pretensions can possibly be ignorant, as their publications are received everywhere as olassioal ; nor can the favourable circumstance under which they are placed, for the execution of such a work, be questioned. Not only have they at their command the richest and most varied collection which was ever made, together with a very perfect botanical library; but as the herbaria are connected with a singularly rich botanical garden, they cannot run the risk of being mere herbarium botanists, incapable, as is too often the case with many a species maker, of recognising the plants they describe excopt when dry. Dr. Hooker, moreover, has studied nature in a great portion of the world, and has made larger collections in their native haunts than almost any other botanist; while few persons have a more extensive knowledge of speoies in all their minutest details than Mr. Bentham.

The want of such a work is recognised by every practical botanist. Many years have elapsed since the publication of "Endlicher:" which, whatever its merits may have been, -and these are undoubtedly great,-must be regarded rather as a laborious and clever compilation that a book of original research, and the same may be said of that of Meisner.
It is clearly of great importance that working botanists should be supplied with a good book, in which genera should be compared one with another, as well as accurately deflned; and that this work, like that of LinNexus, should be throughout elaborated by the authors themselves, exoept in the few instauces where the original materials are not accessible. Without such a book, it is quite impossible that authors on geology and geographical distribution should be able to work acourately. Besides which, even had the merits of former works on genera been greater than they are, it is desirable to bring the statio of botany np to the present time and to eliminate a world of trashy matter, which can serve only to perplex and disgust students, and to make them disbelieve in botanists altogether. Take; for examplo, a work like that of Etotzscre on "Begonia," or the numberless treatises on species and genera which teem from the German press, where new species are proposed from individual specimens without the slightest inquiry whether they have been described before; and where genera are founded on minute points which can barely serve to separate species, especially in such books as those of Kutzanc, in which a single species forms materials for several genera. If an especial example of botanical contusion is needed, we have only to refer to the fact demonstrated a year or two since before the Linnean Society by one of our authors, that a single śpecies of Oak has been desoribed ander ten or more distinct names, and in many cases entirely without excuse.
But not only is it necessary to destroy a number of bad genera, but mullitudes of good new genera exist in herbaria which it is desirable to record, because every new genus, if well defined, gives a fresh datum for the formation of correot general estimates, and is sure, more or less, to confirm or modify previous views.
Besides all this, it is most needful to fix, il pos
sible, approximately the limit of the generio ten in the series of forms from variety up to olem limit that can only be obtained by taking a view of the whole vegetable kingdom. The elats ration, moreover, of such a work can scarc-ly for to result in juster notions as to the trae positi and circumscription of natural orders and the comparative dignity-points which are at pree confessedly imperfectly ascertained, system af system being almost purely artificial.
which exist respecting many proposed division arise simply from imperfect knowledge; and the limits and relation of orders are firmly estal. lished, we can scarcely expect to obtain goon general notions of the distribution of the serem members of the vegetable world.

One of the most distinctive and importas features of the volume, and one which has ners
before been so uniformly catried out, is the before been so uniformly carried out, is the es
mation of the exact number of known good sen in every genus, and of their bution-a matter which has mpirically, but which is the been obtain labours, the enormous extent of which may estimated from the partial example afforde the introduction to the "Flora of New Zealad

No needless delay will, we are sure, take pla in the preparation of succeeding parts of this nor each of which, however, is complete in itself. II trust confidently that not merely botanists, but a who wish to have a complete library, will encoung a publioation of suoh great importanco, as it most desirable that it should at least pay its and not prove a loss to its authors. \(M M_{0} J_{0}, B_{0}\)

We have little doubt that the Ryyal Hortical tural Society will in the end have canse to con gratulate itself that its 'Great Orchid Sinm of Satntday last was an undeniable failure. H3 it been otherwise the Society might hare been tempted to persevere for a while longer battle with difficulties against which no amoun of energy could have ultimately prevailed. Firs of all there was a numerous band of professed exhibitors bound together under a solemn compa that they would not again show their plan Saturdays, let the inducements to do so be nere so great. Then there were in the suburbs a me known phalanx of eminent growers, who, though professed exhibitors, have latterly evinced a position to befriend the Society by sendiug their choicest treasures to the Tuesday show on Saturday these parties can render little assistance, as the last day of the week is usul set apart for the reception of their own friends, whom, rather than to the promiscuous they naturally wish to exhibit their plants. again, there was another class, who, residing distance from the metropolis, could not sen their plants for exhibition and the rest the Sabithout encroaching on then res reasonably and very properly objected. Here the we have a combination of raverse circumstan. each in itself enough to have seriously impal the success of any show-all arrayed against Hortioultnral Society on last Saturday, Which the adoption of a more con. would at any time set them free. profess to be in the secret of the Society' we conceived to be good authority, that season no further attempts will be made any of the more important shows on what is sufficiently proved to be an impossible dav. although the Saturday shows may be abs Sat we have not the slightest doubt that promenades will continue to adralour gardens at South Kensington, to hear go meet pleasant people, and buy pretty become one of the thasiost aristocratio for the week among the most an metropolis. In proof of this point to the brilliant Gardens on the occasion 10 which we and who did not appear to be in any w certed on finding that the Orobid
was supposed they had come to means up to the mark.

While, howe speak of Saturday's sho of Orohids as having on the whole it expectations, we cannot but ad an specime mauy interesting plants. suavis exhibited by Mr. Hill, bury, Esq., The Po near Ware, and to thaw Mr. Saunders's \(5 l\). prize fur the best Orohid \({ }^{\text {rid }}\) adjudged, well deserved the honour.
prored io demonstration that it is not only guite diatinot from \(T\). codoinea-with which it was ouce coin to that speoies in beanty. rantly supendurata, from Mr. Bateman, came londed with spikes of its strange green and black fowers; while that still more extraordinary Orehid, Cypripedium caudatum, exhibited in high perfection by Mr. Wentworth Buller, furnished perfection by Mrstration of the advantages of the mol system under which it had been grown. Messrs, Maule and Messrs. Lee each exhibited extensive and interesting collections, which would however, have appeared to far greater advantage had some feeble specimens-no doabt introduced had sake up the number required by the schedulebeen sltogether eliminated. But by far the most remarkable object on the stage was the speoimen of Renanthera coccinea, of which we have already (pp. 108; 988 ; 1864) given some account, and which, now that Mr. Smiter, gr. to S. Norri Eiq., Altrinchaw, has tanght na how to grow it we shall hope to see again at more than one of will not belie the name-of the ensuing year.
- A Correspondent asks if the light transmitted through Groend Glass is injurious to vegetation in a
house devoted to Ferns and allied plants. We answer no ; bat it may possibly at certain seasons be deficient The effectiof using ground glass is just that of shading; a certain amount of subdued ig jun is suffoin tho the mants of the particular kinds of plants cultivated ander such circumatances Now Herns, it is well known, as a general rule prefer gloom and shade; and
though there are seasons at which the constant gloom though there are seasons at which the constant gloom pot propared to say it would be in any case practically injurious. Of course it is altogether different with the majority of plants which have to elaborate flowert for suck plants peirpetual shade would induce perpetua his Ferns grow freely suffcient proof that in the ground glass there is nothing inimical to such vegetation, the partial unhealthines probably in the soil, or the temperature.

The Liferfool Chrysanthemum Show is announced to take place on the 22 nd of November in
St. George's Hall. We observe it is required that the plants mast be all grown one in a pot, "the stem to be distinctly seen above the soil,"-a very good rule some rule is avoid disputes. Another very whole Secretary before commencing to stage any collection of plants, in eamers or fruit, a correct list of the plants, be pernitted, and any collection of this list can corresponding with the list will be disqualified. the arrangements are frequently their coll produce. This until they can see what their opponents exhibitors themselves, nor neither fair as between the management; and the rule in question should operate to prevent it. Prizes are offered for groups of three Poinsettias, which ahould make a very good display at
- It is minounced that the Joornachof the Rova placed in the very competent hands of of which it contributor, the Rev. M. J. Brakriey, is to appear in parts of 80 pages esch, with two or more woodcuts or such numbere, will be issued to subsensisting of fou year, and from numbers are to appeat in the presen

ORCHIDS AND THEIR CULTIVATION. \(-N O\). \(V_{6}\) IT seems tolerably clear from the berutinisin affected plants have been subjected by "M. J. B.". (see
pp. 147, 172 ). that there

By fry of forther illustrating there aibeases, it min
be well to notice the plants most liable to attack, and the practice which has a tendency to mitigate it, or arrest and eredicato the evil. It if only by mtriking fairly, fully, and openly at the misfortandes in practio Which baffle our shill, and by calling to our ald the accurnulated wisdoth of sclevtitic minds; that we on hope to arrive at sound deductions as to cause and cure. Some may consider it to be more prudent to adopt a reticent style of writing in treating of failures in practice, for generally we have all the good recorded with as little of the bad as possible; but I prefer getting at the root of the malady which, in a greater o less degree, stares every Orchid grower in the face Notwithstanding all the examples I have submitted, the Meadowbank collection is singularly clear of spot for out of hearly 2000 platists, there are not more than three per cent, affected with either one or all of the forms combined. I have seen and had to do battle with it, giving me much uneasiness of mind, when there were three times three; and evan riow, with stelh an insidious enemy to deal with, it would be foolish to indulge in self-gratulation.

The No. 1 form of spot seome entirely to cotufine its ravages to plants grown in a tropleal houte, which is chiefly constructed and reserved, where the collec tion is numerous, for the cultivation of the great sub division of Vandee Singularly enough the very genera that stand unrivalled among all oriental flowersPhalænopsis, Saccolabium, ană Aerides, are most liable 0 attack. I have never seen here or elsewhere single instance of this pulpy muculent disorder in any Vanda. Were this disease only to make a partia encroachment upon the leaf or leaves at the first onset, there might be some hope of arrestivg its progress, probably by some simple abstersive lotion, such as Mr. Radclyffe suggests; but it often first affects the internal portion of the stem, and layer after layer o tissue is destroyed, the leaves sometimes falling of comparatively unipjured. It is diffeult to know how o act in such a case. Fortunately there is only very small percentage of plants attacked in this way, else the consequences, pecuniarily speaking, would be very serious; and those that are so visited are often
the most vigorous among their fellows. It might be the most vigorous among their fellows. It might bo temperature, by inefficient ventilation, by the want of a proper degree of light, and hence the whole system would be improperly consolidated. This indeed would be a formidable array of circumstances, likely enough to induce evils of no inconsiderable character, but the effects produced would be more uniform than what is invariably the case in all well-managed collections, for plants equally vigorous, of the same species-in fact, duplicates of the same, treated exactly in the same way grow on uninjured. This is not a form of disease, 80 fa can be predisposed like the others I shall presentl treat upon, so that one would be inclined rather common to this high order of plants derangemen system is subject to diseases which occur independently of a system of living which may be pronounced by the highest, authorities to be unexceptionable, and whic occasionally baffle their united skill to counteract Surely then it is too much to expect one to practise so successfully, from the physiological point of view we are discussing, as to prevent the propagation of diseases and counteract them after they have appeared. I should much like to know whether this or any other form of disease occurs in the plants in their native habitat Another point of importance which I cannot speak not. I have once or twice thought so from the fact of more than one plant being affected after the disease appeared, and have on all occasions deemed it prudent to move them to another house which forms a hospital for such patients.
The second and third forms of divease ard so intimately conneoted one with the other as to appoar vory mach alik. Nevertheless, in my opinion, which is fortified by the microscoploal examination of "M. J. B.," they are essentially distinct and due to totally different causes. The No. 2 form is very common to all East Indian and Brazilian Orchids and is unquestionably due to a variety of cause more artificial heat that we require to apply to provide a sultable climatè for successful culture Undoubtedly there are varieties of certain ppecien whose system is much more easily deranged than others; but upon the whole practical men have ascer tained that, under certain treatment, this malady never appears so formidable in collections as to excite mach uneasinesis. Before dlecoursing thotit the counteracting medium which hat a beneficial influatice, I may name the plants that are most liable, even under the best treatment, to this form of spot. These are-Oncidium Fieldingii. Phalanomsis of sorts, Cattleya lobata, Dendrobiug densiflorum, and its allies. As I said before too much heat without a proper and proportionate degree of moistiure predisposes to this spotting. W have been told that as soon as spot mane its appear regime. The interpretation of this leaves the novice very mach to his own dedtuctions, and, in nine cases

If there is the lenst tendency to arldity, instead o but it is excoedingly difficult to strike a proper balance ar thore 50 to propound a given ratio so tha hoke in wharge must rely with this caution upon their own experience. For the illustration of thim point, if the growing of a plant belonging to a more texperate region in a tropical houso is persisted in, however well the house may be supplied with moisture, it will be attacked with this form of spot. One case in point will be sufficient to convince the most incredulons. W had a large plant of Acineta Humboldtii, which was growing in a stove house kept rather abve an inter cuediate temperature. Not only the leaves but the pseudobulbs of the plant were affected with the spot Thad it cut up into six different pieces, and potted each piece into a hanging pot perforated roun.l the ides. Three of these plants wero placed in the Cattleya house, and the other three in the Mexican rouse. There is a considerable difference of tempera ure in these houses, and the moisture is in proportion. ow that the plants have completed their growth, and the peouddbulbs are "thoroughly matured, I find tha dhose in the Mexican house are half as large again a hose in the Cattleya house, and more than that ehe race lavo outgrown spot, an the while the later still show it on the young psendobulbs, alchoug not of so virulent a character. In a word, because we hall come to treat more fully upon these questions when considering cultivation, all extremes of heat cold, moisture, aridity, stagnatit itr, imporous material or root action-anything which has a kendency to ex eite or retard overmucts the functions of the plant an artificisl climate is productive of the thorst consequences to the genera well-being bf the plant; /y unlese in such instances (1) what cited of Dendrobium rpeciosum, which is a shiy bloomer under ordinary treatment. All these practical maxims taken together, indireetly make u an atmosphere suited to these exoties: and it ia mainly although probably not absolntely, due to the nonobservance of one or \(4 l\) that dinease in generated The only direct remedy that I ever applied was charging the attmosphere \({ }^{\circ}\) with sulphurous vapour, the water pives deing painted with flowers of sulphur. If this has not been productive of great results, at all events it did no harm, and I am inclined to look npon its influence much in the same way as the confiding patient does he prescription of his medical adviser. Prevention i better than cure, and if there is such a thing as Fungue existing in the atmosphere, the ensual dobes thu administered should subdue it
The third form of spot, although sometimes detected on examples visited with the second form, is rather due to constitutional weakness, induced in most cases that have come under my obsaryation at an early stage of the growth of the plant, than to any sudden cheok or incidental eatse. The affected parts are more lougitualinal than orbicular, rutning more in parallel lines than in concentric circles, and the latnina is ofter destroyed in such a way as to greatly disfgure the plant. Unlike the second form, it has never such a powet ful effect as to destroy the vitality of the leaf, but in some instances it takes years to subdue. have had suveral plants ander ing charge of this ind toted of thich are not producing leaves quite free from spot, and others growing gradually out of it. Gerterull treatment, with the view of propagating roots, is what alcould be nimed at with all such ceptional case in favour of this kind of apot. It is rarely you will find a plant completely free from it, and this by most people is met down to the credit of the being grown in too high a temperature. Being found in the mountainous regions of Khasya, it will bo doubtless very much exposed, which may be partly the reatom for its refusing to luxariate in a climate where we cannot afford at all seasons to introduce rapid air currents. This remidas me that I saw at least aix plants in the very fine Orchidacesus collection of M. Guibert, Passy, without a single spot on either of them. The smallest of them would be a foot high, lothed with leaves to the rim of the pot, and each leaf broad and vigorous. On asking Mons. Leroy his mode of treating them, he intimated thatit was precisely similar in its character to that of others of the Vanda
and Aerides tribe, only he kept them a few degrees cooler, and gave them more liberal ventilation. There Will always be instances of a like character, so anomalous as not to be easily accounted for; and although the mode generally carried out in treating ding to my dicta, rather nduce the second form, this nevertheless presents more the appearance of the third. James Anderson, Meadonobank.

\section*{RITCEEN GARDEN PLANTS-NO. IV}

\section*{Bent}

Consmerable diffeulty is often experienced in get ting Beets true to thame. They are nearly alike in many respects that one variefy is nften sent out fo another. In addition to this much confusion arise from the fact that every seed establishment now-
dey
has its own "Selected" or "Improved" Beet deys has its own "Selected " or "Improved" Beet,
known variety, the re-handling of which is also some times accompanied by a corresponcling advance in price It may this happen that a seedsman may send out this year under his owń name, Nutting's Dwarf Red, while next reason it may be Henderson's Piue Apple, or some other kind.
There was a time when Oldacre's Superb Redi, a rariety raised at Stoke, near Windmor, and the Castlenandery Dwart Red were largely in demand, and were in fact staple varieties. Both have now died out, or they have become incorporated with others. Really perceptible differences of character can be claimed for some four or five rarieties only, viz., Whyte's Black, a very dark coloured root, often of indifferent quality; Very Turner, of Slough, घs Short's Pineapple, deen crimson in colour, tender, sweet, and well-flavoured, dwarf and compact in habit, and generally uniform and fixed in character. This variety was, I believe, raised by Mr. Charles Short, gr. to Sir W. B. Proctor, Bart., Langley Park, Norwich. Another is Carter's St. Osyth, the origin of which is due to Mr. W. H. Dunnett of Dedham, now a partner in the firm of Messrs. James Carter \& Co. This last is a very fine Beet, large, high coloured, sweet and tender, the roots generally being of good shape. Closely resembling this is a very fine red Beet locally dosignated Covent estly designated Covent Garden Moce, a much esteened in Covent Garden Market, being high coloured, tender, mild and sweet in flavour. The roots are of far size and symmetrical. The stock of this is Fuhe dextent in the hands of Mr. A. Dancer of Fulham. Nutting's Dwarf Red bas achieved a widespread popularity as a first-class Beet. I think it was in 1859 that it was prononnced to be the best in trials made with Beet at the Royal Horticultural Society's grounds at Chiswick. "The flesh is deep crimson, of smooth close texture, remarkably sweet and well flavoured, and withont the earthy flavour of which many kinds of Beet partake." This is the character given of it at the trial in question, and I have no reason to think that it has altered.
A very good dwarf variety of continental growth is largely imported into this country. I have no doubt that in many instances this does duty for "Small Selected Blood-red," "Fine Dwarf Red," "Short-topped Small Crimson," \&cc. of the catalogues. I have seen a remarkably fine stock of this "foreign importation." magine this also represents Cattell's Dwarf Blood-red Sang's Crimson, and one or two others which have attained something more than a local notoriety. The great requisites to be sought for in Bert are depth of colour, fineness of texture in the flesh, mildness, sweetness, und freedom from earthy taste. As a vegetable it is higbly nutritious, as well as exceedingly wholesome. Dr. Lyon Playfair states that a good brown bread may be made by rasping down this root with an equal quantity of flour.
The Green or White Beet, known also as Perennial Spinach Beet, is cultivated wholly for its leaves, which are dressed as Spinach. It cannot be said to be a popular vegetable, though it is cultivated to a considerable extent in some oarts of the conntry.
The Silver or Seekale Beet is grown for its leaf-steme and heart, which are used like Sea Kail. A greatly improved variety, the leaves of which are beautifully curled, while the stalks are much whiter, has recently been senć out by Messrs. Beck, Henderson \& Child, of Upper Thames Street. As a vegetable it is said to be very delicious, being particularly tender and delicate when appropriately dressed. The Scarlet Brazilian is cultivated solely for decorative purposes, its leaves being of a good colour.
The White Silesian Sugar Beet is almost if not entirely employed for agricultural purposes. It is by no means largely grown in this country, though cattle greedily devour its sweet and juicy leaves. On the Continent however large tracts of land are devoted to its cultivation, especially in France, Germany, Belgium, and Russia, for the manufacture of sugar. It is said that a root contains often as much as a tenth part of its weight of sugar. It has been computed, that, at the present time, not less than 362 millions of lb . of Beet Sugar are mauufactured on the Continent. Quo.

\section*{HEATING ORCHARD HOUSES.}

I commenicated to you last week (p. 435) some o the results of heating an orchard house, but said nothing as to the mode of heating. The stove used was a brick Arnott, placed inside the house. Nothing could be more economical; but it took up space, and was unsightly. I wished, therefore, for something better; and having perused with nuch interest th account given by Mr. Wy keham Martin of his hypocaust, determined upon trying such a modification of it as would suit my own house.
In order to make myself intelligible, I must premise that the house in question is 48 feet long and 12 broad and is placed wearly E. and W. The roof is hipped. the back angle being \(60^{\circ}\), and the front \(22 \frac{2^{\circ}}{}{ }^{\circ}\). The foundations are of brick. The central path is on the of the house and stops within 5 feet of either end gained. The house is 20 square feet of border are by a glass partition. Divided into two equal portions on a glass partition. One-half only is heated. The and close to the glass back of the unheated portion, and close to the glass partition. A few feet outaide
the door is a pump, which works from a tank filled by the rainfall on the roof of the house.
The heated portion of the house, to which alone I need call your attention, presents then a parallelogram of 24 by 12. The front border is made 9 inches lower than the back; 1st, to give more head room to the trees, and 2 dly , to prevent their shade falling on the back border. The brickwork supporting the border is made to slope slightly from the path upwards, bu by bedding the upper courses with a little extra morta at the back, the top course, which is laid in cement, is perfectly flat.

And now for the heating. A stove (see ground plan) is placed under the N.E. corner of the back border, and approached by steps from outside. The door of the stove is flush with the back wall of the house. The back border is formed of two arched flues, the supporting walls being of 9 -inch work, and the arches of 41 The whole is braced together by thre iron ties. Each of these flues is on a dead level, but the level of the top of the back one is 6 inches higher than that of the front one. The two communicate by an aperture in the parting wall at \(B\). The smoke is first discharged into the front flue, and passing into
built ack one by B, finaily escapes by the chimen buit outside and provided with a damper oortherly wall of the back flue, which is ther. of the house, is cemented outside. Both bice parged inside, and grouted at the top both fluer same thick iron plate which forms the thide. stove forms also part of the bottom of the of the but to prevent this creating too great a draugh escape of heat, a few tiles are imbedded orer it are gradually sloped downwards to the bottom flue, and upwards to the chimney. The back b 8 covered with coal ashes, of which then bar 8 inches above the hotter flue, and two are boocooler. Thus the heat is equalised, and yet the ban kept flat. By a contrivance scarcely worth dorde the 5 -feet border gained by shortening the path i connected with the flue.
Thus the back border is a hotbed retaining its \(b\) ong after the fire is extinguished, and any para covered with a hand-glass can be used for of cuttings. The heat also is principally applied to plants just where they need it, namely, at the ron It may occur to some of your readers thet almost the same expense the front border might han

SECTION.

been heated as well as the back; for if a single arched | stove inconveniently low, and of surrounding the ontaid flue had been carried under each border, the smoke might first have been discharged into the front flue, and then crossing the path might have passed into the back flue. Such indeed was my first plan, but it was given up in coxsequence of the necessity of sinking the

\section*{Home Correspondence}

Collinsia verna (Nuttall's).-This beautiful springhowering annual has been in blonm with me for nearly six weess past. I received my plants from Mr. Thompson, of lpowich, in February last. They were taken from the open ground and planted immediately in a south-west border, where they have succeeded remarkably well. In spite of the hot dry weather of last month they made short stout plants, which tbrew out a quantity of side shoots. The lower division of the flowers is bright blue, the upper pure white. The seed of this annual should be sown in aatumn, for it will not vegetate if kept till spring. Thus treated it will be out of bloom in time for the planting out of bedding plants. Nuttall's C. verna must not be confounded with C. verna introduced from North America in 1826. The flowers of the latter are pale blue and purple; it can, however, hardly be met with true, as grandiflora, a summer-flowering variety, is of ten sold for it. During winter, when gevere weather prevails, a little loose litter might be strewn over the plants with advantage. Quo

Botantcai of Enixburua : Mareh 9.-Dr. Dickson, President, in the clair. Tha following members wera dectod:-Resident : T. Robson, Esq.'Non-resident J. Stewart, Esq., Nateby Hall. Among the additions to the Herbarium announced were specimens of Hierochloe borealis, collected at Thurro, from Mrs. Ross, of Pitcalnie. Specimens of Lopidodendron and Lepi. lostrobus, which have been added to the museum at he Botanic Carden, were exhibited. It was agreed that all the members should be asked to contribute their cartes io visite for insertion in the Society's album, now in progress of formation. The following communications were read:-1. Notice of Rare Plants collected in the South-west of England. By F. Naylor, Esq, 2, Notice of Esparto. By the Right Hon. the Lord Provost. The Lord Provost communicate the following letter from Mr. Hislop, of Lisbon :-" have made the inquiry you wished relative to the
 shipped from Alicante and Carthagena. In Alicante
found three large vessals loading the goods for England, and discorored that last year 4000 tons were sliipped to the following countries-England, France, Belgium, ani Sweden. Its use is for the manufacture of paper. The fibres are used in the Scotch carpet trade, Kidderminster, and Brusele The The Grass is grown in a dry eoil. Mt is is not grown rom sead
planted it prreads rapidy.
It is is not eut, but torn up oy the roots-a verge easy process when ripe The fibre makes a paper with a fino surfaco, and dtrong. \(A\) process is employed for extracting the glue-like mathe in it, leaving the fibre clean and fit for use after drying The Lord Provost suggested that the plant might perhaps be cultivated in some of the wilder parts of this ountry.-Dr. Balifour remarked that the plant was Macrochloa tenacissima, and grew on sandy shores ke Bent. The common name of the Grass is derived from the Latin apartum, the appelintion given to a
plant from which the ancients made bads to tie Vines and ropes for ships. In some of the Latiin dictionaries it is said to be a kind of Broom, but this is a mistake. Specimens of Spart in various states were exhibited. -3. Note on the Discooery of Neotinea intucta in Ireland. By A. G. More, F.L.S; ; communicated by Dr. Baifour. The plaut was discovered by Miss More, in April, 1864, at Castle Taylor, , about six miles inland
from the Bay of Galway. In the same field with the plant occurred a rare species of hawl moth, Anthrocera minos. It is remarkable that in Killarney Arbutus Unedo is associated with two Iocal species of inseets, Notodonta bieolora and Hydralia Bank fiana. A mollusk, Geomalacus maculosus, is also peenliar to the Killarney district,-Dr. White statod stat Anthroera minos had aliso been met with
in Argyllbire.-4. Summary of some of the more interesting Botanical Papers published in France since Juty, 1564 . Bg G. M. Lowe, Esq. \({ }^{-1}\). Report on Degetation in the open dir. Sy Mr. Ir Mab
The long duration of the reent senowstorm had greatly retarded tho fowering of many plants which, provious to last jear, 1864 , wero usually recorded as being in
bloom. With the exoeption of Nordmannum corditolum thoy were exactly the aame as those recorded in fower
on the loth of March last year. A romarkable feature in the flowering of certain plants this year was the progrese made by some of them under the snow Immediately after the snow dissppeared, the Snow drops were found to be 2 inches high, aid in full bloom on banks where no appearance of them wa Eranthis previous to being covered up. A bed of previous to being envered with the snow; the day the snow disappeared the whole were found to be in full blow disappeared the whole were found to be in full by the last snowstorm. Brica herbacea, Arabis albida, Calanthus plicatus, and Hepatica triloba were also in bloom when the suow melted.-_A letter was read from Mr. W. Robson, who weat from the lidinhurgh Gardon to India, dated January \(£, 1865\). Ho had visited Ceylon and procured C"mehona plants from the liarden a Peradenia, near kindy, whero Mr. M-Ficoll has cultivated the plant successfully from cutlinge. A Ootacoomund, on the Neilgherries, he found Mr. M'Ivor cultivating Cinchona very extensively. Orders hav been given to him to flant 130 acres yearly; some of the specimens which had been planted two yearm previousl were 5 feet high. The climate was remarkably five, and suited to the cultivation of all sorts of vegetables and flowers. Mr. Robson left Calcutta on lat December last, and on the elst reached his destination about five or ais miles from Darjeeling, and about 2000 feet lower. The country is very beautiful, and the climate excellent. There are upwards of 540 acre of Tea cultivation at the place, and some plantations of Cinchona.—A letter was read from Dr. John Ander son, dated "Calcutta, December "23, 1£64," in which he says:-"There are many encouragements for gar deners to come out here. Their outfit and passage money are paid, and after 15 years' service they are entitled to a third of their pay, calculated on the rate of the last five sears of service, as pension John Scott (from the Edinburgh Botanic Garden) arrived here on the 21st, and my brotior at onca appointed him head gardener at Darjeeling. He is to bo in charge of tue Cinchons cultivation, and leave this for Darjeeling in three days. I am to be appointed for two months to make observations on the aqe of timber. The materials for sucu an investigation afforded by the late cyclone are immense, and as the ages of a great many of the dostroyed trees are on record, we hope to he able to arrive at some definite conclusions as to the ralue of concentric rings in country like India, as an inder of tho approximato age of various species. I have been to Darjeeling, and can assure you no words can convey the faintent con ception of the magnificence of the snow range as seen from that station. The Cinchona cultivation is progressing capitally; there are 15,000 plants in the open air. The damage done to this garden by the cyclone was very great. All the finest trees, 2000 in all, were destroyed, and now the garien is entirely without shade. Formerly there were splendid avenues of Teak, Mahogany, and Casuarinas, but now they ar entirely gone. It is one of the most painful sights hav witnessed." -Dr. Lowe, Balgreen, sent specimen of flowers of Hepatica triloba, vars alba and nivalis One of the flowers had pink anthers, the other white the latter dries with a pink tiuge on the petais, while the former continues of a pure white.

Royal Hobticultubal: May 13 (Special Show of Orchids).-Some account of the more important fen tures connected with this exbibition will be found in another column ( \(p .458\). )

In the class specially set apart for Vandas, Aerides and Saccolabiums, Messrs, Manle \& Son, of Bristol, wer the only exhibitors. They furnished good examples of Aerides crispum and Fieldingii, the latter with a gracefully pendent spike nearly 2 feet in length; also Veitch's variety of Vanda suavis and Saccolabium gut tatum giganteum, the last a fine specimen placed on the top of an imitation trecostump pot made of pottery ware, about 3 feet in height, and some 20 inches in diameter at the base. Examples of this new deacription of pot, of various heights and widths, were also employed by Messrs. Marle for other Orchids, and with good effect; the colour, that of rough aged bark, asso ciating better with the graceful habits of this charm ing class of plants than the brickored of the ordinary pots or pans.
Cypripediums, a genus of Orchids specially invited by the schedule, to be shown separately on thi occasion, were produced in wonderfully fine condi tion by Messrs. Maule, who had C. calycinum (shown as C. Pearcii), a species with pale green flowers, iaving short tails in the way of C. caudatum, also barbatum purpuratum and multifiorum in pans measuring fully 2 feet in diameter, literally masses of foral beauty, nustained by young piants, each surmounted by a flower, placed in rows sufficiently close together to yield cullectively a fine head of bloom. Mr. Cullen, gr. to Wentworth W. Buller, Esq., Strete Raleigh, Exeter furnished the fine Cypripedium caudatum mentioned elsewhere (cee p. 458), with tails nearly 2 feet in length likewise a very fue plant of C. multiflorum, and beantiful variety of C.barbatum, in wonderfully fine health.

In Miscellaneons Groups, Messrs. Maule again
occupied a conopicuous position. They had magnificent
pantulils or Cypripedium barbatum nigrum, a very dark nnd fine variety of Bearded Ladys and the Foxbrush different binds; drobium nobile, the charining D. Devonianum, and Oncidium divaricatum, one of the most useful of all Urclids for farniehing materials for bouquets. Messrs. Lee contributed Cypripedium Hookerix, hirsutissimum and others; three species of Dendrobium, among which was D. Dayanum, now stated to be the true D. anosmum of Lindley; also Phalanopsis grandiflora and amabilis, of Lindley; also Phalznopsis grandisora and ancidis, antissimum. From Mr. Parker, of Tooting, came hird collection, in which were three kinds Vauda; Phalænopsis grandiflora and its variety called area; Trichopilia coccinea; a fine plant of Lycaste Harrisonix, with 15 fully expanded blossoms on Cattleya Mossiæ.

Among collections of six Orchids the best came from Mr. Robson pr to G Cooper, Esq, who furnished Cattleya amethystina, the useful Lycaste Skinneri, beautifully flowered plant of Oncidium sphacelatum, Phalænopsis grandiflora, a finevariety of Vanda tricolor, and Cattleya Mossiæ. From Mr. Robson also came another collection, in which were the sweet-smelling Burlingtonia fragrans, the singular-looking Epidendrum dichromum, and that universal favourite Sophronitis grandifora, quite a little scarlet gem

In the class devoted to three kinds of Orchids, Messrs. Maule showed Trichopilia crispa, Foxbrush Aerides, and the delicate-looking Oncidium triquetrum.
Foremust among single specimeny was the magnifcent Vanda suavis from Mr. Hanbury's gardener, mentioned at p. 458. Next came the singular-looking Coelogyne pandurata from Mr. Sherratt, gr. to J . Bateman, Esq., and the Chinese Renanthera rom Mr. just quoted. Phalænopsis Lüddemanniana was exhbited gain in excellent condition for so young a plant by Mr. Charles, 'gr. 'to R. Barnett, Esq., Blackheath Park, to whom an extra prize was deservedy awarded; came from Mr. Robson, gr, to G. Cooper, Esq., and Messrs. Low of Clapton, who lad two flowering plants of it in very small square baskets. Mr. Wilson, of Dulwich, showed some of the many varieties of nished Cypripedium Hookeriæ and C. barbatum nigrum; a new Hhysurus from Mr. Weir, with dark green leaves prettily marked with white; and
one or two other pla..ts. Last, but by no means least, must be mentioned the beautiful specimen of Tricho pilia crispa from Mr. Pilcher, gr, to S. Rucker, Esq., did credit to the great collection from which it care and had it not been labelled "not for competition," doultless would have received a high award.

Uncounected with the exhibition of Orchids, but in the same arcade with it, was an extensive display of Stove and Greenhouse Piants contributed by Messrs.
Lee, of Hammersmith. It consisted of fine-leaved plantr, snch as Rhopalas, variegated Yuccas, Alocasias, Cordylines, Dracænas, and Tree Ferna, intermixed with flowering plants of Azaleas, Heaths, Pineleas, Boronias, Leschenaultias, Chorozemas, and Clematises, the whole set up with such taste and skill as to produce an excellent effect. From Mr. Bull also same an extremely interesting group of plants, in whel were Cibotium princeps, Asplenium myriophyllum, Gleichenia flabellata, Orange
trees in fruit, Yellow Rhododendrons in the way of R. Jenkiasoni, Dracænas, Azaleas, examples of the new hose-in-hose Mimuli, Zonal Pelargoniums, the ample leaved red-veined Sauraija sarapigiensis, Anthurium cordifolium, Bertolonia maryaritacea, and other plants. Examples of Beaton's Nosegay Pelargoniums, of which tavourable notice has already been taken in had a plant of the new Hy Mr. Wm. Paul, who also had a plant of the new Hybrid Perpetual whit
rather blush Rose, named Madame Emile Boyau.

May 16 (Fortnightly Tuesday Meeting). -His Grace M. Duke of Buccleuch in the chair. The Rev. Sedum shown by Mr. Bull at the last meeting said that it appeared to be the S. azoides of De Can. dolle's Plantes Grasses. He stated that it was reported Lowe, who had spent 20 from Madeira; but that Mr . Lowe, who had spent 20 years in that island, had never been able to detect it:there. It was, he added, an old cottagers, but which of late years seems to have been neglected and nearly lost. The Nardoo, of which some notice will be found at p. 464, next occupied attention. Among Orchids present, Odontoglossum cordatum, acoolhouse kind, Mr. Bateman's Cologgne pandurata, and the glurious Dendrobium Wardianum, a small specimen of which was shown, all came under review, as did also Orchis fusca from the south of Europe, which was stated to differ but slishty from our own. Some remarks were then made respecting the differens parasitic Fungi which infect Orchid leaves, a subject which has already been pretty fully discussed in our that most cultivators were now aware how much damage was done by them. Of two Deodars planted did not, and it was afterwards discovered, the other the latter had been planted an old Cherry tree had been
cut down; the inference therefore was that the Fung on the dead wood left had attacked the living roots of This, rather than exhaustion of soil, Mr. Berkeley thought was the true explanation why one tree often refused to grow where another had stood before, and several instances confirmatory of this fact were adduced. Among variegated plants present, a Fuchsia with creamy blotched leaves; lex crenata, of which good
and handsome hedges are made in Japan; and Arundo Donax argentea, all occupied attention; as did also Podocarpus macropbyllus, the young shoots on which sometimes come wholly white. These perfectly white shoots, it has been considered, could not be propagated, but it was related on French authority strike root, and that it ultimately assumed the ordinary green colour. Certain parts of plants, naturally white, were next adverted to, as, for instance the bracts or floral leaves in Mussænda frondosa, and the beautifully white calyx in Clerodendron Thomsonm examples of both of which were exhibited. Passing ove Mr. Veitclu's hybrid Orchids, mentioned hereafter, and certain fine-leaved plants in the room, Mr. Berkeley said, in reference to Rhododendrons, that in fertilising, with the view of getting improved crosses from them Mr. M'Nab had obtained better results from using pollen from short stamens than from employ ing that from longer ones, a fact perhaps wort remembrance by hybridisers. At the last meeting the poisonous properties of this genus were adverted to. Mr. Berkeley, however, mentioned that a jelly was made in India of the boiled down flowers of R. arboreum A plant of Begonia from Mr. Earley, of Digswell, pro ducing young plants from the petioles of the leaves; the Portaguese Tulip, which promises to be a decorative outdoor plant, from Mr. Berkeley's own garden; and one or two observations on other plants, concluded the scientific discussion on this oceasion.
May 16 (Floral Committee.)-From Mr. Veitch came beautiful collections of Orchids and other plants, for which Special Certificates were awarded. Among the former were Cypripedium villosum and barbatum mijus in very fine condition; Odontoglossum corda tum, to which a First-class Certificate was awarded excellent Lælias, Vandas, and other plants, togethe with some singular crosses effected by Mr. Dominy between Goodyera and Anæctochili, whereby the more bardy constitution of the former has been infused into the latter. From among these hybrid forms Goodyera Veitchii and Anæctochilus Dominii were selected for First-class Certificates, The former is a hybric beiween Goodyera discolor and Anæctochilus Veitchii, and the latter is reported to have a similar parentage except that in this case A. xanthophyllus was employe instead of A. Veitchii. If, as is stated, these hybrids will withstand rougher usage than the Anæctochili, whose beauty they in a great measure inherit, they cannot fail to be great acquisitions to our stoves. Among other plants Mr. Veitch had charming examples of Chinese Azalens, amo Vervaene, white, flaked with crimson, has well formed flowers of great substance ; and little standards of
another light variety, named Dr. Redel, also attracted considerable attention. Mr. Veitch, moreover, showed a interesting group of variegated-leaved Pelargoniums also a handsome Pleroma; various examples of the dwar golden-coloured variety of Retinospora obtusa; and Ber tolonia guttata and B. pubescens, two charming species to all which First-class Certificates were awarded and a fine-leaved Philodendron, on which was conferred a similar mark of distinction. The same establishment also furnished among other things Rhododendron Veitchii, a valuable sweet-scented variety, to whach a Special Certificate was awarded. From Mr. Salter came Polygonum filiforme, and Sedum Telephium, two useful hardy variegated plants, to both of which First class Certificates were awarded. A similar award wa also made to Mr. Smyth, gr. to Lord Sondes, for white-blossomed variety of Boronia Drummondi, named alba Smythii. From Mr. Bull came, among othe plants, Calonyction sanguineum, a vigorous climber with cordate bronzy-red leaves, and Ficus Yorteana, to both of which First-class Certificates were awarded. The last has handsome coriaceous leaves, which, like those of the Inda-rubber plant, withstand great vicissitudes both of temperature and exposure. From Messre Backhouse came the extremely interesting Alpiues Nots, from the Teesdale mountains: Androsace Clame jasma, and Andromeda fastigiata from the Himalayas another gem somewhat like A. hypnoides, shown at las meeting, to which First-class Certificates were awarded Orchis fusca and the pretty little Primula farinosa also came from the same establishment. Mr. Thompson Ipswich, received a First-class Certificate for Aquilegia cœrulea, a species resembling A. glandulosa but differing somewhat from that kind in the length of the spur and certain otber particulars. Large and brilliant collections of Tulips and Azaleas, the former consisting of no less than 160 blooms, representin upwards of 60 of the finest rarieties, and to both of wh ch Special Certificates were awarded, were contributed by Mr. Turner; and a similar award was conferred on a group of a rare and interesting Arads, from Mr Green, gr. to W. Wilson Saunders, E-q. Mr. Williams in addition to the Mussænda and Clerodendron Thomsonæ mentioned abore
plants of Heaths, the Doable Azalea called Gib these a Special Certificate, and Everlastings. Wilson, gro to W. Marshall, Esq., came a whit From 3 Cattleya slightly stained in the throat with Golden Queen, a useful-lonking yellow. with vellou gonium, came from Mr. Southby,
collections of plauts in Checial Serticiapha cladon Centare ractinosporal edging plants of that description; the pretty Jey lea foweredand other Rhododendrons; Fuchsia aucubafo and the gold-variegated small-leaved Ilex crenata of called Fortunii in gardens. Handsome boxes Roses came from Messrs. Paul \& Son, and Mr. Fe May 16 (Ervit Corm a Certificate was awarded, May 16 (Fruit Committee). -Apples formed th best exhibition came from Mr. Earley, of Di these the contributed well-kept examples of Cluster , Pippin, Wheeler's Russet, Golden Russet Nonp Cockle Pippin, Sturmer Pippin, and King of Pippin Or these the Golden Russet Nonpareil, which shown as Golden Reinette, was by far the beas flavour. Norfolk Beefing and Dumelow's Seedling came from the same exhibitor. From Mr.Cor, of P leaf, came a handsome unnamed Kitchen apparently a sound keeper, acid and solid. We Harved good specimens of Gloria Mundi and Goldee Harvey. M. De Jongle, of Brussels, furnisbed B both late Pears, \(t\) which somewhat resembles Beurré Ranse in firmoure and crispness of flesh. Neither of these were betr than kinds already in cultivation. Among Apples fin M. De Jonghe the best were Pigion de Bruxelles, De Jonghe's Roozen Apfel-the former a cood keepin variety, the latter possessing a slight Fennel \(f_{\mathrm{a}}\) roo and a handsome appearance.

\section*{Notíces of 3Books}

The Applications of Geology to the Arts and 1 Inns factures: Being Six Lectures on Practical Geolory Cantor Series of Lectures for 1865. By Profemo D. T. Ansted, M.A., F.R.S. 8 vo , pp. iv. and 300 with numerous woodcuts. Hardwicke, 1865. It would be very unreasonable to expect anything lin a perfect treatise on such an extensive subject with the course of six lectures, or to look for much in matter intended for general instruction. What have, however, a rizht to expect is a careful statemen of well-known facts in such a manner as not to fm: above the heads of the hearers, that such general sta' ments should in all cases be free from oble matter should always be really practical, and that facts adduced should always be correct. Actoo ledging the extreme difficulty of the task even in hands of a person who is so well known for researches and publications relative to geology, in fic. master of the science, we do not think that the lectures come up exactly to the mark in the poin which we have specified
To begin with the statement at p. 9: "Every kiil of vegetable soil was once rock, which, by the uninte mitting action of heat and cold, air and water, been broken down by degrees into smaller to a kind fragments, until at la
powder, dust, or mud.'
If we go to the prim
If we go to the primary origin of living beings, mbe the earth was first cooled and renderd capa sapporting them, such a statement might just per t be within the bounds of trath; bat no donn first organisms begun to decompose tractical would materially altered, and in a pracical view at the present time it is quite uatrue. example, the "sterile sands of Les Landes, brought into cultivation by sowes of the Broom and Pine seed, the first leaves of the bhid down and forming a thin coat through ncrese young Pines protrude, which grading leaves possible inded that the words are used in the soil in which vegetables grow, but if so it is popular use of the term, and therefore scarcely comp with what is. And such a at p. 14. The name of hum
portion which is derived from the decomposition organic bodies is a very loose term.
consists of varions chemical substances. \({ }^{\text {. }}\), Again, when speaking at p. 49 of aqueo inds mit being "constantly carried along
the other air, the lecturer is quite above the hearer, who has no notion of aque its existenc mist or cloud, and much les of which, lown gaseous form as implied in the passone, indeed, does we have not quoted textually.

seem to us correct to speak of "an atmosphere of ay le us vapour," While a persone passage that none of subject would magher was condensed at sea before it this ayturous vapo
It will, perbaps, be thought lyypercritical if we rark tiat such a passage as the following is above the compreiension of most of the persons intended to provit by the lecture, tliough literally true: "Water as it fills frum the clouds, and after passing through veretable soil, is always sufficiently charged with carbonic acid to render it a ready solvent of carbonate of lime in all its forms." To the uninstructed this nould seem a mystery, and to our apprehension it would have been much better to have told in some eary way, and in a very few words, how the carbonate of lime takes up another particle of the acid and forms eolable biearbonate, and how this is driven off again by behind.
We complain also of a statement 80 very much in arrear of the actual state of science as that the flinty
custe of Diatoms in the mealy deposits of Tripoli are due to infusorial animals. It is now 20 years or more siuce it was clearly shown by Mr. Thwaites that Diatoms are really vegetables, and it can only be by blinding the eyes to the resemblance of their conjugation with
that of Zygnema, that any instructed zoologist conld for a mment think of referring them to the animal kingdom, unless wedded to the old doctrines of Ehren-
The part relative to draining might again have been rendered far more useful by showing that though clyy is in a certain sense impermeable it is not really so, of clay may really improve the The notion of geological maps being published which should in every case show the nature of the subsoil, considering the change which takes place in this respect in different parts of the same field, seems
to us quite Utopian, and if practicable, not likely to be of any real use to the farmer unless in a very advanced atage of education.
Uur remarks have been confined to the two first lectures, which relate more immediately to matters of agricultural interest, but we have been surprised at one or two statements in the fourth lecture. It is
said, at page 157, that of ordinary limestones that of Barnack, amongst others, is one of those best known and most used in London and its neighbourhood. The fact is that no stone quarries are worked at Barnack now of any good quality. A small mason sells some "bastard rag" in neighbouring villages, but none is sent by railway. Clipsham stone, in a neighbouring and is highly valued. Though Barnack stone had once a very extensive use, it was quite in mediæval times, and it is found only in the older parts of eccle8iastical buildings.
Casterton stone, it is said, is believed to be equally good with Barnack, but it is of a very different character, and far inferior to Ketton, which commauds a far higher price. Colley Weston slate again deserved a little more notice. Before blue slate was brought aimost nniverga by canals and railroads, its use was known that the pits were worked by the Romans, the only difference in the use being that the slates were fastened with iron instead of wooden pins.
These and other points to which we forbear adverting, have struck us in reading the volume, which we information saying does not contain a vast body of cannot help thinking that the lecturer might have made the lectures far more useful to the general hearer and reader tban they are in their present form.
Catalogers Recerved.-E. G. Henderson \&o Son's plants, including many novelties. We full list of soft-wooded and kinds of lvy, and a very useful set of coloured and ornamental-leaved plants for garden decoration.Dickson of Sons' Catalogue of Bedding Plants, are soft-wooded plants

\section*{fflorists' ffotuers.}

\section*{the space - I very willingly contribute a few words for} hiview. There is nothing, however, a floral point termon-a "refresher" only be called-to use a legal Violete I limited indeed. With the exception of a few than the Rose about the, and want no other flower sure, and a daily exhibition, flace. It affords me pleait in thestance of Petal.-I put this first in the year. is a sine out thing to look to, but because with me it fint thing to be lo Rose growing constitution is the it constitution, is a poor flimet of what use, admitting spoiled by a few drops of rain or petaled Rose that is witheriowers, generally, are or by the rays of the thenering and mortality, are apt emblems of our own
fora others, even in thy, but some are mach more so
Lor our dmwing rooms same tribe. For our gardens,
more so for exhibitions, we want Roses with substan
tial petals. A Rose needs substance of petal more than any other flower, because, as soon as it unfolds, it is at its zenith, and at once begins to decline. I wish hybridisers would attend to this a little more than thes do. Roses with substantial petals usually hold colour best, and certainly travel best, and last longer than flimsy tinsel ones. Now that we have become a Rose exhiviting nation, this is a most important matter Think of the trial a Rose-bloom has to undergo when it
leaves, say Rushton, before the judges in London have made their tinal award. Think also of the withering heat, that, in addition to the sultry weather, it has to submit to from the pressing multitude
The very best for substance of petal that I know o are Charles Lefebvre, Senateur Vaisse, Prince Leon, Gloire de Santenay, Maurice Bernardin, Duc de Rohan Duchesse dorieans, Triomphe de Rennes, Gloire de
Dijon, Souvenir de la Reine d'Angleterre, all fine Roses, and with good general attributes. More Roses might be named. The character of the petals of summer varieties is not generally so good, as that of namely, Paul Ricaut, Coupe d'Hébé, Charles Lawson, and Madame Zoutman. The last is the finest of the white Roses, and though the character of her petal is papery, she is an admirable wearer in either we similar to and equal to most of our autumnals petali To substance of to most of our autumnals.
ness, velvetiness, and smo must add depth, round petals.
2. Form.-Whether a Rose be globular, or cupped, or any other shape, it should be symmetrical, have correct outline, and be sufficiently full to the centre without being crowded or confused. For garden peony-formed Roses, whose petals lie somewhat in disorder, are effective, and they please those minds that admire irregularity in flowers. I admire most the globular and cupped forms, but I am not adverse to
others. Maurice Bernardin and Duc de Rohan may be taken as fine specimens of globular Roses, and Madame Furtado, a bad grower and delicate Rose here, as the very best specimen of a cupped Rose. Where it succeeds, it is one of the very finest show Roses. Whatever the shape of the flower may be, florally speaking, it should present a level aspect. I do not know finer specimens of what Rose plants and Rose blooms should be (I speak only of later varieties), than Charles Lefebrre and Senateur Vaisse. Taken at all points I think they are the most perfect of the Hybrid Perpetuals. Cecile Chabrillant and W. Griffiths have all points of perfection except the holding of colour in certain weather. These two and Senateur V
the most perfectly folded of all known Roses.
3. Fixity of Colour. This is also an essen
Usually, but Colour. - This is also an essential thing substantial the colours abide. There are some Roses that are beautiful on opening, as La Brillante, but, as soon as the sun rises and reigns, they are "gone." The best to hold colour of the high-coloured Roses ar Senateur Vaisse, M. Bernardin, and Duc de Rohan. As very dark Roses, none will wear so long as Prince Camille de Rohan and Duc de Cazes-Arcades ambo C. Lefebvre does not hold its mative colour well,
namely, brilliant crimson, but then it changes to a rich deep crimson sometimes dappled with pretty mould spots.
4. The true Basis.-Constitation is the true basis, or hardihoo words, ine foliage, vigorous growt, and injured early in the year, the plant will suffer great damage, and probably will not last long. Bad foliage either proceeds from or leads to a bad constitution. A good Rose-bloom with bad foliage or none at all, is defective. Good foliage and health are identical. Did growers keep their Rose-leaves constantly syringed, the I need hardly observe that if a Rose plant does no grow freely; or, if growing freely, it is not hardy, it cannot last long in England. Freedom of growth and hardiness however, do not invariably go together.

Lastly, Free-bloom.-A Rose may have all the preceding qualifications, but if it will not open it is useless. I know of no better first-class Roses that
rarely have a defective bloom,' and that invariably open, than C. Lefebrre, Senateur Vaisse, Triomphe de Rennes and Cecile Chabrillant. W. F. Radclyffe, Tarrant Rushton.

\section*{(y) apiaxp.}

Wr commenced, last week, a few hints on the prac tical Managrment of Bees at this important period and, having recommended the apiarian to decide fully in his own mind as to whether he desired his several hives to furnish him with honey or swarms, our remarks were directed to the consideration of the best course to be pursued, supposing that swarms were the chief object of his requirements. It now remains to us to affor some information to the apiarian novice on certain of a plentiful supply of pure honey-combs.
If the apiary consists of common straw hives, it is comparatively easy to transform them into very emcient honey producers. Many persons possessing such hive imagine them to be totally unsuited for the supply of
nice sapers of pure honey. Slightly altered, even when already tenanted by bees, they may be made almost as well adapted for the purpose, as the majority of hive and boxes of far greater pretensions to utility. A smal oard of inch deal, 14 inches square, well clamped to prevent warping, and luving a bole in the centre of ome putty into a very solt state, ind furm a ring on the under side of the board, of about 4 or 5 inches in diameter. If a little pant be previonsly apphed just where the putty may be attached, it will ensure a much more firm adbesion. This beng done, a small piece of glass may be placed over the central hole in the board With a rather narrow-bladed and sharp pocket knif next cut down between the bands of straw so as to eparate a piece of the crown of the live of the knife will have to be passed diaconally through the band of straw. The kuife must be kept upright and well down, and care taken that tho piece to be removed is perfectly detached. Apply the paint brush to the crown of the hive, corresponding to the ring of putt on the board. Next prize up the loosened piece of the top of the hive, and with a sudden jerk piteh it away quickly but carefully adjust the board level and square vorkiug the putty down by gentle pressure. The glas orering the aperture enables the operator to ancertnin if the board is in the right pooition. See that the board be perfectly level; and substitute a block of wood for the piece of glass. This operation, which is by no means a formidable one, had better be effected in the day time, when the bees are fully at work. The very racture of the combs tends to keep the bees from showing any resentment, as they are intent on filling themselves with the honey
The next matter for the exercise of the judgment of aditional room. It is advisable not to open the bee nunication with a super until the bees are sufficiently numerous to take possession of ithalmost at once. Brat is more important still that this be not delayed unt the formation of royal cells
A super may be either of glass or wood, and should be of a size capable of holding from 20 lbs . upwards. If of glass, it should be about 12 inches in diameter by or 7 inches in height. A ventilating tube ia nnecessary, and is useless for the object intended but it will serve as a good point from which to start the comb building. If possible, pieces of clean worker comb should be attached to it to induce the bees to work in the direction desired, and to commence earlier than might otherwise be the case. An octagonal bo made of a light mahogany frame, neatly glazed, furnished with a separate frame with glass for a cover, and fitted Tith bars, is almost as pretty and useful a super as can be used. A good size is 18 inches diameter by 7 inche deep, inside measure (this applies to all measurement given either of hives or supers), the glass being let in rom the inside, with which it must be as nearly flusl as possible. The bars are eight in number, and are let down in notches, no as to be level with the upper surface of the box, having a bearing of \(\frac{3}{18}\) the of an inch at each end. The cover is constructed of sufficien thickness to allow the glass, when fixed, to be half an nch from the top of the bars. This prevents the dis figurement of the glass with lines of propolis, and allows the bees free access to all parts of the super. No
ventilating aperture is required. Some bits of clean vorker comb should, if available, be attached to some of the bars. The bars will be better if made on the plan in vented by Mr. Woodbury, which consists of a central rib of \(\frac{1}{8}\) of an inch in breadth and depth being added to the under side of each, the lower angles of the bar being slightly rounded off. By coating the central rib with meited wax, the formation of straight combs i asually insured. When only a portion of the bars can be supplied with pieces of clean comb, they should be alternated with ribbed bars treated as described.
All glass supers must be well wrapped up in cloths or flannel, not only to exclude light, but to protect them from sudden changes of temperature.
The bee master must not fondly imagine that, because the bees of any particular hive are fairly at work, rapidly constructing combs in the super, he is perfectly safe from the chances of the issue of a swarm. Such is the glorious uncertainty of bee-keeping, as well as of the law, that even under such favourable con-
ditions no immunity from evil can be surely calculated upon. It is advisable that a good watch be kept upon the hives, or a swarm may suddenly issue, with little or no warning, which, whether saved and suceessfully hived, or lost altogether, can under the circumstances be only considered as a misfortune.

\section*{Garden Memoranda.}
ancbroser Basaet's, Risq., Staypord Himb-The Azaleas and Roses for which this fine suburban residence is celebrated are at present in great beauty, and n hour or two gpent in admiring and criticising the different qualities of the various kinds contained in the two large houses devoted to the Azaleas, and in the
Rose-house adjoining, afford a great treat. In one of the houses behind the Azaleas are some fine plants of Camellias, just making growth. As regards Azaleas the following siort list of the best and most striking kinds, the height and diameter occasionally being inserted to
show the size to which the plants have attained, may ot be uninteresling :-
Bride of Abydos (Barnes), 4 feet by 3 feet, is white, occasionally flaked with violet, and a fine variety for exhibition or decorative purposes. Gledstanesii, 6 feet in height and as much through, is literally a mass of flower in true character. Coronata, the original plant, about 30 years old, forming a bush of some 7 feet in diameter, is a magnificent spectacle; its bright, vivid rosy purple flowers being in great perfection. Sinensis alba, a somewhat scarce variety, has as many as 30 flowers in a truss. Roi Leopold, 5 feet by 3 feet, is a mass of showy blossoms; and Madame Miellez, white, flaked with purple, is quite a gem. Exquisita, a mag. nificent plant, 5 feet by 5 feet, has every flower on it perfect; and Sir Henry Havelock, rosy crimson, with deeper spots, has blossoms of wonderful substance. Juliana, orange scarlet, is still one of the best of its class. President, 3 feet by 2 feet, is light rose with lake spots, and the flowers are beautifully formed. Chelsonii, bright scarlet, is still one of the very best and showiest, of the group to which it belongs. Kinghornii has*: deep roseccoloured blossoms of fine shape ; and Duchesse Adelaide de Nassau, reddish crimson with violet shading in the upper parts, is a very the best of double whites'; and Glory of Sunning Hill is certainly the finest of double reds, or rather salmoncoloured kinds. Without Flower of the Day, white with crimson flakes, no collection can be said to be perfect. Extrani is a most beautiful rose ; Sir Charles Napier, 6 feet by 4 feet, is a perfect gem; and Perfecta elegans we thought the finest crimson searlet variety in the collection. Souvenir de l'Exposition is white shaded with rosy purple. Iveryana Improved, white flaked with crimson, is a flower of great subatance. Crispiflora, \(4 \frac{1}{2}\) feet high and as much in diameter, is a perfect blaze of bloom. Alba magna is one of the finest of winte kinds. Leopold Premier, deep rosy pink with red spots, has large flowers of extra fine substance. Etoile de Gand, salmon edged with white, when well grown and flowered as this was, is very effective. Bernhard André, splendid rosy parple, is semi-double and altogether a filue variety for decorative purposes. Brilhant, glowing orange scarlet with bright crimson spots, is fine in shape and good in substance. President Lemaire, pink margined with salmon, with the upper petals clouded and spotted with deep crimson lake, is a novel and showy variety. Murrayana, 5 feet by 6 feet, is a complete blaze of bloom. Carminata is also in equally fine condition. Semiduplex maculata, 5 feet by 5 feet, is magaificent; as are also Delecta rosy pink, Criterion, and Eulalie Fan Geert. Model, spotted rose, shaded witi crimson, is a fine new variety. Rubens, glowing crimson, and very large, is a splendid kind; an are also Duc de Nassau, large deep purple; Alexander II., white oceasioually thased with crimson; Due de Brabant, semidouble, light pink, shaded with crimson; Comte de Hasnault, semi-double; Speciosissima and Gledstanesii formosa, the last white flalked with crimson. Petuniefora, rosy pink, is a favourite with everybody.
Amongst the Azaleas was a fine plant of Rhododendron Daluousir, with about 70 trusses of flowers on it, just beginning to develope themselves. Near the Azaleas is a roomy span-roofed loouse filled with Tea, Hybrid Perpetual, and other Roses, at present in full bloom. The plants are in excellent bealth, and the flowers individoally very beautiful and perfecto The following were in fine condition, vir, Beanty of Waltham; Madane Willermos, with fifty superb flowers on it; Fraupois Lecharme; President, magnificent, as grown here the finest Tea Rose in cultivation; Paul Perras, 6 feet by 5 feet, full 'of tower and bude; Triomphe des Beaur Arta, Souvenir d'un Ami, Vicomtease Decares, most benutiful yellow; Madame de St Joseph, the finest scented of all the Teas; Cbarles Lawson; Madame Damaizin, 5 feet by 3 feet, with about 60 expanded flowers on it; Senateur Vaisse; Lalia, beautifal pirk, fine under glass; Devoniensis; Madame Campbell d'Islay ; Mrs. Busanquet; Cbénédolé; Anna Alexieff Blairii No. 2 ; General Jacquemisot; Brilliant, beautiful in colour; Pierre Notting, scarcely open, bat evidently one of the finest of new Roses; Prince Camille de Rohan; Niphetos, superb in the bnd; Coupe d'Hébé; Victor Verdier, 5 feet by 4 feet; and Madame. Victor Verdier, the last a fine new Rose.
Mixed with these and the Azaleas were plants of a fine strain of Calceolaria, and also some early-flowering Pelargoniuma, which served to afford variety; last, but not least in this establishment, is the magnificent collection of Orchids which Mr. Basset, with the tante of a connonsseur, has been collecting for years. Vandas, Ondontoglossums, Cypripediums, \&c., in great variety, are here cultivated by Mr. Baker, the gardener. in wonderful perfection. Being vigorous and healtiny, they promise to bloom in the greatest profusion, and no doubt at the coming exhibitions some of then will be brought out in fine style. Amongst more remarkable sinds we noticed Odontoglossum Pescatorei, Phalrenop17 inches long and 5 fine; P. amabilis, with leaves and Vanda teres, all finely in bers; Chysis Limminghii houses was a nice lot of neew in bloom. In one of the strongly; and a group of Oncidium crispums, breaking plant of Cypripeaium Veitchii, together with some uverb varieties of Cattleya Mossiæ. \(B\).

\section*{Miscellaneous}

The late Mr. Alexander Smith.-We have to announce with regret the death, at the early age of 33 , of Gardens, which took place on the 15 th inst. Those our readers who may have come in contact with Mr Smith during the time he held the appointment of Curator of the Kew Mu:cum, or latterly in the Her barium department, and who have thus had an oppor tunity of knowing his intelligent and obliging dispo sition, will, we are sure, with ourselves, greatly lament his loss.
The Parks.-From the estimates for the current year, we learn that our national parks and pleasure gardens cost 99,090 . This sum is thus distributed:- For Kew Botanic Gardens, 15,358l. ; for St. James's, Green and and for Battersea Park, 8345l.

\section*{Calendar of Operations.}
(For the ensuing week.)
Bedding plants should now be placed in their summer quarters with all possible expedition. It having been determined what each bed or border is to be filled with, use every means for securing their safety and success, in order that they may produce a full display of flowers as early as possible. The chief points are to plant in good soil, and to protect for the first fortnight from extremes of heat, cold, or drought. When it is necessary to water, it should be done in the morning, as the plants are liable to be injured by late frosts if watered at night. They should be well watered, however, immediately after planting, taking care to moisten the bed thoroughly. If a fine early display be desired, the beds should be planted sufficientily thick to produce immodiate effect, and as the season advances it is easy if necessary to thin out. Seldom however have we seen masses too thickly planted, but we have often observed the ill effects of beds planted too scantily. It is a common fault to plant too near the 'edges, \({ }^{\circ}\) in consequence of which the outside plants have to undergo a constant mutiation to keep them within bounds. Where the young plants have been pricked out into frames of soil, as most of them doubtless will have been attention should be paid to lifting them with a sufficient ball of earth and roots to prevent their receiving any check, and also to safely conveying them to their destination, and replanting them as quickly and with as little injury as possible.
flower garden and plant houses.
Conservatories should be gay with Azaleas and other showy plants, of which there ought to be now no scarcity. Out of doors, in addition to planting out as just directed, let lawns be kept closely mown, walks cleaned and rollerd, and edgings put into proper repair. - CameLLis.-Keep such as are making growth well
syringed. Should black-fly appear on the young shoots, which sometimes will happen, a good washing with tobacco-water will soon destroy it.
Pelargoniums.-A slight shade will be necessary for a few hours on bright days; green fly is oceasionally very injurious to them at this season, and therefore the plants should often be fumigated; tie and regulate the shoots of late plants according to previous instruc tions
Pinks.-After this time if the weather continues dry, these will require careful attention in the way of watering.

FORCING GARDEET.
Cocurbers.-Stop, thin, and water freely. See that the ball of earth, in such as are newly put outh, is well soaked with water previous to planting

Peackes.-If red spider should make its appear ance, wash repeatedly with the engine until it become thoroughly eradicated. Thin the fruit immediately the crop is stoned, leaving no more on than the trees can briag to perfection. Give air freely to houses in which the crop is ripening; but at the same time exclude if possible cold winds.
Pinfs.-Attend carefuliy to the bottom-heat. Where much fire is used, if requires some experience to be able to koep the soil in a proper state as regards mois-
ture, but this must be effected ture, but this must be effected at any expense of attention if success is to be insured. Maintain a thoroughly moist atmosphere, but do not push jorang stock too fast. Avoid allowing water to lodge in the hearts of plaats showing fruit, and spare those in bloom while syringing. Pot off or plant out suckers as they can be obtained sufficiently strong, and attend to keeping up regular successions.
Ines.-Attend to disbudding and stopping, \&c., as may be necessary, in succession houses, and see that inside borders are kept properly moist, giving tepid manure-water as may be necessary to effect this, and dol not be afraid of giving too much of it to Vimes in pots.

HARDY FRUTT AND TITGHEK GARDMAN.
Kmoner Beans--Full crope of thoes meg now bo sown, and aleo of Scarlet Runnerm
Leers.- Thew may be transplanted msoon as they are large eneugh for that purpose. Iat the rows be 18 inches apart, and the plants 9 inches asunder in the rows.

Peas-Let these be earthed up and sticked is: latter need not be sown so thickly as thosessefor fart: crops.
Potatos.-Fork up the soil betreen the rows, wi! to keep down weeds.
Root Crops,-If young plants of these are attaci
by snails or slugs, give the ground able by snails or slugs, give the ground about thenita \(a\) dose of soot and lime. The best time for doing either at dusk in the evening, or early in the murnus

Thens are several important agricultural topies which have occupied attention during the past week, which are very inadequately represented in our columns to-day. The long paper on Agricultural Education read before the Rogal Agricultural Society last Wednesday, which we are anxious to give entire in one impression, has taken up almost the whole of our available space; and thus the report of the Sooiety of Arts on Cottages for Labouring Men, and the debate which turned mainly on the same subject the other evening in the Honse of Commons; the lecture before the Hangerford Farmers' Club, by Mr. Henry Conbet, on the operation of the Game Laws, aud recent discussions of the same question bei re Farmers' Olubs in Scotland; and the lately published amusing correspondenc: between Baron Liebig and Messts. Napier and Mope upon the Sewage quention, must remain over for comment and report until another week.
The conduct of the agricultural eduoation movement by the Englioh Agrioultural Soeiety is likely to be dincussed before the general meeting on Monday, and we make no apologr, therefore, for filling our columns with the subject to-day, eved though so many other topies are thas displased. The purpose of Mr. Monton's paper is to urge upon the Society the importance of taking steps for the prosecution of professional education, which hitherto it has avoided doing; and we give it with the discussion following it entire, in order that it may, perhaps, bo seen and read by members who shall attend Monday's general meeting for the puxpose of
taking part in the disousion which is sure thon to arise.
- On Thuraday noxt Mr. Strafford is to sell by auction Mr. Wells's herd of pure-bred Shorthorns at lloubleton Farm, olose by the Penshurst Station on the South-Eastern Railway. It includes a few choice animals of the Boorn blood, and othere bred from the stack of Mesers. Ankins, Harvey Combe, and Jonas. Wfibs. Thus 10 out of the \(3: 3\) animals of which the herd consists are descendants of Stately by Prbitan, bred by Harvei Combe; and \(\dot{5}\) others are from Rusa, one of the celebrated Marmancha yearlings, sold at his sale in 18j9. Princess Mutilda, again, and 3 others are of Bootr blood, through the ntock of Mr. Dovelas, of Athelstaneford. And there is not only first-class pedigree, but good and vigorous stock of great individual exeellence, to be mold next Thureday. Mr. Wardo's amall herd is ulso to be disposed of at the same time and place. It contains animals of the Groynne family; and among others, Fathom, a 6-year-old cow, descended from Mr. Richard Boote's celebrated cow Harevoll, and bought a heifer at Mr. Sanne's sale for 180 guineas.

We may add, that on June 7, Mr. Strapfont will sell at Willis's Livoms, King Street, Si. James's, the herd of "(Orand Dukes and Duchesses," the property of the late Mr, Hegan, of Dawpool. To this we shall refer nezt week more fully

\section*{AGRICULTURAL EDUCATION.}

The following paper was yead last Wednenday befrire the Royal his me
The paper to be read this morning is, I fear, of a very diffirent order from those which generally nud most worthuly engage attention at the weekly meetings of this Society, ior I have no unusual agricultural experienoe to relate, mor ny now facta or obeervations to deseribe. It is indeed an argument rather than a histury which I have ventured upon-one, ton, which is, I helieve, lible to be considered, rither ton, which is, I helieve, hible to be cons:dered, rither
on the oue hand as too general and diseursive for an on the one hand as toog general and diselusive for an
audiemce of practicnl agriculturiste, or, on the other, as audience of practicnl agriculturista, or, on the other, as
too pointedly levelled at the recont resolutions of the Council on ite enhject, to be within the competence of a mere ordinary meminer of the Society at any execpt our annual general meetings. On this point, however, I muat at once declare that it has not been my wish to disenss this rulject controversially at all, and that I shall make no reference whatever to what the Conacil have, after their ample and prolonger discuasion of it, thought it right to do.
I hope, indeed, that I mey be pllowed at the close of my statement to point out where and how, an it seems to me, the intluence of the Royal Agricultural Society in the promotion of agrieultural education may le most usefully applied, but this I shall do with no reference whatever to the plan which has been already adopted, and no desire to bring that plan inder discussion now. The object of this paper principally has been to determine and place in the order of their
relative importance the elements of a good agricultural education; and especially to ascertain and indicate education; and especialy to ascertain and indicate
where it is that the existing agricultural education thus appears to be deficient. And the plan of the plaper accordingly has been-list, so to describe the busimess of the farmer as to illustrate the abilities and qualities he mant possess and exerciee during its successful prosocation; 24 , to consider the educitional process by Which these abilities and qualities may be best acquired 8d, to give such illustrations as I have been able to collect of the progress and existing state of agricultural education amone us ; and \(4 t h\), to consider whit may be practicable or denirable in the further promotion of it.

The Occopation of tien Farmar.
1. First then of the Occupation of the Furner.Agriculture is an art or manufacture. It is also a buviness or a trade. Aad people have of late years got into the habit of calling it a science. By this last designation it can however of course be meant only that the facts which make up the experience of the farmer like those indeed of every other axperience whatsneverare recognised by mon of science as in perfect kceping with the known lawn of Nature. There is nothing in the field or teeding house of which a thousand examples in other departments of observation have not been
studied and recorded. To the plysiongiat, the chemist, studied and recerded. To the physinlngist, the chemist,
the botanist, and entomologist, the "mystery" of agriculture, thus, has disappeared. Everything is the illustration or fulfilment of a general law, of which examplis are seen everywhere. Agriculture, then, though not a science, las at length become a museum, as it were, of facts, and inetancen, and specimens, in the classification of which studenta of all the sciences have been successfully at work, so that every part has now the light upon it of well-defined relationship with scientific truth.
If this be a correct account of agriculture as a so-called science, how is it with agriculture as a trade? There is here an even more complete explosion of the idea of anything exceptional or myaterious. The relationship of the farmer to him of whom he hires the land, which is
his manufactory-to those of whom he purchases the labour he directs-to those whe customer-is of the ordinary kind, dependent for its estabhishment and maintenance on the crlinary principles of human nature, and requiring only such protection sequitable administration of the law secures for it. There is no lomer any idea that, beyond the mer There isinistration of juscice between man and man, the Commonwealth requires any other protection of thi or any other industry the climate and position of the country, or in the phergy, the conscience, and the sell interest of its inhabitants. The differences, however, between agriculture and other trades, though they may be only matters of detail,'are very considerable indeed. They are dependent mainly on the fact that io ceed farmer harvest years are generally veeded betore the full return several years are generally veeded betore the full return landlord, tenant, and labourer live kere in closer con acious neighbour hood, than landlord, tenant, and labourer in the case of any other industry; and gene
rally, that the business is territorial, dealing witt the Whole surface of the country, and olten the sole provision for its inhabitants. The perishalhe nature agricultural products is another ciretmstante in them. Bent apart from, and indeed in spite of all these peenliarities, the fact remains that the business revations the farmer are and ought to be similar to those of a other tradesmen, and that he depends for hissuceess in hil
dealings with his customers, upon the very same inali ties of industry, and honesty, good judgment, resolus tion, promptitude. which secure success elsew bere.

But agriculture is especialiy a manufacture and an art, dependent ou professional intelligence and skill; and here, of course, we come upon the essential feature s
which distinguish it. I believe that I imn right in saying that its chref and ruling characteristics have arisen from the fact that thromphout it has to do than any merely material force is indeed thus wolded by the farmer, but in effect it rather lisnits atel lefinues his powers than widens them. He is unt an artist or his fancy or his will. He is hedzent about by freces which are beyond him to resist; many of them bevond him to control or even guide. All that he can to is
