There may be some difference of opinion amongst us as to the value of these results as regards what are called florists' flawers; an artist, for example, would probably prefer to have a plant in its original state, and before it had been moulded by the hands of the florist; but all must aoknowledge that, taken as a whole, they have been wonderfully improved for the purposes to which they are applied, namely, the adornment of our gardens. As to the value of the other ulants to which we have alluded, whether for cultivation under glass or in the open air, there can be but out opinion. Alchough, therefore, fashion and taste in plants as in other things appear to be capricious anc changeable; although as gardeners or arboriculturists we may sometimes ride our peculiar hobbies too hard, yet there is much to be said in favour of the "grand old gardener." If he has not been able to make two blades of Grass grow where only one grew before, he has at least the satisfaction of knowing that he has produced a marked and beneficial change on the gardens and pleasure grounds of this country-a change which will be permanent. \(F\).

The attempts which have been made to introduce the cultivation of flowers amune the lower classes, as observed by the liev. Mr. Parkes in his book on Window Gardening for the People, have proved that a love for flowers is spread among all classes of the London pour. "There can be no doubt that the love of flowers is a feeling common to us all; but it was a problein unsolved, whether the hard life of the Luudun poor had not driven out this common instinct. "ihe experiment has proved that this love still exists." The direct benefits derived from the spread of a taste for gardening pursuits among the classes to whioh reference has been made, is indoed so obvious, and is so generally admitted, that we need not stay to prove them. We may take it as an esta blished fact that the gain is solid and uumistakeable; and this being so, we are much gratified in bring able to record from yea to year the continued success and prosperity of those exhibitions whioh have been establishe as an encouragement to this Home-gardening of the London Poor. The Exhibition conmeoted with the parish of Bloomsbury, in which the movement first took a well-defined shape, wa held a week or two since, with the usual success, in Russell Square. A more general Exhibition, really creditable to the exhibiturs, has been held in the gardens of the Royal Horticultural Society a South Kensington, as reported in our last week's issue; and we have just beea favoured by a correspondent, who takes deep interest in the movement, with the fullowing suggestive remarks on the recent fourth annual flower-show of St. Clement Danes, which took place on the 27th ult.
"The various plants brought in by the exhibitor
arrangement which answers perfectly well. The nsual plan is to give prizes for the best Geraniums, Fachasis, Musk, or Calceolaria, but the working people of the central parts of London cannot be expected to rear such plants successfully. It seems, therefore, more advisable to encuurage them to raise plants fro
or slins, or any way they can best succeed in.
in Some curious specimens of what can be accomplished in this way were shown and received reward, as an Apple tree raised from seed, of three years growth, nearly four feet bigh; several Cherry trees, a Mluin, and a Hully; Asparagus in its first year; Date Palmes grown from the seell of fruit bought at a grocer's; a neat little plant from the seed of St. John's Bread or Locust tref, of much interest; a weli-grown Maize, or American corn plant; a Leek three teet hish, from a American corn plant ; a Leek three feet hish, from a nurse buys a Leek on St. Divid's Day for a blind natient. nurse buys a Leek on St. Divid's Day for a bind natient.
This is planted in a small pot, and thrives well. Scarlet Runners supply much interest, and form a pleasant green border to the windows. One poor woman brought a pot of Watercress ; another woman had Potato plants.
"One of the most delightful plants for the poor is the from the Cape 90 years ago; it was not much cultivated till lately, but now is found particularly well snited to the windows of workhouses, hospitale, or any humble roome. A specimen raised from a slip by a working vigorous growth. The leaves are renewed jearly, and having a fragrant scent are very pleasant; the branches having a fragrant scent are very pleasant; the branches
can be trained to form a screen before a window. One collection brought down from the top of a house was remarkable-two Hollyhocks, two Dihlias, Geraniums, and several other plants. Another top prodnced a little garden, amongst which was a pot which had small Cotton plants raised from seed, carefully protected by a glass shide. A box of Mignonette was in good heons; another had Heartsease in trained to sticks at each end. A two-year-old Ouk in a bottle, grown from aus acorn, was the pride of one woman. Lavender, Bergamut, and Nast urtiums were all favourites. The modlel of a house and garden,
with a pond and Water Lilies, was much admired, the with a pond and Water Lilies, was much admired, the
evening work of a shoemaker. One wonan said she was trying to induce her hasband to take interest in her window garden, hoping it might draw him away from the public house. Virginian Creeper and Ivy aailed to a amall frame make good plants for window gardens.
'Although flowers may not abound on our London plants, yet the green is very agreeable, and forus the
only eanbellishment of small rooms in dirty, narrow, gloomy courts. The cost is trifling, and if the pence spent by children in sweets were laid out in roots and seeds, the pleasure gained might be great. One of the
best and cheapest of window plants is the little native beat and cheapest of window plants is the little native
English Lysimachia Nunmularia or Noney wort, more English lysimachia Nunmularia or Ioney wort, more
commonly known as Creeping Jenny. It is very hardy,
remains throwgh several winters, and produces its remains through several winters, and proluces its
slender trailing stalks with ahundant yellow floweis in
sammer. Ferne may also be cultivated successfally; summer. Ferne may also be cultivated successfally;
one man bad made a very neat glass case for Ferns and Wood Sorrel, which was the first of the kind seen at these flower shorss."
- A teraingai shoot from a Welilngtonia about 12 feet high has been furwarded to us, which pushed vigorously in the sprisg, and which during the present deuson has attained a length of 8 inches, bnt has suddeuly faile, being quite dead for about 2 inches, white probable that some injury must have been sustained during the previous eeason, as two terminal buds were devel ped. Be this, however, as it may, the injury is evidently derived from the tip of last year's shoot, the bark of which is decomposed, and the substance now corroded by some imperfect mould belonging to the genus Polyactis. We bave seen a very similar appearance in the Scotch Fir, without being able to detect the cause. There is no trace of any insect internally, and we believe that the hark jut beneath the point from Whence the buls were given off received las: yenr some
partial injury which gradually spread all round, like gumming in the Peach or Apricot, and at length cat off the supply of nutriment. We have had an opportunity of examining a very large collection of Wellingtonias, but have not met with a similar case. As the rest of the tree is healthy, we do not think, in spite of the prevalence of Larch disease in the neighbourhood,
- We take the earliest opportunity to state, at the request of our excellent correspondent "H. G. R.," that in his letter on International Exhibitions (p. 601), we have unwittingly misrepresented his sentiments in one particular. He had written-speaking of persons incompetent to be jurors, "such as deal only with cellules." Thas latter word, owing to the indintinctness of the MS., we read "c cellulares," and hence, we
substituted "cryptogams." What our correspondent meant to suy was this, that on the Continent there are those who pay attention to little or nothing but cellules of syatematic betany, and decomparatively nothing nonseuse ; and that wohd men are unfle to become the
directors of Botanic Gardens, or the jurors at International Exhibitions. Our learned friend is especially anxious not to be misunderstood, and we not only acquit him entirely of the use of the word "cryptogans," but regret that
of our own. of our own.

We are informed that at the Scientific Meeting of the Royal Horticultural Society on Tuesday next, Mr. Berkeley will give some gecount of a supposed hybrid Frrn from Philadelphia.

We have to announce with regret the death of Mr. Henry Lane, of Great Berkhampatead, in the 88 th year of his age. He was the father of the present enterprising nurseryman and Rose-grower of that place, and may be said to have bsen the founder of the
business, from which he only retired about 12 yeard ago. He was a man of wonderful activity and industry, and kind and considerate to all around him. He was only confined to his bed a week, and could see to read even comparatively small print without spectacles till within a few days of his death, which took place on the evening of the 15 th inst. He was one of the churchwardens of Berkhampstead for a period of not less than 40 years.

Mr. Bateman promised us the other day in his interesting lecture on Dendrobia some new species to be introduced. We hasten to show how happy was his prophetical assertion. Here is a new species, and a second also. Imagine thin stiff erect bulbs, like those of Dendrobium Aphrodite, Rehb. fil., Aug. 1, 1862 nodatum, Lindl., Aug. 2, 1862), but without knobe, and thinner, a foot and a half high, and give them single
flowers like those of the long-racemed Dendrobium lowers like those of the long-racemed Dendrobian oothleted, and a transverse bar on the margins of the lip, and you will at once know our new Dendrobe, named dixanthom in allusion to the two kinds of yellow in it, the disk of the lip being orange, and the other parts ighter. It is again one of Rev. C. S. Parish's numerous Burmese кeцh hiala, sent over to Messrs, Low \&Co.jgrown under Mr. Bnllen's care-toujowrs perdrix !

A neat lilac-flowered Dendrobium, in the way of Dr. Lindley's D. pictum, yet not quite so handsome, since here is no yellow in the flower. It came from Birneo, among Mr. Hugh Low's splendid spolia, and has
recently flowered with Messre. Líw and Bo RoMb. jul.

INDOOR CLIMBERS.-BIGNONIA CHERERE. The easy culture and the great beauty of man climbing plants makes it a matter of rearet that they
should be so much neglected. Iu planting ne hot should be so much neglected. Iu planting new hou
or renovating old ones, cultivators are apt to seek fol quick, rambling grower that will cover the speen to filled in the shortest time. With a little considenation however, others more precious may be introduced at tis same time, the soft-wooded kinds being mulu th ase way, as the others acquire age and curer sufficent surface to allow their natural finctions to lecoma
develoned. Indeed inany beautiful plants w!! mat bloom unless allowed free development.
The suhject of the present notice, Bignonia Cherere is a member of a very extensive and beautiful furai:
We may well pause before it, and fancy beauty there is available for our man much of variety. For example, how beautiful would be a collem of this gorgeous climber in some sheltered nook proved it. This however by the way, and for I ham to my present purpose.
Bignonia Cherere is considered by many at a tendes stove plant, and by others as not worthy of a rlace because under certain treatment it seldom throm more than one or two blooms in a season. As reghtit the first of these opinions I believe that it requate extra heat while in a young state, to push it former up to a certain stage. Let us take for example ould d the large new structures springing up in all directionsthey may be denominated winter gardens or comant tories. In most cases they are cleared of their inmuln,
which are turned out of doors for the summer months which are turned out of doors for the summer months and replaced by a different class of plants, though ia other instances the house is left for the greater part of \(\begin{aligned} & \text { a } \\ & \text { a }\end{aligned}\) season without anything to replace them. Brantify permanent creepers, however, such as this hithe tim
Bignonia, would add a double interest to such honm and when once established they would bear a grow amount of cold, even as much as \(10^{\circ}\) or \(12^{\circ}\) of from, without the least injury.
Before leaving this part of the suibject let me remat that I consider it a great mistake on the part of builders of large conservatories that they should llack the roots of creepers by solid foundation walls, arten are quite as secure, and they allow the roots to eatalil.
am quite aware that in many iustances the milb. I am quite aware that in many instances the mid.
surround structures of this sort. But that is no reaon why a little preparation should not be made unier. neath. The sort of plants we are nosy consiseras such as brick rubbish, than in a well-made bories Such hard materials prevent that tendency to luxatim growth possessed by most of them, and secures a mill abundant bloom; but to confine the roots within mall spaces most frequently prevents a full development of the plant, or otherwise brings in
single bloom or two in a season.
The Bignonia Cherere is an evergreen, with a strong hardy-luoking robust hatit. The flowers are largh trumpet-shaped, of a rich red, with rellow hroms at the are produced in fine clusters of the previous year's shoots. It is better, therefore, when once it has filled the space intenten for it, to pinch the stroug shoots in through tie groung short side shoots which are certain to bring bloom. is a continuous blooming plant in a conservatory temperature, but in a cold greenhouse it seldom opeas. any flowers after the sun begins to lose its power. J. \(\%\)

\section*{BEAUTIFUL HARDY PLANTA}

OR THE SBLECT SPRING GARDE
IT is with the grentest pleasure that I write this list, couvinced that all who obtain and grow the plans therein mentioned, will add for every plaut a I will begin with the little Irises, for they are of
Inter and a great beauty, and very rarely seen as well as they might easily be grown. I. reticulata, pumile, sha Ire chariming little plants; so Messrs. which I have not yet had th seeing in flower, is said to be; and so, too, is a dat purple species I have seen in flower at Messs. derson's, where it is called I. spathulata, They also several fine varieties of I, pumila laxuriate in mandy peat; at Wimbledon I have ligh sandy soil will do. At Glasnevin 1. cristatia gem, and grows on warm borders against honsea freely as a native Rumez.

The transition is easy from Iris to Crocus, and thert are, I believe, some rare things in the latter genus, suc, as C. Aucheri, lately introduced, but for beanty Si . S:ott, and La Majnstuense to wit. 'Triteleid unifora is a little plant of similar habit, very rarely seen an spring bulb, but I have prove. it so in a soll app putty. It is a lovely dwarf plant, and one that

belonge to a

Wrineng out", being qaite as nefoful as the beatt Squills. Hen. The neater and most beautiful Narcisi will
 Re conus, the neerly infroducell and very pretty juncisiais the pure white dubias, and the true awtet J.napili, binked out. Sternberxia lutea is a fine plant
jor aur be pirteer onell, and on light or gravelly soils it tiphitry a s qgol and brig hta bloom about the let O Otober, dipher eell 1 C Crocus does in spring. Bat \(I\) am wandering vor routh to 'age, from green leaves to brown, forget. tiog that 1 am writing of "sppring" gardening; thice, orerere, who grow these exquisite spring plants succutaily must give them a neat little garden for themmiluse ind then of course a good antumnal gubject will nat beidiet heo garden after most of our spring things are

 Scoorirp, too, is fine! Profeemor Syme tells me that gith Him it in much hardier and more easily grown than its common Snowdrop! Leucojuum verruam, agtio, it 2 Alo sand faranat pimit.
Now for the Squills. They, unlike Triteleia and noother littlo fellow named below, do not want thomk hanybody who conld see Mr. Mackay's beds of s. biflia in bloom at Totteridge would doubt the spperioitit of the Siberian. S. pracoox albab is a charm. iop litited dwarf, and so is S. rosea very desirable for ita Moarr and natat habit. Hyacinthus ameth gstinus and
 nothing in this paper but make this known ass fasecina. ting faity among spring plante, there woold liave been puern witten with less result; it is the moost detiandy bautifar thing in the way of \& spring bulb off to mitit (I Im deseribing from memory), and easily gromen ton-easier than the Squilla ; it does not last limg in flower, but Cew spring Alowers do. Lilium tenuiflium is in dwarf early fowering species, for Brythronium Dets-canis and the var. major are fine tuinan, of mbich I need not tell.
Another plant I want to say a few words about is as old an Methosaleh; but might as well have arrived with Maranta Veitchii for all the use that has been made of it-I mean Bulb codiun vernum. It is generally seen in a state of single blessednese, probably in a potin a musty Eandy soil in your choice spring sarden, and it woll prove one of the best and earliest of apring bulbs, sendcolnur from lange rosy-parple fiower buas, distinct in Crocus Susianus-in fact, they were showing firr several an edring of it compook leave of us this year. I hud bad soil, as healthy as growing youths of Rumex Hydro lapathas.
S. experpa, of Hull, myes Silete acablis atba and season covered writh his best Alpines, being in their by all means in allttle raised bed. Silene alpeatris will be done without. Phlox frondoss and Nelsoni covered with flowert on little beds, or become completely single or double, are indispensable, but the new one H. angulosa, is the only one I need particularise. It is plants of it. In Breat advantage when we get good big de., the flowers are said to be sometimes as arge as frown-piece. Ranunctulus amplexicanlis, bullatus fl. pl ard Adonig remas are among the best of this genus palmata I vernalis is brilliant. Anemone vernalis and tris very free.ne, atd with hortensis, fulgons, and sylves rquisite free. Aquilegla alpina again, one of the most sible, but it is ever peeped into, if true is indispenIsvely A. coerulea, now in the hands of Mr. Thompsom. hat for choice. Solp, Marshalli and vehroleves-the lary if in shade ant Epimediums are good, particu of pour bijons, Salit lanata, \&en, round the margins panmel, aud nowing garden. Aubrietias are indis deaply the first form woolly dwarf edginges, and flower apiaprowlsing new plant in this order. Dranthus tive excellent ppecies, all the moris, and fischeti are yon go far bevond is to be found in the genus, if once wallire two of the die.; alpinus and petraisus grown w wate divercing from all eystern, but it's not syistem Andronace good plante.
cilias, are gerns of the frat water. Primula pubescens, atate, margimata, and vater. Primula pubescens, cillate, and raviohing genus. Of the Gentians, verna On mad vermanca are among the best. Cyclamens Ginis, which bas gracefal leaves and loright fowers.

Sedums will come in well either as single plants o edginga, but they must be used in some shape or other dasyphyllum, brevifolium, monregalens", Ewersii, ani hispanicum, being among the best of the wonderfully neat lot. Sempervivums will make still better eitgings S. globiferum, for choiee, being as eompact and neat ac anything can be; the Spider-webbed one is hards in London. S. hirtum makea a charming bul or elging, and is a prodigious bee feeding platt too. O:hers of the genus are fine, and all so thoronghly hardy, that they do finely in the open air in Tutteuham-court-roadia and elsewhere in London.
Saxifraghs are, of course, indispensable. You can do a great deal with a good selection from this very exten sive genus. What can be neater, and to all observers
more interesting, than lines of the little half succulent encrusted-leaved Saxifragas, such as Hoitui, rosularis, Aizoon, \&c., with the distinguished and free-flowermg pyramidalis. They are geuerally grown in pots, but may be grown in the open air with the greateat ease and ate so grown amidst the smoke of London. Nothing seems to affect them in the way of climatic vicissitude and no plants are so presentable all the year round They are never in dishabille. Saxifraga Andrewsii is an ornamental species, or rather hybrid. But
before leaving tio Aizoon section, I bhotld have naid that Rocheliana and lateoviridis are among the prettiest of the sinall encrusted section, that produce heir gallant and sturdy little flowers in tolerable plenty. I once saw 70 kinds of mosey Saxifragns in ons border in the delightfully interesting botanic carden of the late Mr. Borrer, the Grand Llama of British botanists, but one who with all his love for British plante, and all his expenditure of time, labour, and wenlth in their behalf, could yet find time to grow and study thonsands of contmental and American planta, These misey Sixifragas are so much alike in habit, \&c., that it is hardly desirable to specify individuals; nearly all are good for greening-and what plante produce so lovely a green, especially when the showers of brown
leaves begin to fall P Ous I have, called Stansieldii, je leaves begin to fall P Oue I have, called Stansfieldii, is
of close firm habit, and the freest and earliest bloomer of the whole.
Dodecatheons will beautifully flll the centres of beds - I mean the commor apecies. D. splendens and integriAntennaria dioica rosea would forma an exquisite little edging plant for the choice spring garden. Wherever and is foand fit to grow well the tiny Andromedas and Menziesias, as they grow at Comely Bank and other places near Edinburgh, they will form a unigue addition
to the select garden. Eritrichium nauum is said to be ne of the loveliest Alpine gems, but as yet it is rare. I have mentioned enough of "gems," and will conclude with a few subjects of easier culture, which can be got and grown largely at once for edeing your beds, or for flling up the larger ones with chaste mixtares. Nit in early auminer. Next come the double
these ; sow it Daisies of sorts, the double Primula, Clive ien Panvies, white, blue, dark, and the Magpie Paney. Myosoti-
alpestris and Myosotis montana, a beautiful thing if alpestris and Myosotis montana, a beautiful thing is grown in a moist district and in a sonewhat shady situation. In dry ground it is comparatively poor; wick, of surpassing loveliness. Lacking a really good rockwork well-suited to the growth of Alpines and such choice subjects as those named, the best way to grow the most difficalt is in a bed raised a foot or ao above the the centre; the eoil to be very sandy, with perfect drainage and abnndant moisture at all times; and the Rodinson.

\section*{Home Correspondence.}

Ranunculus auricomus and incosstane.-Allow me to ask you whether you have been led to suspect a specific difference between the full-flowered Ranunculus naricomus (the figure in E. B.) and the common fore they are distinct. R. auricomas is earlier, larger, lores more sunyy apote, is of a brighter green, and has the petals equal, withous a notch. The other form, which I call R. inconstans, blooms after R. auricomas, courts shade, is of a darker green, and has few petals, sonietimes in size, often notched, and never so full as thowe of R. auricomus. When the two grow together (for R. auricomus will thrive in the shade also, though preferring more open spots, or the base of lofty trees), R. auricomus is decidedly the larger plant. While resided in the southeru counties, in Yorkshire, and in Cheshire, I never met with the plant figured in E. B. as R. auricomus. Near Chichester and in Cheshire the but, until I resided here, the E. B. form did not croas my path. I have not yet been able to detect a character in either form clearly separating them, unles the position of the permanent style upon the achenes should prove one. Gerard Smith, Osmasion, Ashbowrne.
Black Monmiklea Grape. - Some time in the autumb of 1862, I think in September, I read an aceount of the among others mention was made of thin, which wan described as haviug very large buuches with large oval terries I have Pine of it here, bat I cannot get it
to fruit. My employer reeeived it with Burcharit's Prince, Fraukenthal, Black Prince, Blark Morocco, \&ece, from the Society's Garden in the spring of 1891. It was struck trom eyes in the usual way along with the other surts, and made sirong canes. It was kept in a
wot during the next season, an l made go od fruitiog anes. Next spring the foll wing sorts were planted nut in the bick broters of two lean-to Vimeries, vz, Black Hanburgh, Museat Nuir de Jura, Burebarde's Prince, Framkenthal, Dutch Sweetwiter, and Biack Honukka; all bore good crons the same seas in, except the last named sort, and last senson they all bore an rcell-nt crop, averagitg from 10 to 15 libe of Grapee o each Vine. No sigus of fruit howevir appeared on the Monukke, at which I was rather dimppoiuted. I have a fair crop again this season with the same excep-
ion, although it made good wood, which was well ipened. I pruned it on the spar system. The border in which these Vires are planted has the advantage of heat from hot-water pipes rumuing undar the walk which divide the back and front borders. I intend aking up these Vines and planting young ones aguin nd having two good Vines of Monukka in pote, hould esteom it a favour if any of your readers can neak in it favour before riaking space, so, for it J. M.

Cutbusk's sioedling Raspberry. - The Fruit Committeo of the Royal Horticultural Society are wrong in maying this is an early eort, for the reverse is the fact, it haing at least three weeke later than its pareat the Prince of Wales and for this desirable quality we ecommend it. The habit of growth is equally strong and free with that of the kind just naned, the cane averaging from six to eight feet long, with branche rom the bsee nearly to the summit. The fruit, which borne on these branches in great quantities, partake sonewhat of the character of that of the Fastolti, buth in shape, colour, and flavour; and being very juicy it is well adapted for preserving. We have tested it for averal years side by gide with other kinds, and whe all others are fully ripe this is just opening its blossomes Cutbenk however, an sutumn-bearing sorto Wan.
Earwigs.-I have lost many plants from the attack f these little creatures, whose naume is legion. Purple King Verbena has suffered more than anything elee from their ravages ; Calceolarias, Pansies, Tropaoluas, and Pelargoniums have all been uttackerl, but not so adly as the Verbenas. The remedy I adopt is this: About ofclock in the evening I procure eome good succulent Lettuce leaves, which I lay all over the bed, eapecially on that side against which the most vigorous attack is to be expected. At 11 c'clock I go roupd with a dozen earwige under each leaf; on lifting the latter up the little depredators scamper off in all directions, os hide under a lump of earth. The quickent plan is to pinch them between the finger and chumb, but a more delicate, althougb not less cruel way, is to put them into a water-pot full of boiling water. Tuis iemedy I have proved to be better than any other, and if acci-
dentally prevented from goiug to look over the leaves, dentally prevented from going to look over the leaves, This plan repeated for a week will, although tediou, reatly thin their numbers. Does any bird feed upon either the insects or their egge? W. S., Raverholme Priory, Slea ford.
Early Peas. - With reference to our First and Bent, is due to the numerous friends who last season apoke highly of it, as well as to ourselves, that we sh ul endeavour to remove the incorrect impression regaraing Pine-apple Place, have unwittingly created by their published report on New barly Peas (see p. 530 ). We obtained our First and Best some six yours agn roma gardener in this neighbourhood, and in succesive nrial beason ather searlient known Pea. In 1563 we grow it extensively for the purpose of sale, bnt atterwards besi ated to send it ont antil wo buajected it to serutinising and decisive trial. We therefore sent package to some 50 of the leading gardeuers and others throughout the country, and from all of these the most unequivacal testimonies to its earliness and excellence were received, many of which were published in our Seed Catalogue for the current year. These testimonies were so satiofactory and decisire that we resolved to send it out last spring, but as the seed had been held over a year (for the reavon just stated) the circau stane wil to a great extent account for its not havid, still earlier characteristies than already reported. In our own trial grounds, in two different localities mene Chenter-the one sheltered, warm, and early; the other exposed, cold, and late-nur Firat and Beat was in each case about two days later in blooming and coming into bearing than its two sivale, but the crop was mach heavier and the pods were larger and better filled. We found Sutton's Rangleader sad Cartercline to be identical in every respect, and inclined freely to sport, whereas our own was very true. First and Bost is also a little taller and a more vigorons grower, and whice it yielled three and four copious pickings, baroly two gatkerings could be obtained from the two just named. Dhilhstime's Early was som days later than
nurs, and Damel O'Lourke later than Dillistone's. Curpenter's Exprees
Enper Rival appeare to be a good seco
coming into bearing between our Early Favourite and

Cuampion of England. We are growing our First and Best very extensively this season, as we are certain it will he found and pronounced to be the hest early Pea in cultivation. Framcis and Arthur Dickson \& Sons, 106, Eastgate Street, Chester, Dillistone's Early, and Sangster's No. 1, and I found the first to be fully nine days earlier than either of the others. Its quality is excellent; it is very hardy, a strong grower, and pods larger crop from the First and Best than I did from either of the others, and in fature I shall sow it only for my
Gardens.
Double-Glazing.-I notice (see p. 650) some interesting remarks on this subject. I had known for years that plant houses in Russia were usually double-glazed, but I had no information as to the relative value of the plan. The main purpose of my writing now is to ask your comparative advantages of single and double-glazing regards the flowering of Orchids. I fear he will be unable to do this, as he states that all the Orchidhouses at Berlin are, without exception, double-glazed. In one instance, however, it seems that the outside sashes are regularly taken off during the hottest summer months. If your correspondent will take the trouble to frequently visit this house and some others, where the plants are abont equal in size, \&c., not so treated, and then state in which the greatest amount of flowers are produced, it will be very interesting. With our cloudy skies
roof in the summer, or the flowers will be few and far between. M. Reichenheim's Vandas I should expect to see very luxuriantly grown, and as they are without spot and insects they must be delightfin to look at. But how do they flower? Saccolabiums flower well in fallen for four months, Robert Warner, Broomfield.
Large Fine Leaf.-Observing in my greenhouse \& Vine leaf which appeared unusually large, I measured it and found it to be rather over 14 inches in length and
breadth. Is this an unusual size? Henry Morgan, breadth. Is this in unusual size? Henry Morgan,
Bracondale, Norwich. [A leaf of White Nice received from Mr. Thomson of Dalkeith (see 1857, p. 194) measured 17 inches in diameter, and records of others larger than yours may be found in the same volume (see p. 214).]
Bedding at South Kensington,- All who visit the Royal Horticultural Gardens at Sontl Kensington this season, the beds there-none round London which I have seen can bear the least comparison with them, notwithplaying colours to advantage. The beds in question were as nearly as possible perfect at planting time, which is the great secret of early success in such matters. The
materials should be good, free from insects, and planted close. It tries the patience of many, after having had
empty beds so long, to have still to wait for perfor empty beds so long, to have still to wait for perfection,
with which they are sometimes after all not favoured. It would be much better policy for those who have veniences allow them to do successfully, to reduce con space by filling the beds partially, or, in some instances, wholly with some sort of perennial. In the meantime, however, let us take a hint from Mr. Eyles, and fill the the beds are large do as he has aone, namely fill the centre with Aucuba japonica; this, surrounded effective. At the same time it appears to me that grea judgment must be exercised in the use of such additions they can only be employed in masses that balance well With the whole design, or in miscellaneous beds distinet and complete in themselves. Moreover, the present usefulness of the Aucuba for such a purpose will be greatly enhanced when we get large clusters of rich
berries on it. Of this we berries on it. Of this we may doubtless soon have an
opportunity of judging in this garden. I am not going to trouble you with a long description of the beds, and with what they are filled, for I hope all who can will go and juige for themselves, bur I cannot pass Stella and Cybister, two new Nowegay Pelargoniums, without noticing that they are splendid additions to our bedding materials; and if the kinds Mr. William Paul is bringing different shades of colour, we may hail them as real acquisitions to our flower, ge may hail Inem as real these gardens do Mr. Eyles, the Superintendent, infinite credit, particularly if we look back and consider has had to overcome. A Country F.R.B.S.
Further Notes on the Flora of Kildare.-Several detached bogs exist in that part of the county next to Athy and Castledermott. As it is half.way between Athy and Castledermott. As it is now drained and
planted it is fast losing its boggy character. Here I planted it is fast losing its boggy character. Here I and in every shade of colour from white to deep purple, Hypericum montanum is also common here, but I have not observed it elsewhere. In several spots Cladium cating the ferny nature of the soil in which it delights. Rides through the bog in June are adorned with the Cally pretty Cnicus pratensis, and the still prettier the county. About two miles common in this part of of Dolardatown is another bog of a different de-
scription, called Ballyvas. The former is clothed with a wide waste of Furze, a covert for foxes, the latter with most luxuriant Grass and Rushes, a splendid covert for snipe. In a bog of this kind the sportsman and the botanist had need, however, to walk circumspectly, for there are many paces where it would be much easiex
getting in than getting ont. Cladium Mariscus is most prominent all over this bog. At the lower end Epipactis palustris is now blooming abundantly and in luxuriance, some of the plants attaining a height of nearly two feet. This is the only locality in which 1 have yet seen it. This makes the tenth kind of Orchid that I have met with quite indigenous to the county Kildare. A clever botanist told me yesterday that Listera cordata is found in the county. As soon as I stumble upon it I shall tell you. In a plantation at Kilke Castle there is about a quarter of an acre covered with Lotus major, a very distinct species of Bird's.foo Trefoil; and in another part of the same plantation Carex lævigata is found. In a low meadow between the plantation just named and the river Greece there is a scattered patch of Thalictrum flavum; and part of the banks of the river is here adorned with Typha latifolia. On the road-side between Mageney and Carlow, Ballota nigra is growing most vigorously J. Douplas, Kilkea Castle, Kildare,

Sweet Peas.-Who does not love this sweetest of fowers? Perfect though they be in regard to variety and brilliancy of colour, it is perhaps not impossible to produce something grander than we are already familiar with. Has this been realised in the "New Invincible Scarlet," introduced this season as something "strikingly brilliant and very distinct in colour?" I ventured to give a good crown piece for 23 Peas, and now that they are in full flower I find they are no improvement on old sorts, nor have they a distinctness worth noting. Let any one mix together a few blooms of the Invincible and the old crimson or scarlet, and he wil slight difference I admit, but they are not so strikingly" different as to entitle them to be sold at this high price. No wonder that the public are misled, and made to pay enormous prices for novelties, when this said Invincible Pea is honoured by the Roya
Horticultural Society with a First-class Cortificate 1 Provincial Seedsman. [We saw the flowers alluded to, and thought them remarkably fine-much finer indeed than any we had previously seen. There is, more over, a marked difference in the half-withered flowers you send, the Invincible being in that state much the The Old Der two.]
The Old Dwarf White Rocket.-I shall be obliged if any of your readers can inform me where I can procure
the old-fashioned Dwarf White Rocket, which we used to see in our gardens 30 yeard back. It seldom grew higher than 12 or 15 inches. I have not been able to meet with it for years, and fear it is extinct. J. F.
Preserving Byacinth Bulbs.-I send a couple of Hyacinth bulbs, in which I think you will not find the hollowness spoken off at p. 650 . As soon as the plants
have done flowering I take them in their pots into a hot dry potting shed, where there is plenty of light; about half a peck of buibs, similar to those sent. Josep Forsyth Johnson, Gardener, Manchester. [These bulbs previonsly.]

\section*{Foreign Correspondence.}

Mrxicar Gardening.-When the "Tasmanian landed us in the Bay of Saint Thomas I went to the market and to the public garden. In the first there were good saladings and vegetables, the former grown on the north side of the island. In the garden wer growing well, in some cases luxuriantly, Crotons,
Ipomoeas, Cocoa-nats (the fruit small), Biguonia Stans, and Neriums, very fine and effective, with no end of tropical subjects. At Havanna the gardens and squares were well kept, and at the time of my visi gay with flowers, Roses being plentiful, and fragran lackiontradicting in this case the old tale of thei formed of Piumbago caponsis, Croton variegatum, \&c.; Hibiscus, Vinca, Bignonia, Passiflora, Dracena, and Musa were fine and abundant, and the Guavas formed larga trees. Plants of noble leaf and habit being very luxuriant, and free-flowering subjects plentiful among them, the effect under a bright sun and clear sky was very gorgeous and beautiful. Round the town in wast poti, Lantana crocea, Convolvali, Cacti, \&c., in grea quantity were to be seen, with variously marked lizards crickets, beautifully-coloured butterflies, scc., among them, with other and smaller insects in great plenty many very pleasant to the sight, and others exceedingly anpleasant to the sense of touch. I suppose the natives become pachydermatous at an early age, and cease to be affected by the latter. At Havanna there are very few pedestrians-everybody rides something
At Vera Cruz, which is a hot, stinking, ill-drained sented by a few dirty old tubs! muto which you look to see at the bottom a ghostly and faded Ficus, or miserable Musa. The tub plan has its advantages ir hot countries I admit, hut here the thing was done as badly as it could be, the surroundings, \&cc., being of the and most untidy sort
Going from Vera Cruz to Soledad, during the first few
daye of November, we passed by lakes of Nymeres groups of Musa, and Palms in luxuriant health Proe by stages to the city of Mexico. The jonrner generally accomplished in three days, but this the rainy geason was much later than usual, to endure seven days of torture. the Three-rock Mountain near Dublin is as Re Street compared to the road between Soledad
Puebla! You are jolted from stone to o bump, angleways, forward in every conceivable and some inconceivable ids, and Watching and taking notes of the vegetation these circumstances was impossible. In pase through a ravine I noticed large masses of Schomburet tibicinis growing on the largest brancines of hiest company with Tillandsias, Ferns, Mosses, \&an th situation comparatively some distance further on, the rugged sides of the trach lued wivh Gymnogramma peruviana ar and Selaginella Stopping at one place to chang horses, our host kindly took me to a Coffee plantation and vary interesting sight it was; bushes about thr years old, very neat, about 6 feet high nnd 4 thro laden with beautiful berries, and the leares of \(m\) refreshing a green as the evergreens exhibit in mostly spots in the the shade of tres plant mon Bananas and Pines were grown, and very good to and the proprietor, a lover of plants, was introducing all the new fruits, flowers, \&c., he could obtain to experiment. In some shady parts of the plantation Orchids were established on the trees. The propritoter had, too, a new climber, which I did not see in flomen but which he highly praised for its beauty and perfume to was to be named Hanburia.
About Cordova the vegetation is luxariant enome but untidy: Solaginellas, Ferns, Ricinus, Azalea, to or in quantity; Orange trees in full froit, But hereabouts the 12 mules, Bryophyllum calycina diligence through the misture of mad and stones th tilled the deep holes, and so we were all obliged to pe. out-ladies, children and all - and bad to make detour through the woods, over old stumps and and streams. Twenty-four mules were then foten to the diligence, and several men set to dig it the top of the hill to pick us up. Along the path noticed masses of Oncidium luridum and 0 . bicallosm on branches of small-trees, but the wood was 80 den that it was impossible to sers more than a few yar from the path. At Cordova it rained so hard for days that the roads were reported to be ill a wo state than ever, but I started off in company min several of the hardiest of the travellers to go by rocky foaming streams, through swamps, woods, with the rain coming down in torrents. The " footed mules" were otten down with us, and sometimes never to get up again. I passed several nasep in
"Peons"-on the way, with spikes of Levlis necps their sombreros or hats, and I also saw, while st wood by a by-path, several noble specacan Tobacco were plentiful. The barriers still remini io the atreets of Orizaba, with the caunon planted in them as they wers when the fighting was going on
We left the town at 3 oclock in the morning, whil was very dark and cold, with torches to lighi vithoting a-head with a torch as a piletra daylight at 6 o'clock. Lælia anceps and some Oncin were abundant on the trees. In going over some ren steep mountains covered with Oaks I recognsed an friend, Polypodium vulgare, but very btuiled the ven as we got to the sunny side of these napidly changed to huge Agaves, Ye, Cacti. Away again, over vast prairies with some trees near the road, covered by a beautiful goluen nev species of Cuscuta, till we reach Leaving it, we passed through a country almost be se to farms or Hasiendas, with very few trees
but the Wheat, Barley, and Maize sbundant.
Rio Frio, a den of robbers (they had sallied out a for days before and robbed the diligence, shooting of the passengers) is a very picturesque village, nerns which in rocky places 1 eaw a quantity of neat couid Selaginellas, and other small and pretty plants, bus ther not stop or get near enough to obtain specimens, should be nearly hardy, for it is very cond Agav
were journeying through fields of Maize and Aas meeting hundreds of ma on their way to Vera Craz, when we first had the valley of Mexico; soou after we real appeht Mr. Barron's gardens are at Tacuhaya, \(1 \frac{1}{2}\) l and opposite Chapultupec, the residence of Maximilian, whom I have had the honour plante, knows the names of a goud many, English well. Mr. Barron has kindly am having a thorough overhanl. I have

I arranged for Mr. Bewley, at Rock ville, Dublin ; but bere 1 cal gel which, by the way, stands frost Chelanthes elegastly on exposed rocks. Orchids I shall rell, and sble to cali to my aid, and many forms of beautiful Cacti; and thus I am confident of producing a scene birch may even charm some of the natives of this fine plant country. Orange trees do well here, but want ro bosbes, fuil of flower, and perfect specimens ; Acacia rifolis forms fine masses and is uninjured by cold ; olandra Banksii is in full flower against a wall; while be young shoots of Magnolia grandiflora and Araucaria furns shrubs 15 feet through; Cassias, Ander-
 in fine bealth and flower, while we have Violets in quantity all the year round. The air here is very clear, ght, and pure; you can distinguish a thin column of moke rising through it apparently a mile in height. empervivums, Mesembryanthemums, \&cc., do beautially here on rockwork. In my Orchid house, at 6 or 7 ia the morning, you could well bear an overcoat. Sereral mornings the thermometer indicated 2 or \(3^{\circ}\) of frost, yet with 15 spikes, and pseudobulbs as big usturkeys' eggs; Oncidium Barkerii, too, is fine; and Barkeria Skinneri with a higher colour than I have rees seen it in Earope. Of Orchids not in flower have a capital lot. My old favourite Adiantum Capillus-veneris is here luxuriant and in quantity, with hatrea Filiz-mas and Woodwardias. Ipomcoa Quamoclit forms a beautiful object, and does well to run over some of my arches, sce., and thus agreeably introduces a little colour among the Ferns, which we could not well do at Rockrille. The Emperor has a German gardener, aud gentleman near, a Eelgian. I have just had a lot of plants, which I selected before starting at Messrs. Clapton, but came quite safe; so much for good packIng. I shall save the greater part of them, everu the aburnum
egetation about me is of a very peculiar character Palms with Ash trees; Veronicas with Cherimoyers Roves with Agaves; Beaucarnea, Cactuses, Dasylirions, with Capressas and Eucalyptus, The Ligustrum japonicum makes fine standard trees with round heads for terraces. Somebody should try them in London, where lnow they will grow in a back-yard. There are many kinds of humming birds flitting about the garden and building their nests, of the most beautiful construction fertilisers of Orchids, with Darwin, that they are great drongha field of Apaves the other morning I cound akes of ice an inch thick in the hollows of the leaves and the shady sides of some roads and ditches remained frozen all day. There are very few variegated plants in Cexico. Johm O'Brien

\section*{Societies.}

President, in the Ednsurgh : May 11.-Dr. Dickson, elected: As a Resident Fellow- following gentlemen were \(M D_{\text {., Director }}\) a Foreign Member-M. Domin. Traquair, following communicationsic Garden, Toulouse. The Morphological Constitution of the read:-1. On the selia, and its analogy woith that of certain Rosacees.
By Dr, Alezander results of bis investigations of the author gave the stamens in Mentzelia aurea. From the fact of the after the develop the stamens not appearing until consideration of the peculiar armas well as from Btamens, he believed that here the androecium really
consists of posed to the sepals. coential difference between of opinion that the only os the one hand, and Loass and its allias and its allies, centripetal, in the latter evolution of staminal lobes in senera agreeing in having five compound stamens erolution does not appear sufference in stamina Preaking up of the Loasacere, as has to justify the similarity in staminal where Payer had recognised \(b_{1}\). Dickson btaminal evolutions to the Mentzelix, mondeptont has been examined may be arranged pored to the sepals, with -1 . Arenis type; stamens super \({ }_{2}\) Alchemia, Agrimonia, Sanguisorba true corolla, as no true corolla type ; stamens alternate with the sepals Pagaria, \&e. -2. Report an in tha, Rubus, Rosa, Geum By 3. Abstract February, 1865. By Dr ir Plantatio ing beon Robert Cross. Mr. Cla the Pitayo Cinchonas madeen impressed with. Clements R. Markham hav Pita of the species of Cinchona which grow at and nes If. Cony for India to emptained the sanction of the \({ }^{0} 1\) the Cincharks that ploy Mr. Cross in the eervice 2midst perpetual of the Andes represent it as flourishing andy ever enoying a moment of and mist, and

解 ations, couid the trees ripen their seeds, for a certain amount of dry weather and sunshine is necessary for the ripening of the capsules, and for their bursting in order that the seeds may fall to the earti. The Cinchona climate is certainly moist for about six eight months of the year, and in cultivating this plant it is expedient to soek very humid situations, because the mountains of India do not appear to receive the same amount of moisture as the lofty elevations in America. Nevertheless it will be understood that the natural climate of the commercial Cinchona has been misrepresented by most South American travellers,
The Pitayo Cinchona differs essentially from the C. lancifolia of Karsten in being a more slender tree often found formerly from 60 to 70 feet in height but rarely more than 18 inches or 2 feet in diameter with very slender branches, bearing small lanceolate leaves, which before falling always assume a purple or deep red colour. The "C. lancifolia to which Karsten refers extends over a wider tract of country than any other Cinchona on the Andes. This tree however, is much more massive, and bears considerably larger leaves than those of the Pitayo Cinchona. This large-leaved Cinchona inhabits the western slopes of the Cordillera Orientale, in situations presenting conditions favourable for its development, between Pasto and the city of Santa Fé de Bogota; while the finer kinds of Pitayo bark are limited to a few square miles of steep forest-covered slopes to the northward of the volcano Purace, which belongs properly to the central Cor dillera The map of the Cinchona region of New It reprely mader or Weddel is very incorrect nd as conts cortaia tracts of country as mountainous, they are hot with Cinchona forests, while in realit with low spreading leguminous trees, where no Cinchona ever grew. Karsten states that the bark is no taken from the roots of the C. lancifolia, which, in most instances, is true; but this is not the case with that of Pitayo, the bark from the roots of which in much more valuable than that from the trunks or branches. Further he asserts that the C. lancifolia is never likely to become scarce, and that the continual cutting of the Cinchona trees will rathe augment than diminish the number of 'plants; and this may be true concerning his C. lancifolia, about Which no one cares much, as the yield of quinine often too small to cover the expense of collecting; but as regards the Pitayo bark there is one thing very certain, that at the present time there is more difficulty in collecting 1 lb . than there was formerly in collecting 1 cowt. The Pitayo bark will very probably be found said to grow very rapidly, which is a matter great importance. It may certainly be barked when it is 6 feet high, although it would
not be an advisable practice to do so before the trees are at least 30 feet high. Bark taken from large trees in Pitayo was said to give nearly 4 per cent. while bark taken from the roots of the same tree gave 5 per cent. of quinine. All the bark taken from Pitayo is said to be sent to France. The bark sold in England under that name is not true Pitayo bark, bu comes from the mountains which border on the valley of the Magdalena, and from Almaquer and Pasto, and is certainly from the C. lancifolia of Karsten, which a regards quality is very inferior to that of Pitayo. True Pitayo bark may be known in England by not being much thicker than common window-glass-because it been destroyed long ago, and by its being full of earthy particles, on account of so much bark being taken from the roots of the plants. Professor Jamieson, of Quito analysed the Pitayo bark, and found it to contain 3.2 per cent. of quinine. There is, therefore, little doubt that this species, and the Cinchona officinalis of Loxa will prove among the best for cultivation. The climate is like that of Loxa, and even the vegetation of both regions bears a close resemblance to each other Don Narciso Lorenzano remarks that the principal motive which induced the Government of India to commence Cinchona cultivation, after overcoming so many difficultien, was the fear that the Quina trees would be extirpated in consequence of the waste that is allowed in the woods, where they are destroyed by the barbarous method of pulling up the roots. Fortu nately this destructive method, which, without any doubt, would extirpate this precious plant in a few years, is only practised in the forests of Pitayo, where it is due to the immoderate desire for making money which has taken possession of the Indians, who own the greater part of the land. But iu none of the other establishments for the collection of bark in New Granada has a similar practice been adopted On the contrary, beneficial rules are observed for the conservancy of the woods. The method consists in leaving a part of the trunk, about
3 feet in height, whence shoots may sprout, and in clearing away the surrounding trees to enable the reys of the sun to penetrate. By this means most of rays of the sun penetrating to the cleared ground, the seeds which fall from the trees germinate freely This result gives us full confidence that the good
kinds of Quinas which exist in this country will be kinds of Quinas which exist in this country will be
living plants of Neotinas intacta from Galway. He buted that he had seen about 40 plants in the station but only one of them was in flower. They grew on' dry bank, close to limestone gravel.-Dr. Dickson various sorowing plants of Pinguicula vulgaris from warked differences in their flowers and leaves, and seemed to indicate at all events distinct varieties.

Entomologicat: June 5.-F. P. Pascoe, Esq., F.L.S. President, in the Clair. The Kev. Hamlet Clark com,
municated a paragraph quoted in Gosse's "Jamaica" from Southey's "Md.lor," confirming his statement made at a previous meetiug as to the simultaneous Hies assing of the flashing of the luminosity of fire the in Brazin. He also distributed a number of specimens of a new genus of bectles allied to Marro Cathus, captured by Captain 13uwher in !3risish Cafraria, hovering over and diving througri, the spray of a waterfall and settliug on the rocks. He also read
descriptions of 28 new species of A cistralime I'loytophagous iusects, of which 16 belonged to the genus P? Letters were read from Mr. Edwin Reed, from I3athia, and from Mr. J. A. Brewer, from the A\%ores, account of their entomological captures. Mr. \(F\). Smith exhibited Apate capucinus, taken by his son in Bishop' Wood, Hampstead, on a barked Oalk tree Mr. F. Bond exhibited the rare moth Diantheris albimacula, taken at Gosport, in June, and also a fine specimen of the North American Saturnia Polyphemus, reared from the chrysilhs in this country, together with a large species
of Oph:on parasitic upon it. Mr. Stainton exhibited various kiuds of galls growing upon Quercus llex, at Mentone ; and Mr. Pascoe an apparently new species of Dorcadion, recently taken by him at Alicante. Prof Westwood mentioned a simple mode of preserving the caterpillars of exotic tised by the late Dr. Burchell in South America. Mr. E Moore read descriptions of a number of now species of Bombycidæ from East India. A notice was read of the intended exlibition at the Palais de l'Industric in Paris of economic insects, including, 1st, species which are beneficial to man, as producing silk, honey, wax, dyes, or useful for medicine, \&c.; and 21 , species injurious to cereals, fruit trees, timber, wooden structures, \&c. Some conversation took place as to the recent meetur at Brompton with reference to the destiny of the iron "boilers," now no longer wanted, and which might be used as local museums, of which it was admitted that it
was very desirous that several should be established especially in different parts of the metropolis. The recent death of the veteran French entomologist, Dr. Léon Dufour, was announced. Mr. F'. Smith read some observations in opposition to the views of Dr. Sichel, contained in a memoir just published on the Humble Bee, Bombus montanus, to which he referred as varieties a number of insects hitherto regarded as specifically distinct.
July 3.-F. P. Pascoe, F.L.S., President, in the chair. An unanimous vote of thanks was passed to W. Wilson are exce, for the entertainment at Reigate. Mr. F. Bond exhibited fine the Society Eupithecta pulchellata, reared from the Forglove; also a new species of the same genus, E campanulata, reared from the Campanule by the Rev Harper Crewe; also Toxocampa Craccer, reared by Dr. Knaggg. Mr. Stainton extibited some of the nalis, received from Mr. Edwin Brown, of Burton-uponTrent. The Rev. Hamiet Clarke made some further statements confirming the fact of the simultaneous intermission of luminosity by large numbers of fire-flies Lampyrides) in Brazil, and Mr. Fry stated that this ese with certain species of the genus Aspi soma, generally found near water He als, exhibited number of minute insects captured in the mudle of India by Lieutenant Hopson, and sent by yost to England, inclosed in a small tube. He also gave an account of a kind of frefly found in Ceylon, remarkable or the number of luminous spots arrange \(l\) in twn row along the sides of the body. Mr. Staiuton exhibited the larva of Cerniostoma lotelia, found on the leaves of Lotus major, near Searborough, by Mr. Wilkiuson A note was read from the Rev. Douglas Timmins iving the result of a month's collecting in the neigh bourhood of Cannes during the pastspring. Dr. Armitage exhibited specimens of the male and female of a casebearing moth (Oiketicus, K.) from Monte Video. A note was communicated by Mr. W. F. Evans, confirm ing the fact of the luminosity of Fulgora laternari observed in British Honduras by his sou. The Secretary read an article giving the statistics of the known under the name of La Gatine. Mr. Bates read communication received from Mr. Eenjamin Walsh of Illinois, giving an account of the hybernation of an American speciea of Liminitis; the fact, however, had ong been known in the case of the European species of butterflies beionging to the same genns, an account of The President stated that some of the eggs of the dog tick, exhibited at a former meeting ly Captain Cox, had recently batched.

Roxal Hortroulturat: July 15 (Show of Liliacea, \&c.).-This consisted chiefly of the different
varieties of Lilium lancifolium, of which some well

 appeared to be merely different forms of speciosum. Others consisted of Lilium auratum, among which was a pretty variety with reddish bands from Messrs. E. G. Henderson, named rubescens. The others came
from Hessrs. Bartlett, Cutbush, Bull, Young, and from Messrs. Bartlett, Cutbush, Bull, Young, and
Catleugh. The only other Lilies shown were the Tiger, Long-flowered, and Martagon, of which there was a pretty dark variety named umbellatum. Vallota F. G. Henderson; and Vallota eximia from Mr. Bull. Miscellaneous subjects consisted of six stands of Holly hocks from Messrs. Downie Laird \& Laing, together with a spike of a delicate pink seedling, called Mrs. with a spike of a delicate pink seedling, called Mrs.
Laing. Roses came from Mr. Clarke, of Brixton; hanging baskets, Achimenes, and variegated-leaved Begonias from Mr. Young; Cockscombs from Mr. Taylor, gr. to J. Yates, Esq., Highgate; and a beautiful of Pinus excelsa were contributed by Mr. Carson, gr. to W. F. G. Parmer, Esq., Nonsuch Park, Cheam; and Figs and a Queen Pineapple by Mr. Ford, gr. to W. Hubbard, Eisq., Horsham.

\section*{Nottces of 3300Kg.}

Tancouver Island and British Columbia. By Matthew Macfie, F.R.G.S. Longmans.
The sathor of this book resided for five years in the colonies, which he bas undertaken to describe-in what capacity he does not say; but as there are occasional
indications of his claiming a clerical character, although not using the prefix of Rev., and declining the title of clergyman in what he cally "the Britisil sense" of the term, we are led to the conclusion that he must be a minister of some denomination dissenting from the Church of England. Be that as it may, he has industrinoly avalead hinaself of his opportunities by interest, connected with Vanenuver's Island and British Columbia; and the result, though searcely a book to be read for the sake of amusement, contains a most
valuable fund of information for the intending colonist, whether he go to Victoria as merchant, miner, agriculturist, or merely as a visitor ; in either case he will find much not only to interest but to instruct.

The first chapter is devoted to the history of the colony. Beginning with the exploring expeditions of the Spaniards, which were followed up by the English under Drake and Cook, the latter of whom appears to
have been the first who absolutely landed on Vanhave been the first who absolutely landed on Van-
couver's Island, :Mr. Macfie gives a succinet account of the fortunes of the colony from the foundation a trading post by the Hudson's Bay Company in 1843 of Victoria alone is estimated at 5500 . That of the entire colony is not given; indeed it would probably
be quite impossible in the present state of the country even to guess at it. Every year adds enormously to mines, which rival those of California, and respecting the yield from which, and the various methods procuring the gold, the author gives ample and accu copperare also exported from Victoria; and when the riches of the coast in different kinds of fish are fully explored, the gield from this branch of commerce may be expected to be enormons.
"The facilities possessed by both these colonies for catching and curing fish are pre-eminent. The them to become important in the exportation of this article. Port San Juan, Barclay Sound, Nootka, Hespod, Koskeemo, Sooke, Esquimalt, Victoria, Nanaimo, and many other bays may be enumerated, including the inlets on the coast of British Columbia, 450 miles long-all convenient to extensive fishing grounds, and peculiarly adapted for sheltered fishing stations. The salt sprimgs existing on Admiralty Island and at Nanaimo, have already been referred to in this volume. A gallon of water from the latter place, when
analysed, produced a pound of salt, while sea water only \(4 \frac{1}{3}\) ozs. The spring on the island is capable of supplying a gallon a minute, the specific gravity of the
water being 1.060 . What portion of the globe could be water being 1.060 . What portion of the globe could be to foreign markets? To say nothing of California with its rapidly increasing population, Nexico, Central South America, would immediately become customers were our fisberies entered upon with capital and vigour. European residents in China and Japan would swell the
demand. The natives of these countries, who demand. The natives of these countries, who are fish, would themselves gladly take from us as much as we comld for many years conveniently dispone of. Por is it unlikely that, as the commercial relations of these colonies with India become more intimate,
large markets will spring up in that direction. Anstralia and New Zealand will not be able to provide for their wants in this particalar for 50 years-probably
never. These southern colonies, therefore, present another field for the competition of future fish merchants in Vancouver Inland and British Columbia."
But it is to its Fir forests that British Columbia
owes its greatest celebrity. The western coast of
North America is well known as the habitat of some of the most magnificent trees in the world, which are rivalled only by the gigantic Gum trees of Australia. The Abies Douglasii, in particular, furnishes the most splendid spars for ship building to be met with any where, and an extensive trade is in consequence being Americans term "lumber;" the profits from which may A mericans term "lumber;" the profits from
"Shippers have assured me that 100 per cent, has often been realised by them upon cargoes to China. The captain of a British vessel once stated in my hearing that, having discharged his freight from England in Victoria, he loaded his ship with sawn lumber in the vicinity of the colony at \& cost of from 2l. 18, to \(2 l .108\) per 1000 feet, and sold it in Foochow, after a voyage of per 1000 feet.
With regard to agriculture, the prospects, according o our author, are most encouraging: the climate i excellent, the soil good, and the quantity of land
suitable to the purpose extensive. But it must be suitable to the purpose extensive, But it must be
confessed that in this particular Mr. Macfio's statements read more like predictions of what may be here after, than of what is the case at preserit. The fact is, that the gold mines have proved so attractive, that the attention of settiers has hitherto been less directed to the extraction of the vegetable, than of the mineral riches of these colonies. Here and and with a fair farmers have comme

The following is an extract from a communication written by a settler in this district (that called Comox) with reference to the harvest of 1864 :- The crops in the settlement have been excellent this season, the armers being well contented with their returns. Oats, Barley, Wheat, Peas, and Potaton, are the chief products. Oats have yielded as much as 60 bushels to the acre. One of the settlers, who has about 6 acres under cultivation, has raised over 30 tons of Potatos, a ton and a half of Turnips, a large quantity of garden vegetables, and a smail crop of splendid Oats, beside Wheat and Peas. He also cat over 30 tona of hay, 16
tons of which were sold on the ground at 15 dols, per ton. He has nine head of cattle, including three milch cows, 20 hogs, aud 50 chickens raised this year. From his three cows he made this season over 200 lbs . of batter, for which he gets \(37 \frac{1}{4}\) cents. per lb, at the settlement.' This person has been only two years in Comox, and is a fair example of what may be done by any inductrious man without capital."

Again, "A medical gentlemar, whose lengthened residence in the colony and special inquiry into this
department of farming statistica department of farming statistics gives weight to his statements, writes: - 'The average production of
Wheat is 25 to 30 bushels to the acre, 641 br , to the bushel ; of Oats, 40 bushels to the acre-weight, 36 lba to 46 lbs ; Potatos, 200 bushels to the acre, and of superior quality. All vegetables succeed much better
in Vancouver than in Oregon or Washington territory. This remark applies also to butter. The Potatos grown in the colony cannot be equalled, and our Turnips, Carrots, Onions, Peas, Cabbages, \&c., canuot be sur passed for size and flavour in any part of the world.
illustration of the remunerative character of dairy produce, I am nssured by a gentleman who has a personal knowledge of the circuinstance, that a farmer at the Blue Tent drove into Cariboo during the
mining season in 186330 dairy cows, and netted \(15 l\). per day for four months. In 18 months from his arrival in the colony, he realised 4500l."
Mr. Mactio predicts for Victoria, and we think with reason, a brilliant future as an entrepót for British sit uation the great advantage of being an entirely free port, it is rapidly attracting merchants of various nations, who flud there a cheaper and more convenient market than any hitherto existing. "With Washington territory. Oregon, California, and Mexico in the soath, and British Columbia and Sitka in the north, lnoeking at our doors for goods, there wonkl seem to be a bright ruture in store for our city." "The day is approaching
when the choice products of China, Japan, and India, will be discharged at our wharves for trane-shipment not only to the order of buyers in the adjoining American, Mexican, and other States on the coast, bat . the consignment of merchants in the cities of Canada, Brition United States tonching the boundary of population whose industry will yet enliven and reclaim Mocky Mountains and Lake Huron"" lying between the Rocky Mountains and Lake Huron.
It is impossible to allude to every topic discussed in this volume; it must suffice to say that the reader will an very few untouched: most are fully treated of, and as our extracts show, with a minuteness which is a guarantee of their accuracy. The only part of the unpleasant tone adopted by Mr. Macfie, when discussing
und political affairs. His evident amimus against the Hudson's Bay Company and many members of the government, renders him an unafe guide on the subject, as it is obvious that he can only see things from one point of view. Nven were he right in his opinions, it is uncourteous, not to say nngentlemanly,
to apeak of Sir James Douglas and others, in the offen-
sive language he permits himself to use. We will mos selves with expressing a hope that should thent ous
and reach a second edition, Mr. Macfie will see the proprine of expunging such virulent abuse from his pager.
We will conclude with two short aneedote Victoria society, which will, we think, amuse readers:-
"One lady, who had contracted the inconventeat with plural noung her \(\mathrm{h}^{\prime}\), and asing singular verto expatiating on the magnificence of into the pat by mansion-the number of stories it contained, its turnet and battlements, and the fine view of the san commanded. The fact was, to speak without fir she was the daughter of a worthy lighthouse keepe "Druggists inform me that the demand for hair The cause of this expedient, in such a country, mary bo readily conjectured.'

\section*{Tye \(\mathfrak{A p t a r y .}\)}

Having but very recently become an enthuiat is the keepiug of bees, I have to acknowledge the beadth I have received from the communications on have lately appeared in your columan. think the best way in which my appreciation of the same can be shown will be to send you a badgot d Apiarian Notres; which, relating as they do experience gained by the manipulations of a complete tyro, may prove valuable to some of your reader, is exhibiting the results of mistakes as well as succensan First, having been captivated by the dencription of bar-and-frame hives, I essayed to have some made by our country carpenter. At first I was delighted at th way in which he accomplished his task, and the eractitude with which he had made the ends of esch tram slip easily within the boxes, almost, but not quilk, touching their sides. Greatit was my diamay, as inu on the very point of furnishing these hives with wark to learn from a friendiy correspondent that these fnms
were all made improparly, and must on no account be used, a clear space of three-eighths of an inch between the frames and any portion of the interior of the hine being neeessary. However there was nothing to done but to set to work to remedy the misuake, and my swarms.
Early in May I had the pleasure of visiting Mr. A. Neighbour's small apiary at Dorking. He had nothing but Ligurians, and I was greatly charmed with thel appearance, and in fact with all I saw. A friend of
their owner was manipulating with two stocks while I their owner was manipulating with two stochs hadl
was present, aud I learned more as to how to hand the frames, find the queen, and many other matters, in halt an hour than I had ever picked up before.
On May 20th I mado my first experiment in the my of Drivina; and the formation of Artifilal swary The operation on a flat-topped straw hive was nic thought at first that too many bees had been forcel from the stock hive, so I took the precaution the overing it up with the \({ }^{\text {, }}\) Hower I soon found that, with the bees which had entered the decoy hive placed on the old stand while the bers were being driven, there was an ample population for warning on the hive prosperously, and it soon begon remark
beautifully. The forced swarm also has done ably well. It was the largest swarm I have taken sino commencing bee keeping.
A few days after this I again succeeded most satire factorily in the same operacion forcing swe two hires whole affair, from the time of tying the minates The swarm, too, has proved
see no reason to believe that a forced swarm is in has way inferior to one that issues naturally. Thare bither momewhat elated with my success in thase I have mod yet to learn. I am struck with surprise, and wo at finding how tractable bees are at such times; marvellously quiet and little disposed to ress
rough treatment to which they are subjected. Bour rough treatment to which they are subjer and ancear them, yet they will submit to be pushed soo open here and there, and will obey the hand
as submissively as a well trained horse. If say one I have had several Naturai Swarars issue fou
Ithe lives on which I had previously placed supers. might be expected, litt!e
harvest have been in consequence
My bees behaved very much better
last sumber, giving me some fine supers of pure honey-combs,

A hive which, early in the spring, I imagined to be queenless, has recovered itself in a surprising maniat It became by the end of May as apparently pore than as any of my other stocks, and
40 lbs . Since then it has inereased is population th such an extent as to be quite
I lare \({ }^{2}\)
I have been somewhat disappointed with wy for
:0.2 time after they were tenanted by their swarms 1 D? . wed tegether in one mass by the combs being carried tara bar to bar. I do not know how the evil can the frames so as to remove the combs safely. The bees hare built the crossed over to a second, carried on a few Hes on that, and then again jumped across to a Is there any way which I can adopt for
In emiphteming of at least \(1 \frac{1}{2}\) inch would be preferable as these narrow bare of \(\frac{8}{B}\) of an inch, I should be glad hive vith bars of the greater width, and nothing enn exceed the regularity of the combs, which are in mud thicker through than those worked in
a inive of the same diameter, but furnished with 10 lars instead of eeven.
lars instead of seven,
Should these few remarks be acceptable, I hope to be able to send you some further reports of my apiarian doings before long, and if others of your bee-keeping friends would, from time tould greatly interest and oblige A Susex Clorgymam.

\section*{Garden Memoranda}

Abundel Castle.-The home of the "Head of all the Howards," famous in war and in story, and come maving some of the most beautiful scenery in the :ounh of England, has surpassing interest for the
ondinary visitor, even if incapable of admiring the noble woods which enshroud it; but it is a sort of Paradise to the horticulturist or forester, who bere find therr favourites more closely associated than they are elsewhere with the relics of old time-aye, actually loxuriating in the dust accumulated from the tread of
marlike men during a dozen centuries. warlike men during a dozen centuries.
The bold and densely wooled hill, with its grand old tuew portion of the Castle and entranees and the surrounding wall are in perfect keeping with the work done six centaries ago, quite as strong and thick, and better tuait, if posible), where not covered by Ivied walls and forts, is clothed with Deodars and the finest Pines,
with great Tlip trees in flower. Kentucky Coffee trees, Peulownia, Catalpas large and full of blossom, and Hickory and Walnats laden as they never are in
colder parts of the country. On some parts of the colder parts of the country. On some parts of the
outer fortificationg it is most interasting to eoe the struggle for life between Jasmine, Ivy, and Rose With, whorever these expose the flints, red Valerian, nigrum. And so the old walls that once were the prize of mab, are now safely in possession of the vegetable kingdom, except that Mr. Wilson's nailing on an
Apricot or Pear tree wherever he gets an open space, Apricot or Pear tree
may be an exception,
obtained. The top of the keep that the grand view is cld friend, Helix Hedere is in the richest green by our green climbers," and is in capital preservation, like all the straight towers of Arundel. From its top you look Straight down on the Italian garden about 100 feet zarden, which is clsewhere of a brilliant flower to any but bird or aieronaut. This flower garden is mithin the walls of the Castle, and where the
nid lords of Arundel marshalled their merrie men, Mr
Wilson now Wilson now musters nearly 60,000 of his bedding most disticict and pleas:ng masses of colour-a rich porple. Standard Portugal Laurels-planted out of Iridh Joniper, and Irish Yreens luxuriate at Aruncelin the beds, and they were are used with good effect the without any Grass between the beds, wher Yellowish after parting the brilliant colours and beds of cravel, the "piling up" of colour is generally a little ?lin wes strongest optics; but in this case the mmane smreat ot octionable, in consequence of the Fran Bevis's Tower, and indeed from the the keep top, of the celebrities of Ing. lievis, by the way, was leave this wicked world, from which he had suddenly biade heomat) and round his he.ud the Brobdignagian

\section*{"Now mark me well," said the ohiof, "and obey
The counand I leve. and the word I say:
Wbere ye ursain fiud this trusty gluive}

And be only threw it three-quarters of a
\(H^{3}\),ny the round hills of the park, to a place awall Trve of Gullive therey buried him in a grave sugBut the it wer aravels.
Froun this rare ofill donjou keep, for wherever you cau Ginde the Ithe Ivy there is a now prospect. Just down on the tops of th you have quite a novel view fear some Pines and Oaks planted by her Majestr, the contrasting finely with great people, with, besidefand
most desirable Pines in cultivation-Abies Morinda. It is about 30 feet high, and of mournful grace from th branchlets hanging down quite perpendicnlarly. would be just in the right place at Sir Bevis's grave funereal plant, for the Abies looks "dark as death" well as pendulous. It is not so striking when in small state. Looking beyond the pleasure-gardens th grandly rolling downs are seen dappled with deer and by walking to the other side of the keep, looking towards the sea, the quadrangle of Arundel Castle is at the base, and one cannot say whether the newer buildings look more imposing from the keep, or the keep from the quadrangle. Beyond is the winding Aran and the Briton or Saxon first fixed upon the bold brow of Arundel for a stronghold. All else is changed. The Isle
of Wight is seen in the dim distance, and the spireshowever, I cannot hope to give an adequate idea of the beauties of Arundel, since I had not a photomuat encampment and a weel to spare, and so gardens. Orang
Orange treen in tubs are distribated pretty freely
along straight walks, and they look very healthy-and along straight walks, and they look very healthy-and
why? Because ALL the growth is made out of doors and in consequence the foliage is able to stand any vicissitude, and remain on and in a healthy condition during the winter, the plants being placed in a rather dark and cold slated house. Orange trees treated in this way I have certainly observed to look much better than those allowed to make a start indoors, or indeed the greater part of those grown indoors altogether:*
The deep old moat which once kept cold wa
between the Castle and its enemies, is now dry, but it is shaded by trees aud shrubs sufficiently to form what must be the Sussex head-quarters of the Hart's tongue Fern. Standing among the Pines on the outer maescs of Scolopendrium, with glistening leaves nearly feet long; at the botrom they are contraste with a suow mass of Philadelphus, and then they rise
on the opposite bank for 70 feet up to the orter Catle walls. It forms one of the most smgulap Fern sight maginable; and there is no better opportunity than exists at Arundel for making the grandest of all hardy Ferneries in this home of the Hart's-tongue.
Of the 20 acres of kitchen garden the greater portion has been mede by Mr. Wilson during the past nine years. This is connected with the forcing and
fruit gardens by a tunnel also recently made under the public road, and conveniently connpcting all the gardens. From the moundy and peculiar character of the place, it was no easy matter to arrange so much kitchen and fruit garden compactly, but it is now as much so as could be desired. The vegetable quarters are more suggestive of garden farming than the supply of a private eatablishment, and there is as much ground under a single crop, such as Parsnips, as would support an industrious Dutchman and a few pigg. Apropos of
Parsnips, judoing from little contrivances which Mr. Wilson requires to get them up (short strong rope with a noose, which is passed round the neck of the root) the Parsnips at Arundel must be as difficult to unearth as badgers.
Mr. Wilson is a root-pruner on a large scale. Along the walks of the newer part of the kitchen garden are large Apple trees, which once grew together in an
orchard of 4 acres, bore nothing, bat sent down into the chalk and clay nice straight clean roots that you could make walking-sticks of. They were taken up in 1858 and 1859 , propped into position along the walks (the natives did not think it a very wise proceeding, and were inclined to laugh at Mr. Wilson) and now they are establisted and bearing abundantly. "It does oue's heart good "- I mean one trom the northern and colder portions of these islands-to see the large standard Fig-trees, the Aruudel Fig. bearing abundantly. It reaiises effictively for us the old pioture of contented humanity under its own Ficus; and it is no less satisfactory to the canny man from N. B., and the vestern and northern Gael of the sister isle, to see thos arge Standard Pears, of the choicest sorts, bearing abundantly. And then there are ruws of iwarfer ones,
from 12 to 15 ft , high, trained somewhat in a pyramidal form, root-pruned every three years, and the shoots bent down with fruit,
Strawberries are to some extent a failure at Arunde this season," as they are in most gardena. Can it be the the "pond garden," a low-lying piece of ground at the base of the woody hill, where the soil is much moister than in the elevated main garden, Strawberries have
done well; and in that fine kitcuen-gardnn at Pesworth (which I had also the pleasure of visiting)
where there is a yard and a-half deep of the finst where, into which ti:e spade passes as into sifted addition to the inexhaustuble supply of moisture whinh Jones, the able gardener, covers his Strawberry grounds with a mulching of short manure which keeps them free from drought or crack, and when the mulching is pushed off the soil looks as moist
* This quite coincides with the management of the fine old
Ifanoverian Oraage trees, probably the tinest in existence.

This mulching, too, keeps the fruit as clean as any special arrangement for that purpose.
The quantity of fruits of all kinds at Arundel is quite marvellons, Never have I seen suck lots of Apricotes on garden walls, and on walls of old ramparte, \&c. And mark-the young wood is laid in, not spurred closely, as
it is with a bad result in many places. What they will do with the small fruit, Aprles, Pears, de., cannot Wiil to be a problem to the visitr, but then, as Mr. Wilson says, "we have to feed a great army of birds." in winter, the walls being ten feet thick, but then it is well to read about, not the sort of thing that a gardener can elsewhere lay hands on. His root room is also the interior of an old tower, with a prodigious non-conduct-
ing power of Ivy and stone, and there are old towers for all sorts of purposes, fome furnishel as summer rooms, others unentered within the memory of man-capital-looking tenements for ghonts.
Here and there the Virginian Poke, Phytolecea decandra, is to be seen, and while not despicable as an ornamental plant during autumn, when its spikes of black berries are in perfection, yet it is not grown for ornament, but to feed pheasants; they are said to
grow deliciously tender upon it. In one fine breadth of elevated lawn, well suited for an important extension of the arboretum. which it is hoped will get be made in it, there is a sunken panel croquet ground, which can be flooded at will, and thus the turf is kept as green and crisp convenient skating pround. There is no more admirable coavenient skating ground. There is no more admirabie may be turned on at almost every point in kitchen,
fruit, or pleasure gardens. It is first pumped up from ruit, or pleasure gardens. It is first pumped up from over 900 tons, and is thence distriluuted.
New Zealand Spinach is extensively usert, as it saves the almost hopeless labour of trying to get satistactory I was rather taken with the phan of phant:Ie Dablias and Hollyhocks anming tree and herlower as Pamian as practiend hy Mr. Wilsm, thins securing two simwy
displays in the yar in the cane large beds. Arumdo Donax does finely, as it doubtless would in any tolerably favoured locality in the south of England. Whoever first takes a little pains with this fine plant and some others, such as A rundo conspicua, which will make nearly as fine a plant as the Pampas Grass in the south of England, will produce an original and striking feature. Sueh ombosomed hollows as those at Arundel would form capital places in which to begin.
Whem " serving my time" I was nearly "run off my legs "shading and unshading Melone, Cucumhers, \&c., in the dung frames, but here in the Mclon yard at any time, and cortainly the fluttering old mats, \&c.., are no loss from an æsthetic point of view, while much time is saved.
And what are these old turf pits for-jnet such pits as any rough labourer with plenty of sods conld stick up a number of in a week, with a rough plate laid the top?-hardening a off bedding stuff or such work? No! but for capital crops of Peaches to come in between those on the wall and in Peach houses. I should not omit that the simple frame of wood on which the lights rest was elevated atu inch or two from the top of the turf wall, by being placed
on bricks, and thus thorouch ventilation was secured. on bricks, and thus thorough rentilation was secured.
The trees are planted outside, and just trained as in an ordinary Peacl-house. In the forcius garden the 3 feet high at the bighest point, and 6 or 8 teet wide.
The newer houses are of the best design and finish slender copper hars leaving the interiors as light as open day ; tloors, brickwork, \&ce, evidently calculaicel to last as long as some of the battlementid wails to be seen from every part of the place. In one span-roofed
orchard house, about 100 feet by 17 , the P'athes are planted out and trained umbrella fashion-some of the specimens being exactly of the size and shape of a
carriage umbrella. Well provided with fruit these look novel underneath, and they must be very pretty objects in flower. Of course the wood ripens better in this way than if the bush is a common standard, and then there is better light and more space for standing plants in pots between these umbrella specimens. In the Melon was found moded ennugh to produce gond crops:
Of a whole batch of Pinehouses I have only time and space to say that they are ghaned wioh Hartley's rough plate, and have little perforated pipes over the turuing of a tap, a plau of M1. Wiison's, whidh has suved
him much treuble, especially in the pits, where the lights
Here I must stop; the fruit houses alom? would hive afforded interest for the very delightiul day which,
thanks to Mr. Wilson's kindness, I ppent in this noble place, with its well-kept and excellently managed

\section*{gardens. \(\boldsymbol{R}\).}

\section*{Miscellaneous.}

The Sediment: formed in Wines.-M. Pastenr states that he has carefully examined the sedimenta formed in
wines, and has found they can all be claaepal moder three
heads. The first are crystals of bitartrate of potash, neutral tartrate of sods, or a mizture of the two salts, These adhere to the sides of the bottles, and have but little influence upon the composition and quality of the Wine. The second kiud, also covering the sides of the
bottles, are browu colouring mattere, which, originally bottles, are brown colouring matters, which, originally
dissolved in the wine, are gradually rendered insoluble by oxidation. This sediment, therefore, is caused by the presence of oxygen existing in the air which is over or dissolved in the wine. By several experiments upon different wines enclosed in tubes, the anthor proves this fact, and shows that the deposit takes place more
rapidly when the tubes are exposed to the light. The rapidly when the tubes are exposed to the light. The
wine becomes of a lighter colour, and acquires the Wine becones of a lighter colour, and acquires the
peculiar odour and fluvour of old wines which have returned from a voyage. He attributes the good effect of a tropicai voyage upon wine, not, as has been supposed, to the increase of temperature, but to the continual changing of the vitiated air over the wine through variations in the pressure from constant shaking and evaporation. Accordingly, wines hermetiindeed, do not sensibly change in any way. The third class of sediment, by far the most injurious, is composed of various cryptogamic vegetations, winich, acting as ferments, are the sole cause of the "diseases" of wine. The author infers that wines would be improved by leaving them i

Řats, Mice, Flies, Wasps, \&ec.- Some yearsago I read, in a French scientific periodical, that chloride of lime
would rid a house of all these nuisances. I treasured would rid a house of all these nuisances. I treasured its value, and this occurred some four years since. I took an old country house infested with rats, mice, and flies. I stuffed every rat and mouse hole with the chloride. I threw it on the quarry floors of the dairy and cellars. I kept saucers of it under the chests of
drawers, or some other convenient piece of furniture; in every nursery, bed, or dressing room. An ornamental glass vase held a quantity at the foot of each staircase Stables, cowaheds, pigsties, all had their dose, and the result was elorious. I thoroughly routed my enemies, and if the rats, more impudent than all the rest, did make renewed attacks upon the dairy in about twelve months, when probably from repeated cleansing and fushing als traces of the chloride had vanished, a hendown premises. Last year was a great one for wasps: they wouldn't face the chloride; though in the dining room, in which we bad none-as its smell, to me most refreshing and wholesome, is not approved by all persons -we had perpetual warfare. And all this comfort for eightpence! Only let housewives beware that they place proximity to bright steel wares, or the result will be that their gilded china will be reduced to plain, and their bright steel fenders to rusty iron in no time. \(E\). Payne, in Builder.
Curious Nests of Mice.-A number of empty bottles had been stowed away upon a shelf, and among them was found one which was tenanted by a mouse. The afford a suitable home for her young, and bad theremade into a vest. The bottle was filled with the nest, and the eccentric architect had taken the precaution to leave a round hole corresponding to the neek of the
bottle. In this remarkable domicile the youns were placed; and it is a fact worthy of notice, that no attempt had been made to shut out the light. Nothing would have been easier than to have formed the cavity at the underside, so that the soft materials of the nest Would exclude the light; but the mouse had simply therein she had placed her offapring. It is thereSore evident that the mouse has no fear of light, but that it only chooses darkness as a means of mouse can make a nest is somewhat surprising. One of the Cambridge journals mentioned, some few years ago, that in a farmer's house a loaf of newly baked bread was placed upon a shelf, sccording to custom. Next day a hole was observed in the loaf; and when it was cut open a mouse and her nest were discovered within, the latter baving been mads of paper. On examination, the material of the habitation was found to have been obtained from a copy-book, which bad been torn into shreds, and arranged into the form of a pink, transparent, and newly born. Thus, in the space pink, transparent, and newly born. Thus, in the space
of 38 hours at the most, the loaf must have cooled, the interior been exavated, the copy-book found and cut into suitable pieces, the nest made, and the young brought into the world. Surely it is no wonder that mice are so plentiful, or that their many enemies fail to exterminate them. Homes without Hands.

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

Ip not already done, no time should be lost in putting all houses, pits, or trames in thorough repair before short days have arrived or bad weather has set in. Let needed. Inside whitewashing, although manageable at all timea, may likewise now be done. The repairing and cleanaing of flues, where such still exist, will of course
other apparatus where suspicion may rest should like wise be proceeded with forthwith.
plower garden and plant housis.
Out of doors tall plants may require additional staking and tying. Patches of early annuals will now be past their best, and should be removed, filling their places with plants from the reserve garden. Advantage
should also be taken of favourable weather to do many operations in the gardien just named, such as thinning and transplanting young biennials and perenniais, and any shrubs which may staud too close in their seedling beds.
Chrisanthemums.-These should now be carefully attended to, or they will lose their lower leaves, by which the appearance of the plants will be spoiled, and the production of useless suckers encouraged. Train into form, but not too stiffly, and water frequently with weak liquid manure.
DABLIAs.-Trap earwigs, and remove all badlyformed buds as they appear.
Pelargoniums.-Cuttings may be taken of some of the best bedding varieties, as they will strike now, in the open ground, with greater freedom than they will at any time during the year if coddled up by bottom heat; besides this the plants they produce are healthier, more robust, and form handsome specimens in a shorter space of time. Proceed by loosening the soil of a south afterwards insert the cuttings 3 inches apart, fastening them well with the thumb and fore finger. If the weather is dry, it may be necessary to water them occasionally; but, if possible, defer this till their bases are healed over. As soon as they have made a few fresh leaves, they can be taken up, potted into 3 and 4-inch pote, and placed for a few days in a close frame after which they may be gradually exposed to sun and air.
Randenculusrs. - Beds from which the roots of these have been taken up, should be dug roughly, in order to weeten the soil by exposure to sun and air. The roots themselves will of course be dry, and in safe quarters.

\section*{FORCING GARDEN.}

Mrlons.-Keep the bottom heat in dung frames as egular as possible, and endeavour to secure sufficient warmth from the linings to allow plenty of air to be given while the weather is fine. Water very cautiously, and only when a fresh supply is absolutely necessary, and then give enough to moisten the whole mass of soil.
Praches.-The wood will probably be ripe in the early house by this time. Give, therefore, all the air possible. Give trees from which the fruit has just been gathered a good
Pines.-Plants intended to furnish the winter and spring supply of fruit must be treated with considerable care and judgment, in order to insure their showing at the proper time, or rather to do all that can be done to insure this, for the most experienced growers cannot always succeed in getting plants to fruit at the desired time. Continue to select the most promising plants, keeping them dry at the root, and fully exposed to light, so as to check their growth, and induce a comparative state of rest for a few weeks. Those that have well-matured their growth, if wanted to fruit at once, should be kept close and warm, affording them a brisk bottom heat, and properly moistening the soil about the roots. Those intended to supply ripe fruit late in spring, if not considered sufficientily strong, may be encouraged to grow freely for some time yet, as is these can be got to show in November, they will be suff. ciently early. Attend carefully to plants swelling their fruit, giving plenty of manure water at the root, and keeping the atmosphere warin and moist. Attend to
the watering of recently potted stock, as if too much is given the fresh soil is apt to become sodden, and if too little the old ball becomes so dry that it is not easy to get it properly moist again ; in either case the check which the roots sustain frequently throws the plants into fruit prematurely. Get all succession stock requiring more not room shifted as soon as circumstances will allow, in order that it may be well esta-
blished before winter. blished before winter.
Vines.-Should showery"weather continue, it will be unfavourable for Grapes that are ripe and expected to hang in good condition for a long time, and where the borders are of a strong adhesive nature, it will be advisable to cover with sumething to throw off heavy rain; where, however, the soil is of a light nature, and such that the water will drain through it freely, this will be unnecessary. Use gentle fires where truit is
colouring, with a moderate circulation of air, and on colouring, with a moderate circulation of air, and on
fine days too much air can hardly be giveu at this stage. In dull weather fire-hent will also be necessary where fruit is swelling.
hardy fruit and kitchen garden
Continue to fasten in young wood of wall trees, and to see that they are perfectly free from insects; also stop over-luxuriant shoots, and endeavour to secure a fair amount of bearing wood all over the tree. Gross
shoota that were stopped early in the season may now or soon be divested of laterals. Keep the breastwood on Pear and other wall or espalier trees closely atopped in.
Cabiage, -Sow now some seed of the Enfield
for winter use may still be planted out cutting. Prat Spinach-Sow a littio Prickly nom the season.

\section*{The Agricultural batette SATURDAY, JULY 22, 1865.}

OUr columns are filled to-day with a report of the doings of the past week at Plymouth. The Royal Agricultural Society has received a greater number of visitors and spectators in its showyard than was expected-but the large influx on the Wednesday was doubtless due to loyal rather than agricultural enthusiasm. It had the honour on that day of a visit from the Prince and Princess of Wales, who have thus commenced their western tour most appropriately by an inspection of all that is best worth seeing in the agriculture of Devonshire, as well as in that of the many other counties which have sent their best specimens to Plymouth.

There has this year heen a much fairer interohange of agricultural advantage between visitors and natives than we have had on some previous similar occasions, as at the Canterbury meeting, to record. Devonshire has muoh that is agriculturally admirable; and its beautiful breed of oattle was never before seen in such perfection. Some of our best Leicester sheep breeders also are Devonshire men. On the other hand the farmers of the West have had exhibited before them unequalled classes of sheep and pigs, mostly from other counties The Short-borns, which are now seen everywhere, have also been displayed in fair numbers and good quality, and the Herefords have been first-rate.
The Horse Classes alone, excepting only one or two classes of farm horses, have been a failure. The implements exhibited have been as good a show as ever, and it is a striking illustration of agricultural progress that a large proportion of the whole class which has come uader adjudication during the past week is the creation, and much of the rest may be pronounced at least the growth, of the past 20 years. Twenty years agi no man thought of mowing, and very few had thought of reaping, by machinery. Hay tedders were hardly known, manure distributors were unknown, and corn drills were confined to a comparatively few counties.

These are the machines which have taxed the powers and the patience of a dozen good judges during four days of trial at Plymouth to plaee them in the order of their merit-overtared them wo mar sar, for it is impussible by a few days' experience to determine the relative excellence of sume 60 drills and 40 reaping and mowiug machines on a mere plot of land. And we should have preferred that the societr's juidges had been instructed during this preliminary examination merely to select half-s-dozen from the whole class for a more elaborate and prolonged examination on a greater extent of land hereafter
On the whole, whether successful tinaucially or not, the Plymouth Meeting has beell a great sucoess in all that ought to enter into our estimate of the achievements of the Society. It has successfully brought all the agrioultural enorgiew of the country to bear upon a new diatrict. And there is not much propriety, therefore, in a lament because fewer men from a distance have been among its visitors ; or because some of the old attractionssteam cultivation, for example-have been almost in abeyance; as in a county of small fields it could not fail to be.

\section*{THE GREAT AGRICULITURAL MEEIING} AT' PLYMOUTH.
Tra business of this annual meeting commenced on Wednesday, July 12, when the various implements o the classes allotted for their adjudication were selected by the judges, and sent out to the trial grounds, and a prelimiuary comparison ot some of the reaping machines was made. Thursday was a porriug wet day, and nothing could be done. On Eriday and Saturday a very efficient comparison of the mowers and the drilling machines was accomplished, and some progress wa made in comparing the reaping machines, notwith atanding the rain on the afternoon of the latter day On Monday, which was fine, the reaping machne trials were completed, and the bay tedders, horse rakes, and uurse hoes were worked.
On Monday the yards opened at \(8 \mathrm{a} . \mathrm{m}\)., and immediately the judging of the different classes of live stock Was commenced, and brought to a pretty enrly close averuge show of Short-liorns, that there is a tair display of the Hereford breed, a wonderful collection of Devons, capital classes of Sheep and Piry, and one of the poorest Horse shows that the Society has ever had. The report, which we proceed to give in detail, will we think juatify this general account of the Show-yard. We proceed now to give an account of the live stock:-

\section*{THE Cattle Yard.}

The Classes of Suort.iorns are generally short in point of numbers. The first class of Old Bulls includes only six animals. Of these Lord Chancrllor, bred by Jonas Webb, lately placed 1st in his class at Hereford, stands 1st here. Mr. Sharpe, of Courtlands, Sussex, has thus shown his good judgment in bringing him across the breadth of the island. He is a large framed high-standing long bull with well-sprung rib, deep hind quarter, and good flank-rather deficient in front The 2d prize goes to Mr. Bolitho, of Trewidden, for a roan, just over three years old. Better in the middle than at either end, he is somewhat light in his hind quarters and coarse in front. Mr. Clayden, of Saffron Walden, shows a very long red bull, with thick meat over his loin and rib, but somewhat flat-sided, making his section "amidships " to be rectangular rather than round. The 3d prize is taken by Mr. Curyton of Saltash with a roan of beautitul quality, but of light hind-quarters and sumewhat flat sided. Mr. Tenuant's red roan bull, all the way from Leeds, shown in this class is very evenly and symmetrically covered, rather ander sized, but of very good quality.
The Younger Class of bulls includes half a dozen, anong which there was no difficulty in selecting the st place for Mr. Ford's red and white Dete or DevonsHires, a very evenly covered and well formed beast, and first-rate forwards; the surface smooth over a very symmetrical frame; the early morning sun casting no shadow from bummock or patch, as it did more or less over all the others. Mr. Charlesworth's (Dewsbury) white bull, of great length, and particularly good over the loin, but with rather short hind quarters, took the 2d place; and Mr. Clayden's roan Kivight of North Essex, hardly of full size, with good twist, and barring a lump on her back, very good and even throurbout, takes the 3 d prize. Another young buil shown by Mr.
Clayden, Loud Yaramount, a rich roan, fails in length.
Clayden, Lord Paramount, a rich roan, fails in lengeth.
The Yearling Bulis are a larger and better class than their predecessors-10 animals are exiibited, and some of our first-class breeders send of their stock. The ist prize goes to a massive roan bull by Mr, Fawkes, of Otley, with quite as much beef on him as, coming from such a herd, he ought to have. He lhis a long symmetrical barrel of great depth, and particularly good over the loin. Beside him stands Lord Walsingham's white bull, of great width forward, crested neck, aud masculine appearance-which is somewhat lacking in the 2d prize animal-shown by Mr. Booth. This is a light roan, rather slightly built animal, of beautiful quality, with a head perfect in profile, but somewhat alender
and effeminate as seen in front. He has a straight back but coarse shoulder. Mr. Z. Walker, of Birmingham, takes the 3 d prize with a son of the Gold Medal bull at Battersea. He is a rather short but massive roan in this class.
in this class. Bull Calves there was less difficulty in separating the few best from the ruck. And the 1st prize has gone easily to a large massive and symmetrical calf, as large as a yearling, belonging to Mr . Fawkes, of Otley, and own brother to the 1st prize bull in the older class. The \(2 d\) prize was taken by Sir A. small dark roan of great merit; and the reserved number is won by Mr. G. Garne, of Sarsden, with his number is won by Mr. G. Garne, of Sarsden, with his
Plgmouth Candifate, a dark roan of great substance and first-rate quality.
The Cows are a class of extraordinary merit, of great size, massive, and symmetrical; all of them deserving prizes, but most of them are fat, and one in particular, Mr. Logan's Annette 2d, excessively fat. There are here Mr. Stratton's Diadem and Mr. Sharpe's Elegant, which were lst and \(2 d\) in the extraordinary cow class at Hereford; they are here 2 d and 3 d respectively,
being both beater by a cow of wonderfully perfect form, Ceing botin beaten by a cow of wonderfully perfect form, Lady Pigot shows a white cow, bred by Col. 'Towneley, rather light in her hind quarters, and somewhat tucked up in the middle. Mr. Stratton shows two cows-Maid of Honour, a very deep and well-made roan cow, with massive hind quarters, and Diadem, just calved, but in extraordinary condition, which is the better formed of the two. Then there is Mr. Logan's extraordinary lieavy and fat cow, out of all reason fat and heavy for a breeding animal. Sir E. Kerrison shows Violet 4th, a very large and deep rather short roan cow. Mr. Sharpe's red roan Elegant, which stands 2d in the class, is wonderfully fiue forward, even throughout rather light behind. Mr. Wood's Corinne, coming 1st, is a very wide and massive roan, in better breeding condition than some of them, and Mr. Tennant's
Frederick's Parewell-a long, well-made Towneley cow, Frederick's Farewell-a long, well-made Towneley cow,
deserves a better place than she holds, and rould have obtained it had it not been for the extraordiuary merit of her competitors.
A small but very beautiful class of Heifers contended in the younger class. Mr. Booth, Mr. Stratton, Lady Pigot, Earl St. Germans, Mr. Logan, and Mr. Sharpe showed goolspecimens. Mr. Booth stands 1st easily with a remarkably massive, deep, and wide heifer, Garland, of great length, plenty of hair, and every sign of health and vigour. The dam, Lady Blyth, is just eight years old, and has already dropped six heifers and a bull, Lord of tie Valley. She had three calves in 1864 , and will calve again before the end of the year. The \(2 d\) prize goes to Mr. Logan's Charlotte 4th, another so deep and massive in the hind quarters. The \(3 d\) prize goes to a red roan heifer shown by Lady Pigot, at either end as those placed above it. Mr. Booth
heifer is probably the best Shorthorn in the yard. heifer is probably the best Short-horn in the yard. than two dozen entries. Lord Feversham takes the 1st prize with a roan l:eifer Princess, of great substance,
capital in rib and flank and hind quarter, and a beautiful capital iu rib and flank and hind quarter, and a beautiful
roan colour. The \(2 d\) aud 3 l prizes go to Mr. Tennant roan colour. The \(2 d\) and 3 a prizes go to Mr. Tennant
for Miss Farewell, a Towneley bred heifer, and to Mr. Wond for clotilde, a red heifer, one of the largest in the class. He also shows her twin sister of almost equal merit.
The Calf class did not nccupy so much time in deciding their relative positions. The 1st prize goes to Mr. Pawlett for Charmer 8 th, a thick and wide and deep
calf, of beautiful symmetry, and Sir A. Rothschild takes calf, of beautiful symmetry, and Sir A. Rothschild takes
the 2d prize with Little Cherry, showing admirable quality, perfect straightness of back, in this respect somewhat the superior of Charmer, and first-rate hind quarters; perhaps, however, hardly showing so much substance or growth as its successful rival. The class is a very good one. Mr. Stratton shows three very good roan culves in it. We give the Prize List for Shorthorns here :-
Judaes - - . Drewry, \(\begin{gathered}\text { Short-Horns. } \\ \text { Holker, New }\end{gathered}\)

 e. UuE or Devonshire, , M. Mutchitess); J. J. Charlesworrh, of
Headtield, Dernobury, Yorkshire; 3, J. Clayden, of Littliciury,

The Hereford Classes are good, both as regards quality and number, considerins their distance from home. Among the Old Bulls, Mr. Baldwin's Battrrsera, on which however the judges differed in opinion, one being willing to place him lst again, has lost the rank which he has hitherto held. He is a remarkably long, well-made animal, getting rather thir in his thighs and loose in his flesh; but as grand all along his back and as thickly covered on rib and loin as ever. It has no doubt been againist him that he has been constantly ghown at five or six meetings every year, ever ainee his first success at Battersea three years ago. He is thus beaten now by Mr. Marsh Read's Peremptoriliy, a more massive, and perhaps more masculine looking and grander animal, with firmer touch; but not so evenly
covered, or presenting so true a surface over back aad covered, or presenting so true a surface over back and
side. And also by Mr. Holling's Crieftain 2D, which was 1 st in his class at Ieretord, but is getting somewhat coarse and patchy.
The small Class of Yomger Bul's iuchudes Mr. Duckham's Consmodore, Mr. Stallard's Chieftatn 3d, 1st, 2d, and 3d. Commodore is a very evenly 1st, 2 d , and 3 d . Comanore is a very eveny hin-wide in front, with a rare thickness through the heart, and ample depth every where. He is perhaps hardly up to the mark as regardsssize, and being a little too high just behind the hock bones, gives him the appearance of a droop towards the rump. The \(2 d\) prize bull is shown by Mr. Stallard, of Brockhampton, and the excellent quality and symmetry, is shown by Mr. J. M. Read, of Elkstone, near Cheltenlam
The younger bulls are not a large class. Mr. Paramore, of Dinedor, Hereford, takes the 1st prize with a deep and massive animal in front, good also behind, and very straight and well-made every where. Mr. Wright's (Oswestry) 2d prize bull is even, thick, and long; and there are other good animals in the class-Mr.
straight well-made beast. straight well-made beast.
The Bull Calves are a
The Bull Calves are a small class. Mr. Paramore is
uccessful here again, and Mr. Monkhouse, of The Stow, near Hereford-both showing straight and evenly covered good calves.

The Cows are a rather uneven class. Mr. Baldwin's 1st prize, Duchess of Bedford 2d, is rather small, but of good quality; she girths 7 ft .4 in .-a pretty little cow. Mr. Oliver's (Grampound) larger cow is Highly Commended. Mr. Walker, of Westfield House, Holmer, Hereford, takes the 2 d and 3 d prizes with large framed cows, of which the \(2 d\) prize animal is rather the worse of the \(\ddagger w o\) as regards patchiness and coarseness. They girth upwards of 8 ft . each.
The Heifers are a good class. Mr. Baldwin's 1st prize, Miss Hastings 2d, somewhat coarse over the hip, has a beautifully sprung rib, and wonderfully fine bosom. Major General Hood here shows a good heifer of light red colour, large, and good over loin and flank. The
2d prize goes to Mr. G. Pitt, for a very large and well2d prize goes to Mr. G. Pitt, for a very large and well-
made cow with cali at her foot made cow with calt at her foot
The Yearling Heifer Class is numerous and good. Major-General the IInn. A. N. Hood has another good heiter of great length. Tie list prize goes to Mr. Wright of Oswestry; Mr. Monkhouse, of The Stow, takes the \(2 l\) priza, witio a heifer of good quality and great depth. Mr. Turner, of The Leen, is \(3 d\) with a
great beauty, which had taken lit and 2.1 prizes previously at Ludlow and Increford. Mr. Arkwright shows a long heifer of good quality, but out of surts, and therefore unfit for competition
There are half-1-dozen Heiter Calves siown. MajorGeneral Hood shows a great beauty, and is first; Mr. Moukhonse, of The Stow, shows a dark red heifer,
and is \(2 d\). Mr. Duckhan shows a very long welland is 2 d . Mr. Duckham shows a very long well-

\section*{We add the Prize List:-}
heremords.
Jubars.-J. Druee, Eynahan, Oxon; W. Yeomans, Btratton
Court, Herefurli ; G. Pye. Madlay, Mereford.

Class 10. Bulis above 2 and not exoebding 3 Years olis

The Drvons are of course both numerous and good chases which compete for the local well the breed was never before given. We have it capabilities both as to size and quality sufficientig displayed. The class of Older Bulls includes nire animals. The 1st is shown by Lord Clinton, a grab massive beast with drooping rump, Mr. Clarkh'
Conqubror (Mavagissey) is a straight and even-barbed well-made buill. Major-General Hood's Crown Pbisce is of great length, and very evenly covered. Mr, di Smith's Constryotion, with good back and eremb covered symmetrical frame and masculine lools, is \(8 d\) h his class. Mr. Dayy's Duke of Flitton 2d, with
good head, true and even back, first-rate over the loit, goord head, true and even hack, first-rate over the lai,
is 20, covered, and of first-rate symmetry, is 19t.
The Younger Bulls are a noble class. The let pine goes to Viscount Falmouth for SUnflower, a dark re! bull, true and even from end to end, true and strizht both above and below, and well covered everywhice. The \(2 d\) is taken by Lir. J. H. Buller, with a very grat
beauty and a wonderfully bright intelligent-looking beauty and a wonderfully bright intelligent-looking
head and eye, a well-made barrel, but rather light behind. He took the 1st prize in his class at Hereford, Mr. Farthing's evenly covered Osborn is 3 d in this class.
The Yearling Bulls are another first-rate class, including about a dozen animals. Mr. Turner, of Beacon Downes, Exeter, is 1st and 2d with two young bulls of admirable quality, straight aud true erery.
where, with remarkably good bind quarters. Where, with remarkably good hind quarters, Mro
Bodley, of Stockley Pomeroy, takes the 3 d prize, and Mr. A. Smith is Highly Commended. All the best names among the breeders of Devous compete here, and Mr. Turner's success is the more honourable to him. The Bull Calf Class is another good one. Mr. Taglor, Mr. W. Farthing, Mr. Davy, Mr. Hole, Mr. Buller, and
others show capital specimens. The nrize list is given below

We come now to the Fernale Classes. Mr. Dary takes the 1st prize in cows with a somewhat patcily but large cow, deep and beavy in her hind quarterf. with a great beauty, perhaps somewhat defective in the depth of quart
Mr. Quartly is 3 d .
Among the Heifers in Calf or in Mills General Hood is again 1 st with a remarkably straight, round, long. bodied heifer ; and Mr. Quartly takes the 2d priz with a straight deep heifer, especially good forwarus
The Yeatling Heifer Class is remarkably grod aml strong. Mr. Davy is 1st with a thick and fitsay wet topped heifer, coming very near the alleged mode tho perfection as regards her body, viz, a arich wither rather more patchy tiran its successful rival. IIr. Quratly shows a thick ati ' well covered animal of great Lily, is
and massive frame, and Mr. Rundle's heifer, particularly straight aud good.
The Heifer Calves are a very good class. Mr. Fir. thing lst with a great benuty, and Mr. Snintiza Mr. Taylor, Mr. Davy, Mr. Hazbro, and sir M. Lopes also show in this class.

The Sussex Classes are very geantily fille.]. Messt: IVeriman have the lst prize awardeu to then or al ohd bull which characterises the breed very masive and large, coarse and heavy in and 21 for gooll bearing cows, and 1st for a heifer of werty good quality; Mr. Tilden Smith taking the - Heasman are
for another also of good quality. Messro. He again 1st and \(2 d\) for their yearling beiters - very gand specimens indeed, aud evidently superior in qualiny by make to the only com
Mr. S. Jenuer, of Ryy.

The Channsir Isfand breed is uncommonly well repreeented, bulls, cows, and heifers being numerous and well-filled classes. The very dark and somewhat rmall Guernsey seems to be preferred; Mr. Clement Pallot's lyperial, a very dark and comparatively small hull, being lst in its class of eight ; and Mr. Browning's dark brown cow, and M. Gaudin's very dark Jolie, heing lst and \(2 d\) in the cow class. Of 17 cows, the 3d prize is taken by M. le Lacheur, with a very large light-red and white cow. The heifers include no fewer than 26 animals, and ure an admirable illustration of the breed. M. Nicolle, of Jersey, takes the 1st prize with a straight-backed very dark dun cow, with a wonderfully well-formed ndder. M. le Feuvre is 2d, and M. Gandin 30 , Fith grey and light red heifers raspectively, They are very beatifal olass, demervigg of general commendation.

The Otiser Brams inclade the Long-horned' and afion. The 1st prize bull is one of the former breeda very large well-made animal, with a skin as patchy in ith colour as a plover's egg; and Mr. Chapman, who breed him, also takes the prize for one of the same bnlls, cows, heifer class, Otherwise all the prizes in mens of the heifers go to Sir E. Kerrison, for apecihows a sutfols breed. The Rev. J. L. Brereton litle beast.
We now come to the prizes offered by the Local the one the neatest are for Devons and Sauth Hamsthe coarsest former breed. There is a very beautiful show of the 30h. and \(15 \%\), and a sufficient illustration of the latter. ilpring." Mr. Farthing takes the best "bull cow and entry, and Mr. Pridham takes the 2d. There are aly two entries. In the class of pairs of cows there of the pair Mr. W. Taylor takes the 1st prizeand thick over the loins-and Mr. Farthing is 2d. f heifers and interesting class. The prizes for pairs \(3_{r}\). Bodley talses the 1 only resulted in one entry, and ather light behind. Int prize with a pair of good cows ader \(2 d^{\prime}\) year, \(V\) iscount the class of pairs of heifers ate also Mr. Sinith is 2d, and Mr. G. Turner's heifers aif clasesy good. The younger heifers and the bull a. prize with small but good; Mr. Turner takes the The Soutr Hams a

\section*{THE HORSES}

Excepting one or two of the agricultural classes, they are the poorest thow the Suciety has ever witnessed. There is but one in the class of thoroughbred stallions fur getting thoroughbred stock, for which 125l, are offered in prizes-Motley, by Touchstone, out of Lanercont mare, a dark brown handsome 14 -year-old. Of stallione for getting hunters there are five-not a cood classwith seven brood mares, of which the prize list is given below. There are only three shown as hackneys, and the pony classes are very poorly filled.
Then come the agricultural classes. Stallions over \(9 \frac{1}{2}\) years old, 16 very faif animals, The Duke of Beaufort takes the 1st prize with a Clydesdale of extraordinary power and substance, which has been often successful before. Two dark dapple brown horses showa by Mr. Shepherd, of Stogursey, Bridgewater, a capital pair. Another Clydesdale shown by the Rev. S. Terry, of Basingstoke, is 2 d , and a capital stepping borse shown by Mr. Elphick, of Burnham, Essex, is 3d. The Clydesdales are the best horses in the class. Mr. Horswill, of North Milton, shows a very good one. The youuger class of agricultural stallions contains a few good animals. Amonyst the mares, one of the best is a Clydesdale, shown by Major General Hood.
The Suffolk classes are well represented by a few good specimens. There are but two or three in each class, und Sir E. Kerrison is 1st in three out of four classes. Then we bave prizes offered for classes of agrieultural horses not Clydesdales or Suffulks, adapted for a hilly district; and Mr. Heuderson, of SJuth Shields, takes the 1st prize with a short atoeky bay horse in a very pretty class. The Hunters are a short class, the Roadsters still shorter, and strange to say, the classes of Dartmoor and Exmoor Ponies ahortest of all. In place of the magnificent classes which were expected, we bave two Dartmoor stallion ponies and no mares; 3 Exmoor stallion and 3 mare ponies. None call for any special remark, except perhaps that Mr. R. Smith, of Southmolton, who showed a very fine stallion among the ponies, having called his entry an improved Exmoor, though showing undoubtedly the best in his class, is held disqualified for competition.
The following is the Prize List:-

\section*{THE SHBEP CLABg!}

Are the best filled of any in the yard. There are capital illustrations of the Leicester, South Down Cotswold, and Shropshires, of the Ozfordshire and Hampshire Downs, and of the Dorsete.

The Leicestens include no fewer than 86 entries, viz., 52 shearling and 26 older rams, and 8 pens of shearling ewes, of which the older rams are the best elass. Colonel Inge's 8 shearlings occupy the 1st place in the class. They are of first-rate quality, rather smaller than their neighbours, carrying tiner wool standing in the corners of a rectangle with hind and fore feet wide apart, and carrying a model earcase. The 3d prize goes to one of them. Mr. Tremaine's sheep (Cornwall) are rather larger, standiar on louger legs and somewhat narrow behind. The 24 prize is taken by Mr. Dabhs, of Tamworth, who shows sheep of gool quality. Mr. Pawlett's sheep arelarger, carrying morp wool, and of great width over the bael and obonlder. Mr. Turner, of kenoon Downes, Ereter Who shows cight, has a flock of first-rate quality - the shearlings shown are rather under the generul nize of the class. Mr. Borton, of Malton, talkes the 1st prize with case of his entries, and is highly commended for another. Here too the jndges have evidently given to quality rather than to size of carcase or weinht of Creswell's sheep are of grenter size, and lie and Mr. Raduore aud Mr. Stamper are the remaining exhibitory.
The Older fams are a clans of extruordinary merit. Messra. Creswell, Borton, and Creswell take the 1et, \(2 d\), and 3 d prizes respectively. Mr. Tremaine's aheep are disqualitied, unnecessarily as we thought, of unfair ahearing. Mr. Creswall's sheep are of very
great aize, especiully the lst prize one, which is in his great aize, especially the 1st prize one, which ie in his
fourth year. Mr. Borton's \(2 d\) prize has a wonderfully
round barrel, great width, and firm touch.
Pawlett and Turner are the other exhibitors.
In the very beautiful class of pens of five Shearling Ewes each, Mr. Stamper, of Oswaldkirk, Yorkshire, takes the 1st prize with a pen of beautiful quality, showing first-rate wool; and Mr. Borton and Lient.Colonel Inge are 2d aud 3d.

The Corswoups are a good show, though not very numerous, nor shown by many breeders. Only Messrs, Beale Browne, Wells, Gillett, Walker, Read, Howell, and Tombs, among the many ram breeders on the Gloucestershire and Oxfordshire uplands, send illustrations of this, which is the grandest of all the British breeds of she p. The prizes for Shearling Rams are taken by Messra. Walker and Giliett; and among the older sheep, the prizes go to Messrs. Gillett and Beale Browne. One or two are disqualified on the alleged ground of excessive wool. There are four pens of Shearling Ewes, exhibited by Messrs. Wells and Beale Browne, among which the latter takea the lat prize with a very beautiful pen.
A small show of Lincouns sheep illustrates the sualler size and generally inferior symmetry of the sort as compared with that of the Western side of the island, and is not at this season a sufficient illustration of that superiority of wool of which for certain manufacturing purposes we bave of late years learnt. Mr. Marshall, of Branston, takes the 1st and 2 d prizes. The difference in size, as compared with Cotswolds, is seen especially in the younger sheep. Mr. Lynn, of Stroxton, takes the 1st prize for a thick and stocky sort in the older class; and Mr. Marshall is 2 d and 3 d with his entries. He is also 1st among the three pens of shearling ewes exhibited. Great credit is due to the enterprise which brings what is likely to remain a comparatively local breed so far from home.
The Oxpordshire Downs include some 20 entries. They are a thick and massive sort, covered with a fleece of close long wool. The 1st prize shearling ram, shown by Mr. Bryan, of Witney, is a large-framed well
covered sheep. Mr. Ihyan is also 2d and \(3 i\) in his covered sheep. Mr. Isyan is also \(2 d\) and \(3 i\) in his
class. Mr. Wallis, of Faringdon, is 1st and 24 among class. Mr. Wallis, of Faringdon, is 1st and 21 among,
the oher sheep, and Mr. Howard, of Biddenham, 3 d . There is a very good class indeed of shearling ewes, and in adjudicating the prizes here the quality rather than mass and size of the competing animals has been regarded. Thus the Duke of Marlborough has taken the 1st prize with a pen in which there is a more evid ent admixture of Southdown blood than is apparent in sonne of the others; Mr. Howard is \(2 d\) and \(3 d\) with pens of large upstanding sheep, also of good quality;
and Mr. Overman, of Weasenham, exhibita good sheep. It is a very good class.
The South Dowrs exhibit no sign whatever of falling off in quality or number, notwithstanding the demand for longer wools. Lord Walsingham takes the 1st, 2d,
and \(3 d\) prize among the shearling rames, and the 1st and 3 d prize among the shearling rams, and the 1 st Waters, of Eastbourne, whose flock has for more than
20 years been beforé the public, and is gradually winning its way upwards. Among the eight wonderfully fiue pens of shearling ewes, the Duke of Richmond is try, Lord Walsingham is 2d, and the Earl of Radnor 3d. Mr. Rigden, of Brighton, shows some long and excellent shearling rams. Messrs. Waters and Heasman, of Sussex; Taylor, of Somerset; Farquharson, of Dorset; and Sir T. Lennard, of Essex, are also exhibitors in the ram classes
The SHropshibis are another good illustration of a first-rate breed. No fewer than 72 entries, of which 12 are shearling rams, are exhibited here as a good class, but hardly equal, as it appears to us, to the exhibition of some previous years. And how widely spread the breed has become, and how plucky the breeders, is slown by the large number who compete. There are more flocks of Shropshire represented than and Messrs. Creane are lst and 2d in the Mansell and Messrs. Crane are lst and 2d in the younger sheep-Colonel Dyott, Mr. Thornton, and Mr. Boyd are
1st, 2 d , and 3d, in the older class-and Messrs. Crane, 1st, \(2 d\), and
\(\mathbf{M r}\). Holland and Lady Willoughby de Broke are Ist, 2 d , and 3 d in the capital class of shearling ewes.
The Wiuss and Havprifire Downs come nexto Fewer breeders than usual compete. Mr. Humfrey's sheep, though entered, do not appear. Mr. Rawlence, of Wilton, takes away most of the prizes, being 1st in all the classes, and \(2 d\) with a very beautiful pen in the class of shearling ewes.
There are capital classes of Somirrast and Dorget Shere, Measrs. Danger, of Bridgewater, and Pitfield, of Bradport, taking all the prizes, as indeed they were the sole exhibitors. The pens of shearling ewes are a particularly pretty class. There are four entries in each class. A few of the large and lumpy longwoolled South Hams sheep are shown. They resemble a blunted clumsy Cotswold in form and style of wool, but are well adapted, we understand, to their district.
There is a very considerable collection of the longbodied and long-woolled Dartmoor sheep shows in the wool, including no fewer than 25 entries, and completes the Sheep classes.
The following is the Prize List:-

CLas8 53. SHEarung Raws (53 entries).- 1 , J. Borton, of
Barton House, Malton, Xorkshire ; 2 A. Dabbs, of Seckington, Tamworth ; Lient.-Col. W. Inge, of Thorpe Constantine, Tamworth. H. C.: J. Borton. C. : J. Gould, of Poltimore,

\section*{the pig classes}

Are most of them very fairly filled, and maay of then have never been excelled. Almost the only one whid is noteworthy for inferiority is the class of Berkation Boars, where a first-rate breed has not been nearly well illustrated as it ought to have been. There are unusual number of disqualifications by Prof. Simond owing to the dentition not corresponding with tho
alleged age. There is no restriction as to age in th alleged age. There is no restriction as to age in th different classes, but as the age guides the jadquent merit, of course it is necessary that it be correct stated. Perhaps as time passes we may learn thas breeds are getting more and more precociour, and on veterinary authorities may require to stretch their ruies 80 as to admit at onee, and "in spite of their teeth" the growth of the specimens, and the honeaty of thes exhibitors, in a greater degree than they bave. In 124 entries among pigs are spread over no ferert the 17 classes, which we proceed to enumerate.
Of Boars of a Large White Brred only throme shown, the 1st and 2 d prizes going to Mr . Wainman, of Carrhead, for a large specimen of the breed witl plenty of hair, in which the others are deficien Amoug boars of a Small White breed Mr. Manglea of Givendale, is disqualified, owing to dentitioa, in three of the specimens he has shown. Mr. Sexton also disqualified for one of his entries. Mr. Dick takes the lst prize with a boar of wouderful size tor "small" breed, and excessive fatness for a breedip amimal. Mr. Stearn's entries are very good, one of them taking the 2 d prize.
The Boars of a Small Black breed are a very good class. Mr. Stearn is 1st with a very capital specimen of the breed, in good condition and first-rate healen Mr. Sexton is \(2 d\) with one of his pizs, aurd disqualifeed for another. The skin and hair of these animals is perfect.
The Berksetre boars are not a good class, very mixed as regards age and size, and otherwise varions, so that they by no means give the impression of the Grst-class breed they are. Mr. Stewart, of Glonester, is lst with a very long grood specineen. Messm. Yells and Hewer, of Highworth, Mr
and Mr. Tombs, of Lechlades show well
In the class of Boars not eliyible in previous classes, wr have an enormous white boar shown by Mr. Duckernn of Northorpe, Kirton Lindsay, who is very successfal ass exhibitor in the pig classes; and Mr. Wainman take the 2 d prize for another specimen of the large whit breed-though why it might not have been exhibitad in any other class does not appear.
here is a small class of Sows in the Large Whit Breed, in which Mr. Gamon, of Thorntua-le-Hoor, successful; Mr. Duckering again appears on the pris list; and Mr. Dickin, of Stockport, exhibits one with litter of nine.
The Breediug Sows of a Smatu White Breed are very good class indeed. The 1st prize goes to 1 rr Bulteel, of Ivy Bridge, for one bred by colona
Kingscote; Mr. Sexton is \(2 d\); and Mr. Stemra lom a beauty with 11 pigs.
The Breeding Sows of a Smarl Braox breed are a wonderfully fine class. Mr. Stearn is again 1ot, and Mr. Sexton is disqualified for some of his entries and 2d and highly commended for others. Surely it in hardly possible that the records of this herd can be tep so carelessly as to produce these frequent bluaden We are always more inclined to doubs the indication on which the veterinary autbority rests, than
honesty and carefulness of respectable and long-est honesty and carefulness of respectable ain hisily come
blished breeders. Mr. Coles, of Yeovil, is hion mended for a very good sow with niue pigs.
The Berkshire Sows are a good class, and Mr. Stewart, of Gloucester, again takes everything befor him. Mr. Allender, of Winslow, and ar. Hewer, Highworth, show good specimens. There is classe class of breeding sows ineligible for previous ciaccess which Messra. Gamon and Duckerin with enormous white sows.
The pens of three breeding sows of the varions bred include 5 classes and 19 entries. The large white brend, the small black breed, and the Berkshire are tho best. The following is the Prize List:-

\section*{PIGS.}

Jopors. - T. Trotter, Bywell, Stocksfieldon-Tyne; S. Drete Eynsham, Oג nn; H. P. Jones, Portwayhouse, warminster

\section*{THE IMPLEMENT YARD.}

The collection of Agricultural Machinery, as well as nf mplements of more strictly domestic use, which has
Intterly been so large a feature in the Society's shows, is as extensive as ever. There are upwards of 4000 entries on 275 stands, arranged in two divisions, one of Which comprises the machinery in motion - a much leas atriking sigbt here than it was at Hereford, owing chiefly to the scattered disorder under which, as com. and Weat of England arravgement, it here appears. anall notice some of the the order of the Catalogue, w thall notice some of the more remarkable of the novelties, ar well as of the established merits which they exhibit.
Memrs. Samuelson show their self-raking American reaper, in which the platform receiving the cut corn is of its driving wheel, whatever the thickness of the crop may 'be .Their "Eclipse" reaper too is shown, in
Wbich Hasey's knife is used bue ment is modified by a wider oscillation than usual of the cutting bar, po that two oscillation than usual of one are cleared by the knife at each oscillation. The mower-the position of whose knife is to some rat-did very good work in the trial ground ; and the nonbined mower and reaper achieved we believe a very their stand is Mr. Crauston's, when of the Judges. Near lay tedder is is shown ; and Whood's mowing machine, are first-rate combined mower and reaper, all of which little labour tools, having done as good work with as trial ground. The of the mowers or reapers on the a dropping open-work one-horse reaper is supplied with stubble, rining theaf has collected, and then falling, the diecharge she corn. It will be seen that it the raker to a rery high place on the prize list that it has achieved Jebb's tabular charn prize list.
cylinder with narrow vertical revear this is an upright capabler vertical tubes etanding in the mile and by the eddy and obold or hot water-but acting chiefly by the eddy and obstacle which thes present to the rotary Mewers. of the milk.
cotters, millentall crushers, and pulpers, collection of chaff thin jear subjected to counpetition, tools which are not Hre Smith, of Kettering tition.
their indes; and Mesers. Smith, of This very clever this inuplement-tined hay tedders. Another form of Jeflery, of Stamforis also shown by Messrs. Ashby \& char catters, Stamford, who also exhibit horse rakes, steam engine for steam cultivation, giubbers, stean
cattivators, Hanson's Potato digger, \&c. They have position of the steel rope upon the driver or pulley by which their cultivating tool is drawn to and fro.
At the stand of the Reading Ironworks Company, haymakers, rakes, chaff cutters, threshing machines. and steam engines are shown.-Mr. Cuthbert, of Belale, shows his capital one and two-horse reanerCarson \& Toone, of Warminster, show a capital drill horse hop, with double beam, affording a simple hold upon and means of regulating the working tines.-The Beverley Waggon Company show a large collection of carts and waggons.-Mr. Eastwnod, of Black burn, Bhows an upright elliptieal barrel churn, in which two rotateng vertical dashers revolve heside each other.
Mr. Coultas, jun., of Grantham, exhibits his capital drills for seeds, grains, and manure, displaying not only good workmanship, but great fertility of invention.
Messrs. Woods \& Cocksedge, of Stowmarket, sho their well-known pulpers, crushing mills, carts, and simple strong and efficient horse gear
Messrs. Eaton, of Thrapston, exhibit their rotating Turnip huncher and horse hoe.
Mr. Kearsley, of Ripon, exhibits a somewhat heavy, but very efficient mower, and combined reaper and mower, which did capital work in the trial ground.
Mr. Waile, of Leeds, shows his barrel churn rotating on double friction rollers.
At Messrs. Howard's (Bedford) important stand there is full illustration of his system of steam cultivationthe steam engine has its boiler placed athwart the frame and thus works well on a slope-there is a large collection of implements of ordinary cultivation, ploughs, gralibers, harrows, also harvesting tools, and among them the very simple double-action hay tedder, to which the Society's prizes have been awarded. linder clogging. Instead of the sliding pinions used in other machines for reversing the motion, a simple eccentric moves the pinions in and out of gear. Their horse rakes, too, especially adapted to heavy crops, are exhibited.
Measrs. Hayes, of Stamford, show carts and waggons exhibiting many ingenious contrivances and many proofs of capital construction, and they too have carrieu off prizes.
Messrs. Larkworthy, of Worcester, show horse hoes, Seaman's tubular framed barrows, drags with duck feet, clever steel whippletrees, \&c.
Mr. Milford, of Cullompton, shows capital carts and waggons, with swinging back board, drag, \&c.
Mr. Brenton, of St. German's, shows reaping machines (untried before the judges) with roller delivery assisting the raker, and put in gear at his will.
Messrs. Ransomes \& Sims, of Ipswich, exhibit ploughe, harrows, rotary cork screens, root pulper and custer
for roots, and mills and crushers for corn and cake. Portable steam engines and threshing machines. Among the novelties here is Edununds' semicircular whippletree, insuring equality of draught, and enabling the horse to turn unimpeded by it at the land's end by a very simple and efficient device.
Mr. Phillips, of 8, Southampton Buildings, Chancers Lane, exhibits his rotary spader or digging machine an importation from America, of use in light soils.
Messrs. Reeves, of Bratton, show drills, manure distributors, \&c. Among their tools is a patent corn
screen with a furrowed surface, giving a greater extent screen with a furrowed surface, giving a greater extent Mr. Banlett, of Thirsk, shows his prize reaper and mower.-Mr. Barber, of Liverpool, exhibits a mower in which the finger bar is flexible, and adapts itself to the inequalities of the ground. The reaping platform can be attacherl or detached by simply removing three
bolts, and it malses a mower or reaper in the one machine; and the finger bar being flexible, adapts itself to the undulations of the ground, and is so constructed that the operator can raise either end of it independently of the other, or he can by the same in an upright position.
Messrs, Gower, of Winchfield, Hants, show drills and manure distributors-the principle of the latter appearing to depend on the rotation of a toothed ball in a pierced basin for each drill; the manure thus stirred up falling through the holes. There is also here clever Grass-seed sower,fin which the seed-bore is double, worked by two sets of brashes, the front one sowing Grass seeds and the binder one Clover. It is a very rood thing indeed
Mr. Ireland, of Broughton Lane, Manchester, exhibite vertical elliptical barrel chnrn, in which the planger rotates and oscillates at the same time that it is driven
up and down.
Messrs. Page, of Bedford, exhibit a large collection Messrs A hoer, rakes, chaff cutters, root pulpers, ac Messrs. Amisa 0 ber in ali manner of size and form. Mr. Dicker, of Chagtord, Exeter, shows a cart with a Gardner's 'Turnip cutter in the bed of it, enabling the cutting of the roots in it and the scattering of them as
it is dirawn over a Grass field-a mistakenly laborious tool.
Mr. Freer, of Loughborough, shows his grain planter dibbler, somewhat on the plan of Newberry's dibble.
Mr. Hellard, of Uttoseter, exhibits a very clever cheese-making machine, one of the most ingenious tool

Koevil's machines, with a great many extremely well deviséd and efficient improvements and additious. O this we shall hereafter give a detailed report. It is one of the most efficient and ingenious novelties in the yard
Mr. Parsons, of Martock, shows his combined cast and wrought iron wheele, and ulso a combined Flax-breaking and Flax-scutching machine
Mr. Chulds, of 481 New Oxford Street, shows a clever Anerican mowing machine, which made very good work in the trial ground'; also a very clever selfffeeding saw benclı for use by hand.
Messrs. Priest \& Woolnough, of Kingston, show a capital collection of sowing machines, and have taken way a large share of the Society's prizes.
Mr. Hawkes, of Tiverton, shows drilling machines, in which the delivery of the corn from the seed box is offected by having two rollere, one on each side of the box, and parallel with it, with endless chain around both, at intervals of a few inches, which chains in the upper part of their revolution pass through the seed box, and drag the seed out with it.
A nother novelty, and more practical and useful, is shown by Mr. Skelton, of Bodmin, a one way or turn-wrest plough, in which the two mould-boards alternately take their place by a very simple movement, which converts eachlfrom the acting turn furrow on the active side of the plough body into the side plate on the land or passive side,-At the next atand Mr. Tinkler, of Penrith, shows a very simple and efficient drill horse hoe made by J. Stalker of that town, and a very simple and efficient churn manufactured by himself. It is an ordinary barrel churn, mounted on single friction wheels, with clever arrangements for the escape of the heated air, and for keeping in or letting out the milk or cream, and beating the butter clean from the milk after it is made. It is cheap, simple, and efficient all the better that it does not affect clever and complicated devices for obtaining irregular motion bein dasher-the simple rotation of the barre being the best of all methods of shaking the milk and breaking it.
Messra. Wallis, of Bauingstoke, esbibit Hayes' siraw levator, corn drille, horse rakes, ploughs, horse hoee, \&c. Mr. Baker, of Compton, Berks, makes and exhibits a good water cart with attuched pump, which we have seen in conatant daily and eatinfectory use for several year.
Mesurs. Garrett exhibit, in addition to steam enginer, threshing machiner, \&ce, a clever machine for bruising and reducing Whent and other straw to fodder. The scarcity of hay in many localities las suggented the necessity of rendering straw digestible for cattle and horses, without the operation of steaming; and they invite the attention of agriculturinta to this apparatus. Messrs. Richmond \& Chandler, of Salford, have mong their improvements of chaff cutters a elever device for altering the length of cut without cbange of wheels
Mr. Sainty, of Burnham, near Lynn, exhibits his patented addition to the ordinary drilling machine. The exhbitor's application of a spring to each lever, instead of the ordinary weights, renders the action more efficient and regular ; it enables any amount of pressure to be exerted without an additional pressing apparatus, and thus reduces the draught, weight, and cost. It seems to us a very clever and efficient thing. Mr. Boby, of Bury St. Edmunds, shows his wellknown corn screen, also a clever double-action hay tedder.
Picksley \& Sims, of Leigh, near Manchester, show articles altozether
Messs. Cambridge, of Bristol, exhibit rakes, chain. harrows, pressers, \&cc.
Mr. Brinsmead, of Torrington, shows an ingenious reeding machine tor threshing and combing out a sheaf of grain at a time.
Mr. Nicholson, of Newark, showe his well-knowa hey tedders and horse rakes, rollers, de.
Mesars. Fowler \& Co. exhilit a full illustration of their steam cnltivating apparatus, and it is at work in an яdjoining fielu.

At the sland of Messrs. Horusby we have a full collection of drills. Several forms of his mower and reaper (which have won a capital place in the competition before the juiges), ploughs, washing machines, \&c.
Near this Messrs. Burgess \& Key show mowing and reaping machines, to which reference is made elsewhere. McCormick's reaper is also exhibited in at least two different forms, with revolving rake and with ncrew delivery.

Holmes \& Sons, of Norwich, have a good atand of machinerv, including drills and manure distributors, and a rotary harrow or Cuuch extirpator, which seems an efficient tool.
The St . Pancras Company show complete stable furuiture, and a large collection of wire-work, fencing, gates, \&c. Musgraves, of Belfint, sloo illustrato pertectly a full-sized horse stall.
Messrs. White \& \(\mathrm{CO}_{0}\), of 29 , Bedford Street, Strand, xhibit the earth closet for mechanicully applying Moule's aystem of deodorising and utilising excrementitious matter by means of ary apparatus in deal case. Price 36.
Messrs. Barnard \& Bishop, of Norwich, exhibit their noiseiess lawn mower. Mesars. Green, of Leede, are also the exhibitore of similar machines.-At the stand of Mesars. Greening, of Manchester, is a large
ent yill somem
SReDs, de. - We come now to the outside fencing of the yard, around which are arranged an extraordinary illustration of the power and wealth of our great sped firms. Messrs. Gibbs, of Half Moon
Street; Messrs. Sutton, of Reading; Messrs. Carter, of Street; Messra. Sutton, of Reading; Messrs. Carter, of Raynbird, of Busingstoke, exuibit collectious of seeds and plantes and the stands of Mesars. Gibbs, Sutton, and Carter have never been sirpassed.

\section*{Macuinsay in motion.}

Mr. Robert Willary, of Preston, exhibles a continituous trough for cow house, manuffactured by Picksley, Sims, \& Co., of Leigh. It is a specimen of the interior of a cow house, having a tram-way and a continuous
trough by means of which the cattle can have their trough by means of which the cattle can have their
food prepared and given them by the new feeding food prepared and given them by the new feeding
machine. This feeding inachine will cut Turnips or deliver corn, or break and deliver cake and carry itself and the man who works it along the tramway and trough, into which the material dropes as it goes.
Mesors. Tuxford, Garrett, Clayton \& Shuttlewörth, Ruston \& Proctor, Barrett \& Fxall, and other great firms show steam ellgines, threshing machines, \&c., at work. Mr. Wright of Boston shows a stacking machine
for delivering corn or straw at any required height. for delivering corn or straw at any required height.
Picksley \& Sims of Leigh show bone mills, chaff-cutters, Picksley \& Sims of Leigh show bone mills, chati-cutters,
sce. Mesgrs. Marshall \& Sons of Gainsborough show very well inade aind neatly proportioned 5 and 9 borse-power steam-engine working theshing mach nes, to one of which is attached a mill for grinding the tail corn and discharging it at once in condition for feeding cattle. It is thus described:-Combined double-blast threshing machine, with new patent, griuding apparatua, for
preparing the grain for market and reducing the seconds corn to feeding meal in one operation; invented, improved, and manufactured by the exhibitors. Fitted
with Goucher's patent drum beaters, Coulson's patent with Goucher's patent drum beaters, Coulson's patent spring hangers, improved straw shakers, patent springs
Mr. Maynard of Whittlesford shows his capital siffing chatf machine, for sifting and cutting the straw as food as it comes from the threshing machine.
Riches \& Watts of Norwich show their cheap and clever portable American grist mill.
Messrs. Bury \& Pullard, of Southwarls, show their self-regulating wind engine.
Morticing, sawing, and planing machinery is shown by Mr. Birsell, of Wolverhampton, and Messrs. Puwis, James \& Co., of Lambeth.
Gasworks are shown by Porter, of Lincoln, and Vicary, of Exeter.
Avellng \& Porter, of Rochester, sliow their capital traction engine, which las come across the island
270 miles in six days, doing no harm on its way to the b ,dies or the nerves of any of her Majesty's subject
Messra. Kansome, Richmond \& Chandler, and Turner, of Ipswich, have stands at which chaff cutters, grinding Mr. Gartett's straw crusher is shown
a thresking drum with deeply furrowed surface, int is Which carreppondingly notched steel plates preject from
the cover within which the drum revolves. And the straw is driven through between drum and edges at the rste of 15 cwt . per hour. Eight-horse power being thus eriployed in reducing it to a crushed and feathery state.
Mr. Allen, of Parhament Street, Westminster, bited his 12 -horse power double expansive portable engine, manufactured by Tuxford \& Snns, of Beston. It is constructed specially to economise fuel and water, the
steam being used twice over in the same cylinder. Will plough with 5 to 6 cwt . of coal and 400 to 500 gallons of water, and thresh with 3 to 4 cwt. of coal and 200 to 300 gallons of water per day. Price \(330 l\). The princip

Mr. Black burn exbibits a traction engine in w the boiler is carried inside an enormous roller, which is made to revolve and so to travel. It is intended to be is also applicable as a ateam cultivator, to draw ploughs, scarifiers, or reaping machines. A rotatory digger can be attached for light soils. It is an effective clodcrusher and roller, and will haul any implement of appeared to us altogether inferior to Aveling's traction engine, beade which it was exbibited; and it had
travelled to the yard from Exeter by train! whereas the other had came from Rochester with its train of waggons of itself.

\section*{THE TRAL GROUNDS}

At Woodford, near Plympton, were on Wednesday, Friday. Saturday, and Monday, the scene of a laborious examination of reapers and mowera, drilling mochines for corn and manure, horse rakes and haytedders, and Turnip and corn horse hoes. They did not expect on large in influx of spectators here as on previous occasions of the Society's meeting, but we hyve never seen so large a company on any of the Society's trial grounds before, castle, as wre on Friday lonking on at the competition of reaping machines. Unlortunately a wet day on Tharmay threw the whole competition back, and The Motbing Mication of results
lat bit of meadow land, extremely foul, and having been occasionaliy flooded over its lower half, the Grass and very dirty indeed, in the very worst plight for mowing, and accordingly Messrs. Bamlett, IJurgess K Key, Samuelson, and one or tivo others, had very nower nevertheless did fair work, with occasioual nower nevertheless did fair wors,
draggings of the tool over the Grass.
Burgess \& Key's new and extremely compact and simple American mower, with level crank rod and very
tell packed gearing, did fair work, notwithstanding frequent stops, attributable to the condition of the land. Mro Samuelson's mower was also
Barber's American eagle uliower male
Barber's American eagle liower marle veriy good work, more especially, however, on one side of itis land the Grass getting sotmewhat easier and better set on Grass a good deal, oceasionally missing it altogether. Child's American " clipper" made good work. Sumuelson's mower, badly driven, made a good many mistakes the Grass stubble lorg and combed out. Kearsley'svery good work indeed. It is a heavy toot, but the Grass was very well cut by it. Picksley \& Sims' mower
cut fairly, not quits so cluse as Kearsley's; dives not leave a good open wake behind it. Bamlett's (No. 682), did first-rate work. Cranston's (Wood's), tremely tidy work, leaving a capitally cleared wake, throwing the Grass in a capital swathe, just fit fur being picked up by the hay tedder, and doing the work thoronghly well and very easily.
Burgess of Key, leaving hardly so good a swathe, made very giod work. Hurushy's cat a capital swathe, and left a very shurl well-cut, stubble. We
anderstand that the judges found its draught to be onderstand that the judges found its draught to be considerably heavier than Wood's, about as 4 to 3 . draw. It is generally alleged that Wood's machine is too hight for English crops, and will not last. We know machines that have been in constant and satisfaetory use unbroken for 6 years.
The work of the combined mowers and reapere in Grass cutting was even better than that of the mower \& Key's, and Hornsby \& Sur's, their separate plots. Woul's, Hornsby's, and Burgess \& Key's machines were then made to follow one another, and all made first-rate work, standing prohably in the order in which we have named thens. The Prize List is given below.
For Reaping Machines a large held, of which the upper half was a standing field of Rye, and the lower barely ripe, heavily laid piece of winter Oats, had been provided. The machines were first taken round and round the Oats, entting it withous regard to the difficalties of the different lie of the corn-thus perhups bringing out the ability of the several tonls to meet
these difficulties. Though, after all, it seems to us that the proper way to meet such difficulties is to avoid them altogether, and that no machine should be required make the best twork.
The selected machines were afterwards set to their allotted plots in the Rye. Page's one-horse reape and Wond's one-horse reaper went first; the latter with open-barred tipping piatform, by which the stubble helps to clean the sheaf when it fulls, made very good worl. Cuthbert's machine had previonsly gone round and round, and made fair work. Samuelson's, Wray's, and Maunder's one-horse reaper had also been previonsly tried, but could not sutisfactorily overcome the difficulties of the corm.
On the Saturday Wray's, Brenton's, Samuelson's, and Bamlett's one-horse reapers were again tried. Of these Bamlett's made the best work.
Messss. Hornsby's reaper was also tried, in which the tipping board is dropped upon an under platform, having revolving chains with teeth, which project into the sheat as soon as dropped on it, and half the raker to clear it off. It made fair work, eutting well, and delivering the sheaves pretty well. Their two-horse side-delivery swathe reaper made very good work iudeed until the failure of a tie which held the divider (broken on its travels by rail) rendered it sabjeet to stoppage. It cut the corn uncommonly well, and made a very good swathe. Samuelson's self-raking reaper then went round and cleared itselt and cut its way tolerably well. The Beverley (Bell's)
reaper ( 3 horses), made very bad work indeed reaper ( 3 horses), made very bad work indeed. Wherever the Oats were down and green, the cutting was too
hard, and the driving wheels dragged, and there was an end of it- the stubble was cut too high. The corn was not in fit state for it.
Burgess \& Key's well-known serew delivery reaper, as vell as their McCormick's sheafing, reaper, made very good work. The sheaves however were thrown off in
too violent a manner. This, however, was in great measure corrected in their home made reaper on this principle, though in the imported machine it was very

Wood's, Hormsby's, Samvelson's, Burgess \& Key's, teat on the Monday, when most of us were in the cattle

The following is an abridged accuntit of tome of the
trials as given in the Plymouth paper :trials as given in the Plymouth paper:-

 agrivultural grimin country had inereased in prosperity, and he
but asy that this
was glad to see that the artican and labourer and othor people
 avert, and place it at the dinposal of the working man. Unfor known, but he might tell them that in the Metropolitian market 114 per cent., the sheop hid incredsed just 22 per cent., a very small amount. The importations at the prosent tivie wore much larger than heretofore, there baing 80,000 more cattle,
and 50,000 more sheep, but even with this enormous increase was dificult to fiud food for the poople. It wea not is ho the contrary, it had increased, but he was very glad to say
that in the scoaller towns the consumption of boef was becoming more geueral. Here in Davon ther saw arilmals Well wort thy of the natue: the Quartly's, Tumer's, fand the Davey's had done much for this county, almost unequalled. Perhaps in size they might some day be somewhat increased. but on the whole he thought the couaty might well be proved of her animals. He wished, horvever, to see in Devon sowe
good horses. He thought that if they had sarched the resources of the three or four counties snrrounding them now to be witnessed in the Show Yard. Now, a most important question for the agricuituristi of the tomand which was likely to be made upon the land. It was not only by enclosures that thitivation of effected. Within the last 28 jeare more than 98,000 acres had rate of 1000 acres a year. In Frunce he knew 10 or 12 years ago that they had in Bagland \(35,000,000\) of sheep upon \(31,000,00,000,000\) acres of land, ahowing that we hud a
sheep upon 53,0 anser
cinsiderably larger amount of sheep per acre than the French
had. He then tefurred to the arestion of erlucstinu, and had. He then leferred to the question of eflucstion, and
quated as an example the West Buckland Schonl, the conduct
ot which he spoke of in high terms, and expressed a hope \(t\), see it more generally carried out. Lord FeVRRsEAM then proposed the health of the
Mayors and Corporations of the towns of PLymouth and Devonport.
He was sorry that the Mayor of Plymouth had not been enabled He wassorry that the Mayor of he was glad to be able to tell

\section*{APPEARANCE OF THE CROPS}

Devon: Beacon Downes, Exetor, Juby 10.- Whent is thin, but I think the ear will be well flled: Barley has been much injured by the drought; Onte a very bad erob generally; Mangel, Putatos, and Turuips promising. Feorge Taraer.
KENT: Dumpton, Ramagate. July 10. - From the middle of Marcil to the end of June the weather in this loeality was unumaily dry, so that vegetation proceeded slowly. The erop of liay has been very lights, but very scarce, but on the lat inst. we had severat honts gentlo raiu, since theu following showers, and all green crops have improved much and are now growing lasto. It is too soon yet to spork with any certainty of the corn crop, as so mach depends on the weather for the next few weeks. At present I see no resson why we
may not have an average crop of Wheat and 13 irley. Ots in many places are a failure, aud must prove generally a very defieieut crop; few persons, if any, drought, becane prematurely ripe, will be strall in sample and yield badly; late sorts have improved much by the rains. It has been too dry for Benna ; they have improved of late, but matat be a short crop. Many Swedes and Turnips failed from fly and drouxht, those that ittood are now growing fast. Mangel Wurzel is generally a good plant, and looks well. Berly Putatoa are sinall; late ones (if the disease keopu off) promise an abundant crop. From present appearance I think we shall have an early rather than a late harvest, but that will much depend oa the wenther. Wm. Massero general is thinly planted, but a good head ; atal from the fine blooming seanon we had, we may expect a fair average crop. Barleys are very various: eariy-sown to be a grod average; late-sown very mu-h inproved Thtely, and promises to be a farr crop. Oats dectudedly
a light crop. Peas lave been a grod crop, but mosily grown for the green market. Beans: nsue grown. Potatos: a large breadth planted in this quarter- should say quite four times the extent comptred to five years ago, and promise to bo a large crop, with a mising yenerally. Turnips: very much napmaved with the late raius, Hay: a very light crop- 1 slould thine 30 per cent. below an average crop, both iu scodling
and meadows. Hnrvent will be general about the 265 th to end of month. James Arwot.
"TILLAGE AND AMMONIA."
Under this heading a shortarticle, signed "Hoskyin," appaared in the Agrioultwrat Gazette, p. 015, and which, short as it was, none I think could read but
with pleasure aud profit, as they must everythiug that gentleman writes. But tillage and ammoni-what thoughts are raised in the miad by these two commonly used words ! the former carrying them back to the Divine command given to "till" to the first man tis he now exists, and the latter. I beliove, to the first temple reeorded in history erected for heathen worship. This temple, according to Pliny-"Plinii Historis Naturalis"
-was erected for the idolatrous worship of Jupiter - was erected for the idolatrous worship of Jupiter 18 centuries before the Christian erd, and at a dintance of nine days' journey from Alexandria, To the Temple vast numbers of pilgrims from various parts resortod
to worship, and as they usually travelled on canneles the priests of the Temple, of whin it is rec rded there were full a hundre3, caused inne to be built for the accommodation of the wormippents, and stables for their camele, and in the stables contrivnnoes were inveuted for preserving and ooncentrating the urine of the beasts. The salts which were thus proluced were afterwards sublimed in proper vessels for sale or otherwise, as they might be required; and they were called ammonia, an appellation they have from that remote period retained to the present day, from the name of the Deity at whuse tetmple they were at firsty as far as history informs us, made ; and for centarien afterwards the whole of Eurupe was supplied with them from Ezypt; but now, and for many years, ammonia, or sal-mmousiac, the volatile alkali, has been made in England and Scutland, and in the latter couutry it used to be procured by a pecular process from soot; and, of course, it is also now made recollect anywhere reading thit the ancients in those very early, or even at somewhat later periods, applied ammonia, artificially procured, to agricultural purposes, but I can see no renson but to supprse that they did; for, as they know that deciyod aniunal and vegetable substances, the ezeremontio of bouts, in some shape or other formed the pabula upon which cereais growing state, fed, and were brought to perfection; and as those priestas by the operation of their minds diseovered how to procurt, as Mr. Hoskyns in hin usual lueid and playful mauner calls it, the Spirit of those decaying 'substances by the dimeule chemical operation of snblimation, I can see no reason for doubthave arrived at the couclusion, that, if the excrementa theuselves were necessary or beneficial in the growth of corn, the Sprar of them,
must have been neeessary or beneficial for the samo
purpose also; and experiments which would have been firmed the suggestions of their minds.
And when we further consider how vast the quantities of the salt that might have been made, the raw material being in such abundance, and the high state of excellence to which the Egyptians, who were so near the Temple, had reached in agricultural practices at the same time-never probably equalled, or certainly not excelled, by any other people ancient or modernmay we not assume that they used the salt procured from the Temple for the fertilising of their lands as
modern farmers use guano and other highly concenmodern farmers use guano and other fard it a too far stretching of the imagination to suppose, again, that it was used by the Egyptians in producing the extraordinary crops of corn at the time of Joseph, during "the sever years of great plenty" we read of in the Bible, and especially as there is not even a hint in the sacred narrative that those crops, wonderful as they were, were the result
of any supernatural or miraculous agency, but proof any supernatural or miraculous agency, but proamong those highly civilised and extraordinary people, and which continued in its excellence for many centuries afterwards.
Thus, I think we may conclude, that 3560 years back from the present time tillage was as well or better unders\%ood and practised as it is in Great Britain or any other part of Europe at the present time, and we may further come to the conclusion that the knowledge that ammonia, the SPIRIT of the Dung hill, as Mr. Hoskyns so properly designates it to be Was known also in those remote ages to be the real required to feed upon.

Should my readers doubt these conclusions, I would ask them to look at China and Japan, nations whose inhabitants we look upon as demi-savages, because they
have not the implements of destruction, the Armstrong guns, Minie rifles, Colt's revolvers, iron-clad ships, and \(600 \cdot \mathrm{lb}\). steel shots, that we have for the wholesale destruction of their fellow men,-those countries, half savage as we consider them to be, have for very many centuries been farther advanced in the theory and practice of agriculture than we of England are in the present otherwise highly enlightened age. For example,
take Japan, the latter country, and we gather from the accounts we read of their farming that their cultivation is much deeper, and far more perfect than is that in England or any part of Europe, and that the average yieid of their crops over the seed sown to produce them is near 200 -fold, whilst that of England, which we are taught to look upon as so extraordinary, according to the authority of Mr. Caird does not
average more than the puny and miserable increase of 8 -fold! It is certain, also, that both Japanese and Chinese farmers have for many hundred years known What constitutes the real pabula of plants, as I have assumed the ancient Egyptians did, and that they, and Mr. Hoskyns terms the dung cart, supplied all that were requisite of those pabula, and all that were proper failing crops.

Thus those people, as we are assured by gentlemen who have resided among them, produce annually a sufficiency of food from their own lands for the whole population, and it should be kept in mind in comparing their system with our own that the extent of their country and the amount of population are about the same as our own. But, if the accounts of their agriculture be correct, and I see no reason to doubt them, it is certain that it excels that of any country in our "parts of the earth, and it appears quite certain that neither in Japan nor China are there any weeds among the growing corn, and that the farmers suffer nothing to grow on their lands but what they sow the seeds for. They return also to the land in the shape of manure the same substances they tonk from them in the shape of corn, and always in sufficient quantities to produce their never-failing fine crops. It is also stated, and on the same authority, that the produce of their crops was near 200 -fold, and I think Mr. Layard has written that he observed the same in the course of his travels in other parts of Asia; if these statements be facts, and I see no reason to doubt them, it is seeding and fertilizing producing these results, must be the correct one. We have, also, the highest evidence for concluding that in the Holy Land the produce was 30,60 , and even 100 -fold. But Mr. Caird, a relied-on authority, has stated, that in Great Britain the increase of produce over the seed sown to produce it, does not average more than 8 -fold, and though this is miserably low, I should not think it much below the real quantity; but I myself averaged 88 .fold of Wheat on the same land which was Wheat 14 years out of 17 ,
and one year in another field 1 had of Barley 126 fold, my seed for the Barley being 2 peeks an acre, and Wence the crop was 63 bushels an acre; and of the Wheat I had, on the average of the 14 years, 44 bushels an acre, and often my seed was neither 1 peck an acre often, i fear I am wearying my readers by again thatithe farmerg show that it is not at all improbable in ruality prodnce the countries I have referred to do are informed that the object of the tillersecially as we
possible from thes is to produce the largest crop land; but modern European husbandmen seem to vie with each other as to which can put the largest quantity of corn by way of seed into the land; and hence
the farmers of one part of the world are enabled to provide food for all the people, whilst in another, as in England, there would be a general famine were it not for the immense importations from foreign lands, amoun ing as they did in one year to \(44,000,000 \mathrm{l}\). of money.
runs, Minie guns, Minie rifles, Colt's revolvers, iron-plated ships, and \(600-\mathrm{lb}\). shote, but I think it is Dr. Adam Smith who has stated that the only country that has a chance of existing for any length of time, is the one that produces food enough from its own lauds to support the whole of the people, and such I should think is the convicthe subject
Governor
Governors of countries, therefore, instead of labouring so incessantly, as most of them do, to extend their
dominions, in my opinion ought to employ all their powers of body and mind in making their countries independent of all other nations of the real necessaries of like. Implements of human destruction may keep foreign nations from invading England, but these will not produce food for the people ; and should another general Europenn war break out, could a sufficiency of the necessaries of life be imported into it? I thin not. Geo. Wilkins, Wix Parsonage, July 8.

\section*{Home Correspondence.}

Water Economy of Great Britain.-I trust that your readers will not be led to take less interest in the subject of my recent communication, nor to relax their
observations, because we have recently had the inestimable benefit of a heavy downfall of rain. Every one should remember that, although a supply of rain will help to overcome the evils of drought by filling ponds and surface ditches, to which the poorer residents in rural districts will have recourse, such a supplycoming, as it does, when land and vegetation are
extremely thirsty, and the powers of evaporation are extremely great-does not reach the lower depths of the water-bearing strata, nor in any appreciable wa improve the supply of wells and springs. I thank Mr. Clutterbuck for his timely suggestions, which I hope will aid the inquiry, and I will only repeat that my principal object is to trace the beight of subterranean water this autamn comparatively with the last, in order secutive dry summers upon the replenishing supply of wo winters of which we have the recorded rainfalls. J. Bailey Denton, Woodfield, Stevenage.

Bromus Schraderi versus Italian Rye-grass.-Ir the spring of this year we wrote a few lines in reply to a paragraph which was going the round of the agri-
cultural journals regarding a much-vaunted "New Bromus." On the Continent it seems to have been the "sensstional" Grass of the past season, and in England, and even in our own cautious mother country, Brome. It has even been a matter of contention with some as to who were to have the credit of having intro duced it into this country: soon enough to have troubled the settlement of this matter when the Grass had established itself as "invaluable as a forage plant." In our letter we said that this Grass was not a novelty having been introduced into Scotland many years agn,
We likewise said that if the Grass really possessed the value which it was said to possess, it was not a little surprising that these properties should only now have been discovered, and that, in our opinion, its value as a forage plant had yet to be established. As we inti mated that it was our intentiou to sow a quantity of the seed on our experimental grounds this season, alongside of what we have hitherto considered our most valuable forage plant, the Lolium italicum, and as our samples are ncw of sufficient growth, or rather uily attained their growths, we send you herewith seeds of the feach tor your inspection. The 8ch April, and they have all along had the same treatment. Both seeds came up well; the Italian (imported seed) was beautifully rowed by the 20th, the Bromus was later in germinatine, and was nos well rowed for
fully six days after the Italian. The Italian maintained the lead until the last few weeks,- they are now much about equal. The root leaves of the two are about equal in lengtb, the Italian the uost numerous, branching more from the root than the other, whilst the culms or stems are about equal as regards leaves, and about the same in height. The contrast of
the two from their appearing above ground was very atriking. The Italian has preserved to the last the rich green colour with which it started. The Bromus, which in growth and appearance is similar to Oats, is naturally of a dark green colour, but for some weeks past its bottom leaves have assumed a withered and sickly appearance; this we cannot account for, the two
having received frequent waterings during the past dry weather. The leaves of the Bromus, even when in their freshest condition, aro comparatively dry and tasteless when enmpared with the Italian, the latter heing much the sweeter and juicier of the two. Uuless we find the Bromus to possess properties which we have not yet been able to discover, we must still consider the

Italian Rye-grass to be the most valuable forage plan compared for a second cuttinge we cannmerito in We had some however cutt over abonnot as jot are now both about equal in length, with this ago, that the Italian is coming a way with more of a ing habit, and has consequently more of bry We may mention that we placed a bunch of each brom a horse; it attacked the Bromus first, but left off in the first mouthful; it next tried the Italiau, whici entire buncb. Those who are interested in the thed these two Grasses will find them-also from trial second enttings-exhibited at Inverness during staud of Seeds. Stuart \& Mein, Kelso, N.B.

\section*{Miscellaneous.}

Fertility, -Does fertility depend on the comistom of the soil, we can marl light lands, we can burn clayn
we can harden by the sheepfold and the roller, lighten by the scarifier and the plough. Dom depend on full opportunity being given to rain water traverse soil and subsoil and feed the roots of plants we can by underground channels which carry of th water as it sinks, preserve its continual circallition Does it depend on the nataml tents of the land being fitted for the food of plants, we
can lime, and burn, and till, introduce ageney of air and rain, and the artificial agency of lime and heat, and thus stimulate that chemical sction within the soil on which the preparation of food for plants depends. Does it hinge on the supply additional fertilising matter, we can add these matern
directly from the dung and the guano slip, or we can add them indrectly feeding sheep and cattle on the land upon inporte food. Unquestionably fertility is to a very great ext a work of art. This is not less true on natural and a to be effected in the original character of the Lincol will yield good crops, than it is in the fem Lincolnsaire and Canderige, now laden with rich grim
crops, and herds and flocks of cattle and of sheep, whew thie natural fertility yielded formerly but Sedge an Rush, and bog aud seaside plants, with only wild forl for the live stock.
Thin Seeding.-That was a quaint bit of experience and wisdom which Mr. Cuthbert Johnson disinterred Husbandry," in which the old Chief Justice b declared.-"There is a seed called Discretion; husbandman have of that seede, and miugle it amnay
his other corne, they will growe doubtless much his other corne, they will growe doubtless much the
better, for that seede will tell him how many cuts of corn a land ought to bave. And if a young husben have grey-headed experience, that by possilinty migh seede, yet he that lacketh, it is lawfull for him to borro of his neighbours that have, and his neigbbours b unkind if they will not lend this young husband part their seede, for this seede of discretion hathe a wondro virtue, for the more it is eyther taken of or lent the more it is, Now, discretion is that part of goin culties, risks, and dongers of the way than or rewards of the journey; and it is, we think, fortunate circumstance that in one of specimens of "book farmaing" in our language, it shonid have been desired that the." young husband" do ming
wilh his "seed corne.
Steam Power in Cultivation. - Steam power, After , was not very expensive in the long run. bounh Messrs. Clayton \& Shuttleworth in \(185^{5}\), and the expense of keeping it in repair had been quite a trio penny halfpenny affair. He always brought that engin out after harvest, and the result of emplinying in that he had but little to do all the rest of the years' had plenty of time to go to the Central
Destruction of Couch. - Is it to this end that all our tillage processes are so laborionsly conducted-for purpose that harrows, cultivators, hoes, and pore migh easily imagine it.

\section*{Calendar of Operations.}
125. - The following is extracted from Carter's Traer's Vade Mecum:" - The work this month, ecopling the continuance of Turnip culture and the bys Clovers than on the arable land. Haymaking, \(\mathrm{t}^{-1}\) - perhang the earliest of the corn harvest, in the mian per Pea and Bean cutting, occupy the hands.
oispe of horse labour is thus lighter in July than in any Le month of the year. It includes repeated horse eber wointhe different green crops, sowing of what may be called "stolen" crops, i. e., alter Vetches, Rye, may be called Ryass, and other early forage crops. Carting Litar, and of various other materials, lime, drain tiles, nol materials, which, as horses are at leisure, may be more easily done now than at are fallow is carried year. Aning July.
Hand labour is almost exclusively confined to haymiving and various hoeings, with the earliest of the marvist and Flax pulling, Bean and Pea cutting, and periups Rye cutting, if any is left to seed.
Repe Culture. - This is sown to some extent on most hids of soil, but it is especially the green crops of our fen districts, yielding a thick juicy succulent stem and for, much more nourishing thau any Turnip that can be gr wa in such circumstances. 4 lb . or thereabouts are sown per acre, in rows 15 inches apart, on the flat. I: receives a very imperfect hand-hoeing and singling, and except horse-hoeing, very little other cultivation during its grewth; and it yields a very large bulk of sueculent food of much greater value for sheep feeding per acre than the Turnip or the Mangel Wurzel, krowing sometimes so high than even the tall upstanding Lincoln sheep is hidden in it. A good crop will heep 16 to 20 sheep from October till Febrnary per acre. "Stolen" Crops.-Rape may be considered one of them ; but the term is generally applied to those crops, as Rye, Vetches, Trifolium incarnatum, \&ec, which are sometimes taken on a corn stubble, and fed or cut belore a late Turnip sowing. It is proposed to refer to them here, notwithstanding that it is generally later in the year that they are sown.
(1) Rye is sown as a stolen crop on any corn stubble, which aloonld be ploughed under and harrowed, and if possible manured. Three bushels are sown broadcast -a thick plant is wanted-and being sown early in O, teber it covers the ground before winter, and prodices our earliest spring fodder. Mr. Taunton some vears ago advocated a variety called St. John's Udy Piye from its being capable of being sown so early as . John's Day, and forming a bulky growth above the cround withont starting the ears before wint cut in Mareh and April for forage, and carried to the stalls, or it is follded over with sheep. It is adapted to ligut siils, and will yield on our poorest soils a heavier crip of grain than any other of our cereal Grasses would promuce. The land is cleared in ample time in May for oumciently thorongh cultivation, to insure an early en ugh seed-time for common Turnips, or even for summer Yetches.
Trifolium incarnatum.-This, a hardy coarse crimsonthe ITe Clover, may be sown as early as possible, after Git oreer or Oats is off. 24 lb . of seed are sown broadwill orer the stubble, and if rain has fallen, the harrow hill scrape earth enough up to cover the seed, which semas to find in the hard land a more congenial seedhed than when pains have been taken to manure and fallinte the soil. It sprouts aud covers the ground before winter, and forms a bulky coarse produce in during the time it is year, which must be consumed and wondy that it is in flower, or it will hecome so hard anir wondy that it is indigestible and distasteful. It is Sis forf food. a short time, about a fortnight, that it is hat is neocend a small portion only on any farm is all introdured sary. But Messrs. Vilmorin, of Paris, have atroduced two other sorts of this Trifolium, one a tian the flowed variety, and both of them much later the extent of land incarnatum, and thus three times mop. Sown the same may be usefully devoted to this a. intervala of a fortni day, they will come to maturity the conumon a fortnight from one another; and when last of it therefor is just going out of bloom, and the in full socenterie is being cut, the second sort will be the third, ready and at the height of its value, while dis these , rearty to succeed \(i t\), is hardly yet in bloom. by hatesown Taruips. Re and Vetches, may be followed ve best ennsumeif ; they make very coarse hay, and menenlent, sheeponef and forage, and so long as it is 2t \(t 20\) tons of green food per ack will eat it greedily : grown. If consumed food per acre may thus easily be on the field. consumed by sheep, they should be fodded foum end to The plough follows as soon as a furrow Ion leaves such a dressield is possible, and its consump--ar 3 cmt . of superphosphate, sown in the land that with the Turnip seed, will secure sown in the water drill

As will readily be inferred from the fact that at their Nursery, Ten Houses, each of considerable size, are devoted to the culture of this very interesting Cless of Plats The Collection is regularly augmented by importations received from Correspondents in Brazil, Venezuela, Borneo, the Philippine and West Indis Islands, Provinces, and the Malayan Archipelago, as also from the various Collectors of the Firm-in Nuw Grenada, Central American States, and Mexieo.

The Plants ofored are all in jine health and ery rigonows and ingpection is ropoctfully sotioited.
A PRICED CATALOGUE can be had on application.

\title{
INTERNATIONAL HORTICULTURAL EXHIBITION AND CONGRESS.
}

\author{
TO BE HELD IN LONDON IN 1866.
}

The following Resolutions form the basis of the scheme:-
1. Thet thare shall take place in London, in 1866 (probably the week between From and Ascot Races), a Grand International Horticultural Exhibition and Cungress, to be open four days, and to which the leading Botamists and Horticulturiets thronghout Europe shall be invited.
2. That Two Morning Meetings (of the nature of a Congress) shall be held, at whilh Papers prepared by leading Botanists or Horticulturists shall be read, the Papers to be previousiy printed in English and French, and circulated, and discussion theron invited.
3. That there shall be Two Conversazioni, at which Foreigners invited to assist :: the Exhibition shall have the opportunity of meeting with our own leading II miculturists, Botanists, Exhibitors, \&c.
4. That there shall be a Banquet, to which leading Foreign Visitors shall be isriled, and to which also Ladies subscxibing will be admitted. Tickets \(£ 3\) 3s. each.
.j. That the Committee will endeayour to arrange that the most easity =accessible Engianh Gerdens, in which some feature of British Gardening-such as "Forcing," "Decorative Gardening," \&c.-is well illustrated, shall be open to Foreign Visitors.
6. That a Subscription Liet be opened for the purpose of obtaining the Puads necessary to the formation of a liberal Prise Liet (about to be issued, and containing Prizes amounting to \(£ 2400\) ), the erection or part erection of the necasary Exhibition Building, the entertainment of Foreign Visitors, and for the working expruses of the Exhibition and Congress; and that a Guarantee Fund he alse enteted on.
7. That Gentlemen subscribing Ten Guineas shall be entitled to me Ihimer Ticket of the value of \(£ 33 s\); to one Card of invitation to each of the Suirces. available for one Gentleman and two Ladics; and to Fight Tickets of admissiun for the opening of the Exhibition, when the admission ly payment will be One Givinata each Ticket. Subscribers of Fine Guineas, or Guarantors of £50, will receive unt Card of invitation for each Soirée, available for oue Gentleman and two Ladies, and Four Tickets for the first day of the Horticultural Show. Subscribers and Guaranturs of smaller amounts will receive in proportion.

Gentlemen willing to lend their suppart to this undertaking will perhaps be kind exough to communicate at once with the Secretaries. The FIRST LIST of SUPPORTERS will be published in a short time.
The SCHEDULE of PRIZES will be published next week; and the LIST of OFFICE-BEARERS as suon as pussible.

JOSEPH sat for a bust within a few monthe of his death.
The many personal friends of Sir Joseph Paxton as well as the hundreds of thousands of all classe who have enjoyed the pleasures and benefits which have arisen out of the exercise of his peculiar genius, will hare thus an opportunity of doing honour to the memory of a great and good man. Mr. G. Grove, of the Crystal Palace who is acting as Honorary Secretary to the Fund will receive subscriptions, which the Committee have wisely determined may he of any amount, so as to embrace a large number of subscribers, and give a popular character to the Memorial.

Mr. W. Thomson has kindly forwarded ns a most instructive specimen of a Proliferous Rosf, in which the cup-like receptacle is altogether absent, while the five sepals are present, in a rather more leafy condition than usual, and are slightly coherent at the base. The petals are numerous; above them, the bare stem or thalamus rises to the extent of an inch or more, when it is again encircled by several whorls of closely crowded petals, smaller than the lower ones Next in order to this second series of petals are several circles of stamens, above which are numerous pistils, these being succeeded by more stamens, and these again by a third row of petals. Then come five perfect pinnate leaves at the base of a shoot, which bears leaves and bracts, and is terminated by a flower bud. Hence the general appearance of the whole is as if a series of flowers

Here we may be permitted to explain a remark of ours which has been misunderstood. We said that the mixed flower border is an antiquated affair, and this has been represented as "an unwise saying." Perhaps we should have said that the mixed flower border ought to be regarded as an antiquated affair, for we fear the thing we condemn is still too common throughout the country. But the border or flower plot, which we desire to see antiquated, is that which has io stand for the place of flowers from the beginning of March to the middle of November, and which is made the common habitation of the Snowdrop and Crocus in spring, of the tall Delphiniums in summer, of the Solidagos and herbaceous Asters in autumn, and perhaps Tritoma media in winter. In such a border, or flower plot, scarcely half a dozen of plants can be in flower at one time. No possible objection, we beg to say, can be made to a mized border of spring flowers, or a mixed plot of summer flowers. Many prefer this style of ornamentation, and they may have good reason for doing so. On the whole we prefer it ourselves. But we cannot give up grouping or massing for the production of strong effects, either in spring or summer. We suppose our meaning was misapprehended, a not uncommon case where there is a difference in matters of taste in crardening. It is not difficult to set up a man of straw, as one of our objecting friends remarks, or to imarine a card castle, and then by making a brave charge to gain an easy victory.
Our main purpose at present is to commend the Summer Flowfr Gardes, properly so called, to the consideration of our readers. The whole broad country is a garden at that season, and that perhaps accounts f. \(r\) the fact that the appreciation of the summer garden is often languid. And yet how beautiful is the array of summer tribes. About the middle of June the princely Photodendron hands over the floral sceptre to the Rose, the undisputed queen of all Howers; and her train is crowded by many fine slirubs, such as Spires ariæfolia, callosa, \&c.; the white and yellow Broums, the dwarf Coluteas, Robinia hispida, and the other Papilionaceæ of the middle season, and there are hosts of berbaceous plants usually so called. The early annuals, too, come into gay and lavish bloom ; and towards the middle or the end of July the van of the Verbenas, Lobelias, and Gazanias makes its appearance. Assuredly there is no lack of materials.

Let it be understood that for the Summer Flower Garden we do not recummer.d a separate enclosure, fenced off from the rest of the grounds, though if there is any special reason for that arrangement it need not be avoided. We should prefer a portion of the flower garden, larger or smaller according
have wished that they could recover the old massive Grand Admiral Auricula, which still, self as it was, reapnears in their memories as one of the finest plants they ever saw. It is something that cultivators who have been too much eugrossed with the autumial flower garden, should become aware of the fact that there are numerous classes of hardy plants which are quite as interesting and attractive, if not so hrilliant and shows as their special favourites. We trust that the interest which has been awakeed in spring flowers will not wear off without practical results; and we recur to this subject now, because we have arrived at the point of time when spring bulbs may he lifted and separated, and if not at once replanted, as many of them should be, at least prepared and stored or future use.
We are more and more convinced that any considerable improvement in flower gardening can be effected only by the adoption of the season principle-only by the establishment of special departments, for at least spring, summer, and autumn. The autumn flower garden, indeed, is nearly perfect already. No doubt sumething may ret be found more golden than Mrs. Pullock Pelargonium, something whiter than Centaurea ragusina, something darker than the well-kuown Perilla, therefore the finish of particular parts may still be heightened; but it is not improbable that general effects have already heen produced in various places, which will hardly ever be surpassed. The autumnal flower garden may eafely be left to the care of Fashion, which is at ouce infectious in its influences and exclueive in its aims. But certainly, if special departments for spring and summer are not instituted, if no provision is made for these earlier months, the flower garden will contiuue for a considerable portion of the year a dull and dreary desert, as it as too often been of late -

were strung one above another, like so many beads on a thread.

On cutting this flower down through the middle, its real composition becomes more intelligible. Below, there are the sepals and petals of an ordinary flower, whose sexual organs are wholly wanting; above this the stem rises, and bears on its sides a whorl of confluent flowers (perhaps five in number), whose sepals are not well developed, but which have the other parts perfectly formed with the exception of the reseptacle or cup, which is wanting. This explanation will ascount for the relative position of the pistils, stamens, \&e. Beyond this ring of lateral flowers the stem is prolonged into an ordinary flower-bearing shoot.

To Mr. Bell we are also indebted for a beautiful specimen of a Proliferous Rose, in which the stem grows quite through the flower, and is surmounted by a new flower bud. The oalyx is here leafy, and the cup-like reoeptacle entirely wanting.

Froy accounts that have reached us from various quarters, we have reason to believe that our remarks, concurrently with those of others, on Spring Flowers, have not failed to make some impression in the floricultural world. Inquiries have been made in old places for Primroses, Polyanthuses, Auriculas, and other ancient favourites, which in these days of the "beddingout system" have been allowed to go very much out of sight, and therefore out of mind. It has been discovered that our grandfathers had fine
flowers, though they lived before the appearance of Dahlias and Verbenas. Middle-aged florists -
proprietor, in which the summer tribes ire to be more particularly if not exclusively assembled, in order that for the time being they may produce a condensed effect. As the warm season makes shade desirable, the summer flower plots may be appropriately contiguous to the points where the kept grounds shade off into the park, and the transition between its lower denizens and the lofty trees of the outer region may be effected by the taller shrubs, such as the Guelder Rose, Buddlea globosa, the Catalpa, Robinia viscosa, and many others. It is delightful to step readily from the glare of a summer sun to the shaded windward of a flower garden, whither the faint breeze comes loaded with perfume, cooled and softened as it were by the umbrageous shelter of the spreading branches. The eye looks forth from the shady place and sees eversthing in a finer distance and in a ealmer light. In such delightful scenes all the senses are regaled at once; the thoughts succeed each other in sweet and gentle harmony; and even simple existence is felt to be a luxury.
The Summer Flower Garden, we venture to think, should be mainly in the mixed style of ornamentation; in other words, it should be tilled by shrubs, herbaceous plants and annuals, skilfully combined and intermingled. This arrangement is rendered necessary by the Rose, which is its principal and indispensable occupant. A summer garden without the Rose would hardly be a garden at all. Of course it is well known that Roses are often planted in separate compartments, called Roseries, and that these compartments are laid out in parallel or concentric beds. We cannot regard any Roseries we have ever seen as suecessfal efforts of their designers. Their very structure gives them a stiff and formal look. As it was remarked, we think by Mr. Rivers, the Rose is not a graceful shrub when out of flower; and we may add it is not very graceful even when in flower, only its glorious blos:oms make us forget everything else. Rows of Rose bushes, whether in straight or curved lines, always remind us of the old Linnean arrangements in Botanic Gardens, which, even when they are without gaps, and are equally furnished, as they almost never are, are among the dreariest things in gardening. By all means let such formal arrays of Roses be discarded. But nothing forbids grouping or massing of Rose bushes where it can be fitly done. What charming bods one meets with of the Common or Lane's Moss Rose, for example, of General Jacqueminet, Senateur Vaisse, and other Hybrid Perpetuals, and, where the climate is favourable, of the Teassented or the deep-coloured China sorts. With the ordinary scattered grouping of Roses, the finer shrubs above mentioned may be associated; and combined with these the more showy herbaceous plants, some of which do not mass well by themselves, such as the Hybrid Potentillas, the tall Larkspurs, and many of the species of Iris, may be oopiously introduced. A few standard or pillar Roses-we may a few, for an excess of standard Roses is a nuisance-may be placed singly and in conspicuous places on the lawns. A similar but subordinate use may be made of some of the more striking herbaceous plants, such as Rudbeckia purpurea, Veratrum nigrum, Boceonia cordata, Asolepias syriaca, and various others.

But while we would adopt the mixed style o decoration for the principal part of the Summer Flower Garden, we would strongly insist on the reservation of moderate spaces for masses of particular plants. A nook, for instance, should be kept for the fine hybrid varieties of Iris germanica and other species. Another plat or border might be dedicated to the numerous forms of Pmonie albiflora, edulis, tenuifolia, \&c., many of which are exquisitely beautiful, and unfortunately not jet so highly appreciated in the florioultural world as they deserve to be. It is only, however, north of Londion that these Irises and Pronies bloom so late as June, and therefore belong strictly to the summer garden. The bulbous Irises, both I. Xiphium and xiphioides are well adapted for massing, and are very useful in ekilful hands. We also warmly recommend the numerous progeny of Phlox suffruticosa-many of which are remarkably fine, and afford admirable materials for light airy grouping as well as massing. The plant is extremely hards. It requires, however, a cool, moist situation ; and in dry localities it is greatly benefited by being grown in a mixture of rotted turf and peat. The fine varieties of \(P\). decussata hardly bloom within the summr period. We heg our readers to allow us to recommend to them the old-fasminned Sweet William. In our humble opiorden. Were bot a finer flower in the summer garden. Were suoh phant to be introduced is
the present day, the world would run wild about it. We do not, however, admire the selection of a fow prim Auricula-eyed varieties; and the plants grown in rows at the distance of a foot and a-half from each other. Commend us to a good mixture of all colours, allowed to shoot up into flower in the seed bed. As this practioe may be deemed inadmissible in a well-kept garden, where every space must be annually covered with some flower or other, the same result may be obtained by pricking out the plants in the place allotted to them at the proper season. Hardly so fine, but still very fine indeed is Dianthus sinensis Heddewigii, which may be treated much in the same way, though it is of a more delicate constitution. Certainly the greatest accession of recent date to the flower garden is to be found in the double and semi-double Pyrethrums, as yet comparatively little known; they are emphatically the coming flower of the day, and are destined to equal if not to surpass the finest China Asters, perhaps we might even say the bulk of the China Chrysanthemums. They are quite hardy, of easy oulture, and are well adapted to form single plants, or groups, or masses, at the pleasure of the oultivator.

We have merely skimmed the surface of our subject, so far at least as plants are concerned. We intended to say something of the hardy Liliums, one of the noblest families of the floral kingdom-yet what an insufficient use has been made of them in the summer flower garden British botanists and florists have done miserably little for them in the way of the multiplication of their roots. Good collections of Lilies are not at all common, even in Botanic gardens of oonsiderable pretensions. Would that another Herbert would arise and teach us something in regard to the Lilials, as the truly venerable Dean did in regard to the Amaryllids

The meeting of the Swiss Naturat History Societr will be held at Geneva on the 21st, 22d, and 23d of August, under the presidency of M. DE LA RIVE. What iwith meetingz, soirées, excursions, dinners, and the like, the gatbering is likely to be an attractive one

From St. Petersburg we hear that a committeehas been formed to organise an International Exhibition of Plants and Agriculcural Products in that city in 1868, and that Dr. Regel has been appointed President. Under such auspices and under such peculiar circumstances, a flower show in the Russian capital will be very interesting.

We learn with pleasure that Dr. Imkar, of Dominica, is making experiments on the Cultivation of Cotron in that island, having planted nearly 0 acres of land with that shrub. We hope in due time to lay be.ore our readers the result of this trial, the bistory of tho Cotton plant in the West Indies in a scientific as well as in a practical point of view, being, to quote Dr. Imray's words, a subject as important as it is full of interest.

The Times of Tuesday states that the operative gardeners employed at the horticu'tural establishment of Passy, which belongs to the city of Paris, have addressed a demand to the Prefect of the Seine requiring-first, that their wages should be fixed at 40 c , an hour, or 4 f . ( 3 s .) for a day's work of 10 hours, instead ot \(2 f .16 \mathrm{f}\)., which they receive at present; and, secondly, that the day's work be redueed from 12 hours to 10. Several proprietors of private nursery grounds have accepted these terms.

The foreign papers state that severe damage has been done to gardens in the north of France, by Thunder Storms. The hothouses of a nurseryman at Selles were ground to powder by the hailstones, some of which are said to have weighed 3 or 4 ounces. A great number of trees on the high road from Cateau to Solesmes were tora up by the roots. Much damage of a similar kind was also suatained at Maretz.

\section*{New Plants.}
303. Lella elegans Wolstenholmine, nov. var.

Sepalis pallide amethystinis limbo punctulis purpureis prostextis, petalis ruombeis obtusiusculis acutis amethystinis a medio apicem usque late purpureo prætextis, labelli As Dr. Hooker during his Himalayan expedition from time to time discovered what be believed to be the mos splendid Rhododendron of all, till he met with a much finer one, so in our Dayan correspondence we from time to time make out the most splendid Lrelia elegans. Just now, we regard this one "the very best of all." The flower is very large, larger than that of the Warnerian Laelia gigantea (Select Orchils, Plate VI.), and of a light amethyst colour. The sepils are bordered with innumerable purplish dots. Tue petals have a very broad purplish border, except neur the base, and the anterior part of the lip is quite purplish. In point de再e we call the pant Ble
most splendid Orchid to Mrb. Wolstenholm, of Misi
Cross, Tottenham, who is a very intellicent Orchids, and an accomplisked pupil of her brothee Mr. Day.
304. Aumide Dipforvis, Wall.; Lindl. Ond Els Lindll. Sert. frontisp.

New types of Orchids are very scarce, notwitheten ing so many new ones are imported. Mr. Seranie even suggested, we might not see any more. Hem, however, is a peculiar one, if not new to science, least never seen before in our stoves. Many dried spec mens teach us that Mr. Stuart Low's comparison of the growth of the plant with that of a Phalamopin in a very happy one. The stems are unisually short and few leaved (commonly bearing two to four leaves). Th racemes or panicles reach the length of more that: foot, and bear a large number of very pretty, greer and brown flowers in the way of thoge of 2 lam Sareanthus. They have three peculiarities The firstuto have the spar quite in the centre of the lip, lite Rehanthera. The sebond is to have such ntwo-bented vostellum hanging over the stigmatic surface as remind one of the mandioles of some voracious beetle, 4 Cieindela or a Carabua. The third and most ímpotict is this: the end patt of the lip has so muny fring that it is very mach like such a sketeh of the shm boys make in their first artistic trials, and an in represented in old Egyptian or Mexican ornameat of building.

After having toiled for two lays with the dissection and inspection of many flowers, and having adind many specimens of Dr. Hooker, Baron von Hürel Falconer, \&c., we cane to the conclusion that the phat called Aërides hystrix, from Sikkim, has no claim to \(b\) regarded a species, since the length of the spar is subject to many variations, and the middle teeth of the anterior sunlike part of the lip appear ever premes A fresh spike was obtained from Mr. B. Low. It one more of the Rev. C. S. Parish's numerous discoverim Burmah. \(H_{.} G_{0}\) R. fil

"The genus Hepatica," observes Sir W. Howtur, when recently figuting this plant, \({ }^{6}\) first indiatad by

Dillenius, has been accepted by some succeeding botanists and rejected by others, the former fre ponderating. Latterly, however, the alconeri, Thoms. Kashmir of a species of Anemone (A. Falconeling Hook. Ic. Pl. t. 899) closely resel chararten H. triloba in habit and in all other essentin chares except the position of the three involacral Hepaticta which afford the main distinctive charact
invalidates the latter genus altogether. Wist as to the
Whatever difference of opinion may exise in recan generic amme of this plant, there cam maceous planos to its beauty. It is one of many hardy herdave durinc the and Alpines, which Messrs. Back hous and which hare past spring exhibited in wouns,
they have appeared. The plant is a mative of Hingury, and twice as large both in regard to stature and be size of its flowers, which are of a fine greyish and the iet of by the numerous black anthers surrounding a :an of yellow styles. The leaves are 3 inches broad, 3 lobed, the lobes cosrsely crenated. The flowers are oprads of an inch and a half across. It is, doubtles
one of the finent hardy plants of recent introduction.

GENERAL FLOWER-BEDDING.-NV. III.
Fouragr-plants, as they are termed, have become an item of great importance in the present system of ont-door decoration. They add not only noore interest pire iucreased tone to brilliant colours. I look unon the direction which bedding taste bas taken in this mpect an very favourable to the gardener. Only a few rems ago nearly every plant employed by him for porposes of ormamentation was of a tender character, and required the protection of glass during winter. Moreover, a good many of them now discarded, vielded buta poor return in the way of display for the large amount of care necessary to bring them to perfection. In weeding out unfit subjects, however, another equally etrmargant practice took place, viz., a run upon high colonrs. We have had masses of scarlet and yellow, an otruight lines. From this taste for high colours in flowers the transit was easy to that of colours in leaves, the effect of which is solt and pleasing. Most red-leaved plants are an yet tender, and require care and nursing ; this is not the ease however with the majority of white and ight coloured variegated plarts, several of which, such ns Arabis lucida variegata, and A. albida variegata, ar hardy, and both the plants just named form excellen lines or edgings either in summer or winter, particularly if planted close and not often moved; they moreover reqnire no attendance beyond the operation of picking
the flowers off them in spring. These may be taken as types of the norb of plants to seek for and encourage as mach as our prevailing taste will allow. Where the plese to be decorated is extensive, it is seldom that the gardener gets a sufficient stook of plants to do it with command how he will. The hardiep the thaterials he commad for the will. The hardeet
If in the case of a goodesized round bed we intronuce an edging of the IVy called Hedra latifolia maculata eithersinping or that, I venture to assert that this will be a marse-leaved Centaureactory edging than one of the stif this edging in summer the most effective plant would he Amaranthus melancholicus, which, however, wants a better bring ont the contre by way of relief and to mall plants of the colours, and for this purpose a few mall plants of the Negundo variegata, kept pinched in mre or less low, according to situation and taste, night be planted; the pyramidal form would perhaps this. The only thing to bear in mind with regard lave gravel or that where the soil is stiff it must oring the variegation well out; or where Pelargoniums plants of those of the Mrs. Pollock cluss, which har good frame-work of some other coldoors, unless placed in a that the leaves mill lose their bright colone and foat gromth commen predominate the moment vigorous ill not bare comparison with the best Pelargonium the case of a bed of bright scarlet Pelargoniuma, mist in after vinca elegantissima would greatly nerested advantage. Herting of the scarlet to ience to be equally edgings, which we know by expeiuter than in summer, and even more effective in inpel ine beds they grow into a mass, which can be that the dressine into any shape. It will be found lauts is sufficient for in the centre for the flowering ecessity of moving it often edging, thus obviating the arge-lowering Aplay I would fill the first bed with the ang the Negunubrietia purpurea grandifora, and andentr Tulip, or any good white varieties of Nar?atrast well with the Ivy from March to May. The perged down. This parple Honesty. Lunaria biennis, Told be over by the cames into bloom in April, and time for summer filling week in May, leaviug plenty We have also thling.
Wis is not gafficiently garden variegated Alyssum, but Tre, although when planted in certain beds in autumn it oteh plants asefol spring edging. The complaint that itt in beds or this and the evergreen Candytufte, when aing repeatedly the following spring, is cansed by their are deay of the blossoming shoots. One cutting after iake the useful flower another season. Let us now on anand atiff ediging; not the little pinchert-ith lites gemenaly met with, but not the little pincher-in lines
surround piak Pelargonium Christine in summer, and single yellow Wallflowers in winter. In spring the Cerastium will be one mass of bloom, and in coutrast with the yellow of the Wallfower, I am not acquainted with any summer combination which is half so beautiful Mo itserer, allowing the plant to bloom is not injurios to its effect afterwards. J. \(F\).

\section*{ON RAISING CONIFERE FROM HOME-GROWN} AND FROM IMPORTED SEED.
Several articles have lately appeared in your columas on this important subject, and responding to your notice at p. 604, I beg to offer a fow remarks, chiefly relating to the common sorts; for although I have raised some
of the Californian trees to a small extent, from British grown seeds, I have had no opportunity of comparing them with the produce of foreign seeds under the same treatment. It is well known that the cones firs produced by young trees are seldom well filled. This I expect, holds true respecting all sorts; for cones of
the Scotch Fir from very young trees are deficient in the ordinary quantity of sound seed, unless they are, ns in the native forests, interspersed with, or anjacent to older trees, "which yield male blossoms more abundantly, whereby the cones become fertilised.
I have a few plants of Picea nobilis raised from seeds grown in Scotland; they are 6 years old, and range from 10 to 15 inches in height, grown in the open ground and transplanter at the age of 2 , and again at
the age of 4 years. Like many of the plants of this genus they talke badly on removal, as before growing freely their roots must have a firm hold of the soil. cannot say what progress plants from imported seed all Silver Firs, while young they are apt to suffer from the slightest frost of early summer. The nobilis is justly a favourite tree in all Pinetums where it is of any considerable siza, and from the legance of its dense foliage it will always continue to low growth, soon to become a useful timber tree in this country. Ono of the first trees of this species introduced into the North of cotland (from the Royal Horticultural Society of Loudon) was planted on the lawn at Coul
House, by the late Sir George Mackenzie. Bart., about the year 1831 or 1832. The tree now stands 43 feet high, and its girth at the surface of the ground is 4 feet 6 inches-dimensions inferior th those of the dinary growth of the common Silver Fir of that age.
The Douglas Fir is a far more vigorous tree, and ives promise to become valuable in glens and ravines throughout the Scottish Highlands: but hitherto there has been in the North a want of fertilisation in its 'cones to produce young plants, but plants from imported seed sown in the open ground grow vigorously. A fine tree of this species also stands on the lawn at Coul House- 57 feet high, and 6 feet in girth near the surface of the ground. Its upward growth has diminished considerably during the last
10 years, on account of its top having outgrown shelter 10 years, on account of its top having outgrown shere
and become fully exposed to the open atmosphere nevertheless, its growth during that period has been 10 feat.
It is only in accordance with a recognised law to expect that seeds of these foreign Pines grown in Scotiand will produce plants less vigorous but more hardy than those raised from foreign seed. It is a fact well known to most of the Scotec, and many of the
English nurserymen whose grounds are elevated and exposed, that seeds of the Pinus sylvestris imported from the Continent produce plants of more rapid growth than those raised from the forests of Scotland. The difference is perceptible in one-jear seedlings, and more so in two year olds; but the effects of the winter on the' second year's growth almost uniformly makes them quite brown, and so damaged, that by the month of March they are quite unsaleable, while the plants from the native Scotch Pine under the same treatment and standing alongside, although considerably shorter, are rather stouter and quite green, so that the beds of the one can be known from the other, if brought into view on raised ground, at the distance of a mile; and although plante from particularly in succeed in favourable situations, utterly worthless when inserted in exposed moorland.
Imported Larch seed also produces young plants rather taller than seed grown in Scotland, but plants produced from foreign Iarch seed have the same fault as plants produced from foreign scotch Pine. They are very tender, and apt to have their tops destroyed, even during their nursery treatment, white those from Scotch seed ripen their terminal budv, and are exempt from injury during the severest wiater. It is sornetimes difficult to account for the failure Larch plantations in many parts of the country where and climete on have been produced from seed imported from trees grown in a warmer conntry. The influence of soil and climate on many kinds of Conifere alter their character, and sometimes produce as important a difference is that which exists between one species and another. Those magnificent specimens of the Larch at Dunkeld,
oreign but of British seed; and this success is quite observed the prorress of the tree under different \(c \mathbf{r}\) cumstances. John Grigor, Nurseries, Forres.

\section*{ALPINES.}

It may be well to quote Ben Jonson as an authority

\section*{"It is not growing like a treo}

\section*{In bulk that makes thinge hotter be "}
for the particularly interesting feature of Mr, R Farmer's garden (The Hill, Hornsey), of which I now wish to speak in connection with Alpune plants, is comprsed of two little rocky beds not in re than 5 feet across in the widest part; but even nuw-July 18 when Alpines, \&c., are usually out of flower, these beds re full of bloom-full of interist they are at all times. And this within a pleasant walk of St. Paul's. How it and this within a pleasant walk of St. Pauls. How it
has been done with very little trouble and expense is surely worth relating
About 15 months ago Mr. Farmer had a lot of Messrs. Buckhouse's and Messrs. E. G. Heuderson's beat Alpines and herbaceous plantr, and what to to with
the tiny and choice ones like the Gentians and mountain Forget-me-Nots was the question.
In pote they certainly may be grown well, but then they are likely to meet with many vicissitudes, which they escape if planted out in proper soil and in a proper position, and they are not usually attractive in pots, as
these are generally stowed in some old frame or pit or retired corner, where the free air and light which Alpines relish so unuch, are impossible.
They may not be grown on the things called "rockwork," c)mmon enough in gardens, but resembling nothing in nature, and providing no "hold" or proper mediuin for the roots of an Alpine plant. Neither may they be grown in the mixed border, where they are sure
to be smothered by coarse plants; ' where the soil is to be smothered by coarse plants; where the soil is
rarely or never suitable, and where they woald have little chance of being kept sufficiently muist, or indeed of being seen in character. These colusiderations induced Mr. Farmer to try his Alpines in an open space. A little bed was dug out in the clay soil to the depth of 2 feet, and a drain run from it to an ontlet near at hand; the bod was filled with fine sandy peat and a ittle loam and leaf-mould, and when nearly full rustic atones of very different bizee wore placed aroaad
the margin, so as to raive the bed on an average If frot or to above the turf. More soil was then put in, and \(n\) few roung slabs, arranged an as to crop out from the soil in the centre, completed the preparation for the memter Sedume and Sempervivams, such Saxifragas an cersin and Rocheiliana, such Dianthuses as ulpinus und petræus, Mountain Forget-me-Nots, Gentians, little spring bulbs, Hopatica angulosa. \&c. They were planter, the finer and rarer things gettiny the best pusitions, and when finished the bed looked somowhat like an
enlarged edition of the vases of Alpines which Messre. Backhouse sent to our Shows, but much be maty was nos
expected from the arrangement for a year at least.
However, in eight weeks things had "taken so well" and the bed looked so beautifnl, froan a dozen plants of Calandrinia umbellata that hal been phanted on the little prominences flowering so gaily and profusely as to mase the arrangement equal to one of bedding plants from the elrective point of view, that Mr. Fariner immediately made a fellow for it, arranged in the different tastes of the Alpines, and planted with as different subjects from those in the other bed as could be got; contining himself still to the choieest Alpine-, except on the outer side of the largest stones of the
margiu, where such herbacoous plants as Campanula carpatica bicolor (aky-blue on the upper portion of the corolla, and white below), have been plauted in both beds with great advantage.
The only attention these heds have required since planting has been to keep a free-growing apecies from over-ranning a sabject like Gentiama verna, an ! to well water the beds on hot days-to keep them in fact thoroughly moist. They will require no further attention for years. With the exception of the exquisite Gentiana bavarica every Alpine plant put in those bed has grown well; the beds have presented fresh flora interest every week since the dawn of spring (indeed Gentiana rerna was opening buds all the winter), and will continue gay with the Calandrinia aud Linaria till late in autumn. The best display as regards variety was probably in the season of Dianthus alpinus; the best effect is afforded by the Calandrmia dotted ove the beds, and this lasts for months. It is a marvellous plant for effect, as may be well seen in another part of the garden, where about 60 plants form a mass, growing in peat. When the sun shines on it other colour. The little dark purple bells of the ther colour. sach things os that gem among Sedums-brevifoliam, and fairy bnshes of Alyssum spinosum, evergreen, or in ore correctly, ever-silvery. The leaves of this Alyssam, if I am not mistaken, will show the stellate hairs more beautifully than any other plant known to
nicrosenista. Choice silivery-leaved subjecets like the Oyster plant, Diotis, and Androsace lanuyinosa, are especially useful, even if they never flowered, for mingling with little green thinga, like Thymms enrs
There are miny other things which I have not spa
to name that come in beantifully. Mr . Farmer declares all the gardening he had previously done. The handreds who crowded ronnd the vases of Alpines sent from York to the London shows, will understand this when I say that his beds are like those vases quadrupled in size, plunged in the turf, and "established." And the great thing is that their beauty never palls; they are not the same thing for five months at a stretch-far from it. Thus, when I last saw them, Myosotis mon tana was the feature, -now its large blue tufts have disappeared, but in the opposite bed there are darla blue bushes of the Azorean Forget-me-Not, which by the way furnishes a more dense and level head of colour than any of the other Myosotes. At the same time the general effect of the beds is pleasing at all times from their being covered with the neatest and most interesting of evergreen plants, mingled naturally, and with the stone cropping forth here and there

I have described the way by which this happy result has been brought about. A large feature of this sort would be admirable in some public garden, especially in those having large collections of Alpine plants, \&c., in the scientific arrangements, and in pots from which could be selected at once plenty of good things. Some thing of the sort might be made in any garden-ay, even in a London square. W. Robinson.

\section*{Home Correspondence.}

House Gardening.-Your very interesting report of the house gardening exhibition of the Royal Horticulrural Society induces me to suggest that it is not only for the benefit and relaxation of the working classes of London that encouragement may be given to this comparatively new application of floriculture. It may also the afflicted of all classes. Having been driven by the pressure of a painful bodily infirmity to take up my residence in the crowded locality of Covent Garden after many years spent in the enjoyment of a greenhouse and hothouse in the country, an endeavour has been made to see how far that enjoyment can be supplied in London. A small but inexpensive three-
light greenhouse has been erected in a back yard, open, light greenhouse has been erected in a back yard, open,
however, and airy, beneath the shadow of a Plane tree from 40 to 50 feet high, and a Mulberry tree, both in full leaf; and here, thanks to the intelligent zeal of my son, whose incipient taste for floricultural pursuite leads him to spend as many hours of an evening in his one, escaping thereby the temptations of more exciting pleasures, we have an interesting collection of Ferns many of them British, which have acquired their full growth from plants which were cut or died down to eapecially Asplenium Filix-fcomina, and Osmurdn regalis Neplirodium Sieboldij, Lonaria alpina, Aspidium trian gularum, Pellea rotundifolia, Asplenium viviparum Aspidium macrophyllum, Cyrtomium caryotideum, LepBesides these we have a few seedlings in flower, and Dianks to the kind encouragement of the worthy Dllection the Ropal Gardens of Kew, an interesting flower, including Mahernia vestita, Cytisus canare in Rhynchospermum jasminioides, Sollya heteronhylta, Loddigesia oxalidifolia, Mitraria coccinea, Polygala Dalmaisiana, Rlynchosia gibba, Cissus discolor, Veronica decussata, Monochætum tenellam, Jasminum
didymum, Torenia asiatica, Tacsonia mollissima didymum, Torenia asiatica, Tacsonia mollissima, Chiro
nia Fischerji, Lonicera aureo-reticulata, Malva miniota Prostanthera nivea and retusa, Tradescantia discolor Eutaxia myrtifolia, Graptophyllum pictum, Heterocen cool Orchids me and Eranthemnm Cooperii; and among Skinneri and Odontaglossum grande, both making fresh Skinneri and Odontrglossum grande, both making fresh
bullos. It is, perhaps, scarcely worth while to sperat of bullos. It is, perhaps, scarcely worth while to speak of so connmon is the use in London of this elegant botanical toy, but an invalid whose days are spent the pleasure of being able to watch the growth of a Ferns, many of them mass of curious forms of foreign Ferns, many of them productions of the most distant
parts of the globe, New Zealand, India, Mexico, parts of the globe, New Zealand, Irdia, Mexico, Litobrochia vespertilionis, Nephrolepis tuberosa, Drynaria propinqua, Preris scaberula, Adinntum for mosum, Pinymatodes Billardieri, Phlebodium aureum, \&c. Lovell Reeve, July 15.

Judges at Flower Shows.-The following remarks relative to fllwer shows are sent for the purpose of
illustrating the unfair mode of awarding prizes to often practised in country places upon such occasions. I shall not attempt to weary your readers with par ticulars of the actual grievance of which I complain-
suffice it to state that I have studied and practised both landscape and general designs for flower gardens for many years pasis, that at I- Flower Show on the one of a 2 prizo only, while in the face of this, adnitted to me that my design was unquestionably the
best then shown. opinion, no person should be to say, that in my
arbitrator at exhibitions such as these, who has
the least interest in the matter to be decided the least interest in the matter to be decided
upon, whether plant, fruit, vegetable, or garden design. Most of your readers will readily perceive the differenc between a "design for a flower garden" and the "flowers or furniture" of such design, one being \({ }^{\text {a }}\) natter of art, the other of mere taste; yet with some in —, ay, and in many other places too, the most gaud think you will also bear me out in the following uggestion, viz., that all promoters of shows of flower ruits, and vegetables, or exhibitions of this kind, should employ as judges independent gardeners to gentlemen or private families-strangers to the neighbourhood f they can possibly be obtained; and sbould never appoint less than three persons to the office-men who can prove themselves to be thoronghly disinterested both as regards the exhibition and the exhibitors. In short the right men should be pat in the right place, in orde that exhibitors may at least feel that in exbibiting they
have a certainty of being rewarded according to their respective merits. Edmund Cooper
Nero Early Peas.-It is certainly sonewhat amusing, hough perihaps not surprising, to find that such broad differences of opinion exist in reference to the merite of the New Early Peas sent out last spring. In different localities, more or less affected by some pecu iar conditions, these Peas have appeared in somewha diversified forms ; and so conflicting appears to be the estimonies of the various growers in regard to them that it is a perplexing task even to make an effort to each something like a correct conclusion respecting them. The return furnished by Messrs. A. Henderson Co., which appeared at page 580 , is a singular one their conclusions not having been supported by any other testimony that has appeared in any of the gar dening prblications, while numerous other testimonies to these Pesos fro cold erposed sitnation; the ground was well and moist, and the seed was sown somewhat late on account of these circumstancez. Carter's First Crop and Sutton's Ringleader were the first to appear in ful
bloom, but they were closely followed by Dickson's First and Best ; and when the pods of the two first wer it to gather, Dickson's Pea was so close upon thei heels, that a good picking could be obtained from each a the same time. Carter's First Crop and Sutton's Ring eader are cleariy jdentical, and they present all the characteristics of Dillistone's Early Prolific, excep that they are a little earlier and have smaller pods Dickson's First and Best grows taller than these, is o nore vigorous habit, and produces a larger quantity of wo first was from four to five in a pod, that of Dickson's was from five to seven. Dillistone's, Sutton's and Carter's Pean yield their entire crop in about wo pickings, While from Dickson's four good gather remarkably true in character; whilst, among Sutton' and Carter's, lots of "stragglers" reared their heads and were, as rognes in Peas invariably are, later in and Daniel O'Rourke, from Messrs. Waite \& Co., were identical. What were true were in bad company, for they bristled with rogues, long and lanky, and when these were only in blossom many of the true Peas were
fit to gather. Carpenter's Express appears to be a good stock of Diniel O'Rourke, and therefore identical with it. There was an evenness and a regularity of habi bit that presented a marked contrast to the ragged Daniel 'the others. They produced well, but lik days behind the other three. Essex Rival (not men tioned by Messrs. A. Henderson \& Co.) is so much like Champion of Paris, that I must pronounce it to be dentical with it. It certainly grew a little dwarfer than Champion of Paris annually does, but this was probably caused by the dryness of the season; like second Early Pea, possessing all the wished-for Marrow fat flavour, without the peculiar sweetness of the wrinkled varieties. Princess Royal (Maclean's) in my own garden, as well as in other places where I have
seen it growing, has this season fully maintained its character as the best dwarf second Early Pea in cultiration. It produces large and well-filled pods literally from head to foot of the haulm. With me it grew about three feet in height, but I had it on a strong moist soil. The flavour of the Peas when cooked is deicious, without that full sugary flavour which characterises Maclean's Dwarf Prolific, and which I find, strange \(a 8\) it may appear, to be objectionable to many persons. Maclean's Wonderful has also fully sustained its good epatation, and these three varieties, viz. Princess Royal, Wonderful, and Dwarf Prolific, should find a place in very gardon where first-class Peas are cultivated. Quo Peaa, maske a statement to the effect that Snnpster's No. 1 and Dickson's First and Best are the same in all respects except in the colour of the flowers. I have grown both these kinds this season, and I have found chem very different, Dickson's being so much the earher of the two, that I consider it ind you the result of my experience with them. Both week in March, and bozes on the same day in the firm week in March, and they were placed in heat until they
finally planted out in rows across a sonth border on ibe 1st of June, the produce being then in good on th Sangster's did not yield a dish until the 13 th and then rot so good as the former was on the 15 Dickson's was a fortnight earlier in coming into blom I consider Dickson's First and Best to b" an a forcol early variety; it is a good cropper, bearing goodsing . ings can be obtained. It is recidedly the beat earit kind I have yet grown. I lave not tried Dillistonen quently I cannot say whether they are earlier the Dickson's or not. If they are, and as good in ane they will cortainly be acquisitions. I have Sangster's for several years, and I find it to bo aseful Pea ; it is a good cropper, and with met seasou it has come in well as a succession to Dichme when sown at the same time. J. H. Mason, Stourton interested in reading the opinions of the been ried the various new Peas sent out last spring, and \(火\) Thave myself made very careful trials of all, I give yon the following as the result of my experience Im here mention that all the novelties were procored direct from the firms sending them out. I made my
first sowings January 16th, with the following kinds:-1, Carpenter's Express; 2, Dickson's Fing and Best Early; 3, Carter's First Crop; 4, Suttont Ringleader ; 5. Eley's Essex Rival; 6, Sangsteri No. 1; 7, Dillistone's Early; 8, Tom Thumb; Sutton's Long podded Tom Thumb. The different Nos. 3 and 4, Mav 3d; Nos. 1 and 2, May 6 No. 7, May 11th; No. 8, May 12th ; No. 5, May Nos. 6 and 9, May 20th. And were ready for
ing-Nos. 3 and 4, May 31 st; No. 2 June lat; June 6th; Nos. 8 and 9 , June 7 th; No. 6, June 8 Nos. 5 and 7, June 9th. During the whole sessen could find no difference between Carter's First Cm and Sutton's Ringleader. Both the stocks had a lei stragglers in them, and they are evidently the sam Pea. Dickson's First and Best Early was very qood
and true, and in my opinion is the best New Early Pes sent out this season. Sutton's Long-podded T Thumb I found to be a dwarfer grower than the 0.13 orm, but I could detect \(n n\) difference in the cropp
quality. Eley's Essex Rival did not coms cropping variety, and of good flavour. I would als add that the Peas were standing side by side, and m treated similarly, and I do not think that the trids could have been fairer. My sample ground is sita about 15 minntes' walk from this Nursery, and is it matters. J. Veitch, Royal Exotic Nursery, Chelsea.
trawberry Crops.-Having seen so many failuresi this crop this season, both on light and heary hand beg to give some account of a plan which I have found
to succeed in the most trying seasons of drought. I get my ground ready about October, and I prepare almost as if for Celery. I canse a trencl to be throm out one spade wide and a good spade deep. I then har the trench filled up with good dung porated with the soil. The diraing is inted to be nearly two spades deep; therefore when the trench is inished it has a ridge-like appearance. This complete Ihe preparation for one row, and if If wanted ay bim I should do them in the same way if I could, bies bool I arranging that the next row sod about 19 kim stand \(2 \frac{1}{2}\) feet from the first. ach was 15 yards long, planted more than one row of a kind, as they yielded io bountifully. Having finished or prepared the ing a line along the top of the ridge, and allowing space of about 15 inches between the plants in them Having planted the whole out and watered took little notice of the plants till the Mar forlowing, when I began to keep apil aither to or injure the new plantation. Well, having arrived ai March in the second year, I began to think of fruits of my labours. A bout this time Ihad the compartment well saturated with lime waber kill everything in the way of slugs, grabs, or ces, hat soon as the ground had become deep, and with the
mulching of good farm-yard manure. In May sunped con began to show themselves in great ahundanct, a man was deputed to pay a visit to the bed threx a week to remove the:n, and this continued acem the feet, with rain washing the straws quit the fruit began to ripell, we were use nets to save our crop, so we
to the runners, and wert obliged Thorough feeding, thorough busbanding up the strength are the chief features of my p And here I am led to male an ongration on sorts Strawberries. I never knew Keens' Seedling to ing bil have tried the Queen and could get nolite
amy and found her all I could desire. Heaps of of Admiral Dundas and some others; but 'heaps upon beape' might be written opposite Filbert Pine. There rellow Alpine which I have found very useful, for have bad to get the snow and ice away to get at the
fruit. I think it might be of use to many. \(R\). \(T\). fruit. Gloster.
Gloster. Crop of Potatos.-Mr. Berry, gardener at
Heary Cron Lanhydrock, Cornwall, the seat, which have projuced the great weight of 355 lbs . to the square yard, being pearly a bushel and a balf. Un tive same ground last sear grem Lapstones, which produced a bustel to the equare yard. Neither the one nor the other of these crops was hacked or the free from weeds, and this is the practice which Mr. Berry at all times adopts. After the Lapstones, crops of Brussels Spronts and German Market Street, Bodmis.

\section*{Foreign Correspondence.}

Pontchartrain : July 25, 1865.-Grapes.-In one of our late houses we have a young vine of Black Nonukka, the burches of which are not yet ripe. I cannot, therefore, speak with respect to favour, but perfectly stoneless. I received it from England along with Alibee. The latter is a magnificent-looking white rariety, with berries as large as those of a Hamburgh,
and I should say, judging from their crisp Chasselas-like nppearance, that they would be well flavoured. The bunches will probably weigh on an average \(2 \frac{1}{2} \frac{1}{2}\). each favcurite were it given a fair trial. Those of your readers who may wish to see these Grapes will have an opportunity of doing so at the International Horticn'tural Exlibition to be held in Edinburgh in worth growing, viz., Chasselas rose, Chasselas Duhamel, Clbaselas Napoleon, and Malaga rose ; their colour, as I have proved them here under iron liouses, is most benatiful. Henry Knight, chef jardinier, Château de Pontchartrain, Seine et Oise.

\section*{Sacieticg.}

Rotar Horitcoltural: July 22 (Oreat show of Fruit and Vegetables).-This was a highly interesting display, a table running the whole length of the Conservatory being well filled with fine fruit, while in the ment of vegetables and such cut flowers and plants as happened to be exhibited. Among the latter was a Collection of Japan Lilies from Messrs. Cutbush; cut Roses from Messrs. Paul \& Sorr and others, and HollyCocks from Messrs. Downie Laird \& Laing.
Collections of Fruits.-Only one was contributed on this occasion, and that came from Mr. Carr, gr. to
P. L. Hinds, Esq. It consisted of a Queen Pine-apple ; Sweetwater Grapes, Tegg's Scarlet-fleshed Melon, and Papaw. Pine-apple
Pine-apples. - Among these wore some beautiful
fruit, especially a finely-formed Enville from Mr. Thomson, of Daikeith; excellently ripened Queens
from Mr. Grant, Mr. Youg, gr. to C. Bailey, Esq., M.P.; and a
Propidence, weighing to J. B. Glegg, Esq. The latter was, however, somewhat friit, ove or. Mr. Standish also furnished some good Of Smooth-leaved of which appeared to be new kinds. specimen from Mr. Thyenne we likewise noticed a good duarle.-Three kinds. -

Grapes.-O
Theele Hall, Staffore Mr. Hill, gr. to R. Sneyd, Esq., lection, in wheh were excellent examples of Black black kitd with Black Prince; Horsforth Seedling, a selated to Black Mol-shaped berries, apparently nearly
Alicante. Tater; Royal Museades Seedling; Buckland Sweetlifer, fromal a Tine eadine; and Ingram's Hardy ProOther Grapes we noticed beautiful buck Prince. Among
Buecleucl With a rich a fine new white or rather green variety With a rich Muscat flavour, from Mr. Thomson, of
Dalkeith; Golden Others; , various specimens of Muscat, three bunches of Weighed together 9 Mr . Tyler, gr. to G . Sandere, Esq.,
bunchea of Hill ; finely which wisighed 7 libs. 12 oz., from Mr. tom Mr. Sage, gr. to Exarl Brow of Black Hamburgh
Ben. Dixon, Esq. Mr. Wallis, gro M. Henderson, Mr. to Sir George Beaumont, Barto ; Mr. Mr. Henderson, gr. to Sir George
and Mr. Cruickohank, gro to Lord Chesterfield;
Grapes con w. Wh. Lloyd, Esq. Other Oiborne, Finchley; Mill Hill Hamburgh, from Mr. Black Prontignantham Black, from Mr. Wallis, and had finely frignan, from Mr. Squibbso Mr. Standish
wards, -Collection: Vines in pots.

Peaches.-These were not numerous, but among them were some beautiful dishes of Grosse Miguonne, seedling came from Mr. Ingram. Or Nectarines butfew dishes were shown, and of these the best were Elruge dinhes were shown,
and Violette Hâtive.

Figs.-An excellent dish of Brown Tarkey came from Mr. Whiting, of The Deepdene, to whou a lst prize was awarded. Mr. Rogerson had the same variety, and White Marsellies came from Mr. Cross, gr. to the Dowager Lady Ashburton.
Cherries.-These consisted of very good dishes of Morello, from Mr. Marcham, Mr. Squibbs, and others; lack Jartaran, very whe, Mr. Whiting Mr. Tillery ; Elton, and May Duke Mr. Tillery; Elton, and May Duke.

quibus.
Plums.-Only a few dishes of these were shown, Mr. Squibbs was 1st, with Black Morocco; Mr. Beasley. gr. to T. Wood, Esq., Acton, 2d; Mr. Whiting 3d.
Strawberries. - At this late periol of the season these could not be expected in quantity. The only exhibitor for four dishes was Mr. Tillery, who had in 1st prize for Empress Eugenie, Welbeck Seedling, Rifleman, and Frognore Pine. Mr: Earley, gr. to F Pryor, Esq., Digswell, had a 2 d prize for Elton; and a 3d was awarded to Mr. Phipps.
Anong other suljects were some good Gooseberrics from Mr. Carr and Mr. Young, gro to R. Barclay, Esq. Among Miscellaneous Fruit were Currants, Red, White, and Black, from Mr. Carr; Mr. Ford, gr. to Abbey. Raspberries were and Mr. Beasley, Twyford Abbey. Raspberries were chiefly confined to the
Fastolf, the best of which came from Mr. Moffat, gr. to Viscount Maynard. Of Green-lleshed Melons the best came from Mr. Whiting, The Deepdene, near Dorking, and Mr. Squibbs, gr. to Mr. Turner, was 2d with Hybrid Perfection, prettily netted. In Scarletfleshed the old Windsor prize came from Mr. Weir, gro to Mrs. Hodgson. Mr. Fraser, Lea Bridge Road, sent orchard-house trees in pots; Mr. Carr, P'eaches; and Mr. Rogerson, Figs. Mr. Carr furnished large and beautiful fruit of the Mango Papaw, which was green in colour, changing to yellow; some good Apricots came from Mr. Whiting and others; Apples from Mr. Young.

Tegetables.-Liberal prizes having been offered both for collections of these and for single dishes, the result was a large assemblage of creditable examples of most of the products of the kitchen garden now in season, and some that were out of season. in season, and some that were out of season.
Class 1 consisted of "Collections of vegetables, not less than 8 kinds, "Collections of vegetables, "Collections of not less than 6 kinds, distinct genera." Tbe consequence of this rather loose phraseology was that most of the exbibitors in both classes showed an was value of the prizes, and those who had the greatest number stood the best chance. We would therefore suggest that if the Society should repeat this exhibition another year, it would be much better to restrict the number of vegetables in each ciass to a definite number of sorts (say 8 and 12), leaving the choice to exhibitors. As most of the vegetables conprising these collections were better represented in their respective classes, it will be more convenient to notice them as they stand in the schedule.

Peas.-Ticse were not well represented. Only two collections of four sorts were exhibited, and these were merely tolerable; nor did the single dishes contain anything better than common. A variety called Abergavenny Marrow, from Mr. Earley, was however all that could be desired as far as colour, flavour, and size were concerned.
Potatos.-These were largely contributed, and many of them were unusually fine tor this season of the year. Among Kidneys, the most noticeable were Edgcott Second Early, a very perfect Potato, which obtained the 1st prize for a single dish; Mona's Pride, particu larly nice-looking; Eugénie, a handsome and gool white and red variety; and a very tine sort, originally procured from Sussex, withont a name, and therefore provisionally called Sussex Kidney. To these must be added Rivers's Royal Ast-leaver, an excellent sort for garden culture. Of Round Potatos, the best-looking were Transell's Seedling (1st prize for a single dish), large, handsome, and smooth, with scarcely a per-
ceptible eye; Napoleon, a handsome red, otten blotehed ceptible eye; Napoleon, a handsome red, otten blotche an important point in a table Potato. Another very perfect Potato in shape formed oue of the four sorts to which the 1st prize was awarded, but of this no one seemed to know the na■e. When sorts like these, an seemed to know the nall. When sorts lize these, an
hollow-eyed, coarse, and inferior-llavoured varieties as the Early shaw ought not to be tulerated at a horticultural exhibition; and yet it appeared in collections, and receivel the 21 prize for a single dish.
Asparagus. - Prizes for this in the end of July are certanly undesirable, it being a recognised rule that when Peas come in Asparagus goes out. Now and then a bandful of young shoots may be required in the bitchen for a particular purpose, but it is not necessary for a dist, except in very exceptional cases.
Carrots. -These were largely exhitited, and many of them excellent for the time of year. With the exception of a symmetrical bunch of James's Intermediate, the Judges properly proferred the Short IIorn, which is the best variety for summer use.
Turnips.-Many of these looked old and sticky. There were one or two dishes of clean-grown young bulbe, which, however, it must be supposed would not bear critical examination, as the prizes were not given to them.
Mushrooms.-In such weather us the present it is difficult to get good Mushrooms from artificial beds, consequently they were not well represented.

Canliffovers.-The same may be said of these, of which only three collections were slown. The Judges rightly gave their decision in favour of small compact heads, not yet at their best, in preference to much larger specimens which had passed that stage.

Cubbages. - These were extensive.y represented, and for midsummer many of them were uncommonly good; while others would hive hee 1 more in place in the farm-yard. A great solid? Cibbage is a capital thiner for catile to feed on, but it should certainly never be adinitted to a gentleman's table.
Beans. - These were not so good as we have seen them at many cothagers' exhibitions. lirench Beans, on the other hind, were excellent, and the julges must have had a difficult task to pick out the best.
Rhubarb.-This might have been very well omitted from the sclieciule, its proper seasun being past.
Beet. - Some of this was exceilent in quality, although of course not fully grown ; some, again, looked nearly related to Mangel Wurzel in colour and texture. Onc of the best is known as "Croucher's Beet" in the vicinity of Dorking, where no other variety is cultivated. Of Pine-apple we also observed good examples. sisted of the different varieties contributed, and con-silver-skinned, sown in autumn, besides the asual spring-sown sorts. Some of the Tripolis were very rine, but these were altogether ignored, although valuable in the kitchen at this season on account of their great buik and comparative mildness. The objection urged against them that they will not keep is not a valid one, inasmuch as they are not wanted for keeping, but for present use
Lettuces. - Soine admirable specimens of White Paris Cos and of Neapolitan Cabbage were exhibited. These are perhaps the very best summer Lettuces grown, but another Cos, called Phipps's Nonsuch, appeared to be a good one.
Endive.-This was undeserving of prizes. In fact, Endive, like Asparagus, is altogether out of place now, Shallots.- These were plentitul, and Mr. Earley's, which took the lst prize, were capitally grown. Most of those exhibited were of the large Freuch variety which attaius a greater size than the old light-coloured

Horse-radish. - Only two lots of this competed, one

\section*{which was good.}

Radishes. - These were represented by only two bunches of the white and the red 'Turnip-rooted, and they looked as crisp and tender as spring-grown unes.
Celery.-Of this there were several exhibitious, one or two of them good for Midsummer.
In the Miscellaneous Class were some very young Vegetable Marrows and edible Gourds, some rather old Artichokes, and a collection of Pot-herbs, to which a 3rd prize was liberally awarded.
The names of those who took prizes in the classes ju't named will be found in our advertising columus (see p. 696).
July 25 (Fortnightly Meeting).-The Rev. M. J. Berkeley gave some account of a hybrid Fern found on
limestone rocks at Schuylkill, within 8 miles of Philadelphia, by Mr. Robinson Scott, of Port Kennedy, Montgomery County. He stated that it was found in company with Camptosorus rhizophyllus and Asplenium ebeneum, which were supposed to be its parents. He explained the way in which fertilisation in Ferns might be effected, a full account of which will be given in a forthcoming number of the Society's new Journal. The golden, silver, and grey-powdered Gymnogrammas that often appear unter sumilar circumstances in the same house, were believed, he said, to be hybrids; lut no one had ever proved hen to be so. Mr. Scott's Fern he, however, had nn doubt was a true hybrid. Beautiful drawings, not only of it, but also of the species from which it was supposed to be descended, made by Mr. Fitch, were shown to the mecting. He considered that growers of Feras would do well to turn their attention to the production of hybrids in a commercial point of in which a painted Pteris had been raised and offered to a London nurseryman for sale. The latter thought the price asked extravagant. Nevertheless, 1500 plants

\footnotetext{
Mr. Hill ; 2 , withheld; 3 , \(\mathbf{M r}\).
}

Specimens of Bean and Pea mildew supplied from suburbau garilen were next adverted to. It was sail that mildews in Wheat and other plants were musually prevalent this year, and that if the autumn proved wet
they might hon very disastrous. Two monstrous forms of Plantago majur were alvo shown to the meeting.
July 25 (Floral Cominittee).-Mr. Rivers furniched a tall specimen of what was said to be the climbing a tall specimen of what was said to be the chomiensis. The vigorous habit of growth in question he stated to be the result of double
budding-first, the Manetti stock with a free-growing budding-first, the Manetti stock with a free-growing
Hybrid Perpetual, and then the latter with Rosa devoniensis, Buts taken from the latter and created in the ordinary way it was said reverted to the old well-known firm of that fine English Rose. From Mr. Bull came Allamanda Hendersoni, of which we have gr. to the lit. Hon. Louis: Lady Ashburton, contributed a forked varicty of Poiypodium vulgare, of which whole woodfuls may sometimes be found together, while in an adjacent planitation not a plant presenting the character in question might be discovered. Mr. Cox, gr.ato Lord Beauchanp, furnished a beantiful white Lobelia, called Snowflake, to whel a First-class Certificate was awarded. Pavia macrostaciny ; different varieties of
Salpighssis ; Trituna aurea, a bright orange-fowered Salpighossis; Trituma aurea, a bright orange-fiowered
hardy Caflrarian bubous plant; one or twe Orchinls and examples of Double White Datura fastuosu, were contributed from the suciety's garden.
Fuchsias came from Messrs. E. G. Henderson, among which the best were Father Ignatius and Enoch Arden, both iark varieties, with finely reflexed sepals and widely expanded corollas. To these First-class Certificates were awardef. Fuchsia pumila or Toin Thumb, which came from the same firm, and which appeared to be a variety of gracilis, looked as if it might be found useful in thie formation of elgings. A double-blossomed Fuchsia, with white corolla, nained Grace, was shown by Mr. George Smith, of Hornsey, and Queen of Whites and otherg in the same way were also exhibited
Other Fuchias came from Messrs. F. \& A. Smith, of Other Fuchsins dame frum Messrs. F. \& A. Smith, of
Dulwich, together with golden-leaved zonale Pelargoniums, one or two herbaceons Phloxes, a beantiful
sly.blue variety of liee Larkspur called Madame \(H\). sly. blue variety of liee Larkspur colled Madame H
Jacotot, and various tiue Balsans, for beautiful varieties of which the firm in question is justly celebrated.
A slemter-growing Dendrobium was shown by Mr Wilcox, gr. to Dr. Pattison, St. John's Wood, and the same sort also came from Mr. Veitch. It had small narrow twisted sepals and petals-white becoming yellow at the tips, and a tiny violet-purple stained lip,
From Mr. Bull came a charmingly variegated-leaved From Mr. Bull came a charmingly variegated-leaved plant to which a First-class Certificate was awarded Two virieties of Japanese Lulies were shown by Mr. Townsend, and from Mr. Shlter came a handsome July 25 (Frait Committee).-Dr. Hogs suid July 20 (Fruit Cominittee).-Dr. Hogg said that
before procecding to consider the subjects brought
before the Committee on this nceasion, he would call before the Committee on this nccasion, he would call Chiswick. Dillistone's Early Prolitic, ('arter's First were procured from the various raisers. They were all sown in the same piece of groud and on the same day; they all cane up on the same day; they all Howered on the same diy; tiry all podiled on the same day; they all were fit for table on the same day, and the
result was that they were consilered to be identical.
result was that they were considered to be identical.
The variety among them first offered to the pabli was Dillistorne's, which came out four or five years ago. This, however, was considered to he nothing but a pure stock of old Fiarly Kent, a variety very difficult to obtain and keep true. Of other Peas
tried, Laxton's Seedling was very similar to the tried, Luxton's Seedling was very similar to the
Auvergne and Dickson's Favourite, whilst Carpenter's Express proved to be Nanaster's No. 1. Princess Royal was thonght to be an improvement on the old Dwarf
Marrow. Blue Excclsior struck the Committee as Marrow. Blue Excelsior struck the Committee as were found to be synonymous with Veitch's Perfection. Among the subjects subuitted to the Committee was a eollection of White Grapes from Mr. Rivers, all forms of what the Freuch call "Museats" aud the English "Frontignans;" they inve round berries, whilst in what The Fr-ntignans possess a Minseat tlavour, a quality which is highly develapert in Chasselas Musqué; the great allvantace of this Chasselas is its being earlier than trare Mawats, and ripening in a conler tempera-
ture ; it has, hewever, the bad quality of crackin? \({ }^{\text {r }}\), but within the i.st few years a new race has been introdruced which do not ithicrit this drawback, and of such
Mr. Tivens's Craapes consist. Of Early Golden FronMr. Rivenss (riapes consist, Ot Early Golden Fron-
tignan, Mureat Salomon of the Firench, the great recommemation is that it is three weeks earlier than the Hlack Hamburgh, and proluess bunches from 12 to 18 inches long. The colour is godien, on in fact
deep amber. Early Smyrua, Muscat, de Smyrna of the French, is aunther form of White Iromtignan, not so early se the preceding but hardier, and will
probably succeed out of doors-at all events it will probably well in an ordinary greculiouse. Farly Silver
Frontignan has is eight or ten days liter thau, a vary Godleu FronBlack Hamburgh. Museat à gros grains from Bordeaux

Black Hamburgh, and a month earler. These had ail been ripened on Vines in pots set on hot-water pipes, as described in our last year's volume (p. 799). A Rasp-
berry from Mr. Graham, of Cranford, was remarkaule berry from Mr. Graham, of Cranford, was remarkable
for its large size, but as it had not as yet been subjected to carefui cultivation the Committee wished to see it again before deciding on its merits. There was also a Black Currant from Mr. Ford, which was stated to wang a month later than any other kind, hut the Derris Cutbush, of Highgate, the merit of which consisted in its coming into bearing after all other red laspberries were over, but as regards flavour it was not fit
for table, and seeing that autumn-bearing varieties of better flavour than it already existed, no award was made to it. Some Cherries were exhibited by Mr. 'Rivers. Of these a large Purple Guigne came in after all the Bigarreaus were over; ami the Love Apple Cherry, belonring to the Late Duke class, was
very large, being an inch across, had a colourless juice, very large, being an inch across, had a colourless juice, seedling Peach called Frogmore Golden, but it was not so large as Crawford Early, and not so delicious. It was therefore doubtful whether the variety in question was required. Some Apricot trees in pots, which Mr. Rivers had sent, were next advertel to,
first to show that fruit trees in pots bearing ripe frst to show that fruit trees in pots bearing ripe be transmitted to a distance, and secondly to prove that Apricots can be grown in pots. The whole secret of their culture in that way was very simple: it consisted in giving them plenty of ventilation whilst in bloom-even \(3^{\circ}\) or \(4^{\circ}\) of frost would not injure them then. The rationale of this was that when the orchard-house is kept close whilst the trees are in bloom there is such an amount of moisture in the air that fertilisation cannot take place. Mr. Rivers stated that comminuted chalk exisied in his soil, but in what proportion he did not know, as he had not sent the soil to be analysed; but 1-10th or -12th would not be too much. He, therefore, advised growers to use powdered chalk in the composts they
employed for Apricots. Early Albert I'each, a kind which ripens just before the Early York, and specimen of Early Prolific Plum, were also furnished by Mr. Rivers Messrs. Lee contributed Morocco Plum; aud Mr. Veitel a bunch of his new Grape, raised from Champion Han burgh crossed with Canon Hall. It is, in fact, a Mill Hill Hamburgh with a Muscat flavour; it cannot, therefore, fail to be a universal favourite.
The following candidates were elected Fellows; viz. Captain Inglefield, Lord Beauchamp, and Mr. R M'Ilwraith.

\section*{Potices of \(1300 \mathrm{k} \%\).}

Sur la Production et la Fixation des Variétés dans les Plantes d'Ornement. P'ar B. Verlot, Chef de Culture au Jn
1865.
We have already on two occasions alluded to this excellent work, or made it the subject of observation. There is, however, still much interesting matter on advert, omitting all that went before of the method of fixing varietien.
Our author under 16 heals notices the variations to which plants are subject, and which it will be useful to
reproduce here, though all are not of equal importance. These are as follows:-
1. Diminution of size, or dwarfing. 2. Augmentation of size, or gigantism. 3. Increase of robustness or hardiness. 4. Great size of flowers. 5. Early varieties. 6. Late varieties. 7. Sweet-scented forms. 8. Variety of colouring, complete or partial, in the stems, leaves Howers (whether striped or dotted), fruit and seeds . Albinism, whether inclining to variegation or chlo rosis. 10. Donble flowers. 11. Proliferous forms 12. Varieties arising from adhesion or confluence 3. Partially abortive varieties. 14. Pelurioid flowers 15. Chloranthoid, or foliaceous flowers. 16. Polynorphism in the stem, whether unarmed, spiny fastigiate, filiform, pendulous, \&cc.; or in the leaves, as crisped, fasciate, bullate or blinated, laciniate, \&ce
1. Dwarfing is something totally distinct from mere diminution of size from want of proper nourishment o from untoward conditions of climate, for the seeds of plants which have suffered from such causes, produce vigorous seedlings in good and rich soil with a favour able climate. The secis of real dwarfs on the contrary produce dwarfs ; at least, many of them do so, and by careful selection a dwarf form may be fixed for a time hough many return, notwithstanding all the pains that can be taken, to their original type. They can be propagated with centainty by cuttugs alone or gratting. A duarf Saponaria calabrica refusen all attempts at fixing, while 'Tagetes patula and signata have produce delerably permanent dwarf forms. M. Verlot suggests annual species is by autumn sowing and freeruent ransplanting. We are ourselves inclined however to think such matters are constitutional and depend on we have hat constant pinching off of the leading shoots may have a tendency to produce seed which will give rise to
Mr. M'Nab has stated that he obtained dwarf
by experiment.
by experiment. As in the furmer case stint of suste gigartic forme As in the former case stint of sustenance will ! dwarfs, richness of food may produce giauta, tat in one country, lose the habit in arother. For examol the Hemp of liednont, which is truly examplie in some of the eastern departments entirely loneo ith 3. a robust
3. A robust or hardy habit again may depend a may yield a hardy offspring by crossing, as in the with Rhododendron arboreum crossed with R. biense.
4. The size of flowers depends greatly on soil and cultivation. There may be varieties which essentisi differ in this respect, but the full beauty of the flomets ment. Our Pansies and Poses, and especially the ormer, are familiar examples. And, in such cise will not produce finer offspring than those flowers, the taken from others whicir are emaller andllater. dization will certainly in some cases yieid ratietim remarkable for their noble flowers, but except by direm division we cannot expect such varieties to be prot manent
5, 6. Comparative earliness and lateness are of tie greatest importance in gardening, and we can ara: ourselves of individuals which show a tendency to the late varieties Besides which repeated selection eary sutd with plants from a more southern latitule, wim they blow early, or the contray, to mako consequence to obtain earlier varieties of the Indias Chrysanthemum, and accordingly the early kind have not proved equal to those of later kinds, has repeated experiments will rrobably soon this defect. It is suggested that ds the veretation ? grain becomes slower with increased age, therefine varieties with different habits may be obtainel by sowing seed year after year till it loses the power ad
vegetation. It does not appear, however, that in seas of the same year there is any difference in this respat: between the first and the last.
7. As regards peculiar odour, it is remarked : locality makes a great difference. The smell of Ords: hircina is intolerable near Paris, but in the sonth? resembles that of Vanilla. Crossing is an emman
cause in this direction. Rhododendron ciliatum, riben crossed with the sweet-scented P. Edgworthii, produad a highly scented variety.
8. Varieties in colouring as enumeraicd abore are same One of the mats curious examples of change in this respect, as also in regard of size, and the difficultro permanently fixing the distinguishing characters,
presented by Dianthus Heddewigii. The flowers mere at first of surprising dimeusions, but soon they suored a tendeucy to become double, with consider.abent time, notwithstanding every attempt at indation, will they still present immense differences as reands colouring, thicir size frequently does not s
good varieties of Sweet William.
9. Variegation and Chlorosis, though both direasis, appear to be very different. Varipgated plants a man exhibit robust health, while chlorotic plants are anmal in a more or less failing condition. Both mand propagated by seed. Chlorosis may remedied by the application
sulplate of iron, but we know of nothing nlich almer variegation except perhaps strong and forcing manures In some cases variegation is persistent, but green stime often spring from variegated branches, the variegation, except preserved by cuttings, cense altogether. Albinism may proceed extent that the branches cannot be indaceed tosce The variegated Ground Ivy is said to form from soil, to this rule. When variegation arises stratum penetration of the roots into a deeper hal sometimes cause a reversion to the normarl
10. Double varieties are often the pride of Chese These arise from various kinds of tran
cheir preservation from seed is oiten every one knows who has cultivated Stoc and in some cases, as in the Dablia, the plan do not yield the best flowers, and ther

The Ligurian bee is, we thuk, not smailer than our that the Ligurian queens retain their reon to beliere longer higurian queeus retain their fecuntity at all longer than those of the ordinary species. We believe the quecns to be usually more prolific, but whether the bees are really more industrious, or better storers tainly y, remains an open question. They are cer With more given to swarming than the common sort. natural weapon on intruders, there is great difference of opinion ; we do not think the truth of the ausertion Ligurians desperataly vicious We have had hives of Ligurians desperately vicious, while others would allow almost any amount of meddling and interte whe however wo ang inclin of resentment. Un less vicious than the common brown bee of Europe.
We see little reason for supposing the Liguriar: variety to be better storers of honey. Our own Ligurians have either by accident or otherwise beaten our hives of common bees, but the finest and heaviest supers we have ever seen or heard of were given by
bees of the ordinary species. What li have accomplished under the same circumstances it is impossible to say. To sum up in a few words, we are decidediy favourable to the Ligurinas, hut we do not see any just reason for crgiug thom up as boing English variety. English variety.

\section*{Garden Memoranda.}

Jonm Dat's, Esc., Totrentar.-The cultivation of Orchids seems to be more a hobby of commercina gentlemen than of our graat lanted pruprietors: for although one occasinmally stumbles upon mice and
select collections over the length and meadth of the country, in the gardens of the aristocracy, they aro small, very small in comparison to such collections as Day's, Rucker's, Warner's, Turner's, Dawson's, and some more that could be named. Nice little fortuves, however, have been suuk in geting all these varieties together, and it says mueh, very much for these gentlemen who have had the courage and magnanimity to disburse large sums for That everybody knows to be perishable property. Horticulture is very muoh indebted to such spirited efforts, which but for the means of such wealthy and munificent patrons would be vastly wore circhaseribed and leas fl ourishing.
Every one at all ac mainted with, or interested in, gardening matters has either heard or read of, if they have not soen, Mr. May's phanto, and every (Irchido-
philist ought to see them. it may be considered a Work of supererogation for me to attempt to paint in words the merits of this colleotion, as the ground has been trodden, and the plants portrayed on more than one occasion by able contributors; but I cannot refrain from adding my mite. upon the pleat that "a mod story is nowe the worse for having been twice told." Imagine my surprise to tin! one of the most superb collections of Urchid-in England, or in the word, lupated on a spot of gromm in much later than a lowling
green, with very little prospect, as far as I culd green, with very little prospect, at far as I chuld
gather, of enlargunent in that smmediatelocility. That Mr. Day-whose namo has been connetel with the advent of by far the greater number of nes Cr, huls
 r.ptom wish from time to time appear from the pen of Professo Reichenbach-should bo so limited fir space, and yet foreign to the notions of the gardening fraternity in general. There it is, however, crowded in houkes placed span to span so close together as to suggest the lea of a stifling ateno chitem, propurtiona: ly subdued light, and a host of concomitant evils.
Time was, when this Orchideous collection was in its infancy, which I can well remember, Mr. I) Iy grew Ferns to some extent, and what was done in this way
those who have sren them can testify was done well. those who have sren them can testify was done woull. fronds of the several specimen (fieichenias which are now lost to that e clliection, having been transferred fur Orchids, simply for want of space and the growing necessity of more vaiuable stock. I caunot heln thinkiug, however, that Urchids and Ferns and such-like hadsome plants ought to go together to some extent or the sake of relieving the mass of colour which a "show room" of Orchids in flower presents. On that account the loss of ruch plants for such a purpose is great, for the idea is guol wherever properly earried
out; but under the ciocumstances, we presume, Mr Day could not help himself, and turnel his attention eatirely to this great division of plants-Orchidncere. Every"nook and eamer" of from sis to cight houses of different sizes is fille 3 , and well filleil, with representatives of ail the best plants found in both
temperate and tropical zones. The very roofs are temperate and tropical zones. The very roofs are
almost oppressively weighed down, especially over the passages, with baskets " inummerab. " surpended along als irun rod. Here there are " north-aspuct "honses for to suit the families most advantagenusly. Like every other one who is profiting by experience as time rolls on, besides the uorth ast es homse refurred to, which is comparatively nerr, there is another erection recently completed for the gruwth of the Wast In san genera which seems to be the most suitable honss in that block for plant culture. It is sufficiently hight) admit of plants being smpented ruman iron bar aurois the astrarals without interfering with coufortable inspection or robbing the others on the sta ges of too much light. Ono great and undoubted benefit is the mode in practice for twansmitting heat rerniarly without causing so great fuctuation ag under ordinary modes of heating. iBesides the pipos under the side tables, which go regalarly round the homse, there is a sheet irou trough nearly the width of the centre stage, which is joinel th en homine appaatus, got up certainiy at an :3n. rgig low fisure in proportion to the b nefits that ninst acerue through ita agency.
This, as can be realily understond, will requiro much This, as can be realily understond, will requiro much
lover time to heat thatn a batch of 4 -inch pipes, but lovyer tims to heat than a batch of 4 -imel piper, but
aiter it is heated is will take a very loag time to cool precisely a desil s"sum in the calendnr of ererations for winter; and Mr. Day and his gardener, Mr. Stone,
are poth enthanatic as to its meeting their most stuguine expectations

Tow for the phants. Siccolabiuns and Acricles are not only grown list if thanen here but by the haudred
 1) yanum, which is a large-thowered varicts of Dhmei,
is largely grown, an! when in bloou preants a scene is largely grown, an! when in bloom preants a scene
of enchanting heriness, the wreaths of flown hangug gracefully down, and not two of the plints beins exactly
alike as to colour spotting or size of blooma. The same remark applies to S . guttatum, which is a much
smaller and more beautifully spotted sort, especially the variety so much in request called Holfordianum. S. ampullaceum and curvifolium, two distinet sorts of the same race, are also here in quantity; one variety of the former was particularly striking from being quite as dark and lustrous in the claret hue as the best acquisition among the ampullaceum breed. More wondrous still was the immense quantity of Aerides Lobbii, and the Moulmein variety of virens so largely imported by Messrs. Low \& Co . It is a very difficule thing to procure an Aerides to beat a good Lobbii, and when you have several dozens to pick and choose from, as in this case, it is all but impossible. The reproductive tendency to variation is fully as marked in this high order of plants as in most others under cultivation, and is indisputably illustrated in the case before us. The Moulmein virens is a decided acquisition in its way, having larger and higher-coloured flowers than the original Java variety. But among the larger-flowered sorts give me a good Lindieyanum, which, as most people know, is a variety of crispum,
and ought to be called the Lindleyanum variety of crispum. Oh, how gorgeously beautiful were the branched spikes of this sort blooming on my last visit! I counted one with 58 flowers in fine condition. But Schröderii and Fieldingii were equally well grown, although more limited in number, and out, I presume, of an imported lot came a white Foxbrush ! I must summaxise my reminiscences, however, else I shall be open to the mild insinuation of being a chatterer, and probably be set down as a "bore."
I have seen Phalænopsids much better cultivated, or rather, I should say, in better condition, than the general ran of them at Tottenham; but who can prevent spot and its ravages, however systematical and well-intentioned the treatment may be? The varieties under cultivation are more numerous here than at any other establishment I have seen, including all the
more courmon and well-known sorts, with amethystina, more courmou and well-known sorts, with amethystina, one of the most lovely of the batch, not even excepting Luddemanniana; sepals and petals creamy white, with very prominent cinnamon coloured "barring," and - most peculiar labellum, purple striped and spotted. Plocoglottis Lowii is an acquisition, being a semi-terrestrial plant, with a conical-like pseudobulb,
and pale purple leaves, something after the colour of Coleus Verschaffeltii, the pale yellow flowers crimsontipped and spotted. A number of Dendrobium Pierardii upon blocks, recently imported, were suspended, forming nice pendent spikes 30 inches long, and abundantly bloomed.
Cattleyas, Lælias, and Oncidiums are very well managed, as are the various Cypripediums, by Mr.
Stone. Of Cattleyas there are a very large assort ment, including Mossire and its congeners Wagnerii, Lawrenceana, and a very distinct, white sort after the character of Wagnerii, but having much finer formed sepals, and petals of a better texture. Aclandiæ is varieties having all the brilliancy of Repnllij, with of course, the additional size of bloom. C. lobata is in ptrong force and capitally managed, having as many as 13 spikes of its distinct flowers, with from four to five on the spike. Lælia purpurata, elegans, grandis, and albida are pictures of good cultivation. A batch of imported elegans has added another novelty to that type. Instead of the sepals and petals being unicoloured, there is the usual ground colour in this variety, with a broad margin of rose, like the colouring of a ribbon. The novelty is charming, and will undoubtedly be permanent, as I have seen a portion of the same batch in another place maintaining that characteristic. All the most beautiful Dendrobes are here:-Wardianum, the chief of the group for an exquisite and positively enchanting arrangement of colouring, has bulbs three feet long; and then the chasteivory-coloured eburneum, than which not even a Phalænopsis is more pure in the white; albosanguineum, Dayanum, and the lovely Parishii, with a host of others-few catalogues have more-revelling in health. The once rare Oncidium crispum, which, while so, few could grow satisfactorily, is here in dozens, comprising one or two extra fine specimens both of culture and kind, hanging in long racemes, forming an agreeable contrast of colour from gorgeously rich and brilliant. A plant new to me, gorgeously rich and brilliant. A plant new to me, mental-flowered plant, each flower being in the form of a cross, white with a yellow blotec at the base. Cypripodium Lowii, Stonei, superbiens, villosum, and the handsome-leaved variety named after Mr. Day himself, re in good order. Here I saw for the first time in flower Huntleya cerina, being a good large flower made up of fine white sepals and petals, with a yellow-ground labellum, radiately striped, with black at the mouth. Trichopilias were also large plants, especially the interesting and sweet-scented suavis, as well as the more rare picta.
In the cool house there are, first and foremost, a fine of Barkerisa grandiflora, one or two very fine plants difficalt to manage; all tha Skinneri, plants rather purchased in the market, including a couple of good
plants of Pescatorei, an extra fine variety of nebulo sum, a good nævium, \&c., with a respectable assortmentof the
sorts recently sent home froin New Grenada, the chief among which is Blumei and gloriosum; Masdevallia refracta, a curious monopetalous flower, with the column erect in the centre, purple, rose, and white with three green pronga, each an inch long; Promenæa citrina, the mass a foot across, showing numerous Howers; Oncidium bifolium, much larger in bulb than ne is accustomed to see it; the rare Oncidium cucullatum, with peach and crimson spotted flowersvery pretty thing. Lycastes are also here in pretty rood order, and a variety of Sobralia macrantha, greatly superior to the well known Woolley's sort, having flowers at least a third larger and much higher coloured-quite a gem.
In conclusion, it must be said that it is impossible in the compass of a single article to do justice to the merits of such a collection as Mr. Day possesses. The cardinal points have been merely touched upon, and that lightly, for to the enthusiast and to the practica student there is quite as much food for study and for careful investigation in these rooms, if I may so call them, as there is for the antiquary in the best museum of antiquities in the country. \(A\).

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

THE unusually warm moist weather which we have lately experienced has effected wonders as far as gardening is concerned. Beddiug plants are nearly in perfection. Grass lawns are now beautifully green, fruit trees look more healthy, and as regards vegetables the benefit of the change is also apparent. Potatos have seldom been finer, and there is as yet little or no disease among them.
flower garden and plant housics.
Let shading be used less frequently now than when he weather was so very dry and bright; plants ripening their growth have need of not only all the daylight they can get, but even moderate sunshine.
Bedinga Plants.-A rough plan must now be made of the arrangements of flower beds, which should be umbered to suit an accompanying list of the names o he plants with which it is designed to fill them nex year, and the quantity required for each bed. By compiling a summary from this list, accurate informa-
tion is at once obtained of the quantity of plants which must be propagated by cuttings, and both by these and seeds in spring. By this simple means disappointment is prevented on the one hand, and waste of labour on the other.

Carnations and Picotees.-Layering must now be proceeded with as rapidly as possible, it being a point of great importance to get the plants well rooted and established before placing them in their winter quarters. More of next year's success, as to fine healthy growth, \&c., depends on attention to this matter than many people are aware of. All seedling plants should be marked and layered, noting their various properties as to form, colour, texture, pod, \&cc. ; should anv seed ling, otherwise fine, have serrated petals, it will be advisable to propagate it, as growing it in another situation may to a certain degree remedy this defect; even some of our best varieties will come occasionally (when poorly grown) very rough on the edge. As the blooms
calyces.

Orchins.-Kinds which have already made their growth and ripened it should be removed forthwith to a cool house. Great care should be taken not to excite such plants into a new growth at this time, as it is too late to get them properly matured, and the unseasonable draught upon the stored energies of the plants wil materially interfere with their next production of flowers.
Prnss.-Pipings in some cases will soon be ready for Poslanting. If the situations ultimately iatender for them are vacant, they may be planted in them a nce; bat if these places are occupied by something else, the young Pinks should be planted 4 inches apart on reserve beds in an open situation, the soil of which should consist principally of light loam, to which has been added some charcoal dust; a little dung mixed with road drift and soot should also be added.
Rosms.-Cuttings of China and some other kinds may now be taken and planted in a close frame in a north aspect for three weeks or a month, until they are cieatrised at the base; they sbould then be taken carefully up, potted in thumb pots, and plunged in a gentle bottom heat. So treated they will make nice plants in a very short time, and if kept under slight protection
during winter, will fill their pots with roots, and be ready for planting out in April or May.

\section*{Forcing garden.}

Cherries.-Let no exertion be spared that will contribute to keep the foliage healtiny and clean as long m possible.

Melors.-Late plants swelling fruit should be lept moist, but avoid frequent waterings of the soil by giving good soakings.
Pnres.-Maintain a high moist temperature, with
bundance of ventilation, to plants which are swelling
their fruit; and a ratber drier atmosphere around vione mentioned, use the syringe freely, in fine that has Take care that the bottom-heat dhes not quet wenther. for plants which have been recently potted or plantang STRAWBERRIES, - Layers may now be potted off; p'a them where they will receive partial shade uti ? get established. After that they may have full exproare to sunlight.
Vines.-When late crops have done stoning. tio borders, both inside and out, should have a govd solitin of liquid manure, to assist the swelling of the fro: Vines on which the Grapes are just beginning to ripes should be gradually inured to a freer admission of aim and if it be desired to keep those which are guita for any length of time, they should still bave tion advantage of a slight shading during scorching wettuer.

Hardy fruit and kitohen garderf
Pinch or lay irs shoots of wall trees, and gathes all inds of fruit as it becomes ripe.
Celery.-This may still be planted. The principal ecret in growing very tender and crisp Celery, im spective of size, is to grow it very quickly by means of
plenty of manure and moisture. Whether in romes plenty of manure and moisture. Whether in rowner
beds, the young plants will not succeed without pleaty of water.

Potatos.-Let early kinds be got up as soon ass the tops are ripe enough; and let particular pains be thte to pick out all the tubers, as those left in the grooud are very annoying in future years. Edgcott Second
Early appears to be an excellent Kidney, the akin Early appears to be an excellent Kidney, the alin of
which was very thin and delicate. Monass Pride is alo a good-looking sort.
Spinach.-Sow some for winter in good rich ground doeply trenched. Avoid in all cases thick sowing: ows should stand about 16 inches apart, to allow a passage between the rows for forkiug, clenning, and gathering the crop. At the first gatheriug every olber plant should be drawn out entirely, thas giving winter and spring supply.

\section*{The \(\operatorname{ag}\) Itultural Gatette.} SATURDAY, JULY 29, 1865.

We must express here the great regret which is generally felt in the agricultural world that such men as Mr. Paget, Mr. Caird, and Mr. Thonipson are not members of the new House of Commons. Notwithstanding the large number of wealthy landowners who have always found and will no doubt always find a place on the list of our representatives, there is a great deficiency-until very lately indeed a total absence - of any special representation of the interests of agricaltare in Parliament. It may perhaps be said on the one hand that landowners are as a body qualified to represent these interests; and on the other, with much greater truth, it may be alleged that the interests of agriculture as of every other special class or section of the whole body are most truly served by those who seek the general welfare of the country; a share in the general prosperity being better worth securing than any special advantage or monopoly can be.

But as to the first of these assertions, it is plain that landowning and tenant farming (the latter alone being agriculture) are two altogetherdifferent ocoupations and engagements, resulting in vary different tendencies, responsibilities, and prejudices, which require for their correction or encouragement as the case may be, altogether diverse treatment, and need the application of distinctly separate arguments or considerations-being urged respectively by very different motives. The interests of the tenant farmers of the country are in a certain sense no doubt the same as those of their landlords. In a much wider sense, moreover, are they the same as those of their eustomers, and of the country generally. In this latter sense, therefore, it is no donbt true that the farmer is as well represented by the general body of the Commons' House as oy the landowners occupying seats in it. And speaking for the general body of the tenantry, we would infinitely on their account prefer the votes of the former to those of the latter class on suoh a general question as the game laws, or on such a particular one as the introduction of locomotives on our common roads - to name only two of those which came before last Parliament. But there are many other questions connteted with which the interests of the tenant farmer
require the advocaey of men practically acquainted with the difficulties, risks, and other specialities of agriculture; and it is greatly to be regretted on this sooount that rone of the gentlemen we have named are members of the new House of Commons.
It is, however, matter fur oongratulation on the ther hand that we have Mr. Holland still a member: Sir Edward Kerbison, and Mro Dent too, are practical men. And Mr. M'Lagan, of Pumpherstone, the new member for Linlithgow county, is a thoroughly practical agriculturist, and one who, though cultivating only his own estato, has the entire confidence of the tenant farmers of Sootland.
But it is in Norfolk, the leading agrioultoral county of England, that the ohief grouud for self gratulation and satisfaction has boon achieved for the tenant farmers of the country. In Mr. Clabe Sewbll Read they have in every respeot an unexceptionable representative. We mike no inquiry whatever into his probable vates ous questions of mere party politios. It matters com-parativ-ly little whether he shall be a supporter of Lord Deriby or of Lord Palmersion ou a mere party division. The great point is, that by his return those who hold and rent the land have made a vigorous and successful protest against interference of any kind whatever with therr absolately independent right as voters; and that in his person we have a most satisfuctory representative of interests which hitherto have had scarcely any adrocacy at all of that mractical and special kind which they require. This they will now ubtain ; and we cannot duabt that it will be for the general interesty of the country as well as for the particular interests of those who ospupy and cultivate the land, that Mr. Read will sit for Norfolk.

Had lir. Hope, of the well-kno:n Eist \(L\), thian farm, near Drem, been elceted for his county, as he would have been if he had been eariier in the field, there would have been a doubly cause for satisfaction. Even his defeat, however, under the circumstances of it, is a proof almost as conclusive to Scottish county voters as is the victory of Mr. Read to those of England, that if men of technical experience, and representing the special class interests of agriculture, are desired, they can be returned. And that a leavening of such representatives is needed in the House is plain from the utterance of the outspoken member for East Lothian on the occasion of his contest with Mr. Hope :-Doubtless, had I been a tenant farmer I should have regarded the game laws and the law of hypotheo as you do. Being a landowner I look upon them from another point of view. - Let tenant-farmers learn from this the need of that true representation which they as voters can at any time command, and Which in' Mr. Read for one example, happily for them and for the ensuing Parliament, they have.
One remark more upon what is here an unusual subject. - Why is Mr. Hoskyns not in Parliament? He has been labouring for years as a writer upon agricultural subjects, and especially upon several of the most pregnant and important of tham-as land tenure, agricultural statistics, agricultural education, steam oultivation, \&c. On all of these he is a leading authority, and on many of them legislation is required. He belongs too to the class from whom county constituencies generally choose their representatives, and of that class he is in every respect a most useful and worthy member. He has, in the Society of Arts and in the Rayal Agricultural Society of Eayland, long been a most efficient representative of the best interests of agrioulture. And in the columns and the pages of all the agricultural journals of the day his voice and pen have for many years been urgent. Why is he not placed where his undoubted abiticies would be more direotly and efficiently at work than even hitherto they have ever been? His name certainly must be added to the list of those whose absence from the new House of Commons is a serious agricultural loss.
The Horse Show at Plymouth was the one failure of the meeting. In spite of the liberal prizes offered by the Council of the Roval Agricultural Society, the owners of horses refused to exhidit them. Even! the local prizes, whioh in some distriots oxcito a compatition so full of interest, as, for example, at Chester (where three first prize Royal winners of different years were brought into competition for a lucal prize) failed in the present instance to attract attention. Sarely there must be something wrong in this,
for whioh the Council, or rather the gentlemen who undertake the horse department for the all are the real mainstay of the Society, furnishing, as they do, the sinews of war, have a right to ask to what end has the grand prize of 100l. been given on this occasion. The object of this prize is not the direct improvement of hunting stock-that is provided for by other prizes in another clans-but for the improvement of the breed of race horses; it is offered for "the thorough-hred stallion best calculated to imthe sound thorough-bred horse for general stud purposes." So that to the question of brecders-how shall we succeed in producing stouter and better stud horses than Stookwell, Blair Athol, or Gladiateur? the reply of the Council is-" Send your mares to 'Motley.' Ho is not distinguished as a winner, or a sire of winners, but he succesded in gaining at the late Islington Horse Show an extra or icurth prize of \(10 l\), as a part of \(50 \%\). which the judges had the power of awarding to horses possesting merit, and he has arain succeeded without any competition in gaining our 100l. prize for improving the breed of stout race horses."

Thus the grand problem has been solved at last, and we may hope by means of this horse in a few years to render the attempts of our French competitors futile, and not only to hold our own on the Downs of Epsom, but to win another Waterloo in the Bois de Buulogne.
Joking apart, however, it is certainly very extraordinary that ouly one horse, and that of moderate pretensious, should compete for the largest pize given at the meeting. It shows at any rate that brediers for the turf are by no tions towards them, but fanoy they can get on almost as well without them.
For hunting thorough-bred stallions three prizes were offered; and for these there were six oompetitors, the 1 st rrize being given to the owner of the Baid Stag, the winner of the second prize at the Bath and West of England Show at Exeter
two years ago, when he competed with latan. two yeare ago, when he competed with latan.
This horse we consider well worthy of the prize, This horse we consider well worthy of the prize,
for althougli too short and compact for a successful race-horse, jet these qualities, with an unceniable pedigree, become positive advantages as a sire of bunters.
There were a few good hunters, the best lelonging to Mr. Bitraves, equal to fair, but not great, weight. The mares with foals were but moderate, and moctly deficient in substance, particularly as the Council maintain the rule that none but thoroughbred stallions are fit to get hunters, however light and well bred the mares may be.
There were no weight-carrsing cobs, and the ponise were fow and indifferent, and greatly inferior to those of the Bath and West of England Show at liannstaple a few years since. One called an improved Exmoor, belongiry to Mr. Smith, was disqualified on that account, showing either required.

The cart-horse stallion classes were divided into three, viz.: the general agricultural class, not qualified to compete as Suffolks; a class adapted for a hilly country; and a separate class for Suffolks. Why the latter should be a distinct
class so far from their native county we can scarcely tell. However proper this may be nest year, when they may be expected to be a strong class, this year we think their merits ought to have been fairly tested against other breeds. Thanks to the President, who gained the principal prizts, there were several good Suffolks. The Agricultural Class was weakened in numbers by the fact of separate prizes being given hy the country. Therewas, however, but little difference betreen the horses in ore class and the other. l'he first prize in Class 44 was gained ty y the Duke of Bractort for a useful brown stallion of the cirdesdale breed, and the second went to a promising four-sear old Clydesdale, son of the celebrated Battersea prize-winner Sir Walter
Soott. This horse belonged to the Rev. S. Terra, who was al=o the owner of a powerful, compact and active bay horse, shown in the hilly class, but Which was prohably passed over in consequence of the cxistence of small thorough pins, which, howcrer, produced no injury in action, and were we This horse was the brother of the 1st prize horse
nowerful and active roan horse, a prize winner a he last Essex show, belonging to Mr. Elpirick. Of 2 -year-old stallions there were only six
xhibited for the three prizss, but they were mostly good animals. Of mares and foals there were only four to compete for three prizes, and they were of fair hut not extraordinary merit. In the 3 -year-old class there was only one, and of 2-year-old fillies there were two, the 1st prize being given to a daughter of the Chelmsford prize horse "Britain."

If the Looal Committee, instead of offering prizes for horses adapted for a hilly district, had uffered these rewards for what remained of the old pack-horse breed, they would have done great service, by developing a source from which many of our half-hred hunters are derived. They might also with equal propriety have given prizes for pairs of agricultural horses, a very popular and useful class, affording the publio an opportunity of seeing what the horses of the district really are, and what further improverent is really required.
We give this general review of the Plymouth Horse Show here; hoping that our remarks may induce a careful review of the horse prize list, hoth at the shows of the National Agricultural Society and elsewhere.

\section*{COVERED ẎARDS}

Cassiobury Park, Watford.
Str,-In the various interesting articles which have appeared from time to time in your Journal, setting forth the great advantages arising from covered yards, there is one (and notasmall one) which I have never seen noticed. I allude to the saving of cartage in the spring
of many tons of comparatively useless matter in the of many tons of comparatively useless matter in the
shape of straw and rain-water. I have made various experiments to ascertain how much water can be al,sorned hy a giveu weight of straw of mixed kinds,
aud I find that it will absorb double its weight of water-uven more if quite saturated. Now my covered yards have an area of 1200 square yards, and the
average rainfall here is 25 inches annually-say 12 average from 1st November to 30 th April.
inches from Ist November to 120 April.
Now 12 inches of rain over 1200 square jards would give just 300 tons of water which would fall on my yards if not covered, or 4 ton per yard super.
I have said that a given weight of straw will absorb doable its weight of water, consequently 300 tons of water would require 150 totis of straw, supposing that a farmer wished to keep his yards reasonably dry.
This quantity, viz, 450 tons of complaratively worth less matter, has to be carte. 1 out in the spring, when the yards are uncovered, or if a great portion of the
raintall drains away it carries with it the most valiable ingredients of the dung. As recards saving of straw, it amounts with me to at least 100\%, a year. In respect to all the other advantages detailed by Mr. Moscrop and others I can endorse them with the most perfect July, 1865.

Yours faithfully,

\section*{BIRDS AND INSECTS}

The readers of this Journal are well aware that a doltinh antipathy to small birts lus for a long time promptech a crusado amainst those useful littlo creatures, and with a view to expuse the seuseless nature of these proceedings as well as to give to the uninitiated reader some insight into the character of the plague which is thereny enabled to spread unopposed, I propose in the following brief observations to treat of one particular
insect enemy, whose devastations have receutly forced insect enemy, whose devastations have recently forced I'mean that commonly knownas the Striped Pea Wecvil.
Both in my garden and in the field I have of late lost crops of Peas, and in some cases the loss has been rendered more mortifying, inasmuch as I had selected choice seeds, and deroted great care to the cultivation of early plants. In the case of the garden crop, my gardener had unhesitatingly attributed the deatruction appearance of the plant in the field was "sluge." The real cause was, however, the little insect which I am about to describe, and which, on the occasion to be rerred to, 1 found flying about in such numbers, tha they became entangled in my whickers, and thus gave unmistakable evilence of the wholesale destruction which they must inevitabiy unnse.

If we look at the leaf of the younc Pea we shall find it to consist of tro entire leafletr, that is, withont divivions at the margin--" leaf bifoliate, leaficts entire;" and which is termivated b.y a tendtil which represents other leaflets diver ed to the purposes of climbing.

Now in the injured leaves we have the appearance of pieces having been bitten out around the margin this is either unobserved, or if noticed, it is thought
by some to be the natrue of the leaf, while of those who recognise it as abnormal not a few, as it seems, put it down to the pecking of birds, or the bites of slugs.
A figure represents a much-eaten leaf, but in some the parts are so evenly croded as to canse them at first sight to appear to be tho natural toothing of the leaf. A little reflection will, however, show ua that we have no examples of leares so escalloped (not to be con-
founded with crenations, which consist of a series of
inston and plant ceases to live, as it has been the cose garden crops; and this year my field crop las mith to a loss of about one balf. I countel as wefere \(2 \overline{5}\) insects to a foot of the row, or 1100 to eiery
in length, and Curtis asserts that "in the in length, and Curtis asserts that "in the year
they were uuiversally distributed and ate of the and third sowing ;" and he further adds, that ' very naturally accused the sparrows; traps were for rats and naice ; lime strewed for slugs anit sn and toads were encouraced to extirpate woodlice still the crops kept disappearing, as noze of thee precautions affected the wary enemy in his cont of mail.'
It is now time to describe the nature of no mis chievous a creature, which helongs to the order C ptera, family Curculionidæ, genus Sitonis (Curen Beans there are two species which attack our Pex Beans, Clovers, and other Papilionacere, namely:
Sitonia lineata, (Linn.), the Striped Pea Weevil.
Sitonia crinita_(Olivier), the Spotted Pea Weevil,
Sitonia crinita, (Olivier), the Spotted Pea Weevil,
These vary in size from two to three lines, the l being somewhat less than the former ; thes are bot brownish externally, much of the colour of the The S. crimita appears darker and sometimes almes black when the greyish scales are worn off the olfto -otherwise they are much alike, and betaro similarly, that a description of S. lineata mas sarrofer both

It is of an earthy colour; is more or less elongun? into an elliptical or oval shape. They may be cent sometines in threes and fours on the ellyes 'f fie leaves making the notches, and when these are presen: in the crop, the creatures will soon bo detected in the act of feeding, if cautiously approached; if not, they fall off and disappear beneath the clods of earth, whan \({ }^{\text {away. }}\)

Where the creatures are bred is at present a myslert but I suspect that this operation takes place on \(\pi\) if Papilionaceæ, from which they migrate to their mon leasant food of Peas, and it would appear that the nore delicate of these are the favoured food of thi mischievous creature.
In my own crop, not having enough of the Err Warwick - a fine white Pea-the headland was drilie with a grey Pea, the nine pod; the former were nevt destroyed, while the latter as nearly escaped altonetase oin an adjoining field belonging to a neigat there is now a fine crop of Grey Peas almost untouc. Curtis, in his "Farm Insects," says, "From the im! ect and slender data relating to insects conuected \(\pi\) arriculture, it is frecquently difficult, if not imposib to form any opinion as to the simultaneous or perio dical appearance of the different species: and th certain seasons scem to favour their multiplication, and others to check it hecked, there is not a cron, whether in the feid or carden, that would escape destruction ; and this cheik probably in every instance, might be traced to tie agency of other insects, especially parasitic species,
which I have so often shown are destined to the service of man.

But now the question arises whether the praike referred to by Curtis have not some good amist
Now it happens that about my farm there a amongst other birds, hundred of larks, Alauda valgaris and white water-wagtaile, Motacilla, albe Iy pupthy A. Taylor, has occasiovally shot specimens of theser to nther species, and has examined them in orom the determine their food; in the crop of a lard and in very fielu were several of these weeviss, 10 the wagtail, from the same field, the crop was fult \({ }^{2}\) weevile, and in the gizzard, a mass of elytra of them and other small beetles.
A reed-warbler (Sivia arundinacea) again from the farm, had in the gizzard 25 beetles of different species This then seems to be the tendency for good or were mall birds; so much so indeed that allowed fair play, I believe that this periodicel surpt: abundance of insects from which nur criple
suffer would be rendered next to impossible. As a curious illustration of what even seen hirds do, I may direct attention to a hedg its Fringilla montana, shot in the Pea-fielde secis Chenopodima album, a wecl
some in a Potato crop of tha former sency. sparrowz
all times.
It scemis then from the foregning that cropan liable to a variety of insect attacks; as thene birds lare were supposed to result from bira real truth should lead us

\section*{IGRICLLTURAL EDUCATION.}

Tze realiers of the Agricultural Gazette who take ace ruaibe to \(p\) eruse what sometimes appears in it
nith mu nue atacied, will perhaps remember that nas ure ith of Ipril, a paper of mine, occupying one or: wo of its colunins, appeared in it, in which, awong
Ler matters on the subject. I stated that the educa.
Lon farmers was by no means equal to what their :on of farmers was by no means cqual to what their
notussian reyuiren, nor to that of other classes of the monmuitr with rhom in social standing and general
anduence they ought to be ou an equality. I said, Boreover, that the education of farmers" sons, with lust in union workhouses and national schools, and rery frequentiy not so good, as they are taught nothing Wre than boys in such sehools are taught, "
I mas aware at the time I thus expressed myself, that What I wrote would be received by many well-disposed readerst ; but I should have suppressed the convictions of my mind, not hastily or partially arrived at, had I wion school, and which is the nearest to my residence. I put the two following questions to the boys in that
Supposing the stack of Clover now standing near the stables to be worth \(5 l\). a ton, what is the value of the whole stack ?-The boys themselves, with no answer.
The second question was this: Here, boys, are six smifferent yuantities, weighing so much per coomb (the weght heing given) -how many grains of each quantity of a ground! And the answer to this question was correctly given; and this latter question and the correct auswer given to it from six different parcels
of Wheat since may letter of the 15th of April was Published. Now, a mathematician or a gentleman kimil, and the solution of them, very simple, but I never kners a young farmer who could solve them, or that hisd erer thought of them or such like as being nearly as requisite for a man properly to manage a firm as it is for a sailor to learn the science of navigation icefore he undertakes to navigate a ship; and let me here state that if farmers really first ascertained how many grains of any kind of cereal a given measure of contained, I unlesitatingly affirm that a man he had put three and a-half bushels an acre into the ground of any kind of it, though only a few years siace an advertisement to that effect appeared in the
Agricultural Gazette; but had he been aware, as he urght to lave been, that he put into the ground from fre to seven times more seed than it was possible for it to grow to perfection and for the ground to carry, he preas such a have hesitated before he had sent to the Mromin doting are but reuit for what I do, but at the time I refer to I had re quisite to test his systemat the Rev. S. Smith deems professor advertised that he put in \(3 \frac{1}{2}\) bushels an acre, that ganantity of Barley from only a seventh part of lom than 11 coombs an acre, and one year I had 16 coombs from one bushel; and should any of my themem to ascortain the quantity of seed too small, 1 ask masare will contain, as I allor cereal seeds a bushel them, and they, as I have, will thays do before I sow Not that I pht in \(3 \frac{1}{2}\) bushels of any kind per acre. muinous quantity of seed, but what I am maintaining is : a iemonerrntive quantities of seed are necessary, it Thel, and that the proof that the land is badly cultiAt this uncientic way.
At this present time I have a plot of Barley, the soed 1. Mr. Rayntiril, of the well-known with other seeds Caidentt, d Pawtree, and of this I put into the ground acre, and on lan part of three and a-half bushels an "ccossion before; and yet been Wheat ten years in than are it can srow. Aud knowing how sceptical jears of experience, to statements like these from seent that he mastor of our union house, with an agreemo that it was mine in, seed by seed, and lie assures and to seed that I in, and at the same distance from
 Would be 20 coombs week, exclaimed, a crop like this Prulabiced a table of experiments some tro years since ared that to put into the ground twice the quantity of andege not haif the quantity germinates and grows, have alked hiro, what wrould per cent. grew; but as I

Hallett's, and Mr. Alderman Mechi's, and some others, this year, I made trial of nearly 20 samples, obtained this year, I made trial of nearly 20 samples, obtained
from farmers and merchants, and out of the whole searcely a seed failed to grow-indeed I may say all grew; and as for kinds there is in this respect littic or no difference between them; but if there be any the bearded kind being the most perfect is less liable to accidents of any kind tham any other, and hence al grows.
I wish that learned and excellent Professor would ry his experiments over again, and should he do so in a wide open field fairly cultivated, I have no hesitation in telling him that he will no longer defend ruinously thick seeding on the plea that doubie and treble, and in some instances quadruple, the quantity of seed mus be sown on the plea that a half, or a third, or a fourth of it is too lazy to germinate and grow, but as coon as it is buried in the ground it fails into a profound sleep rom which it never awakes.
But consult Mr. Hewitt Davis, or Mr. Alderman Mechi on the point. The latter purchased a farm which had been in the hands of practical farmers for upwards of 150 years, and the one who was in possession when he made the purchase was considered an excellent farmer. The farm was 130 acree, and the average number of acres sown with Whent was from 18 to 20 acres, and the average yield wns 7 coomhs,
and observe, my readers, what I am stating is capable of proof, namely, that quantity of seed per acre to produce the 7 coombs was nearer 3 bushels than 2, but 1 will say 21 , for I am not so "certain on this point but from 18 to 20 acres were on an average grown with Wheat, and 7 coombs an acre produced, that is, taking anmal quangity of produce of 140 coombs.
Now, years afterwards, at one of the first of the worthy Alderman's gatherings, he had 50 acres of Wheat which averaged 11 coombs an acre; that is,
550 coombs of Wheat from the 130 550 coombs of Wheat from the 130 acres against the half \(2 \frac{3}{3}\) bushels, but from 4 to 5 pecks only, and stiil more than double what I should have putin; and from that time to the present I lave no doubt whatever but his crops of all kinds have averaged more than 11 ombs an acre.
But my respectable readers are still seeptical. But I will give them another example, viz, the doings of Mr. Hewitt Davis, the whole of whose crops were produced from still less quantities of seen, and they were the admiration of all who inspected them ; but as he always says, he learned all that he practised from men who give at least 4l. and 5l. an acre for their lauds, viz, the market gardeners, one of whom, on my asking why he put in his Peas in rows 30 inches, and even 3 feet asunder, whilst farmers put the same kinds in in rows only 6 and 8 inches asunder, replied that he gave 4l. an acre for his land, whilst farmers gave only 30 s., and therefore they could afford to grow straw ehiefly whilst he was obliged to grow corn.
But to return to Mr. Alderman Mechi, and to those who are sceptical in what I have said about his crops, I will say, if they will clear their farms of all useless hedges and ditches and Pollard trees, drain their lauds deeply and thoroughly as he has done, really cultivate them also, and twice or three times deeper than they have done, put into them the proper mineral and vege table manures, and scientifically seed their lands, they Aiderman has increased his, and moreover will relieve their country from the painful and humiliating condition she is now in of being indebted to all the corngrowing countries of the world fur a sufficiency of fond,
but would grow enough at home from their own lands, and have some to spare for iess favoured nations. Geo. Wilkins, Parsonage, Wix.

COWS AND CALVES.
The Trade in Cows,-No reliahle statistics are at our disposal to prove incontrovertibly the rapid rate at which the cows of this country are annually decreasing, from the constant enormonts mortality in town dairies. It is acknowledged by all that reckless mismanagement leads to the rapid destruction of animals tien up for the production of milk in large cities. The misunderstanding on the subject, fatal to salutary reform, has arisen from the diseases of animals beng ill unuerstood, and that many-headed mouster Contagion having been ignored. Some persons have attackel the system of feeding town cors-which min! the torter the animals not being permitted to take exercise ; and however paradozical it may appear, a town-dairy cow is muoh nafer and healthier, less liable to accidents and disease, if kent tied up by the neek for six month at a time, than if driven abont as the cows are in New-
castle, Dublin, and other cities, where freemen enjoy the privileges of common pasture. Pictures liave bieen frequently drawn of dark collars, too low for a man
to stand up in, deprived of any inlets or outlets for pure or foul air, in which the animals can only be seen by gaslight, and where, on inspection, our or five cows are found to be consuming less atmosphere than
one would require. All this is very true, and nothing one would require. All this is very true, and mothin London, who have succeeded in registering the dairies,
attending to the purity, clennliness, and ventilation of all under their control. The paving, drainage, whitewashing, and daily flushing have not. however, affected the progress of pleuro-premmonia. There has bean no diminution of diecase ns a rule. It is raging norm, as it has done more or less for Qu years rast; and so long as it contimics, so long as the towndairy system remains as it is, we must have the coantry drained of the animals it so much neets for keening un the home surply of animal food.
There are those who believe that which is not the fact -riz, that the country supply of mils for larke fowns is restricting the number of town cowfeeders, and that the wants of large cities can he fully met be dairy farmers. Admitting that a very large quautity of the milk nocied by the towns can readily he forwarded from a distamee
by rail, it is a well-known fact that the town cown by rail, it is a well-known fact that the town cown
minnot be diapensed with. A retan'er of milk in the city of London will; pay 2?, per guart wholeente for milk sunplied by a neighbouring darrman, utherens ho less willingly allows \(2 d\). per quart onily for the country milk. This may appear stmuge; liut it is easily axplained when we know that, to spelure the proper carriage of the milk and for the sake of profit, the
country dairyman keeps the morning sa milk for tha country dairyman keeps the moming s milk for tho
afternonns deapatch, and the cenmig's malk tull next inorning, po that much of the cream is removed nud made into freah hutter. whimh is readily sold at a high price in all large towns. The fown darymanl commot is it comes from the cow, adding, it is true, same water, if he diaposes of it directly to the consmate. Thare are so many advantages, which we need not now discuse, we should turn our attention to altering thost condiwe should turn onr attention to altering thast combij-
tions which lead to the regular onlon ess in deatruction tions which lend to the regnlar nl:o issice
of the fine cows purchnsed by the cowfoneters.
That onr renders may formi some inlea of the extunt to which our breeding districts hase bect irnined for town purposes, we may mention that cows which were mold \(x_{2} 20\) years ago for 101 , or 12\%, realimo insw from 191. to 201 It is no unusunt thing for a dniryman to give 25\%, and 201. for a erose shmothomel cow-and They are rapidly diminishing.
It is ndmittel that the number of cons kept in
many large towns-and we nay talie os comel exinules
 during the past 20) years. The mumber, linwever, aumally purchased in any single town is dombe :"nd treble what it used to be juior to 1810. Wi nemeretly remember seeing animals in the London elieds that,
had been one, two, nuil three years in the han ds of town dairymen, on whose farms they were kngt for n couplo of monthe prior to calving: but now the majo-
rity of these animals are sold diseased to tho lintelier within five months of entering the dairy. Th" thwn dairyman has learned that a short-horued cow leaved an enormous profit if she only lives four or five anonthe after calving, and ho kinows that live prome. cessors in the trade erred in kerping the mimain on as long as they did; but he dous nut consider how best to economise the seanty quantity of stock this comintry can supply. He goes on buying amd k.lling twice and
thrice as fast as his aucestors, quite regardless of all consequences.

Formeriy the dairg districts spared for fthe towns the old cows which had to make ronm for the young ones; but now the leau animal, with well-defined dropper ulder, is not to be seen. Heifers with their first calf are boing bous hit un, greedily; and good fat conve, with their reend or third calf, are, as a rule,
delivered to the town cow feeders. (In we then wonder that cows are getting searce! If we comhid onls prolong the average life of the town-dairy cow som six to nine months, the saving to the country would be ennrmins; and geater would lie the saving if we five to six montla after calving in a town conlis be returned in ealf to the country. That this is yractieable and profitable we lone at some firure thme to show. For the moment, we are desiront only of large torms is incompatible with an increase in the breeding steck of tha entury. Any sceprec on this
point cin easils be enlightomed by a communcatise point con easily be enlightomed by a c
cow-dealer or iutellemt town dairyman.
 frexci e: of eennmay in reciatiat to the hios ot onr demonstrate that the interests of the former and of
the people demand a radcal cliange in the mamer in which calves are usell
should he banished from binfeliers' stalls, hoth hy the Britee of the Fuch'try and the strong arin of the luw.
Bon exent the flesh of the "stink calf" or "staggerin y hoh," has heme a marity which
gold has usually fited to purchase of Ince. The
greatest consumption of well-fed val in this rons:try takes place in the motropnlis: and "harene formerly
 calves at ramunerative prices, the London veal trale is now gone entirely into the hands of the foreisia trader.
From Autwerp and other parts many fine calves are
imported; and animals that have never tasted milk or food of any kind cannot well compete with them. The treatment of calves in this country is often
cruel, revolting, and recklessly extravagant. Thousands of them are born where they cannot be reared, either in country dairy districts or in large towns They are not permitted to suckle their mother. Thousands of them die within a few hours of being born, and a far existence, from mismanagement in feeding. One great cause tending to encourage this state of matcers is the ready sale found for a dead calf with its throat cut, whether it has bled or not. We believe that the proper and humane treatment of calves would be greatly encouraged, and their number enormously could be sold as human food unless it had been fed or suckled for at least six weeks. This is the law in many parts of the Continent ; it works well, and should be tried here. One effect of such legislation would be securing for the farmer an opportunity of purchasing far more calves at a month old than he can get now.
The practice in town dairies is to give the calf the first milking of its mother and then dispose of it at dropped Short horn give sos. and evs. for hewly in Aberdeenslire this season give 3l. and 3l. 10s. for newly-born calves in good condition in Aberdeen, and they had then to pay for their carriage homo. The mortality has in some parts been enormous, and it is hard to tell what a stock of calves may not cost at present rates. It is singular that, notwithatanding the regular outcry as to the deficient supply of calves, and the frightful mortality amongst them, nothing is done to remedy the state of matters. As a rule, the dealers
who buy up in the towns in England send the calves by rail to their destination. Thousands of these young animals travel, crowded in cattle-trucks, for from 24 to 56 hours without food, and having perhaps tasted milk once, if
at all, after birtl. As the trucks are shunted and stopped the little things roll over each other, the weaker stccumb, and are trampled on by the stronger may be so squeezed as to die of suffocation or internal injurg. No one cares. The dealer cuts the dead one' throat at the station, and the butcher pays from 108 to 12 . sterling for it instead of the farmer getting it at a better price. These are looked upon as the risks of trade; and the demand for calves has been so great of late years, that many have succeeded, in spite of the cruelty, to make money at it.

The calves which survive the railway journeys often die in very large numbers after having been delivered to the farmer. The starved creatures distend their stomachs with any quantity of milk they can get at.
The digestive powers of the alimentary canal having been destroyed, diarrhoea sets in , and death soon

\section*{follows.}

If the Society for the Prevention of Cruelty to Animals would lend its influence to put down cruelty prizes for the painless extinction of the life of verming

\section*{calves-and we do not see why such a conveyance} should not have an apparatus permitting every calf to suck milk from an artificial teat several times daily. The arrangement could be easily carried out, and the expense of feeding the calves on the journey would be amply counterbalanced by the improved condition in On the animals would arrive
On questions of this kind the interests of the country should be considered before those of individuals. No 50 per cent. of the calves dropped in the United Kingdom ever live beyond the first fortnight of their existence. No one can diepute this fact; and with scarcity of stock threatening us as at present, it behoves all to offer suggestions, and work to discover a remedy Now, the town cow-feeder grudges a single meal of milk to a calf. He should be looked after, and made to understand that animals are not to be starved, and that rice-water, hay-tea, baked-flour and water are better than no food at all for the young animals he wishes to get rid of. The calf-dealers specially need looking atter as well as the railway companies; and so far as widely to disseminate knowledge regarding the very widely to disseminate knowledge regarding the very
simple treatment required for the prevention and cure of the intestinal disorders so fatal to young animals. Journal of Agriculture.

\section*{ON BREAKING UP PASTURES.}

IN all cases I shall presume that, as a preliminary the land has been well and wisely drained. Although some practica! farmers still hold that Grass-land as such may possibly be injured by draining, no such doubt applies to arable, except on the score of excessive outlay.
Clay Land. - The first case we have to consider is the land the herbage is generally of a coarse character, with here and there tufts and patches of rough Grass which cattle will seldom eat, and never thrive upon. Occa-
sionally the turf is thin, and there is an abseuce of the sionally the turf \({ }^{1}\)
Thowards be the end of February the breast-plough should be set vigorously to work on the turt, that
the drying winds of March may make it ready
the drying winds of March may make it ready
twice over will generally suffice. Let the fires be The burners will for their, and not very far apart The but to wenerally attend to these points, especially it the work is done soon as the heaps are charred through let the ashes be spread evenly on the land: if you wait until they are cold combustion will have gone too far, and the portion of the vegetable matter is merely charred. The black ashes are betteer than those of a red colour burning, much depends upon good judgment and management; the fires burn much more slowly, and require more attention, when the weather is damp; but better ashes are then made than in the dry windy weather that frequently prevails in the month of March. As soon as the ashes are spread, horse-plough them in with a very narrow and shallow furrow. It is scarcely possible to plough the land too lightly, for ashes have always a tendency to work downwards, and it is desirable to keep them as near to the top as possible Another horse-ploughing across the first furrows will sometimes be required, with harrowing, rolling, and th
usual operations for reducing the soil to a fine tilth. sual operations for reducing the soil to a fine tilth.
When the proper season for Turnip sowing arrives, begin by drilling Swedes, Turuips, Rape, or a mixture Rape and Turnips; either of these crops would be likely to succeed, especially with an allowance of arti-
ficial manure. Part of the ashes made from the burned ficial manure. Part of the asbes made from the burned
turf should be reserved for drilling with the Turnip crop, unless it has been determined to use the liquid manure drih.
Sometimes newly-broken land does not get sufficiently puiverised to allow the drill to work freely at first. In such cases it will be better to adopt the old-fashioned plan of sowing broadcast, so that the small seeds may fall into the crevices, and be covered by the use of a chain harrow, or the common bush harrow; the ground should finally be made firm with an iron roller, Cambendge presser, or clod crusher, and a good crop may then be reasonably expected.
We now come to the consumption of the first root crop, and I would strongly advise that this should be done with sheep as early in the season as is practicable, especial care being taken that the crop be equably consumed orer every part of the field. The first Turnip crop is frequently patchy, even where great care and abour have been bestowed upon it; in one spot it may be superabundant, while in another it has almost failed. In such cases a little expense in carting roots to these bare places would be repaid twentyfold. This may appear like "robbing Peter to pay Paul," but as the two will work together in partnership for the future, it is desirable that their powers should be equalised. The addition of cake or corn to the food of the sheep when on the turnips will, of course, increase the prospects of an abundant Corn crop in the following season.

Before any horse-ploughing is commenced it will be
advisable to determine in which direction the "lands" or furrows should be, with a twofold object, -1st, for convenience in ploughing, so as to avoid crooked furrows and short turnings ; and, 2ndly, for the ready escape of the surface water. I am aware that the mention of
water running down furrows may be objected to by some who think it possible in all cases to dispense with water furrows; still, on some of the strong clays, although drained effectually, surface water will sometimes be seen ; as, for instance, when a rapid thaw sets in after a deep fall of snow on hard frozen ground therefore I would say, be on the safe side and prepare for an exceptionai case by making water furrows, or you
may suffer loss and vexation when the rain is descending and the floods come.
In horse ploughing for the first Corn crop experience teaches us that the furrows should be shallow; the manure from the sheep and the ashes from the burned turf will then be kept near the surface. Oats are generally preferred for the first Corn crop on newly broken land; Wheat is occasionally grown; but taking Wie average of cases it is best to start with the Oat. With the Oats sow a mixture of Cloverseed and Ryegrass, to bo once mown, then depastured with sheep, and ploughed in the antumn for Wheat; or it may be a better course to let the Clover and Ryc-grass remain two seasons before ploughing for the second Corn crop. On breaking up some poor Grass fields (clay soils and
subsoil) in the Vale of White Horse, in Berkshire, the following plen was adopted: the turf was merely horse ploughed and planted with Vetches, and an excellent crop was the result. After the Vetches had been eaten by sheep the land was again horse ploughed, and Wheat was planted, which produced an abundant crop; then the land came into the regular farm course. In another field of similar quality the occupier adopted the plan of Wreast ploughing and burning; Oats were planted, then Wheat was tried, then Swedes: yet all the crops for the first few seasons were either partially or wholly only case within my knowledge where horse ploughing has proved better than breast ploughing for the conversion of clay land pasture into arable, and I mention it as an exceptional instance.
Strong Loams and deep Stone Brash.-Strong loams and deep stone brash lands may be classed together, because they should have similar treatment duriug the first few years of cropping as arable.

Breast ploughing and burning usually costs from 20 t

As far as 1 have been able to ascertain, their thes: points: that Barley may sometimes be substituted Oats as the first corn crop, and that Wheat had ber be taken after the seeds have stood for one year. A
new arable land has a tendency to become new arable land has a tendency to become hollow ast
spongy; and if the ground is loose, wire-worins, these abound, can more readily carry on their destrucin operations. Measures should, therefore, alwars adopted to keep the soil firm when under kind. I have omitted to mention Beans as a ce suitable to a clay soil, because on new land they are a well at the commencement of their growth; but so lat summer advances they become weak and sick l , blossoms fall off, and at harvest, althongh there mar! a tair quantity of haulm, hut very few corn-pods appen on the stalks; still Beans* may in some situation advantageously substituted for Clover after th corn crop.

Chalk.--In this branch of my subject I slall ins chiefly to speak of those Down pastures that ones exclusively occupied the long ranges of our Euplisid
chalk hills, to which of late the operation of breal up has been most extensively applied. Frieuds occupy large tracts of such soil concur with me opinion that here also the breast-plough and fire the best agents that can be used; and that to any other course is to invite failure. One approved is the following:-Pare the turf as thin as pos
burn it when sufficiently dry, and, when the asie spread, "rafter" + the land with the horse the autumn " rafter" again, across the first work plant Wheat as the first crop: a Turnip crop follome and then the field enters into the regular firm Some good cultivators, after paring aud burnin same season, plant Swedes or Rape and Turni
followed by Wheat or Oats. Where there clance of success, the gain of a Turnip crop attendant benefits, is not to be neglected. regard to every feature in the patient's case Gravel on Chalk.-Some of the chalk hills, sneh those in the neighbourhood of Henley, in Ostoridhs have a surface soil of gravel and flints, In breakingm such lands as these, both the author and some of acquaintance have takon the following course: ordinary horse plough was followed by a "L
Presser," which forced the Grassy edge of the far slice to the bottom of the furrow, and at the same tin made deep channels and a firm bed for the seed This " presser" consists of two heavy iron wheels, abo one yard each in diameter, and a light guide whel, fixed into a frame connected with shafts. One bort draws the presser after two plough teams, and heavy wheel works between two furrow slices; guide wheel runs on the unploughed ground abo yard from the furrow. In the cases referred After the Oats, it was invariably found that th After the Oats, it was invariably found that
had decayed, and was reduced to vegetable monld Which was easily pulverised by ordinary metb These gravelly soils on chalk appear property of causiug vegetable matter to deas short time, and, where such rapid dec
burning turf would be a wasteful process
Sandy Soils.-Sandy soils never make rich pasturz land, but poor pasture on a deep sandy soil frequeitity makes profitable arable land when broken uy, aud bringing such into cultivation the plough

\section*{may sometimes be used with advanta}
course to paring and burning has not been bun deeper furrow must be given than ploughed in, otherwise there will not be suf the first crop. But here, again, I would advise Turnip crop be first grown, and consumed with sheep, and then there will be almost a cert of a good corn crop. The treading of the sheep, from their manure, is generally thougit turf beneficial on fresh broken land; the fibrous the are parted and torn to pieces by the and become food so that they deca
succeeding crops.

Thin stone Brash.-On the poor pastures stone brash soil there is not sufficient moald a thick turf; coarse patches of the worthless C Grass are here frequeatly found, the tough which resist decay for a long period if ploug reakin therefore burning should be resorted to in bing such land. When the paring and burning finished and the ashes spreall, a

Such lands ane never so easily, by paring and barning. Whilst gravelly moils appear to hasten the decay of vegetable
sobetances, peaty lands seem to poseess an opposite

\section*{qaality}

I once broke up a field of 16 acres of well-drained paty land with a clay subsoil, the owner of which at
tiat time held the theory that burning vegetable mater of any kind was a wasteful process, and that the fire destroyed much matter that would be valuable surf was therefore pared off, and drawn together into large heaps; then the land was dug about five inches deep during the winter; at spring there appeared to
bean excellent seed-bed; Oats were drilled in, but the manges of the wire-worm commenced as soon as the Oats were planted, and the kernels from a large spront. The few plants that survived were fed off on and harrows during autumn, and in the following spring Oats were tried again, and again the crop was nearly destroyed by the wire-worms, Yet, after a
mhile, this field showed its productive powers by growing very full crops. This case of failure may act as a warning to those who may have occasion to I would say, breast-plough and burn for the first prsible, and plant Oats; after the first Odt-crop Curnips or Swedes again (if a full crop, a portion of thene roats may with advantage be removed to other
land or yards); then Oats again, with Clover and Ryegravs feecls; then let the land take its regular course nI the farm, unless Wheat should be considered hazurdous, as it is very liable to blight and mildew on onch land. Perhaps for the forst few years no safer more profitable plan could be adopted than the following. Wiich has stood the test of experience nn land
anch hs that described:-1, Turnips; 2, Oate ; 3, Grass, to be mnwn or fed, then (in the next year) breastplough and burn for Turnips, and so on.
General Remarks.-It may be objected by some readers that in treating of the subject of the concry of Fire! fire! It is true that I have recom raised a burning as the safest, cheapest, and best mode that can be adopted; and I do so because experience, observacon, and extensive inquiry over a large district,
contrm my opinion on this point. Many persons have endeavoured to prove, and perhaps have clearly shown by experiment, that nearly all vegetable matter loses and of its valuable properties when suljected to fire, cladual decar. Still, it must not be forgotten that by secured in the first year for the fundamental crop of great bulk, will being forced to early maturity and great bulk, will probably give back to the land as ran here been dissipated gry of valuable matter than act mechanically, and on strong clay soils cause an also make the soil more dry the earthy particles, and folded thereon.

\section*{experiment mggest to clay-land farmers an inexpensive} dhy-woil they should take the pasture on a strong th marked suctisess in some parts of Worcestershire thithe addition of a emall quantity of coal, provide and thos secure the burn very large quantities of clay I, with comparatively slight a increase dose of burned anticipate will be envour to meet the objections that I ctrippate newly be rroken land.

the fertility of the varions likely to raise them; and I of the varioas soils instead of lowering tendency to reduce the standard of fertility can period. Sarely the of any class for a ight, unlese year by year English Iand is
increasing in fruitfulness. There has been, and there stile is, a strong prejndice on the part of owners against
breaking up pasture ; and if we may judge by what hreaking up pasture; and if we may judge by what
heen done with newly broken-up land in many places, the ohjectors have full and sufficient reason for their opposition. Nearly every far:ner could point to fields tiat he once knew as poor pasture, then as heavy corn-bearing land for a few years, and later and ever since as poor, very poor arable land, and "he
knows the reason why." Surely, then, it is time that knows the reason why." Surely, then, it is time that
exbaustive syatems were abandoned, and more liberal exbaustive systems were abandoned, and more
and renovating methods established in their stead.

The question of breaking ap pasture, in its broader bearings, not only affects the interests of the landlord, the tenants and the labourer, but enters so deeply into the general supply of food, and feld for the employment of labour, that it more or less concerns the whole community. He who recognises the wisdom of him who wrote that "The profit of the earth is for all: the king himself is served by the field," * will feel the national importance of the subject.

No one, however, would advise the indiscriminate breaking up of pasture land; there is much rich grazing ought to continue as they are ; but, on the other hand, there is much Grass land that hes always been unvuited for pasture, its character being such that it could not by ordinary means be made very productive either to the dairyman or grazier. This inferior land (unless or other peculiarity) would, if brought into caltivation under fair restrictions and a well-regulated course of cropping, be more profitable to all parties concerned than it is at present.

On the other hand, there is much old cultivated land that would be benefited and renovated if laid to Grass for a few years, oo that on many farms for every field
broken up another of equal extent might be devoted to pasture. Our root crons would at all events be benefited by the exchange if, as seems likely, the difficulty which has arisen of late years of securing a good growth of Turnips has been caused by the repetition of these crops on the same land. Two fields in my own occapation which once grew immense crops of Swedes, now, with more liberal treatment in manure, \&c., are most precarious in their yield. The Swedes when planted make a good start, and a stranger would suppose them to be quite secure; but as the summer advaces decay become entirely rotten when they have reached the size of a lien's egg. Would not new land be a remedy for these and innumerable other cases of a similar kind? C. Belcher, Little Coxwell, Faringdon, in the Journal of the Royal Agricultural Society.

\section*{Home Correspondence.}

The Return of Mr. C. S. Read for East Norfolk is a matter so significant that it cannot properly in an on account of Mr. Read's political creed, for that we will rot at present inquire about, but the fact that the agricultural interest has at last succeeded in securing an independent representative is one of great importance, as marking an improved intelligence about to
dawn upon a large, intelligent, and, we think, almost norepresented interest. It is true that many of our county constituencies return gentlemen interested in land, some times as landlords only, at others, too, being themselves no bad farmers, but these gentlemen after alt mostly represent their own class, and not the tenant farmer. But it does not follow that a country gentleman knows anything at all of farming. Too frequently, indeed, is he called upon even in his own county to regulate
affairs connected with landed property of which he affairs connected with landed property of whicu of law upon which he knows less. In hoth cases it true he may have an agent to act for him as a landlord -to get his rents and do some little underhand matters about shonting and the like, and in legal matters the magistrate's clerk does the business, but this is 'by no means the manner in which agricultural and rural matters should be decided. Just as well is it to have and we rejoice to think that the time is fast approaching when our country gentlemen will advance in their edncation with regard to both the laws of nature and the laws of the land and as they do so they will be even fitter repre sentatives of their class than they are is present
We rejoice to think that the tenant farmer increasing in intelligence, and it is a proof of this position whet we find them so eacerly choosing as a representative the first tennent farmer who has ventured to offer himsel for a countr. We say that as yet the farming class is not properly represented, and it is no answer to us to say that some small places called agricultural towns return members; these, it is true, may represent the town, but not the surrounding rural population, for sented by any man who does all his shopping therein, such man usually knows even less of the agricultura interest than the town lord. On these grounds it is that we most earnestly hape that our agriculutral friends will lose no opportunities of choosing representatives of their own class-there are plenty of them The Church, the Bar, the Railway, the Lunded, and
other interests are all represented, and why then ahould one of the most important interests be le ft ont ? It is indeed a time when different interests are struggling to make influence in the Councils of the nation, and with good reason, when it has come to be considered that people can searcely want any kind of change unleas they become clamorous for it. \(\dot{J} . B\).
Bromus. Schraderi alias Anthistirias (Filldenow).This species of Grass seems to be making some noise in the agricultural world. I am able to contribute some little information respecting it which may perhaps be acceptable. I can testify to the apecies which I grow and from which my seeds were gathered, being perennial, as the enclosure brouglic under my notice had been laid dorn five years, and the crop, about 2 feet in height, was apparently very succulent. From the slight experience I have gained in England it seems to be earlier than the Italian Kye.grass; whether or no it will retain its vigorous habit, or be as acceptable to stock as it is at the antipodes, is a question that time only can solve, The proper time to sow it in this climate In Janu 1 can judge, July and early in Augubt. whe in New South Wries, and ha meeting with a large landed proprieto vator, but has much of the energy of the "old country" in his experiments. He has cultivated this Grass exten sively for several yeare, and has found it, in hia hot and dry neighbourhood, a most valuable forage Grass, cutting heavy crops twice a year. I saw one inclosure cropped with it, and was much struck with its vigorons growth. On making inquiries abont it, I found it popular name at Sydney was "Californian Pruirie Grass." I happened to meet with an old Californian digger, who assured me that it was common on the hills in Californin, and was not injured by the severest frosts. A botanica friend at Sydney said that it was a species of Anthis tiris (Willdenow) and recognised as such by Jeachardt. I did not hear of it in Queensland or at Melbourne. My own experience of it has gone thus far: I returned from Australia in the autumn of 1864 and brought with me a quantity of seed which I sowed in October; the plants came up in November, and although so young and tender they stood through the rather severe winte of 1864 and 1865 well. I had early in the present summer a good crop of its Oat-like seen, and after cutting it when thoronglily ripe the roots have put forth a promising crop of furage, I have read the advertisements of the "Bromns" (which I believe to he the same as my Anthistiria) at 1s. a packet, with aome amusement, for I could have reaped a tolerable harvest of shillinge had I not thougit it more prudent to sec how it snits onr elimate before offering it for sale. I may add that in New South Wules it seems to give abuadant forage. The proprietor above mentioned is a large dairy farmer, makes much cheese, and finds this Grass very nutritious for his stock. and may prove a very valuable addition to one early spring fodder. I almost fear those people who disbefiem the Cambridyeslire transformation of Oat into Birley will sinile when I state the fact that some ronts of this "Oat-grass," the flower-stems of which I ent off to observe the effect on the forage if thu treated, have thrown up eare of Barley-odd, bat true. Jno. Rivers, Sawobridgeworth
Crops in Fssex. - Whent first-rate on the atrong cracking clays, which suffer most in wet weather. Not so full a plant on more fri ble soils, and rather light on ors particulariy well filled, owing to long quiet bionming time. Barley generally full average. Oata much complained of. Beans moderate,
owing to the blossom falling off. Mangel (where a plant) very gond. Turnips ditto. Late Potatos very good. Hay and Clover a very light first crop, Around this neighbourhood the crops generally are good, and there is a very marked progress in the farming. My own crops of all sorts never were better. Harvest began on the 17th, and will soon be general. The parched up pastures are now a rich green, owing to the heary and warm rains. Fond for stock will be now abnudant, and mnst influence the value of lean live tock. J. J. Mechi, July 22.
Depth of Water in a Well.-Through your columns I propose to furnish Mr. Denton with the dip of a wel in 1863, 1864, and 1865. There in wravel about 10 feet under the surface of the valley descending through it to the Thames, three miles sonth of the town. The gravel bed rests on the faller' earth, a more or less water-bearing stratum, and under liea the river Chum, which, rising on the high ground of the Cotswold Hills, near Cheltenham, descends 500 feet in 12 milen to the vale of the Thamen. In culs and it bed at Cirencester the Romans sunk man wich ore is one of these, not in use, the depth of which but that of 1863 was only 27.95 , and of 1861,24.6. The fuller's eurth not being deep under the surface, is soon affected by great rains; we have noted this effect in the subjoined Table. As the average rainfall of summer is greater than that of winter, we can only attribute to evaporation the fall of water which always takes place from April to October. Does not this point to the ase of checking evaporation in high dry soils by means of plantations, as much as encouraging it in low-lying clay districta, by clearing away timber and by deep cultiva-
tion? In attributing to evaporation the absorption of
rain-water in summer, we must not forget that during that season the whole surface of the earth is being pumped by the roots of plants, and that a vast quantit of water is in this way abstracted from the soil. dip of a Well at Cirencester.

\section*{Societirs.}

Penwith : Agricultural Progress.-At the annual meeting of this Society, lately held near Penzance, the Chairman, T. S. Bouiteo, Esq., gave the toast of the day, "Success to the Penwith Agricultural Society." He could not quite tell the age of the Society. It was established about 80 years ag(); at any rate, it was amongst the carliest societies in England. The first agricultural society ever started was in Scotland, in 1720. Some other societies, almost entirely confined to the extreme North, were originated between that time and the year 1770 , which gave birth tu a societ,y which had been one of the most successful, vizan the Bath and West of England. He thought that might be looked upon as the oldest English legitimate society. Azriculture in these isles was at the lowest point until within the last 200 or 300 years. The population was scanty, and they were ill-fed. In the took some trouble to ascertain the quantity of animal food consumed in Cornwall, and he then found that the number of bullocks slaughtered did not exceed 16,000 a-year. Within the last few years an estimate had been carefully prepared, showing that the number of cattle slaughtered in Cornwall during the year 1861 was rather over than under 25000 . If that had occurred in Cornwall, he had no doubt a similar inprovement had tuken place elsewhere. He was aware that some cattle were brought into Cornwall, and he found that about 4000 head of cattle wore lauded in Cornwall last year; but, on the other hand, he was aware that a
very considerable number of fat cattle were sent out of Cornwall, either slaughtered or alive. Probably he was not far out of the way in saying that the number of fat cattle sent out of Cornwall amomuted to about 1500 or 2000 , which must go in diminution of the 4000 . He bad no means of knowing the number of chttle sent out was a yory inportant trade in, whe northey were aware country, but he had reasons to believe that the trade was not less in weight than it was in the year 1812. Now he maintained that much of this improvenent was to be nttrihuted to agricultural societies. Therefore it was that he askod for support to these societies. Still more did he ask for the sake of what this and other societies must be hereafter. He was ton well known to be set down as an enthusiast; but he firmly believed that England was destined to produce very much larger
quantities of food than she had hitherto produced. The quantities of food than she had hitherto produced. The
present high price of animal food was a subject of universal interest, but he regarded it without apprehension, being one of the means by which British agriculture would by-and-by take its proper place anong the various industries of the nation. The total number of animals imported into England in the year 1864 was 180,000, being a very large increase on what it was before. He believed the imports of 1863 were something like 110,000 ouly. The number of sheep imported was just half a million, which was no very great increase on former years; but he was surprised to find there was a very large increase in the number of pigs. He believed there were 85,000 importerl last year, as compared with 25,000 the year before. Now, these were
important facts-and it was for them to seo whether they could not prevent the necessity of such a large importation of cattle. He firmly believed they could. It was very true they might not be able to produce all the corn their friends required, but he thought they could compete with cattle and corn. Now what was to be done? First, the landlords must not be behindhand
in doing their duty. He had very lately been travelling in doing their duty. He had very lately been travelling struck with points counected with agriculture, but nothing attracted his attention more than the great saving of land which was effected wherever he went. He did not think there were any very large tracts of land in Cornwall lyiny waste, but he thought there was
a vast number of small tracts, and he considered it was a vaat number of small tracty, and he considered it was one of the duties of the landlurd to place them in a state
of cultivation. Secondly, is struck hion that they nught

dipping the well on July 15 .
to bring a very much larger number of sheep into Cornwall, but this could not be done until they had
better fences, the provision of which he looked upon as being another daty of the landlord. With regard to their buildinge, in no county in England were greater improvements being effected, but still a very large That was another difficulty which they must get over. Then, again, he thought it was the duty of tbe landlords to do as much as they could, each in his own sphere, to promote the improvement of stock. What was to come
of legislation? On some occasions it certainly had of legislation? On some occasions it certainly hat
done some good for agriculture. Among the things it did for agriculture was the Tithes Cornmutation Act, but he should like to see legislation go one step farther and pass a Tithes Redemption Act - in order that the landlords might have an opportunity of reducing the tithes, of which, he believed, a great many would avail themselves, thereby giving
them the largest possible interest in the cultivathem the largest possible interest in the cultivathe farmers of this country would have to contend with reat difficulties. They were surrounded by most formidable coinpettitors, for he saw in France and other parts of Europe a determination on the part of the Governments to foster and encourage a spirit of emulation among all classes, from the nobles downwards, on
behalf of the agriculture of their conntries. The improvements going on in those countries wer great. Adverting once more to the necessary improvement in agriculture, he observed that the first thing which struck a person was the presence of an enormous quantity of weeds. They all knew it was a very unsightly thing, and there mnst be gteat improvements in that respect. To the Grass and seed he did not think sufficient attention had been paid. He was by no means sure that the day had not come when their system of sowing Clover and Rye-grass would be abolished. The next question he wis the conoma one of still more impurtance, viz., the economy of
manure. When he suid that no less a sum than \(2,000,000 l\). of money was spent last year upon guano, he thought that the importance of economy in the manure of their own farms must force itself upont then. A very large portion in that neighbourhool was entirely wasted. It was not only econony in the saving of manure that should be observed, but in the application of it also. What dit they see done in Scotiand? In ore place in the neighbourthond of Glasgow there was a farm on which were kept 700 cows, and those cows yielded 15,9002 ., being over 222 . per head, a result mainly attributable to the use of liquid manur regard to piss there had been a most astonishing increase, for last yea! 6966 were sold in Penzance market as comparen with \(40: 0\) for the previons year -Abridged from the Royal Cornwall Gazette.

Norte-east Ireland: Best Breeds of Cattle for Ulster.-At a late weeting of this Association, Mr
R. O. Pringle, of the Farmers' Gazette, read a paper from which we make some extracts:-Ulster present a variety of circumstances which nocessarily affect, the character of the stock suitable for it, large tracts of fertile low. lying lands, and, agaiu, equally exteusive
ranges, which consist chiefly of elevated mountain pastures, where stock-keeping is pursued under very different conditions from those which affect farmers in more genial localities. Then there are districts of a prevalence of small farms, of which there is a larger proportion in the northern province than in any of the though thisces into which Ireland if ect the descrip though this fact does not necessarily affect the descrip
tion of castle best suited for a particular district, yet it does affect cattle management in those districts, and is altogether too importaut a matter to be wholly overas a cattle-producing province that has for many years been possessed by the other provinces, yet we are well aware that, wherever the subject has been properly attended to in Ulater, the results have proved that as good cattle can be produced iu "the Black North" as
in any part of Irelaud. The latest iuformation we possess on the subject, as given in the general abstracts of Irish agricultural stittistics for 1864, shows that there are in Ulster 923,283 head of cattle, of which 430,659 are milch cows. If we take the different classes given in the Registrar-Geueral's returns as an
index of the cattle trade of Ulster, we must at once perceive that only a limited proporion is retained after they are two years old. The majority seem to pass from the rearers into other hands, so as not again to come into the annual stock-taking while under two years old. The business of the Ulster farmers is therefore, to rear young cattle chiefly for exportation and this fact assists us in arriving at certain con
clusions affecting the question we have now under consideration. Those who purchase the young beast reared in Ulster naturally wish to have a thrifty description of eattle, which will grow and fatter readily when put on gond keep; and it is the interest of the Cister farmer to supply his customer with the
kind of animal which best suits that customer's views.

The first nuinber of the new series retains the charaeter which the work has long possesped. It is extra profession journal with a good deal more of the matter of its contente, than agricultural journi's generally exhiont. We have in :t the rhetoric of a
quarterly review, the substantial technical and profes sunal intormation of a farmer's journal, and the discursiveness and suggestiveness of a periodical for general readers.
Tue present number contains a very interesting necount of Scottish enterprise in Ireland, in which jnstice is done to Mr. Pollok, the owner of large estates recently acquired, large parts of which he caltivates himieif. We have extracted portions of ths puer for
publication in our columns. There is als, a continustion of the articles descriptive of farm crops-q paper on the destruetion of the grub-the history of the woo trale, by the Old Norfulk Farmer-an engineering paper on water and its uses-a pieture of Galloway and its agriculture - a goad article on our musenme, from which we shall give an extract on the agricultural wuseums of the country-a history of arclimatisation in Francean account of the usetul animals of Turkey-papers o the Rhododendron, on eattle disease prevention, on Bromus Schraderi, the Earmers' and the Gurdeners' note books, and a quarterly summary of agricultura proceedinge.
It will thus be seen that there is great variety f material offered this month to the readers of the Quarterly Journal of Agriculture," of the quality o which our readers shail have ample opportunity of
judging, for we have marked an unusal namber of pages for extract.
Meanwhite, and us belonging especially to this season of the year, we tuke Mr. Bowick's account of the way in which he deals with the Turnip-fly :-
A. large portion of North Bedfordsthire is situated on the 'gault clay,' a soil which is spoken of as 'birdlime in winter and steel in sumner.' A recent analysis by Professor Voelcker of the soils of variour fields on these farms gives them in general terms as an unmitigated poor clay; and Prufessor Buckman's deductions froin an examinition and report of the indigemons plants are precisely of the same character. Need it be wonderel at, then, that even with the aid o steam cultivation rery fully applied, the bruird of Swedish Turnips is not of a kindly nature? Ous annual rainfall also being but abont 18 inches, does not indicate a root-growing locality on sucd a 8 . il. It is the very abode of the Tornip tiy, nnless sowing
delayed till a late period of the selson. Last year sowing after sowing was repeatedly cleared of by them. This season, atthough the ly was equally abundant, we have a good plaut, and propose brietly th detail the preventive and curative menns emploged. Tusser was undoubtedly right when he wrote-

\section*{Where clods prevai!
The Turni!s fail.'}

And, therefore, a fine moull is the object ained at b! Turnip growers on both sides of the Tiveed. We gais this butter ly ridging op before Christinas (the lam daving heen stemementivated after harecst), then carting (hit the farm-tard dang during frost, ans onvering it by reversing the ridges shortly after. Then lie thas till April, when they are hurrowed down, thi
-not reversed. The fine winter mould is thus lept at the surface, where it is required. Sowing does not inmediately follow, but time is allowed for the mo:sture from beneath to find it way upwards again, which it is eure to do. This point we would particularly recommend to the notice of northern growers, whoare so careful, and justly so, about immediately covering up the dung, and sowing quichly thereafter. If you can
do this, well and good; but if you have nut a satisfactory mould, owing to the season, ic., then it will be better onould, owing to the season, d.., then it will be better
to roll down the ridges and wait for a week or ten to roll down the ridges and wait for a week or ten
days before sowing." This will eecure a cool bed, whereas in the other case the seed goes among small, hard, and dry clods : part of it germinates and part dues not; but the Hy clears off the whole.
"Anything that disturbs the Turnip fly weakens its that a dreasing of 1 guarter phat. But we have found acre, applied along the rows just as the braird is above ground, very effectually checks their ravages for a few tays. Even if applied as hot as men can bear to sow it, the phants will not be injured. In a week the is sect pest may again be visible, hut considerably weakened. Then roll after six in the evoling with a light wooden roller, and another check will be given. same operation in the inorning beconse if ang plants are bruised a scorching sun does bot so speedily follow to injure the wounded leaf.
ilorse-hneing freely and closely, as soon as the rows are visible, we also find beneflial. For this purpose we emplay the Suff,lk steerage-lioe, spreading 7 or 8 feet-a most useful implement.
"Mnch has been suid about sowing plenty of seed. In itself this is a goad thing, but rersevering attention to the few preceding himts has saved a crop where only
I lb . of sced to the acre was sown; whereas a disiogard of liming and night-rolling has lost the crop, even with 6 lb . per acre. And there is, after all, one comfort, in that we are not so necessarily dependent upon the Swede crop as our favoured light-land neighthoures. Mangels do well on the clay, and Cabbages do bettef. for we had a crop last year for whichs à much pet ace was offered as the land cost. Then with Thres and Rye for summer keeping, a fair return of ment per acre can be obtained."

\section*{Miscellaneous.}

Effects of Stean Cultivation.-He had often heard persons say, "I have done the same thing by horses that you have dune ly steam; I have cultivited land 1 foot deep by horses." Now, in that lay the "eror-a want of perceptions of the true bearing and merit of stemm cultivatious. IIe believel that the worst enot of tackle ever sent out was better than horses, had for this simple reas m, that if they turned back a furrow that liad beun plonglied by horses, especially if they trad the number of horses required to plough heavy land, they woul I find that the footmarks of the horses inade the soil impervious ty moisture. The consequence was that if they broke up that land in the autuinn, they would have to do it over arain in the spring. The wet being unable to percolate through the subsoil, made the surfuce what they had no doubt all had seen on heavy land - a very nice tilth on the top, with something below like liver. That liver had to be clodcrushed and harrowed in the spring, and it never became a fine tilth. But let them put the steam plough on that land in the autum, or let there be spade labour, whiclı was the same thing-thongla he reilly believed that steam cultivation was very olten better
than spale labour-and the land would be buken up in large pieces, and the larger the bitter. Let it then be dry during the winter season, and the atmosphere would act on the surface, and the froat bring it duwa. They would chen lave as beautiful a tilth in the spring, newly barrowed, as they could possibly desire. Mr. Eowler.

Sule of Rare Kggs.-Mr. Stevens sold a few days since, at his rooms in King Street, a collection of eggs and akins of very rare birds. Included in the former were four egge of the Great Auk (now extinct). The prices fetcled were as under, and go far to show how keen is the taste for all relating to natural history :Lot 140, egg of Great Auk, 29t.; Iot 111, ditto, 332.: Lot 142, ditto, 31l. 10s. ; Lot 143, ditto, 291.; total, 122l. 10s. One egg of the Casarca or Ruddy Shielarake fetched 12 . 16 s., which is rather rematkable, as living, specimens of the bind are, counparatively speaking, in all ornitholegical collections.
Touch. - The touch may be good or bad, fine or harsh, or, as it is often termed, hard or mellow. A thick frma skin, which is generally covered with s thick-set, hard, short hair, always touches hard, and indicates a bad feeder. A thin, mengre, papery skin, covered with thin silky hair, bengg the opposite of the one just lescribed, does not, however, affiord a good toneh. suck 1 skin is indicative of weakness of constitution, though if good feeding properties. A perfect touch will be found with a thick lhose skin, floating, as it were, on a pyringing back towards the mingers like a picce of soft

thick chamois leather，and covered with thick，glossy， soft hair．Such a collection of hair looks rich and beautiful；and seems warm and comfortable to the animal．It is not unlike a bed of fine soft mosc，and
hence such a skin is frequently styled＂mossy．＂The sensation derived from feeling a fine touch 18 pleasur able，and even delightful，to an amateur of breeding You cannot help liking the animal that possesses a fine touch．Along with it is generally associated a fine symmetrical form．A knowledge of tonch can nily be acquired by long practice；but after having acquired it it is of itself a sufficient means of judging of the feeding quality of the ox；because，when present，the properties of symmetrical form，fine bone，swee disposition，and purity of blood，are the general accom paniments．Mr．Douglas，of Athelstaneford，quoted it Pallarton＇s Cow and the Dairy．

Messrs．Raynbird，Caldecott，and Bautree，Basing． stoke．We are glad to learn that the first prize，a gold medal，has been awarded to this firm at Cologne for their excellent collection of English Grasses and grains． The collection is presented to the Roval Agricultural Academy of Toysyselsdorf，near Bonn．

\section*{Calendar of Operations．}

Jorx．－Early Harvesting of Grain．－We extract the following passages chiefly from Mr．Hannam＇s writings on this subject：－It would certainly at first appear that the farmer cannot be wrong in allowing his grain crops to attain maturity－to become fully ripe；ancient practice， so far as it goes，would certainly justrfy him in doing so．And if by the period of maturity the time be meant when a plant has acquired its greatest value as an article of food，certainly this stage in the growth of every cind of crop ought to be attained before it is harvested；it is，however，by no means certain that maturity in this sense is not attained by our corn crops at an early period in the process of ripening．Indeed it may safely be asserted that grain has passed the period of perfec－ tion，and has begun to lose its value before it has become dead ripe．In support，of this the testimony of all nature may be arged that strength and vigour progress with growth only up to a certain period，
General reasoning，however，of this kind could never have been so influential with any farmer as to induce him to alter so important and time－sacctioned a prac－ tice as that of leaving grain to ripen thoronghly．And， practically speaking，the question remained undisturbed till Mr．J．Hannam，of Kirk－Deighton，near Wetherbs， Yorkshire，now（1861）Secretary of the Yorkshire Agricultural Society，in the＂Quarterly Journal of Agriculture＂for June，1841，boldly asserted that the prictice of allowing Wheat to become fully ripe was an prictice of allowing Wheat to become fully ripe was an ot a careful and elaborate experiment made during the previous year，1840．In 1841，Mr．Hannam continued his inveatigations on a still more extensive scale，and the results thoroughly corroborated his former conclusions． In September，1842，the details were published in the ＂Quarterly Journal of Agriculture，＂and the question was discussed at length，the conclusion being that the best period for cutting Wheat is when it is raw，i．e． from 10 to 14 days betore it becomes thoroughly ripe． Mr．Hannam＇s first experiment was executed in 1840．Three samples were cut，viz，reat

＂From tris we see，＂says Mr．Hannam，＂that the bushel of No． 2 gives more four thain the bushel of No． 5 by \(\frac{4}{\dot{t}}\) ．，show measures of grain，and of nearly 8 per cont．of flour in favour No． 3 upon equal weights of Wheat．＂
The theory upon which Mr．Hannam explains these results is，that as the sugar in the green plant becomes changed into the starch of the Wheat， 80 if permitted to remain till fully ripe another change will take place，the starch becoming gradually con－ verted into woody fibre；for it is a well－known chemical fact，that sugar，starch，and fibre are composed of the same constituent elements，differing only in the quantity of water combined with their carbon．
This gradual change to woody fibre takes place in many vegetables as they ripen，and it is by taking this into account that we can explain the curious fact shown in the tables that the ripe Wheat contains 50 per cent．more＂pollard．＂or＂sharps，＂－than the ＂raw cut grain．＂Hence it is no wonder that there should be less flour in the grain of the ripe Wheat．
Fences．－We quote the following from a paper on Fences，read by Mir．Martinson some years ago，before the Newcastle Farmers＇Club：－＂The weeding and otherwise cleaning the heतges should be done twice every year，until the hedge has surmounted every obstacle to its growth．The hedge should be carefully pruned the second year，in order that it may get thick and bushy．This is a very easy operation，performed with a liedge－knife．I would recommend it to be done twice year－once in winter，and again in the latter end o yuly－once in wor \(I\) whlr follow the advice of a very intelligent and respectable gardener and nurseryman in Scotland，who，when asked this question，＂When is the best time of the year to prune Thorn hedges？＇answered，＇Whenever your knife is sharpest．＇It is of great importance to have a sharp instrument with which to perform this operation，whic must always be done by an unright stroke of the hand． I do not like the principle of cutting or dressing bedges with shears．The cut is not so smoothly made；the surface is therefore more liable to be injured by wet；besides，a man with a good switch knife，who is an expert workman，will do double the quantity in a day than he would do with the hedge shears．When two men are employed at one time in switching the samo hedge，viz．，one on each side of the fence，they ought to begin at different ends，the one cutting up the hill and the other down．The Thorn hedges I would continue to prune oace a year，after they have attained the leight of about \(4 \frac{1}{2}\) feet．Indeed I do not see much neesssity for having them higher than that at any time．They ought to be about 2 fee wide at the bottom，and taper away to a point at the top，at the hight above stated．For want of attention ，at at to pruning ad ared unsightly fences．If some of those have got any dressing at all，it has been performed on a principle which cannot be too highly denounced；I mean that of cutting off the under twige，whilst the higher branches are left to overhang the roots of the hedge，and ulti－ mals ruin the fence mis what farmers call the dressing up of the dykeside．It is certainly more like dressing out the dyke＇s heart．＂

\section*{Notices to Correspondents．}

Agrioultural Merting at Plymouth：Prize List．We un－ fortunately omitted mentioning the high commendation received for a Shnrt－horn heifer calf by Mr．B ughton Kingdon，of Rose Hill，Exeter．The jurges were for some time in doubt as to whether they should not award to it the \(2 d\) prize．

\section*{EARTH CLOSETS AND COMMODES. (Moule's Patent.)}

\section*{manufactured solkly by}

\section*{WHITE \& CO.}

29, BEDFORD STREET, STRAND, LONDON, W.C.

\section*{Tie pecullar Advantagrs of these Closets and Comonodes over thr ordifary}

First.-That the deodorising material (dry surface earth, or clay, or other subsoil) is the best for the purpose, ind at the same time is the cheapest and within the reach of all classes
Seoondy:-The supply of such material to any house or premises may be much easier than the supply of water Ir s forcing purup, and its removal after being used may be entirely without offence.
Thirdy.-Its application by the means provided in these Closets is immediate and effective; so immediate that no ficuire sinell need escape into the room or building in which they are used ; and so effective that all fermentation ad all escape of noxious gases are entirely prevented.
Pourthly. - The expense of these Closets, in comparison with that of Water-Closets, is, as to the first cost, rifing, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are nu and pipes to burst in frosty weather.
Listly:-In all large Establishments, such as Hospitals, Crion Houses, Schools, Grools, and Asylums, a very asiderable sum may be saved annually in the production of a valuable manure.
The etticiency of these Closets is so great as to be scarcely credible to those persous who either have not uste \({ }^{3}\) bem or seen their mode of action.

Price of Apparatus without woodwork, 25s. per set. -. The difforent forms of Closets may be seen at the address above; and Prospectuscs will be forvarded on application.

\section*{HOTHOUSES FOR THE MILLION.}

\section*{AWARDED A PRIZE MEDAL, 1862}
on the principle invented and patented by

\section*{SIR JOSEPH PAXTON, M.P.}

COMBINLNG SUMPLICITY, CHEAPNESS, EXCELLENCE, AND DURABILITY.
being capable of fulfilling in the most perfect manner ahe the requirements of horticulture.

MANUFACTURED for the AGENTS, in LONDON ; NEWTON in CARTMEL, LANCASHIRE; GLOUCESTER; COVENTRY; ABERDEEN, and PAISLEY ONL\}; in order to supply the Neighbouring Districts, and to save purchasers unnecessary expense in Carriage.

These PATENT GLASS HOLSES are composed of simple parts, and may be lengthened and arranged to form the boundaries of Gardens; they cost less than Dri: \(\mathbb{F}_{1}\) and insure a certain crop of Fruit. As Portable Structures they may be removed and refixed at little expense; and though calculated for Gardens of the highest order, tie, from their cheapness, desirable for Market Gardens, where they may be made to cover any extent, as also for Suburban Villas and Cottage Gardens.

\section*{TESTIMONIALS.}
"Grosvenor House, May 19, 1863.
"The Marquis of Westminster writes, in reply to Mr. Hereman's note, to say that he has much pleasure in informing him that the Glass Houses for Peaches, \&c., which he constructed for him in Dorset, 18e0, have fully answerod thoir porpose, and prove very antiffactory."
\[
\text { " } 5 \text {, Prince's Gate, S.W., May 10, } 1863 .
\]
es Str, -I am happy to be able to inform you that the Lean-to Roof which you sent to mo at Bryanstone is most successful, and I am quite satisfied will repny its cost.
"Mr. S. Hrreman."
"Yours \&c., Portmax."
" Belgrtive, near Leicester, May 20, 1863.
" Str,-The Lcan-to House Whioh you supplied to me in 1860 has fuly answered my espectations. The House is planted with Vines, and Figs on the baek wall ; there is no artificial hent, and, though last year was a most unfarourable one, some of the bunches of Black Hamburgh Grapes welghed more than a pound, and riponed woll for the seasor
"The material and construction of the homs have proved hicaly matisfuctory.
"Mr. Herbyas."

\section*{" Johusoun Hall, near Silpeshail, Staffordshire, May 11, 1sib3.}

Sir, -1 haro had In operation for several years, Lean-to Vineries nade with your 11 feet sashes at an angle of abont 50 degrees, the lower or front wall being 3 feet high. Nothing can be mere simple than their construction; the mode of ventilation is excellent, and entirely obviatos the annoyance and breakage caused by movable sashes, and I feel much plensure in ree mmending these structures.
"Mr. S. Hereyax"
"Yours, \&ec, Edward Lyon."

\section*{"Wath-mpon-Dearne, near Rotherham, May 18, 186s,}
" Dear Sir,-The three small Glass Houses you sent me answer admirably. The Lean-to with 16 feet sashes covers now about 25 healthy and strong Vines; last year the produce and quality of the Iruit were surprising. * * * I recommend tevery une whó is so furtunate as to take pleasure in his gardev, and who onn afrond the expense, to erect one or more of your cheap 'Hothouses for the rillion '-a nover-failing nource of proflisble amasement.
"I base other more costily and oxtomive glems structures, but, having regard to their cost and effleiency, they bear no comparison with those I had of you.

\section*{"I am surprised that marketigarid deass do not adupt them more geaurully.}

"I remafa, \&u, G. P. Nicrolsor."
" Inverary [Castle] Gardens, May 2, wren
"Dear Siri, -1 have much pleasure in bearing teastimony to the efficiency of the Lemato \(G\) Houses which you erected here for covering in Peach and Fig trees. Although our mall is 17 fa: the fruit sets regularly over the whole surface, and, with the command of ventilation thess buase = fruit can be forwarded or retarded at pleasure.
"Mr. S. Hearanar." "I remain, \&c., Jorm Cate" [Gardener to His Grace the Duke of dert
"The Grove, Stanmore, May Lis Lie
"Dear Stir, -I am happy to informe you that the Glass House supplied by you asssen er expectation. I am using one division for Cucumbers, and the other for beddins-out plazs th. thrive remarkably well, being so near the glass, and having a thorough ventilation, which your are. of construction so ampiy secures.
" Mr. S. Непужам."
"I remain, \&c., W. Laswrs " [Gardener to Juseph Gilioth, E...
"Newton Narserien, Chenter, Janongry, M"
"Sirs, - The ' Spari-roofed House' you sent us is ALL wz could wink, and suita us very well Tr do not grow Grapes, and therefore cannot speak as to tte efllcienoy in fruit growing though wim Liothing in the formation of the house to lead us to foar it would not grow anylhtrg an milims reanto poofe * * ". The 耳 once put up and at work.
"Meaers. S. Heaka
"Yours, \&c., Jayss Dicteorat 50ss."
"Linden, Wellington, somerret, Jmums is:
 well for Vines which are grown without much foreng. Last autumn 1 had the fias: Grryo. . which I erer salv, * * * I also find it very useful for keeping Bedding Plants in durrag wow \(\overline{\text { \#um }}\) in fact anything which ouly requires to be shielded from frost.
"Mros, HFHEMM."

\section*{"Yourte be., Burving Fis}
"Benham Park, Newbury, Berks, Janaar: it
"Bux, \(;\) I am plensed to inform you tio Putent Glass Houses supplied by you 2 sears \(a_{0}^{*}\) D.... great satisfaction. * * * We had a splendid crop of Muscats in one house ; and in: 2 house West's St. Peterthis and Lady Dowines' Soedling. Wo hat an oxtre division put in :1. . Puach House: the trees have done wonders. I took the First Prize for Muscate, and Yint i. . Nectarines grown in your Patent Glass House at the Newbury September Show.
"Mr. S. Herlman."

" Ashurst, near Dorking, Janalary !., :-
"Sir,-lin answer to your inquiry of the 10th, respecting the rango of Houses funn biew th gardens in 1880 by you, 1 am pleased to say the Vines, *c., have been everything that coliat for. As a proof of the quality of the fruit, I have reeeived two First Prizes for 3 luscai. Com in thib rango in 1863 and 1561 . In my opmion these Houses are well adaptod Orchard Houses, \&c.
"Mr. Heremaro"

"Without any pretence to high finish or elaborate workmanin, which in such structures represent a mere waste of money, they are perfectly well male. arrangement is as simple as ingenuity can render them. No ratters wbscure the light and make them cumbrous. No sashes have to be'pushed up or let down by erenir lines and weibhts, or by expensive mechanieal contrivances; ind yet all the ventilation requisite in such buildings is as perfectly secured. ** * \({ }^{*}\). It 15 thenh lines and weights, or by expensive mechanical contrivances; and yet all the ventiation requisite in such buildings is as perfectly secured. portability that must give them a peculiar value in the eves of the public. If we hire a house for two or three years, and are enthusiastic enoug an and and remore
renains the absolute property of the landlord at the end of the terns. but, if instead of tixing up we drop down one of these Hereman's, we pack renains the absolute property of the landlord at the end of the ternt. But if instead of Gaxdeners, Chronrche," July 28 th, 1860 . CONSERVATORLES, GREENHOUSES, sce., tor Designs can be had on application to

\section*{Che Garuentrg Chromitle.}

SATURDAY, AUGUST 5, 1865.
\[
\begin{aligned}
& \text { mbetinas for the ensling week. }
\end{aligned}
\]

We invite thus early the attention of those who are interested in improving the aspect of their Flower-gardens to the display of Scbtropical Gardening at Battersea Park, for twu reasons. The first is, that owing to the rery favourable nature of the season, the plants have this summer put on the aspect of luxurious contentment, which \(t\) is so desirable for them to attain, sooner and more completely than was the case in the less congenial summers which have passed over us aince Mr. Girson commenced this style of gardening, as must be evident from the fact that Ficus elastica is already in luxuriant growth, rooting like a Willow in the Battersea soil ; and that Hibiscus rosa sinensis is flowering and seeding freely. The second is, that a more lengthened experience, as was to be expected, has resulted in a more perfect selection, and a more tasteful arrangement of the still remarkably varied and, in many cases, unex pected materials which Mr. GIbson so well adapts to his purpose.
Our ohject is, homever, not now to enter upen any detaled description of the plantiug of the various beds and groups, so much as to point out a fer of the most successful and effective
combinations; to recall some of the conditions to which, in our opinion, Mr. Grbson very reasonably attributes his success; and to record the fact that Suhtropical Gardegire has heen sn great a suce:ss in this suburban park, that the First Comuissioner has consented to its extension, in consequence of Which a very considerable spaos of ground, necmpring a peninsular position on the north side of the lake, has just been opened to the public. Here, in the future, we may look for novel scenes of beauty; but in the meantime the gems of this year's planting will be found within tho old subtropical area.
One very beautiful oblong group consiats of a centre of rather tall plants of Centauria gymnocarpa, whioh Mr. Gibsons has planted freely this year; this is flanked by a must telling border of Coleus Verschaffeltii, and that again is bordered by a row of Sempervivum californioum, sitting lose to the ground. The effect of these close succulent margins, which we observed were repeated under various conditions, is very pleasiug. Another most effective oblong space is filled with ogitudinal bands of highly-coloured Mrs. Pollocks, on a deep green carpet of the close-growing Lithospermum iraticosum, now out of flower, but which in its seascn must have been itself an object of surpassing beauty. A third very pretty and airy looking group consists of a centre of the white and pink variegated Vitis heterophylla variegata, surrounded by Lonicera aureo-retioulata, so trained as to appear like a basket margin. Prohably however the most telling bed of all is Coleus Versohaffeltii, remarkable for its intense bronzy crimson, anbroken by weakness of tint at any point, and bordered at just the right height by the elegantlycut silver leaves of Centaurea gymnooarpa. This group is very beantiful -hardly so effeotive perhaps as when the broader-leaved Centaurea ragusima is used as an edging, but still so perfect and so lovely that critioism is disarmed. Near this is a bijou group, fit for any drawing-rom. The narrow-leaved Dracma australis oernpies the centre, and round about the stem of this, cluthing the earth with verdure, is the simple dwarf Begonia semperflorens, or some allied species. Outaide this is a belt of Selaginella dentioulata, on which are set out at regular intervals alternately, plants of the brightly-coloured Dracrenas, Cooperi and ferrea variegata, the Dracænas iu turn alternating with tufts of Centurea ragusina compacta. Outside the Lycopod is a narrow close line of Saxifraga pectinata. The fine colouring in this group is most strikiug, and its freshness is secured by simply using a slight screen on the sunny side during the hottest portion of a sunny day
We may add, that Iresine IJerbstii is dingy and ineffective in all the different situations where it has been employed at Battersea, and may be written down worthless ; that notwithstanding the fine colour sometimes obtained from Amaranthus melanoholicus ruber, Mr. Gibson is decidedly of pinion that none of the red-leaved plants approach in merit to Culeus Verschaffeltii ; that this latter is less effective when a belt of the dingy Coleus scuteilaricides atropurpurea intervenes between it and the Centaurea ragusina: and that in one of the outer drives, a very neat effect, just thet of a stone kerb, is produced ly a narrow even line of Cerastium tomentosum, clusely clipped so as to give it a rounded surface.

The secret of success with these tenderlings at Battersea is bottom-hent and fresh moderately emriched soil. It is the feeding that gives the brilliant colours for which both thessoms and foliage are remarkable everywhere at Battersea; and it is the botiom-heat that induces the more tender plants to thrive there so perfectly. But how is the bottom-heat provided-by trencties filled with fermenting manure? No: hut hy brickbats! The manner has heen well described by Mir. Gibson himself in our columns (p. 986, 1863), and to them we refer for details. The effect of this use of hrick rubble is n:0 donbt to store up, as it were, in close contact with the roots of the plants, the heat which is absortied when the sum is darting his fervent rays in such wise as to impinge on the siites of the prepared raised beds, these being so placed as to cutch as much of this heat as possible. Saffice it to zay, that a thick layer of brick rubble furms the base of the heds, which are raised some fout or more, and this rubble is brought out at the sloping sides, so near to the surface as to be merely covered by the turf There is consequently no ohstacle to the ready admission of l.eat when the sun is siinit.e. on the sloping margins of the beds, and from the noture
of the materin?, lieat orce arsortat is quickly
diffused beneath the soil. The plan involves some considerable labour in watering in dry weather, but the results are worth any reasonable amount of labour. In trath, we have here geothermal culture of the simplest and most effeetive kind.

Medical Education may seem at first sight somethat remote from the subjeots discussed in this paper, and yet it is one in whioh our readers are at least as muoh interested as any class of the community, excepting the disoiples of Æsculaprus themselves. But in order to avoid the oharge of not minding our own business, or of meddling with the affairs of others, let us endeavour to propitiate the "faculty," ever jealous of interference, by assuring it that our present concern lies solely with the mode in which Practioal Botany is taught in the great medical sohools of this metropolis.
Some time since, in the pages of a contemporary, a rather severe censure was passed by implieation on the teachers of Botany in London, and, to a certain extent, that censure was a just one. The fault, however, oertainly lies far less with the teachers than with the system in accordance with which they are compelled to teach. That we may not wander into subjects unsuited to the scope of this Journal, let us at onee call attention to one among the many reasons why medical students presenting themselves for examination as candidates for the medical service of the army, in India, and elsewhere, frequently show to suoh bad advantage. It is the want of a "Physio Garden" attached to the several hospitals, wherein pupils could see and examine at their leisure such of the principal medical plants as could be therein grown, What would be thought of a medical college without a hospital attached to it in which the students could see for themselves the "ills that Hesh is heir to," or without a dissecting room in whioh they could follow the deseriptions of the Professor of Anatomy? And yet there is not a single college in Londun that has a medical garden attached to it! Of course circumstances prevent the existence of suoh a luxury in most cases, though not in all. It would be quite possible to grow a few plants as illustrations of lectures in the ample domain attached to the temporary hospital of St. Thomas ; quite possible to do so at University College, perhaps even at St. George's. But as this is ciearly out of the question in most instances, we will draw attention to those means which the pupils have of acquiring a practieal and not merely a eloset acquaiatance with plants.

Our noble garden at Kew at once suggests itsel as affording ample resources for study in its unrivalled collections and museums. Not to wise co well suited for educational purposes, is ill adapted fur the requirements of medieal students, we have merely to consider its distance from the great hospitals. In the three months or less that medical students have to devote to botany there is no time to spare for frequent visits to Kew, beeause it is to be remembered that not only lectures on Botany, but at least on two other subjects have to be attended at the same time, in addition to daily attendance in the wards of the hospital.
Next in order to Kew we mav mention the Botanic Garden in the Regent's Park, and this really does good service. Many of the lecturers derive their supply of specimens from that quarter ; pupils are admitted under certain regulations to study there; and there is a well-arranged and gond selection of medical and other plants. Regent's Park, too, is far more easily accessible than Kew.
In the third place there is the garden of the Apotheoaries Suoiety at Chelsea, a "physio garden " in the old acceptation of the term, and this is, or ought to be, the garden for medical students. In a certain sense it may be said to be
their own. It is easily reaohed by steamboat or omnibus, and is within walking distance from most of the schools. Under the fostering care and superintendence of Mr. N. B. WAbD and Mr. Moore, this garden, endeared by old associations to many a practitioner, is a wakening to a new life of watulness. On a future oceasion we hope to return to this subject, for the dear old "Hortus Botanicus" demands fuller notice than we can give it at the present time. \(M, T, M\).

We have already recorded the discovery of Orchis pyramidalis with double flowers, but this it appears is not the only one of our native Orohids Which is given to dupliaation. Dr. Moore, of of Onectis Mascela wITH DnUbLE Flow ars, read
before the Royal Dublin Society a short time since. He observes :-

Another interesting instance of one of our native species of Orohis has been sent to me from the Bridge of Allan by Dr. Paterson, one of the resident pbysioians there. It is an early Orohis mascula, and the first time I believe it to have been ever seen with double flowers. Happily, the parts are so large, that the nature of the morpho-
logical ohanges which have taken plaee ban be well studied.

Mogun-Tandon, in his 'Eléments de Teratologie,' olassifies the prolifieations whioh take places in causing double flowers as median axillary, and lateral:-Median, when the oentre of the flower is ohanged and prolonged beyond its usual state, and leaving other buds, as frequently occurs in the Rose; axillary, when the prolification springs from the axil of one of the parts of the flower; and lateral, when the addition is rather to the infloreseence than to the flower itself. The remarkable ohanges which have taken place in the flowers of this Orohis aprear to embrace two of these terms-median and u.xillary.

The flowers are reversed on the rachis of the axis whioh bears them, the labellum being next the apex, in place of the sepals being uppermost, which is the normal state of the flower. The changes of the parts are very curious and interesting. On the sides of the labellum are two smaller labella with short spurs, and in the axils of these other flowers spring, thus rendering the morphology axillaty. These secondary florets have, again, rudimentary florets in the axils of their ohanged labella. There is no ovary, or column, or neotary distinct, though in some instances in the secondary flower they are apparently present in a very rudimentary state. The part where the column ought to be in the general flower is a mass of bracts and incipient tiorets, forming a depressed raceme-thus showing the prolification to ne median also. The malformed parts in the incipient Howers do not appear to exceed the usual number of pieces in the regular Hower of Orehis. This is supposed to be the second instanoe of median prolitication in forming the double flower of an Orohis, the first being that already noticed by Dr. MAstens, relative to Mr. Foot's Orehis pyramidalis.

I have now another remarkable instance of duplioation in an Orchid flower, though caused in very different manner from that of the former. It is the beautiful Calanthe veratrifolia, a tropical species. The alteration in this instance has ocourred by the blending of three flowers into one, and is only partial on the raceme. The three Howers are attached to one solid peduncle, which
springs from the rachis between two braets, in springs from the rachis between two braots, in
place of one, which is the normal condition of the flowers. Each has its proper labellum, column, and pollen masses ; but there are only 10 pieces of sepals and petals, in place of 15 , which trould have been the case had the flowers been separate and normal. The spur on the middle flower is wanting, and in plaee of it are two petaloid pieces with green tips. It is further worthy of notice, that the flower on the rachis, whioh is immediately under the malformed one desoribed, is without a labellam altogether."

The Testrmonial to Mre thomas Ingram, which has been from time to time referred to in our columns, was presented to him at Frogmore on
Saturday last, by a deputation of the Comuittee of Hanagement. The subscriptions amounted to about 2301. The T'estimonial consisted of a bandeome tea and coffee service, manufactured by Garbard; a gold watch, by Frodsham; and a purse of 150 guineas.
The watch bore the following inscription :- "Presented to Thoinas Ineaky, Esq., by bis friende, on the soth anniverrary of his terviceis in the Royal Gardena, Windibot, July, 1865."

Horticalturists should be on the look out for DOUBLE-FIOWERED EPAORIDS. Such an one is now before us, and presents a great number of corollas, one within the other, to the entire exclusion of the staineas and pistile.

\section*{- M. Beceumatr has recently communicated to} Inpluenoe of Forests upon Climate. is stated to be extremely complex, depending upon the following considerations:- the size of the forests; the height of the trees and their nature, whether deciduous
or not; the power of evaporation from their leaves; the properties which they possess in comonon with other bodies of heating or chilling the air; and the nature and physical state of the soil and snbtoil. It is trated that France bas 16.7 per cent. of forest land, While Spain has but 3 per cento, and Great Brituin 2 per cent. M. Becquerel concludes that the climate of a country can be improved by cultivating the land,
by draining marshy districts, and by planting treen on
mountains, and on all grouud not used for mountains, and on all ground not used for agricaltani purposes.
 has six splendid outer petals, and three olosson, whicer ones, standing boldly up in the centre of the bloones indication of future double blossoms in this chive , race of plants."
- We understand that on Tuesday next then m He extibited before the Floral Committee of the find LiliUM AUratum, with 29 blooms upon it, the th bulb producing two stems, which bear reapeotind
15 and 14 flower 15 and 14 flowers. This we believe was grown by l it Constantine, gardener to C. Mills, Esq, Hillinato Court, Uxbridge, and certainly reflects great cred.t. the cultivator. It is, we believe, one of the origira. bulbs received from Japan by \(1 . . V_{\text {EITCII, and }}\) is mon kindly lent to him for exhibition by Mr. Milis, ITl hope so glorious an example of this Que
will have crowds thronging to do it honour
1851, was fagured a few yeats, which bloomed firt in 1851, was figured a few yeetrs ago at table 4707 of the Botaical Magazine under the name of Crrrbe Mo Mramoie, having been received from Hondura W. J. Hooker remarks, might pass the plant as 20 unusually large flowered night-blowing Cereus, but the slightest iuspection of the stem and branches, and the different nature of the flower-bud, line pateith petain and above all the great size of the flowers- 14 inches. diameter froth tip to tip of the sepals, that 14 inchan from the base of the calyz to the tip of the stigma-all indicate a most distinet species. The plant is now on of flower, but a comparison of the two species crea in this condition is quite enough to justify their senaratime. Sir W. J. Hooker, in a letter received very latels remarks, "It has been justly observed in a note to the description of this plant in the Botanical Magazine, 79, t. 4707 , that the figure reduced to one-half te natural size gives no idea of the magnificence of the Howers themselves. The plant at Kew, covering a great extent of wall and the rafters of the hothouse, be blossomed most freely during the present summer
(1865);" and Mr. Go iver, foreman of the propagation houses at Kew, has communicated the following menorandum on the subject:-"The Cereus Macdonaloive having flowered remarkably well this season, I har? ventured to trouble you with the following note cos. cerning it. The period of flowering has extended oret six weeks. Upon one occasion (May 30 th) eleven blooms were expanded at one time; upon another ten, and several times seven blossoms were open in the evening. During the month of May 37 blooms expanded, andis June 46, making a total of 83 blooms, a very grat many more buds were formed, but the plant had not the power to open them." It is greatly to be regretied that this and other nocturnal species of the genus can be seen by those only who watch the progress of the
flowers and visit the housea after sunset in the evering flowers and visit the houses after
or before suarise in the morning.

\section*{SEASONABLE HINTS ON DECORATVB} GARDENING.
MAy I take the liberty of indorting some of your emarks on Spring Gardening in the leading article at page 697, particularly about old-fashioned plants? hope we shall be able to resuscitate a good wiany of whe have any, to commence increasing them at once,-10 example, Daisies, both white and red, and t fashioned Hen-and-Chicken, which latter I have latterly been unable to find any where. We have no summer, or
you term it, autuinn Ribbon plant equal to a Daisy fan you term it, autumn Ribbon plant equal to a comple must be planted full at first, and not left to be filled by the growth of the plants. Now is the time to diriue the for securing a stock. They may be palled inw smallest possible pieces, and there is even tume
the autumn planting to divide them agais. I runs short there is no better
between the Asparasus beds

\section*{between the Asparagus beds.}

Let us suppose, for example, that three rom Daisies are wanted, tay white, next to that have one in Germany of a blue, or perhaps purple tint; this would be invaluable had in nost things that are grown in Germany had in England, we may hope to hear orld aliso be in a similar way at once. The new by Mr. Veitch, from Japan, will be g Our own single coloured varieties ha neglected of late years, condidering their and their easy culture. Pansies should aloo be careltuly in last month are struck, they will no planted out. Young plants are bes hero is alll time to get tine plants by asutuen her e in still time to get the seed should also be mmit hitt ings are put in no
res, m oud Matan toos taking in:
The prenent for, moseoves, a poide which for tating
midertion the general arrangements for spring, and ench seeds as Silene pendula, red and white , Tyontis of different sorts, if not done previously indeed, any annuals that it may be wished to try, such Collinsias, Saponario, red and white, Virginia Stock Lapins, dea; the latter are fine for tall rows. \(F\).

\section*{T. HIPRA日ITN MODE OF CULTIVATING ASPARAGUS.}
pur lollowing trauslation we have to thank Mr. Meredith Ir is an essential condition in the cultivation of Asparagus that the ground shoald be rompletely cared from all fruit-bearing trees, thickets or woody piants. Excellent re a sandy pritty nature; in vege cable mould, or one of a sandy gritty nature; in short has dic., which may become injurious, to the ruots of the plants. A calcareous, clayey, or marnhy soil will be less productive.
Preparation of the Ground.- When a convenient piece of ground has been selected, it is first of sll to be mellowed by spreading on its surface a good dressive of horse or sheep dung ( 1 cubic metre per are \(1: 0\) square yards, or 4 perches nearly, or about onertieth of an acre). The lowest layer of a duaghill, the dras of Grapes, or night-soil are likewise good manures. Tho ground is to be dug up to a depth of 16 inches in
fine weather at the beginning of winter, during which season it is to be left at rest.
In the month of February following, at least as soon 23 severe frost is no longer to be expected, the ground is to be laid out in furrows and ridges, in order to shape the shelving heds, and the excavations which are to receive the plantations. For this purpose the follow. ing operations are to be performed
First, there are to be drawn the whole length of the Tround, and by preference from north to south, two lines, leaving between them a space of 14 inches,
intended for the site of the first half-shelving bed. This halfshelving bed, of a conical shape, and 8 inches in heighit, is to be made with a spade, hoe, or other

Twice every day during a fortnight it will be well to pursue these insects with rods, so as to hinder them Asparagus; these thegs appear on the stalks of the Asparagus; these eggs appear at the end of three weeks in the shape of black maggots or worms, which prey upon the Asparagus stems and dry them up. Yet these insects are not the only ones which are to be dreaded. The white worms (or maggots of tree beetles) are very dangerous, and it will be well constantly to put in use the most proper means to get rid of them, for thev eat the roots and destroy the Asparagus plants. It will be useful also to lay mole traps, for while tracing their underground roads the moles cut the Asparagus ronts in order to get through.
Cominon vegetables, such as Beetroot, late Potatos, Cabbage, \&c., ought not to be planted on the shelving beds; but they may be made useful, only during the first years however, by growing on them ten-weok Stocke, Potatos, Lentils, and such other vegetables as are of little inconvenience from their dimensions.

Another mannor of Planting.-In a moist piece of ground the digging up is to be done to a depth of 20 inches, and the manure to be employed is to contain a little more straw. The ground is to be set out in trenches. The planting is to be done flatwise mithont shelving beds. Lines are to bo drawn by the rule, and the holes to be 40 iaches distant from each other. The arrangement of these holes may be quincuncial.
The plantation may be made in the manner already indicated. You rnay likewise plant upou old beds at a distance of 32 inches, and with a depth of about 7 inches. The plantation may also ho mado keparately or in the vineyards, always observing the directions given for the operation.

In the month of October, 'during fine and dry weather, whatever may be the sort of plantation. the small stalks of the Asparagus are to be cut off at 6 inches above the ground. The ground is to be lightly cleaned, and the shelving beds must be dug up to a depth of 12 inches, mainkaining their conical scape.
The Asparagus is to be lightly dunged, the plante
found an exoeption, although its durability may be made more certain by cutting out the flower stems when they are first noticeable.
It may be said, "Well, we have tried the nurseries and cannot get this plant;" and I doubt if it is in more than one nureery in this country, and perhaps it is not to be seen in more than two or three botanic kardens. But what of that ? A new plant, perhaps of difficult propagation, is introduced, ani in a very fow vears there is enough of it for cuerviody: and so it might be with this Peucedanum. Doubtless it is now sooding in many continental botanic gardens. It is perhaps to the nurserymen who take an interest in such plants that I should in the first plaos commend it; and those and others who rnay be curious to see it may most readily do so at Kew , where it wasy be found among the Umbellates, as may most of the fullow ing, which are nearly equally desirable, and woll worthy of cultivation for like purposes:- Pemeedumun petrmum and longifolium, Molospormum aicutarium. and Lignsticum pyronaicum.
Umbelliferous plants ane usually a ragged lot, and mostly unfit to be seen in a benutifnl garden ; but thero are family that are of great beauty; and I am oonfident that if people could see some of those I have named they would at onoe think as I do, that it is searcoly economical to plece valuable tender plants in the oper air except when they furnish an "effect "that many not be had from a hardy plant. And they would also see that it is possible to have verdant and graooful plants in "the full sun" well as in shady pleces. However, some one might perhaps say they were out of thaee there after arranging a conservatory on the Litally dis? reat principle of using verdure aud grace to whinne the higher beauty of thoral colone and stareture-usimb them in fact to "set" the floral gems.
I cannot at present think of any other first-clase plants of the aspect of those I have named in this paper; and though there are many like the Acar thuses which somewhat approach them in general outline, I will place these in a different section. It i a large subject, aud I purposie hunting up the hest of several types of asnect, and shall try and minit the noost desirable harily plants for the margin o. fhe stately herbaceous plants ; the choicest of lunget spiny-leaved planta like Cymara hormit and dountan spinocissimus; and the noatost harity olging plnuts (of which there are many which have never boen used for that purpose, though invaluabie for it); and having sought out these subjects in
every bntanic garden worthy of the name in the United Kingdom, and in the chief nurseries where such plants are grown, not so much with the viem of recording the greatest number of plauts, as to find out those of real dietinctuess and beauty, I am not without hope that the seleotions offered will be found useful for varying and embellishing our gardens. W. Robinson.

\section*{ITome Correspondence}

Deloterioms Properties of the Seeds of Aqwilegit vulgaris.-Two or three bays aco a little bos, son of : friend of mine, was taken ill in a curious and for time unaccountable manner. He wirs much parred and lay about in a semi-comatome itato for nchera hours. On inquiry his little eister mid he had heen - eating seeds out of his tub." The latter wis a play children - from the ripe and full-chared foillicles of the plant jurst named, and had then swillowed a quantity. I do not know whether such properties havi been observed before in connection with the (')lumbine. In any case, the publication of these facts may mot he Without use. The boy recovered in the contsen ni the night, or at least, by the tert, day. Leo. I. Grindon, 85, Rumford Street, Manchester

Calla palustris. "Bow plante", in the frdex no your Number for July 22mt, reminde ' whe that m.re beanty than any native boe plant aftorlimar he had by planting in bogey places the smal trailing Arad, Caila paluatris, which has pretty little smick an. of those of its relative, the "Ethopiun Lily." It horoughly hardy, and thouch often: grown in water, likes a moist. bog much hetter. In a bog, or muddr place, shaded by trees to somin extent, it wi.l grow langer in flower and leaf, thomgh it is quite at homes. fully expneed. I have a small bog nearly covered with the dwarf dark.green leaves of this plant, and ss one nf its white flowers erops up bere and there along each rhizome, and just raives itzelf, fully expanded, abovo the leaves, the effect is thoroughty pleasing. Thowe having natural boge, de., would find it a very interesting plant to introduce to them. W. R
The Royal Horticultural Socipty.-A fews dass agn r received my copy of the "Proceedinos" of this Society, and was much surprised, on looking over its contents, to fini it stated, at puge 124, in the remort of an address delivered by Mr. Bateman at a mepriner of the Fellows held at Sninth Kensinyton ati :he 27 th of June, that the suceessful hybridiser. an 1 introtucer of the new and spleudid race of hardy Clematises, was Mr. Jackman, of Dorking! Now, althomgh mir principal marserymen and foricalturiats may know that such ir not the care, I conosive that the public such in not the came, generally, and those fors the
generally, and those Fellow
nut delay be informed that the merit of originating these magnificent Clematises is due to Mr. Jackman, the intelligent and respectable nurseryman at Woking, in Surrey. Another glaring mistake occurs in the aecond column of page 126 , where Mr. Bateman ie reported to have said: "Amonget these bouquets which are to ho balloted for there are several bunches of what gardener to Lord Carnarron, at Highden, for many years"!! I cannot for a moment suppose that Mr. Bateman, who is so justly distinguisised for his scientific attainments aud perfect knowledge of the genera and pecies of Orchidaceous plants, should have made such an erroneous statement respecting the genus Govenia; and I think it is mnch to be regretted that the prool-sheet of the address was not submitted to him. Permit me to say, that the genus Govenia was founded on the Maxillaria superba of La Llave and Lexarza, and was named by Dr. Lindley, in compliment to the late Janes Robert Gowen, Esq., under whose care were conducted many of the curious experiment upon cross fertilisation at Highclere, near Newbury, the seat of the Earl of Carnarvon. Mr. Gowen was no gardener, but was long well known for the great interest he took in the more refined and ornamental branches of gardencultural Society, and in 1848 and 1849 filled the office of honorary secretary. In 1850 he was elected treasurer, and until 1854 assisted to keep the society afloat during its pasange through a portion of what may now be termed the second and most critical period
of its existence. Had the errors I have noticed appeared in a daily paper, they probably would have been allowed to pass without comment, but in the columns of a journal which is issued to supply what is expected to be correct information to the Fellows, I Consider
Strawberries.-The failure of the Strawberry crops
this year, and the difficulty which has been generally complained of for the last two years of obtaining early rumners for fresh beds, induce me to state my own friend the Rev. W. F. Radcly fe, and other real amateurs, may nevertheless prove useful to others. I take every gathering them with two inches of the string attached, by ones and twos as they appear, and peg them upon the tops of garden pots filled with earth pressed bard ; treat them like any other cuttings to be struck. By this treatment I laive plants well rooted in ahout a Seedling was from rumers of 1864, and so good, that I destroyed before iruiting a two-year-old bed of the
same, as I was ansble to net both. In my treatment and preparation of the beds for new plantations,
follow the directions of Mr. Cuthill's (of Camberwell) shilling pamplalet-"On the Cultivation of the Straw berry," except that as space is not so valuable to me as
to him, I take rather more room, but no lover of the also found his Prince of Wales invaluable these two last years ; it is a wonderful bearer, large in size, very
handsome, and of fair flavour, if allowed to ripen before plucking -a permission not so often conceded by, Straw berry eaters as it should be. I have found bone-dust suit my young plants well; and from the time of the fower truss appearing, up to the berries becoming tinged, I water as plentifully as I can with both guano hardier kinds of Strawberry will succeed fairly in any soil, so that they have but moderate care bestowed Gooseberry, and Carrant trees of the many be like those in many gardens which I have visited this year the fault does not lie exclusively in the season. Want of care before friting; neglect of renewing old planta-
tions and bushes; total neglect, in the case of the Strawherry, of the beds after cropping; to say nothing of the barbarous castom of mowing off leaves and all about this time, which I have actually seen done, are the chicf causes of poor crops in favourable, and of utter failure in difficult seasons, G. I. Mumsoll, Thorpe Malzor Rectory.
Ranunculus auricomus.-Mr. Gerard Smith, who (p. 675), may not have seen a paper of M. de Roche brumes in the ninth volume of the Bulletin de la Sociéié Botanique de France, p. 281, wherein the anthor points out seven degrees of transition between those cases in which the petals are completely suppressed, and those in which they are all present. M. T. M.
. Early Peas.-When we read the Report on th: at page 700 as "a singular one, not supported by any making t at report, had been imposed on or accidently did not consider it necessary to con:-
 at the same page, is also agree with one own. This being our conviction
after carefully then ing This being our conviction,
y sort of early Pea that has
lic since we introduced the
astonished to read the Report of the Fruit Committee of the Royal Horticultural Society, wherein three other Peas are said to be as early as "Sutton's Ringknown, and which we still most confidently declare to be the earliest Pea yet offered to the public. The only kind which has proved to be identical with it is "Carter's First Crops this having been raised from a small quantity received by Messrs. Carter \& Co. from the seed grower, who was growing the stock by contract for un (which last named important fact was quite unknown to Messrs. Carter at that time). This new early Pea has quite accidentally come before the public under two names, for neither Messrs. Carter \& Co. no ourselves were aware until within the last few week that these now Peas were identical, or that both firms had obtained their stock from the same locality The other sorts named in conjunction with Kingleader may be as good in some respects, but they certainly are not so early eitker in blooming. podding, or in ripening. It is not too late to make another trial this season if any of your readers are so disposed. Our seconi sowing this summer was on the 23d of May, and the Peas were gathered fully ready for the table on the 10th of July-less than seven weeks from the time of sowing. Sutton \& Sons, Reading.- "Lest the wording (Royal Horticultural Society), see p. 702, should lead the public to suppose that the Report upon Dillistone Early Prolific, Carter's First Crop, Dickson's First and Best, and Sutton's Pingleader emanated from the Fruit Committee itself, it should be stated that as those four varieties were past their time, and were little else than dried haulm when the Committee attended at Chiswick to give their opinion upon the general trial of Peas, \&e.., the Report that Dr. Hogg called attention to was tha of the officials of the Society at Chiswick appointed to watch and note down from day to day the appearance and progress of the vegetables, charge, and was grounded on their notes. One of the Fruit
Committee.-Surely the queation as to which is the Committee,-Surely the queation as to which is the
earliest Pea will be settled by Dr. Hogg's impartial and disinterested Report (see p. 702). I knew that the Horticultural Society was growing all the new early Peas in its grounds at Chiswick, and before expressing my opinion I was determined to wait and see its Report which I knew would not be one-sided. I procure from Messrs. Dillistone a pint of their early Peas, and a pint each from Messrs. Carter, Dickson, and Sutton of their (socalled) new early kinds, viz. : First Crop First and Best, and Ringleader. I had them sown al en the same day, on the same piece of ground, and I can fearlessly assert that they are all the same Pea both as regards earliness and cropping. I have invited score of experienced gardeners to pay repeated visit and inspect the Peas while growing, and not one of
them could see the slightest difference among any of them. W. Rgerton, Rode, Cheshire.

Flowering Currants.-I thank you for the remarks you were so good as to offer as to the cause of the sudden death of my two flowering Currants. Mra, apt to die suddenly if its lower branches are removed and the season happens to be dry. Some liberty has been taken with one of the shrubs in question, and the soil beneath the other is increased. Another flowering Currant, which remains healthy, has not been tonched, and the ground is otherwise covered by some trailing plants. I have not yet had an opportunity of taking up the dead shrubs, but when I do so I will inform you of the results of my examination of the roots. In the meantime I send this, that some of your readers may possibly benefit by the caution implied.
G. M.

Proliferous Roses.-I have seen your portrait of Proliferous Rose (see p. 697). It is not uncommon with ummer Roses. This year the two Gallicans, Napoleon and Schismaker, have furnished similar specimens. never knew an autumnal Rose grow in such a fashion. Every year some one or other of the summer Roses affords specimens of such abnormal growth, or lusus nature. Some years ago I had a summer Rose (name not known) that produced most of its blooms in the form just alluded to. In due time I will seud an account of the new Roses of 1864 and 1865 . There are
some acquisitions in both years. I think people judge some acquisitions in both years. I think people judge Tarrant Rushton.

\section*{Sotietity.}

Royal Hobticutiubal: July 29 (Show of Ferns fc). -Thongh rather too green in general appearance this was nevertheless an extremely interesting exhibition, for not only exotic Ferns, but also rare and beautiful hardy varieties of that favourite class of plants were present in considerable numbers.
In classes for Exntic Ferns, the successful competitor were Mr. Bull, Nurseryman, King's Road, Chelsea I. W. Taylor, Esq. Mr. Young Mr. Barnard, gr. Esq. ; Mr. Weston, gr. to D. Martineau, Eeq.; and Mr. Higgo, gr. to Mrs. Barchard. Conspicuous among the Ferns shown in these classes were Marattia elegans, Dicksonia Culcita, antarctica, aud cinnamomea Gleichenia flabellata, microphylla, and dichotoma Cyathea medallaris, and Smithii ; Alsophila australi

Cibotium Schiedei, Lygodium scandens, Weadizen radicans, Phlebodium aureum, Adiantum formen and Stenochiæna scandeus

Of Variegated Exotic Ferns there was but an in ferent display, the plants being not only few in no but badly growu. They were confined to \(P\) argyræa, tricolor, and cratica albo-lineata, togeth Amar Tree prese time Among Tres examples of C Hrmers and leabata, and Dicksonia antarction
Hymenophyllums and Gold Ferns were atoo bited and much admired. Among them the bet min Gyranogramma chrysophylla and Laucheana.
Conspicuous among novelties was a ma specimen of an Adiantum named Farleyanum, from \({ }^{1}\), John Green, gr. to Colonel Miles, of Malmesbury omewhat resembles A trapeziforme, but is droopion enser in habit, and is otherwise different from thattion This received a First-class Certificate, as did alen theodium from Mr. Clark, Botanic Gardens f British Ferns from Mesm Ir \& Son, of Dorking, and from Messrs. Stansfield \& So Vale Nurseries, Todmorden, were in all rem excellent. In their group of 12 sorts Messrs. Ivery everal varieties of Athyrium Filix-foemina, indlets among them A. Fieldim diffissum; A. Pinis nanum, a dwarf neat kind; A. plumosum, with beantich preading purplish stalked fronds, crested at the mid Associated with these were Lastrea Bollandie coen the handsomest of the varieties of Filix-mas that an without cristate fronds; L. F.-mas cristatas aplend tasselated sort; Osmunda regalis cristata, a ha some Fern with the ends of the pinnæ crested ne multifid; Polypodium Robertianum, a beautitul kind P. cambricum; Polystichum angulare decurrens, a net and beautifal variety; P. proliferum Wollatonii, noble variety of proliferum, and one of the ba somest of British Ferns ; together with Scolopendinm crispum, a kind with spreading frilled fronds 2 incto in width. Among other sorts from the same grone were Asplenium incisum, a rare and fine kind ; A rium F.-f. grandiceps, a beautifully-crested dwarf nuil A. F.f. thyssanotum, an interesting kind, with lan intermediate in division between cresting and brac ing , and A. \(\mathrm{F}_{\mathrm{o}} \cdot \mathrm{f}_{0}\). Victorix, one of the mest remartio and beautiful of all the Lady Ferns. Along with the werealso Blechnum Spicant imbricatnu, with nen ovate fronds 6 or 8 inches in length; B. S. ramos
crested and striking variety; Lastrea F.-mas cr angustata, an elegant crested kind with fronds narome than usual; Woodsia ilvensis ; Scolopendrium issia latam, S. ramosum majus; Polystichum subtrip an elegant variety of angulare with the basal piran deeply lobed; Polystichum laciniatum, P a valuable and distinct looking form of
and Polypodium pulcherrimum, a rare sind in the way of the Welsh Polypody.
In the Collection from Messrs. Stansfield we notimed 26 varieties of Blechnum Spicant, all tinct, and two of them new, to which first and claas and cates wero rop iy awarded. The same ano 50 varieties of Athyriam, and about the same number of Scolopendrium some rare and curious kinds. Among plumosured uncum, most distinct Scolopendrium lonchophorum, cervi cornu, and supralineato-constrictum, the same compliment There were moreove very good varieties of Polystichum angulare, 6 plumosum, foliosum, contractum, oxypuylum, fieldii, \&e. We also noticed a very baudsoid sub recently discorered alem nigrum flabell Trichomanes incom iriangulare, and others, Trichomanes incisum iriangulare, and Bull, Mr. and Mr. Earley likewise exhibited British Fer Among Lycopods were some magnifice. exampis well known kinds, especially of Selagineli t-growing sort, which is a favourite Yonge Mr. These
Other subjects consisted of some wellogrown Fachs in good bloom, from Mr. Weston; Petunias Macintosh, Hammersmith; Aërides Earley; a fine plant of Caladium Young; and Liliam auratum, fin cuneatum, Leptopteris superba, and a bear of Todea pellucida, from Mr. Bartlett, Some good Hollyhock blooms wer Npp

the food of the people consists chiefly of Buckwheat (phapar) Fagopyium e:culentum, tho Red A aarant (bhatu), and the smaller Millets (chini and koda) with Eleusine coracans (mandua). In serobiculatum October this Amaranth gives rich tints of carmine, orange, and yellow to the landscape, while the Buck wheat assumes a delicate pink: 6. Recent Botanical Intelligence. Communicated by Professor Ralfour. M. Godron finds the flowers of Fumariacess in their early development quite rogular, but flattened from before backwards as if they were compressed between the axis of inflorescence and the bract. In Dielytra, Adumia, and Dactylicapnos, the two external petals, placed laterally, un lerg) during develo; prolonged into a short and rounded spur, and the two nectariferous appendages become finally quite regular the two sepals placed superior and inferior also remain perfectly regular. In Fumaria and Corydalis only one spur is developed, so ns to render the Auwer irregalar this spurred petal becomes larger than its antagonist I. Godron traces the abortion of one of the spurs in the petals of Curydalis solida to the flowers during their development boing compressed at the base on
one side only, in which way development of the nectary one side only, in which way development of the nectary
and its appendages is prevented. In D.elytra and Adlumia, the spurs develop at a later period than in Fumaria, and in such a way that the racsme, in clongating, separates the flomers from each other, and allows ce free and equal formation of spurs.-Bracts are somerally wanting in the racemes of Crucifera; but in some of the characteristic species we find bracts occaionally in the lower flowerd. In Sisymbrium supinuin all the flowers are produced with a pinnatifil bractenl eaf, and the same is the case with Sisy ubrium hir sutum. Brassica oleracea has been seen with large oblong bracts in connection with its lower flowers, while smaller bractiets have occurred at the upper part of the raceme. Similar phenomeaa have been ohserved n Erysimum cheiranthoides, Arabis Turrita, Hesperis matronalis, and Bunias orientalis. Sometimes the lower and middle part of the inner face of the bract becomes united to the base of the peduncle; this has Cruciferous plants. Sometimes, when the bracts are completely wanting, there are traces of the decurrence of leaves at the base of the naked peluncle. - A note was read from Dr. Paterson, Bridge of Allan, referring to a double-fowered Orchis mascula which he ha
recontly picked in the grjunds at Keir (see p. 722).

Willesden Horticulteral.-Tie Royal Horticulural and other leading societies have as their avowed object the advancement of horticulture-3 worthy object, truly, but jet inferior to that of many humble societies which eadeavour to attack the devils of dirt among the lower classes of this otherwise happy country, by encouraging them to live, learn, and laboin more in thei: pretty gardens, and thus add to their health, their pleasure, and their good fare. One of tural Socioty, which held its first annual exhibition on the 27 th ult, in the grounds of C. Latter, Esq., the Rookery, Willesien, just beside the ancient and very interesting Willes den Church.
The first show of a new Society in a neighbourhood previously without one, is usually a very awkward affir, but in this case the cottagers came out freely and made a very good display, of vegetables particu. arly. Indeed on the whole the cottagers appeared to greater advantage, comparatively, than either anateurs or gardeners, for whom as for the former there were special classes provide 1. Messrs. Henierann \& Co. Place to embellish the teit \({ }^{+}\), as did Mr. Videon and thers; and the Rev. Mr. Wharton, Mr. Finch, Mr. Bunnett, Mr. Kerr, and other geutlemen of the neighbourhood who had helped to originate the mociety. worked hard for its success.
Most noticeable among gardeners' productions was the group of fine-leaved plints shown of Mc. Poole, gr. to T. N. Kerr, Esq.; they were fit to compets at by of our great shows ; and other sabjocs ahown best shown by Mr. Kilby and Mr. S unders, bv whoun Black Prince and Bowood Muscat were respectively produced. Mr. John Aldred exhibited a choice collection of variegated Pelargoniums and several specimens of the woolly and brilliant-flowered G.aphashun eximiano. The best vegetables in the Gardeners Section came from Mr. Tennant, who was awarled the lut priee. mong the Cottagere, Mns, Tennant Mrs. Gumm also were the best vegetable growers; and dre. Gumm also "beautiful" for the best dish of maily murphye," nufficiently
cessful compatitors, or soing more into the muea word as to the arrancoment is domanded. It shomla be a rule in all such shows to associate as closely os
 they are sepurated it is diffic itt to compore the:as
fairly, particulariy such classes as Potatos and small fruits. This, with much else, will duubtless be remedied next year, when, it may be expecter, the show will be much improved.

Researches into the Early History of Mankind, and The Development of Civilizution. By Edward Burnet
Tylor, Author of "Mesico and the Moricma." Lomdon: John Murray, Albemarle Street. 1865. I Vol. 8 8o. 378 pp., with Woodeats.
The book whose title heads this notice, is one of the nost interesting and suggestive that it has bren our gond frotune to perruse for many a year. Dealing as it loes with the rudimponts of our intellectual comn. itition an haman ereatures, with the dawn of our civiliz. Ition an
grigarions animald, with our inost element try arts and with our primititive essyrs to compret?end our relitions 6) the surrounding universe, it cannot fail tir rouse a spirit of inguiry in a large class of minde, who lave never before thaught on these aubjecto, and to direct the researclies of those who have, into new and profitable Humels. As for ourreelves, long at wo have been amiliar with many of the topics treated of in this volume. never before did we perceive the intere-t attached to their systematio connection, and never so fully
realizs our ignorance of the eopringo of eo many of our intellectual processes, and of the origin and growth of so many of the habits of our daily life.
The task the author seta to himself, is to explain the theps by which the mont civilised races now existing, may knowledge, arts, religion and mythology, lave, and cattoms, by a searching inquiry into the mental and matc rial conditions of aavager, of infants, of the blind, the deaf but who of thene subjects Mr. Tylor has at hie command a wealto of material that is quito remarkzble, the result of a discriminating sturly of all available sources of information, and especially of royages and books of travel,

He laas furtber pursued his own independent researchee, both atuongge the aboriginal and nemi. civilised
tribes of Mexice, and in the asylums and hospitals of England and the Continent. The whole is acientifically and akilfully worked up, well arranged in thirteen chapterr, and the intorest is sustained from begianing end of the work.
Tue origin of language and of writing demands the athor's first atudy, because "man's power of atter. ance, so far exceeding any that the lower animale passess, is one of the principal causes of his immense
preeminence over them." Five clapters are devoted to these subjects, tracing their development from gesture-langrage, througb spoken language, pioturewriting, phonetic sy yhiola, and atplatuetic-writing, up to images and names. He atarts with the signs used by deaf.muten, assuring us that their means of commun cation with us is not as generally supposed a device of
the teacher, but a natural gesture-lengraxe, the signs the teacher, but a natural gesture-languaxe, the signs
being explicable in every point when curefully studied, learnt from the deaf-mute by the teachir. and by him systematisel for use. The comparison of these gestures with the pantomime language of the Indian savage is fully examined, and their coincidences shown to be so numerous that they may be ranked as fundamentally the same; and the carious fact is dwelt upon, that in he case of some of the lowent tribes of savages, the means f intercommunication with one another, no leas than with other races, is more by gesture than by word of mouth. Still more curious is the fact that the Cistercian monke invented a geature-language by way of mortification of the flesb, and that a great part of these gestures and signs are what the deaf and dumb do now use to convey like ideas. He conclndes thim subject of gesture-langaage by pointing out that it and word language are inseparably linked, the education of the deaf-mute beyinning from the cridle amongat persms that do speak, whilst every infant with perfect faculties is first taught mainly by means of gesturelanguige: by obzerving that the existence of a gestureanguage, indepenitent of teachine, is proved by the ase of Luura Bridgman, who, though blind as well as deaf and dumb, used the gestures common to the deafmite, the infant, and the savage
Tise chipters on the Picture-writine, Phonetic writinga, and hiernglyphics of the ancient Esyptians and Mexicans are singularly clear, and illustrated by well-selected woolcata; and these, tno, are shown to be far from obsolete at the present day, belig more or press resorted to ccur not only amingat the ruile peasantry of Europe but in the current writing of "ar cors," a " \(T\) square" and D rines
From Picture-writing to the uve of Imagem as direct expremions of thoughts the transition is easy fon thi suhject he remarks ( \(\mu .107\) ):-" It has been already noticed how natirally children can appreciate and
gesture-langyage \({ }^{\text {a }}\) and 'pictare-writing. minnner the use of dolls or imas ses as an assistance to though amongst those who grow up under the influence of civilised snciest it is mostly superseded and forgotten in after.life. Fuw educated Europeans ever thoroughly realis. the fact, that they have once passed
through a condition of mind from which races at a through a condition of mian frer stage of civilisation never fully emerge; but this Iower stage of ceviisationd the European child plying with its doll furnishes the key to many of the mental plienomena which di. nguish the more bighly cultivated races of mankini from those lower in the scale, the child, the eavage, and the superstitious civilised than will agree in believing in the existence of an :ctual and not a merely subjective or ideal connection wetween the atho a a similar connection between th which even extends to a similar connection between
name and the object named. To this confusion of idea and object he traces not only almost all superssitiou ceremonies and beliefs, but especially witcherafts and sorceries; and he illustrates this point by facts col lected from every part of the giobe, and from all ages to Which history extends. zeeking to destroy an enemy by melting his image in wax.
We have no space to notice the chapters on the "growth and decline of culture" hor on the "stone are past and present," further than to remark that Mr.
Ti, lor agrees with Lubhock and the most ellinologists, in believing in the existence of two stone ages, priceding that of bronze and of iron. In this ehapter we find a great deal of curions matter that is neither in Lyell's nor Lubbock's works; so much indeed that we would fain see the subject exlausted by the same hand.
"Fire Cooking, and Vessels," heads a chapter full of carious information. As regards fire it begins with the anyths of "Prometheus," and carries us down throngh the methods of getting fire by rubbing.sticks, by fire.
drills, by flini-and-pyrites, and by flint-and-iron, to lucifer matches. The origin of making cooking-vessels of clay is sooght in the castoms of some most rude zavages, who coat wicker-work kettles and gourds with Mlay, to make them longer resist the fire, and of which so ne evidence exists in the baske. whilst the simple in the pottery of some sanges, operation of boiling water in pots is shown to be a
higher development of the aboriginal process of boiling it by throwing red hit stones into wicker-work or skin Tossels of water, which though water tight were not fire-proof.

The chapter on "Some Remarkable Customs," abounds in intereat, the customs alluded to all having reference to the theories propounded in the foregoing parts of the the "Cuuvale," which consists in the father taking to bed on the birth of a child, and being dieted, under inmself, be injurious to the infunt's delicate organisation Indians of South America, the West Indies, California Kantschatka, Greeniand, West Africa, the Eastern Archipelago, Central Asia, and the Basque provinces of Spain-the same reasnn is givenfor it, viz., the supposed cintinued influence of the parent upon the child, a superstition of the sane order as that which establishes their images.
Amongst the "Historical Traditions" are ample liustrations of the variations under which some of our popular tales, fairy legends, and nursery stories, appear in different parts of the world, and which prove early connections between nations now sundered by oceans
and by mans intervening nationalities; and these Mr. Tylor carefully distinguishes from annther group of fables called "myths of observation." Under the former head he describes the tradition of the Deluge, so widely dispersed over the globe amongst uncirilised races. This be shows may have been a "myth of observation," originating independently amongst various peop'e, and sugqester by the remains of mariue animals, and of bones invariably but ignorantly referred to those of man, at elevations above the sea level; bnt when taken in connection with the fact that all traditions inention the existence of the haman race before the said deluge, and the preservation of one mar, or a pair, in a boat or other ressel during the floor, he thinks the evidence is rather in favour of the various traditions laving one source in the remote ages of man's ristence.
The work closes with a chapter on the gengraphical distribution of myth., of which all we can say is, that like the preceding ouse, it is too short for our liking, and afforls material for a volume in itself. It leaves us in hopes that the learned and able author will continue to develupe his ideas in a systematic form, and dilate upon many subjects of whose importance and intorest the present filume gives us but a tantalising taste. Most esperially we should like to see the arte, custome, \&e., of anger much more fully troated, their infuence traditions classified ethnologically, and their contincously traced up to the present duy. Meanwhile we are gratelal indeed for the present instalinent,

\section*{The Restoration of Health. By William Strange, M.D.} London: Longmaris. S:nall 8vo. It is with the greatest interest we have read Dr . Strange's b-ok, and we cunnot but say that the result left on our minds is, that it is a most useful, clever, and well-written work, quite carrying out his intention in of looking upon a little knowlenge of such subjects in our patients as a dangerous thing, and one likely to be injurious to them in case of illuess, we shall have to takn that knowledge, imperfect thouyb it be, into our confdence, trent it with respect, and use our influence to cause its possessors to go on increasing it. We must make allies instead of enemies of our patiens, take game insteal of adversarics; and for that purpose we must, to such an extent as may be done safely, show them our hand."
patient is taken froin the day on which he enters the sick room until that on which he is completely
restored to health, the influence of the naturalstinuli of air, temperature, fond, dink, exercise, bathing, sleep dimate, soil and situation, chanye of air, scene, \&ce, upon the stages of his illiness, being severally examined." Those who wish for a book to teach
man to be his own dictor need not look into thess pages. There are no prescriptions, except a few very simple remedies for emergencies, which are placed in
the Appendix." We recommend any one who would attend upon a sick relative or friend, to get the content f this book well impressed upon hiis or her mind Indeed it is s. full of common sense that angbrdy might read it with advantage.
Sur des Fleurs monstreuses dr Epimedium. Par le Dr L. Marcland. Adansonia. Juin, 1864.

The preserice or absence of a spur to the petals of flower seems, in many cases, to be too inconstant In Viola, Antirrlinum, Halenia, Uiricularia, other plants, the customary spur is often absent. M Marchand in the above cited brochure shows that Epimedium Musschianum is likerise frequently deprived of its spur in cultivation, and hence he objects to the retention of the genus Aceranthos, originally established by C. Morren and Decaisne, as distinct from Epimedium, on account of the spurless flowers.

Epimedium diphyllun will, therefore, to the comfort
gardeners and others, retain its old name, and the more recent one of Aceranthus will disappear, like the spur itself.

\section*{Che \(\mathfrak{x p t a r y .}\)}

THE account given by "Apiator," at page 631, of the gafe arrival in the south of England from a county in
the far north, of a Ligurian Quers, and of her subse. quent untimely and could hardly have ima, wined that an active young queen would have fallen a victim to the animosity of young bees that had only just left their breeding cells, and had never yet taken flight. It plainly shows how careful we should be in all cases of union, or of strengthening weak populations, particularly when the lives of valuable queens, such as Ligurians, are at stake. I have effected a great number of unions, and the only method by which success can be depended on, is to fumigate both families. Some apiarians object that fumigation, although it may not at the time of application destroy the bees, seriously and permanently injures them. This I cannot believe to be the result of fumigation if judiciously applied; at any rate no injury s ever manifested by the rather extensive use of fungus in my apiary. Having become possessed of some Ligurian stocks, by means of queens imported direct from abroad, and luaving reared many young queens, both by natural and artificial swarming. I have bad a tolerably large amount of expericnce with respect to the uniting of swarms and strengthening of weak colonies. I would advise "Apiator" to make use of fumigation when he next attempts a similar operation.
With its aid, I now seldom fail in effecting a peaceable junction. It eeems to me that Ligurians require a greater amount of amoke to subdue them than the ordinary bees, and that they recover in a mach shorter time. 'l's use fumization with success, care must be takeu that the bees have plenty of ventilation, yet are not allowed to become in any way chilied. I ean only add that I find it a very ueeful agent in my manipulations; but were I as expert and clever in the management of my bees as "Apiator" and some others who ing the praises of "driving" in preference, and who have altogether discarded the "magic fungus" might be induced to alter both my ideas, and the style of performing my experimente.
With reapect to the rearing of Ligurians, I do not ind that the yellowest and most handsome queens breed the best coloured bees. One queen raised by me ast year, was the most beautifully marked one that I ever saw, but the bees bred by her were not supprior to those which came from very dark coloured queens. I have now a queen raised from the brood of one of my larkest Liguriuns, and her bees are as pretty and well coloured as it is possible for them to be. Can it be that
the drone has the chief influeace with reard to
colone of the progeny? I have observed that the colonk of the progeny? I have observed that the \(b_{8}\)
marked drones often proceed from hybridised It is also remarkable that from some queens \({ }^{\text {w }}\) breed beautitully coloured b ees, I can never succee! obtaining any young mothers that will give p Ligurians; so I conclude that they muat be crossi common drones. I hive found, as has been stated mita that bees are mach m. vicious and irritable when disturbed, than the pare.h. bees of either variety. Where hives of black ben
abound, I think it must be alinost impossible an apiary of pure Liourians, for there semes a tendency in the varieties to wed together ortunate last year in rearing all my young Ligur queens pure, but in my meig the distores my neighbourhood, and thore the distance of a mile. This season will I fear prove so fortunate in this respect, as the number of hi of common bees has increased considerably. \(A\) pis

Bees attacking Fruit.-Some weeks since a par appeared in some of the journals to the effect that Ligurian bees were considered in parts of Australi beng very destructive to the Grapes, and were in cqirence, denounced as pests that should be exter nated in a most summary manner. I'iat bees occasionally feast on over-ripe fruit, is well known; it rarely occurs, and is usualiy a sign of there beiog extraordinary failure in the secretion of honey, coin. dent with large populations and much brood within t' hives. But it is absurd to ascribe this as a propensi peculiarly common to the Ligurian variety. Longher I had ever known these bees, I was aware that coo ordinary species would, in certain unpropitious seas?: commit some amount of injury to fruit. Bat In hardly prepared to find that this year-a great part which has proved so prolific a honey season-shouldt marked as a bad one in this respect. In my guce where I have very few Ligurians, the bees have hal ttacked the Raspberries to a great extent; as maja three being frequently discorered buried in cons specimen of the fruit; consequently making it a maltee of considerable danger to persons gathering it. Cer.
tainly only a fair proportion of these winged marauder were Ligurians, and I think it but just to give them a. the credit that is their due-of being, in this respect least, not worse than their neighbourg.
If I were in need of any proof that it is time remove all my supers, whether completed or not, the fa of the bees feasting on ripe fruit would supply : deficiency, as it is a tolerably certain sign that no \(m\) honey will be stored by them in this district during emainder of this season. If Heather abounded should not despair of further hire honey being stored in supers and stock bive, should allow the former to remain on for a timelay but in the majorily of districts, all supers may no

The mansion, which is about Glasgow, and nearly two from the burgh is sitnared on the sloping banks of the Cu tributary falling into the Ciyd Duks of Hamilton.
of modern construction, a ve suited to represent, and be in seeping dignity. Oa the crest of an almos which is still undergoing a!terations of character. In front the surface is col purp and well adapted for general ornawental portion of the lawn in this intance assab spacious bowling-green. Consideroo pieasure grounds is covered with the Chestaut however predominating, the Chestaut however predomiaatio, ally
ase with the glen, which is by far the finest feature in the plidess where the picturesque, the romantic, and the beautiful are all in harmonious association.
the beautiful are all in embroidered on the surface with Feras and Mosses, and other interesting plants of our native flora, which appear to have more than ordinary interest in these steep rocky glades, with the river, which has line, but pursuing a somewhat intricate course, turning and winding now impetuously, and again smoothly and slowly. Following our leader by the winding path in seats set into niches of the rock, we cross two bridges, which span the immediately with the precincts of the flower ganden.
Gower-gardever does its work by halves, and this fall, presenting great diversity of surface, because it hes not been too mach tampered by artificial hands, abondantly teatifies that to carry out the ideal of a proper flower-garden is more a matter of selection work hare to begin with, from its many and natural undulations, its associutions with wood and water, its shelter and seclusion, stamps its character wouches here and there to enliven the most varied shades of green. The morlern system of flowermandening is ; nay, it is a decided advancement in the art of gardening, but the abuse of it deserves all the chastisement that has been penved. A gaudy and ill-arranged assortment of colours, even in a lady's
toilet, is characterised in no measured terma by all who study and have some knowledge of the art of arrangement; and so it is and will be with flower-
gardening. Depend upon it, success is not how much flower you can produce in a given space, but a harimonious arraugement of shading in order to produce a well bolanced whole. The Wishaw flower-garden site has been well chosen, and evinces a degree of taste in arrangement which doess Mr. Thomson, the gardener,
very much credit. Doubtless one could suggest alterations in detail which might serve to enhance the beauty of the picture, for scarcely two 'minda agree in
carrying out details; but as a whole it is exceedingly creditable.
It has evidently, from the wall that partly divides it from the aylvan scenery on two sides, been at one time all that did duty as a kitchen garden ; but looking at with Ivy, Roses, and Woodbine, surmounted with self. sown seedlings of the Bird Cherry and the wild Hamthorn, it cannot have been used as such during
the present century. The Calder, which is fringed with a noble row of Chestnuts, and partly screened by and the wall the other side, terminating in a peak at the confluence of two streams. The upper portion is of which a circular greenhouse with two wings has been built. A few plants of a decorative nature, both stove and greenhouse, are always at command, not the
least of which is the rosecoloured Lapageria, which has grown through its original tub, and is luxuriating in the soil of a fertile slope, throwing off shoots of the most rampant nature, trained along the roof and Feeder such as Lapageria is.
of the natural thangement as a whole represents more of the natural than the artificial, there is still a good
deal introduced in the way of geometrical figures detached. These do not impress our admiration so much however as the sort of irregular shrubbery borders introduction of variety of material. For instance, one of the greatest hits in the way of planting for effect milk of several hundred yards length, straight as an plowantly attracts the eye. On eithe terraces above, mogular outline, which this walk, as it were, cuts in tom a part of the trees, Berberries, Rhododendrons, which form the first to straight lives of Hollyhocks, Grias, of which Aus of purple Candytuft; yellow Calceocoloured sort called Bothwell Beauty, form the chief; blue Lobelia, and Cerastium tomentosum next the not too vulgar nor yont order, give colours well defined, Ocenery undoubtedly and unmistakeably beautiful. Yurn with lively satiofaction to the at this, and then Yews, the Wellingtonias which grow well, to the Cedars, the Hemlock Spruce, the purple Beech,
and the mixed members of shrubs which either
forn ind ivis. specimens of Weeping A sh, in a in salient spot, form a the loxuriancer, of the the density of the branches and Pelargoninums, Calceolarias over the surface, where Which blooms freely enough, but is somewhat tame

Anless brightened up by Bhowy colours, the variegated Arabie, than which there is nothing more like green
and gold, representing a pigmy hedge of Holls, the variegated Alyssum, the beautiful and chaste Cerastium, or "Snow in Summer," several of the best annuals, and numerous other little things, all do their part-some introduced in the usual "lining" way, others forming a design where the ground colour is made up of one plant, and circular panels made up of other
plants, the whole being, as it were, set into plants, the whole being, as it were, set into
a franework of other colours-certainly not the most easy task to do well on the part of the designer. Mra. Pollock and Sunset Geraniuins were both doing well here, the former bearing the most handsomely. formed leaf, but not quite so effective as the latter, with the vermilion shading ronod the edge which gives it a more fiery character. All this combination was very much enhanced by the quantity
of Grass lawn, and the spacious Grassy walks, which yield to the feet like a fine Brussels carpet, and have a pleasing effect upon the senses.
Taking our leave of the flower-garden we retrace our steps though the glen, and pass the mansion to the kitchen-garden, which is situated on the opposite side. As a kitchen-garden it is commodions enough without being remarkable for its walled enclosure. It is
divided up into the nsual compartments, and planted with fruit-trees, which do not appear to be particularly luxurint. A range of houses bound it on the one side, with the office houses at the back after 'the usual principal range consists of two Peach houses, three Vineries, a stove house, and an orchard-house, which is a span-roofed structure standing at right angles to the other houses, which are lean-to. Peaches and Nectarines have always been a fair crop at Wishaw,
and Vines have at all times been remarkable for good management. The Muscat house is quite a picture at the present time, both as regards crop and s:ze of for many yearz, and it is ouly justice to Mr. Thomson to say that, taking both it and the Hamburgh houses, and judging them from the crops that have been produced, and the high finish which has generally characterised them, they have few equals. It is one
thing growing a few bunches for exhibition, but it is quite another thing producing crops of this kind, evincing as they do unitorm good culture, which though simple looking enough is not always attained. Sowe of these Vines are planted outside, and sorue have a prepared division and are planted inside. Thereare no inside borders, however, the bottom of the houses being paved, and where Vines are introduced, a sort of temporary divisional border is made for them, Little
difference was observable in the fruit, but Mr. Thomson says that success is a question of feeding altogether, and that if the borders are well made and well drained he would not spare the liquid manure; and according to his own account he does not spare it. The Vines are managed on the spur system, and although the youngest of them must have been over 20 years planted, there is no sign of retrogression, the spurs being in convenient relation to the main stem, and the leaves broad, lusty, and vigorous, showing not the least symptom of spider. Mr. Thomson, on the plea of spare [the sulphur in the atmosphere, occasionally coating the pipes, and keeping the house in ful in his orchard-house culture, and has abandoned the planting out bush system, training the trees in the Figs in pots are nicely grown, and what struck me particularly was a very handsome pot suitable for general use, and really an acquisition to the ordinary run. This is made wider than deep, and glazed brown, like common pottery ware. The length of this range
 Hamburgh Grapes just on the point of ripening, in very unpretending

The stove was filled with a miscellaneous asso of plants, having its back well covered with the beau tiful and fine winter-flowering Ipomoes Horsfal iæ, and the rafters with the invincibie in stove conser Which for rafters, walls, or drape Soveral nice plants of the white and rose-eyed "Periwinkle, the handsome Gesnera cinnabarina, Allamandas, a very good Alocasia macrorhiza, the fine aukum-ilowers Roscöeana, which is not halt so much growins an be for its decorative value ; Maranta zebrina, still an effective plant, and several small bits of Orchids, wer the chief features in the house. A very good use was made of a house speciant by introducing a long narrow which were trained along the glass, and hanging thick with fruit. Such is a brief description of Wishaw and its gardens. They are well worth going to see, the more so as every the venerable nobleman who owns them. J.A.
Botantc Gabden, Ametmrday. - Judging from the this garden is fernished, it evidently has been in existence for many years. Dutchmen are celebrated
gardeners, and no doubt this garden at one time enjoyed high reputation on account of its fine buildinge which, however, at the present day do but small credit to those who have betowed time and labour upon them. Now-a days we must have fine houses as well as handsone plants. The good people of Amsterdam should therefore look to the Palun-house of these gardens, which we consider unwurthy of a thriving
country like Holland, if the poor plant in it power of speech they if the pore plants in it hau better house, which we hope before long will be erected over them, so that the grand specimens in it may nothe iojured by removal. We have had good proof of Dutch liberality in the late great show at Ansterdam, as well as in the magnificent palace
erected there for purposes of exhibitiou. Wo do not expect, therefore, that the present ill-couditione houses in the Botanic Garden will long be fermitted to remain there. The Dutch, as I have stated, are lovers of horticulture, and require a place of this dascription to resort to in leisure houra in our own ountry thousands weekly throng to the Royal Girdene in a proper spirit there will be n.) lack nuywhere outside the The Botanic Gardeu at A nsterdam is just outside the city, in an open space; it lass a park in
front, which is separated from the garden by a road way. It is entered through a large iron gate, close ti. Which is a dwelling-house, and on each sude a greenhouse, containing many rare plants.
The next house, which is "span-roofed," is devoted to Orchids, Ferns, and fine foliaged plants, many of which are noble specimens; among them the most conspicuous is 'yeas revoluta, with several stems of lection of this interesting class of planty, together wit Palms, Dracænas, and Yuccas. We also noticed some beautiful Ferns, annong which were Cibotium princeps and the lovely C . Schue lei; the rare C. Camingii, very distinct Fern; Also;hila microptera, aiso rare and beautiful snecies; Hemitelia integrif,lia, distiuct species ; and Diplazum polynodioides. On the same stage were some fine specimens of Theophrasta imperialis, with glossy dark-green foliage; this was house plant, and is valuable on accorst of jits diatinctlooking haudsome leaves. Aesocirted with it were also some rare Palns aud other fine plants. Orchuds consisted of Oncidiums, Zygopetalums, Aerids, Sacco labiums, Vandas, Cypripodiums, an. many other genera, of which were some well-grown species The next house to that just noticed is spanroofed and adapted to aquatics, smong which the Victoria regia does well every year. The house however seemed too small for such plants to be grown with good effect.
In the Pilm-house are some noble specimens, their prowise soon to lift the glass from the roof of noticeld-fashioned tenement. Among othors we dabiced Livistonis chinensis, with 60 leaves ofl it; f extroricana and umbraculifera, a fine specimen Chamærops excelsa, a noble plant with a fine stem, and one of the most compact of Greenhouse Palms; Phoenix dactylifera, with a stem 20 fee high ; and Caryota maximas a splendid specimon,
40 feet in height. Associated with these were Dracæas Draco, or Dragon's Blood plant, with a stem o wonderful size; Pandanus furcatus, an interesting plant; and a fine example of Strelitzia augusta.
The collection of Cycads in this garden is one of the most complete we have seen. Encephalartos Caffra, with a wonderful stem about 25 feet in heigat, must, we angustifolium and edule are also good plants, as are likewise others, such as Encephalartos Altensteinii and cycadifolia, aud Cycas circinalis. Not far from the cycad house was a large greenhouse, coataining a colection of Anstralian and Cape plants, among which were Proteas, Banksias, Araucarias, Dammaras, and inost beautiful specimen of Dicksonia antarctica, one of the most hardy greenhouse Ferns in cultivation.

Thelgardens themselves are not extensive, nevertheess there is plenty of room for improvement in them which is indeed begun. The situation, however, is to much within the influence of the smoke of the City ever to favour \& healthy outdoor vegetation. W

\section*{Miscellaneous.}

Duration of Species.-According to the principles of Darwin's school, the law of natural selection woald cause the existing type to be supplanted by another henever the external conditions liad undergoue material change; whilst according to the old view, the extinction of a specien wourd hariation of a species, and its want of power to alo more than a certain range of external conditions. But there are circumstances contuected with this subject which hypothesis. There lies at the foot of Dartmocr, not far from the town of Newton Abbot, a depusit of wood, coal, or lignite, which has, for a long time pust, supplied tuel for various manafuctories of bricks and pottery although, from its offensive simell, inapphcable of Miss Burdett Coutte, who supplied the requinite
funds fur ex, horing it through the exertinas of Mr.
Pengelly, who ranasteded, oue by one, the beds of liguite Pengelly, who ransucked, one by one, the beds on tiguite
and clay which, to the number of 72 , alternate with each other in the principal coalpit, and who extracted from them the fossil remains which they severally contained, and, lastly. through the botanical skill of
Protessor Heer, of Zurich, who determined the exact Protessor Heer, of Zurich, who determiued the exact
nature of these remains of a former world with a precisiou which, perlhaps, no other living naturalist could have equalled - has been investigated in such a manner as enables us to fix with certainty its antiquity, and to trace the degree of resemblance which the Flora of that period bore to that existing at preseut in the same
locality. It has been ascertained, for instance, that locality. It has been ascertained, for instance, that
wliitst the plants found in the lignite at Borey belong to the lower miocene period, and bespeak a sub-tropical climate, the overlying gravels were deposited when the temperature of Devon partook of an arctic character. But this is not all ; for the plant which, from the abuudance in which its remains are scattered over
the whole of this formation, from the highest to the the whole of this formation, from the highest to the
lowest of the beds, seems more than any other to have supplied the maderial for the Bovey conl, is nearly
related to that giant of the vegetable kingdom which related to that giant of the vegetable kingdom which has been found living in California. The name, indeed, applied to the foss1 ylant is Sequoia, that to the living
one is Wellingtonia-the specific name of Couttsio being appeuded to the former to testify the large share that lady has had in its discovery; but the best
botanicts are of opinion that its cones, branches, leaves, botamints are of opinion that its cones, brancles, leaves,
and slionts, all of whicls have been exhumed froun the B.vey formation, concur in indicating at least a general resemblance to the Wellingtonia. And, what is still more remarkable, this same tree, or one nearly allied to it, spread during the tertiary period over all Europe, from Greenland to Iraly, and extended even to
Vancouver's Ialand, in North Anerica. How, then, are Wancouvers lilans, in North Anerica. How, then, are
we to reconcile its present contracted range with its wide geographical distribution? Not, as it would sean, by appealing to a change of atmosphere; for if
that had been the cause, it would atill have maintained its grousd in Italy and other warner regions, from which it has now entirely disappeared. Nor are i only living congeners - namely, the Cupressus
Sequia) semp rvirans, and the Wellingtonia Sequosa) gisantea-particularly susceptible of cold. On the contrary, the former will grov in sheltered
situations thronghout Fngland, and the later resisted situations thronghout Fingland, and the latter resisted,
in \(1800-1\), weather so inclement as to have proved fatal to the leodar in various parts of this country. The present linsitation, therefore, of the Wellingtouia within so narrow an area, seems to point to a nstural law, which we recognize by its effects, without being
nble tully to divine the means br which it is carried able tully to divine the means by which it is carried
out. This law is, that a certain limit has been asoigned to the duration of sp, cies as well as of iudividuals, and that this linit is approuchng in the case of the monster of the vegetuble kingdon alluded to. Like the Dragon* it is indeed vigorous where it still lingers; but, like these and others that might be named, the cowtitions of the climate in other respects sewm to have become
less propitions, atthnugh it remains to be seen whether the specimens introduced by Messars. Veitch \& Pince into tweir gardens at Exeter may not ghow that the
tree will stil flurish in a country where its congener, the Sequria Cuutsire, once so luxuriated. Dr. Daubeny in Address to Devonshire Science Association.
Preservation of Ships' Timbers-A communication Has been made by Lieutenant A. Mariot, of the Freneh navy, relative to the means employed by the
Cochin-Chimese to protect the hull of vesolly from the Cochin-Chimese to protect the hulle of vesedel from the
attucks of the auger worm and other mischievons attucks of the auger worm and other mischievons
creatures. M. Mariot declares that the Chinese and Annamites know how to protect their vessels effectuaily, and at a very small cost, and a long residence in the two countries as a naval officer gives weight to his in appearance of many of the native vessels, and found in appearance of many of the native vessels, and found and that in some cases they had been bequeathed from father to son until their origin was entirely forgotten. The timber of theso vessels being the same as that employed in India tor the same purpose, and the waters of Cuchin China teeming with destructive creatures, it was evident that the durability of the vensols arose from some special precaution. The means employed are, oil with a resin, कpplied hot to the wood; both the substances being special probluets of the lauds on the banke of the river Moikou, the trees which gield the ib buving heart-shaped leaves, strong roote, and throwing out suckers. The tree which yieli!s the onl is callet b; the Annmates Caydan, literally oil-tree, amd often frow a beight of more than 200 feet; it whil limenish from three to five pints of cil per week. Buats made ot the wood of this tree are sad never to be attacked by the auger worm. The tree whien yich the resin is deecribed as being sonuewhat similar to the former. M. Mariot, when in command of the Amphrtrite loreha, under Admiral Chamer, omplayed the mative mirture at the eud of a year it was perfectly the m.ollusks, and attere eud of a year it was perfeetly tre trom any Iresh athoks. Journal of the Society of Arts.

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

In order to maintain a certain amount of gaiety in he conservatory, a stock of saccession plants must necessarily be kept up. Any plants, therefore, in pots, which it is desirable should be grown quickly, may give them large pots at this season, as whatever wood the planit now makes must be ripened, with perhaps the exception of such free-flowering plants as bloom on the exception of such free-flowering plants as boom on the will be required Juring the winter months, the drainage of the pots should be ample. When established, a free open situation should be selected for the newly-potted piants,
ripened.

FLOWER GARDEN AND PLANT HOUSES.
Every means must now be taken to keep turf, gravel, and edgings of all kiods in the neatest possible order, tiat no drawback to the complete keeping of the whole may occur; dead flowers should be picked off daly, and
stray growths reduced within proper limits. Trailing and climbing plants should be frequently gowe over, to keep them neatly though not too stiffly irained and secured against winds.

Daelias.-Tuke care that the laterals of these are vell staked out, and use every means to entray ear igs and other vermin which injure the flowers.
Pansies. - Rooted cuttings ot these should now be realy. It will, therefore, be necessary to make beds for their reception. In doing this it is absolutely necessary that wreworms should be caught, therefore the conpost should have repeatod tarniugs; for these puats are as deatruotive to young Pansies as they are to Caration layera.
Rosiss.- Remove dead flowerb, and encourage the production of autumn bloons in the Perpetaals, by watering with liquid manure.
TULIPs.-Throw out the soil from the bed on to the patis, sy that it may sweeten previously to being
returned.
Verbenas.-Go over beds of these frequently Where the plants are still growing, pegging and traiuing will involve considerable uttention, renoving may incline to encroach upon the edging of the beds. FORCING GARDEN.
Pracheg. -The late warm dry season will have been rery favourable to wood ripening; but where any is atill immature, means must be tuken to forward it, as next joar's nutceas will very much depend upon ripening being properly effected. Keep the foliago clean aud free from insects, and endeavour to preaerve it in hoalth as long as possible.

Pinss.-Plants growing in dung pits must be freely supplied with air to prevent their getting drawn, and they should alzo be kept near the glass and not allowed to stand too closely together, for strong robist plauta
need hardly be expected unless this is attended to, and need hardly be expected unless this is attenled to, and
weakly drawn ones seldon or never yield fine frut. Give careful attention to such as are swelling; afford them plenty of warmth and moisture, and as much manure-water at the root as the soil will bear. Do not allow young stock in free growth in the succession pits to stand too closely together, nor to sustain any cheok through noglect in watering, or the want of pot room. Plants growing in beds of soil must also be carefully
atteuded to with water, keeping the soil in a nice moist state. Where rapid growth is required keop as warm and moitt as can be done without drawing the foliage, and give plenty of strong ciear manuse water at the root, and the plants will miake rapid progrees for the next two months.
Vives.--Nee that Vines from which the fruit has just been cut are free from insects, giving the foliage an uccasional washing with the engine if rect spider is at all troublesome; and use every precantion to keep the leaves in health as long as porsible. Prevent the growth of laterals, which unly shade and injure the principal foliage. Lato Grapes colouring shond be assisted with slight fires at night, especially Muscats. Thrips are frequently very troublesome in late Vinerie where plants have been grown under the Vines, and where there is any reason to expect these, the folage should be frequently exanined clusely; giving the howe a heavy smsoling as soon as they aro perceived, at repeating this for two or three times at intervals of thout a week. Shading the bouse the day after making Where it can be done, no ats be able to keep it rathe ahse, will reniler the cure inore elfectual; and if the pest is taken before it gets quite estabhshed, it will be ensily get rict at by two or thre' smokings, but uuleso caikeu iu time it is very difficult to eradicate.

\section*{HARDY FRUIT AND KITCEEN GARDEN.}

Summer pruming and nailing in of the current year's wond will require following opo
CURRANTS, FOOSTBBERRTES, AND RASPBERRIBS.Where time will permit, these will be benotited hy the r'muling wuol of the present vear's growth being crop.

Decating Crops.-Clear away the haulm, stumps and refuse of crops directly they are over, burn thom,
and if the ground is not wanted dig the ashes in, and
let the land remain till required. At this season,
ever, there is seldom gromind to spare
res ever, there is seldom grozind to spare; fur it showit is
remembered that the supply for several month, next winter and spring will depend on the du ite now made use of, in planting out as largely a surget those kinds of vegetables must likely to be a suly as can possibly be found room for. Potatis anta crops soon coming off may therefore be interined was
any of the different kinds of Broceoli or any of the different kinds of Broccoli or Winter \(\mathrm{G}_{\text {fite }}\) and where these are not sufficient, a quatity may comes in by the ranoval of other crops. ground as Pear TbeEs. -These may now if
have the breastwood cut back to five or sir an beginning with the least vigrous first, as they will h
the least liable to start.

\section*{The Agritultural Gatette. \\ SATURDAY, AUGUST 5, 1865.}

THR recent introduction and present existence of a fatal and infeotious diseasa among cattle is excitigg universal concern, and not without sufficient reason. Dearth of fodder for some time past has led to a serious rise in the price of meat, and affurded dishonest dealer's an excellent opportunity of disposing of diseased animals at remunerative prices : but this, though an evil of some magnitude, shrinks into nuthiugness beside the tremendous consequences involved in the exteusion of the cattle plague over the outuntry.

The malady is new to the present generation, but, from records that have come down to us, it is remarkably like a disease whioh devastated our herds more than a century ago. In ita principal features it resembles the Russian "peste" so well known upon the Continent, and whose intruduction into our own councry has been feared fur a long time past. Between the true "p ste," however, and the cattle disease from which we are now suffering, there are important pathological differences that it will hardly be desirable to disouss now, as the modified form in which the disease presents itself to us is probably due in a great measure to a difference of climate. It will be sufficient to admit that the two maladies are ciosely
related, that both are essentially typhoid in related, that both are essentially typhoid in
character, and that beyond all question the disease is imported from abroad.

Much confusion prevaild among the pablie in respect to those affestions that are olassed under the term "typhus" or "typhoid;" and in endeavouring to give \(\mathfrak{a}\) shape to that "which shape has none, it is neaessary to crave the forbonation is not intended, but who may feel disposed to smile at an
attempt to pupularise an intricate scientitic subjeot. Trphoid diseases, then, are diseases of a \(1 \cdot \mathrm{w}\), or hiterally smouldering character, univisally associated with deticient vitalits and pirctration withunt that active raceular and herrons excitemont which acompanies acute discases. The torm therefore applied to the attl. plague is to be touked upon as a reere general expression of the fact that it is an insidious malady, remaining dormant for some time in the syetem, and u.fmately by slow but certain action supling and und Jerninin? the organic forces. All affeitions of the class appear to owe their origin to the introduction into the animal system of some morbifio matter which contaminates the blood, and thus canses a generally depraved condition of the whole orgaviem. This "virus" or "animal poison," whatever it may be, can be generated by variuns canses which come under the head of defective sasitary reyuIntions, decaying animal and verctable muters being principally concerned in the production of the morbid principle. It can also he given off from the secretions and exoretloas of ia fected animals, and thus iransmitted to an ind ones, irrespective of drainaga or ventilation, atad in deliance of all precautions. After gaining an admission into the healthy organimm the morbid principle, or matter, however different its action upon the systems of different aminals-whe ther it be the virus of small pux, or glanders, or trphus, whether introduced by the atmosphre in an impalpable form, or by direet inorntation with pralpable matt r -lies for a mertain defi ute spotee dormant, that is to say, the disease has a periud of incubation, during which the dom.. ani..al gives no evidence of the impending outbreak. Whon the disease appears, a similar morbid malter or virns is eliminated in quantitirs altose:her disproportioned to the amount originally intruduced into the syotem, as seen in the oase of small por. The smallest particle of lythoh from vesicle being oonveyed into the circulation of a hea!thy subject lies dormant for a time, and then resulte in the development of a multitude of vestoles, each one filled with a similat virus. This fact, to well known, fails to receive the oonsideration it merits from the nonscientifio public, but it really leads to a most fuportant conclusion, which is, that the virut during the time it is apparently dormaut, is multiplying itself indefinitely, literally incubating or hatehing new matter of a like kind, until it reaches such propurtions as to cuse some outward expression of its preseuce in the sysiem ; and then the disease is said to appear. We ask special attention to this point; it may seem to be speoulative and theoretical, but it is in fact about as legitimate a deduction as can well be drawn frum an undoubtedly true premiss, and not more wunderful thau the fact that if a seed be in roduced into favourable suil it will, after lying apparently dormant for a time, find an outward expression in the for, \(n\) of a plant, which will bear abuudantly seeds of a like nature.
After this preliminary diseassion, conducted in a very simple and untechnical manner, it is pos-ible to convey to the farmer something like a rational and detinite notion of the nature of the eatle planue.
First, we require the element "iufectinn:" the virus must be iutroduced; and there are sulliwiently numerous sources of supply. Diseased cattle may be purchased, newly imported, and thus br coutact transmit the infection ; or even if care be taken to keep ther in quarantine, men passing from them to beulthy slook can communicate the disease ; sheep, or other animals, not thermsetves subject to the malady, may possibly b. e une the means of conveying if to caitle, by mingling with them zoon after having beein sssociated with infected stook.
Secondly, the virus, being introduced, accumtekates in the system until a sufficient quantity is collected in the blood to render that fluid morbidy stimulant to the different organs and stractures throurh which it circulates, cunsine excessive or altered secretinn, -hence the dis.marges from uostrils and eyes, and the invariable diurrions.
Thirdly, nutrition being arreated there resnlts weakness and emaciation, terminating us'ally in death, unless the system possesses sutlicient stamina to resist the effect of the poisen until has been all, or nearly all, eliminated, in which oise the animal slower recovers.

The disease has nothing in oomthon with pleuropuemonia, of the venieular epizootio (foot and moth disease), but consist essentialty of a poisoned condition of the blood, implicating, of necessity, every organ of the body; all the macous membranes, thote of the month, gostrils, eyen,
intestines, and generative organs are reddened and inflamed, and the skin is harsh, dry, and often excoriated at the insides of the thighs. Sometimes the brain also suffers considerably.
Symptoms: There will seldom be much difficulty in recognising the disease, although the early signs are comparatively insignificant. The appetite is impaired, the animal is dull, slight discharge may occur from nostrils and eyes, the coat is harsh, the milk is diminished, constipation is sometimes present, followed by frequent evacuation of fæces, and then diarrhea going on to dysentery. The epitheliam of the lips and mouth is loosened and falls off, showing ulcerations beneath; the breath becomes foetid; the subcutaneous cellular tissue of the loin and back becomes emphysematous, rapid wasting occurs, the animal refuses all food, the secretion of milk is almost arrested; the discharge from the eyes and nostrils is more abundant, that from the nose is sometimes mixed with blood; prostration increases, and ultimately death takes place, occasiovally in a few hours, but more commonly the animal lingers from one to three weeks. A favourable termination is indicated by a return of the milk, improvement of the appetite, and cessation of diarrhoes.
Treatment: Remedies applied to the cure of the disease must be selected from tonic and antiseptic agents. Fivery means likely to support the system may be advantageously employed. The sulphites have been much negleoted in veterinary practice, but they possess remarkable antiseptic properties, and have proved effectual in typhoid diseases in other animals. A dose compozed of sulphite of soda, 2 ounces, dissolved in a little water, and combined with tincture of gentian and tincture of ginger, one ounce each, may be given in a quart of good gruel twice-a-day, the patient being supplied with thick gruel and linseed tea combined with an occasional pint of good ale at intervals.
Of far greater importance than the cure of the disease is the prevention of its ravages, which even in the short period of a few weeks have been serious. Hundreds of animals have died or been slaughtered, and the statement that \(30,000 l\). worth of stock have been lost by dairymen in the metropolis alone is probably rather under the truth; many instances are known where the entire stock has been cleared off, and in other cases it has been reduced to one-half or one-third, the owners being naturally afraid to purchase animals to supply the plaoes of those lost, from a well-founded apprehension of incurring further damages,

Meanwhile, with the decrease of the number of dairy stock, amounting, if we add the animals at present affected to those already dead, to more than one-third, the supply of milk continues, -how kept up to par, is not diffionlt to conjecture. If only harmless water is employed to meet the deficiency we shall offer no remonstrance, but unfortunately a certain quantity of milk can be obtained during the progress of the disease, and so long as it does not appear to be unfit for use, there is reason to fear it is mingled with the rest; true, we have at present no positive proof that such milk is direotly injurious, but considering the state of the animal's system, it can scarcely be hoped that any quantity could be consumed with impunity, particularly by foung children, who are likely to be the principal sufferers in such cases. Again, there is the constant supply of diseased meat in a state more or less unfit for food; often in a condition which would justify its condemnation, but probably as often giving no evidence of the state of the animal during life-in faot, the only guarantee the public can have of the wholesomeness of the meat they purchase, is to be found in the honesty of the butchers who supply it, unless an inspector, who must be a good pathologist, were to attend the slaughterhouses, and minutely examine all the animals before and after death: whioh of course is out of the question in the absence of public slaughterhouses.
In the endeavour to limit the extension of the cattle plague, the Government is doing all it can possibly do at the outset, by taking measures to ascertain how far the disease at present prevails. Inspectors, elected from the veterinarg profession, are appointed to visit localities where the malady rages, in order to report and advise. Farmers and dairymen are unhappily pursuing a ruinous policy by keeping back information, and seeking muffered. By a ready co-operation with the efforts of the Government a great deal may be done involves delay that whill be fatal, as no measures
of an active charaoter can be
extent of the mischief is known.
Stook owners are further called upon to take steps to protect themselves as far as possible, by the establishment of a rigid system of supervision. To this end the followiag suggestions are offered :-
1. No newly-purchased oattle should be allowed to have communication, directly or indirectly with other stock for at least 14 days: the period of incubation may be fixed at 10 days, but a little margin should be allowed.
2. Sanitary regulations should bs strictly enforced in reference to drainage, ventilation, and disinfection by means of ohloride of lime, solution of carbolic acid, or Condy's fluid.
3. Should the disease appear, the affected animals ought at any inconvenience to be isolated completely; the worst cases should be destroyed on the premises, skinned, and the hide thrown into some disinfecting fluid, and kept there for some hours before being allowed to leave the premises ; the carcass, of course, should be consigned to the knackers to be boiled down at once.
4. All the healthy or apparently healthy animals should be treated with sulphite of soda, which may be given in doses of 3 ounces, dissolved in water, daily, or may be powdered and mixed with the food ; there is good reason to expect great things from this agent as a preventive.
5. Every animal showing symptoms of the disease should be at once removed and treated or slaughtered; and the milk from all animals affeeted should, if the owner has any pity for his fellow crestures, be thrown away; it would be far better to double or treble the present price of good milk than to vend poison under that disguise.

Much remains to be learned respecting the disease; numerous experiments, minute and laborious too, have to be carried out before definite results can be expected, and before these results are legitimately reached it would be premature to speak too confidently: but the publio may rest assured that a good deal is being done quietly even while very little is being said or Writtes. When struggling through a great crisis men are not much inclined for words. An Italian proverb says, "He who is silent says nothing," very judieious course when there ie not much to say.

We shall take care to keep the public informed of the progress of this disease, as occasion may serve; but as the wise man says, "There is a time for all things," and this is a time for steady, combined, and unremitting work.

Notwithstanding gloomy anticipations of the losses to the Agricaltural Society consequent apon its expenditure at Plymouth, the Plymouth meeting stands fourth upon its list as regards the amount received from visitors, ex ceeding all but those at Newcastle, Battersea, and Leeds. The following is the list, from which it will be seen that much greater interest has been this year excited than was exhibited at Lewes, the last occasion when a general election intervened :-
\begin{tabular}{|c|c|c|c|c|c|}

THE CATTLE PLAGUE
TThe following memoranda and letters have ap
Or Tuesday a meeting of the metropolith keepers was convened by Mr. T. P. Dexter, chnim ons the London Cowkeepers' Association, to consider a measures should be adopted with reforence to prevailing malady which has been recently into London. Professor Gamgee, late of Edinher? now head of the new Veterinary College at Chein described the disease as a catarrhal affection, prodec. in the blood an impurity which had a tendency to mon?
itself outward in every direction, and any exhatation even through the pores of the skin, of an animalaff with the plague was, he said, highly infectious. disease was, in the vast majority of cases, inco An animal attacked by it might succumb in to three days, or might last a week or more; but be generally doomed from the outset. The origin of: plague was intected foreign cattle brought to Islingty Cattle Market. Sound cattle coming in contact m.
them there cauglit the malady, and in their turn tm mitted it to others, so that it was spreading in a rani widening circle. It had been but just a month in : country, yet even in that short time he calculated nearly 2000 cattle must have suffered. It was mad be regretted that prompt measures for its eradientio were not taken on its first appearance. He shomed ho though we had antidotes for mineral, we had nonele animal poisous of the blood, and therefore it was nith to prevention than to cure that attention shoold \(h\) directed in cases like that under discussion, All ban that were evidently affected should be killed, or, least, at once and effectually separated from all hedi: animals. He went on to show that although the ent plague was not contagious to human beings, jet the: indirectly it might produce typhus and other feem and diseases, because, after a lengthened period of 0 or insufficient food in any country, the people of tim cattle disease better known than this. So far frow being new, it had existed for centuries. In 175 thousands of cattle perished or were destroyed, : Government compensating their owners. This, har. ver, had to be discoritinued on account of the numen frauds committed. Mr. Gamgee alluded next to the sheep smallpox in North Wiltshire in 1862. He stoon-r how, as long as farmers concealed the illness of the sheep, the disease spread with great rapidity; when they subscribed to pay for the destruction \(u\) that were diseased, and thus encouraged each oher peak the truth, the sheep smallpox was put an eni in three weeks. It would be more difficult to the cattle plague to a termination, but the same cin. was the proper one to parsue. The cow-owners a pry put their shoulders and take steps to carry onk th most advisable measures.

Tre Prior of Meac. - The present unfortanate pasition by disease since the firat importation of foreign mimmith I
by dis. do not wish to interifere with free trade, bet fure
lisk long advocated, what the farmers of this country must ins insist upon, a proper regulation of the foroign and hom
in diseased animals. As, iut times of cooparative quit relation to cattle or sheep plagues, onr agriculturisss pormi

that maintain the highest price in the home marker, -
namely, meat, butter, cheese, and wool; and by this namely, meat, butter, cheese, and wool; and by this
mode of farming they will create manure on their farms for the reproduction cf future crops. Then, with a view to diminish the cost of production, they slonhld employ more steam and less horsc-power, and they should also employ more machinery and implement., that they may require hss of the present high.priced
manual labour. The farmers should tell their labourers that free-trade in labour does not go well with parish protection, but they should deposit more of their earnings in the savings' bank, or hecome members of clubs, with a view to do all that they can to support them selves, independent of assistullee from the parish, Serrysfield Farm, Oxted, Surrey, July 29th. Bromus Schraderi.-I observe in your Paper of the 22.1 ult. a paragraph on the Bromus Schraderi by Messrs. Stuart \& Mein auent a comparative trial they have made on their expermental grounds on the or erits of the Bromus and Italian Ryr-grass, which up in paper, theoretically speaking, looks in favour of the Italian; but as practice and positive evidence are
always preferable, and more to be relied upon tian always preferable, and more to be relied upon than the enclosed letter, which I have cut out, of one of our local newspapers, a place in your next impression, and shall feel chliged, as I think it may be interesting to the agricultural community. You will herewith recelve a sample of the Bromus seed direct from Australia which you may give to any one who will give i
and unprejudiced trial. Francis Somner, Kelso.

To the Eltitur of the Keloo Mail.
"In your issue of Febriary 6 th , which I received by the last mail, I notice with pleasure a letter fiom Messrs. Stu trt
Mein, seedsmen, under the above heading, which you had
extracted from the Sottish Farinor, as having aitracted the extracted from the Sottish Farior, as having attracted the
attention of agriculturists. Being, enguged here in the sed
trade on an extenisive scale, and barins a kivwle tge ofthe
plant alluded to, nerbaps a voice from this side of the worlit

royal agricultural of england.
Montely Cotwcil: Wednesday, August 2, 1865, resent, Lord Tredegar, President, in the chair, Lord thesham, Major-Gen. the Hon. A. N. Hood, Mr. Arkwright, Mr. Raymond Barker, Mr. Cantrell, Culone Challoner, Mr. Clayden, Mr. Brandreth Gibos, Mr.
Holland, M.P., Mr. Randell, Mr. Sanday, Mr. Shutleworth, Mr. Thompson, Mr. Torr, Mr. Wells, Mr. Frere, and Professor Simond:
Finances - Major-Gen, the Hon. A. N. Hood, chair man of the comwittee, presented the report, from which : appearel that the Secretary's receipts during the by Mesrrs. Quilter, Ball, \& Co., the Society's accountants, and were found correct. The balance in the hands of the bankers on July 31, was 7497 l . 16s. The Com!mittee recommended that the money now on deposit ( 1000 l) be withdrawn to meet the Plymouth expenses. This report was adlopted.

Journal Coymittee.-Mr. Thompson reported that in Class II. "the only Essay sent in was not considered deserving of the prize.
In Class V. the prize of 257 . is awarded to the Essay bearing the motzo "Suum Cuique," written by Win.
Henry Heywood, Dunham Massey, Altrinchan, Cheshire. The Essiy 551, by W. T. Carrington, Hallington, Uttoxeter, is Conmended.
In Class VII. the priza of 201. is awarded to the E:say bearing the motto "Rafus," written by A. Bailey Denton, Stevenage. The Essay 566, by John Ewart, Bigg Murket, Newcastie-on-Tyne, and 563, by Philip
D. Tuckett, 76, Old Broad Street, are Commended.

In Class IX. the Prize of 10l. is awarded to the Essay bearing the motto "Anteveni, et subolum," \&c., Fence Ilouses : and No. 576, written by G. Murray, Fence Houses : and No. is Comithended.

The following list of suhjects was reconmended for Prize Essays for 1866 :
County Essay, Worcestershire
Town ditto Leiries, espectially with reerence to the Preva-

Mny other Agricultural subjeet
Hecommended that the Sorthorn, Hereford, and Devon Herd-books to the present time be purchased for the Library.
This report was adopted.
Veterisary. - The following are extracts from the eport of the Covernors of the Royal Veterinary College for the year ending 31st December, 1864:-
During this period all the means at the command of the College were kept in full operation, the lectures, demonstra-
iona, chemical instructions, \&c, being daily delivered so soon as tho schulastic scosion comurenced, viz., in the month of The chief rubjects treated of in the lectures on Cattle
Pathology after the necossary introductory ones were the Pathology after the necessary introductory ones were the
physicul tn t vital propertios of the blood, with the pathological
changes it undergoes in iuflamaation aud other morbid cinditions of the bois. instructions included likewise a full description of the curses, sy mptoms, aud treatinent-prophy-
luctic and curative-of the diseases commonly known as Red-
 Appleny, Dabutes, Purpura
of infarimation, such as
uleeratich, and mortinication.
The number of pupils in attendance was larger than ordinary,
no noless thin 58 "freshmen" ent tring betweell October and the
commenceroent of the Curistmas vacation.
The yearly increasing entries of puplls, with the extended The yearly increasing entries of puphls, with the extended
instruvtiol and more rigid examiuation, bid fart to elevale the
professinn, and to keep the c cuntry well supplied with profession, and to keep the contry well shippled with
gcientific veterinary surgeous on whand the agriculturists can
contidently rely at the time of need. The Buvine auimals admitted into the infirmary have affirded useful instruction of a practical nature, although the
cases of disease have not been of any uncommon kind. One cases howvere of diseace of the eeyebill requiring the perform-
ance of a bold but delicate operation, very rarely had recourse the lower auimals, was success ully undertaken, the result proving most satisfactory. Another complex case of purulent matter within the organ, also required a surgical operation, the performance of wh'ch was attended with the
happiest result. These two cases are only alluded to for the purvose of showing that operations requiring au sccurate the notice of the purifis, on whic: occiations every atep of the irrucess is fully explianert to them.
The number ot morbi 1
veterinary surgenns and others lits been fuily from country furuser period of the lise duration; and these also, according to the stablished custom, have been ussed fore the ebenetit of the
class. Many of them have possessed novel features, and as ruch, a stlection has been made for prblishing in the
Velerinarian tbe particulars of the cases in which they
occurred

The G svernors are fully alive to the necessity wintexss

 the purpose of studying the causes with a
progross of disease as well as the instr treatment of infected
beneficial results.
In the report for last year mention was made of a series
oxperiments being instituted in order to
 within the animal body. Thiq intriente an 1 mprrtapt inju
is btill going on, and several of the facts aarrived
already boen used with advantage, both in freeing animals

The following letter from Professor Sinonds mo read, and directed to bo published:-
"To the Council of the Re Reterin irg Colloge, Aup. 1,1 igiculur
"
 "Beri the stais, of the malads.

\section*{mighland and agriculturar}
improremenss: August 1.-No better instance of how Den-sbire could be ing has been going on in InverHighland Sould be given than the statistics of the
show was in 1831 , the 10 th, we believe, that the Society had undertaken, when 198 cattie, 90 horses, 129 head of sheep, and 11 swine were shown. The nymber of indication that farmers in this locality had not thought of discarding the rude implements with which their forefathers scratched the ground. The sum given way in premiums was 318l. Eight years after, another Highlaud Show was held in Inverners, by which time the Society was able to more than donble the sum for prizes, offering 744l. This called forth 302 cattle, 93 crept up to the number of 24 , mechanism on the farm being still unappreciated.
In 1846 the Society again pitched its tents in Inverness, when there were 428 entrien of cattle, 112 of horses, 357 of sheep, and 33 of swine; and for the first time in the history of the Society, 76 head of poultry were penned; but the number of implements still did not rise higher than 59. The prize money offered was 1050l. It was not until the lapse of another decade that the Show came round to the capital of the Highlands. On this occasion only 248 cattle came forward, but the horses had increased to 131; 469
sheep were exhibited, 43 swine, and 156 ponltry. The sheep were exhibited, 43 swine, and 156 ponltry. The
enterprise of implement and machine makern was now beginning to tell upon farmers, and in all 281 articles appeared in the showyard. The premiume given by the Society were this year lews by 50\%, than in 1840.
are more than 100 in excess of 1856 , hat they fall nearly 70 short of
what they were in 1816 , the number being 361 . The borses are one more than at the previous show; the sheep are nearly double the number they have ever been-viz., 812. There are 43 swine, 294 head of pouitry, and there is a new class opened for shepherd' their due reward. The premiums this year amouat to the sum of \(1350 l\). Thus, in less than 30 years the exhibition has more than doubled its numbers so far as cattle are concerned-nearly one half greater in regard to horses-more than six times in sheep-four times in swine-while the implement list is about 200 times as extensive.

At present we can only say in general terms that Short-horns were a full and interesting class. Of the 18 aged bulls, 16 wers present, and many superior animals among them. The 2 -year-olds were also a superior class, aud the young bulls were both numerous and good. It may be inentioned that Lord Kinnaird's bull, which was placed second at Cupar, was here 1st, beating his rival there, as we predicted he would. The female classes were well representen, and in particular may be mentioned the lieifers. The polled classes contained some first-class animale, prize-takers in many previous shows. In the Highliad classes many of the best breeders of this picturesque race of cattle were represented. Ayrshires were not so numerous, but those shown by the Duke of Athole were particularly excellent.
The horses were, generally speaking, of a good quality. The Leicester sheep, especially tups, were of superior merit, and as proof of this it may be mentioned that the judges spent about an hour and a-hal over them; the Cheviot lst prize animals were all
good, but the others were only middling. The blackfaced sheep were a prominent feature in the show.
The following is the prize list
class I.-CATTLE
Section 1. Bulla calved before 1st January, 1863.-1st, James Geddes, Orbliston, Fochabors; \({ }^{2 d,}\) Androw, Longmora, Rettie,

Abridged from Scottisi Farmer.

Yorkseire : Aug. 2.-The general show-yard opened yesterday, and although the rain fell early in the day,
it cleared off, and the morning was fine, though occasion. ally threatening.

17 goomed is very convenient to the town, and is 17 acres in extent, adjoining Nether Hall. The visitors on entering had a full view of the show before
them. The stock (horses, beasts, sheep, and pigs) them. The stock (horses, beasts, sheep, and pigs)
occupied a line of tents stretching across the entire ground; lower down atill, and in a parallel licte, were the horse ring and the ring in whici to exhibit the the left-band space, whilst at, the nther extremity of the ground the boxes for stables were fitted up in an enclosed yard away from the noise of the thresting machines.
The Council met at \(11 o^{\prime}\) clock to receive deputations from towns desirous of receiving the meeting next yenr, and it was decided in favour of York. Applications were notmade from any other towns in the county.
The annual meeting of the Council was held at noon, under the presidency of his Grace the Duke of Devonshire, K.G. The Hon. Admiral Duncombe, M. P., was appointed President next year. The Dnke of Devon-
The took Admiral Duncombe's place as Vice-Chairman.
The prizes lor implements were awarded to-day. Messrs. Fowler, of Leeds, took the Firat-class Medal Messre. Ransome \& Sons, Ipswich, Second-class Merlal Marshall, Sons, \& Co, Gaimbborough, the 1 at prize of
\(50 l\). for thrashing machine; S. Rovey \& Co., Leeds, 2d prize, 20l., for thrashing, shaking and dressing machines ; Messrs. Ashby and Jeffrey, Lincoln, the Silver Medal; Mr. Allen, 20, Parliament Street, Westminster, Firat-class Medal ; Mr. John Plant, of Burley, Shefield, the Secoud-clase Medal. Several other prize of smaller amounts were awarded.
The show of live stock was as gnod as it was extensive, and every department in cattle, sheep, horsea, and
piga, was well filled. First mizes for best Shortpige, was well filled. First mizes for best ShortStrathallan Castle, Auchterarder ; Mr. Jno. Taylor, of Moreton Whalley, Lancashire; and Mr. J. H. Fawkes, of Farnley Hall, Otley. For the best bull calf, to Mr. G. S. Foljambe, of Osberton Hall, Worksop; for the best cow, to Lord Feversham; for the best heiter under 3 years oll (Silver Cap, value \(25 l\) ), to Mr. T. Booth, of Warlaby, North Allerton; for the best heifer under 2 years old, to Lord Feversham; and for the best hrifor cal', to Mr. (f. S. Foliamber. Lord Londesborough carried off' a lat prize for bis dairy cow.
Firet prizos for Leicester Sheep were adjadged to Mr. J. Barton, Barton House, Malton; Mr. W. Angus, Neawick, Driffeld; for Limeoln :umi other long-woulted Borts, not quatified to competa :as L, qiiwaters, to Mr. T. B. Marshall, Branston, Lucolu; anh Mr. R. C. Work-
man, of Almhoume, Doncastur; for shurt-woulled sheep
in Lord Wenlock,

Rossington, Bawtry ; and for extra stock (with a Silver Merlal), to Mr. J. Simpson, Spofforth.

First prizes for Pigs were conferred on Mr. W. B Wainman, Carhead Crosshills, Leeds; Mr. John Dyson, Dock Street, Leeds; Mr. G. Mangles, Givendale, Ripon, Lord Wenlock; Mr. R. E. Duckering, Northorp, Kirton-in-Lindsay; Mr. Walton, Foundry Street, Hılifax; Sir G. O. Wombwell, Newburgh Park, Easing Parker, Golden Lion Inn, Bradford; and Mr. S. Wiley, Braudsby, York

The great feature of the exhibition was, however, the magnificent collection of horses. The best prizes for stallion hunters were a warded to Mr. J. Peacock, North Holme, Oswaldkirk, York, and Mr. James Smith, Hut Green, Pontefract. Stalion coach-horses to Mr. John Johnson, Brigham, Driffield. Stallion roadsters to Mr. W. H. Brown, Beltoft, Bawtry. Agricaltural atallions to Mr. W. Sumpkin, jun., Lowthorpe, Hull Brood mares (hunters) to Mr. W. Tindall, Whentley, Doncaster. Brood mares (roadsters) to Mr. W. Cbarlesworth, Netherton, Wakefield. Agricultural brood mares to Mr. W. Tennant, Barlow, Selby. Hunting geldings to Mr. Thomas Dawson, Poundsworth, Driffield; Mr. W. H. Clark, Hook, Howden, and Mr.
Everatt, Doncaster ; Mr. Mr. Kidd, Tudcaster, and Mr. R. J. Bentlev, Bawtry. Hunting fillies to Mr. J. D. Wightman, Sutton House, Malton. Coaching geldings to Mr. R. J. Bentley and Mr. J. S. Darrell, Weat Ayton, Scarborough. Coaching fillies to Mr. J. Jackson, fillies to Mr. Enoch Hodgkinson, Morton Grange, Retford; and Roadster geldings or fillies to Mr Christopher Lofthouse, Tadcaster.

The Veterinary Review and Stockowners' Journal. IN
VII. Publislied Monthly. Edited by Profensor J Gaøngee. Simpkin, Marshall, \& Co.
The present number, in addition to much technical and professional matter, contains a good deal that is more generally agricnlturally interesting. The papers on
agicultural statistics, and palm-nut meal as a feeding agicultural statistics, and palm-mut meal as a feeding
cake, are extracted from the Journal of the English Agricultural Society. There is a defence of the proposed Albert Veterinary Colloge, and a reference to the
transference of the Edinburah New Veterinary Collnge which is about to migrate southwards and assume the new title. The following is a criticism by Mr. Joseph Gamgee, sen., of the Modes in vocue of Awarding Prizes at Agricultural Associations to Horse-shoers:-
is It is impossible to deny, with truth, the lamentably unsatisfactory state of the art of horse-shoeing through out this kingdom ; and it is discouraging to see, as is the fact, that for many years past the jaults of commission have produced more positively in,jurious effects than those of omission had ever done, so far
"Fuiling to devise a rational system of horse-shoeing and neglecting to follow the methods pursued in other countries, the subject has heen treated in England as quite an open question. Jack was as good as his master anateuns and adventurers tried their hands; while the last eeven years, what have, by courtesy, been called 'prizes to horse-shoers,' have been set on foot in some localities; conspichous, in particular, has been
'The West of England Agricultural Sociefy. And to show the position in which the horse-shoer is placed and the exhibition made of the ars of farriery, the following paragraph, taken from a London weekly sporting paper, is produced. The pawayge quoted is given, assumediy, on authority:-
in "' Bath aind Wixt of England Agricultural Society.- A novelty was on Monday) was the hurse-she comperitive sheep-shearib as it is unfortunately true that niue out of ten cares of foot lameness arise from bad shoeing, the Society has done well in thins attracting public interest to the question. Whon will the
village smith underatand that, instead of paring and raaping horse's foot to fit a shoe, the iron ahoo should be made to fit
hef foot, with an equable bearing all round from heel to heel

\section*{just as he likes a leather shoe}
elastic hoof requires the placting
heel may expand under wiakht?
follows-The smiths drew lots
ocupied being from \(24^{\prime}\) to 30 minutes; and after mapection by
pier byges the shnes were fitted and nailed nn, the time ncci-
performance consist of the time taken to conatruct the shoe the lavel form of the shoe, the situation of the holes and what the preparation of the foot, the fitting of the shoe, the nailing

The above shows, better than any words of mine can convey, the degraded state in which this important art is at the present time-an art second to few, if any, its oneration, and difficult of accuisition. The cralt of farrisry has all the attributes, if it were properly cultivated, of a ecience and an art; and yet here we have the diagusting spectacle of teeing the sheepshearer and lronde-shoer placed in the eame category, exhibiting their physical powers, respectively, at clip ping, nail-making, hammerins, and paring; and if per chance there had been a prize for pork butcher, then there would fave been additionally-sticking.
that important subject - horsestopeing - la a peophain illustrative of the state of mitters.

Instead of a well-founded Bystem for the instruetion doling out some \(10 l\). between a number of men, cas? from distant places, to perform certain acts men, conit prescribed procedure, dictated in the absence of ratis guidance, and without practical rules, on the sprom all has to be tented, not by manmer, but by time. \(P_{2}\) onrses ! and oh ! for the honome of veteriaary me Napoleon le Graud called the English a nation seepers. I don't know for why; bnt if ans agriculben shoeing in the way we see carried out in England mis. an evident catering for approval, their standand mor oon be lowered.
These "prizes for horse-shoers' serve for a dispir and to see a few poor men working and sweating, s the absence of anything to raise their minds to the fex worth and the important nature of their calling. trifle gained by the two or three most sucressful, afre the exhilaration of the evening, may perchateo ores to buy the wife a gown, and the children a pair tom of shoes; while the poor man himself, left in igment becomes puffed up as the best horseshore of \({ }^{2}\) neighbourhood. So much for best ; if they what him the standard, the relative pesition would coveted.

Enough of alteruately loading and driving the English horse-shoer from one series of errors to anmom. Let these men be instructed, and they are capicic and as svilling as other men of being taught to thing but, misguided as they have been, the meu calling are lowered in the eyes of the world.
"It would be a reasonable service if the men m their directors were made to change places! no
can instruct another in a branch of knowledge he nere learnt himself, When will Englishmen be led us understand that the feat are to hormes what braim mi hands together are to man-everything

\section*{Farm Memoranda.}

We take rdvantage of the immense body of Antienlion evidence lately taken before the Hypothec Cormisame the existing style of Scottish agricult
and energy of Sicottish agriculturists.
1. Southfend, Mid-Lothian : Mr. Willinm Gr My farm is about 200 acres (Scoteh) or 2.0 inyurd cres; and I pay from 1000 l . to 1200 l . of rent in farm is entirely arable. I never felt any inconvenier personally from the law of hypothee operates prejudicially to the to raive nululy and and lay brimine makes a landlord not so select with his tenants. he knows that he has a prior clain over creditors. I think that is unfuir to men pos capital, who engage in the profession of fact have sufficien's capital for the land they amount which they expend on draining, rleaning, manuring, and general vermanent improvements, considerable security to the landlord as comp it other creditors. A tenant ought to hav
capital to make these improvemente, an my own capital, and give my name to a lease, and iny rent at these terms, I dou't 850 what fur security the landlord requires. I have spent somat on my iurm 850l. a year or manure. In the 50 ow three years after my entry I also speab the
draining. I look on these as becurities which the lord has, and which the tenant cannot take awn tverage annual expenditure on mamure is to vo l. I pay cash for my guano, a peal 1864 Martinmas 186\%. I think the hypothee shou abolighed at once, Withott
2. Woolmet, 'Iodhiels, Newhalles, and Deay Bumeboniny, Mid- Lothian: Mr. John Gibs averare of the last seven years, I have paid \(2684 l\).,-sometimes much higher. arable, but I have always had a proportio term of payment of rent for two of the Martinmas, a year atter entry it Candlemas, a year and three months My strongest objection to the law that, it brings in a cl ustice to the landlord
the progress of goriculture.
agricultural country, would h

done so since the repeal of the
both landlords and respectable
derived benefit from its abolition
have taken, conld not continue
consquence of being short of means, they
photy of eapital mould have done. That deteriorates ib) hads and the landioras, because the next tenant these tenants left the farms, the rent which he would ruve done, if the former tenant had had sufficient have done, mange the farm properly. Ny opinion is, thas tha class of tenantry in many districts of Scotland ans been deterivating for the last 30 years. In the dimrict with which I am familiar, they have changed refy much for the worse in respect of capital. I would abosay that there has been a very large proportion of tants who never were bred to farming, many of whom been men of capital, but wanting experience and pactice. There is no doubt that very great progress mon mion is, that in regard to capital, though not s: ill in regard to character, farmers have very much it terionted within the last 20 years. A great change ins taken place of late years in the expenise of farm ficinl manures. There are few tenants in the district in zood credit, who do not And their tccounts for thete in munt annually to more than the rent paid for the land, and in many cases to much more. It is not every one who is in a position to follow up the great improvements which have taken place in agriculture, and a
arge cins of farmers have falien in consequence. the lant two of three years, and particularly with refere to the crop of 1862 , there has been a great trenchan capital ; mnd I believe that there are very few ais the rent of 1862 had to be paid from capital. the hive of bypotzec had beon abolished, and landlords hand insisted upon fore-renta, \(I_{m}^{*}\) don't think that tenants nould hate been rouped out of their farms in consequence of that, because, if they could pay fore-rent, one year. If there was a series of bad years, and the tenant was nnable to pay his rent, the laudlord might roup him off, though it might, not, be his interest to do Mr opinion is, that the effect of the abolition of the la \(w\) i. lirpothee wonld he to bring in a class of tenants with mori capital, and tenants would have to take farms of - /e suitable for their capital.
3. :
3. seton Mans, East Lothian: Mr. Robert
imie.-I farm abont 320 imperial acres. My rent, on the nverage of the last 22 years, has been \(2 l\). 14 s . or a. 15s. per acre. My term of entry is Whitsunday and condeation of crop, Whitsunday, my rent is payable at For Edinburgh and Leith mannres I pay 301. a year, atd for guano and lighter manures anut 4601 . a year. I am also bound to consume all the
ram on the lann. For teeding-cakpt, dc., I pay 200 l . If. I consider my term of entry very suitable, and erms for payment of sent are very eaby for me, 1 farm like mirse would be, that effect of forerenting : quire a great deal more capital. The landlords would value of land in the menantime, but it might reduce the value of land in the meantime, though, I believe, that nting remedy itself in course of time. I think fore-
and rate Wonid bring in a better elass of mén. It would be a berefit to landlorde, inasmuch as they woutd get their money sooner ; but it might reduce, in the meantime, e value of land, by thinning the grownd of ment who be tenants without eafficient capital; but I it would grently benefit the country ulcimately.
think it would be fait to the landlords to Issem of forew of bypothee without introducing the itr acre is a forehand rents. My expenditure for manures itr acre is a fair average of that of neighbouring The merchants who supply thes, and take a second crop. leeding stuff are very often their ereditors. If land was I conld not have tauld be very much to their advantage. :lint time if the foren Seton Mains with my capital at ; I muat have tarenting system had been carried Eescras Hili Haten a smaller farm.
John Formun.-It is, Humbie, East Lomilam: Mro. and field of pasture. I farm about 900 imperial acres, is Whitwanday abut 33 s. per acre. My term of entry
reat at the Cation of crop. I pay the first grano mad Ceeding stufits year following. I spend on being under an obligation to consnme the straw on the अanient for landlord and term ontry is the most conbouthec of the give the farmer, large or small, the The abolition of the law would have the a year's rent be an adruber of thom out of the field, but that would geoverally. It would also give the to the profestion arridiag to their may of taking large or amall farmen, adratage of the men with capital, and to the distike lasellords more careful in the selection of their
thant T firms. feht of my farm Dhem: Mo Filliam sadler.-The
are arable. My rent varies from 1300l. to 1600\%. The houses at Whitsonday, and to the remainder at the houses at Whitsunday, and to the remainder at the
separation of the crop. The first rent is payable two years after entry. Entering to the fallow in March 1864, I commence paying rent in March, 1866. should prefer a Martinmas entry to the whole farm, and to pay rent quarterly, commencing three months after entering. I should prefer that, because I would be enabled to take land on better terms. That rule would be very inconvenient at present, because tenants have been losing a great deal of money within the last three years. On an average, I expend annually from 600l. to 700l on imported manures, besides having to consume the whole straw on the farm. I also expend on feeding stuffs 2001. or 300\%. a-gear. I think the quarterly payment of rents would be decide.lly beneficial to landlords and tenants. Those who have not sufficient capital to take land would not attempt to do it, as they are induced at present to
do by the long-credit system of the backhanded rents. I entered to my farm in August, and purchased the crop; but I was assumed by the lease to have entered at Whitsunday, and the proprictor paid me back 2\%, an acre for all the Grass land. I got the fallow wibhout paying anything, and I leave it in the same way. When tenants of sheep farms enter at Whitsunday, they pay for the stock in full, and they sell part of it very after entering. If they were taking the farm at
Martinmas, they would have less to pay for the stock. Martinmas, they would have less to pay for the stock.
I think it would be much more satisfactory that farms should be fore-rented. If the hypothic were atolisinei, I think that we would get everything that we buy cheaper, because those we deal with know that they run a riss. The manure merchunts are quite aware of the existence of the law of hypothec; and \(I\) am aware that
there is keen compecition among them, but I think they could sell cheaper than they are doing at present.

\section*{Miscellaneous.}

Locomotives on Comnon Roads. - On the 1st: of next month the Act passed in the late Sission ( \(2 S\) and 29 Viet, cap. 83), for further regilating the use of loce motives on turnpike and other roads, will come into
force and continue for two years. At least thren persons are to be empleyed io drive or conduct " while in motion, ou foot, hy not less than 60 yards, and wand drivers of the approach, and he is to sigual the ariver of the lommotive whell mecess iry to str 3 , and he the same. The whistle is not to be sounded nor steau to escape when the locomotive is on the road. The locomotive is to be stoped when required; it is to have penalty of 10l. can be imposed. A locomotive is not to go at more than four miles an hour through a public a city, town, or village. The name and address of che politan Board of Works, the Lord Mayor aud Aldermen of the city of London, and other local authorities, are to make orders when locounotives may pass through cities and other places.
Bare Fallow.-But life is full of it : and especially of such as this. What is education but a 20 years \({ }^{3}\) that seem to bloom invitingly around us, luring the warm spirits and fresil feelings of youth to the edsy ndulgence of more active enjoyment and contact with the world? What is manhood but a continued spiere the same self-denial; biograply of coil-for a future crop-anidst the wistful temptation of surrounding fruition? What is life and assiduous toiler-a fallow for the future garnering of the joyful crop that was sown in tears? Hoskyms.

\section*{Calendar of Operations.}

AJGJsT : Arable Land.-Over a large part of the Barley will probably be earliest ripe. They may be cut by the scythe, bagging hook, or sickle. In the cane of grain amongst whith Clower had boen sown, it may, when the straw is long, be advisable to reap among the green Clover; the sheaves will be the sooner
"won" for not having any Grass amongst them. Barley is not, however, so often high enough to admi of this. The common practice in most parts of England is to mom it turn the owaths once or twice, and place it in cocks, and when dry carry it to the rick-a method not advisable to our variable climate.
Wheat will be rendy for cutting in mout places during this month. Before harvest time men must be engaged for the whole work; it is of the utmont imThe cost may be from 8 s . to 14 s . per acre, prices at which mell may earn 3 s , to 4 s . a day.
Wheat should be cut before it is dend ripe. Reaping nay commence as soon as the grain will give out no juice on being squeesed. Barley, on the other hand, Which is required all of one degree of ripeness, in oriter that it shall all spront together in it all to become dead ripe, a period which is indicated ly the bending down of the ear. And Oata, again, must be cut almest before
they have lost the greeuness of the straw ; as if allowed
to get ripe, they are easily shaken out by wiud ; sud if to get ripe, they are easily shaken out by wind; and if
the crop be heavy, the stckle should be preferred to the scythe to cut it with. And the more rapidly, of courve that carrying proceed, when the grain mau atraw are ready, the better. From the rite of dew in the morning till its foll et might, of the failing of light (either of sun or moon), carts or \#aggons are to be kept at work-never leaving off, except on overtaking the work, or till owe or two in the morning ; provided it be light and dry. It will amaringly oxpedite the work to let a share of it by contract. The pitching to the cart in the field, the building on the cart in the field, and the pitching from cart to stack - the work of two mem and one lad-may be let to them 28 one company, for from 10d. to 1s, \(2 d\). per acre, according to the bulk of the crop. The farmer's own ment build the rick, and his boys are cmployed to lead the carts to aud foom the field. In a hilly dietrict, ot wharever two horses are used in the cart, men will be required instead of boys to drive them.
It may be uecessary in the beginning of this month to thresh the last of che rick for straw, which should be immediately "leased" for thatch, and tied in bandlut and soaked in water ready for use.
Beans will be cartled of the winter-sown fields early this month, and cut on the epring-town fields towarde Early of it.
Farly Tureen left for seed wih also be ready to cut.
Turnips should be hore-hoed asain this month. On
Turnips should be horme-hoed again this month. On
ight rich soils the earlier stubbles-uspecially of Pens -may be scarified, harrowed, s iwn broideast with the White Stone Turnip, barroweil amil rollon, mal left for crop; which, if not always of bulbe, will at my rato be sure to afford a bite of greena, useful for the young lambs.
Mangel Wurzels and Carrotes if seeding, should be pulied and carried to the pigs.

Clovers are being folded over by the sheeps and the secoud cut of the mown fields is being carried home to the horses; purt of it may be lett for seed if considered desirable. Lncerne, the last of the Vetches, Bud Cliver, will suffee for cattle food.
Fallow.-If the land has wrought well under the last nloughing, it will need no) farther work this month but, if it is still foul, advantage must be takici of guod weather to himrow and plough hgain.
Buchucheat will be ready to cut towards ther and of his month, as soon as the mijority of its homomathave ripened their seed. It should be gently moved five or six times during the process of barvenarg, ant whet iry may be atacked in a long narrow ruck, wilh a tunnel through it.
Hemp.-As soon ns the seed has set, the male plants may bo pulled, tied, and carried to the steepiag
Aops.-Alter the middle of the month the groumd must not be noved more than 2 or 3 iachen below the surface.
Mustard may be gown on fitlow this month for Tearghing in green,
Teazel harvest is a tedious operation, and should be let to a party who will take the whole uftir at 11s per pack.
Grass Lands.-Pastures will now decline; but as the aftermaths are ready, they may be readily eased. Lambs and drafted ewer, and also fatting beasts may on the aftermaths, just in the proportion which nutritio In ordinary seasons pasturage gets dry ath scanty during this month; and much cifficulty is usually
oxperienced is doing justice to young and fattening tock. It is nost desirable therefore, to provide keep by means of Tares, Coleseed, or Becond cuttings of Clover, Sainfoin, or Italian Rye-grass. A few acres of one or more of these forage crops will enable the stockinnster to fill up the gap betwist Grass and Turnips, rom which he is so often a serious loser. It is now that calves and lambs so usually get lean and permanently stunted, which may be prevented by a fiur less expenditure of food than will be required to put them again in motion after such \& check lins occurred.
Live Stock.- It is well to clean out the cattle bozes and shods in the early part of August, and carry the contents to the fields for winter Bealus, \&c.
Siles may be effected of some of the cattle and sheep. This is the more desirable as the next month is the shortest of "keep" through the year. Swine will be briuging forth their second litters towards the and of August. The first litters will be stroug young porkers, just fit for the atubbles.
The ewes will not want drafting-those intended for future breeding may be placed on ordinary pastures, stubbles, dec, those permanently drafted must be put to the beat keeping the farm will ufford, always excepting the aftermatha, which will generally be too strong, and onght to be left for the lambs and fatting sheep; the Poultry. - Turn your chickens and grown fowl into the stubble and stack yard.
Dairy Farm.-The quantity of milk given by the cows is not quite so great as in July, but the quality is watter; as the autumn advucte the milk becomes liable to burn, it is well to be prorided at this season with come early Cabbage, a few of which may be given
o the cows dally. Long Grase in meadows should be
mown this month : and if it can be made to heat somewhat in the rick, it will do well for the cows when not yielding mik.

We also extract the following from Carter \& Co?'s Tade-mecum:-
The Cereal Grains and Harvest Operations. There are some particulars in the management of our cereal grains in which they are alike, acd of which, therefore, a statement common to all of them may be made. All our white corn crops come generally in our rotations after green crops or manared fallow crops of some kind or other. Wheat succeeds fallow, Clover, Beans, Turnips, Mangel Wurzel, or Potatos. Oats come after Turnips or Potatos, or Mangels, or newly brokenup land or Clover. Barley generally comes after Turnips. The four-field rotation, Wheat, Turnips, Barley, Clover, is the greneral rule in England. 1, Wheat or Barley; 2, Clover and Grass seeds ; 3, Oats ; 4, Turnips-or 1, Turnips; 2, Wheat or Barley; 3, Grass; 4, Oats ; 5, Beans or Peas; 6, Wheat, are common rotations in Scotland. The cereal crops are generally considered the exhausting crops of the rota. tion; but it is evident that this depends on the cultivation to which the land is subjected during their vation to Which the land is subjecter and on the use that is made of their produce. This ides nevertheless rules our rotations, these crops being taken when the land is, by previous treatment, at its best, and being followed by crops whose management restores the richness of the land. There are exceptions to this rule, bat they obtain only where the land has acquired too great richness and needs deple. tion, or where it is in the hands of its enemies, i.e., of those who, having the power, are disposed to beggar it. In the fen districts of England Cole-seed or Turnips are followed by Oats, and that by Wheat; the extra tendency to straw being taken off by the less valuable crop of grain, and so a possibility of a standing Wheat crop being obtained : and thns again, in the best-managed land under the four field rotation, that system is being land under the four field rotation, that system is being
modified by Wheat being taken after Turnips and followed by Barley. After folded Turnips, Wheat i found to be the best standing crop, and the Barley finds after it quite enough food to yield a crop without its being of so luxuriant a growth as to spoil the sample Apart from these exceptiona, however, the place of al these crops in the rotation is, and ought to br, after a manured crop, such as Turnips, Mangel Wurzel, or a crop which by its growth feeds the land, as Clover does, the Clover root being in effect a liberal dressing of the soil.
The next general aspect of these crops is that presented by the question which has latterly excited a food deal of discussion, namely, thick or thin seeding; but it is not worth while discussing this question on general principles; it mast suffice to refer to the data furnished by experience, with reference to each particular crop of the series, and this is done in the paragraph descriptive of each.
The cultivation proper to these crops is much alike excepting the seed-time. The seed is generally sown harrowed or hoed when the crop is up, and they may be rolled or not, according to the condition of the soil The crop is hand-weeded, if necessary, before coming into ear, and even after, if much weeds or the wild Oat exist among it, which can be distinguished only after earing: and the harvest operations are pretty much alike for all.

Harvest-work in the corn-field is done either by contract or at days wages; and the price per acre varies from 8 s. to 128 , and even more per acre, according to the bulk of the crop. The corn is either mown, or reaped, or bagged. If mown to tie, it is best mown up against the swathe, as otherwise the scythe is apt to cut the ears from the straw, as each new stroke is driven up against the swathe, A strong lad follows each scythe and gathers the corn in sheaves, laying them upon ties which have been pulled and placed by a child preceding him; another lad or woman ties: man, two strong lads, and a child thus make a party.
In " bagging," as it is called, a heavy hook is used a wisp of straw is cut first and doubled up, or a stick is used instead, held in the left hand, and with the right the heavy hook is driven against the corn close to the ground, and so, by successive stroker, the corn is cut, perhaps a foot deep, up against the standing crop; the wisp or stick in the left band serving to guide it to a standing place as it leans against the crop. A dozen such strokes will clear 3 or 4 yards in length, and the workman, returing backwards upon his work, gathers what he has cut, against his leg, into a sheaf, and places it on a tie that has been pulled for him, and laid convenient.

In reaping, each man is of course more independent, pulling his own tie and making his own sheaf; though here also it is usual to have a bandster, who ties after several men or women. The sheaves should be abont
10 inches in diameter, and as near as possible the full length of the straw. They are set up six of a side in shocks or stooks, with two head sheaves, lutt to butt, over them, as a roof; or they are sometimes set up orily two of a side, with two small sherves overhead, hanging ears down, and tied together by a band, as is the prac tice in some parts of the midland counties. It is the general practice in England to mow the Barley and leave it in swathe; but where the crop is tall and buliy, it is beiter tied in sheaves, whether it be Oats

The whole practice of harvest-work is, however being altered by the ase of the reaper, which, as in the case of Bell's or Burgess's, leaves the corn in swathe
upon the land, and in that of Dray, Cuthbert, Gardner upon the land, and in that of Dray, Cuthbert, Gardner
Wood, and many others, leaves it in rather roughish bundles, to be gathered up and tied in sheaves. In al cases the corn should be cut and tied when dry; and this, in the case of most of those machines which have no side delivery, or one not far enough to move the corn out of the way of the horses on their next bout round the crop, needs to be done at once. Two horses (or changed pair) may thus cut from 8 to 12 acres a day and save the labour of 8 to 12 men .
The cost does not exceed from 5s. to 78. an acre, instead of from 8s. to 12 s . or 14 s ., which is the more common experience in the case of hand labour; and in every case a portion at any rate of the work should be done by contract, so as to mak it the interest of the men to hurry on as fas as possible. The work of carrying away should in any case be done by contract. One man pitching to cart or waggon in the field, one lad building there, and one man pitching from the carriage to the rick, may form a party, and their share of the whole work may be let for from 10 d \(^{\text {o to }} 1\) 1s. per acre. Three carts, and two boys to lead them, and one man and a boy on the rick to build are the day labourgrs paid in addition by the farmer, who, with the three contract men, form a com plete harvest party for the carriage and building of the corn; and a portion of the whole being thus let by the piece, drives the whole along with the force of selfinterest.
The thrashing of the several crops is another opera tion, alike for all. Thrashing by machine may cost from \(1 \frac{1}{3} d\). to \(2 d\). per bushel, and by the flail from \(2 d\). to \(4 d\). per bushel, according to the sort and its yield. The cost of grain-cultivation is considerably reduced by the improved means of realising the produce which reaping machines and thrashing machines have furnished; but the chief value of the latter is in their enabling an immediate turning of the crops into the market according to the prices which may obtain from week to week.
One more aspect in which these crops are related to one another exists in the diseases to which they are severally liable. Wheat almost alone, however, of them, is washed and pickled, as they call it, before seed-
time; but they are all liable to injury from the disease against which this pickling is directed.
Smut or blacks more especially is common to all alike; it is the result of a Fungus named Uredo segetum, which results in the conversion of the whole doret into a mass of sooty dust, which is dissipated generally before the harvest by the wind, so that the sample is not injured by it. Bunt, on the other hand, produced ly another Uredo, results in a swollen discoloured seed, which is not necessarily broken by the threshing, and so, sometimes, a flaw is found in the sample. On the kernel being broken, it is found to be full of a black stinking powder, which, if it gets between the mill-stones, 日poils the flour, and so its appearance in the corn is more injurions than that of smut. It can be perfectly prevented by carefully washing the seed, so as to detach or destroy the germs of the Fungus, which, adhering to the grain and sown along with it, become absorbed during its growth, bearing their mischicvous fruit at harvest time. It is better, for this washing, to use a material of a som what caustic character, which shall thus more easily and completely detach and destroy these spores and germs without the labour of washing. A solution of blue vitriol, \(\frac{1}{2} 1 \mathrm{~b}\). to a gallon of water, thrown on a sack of Wheat on the floor, will or properly mixing the grain, wet the surface of every separate corn, and thus completely prevent all chance of the crop being affected by the Bunt. This is the simplest pickle that is used. To float the grain in salt and water, and afterwards dry it with quick lime, is not so easy nor so effectual, though it is still a common mode of treatment.

and a talf of White cover as much as one hundred weigh Speeial Dryers for this ans of Linseed Oil. special Dryers for this paint.

\section*{EARTH CLOSETS AND COMMODES.}
(Moule's Patent.) manufactured solely by
WHITE \& CO. 29, BEDFORD STREET, STRAND, LONDON, W.O.

The peculitar advantagrs of thrse Clobets and Conocodes over thr obdinary Water Closet are:-
First.-That the deodorising material (dry surface earth, or clay, or other subsoil) is the best for the purpose, and at the same time is the cheapest and within the reach of all classes.

Secondly.-The supply of such material to any house or premises may be much easier than the supply of water by a forcing pump, and its removal after being used may be entirely without offence.

Thirdy.-Its application by the means provided in these Closets is immediate and effective; so immediate that no offensive smell need escape into the room or building in which they are used ; and so effective that all fermentation and all escape of noxious gases are entirely prevented.

Fourthly. -The expense of these Closets in comparison with that of Water-Closets, is, as to the first cost, trifling, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are no lead pipes to burst in frosty weather.

Lastly.-In all large Establishments, such as Hospitals, Union Houses, Schools, Gaols, and Asylums, a rery considerable sum may be saved annually in the production of a valuable manure.

The efficiency of these Closets is so great as to be scarcely credible to those persons who either have not used them or seen their mode of action.

Price of Apparatus without woodwork, 25s. per set.
* The different forms of Closets may be scen at the address above; and Prospectuses will be forwarded on application.

\section*{SCHEDULE for SATURDAY WEEKLY SHOWS for 1866}

The COUNCIL of the ROYAL HORTICULTURAL SOCIETY offer the following PRIZES for compe. mongst EXHIBITORS at the SATCRDAY WEEKLY SHOW

They will also grant Certificates for objects not included in the Classes for which Money Prizes are o and these Certificates may be commuted for Medals on a fixed scale.

In the Classes for Miscellaneous Collections of Cut Flowers, Specimens of Ornamental Foliage may b
In the Miscellaneous Classes of Plants, not more than one-fourth of the whole collection in the shat Nurserymen, and one-third in the case of Amateurs may be Fine Foliage Plants, the remainder must be in Plow In cases of Equal Merit in point of Cultivation, preference will be given to those Collections whict is ast variety of Beautiful Plants at present little cultivate

\author{
SATURDAY, AUGUST 12, 1865.
}

A Very important memoir, by Monsieur Gris, has lately been published in "Annales des Sciences Naturelles" on the Appearances presented by tub difybrent parts of the Seed during Germination. A question had been proposed by the French Academy for competition to the following effect: "To study the changes whioh take place during the germination in the constitution of the tissues of the embryo and perisperm, as also the substances contained in these tissues." Monsieur Gris accordingly chose, amongst others, the following plants as subjects for investigation: the Castor-oil plant, the Marvel of Peru, the Italian Anchusa, the Bottle Gourd, the Laburnum, the hianey Bean, the Indian Corn, the Indian Shot, and differing, all of them plants with large seeds, and differing either in the nature of their albumen, or in is total absenoe. Each was traced through its Far thages, and accurate drawings made.
ithat which relates to the part in our estimation discovered by Helates to the curious substance first a substance which and named by him aleurone and in many others, and which seems to play a most impcrtant part in the development of the embryo. the grains of aleurone consist of three parts, the aleuric mass properly so called which assumes a crjstalline form, a globular white nucleus, and a finely granular matter. The formation of these know without parallel. The mar, and as far as we first a oucleus which is attached to the walls by little granular the On these and around the nuclens trangitory grains bodies accumulate; amylaceous but nuclens; the contents of on the surface of the gumber of compartments, the walls of which are appear in the contents pellucid; minute bodies sesume two different forms, which ultimateIy clobular, and crystalline, the other smaller and grains of and the two finally unite to form the again of aleurne. Under germination the parts cryotalline parte, and the contents of the larger feyorption.
The grains are not however in all cinses the and the chemical reacticn there is no white nucleus; as in the Laburnum, is different. Sometimes developed at thernum, grains of chlorophyll are but they do not seem to be dependent grains; Other, and the same may be said of amylaceous matter. The exact nature of aleurone does not
seem to have been determined: sometimes the grains are not acted upon by ether, which seems to imply anything rather than a fattr nature ; but in the Almond and Wood Nut the aleuric corpuscles liquify under the successive influences of oil and ether,-substances which in general do not affect aleurone, and one of which is the natural solvent of fatty matters. It is to be remarked, moreover, that in oily seeds the development of the two substances seems perfectly independent of each other.
These grains are in general sensible to the action of water, and more oil may be obtained from seeds which have been subjeoted to water than when pressed perfectly dry; and Monsieur Gris is inclined to believe that oily matter contained in the grains is set free by the water.
The contents of the perispermio cells in the Castoroil plant and Date consist of aleurone and fatty matter, while in the Indian Shot, Marvel of Peru, and Indian Corn, they are essentially amylaceous. It is carious, that while in these latter plants absorption takes place first in the parts in contact with the embryo, in the Castor-oil plant an inverse order is followed.

It is well-known that the starch during germination is transformed into soluble dextrine and sugar, but as regards cellulose, fatty matter, and aleurone, we have at present no certain information.

Monsieur Grrs adverts to the physiological import of the scutellum in cereals. It is already well furnished with starch grains before those in the albumen begin to decompose. It is probable, therefore, that it is a mere recipient of soluble matter from without which it conveys to the embryo, thus performing the functions of a root, which we believe it to be, the subsequent roots being secondary. The grains of starch moreover in the scutellum are simple, whereas in general new amylaceous formations, which appear in the tissues of the embryo, under the influence of the nutritive matters derived from the perisperm, present themselves under the form of compound grains, which is an additional point in favour of Monsieur Gris's notion.

The development of the cotyledon seems to be singularly uniform, notwithstanding the very different circumstances under which they are placed, and the different substances with which they are in contact. Notwithstanding such great differences, the presence of starch in the first stages of germination is a constant fact, though in very variable quantity. In the Castor-oil plant and Marvel of Peru, for example, the tissues are gorged with it; in the Gourd and Laburnum it is far less abundant, while in the Anchuss it is extremely rare. This newly-formed amylaceous snbstance is always accompanied by a substratum of granular and azoted matter, which is probably derived from the grains of aleurone.

As regards the subsequent phases of germination, they are uniformly characterised by the resorption or rather the successive transformation of azoted substances and hydrocarbons as the tissues are developed, transformations which have in view the development of these tissues, and ultimately the apparition of the ohlorophyll, which must serve for the respiration of the nowly-born plant.

It is, however, a question whether the amylaseous matter of the cotyledons is really derived from the perisperm. In order to ascertain this, Monsieur Gris contrived to insulate the embryo of the Indian Shot, and to canse it to germinate under artificial heut in the pores of a sponge. In this case, equally as in that in which it was left in contact with the perisperm, starch grains were developed, notwithstanding that in many cases none were previously present, though in others there were traces of them.

Such is only a slight sketch of Monsieur Gris's memoir, which requires careful study accompanied by a close inspection of the numerous figures. Oux object is rather to direct attention to it, than to give a full analysis. M.J. B.

How or why is it that the Thrber, say of the Scotch Pine, grown in the north of Earope is of so much greater value than that of the same tree grown further south? A similar question hai often been asked, and its very frequency shows that no perfectly satisfactory reply has as yet been given. M. Chatin revives the question in a paper on the Riaa pirs, lately published in the "Bulletin de la Sociéte Impériale d'Acclimatation.'
We shall take another opportunity of alluding to this brochure of M. Chatri ; at present our bnsiness lies with the sienlific questions involved
proven to exist in this variety of Pinus sylvestris depend on climatal influences, or on the nature of the soil? Those who maintain the former, argue that the superior quality of the northern timber is due to the slowness with which, owing to the iuslement climate, the wood has been formed. But, on the other band, it is stated that the trees growing on the mountain sides of Dauphiny, Savor, \&c., are exposed to as rigorous a climate as those growing in Lithuania and the plains around the Baltio, at least in the winter season. In the period of active growth, however, so far from the climate of the Baltic region being colder than that of the mountains of central Europe, it is, in reality, much warmer, as shown nut ouly by meteorological records, but also by horticulturists, who find that oertain plants will grow in the open air in those northern districts which will not grow on the central Alps.

As the assumed severity of the olimate, and the consequent slowness of growth, are thus disproved by the incontrovertible logio of faots, the next question is as to the nature of the soil. The Baltic Pines, it appears, flourish for the most part in a soll like that in whioh their southern brethren grow, and when transported to the south and grown there, with, and under the same conditions as the Scotch Pine, the northerners still relain their greater value, as witness the plantations at Haroourt, in the Department of Eure. And so , as neither elimate nor soil seem suflicient to account for the superior value of one over the other, we are thrown back upon innate properties and hereditary qualities, and have to say that there is an inherent goodness in the one which is comparatively deficieut in the other, just as the medical student, when questioned as to the cause of the narsotic effects of opium, is reported to have said -"Quia est in eo virtus dormitiva!"

We have more than once adverted to a peculiar condition to which Prace Leaves under glase are subject, from tho sudden admission of a cold draught, when they are spotted with water-drops; and several years ago we gave a figure of a similar condition in a young Cherry tree, where the eflect was evidently produced by the nombined action of cold and moisture. Portions of the leaves hecume brown; they then completely lose their vitality, and as the rest of the leaf is developed the little dead patches fall out.

We have now before us a case, in which not only the leaves are so affected, but the fruit is disfigured by brown spots of various sizes, which penetrate deeply into the tissues, and whioh as the fruit swells become depressed and of a darker colour, giving out large globules of gum, which is either colourless or deeply stained with the ulmates or humates of the decayed mass through which it has to pass.

The history of the case is not without instruction. The Orchard-house in which the trees grow, at a well-known watering place on the southern coast of England, is construoted in front of perforated zinc 3 feet high, 10 feet of the roof consisting of sheet glass, while the remaining 2 feet immediately over the trees-which are on the back wall of the house-consist also of perforated zinc: the object being to secure a perpetual ventilation in all weathers. We do not think such a construction at all likely to suit the delicate constitution of the Peuch; but as one of the trees, a Royal George, had suffered more or less frum the same disease some years before the house was conatructed, we are not at liberty to look for the cause exclusively in the Orchard-house.

There is probably something peculiar in the locality; but it has been invariably observed that the disease presents itself after wet, cold, rainy weather, first by the dark spots in the leaves, then by their falling off, which they do with the slightest touch. The fruit, moreover, which is deeply affeoted, showed the first symptoms of disease in May, about which time there was a wet week, or rather a change from the iatensely hot weather of the precedin, month. Several trees in
the same house, growing in pots plunged up to the same house, growing in pots plungearcely any potted leaves are to be found. These are immediately under the glass, and not subject to any drip when rain falls.

Whatever may have originally been the matter with the trees, we believe that any Peach trees under similar circumstances would very probably have been anhealthy, though we would not say that the fruit would be likely to be affected in the very curious manner in whioh that before us has suffered.

As regard the gumming of fruit, it is very
common this year, partly in all probability from the outicle being first affeoted by oold, and then after drought, by a sudden access of moisture which became stagnant in the tissues. We have now before us Greengages which have gummed to a considerable extent, the bunches in which the excusion occurs so profusely consisting of 15 or more individuals, all of which are more or less affected. Apricots in the same district, though most abundant, are a complete failure, hundreds rotting on the trees. This has been attributed to swarms of earwigs, but all the mischief cannot be laid to these little plagues, as we observe that even where no inseot has caused a lesion, the fruit which pressed against any hard substance has frequently suffered, and in many cases the Oidium fructigenum, which is the pest of various kinds of fruit, has had its share in the evil.
The spotted condition of the Peaches is however quite new to us, and the only remedy we can suggest is to oover over the perforated zinc in the roof, and to provide some other method of ventilation. M. J. B
-The discussion which has been carried on in our columns as to the merits of certain Early Peas, has an interest for several classes of the community, although the evidence is in some of its details rather conflicting. The seedsinan and the practical gardener novelties which have little new about them, save the name, while real Pea lover:, those who partake with thankfulness of the fruits of the earth in due season, will still retain their preference for the later varieties, The physiologist will see in the records that bave keen given, another illustration that this tendency to produce flowers and pods at an earlier or a later date, is an innate hereditary tendency, ouly partially affected by certain average dimensions, and their several organs certain average dimensions, and their several organs
bear one to the other a relative size, variable indeed, bear ore to the other a relative size, variable incleed, easy to ascertain. So in regard to the time of prodacing leaves or flowers; although this varies according to the temperature of the season, the nature of the soil, and other external conditions, yet the proportionate time is not altered. The tion have been exercised, will be the parliest Pea of the neat, although there may be considerable difference in the seasons, and much diversity in the time of flowering at the two periods. Thus the rhythm, so to speak, is as accurately preserved as are the form, the size, or any other attribute of the plant.
To what extent it may be possible to alter the timerate is a question for the Darwinians to answer. Meanwhile, we have abundant evillace to show that some modification may be effected in it; and we doubt not that in course of tinue much greater success in thio
way may be attained by hybridisation, by growing way may be attained in colder and more exposed situations, at greater altitudes, and under various other conditions, which will suggest themselves to those desirous of carrying
out this important expeniment on scicntitic princinles. out this important expeniment on scicntatic principles.
As the changes must be gradual, a lengthened period of time and unfailing patience are absolutely necessary.

\section*{New Plants.}

30G: Shecaitthus meinaceus, Rchb. fo in Mohl. of Schlehtd. B. Z. 1864, 291.
Pedunculo murioulato echinato racemose, bracteis triagrulis
 labello excavato tridentati), utriuque sub coliamia picato,
dentibus lateralibus bidentatis, dento uadio producto
triangulo, calcari retrorso conico-cylindraceo vacuo, pribbere pandurato sub culumn?, culumna gracili elongata, rostello deflexos subulato, elongato apice bideutato, cuudiculy ab inserto reflexis.
There are flowers so very odd, that one could laugh when looking at them. Here we have a zigzag flexuose rachis, full of little spiny excrescences, and flowers in the way of those of Camarotis rostrata, with a long beaked column; the stalked ovaries and sepals ontside full of such excrescences, and greenish yellow; the potals and lip rosy. We canmot buc be reminded of a hedgehog or urchin, when looking at the queer flowers: hence the nanne. Of the leaves we know notling. The plant is one of the numerons Burmese discoveries of the Rev. C. S. Parish. It flowered both last year and this at Upper Claptom, with Messrs. Low \& Co., under the care of Mr. Bullen.

\section*{307. Odontoglogsem radiatum, \(n_{0}\) gp.}

Sepalis oblongis acutis, petalis rhombeo-acuminatis utrinque gupras basin antrorsuma acutaucnlis, labelli ungue brovissimo ginati cum apiculn, dutice lacero entulath, eqrinaris

Here is inteed a splendid new Oikntombt and
flower came from a inst imp since the . for a longer time under good cultivation oball have beeu each of great beauty, must be compared with it.

Odontoglossum luteoparpureum of Lindley, the glorious
discovery of Linden, has all the petals fringed, and ă discovery of Linden, has all the petals fringed, and
totally differeut crest provided with many such bristielike processes as there are here but two. Odontoglossum hystrix of Bateman, for a flower of which we are obliged to the modern monographer of Odontoglots, has very many such processes on the lip, the petals entire or nearly so, and the lateral sepals prolonged in an unusual way, much longer than the lip. Odontoglossum tripudians of Rchb. f. \& Warscz., for fresh flowers of which we were indebted to our friend Linden, has the lateral sepals with angular edges, a longer stalk to he lip, and free radiating tendrils on the base of the lip vhose inferior half is of the most splendid violet purple The other comparable species, Odontoglossum Schlimi Lind. \& Rehb. f., Hallii Lindl., triumphans Rehb. f. sceptrum Rchb. f. \& Warscz. (the types of which lay at our hands, with those of the three before mentioned) have all a very sharp acate apex to the lip.
Our new species has chestnut-brown sepals enlivened with a little pale yellow. The petals, so remarkable for the projecting angles at the sides, are yellow with a few brown spots. The nearly panduriform white lip is finely fringed at the broader anterior part. The radiating carinxat the base are golden yellow, surrounded with brown; a great brown two-lobed blotch stands at the base of the anterior part, little dots surrounding the limb from the middle to the base. The column is white with some chestnut and yellowish dots, and has

very evident fringes at the sides of the stigma. This species was discovered in New Grenada by Mr. Blunt, and has just now flowered with Mcssrs. Low \& Cu. We hope they may possess a rich store of so showy a plant!
308. CGelogyne cornioulata, Rckb f. 1864 in litt. ad dom. Day.
latis apiculatis ovaria perlicellata superantibus ons eucul latio apiculatis ovaria pericellata superantibus, sepalis tantum inferinri obtuse carinatis, a basi in medium obtus angulo obtusatis ab labelli faucem, petalis anguste lancooLutis acutis, labello medio angulato saccato, laciniis lateralibus
semiovatis acutis, lacinia media transversa rotundata retus seu obsolete acuta seu minutissime lobulata, gracili, juxta latera fuves utrinque dilatata, alis lateralibus subacutis, erecto, rostello ascendente.
This bears a long pendulous raceme with great sheathing bracts and sweet vellow-green or honey-colorred flowers the lip of which is of a deeper jollow, with brownish borders to the lateral segments. In its lax racemes it reminds one of Culogyne (Pholidota) undulata, but the
towers are very different, and very curions in the angular centre of the lip. It is curiour the numerons Indian importations, most probably from Assam. H. G. Rchb. fll.

\section*{ORCHARD HOUSE MANAGEMENT.}

Towards the end of last month I paid a visit to
Messrs. Rivers, of Sawbridgeworth, merely to look at their Orchard house culture, and to ascertain if all was as perfect as I had been led to believe, for I could scarcely credit that thousauds of Peach and Nectarine trees, of all ages and conditions, could be free from the pest of the season-red spider. I need merely say that I was surprised and gratified to an extent beyond what I expected. I saw handreds of Apricots, standards, pyramide, and dwarf bushes in pots, all full of fruit, great numbers of which were dead ripe, and slightly sirivelled, but so full of juice that I could not help saying, "An Apricot in this state is decidedly the finest f all stme fruits."
In addition to the above, were standards, planted out in the borders, breaking down with their loads of fruit; hese were planted in a peculiar way, which I will resently explaiu
Mr. R
culture under glass to frea ventilation night att ! the compost the trees are growing in bein brma pact-made so by ramming; and to the rety \(\mathrm{C}=\) matter in the loam in which they are potted, amm ing to 15 or 20 per cent
After viewing the Apricot culture and eation a ance of fine fruit, I turned to the Peach and fin the trees, which seemed to surround me in thoneands-1 standards, half standards, pyramids, and dwarf hon All seemed in the most luxuriant health; the ollo full of fruit, the young ones ripening their shoota if blossom buds; not a leaf affected with red spiler be seen. I confess I wished to know whe such pet success attended orchard house culture here could not reconcile it with what I had heard some of my friends, and from some steady old deners, viz, that their potted trees bore only hard fruit, and that their trees planted out were wild with over luxuriance, or eaten up with red spid the grounds of his success in Peach and Nont culture. 1. To making the compost, loam and manure, quite solid in the pots by ramming it potting the tree. 2. To the low lateral vent'? employed ; in span-roofed houses 14 feet wide a 1 foot in width on hinges opening downwards onea side of the house on the same level, the lower part oiv openings about 18 inches from the surface of the on in houses 24 feet wide, the shatters 18 inches wive. all cases the opening at the same height from :a
ground; no roof ventilation, but merely aperture at each end under the cable abut a for depth, to let off the heated air. 3. 'To the calarme nature of all the composts le uses, which is 80 lariz able to the ripening and well-doing of all stone fro 4. To the constant attention paid to summersonia dressings of finely chopped mauure saturated . liquid manure, or horse droppings from the pow
treated in the same waye. This is always lying on: treated in the same way. as to retain water; the surface of the earth in the? is never suffered to become bare and dry; if \(s 0\), \(:\) : spider soon makes its appearance.
standard Nectarine trees, different houses, and the culture of which I the quite within my gardening talents, an 1 which 10 hiterally crammed with fruit, or received the follorit intimation, whicb, I learned from Mr. R., gen, bly given in the 12th edition of the "Orchard Hown" at press.

Mr. R .
rood. R., it seems, had seen some failures erem mi good gardeners in trees planted in the borden d Orchard houses, and at first could not concire ins
such things should be; but on finding that the borters were made deep, and with fine rich light computs be knowing from his early days that all stone frutitnee hike firm soils, procceded to plant his trees after 3 hem fashion.

The borders in his Orchard houses were stirred mik the fork to a depth of 22 inches, and as it mas
calcareous, and poor, some rotten manure mas mise. with it; the trees were then planted, and the surfi. of the soil trodden down firmly; it has remained in 3 same state ever since-about five years-except tin pricked with the fork in spring to let in wave oing kept dry all winter, and is now ike a lernise trodden pate; the trees are fertile and luanise
beyond any I ever saw. Their heads were pruned : as to lie flat, and the fruit thus han the adrantage o being exposed to the sun.
Mr. R. stated that in houses of a sufficient asp these large flat-headed standard and half-standerd would in a few years bear from one to tro ar. bushels of fruit each, without the usual trobbis? training to trellises.
My attention was directed to a collection of some 'eaches and Neotarines in one department of airs house, consisting of nearly 200 trees; these are all sem ittle trees, with round heads and clear straiging in from 2 to 3 feet in height, nearly The origin ree is miven and thus is found out the curions Peaches being raised from Nectarine stones, versci. The prizes in this large collection
lings are but few, althutugh a great number good fruit. One tree was pointed out as repay the care and attention
the graud am whe whectarit The tree of the first generation produced an eal of White Nectarine, which has produced a pale-coloured Peach, as large and much like a Noblesse. This sort ripened in of the on the 18th of July, and this seasou, on the 12d Nutme ane month, a fortnight earrier than wha of the tive quality.

Mr. R. states that what is called "breeding in," to use the stock-breeder's term, is likely some cases more success than crossing, fruts; for
will lead to great changes in our fruis wished to produce a with can be found.
Peaches he has followe the following stones of early l'eaches are sowd. Many they produce will be found to vary to a great and are placed om one side ; but if one meedling

\section*{HARDY ORNAMENTAL`PLANTS.-NO. III. Water side Plants.}

It is a fortunate and by no means a common garden which possesses a nice piece of water, and though mater in some shape is theautr, it is very rare that its margin is planted of .D5 heauty, it is very rare that its margin is planted as
\(n\) should be ; indeed it is often not planted at all, so 4 thould be ; inded it is often not planted at all, so the graceful-leaved plants natural to such positions, we seo nothing but the sharp water line and a few inches of mashed carth between it and the turf. This of couse could only occur in an artificial piece of water to which native plants had not had access. Rich muddy soil is almost necessary for most plants that like the the water-side, and as this is sometimes absent from artificial and other ponds, ©..., it would be a
"charity" to have a lot of common soil thrown in at intarnals near the margin, for large species to luxuriate in. Such an arrangement would be desirable in one crowing plants like Poa aquatica from forming reguiar belt round the margin, which it will take some trouble to prevent if the soil is rich all round. It is very undesirable that one or two species like the great Poa
and the common Flag should monopolise the margin, because rith groups, distinct or mixed, of half a dozen (ther subjects a picturesque border may be obtained. ne of the firat piants I should select to make Dock, is is a noble and luge-leaved plant. To-day I have massured leaves a yard long on a plaut growing in deep clay mud in water, the plant being 5 feet high. An establighed mass-6 or 8 feet in diameter-of this pecies is as imposing as any "foliage plant" in a
garden. And in autumu the large leaves assume a deep colour like those of American trees, and crentually become of a very decided lurid red.
Next come the Typhas-latifolia of course, but batter still angustifolia, which does not run about so much, and forms such close and waving tufts of its slender araeful leaves as tall as a grenadier. Typha intermodia isflanything even better than angustifolia, being a little aryer in the leaf, as far as my experience goes, and taller than angustifolia. Before the days of railways the Mr. Baxter per went in his carriage to Oxford, and taking Mr. Baxter pere with him, went considerably further to ee this intermediate Typha in its wild state.
Cares pondula is a fine plant for the margins of water, particularly in rich soil, drooping its very long the kes with an unsurpassed grace. Not less desirable is is handsome cylindrical spike 3 very elegantly, and growing in the water forms a very graceful tuft a few feet rom the margin, or on the edge if so planted. Cyperus unding anso a very desirable bog or water plant, re The Bull of the aspect of Papyrus when in flower.
tus, will, the Acorus, the Jellow flag Iris, the Poa aquatica, nearly 6 ieet high, with graceful heads of flower, and the cur own Nuphar Nuphar advena should be grown with :Jiage, and holds it well over the water; and the handsome leaves of the Bog-bean might be made to form surpet here aud there, from which straight-growing The margine narrow-leaved Typha might spring. tiose in our parks offer capital opportunities for the grouping of such plants as theape, and if here and occurred a sheet of the group in a small bay thare njtuphiovides, with a fow golden blossoms of Villarsia atgiu, a very chayming Wator Lilies on ib beer of the water . particularly from the opposite banks of the water.
for the near omitting the bost of all hardy subjects bandy placgins of water, or for deep or boggy soil in Suanders' highly interesting Telmaia In Mr. Wilson and in the Oxford garden, the beauties of this plant are furnicha developed. With a straight tapering stem, Which with regular whorls of slender wiry branches trown droop in the most graceful manner, and imaning trom 3 to 6 feet high, it may easily be Indoed, we have no subject of no ordinary interest. gular and graceful than this in the country more sinthan this. W. Robinson.
WRCHIDS AND THEIR CLLITVATION.-No. VII. directly of the first and greatest points as bearing ( p .120 H . Having already the proper construction of (p. 1202, 1864ing already touched upou this point tieedlens repetition, but to follow up the arguments
leduced in that article, 1 have introduced sections suin all for the different grades of exotic Orchids, such

Without much explanation. Before resuming the Chread of my discussions on the management of cool Orchids, it will be necessary, however, to make a fow observations, so that the engravings may be thoroughly
understood. understood.
No. 1 is such a house as will be found suitable for the cultivation of all those that come within the category of "cool" plants. It is 12 foet wide, an 1 can be made of course any length. This gives a 3 -feet pasasge up the contre, a table of \(3 \frac{1}{2}\) feet on each side, and the remainder of the space for walls. The tables may either be stone, slate, or wood, but the first two are preferable, not only for durability, but for the purpose of retaining and giving off moisture. Some introduce gravol or sand to tho degth of an inch

or couple of inches, which forms a very important and valuable auxiliary towards this aim, while others object to it on the score of its being a harbour for cockroaches and wood lice. These tables can be supported in many ways; either by brick, which is the cheapest, ornamental stone, or cast iron supports. One thing however, ought not to be neglected, and thatis, that there chould always be loft a vacuuns botween the side malls and the tables, so that heat may ascend unimpeded from the pipes, as it anturally inclines inwards. Provision of this kind has been made in all the engravings; and even in an economical point of view it is not undeairable, for as a portion of the table, if it abutted againgt the side wail, would nover be used, you save at least that portion, say six inches, which if deducted from the length of a U-feet house, taking both sides, would be exactiy saving of 70 feet of slate or stone tabling, whioh would
more than pay for the extra supports needed alongside of the pipes, the principle for which I argute being respected to boot. The side walls are about 3 feet 9 inches high, and can be eithor built of brick or stone, as shown in the plan, or might
have 30 inches of their height constructed of wood and glass Either way will do rery well, but it is an object to have the ventilating space, as indicated, on a level with the pipes. This can either bo one continuous vacuum, supported here and there with appropriate iron oastinge, or by providing openings at stated intervals. In the former case it will reçuiro either a wooden or sheet-iron shutter running the whole leugth; and for the latter fittings of something of the same kind attached to gearing adjusted to open the whole at once. From the loor to the ridgo of this house will measure something over 7 feet, quite high enough for the great majority of "cool" plants. With the view of guarding agaiust drip, so fatal to the wollbeing of the plants during
winter, it is wisciou to have the opening at the top winter, it is wisciom to have the opening at the top economical method is that shown in the ridge of Noss 1 and 2, being aimply a convex top of wood nailed

to arched wooden girders, and hinged on one side. A very simple gearing raises this the whole length, and if the house be well made and finished, it is quite water tight A flow and return pipe round this houfe is quite sufficient for heating purposes, aud the apparatus will be found to mork all the better and easier by having the return pipe placod as indicatod under the flow.

No. 2. is exactly after the style of No. 1, differ ing in the engravings only as to roof elevation, and having the sides partly of wood and glass. It is such a house as I would recommend for growing Cattleyas, and from its hicher clevation is well adapted for plants in biskets or pots suspended frow the roof. The simplest and most convenient mode of carrying this into practice, is to get a galvanised iron rod, for
rust in an abomination to look at, and does no good to
the leares if perchance it falls upon them in a moint state. This rod is to be run through the astragals the whole length, which makes it so strong as not to bend even under extreme preasure. I have all along had the most determined objection to plants being auspended over the heads of these on the stages below, is not only obstructing light, but what is more aggrevating still, continually draining their surplus rater on the leave", whether wanted or not ; and no amount of ordinary vigilance can countoract this teudeucy. What should be studied in the ereotion of the house ie, that these rods should be plaood in much a way that the plants may hang above the pach. A house, at such an elevation as this gives a great dmount of light, and as Cattleyas and their allies are very impatieut of darkuess during the four or five winter mouths, we have a thorough recognition of their wants, which is desirable. Two flow pipes and two "returns" aro necessary in case of severe weather for Cattleyas ; and in fact as a rule it is much bettor to be over than under the mark as to piping, for in the latter case atronger fires are required, and the pipes are heated up to a pitch which produces the most unnatural atmosphere maginable, perfectly hostile to all that conostes the vellbeing of the plants.
rm the subiect adaptod for Eact Iadian Orchide, wilt form the subject of my next communioation. James Anderson, Meadow Bank.

\section*{EARLY-FLOWERING TULIPS.}

Premit me, by way of supplement to Mr. Robinsou's interenting papers on "Spring flowering Plants," to give you a fow notes on Early-Rowering Tulips, which during the spring months are singularly gay and effective. Their tine of Iowering immeliately sueceeds that of the Crocus, Snowdrop, Bulbocodium, Early Scillas, and other spring-blooming bulbous plants; and they are out of bloom in timo for beddiug-out operations to be proceeded with. This season I have lowered an interesting collection. I have also seen elsowhere a fow of the newer flowers, and I am more thau ever a zealous champion for the widest recogaitiou of their merits.
For the benefit of thoso who may be di-puse to omploy Barly Tulips more largely than they havo colour. It may also interest some to know that nhinet iuvariably the yellow varietios are the first to il.jwer; then come the whitos, the stripei-edged, and wariet
flowers in rapid succossion. It may, murcuver, be flowers in rapid succossion. It may, murcurer, useful to add that the light-coloured and white illu, in scarlet and nome of the yellow and striped varictices This rule is not intended for application to individual flowers, but to early Tulips in the aggregato. I am an advocate for planting in a very rich soil, and though it may result to some extent in inducing com. paratively taller growth, the evil is doubly compensated or in the aire and duration of the flumurs, as colours and in the better deffined markius's of the blooms. I have had this spriug a bed of some bin bulbs of the old Tulipa Gesmeriana, which \(F\) phatei in a sil composed of fully one-third of rotred manured Tuey grew about \({ }^{2}\) in feet in hense flowers of the most billiant vermilion momonse flowers of the most briniaut vere whating, aud renained in bloum from five to six welks. Massed in this way, T. (iesueriana is insaluable, for shall have
shall grow it in a mass anjther season, bat shat an elgiug of the Dutch late mixe 1 herder Tulip which will flower at the same time, its more soler hues relieving the brillinncy of the forauer, and the tro display is wishel for, ferhaps the most effective methols of ensuring it are, citi.er to plan in rows oach containing one variety, due ris height ; or else to
the arrangement of colours and also hemen have them in masses of one vuriety ouly, with perhaps the addition of a narrow ed, ind of sune other clour to produce contrast. depend on the space toing herbaceous mants, ide, the ratips may be effectively disposed in little gre ul's of from sis to eight bulbs ench. It is scarcely necessary to remove them from beds of this description until the end of the summer, as they can be cut down to within about 4 inches of the surface; but from beds consisto ing wholly of Tulips, they should of caround, in any alhady out-of-the way place.
Let us begin with single varieties, which are much more numerous than double kinds, and whate only a few of the double varieties are realy effective in bede, by far the greater number of
Of pure white thowers thote are but fow. The best is White Pottebakker, a full-sized and atout flower, pure iu c lour, an. \(l\) a cood variety for forcing in potso The others are wis so pure in colour; Alida, and Alba Regalis, two creamy-white flowers of n) great Alba legalis, the creamy-white with these may also be classel lumem Victuria, white, slightly fonthered and llakeil with crimsoa;

I observe that a white Clarimond is announced in some should be a really first-class flower. The white variety of Van Thol is not worth cultivation, it is small and insignificant, though high in price.
Of pure yellow flowers there are Canary Bird and Golden Prince, the best of all the jellow solfs that 1 have seen; and though greatly resembling each other,
the former grows the tallest. Yellow Van Thol is a much better flower than either the white or rose varieties of Van Thol; in colour it is clear lemon one that often comes slightly striped and feathered with red. Two other flowers may be olassed with the foregoing, viz. :-Thomas Moore, golden butt, very
good and new; and Duc de Orange, orange-yellow with bronzy-crimson edging and base, somewhat ill formed, but nevertheless a very showy kind.

Of self flowers of a rose or violet colour, or simila shades, there are Proserpine, a splendid kind, rich silken rose, which deepens in colour by age ; Rouge and very fine; Rose Luisante, a paler form of the fore going, yet materially differing from it; Molière, purple, with the base yellow; Lo Matelas, deep rose, very strong ; Rose Gris de Lui, pale pink, changing with age to rose, the outside of each petal being marked with roqy-crimson ; Florida, purplish violet; Rose Van Thol with glossy rose, very fine: Terburg, a very beantiful violet flower, remarkably fine and new; and two beautiful varieties that I saw for the first time at the Liverpool Hyacinth Exhibition in March last, viz.:Queen of Violets, a finely formed soft lilac flower, and fine.

Among crimson red or scarlet selfs there is great Variety; such as Scarlet Van Thol, bright scarlet,
Vermillon Brillant, larger, deeper in colour, and later than the foregoing; Belle Alliance, crimson, very showy Cramoise Superbe, cerise crimson, a beautiful flower Fireball, scarlot, with fiery edging, very striking; Feu Roufe, scarlet, with a yellow flame on each petal ; Couleur Cardinal, bronzy crimson, with bright scarlet edging, a beautiful flower; Cardinal's Gold, a broken Couleur Curdinal, and yet not sufficiently so to be classed with the striped flowers, the ground colour being scarlet, shaded and streaked with bright yellow. Other flowers in this division are Epaminondas, rich deep scarlet, but said to have whitestripes, though I have never seen it in that condition; Clarimond, deep rose, becoming darker with age, and having a faint streak of white on each petal; Couleur Ponceau, deep rosy
crimson, with a flame of white up the centre of each petal, sometimes almost a self; and lastly. one of the grandest flowers I have yet met with, viz., Van Vondel, n very large and extrenely showy variety, nerfectly distinct and well formod, in colour a silken rosy having slight pencillings of white on each petal. It is enumeration does not by any means exhaust the list of self flowers in these shades of colour, but the foregoing are distinct and really good.
Striped flowers are also somewhat numerous. Those having stripes on a white ground are:-Royal Haarlem, Weavily, with rosy crimson flakes; Bride of Rigaud, heavily feathered and flaked with rosy lilacnometimes almost a rosy lilac self; Comte de Vergennes, slightly striped and feathered with rosy crimson, very fine; Superintendent, white with rosy lilac flakes, very showy and early, though rough on the edges and deficient in form; and Roi Pepin, a magnificent variety, having bright scarlet flakes; this is one flowers on yellow grounds, there are Marquis de Wessenrode, golden yellow, pencilled with red, a very showy variety; Maria de Medicis. yellow, with crimson etreaks, very novel and beautiful ; Red-striped Pottebakker, bright yellow, striped and feathered with red; and Standard Gold, rich yellow, flaked with crimson, bold and showy. The Red-striped Pottebakker this spring six bulbs of each, and in either case there were two blooms pure yellow; the remainder were striped more or less heavily. Other striped flowers not exactly comprehended in these two subdivisinns, are, Grootmester van Maltha, deep rose, with broad flakes feather, a very beantiful flower, perbaps more propert an edged variety, though I have classed it with the striped kinds; and Wassen van Leyden, pure white, petal, very pretty indeed, but somewhat tall in of each Among the edged flowers are some very beautiful varieties, such as Knizer Kronn. red, edged with to be if?entical with the foregoing, and certainly very mucn resembling it; Duc d'Aremberg, bronzy crimson,
with dep golden edge; Duchesse de Parma, orange
red, fenthered with vellow. red, fenthered with yellow; Archduc d'Autriche, rich
crimson, edged with yellow; Yellow and Red Remarquable, crimed with yellow, very showy; La very novel; El Dorado, yellow base and streaks, edged
slightly feathered with white; and Cerise Gris de Luip Many of these I dges, novel and good.
Many of these I have bloomed myself, and the others I have seen in flower. They comprise the very ream of the flowers at present in cultivation.
Remarks on the double flowers will occupy but little space. I have met with a few double crimson varieties, viz: : Imperator Rubrorum, bright crimson, by far the best of its class; Rex Rubrorum, deep red, but having the great defect of coming green on the tips of the
petals; and Pæony Red, a bright-coloured flower, small and somewhat thin, yèt showy. Rose Eclatante is catalogued as a dark crimson flower, but with me this season it anme with dark crimson stripes on crimson colour, but is deficient in substance; and the same may be said of Couronne des Roses, which has more of rose colour in it, but is also very thin.
Of Self Yellows still the very best is the Yellow Tournesol, which I this season saw very fine at Liver pool. It is of a pale colour, and has a blotch of orange buff on each petal, but it is a full bold flower. Another is Yellow Rose, pale yellow, and very good for borders. Of White flowers I know of none other than La Candeur, French white, not a first-class fiower. I am
informed that a new double white Tulip is being offered on the Continent this season, and perhaps something will be seen of it next spring. Bleu Celeste, or Blue Flag, pale purple, still stands, as far as I know, the solitary representative of this shade of colour.
Of edged flowers, glorious old Tournesol still holds the supremacy, though I often wonder that Gloria Solis, very much in the same way, but with a deeper odging of gold, and somewhat taller in growth, is not much more generally used for bedding purposes than it is. Duke of York, deep rose, bordered with white is a really good flower, the colours being very clear. I wish it possessed a little more substance, still it is very effective. Overwinnaar, or La Belle Alliance, is a crimson flower edged with white, but is not so good or so effective as the foregoing. The old Double Duc Van Thol is still imported from Holland in very large quantities, but it is not nearly so generally grown as Tournesol. It, however, has the recommendation of being very cheap.
Two late-flowering donble varieties yet remain, viz, Couronne Imperiale, and Mariage de ma Fille. These are so nearly alike, both in the character of the flower and the bulb, that they may be regarded as identical The last perhaps has more crimson in the marking than the former. They are both white-ground flowers, heavily flaked with rosy crimson. Out of four bulbs of Couronne Imperiale that I bloomed this season, one broke into a pure white flower, somewhat slightly flaked with bright rose. In this form it was ver distinct, indeed, so much so, that I do not think any one could have recognised in it any approach to it real character. I have carefully marked the root, on purpose to ascertain next season if it will perpetuate this distinctiveness. I have yet omitted two other varieties from the late-flowering ones, viz., Prince de Galitzin and Tawny Gold; the first a dull yellow flower, heavily flaked with orimson; the latter brighter colc ured and not so heavily flaked, as far as could discover in a somewhat imperfect bloom.

The double flowers need a thorough and rapid improvement. The demand for them as a whole is scarcely sufficient to warrant us in looking for this With one or two exceptions, they are not nearly so beautiful or so effective as the single varieties, there fore the work of improvement is not likely to be taken up with that feeling of enthusiasm and that
persistency of purpose that are required to ensure persistency

\section*{Home Correspondence.}

Govenia.-Mr. Bateman's statement alluded to a p. 723 , with respect to Mr . Gowen, to whom the genus Govenia was dedicated by Dr. Lindley, may perhaps from an explanation from the two following passages from the Botanical Magazine, the first of which
probably had made its permanent impression, while the latter had either escaped notice or memory. Bot. Mag. tab. 3667, Rhododendron nudiflorum var. scintillans:-- The origin of this variety, first reared by Mr. Gowen, the gardener at High Clere, is thus given in his own words in the Botanical Register." Bot. Mag. tab. 3676, Potentilla glabra:-"I take the earliest opportunity Maged by a vacant space in the present number of the Magazine to offer my very sincere apology to J. R. the gardener at High Clere, whereas the gardener is Mr. Lindsay. Mr. Gowen is a pentleman of indepen dent fortune, much devoted to science, and well-known in the most respectable circles in London; and under whose advice and direction many of the improvements Caernarvon, a circumstance afected by the late Earl of mistake." The other points alluded to by "F.R.H.S" as inexcusable and discreditable are evidently either errors of the press or mistakes of the Reporter. I think the terms applied to these errors are rather harsher than the case deserves. The authorities of the there should be a correct account of the proceedinge and a ahort-hand writer is employed to take notee and a abort-hand writer is employed to take noten, but
subject-and no really competent one can ign Even where the requisite knowledge exists be the speakers, which is not alwasey are saboith seen quite as grave errors as ays possible, and I communication of "F.R.H.S.," in mentioned what has really taken place at the Scientific where they have evidently been takentic leati with considerable horticultural and botanical tion. \section*{Eocieties.}

Erioyological: Aug. 7.-F. Pascoe, E:q., F.L.s. Preaident, in the chair. Mr. McLachlan exhibited some apecimens of the Ant-lion fly, which he had reared from earribited a living specimen and gave an account of the curious manners of a large exotic green grasshopper Whirh had been reared in lisis hothouses, the young of which had been imported with Orchids, to which it lau proved very injurious, feeding by night, Mr. Pascoe and explained the manner in which it makes the noise which it ennits by the frictim of its legs. A specimen of the very rare Trachys pygmx , taken in the
inestoft marshee, was cxhibited by Mr. Saunders. Some remark able varieties of Cryptocephalu; 10 -punctatus from Rannoch were exlibited by Mr. D. Sharp; also the larma of the beautiful La npyris (Eros) aurora. Mr from the neighbourhood of Santa Martha, Venezuela, or Mr. Burchard. Mr. F. Smith communicated a note from Mr. S. Stone on the great abundance of queen
wasps in the spring; their equal scarcity at the present time was also noticed by several of the members prewent. Some beautiful drawings illustrating the forwarded by Lieut. Beavan. The commencement of memoir on the Buprestidæ of South Australia, by Mr.C. A. dicon, of Adelaide, was read. Also a memoir containing exotic Pligtophagous beetles. Mr. Dunning exhibited nemarkable specimen of Bupalus piniarius, having the body and antenne of a female, but with the wings some obsersatious upon so-called bermanhrodite insects, and on the necessity for a better classification of them than hal been proposed by Mr. Newman. He also rea a note on thie rearing of Bombyx Atlas in France, to
which Mr. Moore replied, that he had previously sucoeeded in rearing it in this country. It was doubtfo Whether it could be applied to supersede the common ,
Royal Horticultural: Aug. 8 (Floral Committee) duced on this occasion. From Mr. Clater, of Cam bridge, came Gymnogramma Mertensii latifolia, common-looking G ild Fern; a large collection of cit leares of Pelargoniuma, the last framed and glaze and consisting of some best of the tricolor an other rariegated leaved kinds. Tarious Pelar-First-class Centiticate Walthamstow, to whom Peel, a hand>ome scarlet, with the leaves faintly enpecimen from Mr. Constantine, gr. to C. Mille, Esq. Frim Mr. Turner, of Slough, also camee a charming
Mollection of the same handsome Lily, as well as one collection of the same handsome Lily, as well as one
or tro plants of the lance-leaved lind; and examples of auratum we e also furnished by Mr. Tillery, gro to the Duke of Portland, at Welbock. Mr. Bull had a Epots of which are redder than those of the ordina class. The last-named exhibitor also received a Firstwith handsomer foliage than that of cinnamomea, ling Damilias came from wre also exhibited. Seedtho alsn showed cut blooms of Verbenas, among thich Cieupatra, a beautiful clear rose with con हpicunus leman eye; and W. Dean, violet shaded purple, Fintclasg Certificates. To Phlor Fuithoured with crimson eye, from Mr. Turner, a First-class Certificate blooming rosy crime the same exhibitor also had a fine white Lobelia ramos Phloz, named Herbert. The fine Tas reproduced on this occasion by formerly exhibited, Hornsey, and Mr. furnished by Mr. G Meesrs. Garawas \& in the way of Mrs. Pollock, from Ashley. Coptificate. Mr. Porter, gr, to the Hon. A. J. Hollyhocks, among which Jobn showed three dozen man distinguislied by a First class Cartifican-scarlet, Celargoniumbridge Welle, had a double Certifieated Mr. edged rariety of Coleus Verschaffeltiol, called greenSoedling Gladioli, in bad condition from
travelling, rame from \(\mathbf{M r}\). Dijtman, of Haarlem; and rom Mr. Eckford, Coleshill, came a brorvo-tipped
yellow Dihlis, anmed Sir J. Wilde. Mr. Preen yellow Dahlis, mamed Sir J. Wilde. Mr. Press
Hornsey, showed shrubby Calcoolarias, and example of Anthurium cordifolium came from the Nociety's garden. The Rev. E. Hawke was a warded named Senio Wricate for a bright maroon Hollyhoc carmine, tinted with salmon, from Messrs. Downie Laird \& Laing, received a S scond-class Certificate ; and a First-cless Curtificate was assigued to Chas. Eyre crimson scarlet, from the same growers. These were
shown in-beautiful shown in-beautiful condition in the shape of spikes Pectis angrustifolia, a yellow starry. fiowered plant, was shown by Mr. Thompson, of Ipawich, and received a Second-class Certificate. Palafoxia Houkeriana, a double pink-flowered North American annual compnaite from Brassia, like a was also similarly rewanded. A fine Mrassia, Ihe a gigantic berrucoss, came from Lady Miller, a compact free fluwering dind, distinct from Lary Miller, a conpact free fluwering kind, distinct from
Mrs. Pullock. To Mr. Veitch was awarded o First-cless Certificate fora fine Cattleya, probably a variety of Mozsic and a Second-class Certificate for the slender-growing new Anstralian Dendrobium tattonense, described by us in a former report. We also noticed a plant o Cattleya Sidneiana, a robust kind with veined violet shaded crimson lip, an l light coloured sepals and petale From Mr. Chater, of Saffron Walden, came various fine Hollyhocks, from among which Firely. variety like the Rev. Jushua Dix, but brighter in colour, was selected for a First-class Certificate ; and Hebe, delicate pink with a rosy salmon centre, for Second-class Certificate. Castanea pumila, a dwarf growing Chestaut, and Sophora japonicain tuwer, wor contributed by Messrs, Ooborn. From
Fulham, came Opuntia vulgaris in fruit.
August 8 (Fruit Cammittee).-Most

Travels and Researches in Crete. By Capt. T. A. B Spratt, R.N., C.B., F.R.S. In 2 vols. 8 vo. Lundon Joln Van Vuorst, Paternoster Row. 1865.
Crote, now called Candia, from the name of its modern capital, closes in the Greek archipelago on the south. It is a large and beantiful island, 140 miles long, bu very narrow, extremely bold and mountainous, well watered, and abounding in frnitful valleys, and in parly times was celebrated for its hundred cities. Crete
holds a conspicuous position in the mythology and earliest history of Greece. Here was Mount Ida celebrated as the birthplace of the mighty Zens; and Gnossus, the city where Minos administered justice, supposed to pass judgment on the sonls of men. Here it was, or at Gortyna, that Drodalus constructed the famons labyrinth; and here lived the terrible Minotanr the dread of the Athenian youths and maidens, til Theseus gained the love of Ariadne, and with her assistance and the clue of thread mastered the mazes of the labyrinth and glew the monster.
It is not every Englishman that has the good fortune to visit these scenes of classic story, and certainly
nobody could have had greater advantages, or better oppretunities for making investigations, than C.ptain officer of the Royal Navy, in command of a Britial otncer of the Royal steamer, engaged upon a Government survey of chat island and the neinhbouring seap, witiors and men, and with plenty of time; surely there never was such chance for making out the disputed s'tes of ancient
cities. Captain Spratt possessed also the happy art of making friends wherever he went, and succeeded in engaging the services of a distinguished Cretan patrint, Captain Mamias by name, who proved extremoly usefu in the work. Aucon from Visconat Strangford, in the translation of modern Greek and Crotan words contained in vocabulary, and from Professor Churchill Bibington, of St. John's College, Cambridge, who furnished a learned appendix upon the several new inscriptions that were found in the island, and we fall to the lot of fem

\section*{travellers.}

Captain Spratt introdsces himself to the reader on the summit of the snow-capped Ida, 8200 feet above the level of the sea, Whence he looks in hand magnificent prospect, and, instrument in hand, make by way of the plain of Netha, a sort of mountain fortress, to which he gained acces through the infuence
of his frmed Sfukiot guide and chief, he gliden gracofully into his rabject, tracing first the possension of the inland through the Sarncens and Venetinas, from whom it whe wrested by the Turks in 1669, after the memomble siege of C andia, where the Turks made in all 56 assaulte and the Venetians 86 sorties. When the Greeks rose against their oppressors in 1821, the patriots of Crete tried to throw off the Turkish yoke; but the war,
connuenced in the noble canse of freedo:n, was carried on with neelless barbarity, and soon became a war of retaliation between religions and races, and desolated this fair land, bringing misery and sorrnw to every freling heart, and porerty and disease to many a Cretan family. The pros; erity of the country was thrown back fully half a century, and a burning spirit of hatred and revenge wal left, ready to break out into s flame at any mement of excitement. The popalation of the belong to then to be 210,000 , of whom only one-third Captong to the Mussulmans, the dominant race.
Captain Spratt mentions with due preise the researches of Sir Heirry Leake, and the travels of Mr. now a Q C and Count Court judg Colloge, Camliridge, this latter gentlemnn in some particulars regarding the sites of ancient cities, and the reader will probably agree that the eaptain's local knowledge and means of getting information from friends on the spot gave him
more advintage than his predocewor had from hin more advintage than his predocemor had from his
classical attainments; moreover, the came nources of informatiun wore opon to the sailor. He givep, tinwever, his principal attention to the country east of Mount Pis in order better to sapply a defeiency in Mr. Paishley's work, and speaks of the western fide only where discoveries of importance have been made.
Of the position that Crete held in ancien! times be writes to this effect:-Under the wise rule of Minon, it is evident that commerce, art, education, and social lave attinned a high state of advancement at Gnoasus,
the cipital. Its laws were celebrated throighout Greece. To Dwislus also and his successors we may trace improvements in art and taste; and Crete long maintained its eqrly reputation, for even B) late as B.C. 696 the Athenians sent to Gnowrus for the ange and poet Epimenides, who, they were informed, could purify their city and stay the plague: a great tribute o his learning and merits every way-though this ame poet gives an indiferent character of hawn countrymen, which St. Paul quates in his Epistle to
Titus. Certain it is also, that the coins of Crete are Titus. Certain it is aleo, that the coins of crete are they are greatly almired by numianatists, thonsh they are singularly deficient in regard to form and surface.
Captain Spratt was fortunate enough to obtain an exquisite statuette of Venus, aboat 2 feet high. It and without a hoad-this, h wever, was happily ditovered about 200 yards off. Whether it be a copy of some unknown worlz of Prariteles, or of some other great master, there can be no doubt that it is a perfect gem of art. Of this the reader may atisfy himself by glance at the excellent engraving at p. 72.
Spaaking of this little treasure the Captain writes with much enthusiasm:-"The back is strilkingly beautiful. There are apparently several bronze copies fit in the British and other musetms, which show that there existed somewhere a much admired original these copies differ in a slight degree, according to the igno copies differ in a slight degree, accorang to the attitude of all identifies them as intended for some reputed original somewhere

In this statuette, the goddess is represented as bivig jnat come ont of her bath, and in the act of very diffisult attitude to represent, from the necresarily bati-turned and bent pozition of the body, and yet with tine head erect, it is marvell musly wrought notwithstanding.

The style is of the attenuated school of figure peculiar to a certain early period of Greek art and caste. The perfect grace and eary pore, the modest and beatiful expression, and the different position given to the arm and hand to that usual with all nu le figures of Tenuis known to us, will maturally strike the ad niration, and greatly enhance its appreciation as a work of the most chaste and delicate conception ard beanty, and uf the purest taste for the representation of so work, the subject as that of the Creator's most perfect worla, the In 1860, Captain Spratt was commissioned by the trustees of the British Museum to purchase two
sculptured sarcophazi, which had recently been found near the theatre of Jerapetra. The sides of one of these represents Achilles dragring the body of Hector round the walls of Troy, the discuvery of Achilles at the court of comedes, and Viucan making a new shield for the hern at the solicitation of Thetis.
In thie identification of ancient sitos the classical scholar will take great dulight, and he will find the reasons assigned sufficien'ly convincing. Tu him also the appendix on Cretan anil modern Greek, and Prof. Churchill Babington's excelient appondix on the reader will find very much that is extremely interesting: the beautiful sketches of a country singularly wild and picturesque; the account of the sponge diving, which quarries at Gortyna, which are probably the plano
ning of Drodalus-all these things are told in a
wouderfully fascinating way. In the course of the survey Captain Spratt sought the shelter of Kaloi Linines, a locality undescribed previous to his visit, and was enabled, in a variety of ways, to identify it with the "Fair Hedrens" spoken of in the 27 th cleapter of the Acts, and having so hallowed au interest, as convected with St. Paul's history. In the protec-
tion it affords from the prevalent winds in the vicinity of Lasea, sometimes called Thalassea, with the remains of its ancient mole connecting it with the island of Draphos, and in the existence of a rude chapel dedicated to St. Paul, he saw confirmatory evidence. "But Havens," a storia fell suddenly upon the steamer, and the Captain is so convinced of the similurity of his position to that of the Apostle, that he goes thornughy whole affair with all the zest of a sailor, and with the grand advantage of personal experience.
Saturn and its System. By Richard A. Proctor, B.A. late Scholar of St. John's College, Cambridge. Pp. 252. Longman \& Co. 1865.
Saturn is by far the most singular planet in t'ie whole solar system, and when, in July, 1610, Galileo first directed his largest telescone to this planet, it must have been a time of deep excitoment to the astronomer.
Though Saturn was most favourably situated for observation, the result was unsatisfactory and perplexing. On each side of the planet he saw what seemed to be a minor disc, and in November he told Kepler, "Saturn
consists of three stars in contact with one another." After an interval of a year and a half he resumed his eraminations, but to his amazement, not a trace was visible of the appearance that had perplex the tescope in fault? did the instrument need adjusting? Were the glasses defective that his triple planet had become a single disc? or were his dis.
coveries all illusions? "Is it possible," he exclaimed, "that some mocking demon has deluded me?"
The truth was, that in December, 1612, the ring had totally disappeared, its plane at that time passing through the sun. But the changes that Gatileo subsequently observed were more perplexing still. These, were startling enough. The cioht attending satellites of Saturn are extremely beautiful, but it is the stupendous double, or rather triple ring which surrounds the planet that is an object of so much interest to the astronomer. The first question to determine was, whether the ring was solid or not. Laplace proved, that for any solid flat ring to remain in equilibrium, it must rotate about the central globe; that it must be
divided into concentric rings rotatiug at different rates; and that, should its equilibrium once meet with the slightest disturbance, it never could be restored. Mr. Maxwell, who gained the Allams \({ }^{2}\) Pize Essay at Cam-
bridge in 1857, proved that the rinzof Sdturn be solid, and Mr. Procter seems to think there is con clusive reason for rejecting the supposition that the rings of the system are continuous tuid rings. We
are therefore driven to the strange conclusion, "that the rings are composed of disconnected
satellites, so small and so closely packed that, at the immense distance to which Saturn is remored, they appear to form a continuous mase,"-taking an a priori angument in favour of this supposition, from
the fact of a zone of asteroids actually travelling the sun, and zones of meteorites also doin, the same thing, for that he thinks is the only satisfactory expla. nation of the periodicity of the well-known meteoric showers.
There is a whole chapter on the babitability of
Saturn, into which we have no intention of dragging Saturn, into which we have no intention of dragging
cur readers, merely giving an opinion that there seemg to be no sufficient reason assigned why Saturn might not be inhabited. The moon, however, on the contrary, we have always thought to be in a very different case, Laving to all appearauce no appreciable atmosphere ; its day, moreover, being a whole month long; and nearly
one half of its surface being deprived of the posaibility of ever seeing the glorious earth shime from the day of ivs creation to the present time.

The first Part of the new Series of The Journal of the Royal Hoticultural Society of London, edited by (i)mprises papers on the following subjects:-On Hybridism considered as a cause of variability in Vege-
tables, by M. Naudin; Hypocanat Heating, by Mr Lables, by M. Naudin; Hypocanst Heating, by Mr.
Wykeham Martin; Note on Truffles and Trufll: culture by Mr. Broome; note on Cotoneaster Simmonsii, and on Dendrobium herlyosuaum, by Mr. Bateman; note
ou Amaryllis, by Mr. J. Anderson ; remarks concerning Soil and Climate, in relation to the culture of fruit trees, by Mr. W. Ingram ; on Variability in the Pear tree, and a note on the Flural Organogeny of the Pear, Oy M. Decaisne; and papers or translations on Spot in Orchids, on Variegated plants of the 17 th century, on
Vineyard Culture in France, and an abstract of Vineyard Culture in France, and an abstract of The papers are well written, and as was to be editor carefolly edited; and as it is evidently planued to take scientific range of subjects relating to practical and mended, not only to the Fellow of the Society for

Whom it is especially provided, but to all others who
are interested in the scientific literature of horticulture.
Boors R:oetved.-Cowper's Task: The Sofa; by Walter Macieod (Longmans). An edition with notes and erercises adapted for the use of students in TrainLanded Title, its safest aud best reform; by J. Kennedy (Longmans). -The Geological Magazine, Nos. xiii. and xiv. (l.ongmans). -The Fifth Annual Report of Guide to the London Charities (Hardwicke). -Handbook of British Water-weeds; by Dr. J. E. Gray comprising brief characters of our native sea-weeds, and analytical lists of the Freshwater-weeds.-The Bistcry and Antiquities of Wimbledon; by the Rev. W. A. Bartlett (Siunpkin \& Co.). In this very interesting
book, it is stated that of the 984 native plants found in Surrcy, about 600 have been recorded as occurring withiu three miles of Wimbledon Clurch. - Catalogue
of British Plants (Black), the fourth edition, printed for the Botanical Society of Edinburgh, with Mr Neill Fraser's list of the varieties of British Ferns apcended. - The Food of the People, a Letter to H. Penvick, Esq ; by Joseph Brown, M.D. (Longmans),
The author believes that Englishmen have degenerated physically, and that the adults of the present time having been brought up with the deficiency of food which characterised the Corn-law days, have less power than their forefathers to support themselves under any Hrain upon the system, and less power of resisting disease. His remedy is an increase of food; anil the utilisation
of sewage is pointed out as one of the many means by of sewage is pointed out as one of the many means by
which this increase is to be brought about. -Stammering and Stuttering; by James Hunt (Longmans). The author observes that a great service would be done to sufferers frove defective speech by warning parents rot to to neglect it in early youth. "Impediments of speech, so as other disorders of the human frame."

\section*{Tye \(\mathfrak{x p t a r y .}\)}
"I agree with you that Ligurian Bers are a fair suoject for discussion, and many of your apiarian readers may be glad to hear the results of the experiencer of them. workers are larger than the common bees; mine are, when bred in their own cells. I cannot myself state positively that Ligurian queens retain their fecundity longer than the common queen, but I found this last season that the bees lived a month longer than the common ones. Another person who lost his queen in a mixed hive observed the same thing. I think there can be no doubt that the queens are more prolific, but I should like to hear from other correspondents if they last found them more industrious. I have for the at the monss, and the Ligurians bave done better than at the moors, and the Ligurians have done better than
the common ones. If you have the pure Ligurians, I think you will find they are not so waspish as the common ones, but I have remarked that the hybrits are more irritable than either. J. Elmo."
Our correspondent is mistaken in supposing that we meant to convey'the idea that we believed the Ligurian workers to be larger than those of the ordinary variety They certainly are not larger. Mr. Woodbury, wh.
has had more experience with these bees than any other English apiarian, believes them to be decidedly smaller, and there are others who hold the same opinion. The German bee-keepers assert that the cells of the combs constructed by Ligurians are smaller than those built by the cominon bees. If this is the case it is but reasonable to suppose that the bees reared in these cells nust be of a more diminutive size. We have not examined into the truth of this assertion as regards the size of the celle, therefore we cannot speak with authority. From your remark "when bred in their own cells," it would appear as if you imagined that the cells formed by Ligurians are in reality of a greater diamoter and depth than those in hives of the brown bees. Have you measured them? Mark out very carefully and exactly two square inches on the surfaces of the combs of either variety, and count the number of cells comprised within the space. It is needless to say
that the bees of both hives should be of undloubted purity.
With regard to the supposed increased longevity of Ligurians as compared with ordinary bees, it wculd be necessary to institute a series of experiments bearing closely on this point, before a decision could be arrived
at. The mere fact of Ligurians remaining in existence in one or two hives, a few weeks after the extinction of the common workers, really proves nothing. They nay have been bred later than the others.
We believe that Ligurians may lay claim to being more industrious. In the first place, the queens are wonderfully prolific, consequently there are greater demands on their energies and resources. In the second place, we have frequently noticed that bees from our Ligurian atocks, are out foraging an hour or more betore those from ordinary hives kept in the same garden. This is the more noticeable early in the spring, or on bad working days.
Thirdly, our own hives of Ligurian bees have given
larger supplies of honey than those of the cose From one of the first during tomiciled and mivilat have had a very fiue natural swarm, ant seasoz a honey of the purest possible quality, ant 55 lin , supers. The swarm itself has filled a super in :a full and weight, in addition to its large stocl-bor Taking the issue of for the coming winter. his is a very unusual yield; but we hare considera: seasons, from hives that have not liave had in parsupplies of honey. On the other hand, eve pleasure of acquantance with a gentleman ardent sticker for the common brown wo who years ago, obtained two glass box supars wat them of the extraordinary weight of 112 lhs and bs, respectively. In aldition to this a swarm ame season filled its stock box (an octagon ghas a splendidly \(\frac{1}{2}\) lbs. of hon, so beautifully pure a were for a time the wonder These were all taken them. The propriet so believed, and with all why ance of justice, that he had the right to some advocates of Ligurians and the despisers of our species.
With regard to the Ligurians being less irritable, \(x\) the remarks on this diversity of opinion. Since m: we have been informed by a clerical friend, to ithon had made a present of a small Ligurian artifio ilsmity eared purposely for him, that the bees were the mi vicious creatures in his largely-stocked warm raised by us fr m the same parent st ent same time and under exactly similar circumstances, retained in our apiary, has beer wo mil behaved as to allow of handling and frames without the protection of a bee \(d r\) disputed subje possible to lay down any law on this experience with these bave from the lime of our inn usually more irritable, and to resent interperenem hotly aud persistently

\section*{Garden Memoranda.}

Mr Wm Paut's Nursery, Walthan Crosi-1 visit to this nursery is fraught with especial interat for apart from the great progress made in its forms:in
during the short period of chree or four years, it my during the short period of chree or four years, it mys
be regarded as the birthplace of some of our bas seedling Roscs.

On entering the grounds it was soon apparent \(f\)..: Mr. W. Paul continues the construction of hishona upon the plan origiaally laid down by him, an a ment by which he hopes to derive the greatest p
amount of heat from one boiler. The house priated to Tea Roses hizs answered porfectly no assistiance from artificial heat, and yet it is astonal. ing what a single hou-e of this sort p beginning of the ouwart. The Roses ore ill lan out in borders prepared for them; the stronjeas a most rambling are trained to the pillars and ra: and the others are planted so that the weaker grom sorts are in the front, the whole having a very ple appearauce. Other houses are filled with variod exciusively to joung Tines, some of which be planted out; others are for fruiting in houses are wholly devoted to purposes of proparsi. in these were a fine lut of Roses upon roots, struck in heat from very small cuttings, luxuriantly. The New Hulland house is
sively with spring-flowering plants, from later summer-llowering kiads are separate another p'ace I remarked a fine healthy Tecoma jasminoides rosea, in a 32 -size 10 or 12 fully expauded flowers upon it. Of Beaton's new seedling Pelargoniums, the a profusion in pots in other houses, indicatin culture. One, which I shall call Helen L 32 size. pot, had upon it no fewer diameter. A seedling of a later bateh (No. good, having a flower a shade or two darker Duchess and several others are also ments on all older varieties include a distinct clase, called the Waltham \(P\) has the the way scent, aud habit of the Stag's-horn Pelargonium. Though good beduer, as well doubt bouquets, \&c
equally distiuct-looking seedling, but retain of a decided dark plum coil to fect Perilla
moreover, both silver and golden variegated Pelargoniums hope to see soon in the hands of growers.
The first thing which strikes one in walking the grounds is the luxuriance of the stock foung Cherries look unuaually strong and healthy Let as hope that a system of summer-pruning may soon be introduced into our nurseries, Which will the young trees gett into the hands of growers.
Among hardy ornamental foliaged-plants one or two may be worth adverting to on sccount or thair distinct or ust-leaved Alder, is a very graceful plant, with leaves deeply and evenly cut. This tree has an unusually ploning outline when viewed at 8 distance, and it gains fivour even on closer inspection, the colour being a bright olive green. Of all white-leaved trees the best is parhaps Populus aggenteus, the general appearance of which, especially when sun and wind aid in giving it effeot, is very pleasing, and it is one of the cheapest of anriegated leaved Acer Negundo, which when judiciously phater and varied green of woodland scenery the wildernesses, produces a grand effect. Ulmus microphylis pendula is a most gracefully weeping plant, when worked upon a good single stem; the branches ere exoeedingly numerous, very small, and of uniform are very narrow and elongated. Of Hollies there is a very fine stock here, numbering, I believe, between Colchic Laurel is very distinct from the common one, the leaves being longer and more pointed. Turning to Roses-truly the "Queen of Fliary kind. there is here a grand treat indeed for the connoiseur. The long-continued drought seems to have had but litte effect on them. One thing was remarkable, momely, the improved effect which the later introductions in the way of dark Roses gives to a collection There was the great desideratum of our forefathers, old Gers of almost every colour were Le Rhone, Olivier Delhomme, Madame Boutin, Madam Charles Wood, Julie Daran, \&c., together with Emperors, Dukes, senators, Generals, \&c. Lord Macaulay too bore his crost must manfully. This is really, after much adverse criticism, a very valuable acquisition. One cannot leave theee, even with the passing glance which has been given them, without reference to one variety, which now that our great and good gardener is no more, has additional
intereat for us, apart from its merits, viz., the variety called Sir J. Parton, which Mr. Paul informed me is the best of all bedders of its class and colour. I also sun one or two meritorious seedlings.
With reference to Beaton's Pelargoniums, it is known that some 5000 of these came into the hands of Mr. Punl; from these some 4500 were thrown away; of the questionable one; two, for second trial; three, well proven varieties.
The varieties, which Mr . Paul has sent out this sold er-some of which he is alresdy out of, having cold them as fast as they could be propagated, to the Dumber of r 000 -have each a bed devoted to them Indian Yellow, which is filled with the variety named habit, and a freedom of flowering equal to that of any render it a useful addition to bedding plants. Its Of Mre. William Paul there an orange scarlet. excoedingly delicate and beautiful variety, perfect in all the mor good substance. The plant here possesses of colour will a good bedder, whilst its originality upper potals. Orange \(N\)
a younger and later peedling- whe one exceptionfrom Indian Yellow, boing the thon; it is quite distinct Arourite It has also a plain leaf, and will become prourten effect ind indisponsable in all efforts of flowerfuture prove to be the "Cleomede," against which al equaisitioners will have to wrestle. It is a wonderful niear to be the best of his collection. In colour it is but slightly zoned, and a hybrid-nosegay, with leavee scurlet, with the form of very compact. Model, is philling The individual flowers are larger than a five
Scarlet Gem, an orange-tinted scarlet with a whit Tye is a free bloomer with dark horse-shoe foliage.
The individual flowers upon this variety are equally Duchend fine, as those on that just adverted to. one of the ecaliar scarlet; it is compact in habit, and is Beaton is clear most showy in the collection. Donald portect in in form flower. The individual florets are
nspect ond other new varieties. Princess Lichtenstein is a soft pleasing salmon pink. emooth, of good form, and a good Dwarf, for the name seems applicable from its dark Dwarf, habit, is a compact and very free blooming variety, the flowers of which are much darker than those of Stella.
Magenta Queen, though not so large as many, and especially the hybrid nosegays-one of which it is-is nevertheless a pleasing variety. The top petals are renn, and the lower ones varinble; it has a white ye, and possesses a strong free habit. Salamander is bright scarlet, with boreeshoe leaf, and is of good form
habit.
Glow-worm is a remarkable flower, aptly named, the play of colours upon individual flowers being exceedingly beautiful and variable. The top petals are fiery scarlet, the lower ones crimsoned magenta. The leaves are slightly zoned, and the habit good.
Alexandra is another variety with more or leas varied hues upon individual flowers The top petals are crimson, the lower ones scarlet. Thim has a distinct horse shoe leaf compact and effective
To Indian Yellow Nosegay, so favoured lately by the Floral Committee of the Royal Horticultural Society, let me again revert. It is a very telling plant, with a distinct shade of colour of the orangescarlet tint, and will be a favourite out of doors, the habit being good. One of the most novel is, however, a peach-ooloured Nosegay, with good large trusses of compact form and fine habit. This is a very decided acquisition - as a pure peach colour is a desideratum we have long been in search of. There is, distinct blotch of white upon the upper petals. Another orange-scarlet with immense trusses is likely to make its debut under the name of Imperial. Yet one more before I leave
them : one of the best, and a companion for even Amy Hogg, is to be found here. In form and habit and size of truss it is all that can be desired, being distinct in colour-a decided and distinct cherry-from any of the above. The stock, however, is very limited. In sections 2 and 3 are very many evidently superior to the majority of bedding sorts at present in use, though it would be premature to attempt any description of them at present. There are one or two, however, to which I cannot help giving a passing notice, one
which will probably be called Dwarf Stella It is very which will probably be called Dwarf Stella. It is very itself. It will prove a very useful variety for divisional planting, scroll work, small bods, tc.

Enchantress is another of those we may yet expect
 purplish crimson with scarlet eye and very massive 50 flowers upon a truss. Beauty of Waltham is another of those original and striking varieties, which, chameleon-like, seems to assumes a variety of colours. The general appearance of the small stock of this on hand promises for it a glorious future.
With dazzled eyes I feel relieved in having got thus far through this volume of colour, and am pleased to proceed to Mr. Paul's new nursery ground at Loughton, amidst the wildness of Epping Forest. This is at present some 20 acres in extent. It slopes gently from east to west, the more abrupt descent being on the easterly side, whilst the old historic forest encloses the whole on the northern side. This ground has net it is almost quite filled with every description of nursery out-door stock of the tree description, both evergreen and deciduous; and so deep and good is this long-rested soil, that though many things were not planted out until the latter end of May, all seemed unconscious of the past excessively hot and dry weather.
Here are Deciduous Azaleas in great variety. Rhododendrons, seedling Araucarias, Roses, Apples, to., all growing most luxuriantly. Even the rare and beautiful Umbrella Pine, Sciadopitys verticillata, is doing exceedingly well in the open ground. Rown of fruit trees planted for permanent fruiting, line the sides of the walks. Elevated upon the western slope there is still standing an excellent example of the wild Crab of the forest. \(E\).

\section*{Miscellaneous.}

Dry Soil Closets.-A Galashiels correspondent, \(\mathrm{Mr}_{\text {r }}\) James Kerr, says he has since last year been using with atisfaction a simple apparatus, by which the deposits are at once deodorised by coal ashes or earth, and thus thrown out into a shoot or iron bin for removal by the action of this "earth closet," he says, is very simple, the whole process being effected by opening and closing the lid, to which is affixed the lever cranks. He wishes build the attention of lander propuch earth closets in many situations where it would be preferable to a water-closet, viz, where there is deficient water supply or want of proper drainage, and the immediate deodo-
rising of offensive matter ought to be effected at once, instead of running it into festering cess-pools or ill constructed drains. By the admixture of ashes or earth with the night soil, also, the ammed and retained for the field or garden. Mr. Kerr is not the originator
of dry eoil closets, but his plan may be an improvement on others. The Royal Sootlish Society of Arts, it is naid, prize committeo for the simplicity of ite mechanioal action. Builden
The Rafl Spider, Dolomedes fimbriatus, is a large species, being, indeed, one of the largent British spider, its size depending more apon the dimensions of the body than the length of the limbs. It in a remarkably hand some spider, itt general colour being chocolate brown, and a broad orange band being drawn 00 as to mark the outline of the abdomen and thoma. There is a double roir of small white spots apon the sarface of the abdomen, and a number of short dirk tranaverse bare give variety to the coloaring. The limbe are pale red. This creature belongs to that group of spiders which
do not live in a web, and wait for casual insects, but which chase their prey after the manner of carnivurous vertebrates. Indeed it may fairly be maid to belong ti) the large aroup of wolf spidere and ie mearly ellind to them. The raft spider il only to be found in fenny or marshy pleces, and is mostly seen in the fens of Cam. bridgeshire, where its remarkable habits have long been known. Not content with chasing insectaon innd, it follows them in the water, on the sarface of which it can run freely It needs, however, a reating-place, and forms onc by getting together a quantity of dry leavea and similar substances, which it gathers into a rough ball and fastens with silken threads. On this ball the apider aits, and allows itself to be blowa about the water by couren. Apparently, it has no means of directing it rind or bufers its raft to traverne the nurface as tho or the equatic incects are constantly coming up to breathe the air; and although they may only remain on the surface for a second or two, the spider can seize them before they can gain the sate refuge of the deeper water. Then there are insects, such as the gnat, which attain their wings on the surface of the water, and can be taken by the spider before they have gained strength fravergat. Also, there are insects which habitually elves seized by the more powerful and equally vors cious spider. More than this, mothe, flies beotles, anid other insects, are continually falling into the water, and these afford the easiest prey to the raft spider, regain thes und then arries them bick to there to devour thom in peace. The spider does not merely sit upon the raft and there capture any prey that may happen to come within reach, but when it sees an invect apon the sarface, it reaves lhe rift, res it
 surface of the raf. It can even crawl eeveral inohe in depth. This feat it doee not perform by diving, as is the case with the water apider, but by means of the aquatic plante, down whose stams it crawls. Its capability of existing for some time beneath the surface of the water is often the means of saving its life; for when it seen an enemy approaching, it quietly slipe under the raft, and there lies in perfect security until the danger has passed away. There in, living in the same localities a closely allied species, the Pirate Spider (Lycos iratica) which has similar habits, chasing its prey on the water, and descending as well below the nurfece It does not, however, poses the power of making

\section*{raft. Homes without Hands.}

Scientifce Edwcation.- Physics lies at the foundation be a great gain to have the youth of this country soundly instructed in the laws of the elementary forcem -gravitation, heat, light, and so forth. The purely physical sciences furthermore have the great practical advantage that they can be pursued to a great extent without" while the state of messes," while the state of knowledge regarding them is such that these elements can be taught as thoroughly as those of grammar or those of mathematics. Tbe
practical difficulties in the way of teaching boys chemistry thoroughly and as a discipline, appear to me to be much greater. Still greater obstacles beset the teaching of most of the biological sciences thoroughly and as disciplines. For the latter purposes and for boys, zoology and animal physiology are ont of the question; though I do not see why the rudiments of both, or at any rate of human physiology, should not be made a part of instruction. Human physiology could geography, and might be much more readily brought practically home to a boy's mind. Bat botany, wreate and clear and definite terminology might be made the means of giving a thorough training the elementary biological science. By the well guided study of a score of common planta a boy would not indeed be made a botanist (nor is it necessary or desirable he should be one), but he wound learn the use of his eyes and of his fingers, the employment of laws of vitality, and the scope and signification of the leading ideas of biology. He would be put on the ame level with respect to biological science as a who had been well grounded in Latin grammar, Classics. and the whole, I am atrongly in favour of confining instruction in mience for disciplinal purposes to
elementry physics (with incidental cheminty) and
botany, with the addition of the outlines of human hardening them off by means of partial exposure unbil physiology. A boy well grounded in the rudiments of these sciences would find none of the methods and very few of the conceptions of the others absolutely strange. If it should be found practicable, in addition, to teach the outlines of geology as information, so much th better; but I am sure that the great aim should be to teach only so much science as can be taught thoroughly and to ground in pribciples and methods rather than attempt to cover a large surface of details. I believe that the most perfect method of teaching science is that pursued by chemists and anatomists, who combine lectures with practical demonstrations, and thus unite all that is excellent in both the professorial and the tutorial systems. But it should be understood that scientific teaching will be a mere sham and delusion, and had better not be attempted at all, unless a fair share of time and attention be given to it ; and unless the rewards attainable by proficiency are fully equal to those within the reach of the boys who devote themselves more especially to other lines of work. If no scholarships at the Universites are open to boys, and if n) fellowships at the colleges are attainable by men, who show a special aptitude for science, the introduction of scientific teaching into public schools will be a mer farce. Professor Huxley in Evidence before Select Committee of the House of Loods.
Gastrolobium grandiflorwh.- The Poison Plant, of Which specimens for my inspection were submitted by detrimental to the herds and flocks which proved so the Cape River, and on the sources of the Burdekin and Flinders River, is botanically known as Gastrolobium grandiflorum. It is a leguminous bush, several feet high, with orange-yellow flowers, the latter imparting to it a very ornamental aspect. J. Macdouall Stuart, the famous explorer, brought the first specimens from Attack Creek, south of Arnhem's Land, and from these the species was established in the "Fragmenta Phytographiæ Australiæ," iii 17. It is much to be feared that this plant has a wide range through the interior of tropical
Australia (though it was not met with on the ronte of the expedition to which I was attached), and not unlikely Leichhardt had to encounter it during his last expedition. The occupants of territory in which the plant occurs may now, however, guard to some extent against known, nor is it unlikely that by setting fire repeatedly to the vegetation of the scrubby ridges on which it grows that it may be extirpated. Gastrolobium grandiflorum is the only species of the genus as yet found for instauce \(G\). Australia, where several congeners (1. oxylobioides), on account of their calistachys properties, render extensive tracts of the country on detailed statements of the a future occasion to enter on detailed statements of the effects of the Gastrolobia on the animal frame, and give also the results of the chemical analysis of these plants. Expositions of the
highly deleterious effect of the Swainsona Greyana which as a pasture herb on the Darling flats frequentl causes the death of horses during dry seasons, when deadis cffect ais as well as an explanation of the grown and depastured in certain localities, sleep to perish within half an hour, may, as referring likusvise to leguminous plants, then come simultaneously within
the precincts of my elucidation. Ferd. Nueller, the precincts of my elucidation. Ferd. Wueller,
M.D., F.R.S,, in Proceedings of the Royal Society of Victoria.

\section*{Calendar of Operations. \\ \\ (For the ensuing weet.)} \\ \\ (For the ensuing weet.)}

As in spring a progressive increase of heat and moisture, to keep pace with the advancing season, was one must be adopted. The bealthy state of plant during their winter or season of rest, and the amount of accumulaterl energy for a new year's growtb, depend Tery much on their management during the autuman They must be gradually hardened by exposing them to an increased circulation of air and lower temperature, admitting all the light possible. We have frequently they the necessity of thoroughly watering plants when according to the too common giving a little and often, rule, then, only to give water when it is required, and then to give plenty. These remarks apply more parti enlarly to hard-wooded plants, which, to ripen their growth properly, require a longer season than those to grow and flowet somie time longer. Remember the value of liyuid manure for plants which are flowering freely, amd others which it is clesirable to invigorate to the utmost.

\section*{HOWRER GARDEN AND PLAANT HOURES.}

Do not allow any of the transient summer beauties to remain in the flower-houses longer that they are orntmental; and those which have been grown as annuals, when they cease to be useful ; for, if lapt boyond a Auriculas. -These may now be hart.
the purpose moderatoly rich soil. After potting keep
hardening them off by means of partial exposure nuan them free from green fly and dead leaves.

Dartiak.- Co over the plants regularly twice a week, removing all superfluous upray and bude. Naturally strong growing varieties must, however, be disbudded with care, as they require less attention in that respect than more weally kinds. Tie the side shoots to stakees, and keep earwigs in check by trapping them in inverted pote with a littie dry moss in the bottorn of them, or with dry bean-stalks into which they will crawl, and may be destroyed every morning.
Pansibs.-Make beds for the reception of young plants. In doing this it is absolutely necessary that wireworms should be caught, therefore the compost hould have repeated turnings; for these pests are very destructive to young Pansies.

Pelargoniums.- When sufficiently broken let cut down plants be shaken ont, and after having been disrooted let them be potted in as small pots as they can be got into. Alter potting they should be placed in a frame where they should be kept close for a time; when they have become fully established, dispense with PINKs.-As soon as well rooted let these be planted into beds previously prepared for thend. Trap grubs which are sometimes very destructive to the young plants about this season.

\section*{FORCING GARDEN.}

Metons,-Keep up a good bottom heat, or shanking and canker will be a untural eonsequence. Keep the plants sufficiently thin, to allow the air to oirculate freely amongst the leaves, and to act upon the surface of the soil. Thin out weak shoots, and let all the fruit be properly supported upon some hard dry substance.
Peaceres.-As soon as the crop is entirely removed, any of the trees which exhibit too gross a tendency in down at a safe distance of two to three feet, according to the age of the tree, and shortening some of the strongest roots. Any tree which is very gross should be carefully undermined, to ascertain if any roots have descended into the subsoil. If such is found to be the case, they should, of course, be cut away; and to prevent a recurrence of the same, the tree should be lifted ont entirely, and the bottom of the border made impervious by means of concrete. The trees should be frequently examined, to prevent the establishment of scale, red spider, or other insects. It is sometimes difficult to eradicat
ance will do mach.

Pines.-Give every encouragement to plante now showing and swelling. If the quantity of frait which has already made its appearance is inadequate to meet the probable requirements during winter, water may for a short time be withheld from a portion of the plants which are fittest for frniting. On the other hand carefully avoid any check to those which it is desirable to keep on in a growing state.
Vines. - In late Vineries the Grapes which are required to hang till the new year should be well thinned, and the shoulders tied out, so as to ensure a free circulation of air amongst the berries, that their skin and fontstalks may be better matured, and less liahle to decay daring winter.

Strawberbies.- The potting of these for forcing should he proceeded with as soon ns the young plants have made sufficient roots to allow of their being transferred to pots with nice little balls of soil, which will adhere to them if taken carefully np with a curved trowel. This platu is preferable to laying them in suall pots, it it saves tituo and pots, and sutceeds perfectly. The soil for forcing Strawberries should be of rather a strong loamy fiature, and have some well rotted cow or horse-dnny added to it. Take pains to make the drainage very perfect, as it is necessary to give a con-
siderable quantity of water during their growth through the autumn, and when they are being forced next season; and if the drainage is defeetive, the health of the plants must suffer.
hardy fruit and kitchen garden.
Notwithstanding the rains which we have lately experienced, in gravelly localities it may be well to examine the state of the soil about the roots of Peaches, Apricots, and Figs, on open walls, especially of those whicl are carrying a crop of fruit; in many cases the ground will be found dry, particularly whete over-
hanging copings are in use; and unless watered the hanging copings are in use; and unless watered the
trees will snon show evidence of the neglect, by rasting some of their fruit, or by their diminative size and abserce of flavout, Means must now be taken to preserve wall fruit from the ravages of wasps, flies, \&c, either hy covering the fruit with some material to exclude these pests, nr hy entrapping the latter with
somefling attractive and cotne-at-able. The latter mode of dealing with the exrmy is preferable, as by covering
the fruit with any opaque material it in scteeted from the stiti, wat thas deteriorated both in appeeafanco and

Fatirs. - Let the enther vatietics of Peath and Apples be carefolly gathered as they tifien.
regetables. - Tripoli Onions for ftelufe tramishlaitoing should now be sown, and Endive for a late crop. Continue to make successiomal sowings of Cos Lettrice, and make the first sowing of Hammersmith Cabbrage
autumu ube. The last wowing of Eiarly Stone and his Globe Turnips should be made this week able share of attention should now be directed tovery securing an adequate supply of salads and other sum,
matters for winter use. Chicory is plant of which there use. Chicory is ond inmlan will do in spare nooks or corners, thero need nothel difficulty made about want of room.

The exceptions to the general failure are in the aase of clay land Wheats, and notably in that of Wheat on the poorer elays, whioh is almost everyWhere unusually good. The Barley on the better class of Barley soils is also a fair crop whereser early sown. Peas are a good orop in some districte.

The Root Crop is a great improvement ovel all southern and midland Eagland over that of last year. Mangels are geherally yood, and itwedes and other Turnips are tolerably promising, In the Notth and all over Yorkshire and Northumberland they date, however, being destrojed by the grub. In the dairy districts there has been generally a good crop of Grass, atad the hay has been well made. All over the eastern and sonthern counties the hay orop has been unusually short.

AnY doubls which may have orinted in the minds of the most cautious investigators, as to the precise nature of the pritailling disease atmotig eattle, have been removed by the experience of the last week. In various well-marked cases the symptoms and post mortem appearances place it beyond all question that we have the true "Rinderpeste" in our country, imported, there is good reason to belinte, direet from Russia. At the outset certain differences in the signs manifested during the progress of the affection justified the hope that it might be modified by our climate: but even this consolation is now defied us, atod nothing remains but the naked fact that a mont virulent and eminently infectious disease is extending with wonderful rapidity among our herds ith various parts of the country, in spite of all measures that have set been employed for its prevention. Every day fresh intelligence arrives pointitg to new centres of contagion. All kinds of suggertions re freely scattered through the public prints; allopathic treatment hete, and homoopathis tinotures there, are lauded ; marvellotis oures of neurly overy eave treated are published for the betiefit of all whotn it may concert, and as a consequence, the soigntifo inquirer is sorely himdered by the abundance of useless information so profusely lavished upon him.
During the last week a very important element in the question has been discovered, in the shape of a general teudeney to ignore all other eattle diseases save this one: In the potformatiot of our dutios it has oécuizred niore thein sico or twico to see animals under treatment allopathic and homoopatbic for this disease, when all its chardicteristio signg have been wanting. Convalescen cattle have been pointed out which gave indubit able evidence of not having bepn attaoked at all and henee triumphant assertions of suceassfal results meet with no response from those who are best acquainted with the malady, because their experience compels the sad admission that as yet medicine has proved to be powerless to arrest, or even ameliopate when once the disense is developred.

Up to this time information has been received of the appearance of the plague in several parts of Kent, in Norfolk, Befkshire, Devonshire, and Northumberland, and with the insane determination to hush the matter up, still so prevalent, we may donbtless add many other counties to the list. The system of sending diseased cattle of the premises along publio roads to the butchet or to market also continues, and necessarily leads to the extension of the malady. Noubtless the cesire to avuid the less of the whole value of the animal is natnral, but the effects of such proceedings are not the less disastrous to the country.

Abandoning fer the present all idea of smecessfol treatment, it is nerertheless of the highest importance to learn all we can of the chatneters felonging to the disease. And first, in relation to its infectious nature. In most instances the outbreak in a certain loeality has been directly traceable to the purchase of animals, either foreign or English, infeoted with the disease generally in a latent form; but of late, cases haveoceured where to direct oommunieation could be proved to hive taleti pluor betweef the healthy ind disemud atocts Where \(\mathrm{H}_{6}\) frest pufohases liave been made for
many manths, and whero, as far as could bo necorthimed, no persons who had boen is attendance upon infected animals have had aecess to the place. In one partioular instance the appearatee of the disease wase quite inerplicable, wecotding to the getueral idea of the neuebrity for doutact ; ifld ulter much ingiury it was disecie ced that somestieep in an adjoining meadow, only divided byiren hurdles, had been twice to the netropulitau market: thin was the onl 5 circumstance that gave anr clue to the crigin of the attack. That the infliotion oame to as
from abroad at the commencement, no one is disposed to deny ; that it is highly, almost ecrtainly infectious is not diapted ; that the infeotion may be oonveyed is an variety of waye, -by contaot, by other animals that liave associated with diseased stock, by the attendmats, by drinking from the same bucket, -ape all facts tolerably well established by evidence; but in what other way infeotion may be carrir d we have jet to learn; how far the atmosphere may lie instrumental in wafting the poison from one locality to another, is jet only a matter of oonjeoture, but with oven our limited expericnoe of a few weeks, there is good remson to suspect that such a method of convevance is at least probable. Nor is there anvthing in the cireumstaned inconnistent with whit has been observed in relation to other infectious disenses.
Admitting, hutrever, the possibilits of the communication of the malady by means of the atthosphere, it is not any the less necessary to take every precaution to avoid all direct transmission of the subtle puison given off by the infected subjucts very little care is even now taken to prevent men passing from a diseased cow or ox to the sheds where the healthy stock are. Nor is it at all ensy to effectually carry out the restrictions which are so important. Only a few days back an attendant after receiving minnte directions to aroid passing near the healthy stock, directly showed the anntint of attention he intended to give to instructiona, by walking up to some cows for the purprise of point ing them out as free from the affection. These diflculties will unduuhtedly continue to be felt as so many of the precautinuary measures must be entrusted to the uneducated and unreflecting, but 60 much the more is it imperative upon those who have the charge of storlin to see their direntions caffied into effeot; beokuse admittine, at we are from recent observations emmpelled to do, that the malady may he communicated without palpable coutact of diseased animals, and even without aty indirect medium of communication being apparent, we sire rievertheless constrained to insist upori the importance of the severest system of inspection, and the immediate removal of any animal that shows any symptoms of the disease.

Want of time compels us to defer some momentone points for diseussion in our met.

\section*{THE CATHLE PLAGUE}
[We contivite to give extracts and abridgements of the letters which have lately appoarod in the aitly
1. From ter Earl of Ehannon, Castle Martyr, Aug. 5.- I have just read yoter agricoltural article on the subject of the Cattle Plagur. From the descrintion given of the disease, it appenra to me that it womld be nuost desirable that the effeete of the Tapkinh bath shouk be tried on totme athitills affected. Havithy a bath oin miy owit premifer, it have tested it extenaively in various divenses of cattle, Horsen, and lergat and wilt the greatert stceess. In lilecwes of the blowd Hs success is almost invariable, and also in how typhoid diseases. Thie nel peat neems to be of thin diaracter, and I should entertain most sanguine hoples of the effects of the bath. Its stimulating powets, and also the carrying off, through the pores, the impurities of the blend, mark it as a most dempable arent in the present epidemic. These baths for cattle, as they do
rot require a bigh finish for sueh purp ises, can be rot require a bigh finish for sineli purp sane, can be
cheaply and simply put up-indeed I think no large atockowner mught to be without one.- \(\mathrm{S}_{\mathrm{TH}} \mathrm{s}\) Now
2. Froxt Professor Simmonds.- It is mach to be feared that, unless fariners, atockownera, cartle denlere, and others, whose interests are mmediately involved ordially \(\mathrm{c}^{-}\)-operate in the endear me to quickly exterminate the disease wherever it may appurar, it may assume a magnitude rizhty to he romarded as a great netional eahmity. For this end it ia important that
all persons shoul linos-" Firet, -That the disease specially lelonga to the \(n\) x tribe, and that it has never hern known to attack any other doment iented mimal. Scondlly, that if is the twoot infeetiotid, its well an the most fatal, in the ensom for 10 degr, or
 being inlected. For these feasons if is imperatively neeessmry that the following precautions be ohservell:1. That all newly-purehased cattle of every kinet be keit days. 2. That every cattle-owner keep a strict watci
over his stock, so as to recognise the first indications o the divease, and, as soon as any of these are mantionary call to his assistance the professional aid of a veterinary
sargeon. The early symptoms of the disease are usually a remarkably dull and dispirited condition of the animal, which will stand with its head hanging down, ears drawn back, and coat staring, refusing all food, and the eyes and nostrils. The skin is hot, but sometimes chilly, the temperature varying from time to time The extremities are cold, the breathing short and quick, being not unfrequently accompanied with
moaning as an indication of pain. A slight cough is sometimes present. The inner part o the upper lip and roof of the month is reddened and often covered with raw-looking spots. The bowels are occasionally constipated, but in mos instances diarrbcea soon sets in, the evacuations being 8 limy and very frequently of a dirty yellow colour. The prostration of strength is great, the animal staggering
when made to move. In milch cows the secretion of when made to move. In milch cows the secretion or
mill is rapidly diminished, and soon ceases altogether 3. That all infected cattle be instantly removed from the healthy, and placed in situations as far from them as possible. As a further precaation, it would be well to have the healthy washed and cleansed. 4. That no cattle the subjects of this disease be allowed to remain in any meadow or pasture field unless they can be per fectly isolated from all other cattle, as well as kept at a distance of not less than a hundred yards from all roads along which cattle may be driven. 5. That every animal which is violently attacked with the disease be killed at once, and buried without delay, and that the Bkin be placed in some disinfecting fluid before being sent off the premises. 6. That no cattle be allowed to go near to the burial places until several weeks have elapsed. 7. That no person who has the charge of the that all indirect communication between the infected and the healthy be strictly prevented. 8. That no fodder or straw which has been used about the infected yard or upon the manure heap until it be first well sprinkled with chloride of lime or sone other disinfecting powder. When practicable it is desirable that all such fodder and straw should be burnt. 9. That all sheds and stables in which diseased cattle have been located be thoroughly washed, cleansed, and ventilated, and likewise disinfected by whitewashings with quick lime, before any other cattle are placed therein and that during their occupancy by the diseased all manure and evacuations be mingled with some disinfecting agent before being taken away. 10. That all railway cattle trucks, station pounds, ships used in the cattle trade, Wharves, and other places where cattle are brought together, be kept as clean as possible by frequent washings, and that disinfectants be used whenever by diseased cattle. 11. That no store stock, milking cows, or cattle of any kind which have been exposed to the infiuence of the infection by being located with the diseased, be sent to any fair or market in less time than a month after such exposure; and that in all cases in Which it is determined to stay the progress of the time believed to be fit for human food, the animals be sent direct to the slaughterhouse when not killed on the premises of the owner. Jas. B. Simonds, Royal Teterinary College, Aug. 3.
3. Froir Propresor Gaygere.- Prom Market Drayton we learn that on one farm 33 out of 95 head of cattle have dised,
and there are reasonable grounds for fearing further losses in the same neiggbourhood. Mr. Parkes, veterinary surgeon, Birmingham, reports an outbrake at Weat Bromwich armer purchased a foreign cow from a dealer on the 18th of
July. This cow bad a call by her side about three weeks old and had been bought a day or two previously in Smith oild, appeared in this animal. She was returned by the farmer on the \(21 \mathrm{st}\), , and died on the 23 d or 24 th. On the 27 th the general
ntall Was affected, and six cows, the whole in the man's possession, had succumbed to the malady by yesterday mann14 head of cattle imported into London and near Kelso, letter bearing yesterday's date states that

Referriug to the particularly to direct contamination. my last letter, 1 alluded more we find that there are very fow cases of indirect the tagion; and if farraers and cowkeepers can keap ci to fear the ap
earry removal

\section*{symptoms.} all the appotite diminishes, and then others at intervals. In symptoms of fever. the pulse is very find there are general is a diachextremities at arst hot and afterwards cold. Thera outstretcher position
liable to twitchings, and there are spasmadic jorkings of the
muscles in other parts of the body. The position of the animal
is now often characteristio arched, joints moracteristic. The legs are drawn together, back

to abort, and sink speedily afterwards. The pulse becomes
weak and indistinct at the jaw; the discharge from nose and oyes and the salivation increase; the cough becomes more or
less indistinct, should it continue. Ina number of cases the
cough is entirely absent. On the membraue lining the mouth
 and stages of the disorder. All are agreed that the period of
incubati.n never exceeds 10 days, and often extends nnly over
four. Then the general fever sets in with abdominal pains.
and lastly, the spine is more or less affected. The animal
stands and rises with difficulty, and often dies in convulsions. tands and rises with difficulty, and often dies in convulsions.
John Gamgee, Principal of the Albert Veterinary College, 48, Pall
S. Wug. 4. 4. Froy Professor Gamaris.-Two cows were purchased on with other cows in a shed. On the \(24 t h\) one of them took ill; she was sold at once with her companion, and died, whereas the latter has been traced now through a dealer's hands to immediate destruction. I may mention that the first cowleeeper who bought the two cows has sustained most serious losses tock. Now it is evident that in all probability the foreign the immunity which always follows one attack. Animals are not seized twice with the disease, and, once over au
attack, cannot have a relapse. There is a polnt of very great importance which has been mooted by Mr. Helps
n his offcial letter. Is it, or is it not, possible to adopt
measures for the eradication of the disease? Not only does Mr. Helps say that our Government can do nothing, but that rave failed in their endeavours. Now this is not the case. I
quite agree with Mr. Helps that serious outbreaks have
occurred in countries where the sanitary regulations for conoccurred in countries where the sanitary regulations for trolling the spread of epizootics are admirably orginised ; but vould these outbreaks not have been intinitely more serious
without the exercise of the power which foreign governments
wield? There is nn doubt that they would. If we compare
the Austrian outbreaks with the one in Egypt in 1863, we shall find in the former the average loss on the stock of the whole
country barely exceeds 2 per cent., whereas in Egypt it amounted nearly to 50 per cent. I am quite aware of the
different conditions under which animals exist in the
two countries, but if we take the Mrugarian Steppes, which are famed in history as the favourite haunts of cattle i863 the loss never exceeded 5 per cent, on the total stock in
the se districts. This metropolis should contrast favourably
with the Hיungarian Steppes. Here, at all events, stock is
subdivided in small lots. There they rove in large herds, so malady. And how doos the case stand? Within seven weeks
from 10 to 12 per cent. of the animals in this metropolis have been destrayed. This is not absolutely correct. It canvot be,
but if I err it is on the safe side. In Austria the losses sustained by the disease on the infected stocks amount to tho of the discase, but it also demonstrates the activity with which At all events, I should estimate the percentage of deaths in
infected stocks as certainly exceeding 90 per cent. I have spoken very strongly in times past on the subject of veterinary inadequate. Unless the inspectors can do their duty calmly and dispassionately, without being hurried, "not to lose the market," or "not to keep cattle lest they should suffer in a better supervision at nur ports. And so long as the inspectors to pass at once, notwithstanding that they have been mized do more than it has done. John Gamgee, Principal of the Albert
Veterinary College, 48, Pall Mall, S. W., Arg. 5.
5. From the Araert Veterinary Colleae. - From the rapid
apread of the Russian cattle plague the committee of the Pread of the Russian cattle plague the committee of the
National Association for the Prevention off Cattle Diseases
have requested me to issue such suggestions to stock as may be of some service under existing circumstances It is important at once to state that reports of fresh outbreak are reaching us daily: that persons acquainted with the cattl
plagte, who have visited the Mctropolitan Market animals purchased after having been in closo proximity with those diseased; that infected animals have been froely bough from the dairies or farms where the disease has appeared, and
that some unprincipied dealers are attempting to turn this sorious calamity to profit by buying what they know to be
contaminated, at a low price, to be sold at the value of sound that infected animals have thus been purchased in th metropolitan districts, and have been transported to
country markets and fairs, where they have been sold as healthy stock. The purchases of atock must, therefore, be be effected with persons of undoubted respectability, a special warranty, as to the condition of animals bought, should be cattle for feeding or dairy purposes should for the moment be diseasen state may be expnsed for sale. Sale of stock. -It is the at large from th sale of animals concerning which there may be rain. If the officers of this association are consulted, arrange mecount, however, should infected animaly be travelled by
road, in railway trucks, or atcam-boats ; and it is best to have
in suitable vans. Quarantine. - Nowly-bonght cisttle should be kept separate for a perind of not less thatu ten days, and
on no consideration whatever shoulid they be placed
amongst stock known to be diseased. As an indicatuon of the great value of this measure, I maty be permitted t under my notice.
German or Dutch c German or Dutc
Subdivision of stock:-1t is very desirable to keep stock in
small lots, so that, should the plague attack any sin One of the earlieat outbreaks which that animal may be found belnnging to a cowkeeper who had his cows geparated in three or four places. Out of 140 animals only 24 were infected, and
the disease has not spread from the ningle shed in which it was first introduced
grains, bad bay erate quantity, and with great regularity. Sour great importance to attond to perfect cleanliness and
ventilation under any circumstances, it is especially mo if the
 instructions may be had on point

 able to the laudurd's feusal superiur; (3) the chims of firm servaits for their current
cereditors for funeral expenses.
Terms of Entiy and Payment of Rent.--In any consideration of the law of hypothec, it is of importance to keep in view the usual terms in sevtland for entry to land by a tenaut, and for paymient of reut.
tiuns term of entry in arable farms is, whth a fow local excep. tions, either (1) Martinmas (17th Norvuber) fur the whole 1)
session, or (2) Whitsunday (15th May) as to the houres Grass, and fallow land and the soparation of the crop of that year from the ground as to the land under crop. The tern of entry \(n\) Grass or pastoral farms is almost invariably Whitsunday. The legal terus of pyment of rent-in other words, those terms at which, in the abseuce of epecial agreement between the pricties, reut is payable-are Whitsunday and Martinmas Wriginally fixed on the assumption that one half of the ren day, and the other half after reaping his crop, vizh as Inartinmas. In the caso, therefore, of an arable farm, with entry a Martinnmas 1850, the rent is legally due at the terms of Whit sunday and Martinmas 1806 . The rent is also legally due at
the same terms when the entry is to louses, Grass, and fallow the same terms when the entry is to houscs, Grass, and fation that year from the ground as to the land under crop; it Weivg settled by decision, that the tenant's pnssession of certain parts
of the farm, as botwixt Whitsunday 1865 and separition of crop, if only to be viewed as an accommodation, and that, as
he reaps no crop until that of 1866 , she rule is to bo held the be reaps no crop until that of 1866, the rule is
same as if the entry had been at Martinmas 1855
In the case of a Grass or pastoral farm, with ontry at Whitthat is at Whitsunday 185i, -and the next half at \(\$\) Iuting, 1865. Tho apparent auomaty is explained on tue principle, settled by decision, that the law recugnises the crap oi the year as the test by which the payment of rent is regulated, and that the Grass is really the crop, which is presumed to
been "hained," \(i\).e. kept unstocked during the winter
buen hained, i.e. kept unstocked during the winter. are observed in some parts of Scothnd, the conrentional terms, that is to
difiterant.
In the case of an arable farm, with entry at Marlinmas 1865, the conventional terms, accoriling to the general practice, are either Martinmas 1868 for the first hall-year's rent, and Whit for the first, and Lammas (1st Auguyt) Istir for the second. and fallow at Whitsundey 1865, and separation of crop 1865 frou the ground as to the land under crop, the conventional terms are, according to the general practice, the same as those above stated where the entry was at Jartinmans \(1800^{\circ}\).
In che case of at Gass or pastoral farm, with entry at Whit generally adoptod, are Martinmas 1865 for the first half-year's reut, and Whitsunday 1560 for the second.
These terms are applicaiole to the greator part of Scotland. But there are some diatricts, and also particular cstates in other districts, where the conventional ternis are the same, or noarly the same, for arable and for p.storal farm8, In some of these cases a tar?s croo from the grouud, pays his first half. -ear's rent as soon as at Martinmas 180 , and his second at Whitsunday 1866 ; but more conomonly the firat is pasable at Candiemas, and the secoud at Lammas 1866.
In the case of arable farms, rents payable before a crop has been roapod are populariy known no forthand robic It the sume way rents payablo al
kno win as "Luctikiand " rents.
which the lindlord's sthethery the Zuas. The haw unde appear to have attractod public attention as a law supposed appear to have attractor pubirc attention aly aw suppose

In dolivering judgrment in the Honso of Loris in the
 baw so unfavourable th the rizhat of a park Hecer "f arian by sumple in pron market; and, shartly atter the decision in that The Bill thus introduced was withdrawn, as wore also other Bills brought into Parligmeut with a simflar object. This was

Within the last ycar tio question inas attracted a considerable share of publit attenject of discusslon at public mectinss, anl has kiven rise th the mattere The ocosin, nu of this rencwed at tenturen to the polley of the law was the decisica of the Enmt of sess in in surbject may probably also be attributed to the face, that the successfal ciltivation of the son now depends very much on ongiaber, whose capital and labour only a fent yetrs Mos culltributed but little to the ordinary operations of agricultire.

 bankers, corn and mante merchints, and als ) gutlemen
from England whotn we thonght it of importun- to eall and operation of that we migh in that commery. \(A\) ins.as the wit uesses s.) exmmine there have baen suveral mpresintipes commattees, which had been firmsi in simu ?atis of the conntry,
anmulle li: sit us, nad we examined such of their members as they bi inistod to us as most likely adequatoly to represent tberr vicus. On the other hand, the names of persons in 1:1urent nis' iets,
belleved to be favourable to the existing law. Wers firnished to us by those possessed of local informati it ; an, : aump opportunities were given to all to come lee re us why migh haps bo the case, that fower of the smaller and low wealthy
 have expected, or perhap; than wo mhrht have wishe 1, on
account of its being represented to us that the interusts of that class are peculiarly involved in any proposal for a machi fication of the law. But, on the whole, we are satisfied that exhaustive of the subject. Vecers of then 0 poent to the Ene--On the part of those who
adrocate the preferencs 1 n fow sur of the lindl or 1 , and ather creditors of the tevant, it was ripecented t. 1 sis that the law is unfir to th general dealer, iamsmads as, through the protec ion winich
affords to the ladorl, it frequently eubles him, when tonant becomes bankrupt, to obtain full payment of his claim for rent, while the other creditors freller ily recoivo but,
small dividend, and freguently no divileal it all, thic efect of the tenant bing entirely swept awas to satisfy the handlur l' demind. Ocessionally, it is asial, this deanal may ammat to the rent for twis years, the crop and stockine beins hispoliog
cated buth for the jear that is past and fin the morrut year. such a preferenes, it was hered, canuot but bo mist injorions to seed and manure merchouts and other dulders wh) supply articles to the tentat on relit; and, among athers, to tho an all tradesmon in the leality, is tha are demendent alta, othen
on the custom they receive frum the nei hbouring farmars. In particular it was representel on behalf of the manne merchiants
 expenditure on a farm was very much less than it now is, circumstances have su altered in this ree
and siso by the use of expensive feedilig-stunfs (the anural

Bery
 as unreasonable and unjust. The position of the small
tradesmen, when a bankruptcy occurg, was represented as
one of peculiar hardship; and it was said that no gond
reason exista, why the agricultural labourer should have a
preference for bis wages, while the carpenter and blacksmith
who work on the farm are postponed to the landlord, and onls one of peculiar hardship; and it was said that no go
reason exist, why the agricultural labourer sliould have
proference for his wages, while the carpenter and blacksmith
who work on the farm are postponed to the landlord, and onl
allowed to rank rith the other creditors. There is peculiarity, it was contended, in the relation between landlor and tenant to entitle the former to any preference over othe
creditors; and, indeed, without any such preference, it wa
said that he frequentiy receives from the oiatlay expended said that he frequentiy receives from the oistlay expended o
the farm by the tenant a sufficient bonefit to compen
sate him for a temporary loss of rent. In addition sate him for a temporary loss of rent, In addition t
these grounds for introducing a material change in
the law, it was further very strongly urged on us, an more particularly by several of the teants of larger capital,
that the height to which the rent of land in Scotland has risen is to be attributed in a great measure to the injurious
operation of the law of hypothec, which enables landlords, in operation of the law of hypothec, which enables landlords, in tenants of inferior capital or skill, whom they would not the system of back-renting, or postponing the terms of pa being dono with the view of enabling such tenante first t realise their crops, and then to satisfy the landlord out of the
proceeds. In this way, wo were told, encouragement has beea given to a class of men who ought either never to have been than they now have; and who, by offering for larms, have fostered a fictitious system of competition, through which the
rent of 1 and throughout Scotlaud has been unduly raised. Th rent of 1 and throughout scotlaud has been unduly raised. The
introduction of fore-rents, or bringing the conventional into
conformity with the legal terms of payment, which many conformity with the legal terms of payment, which many
deprecate as an evil likely to arise from any change in the law, deprecate as an evil ikely to arise from any change in the law,
would, in the view of those to whose opinions we now refir,
be an advantage rather than a disadvantage. as rendering larger ctpital necessary for prosecuting the profession of agriurged by some witnesses, as a reason for a change in the law.
that the preference now given to the landlord prevents banks from accommodating tellants with advances of money,
and that tenants would be benefited by the increased facility in obtaining loans which the abolitiou of the lan \(1-\)
lordso prefere would brivg with it. The power of the
landlord under the present law to follow grain in the hand of a purchaser, if the rent for thy year of which the grain is the
produce has uot been paid, was greatly ohjected to as contrary to general principle: and the private manner in which sequestration by the landlord may be carried througb, owin
to the absence of any general systom of publication of seques
trations, was stated to be injurious to the public os indue
persons to deal, or to continue dealing public, as inducing
remains in a farm ostensibly in good credit, but over whose landlord, and kept by him in suspense for security of his rent
several of the wituesses who thought the abolition of th landlord's preference desirable, were at the same time decidedl of opinion, that greater facilities than now exist
given by law for getting rid of an insolvent tenant.
Vieces of those favourable to the
genetrally favourable to the maintenance of the prosent law, it
was, on the other hand, represented to us, that the losses
which manure-dealers and other traders suffer the
which manure-dealers and other traders suffer through the
operation of the landlord's hypothec are very small, compared
witin the amount of the dealings in the course of which the witit the anount of the dealings in the course of wh

\section*{steater than the return obtained bs landowners; and that}
articles in which they deal. These dealers also prices of the
have it in their power, if they please, to regulate or alter their have it in their power, if they please, to regulate or alter their
terms of payment from time to time, and, in any cases where
they may think it prudents to rcstrict their transactions to sales for ready mones; and were the landlord's prefere
and more especially nis power of sequestration in security be abolished, ther might, in case of a prurchase
the arrival of the balf-yearly term of payment of
rent, and so leave the latter without any means of satisfying
nis claim. It was further urged, that a landlord farm to a tenant for a period of 19 Jears, and so practically
a different position from a merchant who deals only in isolated transactions from day to day, and who may cease dealing with
a tenant of doubtful solvency whenever he pleases; and that this consideration was the more worthy of attention from the fact, that the greatest degree of care originally exercised in the the lease, or from unforeseen changes in his circumstances, wholly unavailing for the landlord's security. In this way, place the landlord's claim for rent on the same footing with very seriously the value of land, not mercly as an investment but also as a securits, and would therefore affect very Whose money is lent on heritable bonds. With regar to the argument that the outlay expended on the farm
by the tenant places the landlord in oo favourable a position
as to render him secure independently of any preference the law of hypothec may give him, it was represented that, s
far from the land being improved by a tenant who falls in arrear with his rent, it is in the very great majority of relet, the landlord must either be content with a reduced rent
rent or must himself lay out a large aum in order to reatore the afforded Ly the law of hypothec induces landlords to secept of accept, was denied by the landilords and factors who gav
evidence before us. These gentlemen asenre evidence before us. These gentlemen assured us that they
never take the law into consideration in selecting a tenant the rent would be most imprudent and would cer payment of involving the landlord in difficulty and loss, It was denied creating a fictitions competition for farms or unduly raisin the rent of land. The law, it was said, has existed for centuries, whereas it is only of very recent date that any such
complaints as to its operation have been brought forward. The complaints as to its operation have been brought forward. The
present high rents of land were attributed to the increased
competition ex causes of various kinds; among which in recent years were to bo noticed the high prices of farm produce which prevailed abment formers in several ristrices if Scotland from the cultivation o fully as great adrant, that the present state of the law is of

\section*{[We take advantage of the immense bocthec
evidence lately taken before the Fyprom it} the existiug style of Scottish agricult
and energy of Scottish agriculturists.] (Conlinued from?
6. BonNingTon, near Ratio Mr. James The extent is about 1000 imperial acres, about 2000l. a.year. I have been 1836. practice of agriculture. I began in the cropping farms is a Grass farm, to work on win entry cropping farm, where I reside, there land which I entered to as summe entered to it almost a year previous to the of entry. I paid for that to the landlord or incoming tenant is but sro out. My general term of entry of pa
Martinmas, and my general term arable land Candlemas and Lammas, aiter arop. The entry to my Gres farm
.-. being payable at Martinmas following, and girs: next at Whitsunday. These would be convenient envugh terms, but the law of hypothec puts us to a certain extent in a wrong position. I think there should be no such law, and that it should be matter of arf ngement between landlord and tenant. If it were art Hoided, I think the system of fore-rents would be geareally adupted. I think its abolition would evengeareralls be adrautagcous to the landlord; and I think it siuld be decidedly advantageous to the tenant. The teant would certainly be in a better position paying fretand rent, with no law of bypothes existing, than he is now. I think there is a tendency at present to overrate the value of land, i. e., to offer more money for land than it is actually worth, on account of the postponed terms of payment. the present system rents are monduly forced up in the Lothians than for similar land in England, tlough no doubt the superior skill and intelligence of Sootch farmers may be an element. Even under the law of hypothee in Scotland there is a difference of 20 per cont. between farms let privately at a fair value and tarms let publicly. On the farm on which I reside, cunsisting of 670 imperial acres, I lay out 10002. on pureliased manures, and I buy 450l. worth of linseed calie fur feeding. I cannot complain of the operation of the law of hypothee so far as I am personatly concemed, though I have lost a little money occasionally by tieighbours who have become bankrupt, to whom I liave sold seed corn.
. Longniddry, East Lothian : Mr. Alexander Henderson.-I farm about 750 imperial acres. My rent is about 1700l. or 1800l, a year. I have been poot 40 yeurs a farmer. I have also acted as adviser in regard to the Luffess and Rankeillor estates. I are been much employed in arbitrations and valuations, and in giving advice as to the letting of farms. My term of entry is Whitsunday, and the separation of the crop ; and my rent is payable at Candlemas and kast Lotlian. If the law of hypothec were abolisied, I think the rents must be made payable sooner. The tenant would just require to have additional capital in lis pocket in the shape of a year's rent. I think that would improve the status of the farmers, and it would more capital. more capital. It would have the effect, in my opinion,
of reducing the rents ; but I think they are unnaturally ligh at present. It is the fault of the bidders that lhey are so. I know no reason for their offering too bigh rents, except that, when a landlord advertises, he gets as offerers people from other professions than the agricultural interest. Mercantile men, who have made a little money, come in and overbid the practical men in the country, and they are generally preferred. A cod many of these men have come into Last Lothiam, have into various districts of the country, and there bave been a good many farms let lately to others than practical men. Some of these have capital, and some Lare not. I have no other objection to the law of uypotbec, except that it unnaturally increases the competition for farms, and that the merchant has not couds as he wouportunity of getting payinent for his manure merchant protects himave. I don't think the those who mayt protects himself fram loss by charging furtber than pay ready money a much larger pricefurtber than the difference between ready money and -one for credit, and are always sent to the customer the land I possess myself, I on year on manure, and I spend 2400 l . or 2500 l . a year on manures and feeding stuff together. I don't know gtarting, but I think fore-renting would take well at 8. Whirction think it would secure good tenants. George Hateey.- I have Mains, East Lothian: Mr: of agriculture for - I have been engaged in the practice of agriculture for 40 years. I have been treasurer to The eastent of my Agricultural Society for 17 years. my rent is from 8501 . to \(1050 \%\). My term of entry is
Whitsunday payable at C'andlemaration of crop, and the rent is reaped. At Candlemas and Lammas, after the cron is adrantage frome not personally experienced any disbas told much, till law of hypothec. I don't think it increasing the pice perhaps recently, iu the way of minure as some pice of manure. I do not use so much adaptere for Potatos, meighbours, as my land is not Prruian gaano yearly i get from 24 to 28 tons of aiber special manure. I have used very little of any as inature. My expenditure for feeding stuffs is about
lool, a year. effect of mink the law of liypothec has the Otherwise me, from land higher rented than it would civer the means of the power that the landlord has fied as compeans of the tenant. It brings men into the difacite to convine non-practical men; and it is very vighest rent is not a proprietor or factor that the Bricad there is any about the best thing going, proBr ann anpractical capability at all to take the land. of Lis trsiness. If a man had who knows nothing Berwickshites, and If a man had studied farming in capital, I donnt came to East Lothian with plenty of practical. The think he should be rejected as uncapital and sometimetical men are sometimes men of lords exact security for mot. At present, many landecurity for the proper stocking of the farm
and for the first year's rent, and I think that is the 9. Niddriey fair cantion.

Mfyine.-I farm fully, Mid-Lothian : Mr. Thomas 110 we. - farm fully 500 imperial acres, and pay Martins 2000. a year of reut. My term of entry is of enmas, to the whole farm; that is a common term mastry in Mid-Lothian. My rent is payable at Candle mas and Lammas, after the crop is reaped. I am within three miles of Edinburgh. I lay out above 1200 ? a year on purchased manures. Mine is not a feeding farm. The produce is mostly sold off the groand, but I spend about 2007. a year on feeding etuffs. It thisk the law which follows grain after it is sold off a farm is a hindrance to trade, and creates a certain distrust among mercantile people. I think that is a mostohjee tionable part of the law of lyputhec. I sell most of my Barley by sample in the offices of brewers in Edin burgh; and uuder that law these men wight feel a distrust of me, and want to know how I stand with my landilord. I think there should be no bypothec after a lonâ fide sale, delivery, and payment.
10. Tifornton Locit and Leaston in East Lotuian : Mr. James Brodie.-I farin altogether 3300 imperial acres. The rent of Thornton Loch is a Wheat rent; the others are money rents. For the Whole farms my rent 18 sometimes under and sometimes beyond 40002. The term of entry to Thornton Loch is Whitsunday and eeparation of crop; to Leaston thie entry is at Martimas. The rents for Thornton Leel and Leaston are payable at Cundlemas and Lammas, after the crops are reaped; theofirst payment being in the one case a year and three months after entry, aud in the other a year and nine months after entry. have felt the hardship of the law of hypothee in this respece, that, being in the hahit of taking Turnins on other farms, I have had to pay for them twice. Having prepaid the tenant, I was called on by the proprictor
to pay over again to him the price of the Turnips to pay over again to him the price of the Turnips
which had been consumed by my sheep on the field That happened just once; but on another occasion a similar claim was made against me, which was not iusisted on. My stock had been removed before a sequestration was served upon the telant, and it was doubtful whether the landlord had a right to ash me to pay ; but I refused payment, and it was not insisted on. Mave heard of similar cases, but they are not common.
Marmers, however, have not stock of their own to eat their Turnips, and they are in the habit of letting them; and it is usual to pay them a sum to account when the sheep are placed in the field, and the balane when the sheep are removed. I have no menns of ascertaining whether I can deal safely with a tenant in such a case. I cacnot ask him to show the landlord's receipt for his rent, and it may not be due. I have also felt the hardship of the law in regard to seed-corn. I supply tenants with seed; and there have been cases where I got no payment, and the landlord got the benefit of it. I think that merchants supplying seer corn, or manure, or tiles, or lime, should have some prefercnce, becanse at present the landlord in the event of a sequestration gets the benefit of all these articles.
The landlord rets everything, and the other creditors The landlord gets eve
too often get nothing.
(To be continued.)

\section*{WHITE \& CO.}

20, BEDFORD STREET, STRAND, LONDON, W.C.
The peculiar Advantages of these Clobets and Commodes over the ordinary Water Closet are:-
First.-That the deolorising material (dry surface earth, or clay, or other subsoil) is the best for the pupsis and at the same time is the cheapest and within the reach of all classes

Secondr. Tho by a forcing pump, and its removal after being used may be entirely without offence.

Thirdly.-Its application by the means provided in these Closets is immediate and effective; so immediate tss: offensive smell need eseape into the room or building in which they are used ; and so effective that all ferma and all escape of noxious gases are entirely prevented.

Fourthly. - The expense of these Closets, in comparison with that of Watur-Closets, is, as to the firs ared, and there ar \({ }^{\text {s }}\) trifing, and as to repairs almost nothing. For instance, there is no expensive cistern required, lead pipes to burat in frosty weather.

Lastly.-In all large Entablishments, surh as Hospitals, Crion Houses, Schools, Gaols, and Agylum considerable sum may be saved annually in the production of a valuable manure.

THE LADY To the Lovers of Fine Fruit.
1 I introduced to the Public my Seedling Strawher Amateur) which is now declared to be the most valuable variety at the present of the 2tth June last, alludlng to the great failure of the Strawberry crop this year, it iss statod that near IISleworth and Brontford, as well of Sjon, the tailure is complete, and the only kind of Strawberry that which will become memorable, ", Having for many years past turned my attention to the raising of Soedling Strawberries, of which 1 have
yearly produced some hundreds, I feel convinced that the variety now ueing introduced will prove itself to be the fanost one I have ever raised. Many First Prizes have been already awarded to it at
Horticultural Exhibitions furboth forced TTh Lady ripens about the time of the British Queen, and continues fruiting a long time; is a great cropper, bearing a arge handsome
fruit or a salmon colour, tined with crimson, and rriening to the
rery end sthe seeds are small and fow, the flesh is pering Very end sthe seeds are small and fow, the fiesh is very juicy, and
neits in the mouth, the flavour is between a Pine and a Melon, and mis moss delicicous, with the hirhest perfume I have ever met with.
The entire of tecrop is of lare size no useless fruit being producel,
 Plants are now ready to be sent out (in lots of not less than 201. Plants are now raady to be sent ut (in lots of not less than 201.
All applications must be accompanied by a Post office Order on Birming bam, Postage Stamps, or Cash, to receive attention.

\section*{HARDY ORNAMENTAL TREES AND SHRUBS.}

\section*{OSBORN \& SONS}

Invite lovers of Ornamental Planting to an inspection of the varied forms and foliage of their Collection of the above, to which they have for many years deroted especial atsencios. PRICED CATALOGUES, consisting of upwards of 1500 species and varieties, may be had an

petals, and containing four short colourless हtamens and a simple style. The structure is only to be seen in unexpanded buds and on careful disseotion, but so distinotly thet there is not the slightest doubt of the matter. The formation does not seem to the eye to be axillary, but marginal, though it is possible that had the specimens been examined in an carlier stage it might have been traced Jower down, and if so we should have something analogous to the proliferous Daisies which are known as Hen-and-Chickens. The subject is well worth a more careful investigation than we have hitherto been able to institute, but it is too interesting to be passed by without notice. M. J. 13 .

OUR correspondent "R. T. C."some time ago sent us a curious variety of Delpininim Consolida, whose portrait we now present to our readers. It was found in the garden of a country inn, and our friend desoribes it as "a strange monster, neither fish nor flesh, which can neither Hower nor iruit properls, a curviosa infelicitas, through complicity incompetent." In truth, the flowers seem to be absent, and their place is supplied by very numerous, narrow, overlappiog bracts, of a pale

We have to-day the melancholy duty to record the death of one of the veteran leaders in botanical soience. Sir W.J. Hooker, the estimable Director of the Royal Gardens, died at Kew on the 12th inst. Next week we purpose giving an obituary notice of our departed friend, whose mortal remains now rest near the spot where the labours of the later years of a long and useful life have been so well carried out.

A tery singular variety of Fuchsia, raised by Mr. Apten, of Gatton, named The Victory, wa Eshihited on the 8th of August at the Tuesdas meeting of the Horticultural Suciety. In addition to the eight normal stamens there were four exterior to these, which were greatly elongated, the anthers being converted into purpie petals, giving the flowers a very curious appearance, and l.alling to mind the spoon-shaped staminode of To the petala just seen a double Fuchsia in which indies petala were replaced by somewhat similar andies, only the limb instead of being expanded and shaped like a little flag, was tubular, exactly times the cornet-shaped leaves which someThis oceur induced Spinach and the common Cabbage. Thas induced us to look more narrowly to the way in which Fuchsias become double, and We Wine surprised to tind that the additional are already fetals are produced when the buds little short deformednced, and appear at first like little short deformed nail-shaped stamens, the top of which is composed of large prominent cells, along the mass of which a fissure at length takes contorted. In the cases examined the abortive rancen was alyays cases examined the abortive the petal, but in most instances several are formed, other.
It Clarkia elogans, a plant belonging to the are numernal order, where the additional petale less perfect stamens in almost inextricable conpotals appeare, however, only two additional such curious conch normal petal, we have seen immeriato condition that we think it deserves transformed atam. Instead of anything like a before us, the new, we have, at least in the case difion of a little flower with assuming the con-
vaulted with briok, 50 as ho has tho doors and windows open in the hardest frosts, seoludi"g only the snow." About this time were plated four Cedar trees, then abut 3 fect in heig'it. Three of these unfortunately have divappeared, one within the last few rear-, so that one tree alone remains and still forms a striking object frum the river, though destined ere long to follow its former c mpranions.
Some years after this period, the supcrintendenon of the garden devolvid upion Mr. Samile Dondr, an eminent member of the Suciets, and well-known in the botanical world for his researches in Crrptogamio botany. The next name of note that we meet with in the annals of the garden is that of liay's friend Praskin, when acted as Demonstrator of liotany to the sucietr. In 1 12:2 Sir Hank slonane made over the premises to the Apothecaries Society, on condition that they should give annually to the keyal Escietr 50 plants, until the number shomh amount (1) \(20: 10\). This, as it were, scoond foundation of the garden, was happily inaugurated by the appointment an gardener of no less a person than P'umar Minamer. A jear or two after thia, Isaar liant was nominated by the Siciety as "Preffetus Horti," and it fornied part of his duties to demonstrate the structure of plants to the punils of the society. James Sucrahit, of "Hortus Cllhamenmis" notioriety, the brother of Wildam Simanab, to whom the Oxford Garden owes so much, appears ahout this time to have been one of the garden committee. Some years later, in 1761, Mr. Henson, the author of the "Flera Angica," hecame curator of the garden. He was nearly the first among English botanists to adopt the Linnean system, and thus forms a link between our own Kay and the illustrious swede. Then followed in the office of demonstrator, Wilutay Cortis, the author of the well-known "Flora Londinensis," with its eminently faithful representations, and who was also the originatur of the "Botanical Magazine." On his resignation, Mr. Wherler was appointed in his stead, and superintended the aditirs of the girden in conjunction with Mr. Forstyin, of arboricultural notoriety. In 1814 Mr . W. Asperson became the curator of the eatablishment, at the auggestion of Sir Joserp Bayks.

We have lingered thus at length over the memorials of some of the more eminent personages connected with the old Chelsea garder, because there is soaroely a garden in England which possesses such a muster-roll. Fur its historioal associations then, if for 10 other cause, great interest uttaches to it. Its fortunes have been fluctuating in no ordinary degree, depending in the earlier part of its carer oa the success and popularity of its efficere, and on the taste and predilection of individual members of the Societs.
Our own personal recullections begin at a time when it had fallen into a state of decadence from the uncertainty that prevailed in the Society's councils as to the tate of the garden. It was even suggested, we believe, that the old garden should be abaudoned, and a new one furmed in sume les. crowded lueality, at a greater di-tance from the smoke of Iondon. At the time we speak of, however, the garden still afforded to Ir. Lindiey the opportunity of giving practical inctruction of a kind which could not be given in the several lecture ruoms, and which was appreciated liy anme amone his audience-not by the majoritr, we fear, thongh most thoromghly by the tew. It required some sacrifice on the part of a student, say from the Burough liospitals, tos prisent him-elf at Chelsea at half-past cipht in the morning; nor can it te deemed surprising that, ws the session wore on, the numhers attending these prelections gradually deelined. Bu' there are among the medical practitimers of this country mans who look hack (1) thene leatures of Dr. Listilfy as affording more real practient information on bitany than was contained in the more formal cursos which they attended in their own hospitals, or was to be found in the books which were within the reach of puisis.

Nuw, ngain, withii the las! year or 1 tro, great efforts have been made, and ar manir. in render this gorden useful in stidenta. We know from experience that the latter do appreciate what is beng dore, which are nut so readily available elsewhere ; and the members of one class at least, visit where ; amd the mith their teacher, in preference to going further a-field or herborising, because they say they learn more at a smaller sacrifioe of time and money. In the out-don department there is perhaps little to attract the ordinary observer, but
the collection of medioal plants, and the numerous illustrations of the natural orders, render it very serviceable to those for whose use it is more
especially intended. A "cool house," facing the especially intended. A "cool house," facing the
north-east, has been lately erected at comparatively little cost, and answers its purpose admirably. The plants are disposed in groups, deprived of the pots which disfigure an ordi-
nary greenhouse; so that, enter it at whatever season you may, there is a freshness, a natural look, which is entirely wanting in ordinary cases. The difference is as great as that between same creatures roaming in their native pastures. In the other houses the collections are of the most interesting character ; the number of plants is not so great as to induce bewilderment, but the plants themselves are such as arrest the attention of the student. In two of them pot culture is almost or quite discarded, the plants being grouped over an uneven surface of rockwork and turf, by which means the more characteristic are enabled to assume something of a natural aspect. Another double house is filled with bender medicinal plants, which are kept in puts in the usual way, and though not extensive, the collection is being daily
augmented. augmented.
We must not omit to mention that alditional modation of the or construction tor the accomestablishment; together with a Cominittee room, destined also to serve as a ronm for-students, where they may study plants in wet weather, and consult diagrams and books in Botany and vegetable Materia Medica; so that it is to he hoped that we shall not hear much longer of pupils mistaking Antirrhinum for Aconite, and not knowing a Popps Capsule when they see it.
We trust that the Society may receive every encouragement, both from within and withuut, in this praiseworthy undertaking, and that means
may be taken to make the existence of the garden, and the facilities it offers, more wid ly known among the pupils. II. T. II.

\section*{We rherve that the Underciaff Horticultural} Society is boldnag ont inducements tor the stndy of Marine Botany, by ineluling in the schedule of its Forbilition, which takes plare on the 2 ath int., prizes for collections of Seaweeds and Zoophytes. The prizes British Herbarium, but also for a special Hernarimu and for a device both made up of Isle of Wight species. This brauch of Natural History, hitherto inusih neglected, judging from the attraction it inas affurled at the previous summer show, promises to beeome one
of the mont prpular of scientific recreations. Freshwater botuny is also introduced witio the view of enconraging the cultivation of aquatic plants, as the
best means of more generally introlucing ornamental water, casendes, \&ce, in gardens. Prizes are also offered exterior of their cottages and premises, the ohjpet, buins gardens, and so to keep them awny from the pot.house. We wish the Society every success in its endenvours to elevate the condition of the working classes within the range of its influence.

Some time since we received a sample of an ApHis Wasir prepared at the City Soap Works, with a request that it might be submitted to experimental trial. This having bren done, we are emabled to report favourably of the results. Among other things it was apphed ti) various Canmas, Marantas, and Caladiums infested by red spider, and a single application proved effectual for tireir destruction. It was applied, according to the directions given, namely one part of the wash to eight parts of water, in various ways-by the syringe, by the sponge, and by dipping the plants; but is all cases was equally effectual provided the lenves were hour or so were syringed with clean water It claims to be invariably successful in "removing and destroying by one application, all the aphis, red Hops, Roses, fruit trees, Quickset hedges, by which frequently and fatally injured;" and is said to have bern also "fonud perfectly efficacinus in removing mildew from Vines." It leaves no deposit on the small experiment goes, we are inclined to think well of it

We have also made some experimental trials of one or two kinds of Artificial Maveres, namely,
Goutding's and Standens, two plants of Colelis Goulding's and STANDEN's, two plants of Coleus each of these manures, two with guano, while two of the same batch were grown heside them in the same the plants, which were all alike at the commencement, presentell a decider difference of aspect. The greatest Gourement was visiblo in those treater with Gouldres's manure. Those treat:d with Sranden's manure and guano were nearly alike, the former laviug
maintained during seven weeks, after which the trial was discontinued.

De A French newspaper gives the following mode of Destroping Ants in gardens, " without having of the villago." It consists in turning down empty fli)wer pots, one or more, as may be necessmy, in the places frequented by the ants; these being attracted by the shelter, make their hills beneath the pots, and one has but to remove each pot and pour boiling water on the mass to destroy them. The pot or pots may be shifted from place to place as long as the presence of the little intruders is manifest, and the process of destruction repeated.
- A magnificent flower of a Moystar Gladioldes, raised by Mr. Standisi (the Earl of Shaftesbury), has just been sent to us from Deal by Mr. Dowbrain, which is worthy of a few lines. It was forwarded as a double
flower, but it is not strictly so, but an abiormal develuphent caused? by the coufluence of three different blooma, or perhaps of four, for there are ten distinct plicentre in the conpressed bisulcate capsule, and four styles, two of which have four stigmax, and two a pair
only. The stamens are nine in number, but one is confluent through its whole length with its neighbour, the anther being converted into a petaloid expansion. There are fourteen potals, in two whorls, seven in each and alternate with each other, six apparently on the lower sile of the flower being smailer, deeper-coloured, and more elliptic tham the remaining cight, which are breadly ovate or obovate, and of a lovely salmon red The flower is altogather one of the most bantiful we
have seen; but we fear that as it arises merely from contluence, the plant next year may proluce only norinal blooms. It is to he observed, however, that all the flowers of the spike partook more or liss of the same character, those on the upper portion of it more 8.) than those of the lower. The bloms moreover are
more pers:stent, though the pollen s ems to be quite perfect. M. J. B.
- We glean a few scraps relating to French Horticoluture and French markets, from the foreign
correspondence of the Times. Eight thousand baskets of Mushrooms, \(s\) ates our contemporary, were offered tor sale at the last market at P'ériguenx. Calculating each basket at only 5 d. the bisket, these whon brought thein to market riceived alove 160 l . 'There were ne, ghbourhood, and the Manhonoms were all sold be'one three in the afternoon. From the Memorial
de laucluse it appears that de l'aucluse it appears that there were 65,000 duzen of Melous offered for sale at the last market of Cavillon. They were all sold at an average of
\(15 d\). the dozen. The vineyard Petaches in the neirhbourhood of Lyons liave arrived at in the neigh the fruit is dear at the Lyons market. It may be purchased, however, on reasouable terms from the growers at Vaugneray, Arbresle, and Linnonest, where which the produca is inore than wisually abundaut this year, and where choice Peaches may be had at from 1 s. to \(1 s\). \(6 d\). the lundred. The price of Chasselas firapes in these markets is set down at from \(1 d\). to \(1 \frac{1}{2}(l\). the pound weight, and IBlack Grapes are cheaper. Very Almonds, \(2 \frac{1}{2} d\). to \(3 d\). the liundred; and Plums from Paris markets. Paris zwarkets.

\section*{(Continued from p. 723. .}

Second Fear. - In March or April begin by suptiong selecting vigorous plants a year old, and setting ins selecting vigorous plants a year old, and setting ion
in the same manner as recommended for the firit Props are to be placed at the foot of each plant, 2 .tes at an angle of \(45^{\circ}\)
In the begimning of April a first diressing is to bo e ou the sheiving beds and on the gronuds; \(u x\) x ou well to perform this operation the day atees prinkling or rain, in order the more easily to bime during the whole season, so as to free the anparae plantatiou frorn all weeds, and keep it in a perfe:tcs of cleanliness. It is unnecessary to repent ure ' Asparagus with the spade, or to secure the dosinet of insects.
As soon as the Asparagus stems becone :.. fasten them to the props, in order to protec: :against the wind, which wight break them.

In the month of October the dry stalks are to te off at 8 inches above the ground ; the shelviag belion to he turned un, always lightly hollowing ons: trenches. The minure prepared is to bospread 09? shelving beds, which are then to bodug up. Tue prot having become use!ess, are to be taken away. Lwo. he laying bare of the plents is to be done by tav: away the earth, as already directed, up to the sumisi of the manure. 'The earth must be mellowed mith hands, and covered at once over the planta, wot mall hillock.
Third Year.-In the middile of the month of Yare. during fino weather, suall knolls, fr tu 6 to 8 incies nat base to be made over each plant, taking uevertherem. a basis the comparative strength of the cromns, more less large, or of a more or less determined deven: served the preceding year to supply the bad ona those which had failed, are to be covered onf liillock of only 4 inches high, and should then belerir themselves.
From the other plants, three, or at most in Asparagus heads may be gathered; but they are nas the fingers However, there is a particular knife, equare shaped at the end, and liarion on one side, fortuing a saw, ake away the eartl about the stalk, and whll mill elsy for the fingers to reach the subte
Which care must fo take cut off when it is aboni inch and a half above the surface of the ground, when it is red, rosy, or violet.

With regard to the gathering, one finger mustices behiod the Asparagus stem at its base, and injury to its neighbours, which may an Asparagus knife, will be avoided ; and th be left any wounded onds, from which flow and sprond around, occasioning rap the gathering of the Asparagus, an once to be formed anew.
In the month of April, the props are to be wi. placed, and the stems fastened to them in due tima. dressings must be as frequent this yea preceding year. After having, in to October, stalks is neceseary, in the mout ground, and the dead rubbish thrown Asparagus plantation. The shelving plentiful dung ti manner. a depth of 4 inches, the earth is to and thrown upou the shelviug beds; layer is tuted by a a thickuers and a half, if night-soil is made use 2 incles if it is ouly common manure. stal
raken awar, preserving that nearest to the crown, so wicicte the exact site of the plants for the fourth The ohject of this operation is to clean the sub. rear. Tha stocks; it will also give space to the stems terranean stocks: it firth in the following spring, aud Ti. fachita'e their growth
A.i.f hoilhaving epread the manure, the shelving beds Auat be iug up, and the manure envered with an inch so tro of earth; above the very bulhs a small hillock if tro of mate, over 3 inches thick, reckoning from the a to be mane, stock. The feeble plants are to be subrentont with a emall stick, in order to know them magin in the spring.
Fourth Year.-About the middle of Mareh, in dry weather, or the day after a sprinkling of rain, knolls of the height of from 10 to 12 inches must be formed orer each plant with good mellow earth. The feeble mhots maiked with a small stick at the preceding laring bare, are to le covered over with hillocks of a lintriess of from 4 to 6 inches only.
While earthing up the Asparagus the ends of the dry ealks are to be taken away. The gathering is to take hece from the largest ones during oue month at the tuost. Then they aro to be left to run into seed. The whest feeble ones are to the spared in order to atrengthen them. At the meond dressing in tho month of May, earth taken from the shelvbeds, in order to corer over, to an excorer over, to an extent of a few centimetres, the whole surface of the grounds, so as to shelter the Asparequs plantation from the dryness of the leing bigger, aro to be leing bigger, are to be
5 feet high. The dres.
Whgo are always to be frequent, and to be dose luring fine weather.
In the month of October the stalks of the Aeparngus are to be cut off at 14 methes above the ground, and the plantation is She clearel of the rubhish; manure is to bespreal on the shelving bids, which are the male up from the kuolls in the trenches: and are then to be dug up to a enth of 16 inclers.
Notwithstanding the manure laid upon the shelviug bets, the stalks of the Aspa ragus are to be laid bare in the manuer already described. Upon the crowns are to he prut a feww handfuls of good manure, whiels is to be envered over with two inches of good mellow earth ; the knolls, Which are to be formed over the centre of the plants, are to be over three inches in height. The meaus alrealy indicated for tanarking the feeble Fauta, to designato them for the next year, are to be followed

COLT
No. YIII.
No. 3, to which allusion hies already been male, and of which sketches are appended, in such a house as is in general request for Indian plants the East especially Viants, more and such like ; al Aërides, Dendrobiums, Angræerums, CTpripediums although for Phalæuopsis, Saccolubiume, region, and and all the dwarfer fraternity of that N. 1 will be found far more suitable. Such a style as ue than either of thents is, however, in more general imported plan of the two former. Mr. Low grows his and I don't kno, albeit, in such low houses as No. 1, sate than know where to find small plants in a better Dew hown those under Mr. Bullen's care. Mr. Veitch's :on of bis are something like No. 3, with the excepand are narrool houses, which are under a north aspect, double glase, and Mr. Dominy, whose intelligence and
prectice I bea of opinion the to speak of with all respect, seems to be Worthy of athe double-glazing principle is good and Warner, and adoption. Mr. Day, Mr. Rucker, Mr. Sime caat, but othera have houses something after the What I , but not quite so ornamental in uppearance. rated equally wo convey is that Orchids can be culti Wiah it, decoration than this ; so that gentlemen who masthetic arasocinte houses of this kind with the fineat hand, they can bectural grandeur, while, on the other rete to cume within the province of the lees uent, or those who care little for of the less
exubstantiality they get a plain design accompanied with calledtiality. No. 3 is a house of what might be called good proportions, being \(60 \times 22\) feet, having a centre table and two side tables, with a path surround ing the centre of 3 feet width. The gruund plau is a section on a level with the tables, whic, is turn are on the same level as the walls, and are expected to be polished ashlar for appearauce' sake. Neat cast iron supports are represented to carty either stone or alate tables of uniform size. The end section : drawn to a little largir seale than either the ground plan or the side elevation with a view of culancing the effect upon paper. The house heing of considerable span, unlike the other two described, wheh are intended to be simply framed of astragals-say about \(2 \frac{1}{2} \times 1 \frac{1}{2}\) inches, will require rafters at intervals as indicated in plan, and to these mfters are attached two cross-tie rods to strengthen the building. Between these again come astragals, which can be iutroduced, leaving spaces for glass to suit the taste of those interented -a very good division, however, being 13) inches. I would never think of putting 18 oz ghass into such a houso, noither will it he neecessary to
put heavier material than 21 oz ., which for general
quite at home, simply hecause ther are dexignel to sield an atundanee of light: iweem-e the priminle of the plants proxmity to the gla-s coutributhe: to liwalth and influencing free bloommg proprentie: in tee ghised nnd because a thormugh system of hantme and rent.la. tion is indicated and enjome!-ail in lippensable requiremente in the routine of sucecorfui plant cultivation. Jumes Anderson, Meadine Rank.

\section*{THE COTHON FIELIS UN EOYPT.}

I abmiven in Alexandria the firnt week in Feliruary, and after risiting the Citton marhet and packing places there, I went to Cairi, and commenceit a tour through the best Cotton districts, inelu ing the towns of Bentra, Zigazig, Tanta, Man-morah, S1..1h in 1, \&.C. where there are many giming factomes. I commenced my tour hy visiting the well manazel Cottom firme of H. H. Halim 'rakha, nucle to the preatat Viceror. Ho has above fin stenm-enginee, portutle or fixelt, ongnged in pumping water, working centrifugal pumpe and steam ploughes: and has ma lega than 222 etean ploughs at work on his fnrms. As tho fistrm of
Cotton culcivation followed on his farm at Shochra is
 said to bo thie heest, I will hriefly reate what it is. Kirat, 1 munt ohserve that tho. whele of thie enltivation on the Deltan is entirely depiendent on artificinal irrigntion; I ment: lhat the irrigntion in made available by kkilful art carrying out what ne. ture has provided.
It \(\%_{1}\) I believe, e very general opinion that the whole smbaien a

 is ealied the Delta. it is çuate true thas
 borlering on the denert outside the can. bankmen's of the Delta, the amount of culdivation is entirely dependent on the quantity of land cavered by the annual
 finodings have raised the sent, of convered the sauds with a rufficient depth of alluvinl deposit, embankments arc (onstructed Which serve for camala, into which the waters of the Nile are admitterl, and which ombaukmente cyually protect the land from boing flooded at high Nile. All the various branches of the Nilo, from Cairo down wards, are most carefuliy emsbanked; indeed, wherever there is a douht about the atability of the banking, a loop embankuient is made at the hack of the weak place, an us (t) prevent place, miths ti) prevent country, snould the country, sinnuld the weak hank give way.

\section*{No. 3.-Ground PLan.}

The Nile begins to rise about the hoginmug of Jnly, and reaches its highest point about the inth of Aluluat, but these periods vary a few wenks in d.ffirent parts of the country. The whole of the Dolaiking the b,tiks \(\pi=\) water is let into the canals bo not exist. When the required, where flood gates do not exist. When the Nile is suffeciently high, the natives most skilfullv take advantage of the orpor:unity to admit snffeient water to nourish the growing crops, and to fill tharr cinale, out of which. at all other periods of the sear. they have to raise the water for irrigating yurpose. They do so by various means. The most primitive metho is the following, viz.:-two men stand on the buak of the water, and with a flat mat, swung by ropee, between chem, lade the water upwards. Next, the long swing pole, balanced with a coninter weight. Third, by cattle gear, which works an endless rope, having jars catcle kear, it mioh apmears the mimple anc attached to \(i t\), wheb appean a men whel, which effective for various deptho, Next eomes a wheel, which only serves for certain depths. The centrifugal pump is holding space in its riv. The centrifugal pump is next, and of these there is an immense numbier now at work in the country. They, however, require steam ongines, but on some large estates there are stemm pump of 50 horse-power, which aro capable of supplying water to canals 15 miles di-tant. Thene letats

Will enable you more clearly to understand the farm. farm with Halim Pasha's chief engineer, and in farm with Halim Pasha's chief engineer, and in
the first field which we visited (of about 40 acres) we found four portable steam-eugines at work two working one steam-plough, and the other two a cultivator, one turning five furrows, the other
seven. I preferred the cultivator, from the perfect manner in which it grubbed up the old roots of the Cotton plants. The ground was most perfectly broken up to a depth of 12 to 15 inches, and I am
told that it is not beneficial to go to a greater depth. told that it is not beneficial to go to a greater depth. ploughs were entirely worked by Arabs. There was not an European in the field, but there were European engineers at the farm engine establishment, to make repairs if required. The chief engineer told me that he finds the Arab to be an apt learner and intelligent. We then went to a field in which they were sowing
Cotton. The seeds are soaked in water previous to being put into the ground. The ground having been ploughed and harrowed, is thrown into lands with seeds are sown on the sides of the furrows, about 4 inches down, on that they may not be covered with water when the irrigation is commenced. The sowing is done in this fashion:-Five men, walking 4 feet
apart, make holes in the furrows 4 feet apart; five apart, make holes in the furrows 4 feet apart; five
children with the moistened seeds in small vessels, follow close to the men, drop about 12 seeds in, and then drag a little soil over the seeds. The lands are made so that the holes are 4 feet apart each way. When the plants are about 8 inches high, they are thinned see only one plant, but in many cases I saw four. The seeds being put on the sides of the trenches prevents the young plants being damaged by the water when irrigated. The water is turned into the trenches every three or four weeks, until the flowers begin to set into bolls, and after each gathering more water is given. Picking is commenced and continued at
intervals of about three weeks, when it can be done; but the want ot labourers will not now allow this to be done so properly, and the crop is gathered at three or four pickings as a rule throughout the country soon as the picking is over the plants are broken u and the grouad cropped with Wheat, Beans, \&cc. On this estate experiments on a large scale have been made to test the effect of various quantities of irrigation, and the yield of clean cotion per fedan, or acre, was as follows:-from irrigated land, 250 lbs ; from land
irrigated two or three times, 400 lbe ; from land irrigated six times, 600 lbe ; from land irrigated and manured with guano, 900 lbs.
Such is the best system of cultivation, but the general Fystem amongst the peasantry is not so perfect; the seeds are sown much nearer, say in rows 3 foet apart,
and the plants not more than 6 inches or 8 inches apart The result is that whilst Halim Pasha's plants are feet to 10 feet high, the villagers' plants are only
feet to 5 feet, and where greed has prompted them feet to 5 feet, and where greed has prompted them to
plant still more closely, the produce has been even
less, and the yield proportionately worse. The village system of picking is the same, but carceness of labour be done. They usually turn a lot of children into the fields and gather the crops at three times, About
January they irrigate the surface of the cotton fields, January they irrigate the surface of the cotton fields,
and sow Beans or Clover, or Barley amongst the Cotton and sow Beans or Clover, or Barley amongst the Cotton
plants, and when those crops are ripe they are gathered, and the Cutton plants broken up. Sometimes they
leave the Cotton plants standing for a leave the Cotton plants standing for a second year's productive a system as re-sowing, and the Cotton is inferior. I am sorry to say that the result of my personal observation this season, during my two trips
ap-country, has sonvinced me that a very large pro-ap-country, has convinced me that a very large pro-
portion of last year's Cotton plantations are left standing to produce a second crop this year. In many places I saw the people cleaning carefully the Bean crops from amongst the growing Cotton, and in other places I saw farms where the plants of last year have beeu cut down and have made a considerable growth this year for the sufficient labourers to cultivate the plant properly, for the peasantry are most intelligent cultivators, and invariably pursue the most productive systems. They have nothing to learn in that way; indeed, our the careful cultivation of every available yard of land, and the cleanness of the growing crops, not a weed being to be seen, while the manner in which they protect some
of their crops, hy putting upright reeds aloug each row of seeds, to protect the young plants from the winds, is worthy of notice. I have been in fields of 30 or 40 acres, in which more care was taken to protect the Before I conclude I must mention a botanica peculiarity of the Cotton plant growth in Egypt.
My attention was called to the fact that the wood My attension was called to the fact that the wood
of the planty, when 10 or 12 months old, has the appearance of two-year-old timber; indeed, so strongly is the second growth indicated in the bark ringe, that some Araerican friends, who are Cotton cultivators, growth, and only after a very careful investigation olimatic cause, whigh I believe can bo accoupted for,

Mr. Chapman, the intelligent English gardener of when the Nile is at its highest, and the heat the greatest, there appears to be a pause or rest in the growth of all kinds of trees for about, a month or six weeks, and that when the hot weather is over, in Angust or September, everything appears to make a
fresh start, snd trees make shoots afresh as they do in the spring. I think that this will account for older appearances; the plants make their first growth before the hot season, mature their wood during the six
weeks' rest, then make the fresh growth and mature it before the winter rest, thus actually making two years' growth in one year. I am not aware that this peculiarity has ever before been noticed, and it may to the plants. W. Wanklyn, in Cotton Supply Reporter.

\section*{IN-DOOR CLIMBERS.}

Pergularia odoratissima.-This was first introduced to this country in 1784, but it is so seldom met with that I hope the following account of its merits position than it now occupies. Many beautiful old fashioned stove climbers have doubtless been thrown ont of cultivation from the change that has latterly taken place in the heating of garden structures. A few years ago tan was the material in general use for sup-
plring bottom-heat to Pine-apples, and large pots plunged in the corners of Pineries fur the most part contained such plants as that under notice. In such a position the roots had the chance of passing through the bottom of the pot and running amongst the tan, while the pot still furnished sufficient check to induce the plant to produce a greater profusion of bloom than it otherwise might have done. I do not know that we have gained much by our change in heating such places, except perbaps a little saving of labour, and increased neatness.

In most Pine stoves now-a-days there is hardiy plunging material sufficient to cover the pots, and the dry heat underneath prevents the roots from spreading in that direction. It, however, may be said that such places are as well without such plants, which only encourage insects. Nevertheless, there are few houses, even at the present day, without some of these pests, those that are the best managed having, of course, the least ; and I maintain that creepers add great interest to such places, particularly as many of them will not grow in cooler places, which is the case with the one under notice. I have tried it in an intermediate house, and conxed it on in all manner of ways, but, when the cold months come, the shoots commence to damp off, and, by the return of spring, few are left. It is an evergreen twiner, which grows freely when in good health, but like some others it requires time to make a good stem before it commences to bloom well
As regards special treatment, when once the plant has covered the space intended for it, all the shoots ahould be cut close in, similar to the short-pruning of
Vines. The flower trusses issue from the axils of the Vines. The flower trusses issue from the axils of the vigour of the plant, from three to six trusses, and each truss is composed of from 30 to 40 blooms of a light green colour with a yellow throat. None of the plante of this genus can lay claim to much beauty, but this particular species is perhaps the sweetest climbing plant in cultivation, one truss being sufficient to fill a whole house with its pleasant perfume. Generally it commences to bloom about the end of May, and it c 3ntinues less or more in beauty during the summer montur. It is casily propagated, and even small plants of it will grow well in peat and loam. J. \(F\).

\section*{Home Correspondence.}

Chamapeuce diacantha and Casabonce.-Fine and distinct as is the habit of Sulvia argentea, the first of these plants will be found to surpass even that in like qualities. It is a Composite plant, quite distinct in aspect from anything else that we cultivate in the order,
and which has struck some of our best bedders as being a grand subject for innovation in a bedding arrange-ooent-in the centre of an ordinary bed, and for bold margin in such noble compositions as those made by Mr. Gibson at Battersea. But that it cannot be had in sufficient numbers, we probably should have this already well exemplified by some of our leading decor ative gardeners. There is litcle reason, however, why
it should be so scarce, as some of the continental nurserymen catalogne seed of it-the only ready way in which it can be obtained. Plants 12 months from seed, planted out in rich soil with the bodding plante, soon make symmetrical specimens, from 18 inches to 2 feet in diameter, with leaves shooting straight out, These thickly with fierce white spines along the margin. These give the plant its peculiar character. Its near
relative, C. Casabonge, is less striking from being more relative, C. Casabonse, is less striking from being more suhject very distinct in aspect, and thongh not so liable to be coveted by the bedder as diacantha is at first sight, yet might be usefully employed where variety is sought. It, like the first mentioned, sbould be planted out when a year old, ind will then make handeome William Robinson. Gram Robinson.
Grape Judging. - At a large town abjut one hundred
and first, second, third, and fourth prize anamily \(h\) for the three best bunches of black Grapes. Atamed show many exhibitors staged fine examples of bl Grapes, and among them were two well-known I
exhibitors, one of whom showed three binche exbibitors, one of whom showed three bunches of
Hamburgh, very large, well grown, sloes; the other showed three bunches of Blathat rossa, very large, well grown, and with a bear colour. It was the opinion of many who sam them judges had made their awards, it was found Black Barbarossa had been placed first. To the b the exhibitors, let it be added, no rault but I have all along felt a
favour of the Black Hamburghs, and I shonld like to have the opimion of my brother garden question whether Barbarossas should thus take pas dence of Hamburghs. It is not an unimportant queat 1 may add the first order, and that \(I\) have no personal part io
matter. J. \(M\). \(L\).
Heated Soil.-I have just had a large stack of to loam drawn home and put together very closels, I find it is so hot to-day that I can hardly bear hand on a stick which I had rammed in as possible. When it came out it was fearfully hot nam was taken from a very old pasture.

Poas.-Messrs. Henderson state that Dillistone's Early, Car
Sutton's Ringleader are identical i
that Dickson's First and Best and Sangster's likewise identical, coming into bear 10 days after the foregoing, and
produce a much better crop tban th produce a much better crop toan thacterised as statement to say statement the second, in the for trial of early Peas at Chiswick
Dickson's First and Best to Dillistone's Ringleader, and thus

\section*{Measre. A. Henderson \&}

The one day it is designated a firs said to be a second early; at one piace it be a very prolifo cropper,
indifferent character in this respect
ocalities of the country will therefore have to decide he question of superiority for themselves. Throughout the land each Pea will have its warm adherenle, and the their sale. Ringleader and First Crop (which shoul be re-named, Mesars. Sutton \& Sons having admitted be ceir identity), Dillistone's Early, and Dickson's First o.l Best, are the candidates that appeal for public anpport. I predict that the two first will soon become thorbod the one into the other. I do think tha Dickon's hat two, but uoless it is very carefully cocted at short intervals, it will no doubt also retro grade into an ancely be expected that all should agree as to the merits of the Peas sent out last spring, but I mm somewhat surprised to find it stated in one report that Dickson's First and Best is identical with Dillistone's farly, and in another, that it is similar to Stngster's io. 1. I had many opportunities of comparing thes three varieties for several seasens previous to the first uamed being sent out by Messrs. Dickson, and it is unto either of the other two kinds. I have no hesitation a endorsing Mr. Veitch's opinion, that it is -" the bes ow early Pea sent out this season. There is no doubt that Carter's First Crop and Sutton's Ringleader are the same, and that they require selection, there being manyt.
Coning of Thyjopsis borealis.-I have a very fine plant of this, with a quantity of frait on it. It i perfect pyramid from the ground to the very top.
have also a plant of Wellingtonia, measuring 18 feet in height, 36 feet in circumference, and 3 feet inclies round the trunk at a foot from the ground, on which there are several cones. Whether or not the ruit of either plant, however, will come to maturity in Drinertono Park, Bury St. Edmunds, Suffolk.——I ave a plant of Tuujopsis borealis, 6 feet Ligh, bearing nuwards of 50 perfect cones, but on not a eingle other
plant can one be detected. W. Hopwood, Jersey Gardens, Cheltenham.
Lilium amratum. - With me one bulb of this Lily has thin year produced two stems, each measuring 21 inches dircumference at six inches fro 8 the aoil, the highest atem measuring 8 feet in length, the
other 7 feet 9 inches. The number of leaves is 185 , and 20 flowers, on an average 10 and 12 inches in diameter. The variety is one of the finest I have seen, thin jear produced three flowers, each measuring inches in diameter. Robert Bullen, Gardener, Bon Bridge, Leicester.-At p. 722 reference is made to ower of this lily in which there were three inne petals, showing a disposition to come double. Last sommer I had a plant with a perfectly double iower on it, or rather what some would call hosefolly ornamented with golden bands, and s, beautiamine of it was another bloom, as large and perfect as the other. There was about halfan any between the two, the inner bloom having a but it is not yet in blossom. I have the plant still, scertain whethet or not the double form is constant. Thos. Jones, Gardener, Rusholme, Manchester
favourite is, Dwarf White Rocket (see p. 676).-This old "J. F.," not lost. bappy to inform your corresponden arge numbers, but it suddenly disappeared all here in could nourhond, and after diligent search and inquiry ond not find a single plant. Through the medium from kind friends in Scotland and the West of place informed who sent me plants from the latter place informed me that it grew in quantity in he with his address, I shall be hat "J. F." will favour me tha of the true kind. I received from pariou quarters plants of a French white variety as the trus and but it grows taller, the bloom is more straggling Wood, Rochford, Eeseatiful as the oll variety. inquiry were set on foot, many of our missing plante they deserve. George Wood, Rochford, Feses the notice they deserve. George Wood, Rochford, Fesex.
Large Vine Leaves. -I have sent,
thiuking that its dimensions mi sent you a Vine leaf, It is however not our largest bht be wortin recording. several leaves exceeded anything 2 inchea. Last year we have unfortanately lost thair actual sire wob spur carries a large leaf, besides numerous others. The Vines are hard worked and loaded with fruit. Wm. Greenshields, Culzean Castle, Ayrshire. [Your leaf, even after co loug a journey, measared 17 inches in
diameter one way and 16 inches the other worthy of association with those recorded at p. 676.]
Willesden Horticultural Sociely. -1 beg to thank you for the kind notice you have given of the late seat willesden on the 27 th ult. ; but I hope I may be allowed to add the name of Mr. W. J. Lucking whose assistance has been most valuable in promoting the interests of the Society, and the success of this, its first meeting. Mr. Lucking was one of the committee, and from the rery first took a very lively interest in the welfare of the Society. \(\boldsymbol{H}\). Finch.
Grafting Rhododemdrons.-In the early part of July, 1864, I saw some remarks in your columns upon "grafting Rhododendrons." This summer I have been trying my hand upon some, but I fear I have failed I took the plants out of the ground and potted them the second week in July, grafting then at once, and plunging then in moist bottom-heat. They appeared to be going on all right, and had callused along a
portion of the junction, but now they appear to be going brown, and some of the stocks are dead. My bottom-heat has declined, in fact is almost gone, the pit being shallow. I plunged then above where the unction was made; bave I plunged them too deep, and so caused them to rot \(P\) or what is the cause of my
failure? Ingrafting I mere! cuta alice from the scionanil failure? In graftingI merely cut a slice from the scion ani The causes of the failure of the Rhododendrone were grafting out of season, aud pluaging in bottonoheat Roil soil, and potted and grafted any time from November or bottnm-heat is death to any of the Ericaceas. Very little bottom-heat, if any, is required; the plants should stand on a level surface. If in the winter months a close frame was placed in a house where the temperature ranges from \(60^{\circ}\) or \(70^{\circ}\), they would do well. The side or wedge graft is simple and the best.]

\section*{Foreign Correspondence.}

Cinohons Coltivation at Mabjerling.-In hi
eport for the month of March, 1865, Dr. Anderson gives a favourable account of the pragress of the plantaions. Now that the plants are nearly all in the open air their progress is more dependent on the nature of the weather than when they were growing in conser vatoriee, where the external cold could be counteracter by heated flues, and where the moisture in the atmo sphere could be increased or diminished according to their requirements. In the open air the plants are in a much more natural condition, but the change render it necessary to record the meteorological conditions of the month, in order to show how the growth made, the operations of making cuttings, planting out, \&cc, and weather. The drawing up of rules for the guidance of
wher those growing Cinchona and the deciding of the very mportiant questions of which is the best season for bart, and above all the time when bark can be most aasily removed from the trees and dried, will be influenced by the results of carefully made meteorologica observations. The time selected for the latter operation must be that of least growth, and this period will be most favourable should it coincide with the driest and sunniest season of the year. During March the weather has been extremely dry, the sky has been clenr and cloudless, and though the sun has been very powerful, \(80^{\circ}\) at the lowest plantation, yet from the great radiation occurring during the still cloudless nights, the mean minimim temperature has been very low. The natural dryness has also been much increased by thes have been caused by villagers burning the jungle for cultivation during the approaching rainy season. At the fourth plantation the mean maximum during the month was \(74^{\circ} .68\). The mean minimum \(53^{\circ} .55\)-mean temperature \(64^{\circ} .11\). At the fifth and lowest plantation the mean maximum temperature has been \(78^{\circ} .89\), the mean minimum \(\left\{53^{\circ} .8\right.\), and the monthly mean tempe rature \(66^{\circ} .34\). These are not conditions favouring the growth of any plants and certainly not of Cinchonas, equable temperature. Though the growth has been mall, still there is a marked increase on that of February, and the plants are in perfect health and have not suffered in the least degree from the dryness of the air. Fone handred and twenty plants of Cinchons officinalis have been planted out in the bark-yielding plautation, No. 3- 3715 feet above the sea. Only 721 cuttings lave been made during the month. The menced during the month; and it was expectel that
at least 1000 piante would be rendy for distribetion on the lat July. The condition of the stock plants of C. officinalis in the open air has changed but little, as the atinusphere is extremely dry in consequence of the rapid incrense of temperature, and the reckless deatructiou of all the vegetation around us by the natives who are clearing the land at preesnt for their crops. For the last fortnight all the slopes have been in a continued blaze all around the apar on which the Cinchona cultivation is carried on jeet now. Dering usually small number of these are C. officuulis, Au unplants were partially checked by their removal from the frames into the open air, and bocause it -us considered necesary that these stock plants should be allowed to make young and strong wood again before cuttiag them down for propagation. The permanemt planting out of the C. Paludiana has beell delierred o coount of the parching dry weather we have had until now. The condition of the plants must be considered improved in although growth hai been show they hare distributed in the ground, so that a luxariant will no doubt commence as soon as the utmosplier becomes muister than it is at present. The totul number of plants, cattinge dec on the lot April, 1865, is thue stated:-C. succirubra, 37 ; © micrantha, 129t; C. officiualis, including varieties, 23,929; C. Puhudiana, 5092: total, 37,382. The greatest amount of growtlo during the montl was \({ }^{3} \frac{3}{4}\) inches. This occurred in C. succirrubra and C officinalis, at the two lower plantations, 2500 feet and 1825 feet above the sea reapectively.

Hardy Ferns: how I Collected and. Cultivatod thom. By Nona Bellairs; with Frontispiece. London Smith, Elder, \& Co. 12 wo., pp. 128.

\section*{This little book records the experiences of an enthn-} siastic Fern hunter, and points out in a very attactive and winning way how much plensure is to be derived both from gathering and cultivating our wild Fornsshould begin our collection," observen the auth.ress at should begin our collection, "beorven the auchioress at near our own homes, bringing first one root, then another, finding out to what fumily they belong, wha soil suits them, and their distinctive characters and habits. The cottage garden may always have room for ite Fernery; a fow plants by the old well, by the wicket gate, will supply subjects for thought and study helping to turn the child's heart to the luve of the pure and beautiful instead of the vile and debasing. We may all help each other in studies of this kiud; giving or lending books, dividıng a fortunate discovery with lesssuccessful Fern-huntert; in a hundred ways we
may one and all help in diffusing the pure and happy thoughts which the study and knowledge of natura objects give.
And then "the reader is conducted through various Ferny scenes, and is permitted a glimpee at the old Fern book of early-collecting days, in which the pecimens stand labelled with the fond numee of a wild imagination - Lastrea dilatata appearing as Dryopteris, unmitigated Filix-mas doing duty as
Lastrea cristata, and Oreopteris alone correct. By the Lastrea cristata, and Oreopteris alone correct. By the named, hunting became more ensy. Furnished with such a hem floolite eourlack to pick Ferns ont of rock or wall) the writer starts on a Scotch tour ; and, puzzled at first how to carry her Feras about for two or three months in any quantities, she at lart hit upon the following plan, which answered completely:She provided hereelf with a large tin box with pad-
lock and key, and three or four yards of common brown calico. As the Ferns were found they were wrapped up in bits of calico, with a little earth and drainage at the bottom, sewing them tight hike mummies, leaving only the fronds and stalks uncovered. In this way the tin boz held large quantities. At the ins the box was merely unlocked, and once in every ew days the Ferns sprinkled with water. They were carried in this way for two or three months,
One stage of the Scottish tour, through the classic ground of the Trosachs and Loch Katrine, is mo romantic that we cannot resist the temptation to quote a portion of the description:-

Through the Trosachs-not walking or driving eisurely, stopping here and there to admire nuw dragging this wheel, now getting down tor a lounge up the outside of a rickety old coach, driven unicorn fashion with a wild-looking 'leader,' having a mad gleam in her eye, called 'Black Bess' by the coachman, who instead of minding his horses, kept quoting Sir Walter Scott, to the intense horror of one of our party, a superb four-in-hand 'whip.

Oh! the perils of that drive-the ludicrous misture of the sublime and ridieulous. Black Bess scorned a whip, and the coachman employed his to illustrate his quotations. 'There, madan, is the rock where
Fite James withstood Roderick Dha. Fitz James withstood Roderick Dhu.

Hie back agninst a rock he bore,
And tirmly placed his foot befure.
Hold in, Beas, will you; what's up now
friend,' broke in the whip, 'do let me have the reins. piopray bectis as sentle as a lamb when you let her have her own way. Hold hard, old girl. Now for it!' and like \& mad thing, Bess was tearing down few more alarming quotations, and we came to Loch Katrine, 1 ying graceful and beaming, with its little sunny isles beneath the shadow of its mountains and its trees.
"A small steamer plies up and down this lovely lake, and you find yourself looking out for landmarks, given, you by Scott. The "beach of pebble bright as snow, the 'gilver strand' are there, it only neede 'fair
Ellen's' voice to take the place of the rough music of the paddles.
"Loch Katrine is a graceful preparation for the grander beanty of Loch Lomond. I can hardly fancy a lovelier picture than that which bursts upon you as you near the inn of Inverenaid, Ben after Ben rising in bright patches of green here and there.

II did vot forget the Ferns ; I spent hours hunting the hill sides at Inversnaid. Oreopteris grew in abundance, with beautiful Filix-feemina and other common Ferns. I had made friends on the lake with a gentleman, armed as I was with trowel and bag. He joined us in the walk.
"c What success? ? I asked, half hoping he had found some rarity, half fearing lest his booty should exceed my own. He shook his head. I opened my store triumophantly. 'Look here,' I said, 'Is not this a wonderful find ?' and I diaplayed a graceful little Fern. 'This is the Woodsia ilvensis!
"I saw a twinkle in the 'Fern man's' eye, but he
told me gravely -my apecimen was only a baby Filizfacmina; and then he added how troublesome baby Ferns always were, and that one could not easily decide on a Fern uniess there was fructification. I might hun for varieties of Filix-mas and foemina, but he thought I should find nothing else. Then he discoursed of
Forns in general, and of Fern hunterv-how he found ladies looking for septentrionale in a wood, for Ceterach in a ditch, and for Asplenium viride on \(\Omega\) wall. 'I do,' said I. 'It is a pity to waste time,' he answered what you are likely to find, and then take anything strange you meet with. And no it came to pase, I only brought away from Inverenaid a few young
plants of Oreopteris aud a Lycopodium or two ; but I plants of Oreopteris aud a Lycopodium or two ; but thore had been a fow simplo directions as to the 'how' of finding Ferns.

In this chatty way Miss Bellairs runs through her experiences of Fern gathering; and we cannot but think that many who will be pereuaded to read of her pleasant wanderings, will be tompted to follow in her
track. They might do worse than set out on a Fern track. They might
exploring pilgrimage。

\section*{Mas, considered Socially and Morally. By George} Longman \& Co
The author, or, as he modeatly styles himself, the com piler, of this little book tells an, that he formed the habit of writing down the most noteworthy opinions Which he heard or read on social and moral suhjects. He evidently has an affection for the writings o quotation from his favourite Cicero, and sometime from Homer, Virgil, and Tacitus. This is no systematic treatise, but a series of thoughts and opinions which rum on from the attributes of God to Pantheism superintending Providence, prayer, instinct and reason immortality, civilisation, reason, and the sources of knowledge, and ends with consolations under affliction, old age, and death. The anthor makes ase occasionally teaching of the Vedas, which in in for instance, the Pantheiem, the ground on which the Rajpoote defend Chinese civilisationticide, with remarks on Indian and Chinese civilisation, \&c. He also refers sometimes to the wiae sayinge of the Indian sace Manr, and would
be very glad it be could be identified with Menes of the Egyptians, and the mythological Minos of the Greeks. He maken a mintake, however, in supposing in the Roman for curtius who plunged into the chasm We quote an incident from Arabian life:-
neighbour's horse. Determined to obtain it, he dis guisen himself as a lame beggar, and waylaid the rider T'ourhed with compussion, the horseman dismounteil and helped the chipf into the saddle. The latter imme diately struck the horse, gallnped on a few paces, and threw off his dizenise. The owner sadid, 'I will give you the horse, on the sole condition of your never diss
closing the aftiri:- 'Why?' asked the chief. 'Because, said the other, 'if the story be noised abroad, no lame or miserable man will ever find a friend in the desert. The chieftain was struck with the reply, and instantly dibmounted. \({ }^{\text {D }}\)
Brande's Dictionary of Science, Literafure, and
Art (Longmans), Art (Lesgmana), the publication of which has
been already amnounced, has reached the Fifth Part.
This new edition of a tandard work is a capital
has been copiouly introdaced wherever wanted, old matter has been carefully revised, and the whole now stands before the public as an example to be followed by the makers of all similar Dictionaries.
We learn from a Circular that a new work called
pinacea: being a Handbook of the lirs and Pines, Pinacea: being a Handbook of the lirs and Pines, The Title, which is a rather lengtiy one, goes on to promise "their distinctive characteristics, and the best modes of growing them; with brief practical notes on their hardiness, and the soils and situations most suitable for them: showing such kinds as are of coonomic value for their timber, and such as are useful for ornamental planting in the climate of Great Britain and Ireland: also, a natural and common-sense classification and nomenclature of them: to which is added an alphabetical list or index of the names of all the gevera, species, quasi-species, varieties and sub-varieties, and all the synonyms or aliases by which they are at present known : comprising all that is desirable or necessary for the British arboricalturist to know concerning the 'Firs and Pines' of the world, to the present date." One of the many arboricultural wants of the present age, it is observed, is a handbook of the Firs and Pines, giving their distinctive characteristice, and the best modes of growing them, practical notes on their hardiness, and on the soils and situations most snitable for them; showing such kindsas are of economic value for their timber, and such as are useful for ornamental planting in the climate of Great Britain and Ireland: all at a reasonable price, and in a portable form. This, it is universally admitted, is a desideratum which has not yet been supplied. Most writers upon the Firs and Pines, says the anthor, have either been learned botanists, literary pedants, theoretical philosophers, professed book makers, or, when of the practical class, personally interested vendors of the so-called Conifers; and the consequence has been that all their laudable attempts to remove obscurity have only added to its shade. The reason this volume is to appear at the bar of public opinion, is thus stated:-The Scottish Arboricultural Society bas for some years past offered a prize for the
best essay upon 'The Introduction and Cultivation of the newer Coniferm, with special reference to the climate of Great Britain and Ireland.' The author had been often requested by his arboricultural friends to enter the lists as a competitor, and was at last induced to do so ; and during the autumn of 1864 sent in the whject matter of his landbook, under the motto, Wave your tops, ye Pines ;' to which the judges on essays awarded the first prize. The essay was, however accompanied by a code of conditions, to which the pubwithdraw them, the consequence was "he won the honour and forfeited the golit."

Catatoates Received. - Osbom \& Sons' Catalogue of Hardy Trees and Shrubs is an extensive and carefnlly prepared list of probably one of the best trade collections of Trees and shrubs in the country. It is quite a model as to orthngraphy.--Lowis Van Houtte's Prix Courant (Ognons a Fleurs) is a very complete list of
Dntch Bulbs supplemented by a variety of other Bulbous Tuberons, and Rhizomatous planto, and a ver extensive series of Amaryllis (Hippeastrum), which we observe M. Van Hnutte has given up naming.-Haage et Schmidf's (Erfurt) Catalogue d'Ognons à Fleurs besides the Dutch Bulbe, contains a very extenslve series of Miscollaneous Bulbs and Taberons rooted plants, and is interspersed ireely

\section*{Che aptaty.}
"I FEEL much obliged for the fall and explicit informa tion given me about the Stewarton hives, which were great puzzle to me.
"In my last communication I gave some information (Cout the times of SWarming in this patt of Wates Carmarthenshire and Pembrokeshire), which I thought might have been useful to other apiarians. Swarms swe with us much later than in England. A swarm hived for me on the 89th of May this year was the second prime swarm that had come off within a circuit of many milcs. It wan only because the weather was
onusually warm for the season that, there was any anasually warm for the season that there was any
warm in May at all. Prime swarms nsually isenu during the firat half of June. The hay and corn harvests are two or three weeks later than in England, so that I presume horey gathering inay continue later alss. The above-named swarm of the 2 ath of May
threw off a swarm on the 4th of Jnly, and a second swarm on the 21 st of the same month. As I shall h able to obtain the been of some condemned stocks,
wonld it he advisable to retain both these swarms, and trengthen them by the addition of some bees? I an rbtain these bees early in this month (August); would it te mafe to mite them now, as Taylor, in his usefu Manual, and you in ore of your communications a fer weeks since, eay that September is the proper time for this operation ?
"I presume that both hives would require feeding, particularly the second swarm; but as I can obtain here, ran from the combs, at from bd. to \(7 d\). per 16 . incline to retain the second swarm if I can unite bees to winter, and trust to feeding to carry it through the

There is an abondance of Heath at the mile and a quarter in aliect the distanceof on wards, nothing but Heath, Heath, fir milen the pose the bees in our neighbourhood take allarta allowed as swams of the current year when taken allowed to remain until the middle of , in Aupust but that old stocks cease gathering Ba n August, .着" For feerling bees, I have fuund that Taylor'B to make a kind of barley-sugar, can
sugar, and boil rather oently till
stick dipped into cold water, solidifies.
does so it must he talen of is The moment minutes longer than is requisite, it begins to gran again. A quarter of an hour is usually sofflie bees eat it greedily, however hard it may bo; bofi should be managed
Boyle, Narberth."

There are many parts of England in which the period for the issue of prime or first swarms, is as 1 or later than in your district. Where Heathe abounds, swarms are generally later than in the mon cultivated parts. We should not have been incline retain the second swarm which arrived so 10 but should have returned
swarm of this same soason that it issued from it, and still wis

Misssrs. Calter's Seed Grounds, Dediam and Sr. Ositit, Essex.-Savages of Swan River ! Mo hasks of the hunting o'er the Collinsia and Rhodanthetappled prairies, but "never more!" For, how-
arer delightful it would be to pick up the beautiful Erer'astings in that strange southern land, there would also be the possibility of cncountering one of those
atoriginal beauties, of which Professor Huxley has told atoriginal beauties, of which Professor Huxley has told
os in his lectures, carrying on a string the skulls, half wor away, of her male relatives-much more unpleasant company even than tomahawks or rattlesnakes in the far Test, where grow those brilliant annuals, of which Douglas sent us home such heautiful samples. But
lere I am in East Anglia, in the midst of fields of the bere I am in East Anglia, in the midst of hatherings from the banks of Marray to the sloper of the Alleghanies, and with no mnre
fercious quadruped at hand than an eastern-counties ferecious quadruped at hand than an eastern-comties
robtit-nothing more alarming in the way of biped than the manager of Messrs. Carter's Syllenham Nursery. The reader will bear in mind that there are tw firms abont 14 miles apart, besides a great deal of
grond away from those devoted to the culture of the arrand away from those devoles; and as flowers and vegetables are coitivated to about the same proportionate extent in
meh, I shall not treat of them separately, but stride meh, I shall not treat of them separately, but stride 14 miles' stride is scarcely figurative in the neighboursorprise of seeing at St. Osyth, where a cartway, about In feet, wide and half a mile long, that runs across the form, has heen anwn with this popular annual, as well 23 annther band of equal length at the boundary.
There is the blue riband of the turf and the blne riband of There is the bhe riband of the turf and the surely this is the blue riband of the garden. It was rather disappointing to find dozens of acres bare of flowers which had ripened off, and the ground
being planted in market-garden fashion with Cabbages and Broccolis; but I was 20 days late for the best display, and too early for the Astere, \&c. Plenty of work, how-
ever, particularly familr, one has to cross \(2 \frac{1}{2}\) acres of Thyme, a greater grantity of Marjoram and \(\mathrm{Hyssin}^{2}\), and a small farm
phanted with the French breaklast Radish, to find phanted with the French breaklast Radish, to find which, if not attractive from point of colour, are tertainly among the most desirable and most graceful things sent out hy our seedsmen. Having paid some foc cartain it is that the vent are seldom seen in private andens, where they rarely grow one better than a bonour. I give these a little more prominence than cranescent things, because if cut at the right time-as son at the inflorescence is developed, and before the able for vase decoration in rooms, particularly i mingled with two or three of the best Everlastings. The
Stipa, Briza, and Pampis Grass are already used in this way to some extent; but if to these are added Sirghmm bicolor, with a gracefully drooping showerinflorescence; Bromus brizaformis, like a
Briza in spikelet, but drooping over even eqracefully than the Sorghum; and Panicum panic'e is einerging from the sheath, like water hom a fine syringe or jet-a much more beantiful Pidted, as first-rate and distinct, Hordeum jubatum,* Aptatherum multiflornm, Agrostis pulchella, and
 experience that Stipa need not naming. I know from mith anything a gardener could not furnish the ladies With anything more welcome than a nice lot of these, inge and the Grasses one naturally associates Everlastinge and these are largely grown at both farme, but mofly at \(\mathrm{S}_{\mathrm{t}}\). Osyth. The best Everlasting I saw was ne Ir entia Wi W. grandifloza] of a glistening golden colour. Aporlhy conspanion of the heads expand it will be found irizhly angusitimu," becanse the uropened heads are With the Helichrysums, than any of which it is brighter of Whe wareatiful. It may be a large form or variety If cos noes not admire the beantiful Rhodanthe, which Here there and ara till Rhodanthes come rotuld again buing mneulata, thonghardens of each kind, the bearcely possible to beat We are

This, thnum gety geting towards the middle of the
grounds, which appear to be laid out in painted aliot 5 or 6 acres of superfine selected York Cabbage, a neat looking sort ; but it is bounuled by a wide strip of Xeran themum annuum, nearly 400 feet long. Beyond ar clear and well-coloured squares of Brachycome, bit blue and white, separate; but the most beautitu square of all is whare the two varreties are nearly equally mized-that, waving in the wortuing sun, looks like a little silvery sea. It is needless to invite attention to that large piece of Tropazlum Tom Thumb Siarlet, because the ground looks as if it were covered with new scarlet bunting cloth, and is almost painful to look upon from its extreme brilliancy. No other plant conld have produced such a telling level sheet of plant could have produced such a telling level sheet of ums there are in abundance-sprotted, bronze, "black," and gellow-but King of Tom Thumbs is stid to be the best. It seemed to me the most decisively coloured of all as regards the single bloom, being like a Scarlet Geraniam, but did not throw up such a sheet as the Scarlet Tom Thumb. This, however, was explained by its being sown later, and of course \(I\) am only able to give the aspect of thinga as they looked on a single day. Nothing in the diatance looked so dressy and adylike as the squares of Rocket Larkspurs, pink, blue and white mixed, though there were many conpetitors
-showy, like the douhle Sunflower, Princes' Feather, Coroopsis, and Marigold-beautifully coloure l, like Convolvulus minor and the Fiscarias-or interesting, such as fields of Canary Climber grown and staked like Peas, Everlasting Peas in like manner, and long strips of trial ground in which a short line or two of each sample of seed is sown.
I was not quite sure of the hardiness of Calandrin: umbellata on level groumd till I faw here a square o old plants foll of seed. Their age I suppose had mate then cease flowering so soon in the s.ason, as youns plants bloom ou freely till very late. Calandrinia dis color, sown in March in the open ground, is a nobie field than the Clarkias do over their acres, and quite "effective" when expanderl in the sum.
If the quantity of a vegetable grown for seed be any indication of its inerit, which it nught to be, s omething may be !earned here. On the way we passe, about 10 acres of French heans-kinds Newington Wonder, and Dwarf Dun. A Vegetable Marrow called the Cluster, grown in quantity, seemed very distinct, from the fact of its not running about as Marrows are wont. but fruiting freely close to the collar. Of l3rnccolis, Maule's Late White, Southampton Late White, amd Carter's Champion, were the favourites, and grown to a great extent. Parsley seemed a special ohjoct of care, as more than half a score acres were devoted to
it, Dickson's Curled and Dunnett's Garnishing being thought most of.
Messrs. Carter's foreman at St. Osyth was quite enthusiastic about the merits of Wheeler's Tom Thumb Lettuce said to be the best winter kied, and also gnod for the summer months. Of Peas the earliest wer Carter' First Cus Sutton's Ringleader, which Carter's proved to be identical. Maclean's Litfle Gem is a grea favourite. The straw from which 16 four-bushel sacks of this Pea had been threilied was taken away in a cart, grow much of Veitch's Perfection?"-"We had 50 acres of it last year and hadn't half enough," was the "eply; and I betieve this made the voice ritsin of note taking.
Of en
Of course I did not see half the annuals that are grown here, because the men were threshing numbers o them ont like corn, and cleaning and stowiug away the seeds in bags to get a final cleaning in the winter ; and numbers more were pulled up by the roots anil stacken along to dry in the most business-like manner; while lots of things like the Nemophilas were pulled up and tho lost their beanty, in a way that wonld seem eruel to many of the thousands in whose eyes they will almost be sacred subjects next year. A few things are grown for division, de., euch as the
Gladioli, and very imposing they look whes grown thus in quantity; the Tritoma, by the way, I should not have expected to do sn well, fully exposed to the sea breeze on these unshellerew and desirable opportunities for picking out new flowers in these varieties of both vegetabl in the world, and it is well farms is perhaps unequalled in the erinated the double and margined Clarkias and many other popular improvements in both parts of the ('talogue. Just as we are examining the differences between Comrolvulus trientor and its var. splendens, we spy a new and miximet var. among the common kind. In this, the white is eyp, giving quite a nar appect to Convolvulus minor. \(R\). eye, giving quite a new aspect to Convolvula

\section*{Miscellaneous.}

Strueture of the I'inegar Plant.-Many adilitinns to our knowledge of this Fingus have heen made by Mr. II. J. Slack in his recent paper read to the ahiero secpicsl society, and pinegar plant with low powers shows no more than": the Micrographic Dictionary describes, but if portions are carefully illuminated and that the virtues of this tree had not been exaggerated
viewed under a magnification of from 1 to 3000 linear, it will be fumd that the gelatinous matter, hitherto treated as structurelios, contains millions of small bodies reaembling the Bacteria that occur in the pellicle of solutions set aside to develop infusoria. These bodices vary considerably in size, some not exceeding yedoo of an inch in length, othem twice as big or more. If shained with iodine, they simetimes become a little phiner; but the more delicate wilt not appear ab headed structures to an observer coming quite fresh to their examination. Mr. Slack does nut c naider that all are beaded, and some seem to be in an intermediate state. The number that can he made out will depend upon the time employed in the investigatian, and in the murse of a west or the the aberver will he able to trace their structure to a sufficient estent to justify the belief that all either porsess or tend toward the Hacterium form. Mr. Slack believes the Yeas: plant se commonly associated with Bacterium-like hodies, and, probably, when their number is moderate, they do not noticeably interfere with the varions fermentations. In the Vinegar plant they are so numerous ns to saggest the idea that they play an important part in the complieated series of actions which the plant, as a whole, excites, Popular Science Rerienc.

Australian Perfumes. In Australia there are many trees with fragrant leaves, and principally the Tasmanian Peppermint (Eicolyptus amygdalman), the Peppermint tree (Eucalyptus odorati). the Blue Gum tree (Euchlyptus glabulus), \&c. Esasntial oils distilled from the leaves were fhown at the last Exhibition, amblalthough deserihed in the catalogue as ouly fit fur painting purposes, I (xpresel an upmion that they might he remdered available for permunery. Anexpertment wheh Imale with lie onl of Euchyptus combined with peppermint) confirmed me in thit itea, and I am pleased to find that the colonis a bave fermeng their atrention to the entiject, and are now rendang
these oils to our markets. The Watt'e flower is alan very abumbant in those parts, and as it closely rexemblem the Cassie in frigrance it might lee tarned th gnod account. I renpived not hing sinco fr in fismbman a

 Myall-wiond (Acacia prumula), which his ant intenae and delightful small of Viole's, a very senrce ndour in

Wooden Cons. - Persins who reside in our large towns, especially the largest, are very apt in slander the milman, ma aso fion of his commodity to a free use of the it is not our intention to jin in any auch candal, for the milk of our lisatory is renuine and scandal, for the milterated, although not derived from a quadrupedal cow, goat, or any animal whatever. Some, perbaps most, of our readers will have heard sumething of the
existence of vecetable cows, or plants vielding inik; it existence of vegetable cows, or plants yieldink nink;
is of these " wonden cows" we purpose to refresh their memories. The Caoutchouc, or India-rubber of commerce, as it exudes from the tree, very much resembles mille in colour and density. Many other plants yield a similar fluid, and in some instances this is so sweet and palatable an to be employed by the
natives for almost all the purp ses of animal milk. The "Cow-tree of Demerara" is described as a tree the base of nearly 18 in hhes. This tree is known to botanists by the name of Tabernais bana dilis, and to the natives as the Mya-hya. It belonga to the anme natural order as the Penang India-rubber tree, and the ponison Tree of Madagascar (Apreynacmailan, and its park and pith are so rich in milk, that a moderately. sized stem, which was fellent on the bank of a forent stream, in the conrse of nn hour coloured the wate quite white and milky. The milk is said to be thicker and richer than cow's milk, mixea frenty wion water, and is perfectly innocunna, and of a pleasant and the natives employing it as a refrealing drink, and in all respecto as animal mills. The Cinghalese have almo a tree which they call "Kiriaghuma," butt which helongs in a different order of piants (Asclepiadacex). It is the Gymnema lactiferum, and yielde a very pleasant milk, which is employed for romestic purposes in Ceylon. There apperrs to be also a mik tree common in the forests of Para which the native call "Massenodendron," but of which we have no definite knowledge, except that it was for a considerable time used on board H. \(31 . \mathrm{S}\). Chanticleer as a sulhstitute for cow's milk. It was said to suffer no chemical change by keeping, neither did it show any the most celebratel of all the Cow trees was sur. diseovered and inade kuown by lumbly ita as the Palo de herent uacural order from thinse nlready belonge to a different navaral order froin these arready inentionell (Artocarpaceay, and to one when indule nlso the ponsmons this Co tree is Galactnilendron util?, the "useful milk tree," or, as mare recentiy called, Brosimum ntile. Its discoverer states that while staying at the arm of Barbula negres of the farm, who drink plemtifully of this vegetable milk, consider Gully of this vegetable milk, consither it a wholesome

When incisions are made in the trunk, it yields abundance of a glutinous mill, tolerably thick, devoid of all acridity, and of an agreeable and balny smell. It was siderable quantities of it in the evening before we went to bed, and very early in the morning, without feeling the least injurious effect. The viscosity of this milk alone renders it a little disagreenble. The negroes and the free peonple who work in the plantations drink it,
dipping into it their bread of Maize or Cassava. The dipping into it their brend of Maize or Cassava. The
overseer of the farm told us that the negroes grow sensibly fatter during the season when the Palo de Vaca furnishes them with most milk. This juice, exposed to the air, presents on its surface membranes of a strongly animalised substance, yellowish, stringy, and resembling cheese. The people call it cheese. This coagulum becomes sour in the space of four or five
days. Other trees are known which possess similar days. Other trees are known which possess similar properties to a greater or less extent. One of the chase is balsamifera). Here again we have a plant belonging to a different natural order from any of the others, namely, the Euphorliacer, and oue containing a large number of plants with acrid and purgative juices. Leopold von Buch states that the juice of this plant is similar to sweet milk, and, thickened into a jelly, is eaten as a delicacy. A species of Cactus (C. mammillaris) also yjelds a milky juice equally sweet and wholesome. It now constitutes the type of a genus called Mammillaria. The milk is affirmed to be mach inferior in its quality to the majority of the above. Although none of the Cowtrees enumerated yield a true India-rubber, that substance, or one greatly resembling it, is afforded by some of their allies. It is curions to observe how, when failing to serve mankind in one direction, these trees become important servants in another. How forcibly this reminds us of the quaint lines of George Herbert:-

More servanta wait on Man
Than he'll take notice of in every path
He treads down that which doty befriend him,
When sicknes
When sicknoess makes him pale and wan.
Oh, michty love ! Man is one world, and hath Oh, miphty love ! Man is one world, and hath
Another to attend him. Science Gossip.
Flower-Farming in England.-It has been proposed to cultivate flowers in Eugland for perfumery purposes, but the climate renders this scheme totally impracticable. English flowere, however beatiful in form and colour they may be, do not possess the intensity of used in France for perfumery would only grow here in lot-honses. The only flower which might be had in abundance would be the Rose, but the smell of it is and the Rose-water made in this country can never equal the French in strength. If we add to this the shortness of the flowering season, and the high price of land and labour, we may arrive at the conclasion that such a specnlation would be as bad as that of attempting to make wine from. English Grapes, As a proof of
this, I may mention that I had a specimen submitted this, I may mention that I had a specimen submitted
to me not long since of a perfumed pomade which a lady had attempted to make on a flower-farm, which she had been induced to establish in the north of
Eiogland, and it was, as I expected, a complete fuilure. The only two perfumery ingredients in which the English really excel are Lavender and Peppermint, bat that is owing to the very cause which would militate against the success of other flowers in this country, for our moist and moderate climate gives those two plants the mildness of fragrance for which they are prized, whilst in France and other warm countries they grow strong and rank. Rimmel's Book of Perfumes.

\section*{Calendar of Operations. (For the ensuing voeel.)}

Everfteing out of doors should now wear an appearance of perfect order and neatness, and this can only be effected and maintained by a systematic perseverance in going regularly and frequently over the whole outside department. Considerable attention is necessary to Keep half-hardy plants in order at this season. Tall or straggling growths in masses should be constantly shortened, and if this is done with taste the beds may be toale regular and uniform, without being formal. At planting-out season, for the eake of immediate effect, beds are generally filled rather thickly, and in conse-
quence of this a careful thinning may be useful, espequence of this a careful thinning may be useful, espe-
cially where over-crowded plants are liable to be injared at the bottom, as may be the case in low, damp places during the present rainy weather.

\section*{FLOWRR GARDEN AND PLANT HOUGRS}

Continue to nse less shading now than when the weather was so hot; plants ris ening their growth have need of not only all the dayligs they can get, buteven moderate sunshine.

Cingrarias.-These will now [want a cool shady situation; it mildew makes jits sppearance sulphar should be at once applied. I he first-struck cuttings will now require reppotting; also the first-sown seedlings for early bloom.
Hourriocrs. - Fine varietien may be propagated by means of eyes tuken from the strong parts of this year's wood. In selecting them, care should be taken to bese of the leaf, and to reject those which are developing
flower-buds only. The cuttings should be prepared by
splitting and cutting the stems ap into lengths, leaving about 2 inches below the bud, and paring away the
pithy part; they should then be planted about 1 inch deep iu a frame of very sandy soil, and carefully shaded; if they can have the advantage of a little bottom-heat, so much the better.
Orohids.-Kinds which have already made their growth and ripened it should be removed forthwith to plants into new growth at this time, as it is much too late to get it properly matured, and the unseasonable draught upon the stored energies of the plants will
materially interfere with the next production of flowers. materially interfere with the next production of flowers.
Priargonioms. -The propagation of greenhouse arieties should now have a due share of attention. The large kinds may be cut down aceording to the asual practice, and cultings selected from the shoots so cut off; but with the fancy varieties a different course must be pursued; most of these produce such a pro-
fasion of flowers, that, if left to their ordinary course, fusion of flowers, that, if left to their ordinary course,
it is almost impossible to obtain any proper slioots for cuttings. By picking off the flowers as they appear, and encouraging the growth of the plauts by rich soil and liquid manure, the extreme points will make cuttings, and the young side shoots will produce them in abundance.
Ruses. - Cuttings of China and some other kinds may now be taken and planted in a close cold frame in are cicatrised at the base; they should then be taken carefully up, potted in thamb pots, and plunged in a close warm frame with a gentle bottom-heat. treated they will make nice plants in a very short time, and if kept under slight protection during winter will fill their pots with roots, and be ready for planting out in April or May.

\section*{forcing garden}

Chrrateg, -Endeavour by all means to keep the foliage healthy and clean as long as possible.
Mexons.-Attend well to plants swelling late fruit. Avoid frequent waterings of the soil by giving good soakings.
Pinks.-Maintain a high moist temperature with abundance of ventilation, to plants which are swelling fruits; and a rather drier atmosphere around those which are in flower. In all the stages except that last mentioned use the syringe freely in fine weather; but, on dull days, depend almost entirely upon the evaporating troughs, and be careful to admit air, to prevent too great a condensation of moisture. If the syringe is used in excess during this month, it is liable to render the soil too wet for the healthy development of the plants. Take care that the bottom-heat does not get too strong for plants which have been receutly potted or planted.
Strawberries.-Pot off layers, and place them where they will receive partial shade until they get established. After that they may have full exposure to sunlight.
VINEs.
Vings.-Houses in which the Grapes are just beginning to ripen should be gradually inured to a iree admission of air; and if it be desired to keep for any leng th of time those which are quite ripe, they should still have the advantage of a slight shading should the weather become bright.
hardy fruit and kitceen garden.
Continue to gather all kinds of frait as it becomes ripe.
Crlery.-This may still be planted. Some prefer 6 feet called the Scotch plan, viz., beds of from 4 to of Peas, are trenched two spits deep. The bottom spit receives plenty of raw manure or half-rotten leaves,
and the top one old manure. The principal secret in and the top one old manure. The principal secret in growing very tender and crisp celery, irrespective of size, is to grow it very quiclsly by means of plenty of manure and moisture. Whether in rows or beds, the young plants will not succeed without plenty of water.
Endive.-Transplant while the weather is favourable for operations of that kind.
Letruoks.-Sow now to stand the winter, and transplant the produce of previous sowings.
Onions. - Sow some of the Tripoli or Spanioh for early use; lift ripe crope, and carefully dry and atore them.
Poratos.-These keep growing late this year, but let early kinds be got up as soon as the tops are ripe; let the produce be sorted, and it of an approved kind let all the small and moderate-sized tubers be carefully
preserved in dry sand or charcoal dust. Be at a little preserved in dry sand or charcoal dust. Be at a little allow your number of sorts to exceed half-a-dozen, selecting those only which are most liked at table, free croppers, early in coming to perfection, and least liable to be affected with disease. As soon as the Potatos are off plant Winter Greens on the same ground.
SPINACR - Sow some for winter in good rich ground, deeply trenched; if in rows they should stand about
16 inches apart, to allow a free passage between them 16 inches apart, to allow a free passage between them for forking, cleaning, and gathering the crop. At the first gathering every other plant should be drawn out entirely, thus giving additional space to those which are to produce the late winter and spring supply.
TURNIPs.-A Bowing of Early Dutch, American, Rod
Top, or some other approved kind may yet be made.

SATURDAY, AUGUST 19, 1865.
}

ETRBY day brings intelligence of new outbreaks of the Cattle Plagur, and every inspection adds something to our stoek of knowledge. A disease so disastrous in its effects, and withal so nosel to the present generation, demands more than the study of a few weeks; facts, numerous and important, are already collected, but a vast field lies before the explorer yet, and not until he has trodden over the whole ground oan he olaim to be heard as a true exponent of the nature and relations of the terrible malady which is devastating our herds over a large extent of country.
It has been urged as a reproach to the Veterinary profession that no efforts are being made to curre, but only recommendations being given to
kill. This, however, is an assertion that emanates only from the uninformed. All over the country attempts to treat the disease are being made, both by the qualified veterinary surgeon and also by the mere "cow-leeeh, who still flourishes, and is
often still intrusted by misguided or indifferent nwners of stock with the management of their Alocks and herds. So far from the medioal treatment of the disease having been neglected, it was almost universally adopted at the outset ; and not until the dauger of allowing infeoted animals to live and extend the infection was realised, did the system of destroying, and burying, find favour among scientific men as a matter of expediency. Judging from a large bulk of evidence now before us, obtained by observations made in London, as well as in distant parts, the cattle plague is quite as manageable as any other fatal and malignant affection, and as a rule the further one goes from the nietropolis the larger the percentage of cases of reoovery under treatment, where the measures adopted have been judicious and prompt.
On behalf of the veterinary profession we deny distinctly that "bovino typhus" has ever heen considered hopeless; on the contrary the
feling among the profession is quite the feeling among the profession is quite the
other way. Veterinarians are more ready to treat the disease than stook owners are to have them treated, knowing as the latter do from experience how large an amount of loss would be ineurred under the most favourable circumstances not to speaik of the anxiety which is known only to those whose worldly goods are represented by such unstable securities as oxen and cows, under present circumstances, are. On the other side the markets have been open, every facility has existed for the prufitable disposal of stook from infeoted locelities, and thus the "plague" has been distributea throughout the country-no less than suffering from outbreaks of greater or less extent. suftering from outbreaks of greater or less extent. discriminate treatment of diseased animals would be injurious to the interests of the country; it mould at the best result in the establish-
ment of a variety of contlioting opinions as to ment of a variety of contlioting opinions as to opportunities to the uuserupulous to vaunt the merits of their quackeries, to the detriment of public, who of that considerable section of the Wbat is done in this delight in being victimised. tically condued in this direction should be systemathat the resulted, under competent supervision, so The veterinary misht be relied on.
to bo fully developed; and this it will be, provided the means that are being adopted do not, as we hope they will, strangle the disease out of existence, time all preablices and prop rtions; but up to this directed to limiting official inquiries have been however, it is somewhat outbreak. At present, veterinary profession with rith a malady whioh bas not appeared in our
country before since the veterinary profession has been in existence.
In our last remarks wo observed on the importance of considering the characteristics of the cattle plague as they present themselves in different instances. And in reference to the iufections nature of the malady, we remarked upon the difficulty, in many oases, of trecing the disease to ita origin. Generally wo find good evidence of the outbreak haviag oocurred among newly purchased stock, coming from the Metropolitan Market, shortly after their arrival in a locality; but there is, on the other hand, equally good evidenoe of the infection having extended from this centre to places at varions distances around, from a quarter of a mile to a mile or more
without any communioation being discoverable. is not our intention to assume that the infection must, in these instances, of necessity be conveged by the atmosphere, but we cannot refuse to admit that it may; and the idea is at least as reasonable as the belief that such infection may be coaveyed in the cluthes of a man or the wool of a sheep. Hrtber, wo have notioed that an outbreak may occur, and a certain number of animals may die, or be destroyed, and the disease apparently cease part of the same farm, even when every precaution has been taken that experience could suggest or its prevention
Again, the appearance of the malady in icolated cases, at intervals of two or three days, is peouliar ; it shows either that the period of incubation varies very much in different constitutions, or that some source of inlection is constantly present. or that animals may communicate the disease to each other before the indications of its existence are seen in themselves. It cannot be denied that opinions upon the precise modes of infection should be cautiously received and promulgated; that view is most satisfactory which involves the necessity for the greatest amount of vigilance; and it is at least rafe to call speoial attention to the faot that the disease can be propagated indopendently of
any apparent contact with infected animals. The any apparent contact with infected animals. The to close any and every possible channel of communication.
He will be urged to this by several considera tions: first, the extreme fatality of the disease; secondly, that it is certain to be conveyed to a healthy snimal exposed to its influenoe; and, thirdly, that there is a probability of its extension, even whea care is taken to out off all direct or indirect communication.
In different parts of the country and in different animals the disease presents itself under different aspects, both in its symptoms and in the changes which it produces in the tissues of the body. This will not be difficult to understand if it be remembered that in our first article we explained the malady to consist in a poisoned condition of the blood, causing, as a mattor of course, certain derangements of the nutritive functions, and
impairing the perfection of the several textures; according, therefore, to the susceptibility of the system and the amount of resisting force will be the duration of the disease, and consequently the extent of the morbid changes. Hence in one case we find extensive disease of the palate, ulcerations extending outsid the nostrils; in another dysenteric diarrhoea, with iuflammation of the mucous membrane of the true stomach and intestines. In a third the most characteristio changes are found in the third stomaoh (manyplus), the peculiar leaf-like folds of its membrane being marked by patches of inflammation or uloeration, and sometimes loss of texture by sloughing, leaving large and ragged holes. In a fourth instance emphy sema, i.e., existence of air or gas under the skin of the baok, or over the whole budy, is a marked indication, in other cases this sigu is altogether absent; sometimes there is much discharge of mucus and lymph from eyes and nostrils, at others searcely any.
A. 5 general statement of the effeots of the disease, it is correot to say that the mucous membranes are influned; but whether the inflammation shall happen to be most marked in the membrane lining the mouth, or that extending through the digestive system-or whether the morbid action shall especially implicate the lining of the windpipe and tubes of the lungs, are points dependent upon certain determining intluences about which we know nothing. There are doubtless peouliar susceptibilities among animals as among human beings, one man being aubject to bronchitis, another to diarrhoea.
The symptoms of the malady will in wome degree
depend upon the virulonce of the atthok. Among praction men, diminution of the milk is considered to be one of the earliest nigas, and if in addition the animal is dull, refueing to est or ruminate, and standing with the head lowered, the evidence is colerably complete that the attack has commenced. It is very curious to waton the progress of the affection in different animals alter these firat indications are shown; many of them remain for a day or two with soarcely soy change, some have seemod to improve, and then suffer a relapse; while on the other hand it often oceurs that an auimal which in the morning gave onls doubtful evidence of the presence of the malady, has all the worst symptoms fully developed by the vening.
The symptoms which supervene upon the first are definite enough; diarrha+a goincon to dysentery, exudation of dirty white material from the membrane of the palate and upper lip with superlicial uloorations, whioh are also sometimes sern under the tongue, general prostration, grest distress in breathing, groaning constantly, abundaot disolarge from eyes and nontrils, peouliar fator of the breath, with the trembing of the museles of the hind quarters.

Commonly there is a peouliarly harah condition fhe ooat with an exudation from the skic, wore partioularly between the thighs, in whioh aituation there are often extensive exporiation.

Very little trouble is felt, by those who have seen the disence, in recognising it when once developed; the expression of intense suffering and the extreme prostration of the vital powers at an early period are not to be mistaken. The real difficulty is felt in attempting to docide upon the best course to be pursued, under the ciroumstances, in regard to the remaining healthy stook. By the Order in Cuuncil animals that have been exposed to contagion are not to be sent into the market for sale, and the ownor has, therefore, the alternatire of keeping them and running the risk, which almost amounts to a cortainty of their taking the affootiun, or obtaining lioence from the veterinary inspeotor to send such as are fit for the butoher to be immediately slaughtered; this appears to be the only course offering a chance of saving something from the wreck. What the effeots of suoh a systom will be in the future remains to be seen; at present we must confess that of two evils it seems to us the least. Any attompts to preserve animals for treatment, ave in properly arranged quarters, we deprecate, as opposed to the true interests of the country.
The Illustrated New of the 8 ch July contains a letter from Melbourne, Australia, in which after describing the beautiful villes and gardens whioh are springing up around that oity, the writer anys:- "But alas for the turf-the green sward on which the pretty girls play croquet, and the fat babies tumble about-we have it not, and never shall have it, dospite a shower of gold." It may be impossible ever to produce a spard in that arid climate to compare with the green pastures of naerry England; but if these lines should ever catch the writer's eye, he msy find some comfort in the following worda of MEYBr:--" A beautiful lawn surrounded by Bambuseo, such as I have seen in Indis, even though the turf be compneed ohiefly of C'yperoiden, is one of the most charming objects in nature." Let us suggest that this fact should be submitted to Dr. MUELLER, the talented Director of the Botanic Garden at Melbourne, who may also be able to suggest some more suitable plants for experiment. We can alsoassure the writer that if be will colleot so many drops of that "shower of gold "alluded to in his letter, as would suffice for the preparation of a "report on uweful Grasses and forage plants, with notes on such others as may be considered worthy of experiment in the British Colonies," as indioated in a former paper (soe p. 634), that shower will help to fertiliee Australia throughout all time.
Australia has been reserved for the inheritance of the Anglo-Saxon race; its divrrsified climato is, on the whole, not unsuitable, and though not "a land flowing with milk and honey," the diffionlties to be surmounted before gathering in the fruite of the earth will conduce towards maintaining the energy of the race. Its soil, by cultivation, yields all the neoessaries and many of the iururies demanded by the highest civilisation. Its pastures are boundless in extent, but very eadly deficient in productiveness. "The Grazes are numerous, but they grow in separate trifts, on a reddish calcareous earth in socue places, and a black sunoracked soil in others. Owing to this, the sheep and cattle runs of the great "squatters, with their
immense flooks and herds of necessity embrace vast tracts of country, and are continually spreading farther and farther into the interior,"-hence the neoessity for exploring expeditions to prepare the way for the march of these "shepherd kings" across the continent. With the exception of the basin of the Murray River, there is no great river system giving acoess by boats to the interior; in many distriots there is a deficiency of water. No dependence can be placed upon wild animals, nor on vegetable productions to supply the passing wants of the pioneer. Supplies must be oarried on pack horses; the toils and dangers of exploration are of no ordinary character.

Another expedition to the north is under consideration in Melbourne. Experience has led to great perfection in the details of equipment, but the depôt system is capable of some improvement, so that the expedition may fall back upon atares which hare been increased by cultivation, instead of being diminished by the consumption of the party in oharge. A dépôt being established in a suitable locality where there are no natives, a few acres might be planted with rapid growiny, productive and nourishing kinds of grain, of easy transportation, and requiring little preparation for human food, such as Cobbett's Maize, whereof three orops are gathered within the year in Queensland; the Chick Pea (Cieer), Lentils (Ervam) of sorts, Haricot Beans (Phaseolus) and such others as on application may be recommended by Messrs. Mueller, Moore, and Hill, Direotors of the Botanic Gardens at Melbourne, Sydney, and Brisbnne. Let us further suggest the propriety of taking the opinion of these gentlemen about an fruit trees, particularly the Spanish Chestnut; also the Locust Bean (Ceratonia siliqua), and the Date Palm; the Wild Rice of the basin of this Amazons, and the so-called Wild Rice (Zizania aquatica) of Western Canada, besides others which they might suggest to be planted at intervals on the ronte. Tnus a little forethought and judioious outlay might in due time save many a valuable life, and the march of such a company might, in after years, like the visits and gifts of live stock and seeds by the illustrious Cook to many an island in the Pacifio Ocean, be held in grateful remembrance by the simple natives, whose ory hitherto has been, "white men come, kangaroo go away.
The electric telegraph from Melbourne has already reached Bowen, Port Denison, in about
latitude \(22^{\circ}\) south, and in order to complete comlatitude \(22^{\circ}\) suuth, and in order to complete com-
munieation with England, cable will probably, ere long, be landed from Singapore and the Duteh
East Indian islands on the N.W. coast of Australia. The hereditary robbers of Northern Arahia, who defied the rapacious Turkish Pashas of Damascus and Bagdad, have owned the soft influence of British gold, and become the guardians of the desert wire. In dealing with the more primitive natives along the route to Bowen, through vast districts which have never heard the crack of the stockman's whip, can any one suggest a better policy than one of love and mercy, or a stronger appeal to the goodwill of the natives, than preceding, or at latest aooompanying, the passage of the wire with the planting of fruitbearing trees and herbs? B. M. F.
-The annual meeting of the National Assooiation for the Promotion of Social Scitnce will be held at Sheflield, from the 4 th to the 11 th of Ootober. The Section of Agriculture is presided over by Mr. Holland, M.P.; Prof. Joun Wilson, of the University of Edinburgh, acts as Secretary, The subjects decided upon for discussion before the Agricultural Section are:-1. The Game Laws.
2. Agricultural Tenancies-Leases, \&e. 3. Agri2. Agricultural Tens

A circular has been issued to local Agricultural Societies, informing them that the National Assooiation wiil be glad to receive their support,
whether in the shape of a personal deputation or Whether in the shape of a personal deputation or
of written faper * on any of the subjects specified.

\section*{The Cattle plagle.}
[We contimue to give the letters of our corrospondents as well as extracts ard abri.igements uf the lettcrs which have lately
appeared in the dails papers on this suhfoct.] 1. Dorset. - As the statistics which you collect are
so valuable, I take this cpportmuity of giving you such
notes as I can collect as regards the condition of our notes as I can collect as regards the condition of our
animals in the county of Dorset. Cattle.-As yet I to All papers, de., shonld be for warted as early as possible
have not heard of a single case of the "murrain," for
with all its new names, I think this old term will be best understood, We have, lowever, a disense very prevalent, which is described by Clater under the terms bl in, hawkes, or gargyse, now caller font-and-month
disease. In my own parish a farmer is said to have 30 cows attacked with the disease, and it is in various parts of the county. My bailiff tells me that about 12 years ago his father hadabout thic same number of cows attacked, and ns nearly as he can recollect the summer was much the same as in this year, which I take it has been remarkable for hot days, with north or east winds, and
cold nights. His remedy was then ground Oits, with cold nights. His remedy was then ground Onts, with
the coarser bran removed, made into gruel, with which the beasts were drenched two or three times a day; this gielded support in cases where the mouth was so sore caliy upon the bowels, and he did not lose one, while his neighbours who did not do this lost his animals from sheer exhaustion. This is interesting as showing the periodical appearance of diseases incidental to animals. We have heard of a few eases of splenic apoplexy in Somerset, but only in the districts in which this disease has ever prevailed. Sheep. In our own flock and others a few ewes are annually lost, apparently from some blood disease of the splenic apoplexy class, in as far as I can make out from a post mortem examination and the guidance of the writings and lectures which I have heard or read by Professnrs Brown and Simonds. The must trubblesome complaint re have, however, with our sheep-and it is very prevalent- is that of
Inme feet. Prof. Brown's paper in the \(B\) th and West of England Agricultural Sxiety's Jourmal has so fully described it that it leaves little more to be wished. I quite think with him that this is to be prevented, by careful periodical examination of the whole flock, washing and paring of the feet, but all penple, and
especially shepherds, are slow to use preventive especially shepherds, are slow to use preventive
measurez. Dry upland pastures seen the least liable to produce-sandy stabhles and low meadows in wet
weather aggravate it. The best thing would seem to be to separate affected sheep and put the \(n\) in as dry a position as possible, pare and apply atimul-ting and astringent remedies, \(P\) igs. -
sudden losses ainong this stock from unexplained sudden losses anong thas stock from unexplained into them. Oar county has promise of rich pasturage, and more than an sverage crop of roots, but with animals that were so sorcly pincher in many places last year plenty is even more destructive scarcity. Recent events will result in good if it only teaches the farmer how inportant it is that be should
study the principles of healthy and diseased action, and this if it only taught him how crude are the common farriery notions with which he is too often content to put un; but while thrise in charge of cattle believe in the existence of the tail-worm, talk of the Cran kums, or attribute so much to a beast being ". Mnserop (inouse-crope), we shall have very little reliable evidence about our cattle diseases. I had an ill favoured steer
of about four years old which no treatment condd improve. "Oh !" says Hodge, "he has the tail-wnrm."
- Myself: What is the tail-worm? - Hodge: It is a worm hegins at the tayle, and creeps all along the
back-bwon till he gets to the heall, and then the beast's teeth drop out, and he dies. Podge tells me he is "moscrop."-Myself: Moscrop; that means anouse crop.-Podge : Ees, sure, a shraw (anglice shrewrenouse) erept over his lines, and he'll lose the power of his himder quarters. Pudding said he had got the "Craukums." Myself: Well, that is a queer name, and what may be its nature.-Pudding: 'Oh that's a disease of the ox." Now I knew that before. True, the poor benat ha! some affection of the hocks, but
or whether from purtial paralysiv, or what, 1 conld not make ont, This case occurs with variations every day,
Country people are nos learnel about cattle disenses, nor do we think the usual draggers knimet mach more What we want therefore is not to be told, "res its" principles of diseased action. This was onee tanghtat the Royal Agricuttural ('ollege undar Prof. Brown who is a really philosophical inquirer. J. B., Bradford who is a really plity
Abbas, Aug. 13 .

8. Essex. - The cattle plague has unhappily broten out near us in Essex. No less thun 30 beasis, cem
and calves, and one prize pedigree bull value 10 goinem at one farm, Mr. Taylor's, Hazeleigh Hall, have fella victims within the last fortnight. They are beriod end
covered with disinfecting chloride of line. covered with disinfecting chloride of lime. I han
just learied that J. O. Pirker, of Wondhammul timer Lodge, adjnining the raid Hazoleigh Hail hate, it to be deeidedly contugious. I would recommend that as "Doctor Green" has now inade an appearanee extreme drought, a full amount of green food shonid be resorted to for cattle in their own stalls, and pure wite to partake of at their will. Maldon.
4. Essex. - We have several notable cases of Steppe Murrain in Essex, all from Chelmsford market-in ino cases from suckling calves bought in that market, 0 ie have become infected. One effect will be, no doubt , purchase from farms and not from markets. J, J. Mocli,
5. From Mr. GIrcertr (abridged).-Having been for aiores years extensively connected with the trade and sale of cutte,
foel it my duty to forward you the following facta and mo os
perience relative to the present disouse in cattle which
 mado by cortain professors connected with veterinary cho has beun imported from abroxd, yet though he monteme

\section*{THE LAW OF HYPOTHEC.}

THE following is the conclasion of the Report of the Royal Commission on the subject, the former part of Which was published last weok:-
Nense of Cum minetonere.-Wo have gives to the whole subjoct the moat anxious considernition and wo nom burably beg to ubboit to your Majesty the result of our deliberations.
Principle of the law ahould be maintained -In the general
principle of the law, under which the landord of an aericultural subject has, in securlty of his rent, a preference over the
crop raised on the ground, and the stock brought upon ft by The teoant, wa are ground diaposed to recom brought upoo it by has existed for centuries, unt only without complaint, but as a
 uriqurudence, and under its inthence this cuntry has undonbtedy made great advances in the seience and practice part of the opponents of the prosent law of hyrothec and of its apponters, the consequences which would be likely to result
rom ita repeal \(m\) yy havo been to some oxtent exaggerated. 3ut such a measure would, in our opinilon, certainly be folmust act injuriously on the temants. and eqpecially on the raluable and industrons class from their proment possesstions. We should also anticipate, from the abowition of the existing
law, other changes in the relations between landlord and tenant which might operate very differently in different parth
of the conntry, but the ultimato coneequencen of which it impossible to foresee.
Atherations desivele-White kolding theso Howe on the are some noints in regard to which that law would admit of beneficial alteration. The provision of the law which has been most generally objected to is that under which a hndlord,
when the rent is uvpald, to entited to demand ro-delivery of
 Whom such crop has beon purehased otherwise than by bulk in
upen market. That the power thus conferred on landlorde chen bearket. so very rarelp or, rrised aA seareely to ammunt to a a rule wh:ch experieuce has proved to be uunecessary.
Purther, there are seroral districts of Scotland in which no Furthor, there are sevoral districts of scotland in which no
bull mafleets are held, and the increase of railway communi. bult marketa are held, and the increase of raitway conmuni.
cation and other causes bave, in many places, made sale by saraple the most convenient way in which farmers can conduc same protection against interference on the part of the land lord shoubd be axtended to salos by gample as has been settled
by long prastice to attuoh to sales in bulk. We aro slto of
 pregarding the sale of grain or other farm produce into conof courme, sales in breach of sequiestration mught not to he protected. And, as a means of preventing collustin, it woul t . against the ladiond's claim, that such elate, wherever made
ahould thave been followed by delivery of the eubject, and payment of the price.
With this exception, and owe other to be noticol immediately, we do not consider any limitation of the right now poseossed highly creditablo both to landlorde and tenhnts througbout for zent are of rare occirrenco. In one or twin distric:s they bave, during the lest few yearn, boen more numerous than
formerly; but it seens to us that these instances may bo attributod to local and tompotiry caviof; and they ato certahaly mot sufficient to empport the allogation that it is a
general practice among landlordas in relianco on the coonrity genich the law of hypothec affords them, to eatrust their farmo
to nclase of tonants whom othervise they would not be disposed to acoopt.
for obtaitiong payment of the rent the other creditors of an Insolvent tenaut often suffer moore than the landlord. But the ovidenee 1 thd before us has entiroly farted to show that the insolvency of farmers have been, on an average, greater than they are such as might not in a great dogreo be aroldod by the The position of the emalio
The position of the smaller class of country trajesmen and artificers is somewhat dititerent from that of the larger dealers,

GUANO AND EXPERIMENTS.
How often has it been said to me, "Mr. Mechi, you are an experimentalist, and of course, as such, it cannot be expected that your farming should pay you but we are much obliged by your losing money for our benefit, for you tell us of your failures."
This is very cold comfort for a man of business, and a very fallacious mode of reasoning, as I shall presently show. I consider no man to be a good and progressive farmer who does not experiment, for such a person is almost always enveloped in the mices.
old traditions, and strong prejudices

How often have I spoken of thin seeding, and the reply has been, "it won't answer on our soil;" and when I mildly inquired for the comparative experiments that had brought him to guch a conclusion, the reply has too often been- "No, I's answer on soil : I like mean, flant and a thick crop."

But is it either expensive or difficult to make expe riments in agriculture? Quite the reverse; a quarte or an eighth of an acre here and there will tel us a result as clearly as a whole farm. This has been my custom, and by such comparative experiment I have been enabled to deduce a practice suitable

But now, as to the value of guano, for superphosphate rarcly shows any good effect on our Essex clays owing, I presume, to our having already a sufficiency of bone earth in our soil.
I have been a user of guano for more than 20 years, and at a time when my practical friends ridiculed the idea of a "mere peppering" being able to rival the massive dung-heap. My general preparation of rich shed manure, 4 owt. of Peruvian guano, and 2 ewt . of salt. It was thought that the guano might, be partially superfluous atter such a dressing of grod manure; so to test it guano on a certain portion, and the result was a loss of 5 tons of Mangel per acre, which I could have sold at \(1 l\). per ton. But see what follows: this spring we as usual harrowed in (after the Mangel) \(1 \frac{1}{2}\) ewt. of guane Oats, and on the portion not guanoed for Mangel the previous year, there are at least 8 bushels less of Oats, and a proportionate falling off in straw. It seems very probable from the appearance of the young Clover that the effect of the guano will be traceable in that crop. Now when I am askel", "Ah, but, Mr. Mechi, does it pay ?" I will reply, Here is an extra expenditure o 2l. 14s. per acre, and I get in return for it 5l. in Mangel,
1l. \(5 s\). in Oats, and so much in straw and Clover. The fact is, we don't, as a rule, half manure or half cultivate and although I make so very much rich shed manure, it is clear from the above and many similar experiments, that I must not dispense with guano as an auxiliary I look for profitable results

Well, but then, Mr. Mechi, where is all the money to come from to buy this expensive guano and keep so much more stock P" I reply, Diminish the size of your holding; remember that it is the maximum crop that payg- the minimum keeps agriculture poor and humble.
Take the country through, and we find three-fourths of the land held too largely in proportion to the tenant's capital, and consequently unsatisfactory and unprofitable to the country at large, as well as to the occupiers.
With facts such as I have just quoted, and which I could greatly multiply, I must be excused for adrocating a much higher and more intelligent practice in our general agriculture, and a greater emancipation from old customs no longer suitable to our altered and progressive condition.

Let us always remember, with a humiliated feeling, that the statistical agricultural map of Great Britain gives \(4 l\). per acre capital, and \(3 l .12 s\). per acre return or gross produce. Can this be sacisfactory- When we reflect that commercial and manufacturing energy and progress have caused an rere of land in Lombard Street to be worth more than \(2,000,000\) l. for its fee simple However highly I may manure for Beans, I find it pays to put on for the Wheat that follows \(1 \frac{1}{2}\) cwt. of guano and 1 cwt . of salt. The omission of this shows great diminution in the crop. I always leave a smal portion to test the difference. Why should not my brother farmers do the same? J. J. Mechi, Aug. 3
P.S. - This wet harvest gives a signal instance of the sowing over a weal faccid, spongy, fluffy crop, pro duced by thick sowing. In the first case the ai circulates through and under the reerly sheaves; in the other, the soft compressed mass excludes air, and sit closely fitting to the ground, and by thus retaining moisture canses the grain to "gpear," and the straw to
become musty. My Wheats have suffered little or no injury from the rains, although still in the fields neither have my Oats or Barley. There is a mistaken motion that more straw is got from thick sowing tha from thin. The contrary is the case. My experience is that a crop of straw from thin sowing weighs more as well as producing more corn, than the thick sown The advantage of cleaning by hoeing must not be forgotten. I fear that this rainy weather has so stimu

EARLY DOMESTICATION OF ANIMAL IN ENGLAND

\section*{DOUBLE-EARED WHEAT.}

For the sake of opening up a field of inquiry, I send yon the bithertn barren results of my experimenting with twin-eared Wheat, "that is, 'two perfect and distinct evrs growing upon one straw. And I should be glad if mome abler vegetable physiologist than myself would any what probability there is of ever making these eports reproduce their like. I fancy that a variety in the animal or vegetable kingloms has sometimes originated in a lusus nature: is not the Purple lleech an instar re? and my Purple Peeches last year and the rear bifure bore Beech-nnts, thongh i lave not tried if they would grow into young Purple Breches. Theat inclined to think that the mans-branched Wheat called Egyptian or Mummy Wheat (riticum multiplici spici) arose from a monstrosity exhibiting a predisposition to extend the axes of the spikelets; for I have grown some of this Wheat, and found that in two years it lost nearly all its branches, reverting, I supposed, to the original character whence the monstrosity had sprung. Still this degeneracy may haro been due to difference of climate, - Wheat that mot caring nick-named '6hen-and-chickens" in Egynt, not caring to throw out half so many young offesioots in Theolnshire.
There is no doubt that double-eared Wheat would be raluable if we could once get it to become hereditary and permanent in type, supposing the quality of the coold not be good. The discoverer or inventor, if he reward, owing out a patent, would reap a handsome it is quite possible to obtain a variety of Wheat that will accumulate a greater proportion of its total weight in grin then any other.
in Theasingault found that the increase of dry weight in Theat plants between flowering time and harvest, mas no less than 77 per cent. ; and at harvest 450 planta, foilows: The seed, long exposure to the air, weighed as Bntraw, 32.6 oz . ; and roots, \(42 \mathrm{n7}\).-a.together 66 oz . not fixed relative amounts of grain, straw, \&c., are of the plant, whities : all just depends upon the liabit for our fields abound become the habit of a variety; bot our fieen weigh nbound with all sorts of proportions 40 grains weights of grain and straw. I find cars of fo grains upon 5 feet length of straw, and cars of thick crops wheet lergth of straw, in the middle of firnur crops where food, space, air, \&c., can hardly Whether a plant more than annther. I do not know and lenst to straw is more likely to running most to ear moderate-sized cars thane likely to be found with two can meet with a cars than with one large par; but if I mare corn than a variety that will give half as much shail he a benefactother, in proportion to the straw, 1 bigh-farming poractor to matkind, or, at any sate, to the emps ron to a prition of mankind, whose stimulated it thongh to fibrine instead of gluten and starch.
sonble-eared worth while to make a few trials with Agrerse, though others there being some slight chance of Agricultural Gazelte for friled before me. In the drawing of "Twinte for 1849, r. 363, appeared a B. Booth, of "Tarcler-h. \({ }^{\text {Praded Wheat," from Mr. W. }}\) Profesar Henalow wing. In a subsequent number, p. 378, entinei'y, grown two or thed that he possessed a similar
market. "The person who met with it," he says, carefully planted every grain, in the hope of reproducing the monstrosity. As might have been anticipated, he was unsuccessful, though there seems to be no absolute rule why a predisposition to produce twin ears may not be continued through the seed." In a number of the Gardeners' Chronicle, I Whret in what year, I saw a drawing of an ear of Wheat having additional spikelete branching from the notches upon the rachis; the Editur's observation being, that the predisposition might be hereditary, and if only o:le grain of sach an ear produced its like again, the offepring of that would he almost sure to perpetuate the new form. I think that I have also seen a drawing of double-eared Barley in a Gardeners' Chronicle of some years ago.
Now, double ears are not very great rarities in our neighbourhood; our gleanıng women occasionally pick them up, some superstitious wives immediately throwing them away as unlucky for people whose means are unequal to more than one baby at a tine! By offering a small gratuity for every double-ear brought to me, I have succeeded in obtaining a good many specimens; and for three separate years I have sown the grains in a plot in the middle of a Wheat-field, without getting one monstrosity, all the plants having borne common single-eared Wheat. The harvest of 1863 furnished me with no fewer than 67 of the "sporta;" they were sown together in a plot in a Wheat-field, but last harvest I could not find in their produce any indication of double ears, branches, or even extra spikeleta. I never saw a twin ear in a standing crop, or in a bound sheaf; but I an of opinion that 100 acres of Wheat produce a great number every year. Three of the above 67 were found by gleaners in one field of 22 acres. I do not see why the gleanings should contain a larger per-centage of sports than the general crop; and if the gleanings amounter to a quarter of a bust:el per acre, and the entire cron to 40 bushels per acre, there were thus (probably) 480 donble-eared straws in that field. That these should have escaped observation in the mowing, gathering, tying, stooking, pitching, Joading, starking, the eshing, is not surprising, when we consider the enormous number of ears among which (if there) thes were intermingled. At the rate of 610000 grains per buchel, and 50 grains per ear, the whole crop comprised \(11,264,000\) eare, each of the double ears being thus concealed anong \(23,466 \mathrm{c}\) mmon ones. It is quite possible (and from the number of these double-ears 1 think probable) that some of them grew from grains of double-ears; the proportion of ordinary cars, however, being so overwhelming as to prevent any annual increas of the others, - which would not be the case if the double ear grains were separated from the bulk of the seed.
I inclose drawings (natural size) of a few of the specimens now in my possession-two good twin. ears, one singular development of the straw, and one triplebranched ear, the only instance I ever heard of.

I inclore one branched and one double-ear, and hope tbat someborly interested in Whents will follow up my unfortunate experiment antil success is at last attained. John Algernon Clarke, Long Sutfon, Lineolnshire Auqust 11.

There is in the drawing sent with this coommunica
tion every stage exhibited between the two extremes half way (in the rachis) 1 nto two or more brabchiol several inclies below the car.]

The great French naturalist M. Florent Prevoat made the alimentation of birds his curpful atudy. "He collected and preserved the stomachs of many apecien, taking them at different periods of the year, and at various stages of their growth. He comes to the conelugion that they are more serviceable in the destruction of larve and insects than is generally believed, that this greatly countirbalances any injury they do to the crops, and that all of them are more ureful than injurious to man. This is high praise. They certainly appear to do coneiderable injury to many farm crops, and this is evident to every beholder; but how few look closely enough into the suhject to arcertain the good they do. The rook comes in for no small share of calumny. He is a great gormandiser, we know, of very many kinds of fuod: corn, pulse, flesh, fish, seeds, are all palatable to him, and occasionally he will pleasantly dine off chicken, the younger the better; but his real taste lies amongst grubs, wireworms, beetles, the larger caterpillarg, worms, and also field mice, eggs, de. He is indefatigable, however, in gearch of grubs, and will denude a field of pasture or a growing corn crop to get at the grub lying at the root-plantn. The eparrow equally divides the censure with the rook, and by many he is thought to be the mast mischievous. He is no doubt the most audaciona thief, and but few thing come amiss to him; but then from his very nature he is never idle: the fy, the moth, the butterfly, cockchafer, beetle, worm, caterpillar, and nearly all the insect tribe are constantly sought for and devoured by him, to ney but ittle of the sceds of weeds. This is great compensation for the injury and mischiof he perpetrates. The linnet is probably next in our low estimate of birds; he is a
ad enemy to our seed crops, upon which his tribe cmgregate in large numbers; but at other periods, particularly in the summer, their food is manly insects, motum, butterin winter the flowers and seeds of weeds, autumn and winter the destruction of which they do very pasential service. The lark, too, delights to scratch up easential seed Wheat, and "bill up" the first springing of it but his food e msists almost entirely of the insect tribe in their varions stages of insect life. The blackbird, who delights in our Cherries, and the thrush, his oceasional food. It is highly amusing to see them chase flying insects and large butterflie*. The chaffinch, hedge-spirrow, red-breast, bullfinch, wagtail, nightingale, black-cap, wren, titmouse, and the inartin and swallow, are all wen known and abound in orr gardens and or them do us some little damage, but for most part of them do us some little damage, but for fornd to be in earnest after worms or insects, aphis, grub and caterpillar, or their progenitors, while on the wing. It is altogether inpossiule fully to estimate the immensity of good they thus effeet. They undoubtedly do us more gor craps, our fickle c'imate will preveut a damaging increase in their numbers. \(O, F\).
The Harvest in South Essex.-Wheat here was unprecedentedly precocions, and was by the middle of
July fit for the sickle, scythe, or reaping machine. The want of labourers to cut it in due time, as I forewarned in my last paragraph would be the case, is now evilent. Where 50 strangers have generally appeared in former have this year offeren their services. Tise Excelsior reaper and other machines certainly should have been put into requisition, here especialy, where the most The system has very wisely been adopted on a large secured before the late and present rains set in, and very much more corn herealout might have heen cut
aud housed, and freed from the wet and wind now prevailing, which is now sadly sherdling the grain in poone localitis s, by reason of the rottemmesy of the chaff, to
the extent, of at least 8 buahels per acre. The Wheats in this district of' Fssex are neves theless on the whole much over the nsual averdge of 4 quarters per acere on months ago; and the \(\in\) ffect of gond farming, in my opinion, never was mare fully excmplised than in the present season. The sample and "eight of the grain yield in the ear, and the fact of its being 5 lb . per buskel compared with that of last seasmm full-bodied grain, comprising the most and the very best of flour ever remembered to be produced by the observed, that during the past year. \(g\) ond bread ani flour made from the very heaviest grain ever known, at a range of only 40 . to 45 . per quarter, have not been
procurable at less than \(6 d\). per quartern-this week bread is \(6 \frac{1}{2} d .!\) Whether this is a fault of the miller, or biker, or both, or the community for tolerating determine. \(A, H\)

Cattle Plague.-On looking over the Number of the Agrioultural Gazetto of the 12 th inat, I find a paze 754 , a communsication signed "M.D." suggesting a
purging drench of Epsom salts, sulphar, nitre, and ginger. Also a drench of chlorate of potash, ginger, Gantian, Cinchona bark, and Aniseed. The recipe is valueless without a proper formula, I wonld submit therefore that "M.D." shall mend his hand and give quantities to make

\section*{Eotittit\%.}

Bath and West of England.-The Cattle Plague. Society before the regular of the Cuncil of the menced, Colouel Acland, M. P., drew attention to the ionportance of taking some steps in reference to the visitation commonly known as the Cattle Plague, which is causing so much alarm in varions parts of England. Daw, by whom the arrangemente had been projected and matured, a meeting had been held at Exeter on the previous day, when a District Cattle Assurance Association had been formed, and a committee, comprising several members of the Council of this Society, had been appointed, with Mr. R. R. M. Daw as their honorary secretary: at the instance of that reeeting
be (Mr. A.) had undertaken to bring the subject under the notice of the Council at their present meeting. A. Sanford, Wellington, said, what the Societ
Mr. ought to do was to circulate the best infurmation they conld, on a subject of such vital importanee, among the agriculturists in the district of their uperations; nor was
there any time to lose, for the diseave was, no doubt, apreadiog in different parts of the country. In e nclution, he suggested that a handbill containing informaCouncil's authority, and that nub-committeer ahould be
formed fro:n amony the members on districts comprised within the area of the Society's operations, for the purpose of giving prompt and extensive circulation to such information.
Mr. Daw (Exeter) said that anything to be effectual must be done within a small area; everything depender on prompt action, and this was atterly incompatible
with a large district and cumbrous machinery. In Devonshire the danger was actually at their very doors, and one farmer, Mr. Snell, of Eg r Bucklart, had lost every bead of his cattle by it. The proper way to cope and he thought it highly desirable that a Mutual Pro tection Society should be established in every Poor Law Union in the counties comprised within the Society's area of a Poor Law Union was quite large enough for the distribution of insurance risk, and quite as large as consistent with promptitude of action. At the Exeter meeting on the preceding day, they utterly repudiated the idea of treating the matter in the form of a county movement, and at one of the largest meetings ever got together in the Guildhall, they had resolved to establish a Matual Assurance Association, confined to a distric coincident with the area of St. Thomas's Union, be-
lieving that that would be the best means of dealing with the evil, and leaving the residents in the other unions to follow their example. Hence it was that they had refused to allow several large stock owners in dis tant parts of the county to become insurers in the Exeter Iistrict Association, hut rather recommende
them at once to form associations in their own immediate neighbourhoods. This course of action was the more essentinl because of the peculiar mature of the disease. He would not attempt to describe it; that was unnecessary after what had appeared in the newspapers; but he divi not hesitate to say that when an valley was daken ill it should he killed at once. valley of the Nile, where the disease was altowed to
take its course, full 80 per cent. of the cattle were swept away by it ; but in Anstria, where they had combined in mutnal protection associations, and distributer the loss among a company iustead of casting it, onl destrayed, the loss was limited to 2 per cent. If they established associations with ton exten!ed an area - such for irstance as that of a county-they would need staff of pid iffluers, a secret ity, valuers, and so forth but if they contined their onerations to narrower limita it would be easy to find gentlemen willing to act as honorary seeretarips, and they would only need oue inspector, who wouk take an area co-extensive to that of a Poor-law Union and 110 larger. Such an area sould probubly be rep. be quite sufficient for ingume
 purpose-, and would, in the event of a bard visitation, bake quite sufficient demands oft the atteution of any one inspector. In the Exeter Association they proposed that every stocknower joining it should pay an entranco fee of 1 s , per hoad, stating the number of tock in his possession, and that he should pay such ther calls as might from time to time be made. The Association would be managen by a Committee, of which every insurer of 20 brallocks would be
eligible as a member, but it would also include persona of influence and intelligence, who, thongh not actually ormares of stock themeelves, might ohoose to show their interest in the ol jects of thie Assoniation by subscribing a though they were. In the event of any anima: reing affected, the first step would be to call in an ispector, who would have power to order its inmediate destruction; and two practical men having assessed the value of any animal so destroyed, its owner would receive two-thirds or three-fouths of the amount as might be agreed upon in the conditions of association. It must be obvieus that in small areas the affair would districts

\section*{Mr. G .}

Mr. G. H. Andrrws (Rimpton, Sherborne) contended that without the intervention of Government authority at the out-ports nothing effectual could be done. An animal imported at Southamptom the other day had communicated the disease to a!l the other anmals in a park where it was minodured, and all the ammals had since died. He did nut believe it pnssible for the most soientific man to sey what animals had the disease latent in thein or nut. The ouly plan hy which the
Government could stop the disense would he by entablishing at every port arraugements for the slaughter of snimals and the ingpection of the fleah fifterwards. Sound carcases could then be sold as in the London meat markets, withont any serious inter. neederi. He concluded by suggesting that Govern:Lent should be memorialised in favour of some euch plan as he had ventured to recommena.
A long ciscussion ensued. Lltimately a committeo was appointed to collect and disseminate information on the embjecs of the divesse, and with autharity to communicate with the chairmen and clerks of the Buards of Guardians in the several Unions in the sis western counties, with the hope of calling attention of agriculturists throughont the district to the importane"
of adopting due proctutions rgsinst the spread of the malady.

A motion to memorialise the Government to alopt additional precautions at the outports, in accordence with the suggentions of Mro Andrews at an earlier ntage
the Chairman
A meeting of the Committee appointed to ave disseminate information on the subject of the Cus: Plagne, was held immediately after the rising of 'is

\section*{and Weat of England Agricultural} Taunton on Naturday last, Mr. H. at a former meeting of the Council ponst of being
Journal, was elected secrotary
Munle; and Mr. Spacknan, Wath, was elected to superinteudent or director henceforth
- coen devoted to that purpose exclusively, a course readered ade of thẹ Society's operations.
Agbiccitcrat. Tmprovempat op Trbland. Cionmel. - The annaal meeting of this Society is being ficil bere this werk; and fines that there is an abundant exhitition of stook, Most of the classes are unusually large, and they aro filled wholly with entries from Irish exhibitors. The following Table will show the entries at the ans of the Society for the last five years:-

The etrength of the Cattle classes is with the ShortChieftais." of Mr. Moffat, of Finniscorthy, TVexfurd, is a sand level benst with a fine touch; and the 2.1 prize bull of Mr. Fitzpatrick, of Templemore, Tipperary, doplays hive dimenaions. The next class-uf bulls celved in 1863 - is well filled with entries, but better animis are to be seen at the Dublin Society's Show.
However, the 1st prize red bull "Felix," of Mr. Wallis, of Drishane Castle, Cork, gained the 1st prize at the Dublin Spring Show, and another 1ot prize at Cork a fortuight ago. In the large yearling-bull clasa, the 1st prize rod bull, "Chief of Lothian," is shown by Mr. J. Once Dien, Waterford, gets nothing for his capital bull placed \(2 d\) at Dublin, The 13 bull calves pake a placod 24 at Duss. Mr. Anderson's "Dictator " is splendid; uis "Squire Haclinger" liftle inferior; Mr. Mutler'
two calves receive well-carned commeudation two calves receive well-earned commandation;
\({ }^{4}\) little white beaty 19 exhibiterl by Mr. C.owke? of New Ioss; and Commendations have Cowke,
 lst prize cow " Récherché," out-and-out the best and by Mr. Booth's "Mouk," she has grand form and sylf, has a beautitul roan coat, and haudle like
Rates cow ; she won the l st prize as a calf at Cor of Bules cow; she won the 1st prize as a calf at Cork, the Nociety, and only yielded the palm at the Dublin Spring Fidew to Mr. Eastwood's magnificent "Frederick" Plenty of C mmendations are armarded in this class. The class of six heifers calved in 1863 contains a very potseasing ronsaiderable merit. Wr. Massey, the others amod cl ase, the lst prize, "Medora," of Mr. Bloomtheld, of New l'ark, Watertord, being extremely pretty,
Hhile Mr. Anderson and Mr. E. J. Smith, of Islanmare, Crom, Limerick, show calves littlo inferior
In other classes of cattle several stalls are empty, the Fry much like a panic (at present very unreasonable) prev.ils in some quarters, and a feeling is strongly exprased that Government ought to stop the trilling
Irish inports at once, seeing that such a measure could oppribrium in case the pest should be introduced into opprainrinm in case the pest should be introduced int
this land, which lives by its cattle. Fimes (abridged).

\section*{Interness-At the annual meeting of the Highland} dent of the Society, spoke thus of Highand Agricul-
tore:-'In not help contrasting the picture which the day I could rented to me, in the improvement which has taken place in the Highland cormeties of Scotland, witl London with reference to the condition of these end of the montlan, of June, I received ach, towards the iote from a gentleman who may be well-known mminence, connecterl with the social and eronomic - Professor Lendon, a foreigner and a Jew by birth tio "rote to me that a very distinguished man, paper upon the agricultural and social condition London, and asking ine if I fore a statistical society paper. Nom, 1 was very anxious to do so, becauga I Tant of information respecting the real condition of the the soath of Englanid, especially many of our friends in and which often, I am afraid, is prevalent in the
mothern districts of Scotland. I went. and I must
sat then of information to whin respect to the peculiar absence trone sanguine expectation I have alluded exceeded my I inform you will be surprised - I think your will - when
 anri, and the phenomper prolessed to account for this nod all the southern countios the whole of Eogland a ont the counties caunties of Scotland, and many
donbtedly a most melancholy fect that the Highland deasunties of Sootland were in a stuguant, sud eveu in lence of the impression to which I have referred, is the common noti is, which was evident!y the notion of Dr. Leone Levi, that the introduction of sheep farming into the Highlands was not an addution to the ancient culture, but war entirdy in substitution of it. Now, I believe this to be a very general mistake. The truth is that, bofore sheep farining was introduced into the Highlands, the pasture of the higher mumntains was wholly lost to the use of the furmer, and the low grounds gave foxd to a few black cettle, while the lower slopes
of the monntains during the three months of smaner of the mountains during the three months of summer little shealings which all of us have seen in our walke on the mons. But the pasture on the higher monutaino pastured there. It was entirely lost as far as rugard the production of food for the human rac.: The introduction, therefore, of sheep farming, whioh took place exnctly 100 years ago-for I believe 1764 was the sire year they saw this aystom introduced into the High-
lande-was as really an addition to the foud-produciug capabilities of the country, as if the tops of the mountains lad been for tho first timn reclaimed from the ocaan. I do not mean to say that shrecp tarming glens of cur Weat particuiar diatricts-in the narrow maintain a miserable cultivation, living upon very bad Oats and very bad Bere-1 do not mean to say that
sheep farming may not have been a subatitution in sheep farming may not have been a substitution in
some of those localities ; but I mean that shoep farming some been, not a subatitution of ancient tillaga, but wholly in addition to it; and if you comnt it acre for acre, you have four or five times the amount of limd
under tillage now which you liad 100 years aco. And one of the heat proofs of this is the extraordinary and almost incredible rise in the value of land which has tikken place in the course of the lase 100 yeurs. Toillue trace this I may meation a particular case which cume
under my own knowledge during the last few yen under my own knowledge during the laot few yeara I be 100 years ago, and at the conclusion of the civil war the rental was about 5000l. It is no longer in the hands
of one person, hat is separated iuto several harda ;and I kn )w that the lampa which from 1756 ta 1760 represented only between 5000 l. and 6000 l. a.year, now represent a rental of nearly \(\uparrow 0,000\). Now, making full allowance for the difference in the value of money, you will at once perceive the sort of inorease that must arise from having the new cultivation and the enployment of land
in entiraly new purposes; and I must bay that at a time like this, when the working classes are paying \(9 d\). to 10 d . \& pound for meat, this does seem the
strangent accusatum to bring asanst the Highlamh, strangent accusatun to bring aganst the highlanks, skill an loutlay of capital, to increase the muply of frod for the country. A third proof of this misunderstanding is the undoubted fact that, at certain intervals, there have been periods of distress in the Higblands. But I think if you inquire iuto the fact you will find that the distrens has aliays taken plice ex.actly where the old aystem has remained unchanged, where we
lave a very poor cottar peasantry without' capital and without skill, living on Potatos and the pruduce of their little crops, and who, being exposed to the
vicissitudes to which our climate is particularly exposed, have felt the pressure of fanine, which bas, in all circumstances, been a great affiction to the Highlands. Before passing on to another subject, you will allow me to say a few words with regard to the other tenantry. I believe some of the most successful instances of the neighbourhood of this city. I am told, for example, that they are very thriving and successful in the
district cailed the Black Isle, which, aithough it no doubt at one time deserved its anpellation, ought now more properly to be called Yellow lsle, from the beautiful crops with which it is covered Bat I believe the siwall crofter tenantry will only be able to maintain their places where they are enabled to oke out their subsistence by daily lubour; and I believe
that in cases of success it has been in consequence of that in cases of success it has been in consequence of
their nearness to towns like this. But in the western district of the Highlands, where access to labour is more difficult, I believe the small cottar tenantry will be naturally replaced by a much larger class nf farmers; and I do not believe this will be much lone to the country; but, on the contrary, as regards the produce one more for the better than for the worse. I da not say this, gentlemen, withont full appreciation the merits of the small tenantry; bat it appears me that, after all, there is a very great mistake in the Highlands. The tenant farmers of Scotland ma rightly be divided into three great classes. At the lower end of the scale you have the small crofters t. which I have referred, and at the other eud of the scale you have the great cap.talists of Berwick an i the
Lothians, representel in the Highlands by the larger and more extensive grazings. But botwoen these two extremes there is a large class who are not embraced in them-the great bulk of the tenantry of Scocland, what I may cill the middlo-class tenantry-men paying
between 100\%. and 500\%. a-year. Now, although believe it to be true that the small cottar population o
the Highlanda is deereaslage I do not belfeve that thie middle alan is dicrensinga but, on the contrary, is ineroaning: I myself have had some peraomal experiphre of ath thes. classus of teanatrs, and I hanw wery well the immense advantage wheth it sometimes is to men who own latad, and je see-sing great reamrees of stheir own. I know the onnest in sueh circumstanoes find their rente rery secure, and that there is very little trouble for tho outlay of capital. I muat any this, that teanants lay out greut capinul themedves wichout asking their lanilords' amsintanco. I mast say;
pasaing from Berwickahine and tho Lothanr, that I never can cease to adwire the maguificent cr.aps there exhibited; and nutwithstandiug my own praference perbapa arising from early moonatious ant if m the appearance of the country with which I am mons fumiliar, and where I clitely live- I comess that I保 bo ungrateful to a class of inens homen. I should the landowiers of scothand nre wheter, 1 becinve, obligration, if I did not way lliat I helnev! I Lamed deal place under the caro of men is scotland has tahen capitaiut, who liave meldom more capital the juat anough to stock tho farm, and have beyoud time to depend upon their owa labour, and that of Hwir sonn and danghters. I shand itudend decqly rigret any cbange, from whatever caves it might cume, whioh would tend to depreciate or diapumge the
middle-class teanutry in Scutiand, or which would tend to substitute for them men of great rapital like the
 rotime to thive and jincisper, and that it will bo the Now, baving said so the scolland to preserve them. reaces that have been erroneously drawn fion falay Statiatics, glow me to pass \(t\), amothict bul.jures, to which over this Suciety, and "hich I muse hur agun presiding and to refir to, as it is the last time 1 mhall have the amd that is the impmetunce of having real, grmuino of information by arme euninent men ns Prop Levi. I don't thinis that the errors iuto which that gentleman foll were due to the fact that be relied on atatistice: on the contrary, the orrors into which hu and others tell are due to the fect that we have no reliable atatistics ougriemture in thing compry. It is confession at this time co day. I do not ryy this deypro. Catory of thr Ifighland sieciety; becanan, s) fir an the exertions that liave been made by our distinguinhed speretary, Mr. Hall Maxwell, we have altempter to get something likea syatoin of agricultural statistios for \(\$\) cot land; but from various causes, to which I need not refer the attempt broke down. The only part of the United satisfictory statement of its athicultaral produce is the sister kinglom of Irelmal. I have maw th inform you that it is the intention of har Majo- 'y 's Govern iment to endenvour to get England and Scotland to The difficulty hitberto standing io the way is that we have not har in England and Scotland the same an eurnest appal to the tenant-farmeme ore make intelligent enough to know the smportance of know ledge in all its forms, to second the exertions of the Government to enable them satiafuctorily to may what Kre the number of acres under each crop in the United
Kingdom, and to give all such information. Were this done, and had we a good syatem of agricultural shatistics, we stould be able more effectually to refute the erroneous statements made by Profensor Levi in his paper.

Northumberland. - At the late annual meeting of this Society Earl Grex spoke as follows on the agriculture of the county : - He was told by those who
were far better judgea than himself that in the show. were far better judgea than binself that in the show-
yard there was abundant evidence, in the excellence of yard there was abundunt evidence, in the excellence of progress which agricalture was making in the county, As to the fact, he thought that no doubt could be entertained by any who like himself, were old enough to remember what the state of things was twenty-five or thirty years ago. The change in that time seemed to remembered that at that time attempts which had been made to iunprove farming were few and feeble. Now, on the contrary, scientific furming was almost universal throughout the county. The sums which had been spent on drainage in Northamberlasd in the last 25 years alone might, he believed, be written not by thousunds of pounds, but by hundreds of thousauds. They also saw similar improvemente in farin buildings, espethe cottages of the farm labourers. He could remember the time when the dismal Northumberland tarm cottage was almost a by-werd in the kingdom; and to a great extent he tbonght they deserved the reproach
- they had incurred it loy the state of their cottages. But he was happy to believe that at the present momen
there was no county in England in which more had been done in a limited time to improve the dwellinge of the labouring class than in the county the which had also seen a wonderful change in the process of cultivaalso seen a wonderful change in the process of cultiva-
tion. Up to a certain number of years ago everything seemed to have got into a state of stagnation. People merely followed the beaten track of their forefathers, and there was scarcely known an attempt on the part of farmers to depart from time-honoured practices of former days. But they had latterly awoke from their trance. Kxtraordinary efforts had been made; and they now saw in every department of farming wonderful change. The implements which they now know were no longer the old-fashioned ones of their fore fathers; and there was no county in England where a larger proportion both of their Grass crops and of their corn crops was got by machinery instead of by hand than in Northumberland. That had all been done in a few years; and he was intormed a few days ago by a tenant of his own that the cost of harvesting the crops was all improvement. And in the same manner the increase of stock and the improved modes of managing it-the improved modes of cultivating, were all testifying to the progress which had been made. No doubt the farmers had a hard task in bringing about the great improvements they had done; but they had proved themselves equal to the task, and the proof of it was land was higher than at any former period, and it apparently tended rather to rise than to fall. The difficulties of the farmer had latterly been very great, but perhaps in the last 12 months those difficulties had been greater than usual, because, if he was not misinformed, the past year had been one of pressure and heary trial o a they had most of them found that the corn crop of last year was a very disappointing one, probably owing to
the severe winds which prevailed at the critical seazon, the severe winds which prevailed at the critical seazon, expected; and while the greater part of England had the contrary, the farmers had in general less than they calculated upon. That fact had been a heavy trial to the farmers of Northumberland; but it liad been me in a great deal no doubt by the high prices they had received for their stock. That seemed to him to mark a sign of the reduction in the price of corn to which
they would have to look forward in the future, because he did not think, if they looked to the future price of that commodity, they could look for any high price for corn in this country. Agriculture was extending and im proving all over the world; the Focinies of transporting adopting railways, and even those countries which had been most behindhand and the exception were now adopting the railway. Thus those inereased facilities foreign countries more easy, and our population wer enoying the inestimable benefits of that cheap foo which couduced so much to the general prosperity, and it was not likely we should return to the old prices. With the population, their increasing numbere, as well as the increasing daily comforts of the people, would promote the demand for woollen clothes. On the whole, he thought that, with respect to farmer's stock and the growth of wool, they might look for a continued high price fur some time to come. And that appeared to point out to them the direction in which their efforts should mainly be made in endeavouring to meet the difficulties which surrounded them as farmers. As to the increasing of the corn crop, he could tell them that it must be done in combination with an increase in the production of stock, and though there were great difficulties to be enconntered-especially in certain districts of the county-in increasing the proportion of stock, from the nature of the soil on some of the heavier lands near the coast, he did not consider the matter great difficulty. He looked to their deriving grea assiatance in that respect from the recent invention of the steam plough. He knew that some of those who had already tried that implement had been quite astonished with its benefits, and they believed that in \(\varepsilon\) few \(y\) ears people would see the flat and heavy lands of this they would by that means be ennbled to raise a large proportion of produce than was now done. He also was almost in vain to grow euch crops anless they could have them often. Much, however, might be done in that respect by the use of portable rails or tramways, great extent, and which did very much in preventing land from being injured in getting away the crops.

\section*{Farm Memoranda.}

Wo take advantage of the immense body of agricultural Edinburgh to publish such extracts from it as will indicate the existing style of Scottish agrical ture, and the enterpriso and energy of ficottish agriculturlste.]

\section*{(Continued from page 761.}
11. The Mancre Trade? Mr. William Hope-
My firm (MacLean \& Hope) has large transactions in these arriclea. (Mactean \& Hope) has large transactions in farmers ; most largely in the Lothians, birge number farmers ; most largely in the Lothians, but also in othe
parts of Scotland. In 1863 and 1864, the amount of seeds, guanoes, and other manures and feeding stuffs
which we sold in the three Lothians, was 190.000 . for 12 months: our dealings with other counties are ou smaller scale. During the same time we bought about 75000 . worth of all kinds of grain from the markets around Edinburgh. The principal markets from whech we make these purchases are stock markets. The stock is put down in the market, and generally delivered that day; though to a large extent, in East Iothian, Edinburgh, and Dalkeith, the bag is only put down, and the bulk delivered the following day, or two or three days afterwards. The mass of what we buy is presumed to be in bulk. It is put on at the station nearest the farmer; but the day he sells it, it is in his barn a home. In Edinburgh we pay the parties with whom we are acquainted, if the stock is at the railway station against a delivery order. If it is there, and we get a railway receipt or a delivery order, we pay that day; it is at the Edinburgh station, the whole is entered in the market books as sold, equally as if it were in the market. At Haddington they enter the quantity given in by the farmers, and report the sale as if it were on the spot, and the buyer and seller arrange how and when it is to be delivered; but the whole entered as soid, whether it is at the railway station o still in the farmer's barn. The same rule is followed at Dalkeith. About three years ago we had some difficulty as to payment before delivery of the bulk the merchants relusing to pay till the stuil was brough of them don't ask payment till it is delivered the followof them don't ask payment till it is delivered the followupon to pay over again once for grain and once for seeds Our terms of credit are three months for Peruvian guano, and four months for other manures. We profess to exact payment at these terms, but we have frequently to give longer credits. If we had not to incur risks in many sales to the extent which we do by long credits, and if they were altogether cash transactions, I have no doubt the trade might be conducted with equal
profit to us, and with a saving to those now buying on credit terms, to the extent, say, of \(2 \frac{2}{2}\) per cent. Suo posing the law of hypothec were abolished, and the uncertainty as to the tenant's position removed, 1 have not the least hesitation in saying rougbly, that the prices would be reduced to that extent. Taking different parties chosen throughout the higher and
lower parts of the Lothians from 1855 to 1862 , lower parts of the Lothians from 1855 to 1862 ,
find that in one case the value of the seeds, manures, and feeding stuffs used, is nearly three times the rental of the farm. The rental is \(849 l_{\text {o, and the }}\) expenditure ranges from \(1040 \% .10 s .3 d\). to \(2263 l\).
12. Edington Mains, in Berwichshire : Mr. John Wilson.-I farm 1140 imperial acres, arable. I am also tenant of Rawburn, a Lanmermoor sheep farm,
about 4000 acres. Ny rent is 3700 . I am author the article Agriculture, in the "Encyclopm lia Britan nica," which was also published separately. My term of entry for all my farms is Whitsunday and separation of crop. My first rent for my low-country farms is payable nt Whitsunday, 12 months, and for the sheep farm at Martinmas, six months after entry. The term of payment for the low-country farms is a very usual one, though there are many variations. Under a forme lease, my first term's rent was postponed for \(£ 1\) months
in the lease now current it is brought forward nine months, and that is becoming a very common arrange ment in Berwickshire. Speaking generally, I think the term I have named for arable lands is one that very fairly meets the interests both of landlord and tenant. tis a fore-rent so far as the corn lands are concerned because it is paid three months at least before the crop is ripe. Upon my low-country farms my annual pay ments for purcbased manures, feeding stuffs, and
whole farms. These payments are perhaps not so tare in Berwickshire as in some other counties, because thare is little or no Potatogrowing in the county, and the Turnips are wholly consumed by live stock. Ihave suffered no direct loss from the law of hypothec, because I never happened to be creditor of a bankrupt
tenant ; but for the last 34 years, during which I have tenunt ; but for the last 34 years, during which I hav
been a farmer, I have had frequent opportunities of witnessing its effects. I bave cone to a pretty decided opinion, that the law, as it stands, operates injurionsl to the whole agricultural interest, including both land
ord and tenant. I have observed three classes of evil consequences arising from it. The first of these is of where persons have had to pay over acain to the land. lord for produce honestly bought, and paid for to the tenant. I think I could coant on my fingers all the cases of that class which have occurred within my own observatim, or which I have heard bout. They have been felt by the whole community to be a great injustice, and they have caused a great scandrl whenever
they have occurred. A more numerous and very dis. tressing class of cases are those in which tradesmen, who have furnished commodities indispensable to the working of the farm, have virtually had their property confiscated. The landlord has been paid in full; and though their cominoditiea have gone into the land, and were as indispensable to the working of it as the labour of the farm-labourers, these tradesmen have either got nothing at all, or a very amall composition for their
debts, I refer to cartowrights and mill-wrights, who
have put up machinery, which has been virtailly
fiscated; blacksmiths, saddlers, bre meated; manure dealers, and lime-burners, bikers, es occasion to ouserve instances of all these pive where losses of a very distressing kind hapa is really the worst of all. I allude to the referms which the law has upon the letting of land appears to me, that it has in very numeron who undoubtedly did not possess adequate capith tendency of it has appeared to me to be, to crece andlords or their agents from that prudence oresight, which it would be otherwise necessary such important transactions. I know that the many andlords and acento who act as prudently as they would if the law did not the tendency is as I have said; and I have re numerous instances where the effect has been to to the acceptance of tenants opportunity fexamining lists Where 1 have had have observed that the men of least means were most reckless in their offers. Those who were usp n insufficient capital, or on borrowed capital, were cautious than men who had substance of their own have also seen this consequence ensue, that the lendind by accepting a man as tenart, and into anto his means, gives him facilities for obtaro. credit which he would not otherwise have; do think that a serious injury is done to those this men around who are naturally led to deal with th man, and who have not the aame opportunide knowing what his real circumstances ar lord must have. That effect of the frequent occurrence in my observation, and I thium s the worst effect of al!. I cannot say that I way to a total abolition of the law, becalla landlord should have a reasonable security should be shortened considerably in its opention I understand that it enables the landlord virtually obtain payment of two full years' rent (taking account the stock and growing crop), leaving to the other creditors at all. Now I think too extended. When the law originated, th: s. here untry was rery or tenants, and the rents could only be paid being given; but the state of matter different, that I think there ought payments of : a considerable extent; but I think, whe's the term's payment arrives, if the man preferable claim over what is on the farm. I wokl entirely abolish that part of it, which allows gnim be followed in the liands of bonả fide purchasere think that is nothing short of an outrage. sale by sample should be made equivalent to a arie bulk. I think any change in the law should not aud existing leases. One main ground on which I deairs see a change, so far as landlords and temanto cerned, is, that I think it would lead landlord to do what many of them do at present-viz the greatest care, by inquiry and by requiring
pronf of sufficiency of means, to ascertain that who proposed to become a
person to put in that position. I believe at is by all who have inquired into the subject, that Scotland and England nothing against the progress of agriculture and ness of the soil, as its being occupied ly men insufficient means. Every improvement which has introduced has been in the direction needful that a tenant, in order of matters. I cannot say that I ha deterioration
respectable

\section*{There are none of the very small cla} by one or two pairs of horses; and speaking g that class of tenanty are in as gno
proportion to the land that they the larger farmers, and they usually terms that others do. A change of the farms in Berwickshire, and the and pays \(4 l\) or \(5 l\). an acre
there is a more industrious county. He lives in the vicinity do a little carting. Many carry on and don'
chink that tho capital at the looldinge they occupy. Not oul Fingland, a very large proportion farm (apie:nl. It rents were forehunded require more capital in many cases, already. If a tenant had a farm of
funm, if the law were repealed and the reuts made \(\mid\) We commenced culting Wheat a fortaight ago, and fore-rented, tha that extent probably not be able there is no lock of canital and no lack of farmers with adequate eapital in the country. The competition for every farm that comes into the market is suticient provi of that, and I think the change waid lave the effect of graduilly leading to the selection of a different class of men. I don't mean that the size of the tarms wouh be different, but it would lead landiords to be more careful in accepting offers to ge that the person offering had adequate means to meet the rent and collateral engagements. I would ratler not express an opinion on how it might operate onthe large class of impoverished cottar-farmers in the Hiphlands; but, so far as my own orservation goes, are many inen who succeed in getting farms at present who would not do so is a ditferent state of matters, and I think it would be better for themselves and others that they did not. I am aware that in many cases landlords, or their agents, do what I think they should alferer insist that he shall produce to them satisfactory proof that lie possesses adequate funds to stock the frrm, but I believe they are usually satisfied with that without asking anybody to become cautioner for pymment of the first rents. I cannot see why, in pronciple, there should be a distinction between farmLabourers' wages, which are a preferable claim at preent, and the accounts of blacksmiths, carpenters, and other tradesmen, who as certainly perform part of the labour of the farm as those who plough and do other agricultural operations, because without thei mork and furnishings the business could not be carried on. I aloo think that the accounts of merchants from whom seeds and mariures, which go into the land and become the property of the landlord, are bought, stand in a different position from personal debts incurred by the tenant for his household living, \&c. I am not prepared to say that these should be preferable to the landlori's claim, but they should stand more on an equality, and I think that would be sufficiently provided fur by the change in the law which I have indicated.
(To be continued.)

\section*{Calendar of Operations.}

Clatrbris, Isle of Eix: August 8. - We have bad another most unusual summer. Frost lingered long into the spring, and then in April Midsummer heat burst upon us so suddenly that all vegetation, from a state of barrenness and dearth, sprung into active life. From that time until the end of June or beginning of July we had scarcely any rain. Frosts t50, returned with cold N.E. winds the last thre nights of April, and did incalculable mischief both to tie Grass and corn crops. Wheats hurried into rapid growth by the unseasonable heat of April, were unfitted forgely, in severe change, and consequently suffered largely. In some of our fen districts they were cut down to the ground, and where not wholly destroyed brown to seat again from the bottom, and have since grown weak ard sickly. We estitrated our own loss by hose three nights' disaster at something like \(500 l\), 80 fickle and liable to injury from atmospheric changes onr fentland.
The drought of May and June occasioned our pastures ances the Grass was dead, and to all external appearances the Grass was dead. Not a vestige of green was be found, but brown barrenness characterised the frome. It was with difficulty that stock could be kept Tas shrinking and losing condition. The hay crop was the lightest we ever remember to have seen kathered. The rains of the last month have altogether anterer the appearance of the country. Once more ou: of an look green and fruitful, and we have the promise hich has of the has lately visited the metropolis and other parts cattle will ry, causing such fearful losses amongst the winter supnake farmers very timid in purchasing their is their supplies for manure-making purposes, -for that their only use very frequently in this neighbourhond. asefoul mees of profit we cannot regard them, but as houl Rabines we are compelled to have them. fair crop, althous planted well, and promises to make a has to some though covered with "smother fly," which Mangels on cool lands are it and retarded ita growth. crop. Coleseeds lands are good, and will be a heavy ceal inftested withe generally a good plant, but a good frequent shorvers fly and other insect pests. The loquer tempervers we have had lately, will do much to help it, and it may jet prove a good crop. We sowed some early in June, weil.
It is merely uttering a truism to say, that the excesrepps on rint of April, May, and June made the Wheat ein.ft in the straw soils very light in bulk, and very boll, ant wheraw. We never before saw them so bralk. We are compelled to on the ground, so light in impossible to reampelled to mow everything, it being Te have a fair quatity. On the earliest ripening soils monh mildew quality, but on the later lands there is inlerior corn in There will be a great deal of thin Dears since we sam en districts this year. It is many dars since we saw mildew so prevalent and so mavere

Oats are very various; on some cool lands we haves on warm dry soils they we have aver grown, wheren generally is not favourably reported of, The crop greatly improved by the raiua five weeks ago.
Barley is shorter than usual, but has a good head, and looks like yie!ding well, and produciur a rood average quality. Beans and l'eas are botia well-podded but viry very much in the length of the straw, accord ing as they are on a gravelly or (lyy subsuil.
As far as we can yet estimate the Wheat crop in this immediate locality, we should say it will be from one to one and a-balf quarters per acre below an average and the quality will range from very good to very bad, but we fear much more of the latter than the former. Oats we should consider slightly below an average. Barley quite an average, perhaps a little over. Beans and Peas an average. Potatos at present promising but disease may, as the result of the heavy rains of the last few days, soon appear. Kobl Robi, Mangels, and Coleseeds a full average crop. May very bad indeed A. S. R.

Che (Garontegi Chromite.
SATURDAY, AUGUST 26, 1865.

In drawing the attention of our readers (p. 673) to the rage which sometimes exists amongst us for certain tribes of plants, we endeavoured to show that, on the whole, this enthusiasm is not without its good results. It may be true that this marked preference for certain families of plants, or for what we suppose to be an improved race of florists' flowers, may sometimes overshoot the mark, yet upon the whole we have no reason to regret the general results, which are certainly of the most satisfactory kind. Our gardens are rendered more cray ard enjoyable, and our Parks ard Pleasuregrounds have added to them quite a new feature by the introduction of foreign trees and shrubs. Moreover, the results are also apparent in our forests and on our hill sides, and a rowdily number of exotic trees, which hare made themselves at home with us, are like! to become of considerable importance, not only on account of the (隹ect they produce upon our landscapes, bit also in a commeroval point of view, owing to the value of their timber. For these results, therefore, wo would give every
encouragement to horticultural or arborienltural enthusiasm, thankfal for the good it leaves with us, and exxoning any little prejudices or imperfections whioh may be perhapa inseparably connected with it.
Our main object in alluding to this subjeot was to direet the attention of our arboriculturists and landseape gardeners into a somewhat different channel. We acknowledge, with gratitude, the effeets which have been produced upon our garden and park scenery by the introduction of many trees and shrubs of foreign origin. Need we name as examples the Indian Deodar, the Arsuoaria of South America, the Pines, of California and Southern Europe, the Glyoine of China, and a thousand other things which are now naturalised in England. There is, however, one ollass of trees which have been hitherto much negleoted, but which we are glad to see are now attracting the attention of landsoape gardeners and planters-we
allude to those which have DEEPLY-coroorkb allude to those which have Debply-coioured
Foutrage. Upon this ollass of trees a little of the enthusiasm to whioh we have alluded would be well spent. To all who have grown weary of such things as Pines or Ferns or Orehids, as well as to those who are proving constant to their first love, we say, " here is a subject for your onthusiasm; it will amply repay any exertions bestowed upon it, by enabling you to leave a beantiful and permanent mark upon our landscapes."
The rage for trees and shrubs with rariegated foliage has supplied, and left. with us, a number of very remarkable and effective objects of that clase. Wé have amongst others our variegated Hollies, Ivies and Honeysuckles, and the splendid Golden Yew with which Mr. Barrow produoes such grand effeets at Elvaston Castle (see p. 938, 1864). It is not, however, to this olass of plants that wel
are now alluding. The lore for such beantiful are now alluding. The love for such beantiful
objeots is rampant enough and needs no fresh spur from us. We plead for the extensive cultivation and use of trees and shrubs which have leaves not strikingly variegated but richly coloured. Already we have several of these things common in our parks and gardens, such, for example, as the Purple Beech, the Purple Hazel, and some others alluded to by Mr. Batexan, in his address to the
Royal Hortieultural Societr on the 27th of June Royal Horticultural society on the 27th of June
(see p. 605). We need scarcely remark that we cordially agree with Mr. Batrman as to the effects produced upon our landso ipe by these trees. "With materials such as these," he remarks, beautiful sylvan sconery might bo oreated which even persons with comparatively limited means might afford to provide.
Were the taste for suoh objeets more fully to supply \(i\) it. Many of them, as we have shown, are already amongst us, and many more would be soon forthcoming. Perlaps no class of trees would be more valuable for the object we have in view than the Maples of Japan, They are very remarkable for the rieh and beautiful colonr of their foliage. Some of them have leares of the deepest purple, or red, or yellow, and others have their foliage most curiously marked. Nearly ali take on the most beautiful autumnal tints, and produee a marked and pleasing effeet at allt times on the landseape. We have frequently thought that it must have been one of these Maples that Padre Huc met with when travelling in Chinese Tartary, and about which he tells such wonderful stories. Those species which are found in the eentral or more northern part of the Japanese
Islands would probably prove quite hardy in our Islands would probably prove quite hardy in our
climate. Many of them are now in Englaud, although at present extremely rare. At Mr. STaxDisir's sale last year his collection, which Was rery rioh in Maples, was entirely dispersed. We advise the possessors of these plants to take great oare of them, and to propagate them extensively, for if our taste takes a turn in the way we have iodicated, they will be much sought after, and will prove of great value.
We come now to another question,-Would it be in accordance with the rules of good tasto to plant these trees extensively in order to produce an effeect upon our landsaapes? We say "yes" without the slightest hesitation. It has been our lot to travel much in foreign countries where many of these trees to which we have just
alluded are at home, where they have been planted aud reared by the hand of Nature on the bill sides, and wo can bear testimony to the faet mases of brilliant colouring of resting on those masses of brilliant colouring of many different
huas which they present, and more particularly in
autumn, when the leaves are ripening before they
fall. Our own experience has been principally in Oriental countries, as in India, China, and Japan, but American friends have given us glowing pictures of the effects which these trees produce on the other side of the Atlantic, and we readily believe the pictures whioh they have drawn. If Nature, then, shows us suoh an example, we can searcely do wrong in following her, and we need not question the taste which leads to so muoh enjoyment
With materials at hand of the kind we have indicated, we would advise all lovers of hardy trees to direct their attention to the subject, for it is one whioh will amply repay them. Let us have the same amount of enthusiasm displayed for these trees with richly coloured foliage as we have had for Pines, Ferns, and variegated plants, and the most striking effect will soon be produced in our landscapes. We commend this matter to our landscape gardeners, and to all who are engaged in planting trees. \(F\).

We mentioned (see p. 746) the extraordinary failure there has been in the Apricot Crop, from premature decay, partly attributable to the attacks of insects, and partly to something wrong about the trees themselves, which seemed to predispose the fruit to decomposition. Where the fruit was ripe, it in most cases fell off, but where this was not the case, it ultimately dried up and remained upon the tree, and it is now evident that the mischief is not confined to the fruit, but has extended to the little spurs, or twigs, on which it was produced, or rather perhaps there was something wrong about the tree, which first induced decay in the fruit, and ultimately of the productive shoots. These are already quite deal, and cut a very sorry figure upon the trees, a large portion of the wood of which in many cases will have to be out out next spring. In every case the disease, for such clearly it must be called, is attended by profuse gumming, which either hangs down in long colourless or yellow strings, or forms large discoloured globules, especially at the point where the stalk of the fruit is attached to the ring. The disease is not confined to one variety. We have seen it abundantly in the Moor Park and Breda Apricots, especially the latter, less so in the Roman, and soarcely at all by comparison in the Peach Apricot; nor is it confined to a single garden, for we have observed it in every garden which we have had an opportunity of examining in the neighhourhood. It is difficult to account for these inflictions, but it is probable that a sudden and bountiful accession of moisture after long drought, together with the comparatively low temperature at night for many wetks, has had a great part in its production. At present we have seen nothing of the kind in Peaches and Nectarines, but now that the time of ripening in these fruits has arrived, we should not be surprised to find that there is a similar failure. M. J. B.

Althouar our British foresters may not be so immediately interested in the culture of the Rias Pine as their French brethren, yet the subject is one of such importance that a few remarks extracted from M. Chatin's paper already referred to (p. 745) may not be out of place. The Riga Pine (Pinus sylvestris rigensis) is merely a variety or race of Pinus sylvestris, distinguished from the ordinary furm by botanists on account of its erect branches; by the forester by its more rapid growth and larger size ; and by the builder or shipwright by the elasticity of its wood, whioh renders it peculiarly useful for masts. M. Vilmorin gives the following characters by which it may bo known from other varieties of Pinus sylvestris:"The stem is ordinarily perfectly vertical, preserving its thickness all the way up, and is often nearly oylindrical for half its height. The crown strong branches, which are all of about equal size, ascending and fastigiate. The general form is elongated and pyramidal, recalling that of the Italian Poplar. The bark is of a reddish yeilow colour, splitting off in scales. The shoot is earlier in the spring than that of the Pine of Haguenau, and much more so (10 or 15 dass) than that of the Geneva or Ardeche Pines, and it is of a pale green colour, without any tinge of red. The leaves are less glaucous, shorter, and straighter than those of the Haguenau Pine, and more closely pressed against the branch. They are, on the other hand, longer and narrower than in the Geneva Pines. The cone is smaller and shorter than in the Geneva variety; it is generally
of the scales are slightly prominent
varies in tint from yellowish to reddi, smaller and less resinous than in the or sylvestris with horizontal branches. The als of the male catkins varies from yellowith red."* Thus, continues M. VILMrorir, is 4 forests of Russia and Lithuania it aequires
dimensions of the largest Firs (Abies), and fonins excellent timber, whioh fetohes a high price French and English ports, On the other hand greater portion of the Scotch Firs, grow
mountains of Switzerland and Germans paratively small trees, badly shaped, not to supply even an ordinary beam; in fact, hari little or no resemblance in size or quality to Riga Pine."
M. Chatin gives the results of measuremeats trees of the Riga Pine, sown at Harcourt in 18 s some of which had, in 1860 , attained a heiz
70 to 80 feet, and a circumferen When contrasted with the Scoteh Fir, the \(C\) Pine, and the black Austrian Pines, the adrant. was quite on the side of the Riga Pine an to and by inference as to the qualities of the for M. Chatin holds the opinion that the gider the growth and the thicker the layers of rood, th more valuable it is likely to be for constrowin
purposes, if not for fuel. A sandy soil suito purposes, if not for fuel. A sandy soil suith th
Riga Pine best, but it will grow on limestone sit and while it grows well in dry situatioss prefers one which retains a small amount
coolness. It is well adapted for the barat heathy slopes in the north and central districs. France, with a southern, south-eastern, western, south-western aspect, where any other arbs vegetation could not be profitably grown Chatin concludes his paper with some gemem
remarks on the sowing, pruning, and manes. ment of the trees, for the details of which werl to the pamphlet itself, merely stating that the method of treatment recommended is one which intended to secure the due development of th "leader" at the expense of the lateral branches
- The Lobelia -of the tall perennial typeit seems, undergoing the same kind of improremer which is being effected in the case of other fluma Scarlets and Purples we have long been familiar n: but other colours have till now been wantiag, atrangely enough the plants themselves hare b much less freely cultivated than their be merited. Perhaps this has betn owing to the a variety, but if so, we cannot but expec perennial Lobelia rise again in popular fav deciof seedlings which has reached us, oc mocideriy new colours-piak cadiate shades hail them as great acquisitions, for the Lobelis is on the good old summer flowers which have boen elbom out of the garden by the bedding system, tho aubjects are more brilliant than it, When BuL management. We are indebted to Mr.

\section*{THE LATE SIR W. JACKSON HOOKER.}

One of the most familiar names to all the readers of the Gardeners' Chronicle is that of the illustrious botanist whuse death wo recorded last week. The year of Sir William Hooker's appointment to Kew but shortly antedates the fonudation of the (iardeners Chronicle, the Editor of which paper was in 1839, with several other scientific gentlemen, applied to hy Her Majesty's Government to draw up a report on the condition of the Royal Gardens of Kew , then the private property of the Royal family. Their recommendation was, that these gardens should be made over to the nation, and should ultimately become the head-quarters of botanical science for England, its colonies, and dependencies It was with heartfelt pleasure that the Editor found these propositions acceded to by her Mujesty's Government; and above all, that a man had beea nominated to the appointment who, whether for his distinguished position as a botanist, for the liberality of his sentiments, the urbanity of his manners, and his singlenens of purpose, or for the energy with which lie had adranced so many departurents of botanieal seichee was of all others the best fitted to carry out the views embodied in this report
William Jackson Honker was born at Norwich on the 6th of July, 1785. His father, at that time a confidential clerk in a large manufacturing business, was man devoted to reading, especially travels and German literature, and to the culture of rare and curious plauts, of which his collection was well known amonget amateurs.
He received his education at the High School at Norwich, under the tuition of the celebrated Rer. Dr. Foster. Having inherited, through his godfather, William Jackson, Eeq., an ample conpetency in lauded property, he determined to devote his life to travelling nnd to scientific pursuits; while, with a vies of qualifying himself to superintend and improve his estates, he resided for a time with Mr. Paul, a gentleman farmer living at Starston, in Norfolk, where, however, his whole time appears to have been devoted to Natural History. Being a keen sportsman, he formed a fine collection of the birds of Norfolk, which was rendered more valuthe birds of Norfolk, which was rendered more valu-
able by many close observations on their hatits; aud becoming very intimate with Messra. Kirby \& Spence, Alexander Macleay, the Secretary of the Limnean Society, and other distinguished entomologists, he also deroted much of his time to entomologry. Ahout this time he became acquainted with Sir J. E. Smith, the most eminent British bntanist of his day ; and having himself discovered the Buxbaumia aphylla, one of the most curinns and rare of British Mosses, which he took to Sir James, he was by him encouraged to commence the study of that Ecieuce, Which afterwards became the main pursusession of his estates, he seems to have given up everything for Natural Mistory; ho made extensive botanical Orkueys, Hebrides, \&c.), accompanied first by Dawson Turner, of Yarmouth, F.R.S., his future father-in law, and afterwards by Wm. Borrer, of Henfield, F.L.S. this time he principally resided in London, where he made the acquaintance of Sir Joseph Banks, Robert Brown, Drs. Solander and Dryander, \&c.; indeed of most of the distinguished scientific men of the day.
Encouraged by Sir Joseph Banks, he in 18099 visited Iceland, which be extensively exploren, Making large collections in all branches of and drange, were totally lost on his way home, through the burning at sea of the ship of marque in which be was returning, and which was bringing Danish prisoners to England. His escape, owing to the arrival of another vessel in mid ocean, was almost miraculous; an account of it will be found in the modest narrative called Recolle edition
In 1810-11 he made extensive preparations for accompanying Sir Robert Brownrigg to the then little known island of Ceylon, of which the latter was appointed Governor: for this purpose he sold his estates, the proceeds of which were invested in busi ness and foreign securities, which were unfortunately ill-chosen, and afterwards much decreased in value. Of the zeal with which he carried on his preparations, we may give as an example the fact that he made pen and iuk copies of the plates Indian plants. His entire Mements, however, all came to nothing: as the arrangements, however, which immediately afterwards took place in Ceylon, prevented his plans from being carried out.
In 1814 he made a botanising expedition intr France, Switzerland, and the north of Italy, which extended over a period of vine months, and in the course of which became acquainted at Paris and elsere with the principal botanists of Europe; thus
laying the foundation of that intercourse and correspondenco which lastod until his denth
In 1815 he married the eldest daughter of Dawson Turner, of Yarmouth, Esq, and settled at Halesworth. in suffolk, where his house at once became the rendi 2 vous of British and foreign botaniste, and where he commenced the formation of that grent Herbarium which is now the finest in the world.
His first botanical work was that on the Britioh Athgermannim, which was completod in 1816. Thin Which is a model of shilful mierose? accurate description, is further umrivalhed as an example of first-rate botamical engraving, the drawnzs for it being prepared by sir W'illimats expaivite pacil, and atternards itched un coppur ly W . C. Edwarde, at creat enst. The "Museologia Britamies" wat publiahed in coryutaction with Dr. Tasher, in 1si7, and was follioned ty the "Murci Exutici." These and other worke, n lided to on increasing home and foreign corrospondence, filly nccupien his thase for the but 6ipe zeem of his life. Meanwhile his property had been rapialy dete. riorating, and with an inereasing fambly he finnd it necemary to look out for some remunerativo sciontifio Sir Joseph Banks to acospt the then vacent Regiue Professorahip of Botauy in the Univemity of Glangow, which, although not a medical man, Sir Jospph wat able to procure for him. In 1820 ho ecoordingly removed to Glasgow, the emolument of the chair being 50l. as alary, and under 60l. for studenta' feen. His life at Glaegow whe ontirely dovoted to limany he rose early, ant went lute to bet : he tisked limst little, avoilhing society except on has oecenional journeys to Bencland: and devoted the whole !wwers of his mind and his pelcil to his favonrite reimee. He was a most popmar leeturer, his eass hemg sometines attended ty as many volunteres as medreal men: ho encouraged his students in the pursuit, by taking then on excursions, by giving them rare plants frow his duplicates, and by furnikhing them with letters of introduction to all parts of the world when they wont abroad. He kent up a close connection with the officers of the Admiralte. Treasury, at Colotial Offloe ; and it was mainly through his exortions that botanists were so frequently appointed to tho varioue Government expeditions of that period. His agreeatio manners and intimate knowlelge of all parts of seot land rendered his house an attractive resost fur Ecientific and literary men

Wuring the 20 years he reniced at (blargow ho publinhed his "Flora Scoticn," in which the plauts of a great part of the British Ieles were for tho fint time arranged according to the natural mothod: the "Flura Exotica," and (in conjunction mith I)r. (Ireville then "Icones Filicum ;" also the "13,tamieal Mi-cellany," the "Journal of Jotany," the "I cones Plantaraza," tlo Fin's, Back's anl other Welic lixpeltauns: the "ly Boreali-dmericans," and (in conjunction with Dr Arnote) the "Botany of Beechey 's loyage, and various other works of standard authorits. In laid he commenced the authorship of the "Botarical Migarine, which he carried on for nearly 40 years. His Ilerbarium in the meantime was rapidly hecoming the finest in Europe, mainly owing to the indefatigable correspondence he kept up with all parts of the world and to the number of trained Scotch medical students. Who, when eoeling their fortunes in foreign countries continued to send him plante, even up to the day of his death. Latterly his salary from the Crown was increased to 1502 , while the other emoluments of tho Professorahip amounted to about 700 l . ; the number of tudents having increasod from 21 to upwards of 100.
During his residence in Glasgow, he wad twico offered knighthood, which he accepted from Willian the Fourth in the year 18.36: this homour being bestowed on him in conbileration of his seientific career, and the great services he had rendered to Botany. So much for his profensorial career in con nection with Scotland. In 1841 he was appointed to the Directorship of the Royal Gardens at Kew, under circum

\section*{THE BOTHWELL CASTLE HEATHS}

It seldom fills to the lot of any one to chronicle an uninterrupted successful career of Heath growing for upwatcls of five-and-thirty fears. To have been a successful grow'r and rropagat or of the race in question over such a lengthened period claims more than ordinary attention, and justifies a special notice of this kind; but what rendern Mr. Turnbull's practice more illustrious still, and what his name will in future ever be honourably convected with, is the introduction of a batch of seedlingra, many of them set unknown, quite eclipsing the best sorts uvder cultiva tion. It is evident to all those who are acquainted with the Bothwell Castle collection, that great skill must have heen unaifested in the cros-ing and re-rossing of chomice varieties ond great firminess to wiseard all those which did not possess features of excellence distinct foom or in ndvance of the types from which they were produced. More womed still is Mr. Turnbull's attachment to his pet tribe; for
ucless to such eminent growers ass the late Mr. Jackson,
of Kiugstun, Mr. Kinghorm, Mr. Fieirbairn, Mr. McNab, of Edinburgh, and Mr. Henderson, of Woodhall-all men eminently great in this particular line; and to a few of his own students, who now hold situations among the forem.nst in tio chatry, ho llinge, in case they been chary of giving away his seednge, in case they a fers of the very loest and choicest remainiug still in his own heuls.
That hathey are a "ticklish" race of plants to manage That they are a "ticklish" race of plants to manage
we have abundant poof; and although one occasionally wees groups of them "well done" at the London shows, it is more the exceptiou than the rule. It is quite a mistake to suppose that their populanity as because they are not brought out in iirst-rate style To any one who has the slightest heritation about their merits as show plants, or the individual beauty and variety of form and colour in the flowers, I say come
and see such a collection as Mr. Turnbull possesses, chiefly of his own rearing, by painstaking and what must be called scientific eross breeding.
Wot a type of the race but what he has manipulated upon, and generally with the most satisfactory results. One type ouly has defied his efforts, and that is elegan, which refuses to
this, however, is freely emitted by irritation, and seed ripened capable of producing a numerous progeny-
all somewhat different in character. The hard-wouded all somewhat different in character. The hard-wouded
race, such as tricolor and its allies, is difficult to race, such as tricolor and its allies, is difficult to
hybri lise with the ventricosas, for seedliings from such are true hybrids; but it is pos-ible to produce them, although, within my knowledge, we have no very distinct progeuy from this line. The same remark is, is a Heath that some have never been able successfully to cross. Linnaoidea, hyerralis, and vestiti have been crossed with hard-wooded sorts by Mr. Turabull
advantageously, and so have the numerous forms of mont of the hard-woded suction, which show great variety both in foliago and flower; as well as the
V ntricosis, which are a wery namerous and ornamental division.
Firs and forebust among those intended to be pirticularised is INrornokians, au antum-fiowering feath beghing to bo wel known. Is was dedicated to
Mr. Murnock by the maiser, and will certainly, imdependent of his morits, perpetuate his name. This is a colvar of the former, with the free-hloming properties of the la ter; and athoush having the viec.d appeurTurnsulis is unchestionabiy by fur the finest of the Aitunian brced, having much longer-taber fluwers, and a more ferfeceiv. formed limb than the old Aitoniaua,
aud varly more pronitis of flowers. It is oft the latter, by jasmorififura alia; and it also is pretty well Jackson. is oue of the richest-ruouthed Heathis I know, it is off Yrbyaua by ruturta, and has the pure wiite nod the month of the crrolla deep rose. It is a free blommer, athd inelines to have drooping flowers.
Ventricusa alba (Bochwellii) is also) in the hands of
the public. It is of a more bu lhy hobit than most of the veutricosas, and is a very free-flowering, chaste, white-coloured sort, worthy of a place in the most choice collections. Mr. Turabull has had many seedlings from these, some of them in arlvance of the best-named sorts, but not
Susileana maju is a very distinct, short-tubed, much-inflated flower, of a rosy cast, very much large and more free in habit and blo en than the original and normal type, which has been brought about by careful selection of seed, without any attenpt at cross-breeding. This is really a gem, and, although in a fow hands, is much cultira e i, luat is of mont excellent habit, easy hroppertion, and a distiuct flower. It is a scedling, of the former, but much more :oft-wooled, aud the flowe more of the latter than the furmer, being white and lilac-a very desirable sprius-fiowering Ileath. Austimiana, named a!ter a niember of the firm Austin \& Mcaslan, of Glasgow, is a fine habited sort somethind in the way of Irbyana in form, but rosyretorta. Lumglasii is another scedling of intrinsic merit, of a paic culour, but very prettily marked with
rose on the corolla, after the style of colour of retorta major, but finer in form, beinf a seeuling between that variety aud Iustiniana. It was in general culcivation but not having secu is for s'me time, I fear it
Such are a few of the names of tiose which have either been or are still ia the market. Subjoined is a notice of more recent nuvelties that Mr. Turnbull does not seem incined to let out of his hands. These are numbered frou my note-b sok withuat ruferonce to any other distinguishing mark.
 gling; and the flower of the former, with : greatly
superior corolla, having fue dark roey lines down the
centre of each segment. It is free, aud nearly as highcolouted as Mannockiana, but much larger in the Howers.
No 2 is also a dark-coloured sort, between retorta and Mrrnockiana, having flowers nearly as large as the ormer, with the handsome mouthed corolla peculiar to this parentage, and the additional attraction of somewhat downy fuliase.
No. 3, a cross between Douglasii and Marnockiaua is longer tubed, and scarcely so much inflated as eithe of the above, of a searlet colour, with a white limb and deeply promineut rosy scarlet eye ; it is of excellent abit.
J. 4 is a variety of the Marnockiana type, with cowers a third larger, but not so fine, flowering a nonth earlier than that sort, and having all the appear ance of viscidity; but quite free, throwing much larger heads of bloom than even Marnockiana-a mos decided aequisitiou.
No. 5 is sometimes called Aitoniana rubra, being o he same form of flower as the white Aitoniana Turnbulli, but red in the tube and very deep red in the nouth of the corolla, a much larger filower than the one with which it is compared, being a seedling of litoniana by Macnabiana, one of the most distinct and the best varieties in cultivation.
No. 6 is a seedling of Shannoni by retorta maju and is a clear hybrid between the two as to colour and ze, having the additional charin of yieldiog so many dented in the character of either of the parents.
No. 7 is quite the converse, being off retorta major
by Slannoni; and although a most excellent sort, is not equil either as a flower, or as regards free blooming, bushy habit, and a freedom of bloom, wherever it has been manipulated upon.
No. 8 is between Shannoni and jasminiflom alba, having the free growth and the handsome habit of the atter, with a mach freer flowering tendency than rither, the shoots giving 12 blooms instead of 6 , as in
the parents, and withall not losing chat beautiful white wasy tenden:y always accompanyiug that old and beautiful sort, jasminiflora alba.
Mans more than these could be enumerated, but hese posecss merits of so unquestionable a nature as o distinguish the:n for many years to come. I au uerits, like many who are inclined in the advent of a rood thing to push it forward before it has size and are to recommeud it. Quite the contrary. The plauts I speak of are many of then a yard in diameter, some re some of the best examples of other people's cfforts such as the sorts bamed as formin: the parentage of the above-naucd prozony, aud the beautiful odorata Massoni major, which was never very fertile in pro ducing choice scedling; ; lamous elegans that has
out-grown the size of the house; several splendid pecimens of retorta and the major variety, one of the former in particular measuring more than 6 feet acioss, and bristling with heads of bloom. lregatis major is also grown in fine condition, throwing inumense heads of bloom. In fact, go when you may, there is always od display; but in autumn, when the choice seedlings I have enuwerated are at their best, the sight is gorgeons, capable of enamouring even those who go The bouse in which they grow has been built for about half a century, and is of simplejcoustruction ; and yet, considering the time of day in which it was built, very suitable for plant culture. It is a half span with semi-octagonal cuds, heated with a flue. Simple as it is in comparison with what we look for at the present day in the way of erections and fittings, it has served Mr. Turnbull's purpose admirably. J. A

\section*{VEGETABLE HYBRIDS,}

So much was doue a hundred years ago by Kölreuter and more recently by Gairtner, towards the knowledge of vegetable hybrids, that little comparatively secmed
to be left for moderu rese.irch. Naudiu, however, has made some valuable contributions on the sabject, and Wichura, who seems to have been unacquainted with Naudin's Prizo Essay, has presented us with a mass of valuable information in the treatiso before us, * in part corroboratory of former obscrvations, and in part teeming either with original matter or suggestive of future investigation.
Dy a happy thought he chose the genus Salix, which abounds in uatural hybrids, and which affords peculiar naturally, and which is less exposed than many other genera to error arising from inalvertence or want of dexterous manipulation. Wimmer had already asserted that a great part of European Willows were hybrids and his collection of the genus at Breslau allorded Wichura an opportunity of testing at the same time
the correctness of hit observation, and studying the the correctness of his observation, and studying the general subject of hybridism in detail.

As regards the former question, he arrived at the conviction that for 34 pure species there aro .o sputane us hybrids, which, again, hy intercrossing,
hive gillol ift known binary hybrids. These, how-
ever, are not produced indiscriminately in ereter
locality. Intermediate forms always locality. Intermediate forms always occur in it
neighbourhood of the plants from which derived. As regards the number of indipidual 28 cumstances are in reality uufavourable spreading. The mother pollen, or that of the briz ancestors, is more readily received then ; the potency of the polien and of the plauts thet dimiuishes year by year ; females are producil greater numbers than males; some hybridd hare cier ovaries, though not sterile pollen, while others only a few seeds, and those not s) perfect as the seet of pure species, whin those cases where y is less vigorous the plants are lost in the Darfin struggle for life.

Again, where the plants are shaded, the polles : trange species is not so readily transportel, white, th the contrary, in open places, as the pebbly banks rivers, where there are not the same iupenian ybrids of various degrees oceasionaly abound peculiarly struck, three years siuce, on the esp shingly margius of the Dee, in \(\Lambda\) berdecuslire, the inmense variety of forms, insomuch that it see at first sight almost a hopeless task to bring augth like order out of the confused mass.
As Willows are eosentially diocious, it is extrent easy to isolate the shoots perfectly, by meano cylundrical tarlatan bags, which cau bi imade perit mpervious to strange pollen by handliug is noel the elter eud, whil the stamens, a process which c be effecterl without some injury to the flowers, wi way possibly affect their health, or at any rate place them in au abnormal condicion, as soou ah no longer formidable, the bios arc remord, aut plant is in a perfectly natural condition moreover, present another facility from the fact that their pollen may some rensumable tiune before it is used withou its vitality, and iudeed lougor by some days tias the ripe seeds themselves, which gerainiate rit rapialy, the epispore bcing extremely thin, aul unbryo alreary on with choruph another peculiarity in favour of the cincite genus, as the young plants make sloots ander able circu astances two or three feet in wugt the sear, and sometimes, though rurels, \(\mathrm{p}^{14 \ldots}\)... dele se, while the appearauce of bla some che delayed beyoud the third ye

The toso ciosily related the parents, the inore irregular the Jien; and the greater the nuaber of species inter n.tiou, the zeater the anomaly. As far as has been tuugh their physiology has nut been so deeply tudicd. Luxuriant growth in Willow hyibrids is curainly not the rule, though even in a senary hybrid, whe' produced a catkin in 10 months, the vigour wa emarkable. Frequently there is a defective develop. went, while the relation of the sexes is modified.
A: the conclusion of his treatise Wichura veutures 10 propise certain liypotheses as to the nature o ugirads, which are to be considered rather as susgestive inl watter for fresh examination than prouf
Supposin, each pure species to bo accommolated to tue circu!astances which suit it best, and whit h enab.e then two are cumbined of different thou th clo.els related clrardeter, there will be a proportionate degree of disaccommodition, which unfits them for their mosition, and exposes them soouer or later to destruc tion. Were a hybrid between a fish and a bird possible conse could ne.ther swim in the water nor fly in the air, and o will it he proportionally with all hybrids whatsoever The more species are intermingled, the greater, in cousequence, will be the disacc mmodation, and the more they will contain within themselves the seeds of ducay. Hybrids of nearly-related species will be likely .) be more perfect than those of species which are nure cistant, especially as irregularity and failure o rubimed. Uuly such species, therefore, will be likely to interuingle, or, indeed, can do so, which possess in common proportionally numerous peculiarities, and agree in many conditions of life; for every species
requires all the peculiarities with which it is furuished to maintain itself in certain vital elements. inereasiog sterility of hybrids, when fertilised with their own pollen, depen is upon the seeds of disease cing propagated constantly, and the diseased condition constautly arseavated, by the union of individunds in arrees exactly with Darwin's views of iuter-breediag causing sterility in successive generations, though, perhaps, there is a greater rapidity of deterioration in Finally than the other.
Fivally, plants of other genera which have a teudency to vary have often irregular pollen, one grain having greiter potency than another, and hence, from the Cuitirated plants, like graius, variecies a state of dis aecomanodation. The nature, indead, of beasts and soon as like that of hybrids, has a tendency to vary so for which they are especially adapted, for inperfect aconmodation of an organism induces an increased tindeney to variation. Reader, June 3, 1895.

\section*{THE GREAT YINE AT CUMBERLIND LODGE.} This is considerably larger than the famous Hampton 'ark hine, and occurs very appropriately in Windso ank, where drives, woods and trees and every thing else from its size and health, the vemain so. Judging growth, and the profusion of good fruit, no limit can be astigued to the capabilities of this Vine. Iudeed about seareely be expected to :be more explicit gorlener matter than was a certain "grumpy aruener, who, when asked by his noble employer how chillager a fine Wistaria, that ran along the ton of It, Tould grow, replied, "Till it stops",
Pine pit, which 65 years ago as a cutting in an old to aut it, and since then the house has been enlarged will wes, the last time six years ago, when the back 138 feet taken bark 4 feet. The house is a lean-to sidarably long, 20 wide, and 12 high at back wall, a conut Hamptoncer space than that occupied by the Vine clenn firm court, and this is completely furnished with thudant crop of bearing healthy foliage and an heary as that borne by the Vine in other years. There -rurely it is 21010 nice bunches, colouring well. The tree tree could offer a more this dignity, for no other fruit istide, and the floor of the house is a well-prepared the case fully occupied by the roots; but that is also even when waking thit of seil about the house, for feeding roots more than 6 feet doep. Instead of
 proviug every yeur," and Mc. Whakley, who for a lon, ill a mued lageer sple o the house young wool has to ', flecly cat a was The suil of the synt was t.ans ae-eribe i to me:
 gravelly clay, then blue gritcy or sanly clay, aua
Enally a basis of athi yeilaw eis." Bat on further incrivy, I found that Mr. W'I ma'ley's clay and ruine Were angthing but as like as two l'ens, and that the excellent stuff to ameliorate th rell Simou lure clay of North Loudua. In fust the Yiue is growing un four or five layers of sandy cud gritty carths, rich enourh to furnish it with abundaut fovil, sandy an 1 riable enough to prevent any watery or unfruitful develonment, aud so stratifed ou this warm sloping that not a drop of water remaius on the ground after the heaviest raius.
Where the natural coil is as suitable to the: Vine as this, cf cuurse as gool results may be expected as from the best "made "border ; and in any case there is no reason why we shouh not oftouer kee noble specimelitabe, while urupla more attraktive, that the ringle stick plants in comm mise. Are there larger Gapo Vines than this, and if s) where ane tacy I 11: \(R\).

\section*{MONA'S PRLDE POTATO.}

Three years sitee, when on a vinit to my friend Potato with tha abovo name. which was very tanch esteemed ia the islond, an 1 reported to be as early as the Ashleat Kimey, bat a better (rupher. I drew cthronicle, aud althourth a few persons in Laucashire ank chessire kuow the varietr, it was comparatively many gardeners in Euglaud, and although I have aever heard but one opiuiun espres-ed with regard \(t\) its being early and very productive, still I shomld like to see an expres-ivu of opiliun with regard to its being
carlier thatu the true Ashleaf Kidney or not. Fueling anxi.sus to learn what the Futato was duin r in is native place compared with other carly Potatos, visited the island in the midai: of Ausust for the pur pose of gleamug information.
Mr. Butterill has a lar, farm wear to the village of Uuchan, a sliort distauce frou louglas, aud in one of
the best bits of Potato ground in the islaud. He is growing brealths of Moma's IPride, Ashlen
 kinds. The men were at work digging, an! we decided that Mona is the first early, by 19 to 14 day ext the Astheaf, followe ciosely by Maus in which are fit for use about a fortuight or so after Mouais Prite, Mratt's Prolific beiut the latest of the three. The characteristics of ticso Putatos are
Mona's Pride grows to a large size in good ground, and is a heavy cropper, but if grown too large it
becomes hollow in the contre. It is a haudsome Potato, and those who grow fur exhilition prizs it. It sprouts very early, and in this condition it is easily istinguished from any Potato, as it forms and if these re removed, and are plauted in good soil, thes will produce good tubers. It is redly for digying very early, before the haulun indicates ripeness, and is good in quality. It is such an early sproutuge kiud thai two cropis in a year inhy easily be obtained, and it is certain: it is a much better crupper than the Ashleaf Kidney and its congeners, and carlice.
Ashleaf Kid.eey is so well kuown as to need no lescription
Rivers' Royral Ashleaf is a fine-cropping bandsome kilney of gooll quality, but later than Mona's Iride and the Ashle of Kidncy, and a little earlier than Myatts Prolitic. This is cert inly an exceilent rariety.
Dean's Royal Prolific is a very dwari-gtuwing kind, snd in form is neither kidney nor round, hut a cross between the twu. It is a very heavy cropper, and the tubers cluster round the haulm in a mass. It is never too large for a gentleman's table, and in a young state is a dry eating Potato of full flavour. Six rowa of this kind can be grown on the same space of ground required for four rows of the taller growing second carly kinde, and it is a first-class kind for pot culture. I met with this Potato six or seven years since, but some other name than that 1 have given
Myatt's Prolific Kidney is one of the best second carly Potatos known. If is everybody's Potato, alike suitable for the cattayer's and the gentleman's garden. It crops well, and is of (xseilent quality.
Wonderful Red Kidneu is a hads) the thin-skiuued Wanderful Red a pale red culour, a heavy cropper, with thin haulin of meutium lessgth, and is ready for diggiug with Mrattis l'ulific. It is the earliest real now, and of supurior flavur. For general use like
kuow. It remans in use until April, as it is late
in eprouting still in very carly fit for disaing. It should nt be ben! nand Nuvember
As the M ma's im? is fast rising into gularity, its history may fute. - - In : It wa- 1a-i nearly the lise since in an

Cucumber Growing for Soed. - Mr. Joseph Hamilton, rmerly gardener to the late F. A. Philips, Esti, Thornfield, Stockport, now resides at Wellington Place, \(B\) techerly, near carlisle, where he grows Cueumbers uphidel into -uitable eumpartments, beiur approurinted to their growth, principally fur seed. When in the ts their growth, principad S:ockport, Mr. Hamilton turned much of his attention (n) the umproving and raisiug of new varieties of Cacmuber, amil some of his s.rrts are still held in high estinati, n, namely,

Prize, Lancashire Witch, and other kinds. In 1824 he obtained a packet of cucumber from which many of existing sorts have tinent, froms whico many of these he las preserved true up to the present time. One is colled Walker's Cncumber, the other Walker's Pa Green, and by others Wanker's
Long Green. The latter is a five long, gond sort. Two nev houses, erected las', spring, contain all the newest and best variteties, which are carefully attended to on account of their
exclude all insects from the house in which they are exclude all insects from they are in bloom, other wise the grownent sorts could not be produced true to name. Amongst varieties ripening seeds at the time of my
visit, I observed Ipswich Standard, Sir C. Campbell, Newton Hero, Roman Emperor, Sutton's Chapoion, Iong Gun, Walker's Long Green, Telegraph, General Canrobert, Lancashire Witch, Hamilton's Marke
Favourite, and Boteherby Hybrid. The latter is sammer Cucumber, fine deep green in colour, and it grows about 24 inches long. The Lancashire Witch
and Market Favourite are useful for early forcing. I have cut the former as evenly swelled in January as in early summer. Associated with these were fruit of a
eort called Johnston's Lord Herries, a white-spined variety, nearly stmooth, with small neek and a free variety, nearly stmooth, with smale neck and a The
bearer. This measured \(27 \frac{1 \pi}{2}\) inches in length. The finest of all however were three sorts, named respec tively Pride of the Border, with a tipped spine, dark
green in colour, slender in form, and having a very green in colour, slender in form, and having a very
short neck,-this grows 31 inclies in length; British Volunteer, jet-black spine with a rather small neck but fine in form and colour, length from 30 inches to 31 inches; and Invincible, white spine with a very last is a very handsome Cucumber, a strong grower, and a free bearer. Its fruit measured 30 inches in length All these three will make good varieties for exhibition Robert Weddle, Gardener, Crofton Hall, Carlisle.

Carter's First Crop Pea.-In a recent issue of your Paper, Messrs. Sutton state that Sutton's Ringleader agree that they are one and the same variety. We can also bear testimony that neither Messrs, Sutton nor ourselves were aware at the time of sending it out that
the two Peas were the same. We have been convinced from our own trials in the present and also pas seasons that Carter's First Crop or Sutton's Ringleader is not identical with Dillistone's Early ; and the following letter from Mr. Dillistone will corroborate ou
opinion. "I have," says Mr. D., "been from home, o I spinion, have answered yours of the 8th before, respecting your First Crop Pea, With me it certainly,
differs from ours, \(i . e\), Dillistone's First Early, in habit, differs from ours, i. e., Dillistone's First Early, in habit,
but I found it no earlier than a select stock of the latter." Notwithstanding the adverse trials of some of your Correspondents, we can still. confidently state that Carter's First Crop Pea is a new variety, and that it is
also the earliest and at the same time most prolific (early) Pea in cultivation. James Uarter \& Co., High Holborn.

Ea in cultivation. James Carter \&f Co., High Holborn. the portion of one of the flowering Currants which was
immediately next the ground, and you will perceive that there is a root, which is a very long one, springing
from a spot where the bark appears to be unsound. I think your correspondent, Mr. Reed, has misunderstoor me ; or perhaps I did not express myself clearly on the subject of pruning. I did not inteld to convey
any opiuion about pruning, properly so.cille.l ; I only meant to say in apparent corroboration of Mrs. Loudon's statement as to the exposure of the surface
and of the collar of the plant by the lower branches having been, as she says, "cut away from a mistaken idea of neatness," that thus the shading of the ground which results from the natural habits of the plant lad becn prevented. This was just the case with the two plants which died. Nothing of the kind took place with those which have remained healthy. This
seems to me to have something of the force of a crucial experiment, but perhaps you will kindly give us your opinion. I could discover nothing at the roots letter interesting, wheaser \(G\). \(\mathbf{N I F}\). .We consider your the right cause or not, with regard to which it is very difficult to give an opinion without acsual experience. Your communication is at least suggestive. There is,
however, disease at the root. The bark is decayed in a curions manner, and on a superficial view might be pro. nounced to be covered with a little tawny Thelephora, but the microscope shows that the appearance is not immediately due to the presence of a Fungus, but that the tissues are decomposed. There is, however, another
appearance of a different nature, and one which we have often seen in Standard Roses, and never without ultimate mischief. The bark in part shells off, and there is a very fine white powdery appearance on the denuded portions. On submission to the microscope irregular very obscure threads are seen sparingly, and amongst them. proportionally large globose spores of
different sizes. We cannot positively assert that this is the source of evil. It may be the consequence, and not the cause ; but it is at least matter for grave suspicion. It is astonisling how small an amount of fungous gpawn may prove injurious. There may, however, be a
close c innection hetween. plants bare and the appearance of the Fungus, The one may have favoured the developmente of the other, and so we may both be right development of the other

\section*{Sorteties.}

Royal Horticoltural: August 22 (Floral Committee). -Several interesting exhibitions were contributed on this occasion. Mr. Barker, of Godahning,
furnished two valuable new Ferns, one of which was named Asplenium erectum proliferum, and the other Pteris flabellata ascensionis, both beautiful kinds, to
which First-class Certificates were awarded. The same which First-class Certificates were awarded. The same
exhbitor also showed a charming collection of cut blooms of Petunias, all excellent selected varieties of good colours, size, and substance. Messrs. E. G. Henderson received a Special Certificate for a specimen of the Scarlet-flowered Eschynanthus-like Agalmyla staminea. The same exhibitors had also various other plants, prominent among which were one or two the varieties of Lilium
auratum, with more red than usual in their bands and auratum, with more red than usual in their bands and
spotting. Cut blooms of a Verbena called Blue Defiance came from Mr. Salter, of Sydenham, who also showed blue Lobelias in the way of speciosa anid Eckford for Verbena Lady Jane Ellice, a fine light kind with green eye, surrounded by a ring of pale rose. From Messrs. Smith, of Dulwich, came one of the best varieties of Lilium auratum, and various zonal Pelargouiums. Messrs. Kelway \& Son furmished a collection have been more or less injured by the late rains. A brilliant scarlet Verbena, with a small lemon eye, called Scarlet Cushion, was shown by Mr. Wills, gr. to Sir P. G. Egerton, Bart., and received a First-class
Certificate. The same exhibitor lad also various promising seedling Pelargoniums and Verbenas. From Mr. Veitch came a valuable collection of Hybrid Cattleyas, to which a Special Certificate was awarded. A violet-shaded, purplish-lilac kind, with the sepals and petals covered with minute black dots, nauned \(C\) hybrida picta, received a First-class Certificate.
devoniensis, with pure white labellum, terminating in intense velvety crimson, the sepalsand petals being green-ish-pink, was also extremely pretty, as were likewise one or two others. From Mr. Veitch also came other Orchids, to which a Special Certificate was awarded, Among them were fine examples of Odontoglossum grande, an Siccolabium Blumei. Dendrobium MacCarthiæ, a handsome Ceylnn species from Dr. Ainsworth, received a First class Certificate. Mr. Bull received a Second-class
Certificate for Tapienotes Carolinæ, a Gloxinia-like plant, with pure white flowers, and shining deep green leaves. From the same exhibitor also came Xanthosoma violacea, with long deep violet-coloured stems surmounted by large Caladium-like leaves; Amorphopballus grandis, coming into flower, and like zost
Arads emitting a very disagreeable smell : variegated Arads emitting a very disagreeable smell : variegated
varieties of Chrysanthemum and Aubrietia; and Fuchsia Gipsy Queen, a large showy dark double-blossomed kind, which was Commen 'ed. From the Society's Garden came some ornamental Grasses, the most striking among which were Pennisetum longistylum, and Seturia macrochæta. Mr. Hopkins, of Brentford, con-
tiibuted some promising blooms of seedling Dahlias, as did also Mr. Keynes, of Salisbury. The latter received First-class Certificates for Marquis of Winchester, lilac. The same exhibitor also had John Downie, yellow, tipped with red; Frank Tiffin and John Bunn, both yellow, striped with red, to all of which Second-class Certificates were awarded. A Second-class Certificate
was also awarded to Mr. Legge, of Edmonton, for The Pride of the World Dahlia, golden yellow, faintiy tipped with red. From Mr. Pope, of Chelsea, came Farny Sturt, of which only one bloom was shown, but that sufficiently indicated that it is one of the best tipper Dahlias in cultivation, the colour being crimson, heavily tipped with creamy white. Mr. Burgess, Chelsea, con tributed Dahlia Mrs. Lund, a small-petaled canary coloured flower, neat and very regular in
which a Second-class Certificate was awarded.

Aug. 22 (Fruit Committee).-A collection of 10 Early Kitchen Apples was shown by Mr. Wm. Paul; it consisted of Hawthornden, Emperor Alexander, Jolly Beggar, Lord Suffield, Duchess of Oldenburgh, Keswick Codlin, Large Yellow Bough, and Manx Codlin. Among other
fruits was a collection of Plums from Mr. Cox, consisting of Winesour, Goliath, Pond's Seedling, Fotheringham Gage a fine-looking variety, larger than Black Diamond Greengage, Jefferson, Huling's Hybrid, a kind some what resembling the Jefferson ; and Diaprée Rouge From Messrs. Leo came Gordon Castle Plum, and the Stoneless Damson. We also noticed Early Grosse Mignonne Peach. Mr. Laing, of Twickenham, showed a seedling Siberian Crab of wonderful beauty, being at of a brilliant red colour A Pine-apple from the Society's Garden at Chiswick, ripened in the open air, was cut, and proved to bs excellent in
flavour. Mr. Wills and others showed some fleshed Melons, one or two of which were good.
Beurré d'Amanlis Panachée Pear, a kind blotehed and striped with red, fine-looking specimens were exhibited. aquea.

Mancifester Horticultcral Exhibition: Aug. 18. -The third exbibition for the season, of Fruits, I lants, and Vegetables took place at the Botanical Gardens
not so numerous as on the former occasions, in coose quence of the lateness of the season, yet fruits 2 vegetables were shown in considerable quantities large house in which the various products
staged presented a very interesting appearance, owing to the judicious arrangementa Mr. Findlay
Orchids, but the fine specimens belonging to Turner were missing

\section*{\$0ttces of 玉iookz.}

Townes of Prance and Stoitzerland. By Rev, G. F Cambridga. Pp. 315. London: Longman \& Co 1865.

Ieecares are found in various parts of the world at depths varying from 50 to 200 feet below the surface of the earth, onconnected with glaciers or suow mountains, andiulatitudes and ataltitudes where ice could not under ordinary are very singalar, and many of them well repay iespection; wo Mr. Browne describes the twelve which
be lins visited, giving a good deal of usefal information for the guidnuce of persons who wish to make an inspee tion for chemselves, and interspersing his accounts with the ols and little incidents that occurred in his isvest with a deal of lunnour. With an uufailing flow of buojant animal spirits, and sometimes accompauied by couple of lively sisters, ever ready to make Mr. Browne seems to have passed a very pleasant time
in making his explorations, and cones back to England rith a series of measurements and thermometer readings, and a few pretty sketches of the ice-caves. These before the British Association at B uth, in 1864;
the prismatic formation of the ice, the other on the goneral character of the ice caves and their possibie caues and finally, at his leisure, he gives the reading form of a light and amusing volume.
The first ice cave that Mr. Browne deecribes is the ghecère of La Grenollière, not far from the village of
Arzier. It is situated at an elevation of about 2800 feet above the level of the Lake of Geneva. The cave was suall but lufty, its floor being 51 feet long, of which ice. There were four principal columns of ice from 12 to 15 feet high, proceeding from fissures in the side of
the cave, and looking like frozen cascades. When the ordinary atores of ice fail, Geneva is supplied from this source, and the peasaits, observing that the supply of
ice seems to be greatest in the fine hot weather, have ice seems to be greatest in the fine hot weather, have
imbibed the notion that the ice is formed in these caves in summer and melts in winter. This however has been conclusively proved to be a mere vulgar error, for M. Thary found the caves in a state of atter frost in aummer, invariably found them more or less in a state of thaw. It is true that some currents of cold air were oberved in the caves by Saussure, but the lowest tem-
peratures which he noted were considerably above the freezing point. The reasonable explanation of the preservation of ice in these caves seems to be, that the heary cold air of winter sinks down into these ghacieres, the entrance of the cave being always situated On a higher level than the place of the ice deposit,
Where the warmer and lighter air of sumuser cannot dislodge it on any principle of gravitation, so that heat in very olowly spread through the caves, and when some ing is very slow, for ice absorbs \(60^{\circ} \mathrm{C}\). of heat in melting garante when ice is once formed, it is a materia There appear to be three necessary conditions for the situated below the entrance of the cave, elise the cold air would escape by its own gravity, and be replaced by direct radiation; 3dly, the wind must not have free access to the cave. To judge by the sketches tremely beautiful. Some of them required long ladders to effect an entrance, for some an ice-axe and a rope are venturesome young ladies wese able to share the perils hadder lends prise. In the Pré de S. Livres a vertica Ladder lends to a ledge of rocik, on which bushes and
trees grow; a longer ladder next leads to the deep 177 : after traversing a space of 29 feet wide by 177 feet long, over a coat of smow, glazed over with ice, for every step, one somppery, and requiring the axe lite the end of a roof, and from the eaves maguificent icicles are hanging down; into these an old ladder has tect and descend the ladder. The icicles are found to that a sort of fairy cloistered walk under the eaves of and foof. The travellers are now on a flooring of ice, are, and entering ap to their arin pits lappily their through the hole and creep down the trench-side to different place a so that has the hole been cut in a
them. All this is made plain to the reader by means In very pretty stetols, and a profile section of the cave. Mr. Browne writes:Berieatli this dom
ad grouped iteais a very lovely cluster of colnmne had grouped itseif, formed of the clear porcelaun-like
ice, and fretted and festooned with the utmot delicacy, as it Auderson's fice maiden had been there in one of her amiable moods, and had built herself a pulace This dome iu the roof was similar to many which afterwards observed in other glaciers, being a vertical fissure with flutings from top to bottou-nut a upherical done, but of that more elegant shape which the Comale dress of modern times assunces on a tall person." Sume of these expeditions had just enougb of dauger connected with them to render them interesting, and to bring out the character of the Englidhman. In guides to a considerable allowance of chaff. If a Frenchman tries to explain to him the usual depth of a fall of snuw in those parts, he observes that it is rather more than two joints of a remarkably dirty finger. It gets some dinuer as a Mairie, he is merry over its
ingularity. "There was some talt of a poulet; but aingularity. "There was some talk of a ponlet ; but
the bird still lived, and the talk came to nothing. The linner ended with the haricote, and we then relapsed into dessert, namely, bread and kirech. The mayorese came in with the dessert, and sat on tho end of the bench, below the hats und the bread-tio, eating the
 Mr. Browse noticed that "s the surfaces of the columne were covered by very irregular lines, marked so:newhat deeply in the ice, and dividing the surface into areas of deeply in the ict, and diviting the surface into areas of
all shapea, a sort of net-work with meales of many different shapes and sizes. In fact, it was found that these were the ends of prisms, which could be detached with ease, by usiug no instrument more violent than the fingers, and soinetimes the prism could be pushed at entire, like a knot from the edge of a piece of nood. The point of a thin lnife entered froely at any
of the surface lines, and split the ice neatly down the ides of the prisms." Now, Prot, Furaday has observed well-marked cryatalline structare in ice that has been ormed under a lower temperature than the freezing point. And Prof. Tyndall has pointed out, that owing
to a want of perlect homogencity, some parts of a block of ice exposed to a temperature of \(3 y^{\circ} \mathrm{F}\). will melt, while others remain solid. Thus the prismatic ice, which seems to have greater power of resisting heat than ordinary ice, is accounted for, and thus the hollow talactites of ice fuand in some of these caveras are explained.
De \(l\) Arbousier, de la propagation, de sa oulture, et des produrits Economiques qui en résultent, fic. Par 8 vo . pp. 26. 1868. With a lithographed plate.
Loudon, so long ago as 1838, drew attentivn in him Arboretum et Fraticetum to the various economic uses to which the common Arbutus and its different parts may be put, for the formation of augar and apirit, for tanuing, charcoal-making, and fencing, and we have
here a pamphlet, the express purpose of which is to recommend the caltivation of the plant on a large scale in France; while, as we hear, there is a project on foot for the formation of a company to utilise more especially its fruit, and the valuable properties of the lost aight of. It is clear that the cultivation, supposing the sanguine views of pryjectors should be realised, The plant at Paris requires protection from severc frosts. The fruit is eaten in many place where it growe abundantly, bat it is at best an insipid article of food, and it is not, very probuble that any attention of the ever lighly nutritious from the quantity of pectine and parapectine which it containe, and it is mainly on this that its supposed merite in manufactures anm founded. There is no doubt that a good and wholesoune jelly can be obtained from it, but it requires the addition of vanille, or mome favouring substance, to make it palatable. It is believed also that it may glucose, and that it surpasses most other substances for distillation. These matters are detailed in the pamphlet, with copious receipts for the formation of jelly, prenerve, syrup, liqueur, wine of various kinds, rinegar arom the fruit. A greit deal, moreover, is said of its dyeing properties. The chemical products which it yields are slummed up as from the frut. 3. Starel
from the fruit. 2. Parapectine from from the fruit. 2. Parapectine from the fruit and leaves 5. Wax from the fruit. 6. Green colouring matter from the leaves. 7. Violet colouring inatter from the fruit. 8. Sugar from the fruit. 9. Alcohol from the fruit The real economic value will of course depenc upon the product per acre, and the expense of cultiva but as seedlings do not bear fruit for seven or eigls years, layers or cattiugs would be preferable.

The last (August) number of the Botamical Magazine derives a melanchuly intarest from ite being the late which passed through the hands of the late Sir W. J. Hooker, who has edited the work for nearly 40
one of Mr. Veitch's introductions from Japan, named iu our columus ahortly after its intruduction, bit now that it is brought more thoroughly under the hands of the cultivator, more than justifying the name. The Alowers, tiligge, and hatrit resciable those of the oly Primula curtusoides, but the fliwers at least are \(t\) wo o o three times ns large, and already moveral very diatiuct varletien both \({ }^{3}\) regarda form and colour have been ruised by Mr. Viitch. It is amongat the most hopefal of receut additions to the liste of spring flowers, aud with auch planta th this and Anemoue anguloat work upon, the interest which gathers round our spria gardons should be of the liveliest oharacter.- Bertolonic guttata is another of Mr. Veitch's plante-nind co rather Braxilian. It it a lovely dwat stove perennial, of the Melastomaceoss family, with ovale menminate fivouerved leaves of a rich areen, dotted erer with roby spots. The flowers are smail and piakish-Scutellarin aurata sulphurea, a dwart brauching olove platt, iutro duced frum Brazil, and beariug terminal racemes of long-tubed sulpliur-yellow flowerk - Pasamisia lomgi oolla, of uncertuin Soath Auserican origin, growa by Mr. Batmann, and a goud deal resembling other specie which have been lately figared. The leaves are elliptic acuminate, thre" or five-nerved. and the erimson green-tipped Ahwers are in whort recurvid sumatrama, elready fully noticed at \(p .506\); a beanciful figure of this charming plant is given
The previons (July) number contains figuren of the Mexican species, which flowered lang oummer, for the firut Mexican species, which flowered lant ounmmer, for the firut
time in Europe, in the conservatory of the Royal Botanic Suciety. It is, as Mr. Batemin has obnerved table world m with the liabit productious of the vege , with the hasit of a sigan 40 more. Like the Agave, it dies athit ilowe ing。 leaving however a supply of young plauls in the elupe of ge nine about 15 feet high, iacluding the much-brunched pyramidal pauicle; the fluwers are aprending whitinh remaskubls hairy Montuein species with yellow flowera, fully woticed at p. 434- - Marianthus Drummondii, olender West Australian evergreen greenhouse cliniber, with pale blue flowers, and very inuels the aspect of altissima, a Natal bulb, with a t.ll erect sca, ( 4 feet lighi), terminating in a dense receme of reflurea pale-green flowers. - Phalonopnis Liiddemanniana another of the beautiful new ()nchids which have mad their appearance during the present yeur. The flowera cully deseribed at p. 410 , are white, (haickly cross-barre
with amelhyst. it was introduced by Memus. Low.
In the three lant numbers of the Worist and Pomo logist we find figures of Pelargonimm Amy Hogg, one of Beaton's new semi-nosegay varieties, and of a lovely purplish rose, bearing inmense trusses.-Pelargonism John Hoyle, one of the beat new varieties of the green shrub introduced oblata, a Japauese over combining in its foliake and berries the beautien of the Laurel and the Holly. The chief peculiarit oblate figure, and of the colour of brigitt sealing-wax It is of more vigorous habit than the connmon Skimunia and bears exposure to sum better than that.
In the re ent numbers of the Moral Nagasime are figures of the following : Rhododendros Princens
Alexandra, oue of Mr. Veitch's luybrids, with the habit of R. Princess Royal, but white fowers.-Pelargonimm (Zonal) Vemse, one of Mr. Hally's marbledoleavec needlings with finescarlet white-es ed flowern. - Hopation angulosa, the pretty Anemone anguluma intruduced by one of the buds unnistakably showing an inferio ovary ! Mimulus duplex, a group of the hose-in-home varieties already noticed by un It is oboerved that some of the varieties obtained when they were exhibited a First-class Certificate," but it should be explained that it was a single certificate which was granted to the daples form of Minaulus as a denirabl novelty, and not to any of the individual varietiee. - Primala cortusoides amaena, noticed above--Andro a foot-note A. fastigiata.-Anemone fulgens, oue of the fine thinge nhown by Meners. Buckhouse during the spring months. It is a Greek plant with brilliant crimsion fluwers, aud is clusely allied to A. horteusis. - Berberis stenophylla, Messrs. Fisher Holines \& Cos eauubul hybrid which frequent allusiou bas beeu made by us. Seedling plants it is stated, and as was indeed to be expected, do not come true.- Rhododen dron thibaudiense (surely thibuudioides) whicts lum flowers hke those of 12. Keysii, but in terminal bunche instead of growing from the old wurd.- Aquilegia Muantains grown by Mr. Thompeon, of Ipsuich. The fluwers have very long apum, blue sepais, and "hite petals, and stand erect instead of being pendent. - Clerodendron Balfourii, a plant like the parent Thomsunse, uxcept that it hab lurger fowers, the difference ins ithe, how very haudsone stove climber.- Primmala internodius purple-flowered garden variety, with the character of the Alpiue Primorome.

\section*{}

The encouragement given to ruisers of New sebdina FLorisis' flowers, should urge them to leave no FLoRiss untried by which they could hope to inprove upon the existing kinds. At firsc sight we appear to approximnte very nearly to the standardo it excellence
in mavy subjects, but on closer inspection it generally found that the most heautiful flowers are somehow or other deficient. When the "Properties of Flowers" were first published by Mr. Glenny, they were set down by muny as a chinerera, or were looked on as a standard
which would never be realised; but florists as a body at once recognised them, and gave him the credit for making an advance in floriculture such as will be reniembered as long as florists' flowers are cultivated.

The judges at our exhibitions often make sad mistakes in awarding certificates to novelties, by following their own ideas as to what constitutes a first-class
flower. They have a natural taste and a quick perception of the beautiful perhaps, but if asked what should constitute a perfect flower in any particular genus, they would most probably be at a loss to answer so important a questiou. Hence it is necessary that every judge of florist flowers should be well acyuainted with the recognised properties before officiating in that
capacity or commencing the cultivation of this olass of capacity or commencing the cultivation of this olass of flowers, more especially the raising of new kinds.

In the raising of seedlings I am afraid many persons begin with no fixert purpose in view, further than Wiahing to bring before the public some splendid produotion that will make their name famous. A life-
time may be spent in this hap-hazard way with no very satisfactory result.

The first thing to be considered is saving the seed. This should be obtained from sume variety with good sound constitution and excellent habit, the flower if possible to be also of the finest form. The male parent should pusstss purity of colour and excellence of
shape, looking at these two properties before noticing shape, louking at these two properties before noticing
the babit aud coastitution, which latter should be the babit aud constitution,
present in the female parent.
As an in-tance how easy it is to err and 'do the reverse of what was iutended, I will refer to the Rhododendren, a flower which has been greatly improved within the last 30 yeare, the fine erluitition of these plants at the Koyal Botanic Gardens and Suuth Kensington being now among the gieatust floral treats of the season. When Rhododendron arboreum was first iutroduced, its beautiful colour caused two well-known lovers of horticulture in those dayg, the late Deau Herbert and the late Mr. Henry Burn, of Totteuham Park, to turn their attention to the improvement of this particular flower, and how they Bucserded is well known to the many thousands who
have seen the magniftsent banks at Highclere and Tottenham Park; but unfortamately they used the wrong veriety as the female parent, taking \(R\), arboreum for this purpoee, and crossing with R, catawbiense and other lateblooming kluds. The majority, or more perfection, the flowers being year after year destroyed gentlemen was to introduce scarlet Rhododendrous blouming as lare in the season as \(R\). catawbiense, but by takins the wrung species an the female parent, that intention was to a certain ex'ent frustrated, although the brilliant colours of R. altaclerense, 12. Russelliamum, aud R. Nobleanum cannot well be equalled for conservatory decoration in early spring. Many fue varieties raised by Mr. Burn have nover been did-
tributed. tributed.
To the late Mr. Husea Waterer belongs the crodit of bringing betore the public the beautiful late-blooming varieties of this Hower. He avoided the error made by his contemporaries, and usec \(N\). at tho male. The whole race at Knap Hill and Bagshot have sprung from this judicious crossing, which, in a commercial point of view, has evidently been most gatisfactory.
Again, in the case of Pelargoniuma, Mr. Hoyle every year produces some wagnificent varictiee. John Hoyle and Mary Hoyle of tho preacnt beason appear to come ne near perfection an possible. The bottom petals of inost of his tarieties are so fine that each mindidual flower is a
circle. Hoyle has carrial on his crossing with great, okil, aud avoitied the kinds with narrow petals, more especially in the male parent.
The late Donald teaton ofice said be houl aromething to tell us respecting hybrilising Pelargoniums, but 1 om afraid his lamenterl death deprived us of the information acquired throuyh his great experience with this paiticular chass of Humers. If I remember rightly it was to the effe et that tho long aiol the short stamens abla perforus i.fferent funcrinus, the pollen from the from the short stafmens the lower petals. It would be of great service if some sucoesaful hybridiser wonld give his experience in this matter, whioh is worthy of trial, especially in the Zinale section.
Tho late Mr. Beck wrote in the "Florist" that he did not hybridise hie E'elargoniums artificially, but placed them in groups, each colour separately, aud left the crossing to insects and nature. His seedlings have always been of a lugh character, but in my opinion wanting in many good properties that especially belong
to Mr. Hoyle's strain. The late Mr. Foster produced more many of them of excellent quairy, petals, whereas Mr. somewhat narrow in the lower petar, wore
Hoyles flowers are distinguished by the very opposite character.
These references are made with the intention only of pointing out to raisers of seedlinge that they should, the habits and qualities of the kinds they operate on, so that their labour may not be in vain. Much more might be said of the success of such raisers as Mny and Puxley among Carnations, Kirtlard among Pico tees, and Sainsbury, Doils, and many others among Dablias. It is to be hoped, moreover, that others will take up the pursuit and assist in producing novelties
for our exhibitions. There is, as I said before, ample room for improvement, and with Nil Despe randum for a moto it is impossible not to succeed. William Heale.

Nero Roses.-I lately promised in your pages to speak of new Roses after further trial. I do not think that it will be so good for the public service to wait longer, as to speak of them at once, because the bud wha season will soon be over, and people maation. Further, I am induced to do so at once on account of a letter Which I have received from Mr. Postane, of Brentwood, Esex, in which he says-"I hope you will pardon my
asking you to be so kind as to inform us what Roses you can reconmend from your own experience out of those of 1864-65. If you state the style of the flower and habit of the plant, you would confer a great favour on amateurs who, like myself, have not the opportunity of seeing the new Roses growing. Where a huse at all resembles a well-known kind, your statement that it does so will give one some idea of the sort of flower you are describing.'
I will endeavour to do so, and I hope I shall not give the impression of "egotistry" in spenking of
my personal experience; for I need hardly siay that my personal experience; for information and experience, to borth anything, must information and exponal and egotistical

The character of all the kinds that I shall recommend so far as I have had opportunity to try them, is that of good growth and foliage :-

Roses of \(18044 .-1\). Madame Victor Verdier, clear crimson, somewhat in the style of M. Bernardin, better formed, and of lighter colour. 2. Pierre Notting, deep crimson, a highly improved Mrs. W. Panl. 3 .
Baronne Pelletan de Kinkelin, the best shaped dark rose that I have seen for some time. 4. Lord Macaulay rich lustrous erimson, sometimes dark, very thick petals a lasting flower. 5. Lord Herbert, light carmine crimson, beantifully folded, and full to the centre. 5 Eugène Verdier, a fine purple or purple crimson, in the Way of André Leroy d'Angers; it is all abundant bloomer. 6. Leopold Premier, a well-formed handsome scarlet crimson. 7. George Prince, globular, a deep clear red. 8. La Duchesse de Morny, pure rose with
silvery reverse to the petale-a grant bloomer، 8. Lord Clyde, searlet crimson, of great rubstance, some times a little rough at its eilges; for style and sub. atance it is allied to Lord Macanlay, but the colonr is lighter.' Here Lord M. is the best. 'The above are nine lighter. Here Lorid \(M\). is the best, The above are

The following have not been quite full to the centre, but they are hatudsome, clear in their coloure, and sure to make good garden Rosen, probably good show Roses. 10. Panl de la lieilleray, cerise crimson, in formation bearing more resemblance to Jules Margottin than to any other. 11. Gabriel Peyronny, intensely brilliant crimsnn, folding inwards, like Reine des Pays Bas, and very like it. The following appear to he fine full Roses, but they did not open well, viz,s, Alpaitile de Rotalier, Madame Derreux Douville, and Vicomtesse Doaglas. When more established, they will do better. All the Roses previously mentioned as pot plante were wintered on raised banks in the open garden, with a slight covering of straw over their roots. All the above kinds, and those which I am about to name, are rightly described in the catalognes as to their colours.
2. Roses of 1865.-1. La Duchesse de Caylup, clear carmine-erimmon, of perfect outline and dinposition of petal, of fine substance; a lasting flower a:der sun and rain. It dies well; after five days, a gond pinle. 2. Insliton Radelyffe, rosy crinson, large, of per feet outhine and disposition of petal, an abundant hloomer. The petals are substantial, bub, want a little mure silion to cork ent the heavy night dews aborbid by the petals. It never discoloura. It is a vary fine lisse, and when bulded (not grafted) it will be found to be a fine hind. It is a good grower, hat good fuliagey and dat of 40 ,T 50 blonnis there has not been one bad one. It is ht tre bloomer in atl weathers, net or dry, 3, Duc de
Wellington, a rich darkish crimson, darker shaded, with well-cisposed relv+ty substantial petals; a very tine Rose. 4. Madlle. Amelie Halphen, clear carmine. crimsom, a deep petaled, woll-formed kose. These have been the four bast; and for a limited trial (on respeci of 1, 3, t) I can conscientoutsly recommend liem.
I believe that the following Roves will hereafter be found to be very good, viz., King's Acre, Princesse Lichtenstein, Emile Boyau, Elizabeth Vigueron, Madame oresu, and Achils Gonod, ouc of the bett growery,
liability to err. We muat no bole to spenk with th opinions of novelties on weak stocks inasty inform has severely tried our strong anil establisited \(F_{\text {a }}\) Some of the infants here will prohahly not blonm this year. At present, therefore, I recominen 1 , Roses of 1864 and four Rnses of 1865.
I see that Mr. Keynes has given high testimorias: Madame Moreau and Madane Runsset in hivCata ras lately receiveil. Mr. Adolphus Kent, in a letter to Vigneron at Mr. W. Paul's, Boyau and E also spoke highly of two dark Roses, Dr. Lindier en cour de Lion,

\section*{Garden Memoranda.}
 yonoln. - With Manchester one associates good deal that is edvanced in civilisation and the arts; one knows it in an Eldorado to the Orchid grower, aud the citr of ood omulihuses, but to think of it in conucetron with Mesers stansficlu's Nursery seemed out of the question. That surely, thought I, must be somewhere up in the revion of Asplenday enlightened me, and an hour's raimay run from Cottonopolis brought me to the side of a culd pit containing several thousand fine plants of Aspleniun fontanum, and among the most genial lot of cardeluers and Ferngrowers innginable. I had resolved logists," thinking that the sages who had detected and mand so many abnormities and curiosities in the way ordmary mortals; but the first sight of Mr. Abraham tansfipld immediately thawed that particular coat of ice. And then, Mr. J. Nowell, the muscologint, and the jounger Stansfields were singly capable of dinnolving any further amount of frigidity.
The immense collection of Britieh Ferns and their rarleties possessed by Messris. Stansfield is for the most pert grown in pots, and this was my first surprise. thought the Ferns were Alpines, and that Stansfielde, the Vale Nurseries, never could have made euch a noise
in the world unless the place was specially prepared by Nature for Fern-growing. On the contrary, the nursery in just under the shade of a very grin-looking town-
I mean an iron-grey sort of town, bu-iness to the backbone. It ia said to be at ouce the dirtiest and prettiest town in the north, and entering it by train you see Thile from the opposite one jou look on a picturesque and fertle pulley, slut in by high hills-a scetre which before its invasion by King Cotton must have been Halfax, 9 from Rochdale, and about 19 from Manchester. Only 3 miles from 'Todmorden is the chiof Labitat (as far as I know) of that little vegetable conl-drip thore. But Messtrs. Stansfield have been lucky enough to introduce to their houses this extraordinary Mess, which shows its presence here and there In the chief British a patch of iridescent golden-green. In the chief British fernery, which has rock work in abounds, and presente a picture far surponing that of the finest Trichomanes, tipped with golden dew. What a great thing it would be if people could introduce this Moss to other cool ferneries, de. The plant is so scum on the stones, but then the colour! especially carities. It is like nothing else in the vegetable kingdum, and ouly reminded me of some of the most But the Ferns, what shall I the microscope fracy nearly 100 named varieties of Athyrium FilixAud then think of small host " yet undetermined." Aud then think of the long names (Athyrium Filisnecossary to express the wondrous divergence of many of these from the normal type, and then the descriptions (these are "Original," as in many cases the sori or eomething else grows where something else "ought book. It may not, however, be out of place to tell the uninitiated in British Ferns, that the best of the newish Viety Ferns are the vars. grandiceps, Vernonie and cillection of hee worth getting immediately for overy laction of hardy Fertis.
ats for the Blechnums there are nearly 50 named aril 8 sme in of the collection, for the most part distinct, Fur instance, what can be more extraordinary than with fronds very common Hard Fern as concinnum, sud not a quarter inch wide, the fertile fronds instead of litle more than midribs, with simple knots anomalum and anomalum minus, fertile balf like in a beand pulydactylon, with the fronds terminating so far as attempting to ridiculo this "r people go varieties of British Ferns, but many of tho Ati,yrumin ithabitants of our Fernerties, such as beauty of the species, have been thus preserved
for us. Berider, if there particularly gracefu, there are many of them not
tnonstrous, they be particularly people are not prevented by Act of Parliament from then, oure a plant is in cultivation or in people's dayg of deep thought on "species" aud all living
thinga, surely towards forwarding "makers" have done something
thought like Darwin, by clearly proving the wonderful variation of the subjectis they deal with.
There are 20 named varieties of Lastrea dilatata cultivated at Todmorden, and nearly 46 of Lastrea Filis-mas, annog the moat str.king of the former bemg
Howardi, which bears the same relation to the ratie Howardi, which bears the same relation to the rarie
ties of dilatata that Fieldize does to the varieties of Athyrium. Among the Filix-mas breed, Barnemsii, "regarded by some as the hanl Isomest Britisi Fern in most remarkable. There is scarcely a British Fern of which Messrs. Stansfield do not possess varieties. Thus of the beautiful Asplenium fontanum there are four or five, but then when it is growis by the thousand, and in large specimens too, where should varieties the found if not at Todmorden? Asplenium Trichomanes has a dozen rarieties in cultivation there, amnng the
most remarkable being laciniatum, with the pinnar cut in almost to the midrib, triangulare, and Moule
But all these variations are surpassed by the Hartbtongue, of whioh Mesers. Stanmield grow upwards of 150 varieties, besides "imptoved forms." Marvellous is the diversity of form oxhibited by this protenn species, and among the most mitring are the varictien
constellatum, limbospermun, cerri cornu, louchophorum, albescens and pallescens (two white Hart's. tongues), margiuato papillosum-but it is useless attompting to indicate the mont etriking of the 150 here without a special article, and a special man too. Among Polystichuma, aculeatum densum, with a densely imbricated aspect; \(P\). angulare grandidens, imbrios.
tum, and plumosum are among the more desirable, while more common and favourite varieties, buch as Wollastoni, ere grown in quantity. Of Polypodiums than P. cambricum-the most remarkable are pul than P. cambricum-the most remarkable are pul. beauty to the favourite.

Largely as the British Ferns are grown at Todmorden, exotic species also fall in for no s:mall share of attention and hardy exotic Ferns are very abumdaut, species of Nurth American Lycopods-pretty trailing things suggestive of the huatiug grounds of the
fur West. It was intereating to see large batches of Cystopteris aipina, recently i.nforted from the Tgrul, and other rare suhjects beginning to unfold Laueashire ; aud no sight was more pleasing than a view of Botrychium virginicunn, obliquun, and the beautiful lunariodes unfolding their elegant fronds, along with Schimea pusilla by the score. There are also
many curious aud rare Alpines and Britisi plants, for a many curious aud rare Alpines and British plants, 10 a
real love of plants exists among the Todmorilen people, and though busy as bees with Fern growing and general "nurwery work, thoy doem it well to enjoy the dendron things in this way occasionelly turning up with the large importations of handy Ferns from America and the Continent.
And the Stansfields would appear to have infused this enthusiastic love of plants and botany into the hardworking men around to an extent very rare indeed in this country. This is proved by the flourishing state of the Todmorden Botanical for ite preidea Mr. A. Stansfield, and for its vice president Mr. J. Nowell, the muscologist. Monthly excursions are made to interesting local plant-hannts; and now and
then a distant one among the wilds of Clare or the then a distant one among the whas of Clare or the old and young. \(R\).

\section*{Miscellaneous.}

Spikemaril. -The true nature of Spikenard hae been at all times the subject of much controversy. Ptolemy ineutions it as an odoriferous plant, the best of which
grew at Rangamati and on the borders of the country now called Bhotan. Pliny says there bre 12 varietie of it-the best being the Iudian, the next in quality the Syriac, then the Gallic, and, in the fourth plac that of Crete. He thus descrives thick root, but short, black, brittle, and yet unctuous as well ; it has a musty smell, too, very much like that of the Cjperus, with a sharp acrid taste, the leaves being smail, and growing bence it is that Nard is so famous for its two fohl pro daction, the spike or ear, and the leaf." The prien of genuine Spiketurd was then 100 denarii per 1b., and all Cheaper, some being only worth 3 denarii per 16. Gialen and "iuscorides give a sone whit similar actmont of Splkemart or Nardostachys, but the latter pretends
That the so-calid Syrian Nuti come in reality fro.n Wat the so-calid Syrian Nund come in reality fron.
India, whence it was brought to Syria for shipment. The ancients appear to have esuf funded spik ensard with some of the Iragrant Grasses of India, wnich would account for the report that Alexander the fireat when he invant the fragrance of the Nard as it was trod upon by the horses' fect. This error was shared by linnzous, Who did not attempt to classify it, thing it was the same ar the Nardus, commonly called Ginger-grass. Sir William Jones, the learned orientalist, tarned his serious attention to this
question, and after a laborious investigation suosesded in estublishing byond doubt that the Sprikenard of the ancients mala a plant of the valerianic order, called by the Arabs sumbul, which means "epilre" and by the trindús jatamanal, which signifies "hocke of hain" buth appellations being derived from its having a stem which somewhat resembies the tail of hut ermme of of V small wensel. He consequently fuve it the mame of Valeriana Jntamansi, it it found in the mountainoul name appears to brincipally in Blotiverl from the Tumil Nepangume in which the syllable nifr dentutes anylling possemsiog iragrance, *ucti as ráartum pilla, "Lemon:-2rass ;" befrum manei, "Indian Jasmine;" hifrte manum, "Witu Grange," \&c. It ishighly prahmbl, hawever, that the word sphkenard was oftea applied by the aucients sx: gemeric name for overy cott of perfame, as the Chinew now properly means iscense, It belog for them the type of afl perfumes. Gossamer Spiders.-About a week agn I happened to bo wandering round the garden oftunted at the bact of the house in which I reside. The ams wat shining brightly, and in every direction threads of gnsammer stretched like fatry clotheraine from the plate to the pellings, and from theners to the Benn
atjuining gardeli. Observing that the threathe were in much grenter bitmisere at the kower end of the gawten, induced me to pommence a hunt in order th divelver Cluatered together like a sivarm of tres were at least 300 of the timient spiders I ever maw. A rampal panic Was the immediate, result of iny touching ham. "Onw and all," they scampered off over the large web, on which they had tesembled. Nothe nively endeavoured to hide under the leaver, othern dither fell or threw themselved from the web, and hung suspended by
delicate thread. I miptored a few of the fiying huta then holding them on my hand, observed a flament o Web rapidly jerked out until sufficiently long to smatain the little fellow, when away he weat, ascending rapully until quite lost to vision. Procuring a wine glass, and placing in it some strong spirit, for the purpose of examine them with a lens, I was mot a hetle astoniwher on taking some of then outt from the spirit after an hand, the rays of the sum shioing on them throngh the pocket lens, that the little vichims stlll had life. First a feeble kick with oue leg, then anothourth; and so
with two a trifle stronger; a third nad fourt on, until they marched a way not cven tipry, as free The spiders if they had lived of the garden spider The spiders were the young of the garden spider
(Epeira diadema). I relite the fart, nas I was mot a ware the young of the epeira ever flonted about on their webs, a habit I imagined peculiar to a particular species, suither did 1 know a young spider could bear soaking in strong spirit for several minutes with
causing its death. J. K. Lord, in Sctence Gorsip.
Flowers and Foreign Flower-Fashions.-Bouqueta for the hand abroad are not made up like "the run"
of Snglish ones. The prettiest mode is to have a of English ones. The prettiest mode is to have
kind of Fern-sh ipel spray of green gning domn the bouquet between each little group of flowers. It seems to ine that in componing a bouquet there are five or nix some mention things, as usual, that everyone bas at hand), and then these sprays aro fastened to the centre The effect is exceedingly good; and all delicate foliage have such varieties in our greenhouses. The flowers
would nut be mixal mach-l perhap,s red and white in

 rarely unised. Tou have some one flower and its own
huds for ath. Then, if more green is wanted, there are I ways sprays of Ivy, drooping fronds of Fetn, ling
ribbone of delicate Girast. As a general thing, liowever,

 prety: and so in the plan of laving a drooping tuft on one shoulder. I never very much like seeing a head

Where about the dress. To me there always is the feeling that some blossoms should have fallen, or been hard, and complete, and finished, when every scrap of flower is collected and put in the hair. For actual use on dinner tables, the prettiest fashion I ever have seen by far is that of the large open vase supported on gilt branches, slways so arranged as to look wide and low in proportion to its height. Of course in the centre of the table there must be something high; but there it seem so much more natural to have lights-a tall branch, for instance, with candles, an! only at the feet two or three groups of flowers; three groups of flowers or fruit forming a natural ornauent round the foot of some high centre. Mucb green is again especially desirable in this place, because there is always a certainglare of ligh and plate, and table-cloth and dress; and a mass of green is therefore more than ever welcome to eyes that feel alightly weary, as most eyes do in London before it comes to dinuer time. I should suggest then having if for a lirgye or long table, some centrepiece of this kind, and placing the vase I describe at the top or bottom. But for a small table, especially a round one the said vase itself is charming, when used for the centre ornanent-and, indeed, in such cases no other lowers are necessary: and if other flowers are used it is all the worse for the users, who pay an incrensed florist appropriate for filling such a vase I will simply copy a list I took down in Paris, which seemed to me to combine all colour, and grace, and lightness, in the most charming manner. The disk or vase, I should mention, was of plain frosted glass, shallow and wide, and resten ou twisted supports of bright and frosted gilding. The dish was itsell filled up with bright dark green Moss-
one of the beautiful greenhouse Lycopods inight well be used here. Lycopodium denticulatum is, perhaps, best ut all for the purpose, and is easily grown any where, in that will not suit many flowering plants because of want of sua. The Moss was raised in the cent...- not a heap, but curved upwards. The
flosers ware as follow:-One deep-red Rose, one of the palest blush white, a spray of white Convolvulus just tonched with pirk, a cluster ot red drooping flowers (I thought, of the rose Acacia), one spray of pale wild Rose, one bright pink Rose, a cluster of white Acacia, and a drooping brauch of the pink Convolvulus. It is to be remarked the colours were all shades of rose and white. The whole thing was most perfectly bright, and fresh, and beautiful. Each flower was simply laid down on the green, fairiy round the vase, no attempt being made to fill up the centre at all. lee fowers just touched, and had each its own green in the Moss. I give this to show the style of thug, but, of course, other flowers can be used for any of those nam d. The great thing is, it seemed to me, to have some idea to work to; and there certainly are such nobody is ashaned of trying to inake themselves and everything elae look their prettiest. London Society.
Buxton, is Devun, is a fine grove of Elms planted in the year 1677 by Mr. Fortescue, of Spridlestone, and other paris ioners, for the express purpose of being sold, when at a proper growth, do raise a fund for the benefit of the pour; a singular instance of prudent fursight, and well worthy of imitation, there being anany parishes in which small wastes might must beneficially be thus planted. Sixteen were cut down during he winter of 1819 , and produced the sum of 922.28 . There is a stone on the spot with the following inserip-horn:-" This colony of Elms, regularly disposed into walks, was planted in November, 1677, by Edward
Fortescue, of Spridlestone, Esq., churchwarden, with the apprubation and contributions of the majority of estated parishioners, to the inteut that when perfect in growth and sold, lands may be purchased with the woney for the relief of the poor of this parish, and that mas be encouraged to provide for more successiou by substituting others in the room of these." As lamit canmot legally be purchased, the proceeds are funded for the benefit of the poor. 'Lyson's Devonshire, quoted in Notes and Queries.
Number of Useful Plants.-Some interesting statisties have lately appeared upon this subject. The number of useful plants has been computed to be 12,000; but it must be remembered that the researches which lead to this ennclusion have ouly exteuded over certain parts of the world. There are no less than 2500 known economic plants, among which are reckoned uncultivated edible graminaceous seeds; 23 of other fanilies; 260 com stible rhzomes, roots, and tubers; 37 Onions; 420 vegetables and salads; 40 Palms; 32 Virieties of Arrow-root; 31 sugars, ami 40 saleps. Vinous drinks are obtai ed from 200 plants, and aromatics frut. 266 . There are 50 substitutes for coffee, and 129 gutte perch.t in 7; resin and balsamic gums in 889 ; was in 10; grease and essential oils in 330; 88 plante coutain pstash, sod ; and iodine; 650 centain dyes; 47 sonp; 250 flbres which serve for weaving, and 44 for paper making; 48 give materials for roofing; 100 are e.. pluyed for hurdles and copses; 740 are used in building,
and 615 are known to be poisonous. According to

Endlicher, out of 278 known natural families, there appear to be only 18 absolutely useless. Popular Science Review.

\section*{Calendar of Operations.}
(For the ensuing week.)
A short time ago we recommended all who are anxious to make a fine display of flowers next summer to take notes of the most effective plants for that purpose, and of the habits and peculiaritiea of each. the present state of the plants noted, marking the present state of the plants noted, creditable display, but which are now becoming shabby. The right way to proceed is to make a list of desiderata. One important point to be attended to in the selection of plants for bedding purposes is the proper balance between flower and foliage, and especially anongst the bright warin colours. The principle of methodical arrangement misht indeed be carried beyond to parterre; every clump of shrubs might be made to and colours. Many of the most showy herbaceous plants are now in beanty, and by studying the effect they produce in different situations it is more easy to decide where new plantations

\section*{flower garden and plant houses.}

The late heavy rains in some places have somewhat mparred the beauty of bedding plants, which should therefore now receive a littlo re-arrangenent. Weeds nust also be kept in check, Grass cut short, and walk kept clean and neatly rolled. If wet weather should continue, fine specimens of greenhouse plants now in the open air had perhaps better be placed under cover.
Bedding Plants. -These may now be propagated, and in doing so see that cuttings of a proper description are selected for the purpose, and that they are put into well-drained pots that will oceupy little rooun during winter. See that the cuttings are not allowed to fug When potted, place them in a cold frane, and shade them from bright sunshine until they have become hittle established. The chief point is to get allow them to get weakly and drawn. The greater part of out-door stock should be wintered in store-pots, the plants in which will yield good materials for propagation in spring
Carnations and Picoters. - Pot-off rooted plants and place them ons ashes in a shaded and sheltered place, covering with frame-lights, so as to prevent excessive rain from soduening the soll, that; regular frame is at liberty as to watering, \&c., must be given them.
Dablias. -These even yet in some places may requir abundance of water, if fine blooms are to be expected.

\section*{FORCING GARDEN.}

Cucumbers.-If bright weather should set in, dew the plants overhead once or twice a week, observing always to use a fine rose, as a heavy strean breaks down the leaves.

Praches. - The late warm dry season will have been very favourable to wood ripening; but where any is still immature, means inust be taken to forward it, as next year's success will very much depend upon ripening being properly effected. Keep the fuliage clean and free from insects.
Pines.-Affurd plants lately potted a liberal temperature, but let it be accompanied by sufficient ventilation to prevent undue elongation of the leaves, and to mature their tissue while sunlight is powerful enough for that purpose. A less lumid atmosphere should be supplied generally, and especiully to plants intended for fruiting early next spring, as it is very inportant that they should acquire a strong sturdy babit, and that the uccumulation and elaboration of sap should of the plant. As,ist the swelling fruit with liquid manure, but admit abundance of air, for the sake of the Alavour, and to prevent the crowns growing too luxuriantly.
Vines.-Preserve ripe Grapes from the effects of danp, by avoiding the spilling of water about, the favourable weather, accompanied by a little fire heat during rain or fogs. Late Vineries should now, if possible, be fieed entirely from plants in pots, or if any are allowed to remain they should be of kiuds requiring
little or no water, such as bults and other stove plants, which like a dry coul treatment to induce thens to rest. From this time the points of all growing shoots should be stupped, as leaves produced atter this time appropriate stored-up energy, without ripening sufficiently early to benefit the Vines in return. Care, however, nust bs takell not to stop too closely the lateral shoots of Tines which are still growing vigorously, as they are linble in such cases to burst the bu is tou near the base of the shoots.

\section*{hardy maut and kitoren garderg.}

Shorten the breastwood of wall trees, and at the same time divest them of superfluous shouts; gather all kinds of nutdoor fruit as it becomes ripe and fit for storing. Celery. - Take advantage of dry duys to earth the rows up, sprinkling a gond dusting of quicklime or soot about the plants in the lines, and over the surface of the ground for some distance on each side, to destroy
slugs, which generally do conoiderable dune Celery, especially iu wet seasons: The soot or in
should be applied two or three times haf the plants, at intervals of a few daye, and early in morning, before the pests have retired to ther in the places.
Strawberrizs.-Let young plantations of them he
well atteuded to by stirring the soil betrean the and supplying them with plenty of liquid manemis they may continue to progress at the root, and employ their lenves in the elaboration of sen by every means vigorous growth now, and time fr next year will be the reward. Alpine Stranthe should be looked to, as they will now or soon bap useful in supplying a desirable addition to the domIf they are in a state to receire water, supply shape of liquid manure. Plant a fem beds of yoce
ruuners on a north wall for another year, lt ruuners on a north wall for another year; lot the w be a sandy loa m, moderately enriched.

SATLRDAY, AUGUST 26, \(1865^{\circ}\).
UpOr the question of the origin of the malady
Which is still steadily extending among our herds,
thereneems to be a reaction in the publio mind. The
outery against the introduction of foreign oattle
is varied by assertiuns to the effect that no cases
have yet been traced to them, and that no foreign
animals have been seized at Eaglish ports in consequenoe of this disease; and further, that the filthy condition of the cow-sheds in the metropolis is sufficient to have caused the disease in the London dairies, from which it has extended to the country. About this line of argument there is a certain speciousuess which causes it to find favour with the multitude, and when seasoned with a little abuse directed against those whu take an opposite view, it is generally received with approbation. Very little consideration, however, is
required to prove the flimsiness of the basis on which these conclusions rest; for example, the statement that no foreign animals have been seized at English ports in consequence of the disease being found amoug them, whether true ur not, is of no importance. Every oue who knows anything of the system of in:pection at purts must be aware how impossible it is for one man, amidst all the hurry and confusion of disembarking a cargo of 500 or 600 animals, perhaps in the middle of the night, to properly examine individuals; any of them that present decided symptoms of sickness, symptoms that can be detected as the animals pass by, are seized upun by the inspector ; but as a watter of course, the early signs of this or any other disease beiog deteotable only by a careful and minute observation, caunot be discerned during the cursory inspection which is alore possible under the present system. Thus any number of animals having the dieeare in its incubative stage, or unly indicaling it by the first symptoms, such as luss of milk or dulness, which would eertainls not be recognised in the excitement at:endaut upon the prucess of landiug, might be passed and be sunt to distant parts before any decided evidence of the
disease might present itself. That suoh things do disease might present itself. That suoh things do happen is tolerably olear from the fuct admitted, that these animals have shown the malady some time after landing; but by a strange perversion of reasoning, this circumstance has been adduced to prove that they must have taken the affeotiou is this country.
The other argument, based on the sanitary state of the cow-sheds in the metropolis, has been adranced either by certain medical men, who, however eminent in their own profession, are liable to error in discussing veterinary matiers, or by nonprofessional men, whose ideas upon these subjects appear to be of spontaneous origin, utterly independent of lugic or science. In the minds of those who are most accustumed to cow-sheds there is a keen appreciatiou of the fact that these habitations are in many instances quite unfit for a life-long residence for animals whose natural haunts are the fields and mountain pastures. But are these sheds wurse than they were 100 sears ago? Have the causes which induce typhoid diseases been steadily increasing, until the smouldering fire has burnt into a flame? It should be so to account for the sudden origin of a malady which has not visited our country for 120 years; but on the contrary the opposite is true; huwcver bad cow-sheds in general may be, they are better ia every res, ect than they were; and so far from the diseaso being most rife where these assumed causes are present iu the greatest degree, it has occurred and continues to ocour in sheds which are models of perfection, and not only so but in open fields aud extensive marshes in the healthiest situations. On the other side of the question it is in evidence that animals coming directly from the Steppes of Asia have been brought to this country, and that soun alter their arrival the murrain beame rife, and has since extended, and is extending still, throughout the country.
Granted that the disease is only once landed on our shores, it must be admitted that cattle of all breeds may be exposed to infeotion, aud thus the iutroduction of the malady to distant parts of the country may be the result of the passage of Dutch, Irish, Seotoh, or English animals which have acoidentally been expused to the infection. It is uut necessary to trace a Russian ux ur cuw wevery locality where the disease exis!s; so loug as we eau explain its introduction into the country, there
is no difficalty in suggesting a variety of means is no difficulty in auggesting it could be extended. Setting aside, however, the question how it came, there is no doubt of the faut that it is here, and we are mainly concerned for the present with the methods of preventing or reraedying its evil cousequences.
Medicinal treatment will cooupy our attention shortly, but, save under very strict regulations, we have already deprecated its empluy ment for reasous which concern the public welfare; prevention, however, is in this matter so much better than cure, that we are constrained to give more than
ordinary promineneo to all propositions haviog this end in view.
Starting with an adenimion that gemeral attontion it to be given to ventilation, drainage feeding, and cleanliness, we proceed to the consideration of thuse puints which particularly relate to the extension of the disease by confact, direot or indirect.
First, in reference to a healthy district: an absolute law shunla be established a mong agricul. turists by mutual consent, uut to purohese fresb store stook outside the buandaries of that district. Certain practioal difficulties will sttend this system, but it is the ouly oue which promises sulety.
Secondly. In a distriot already infeoted, every precaution should be taken to provent the moviny of animele from place to placo-sill diceased stwok should be isulated perfeotly-and all the worst cases destruyed and effectually disposed of, so that there shall bo nu chasce of their beiog emplojed for human fool or contaminating the air we breathe. All contant with dissaced animals ahould be oarefully provented, ven to the extent of prohibiting the ame man from passing from one to the other. The grest owil we have to contend againat now, is the travelling of diseased or iufucted stock alung public roads from one part of the country to another. The Order in Cunucil is specially framed to stup thas; but it is extron ely difficult to prevent it where men are determined to conoult their own peouniary advantage in defiance of the laws, and regardless of the interests of the couniry

In faira and markets there will be much risk of infected animals being purchased, and where necessity compels the obt 11 am ant of stuck from these buluroes, they should bo kept quito apart from others for a fortnight at the least.
Marshes and cmmon lands are espocially awtward to manage in this emergonoy; but su far as oin be arranged, cattle shoulit nut be allowed to travel to and fro; aud in the event of the diseave appearing in one herd the rest shuuld be directly, removed and kept apart on their several owners premises until a fortnight has elapsed. The diseased animala should if possible be temporarily isolated from their companions, or if suffiring from the worst form of the disease, at once killed and buried. The remaiuder of the herd is wo be considered infooted. But the animale may not ahow any indioations of disease fur some time, and while they remain healthy it is desirable to obtain the certifioate of the inspeotor for the diatriot, in order to send those of them that are fit for the butoher to the nearest slanghter house. Owners of healthy stook will hardily need to be warned not to turn animals into unenclosed lands while the malady prevaile, and to avoid exposing them to ountact with any other animale as lar as posaibleo. Practically the suggestion to remove infooted animala from unenolosed lands, partioularls where they are of great extent, caunot be legally carried out in certain iastances, because, in order to do so, it would be necessary to drive them through other herds and alung publio roads, to the great dauger of healthy stook, aud in contravention ut the Order in Council. In such instances as these there is no alternative but to destroy and bury on the spot all animals that are nut likely to recover, and to make temporary arrangem.nts for slaughtering and dressing all that remain unaffected by the malady. We du not advanue this idea without being aware of the wumerous dilliculties that will liave to be overcome, but no uther more feasible plan ocears to us. As the coase stands the animals inust not be remord, they are therefore to be left to die, or some arrangernent must be made for at once on the spot butchering thuse that are available fur human fuod. The observatiou su cunatantly ringing in our eare, "It caas't be doae," should be suspended for the present as ill-betitting the mouths of those who have the onerous duties of an emergeney to discharge.

The extensive use of disinfeotanta abont atrawyards and sheds where diseased oattlu have been placed, must not be neglected, no manure or litter should be removel until after the disinfecting process las been properly caritid out, and if cunvenient the loose litter struuld be burued; in mayy instauces this will not bu possible, and then a liberal sprinkling witin chluride of lime must be had recourve to instead.

Considaring huw much the akin sympathises with the disease of the muocus membranes, it will be advimable to employ antiseptio slutions for the purpose of washing the surfuco of the body at intervale No agent is likely to be more bemetioial than carbolis soi , mixed with water in the proportion of oae part of acid to 100 of water;

ConDT's fluid may also be used with advantage, but the tar producis have proved thenaties so effective as antiseptics in other

During ths past few weeks opportunities have occurred of observing the effects of treatment directed to the cure of this malady. Various methods have been adopted by different practitioners with various results, and next week we propose to offer to our readers an account of the proceedings that have been instituted in different parts of the country; meanwhile adding caution to the effect that only the empiric offers a specific,-no positive cure has been or is likely to be discovered. A certain syatem of treatment, based on the principle of supporting the animal while attempts are made to assist the elimination of the poison from the blood, has been apparently suceessful; wo say apparently, hecause it must be remembered that about 20 per cent. of all the animals attacked will recover without any medical trestment at all; remedial measures, these eaves of spontancous recovery must be taken into acoounto

This wet and diffeult weather of the past fortnight hat certainly taker a considerable percentage of the orop returis, below average though they能化, which we published two weeks agen And it is but fair that we should publieh the further report of a correspondent who gave ut his opinion then, as his present acoount is in all probability prue of many counties is South and Midand Englated besides the oae from whioh he writen. He says:-

Since writing to you on the 1st finte., we have had a grent quantity of rain, which has made our harvest long and very expensive. I lave muddled together the greatest part of my corn, but have nos order, and very fow that are not more or less injured. Barley is all dise.sloured, and no small portion sprouted. Wheat has been carted in a soft but little grown, but it will require the winter's frosts fere a bad crop, and á great poftion of them are left on the ground. The Pea straw is all spoilt, and a grent many Pens are left on the ground. Beten are all out yet, but swelling out of the podos

The Putato disense has made sad progress. The liaulon is nearly bare of foliage. The fields are looking nearly black. The atonch is most disagreeable when you puss near them, and the tubers are getting rotten. Turnips, particularly early ones, are growing very fast. It is too wet firs bulb.
brought here by a dealer who brought from Loudon eight cows, which he sold to nearly as many different whase buildings adjoin a farm of mone, had a dairy of 20 very flite cows, and last evening he had bat two leit, one that was thought would resover, and one that hed been in the midat of it all the time and had not had its The opinion is (I don't know that it is worth anything), from its being a Dutch cow, that she had had it before. I have eight within a few yards, say 30 at most, that are to appearance clear yet.

This is a gloomy pietare-drawn too by a man who is generally disposed to look on the briuht iide of everything. We fear it is true of every large portion of the island.

\section*{THICK SOWING, SHALLOW PLOUGHING, AND} WEEDINESS.
Said a friend to me yesterday, "all the way from Grass to London I saw seberal chps sowing through them, as high as iny stick. There cannot be a crop there, for the sheaves will be as light as feathers.'
The experietce of 20 years has taught me that thick sowing talicts an enormous ingregate losu on British ordinary shalloiv plonghing-for, as I have before said, the Thistle and ather strong and deep-ronted weeds, are merely decapitated by ordin'ry ploughing, and consequently our laid Barley crops give unaistateable
evidence that those weeds have atill possessim of the soil and subsoil. They stand towering above almost be fuand, owing to miy second or under plough
(irawn by four strong horses), having, when prepiring for the root or C'abbage crop, destroyed then As I pass through the country by tran I can indge where the ploughing has been shinllow or deep by the appearance of the Barley creps eapecially, and by the Greab Britain costs the oountry millions anmuglly. These weedy intrudern take the lion's share of the food
harvesting such crops, especially in a wet harvest time sthis in. Thees green weeds not only tend to delay the drying and carting, and heat the stack, but supply a stock of seeds for future crops. The sample is also frequently diminished in value some \(2 s\). or 3a. per quarter, becanse these flat laid weedy crops
almost always turn out a bad light sunple. But when turn
But why are these crops laid flat? Mind, I do not down, and appear to be laid; but, if you ex.minue them, you will find, as mine are, that the stems are not horizontally flat, but that they are merely bowed or arched, leaving plenty of room for circulation of air under those arches, which never allow the heavy heade to come near the getound. They are, although laid, actually repesing on arches formed by the atrong reedy stems of their neighbours. These stems, stiff, glassy, and of their neighbours. reed-like, stand erect as stubile, and iffem the soft,
steps when walking, very differently from spongy stubble of thick-sown crops:-mark the difference in growth of a thick and thin-sown crop when the warmed soil in apring stinulates vegetation. In one case the crowad air. Which, being excluded from their stems in later grawth, cause those stems to beenme
 whigy, soft, and deficient in that glassy covering keeps the stem ereet. In consequence of overcrowding, down goes your crop prematarely, and up come your weeds, whioh have now lost the shade of their com petitor the corn. Light frothy straw, and lean miserable kernels follow as a natural consequeuce, and are certain preludes to \(a\) low price aud loss of profit.
But then say the advocates of thick-sowing, "But I like a thick crop at harvest." I ruply, "So do I; but what is the true test of a thick crop?-not bulk, but weight, both of straw and corn. Experisnce has thught me that I always get a greater welght of both by thin suwing than from thick.

It is easy to understand why thick sowing has so strong a hold on the agricultural mind, and why it is no longer justifiable in practice. Before drills were invented broadcasting was a necessity, and tating the variability in ploughing it is ensy to understand that much seed being too deeply placed never came up, while much of it near the surface was food for birds The farmers might well feel anxious about exact depth of furrow, and carefully laying them, as well as having a sower cuan Cuthe art. But drills and iroti stelel-toothed hartonibl have chatiged all this, and rendered a very mueth mbllef quantily of soed absolately neeessary for each seed in well cultivated greund is, by the drill, placed in a proper position t.) grow ; therefore let my old practical friends take the hint, and addipt themelves to an altered state of things. thingso Even 1 a country frieuds, over che Bor themselves of the cing to broadcasting, thus depriving themselves of the beneli, which takes 7 feet in width, and by which from 12 t 20 acres a day smay be both cleansed and cultivated. Owing to the removal of trees and fences, drainage, and tenerally improved cultivation, our seeds are no longer sulfecteil to such dangery as formerly.

It is èlions to trace how much accident has had to do with diminishiag the quantity of seed. When the drill was first introduced there whe the desire to put in the same quantity of seed as when broadcasted, not considering bow perfectly the clrill placed every kernel, while by broadcasting much was wasted. An old friend in Warwickshire gave me an instance of this accidental diminution. When the new drill came, he ordered the man to take care to put in plenty of seed (their usual quantity being 3 bushels of Wheat). The man saw so
muth seed coining dorn the pipes that he thought there must be a plenty. The field was of 20 aures, and when the mater returfied at midday he found thay had ouly put in 6 peckes Great was the dithay and doubt whether it slould not be rasown.
However, the other half of the fleld was drilled with 8 bushels. At harvest the thits sown beat the thick by more than a quarter per acre, and ever sinee six pecks has been the quantity of that neighbourhond.
Surely we ought not to wait for an accidental disCovery when it is so éasy and inéxpensíve to make comparative trials oti a anall portion of each feld.
have been led to make these remarks by my practical experience in thin sowing and deeply mitio. vating. It must be borne in mind that 1 allude to strong hervy tand, well drained, and kept free from weeds, ant properly manared, and in tile oereal county of Resers, Let each man judge of his own soil and climate, and take into consideration all other circumstances. It would be impossible to lay down an rate I am satiffied that by moderale and careful experi. diminution in the quatity of seed sown, eapucialiy as

A 9 I have often said betore, the quantity of corn produced does not matuly depend upon the quantity of seed sown; it in the natural or artificinl fertility of the soil that cunses the young plant to multiply its shouts or stems in spring.
The half perkj rer acre of Wheat on my 9 -acre field is now cat and in shook, as well as the two lands of two sorts of Wheat on each side of it sown with my usua
test them carefully, by feight and meisure wo be corn and straw. This is a singular instance of at winter; but in the spring it branchod ont loor in c ? close to the ground and then up rose verticalis to 28 strong reedy stems from below, from ? stem having a fine car averaging fity, tion being an increase of from 500 to 1400 for each ketere This is somewhat diferent from kingdom-9 for 1 , as describod \(\ln\) Mr, James \(C\) : is admirable book. My men estimate the general rial? the field at 52 bushels; if 80 , the increase for the ba
peck will be 52 bushels, or 416 kernels for There certainly must be somether for one
in our agriculture, when we find \(\theta\) for 1 nis
general average increase. In Russia, where there in hoeng, and where Weeds and Wheat grow in coment he average increase is from \(3 \frac{3}{2}\) to 5 for one, itcoic: to the quality of the soil.
The question, as a national one, will be the fite for a thorough agitation. There is something pracisis absurd in supposing that we can put in a sereme kernel of Wheat in properly preparel ground, and and obtain from it a quarter of an ear, or ten kern-la, n: that it must only produce that one ear. I beliere the same princlple holds good for Wheat aifor Tump. rees, or animals.
Put ten animals for nine months on a pasiare m!: only contains food enough for one, the consequas would be death to noost of them, and half starntion for the survivor, -se it must be with plants: wh han it is so with trees and Turnips. 'Ihe want of air a:i hight as well as other food is destruction.
We never see two trees in close proximity wition observing that they turn their baeko bo each other, s: extend their arms in opposite uirectinus; ferr ip
branches are formed between them. It is not tho the of ear liy food that causes this, but the want of im eierial food, without which netther plants mor nim can flourioh.
Let ing prhetical frlends ponder of this imporion waster, and let them remomber that onmentim wish to raiae a new stock of corn, they cofofuthy pray
kersel in a hole, in well caltivated groind, and ryime

\section*{THE CLONMEL SHOW}

Stroes the alurin has arisen regarding "the cattle plague," some degree of apprehension was felt regarding the success and ultimate results of the Clonmel meetuag, and certain more than usually timarial to the Lord contemplat to have the slow prolibited altogethe Lieutenant but the simple unnouncement made last week by the secretary that there were no entries from the other side put an end at there to any alarm which might be felt from danger arising from that source, although it did prove that Irish breeders were left entirely "on their own hook" to sustain the character of their national show, and to dieprove the assertiou which had been so confidently put forward, that an Irish. Royal, without Englisis ntries, would be a failure. Knowing tolerably the character of most of the Short-horns of any pretensions in the country, we had no fears as to the success of the Clonmel meeting, and the result has perfectly justified our anticipations; for in the leading feature Royal-Short-horns, sheep, and pigs-the meeting of 1865 has contrasted most favourably with any show which the Society has held for several years, only haif--dozen of the 79 entries in the Short-horn departmeut being absent.

The aged Short-horn bulls did not, indeed, come in holiday garb, made up merely to be looked and wondered at from the quantity of flesh piled on their bones; but, what was much better, they were brought in their working clothes, and this, perbaps, assisted to render the judging of the section somalt than uaual for Messrs. Unthank and Garne difk a good bit of time to get through it, settling down at last to Mr. Moffat's White Chieftain us 1st, with Mr. Fitzpatrick's Professor Miller as 2u. Mr. Moffat's bull is a thick-bodied animal, wilk great thighs
and good flesh. He is by Mr. Barcroft's Sir Colin, out of that fine thick cow, Amy, the Manchester aud Liverpool winning yearling of 1856 , which Mr . Barcrof by Mr. Simson, of Blainslie, and after coming over last year was put 1st in a good section of apged county meeting. He is an upstanding bull of great substance, showing well when brought out monded card weut to Field Marshal 2d, which, when shown by his breeder, the Marquis of Waterford, was sit repeatedly at Dublin and elsewhere. Field has retained his good fore-end, though he has got a bit too light in the thighs.
Major Wallis's Felix-which, when shown by his breeder, Mr. Jones, Mullinubro', was the 1st prize two year-old of the last Spring Show, as well as Waterford, Cork, \&cc.-was again head of his section. Felix is a blond, being by Master Harbinger, of Warlaby descent out of a Matadore dam bred at Sittyton. The 2d Iothian, a thick, good-fleshed bull, a get of Lamp of Lothian's out of one of Troutbeck's Gwynne tribe. the Kilkenny Royal in '63, Gwynne of Lothian was th wood, the Ganly Cup bull of last year's Spring Show and the winner last auiumn of the Queen's County Cup, was Highly Commended. Ravenswood has a goud foreend and rib, and is altogether a nice bull.
There was a good yearling section at Clonmel, and
the first on the list was Mr. E. J. Smith's Chief of Lothian, auother of the Ardfert Abbey lot of Lamp of Lothian gets which have spread over the country. In Chief of Lothian there is a double portion of Lamp blood; for his dam, Florentine, the Rojal Dablin gold medal heifer of ' 62 , was also by that very lucky prizewinner getting sire; and he promises to turn out well, baving the head, ueck, counter, quarters, and thighs of a gond bull. The 2 d bull in the section was Mr. Kearney's Telegram, a growthy, iupproving 13 months' dd calf by Dr. M•Hale.
Thirteen capital bull calves puzzled the judges a bit, and it was not until considerably past the hour fixed fur breakfast that they finally made up their minds
to give Mr. Anderson, Grace Dieu, the lst and 2 d prizes in the section for his two Master Harbinger calves-The Dictator, a good topped calf, and Squire Harbinger, own brother to Mercury, Mr. Anderson's 2 d prize yearling of the last spriug show, which had nore age, and therefore rather more substauce than the other. An H. C. honour went to Mr. Thomas Butler's Soubadar calf Rockingham, and then the judges settled the matter by Cummending all the other calves in the section, as will be seen by the entries which are given elsewhere in this impression.
From the calves to the cows is but a uatural tranition, and a most creditable lut of the Intter cume into ring on Wednesday morning, which were speedily disposed of by putting Mr. Smith's Recherché, formerly Captain Bath's vell-known cow, as 1st, with Mr. An
dersun's Daudelion, from the Sarsden herd, as 2 d and a High Commendation to Mr. Barcroft's useful Mysie 19ch, a former Royal winner. The judges Commended the whole section, and that
Of the three thought of the lot.
Joues's Lady Spencer, three-year-old of the last Spring
different meetings, was again lat ; with a strong, larg
framed heifer, the Princess of Wales, belonging to Mr framed heifer,
Half a dozen two-year-old heifers, there being one absentee, caune in for another general Commendation, the special honours being given, first of all, to Mr Massy's W oodbelle, bred by Captain Ball, the first yearling of the Spring Show of 1864-where she beat, among others, Mr. Eastwood's Rosette the Secondand the \(\mathbf{2 d}\) of the last Kildare Street meeting. belle has a grand fore-end, rib, and loin, and comes o Dr. M \({ }^{4}\) Hale blood, through her sire, besides being out of a Baron Warlaby dam. Next on the list of winners came Sir Robert Paul's Silk, which, with her very pretty head, neck, bosom, and rib, has always ta from Kildare of the judges; so that she has gone home from Kilare which she has been shown. Mr. Butler's Countess, substantial heifer, with the Soubadar head, and a good rib and thighs, was Highly Commended, with, as have said, Commendations all round to the others.
Most of the yearling heifers were first-rate, and the whole section generally was good. Mr. Anderson's Gamehen 2d, by Bright Lamp -a son of Lamy of Lothian, out of a Lord Clyde da:n- Was por Spring Show had been Highly Commended at the last Spring Show and has improved considerably since Euster. She was beautifully brought out, and has a nice head, neck breast, and rib, but does not come out equ's Rosette, re loin. The 2 a
 1st prizes at the Cork Show a fortnight ago. She is by Booth's Elfin King out of a Crusade dam, Mayuard's old sort; and another of the same line, but having an additional cross of Booth's blood-namely Elin Rose-also belonging to Mr. Welsted, and thoug Commended. Elin Rose is a sweet ine style of Rosett Another H. C. card went to Mr. Meadows very promising Fanny 15th, which had obtained a similar mar of distinction in Kildare Street last Easter ; the Co mendations in the section going to her half sister Primrose 5th, also belonging to Mr. Mend Maguire.
There was not such a turn-out of heifer cilves as there was of bull calves, but those shown were good. Mr. Bloomfield's Medora, a very pretty calf by Mr. Anderson's Bright Lamp out of Knight of Windso dain, was put 1st, with Mr. Anderson's Octavia 3d, calf of great sweetness, by Master Harbinger from Lord Clyde dam, as 2d; and Mr. Smith's Sunshine promises well for substance and style, was Highly promiaes wel
This finished the Short-born sections, and all through mple proof was afforded, if such was at all required, that Irish breeders can make a capital show without anybody's help. The records of former shows, and more especially those their friends from the other side of the Chanuel and send them home well licked into the bargain ; so that our satisfaction at the result of the concerned, does not arise from being allowed to have all the crowing to our selves on that occasion.
The Herefords, which came next in order, were few in number, but good in quality. Mr. Kearney's Si Capis Ball, bred by Mr. Kea, Monaughty, which got the prize, is a very neat, thick bull, of good quality and the Sultana cow, belonging to the same gentleman, the dam moreover of the prize bull, is a, cow of great substance. Mr. Reyneil's Ashton Maid, also andmpor The tion from Herefordshire, was \({ }^{2}\) months' old Winifred 4th, a very perfect animal, with capital hair and good flesh.

In the polled breeds. Mr. Owen, as usual, sustained the character of the different sections; and in Devons Captain Boyle, Tanagh, Rockcorry, had it all his own the bucept a Cominendation which lie won last mont at the North-East Association. The yearling heifer was bred by himself, but the others were inported from Devonshire. The show of Ayrshires was limited and still more so owing to several entries not haviug come forward. Mr. Borthwick's cattle were among th absent, as that gentleman bad been disappointed in the ateanboat arrangements for the conveyance of stoc between Belfast and Waterford. No prize was awarded in the section of Ayrshire bulls, whiter's cow, a strong useful-looking animal, of a larger aize than the ordinary run of Ayrshires. General Gough had a good pair o cows, which were respectively Highly Commended and Commended; that gentleman's heifers also winning in the section including yearlings and two. tear-olds. Some eutries of Highland catile had been made, but none of them were forward. The Kerry sections were also but indifferently filled as to numbers; Mr. Brady's eutrien not having been sent, in consequence, we believe, of foot-and mouth disease having appeared anong some of the cattle with unwilling, therefore, to seud his cattle, leat they might carry the disease with them to the show-yard. Caplain Bayley, Friarstown, showed a haudsome well-bred cow
prizes in their respective sections were taked, forlo by high cominends and commends to Mr , frean cow, Mr. Frend's three-year-old heifer, and Mr. Pol heifer of the same age. Mr. Barry Drew's heifors In the extra premiums, competed for old ration tenant farmers of Ireland not paying more onat ib a year of rent, Mr. James Smith, the Cbailenge dolder of the County Carlow Society, took bome with his Fairy Queen, a very well bred cow a and lat prize for the best three-year-old beifer, with X : Year's Gift, the same heifer which secured the Beraty Cup for him last year at Carlow.
Passing on to the next great section of the shor, found in the Sheep classes, we have to record a how of Leicester shearling rains to begin with, st prize in that section, together with the Curk C belonging to and bred by Mr. Owen; the 21 to Mr. William Fennell's ran, which had good yareme and thighs; and the 3 J to Mr. Meade's ram, whiein aged section a thick, heary sheep, sentatives of the late Mr. Mountiford Longfield, put 1st, and a yood quartered sheep belonging to Marris, 2d, Mr. Fennell coming in as 3 d , with a b lumpy sheep. The lst prize fur the best five shealit ewes was awarded to a pen of stylish sheep shomat
Mr. D. Hewetson, Mr. Marris's pen being 21 ; anj \(y\) Hewetson also carried off the prize for the bet ewe lambs shown, four of which were particularif go \(^{\circ}\) If we do not mistake, we think that Mr. Heredran prize shearling ewes and ewe lambs were got by \(n\) which he has had from Mr. Owen. He bas bee some years a leading exhibitor at the Waterford sbon
aud we were glad to see him coming out so stroog Royal meeting.

There was a considerable number of long-roole sheep shown, some of which were not only heary ticularly the case in Mr. Curroll's shearling ram, mis took the lst prize in his section.
came in for the \(2: 1\) and 3 d howours, , Beale Bron H.C. ; Mr. Low, Kilshane, getting a similar boworme award for one of his Cotswolds. Mr. Beale Brove took the prize in the aged section, and 18 t aliso mith pen of sheneling ewes Mr, Low's pen of nice being 2d, aud with five ewe lambs the also carried off the prize in that section.

Mr. Marris was the ouly exhibitor of Sonthdores and took all the prizes. His sheep were neat, wellisher animals, the 1st prize shearling raut being partucua so: and, in fact, it was alluost expected tha tue shearling would have won the Short-woolled Cork when he was brought over from Eagland. But Sm. downs have no chance with the Shropshires, whal the latter are very inferior, which was not case at Clonmel, the turn-out of Suropar had only being the best we which, Ireland, but of a description which, we have gai reason to believe, actually astonished Wednesd Looking at the Shropshire sections on what could not help contrasting them with what wh seen only a few years ago at rish show, bui numbers were not ouly exceedwis but sunall. The bmi however, las now increased so much in pubio mens : lhat the sectiont part if our shows. least important par of those shown by Mrs. Snilh took both 1st aud 2 d prizes, the to the 1st one, which was a lengtby,
theep. The 2 d sheep had a good was a sheep of great size, Mr. C. W. Hamilin a toeld backed ram of beatiful quality, wiich mis? 3 d , with an H.C. and two Commended cards of the Han wood flock. Mrs. Smith Barry was fortunate in the section of rams of any pair of two-shear rams being put 1st and
Hamilton again came in 3d, or Highly with a Commendation to the onl showed in the section. Mrs. Smila Barry's sires undoubtedly great substance, bumood sheep, a the quality or style earlier, which had been ghorn much earne of sheep time of the year. pens which also belouged to Mrs. Suith Barts Bessborough taking the prize in the ewe lanb with five nice well-bred lanbs. open for cumpetitiou to bond fide
over \(100 l\) a y year, Mr. David He 1st prizes for five ewe hogget ewes, season, and for five hogget ewes, Mr.
sheep being all Leicesters; while the compet to farmers paying under 100l. Wa uumbers being limited, and
prizes guiug to
As might be expected from in the coluured breeds, was ex
breeders coming ou , hi greisl priz

Malemenn's Bertshire boar, Blair Athol, which was pat Mre in the and Mr. Joyce taking the lion's share tr.

Mr. Wainman showed in the white breeds, and was wocessful, his soung boar taking the Gold Medal in be white sections; but the Carbead swine were wel by pigs from the Loughcrew sties; and in the Wrinmer young of Mr. Naper's pigs being put lst in the metion of breeding sows over 18 months old Mr. Davsd Malcomson was also a successful exhibitor of Yorsshires in the different sections, his som minning in their section. Mr. Michael Carroll, who bery seccessful exbibitor at Waterford, took two 1 sts in the extra premiums competed for by tenant farmers not m! ing more than 100l. a year of rent, both his winning sows having been got by Abbey Farm boars.

Fighty-three entries filled up the Horse sections but although some of them were a fair description of steek, it must be allowed there was a large number of rety indifferent animals exhibited; so much so, that
while the judges refrained from giving \(2 d\) prizes in some of the rections, owing to want or merit, therc were sections allogether rejected from the same cause. The Medal as the best of the prize draught stallions, and also the Challenge Cup for the best animal of any age or sex in that department, was awarded to Mr. Mooney's Young Welshman ; while the Croker Cup for the bent Mright-carrying M'Craith's Forager, a seven years old hore by Cosack out of a dam by Liverpool.

\section*{The following is a list of the judges :-
firnar- मonve.-Mesars. Unthank and Garne}
 UTrikr Breets - Messrs. Guthrie, Mowbray, and IIilhard.
Cant Horsps. - Major Borrowes, Bir P. Nugent, and Mr. Darker.

 Implimants-Messrn. Borthwick, Wade, and Finlay. Abridged from Irish Farmers' Gazette.

At the Annual Banquet of the Society the Marquis of Waterford, who presided, said:-

\section*{}

Whent, and Oat) has a contiderable value for feoding purposes, when rendered available an fond. My labouren often say - " \(A\) h, master, you could not keep half 80 mucis stock as jou do, if you did not consume your straw." Of curse, near harge towne, farmers will sel their st raw and bring back manute. So important is straw considered as an urt.cle of animal food in Spain, that Messrs. (iarrett are making machines, driven ly sleam Iower, ior "straw pulping;" so that it is rendered soft Iad silky-in tassured duly prepared for animal digestion. Is an assumed that in ahl warm Eastern countries straw
is always used an food for animuls. 'Tis suid " wise men come from the Enst," and in this case I am sure that our English farmest have something to learn. Let un see what straw is compised of, sand why it should be valuable as fom, and especially as a sutwstute for hay, area. The lute Mr. Horsfall said in that excellent paper on Feeding Stock and Dary Management (Soce. Journo. vel. 1s, p. 173)," I am satisfied that the mont economicul use of food rich in albumineus mutter is tngether with
\(s^{\prime}\) raw or other materials which are deficient in this element." This 1 had proved to be true. He especially chmmends Bean straw. He says, "In Wheat straw, for stareh (reduced :.s onf, 18! 16. (rom \(1(\mathrm{k}) \mathrm{lb}\). of s ! raw) available for the production of fat or for respiration." I have long since adopted atraw an food, and sbould consider myself foolishly unproftable to wasto it uselessly in an open and wet farmyand. I believe that Cahb gee would have been much more extensively grown had farmers known how necessary it is to give with the much of the Cabbage is wasted. J. J. Mechi, Aug., 1865 .
Agricultural Statistics, Ireland, 1865. - The follow
ir return shows, in statute acrep, the extent under Flax in each county in 1864 and 1865, compiled from returns obtained by the constabulary and metromolitan police, who act as enumeratore:- Ulater, in 1864 278,148 acres; in 1865, 283,280 ; decrease, 44,854,
Munter, in 1864, 7,580 acren ; in 1865, 4,980; decrease, 2,600. Leinster, in 1864, 7,388 acren ; in 1855 5,862; decrease, 1,526. Connaught, in \(1861,8,582\) acres ; in 1865, 7421; decrease, 1,161. Tntal acreage under Flax in Ircland in 1864 and 1865 : in 1864, 301,643 acres ; in 1865, 251,552; total decrease in 1865, 50,141. Total extent of Flax gronn in Ircland in earh of the following years: in 1851, 140,536 acres, in 1852, 137,008; in 1863, 174,579; in 1854, 151,403; in 1855, 97,075; in 1856, 106,311; in 1857, 97,721 in 1858, 91,646; in 1859, 186,282; in 1860, 128,595; in 1861, 147,957; in 1862, 130,070; in 1868, 214,099; in 1864, 301,693, of the General Abstracts, which will dhow the acreage ander the various crope, and the number of live stock, by counties and provinces; they will, I trust, be ready Wor publication in the course of the ensuing moth.
William Donnelly, Registrar.Generah 5, Henriettas Street, Dublin, August 12
Termin in Poultry (in reply to correspondent). Should yous suspect your birds to be infested with vermin, a visit to the hen house nfter dask will tell you if sach be the case. Yorir birds will be restlem and fidgetty, constantly moving, and picking their feathers with their beaks. If the little chickens are snftering you will hear a plaintive low piping from them when
under the hen, instead of the quiet soothing chirp they atter when really at rest. In the day time the hittle ones move listlessly about, with their back and neck feathers areherd; they seem restless and dissatisied, and flesh red. The insects are very small, of light yellowiohs colour, and are generally found under the winge and on the back of the neck in greatent numbern. The mont effectual care we have found to be a little white precipitate ointment rubbed in with the hand between the shoulders and along the rivige of the back. Care must be taken in applying it to use only such mmall quantities an will be absorbed at once by the skin, so that it may not remain on the outer surface of the feathers. Where the bird is in a very restless and bad state, a little sweet oil may be afterwards applied on the sides of the breast nd thighs. In using the remedy the quantity must of course le regulated by the size of the bird. Where a hen with a brood is affected, it is an excellent plan to coop her on a heap of wood ashea after dreming her with the ointment, so that the particles of the ash may adhere to her feathers: indeed, where fowls have constant access to wood ashes they are seldom troubled with vermin. Good diet, clean water (not rain), and a requent use of the whitewash brush in lail ages free and coops, will do much
from suct scourges. J. B.

Dorchiseter: The Profts of the Meat Manufac. ture.-Mr. Dames gave a lecture on this suljucet at a reeent meeting of this Clui. He said: I shall not attempt to show tho relative advantages of feeding cattle and of growing corn. It would be presumptuous on my part, in the presence of so many practical men, to attempt to prove that you could gain more by one system than apother. I shall rather demonstrate to you the fallacy of the advice given by many people at arricultural meetings, that it would be desirable for you to fatten cattle instead of growing corn. The effect of acting upon such advice would not be as the peopie. I heliuve the price of meat, if you acted on thit pinciple, would be so reduced that, you wonld fa! in the object you had in view. I devire in the first place ti, draw your attention to some remarks of Sir Lawrence Palk, in Devanshire,
who, after making a good speed, said, "The long and hort of what I would inpress on the agriculturists is that they must look for the future more to prolucing rond beef aul mutton than to growing cereal cropa." Now price must depend upon supply atd demant. If you produce a larger quant! \(y\), price nust lower in consequence. The price of meat ior some years pas', as
you are aware, has been, as I may say, the sheet-anchor of the farmer. But the demand has been met by the producers of meat. Although the price has been high, we must not forget the expensive means that have been used in fattening those cattle, and those enterprising men who have done sn have only met a fair return for t. If ti.c alvice of Sir Lawrence Palk and other gantlemen could be acted upon, what would be the effect? The price of meat mist ve reduced, and that to the extent of s.iy \(1 d\). or \(2 d\). per lb. I believe mymelf most firmly that it mould convert th present fair protit into a positive luss. Some have couleuded that the increased supply would be met by increased consumption; but it is ginite evinlent that unless jou can reduce the price of meat you cannot increase the consumption-not in an equal ratio, to say the least o

If it was possible, for instance, to get me per lb., I would ask you if the great price not being able to buy meat at conseqnence too, that if it were possible to raise the labourers and artizans of this country to 25 or 30 per cent., it is quite possible the price would rise in "uroportion; bat proportion, and nis else, is a manketable article. Therwume it an years to imerease the mice of wame I 1 salif myself that in the course of years war advance in this country, if we continur fuest: that the price of meat and produce will were... value in proportion as wages increas the artizan-labouring classes of this cunimy u... work to save, but to live, and live well if they can. Гucs fore it is only a question of time, but it must bat time before any revolution of that kind can tale pha: reference to the price of meat, let mecall your atiois: to the report of a committee of the House of Conne that sat in 1834 or 1835 to inquire into the agricu:distress at that time prevailing. Before that comanice some eminent farmers-some of the best in the eairs counties-gave evidence, and their cridence mesi: : argely, but that they had to meet a loss on the anim hoy sold Their evidunce was copoboratel is each other that the loss on theso animals amounted to 16 . or \(2 l\). per head each, and they a them roots into the bargain. Mr. Welwood. I have had considerable experience as
an adviser in agricultural matters. I have been a an adviser in agricultural matters. I have been a
tenant for 40 years, and a factor for 24 . I am in the tenant for 40 years, and a factor for 24. I am in the As a tenant, I have experienced no inconvenience, either directly or indirectly, from the law of hypothee. slways get manure at its fair market value. I object to the landlord having power to follow grain after it is sold, delivered, and paid for ; and I wonld extend the rule which now applies to bulk markets to sample markets. That is the only change I would suggest in the present law. I think you would ruin temants altogether if you altered the law. I draw about 28,000 l. a year of rent, every farthing of which is paid, except \(200 \%\) or \(300 \%\). of small balances ; but, if I asked these tenants to pay in advance, it, would ruin them. Landlords would be in a worse position than manure, seed, and cattle merchants, if they were only to get their rents every six months after entry; because, if I buy cattle, the dealer will not part with them till I pay him the money. Landlords would only be in the same position as these merchants, if tenants paid their rents before getting possession.
16. Timphidaay, Broombacks, Shaw, and Spylaw, Roxburgie : Mr. William scott. - Two of these are pasture farms, and two arable. They extend to about 3300 imperial acres, and the aggregate rent is 37002 . or 3800l. I have been engaged for 23 years in the prac tice of agriculture. To the pastoral farms, my entry is entirely at Whitsunday, and to the others at Whit-
sunday and separation of crop. My first rent is sunday and separation of crop. My first rent is twelvemonth ; for another at Martinmas twelvemonth; and for a portion of another, at Whitsunday, year after entry. The rent of the pastoral farins is payable at Martinmas after entry. The rents of a large proportion of arable farms in my district are payable at Candlemas and Whitsunday after entry, rule in Roxbarghshire is to pay the rent before the crop is reaped. I think the term of entry which I have mentioned is the best. If the tenant has capital, the sooner his rent is paid the better. I think Whitsunday or Lammas would be the best term of payment, even tinmas or Candlemas is, I should think, the proper term. My reason for preferring these terms of payment is, that they would secure the tenant being a man of capital. The very first farm my father had he lost by a temant without capital coming in when the lease was out. I think it was relying on the law of bypothec that the landlord took him; but he only had the farm for two years; he was obliged to give it up. This took place 26 or 27 years ago, and, though yot directly au injury to me, it was so to my father and to his
family. I have offered for farms in Roxburghshire, and other persons have been preferred who had not capital, and who only kept the farms for a year or two. I also
object to the law, because I think it is unfair to the public with whom the farmer deals. I think the public I do not see any distinction between a landlord letting a farm for 19 years, and a manure merchant who may lave only one transaction with the farmer. The
landlord is only placing the interest of his capital at landlord is only placing the interest of his capital at
stake, whereas the manure merchant and others are placing their capital at stake with the manare merchant and would be easy for the themselves by ready-money payments. I hav known numerous instances of grocers, and other tradesmen of that class, having suifered from the law of hypothec. I know an estate in Roxburghshire on Which every farmer has failed within my recollection
and taken in the public. There are at least six farm on that estate, and these failures have extended ove don't think I know of many other similar cases. in the district in a year, - scarcely that number on the avernge. In one case the landlord did not get his full rent, but he let the farm considerably higher afterwards, and in that case the other creditors got nothing at all. I don't think landlords have generally suffered by the farms being in bad condition on the failure of tenants. On the estate I have referred to, the landlord has universally got a considerable rise of rent after all these failures. The tenants farmed the land very
fairly. One of the cases was five or six years ago, two of them since, and the others previously. The tenants who came in after the failures are still on the farms. They pay higher rents, but they got the benefit of the liming and draining which the former tenants had done. It requires more capital to farm in Roxburghshire than in the Lothians, because we keep a much larger stock of sheep and cattle than the farmers of the Lothians do. I don't think we lay out as much on manure, in proportion to our rents, as they do in the Iothians, but we raise more manure on our farms. I would abolish the law of hypothec, even as to existing leases. That would be no more unfair than the abolition of the Corn. laws was, or than the abolition of tolls would be. Under the system of high farming, I think landlords lay out on draining and improving. A good tenant at once commences to improve the farm by liming and amount of capital on that farm, which the landlord
has the benefit of, and which no other creditor can get than a year's rent on the farm in that way. I think the effect of the abolition of the law of hypothec would be to improve the farming. There would be a much better class of tenauts than many who now offer for farms and get them. I think it would lower the rents a little at first, though I bave no doubt they would afterwards come up to the same amount. A number of the present successful offerers for farms have neither skill nor capital, and a man with both has no chance. If a professional farmer merely offered according to the value of the land at the present time, he might as well keep his offer in his pocket. The abolition of the law would lower rents on those estates on which it has been the habit to take tenants without capital, because there they have got up to a fictitions height. Q. Do you think landlords would let their farms, if the lavo
were abolished, uithout stipulating either for security for the rent, or for forehand rent? \(-A\). I think they would. If they took a tenant with sufficient capital and skill, I don't think that would interfere with the letting. I don't think they would ask any other security, at least in Roxburghshire. I think, if the inquiring as to their tenants. Q. Then you think it is possible to make men prudent by Act of Parliament -A. It would be by their own pockets suffering. present you thina anal on sun un the suffering under the present law; they generally gain by it largely. I don't think a landlord would knowingly prefer a tenant who has neither capital nor skill, but as forg as the present law exists for him to inquire whether he has capital and skill. I who died a few months ago. The tenant under the former lease was a gentleman who was well known as an excellent farmer. I have heard that he was offered the farm again privately. In was the On the estate I mentioned in Roxburghshire the landlord was a very great gainer, because he got a consider able rise of rent after the failure of each tenant. He is getting many hundreds a year more than he would have got. So long as the law of hypothec exista temans rua no rinming Q. Dowt in the world the guano merchant voould often take care to get his account paid before the landlord could demand his rent?A. I don't think that is likely to happen. I think tenants would be more anxious to be pointed in paying their rents. I think guano merchants are quite as enient to tenants as landlords are. If they see their way they would be quite as much inclined to let the tenant go on as landlords would be. Of connse the guano merchant would try to get his money if he thought the tenant in a bod way. The fact of a
landlord letting a good farm to a tenaut induces the guano merchant to give him credit. He generally goes on the faith of the landlord having taken proper precautions in letting the farms. My family has risen brothene farm, - tho pay rents amounting to ahout 14,000l. a year. All the farms are in Roxburghelire, except one in Selkirk. Heriotsfield was a small farm ying totally waste when my father took it. I speak the sentiments of my family are fo the the progress of agriculture. I am aware that agriculture has made great progress in the Lothians. Many of the farms there are very well farmed, accorling to the system they are farmed on; but I don't think their system is good at the present time. They should rely more on stock and less on grain at present prices. If thic
farms were fore-rented, the rents would be lower, but I think that would be an advantage to both landlord and tenant. The landlords would get farmers with more capital, and, in the end, they would get as much money. (To be continued.)

\section*{Miscellaneous.}

Farmyard Manure is made up of the mized excre ments of the domesticated animals, and the straw itter, and other refuse stnff produced on the farmstead. It is very variable in composition, the variations arising out of the conditions under which the article is found and preserved. When it is in great part made up of the solid and liquid excreta of stall-fed oxen and horses kept on a liberal dietary, and properly preserved, it is a manure of great value; but when it is produced from poorly. fed animale, and has not been protected from atmospheric influences, it is often bat little more useful than its weight of rotten straw. The following table exhibits the componition of four kinds of farmyard manure:-

\section*{Calendar of Operations.}
drans- Harrest Work:-The use of the reapiug anaine las been alrendy described. Wheu, on the \(\because\) the corn is cither hand-reaped, "fagged," as alres'y described, or mowed and tied.

The processes of mowing and hand reaping are well cograsted in the following report of the two by Mr. Mr. Tay lor first considers the comparative merits of the inflements in reference to the processes of binding, ninning, carrsing, stacking, and threshing the crop.
Io regard to binding, a man can bind and stook 1500 Is regard to bindmg, a inan in ten hours, as easily as he an bind 1200 sheaves cut with the sickle: the chief rason for the difference being in the circumstance of The bidder to the mower having his work straight ane.reth. It is allowed on all hands, as remarked by Mr. Taylor, that mown sheaves win one fourth quicker tan those cut with the sickle, though there is no peraptible differeuce in wiuning different lots of grain sil cut with the sickle. As to carrying and stacking,
nown shenves are closer in the head than reaped bbesves, and on this account less grain is lost by shedding while being carted; and as astack built of mown obervis is more open, the grain and straw in it not cois win sooner, but on that account may be carried with safety from the field in an imperfectly dry state. I: is allowed that a stack of mown sheaves has a rougher appearance tiall one of sheaves cut with the sickle, and tbat it exposes a greater number of heads of grain to
tbe weather and the depredations of birds; but this the weather and the depredations of birds; but this
difienlty is easily overcome, as a man can dress a stack mith a seythe-blade in an hour. It is admitted that hand-reaped sheaves are threshed sibout ten per cent. faster with the flail than mown ones; but as that implement is now in very linited use, and a good tirshing marline is equally effective and expeditions with sheaves cat in either way, this objec-
tion is of little importance. Another question of noment in using the sickle aud scythe is the quantity at wurk performed by each, and its cost. The following are the results of Mr. Taylor's experience in the employment of seven harvest labourers connected with the operation of each implement, viz., with the scy the, (1.) Howers, two gatherers, two binders, and one riser ; and with the sickle, six reapers and one binder:-

\section*{}

Prom these resalts, the advantage from the use of the scythe is obvious. According to the statement given by Mr . Taylor, it appears that the cost of mowing in about 4o. per acre-a sum considerably less than the expense incarred by either kind of sickle.
1 Probably most of the hand-cut Wheat in this country is now done by the fagging hook, which has the advan. tage of greater tapidity than the sickle, while the
dawes are at the same time looser, and more easily Won, Uf the merits of mowing, the following accumnt is ziven by a Ross shire currespondent, who describes ta lavesting of a light crop in a goud season. How
much later huvest is there than in the sonthern such later havest is there than in the sonthern
counties is plain from the opening sentence of the pangraph:-
On the 14th of September (1859), we completed one of the foom bad weether from beginning to end. Take the following y specimen of what can be done by the scythe, with a light trop, and having all the hands well fitted for the different
 perv gone ovir-tach man having cut ititle less than two acres
por day. There were employed in all six scythemen, six promer
 hald four: all the others were the rakers were engaged for the
ot the hands wore the harvent. A few the othars were discharged when the cutting was completed ;
tecking the eron

 That burke crothy harvest. with a better filled stack y yard,
COnt there is lest than uagal ; Barley considerably less ; and In the S a

reaping Milland Comuties, in some districis where hand long stal,ule, and two others, butt to butt, are bound the shofle thenerst in the four with a atraw band, making
a storm of wind. Uats, where.
ats, where bulky crop, are almost everywhere
treated in the harvesting, and tied in sheaves and
stooked, like Wheat. Fxcept wher a very bulk erop stooked, like Wheat. Fxcept shere a very bulky crop,
it is, however, in the fouthern Conuties commmin bot with Oats and Bales, and almost universally both practice in the case of the Barley crop, to mow the crop and let at lie till nearly dry in swathe ; then to turn it with the rake, and break it into little eocks with the large sheafing prong, before it is carried.

The folloning is Mr. Shirreff's experience in Eas Lothian, of the liability of the different grain crops to sulfer injury from rain when tied in sheaves atad stooked, as is the practice in the North:-
"Let it be supposed that the soil is in good condition" and that the wetness extends throunout the untire period of growth, then the Oat will certamly sustain the least injury, and Wheat the most. Should an excess of wetness be confined to the period of harvesting, then Barley will be least injured, and Oats the most. These conclusions are unquestionably just when the crops are bound into sheaves ard properly stooked, although the case may be otherwise when the crops are harvested like hay.

The Oat being found congenial to high latitudes, and ripening at a low temperature, accounts for the plant being found able to cope with wet seasons.
"And from the ears of Barley adhering closely anil securely, and being entirely free from chaff, rain seldom penetrates far into the sheaves, nud wet ears are casily dried, and hence this grain is sellom injured by sprout ing in the field. In 1857 the Wheat and Oat crops Fast Lothian were most extensively injured by aprout while Barley was little affected. The power of Barley to cope with wet harvests is univerally admitted by the farmers of this country. With Wheat and Oats the case is very different. Sheaves of these grains "ith chaff which long retains musture, they are easily sproutel, and more especially Uats.

In 1857, in a field of unripe Wheat standing upright in an exposed situation, I found 5 per cent. of the grains sprouted. As a general rule, the riper and drier the grains are, the sooner do they sprout in a wet harvest, and hence the advantage of a reaping machine in expediting the cutting down of crops bolore they have attained full maturity."
Let it be wded as a cantion to the young farmer, not to let his anx:ety get the better of his patience in the dry before it is carried. In the Western counties it is common to "puck" the corn in the field in difficult weather, i.e., carry it by band as sook as nearly dry to
different points all over the field, about a cart-load to each, and build it there in little mows barely two sheaves' length in diameter, and perbaps ten feet high, securing the top with a little cut stubble; letting the Weather dry it in those "pucks," and thereafter carry ing it to barn or rick. It is also customary, as already said, to build in very small ricks in the North, in order
thereby to be able to carry corn before it is perfectly dry.

What expedients are possible in a wet and tedious harvest time, may appear from the following note by Mr. Hallett, of the Manor House, Brighton, writtein during the wet harvest time of 1860 :-" On the three lays, August 30, 31 , and September 1, expecting the wet weather to continue, I had 30 acres of Wheat. reaped and placed under cover in barne, hovels, cattle and implement sheds, \&c., 一in fact, in everything that had a roof to it,-setting each sleaf upright on the the air. Each acre of slieaves occupied an area of 400 superficial feet. The Wheat was cut when dry and carried immediately ; it is now in excellent order, and my people commence threshing it to-morrow. Had the wet weather continued, the whole might have been removed in a few days, and stacked either out of doora or under the same roofs, making room in the former case for 30 acres, and in the latter case for at least 20 acres more. To show that in the extreme case of the weather not permitting the Wheat to be cat dry it might atill be saved, I may mention that two waggon loads of sheaves standing in the field throughout the wet week ending the 25 th of August were carried ou that day in the pouring rain and placed under cover. They were then soaked throughout, and are now, September 10th, fit to thresh. I bad one field of ten acres dried in the straw on three kilns in a malt-hnonse, each of which was 25 feet square, and contained upwards of an acre of sheaves.
[The above notes are abridged from Morton' Farmer's Calendar.]

\section*{MEETINCS FOR THE ETSUIVG WEEK
}

Tue Schedule of Prizes for the International Monticlitcral Exhibition of 1866 presents some differences from the schedules of our ordinary metrupolitan shows, to which it may be useful in interests of the exhibition to direct attention. subjects invited, we may remark at the atset, have been chosen so as to afford an opporthe roceedings, and we trust, for the hor Eagland, that amongst the growers who contribute, erery class will be well represented. It is no crdinary occasion this, but one which should sifiod proof to our continental friends that good :urdening is with us the rule, through the length \(\therefore\) breadth of the land; and if on this ground
we sincerely hope that no one who is able to mbit good gardening produce, whether flowers, coce push on with his preparations.
This International, it must be recollected, is to be a monster show, and it will be observed that in accordance with this idea the classes have been 6 framed as to invite collections and specimens onder many varied heads. This is, in fact, the to regard as an unnecossary multiplication of rasses ; the intention really having been to provide ir as mayy exhibitors as possible. Confining our tiating to Plants and Flowers, we observe that principal subdivisions. are arranged under four d-roted to General Collections, will be found the Sineellaneous Stove and Greenhouse Plants and with varius clants of our present shows, along hition to thesses for New Plants; but in Shrubs and Trees, Hardy Alpine Herbaceous ariegated Plants, and Annuals shown for lasses which will let in a great variety of
, flower and out of flower, which wish never meet with at our flower-shows, and is many who would be altogether unable to trees and shrubs alone, if fairly plants. Hardy ite will form a nurserymen will take care they shall (ribition; while the boxes of Annuals representrardeners gardening, will enable our clever flower risiturs, some of the for the benefit of foreign The foregoing in the summer flower-garden. secend seeting are all mixed collections. Th as representiong distinct Families or collecplants, such as Orehids, Arads, Here the object is to get together
effect by securiug masses of for effect by securiug masses of ate accustomed to see in of the show. Orchids we principal shows both in London and elsewhere, the Internation them in overwhelming will convey to and no feature, we
better notion of the resources of English gardens than the display of these choice and valuable plants which will be presented to their gaze. In this section, Palms, Cycads, Pandanads, and Tree Ferns are invited, and what is desired by the framers of the Soheduls is that these should be it the form of large specimens, such as may be distributed over the show and form centres of attraction, around which the dwarfer-habited subjects may be grouped. We would particularls mpress upon those who possess large specimens of these plants, that they will be doing good service to the project by permitting them to form part of the exhibition. In this section, too, occur the novel classes of Hardy and Greenhouse Conifers, which may be made very useful in grouping while Arads, Araliads, Bromelians, Marantads, and Cacti come in as so many separate and distinct features, to be worked in wherever they will prove oost effective
In the third section, representing the Genera of plants, the same feature is carried a step further for the sake of breaking up the prize list into convenient portions. Here we get Caladiums, Anthuriums, Nepenthes, Sarracenias, Begonias, Heaths, Rhododendrons, Liliums, Agaves, Iucoas, and such like; the groups brought togrther in sompetition for this series of prizes being again intended to form special features, scattered here and there through the exhibition. We find Musas are invited, and these would be expected in the form of large plants, to aid the effects yielded by Palms and Ferns; we find Aucubas in berry and Evergreen Berberises, which will afford striking variety in fruit and foliage; and we find specimen plants of various prominent genera, as Allamanda, Croton, Clerodendron, Ixora, Dipladenía, Erica, \&c., these specimens being required to ocoupy prominent pesitions in the final making up of the pioture. Orange trees are invited in this division of the schedule, and we trust some respectable examples may be brought forward, which will bear comparison with those shown on the other side of the Channel.

The fourth section, representing species and their varieties, will contribute most largely to the brilliancy of the show, for here we meet with Azaleas, Rhododendrons, Roses, Pelargoniums, Calceolarias, Fuchsias, aud various other popular flowers, which, if represented as they ought to be, always make a grand display of bright and telling colours, but which, as here multiplied and set off by the abundant and varied evergreens which are invited to accompany them, will, we have no doubt, prove to be rastly more effective than ever.
A mong the less usual subjects of exhibition brought in here are Standard Rhododendrons with Standard Laurustines, Bays, Portugal Laurels, Hollies, Box trees, \&c., all most important elements in the tasteful arrangement of the show. For the first time, too, tolerably good prizes are offered for Yonal, Nosegay, and Variegated Pelargoniums and we trust some of our growers will lay them selves out to produce better plants thau we have jet seen exhibited. The chief difficulty they will have to contend with, is that the show may fall a little early for such subjects, but this should only be an additional incitement to a British gardener to rise superior to all difficulties. doubt that it can be accomplished, if it is set about in time, so as not to render forcing necessary at the last. Tree Carnations, Tree Fuchsias, Tree Mignonette, Tree Heliotropes, Tree Pelargoniums, Tree Roses, with Pansies, Tulips, Gladiuli, Pinks, Pæonies, \&c., make up the remainder of this class, whioh again affords abundant scopo for cultivators of every kind and of every degree.
Seedling Flowers, Fruit, and Vegetables have not been overlooked, but will, according to their merit, be rowarded by Certificates. Respecting the remaining features of the Schedule we shall have a few remarks to make hereafter. What we now most earnestly deaire is to induce oultivators, everywhere, professional and amateur, to take measures to fill up between them all the classes provided for plauts and flowers. The Committee will, we are sure, be only too glad if every prize offered is competed for and won.

We have received from Mr. John Carson, a gentleman well-known at Melbourne for the interest he takes in everything connected with Horticulture, some information with respect to a Disfase with which Hollyhocks are affected to stuch a degree as almost to preolude their cultivation. Almost evers plant is attacked by a parasitio Fungus, which soon undermines its health,
and leaves an unsightly wreck behind. A specimen which he kindly communicated shows that the Fungus is a species of Precinia. This was the more surprising, as we kuow of no Malvaceous plant which is attacked by Puccinia in Europe. It appears, howerer, that lifsireno gathered in Chili leaves of Althres officinalis, which were infested with a Pucoinia, and un closer investigation it is quite certain that the Australian Fungus is the same, a tigure of which will be round in the posthumous fasciculus of Corda's Icones. The very complact sori are much raised, and always umbilicated beneath, the depression being either free, or producing another crop of spores. The spores are pale, with very long pedicels, which are often thicker above. They are generally more or less oontraoted in the centre, but they vary very muoh in outline, and are generally bluntly apiculate above. It is curious that two European plants, the one is Chili, the other in Australia, should be the prey of a parasitic Fungus which at present has not been found on any indigeuous plant of the same natural order, and in the latter case to such an extent as to interfere greatly with its oultivation.

Mr. Carson at the same time gave us the leaf of a Plum infested also with a Puccinia, and that frequently so virulently as to cause all the leaves to fall. This, however, is the European P'uccinia Pruni, and it is often very mischievous at home. If in the one case it is remarkable that a European plant, which dues not suffer from parasites at home should meet an inveterate enemy in Australia, it is scarcely less curious that the Plum wherever it goes should carry its parasite with it. In the former case we have an interesting example of one of those nnexpected causes which occasionally forbid the establishment of a species in a climat which other ise might be congenial. N. J. B.
A good deal has been written respeoting the perforations which are often observed in leayes, caused br the separation of little dead patches, which often remain partially attached to the aperture. These frequently arise from drops of water remaining in a more or less chilled condition for some time on the surface, but sometimes from mere comparative weakness of certain portions of the tissue, as was certainly the e?se in a plant of the famous ILand-plant at liew, which at first sight looked as if it had been attecket by some Fungus. As the process is in gen ral slow, a greater or less degree of uncertainty will always attach itself to such observations, however satisfactory they may seem to the person who has more especially stadied the matter. A case however has just occarred ia which the cause is at once apparent, though neither attributable to mere culd or partial constitutional weakness. Some Maple trees struck us in paising from the extraordinary degree to which their leaves were either perforated or studded with decayed orbicular patches. These would have been puzzling enough, had we been left merely to conjecture, as it would scarcely have been possible that the trees should at once lave been covered with such large perfectly round drops of watir. After louking however at a few of the leave, thec cause was quite clear, as the remaius of the dotted form of Rhytisma accrinum were visible in sereral instances. The mycelium of the luurus had dubtless in the first instance eotablished itself ou the leaves, but ciroumstances were not favourable to its development, and in consequence, while the other portions of the eaves grew, the infested spots withered, and in process of time in must instances fell out, while in a few only, indubitable traces of the Rhytisma were left behind. The ubservation is of the greater importance as it tends to confirm a notion of Frifs that parasitic Fungi may in some climates be only partially developed on leaves so as to cause spots, while the perfect plant appears only in the districts which are congenial to its nature. M.J.B.

The Aralia jafonica of Tifunberg figures in Dr. Sermann's revision of the Araliacem, under the hame of Fatsia japonica, given to io by Dearsve and Plancion. The aralia crasstrolia of Panks and
Solander appears in the same paper as Pseudopanax erassifolium of C. Koch. This, observes Dr. SEEmann, is a rery variable phant. Parkisson, who accompanied Capt. Cook in one of his vorages, has left Zealand, the one having crimson, the other purple petioles. In recent yeara, continental bursery men have raised as many as 20 varielies, chnefly differing in the livision, shape, and coicur of the leaves. One of the oldest imnates of our gateons ins heen described as a
separate species by Rroms, umder the name of Panaz coriaceum, aud by linoseie under that of P. lon gissimum. It has a simple stem and a dark green bark

Btriped with brown; all the leave are quite simple,
 with rather large teeth, Aralia latifolia Hort.) and angustifulium (leaves \(\frac{1}{3}\) of an inch broad, with very
small teeth, 1 ralia integrifolia Hort.). Panax pentadactylon, Decaisne \& Planchon (Aralia pentaphylla and A. quinquevulnera Hort.), and P. tridactylon, foliata Hort.), and Arali. heteromorpla are also garden varieties of this variable species.

On Saturday last, being the anniversary of the Prnvoe Consort's birthday, the Gardeans of the Royat open to the public, in accordance with HER MAJESTY's desire. The visitors were of a decidedly superior class to those who in the previous year thronged to see the
flowers. The namber of persons who entered the Gardens is reported to have been about 130,000 . Several bands were in attendance, and continued playing until the Gardens closed. There were numerous refreshment stands, and the two anmexes were set apart for those who desired to picnic on the Grass. The public appeared to appreciate the liberality of the Society in opening the Gardens gratis, and we understand no
damage was done to the flowers, shrubs, or buildings. -Those who are interested in the study Oncerids will be glad to know that Dr. LikDury's
invaluable dried collection of these plants. has been acquired for the Kew Museum.
- On the 26 th ult. a very large consignment of Grapes frow thr Soutie of Franon arrived at the Waterloo Station of the South-Western Railway. The
fluit, which was contained in about 1200 circular fruit, which was contained in about 1200 circular
baskets, weighed some 12 tons, and occupied five large railway trucks. The Grapes were shipped at the port
of Havre, and conveyed by boat to Southampton, whence they were despatclied by train to the metropolis. Although rather small in the berry, the fruit, which Was of a purple colour, was extrèmely sweet, and,
Weing sold at a low price, found numerous customers among the poorer classes of the metropolis, for whom it was purchased by the dealers of the New Cut,
Shoreditoh, and other cheap markets. Dirmingham and the other manufactuing towns buy largely of this demoription of Grape, and the fruit is now extensively used in the manufacture of home-made wines in London. The day previous a still larger consignment reached town by the same route. This pax
1300 baskets, and weighed 17 tons.

\section*{us at the last Tuestlay meeting of the wos kindly sent} tural curious and hand Mr. Parsons, which was equally lately drew attention. That, however, was a mere case of lateral fusion; this was one of metamorphosis. The three sepals and petals were in their usual position, but in addition to these, alternating with the petals, was a
third whorl equally developed, replacing three of the stamens, the remainiug three being perfectly normal.
This was not the only monster produced on the occain which the froit was completely amalcamated with the neighbouring shoot; and a Japan Lily, in which the upper part produced little bulbs, the lobes of which were
An anomaly was also exhibited amongst Plums, in which there was no stone whatever, though the kernel described in Hoct's "Fruit Manual" ander the name of Stoneless or Prune sans noyau. It is somewhat aualogous to the Bladder Plums, which sometimes are produced in America, and which occur also occasionally in the common Sloe in this country. M.J.B.

\section*{THE LATE SIR W. JACKSON HOOKER.}

It requiren, as is well known, a concurrence of initiate a public improvement ; and we need hardly add that when this was to be a scientific one, under the Government of Lord Melbourne, these circumstances must have been numerous and weighty. Amongst them the first and foremost was, that a site capable of indefinite extension, and containing a garden of no
mean celebrity, however far it might have fallen from its once proud position, was offered to the nation. Secondly there was the Report drawn up by command be ignored. Thisily, there was the singular fitness of the late Director for the appointment. And lastly, of most inprintant of all, a powerful feeling ind havour had long existed in the breast of one of the most accomplished and influential noblemen of the day-the late John, Duke of Hedford, himself an ardent horficulturist, and the father of a statesman alrpady risen ligh in office-the present Earl Russell.
from the commencement of his botanical Hooker had, strong interest in Kew, and had never abandoned the secret idea that the time might come when he might
hold the post of its Director. Fur many ears Juring hold the post of its Director. Fur many years Juring honoured him with his friendship and correspondence;
sent out, and by means of his diplomatic relations and various parts of the world.
The placing of Kew on a national footing had been or some time a common object both with the Duke and Sir William Hooker, and the former did not fail, before bis death in 1839, to urge upon those in political power the fulfilment of his favourite project. Upon
his death, his son, the late Duke of Bedford, zealously carried out his father's wishes; but it was upon the present Earl Russell, then Lord John, that the chief weight of the transaction fell; and it is to him, then First Lord of the Treasury, that the nation owes the possession of these magnificent gardens.
In 1811, Mr. Aiton (the Direotor of all the Royal gardens, whether fruit, kitehen, of botanical) resigned his post at Kow, having hold it for 50 yeara. He was
succeeded by Sir William, who recoived a salary of 300 l . per annum, with 200l. to enable him to rent such a inouse as should accommodate his herbarium and library, by this time of immense extent, and essential, we need not say, to the working of the establishment, whether
in a scientific or conomic poiut of view. Sir William entered upon his duties in command of unusual resources for the development of the Gardens, such as had never been combined in any other person. Single in purpose and at the same time prepared to advance by degrees, he at once won the confidence of that branch of the Government under which he worked, which was then known as the Office of Woods and Forests, under the Presidency of Lord Duncannon. To those in office above him, he imparted much of the zeal and interest
he himself felt, which was proved by constant visits to the Gardens, resulting in invariable approval of what hie was doing, and promises of aid for the fature. brought to bear on the work in hand, was his extensive foreign and colonial correspondence, including especialty that with a large number of students whom he had imbued with a love of botany, and who were scattered over the most remote countries of the globe, and several of whom indeed remained in more or less active correspondence with the Gardens up to the day of his histh. His views were further greatly facilitated by Offices, the Admiralty, and the East India Company o all whom he had been the means of rendering services, by the recommendation of former pupils to bstanical results of the expeditions they sent out. Nor cam we omit to mention here the late Curator, Mr. John Smith, an officer of unusual botanical and Lorticultural binowledge, by whom he was zealously secouded in all his plans. Previous to this time, Mr Smith had been a foreman in the Royal Gardene, in which position he had shown unwearied zeal and devotion to his duties; indeed to him alone is due the credit of having upheld the scientific character of the Gardeus for many years previously.
At the time of Sir William's taking office, the Gardens consisted of 11 acres, with a most imperfect and generally dilapidated series of 10 hothouses and conservatories. Most of these have since been gradually pulled down; and with the exception of the Great Orangery (uow used as a museum for woods), and the which had just previously been removed from Buckingham Palace, not one now remains. They have been eplaced by 25 structures (in most cases of mach larger dimensions), exclusive of the Palm stove, and the hitherto unfinished great Conservatory in the pleasure-grounds.
To describe the various improvements which have resulted in the present establishment; including, as it does, a botanic garden of 75 acres, and a pleasure-ground or arboretum of 270 acres, three museums, stored with many thousand specimens of vegetable products, and a magnificent library and herbarium, the finest in Europe, placed in the late King of Hanover's house on one side of Kew Greer, aud adjoining the Gardens - would
rather be to give a history of the Gardens than the life of their Director: we may, however, give the following dates of the most important events, so far as the public are interested.
The first step was the opening of the Gardens to the public on week days, which followed immediately upon ir William entering upon the Directorship. Rather more than 9000 persons visited them during the first year of their being thrown open; a number which has gradually increased, until in 1864 no fewer than 473,307 persons visited the Gardens.
About 1843 the Queen granted from the centiguous pleasure-ground an addition of 47 acres, including a piece of water, by the side of which the Palm stove was afterwards erected
About 1846 the bearitiful wrought-iron gates, In ed by Decimus Burton, were erected.
In 1846 the Royal Kitchen and Forcing Gardens, which ran along the side of the Richmond road, and which included 15 aeres, were added. Upon this piece of ground stood an old fruit-house, since memorable as the origin of the first Museum of Economic Botany that ever exided. On the said piece of ground being given over, Sir William requested that this building might not be pulled down, but that the windows might be enlarged, the walls fitted with shelves to hold specimens of planter and the wiole thrown open to the publio

The chief contributions were from Sir William's on
collection and that of Mr. Smith; and collection and that of Mr. Smith ; and these were mom
increased by means of a vigorons col are now represerited by the three admirable Masemen so well known to the public.
In 1861 was commenced the large Temperate \(H_{7}\) our in the pleasure grounds, often called the Wiater Gardens;
the last building wanting to complete the establistont the last building wanting to complete the establishoen:
in a horticultural point of view. This beautiful bni: ing, as is well known, was designed by Decimus Burb Esq., and is admirably adapted to its pury them, which have been so much admired, is, lowe wholly due to Sir William's judgment and taste William's hife spent at Kew in the above puls provements, added to the daily correspondence superintendence of the Gardens, would have left les littlo time and energy fur scientific parswits; sach up the active habits of his early life

foundation is laid for the use of ornament, both in winter and spring. Even if no other Blants were employed, the Anculn and Cerastium, if neatly
trimmed, would tend to enliven sucha border as has just been represented; but we have plenty of means at hand to fill the whole during the winter months, and perhaps with as much effeet as in the case of summer plants. Let \(b\) be yellow single Wallfower and a few dark Tulips: c. dark Italian Wallf wer aud Tulipa Gesnerima; d White Honesty ; \(e\), Dornnicum cordifolium; \(f\), Silene pendula; \(g\), Yellow Panay; \(h_{3}\) Blue Pansy ; and \(i\), Saponaria calabrica. Concerning these plants I shall have something to say shortly.
It may be borne in mind, that the Aucuba may be lifted at any time, and the design altered, according to taste. J. P.

\section*{Home Correspondence.}

How to Grow the Woodsias.-These little plants are often stowed away in dark and hamid corners, frames, \&rc, in which, in nine cases out of ten, they fail to grow. In Norway, and other countries which they inhait, they are found fully exposed to the clear free sun and light of day, and they will be found to do well under like exposure in this country. There is now in one of the reserve gardens at Glasnevin a few dozen plants of our native Woodsias growing in 60 -sized pots, plunged in coal ashes, and fully exposed to the sun in a warm corner. They look healthy, ripe, and safe as the commonest of cultivated Ferns. Dr. Moore found these plants always growing on the sunniest spots in Norway, aud he considers this the way to grow them. O course they are Alpinen, and doubtless they would thoroughly enjoy the conditions which I have prescribed for the choicest Alpines,-plenty of moisture, suitable soii, and full exposure to sun and air. They would also contrast charmingly with the succulen Alpines, de., in the beds I have recommended. Asplenium septentrionale along with the Woodsias was finely developed, and quite at lome. W. Robinson.
Peas.-On the 28th of March I sowed Sutton's Ring. leader, and had a splendid crop in less than eight weeks, which I allowed to ripen. I then sowed the ripe seed on July 10th, and have now a capital crop of Peas, the
second crop having been six weeks only in growing, and the two crops have been produced in less than five monthe. I beg to forward you a sample, the pods in whieh you will observe are well filled. Thomas Fielder, White Horse, Binfield, Berks. [A very fuir sample, averaging about five Peas in a pod.].
Mishleto.- I have just observed two plants of Mistleto growing on the branches of a Chionanthus virginica, about 7 feet bigh. There is a Siberian Crab about \(8 \frac{1}{3}\) feet from the Chionanthus, on which Mistleto is growing luxuriantly, it having been put there by my gardener years ago. He, however, did not put any plants of it on the Chionanthus, and was surprised when he was shown them. I would therefore like to know if this is a e 1 mmon occurrence. C. M., Cobham.
Bulhocodium vernum.-Your correspondent Mr. Wm. Robinson advises people not to grow Bulbocodium vernum in the shape of single roots, but to get a good patch of it. Can he or any one clse inform me where any of it may be oibtained true, as some of us have been trying for years to get a root, and have always been reated to something different. M.C.W.

Coning of Thujopsis borealis.-There is a plant here of Tisujopsis borealis, which is one of the hardiest and most beautiful of Conifers, about three feet high, with a quantity of seeds upon it. This is the only plant upors which I can find any speds, and we have many
hwadreds from 3 to 6 feet in height. The plant upon which the seeds are, is growing amongst a quantity more of Thujopsis, and of course under thie same circumstances. D. Freeman, F. \& A. Diclison f. Sons' Nurseries,

Mona's Pride Potato (see p. 795).-Having assisted in awarding prizes at the Douglas (Isle of Man) Horti cultural Society's Exhibition last year, I had an opportunity of seeing some splendid examples of the Filbert Kidney or Mona's Pride Potato. I am not able to speak from experience respecting it, but I was assured by some of the exhibitors of it that it was the earliest variety they had on the island, and that they had tried it against the true Ashleaf, Myatts variety, and the Royal Ashleaf, all of which must give way to the superiority of Mona's Pride, both in point of who are interested in early Potatos to try it as an carly frame variety, and to give us the result of their erperience in reference to it. D. Freeman, \(F\) \& \(\boldsymbol{A}\) Dickson \& Sons' TWurseries, Chester.
Hint to Ornamental Planters.- Your remarks on the utility of ormamental trees and slirubs of ioreigu origin call to my mind a very fine colleetion of Japanese plants, which was exhibited by John Knowles, E-q. Trafford Bank, at the late Exhibition of the Manchester Botanieal Society. Many of these were 4 feet high and 3 feet through, showing their use and beanty to much greater advantage than in a small state. Amon stt them were Cryptomeria Veitchii, fully 4 feet high and very bushy, with beautiful glaucous toliage This cannot fail to form a fine feature in winter and spring, provided it proves hardy. Retinospora obtusa, as shown, had a fine pyramidal habit, which, however, does not seem common to this plant. Jons, promises to make a good
with tine pendulous brauches,
companion for the Deodara, while Thuja falcata, with close upricht habit, scems specially adapted for forming
bold divisional lines in a garden. Berides these there were also screral \({ }^{\text {ther }}\), gassessing great varie \({ }^{+}\)y both of form and col ur, which must in a few sears greatly revolutionise our present system of outdoor decoration. T. F., Manchester

W'asps.-ln the Morcester Chronicle of last week the question is asked, Whether anybody has seen a wasp since May? In April the quecins were so numerous that it was supposed we should have had in the autumn an overwhelming supply of these destructive peats, and it is recorded that one gentleman paid more than 68 for the destruction of queens in his gardens and grounds during that month. He might have stved his money. The strarn frost of the 1st of Moy anpears to bave done its work in destroying these imsects, searcely one having been seen since. The peopi.e in Worcester have reason to rejoice at the paucity of wasps. I wish I could share in the general joy. Wasps, although not so numerous as I have seen them in dry seasons, are large plentiful and wros was brouglit in to me in April, and the frosts of May, June, or July, do not sem to have lessened their number much. Here the quantity of wasps' nests brought 14 will not fall below the average of former dry summers. Even while I am writing this, nine nests have come in, and nome of them are very strong ones. E. Tennelt, Oslierlon, Nolts.
Grevillea Manglesii.-Let me strongly recommend this plant to all your readers who have to cmbellish large conservatories, \&cc. It may be equally useful for small ones; but as I know the plant, it is abont 10 feet high, with a peculiarly graceful labit-quite unlike that of any of its relatives we cultivate, and having a
very enticing resemblance in habit to tho Weeping very enticing resemblauce in habit to the Weeping
Willow. In fact, it will do for lare co servatories what that fine plant does for cur pleasure grounds. It is abundantly covered with white flowers i: spring, but the drooping character of its slender branchlete is its chief charm. W. Robinson.

\section*{Foreign Correspondence.}

A New Zraland Flowgr Show. - The following account of a show held last March in Canterbury, New Lealand, shows that aardenine is carried on with spirit in that distant enlony:-The sluw was one of the finest, if not the finest, held in Canterbury; and those who are inferested in the progress made in horticulture would have been well repaid even for a trudge through the rain and mud, which, it appears, affect New 7 ,"aland flower shows as much as our own. It speaks well for the enterprise of antipodal gardeners, that they are not content with striving to attain excellence in the growth of old faniliar favourite plants, but that they endeavour to introduce new specimens into the province. The productions of all climates were, it is said, shown in much beauty and perfection. And it may be taken as an evidence of the fertility of the New Zealand soil and the adaptability of the climate, that, notwithstanding the fickleness of the latter plants and vegetables thrive so well. Flowers, fruits and vegetables of all kinds which have been introduced seem to take to their new homes as if they were indigenous. This might be remarked in the heterogeneous collection of the plants shown at the exlibition: natives of England, of the Continent, of the Fist, and cven of warmer climates. The display of Fuchsias was beautiful the choicest specimens were Guiding Star, Venus d Medici, Souvenir de Chiswick, Sir Culin Campbell, Queen of Hanover, Rnse of Castille, Fair Cramia, and Madame Cornelissen. There was a lovely specimen of the Plumbago capensis, and others of Achamenes Meteor, of Nerium splendens, and of Polygald ncuminatin A pretty specimen of the Hoya carnosa attracterk great admiration, both on account of its dark glossy foliage and of its elegant blossoms. The Glixinias were very pretty, and some of the Begonis were remark able for the large size attained by their fulisge; G! oxinia Magnet was perhans the finest of its class shown. Some beantiful Petunias were sent in for exhibition; the double ones were of especial merit; but, adils onr informant, we must aver our preference for the single ones. In some instances the double-flowered plants produced by cultivation are inferior to the simple form of the parent plant. These double Petunias were the first shown in Canterbury, and had been gallantly named after some of the ladies in Christchurch. Near the entrance of the saloon stood a large phant of Hydrangea in full blowm; it was growing in a tub, and had
attained a considerable sizs. Nr. W. Witon sent a attained a considerable sizz. Mr. W. Witson sent a
very choice specimen of Humea elegans, with delicate piak pendent blossoms, so exteusively used in gardens in Englaud as a centre for beds. One strange contribution must not be overlooked, a specimen of tive Tea-plant, the Thea Bohea, the only one, it is sain, in Canter bury, and the property of Mr. Miles. Only a few Pelargoniums were shown. There were some very interesting specimens of the Sensitive plaut; and some Ice-plants of great beauty were shown, and were noticeable for their sparkling foliage. Mr. (iould sent plant of which the substance is maufactured upon which the Chinese paintings are made. The laslsams were very good, some fine double ones being exhibited. There was a novelty in the shape of a slirub recently There was a novelty in the shape of a shrulu recently
elegantly variegated foliage. Messrs. Ollivier and Paciser contributed some very good specimens of the
Amaryllis; that known as coccinea is a very pretty one. Dr. Lillie sent some fine Asters, and Mr. Brooke some capital Hollyhocks. Some of Mr. Painter's Fuchsias were much and deservedly admired. Outside the
room were two collections of Conifers, one belonging to Mr. Greenaway, and the other to Mr. Hislop. They Cupressus, and Arbor-vitæ. Mr. Hislop sent in a firstrate specimen of the Virginian Cedar, growing in a pot; be easily acclimatised, and will doubtless prove a most aluable tree for its timber.
Amongst the cut flowers, the Dablias were, perhaps, the most remarkable. Roses generally occupy the
place of honour, but the season for them was well-nigh past. The Dahlias shown were for the most part fine blooms, but not so large as those we have been accustomed to see in England. There were some of great beauty as regards colour, especially the claret and sulphur-coloured ones. The old-fashioned Globe Dahlias seem going out of vogue- at least, we have setts, Lillie, and Greenaway were the successful competitors in this department. The bloomo of Verbenas and Narigolds, and some specimens of the Clarkias were very good, as were also some of the Lilium lancifolium. tractive feature was Mr. l'otts' basket of fruit most the different compartments of this were arranged samples of Apples, Pears, Plums, Siberian Crabs, Cape Gooseberries, \&c. Mr. Tunmor contributed some fine greenhouse Grapes. Mrs. Deans sent some splendid Apples and Pears. The Peaches were very choice,
especially those sent by Dr. Watkins, of Akaroa. Mr Haylock sent some very large Plums, ns did also Mrs. Muted by Mr. W. Wilson, and some very good Peaches by Mr. Wilson, of Papanui. Mr. Wilmer showed some good Applea, and there was also a good exhibition
of Greengages. Mr. Potts sent some Mulberries. This fruit seems to thrive very well in the province, the soil being well suited for it, the only obstacle against its successful culture being the sharp frosts we have sometimes to encounter.
Vegetables were remarkably fine. Perhaps the most noticeable were the Potatos. Some one has described New Zealand as "a land flowing with pigs and potatos," inticle. Mr. Dalgety slowed some which would lisve delighted the heart of an Hibernian. Some of the finest ing the show were those known as Deacon's
seedlings. The other sorts were the Orange RavensProlific. Mr. W. H. Lane showed some ripe'tomatos. Mr. Wilson sent eome samples of Hallett's Wheat, cereals of the province. Mr. Painter showed a " prodigy Cabbuge," as it was uamed, and the term was certainly an appropriate olle. There was an immense variety of also carried off the prize for Cucumbers. Dr. Stedman exhibited some of the largest Carrots we have seen.
The Beetroot and Celery were also very fine, but much of the latter, owing to some defect, cither in the soil or in the culture, was what is tcchnically called "piped." dark colour were shown. There were remarkably large Onions, and Garlic enough to bave satisfied a Spaniard's love for olla podrida.
Cinoeona Cultivation at Darjeeling.-Dr. Anderson's report on the progress of the plantations during the month of April, shows very favourable results. and highly favourable to growth, \(11 \cdot 18\) inches having fallen during the latter half. At the fourth plantation, the mean maximum temperature during the month mican temperature \(68^{\circ} 5\). At the fifth and lowest plantation, the mean maximum temperature was \(85^{\circ} 4\), the Thean minimum \(62^{\circ} \cdot 3\), and the monthly mean \(73^{\circ} 6\). temperature as compared with last month, while the mean maximum temperature at the fourth plantation has fallen slightly below that of March. The growth of the plents had everywhere been most satisfactory, and especially at the lowest plantation; the condition of all the species could hardily be surpassed, the plants being covered with luxuriant foliage, and the largest sending out vigorous branches from the axils of the three or four upper pairs of leaves. The total number of plants and partially rooted cuttings of all species was 49,486 on the 30 th April. The number permanently planted out was 325 ff . The number of plants added during the month to the number to be retained as stock plants was 9820 ; all of these belong-
ing to Cinchona officinalis were planted in beds in the open air. The increase by cuttings during April far exceeds the number obtained, since the commencement of the experiment, 12,104 cuttings of all epecies were nade. None of these are bads, only vigorous shoots were atock than a large monthly increase of cuttings talen from over-promed plants. The 7214 cating made during March had all rooted and were ready to be
potted off as soon as the more urgent work of preparing ground for the
In the report for February it was stated that an experiment had been made to ascertain the difference in the number of cuttings obtained from plants growing under glass and those growing in the soil and fully plants under glass yielded a larger number of cuttings than the plants entirely unprotected. The proportion was three to five. No general reliable results can be
oltained until the experiment has been carried on for a year: as during the rains the plants in the open air will grow must luxuriantly and will give a much season. The operations at Rungbee during April, in addition to the makirg of cuttings and the planting in the open-air beds of 9820 plants, consisted of planting Cinchona Pahudiana in permanent plantations, making drains in nurseries and plantations, and repairing the roads, all of which were much damaged during the heavy and sudden falls of rain occurring during the latter part of the month. A new road, giving access to the southern slope of the spur, had also been finished. The nursery for the distributiou of Cinchona planta had been commenced during the month by 1000 cuttings of Cinchona officinalis having been placed in it. The number of plants, cuttings, \&c., on the 1st of May, 1865, is given C. micrantha, 1554; C. officinalis, including varieties 31,929 ; C. Pahudiana, 5092 : total, 49,486.

\section*{Societies.}

Royal Horticuitural of Ireland: Aug. 24 (duy 24th ult., and we thought the pretty hollow in which the Society bolds its summer and autumn exhibitions, just by the edge of Dublin Ray, would be flooded; but just in the nick of time the sun came forth and dispersed the rain clonds and vapours that obscured the beauties of the Bay, illuminated the Hill of Howth on the opposite shore, and prepared everything for a most agreeable afternoon and excellent show. Instead o specify any peculiarities of the Society or its exhibition as compared with the London and provincial English shows ; and this is the more desirable, as the Society is in a most prosperous condition. First, then, as regards
the show: it, like the others of the Society we have seen, was well arranged, and the tents regularly filled This is a desirable feature of a show, and the Dublin people, by making it a rule to fine those who do not stage in the classes in which they have entered, take a good means of preventing what is the cause of considerable inconvenience at the London meetings. Of the plants, nothing seerr at the show calls for such special remark as the "group for effect, consisting of from 12 to 15 Exntice, one-third at least to be in flower." This a well and cleverly arranged group. This sort of class is deserving of great encouragement. The Foliage-plant Mr. McNeil, also of the Phoenix Park, who usually wins the group for effect prizes. Liliume, too, were made a feature of, and a very effective one, Mr. Tobin winning the best prizes.
Florists' flowers were a much more conspicuous feature at this show than at any that occur in London. They receive greater encouragement, at the expense, however, of the large groups of stove and greenhouse plants, some of which cost the exhibitor more for
carriage than would pay for the conveyance of all the florists \({ }^{\circ}\) flowers at the show. The climate of Ireland suits the Dahlia well, and it was shown very creditably and largely - Messrs. Campbell winning the cup. However, it was in Gladioli that the exhibition was greatest, and they were shown in astonishing perfection and beauty. Those grown in the neighbourhood of Dublin were far before some sent from England, but all were eclipsed by the stands sent from the north of Ireland by Messrs. Dickson, of Newtownards, who are the most successful growers of florists' flowers in Ireland. The best prize was for a Seedsmen and Amateurs' Subscription Cup, value 10 guineas, and the stand from Messrs. Dickson, which won this, was a show in itself both as regards arraugement and the great size and perfection of individual spikes. The kinds were as follows -Napoleon III., Impératrice, Duc de Malakoff, Mac Mahon, Comte de Morny, Sulphureus, La Quintinie, Lord Granville, Ninon de J'Enclos, Diana, Madame Binder, Achille, Calypso, John Waterer, Impératrice Eugénie, Madame Basseville, Mathilde Landevoisin, Rapbael, John Bull, Le Poussin, Chateaubriaud, Madame Leesèble, Crystal Palace, Hebe, Madame E. Verdier, Linné, Adonis, Florian, Maria Dremontier, and Madame
Fruit was well and largely shown. The Peaches were ine, Ireland being an excellent country for Peacl: enlture in the open air, bnt some of the best dishes were spoiled from bad packing, and of course got no prizes. Several kinds of Grapes were sliown by Mr. Roberts, gardener at Charleville Forest, Tullamore; they were of great size, particularly Mill Hill Hamburgh and the Muscat of Alexandria, the latter larger in bunch than we have seen it in London, though not so well as regards
in weight. Mr. Smith of shows this year over 8 in in weight. Mr. Smith, of the Vice-regal pardens, had The fruit was placed on metallic leaves four feet ligh water-plants that sprung from a central stem, effect was striking and good. The way not was well exemplified by another exhibitor in tho direction, who piled up his fruit on a little squer wooden stage with steps, without leaves or any square paniments-about the worst arrangement concerom next to putting it into a flower.pot The chave Ireland is particularly favourable to the srownate our vegetables, and they were as usual shown in fin condition, Mr. Delany taking the chief prize.
In the evening the Society and its guests dined the Salt Hill Hotel, as they do every season on the de of the autumn show ; and this time, as is his castom, the Duke of Leeinster presided. Lord Powerscourt, La James Butler, and soune of the leading noblemen an gentlemen of Ireland were among the guests. It abould
be mentioned, however, that it is rather a dinne be mentioned, however, that it is rather a dinner gardeners generally are practically excladed from It is gratifying, of course, that horticulture should thus honoured by the leaders of the land bot equally desirable that the gardeners should be brood together annually, and the Society might do well try an experiment of that kind, if an amalgamation impossible, as a horticultural dinner without practial gardeners is somewhat paradoxical. There was a cipital dinner, much of the fruit shown having been presente by the owners. Lieutenant-Colonel Hillier, in returnier thanks for the Army, regretted the unavoidableabence of Sir H. Rose, who had devoted so much of hi energies to the social and moral improvement of th soldier, and had accomplished a good deal in that \(m\) by means of small gardens.
Captain Miller, of H.M.S. Royal George, replyin very happily for the Navy, begged to assure company that the Navy took the deepest interat in borticultural matters, though from want of space a ourd ship they could do bat little in that direction on he had seen very beautiful plants grown on board be Majesty's ships, and he had heard of Gooseberry buhbe growing in the days of Admiral Benbow, but he had actual knowledge of the fact! He hoped that the Nam in addition to fighting the battles of the comntry, woild also cultivate a taste for flowers.
Prosperous as the Society is, it neglects one important good-giving a breakfast to the exhibitors. No men work harder than exhibiting gardeners, aud there pretty good pvidence of their ability to eat a go breakfast when on an exhibition day the stagiug is done. Now as shows are often held in places wherei is nearly impossible to get a good breaktast, the men are often driven to the publichouse and its amenite of our flower shows, their will. societies, it is needless to say arise alnost directly from the skill and energy of the gardener, and except wher a society is begiming or in abject poverty, he duors d be made comfortable, after perhaps twelve hours work, which more than any other requires a combin tion of taste and severe bodily labour. ratifying to a hungry gardener to kuow chat Dublin Society has plentyof funds in hand, couse, it is not impossible that he might view the
with even greater equanimity. Another improveman might be made by somewhat increasing the prizesi the large and important classes of plants which ave costly as regards culture and carriage, and so mboe more useful as an attraction for the publicupport of course the whole thing depends.
The popularity and prosperity of the Societr mosk be to a large extent owing to the courtesy, energy, and full knowledge of horticulture on the part tary, Mr. Ambrose Balfe, who works hard and fully to make the exhibitors and all elee concant much at home as possible. He is entied thanks of the Dublin exhibitors. \(\boldsymbol{R}\).
Crystal Patace: Aug. \(30 \& 31\) (Autume Eulit bition of Fruits and Flowers).-This was a magild oue exhibition, especially as regards fruits, tolf being filled with Dahlias, Asters, Cut Roses, Gladioli, and subjech of that description.
Pine.apples.-These were not very plentiful. Tmo good Smonth-leaved Cayennes were shown by gr. to W. Leaf, Esq., of Streatham.
H. Stone, Eso., of H. Stone, Esq., of Dulwich, had a well-grown somewhat unripe Prickly Cayenne andad an Queen, as did also Mr. Miller, Combe Abbey. Mr. Higge, g ributed a well-swelled Mescow Queen
Smith, gr. to A. Anderson, Esq. Mr.
Edwards, Esq., and M
Collections of Fruit.-By far the best
from Mr. Miller, gr, to Lord Craven magnificent Muscat of Alezandria Gr Plums, a Monarch Melon, the we \({ }^{3}\) Ib. ; a Moscow Queen Pine-apple Black Hamburgh Grapes, which
\(10 \frac{1}{2} \mathrm{lb}\). ; good Barrington Peaches, an Nectarines. \&Mr. Bailey, gro
deloes, contributed the next best collection in Merit. It Crapes, the last fine bunches, cut es in pots; a Queen Pine-apple, Bailey's feshed Melon, Elruge Nectarinea, Red Magdalen Les's Perpetual Figs, and Jefferson Plums. Barclay, Esq., Knot's Greer, Leyton. It conLady Bon Chrétien Pears, Morello Cherries, a ne-spple, Royal George Peaches, and Jefferson In a collection from Mr. Carr, gr. to Hinds, Esq., Byfleet, were fine examples of
Figs, Peaches and Nectarines, Plums, two Pinepples and White and Black Grapes. Mr. Bones, gr.
and. this class.
Grapes.-Among these were some magnificent esamples of skilful culture. Mr. Meredith, who stood as woal first, had three bunches of Black Hamburgh auich issed. These were deservedly the admiration of Next came three wonderfully fine of the same variety from Mr. Miller, gr.
Craven, which weighed together \(11 \frac{3}{4}\) lb. Sage, gr. to Earl Brownlow, also furnished admirable Black Hamburghs, as did also Messrs. Lane, Whowe fruit was remarkable for fine colour and bloom. shown by Mr. Osborne, of Finclley, and Mr. Ford, gr. to the Rev. T. D. Hudson. From Mr. Irving, gr, to the Doke of Hamilton, came three bunches of the last-named variety, weighing together 11 lb .3 oz . They were, howeere, deficient in colour. The last-named exhibitor had together \(7 \mathrm{lb}, 3 \mathrm{oz}\)., somewhat injured from travelling. Good Buckland Sweetwater was shown by Messrs,
Lane. The best Muscat of Alexandria came from Mr. Osborne. Mr. Wills, gr. to Sir P. G. Egerton, Bart., had Trebbiano, apparently over-ripe. Mr. Bailey sent new Grape. And Mr. Miller had the finest three buaches of Golden Hamburgh ever before seen in this country. Their united weight was 12 lb ., the centre bunch aloue weighing 5 lb ,, and furnished with large hand-
some shoulders. Such a result must have been highly gratifying to all concerned in first introducing this fine Grape to public notice. In the class set speciaily apart for large bunches was one of Black
Hamburgh from Mr. Irving, weighing 5 lb . 8 . but, as with other fruit from the same exhibitor, it was deficient in colour. Mr. Osborne had a compact wellcoloured bunch weighing 3 lb . Mr. Meredith showed a
beautiful basketful of Black Hamburgh, for which he beautiful basketful of Black Hamburgh, for which he
received a lst prize. Other basketfuls came from received a lst prize. Other basketfuls came from
Measrs, Lane and Mr. Osborne, the fruit from the latter being; somewhat larger in the berry than that from Messrs. Lane; but it was not nearly so well coloured. Prom Mr. Wills came a fine basketful of West's St. Peter B , and Mr. Cross, gr. to Lady Ashburton, had
beatiful Black Hamburghs. We observed some Grapes and other fruit from the late Sir Joseph Paston's houses at Rockhill, and fine collections of Tines in pots from Messrs. Lane and Mr. Geirs, gr. to Holloway came bunches of his handsome-looking new Melonsyal Vimeyard
ing in the first rank among Scarlets, and Marquis of Pears that of Green-fleshed kinds.
Pears.-These were shown in large numbers. The Came from the neighbourhood of Chiswick, and was shown by Mr. Anstiss. It was a small Pear without a name, something like Comte de Lamy. It was, howWho bad tasted it, that "if that was the best-flavoured Pear shown, what must the second-best be! " Williams's \(3 d\) prizestien was the sort to which both 2 d and
given for flavour. Of Louise Bonne Wilson, of Ge notishurat welli-grown examples from Mr. The heaviest dish consisted of Uvedale's St. Germain, from Mr. Gadd, gr. to J. J. R. Jaffray, Esq., Betchworth. 8 ll .10 oz . These came
M . Wilcon had Cover; and Mad 12 five specimens of Maréchal de la mall fruit of Uvedule's St. Germain. Thg best contribated were shown by Mr. Sheath, Langley, who Gnatel's Bergamot, and Louise Bonne of Jersey. Mr. Looise, Beurré Diel, Court, Epsom, showed Marie and Williams's Bon Chrétien Colmar, Gansel's Bergamot, empecially - These were rema
Epecially such sorts as the Quarkable for high colour, Thes The kinds for culinary purposes were as a rule diblee came in size. Among the latter, the best uix
The lorsrs, Gadd \& Son, of Worthing. Capagne, Were Nelson's Glory, Reinette Blancle
Reatiinh Fillbasket, Suffeld, End New Hawthornden. Thander, Mary's Cest lot was contributed by Mr. Lane, Sho had Hoary Morning Et
nader, Ble and Tamboureim Pippin, Praiseworthy, Lord Suffield,
heim Pippin, Hollandbury, large and possessing hig Apples in cultivation; Emperor Alexander, well coloured; Cellini, and Lord Suffield. Mr. Kalle, gr. to Lord Lovelace, furnished New Hawthornden, Alfriston, Emperor Alexander, Broad-crowned Pippin, and Manx Codlin.
Grabam, Esq., contributed beautiful fruit of Emperor Alexander, Hollandbury, Dutch Codlin, Kentish Fill. basket, Hawthornden, and Brabant Bellefleur. Among dessert fruit the best came from Dr. Cooper, of Slough, den, Early Red Margaret specimens of Quarren den, Early Red Margaret, Red Astruchan, Cox' Orange Pippin, Nonsuch, and Ribston. From Mr Sheath, of Langley, came Quarrenden, Peach Apple, and Rargaret, Cox's Orange Pippin, White Peach, and Ribston, the last large and fine. Mr. Honse, Chalvey, furnished Quarrenden, Early Red Margaret Nonsuch. Mr. Cox's Orange Pippin, Ribston and Nonsuch. Mr. Lane sent Fearn's Pippin, Cellini, Car.
nation, a handsome striped kind ; Peach Apple, Red Astrachan, and Colonel Vaughan. Kerry Pippin, and nearly the same sorts as those just named, came from Mr. Wren, gro to E. Purser, Esq., Carshalton. Mr. Newton had beautiful specimens of Cornish Gilliflower which, though not generally handsome in appearance, is nevertheless one of the best-flavoured Apples in Plums.

Plums.-These were present in abundance, large and fine. The best came from Mr. Bailey, who showed Jefferson, Victoria, and Washington. Mr. Simmouds, gr. to J. Smith, Esq., Dorking, sent Jefferson, Kirke's, and Washington. From Mr. Goldsmith, gr. to Sir W. Farquhar, Bart., came Kirke's, Washington, and Pond' Seedling. Mr. Sage and Mr. Wells also showed simila varieties. Among other sorts we noticed Coe's Golden
Drop, Golaath, Greengage, Magnum Bonum, and Black Dianond
Cherries.-These were chiefly confined to Morello, some fine dishes of which were exhibited. Other sorts were the Late Dake, Flemish, and Kentish. We, how of Sher, saw a beautiful dish of Bigarreau from Mr. Bailey,
Figs.-In
Figs.-In some of the dishes shown of these, the
fruit was very large and fine. the sorts were the Brunswick, Genoa, Brown Turkey, and Madagascar.
Nectarines.- These were for the most part somewhat small in size. The best came from Mr. King, gr. to R. Loder, Esq., Slaugham, and consisted of Violette very good high-coloured examples of Elruge, and Mr. Iugle, gr. to C. G. Round, Esq., also showed the lastnamed variety.
Peaches.-These, like the Nectarines, were not remarkable for large size. The best dish of Royal George came from Mr. King; good Barringtons from Mr. Kaile; large and fine Walburton Admirable from Mr. Evans, gr. to Gen. Cartwright; and Royal George from Mr. Ingle. Some well fruited Peaches in pots
were shown by Mr. Vertigan of Clapham, and Mr. Fraser.

Miscellaneous Fruit. - Mr. Sage, gr. to Earl cluster of the fruit of Musa Cavendishii. Mr. Carr had fine fruit of a violet-tinged variety of Meaches, Plums, and the large fruit of Passifora), quadrangularis. From Mr. Cuthill, of Camberwell, came a handsome oval, lemon-skinned Melon, weighing
5 lb . The seeds of it were received by Mr. Cathill from Australia, where it is said to attain twice the weight just named. Mr. Sawkins, gr. to A. Smith, Esq., Bramfeld, had Red Grape Currants still in a atate of perfect preservation. Mr. Higgs had
Red Currant equally well kepts. Large yellow, and both small and large red Capsicums were shown by Mr Sage, gr., Aslıridge.

Daklias.-These were numerous, large, and fine especially the blooms in the winning stauds.
In the Class of 48, Varieties, Mr. Keynes, of Salisbury, had the 1st prize for beautiful examples of Annie Austin, Lord Derby, Leab, Mrs. Trotter, Charles Turner, Baron Taunton, Lord Shaftesbury, Queen of Primroses, Lord Clyde, Golden Drop, Andrew Dodds, Helen Potter, Queen of the Isles, Garibaldi, Earl Penston, Jenny Austin, Princess, Donald Beaton, Lilac Queen Marquis of Winchester, Lady Maude Herbert, Miss Henshaw, Disraeli, Hero, George Wheeler, Peri, Willie Austin, Ne Plus Ultra, Earl Russell, Bird of Passage,
Juno, Foxhunter, Edward Spary, Miss Herbert, Charlotte Dorling, Chairman, Champion, Hugh Miller, Mr. Wyndbam, Lady Gladys Herbert, Annie Keynes, Mrs. Hoge, and British Triumph. To Mr. Keynes was also awarded the \(2 d\) prize in this class. Among other exhibitors in it were Mr. Walker of Thame, Mr. Wheeler of Warminater, Mr. Allen of Shacklewell, Wood \& Ingram, Huntingdon, and Mr. Legge
Edmonton.
In the Class of 24 Blooms, Mr. Keynes was again the most successful exhibitor. His kinds were Leah, Jenny Austin, Cbairman, Norfolk Hero, Baron Taunton, Hugh Miller, Lady Gladys Herbert, Andrew Dodds, Helen Potter, Mrs. Wyndham, Earl Pembroke, Golden Drop, Disraeli, Anuie Keynes, Pauline, Lord Derby, Annie Austin, Champion, Bird of Passage, Charles Turner, Juno, Miss Herbert, Golden Gem, and Miss

Wheeler, who contributed among others good blooms of Bellona, Garibaldi, Lord Derby, Andrew Dodds, and Miss Henshaw. Messrs. Kelway \& Sons, Langport, Somerset, Walker, Roe, Wood \& Iugram, and Godden, all staged good flowers in this class.
In the Class of 12 Fancy Dthlias Mr. Keynes took the 1st prize with large beanti'ul blooms of Striped Perfectiou, Messenger. Patent, Magpie, Sam Bartlett,
Pauline, Regularity, Fornidable, J. Salter, Proserpine Pauline, Regularity, Formidable, J. Salter, Proserpine,
Queeu Mab, and J. Buna. Mr. Legge contributed annong others, fine examples of Mary Lander, Princess of Prusiia, Glory, Lady Paxton, Eclat, and Lord Warden. Most of the exhibitors named above also took part in this competition.
In the Amateurs' Class of 24 kinds. Mr. Perry, of Castle Brounwich, was lst with charming examples of Purity, Countess of Shelbourne, Delicata, Earl of PeinWroke, Bab Ridley, Miss Roberts, Stella C.llas, Gearge
Wheler, Leah, Princess, Lord Derby, Hugh Miller, Ne Plus Ultra, Charles Turuer, Umpire, Model, Marooncoloured Seedling, Blusli-coloured Seedling, Charman, Bird of Passage, Volunteer, Lord Palmerston, Miss Henshaw, and Disraeli. From Mr. Thornycruft, Floore near Weedon, came Lord Dundreary, Liluc Queen, Model, Unpire, Willie Austin, Triomphe de Peeq, Chair man, Charles Turner, British Triunph, Admiral Dundas, Annie Keynes, John Wyatt, Juno, Noriolk Hero, Laily L. Paulett, George Wheeler, Mrs, Church, Volunteer, Derby, and Miss Henshaw. Mr. Jedy Austin, Lord Colchester, had fine large blooms, anong which Criterion, lilac, measured nearly half a foot in diameter Duchess of Wellington, maroon, was nearly equally large, and we also noticed fine examples of Charman
and Norfulk Hero, the last a fine orange-saluon kind. Mr. Norfin hero, the last a fine orange-salumon kind.
Mr. Margate, also showed in this class.

In the Class of 12 Blooms (Amateurs), Mr. Thornycroft was the most successful uxhibitor. He had Miss Henshaw, British Triumph, Willie Austin, Chanpion, Baron Taunton, Lord Dundreary, Juno, Chas. Turuer Adniral Dundas, Loru Pahnerston, Nero, aud Lord Derby. Mr. Petfield, gr. to G. Thornhill, Esq.,
who stood next in point of suerit, had George Browi, Count Cavour, Edward Spary, Goiden Gem, Mrs, Bush, Hugh Miller, Jeany Austin, Leah, Norfills Hero, Baron Taunton, Lord Derby, and Charlatte Dorling Mr. Perry, Mr. Dicks of Brock ball, near Daventry, Mr Hopkins, and Mr. Bennett, also all showed good blooms.

In the Class of 12 Fancy kinds (Amateurs), Mr. Perry had considerably the best blooms; they consisted of Comus, Startler, a fine white-tipped deep mulberry Gem, Garibaldi, Pauline, Harlequin; Messenger, a seediing something like Queen Mab but reduer in colour ; Miss Jones, Queen Mab, Countess of Bective, and Flirt. Summertide and Lady Paxton were also shown in beautiful condition by the same exhibitor, to whom a 2 d prize was also awarded in this class Mr. Thornycroft had a good third-rate stand
Seedling Dahlias.- These were tolerably plentiful. The best two were Marquis of Winchester, deep maroon, beautiful in shape, both as regards the flower and petal, and Mrs. Savory (Clurch's), white, heavily tipped with purplish lilac; both these belong to Mr. Keynes, who received First-class Certificates for them, and for Lottie Atkins, a fine kind, described by us on a former occasion. Fanny Sturt, a Fancy kind in the way of Lady Paxton, from Mr. Pope, of
Chelsea, also received \& First-class Certificate. To Master of Arts, bronzy salmon, from Mr. Turner, a Second-class Certificate was awarded, and a similar kind striped and mottlec with gearlet from arr
Hollyhack there certainly should have been; but instead of them there certainly should have been; but instead of them
there were some very large and fine single blooms, especially those in a collection from the Rev. E. Hawke of Willingham. Among them we noticed J. Ullett Decision, Rev. J. Dix, Lady Des Vornx, Lord Palinerston, Imperator, Gem of Yellows, C. Eyre, Willingham Defiance, Lord Craven, Purple Emperor, Fair Eilen Beauty of Mitford, Mrs. Cuchrane, Lilac Perfection Eminent, J. Clarke, Wm. Dean, Albion, Gladıtor, G Young, and G. Keith. Many of the blooms in other colleetions seemed considerably injured by the weather
Verbenas.-Mr. Perry showed some cuarming sorts, conspicuous among which were Auricula, dark mulberry with large pale green eye; Black Prince, very durk with white eye; Snowhall, one of the very beat whites Lilac King, a beautifully scented kind; Géent de Batailles, large uark crimson; Cuarles Perry, delicat pink with crimson eye; sud among scarlets, Lord Leigh, Fushunter, and Firelly, all fiue varieties.
Roses.-Several bortuls of these were shown in good condition. In a collection from Mesirs. Paul \& Son wo noticed the glorious new yellow Tea Rose Maréchal Neil, a real acquistion ; also Cuarles Lefehrre, Pince Camille de Ruhau, Madame B ill, Madame Victor Verdier, Prituce of Wales, Gloire de Dijon, Maurice Bernardin, Pierre Notting, Gloire de Santenay, and Madame Willermuz The same exuibitors had also Alfred de Rougemont deep velvety crimson; Luuise Sivoie, and Louise Magnan. In the Amateurs' Class the best blooms were contributed by Dr. Cooper, of Slough, who had anong others Maréchal Vaillant, Senateur Vaisse, Guyet, Madame Boll, Gloire de Santenay, and Gloire de (Dijon, all in excellent condition. Mr. Thornycroft, Mr.

Mr. Smith, gro to T. Mozon, Esq., also all showed good Rose blooms.

Asters.- Both German and French kinds were shown in admirable condition. The French sorts especially were very large, and the colore not less remarkable for their conpactness and neatness. We should, however, like to see greater variety, both of colour and character, than was presented on this occeasion, many of the sections into which Asters are now divided not being represented at all. Let us hope that this defect may be remedied next season.
Gladioli.-Cut spikes of these were shown in beautiful condtion by Messrs. Kelway \& Son, Langport, Somerset. Some of the best among them were Pliuus, light cherry, with white throat; Rubens, crimsonstriped vermilion on pale ground; Raphael, purple shaded vermilion, slightly veined with white; Prince Imperial, soft rose, stained with violet crimson; Ophir yeliow striped with purplish red, but scarcely so clear or gearlet, striped with white, a find kind; Madame de Vatry, white, atriped with purplish crimson Madame Basseville, cherry, stained with purple on a white ground; Madame Vilmorin, shaded rose,
with a large white centre; MacMahon, red striped rose; Maria Dumortier, large white striped and atained with violet and rose; Le Poussin, still a good old kind; Madame Rabourdin, rose veined with carmine and beautifully marked with white in the centre o each petal ; Achille, feathered crimson with pale yellow throat; Monta, large soft rose relieved with a little white. We also noticed in this collection one or two promising seedlings, viz., Monta just noticed, Mrs. Stuckey, and Rosa. From Mr. Sladden, of Ash, came Miss Slidden, a good yellow; Prospero, crimson scarlet feathered with violet; aud other a large showy light kind, and several yellows, all of which wanted brightisess. From Messrs. Paul \& Son came Finton, bright scarlet; Princess of Wales, white,
with yony parple marking and stripes; La Quintiuie fine salmony scarlet; James Veitch, crimson, with violet feather ; and Madame Furtado, a gooll carnation sort. Mr. Brown, Sadbury, also showed Gladioli Yneca leaves, we observed, were employed by some exhibitors to set off their flowers, an unnatural practice, which cannot be too soon abandoned.
Fine-leaved Plantr.-Of these Messry. Downie, Laird A Laing had a large and valuable collection, in which were assembled nearly all the ornamental-leaved Solanums in cultivation. It ircluded S. pyracantha, with rich cinnamon spines and ribs; S. marginatum argenterm, with silvery shaded foliage of good size which when moved by wind has a fine effect; S . robustum, with large spiny leaves; and S. auriculatum, Datur 1s, Wigandia caracasana, Nicotiana wigandioides, Pulymnia grandis, with fine large deeply cat pule-green leaves; Ferdinanda eminens; Phytolacea dioiea, with oblong leaves and red stems and leaf-stalks, and many others-all well worth the attentiou of lovers of fine leaverl plants for purposes of outdoor summer decoration
Miscellaneous Sabjects. - From Mr. Rhodes, Syden ham, came a fine boxful of cut flowers, and a sinila exhibition was also furnished by Mr. Frisby, gr, to H Chaplin, Ewq., Blackney Hall, Sleaforl. From Messrs W.terer \& Godfrey canse an example of the beautiful glauous or rather silvery-marked variety of Cupressus Lawsoniana. From Mr. Parker, of Lower Norwood, came Japan Lilies. Messrs. Downie, Laird, \& Laing contributed soune handsome varieties of Pentstemons, Antirrhinums, and Phloxes. Among the latter Le Lyon, Mrs. C. Wood, Triomphe de Twickel, and Vicomte de Beaumont, appeared to be good sorts. From Mr. Brown, of Sudbury, came specimens of Invincible Scarlet Sweet Pea, which is certainly an improvement in point of which on the sort usually caltivated, specimens of August, of Beddington, had a box of double and semidonble Zinnias. Messrs. James Carter \& Co., of Holborn, furnished an extremely interesting display of Plant Cases, filled with much taste and skill ; also beantiful plants of Mrs. Pollock Pelargonium, the best of all the tricolor-leaved tinds in general cultivation, and other subjects used both for in and outdoor decoration.

\section*{Eatinge, Aotor, and Hanwele Hortculyurat.-} The first annual extibition of this newly-established Snciety, under the presidency of the Right Hon. S. H. Eltpme, M.P., was held the other day at the College, kindly placed has beautiful grounds at the disposal of the rommittee. The Socitty was only projected and established about three months ago by few gentlemen residing in the neighbourhood, and so warmly has their object been supp,rted that about 600 persons, including the leading families and cottagers of the locality, were present. It may be stated that the Society was formed mainly with the view of holding out an inducement to cottagers to contend for the prizes to be awarded to growers of aseful vegetables and the more hardy and ornamental deacription of flowers, and such wes the success of the experiment that the cottage growers were found very greatly to excel in merit the gentleman's gardener exkibitors of such productions as Potatos, Cucumberv, Onions, and Croductions as Potatos, Cacum-
as a proof of the thorough impartiality of the judges, that the greater number of prizes were awarded
to the humbler class of exhibitors. At halfopast four to the humbler class of exhibitors, At halfapast four company, expressing his gratification at the large assembly and the wonderful success of the Society The show of fruits, flowers, and especially vegetables, was most creditable ; but what particularly pleased him was the good that had at this early period been effected among the cottagers in the neighbourhood by giving them an inducement to devote their leisure time to garitening. He found that the number of subscribers was 170 , and the amount of prizes in money awarded to exhibitors was 57 l. He congratulated the committee had success that had first real annual meeting the number of the subscribers would be greatly increased.
The right hon. gentleman then distribated the prizes
to the fortunate exhibitors and growers; and, after a vote of thanks to him, the company separated.

\section*{Rotices of 3300K\%.}

The figures in the recent numbers of Seemann's Journal of Botany represent Erucastrum Pollichii,
Hedera canariensis, and Mentha cardiaca The Erucastrum is the same as that rewarded with a gold medal by the Royal Horticultural Society as a new British plant, under the synonymous name of E . nodorum. This was found by Mr. Joshua Clarke on a sand heap near Saffron Walden, and is held to be with littie doubt "one of the plants introduced from the continent by commercial intercommunication." Of the canariensis in Ireland has been so often asserted and denied that most botanists seem to look upon the plant as one of those phantom species which occasionally flit across the botanical forum. There is in gardens a ver fast-growing large-leaved plant, commonly called Irish or Scotch Ivy. This plant, as I understand the specio is one of the many varieties of H. Helix. There is
besides a plant which gardeners call Sharp-leaved Irish Ivy, and this I hold to be one of the varieties of H. canariensis. It occurs wild in Treland, and is evidently the plant alluded to by Mackay in his Flora Hibernica." Dr. Moore says of it- "The plant known in gardens as the Sharp-leaved Irish Iov, I do not remember lately growing at West Aston, Wicklow, and Mrs. Acton, mother to the present proprietor, who has resided there during the last 60 years at least, told me she remembered zetting it from the late Mr. Hodgens, of Dunganstown, Wicklow, about 40 years ago, as a rarity he found somewhere in the neighbourhood of that place. I consider it to be the plant alluded to by the late Dr. Mackay in Flora Hibernica, who compares the leaves to those of Passiflora cœrulea! and states that it was found by Mr. Hodgens, and also on walls near Merrion. The latter place is about fnurmiles from Dublin." A certain confirmation of H. canariensis being an indigenous Irish plant is afforded by its general geographical distribution, assuming it to belong to the Iberian type of our Flora; and acting upon that assumption I proof the Hedera growing in Portugal, and I was delighted to fird it to be H. canariensis, thus furnishing another proof of the correctness of the accepted theory of plant distribution." The Mentha cardiaca of Gerarde is identified with the M. gentilis of Sole, and of English Botany, t. 449. Among the more important papers are some remarks on New Monimiaceæ, by Alph. De Candolle; on the Andrœeium of Mentzelia, by Dr.
Dickson ; Revision of the English Mints, by Mr. J. G. Dickson; a Revision of the English Mints, by Mr. J. G. of a Revision of the Araliaceæ, by the Editor.

Catalogues Received.-J. Carter oo Oo.'s Vade Mecum, Part 4, in addition to complete lists of Dutch bulbs, comprises a good many of the rare Cape bulbs, as Iria, Sparazis, \&c.-F. \& A. Dickson \& Sons Catcu logwe of Duteh Flower Roots offers a selection of the best kinds.-C. Turner's Catalogue of Bulbous Flower Roots gives, besides Dutch bulbs, an extensive list of choice Tulips.-B. S. Williams's Bulb Catalogue is a gnod general list; the secoud part devored to new Pelargonimms.-W. Cutbush \& Son's Bulb Catalogue is an excellent liat of select sorts.-W. Paul's Solect List of Hyacinths, \(\&\) c., is supplemented by a useful list of Spring-flowers, hardy and tender.-W. Bull's Retail List of Nero Plants for the Autumn of 1865 comprises many interesting novelties; amongst others the Gne Allaranda Hendersonii, and the Duplex Minuluses, of which 12 varieties are offered.- - ddolph Stetzner's (Gisent) Preisliste is a rather full general list of new or recent plants.-Jean Verschaffelf's Catalogwe des Plantes contains a very complete series of Azaleas, Camellias, and Rhododendrons, besides a general lint of choice stove and greenhouse plants, and a grood Eugene Verdier fils ainé issues a list of Gladioli.

\section*{fflortsts' \(\mathfrak{W}\) Flowers.}

We are glad to see that the cultivators of the TuITP, who are mont numerous in the midland and northern districts, and by whom the National Talip Society is from year to year upheld with a varying degree of
permanent and extisfactons of this flower on \& At the annual dinner of the present year heretolon from our contemporary the Plorists' Guvide, resolutions, to which we are happy to give fum publicity, were agreed to; and if these are carned a in the spirit in which they appear to bave been an nated, we cannot but expect a more properones aig for the National Society. The principal remlatione as follows:-

That the next annual exhibition of the Nation Tulip Society be held in Birmingham

That Mr. W. R. Lymbery, of Nottingham, be ointed Permanent Secretary.
That a National Committee of Tulip gromen appointed, and that one or more be selected from district or town where Tulips are grown
Then follow the names of those who were nominnted with power to add to their number, namely, Masen Steward of York, Hextall of Ashby, Haynes \& Parkines of Derby, Rev. S. Creswell of Radford, Barber
Stanton-by-Dale, Battersby of Mansfield, Baerbar Stukehill, Lee of Leigl, Stockport, Hart \& Dixon of Leeds, Dean of Shin Hardy of Warrington, Hepworth of Huddenfit Jackson of Deighton, Turner of Slough, Betteridge Steventon, Headley of Stapleford, W. Willison Whithy, Wiseman, Barnes, and Sharp of Birminghur, and Colman of Norwich.

That Mr. J. P. Sharp be appointed Local Bencer for Birmingham, for the current year.

That Mr. Lymbery's form of schedule be adoptod e a model or basis, but the amount of prize money to to awarded to be in accordance with the funde at the disposal of the Local Committee of Management each show, and arranged between them and Permanent Secretary on the 1st of May in each year

That the show of Tulips for each year be hell between the 20th and 30th of May; and that end exhibitor be supplied with a proper form to fill in toe date on which he may wish the show to be hetd, whect form must be returned on or before the 1st of Masi each year to the Permanent Secretary, together wi post-office order for his year's subscriytion; and th the schedule be sent out in one week from that date.
"That the only days on which the shows shootit Friday, in each year."
"That the duty of each Local Secretary or Manger shall be to get all the assistance he can, either by dens. tions or subscriptions; form his own Committee and bs responsible for their acts; choose the place of exhibition and make the bost arrangements he can to make profitable to the Society. He shall communicate min the Permanent Secretary whenever he thims necessary, and shall make all the 1st day of May. Immediately and Locel Sepretaries shall decide upon the Schedil and Local Secretaries shall decide upon the
of Prizes, and it shall be sent out by their joint adim by the Permanent Secretary.

With a more permanent organisation of this kud th Society has a better chance of flourishing and extenume its influence than under the intermittent character which its previous existence was marked especially so if the varions elements of which the working body must necessarily be compoted will be
content simply to work in larmony for the commoc good.

\section*{The Kpian.}

Will you kindly give me some anvice as indidits BARRENNESS IF A QUBEN Bre ?

Having forced a swarm from my stock himetwe royal cells were constructed, and when the queew nearly arrived at maturity I removed ome with which was attached to a good brood-comb, bees clustered thereon, and placed it with othen six hours, at the end of which time the que come out and had been well received. to work merrily, the brood is nearly a shows no honey haseding She apnear barren, and as a full fortnight has elapse emerged from the cell, I fear she will remain nor worm the combs several dimes, repeatedly, and she appears to be just the when hatched. She cannot to be be praciag r when under observatiom,
stationary, with certainly not
"Ought I to remove this barren queen, and add saitable brood-comb (without the bees), for

The swarm forced from the stcck, with the on queen at its head, has progressed bravely, quite strong.

The parent hive appears to be doing well with it young artificially-raisod queen. the coming our of abstraction of the remaining after the absa
hoold not after a long search find the third, so I dook back the swarm into quietly. J. \(\boldsymbol{H} . \boldsymbol{H}_{n}\), Fwhelhaw \(^{\text {and }}\) Band, London."
The foregoing letter ought to have received attention sme weeks ago, but want of space, which has prerente ercuse for the delay. When forming a nucleus, it betrer as a rule when practicable to give at least two copil cells, as there is less probability of failure than thow one only is inserted. Four royal cells are not miny for a stock hive We have known as many as 16 , apid have heard of more, being found in a hive after a Trum has been taken from it. There seems no reason thinhe is by no means an unusual time to elepse hefre eggs make their appearance. We should not be ta all alarmed about the matter. When your letter mas written, dronss were still plentiful in your apiary, and ere this reply is in print, most probably you will fod your queen has become a fertile mother. If our means of the inverted bottle feeder; this will excite the queen to fill the combs with eggs, and you will, by this means, obtain a sufficient population to carry the hive through the winter.
Queens do usually increase considerably in size after impregration and before egg laying, but occasionally they continue for a long time remarkably mall and athenated. The racing over the comb by a young queen is however usually regarded by us as a sign of her haren, or have shown herself to have been a decided drooe-breeder, we should not advise, at this late period of the season, to attempt to raise another. It
mould be better to unite your bees and combs to another of your weaker hives.
You did wisely in returning the swarm to the old
stock, as it would have done but little good without liberal feeding, and the stock hive would have been usiderably weakened

\section*{Bees and Beehives at the Royal Agricultural} to bo seen at the Royal Agricultural Exhibition held attracted more atteution than that of Messrs \({ }_{i}^{4}\) Sous, whore athibited a large and varied collection of all the paraphernalia connected with bees and bee-hives In addition to specimens of the hives kept by them were two hives containing living bees, which were allowed of a Unic of egress and ingress. One of these consisted of Ligurian bees, having at their head a splendid jeilow Italian queen. The other was a square glass a.ve stocked with English bees. This being a bar-and-
frame hive showed the position of the bars and frames mitu the combs and the bees clustered thereon. Both these hises were brought down from Mr. A. Neigh ingress Apiary, near London. The bees obtaived enclosure by ureans of covered ways, nearly 3 feet
long, which whilst being covered to inconvenience them but little, to the interest wizh whith glass, they added greatly way interest wizh which they were observed. By fine sueazon, Messrs. Neighbour exhibited two very from supers of honey-combs; one a square glass boz Exeter; apiary of Mr. Woodbury, of Mount Radford mith remarkably splendid looking honey-comb, from the apiary of Mr. S. Bevan Fox, also of Exeter.

e ago might heve boen counted by hundreds,
the white kinds possessing a beautiful golden tinge The Monukks, a stoneless Grape, has fruited hert this season; but its flavour has not been good. setting Grape of fine flavour, well suited gocd free forcing. Of seedling Grapes Messrs. Line have on with wonderfully large bunches, the berries in which measure individually quite 3 iuches in circumference, and when separated from the bunch have more the appearance of Plums than Grapes, It is good in Gavour, the skin thin, and the seeds not unusually large. Its colour, a deep anber, is somewhat agains it, but under more liberal treatment it may becume perfectly black, the borier in which the Vine is growing being merely a makeshift one aboat 2 feet in width and nos much more in depth. Be that however as it may, the variety, which eridently belonge to the Hamburgh mection, is well worth attention, if only for ite sise.
The home nurnery, an it in failiarly termed, or that which containe the glass houses, occupies the sloping aide and lower portion of a delightful valley tirough which the London and Birmingham Railway rune Here has been formed a hardy winter garden, in which ample diversity both of form of bed and colour may be found. A great circular central bed contains thriving young plants of Wellingtonias, the peculiarly
fresh and pleasing green of which fresh and pleasing green of whioh forms Yuceas, Thuja gigantea, Cupremsus Lawsonians Thujopsis borealin, Thuja aurea, Irish \(\mathrm{Yew}, \mathrm{Boc}\), and plants of that description, bede of all of which may be seen here, divided from one another only by means of narcow circuitous walks. Still further up the hill are compartments containing examples of most of the different kinds of Roses in cultivation, flaked, or rather supportod, by a little arboretum, conspicuous in which is one of the most striking plants that can be employed in giving point and effect to groups of hardy materials used in ornamental planting, vir., the whire leaved Acer Negundo. From the top of this slope, such as the Queen of Flowers alone can furnish, a fiue view of charming park scenery which lies on the other side of this valley, may be obtained.
Among Roses remarkable for very high colour as well as for other qualities constituting first class flowers, Senateur Vainee, Charles Lefebvre, Olivier Delhomme and Pierre Notting certainly stand in the first rank Baron Adolphe de Rothsehild, Alphonse Damaizin, Lord Clyde, Maréchal Vaillant, Profemeor Koch, and many others are also brillinnt varieties, without which no collection can be complete; but the cream of the glowing crimsou scariet kinds is andoubtedly Vigier and Due de Rohan Rohan very dark rich velvety crimson morta, which in a half blown state are extremely pretty, and which when skilfuily set in bouquets are perfect gema. These are all Hybrid Perpetuals, a cless to which Madame Alfred de Kougemont and one or two other white kinds are interesting recent additions. In this section, however, great improvement must yet be equality with that of the Scarlets. Enotion. Modele de Perfection, and Madame de Stella are Jaune d'Or and Madame Falcot are both acquisitions, 2s is also Marquise de Foucault, a fine crean-coloured
kind, while Triomphe de Rennes, deep lemon, and Madame Alfred de Rougemont, beautifully cupped shaded French white, are fine features of the Nolsette class, Of old and tried fayourites in all classes the ame is legion. We might add the names of Roses uitable for forcing for the early spring decoration of greenhouses and conservatories; but Messrs. Lane
have saved us the trouble by printing alist of the best sorts for that purpose st the end of their Rose Catalogue.
What are called the Balshaw Nurseries, also belonging to Messrs. Lane, are situated on Berkhampstead Common, a large tract of elevated ground, from whic naguificent views are obtained in all directions. Here he soil being excellent and the air pure and healthy, Roses grow with great vigour, aud bloom with a pro
fusion unknown to them in less favoured localities Even comparatively tender Conifers resist cold better bere than in low grounds where moisture hangs ebout their leaves. Arsucaris imbricata may be found here in thousands-fine plents, varying from 2 feet to 12 feet in height, densely branched from top to bottom louglas Fir grows here plentifully, strong symmetrica ittle trees frou 10 tol 15 teet in height; Cupresesus Liw oniana and Thujopsis borealis, together with T. dola
brata, Abies Nordmanniana, nobilis and a particularls laucous varieity of the last, as well as Wellingtonins, ant planted here in wonderfully large numbers. On some of the Wellingtonias are cones which promise to ripe eeds this season. Plantations of Junipers, Irish Yewe Thujas, aud Arborvitæ line the pathe on every sid Amung ordinary evergreens we noticod Burbert Aquifulinea, which is extensively grown for eover, fo
which it is very suitable. Among Portugal Luurels w which it is very suitsble. Among Portugal Laurels wh tion of Orange trees, with large busliy heads and straight stems some 4 or 5 feet in height. Scarlet-
extensively cultivated in the shape of standarde Rhododeadrons and other American plants form quite a conspicuous feature of these grounds. in which they are found to thrive in ordinary yellow losw as woll a in peat. To these, as well as to other nursery stock, some 70 acres are devoted.
Another nursery belonging to Messrs. Lzne, also
nccupving elevated land, is situated nccupling elevated land, is situated on Wiggington
Common. Thit is devoted chietly to fruit ireese, of which there are large quarters, both trained and un'raiued, dwarfs, and standards, all as heallity and clean as it ie possible for stock of this description to be. Oue of the principal features of this nursery is an avenue of Araucarias and Drodare, about half a mile in length, in height, and of it consista being nome 8 and 10 foot in height, and of uniform size. The elfect produced by them is therefore excellent. The Araucaria is considered by many to be too stiff and formal a tree for avenues; in the west of Scotland it is, however, used largely for that purpose, and wherever the situation is suitable for free and bealthy growth it may doublles be employed in that way with advantage.

\section*{Miscellaneous.}

The late Mr. Hugh Cuming.-We have to record the danth of one of the most distinguished of Natural History travellers, and the posesenor of the finest and most eatensive concloological collection that has ever been formed. In both these capacities the uame of Hugh Curning has long had a world-wide celebrity; and few men, if any, have contributed so argely to the material extension of the Natural Sciences, which, from his infancy, formed a subject of his eager and alcoost passionate pursuit. Mr. Cuming was born at West Alvington, Kingsbridge, in the county of Devon, on the 14th of February, 1791. Eiven as a child his love of plants and of sheells displayed itself in a remarkable manner; and under the friendy patrouge and encourageinent of Colonel Montugu, the cele brated author of "Testacea Britannicd," who resided in the neighbourhood, it was largely fostered and
developed. Apprenticed to a sail-maker, be was brought into contact with seafaring men, and in the year 1819 he made a voyage to South Auerica, and settled at Valparaiso. Here his passion for collecting shefls fimad an ample field tor its development, and was greacly stimulated and assisted by the Euglish Consul, Mr Nugent, and by several officers of the British Navy among others, by Lieut. Frembly and the officera of the surveying ships under the comusand of Capts. King and Fitzroy. In 18:6 he gave up his businesis in order to devote himself wholig to his fevourite porsuit. With this ohject he built a yacht, expressly fitted for the collection and stowage of oljecte of Natural History and a cruise of upwards of 12 months among the islands ot the South Pacific amply rewarded him for bis toils dredging and collecting by sea and shore. On his steuded duration alo prepared for a voyage of mone ateuded duration along the western coast of America and his reputation being now widely extended, he started under pecaliar advantages. The Chilian Goverament granted him the privilege of anchoring in ths ports free of charges, and of purchaaing atores free of duty, and he was furnished with letters the authorities of ull the States which he visited attention, and gave him every p)ssible fucility. Island of Chiloe, in lat. \(44^{\circ} \mathrm{S}^{\circ}\)., to the Gulf of Conchague in lat. \(13^{\circ} \mathrm{N}\)., dredging, while under sail and at uncbor, in the bays and inlets, searching among the racke, turi ing over the stones at low water, and rambling irnumi over the plains, river banks, and woode, Mr. Cuming re turned with all his adcumulated stores of plants and animals to his native land. The Zoological Society ba just previously been established, and it was in 1831 that its evening scientific meetings began to be enlivenad
by the brilliant displays of new shells from his which were described by the late Mr. Broderip and the late Mr. G. B. Sowerby; while the anatouny of some of the more interesting mollusks formed the subject of papers by Prot. Owen. For four and-thirty years his unrivallod collection has con tinued to supuly fresh novelties for these meetings and the supply is still far from beling exhausted. In 1835 he determined to modertake Islan expedition, and fixed upon the Pulipp ae and wich in natural productwons, little expiurea, if great advantage, as the scene of his lalours. Hegreat advantage, as the scene of his lalours
Letters of recommendation frim the authorities it Madrid to the Govennor-Geueral at Matilla, to

Alchuugh his diengings and anderings by the sea-shove wert by no meuns ucomirected to the wools and forests of these luxuriant slands, and in them be reaped a most ahundant harvest plants, and filled his store elests with innumerible and never betore rewarded the exer ions of a colluctor. In every locality Mr. Cuming becane the guest of the padre, or priest, always the chief personage of the
their equipages were placed at his dispessil, and, what was of still greater importance, the services of the Government, and numbering in some places as many as four or five hundred, were secured to scour the woods for snails and plants. Small bribes of money were most effectual in directing the lynx eyes of these youthful collectors to the detection of such as were especialiy pointed out to their notice, and shells which gladdened bis eyes by their ex"eeding novelty and beauty were brought to him from day to day in quantities which seemed prodigious. After four years spent among the Mslands of the Pbilippine group, ana Mr. Cuming Malurned to England with the richest booty that had ever been collected by a single man. His dried plants, which numbered 130,000 specimens, were immediately distributed, as well as his living Orchids, which were numerous and of great beauty. Large numbers of birds and reptiles, quadrupeds and insects, were also added to the museums at home and abroad. But his shells formed by far the most important part of the spoils which he had secured. Before leaving England he had broaght together, through his Pacific and South Armerican collections, and by mearis of purchase and exchance, the largest and most valuable private collpction then in existence. His vast Philippine col lections enabled him to increase this to an enormous extent; and during the five-and-twenty years that have aince elapsed he has been untiringly engaged in its arrangement and completion, in adding to by purchase and exchange, and in getting the t that it contains not fewer than 30,000 species and varieties, and in most cases several specimens of each. Mr. Cuming had long been subject to chronic bronchitis and an asthmatic affection, each suc cessive paroxysm of which afforded his friends more and more serions grounds of ularm. His last, attack came on on the 26th of July, after a visit to the Crystal Palace; dropsical symptons, to which he had before been sabject, reappeared; and he died on the 10th of August, at his residence in Gower Street, sur rounded by the coilections which had been the object and the solace of his life; and in the contemplation of which he had continued to occupy himself until within few bours of his death. He had from time to time disposed of his duplicate specimens to the various publi and private collections of Europe and America, and always took pleasure in acknowledging that his expenses and his labours had been amply repaid "The great object of my ambition," he writes of bimself, in the year 1858, "is to place my collection in the British Museum, so that it may be accessible to al the scientific world, and where it would afford to the public eye a striking example of what has been don Bincerely do we echo the wish of the world of science. that this object may ere long be accomplished. Athencoum.
Aconits mistaken for Jalap.-Some serious and fatal accidents have recently occurred at Constantinople jalap. From what we can gather from the account or the occurrence given by Professor Dr. C. D. Sct roff, of Vienna, it would appear that a mercl ant at Constanti nople received from Calcutta a parcel of a drug which he considered to be julap, and which he sold as such to several apothecaries and druggists. This terrible error was soon followed by serious consequences. A fatal case of poisoning occurred, and suspicions having been aroused respecting the medicine which the patient had taken, the danger was traced to the supposed jalap. A further examination revealed the fact that this drug was in reality Aconite root, and of that peculiarly poisonous variety which is known in India as Bikh, and which is commonly attributed to Aconitum ferox Wall, although the roots of other species are also collected under the same name. The confounding of druge so littie similer as jalap and Aconite seems, at first sight, to indicate extraordinary ignorance on the part of the purchasers. But we have found upor examination that some of the larger roots of the Indian Aconite have a certain distant resemblance to the sinal and inferior jalap tubers that have of late years appeared in the market. A very cursory examination, bowever, will immediately show their distinctness harmaceutical Journal.
The Origin of Otto of Roses.-Otto of Roses has been made for a very long time in India, and Lieu tenarit-Colonel Polier thus relates its origin in the Asiatic Researches:-"Noorjeehan Begum (Light of the World), the favourite wite of Jehan-Geer, was once walking in her garden, through which ran a canal ot Rose water, when she remarked some olly particles floating on the surface. These were collected, and thei aroma found to be so delicious that means were devised to produce the precious essence in a regular way." Rimmer's Book of Perfumes.

\section*{Calendar of Operations.}

\section*{( Hor the ensuing week.)}

Few autumn-blooming plants are more attractive than Japan Lilies. They come into bloom at a time when the beauty of New Holland plants is over, and when an uctual scarcity of flowering plants exists, wherewith to decorate our conservatories and greenhouses. They
produce a gorgeous display either in-doors or out; and as they are quite hardy they may even be liberally ar in pots is by no means difficult. Immediately when
the bulbs go to rest is the proper time to repot them. If large specimens for particular display are required, large pots may be employed, and half a dozen flowering bulbs placed in each pot. Rough peat, intermixed with little loam and silver sand, is the best kind of soil for hem. The pots should be well cirained, and the crown of the bulb should be just covered with the soil. When potted they should be placed in a cold pit or frame, and where room under glass is an object in winter, they
may even be plunged in the open air in coal ashes, in a manner simoilar to potted Hyacinths.

\section*{flower garden and plant houses.}

Stove plants which flower upon young wood may now receive a shift. Those, on the contrary, which flower upon the ripened wood, must be gradually encourage o go to rest. Poinsettias, which do not flower unti January, may be repotted now, and freely supplied with
liquid manure; under this kind of management the liquid manure; under this kind of management the
floral leaves will be double the size that they would be if less liberally treated. Before the season is further advanced, every gardener should calculate, as nearly as e can, whether the extent of his framing conveniences We sufficient to afford shelter during winter to his stock of established half-hardy plants, as well as those he is now propagating. If his room is deficient, he mus ither restrict autumnal propagation within certain imits, or prepare additional pits without further loss of time. Brick pits are of course the most durable, an athough expensive in the first outiay they are cheapest the end. A common make-shift pit however migh be built of turve
prove very warm.
Balsams. - Keep these in beauty as long as possible Do not let them suffer from want of water, remov all dead blooms, and keep the foliage clean and healthy
Dablias.-Exhibitions of these will now be held pientifully ali over the country, and to procure fin many an amateur. Early flowers, from which it may be desirable to save seed, should have attention, and as they wither, the decaying florets should be extracted Seedlings, especially weak late-blooming ones, that give any evidence of merit, though they may not be quite up to the tied again as high cultivation anothe season may induce a more favourable development of their good qualities.
HоLичноскs.-Save seed from the best kinds. Some adopt the plan of removing the upper part of the sike, leaving six or eight of the early blooms. When the plant throws up four or five stems, and propagation of the variety is an object, one or more of the spises of flowers may be sacrificed; the stem may be split, cut in lengths, with a bud in each, and placed under a hand-glass, taking care that the small portion of shoo retained is covered with soil, leaving the point of th bud exposed. Strong young plants may often be raised in this way.

\section*{FORCING GARDEN.}

Cucombers.-Where a supply is required during winter, vigorous young plants should be secured at once from seed, as plants that lave been bearing through the autumn, however promising
MELONS.-Where fruit is ripening give air as freely s the state of the weather will permit, and keep the atmosphere as dry as possible. If late plants are infested with spider, syringe morning and afternoon as freely as can be done without iujuring the leaves; short, use every means to get the plants perfectly clean, while water can be employed without danger of creating too much damp.
Pines.- Be careful not to over-water fruit that is -ipening. Endeavour to afford growing stock a steady bottom-heat of about \(70^{\circ}\), and keep it well supplied with manure-water at the root, but avoid getting the soi too wet. As fire-heat will soon be necessary to a con siderably larger extent than has been the case during summer, care must be exercised to secure a properly moist state of the atmosphere, keeping the evaporating pans or troughs regularly suppiied with water, and moistening the floors, \&ce., frequently, as any sudden change from a moist to a dry state of the atmosphere would be injurious to growing stock, and also to plant swelling their fruit. Be as sparing of fire-heat, howeve as circumstances will permit, and shut up early. Wher young stock \({ }^{18}\) grown in dung pits care must be exercised after this season not to get the plants weakly through keeping them too close and warm; air should be admitted freely on every favourable opportunity and sufficient command of warnth should be secure from the linings, to allow an opportunity of giving a little air at night and on warm cloudy days.
Vines. - Remove all decayed or unhealthy berries from ripe Grapes, and keep the house well aired and free from moisture

\section*{hardy fruit and kitchen garden}

Look over gathered fruit frequently, in order to see that nothing is going wrong with it. Keep it as thin as possible on the shelves on which it is placed

Cabbage.-A sowing may now be made for spring
. Plant out those sown last month for Coleworts.

Celerg.-Earth up plants of this in an adratices Cate of growth, choosing a dry day for the parpose. Letruce. - Sow Brown Cos and Hardy Cabbaze spring use, and plant out those sown last monse if warm situation, where they will be useful late in 4 eason
Spinach.-Make a sowing for the winter and sprinz supply
TURNIPs.-A sowing may soon be made of eatr Dutch for spring use.
Winter Greevs.-Plant out these on Potato grouma supply being less than the demand.

farm, furnish beef. Nowhere is there better mutton. The Velvet-eared or Rough-chaff Wheat, commonly grown, yields the very best quality of flour for bread, and a first-rate quality of Barley yields good malt. Moreover, on the downs and marshes, and in the Clovers, Sainfoin, Turnips, Mangel Wurzel, Oats, Beans, Peas, all of which are largely cultivated, there is ample stor of provender. We don't know any where a district which more completely or abundantly provides ample food for man and beast.

The lesson of liberal outlay, deep cultivation, well organised farm labour, and prompt business arrangements, is well taught on the extensive market gardens of Mr. W. ADAMs, of East Ham, to which we formerly referred. But these are all on too exceptional a scale to be copied on an ordinary farm: and the illustrations of intelligent and energetio management which the farm of Mr. Joun Waters, now to be described, affords, are likely to be more generally useful, because they are seen in connection with the flocks and herds, the pastures and ploughlands of ordinary agriculture. Mr. Waters has long been known to English agrioulturists as a Southdown judge and breeder. In his own county he is also known as one of the principal tenants on the Duke of Devonshire's estate, and as an excellent practioal farmer. The land in his occupation, 1 extending from the level on the hill top across the slopes of Down and lower ploughlands to the marsh on the Pevensey level below, amounts to between 700 and 800 acres, 350 being arable, 200 grazing ground, and the remainder downland. carries a stock of 500 ewes ; and this, in the early summer time, means a flock of 1400 sneep, including 650 lambs or thereabouts, 50 shearing rams, and 200 young ewes. The marshland carries about 100 beasts of all ages, 40 being sold to the butcher every autumn, at \(2 \frac{3}{6}\) to 3 years old, having been some of them bought in, but mostly reared as calves (three in succession to every cow). Some 500l. a year are spent on acres of arable land. The rotation adopted is for the most part the four-field or Norfolk course of cropping, varied however by taking two white crops in succession on the lower and better land, where also Sainfoin has latterly been,: most successfully grown and kept down three or four years together-varied also on the higher land by taking Grasses after. Wheat, breaking them up for Oats, and following these with Vetehes and Turnips.

The character of the management may be read in the crops ; and a fortaight ago we saw on Motcomb Farm clean and abundant crops of Wheat and Barley, the former on the hill top equal to six or seven quarters an acre, the latter an exceedingly heavy crop of excellent colour on the land below, but close to the edge of the Down. The Oat crop is nowhere good this year, and not first-rate at Moteomb. An abundant growth of Sainfoin, four years old, a good second cut of Clover, oapital early Turnips, good Swedes and Mangel Wurzels, all testified to the condition of the land. The chief weeds of the district are Charlock, Wild Oat and Shepherd's Needle, the last, however, being abundant only when the corn orop has failed. Moteomb used to be as yellow with Charlock as the rest of the county, but it has been got rid of here by growing fallow green crops, two or three years in succession. The wild Oat is still a nuisance in some fields, and any attempt at a deeper ploughing than usual has generally brought it up abundantly. The greatest fertiliser of the land is the sheepfold. Heavy dressings of dung are applied to the fields in their turn; but nothing is equal to the regular fold with sheep. A double "fold-tail," which is sometimes allotted as the preparation for a corn crop, is sure to result in abundant straw and grain. Wo siw in consequence of some such treatment along with a dressing with ODams's blood-manure, a laid Barley crop close to the edge of the bire Down, notwithstanding the natural poverty of the soil and the drought of early summer. The management of the flook is thus
It is the fitness of the Southdown breed of sheep for this mode of management adopted on these farms, half down hall arable, which will secure its permanence over a large part of Enyland. The object of breeders latterly has been to get a larger oort of sheep carrying a hearier fleece without losing the quality breed. Mr. Waters's flock, bred fur the last 30 years under continnous management on the same
farm, have always been known as well-bred Southdowns ; and for at least half that time special attention has been paid to their inprovement. For 14 or 15 years Mr. Waters has purchased the best rams to be had, paying some 100l. a year in this way ; and more thau once has he had to respond at Babraham to the toast to the purchaser at the highest price of the day. A judge for many years at the Royal Agricultural Shows, he has hat ample opportuaity of beeoming acquainted with the best Hocks of the oountry; so that while long an exhibitor and prize taker at shows in his own county, he has gradually been gaining ground with a view to competition at the national exhibitions. And having at lengch acquired a flick of unusually large-framed sheep for Suathdownslong and wide with deep and heavy quarters, big scrags and bosoms-carrying too a heavy Hecoe (the whole flock averaging \(4 \frac{1}{2} \mathrm{lb}\). of wool, and 9 lb . having been occasionally cut)-he commenced as exhibitor at Battersea. He was there honoured with both a high and an ordinary Commendation. His sheep were unnoticed at Worcester, but one shown as a shearling there, obtained the 1st prize in the older olass next year at Newcastle; and other shearling sheep unnoticed at Newcastle received respectively a 3 d prize and high commendation at Plymouth. On all these ocodsiuns of course Mr. Waters has been competing with such men as the Duke of Ricemonn, Lord Walsingeam, Sir T. Lennard, and others who for show purposes get their lambs in January, the yearling sheep thus coming to the showyard at eighteen months old; whereas March and April are the lambing months in Sussex. Three months are a great difference in the age of a young sheep-too great hitherto, indeed, to allow of successful competition in the shearling class at the Royal Agrioultural Show; but it disappears oomparatively in the seoond jear. Motcomb sheep are thas placed on more even terms with those of Goodwool and of Mertun Park in the older class, and there Mr. Waters has been more than once successful.
His sheep fetch good prices. The top price last year was \(100 \%\).; and one of the commended sheep shown at Plymonth has been sinoe sold for \(50 \%\). There are now 20 or 30 young rams to let or sell having all the characteristic merits of the Southdown, improved far beyond the average of the breed both in size and fleece-just in those points, in fact, where the market price of mutton and of wool shows that the breed requires improvement This alteration, too, has been obtained without the loss of any essential merit of the Southdown sheep the mutton is as good, the fleeoe is worth as muoh per pound, the sheep are as prolitic and as hardy Five hundred ewes have on the average of 20 years produced 600 lambs a year ; and their hardiness is shown by this-that only one of the ewes bought by Mr. Waters at Babraham remains-only one (a very fine sheep she is) has stood the hardships of the ordinary treatment of a Southdown flock in Sussex.

Moteomb is furnished with no fewer than 23 labourers' cottages attached to the farm. Wages, nominally \(2 s\). a-day, amount with harvest earaings to \(15 s\). or \(16 s\). a week the year round, besides beer occasionally, which is brewed at home at the cost of 30\%. or 40l a-year. The visitur will see a first class flock of Southdowns, on a farm well and liberally managed as regards both labourers and land.

Notwitistanding the fatal character of the Cattle Disease, its treatment would seem, from statements which are constantly being published, to be a matter of extreme simplicity. One man, with coolness that might freeze all the enthusiasm of hi competitors, asserts that in not a single case has hi meshod failed. Another, more modestly, invites observation, and rather suggests than claims that his results would startle, by their magnitude, al who should favour him with a visit of inspection. The Government is overwhelmed with generous offers of assistance, and at this moment, while cattle are beiag lost by hundreds, several certain cures for the malady are waiting accoptance; meanwhile scientitio men are trying, without much suocess, to battle with the disease that yields so readily, we are told, to half a dozen quack systems.
Without pretending to offer a specitic, we do not hesitate to assert in general terms what indeed we have already stated, that the cattle plague is a curable disease. Among the profession the fact has never been doabted, and from the commence ment animals were submitted to treatment, and with decided success, that is to say a certain number of cases recovered. Even in the, worst
forms of the disease some instances of restoration have been observed, and where the attaok is mild the per-centage of recovery will be considerable. At any rate, taking the average throughout the conntry, one-fifth of the animals attacked may be expected to recover naturally. In some parts and in some sheds the disease has presented itself in a very malignant and destructive form, the animals being suddenly"attaoked, and dying in"a few hours; in other looalities premonitory symptoms have been observed for several days before characteristic indiostions have appeared, and the cases have throughout been marked by a slow progress, and by symptoms varying in severity; one day the appearances may excite hopes of favourable termination, the neat every sign is opposed to the idea of recovery.

Under these circumstances, conolusions drawn from the employment of certain remedies in one set of cases, will be quite upset by the results of the same or similar treatment in another set; and no better argument can be advanced against a specific cure, than the fact of the disease assuming very different aspects under apparently similar circumstances, sometimes runniag its course with a rapidity that renders any treatment futile for want of time to enable medicines to act, and at other times occurring under a low form, progressing almost imperceptibly towards a fatal termination, but occupying days and even weeks, and thus permitting time for the use of remedies.

Numerous examinations of the tissues of animals that have died or been destroyed in all stages of certainty of the precise condition of the internal organs in the different phases of the disease, and justity the statement that no single remedy can pussibly be effective under all circumstances. certainly not indicated when the earls ssmptoms are febrile excitement are present, nor would there be any reason in giving medicines that had been found effective in calming exoitement and lessening or removing febrile symptoms to an animal whose eystern was prostrated by the malady. No safer or more soientific plan of treatment can be adopted than the one based on the principle of eliminating the poison from the body by the medium of the secretions, and supporting the animal during the process by tonics and atimulants regulated to meet the requirements of the care; and, in addition, supplying nutriment in the most easily Well-boiled gruel, mingled with good ale and a portion of some carminative, as ginger or pimenta. A eurious ides bas lately been circulated, attributing the fatality of the malady to an inability on nleerated cot.dition of the mouth, and advising the use of gruel and Linseed-tea as the only treatment mecensary to cure the "starving disease." This notion is erroneous, the mouth in many eases is not affected at ail, and in \(s \in v e r a l\) instances animals have oontinued to eat up to the hour of their death; besides which, the disease in its least active form will kill in a much shorter time than would be required to destroy life by merely depriving the animal of food. There is no doubt of the great importance of giving nutriment in moderate quaritities frequently, but not for the purpose of preveuting starvation. The animal dies from the depressing action of the poison in his system upon the nervous functions, and treatment to be effective must be directed to the removal of that poison from the blood, st the same time that effurts are being made to sustain the animal's vitality.
Treatment of the malady should commence with the first sigus of ill-health, however slight those symptoms may be. A cow in the morning gives a quart 1.88 milk than usual, or there may be observed a restless and anxious expressiun of
countenance, the appetite is not quite so good rumination ceases, and is again continued at short intervals. Any or all of these trifling signs are of importunce at this time, and have in many instances preceded a most rapid and violent attack. At this early stage a laxative dose, combined with agents that will calm the nervous exoitement and promote secretion, may be exhibited. Castor oil is generally preferred as a laxative, and a dose of one pint may be given at once; a febrifuge draught being administered in the course of an hour, and repeated at intervals of four to six hours, according to the animal's condition. We need harily add that the aid of a qualified veterinary murgeon should always be sought, and treatment egulated by his advice.
the administration of the purgative is composed of potash, one drachm; nitric or chloric æther, one ounce; water one pint. Give two or three times a-day. It will be observed that 20 formulæ might be written having each of them an action similar to the one we have advised, or possessiag properties adapted to suit the peculiarities of individual cases. If, for example, instead of an appearance of nervous excitement at the first, there should be dulness manifested, an ounce of aromatic spirit of ammonia might be added to the mixture. Should there be debility present, the draught may be combined with a pint of good ale, while in the case of a plethoric animal such an addition would not be desirable. The principles on which treatment should be conducted being admitted, there will still be room for the exercise of great judgment in sarrying the systern out. In a fow instances the remedies we have just suggested produced most satisfactory results, the febrile symptoms gradually subsided, and the disease did not adrance to a further development, but the same method in the same localities proved ineffective and did not arrest the course of the malady, and this circumstance, so coustantly observed, leads to the conclusion that recovery under treatment is more often dependent upon the strength of the animal's constitution or the mildness of the attack than upon the influence of medicinal agents. In the second stage of the disease, when the appetite, as a rule, is lost, the secretion of milk is much diminished, and indications of the virulent disease are marked, the exhibition of febrifuge mixtures will no longer avail; it will, therefore, be understood that the means advised for the treatment of the early stage are only applicable while that stage exists, and that without refurence to time of duration; the moment the first symptoms are succeeded by others indicating the second stage, which is marked by some degree of prostration, a new course of treatment, consisting of tonics, antiseptics, and stimulants, must be at once adopted.
An extensive list of agents possessing the requisite properties will allow of the exercise of any amount of fancy or prejudice in selection. All the mineral acids find advocates, and whether we employ sulphuric, hydrochloric, or nitric acid, is probably a matter of indifference. Mineral tonies, as sulphate of copper or sulphate of iron, have been largely used. Vegetable tonics, Quassia and Gentian, are valuable, aud quinine has been employed, but sparinyly on account of its price. Araong antisepties, carbolic acid and the permanganate of potash (Condy's fluid) hage justly taken a high stand. Alcoholic Hluids in the form of rectified spirit or brandy have been also exhibited extensively. And cases of the most decided form of the disease have recovered under their use in conjuuction with nutriment frequently administered.
The doses of the different agents given by different practitioners vary considerably. Of mineral acids, an ordinary dose will be one drashm diluted with a quart of water, and oombined with 1 or 2 ounces of tincture of Gentian, but as much as 1 ounce, we were told by one experimenter, had been exhibited at once. Agsin, half a piat of brandy or spirit would be considered a fair quantity for one dose, but an entire bottle has been given in gruel, and repeated daily with apparent benefit. Allowing considerable latitude in the matter, we are nevertheless inclined to recommend moderate or even small doses of any agents, and frequent repetition of them, for the purpose of keepin, up their action. The formula we are now using in the second stage of the malady consists of Quinine, 10 grains; sulphuric acid, 1 drachm ; tineture of Gentian, 2 ounces; to be exhibited three or four times a day in a pint of strong ale. Good gruel and Linseed tea sre ordered at intervals in moderate quantities, say two quarts at a time, with a tablespuonful of powdered ginger. If diarrhez is present, the gruel should be made with fluur instead of natmeal, or siarch made in the ordinary way should be administered, a quart at a time, once or twice a day until an improvement takes place.
Under the action of each of the agents mentioned, cases have recovered on the oue hand, and on the
other have under similar circumstances died. We have a long list of animals treated, with different results, and next week we propose to illustrate the systeras we have alluded to by reference to groups of cases, and, by comparison of the results, to endeavour to ascertain what are the advantages of each method over and above that grand system which seldom meets with much consideration, the

\section*{THIS WET HARVEST-HOW TO MTIGATB}

I do not venture to throw out any hints for the all about it, but there are wany amapupposer to kone like myself, are seeking for and desirourmers nformation.
There are two sides to every question, and so it or tile earth means (after 5 inches or 500 stiff mb chy per acre in August) water through unthatched ont wet sheaves, speared or sprouted corn, spolled shers corn unfit for market, extra labour and waste sir of mind, rivers overfiowing, full ditches, lasd lite bue lime, long fallows (where uudrained), seas hoeing impossible, weeds rampant, land in deep ruts and deeper foot holes in carting iff th labour prospect for autumn scarifying and coltima families almoss losing their and their wive families almost losing their gleaning corn, the an and best of the farm-yard tea washed away, man deeply furrowed and injured by rushing torrents inclined planes; the fly very busy, and magres abundant in sheep; Bass, Allsopp, and our othe looking after old dry
short supply of malting quality naturally anticipat in their profits-tantalising fine Sundays and Mondays-spoiled second crop of hay. So mich the dark side-now for the bright view, the bit of \(t\) between che clouds. Five weeks ago the country me all drab, now it is "witn verdure clad;" stock ru then a drug for want of food, now it premium: when we consider that more than half kingdom is in Grass, one may realise the impor and profic of a natural irrigation of sine 700 tons acre of warm rain falling on a hot surface, and carer down to the cold subsoll in drainer landsan temperature. Turnips, Mangel, Rape, aud especas:' Cabbage
to the as compared with ther greatly rootsed supp-a allowing, however, a sufficient aiscount for the car! plague. 'Taking all circuinstances, on my owa firm I consider the balance is an advantaze in my furer because I have got up my grain crops in fair orler with very little loss, while my pasture, Italian Hft grass, Mangel Wurzel, and particularly Cabbage (of al of which I have a considerable breadtb), are immensil benefited and increased in produce by the raine. also get a higher price than last year for my coro.

These remarks apply only to my own land and cumstauces. Had I much summer fallow and observation of the crops this season leads me to the following conclusions:-That on stiff clays (like mrae that crack widely in dry weather, there is a vers larre crup of Wheat. On my own land I have several fi yielding 7 to 8 quarters of Wheat per acre, aud I knor

Remedial measures chinla and stimulacceed. There is a general use of thd dinade in cattle is almonet sto suant. The loases man of busineng must, in some instances, deriving
an unusual benefit from the bargains pioked up under
the influence of a panic. So far as I have had an opportunity of judging, the disease is not epidemic but infectious, and we can trace the principal cause-contact by the injudicious purchase of infected animals. Some think that the veterinary practitioners convey it must be hard, it should be, if possible, from a known farm, not from a market, and even so, an isolated probation is essential on a distinct part of the farm, with a special attendant. J. J. Mechi, Aug. 28.
2. On Vewrilation. - The remedy which surpasses all others, both in the provention and in the treatment of humann
ty phus and of allied diceases, is fresh air. With plenty of fresin typhus and of allied diceases, is fresh air. With plenty of fresin
air, in fact, human typhus almost ceases to be contagious,
The same remedy will, I am confident, be found equally efficacious in preventing the spread aud in diminishing the
mortality of the cattle plague, and it is worth considering how the remedy can best be applied for this double object. I. For
Preventing the Spread of the Disease. - Experience shows that the strictest quarantine and the most rigid isolation do not
prevent the disease appearing in new localities. The moment prevent the disease appearing in new localities. The moment
it gains admiasion into a crowded, ill-rentilated cow-house, the
conditions for its rapid extension could not conditions for its rapid extension could not possibly be more
favourable. Fumigation and disinfectants may do some good, favourable. Fumigation and disinfectanta may do some good, in our metropolitan cow-houses were at once removed to wellventilated wooden sheds erected in open spaces in the neighof the cattle plague. A similar procedure ought to be adopted
with regard to the cow-houses of many of our country with regard to the cow-houses of many of our country farms, the aanitary condition of which is often not better than
what we find in the metropolis. The carrying out of this
measure will no doubt involve considerable ineonvenience measure will no doubt involve considerable inconvenience
and expense, but the inconvenience aud expense would be
nothing compared to what they will certainly be if the cattle
are pernitted to remain where they are. There could be
no better proof of the sound are permitted to remain where they are. There could be
no better proof of the soundness of the recommendation now
made thau the significant fact that the disease is almoot made thau the significaut fact that the disease is almont

fined in cow-sheds. have, for the most part, escaped. II. For fined in cow-sheds. have, for the most part, escaped. II. For
the Treatment of the Disease. -The practice now in force is to
remove every animal when the firct symptoms of the disease
manifest themselves to the knacker's yard. There it ether manifest themselves to the knacker's yard. There it etther
dies-and in the atmosphere of a knacker's yard this result
is not surprising-or it is killed; and in either case the carcase is converted into manure. Once in the knacker's yard the lsw barberous one. and evinces a lamentable confession on the part of veterinary science in the 19th rentiry. All opportunity of
trying the effects of treatment, and, above all, of fresh air, is
cut onf, and much valuable property is wantonly destroyed. I venture to recommend the erection of temporary wooden hospitals on the commons or waste grounds in the neighbnur. intended for healthy cattlo-to which all infected animals could air, and where the effects of different methods of treatment
could be tried. Much valuable property would thus be saved for there can be no doubt that cattle, after having passed through the plague, would soon regain as perfoot health an
man does atter experiencing an actack of typhus or mallpoz. \(\operatorname{man}_{\text {m. }}\) does .
3. S. G. O. nv THE Times (an extract). Let us auppose two steamers, under precisely the same conditions, vessels which in every respect as clean or dirty, well or ill ventulated; the e brought, being the same. I atrongly mapect, if you travelled
my squire's healthy Devous the same distauce, to embark
them for Holland in ove of these steamers, healthy foreign cattle were travelled to be embarked for London, either on the royage or scos after landing, tive pro-
bability would be as great that the one set of beasts as the other would show the disease. It is no use assuring me that by boat; that the beasts stuod the crowding, bruising, halfstarving and foul accommodation, and yet escaped the disease.
I assert that they did so simply because, to develope this
scourge, it requires a locality to be tainted up to a certain scourge, it requires a locality to be tainted up to a certain
degree; all that is then wanting is the action of a
certain atmosphere to make ft at once a hotbed of disease. Without this peculiar atmosplerio condition, the socols of the disease existing, could not fructify. As with orowded alleys and lodging-houses, so with stemmers, cattie trucks, and cowoan guard against postilence at peculiar masona. We nurne and he bites to kill us. Why should we have expected a thing
so tame should ever become so deadly?-because he was viper at best. So with dirt and bad air; for a season the wey leave us unharmed, and we bear with them, but on a sudden they vindicate their mature and destroy. Chenaliness is nezt to
godliness. Soap, whitewash, pure air, clean clothing, good godliness, soap, Whitewash, pure air, clean clothing, good
drainage, take precedence of medicine. An assembly of
"vets orer the doceasod in a cowshed, board of modical ingpectors with oabo walting at the mouth of a
blind alley, cholera smitten, are alike worthy of
respect; thiey are the detectives come -after the respect; they are the detectives come -after the

many such changes in my recollection. and no doubt very
many more remarkable ones have occurred within the past century. Yet strange to tell, we had no ontbreak of the
murrann between the years 1745 and 1565 . Supposing your
theory correct, it is curious that in the London cowhouses,
where no change of diet tnok place, the disease first manifested
itself with such fatal virulence. If rank Grass has anything to itself with such fatal virulence. If rank Grass has anything to
do wirh the development of the murrain in East Nurfolk, we w
 hedge, and an arable field on the other side, which the cultivator endeavours in vain to convert to per-manent pasture. He sows down the ground in good heart, and with a good mixture of seeds; treats
it very gently for some time at first, and does

\section*{nd} not neglect top-dressing, and things look pro-
mising for a year or two; but after this the surface begins to get bare and patchy, the Grasses die out, weeds supply their place, and it is evident there is some peculiarity in the soll which insists on running counter to man's wishes, and obstinately refuses to be clothed with Grass for any length of time, and the ground has again to be broken up, and I believe there are certain soils on which Grasses will not thrive permauently, do what you will. A friend of mine is just now making a rather expensive experiment on this very subject. He some time ago sowed out an arable field of 10 acres to Grass, the land having previously been well prepared. He has been carefully nursing this field ever since-not omitting frequent top-dressings. A bullock is not allowed to look into it, nor is a horse, 50 that literally while Grass grows the horse starves, or may starve; sheep are privileged stock, they are put in sometimes as a great favour, if they only kuew it, and by-and-by my friend hopes to be able to show a fine field of permanent pasture-I only hope he may, but in the meantime where are all these years' rent and profit, and where are tithe, taxes, and rates to come from? A renting farmer could not afford to make such an may be in total failure after all. It seems strange i true, and I believe it to be so, namely, that Grass, to do well and become permanent, requires gnod and deef land, deeper than any other plant we cultivate. As an instance, where do we find the richest and most luxuriant pastures bat on marsh lands, which are all ailuvial deposits of great depth? The artisan, the that beef and matton are scarce and dear. What made them so? The answer is not far to seek. Free-trade prices of corn do not pay the grower, and as a forlorn hope he resorts to Grass husbandry. Now four-fifths of the arable lands of this country and of Scotland will not flourish under Grass, and the attempt to make them do 80 is like throwing so much land out of cultivation for the time the experiment is going on. It is only by a regular system of aration, that is, cereal and root crops alternating; cultivation and stock management combined, that a plentiful supply of beef and mutton can be obtained. We want roots and straw for our full-aged cattle, and we want roots and straw for our young stock to bring on.

Take a farm of 100 acres all Grass, and take another farm of 100 acres under a regular course of tillage, arable and Grass; say such a rotation as this-Grass, Oats, Potatos, Wheat, Turnips, Barley with seeds; which veal, pork and bacon, eggs and poultry per year? -the youngest farmer here could tell me that the

We see men who ought to know better stand up at public meetings of farmers and denounce Wheat cultivation. The next day we hear of a great Statesman delivering himself thus:-" The farmers have produced such abundant Wheat crops this year (1864), that at the moment when the credit of the country was in a most delicate state, they had saved us from a commercial collapse, the effects of which would
have been of a most disastrous character." Let us therefore think of these things.

\section*{RECENT SALES OF SHROPSHIRE SHEEP.}

The Fosse Sale.-At Mr. T. Horley's sale near Leamington, Mr. W. G. Preece, of Shrewsbury, officiated. The rams this year, owing to the entire failure of the root crops, were not so forward in condition as on previous occasions, but their uniformity of type and character was more marked, and their hardiness of constitution, their symmetry, and wool-bearing properties apparent to all. The average of 36 sheen let and sold was a little over 9l. 11s
The Leese Farm Sale-Mr. John B. Lythall submitted 30 rams, of the noted "Patentee" blood, the property of Mr. S. Byrd, for public competition. Mr. Byrd's flock contains more of this renowned blood than any other, and has furnished some of the most remark able R. A. S. sheep on record, of which we may mention the 120 guinea Canterbury "Patentee." The sale commenced with the grand two-shear ram "Gayton Prince," \(h^{\prime}\) ghly commended at Hereford, a very long firm sheep, with good neck and head \({ }_{3}\) and which realised 40 guineas. No. 2 was let to Mr. Keeling at 17 guineas, and had he been better on his legs, would have made doable that figure, as he stood 4 th at the Newcastle Royal Show, and was a true-made animal, of good size and fine quality. The other old sheep included the four-shear "Monarch," sold at 27 guineas, and "Canterbury 2d," five-shear, at 14 guineas. The shearlings commenced with a perfect specimen, which was let trom the 2 d of October at 29 guineas; No. 11, a great favourite of ours, making 24 guineas. A brother to "Competition," purchased by Mr. Keeling at 71 guineas, was cheap at
the 21 guineas at which the Earl of Shrewsbury secured
him; and other satisfactory prices followed, the gen being within a few pence of \(14 l\). . 18se for the let 6 d . Der Grendon.-Mrs. Baker's annual sale includea and 80 ewes. This flock has taken high honours ras. Royal and other shows, and is distinguished \(f\) udicious combination of size, quality, symmet wool; and a splendid specimen of the true Shim was to be seen in the second lot, a three-shear "Nuneaton," winner of several lst prizes, which let for the season at the satisfactory figure of 23 grinas to Mr. Clare; and the remainder ranged from 23 dom to 6 guineas each, the average for the 30 bo The Ye
ree Farm.-The highest average of season was attained by Mr. Keeling last year. in common with others, had great difficulties to with in the failure of his root crop last year early maturing and weight-making properties true-bred Shropshire were fully developed in the the animais offered. No. 4 was a lung truem sheep, very good in colour, and with a heavy akin not dear at the 20 guineas at which Mr. Brooksbank compact sheep, aud was bought by Mr. Botteley same figure. The higheat price given was for 10 the representative of this flock at Herefond Plymouth shows. This sheep was purchasel Mr. Phillips, at 38 guineas, and, with the exception a trifing improvement required abont the head all but perfection. The general average was as new as possible 13 guineas.
Pendeford. -This flock, which was originally fond 50 Mr. W. Masfen, at Norton Caines, upward of blood, and several of the most popular flocks of the de are indebted to it for great improvements. The nhe show great hardihood of constitution, good quality, 20 size. One of the very best made shearlings we has seen this year was No. 2, which Mr. Osbor
the low figure of 10 guineas. No. 6 was a
backed sheep, and fetched 19 guineas to Mr. Benne" Nos. 7 and 11 were both long, useful sheep, but th latter was slightly mottled or he would havo ma more than 132 guineas, which these two brougt \(g\) one the cheapest lots of the day. The old sheep were particularly the level, firm, and well-covered made 17 guineas to Mr. Wilson; and "Intrepia, a heavy-fleshed three-shear, by Mainstay, w to Mr. T. Lowe, at 1 guines less The average notel for the rams was \(10 l\). 78 , for 35 , and for the om about 63s.

Freeford.-The sale included the noted Royal Agt cultural Society's 1st prize old sheep, "Beaufort," the "Duke of Newcastle," winner of 1st prize at Rop Agricultural Society, 1861 ; "Novery, another \({ }^{\text {a }}\) other sires of note. The Freeford flock dates bact years, when it was founded with ewes from the \({ }^{3}\) Whittington Heath flocks. It was improved from tim to time by the introduction of rams and ewes celebrated old Hagley blood, and it has since bete maintained by selected sires from the best and mo successful pure-bred flocks extant. Perhaps the
Shropshire flock at present possessing better more beautiful form, or fin the most eminent flockmasters have tesices ranging 40 to 100 guineas each. Satisfactory prices were the general average being about 11 guineas 22 if Mr. Cozon's were taken separately, The highes was given for "Novelty," which was let for 34 guine "Beaufort" realised 31 guineas, the buyer bein W. Yates, of Grindle, near Shiffal; and "Dnke Wewcast

Thlford Park_-Mr. G. A, May's rams mbuith sule possess great frames well covered wh cone meat of the finest quality, and remartably common with the whole tlock, they had bor privations of the previous winter, and they we desiguated a rent-paying class of sheep, former from 10 lbss-the lowest weight-to over 14

}
there. Like all otherpy if its ravages always ended in virtue of the terrible gift of communicability, the fatal and characteristic power of migration.

Trade and war, those two inexorable tyrants, are the chief agencies by which it is disseminated. In the course of ordinary traffic, vast droves of cattle anuually leave the Steppe for the markets of the West. Too often these droves carry with them the germs of the scourge. So prolific are theso germs, and with such rapidity do they multiply, that, from a siogle case of Cattle Plague, great outbreaks often spring, which, in fow months, spread over whole principalitics, and count their victims by tens of thousands.
The actual onset of the disease is marked by the constant and well-known sigus of violent diaturbance which usher in all the contagious fevers. Higour or shivering, followed by an increase in the temperature of the body, frequent pulse, and sudden prostration of the powers of life, are the leading and familiar signs. The coat is stark; all fodder is refused; and at the end of a few hours, at most, rumination finally ceases. The poor plague-stricken ox, standing with its back arched, its head hanging down, its ears lopped, and its legs gathered under the body, presents, to those who know how to interpret such sigus, an unmistakeable aspect of grave illuess. Transient quiverings of the muscles, especially about the neck and shoulders, betray already the severity of the nervous disturbanco. The animal looks dull and dispirited; is reluctant to The animal 100 ks dull and dispirited; is reluctant to
move ; and, when made to move, often staggers from weakness. In the milch cow, the secretion of milk at once ceases.
In some fer cases, the bowels are at first torpid but in the great majnrity, in the course of a few hours, or on the second day at the latest, diarrhoca sets in; and the discharges, becoming more and more profuse, the malady finds its chief outward development. The evacuations are more or less fluid, of a dirty yellowsometimes blood-stained; have a pecular sour smell; and, on minute examination, are found to be charged
with flucculi derived from the diseased intestine. As the drain from the bowels proceedf, the inss of power makes rapid progress. The tail has lost its native function; and, in summer time, flies, busy in their work of petty torture, swarm upon the hide, undisturbed by that once lively member.
In malignant cases, the discharges become involuntary; and the raw and fretted vent is often entirely prolapeed.
At an early period-sometimes, as I have myself seen, at the very outset-a mucous fliid weeps in abundance from the eyes aud nostrils. Transparent at first, this mucus soon becomes laden with whitish flakes, and at length is entirely opaque. As the disease advances, this ill-conditioned stuff stands in viscid pools beneath the head of the patient. With the extension of the catarrual condition to the throat and wind pipe, cough sets in, and the breathing grows more or less hurried and embarrassed. Under these circumstances, the act of breathing is attended by a peculiar rough moan,
be very characteristic.

The temperature of the body, which at first was uniformly higher than natural, is now unequally distributed; so that, while the mouth and roots of the ears are still hot, the tips of the ears and the extremities often have a death-like colduess.

With failing strength, the animal finally loses its legs; and lying with its lead hanging back on its tion which is so familiar to us in the typhoid fever of our own species. As life ebbs away, the belly becomes distended; the limbs are agitated by iuvoluntary twitchinge; \({ }^{*}\) and in some cases the back and loins crackle when preseed, from the extrication, while the animal is yet lising, of putrid gases in the areolar tissue.

When things have come to this pass, the breathing becomes rapid, its rhythm irregular ; and, the temperature of the body falling from hour to hour, the sufferer soon sinks.
One of the most important of the characteristics of the contagion of cattle plague, is the almost unerring certainty with which it appears to take effect. When stead, nothing short of the instant slaughter of the infected subjects, and the destruction of all exuvire from them, seems to give any certain security in preages, of all races, and in all degrees of what is called "condition," appear cqually liable. To have had the disease once before, is the only circumstance which constitutes an immunity from it. In many instances, not alono attacked.
In various ways, and through a great variety of farms, the diseaso is oftell conveyed to neighbouring the hides, the horns, and the loofs of diseased beasts. Not that the fact is any certain proof that these parts are coutagious by their own power. Largely tainted as they must necessarily or auother, is cast off by the internal specific

My friend Professer Simonds writes to me to say that
these and other vervous phenomena are not so highly deve-
these and other vervous phenomena are not so highiy deve
loped in the present epizootic as in the cases he saw in Galicia,
disease, it is probably to this taint that they are chiefly, if not entirely indebted, for the part they play in sowing the pest. It is most likely in virtue of germs sowing the pest. It is most likely in virtue of germs
derived from the same patholugical source, that men, derived from the same pathological source, that men,
oxen-themselves uninfected-horses, sheep, dogs, poultry, and other animals, domestic and wild, often fultil the same fraction. Flooded with intestinal and other discharges as the places are where the sick cattle are kept, it is easily intelligible that persons visiting them mav carry amay in their shoes and in otber waye enough of infrection to taint the soil of distant placee. In this was neatherds, furriers, sanitary inspectors, and lastly farmers, curious about the new and fatal pest which has stricken their neighbour's cattle, may often become, as on the Continent they are known to be, unconscious bearers of it.

Unless we lave an eye to it in time, many of the modes of transmission here indicated are likely to have no little hand in spreading the pest. A priori, it would seem certain that the discase wiust be dissemi. nated chiefly by the discharges from the intestine and the nostri], and by extalations from them. Although tho view does not appear to have presented itself to any of the scientific men who have written on cattle plague, incidental evidence of its truth is not wanting in their works. Take, among otherf, the very general remark that the manure of iufected homesteads has nu especial virulence in convering the contagion. As wo shall seo presently, however, on other grouuda, no special evidence of this kind was ueeded
As the discharges are liquid, their first effect must be to taint the soil on which the patient stands. In the same way they taint the ship, the wharf, the cattletruck, the public road, and the market.
In the country, taking the line of watershed, it rould seem to follow that these discharges must often, like those of cholera and of human typhoid, contaminate the drinking water, which, when in the form of small running streams, may, in its turn, become the means of carrying the disease to distant spots. The attention of continental observers does not seem to have been called to this mode of transmission; but physicians here who are acquainted with the evidence collected upon it in regard to the two human diseases just named, will easily see how it may often atervene in causing many unexplained outbreaks.
In the town dairy, on the other hand, these digcharges are distributed by the sewer. In certain districts of London, for many wceks past, the sewers have been constantly fod by this infectious stuff. From what we know of this mode of dissemination in the typhoid fever of our own species, it is more than probable that ifluvia from this source, finding their way through untrapped drains, may carry the cattio plague to cows that lave had no other contact with it. Practically, the greater part of the poison cast off by the infected animal takes the form of manure. This being so, all thoughtful men must be arxious to know what has become of all tho cattle plague manure created in Jondon and its suburbs within the last two months. If it bo true, as many fear, that much of it has already been taken into the country to be spread over the land, the results may be disastrous indeed. I have myself reason to know that no longer ago than Saturday last (August 5th) a load of manure, which had undergone no disinfecting process, was sent from an infected dairy to one of the canals which radiate from London, to be despatched thence into the country. It would be interesting to know what has become of that precious cargo. Did it perchauce meet any droves of cattle in its way through London? Is it at this its trail frection behind it to the meadows of Bork. shire or 13 ucks? To what manure-yard next were the horse and cart sent which first bore it away

I have said that Rinderpest is unknown here. In the latter part of last century, by one of those striking incidents which are so full at once of teaching and of deep and various warning, wo ran a great risk of having this disease naturalised among us. In 1744 who wrote an essay on the discase, seems to have ascertained that it was brought to us by an English tanner, " who had purchased a parcel of distempered hides in Zealand very cheap, becartse they were for. bidden to be sold and ought to have been buried." From this parcel of hides there issued a power never known in these islands before, which, rapidly reinforced as it went by its own offspring, grew to such a height as to slay myriads of oxen. For 10 whole years this epizjotic raged with unheard of severity. In the third year of the disease 80,000 oxen affected with it were killed, and nearly twice that number died of it. \(135,000 \%\). Were, in the same year, paid out of the Treasury to farmers in compensation for slaughtered cattle. In Nottinghamshire alone 40,000 head perished in six months, and in
So great a price did the nation pay for the little lot of distempered hides imported by that sordid aud ignoble tauner

But if the mode in which the disease was introduced into England be instructive, the means by which it the King in Council the following stringent measures were prescribed and rigidly enforced.
ntire, with their aring and slashed from and entire, with their skins on, slashed from head to fook
2. All hay and straw used about the sick animals to be burnt.
. The sheds occupied by them to be cleansed and fumigated, and not to be re-occupied by sound cattie for the space of two months.
ther; for a month after convalescence. 5. No diseased cattle to be driven to
non their flesh to be used as food for dogs. 6. No healthy cattle to be removed from. the disease had prevailed, in less than a month after its disappearance.
To insure the more certain execution of these measures, Government undertook to pay 40 s . for every \(0 \mathbf{x}\), lull, or cuw, which was killed, and \(10 s\). for
every calf, with a corresponding pice for their skins. every calf, with a corresponding piice for their skins.
In 1747, the disease being still rife, but being then confined to the southern counties, another Order in Council was issued in the month of January, forbidding any cattle, whether sound or sick, to pass the Inmber or Trent northwards, from that date to the cud of March.
By continuing to execute to the leiter every detail of this preventive code-and not, be it observed, by improved drainage of cattle sheds - the epizootic was at simple and pregnant listory.*
Theso events speal for themselves. All hanging together, as they do, ly a single thread, each is, in its way, decisive.
never a year passes that cattle plague does not frequently arize epontauenusly. Fhag hero we have a thousaud years, with all their variations of wet and
drought, and heat and frost, and blight, and infinitely various chances of peace and war, of plenty and scarcity, and of breed and keep and condition, bringing back their myriads of departed ozen to bear witaess against such a notion.

From the time when he first issued from the loins of the wild Urus, to the date of this outbreak, the
lutithos, wirt in by the sea, had remained protected
fiom this phague, as Fngli-h eluen) from this, phague as Fncli-h shecp, had in the samo That this long immunity was not 1 in to the ahsence of any of the natuad comlitions necesary for the rapidy here as in it wative lome, and with precisely the same resnlr, untrace, mhle outhreak, without was silels due to the continual fructification of the
imported germ, was finally proved by this other fact, that it was extinguished by measures in no way affectdircted to the extinction of the siplecific cause.
Hat the pest, of which this is the history, been some nowly imported animal or plant, the events
could not hare testified in a more clear and decisive could not hirc testified in a more clear and decisis in proof of the simple law of propagation by continuous succession on the other.
ermptive fever peculiar to the is a contegious and the eruption, instead of occurring on the skin, as in alimentary cansar and air-passayes, mostrins included. are cast out of the body in the discharges from these surfaces, which thus become the chief means of propagating the disorder. In Russia, the plague is often actually inoculated by virus from this source.
3. The specific poison which causes cattle plagne is, ease itself; and the Iiving bolly of the animal aff cted with it is the only known medium in which it is bret.
4. (A proposition which is merely a corollary of the last). Cattle-plague, like syphiliz, lihe human small. pox and sheep's small-pox, and, I may add, like the
living organisms which people the parth, having first come into being under conditions of which wo know nothing, is never kuown to spring up spontaneously now, but is self-propagated only.
To be successful, all attempts
To be successful, all attempts at prevention must be
based on these principles. It is from want of clear

\footnotetext{

}
apprehension of some among them, that certain foreign Govervments, in spite of an otherwise very
stringent preventive code, have often failed to stay the pest. It will be from want of applying these principles sufficiently early, or with sufficient vigilance to meet every incident of the case, that we, in England, shall fail now, if fail we do.
Tho succeed, three things only are neewnary; but they are all three vital :-

\section*{by the instant slanghter of iufected cattle.}
2. To get rid of all poison cast off by them.
3. To prevent the reimportation of the pest.

All three, but the second especially, are things which require great knowledge and still greater vigi-lance-qualities which are only too likely often to be in default in this emergeney. The first needs, in addition, a loyalty to higla principle in the execution
of measures seemingly adverse to the money interests of measures seemingly adverse to the money interests
of the hour, which, I fear, is likely to booften wanting in the farming class. C'uld all this be accomplished, cattle plague in England would be no more. Lit us strive to go as near it 88 we cin.

\section*{Home Correspondence.}

The Agricultwral Crops of 1865.-[Mr. H. J. Turner, of Richmond, thus writes \(t\). the Times.] During the last 10 days my professional engagements have again taken me over a large prrtion of the be obliged if you will permit me, as usual, to state my impressiou respecting the agricultural produce of our country for this year. Some time ago you did me the honour to insert a letter of mine on this subject, and,
with one exception, the opinion I then gave on the prospect of our corn crops has been fully confirmed, now that I have seen thosc crope when arrived at maturity, and upon a far larger area of land than I had lad an opportunity of inspecting when I wrote before. The exception is in the Wheat crop. I said I thought under any circuinstances that crop would prove under average, but I now think that in bulk it is an average one. I wish I could stop my description here, bit trutir obliges me to add that, althongh the quantity is
inne satistactory than I ha.l anticipated, he quality I an persunded will be fonmed greatly inforion to that of last yar. Owint to the showery weather which has prevaileat for the hat three weeks over most of our country, corn, and especially theat, will be found modorate sample-dark in sample, crude in condision, and in many places in the most southern counties
unquestionably unsound. The matural resuit will be that for several weeks yet we shalt have to depend in a great degree upon old Wheat for our bread meal and llour. Fortanately, the stock in hand is ample, and of superior quality. We already hear statements put forth as to the yield. In my opinion those accounts are generally worthless, as, in consequence of the soft condition in which the grain has been gathered in, very little of it has been, or, indeed, could be threshed as yet; and it will be some time before any reliable judgment can be formed of the yield of the general humility of the season. It has almost equalis"d the pariod of harvest in the whole district between York and Rughy, and yesterday there was nearly as great a proportion of the crops of grain in the fields its West Riding of Yorkshire. Barley is generally a fall average crop, bat the colour is mostly very dark, the sample rough, and in many districts it will not be found free from sproats. Oats are a moderate crop over the whole well, and will, I think, prove a good crop generaliy. Turnips, sonth of Dorcaster, are a full average crop: north of that place they are in many feelds patchy; while in the North Riding of Yorkshire, and in the counties of Durham and Northumberland there are hundreds-may, thousands-of acres of land where that valuable crop has been utterly destroyed by fiy on abundant. In Trent Valley in our eales, on the dry pastures of Luperatershire, and on our extensive marshres there is more food for cattle and sheep than I have seen for imnay years. These excellent pattures, aided by catio en errn, rifl fittera off animals in a forward state, and put all our other healthy stock into capital condi.tion for begiming winter, widely thiffring from the pastures of last year. I have the honony to be, Sir, your faithfnł servant, H. J. Turner, Land Agent \(^{\text {L }}\)
Beet Sugar. - The low price of Wheat, relatively to that of meat, renders the cultrvation and use of root crops of increasing importance. Is it not incumbent on us to silf the question whetrer Beet-root might not now be profitably grown in England for the production of in the pulpatter the sugar has been extracted? In s) me "arrondissements" of that country the horned catble have inereased tenfuld in number, and the Wheat thes been doubled in quantity, priacipally from the larwer supply of manure thtus obtaine.l, und partly no doubt from the tilluge of roots taking the place of wretched falluws. Through my friend \(\mathrm{M}_{\mathrm{r}} \mathrm{r}\). R. Huat, of Uhe Government School of Mines, 1 have obtained from Paris a statement as to the produce per acre, estimated at
made, yielding 86 per cent. of refined, and 14 of molazion The pulp is apportioned among the farmene suga to the quantity of roots severally delivered by accorime they receive cash for the roots and pay for the The manufacture of sugar costs about 10 s. per ems, labour, fuel, lighting, \&e. A profit equal to the miz of the molasses and pulp, satisfies the manufactren Calais then grow their Beet-roots. In the Pas d Calais there are manufactories prodneing five toos ot raw sugar in 24. hours, and employing 150 to 20 pe n, of both sexes. France consumes annually aboz
400,000 tons o? Beetront sugar anil about 40,000 of cane sugar, although home-grown sugar francs per 100 kilogrammes, equal to \(168.10 d\). per ent and French Colonial \(3 s, 4 d\). less: and yet the nont of Beet sugar manufactories has increased in the h year from 364 to 398 . Might we not partly calenth on a produce of 12 to 15 tons per acre in Engiand instead of 8 tons as in France, from our better ciliins tion and more abundant manure? Sugar does not tare nitrogen, phosphorus, or sulphur from the soil ; carbos oxymen, is component purs, abova for they restore so little to it in the shape of manore. Raw cane sugar, during its transit from the colvate wastes largely by leakage. The Finglish revenue reairm
bout the same amount from sugar as from malt; ; about the same amount from sugar as from malt; \(c\) wid
any increased production of a grain crop, like Batin (were the duty on matt abolished), be compared nits the benefit that the farmer might derive from the largely increased demand for Beet-root sugar which would arise if the duty on it were removed? C. F, Falmowth, \(\mathbf{A u g} .11,1865\).

\section*{Sorictitg.}

\section*{MEETINGS IN SCOTLAND.}

EDINBURGH.-At a meeting of the magistrates Edinburgh, helt in the Couneit Chamber on the 2lst of the Cleansing Committee of the Town Council, which it was stated that there are 145 byres in the city which have all been cleaned and lime washed in aceor
ance wati the instructions issued. A sanatorium diseensel animals in Mr. 'Tou's girdnh, Lorer's lom Leith Walk, has been cempleted, and a lorry cmanstrut. lor the purphse of conves ing disensel anumils th i is 2085 , whose value may be estimated at \(33,000 \%\).

Highlant Societt.-Professor Dick's report to the Highland Society says that much might he done b tit in the way of provention and cure by cleanliness, ren tilation, and drainage; and on those stocks where the disease made its appearance he would advise that all the cows irs the place should immeliately get a dove of purgative medicine -1 lb . common salt, and 1 lb , treach -with plenty of water, as a means of removing any latent irritation of the bowels, and clange of die should also be made; wet rank Grass shoald avoided, and hay scalded with hot water given instend and Linseed cake used instend of the grains so comman given. The cake to be scalded and mixed be procured, in prefererice to Mangel Wurzel; h them also have plenty of water; a little salt shoulid bo iven dily with all their mask food, and if convenien! in fine weather exercise should be given daily. Havis described the symptoms of the disease, as showa in the animals affected, he naid-From the general aymplom and post mortem appearances, 1 am of opinion that in disense dependis chieffy on atmospheric causes nad diet of the cattle, which may be prevented by ationtio and occasional changes of diet: and where any even suspicion occurs, I wonld at once give a dop purgative medicine to every beast in the herd-my 1 lb . of common salt, 1 lb . of treacle, and 2 ouncer the ginger, and this dose might be reppathe best plan to adopt will be to give 1 lb . of Linseed oil in the and place, and if the bowels are costive, 11 lb . of coming dap, and plenty of distilled water. He also is trpose greater or lesse extent, and it was natural to 3) unlergo, the exceptional fatigues of travelling, would Mr. Scote to that disease.

\section*{Farmers' Clubs.}

\section*{Cab, The Oattle Playue.-At the luat mbeting} their meoting a fortnight ago, no fresh the disease had occurred in this neighbourhood. 8 mhich to questions, Mr. Hayes stated that the and to the satis ground were buried without follon of Mr. Barford, the
appearances of the auimal he had opened:-Tbe lungs were free from disease, bat the left one was much congester, which he attributed to the animal lying on thrat side. The tongue was in an ulcerated state; the heart was empty, but free from dise.ise, the reticulum, or secomd stomach, containing hard and dry ingesta. In the large intestines were threads of lymph effused upon the mucous membraue, and containing very dark fieculant matter; the small intentines were much congested. The liver was healthy, as was also the gall bladder. The Schneiderian me nbrawe was likewise congested, the trachea, or windpipe, containing extensire layere of lymph. He had treated several cows belonging to Mr Hayes that were sufforing from the divease, histreatment being diffusible stimulanta, followed up by autiseptics, which Professor Simonds approved of, stating that the disease must be dealt with as an infeetious oree, there being no doubt on the Professor's mind that it was importer from Russia.
Mr. Spooner hoped the discrssion would lead to some practical conclusion on the subject, which was a very important one, not only to agriculturists, but to the community at large. They must not think that they could fall back upon the ordinary insurance societies in a case of this sort, for it would ruin them it they were to attempt to make good the losses sustained by the cattle plague. He thougit they should not part without taking some steps towards forming such a society, but probably they would think it kloukd emanate from a larger meeting, either at Southamptors emanate from a larger meeting, either at soathampton
or a county meeting at Wiuchester. The machinery of a society of the knd he was referring to would consist of an inspector, a committee, and a secretary. An owner of cattle would subseribe in proportion to the number and value of his cattle, as described by hinself, and, as he would be interested in not rating them too high, so there was little probability of thas objection occarring. Besides, it would he very easy to tell if they were not properly valued. In somel societies the scale of payment adopted was 1s. per animal, but
he thought it would bo better to pay 1 por cento on the he thought it would bo better to pay 1 por cent, on the
value of the stock. Of course, no money would be paid out of the society without the sanction of the committee. He also thought that assistance would Do obtained from other scurces; landowners, and people of property in towns would probably contribute to the frnds of smin a society, so as to liglaten the broden that might fall upon the members of it. With these views he had drawn up a series of resolutions which be thought would very properly proceed either from that or a larger meeting. The resolutions were as follows: 1. That it is the opinion of this meeting that, with \& view
to prevent loss to owners of cattle from the prevalence of
the to prevent loss to owners of cattle from the prevalence of
the e cttle plaue, , it is most desirable to form a mutaal insur-

ciatinn who, hivine complied with its rules, might 1 iso
cattle from this fatal disease.
a
e. should give in a list of the cattls belonging to him, with age
and value of each, and siould pry deposit of 1 par cent. on
such value, and engaging to pay a pro rata asesessment for any further sum that may be required.
3. Tant, in the event of the
associstion being visited with the disease, he having given due notice to the inspector as required by the Order in Council,
shall be reimbursed by the society to the oxtent of of
the value of any cattle that may die or be destroyed by order
 4. That a secretary and an inspeotor bo appointod by the society, whose romunerations shall be loft to a managing coms mittee of the soclowing gentlemen shali be considered officerg
5. That the following that no pecuniary award will bo made of the association, and that no pecuniary award will be made
unless sanctioned by a majority of the commiteo, three of whom shall forta a quorum.
6. That the operations

That as the extensive prevalence of this fatal and virulent disease would beconee a national misfortune of great magnitude, and one that concorns every consumer of meat, tho
assistance, pecuiary and otherwise, may justly be invite, no
only of landowners, but of other gentlemen, and the publio general, to any society having for itt obje

The Chamman considered that Mr. Spoonev's proposalis were orceedingly mell timed, and adapted to mees the emergency; but in his opinion thoy shotld be sub mitted to a larger meeting.

Mr. Blundrel arid: The Order in Council calling upon parties to kill infected animals was all very well as far as it went, but how were they to kill the infection? Killing diseased animals was one thing, bnt that this being a nationn! colamity those who lost by it ought to be compensated out of the national purse. It was for them, as a Club, to devise some measure losses resulting from it, which would be beat done by calling a large public moeting, as had been done at Norwich, where Lord Leicester gave 500 , the Mayor of Norwich 1001 , and other wealthy indivicmals large sums for the purpose of initiating an association for compensating those who lost cattle by the disease. They had Southampton, Portsmouth, and other large consuming towns in their inmediate neighbour assistance which they would would be own snbscriptions, as meet the losses they might anstain if the disease assumed larger proportions. It was a national calamity, and they had a right to look to the public for assistaner. He thought a requasition should be signed and presented to the
public meeting of the inhabitants of that town, and in addition thereto, that circulars be sent to the landed proprictiors and wealthy residents of South Hants, acking them to co-operate with the said public meeting in raisiny funds to compensate those who might lose cattle by this disease.
Mr. W. Warner made inquiries as to the cattle that had been turned into Mr. Hayes's pastares since the disease had broken out there.

Mr. Hayes replied that the cattle referred to belonged to Mr. Spincer, batcher, of Soutbampton, who believed that the disease wal not infectioct They were in the same pasture as tha: where the disonve had made its appearance, and up to the present time no Mr. Barfond of the malady had manifested itvelf.
Mr. Barford hid ny duabt the disease was infectious. Mr. Spoonse said whatever doubt might exist as to doub the disease was engendered, there could be no doubt that it was infectious, and the Order in Comnei would be infriaged by turning cattlo into a placs where the diseme had previously manifested itolf within the ime specified
Mr. W. Warner moved, and Mr. Bhetadele secunded the following resolution:- "That it is the opinion of this meeting that a request bo ecnt from the Club to the Mayor of Soathampton, respratfilly urging him to call a public mecting of the inlabitants of the town and the neighbourhood with the view of adopting the bost measures calculated to stay the progress of the catite plague by forming a mitual asiurance nssociation, or such other meats as may be resolvod on."

\section*{xutuitus.}

Field and Pern: ar Scottish Flocks and Herds. By H. II. Dixon, Author of the Royal Agricaltural Society of England's Prize Essay on shorthorns.
1865. Rogerson and Tuxford, Marl Lano Express Office, 245, strand.
These two volumes, endorsed respeotively "North" and "South," give the very rachy journal of a very clever"writer, who has for the last three years heen wandering amonget the best cultivated farms and the best bred studs and herds and flocks in (irent 13ritain. The North and South are here however both c nीned to Sotland, and refer respectively to the Highland and
the Lowlayd counties. It needs a certain ainount of special knowledse, as of the herd book amal the stur book, and of spontine life as well as of ordinary farm practice, to thorouglily appreciate and understand all the allusions and surgestions in which Mr. Dixon's pun continually indulges throughout the collection of anecdotes, scraps of conversation and of information by which its work of description is accomplished. But overy one can appreciate and enjoy the author's powers, both character and scenery before the mind. His own sympathy with the humours of the many individual and original men he meets with on his agricultural and sporting tour is caught readily enough and thoroughly enjoyed. And thus, while it is the agriculturist and sportsman perhaps especially to whom his pares ar presented, they will afford both amurement and enjoy ment to a large and general circle.
We extract a passage or two from somo of the more strictly professional chapters of the work. In an account of Falkirk Tryst and the stock markets of
Scotland there is this reference to the foreign trade:-

Despite theso large supplies, farmers have of late years found it so much more profitabl: to make their comsacks walk to market in the shape of beef and matton, that they have often hardly known where to look for store beasts. Time has, indeed, verified what Mr. Aitchison, of Linhope, said in one of thos.9 glowing periods which used to 'bring down the huse, when he retmened theske for 'The Tenant larmers' at the Highland Society's banquet - 'Steam is your Highland drover. And so it was in verity, a few months since, when a dealer, fluding limself left skort for Ellon, set off from Aberdeen on a Wedneaday, and rotarned with a large lot of Herefords from Eagland on the Satere--

A Dammark beat trade is being opened up with the direct steam nuvigation from Coperilagen to Leith, and folly 5000 'Dutchmen' are pissed through the bands of the Swans between May and October, and sold to the Torfarshire, Fife, and Lothian farmers at 56 to 8l. They are mall blacks and whites, and very like the Ayrshires in size and marks. The Holstein cattle, on the contrary, which are poured in from Hamburgh and Oldenburg, are not unlike the Fife breed, and of all colouns, black, apotted, and red and whits. Mr. Smith, of Les Shate near Dundee, imports abont 500 or 600 of them annwally, and purs thein into the farmers, and then buys them back at a profit of from 2.s. to 30 s. a inonth for a few months' keep. Tue smaller butchers buy them up very readily, but the lading mun do not take kindly to anything but Britisu-sed beef and mutton. Still, when the beasts have been judreiously selected off slip-b ard, and fed for a time in the country, they come out well, and command a ready sule, as they carry both flesh und far, and are generally good killers. Between the midale of March and the
lot of November, Hamburgh ships fully 2000 of these cattle, and 15,000 sheep to Laith. Some of the cattle are "as old as a man," and with strong marks of the collar ; and many of the Morinoes are mont venerable
wool producers. They are generally four and five years
old wedders, and suit the second-class Glasgow butchers, old wedders, and suit the second-class Glasgow butchers,
at all figures from 22 s to 30 s ., while the Holsteiners at all figures from \(22 s\). to 30 s, while the Holsteiners
will fetch from 18l. to \(23 l\). These sheep are the incarnation of ugliness, with long tails and white noser, and most of them with a strong dash of Merino blood. When they do not come over clipped, as a large proporto 8 lb . per quarter, but the better class scale twice as much."
The following is an account of the show jockeying at the Ayrshire competition for prizes offered to dairy stock:

The show dodges of the Ayrshire men are inexhanstible, and not unattended with danger, as one man in his last 24 hours of a strong prepraration jockeying during that time. A cow is generally kept sharp set till four or five hours before the show. If she had been on too fine food, her paunch would be drawn up, and the vessel would lean forward, and the teats not in position; whereas, if the paunch is gradually filled in these few last hours, first by giving her common fool, and then by coaxing her into quantity by bettering it at every supply, she is filled to repletion,
and the vessel liangs taut and square. She often gets her pound of salt at night, and between the two agencies she should be turned out quite the thing in the morning. Cows are also kept well up to 'tid during the show season with grael made of Linseed meal, Oatmeal, and flour, diluted with their own milk, shape of the vessel ie also as carefully looked to and adjusted as the Spanish cock's comb, which was, while the fashion set that way, kept up in pasteboard splints,
till just before going into Bingley Hall. A board is till just before going into Bingley Hall. A board is with strings round the cow's back, so as to keep it in position, and the vessel is laved with cold water all night, to make it flat and contracted and give it consistency.

They are also washed over with batter-milk, and the finer lights put in with soap and gum. Sometimes the cow barbers use butter-milk for the legs, and take to hair-oil, and the horns are rubbed with charcoal or Hawthorn ashes, in accordance with an old superstition. In short, the day and night before the show are in many instances quite as important as an artist's glazingday at the Royal Academy. The judges are well up to the little game,' which extends to scraping rams' horns almost to the quick, and then japarning them, and is
on all-fonrs with that artistic clipping to hide weak points, against which old Val Barford, K.C.B. (Knight of the Clipping Board), struggled so long, till the Royal Enghish Society issued its ukase.
We add the author's account of the late Duke of Athol as an agriculturist, and a description of bis

\section*{Ayrshire herd:}
the mid hide the ravages of that terrible malady which was so surely eating away his life, and yet calmly giving
orders about his cattle, Ayrshire and West Highland, which 'will not be scattered, when I die, to the four winds of heaven.' The servants of the exhibitor had not forgotten how unceasingly he watched over their interests at Battersca; and they seemed to vie with each other in holding his horse, and anticipating every wish. His death, as he told his friends, when he bade them good-bye in the yard, with as much calmness as if he were only taking a journey, may be a matter of only 10 days or three months; but it was six weary months before he found rest. When he could hardly speak, we saw him leaving the Dunkeld station to superintend the trucking of some Ayrshire cown, which he had selected for the Royal dairy at Balmoral; and later still, when her Majesty paid her visit of sympathy to Blair Athole, no pain or weakness could restrain him from accompanying her to the station. Then for the last time his Highlanders heard his voice, as, after kneeling to kiss her Majesty's hand, he strove to dispel the gloom of that sad parting ly giving them the word for three lasty cheefre

It was as President of the Highland Society in 1858.61 that he first took a fancy for farming and Ayrshires, of which her Grace had a few Dunkeld. A certain number of them always accompanied him to Blair Athole, and he took them with him the first time he ever went there by rail. He left Dunkeld for Blair Athole some montha before he died; but to the last lie had a weekly report of the milking and specimens of Beetroot, Mangel, and Kohl Rabi sent him from his farms at New Tigle and Haugh End.
"The dairy books were kept during his Grace's lifetime with the most scrupulous exuctness; and her Grace the Duchess Dowager, and lier friend Miss Mnrray MacGregor, have taken an equal interest in the since herd his decease.

The herd never exceeded 50 cows in milk, and including a few cross-breds and a Jersey; her Grace has nearly as many at present, and about 130 head in all at Dunkeld. The milk was first reduced to the present Careful \(\begin{aligned} & \text { system of calculation on March 31st, } 1859 \text {; and }\end{aligned}\) on Thursday every cow's milk is weeghed separately, week. If the by seven, to ect the amount for the Colly Hild, White Loge, and Idiot were, at Kelso-an
week, so that it is possible to look back over the book for more than six years, and approximate within fraction of what every cow has been doing. Taking
the average of the largest week in the heiglt of the the average of the largest week in the height of the
Grass, we find that 702 milkings produced 8100 lb . of Grass, we find that 702 milkings produced 8100 lb . of oream. That Ayrshires differ very widely, may be seen by comparing this 9 -quarts-a-day average with Glengall's, who averaged 12 quarts and a fraction dsily or 58 successive weeks. For seven weeks, between May 7 and July 3, she averaged a trifle beynnd 6 gallons a day ; and Colly Hill, who led in 1860.61 still gives 4 gallons at her best, and beat them all save Marion last September.

They generally begin with cooked food in November and a two horse-power engine, with a corn grinder, oilcake bruiser, Turnip pulper, and hay, chaff, and strawbedding catters attached, is fixed in the boiling room a the end of the byre. The four boilers are filled with hay cut 2 inches long, Rape-cake and Bean-meal in layers, and then steamed; and the large waggon, which runs on a fram-road with turn-tables, bears two pails of mixture to every cow per day. The four milkmaids have each a soap-box, a towel, and a currycomb. After each milking they scrupulously wash their hands, and they leep their pets in winter as bright in their coat as a blood horse. At one time it was the regular milk-
maid fashion to shift sides so as to balance the vessel, but it was found to do no practical good, and the cow often became shilty and kicked over the pail. Eacb rake or 30 lb . of milk is weighed, and then carried to the tin dishes in the dairy. The calculation is that one gallon should be equal to a pint of cream, if it is fine veather and it rises properly, and that a quart of cream should produce ab ut a pound of butter; but this is hardly borne out in practice. Ony skim-imilk cheese is made, and nearly a hundred flagons at the door of the dairy were ready to receive the milk of the night before, and to disperse it at a penny a quart through Dunkeld.
The volumes from which we have taken these extracts are full, not only of the sober business as well as the most energetic enterprise of agriculture, but we have the romance of country life in every phase most cleverly depicted. There are no better pictures anywhere of coursing, racing, and otter hunting. And we shall hereafter give our readers the benefit of some of the mere farming sketches which are also here collected.
The Cattle Plague: its History, Treatment, and Pre vention. Pp. 20. By A. J. Murray, M.R.C.V.S.,
Professor of Veterinary Surgery in the Royal Agricultural College, Cirencester. Taylor \& Francis, Red Lion Court, Fleet Street.
This is a short and simple account of the Steppe Murrain, for the preparation of which the author has been at pains to study the disease in some of the districts where it has broken out, and to collect evidence from the published works of continental authorities on the subject of inoculation. This means of diminishing the ravages of the plague has been recommended, and it is of importance to show that it
has been largely tried, and that it is a failure. As regards the author's own district, it appears that the disease has broken out at Calne, in Wiltshire, but that it has not extended beyond the immediate locality. Mutual Insurance Associations have been formed at Cirencester, Highworth, Tetbury, and Nailsworth, so already a system of insurance and inspectorship in operation for its suppression. The well-timed pamphlet now issued is a sensible and a temperate account of the malady, and will no doubt obtain the wide circulation deserves. Professor Murray recommends half an ounce of dilute sulphuric acid with an ounce of gentian in a quart of cold water, to be given twice a day in cases where it is considered desirable to treat the
disease. There are also other particulars to be attended to in the treatment, for which the reader must consult the pamphlet. "It must be remembered, however," he says, "that treatment is not recommended when there is much risk of spreading the contagion."

\section*{Farm Memoranda.}

We take advantage of the immense body of agricultural
evidence lately takeu before the Hypothec Commission at Edinburgh to publish such extracts from it as will indicate the existing atple of Scottish agriculture, and the enterprise
and energy of Scottish agriculturiats.] and energy of Ncotish agriculturists.
(Continued from p. 808.)
17. Kippendavie, Pertit: Mr. John Stirling.-I am well acquainted with the condition of farmers in the western district of Perthshire, and in part of Stirling. The great bulk of them are small farmers, paying from 100\%. to 300l. of rent. The value of their land varies from 15s. the imperial acre to 25 s. It is a late district, and a good'deal of it is high-lying, poor ground. They are very improving tenauts. There has been great
improvement in the last 20 years. They use a great amount of artificial manure now, which was perfectly unknown 20 years ago. A great many of them are sons of farmers, who were bred to the bueiness, and who either succeeded to the farms, or wers put into them by their fathors, and they are a very well-doing set of nen generully. The period of entry to these sual farms is Martinmas to the whole farm, and the first
rent is payable, nominally, at Martinmas and Whitsun-
day afterwards; but almost the whole of the rents an after entry. I should say the maiority of then have not had more than sufficient to stock thiese im and keep themselves and their fumilies for the \(i\) year, with perhaps 100\%. over, and they coull not hery paid forehanded rents.
the 12 montho they the 12 months are out. If there is a way-going teme the crobability is that they don't bu
the neighbourhood. Many of the farmers have tos years on the same farm,--much more than one They certainly could not, as a class, pay forehand I believe they have improved a great deal of that high land, which would not have been improved wise, the laridlords having almost universaily exec impossible to throw these small farms into holdings; but I think that is a question affe interests of the smaller class of tenants, -men
from 100l. tn \(200 \%\) a year of rent. If these form thrown into larger possessions, I would save in bo and in fences to a considerable extent; so that forehand rent, I would, as a landlord, be as k giving 15 per cent. of deduction, as I am now ; bsi whom it would extinguish the small class of tema whom I look on as a very valuable set of men. I tuias
the majority of them would emigrate. Their sone grieves and foremen, who are looking forwand getring a farm some day; but, if they saw nothul? large farms, they would look on that as lopeles, ons all the younger men would emigrate at once. A mic of that sort has a prospect of eaving enough of mo with some credit, to enter a farm of \(100 \%\) or 200 i rent; but, if the rent is 500 l . or 600 l ., he has no chr I would not say the land is better improved lig them men than it would be if it were in the hands of metion capital; but there has been a very large amonat improvement made upon it. The farms of which have been speaking are principally arable, and to siderable extent they are dairy farms. The farnen make considerable part of their rents from produce, and feeding stock. If the law of hyp were abolished, the whole of that class of tenanto require to pay forehand rents. I am quite clear would be necessary for the security of land theause otherwise every person would be paid the lat day and they would a thir dis pid the rent was due, but for the law of hyputhec would certainly be quite prepared to
of hypothec so far, that we should not be entitied v follow the crop or stock off the ground, when it is bond tions should be published in the Gazette. I undertasi there have not been above one or two cases of follomity crop in my district in the last 30 years, ant these cases it was sold in breach of sequed
It is very difficult to say what sum is required a farm of 150 or 200 acres in my neighbour much depends on the times. Tenants would their farins were fore-rented
of that class have been doing well, I dou't the money generally, because they have edur their sons, and put them into small farnas; so tiat of the men, who have been doing well dun ood instances of these small tenants taking lar the espiry of their leases, I have now in my ars hands a farm of 150 acres, which thic tenant tet ats end of a 19 years' lease, because he farm, He began with his stock oul
 three of their sons in farms, who beran small farm. The father might have no difficil! fore-renting his farm at the
18. Holuston, near Axr: Mr. James Drennm. My farm is all arable. It is nearly 250 acres in cxis and my rent is a little over 7002 Martinmas. That is the general term
Ayrshire for arable land. I entercd to the at Martinmas. The landorer ares leas to exact payment of a half-year's rent Whitsunday before I reap my crop; but the practices the estate has been to pay the first half rear it. vember following, althourh the lease besrs Whitur I have no doubt that the present law of hing operates prejudicially against tenants
from banks. I think that, if the law from banks. I think that, if the law than they do at fresent. If the banks money after the repeal of the law, ask security; but in the meantime, farmers can acarcely

Without Her of hypothec, the landlord would be in the same prition other creators with the second half-year. first half-year of abolish his right to seize smby what is on the farm. Supposing the tenant The diffiulties after the Whitsunday term, when Soup might step in and reap the crop, and leave mellord to rank on the eatate with the other With fore-renting, the were paid till Martin, ithe poitent of any thing going wrong during the mer, after Whitsuaday. If the dinculty arose :t the Whitsumday rent was paid, he would rank ad give the landlord no security. I can see no 2n heirs to stipulate for ; and it is for him to consider ani..... to ask more. I would advise the landlord 2 le cuntent with fore-renting; just to have a little 2.3 , like other people. There might be a case, of arse, in whight enough if careful in the selection of 2: . cuats. In Ayrshire, the small tenants are a hardIf ling class. I believe every hard-working man is Ehable to the country. If the law of hypothec were whe mall farmers might go to other occupatior:s, and mea suan deal better. A number might not be able to betp their farms. Men of a little more capital, of corre, would take them. There are a number of moplo just now who say they are willing to take farms, them. That class of men would step in. They would apret to get the farms at a lower rent, where they are wodear. There is no great tendency in Ayrshire to -sicarable farms are not worked to great advantage a the leavy inland districts. In the lower part of the connty the farms are larger. Suppose rents were preiani, a half.year's rent being payable on entry, that fere-renting; but their credit in other respects would be co much better, that it would be almost an equivalenth

\section*{Miscellaneous.}

Agricultural Education. - The Albany Cultivator of Augat 3 rd states :-Mr. Secretary Klippart, who is Doin trvelling in Europe, has written a letter to the Ohio State Board of Agriculture, which we find in the columas of the last Ohio Farmer. It contains his sombl of an interview with Baron von Liebig on the sabject of agricultural education. Liebig is represented Buying:-
"In ohio you do not want to build a palace for an agricul mating up your educational buildings, and then starve your
 Ihive picture of it: I am told it cost some 70,000 or 75,000 Atr, and now you are starving the professors in it. You Sthe sane in Cleveland and Ciriciunati; then I am told you
han two universities in uhio, and now the professors can
andeg ire cin the salary you payy-the consequence is that ase whools colleges, or univeraities must run down. There 20 phace in the whole world where knowledge can make so
zurch money as in Anoerica; therefore your best men will not byome teachers or professors-simply because they can make are money out of something else, and ther naturally apply
:aer talent aud ability where it pays the best. No man will : gire in an educational course of life for life, on a salary of Wivliar or 1500 dollare a year, when by applying the same dNare a year, Hence you have no first-class professors in 2. America, but you have instead first-class business men, : ces gna will think that you must at least buid fand of Maring College,' or even a yot more expensive establi inhment. Tombiet an ordmary good building, but you don't want the
int there is at Hohenheim. Then, too, I am afraid atater sou have your buildings, you will employ third or
aterate profesors, , aud you will find that your establish Tit will Mhuish, and your standard of attainments will be
wi. These are your great dangers. On the uther han 1 ,
 \(O_{\text {a }}\) the sue agricuiturul world.
(7) A subject of managing the farm connected with th Agticultural College, Liebig expressed himself as an thmanger or director of the establishment should be a

 2.enents are madie, and the experiments should al ways be Len the they should all tend to being put into general practice; \(\therefore\) ne tex expense and without exhaisting the soil, and of Precthan of the methods; because if your experiments cost Linve made no advancout in agrobiculture; allthough you may Finaled it problem or ascertained a fact, yet for agriculture Wator is practical malue. If, on the other hand, your Sto ve cirry on the experimental farm what is parlhaps being Nurat making no protgress. You cau never peersuade a "trent tor ' coll minnues Liebig: "a few hundred acres is
 phanely hise four model farm fudent perhaps can get a farm - your model farin; he may not be able to get no
much Grass land or so much upland, or may be unable to have
farm buildings precisely like the model ones; then what good does your model do when nobody can copy it? - and to cony part of the model impresses the ignorant that the whole is copied, and the results in oopyiog a part cannot be as great or moral effect is that that part represents the whole; therefore I
would not advise mumel furniun
iden whenheina set out with the idea of \(b\) ing a model farm, wien there were not half-a-d wze
estates of the same extent or geological structure in all whr
temburg; and as for noubg ; ard as a matter of course it mings or princes could cupy it, aud small farm could not even attempt it. Confine your institution to experi
ments, and as for practice, Soul have every day at your servic
the the practice of the wholl state of ©hin. Let the students
visit the best farms in the state, and see how things are managed, and it will do them more good than if yout uudertak
to carry out the model idea. Now when you get home. pray do not misrepresent this idea. I want you to make experi-
ments, nut siwply to show what can be dunc but ments to show what can bo done 1 rufitithly, and what may 1
doue by any intelicent farmer Of to a acn mplish muth for the present generation of farmers, but generations."

The Birmingham Dog Show.-It is announced in our advertising columns that the sixth annual exhi bition of Sporting and other Dogs at Birminghaw will be held on the \(27 \mathrm{th}, 28 \mathrm{th}, 29 \mathrm{th}\), and 30 th of November next, in the Curzon Exhitition Hall, now in course of erection in that town. The prize lists have been issued within the last fer days, and, for the first time, include classes for pens of puppies of all the leading breeds of sporting doga.

\section*{Calendar of Operations.}

Septrmber-Harvest Work. - Where harvest is earls the stubbles are ploughed: Bean stubbles for Wheat, and other stabbles for Beans or winter Tares and fallow. Lime may be properly applied now where it is desired, on the stubbles, broadcast, at the rate of from 50 to 150 bushels per acre. Marl, and chalk and chy, may be hauled out this month on land where it is intended to apply them. Manure, too, may be carried out to the lands intended for Wheat. It is a good plau in districts where the harvest is early, and autumn moist, and where weeds thus have time and opportunity to grow, to pare the stubbles, harrow them weil, gather the rubbish together, and burn it.
Tbe ploughing of Clover lea for Wheat may be proceeded with. Failow Wheat may be sown towards the end of the month: four or five pecks per acre are enongh for so early a seed-time. 'The earliest portion of winter Tares should be sown some time in September : and Rye should be sown in the commencement of it, both upon some corn stubble that has been prcpared for them.
Live Stock.-The pastures still afford good fare to store stock ; but for fattening animals, both sheep and cattle, they must be supplemented with cake; and the farmer will have an adequate portion of his Turnip crop fit for use early in this month. Hoggets will be much the better for getting some after-math or Clover stubbles to keep them growing, and prepare them for going on to Turnips. Coleseed suits admirably for this purpose : and some farmers provide it by growing it, mixed with the Turnips, on the piece which they intend to use first.

Lambs ought, if needful, to be again dipped during this month. Nearly all the fatting sheep, if well bred, will be ready by this time-those still on hand must be put to Turnips or Rape, being allowed corn or cake.
Breeding sheep should be dipped or run with some liquid, any time this month, wher the weather is dry, in order to free their wool and skins from vermin.

\section*{Notices to Correspondents.}

Clover Dodder: c S. Your sample is a handful of the Clover Dodder, a mischievous parasite which springs from a seed capable of separation from Clover by screemung. It springs from the soil ; soun lays bold of a phant : and its conncction
with the soil then dies. Thereafter it grows from plant to with the soil then dies. Therearter it grows rroes, sucking plant, entangling a whole circle in its embraces, suck for
their juices and destroying the whole. If the Clover is fur seed, the circles thus destroyed should be pared and burned before the crop is harvested.
Harvest Ifyms: Correepondent. We were mistaken in describing the Hymms published by the Rev. H. Moule as being exclusively 'Harrest' hymans. The subjects are not limited, but general. And it is desired through the few harvest hymus alluded to, to get these
into the hands of the agricultural class.
insectis: J F P. The earwig certaioly feeds on vegetables, and for want of other food would attack Turnips, but you may eatis'fy yourself easily if they be the real depredators in yomr case by examining the fields after dark with a lanthorn. We
should fear that it is the surface grubs which have done the misclief. W.
Leather: IF \(A\) g. We can find no infurmation on the composition of leather clippings. But it is doubless rieh in nitrogenoins matter. In the conversion and fixity of character conis, however, such an insolubility and fixity of character con-
ferred upon it that it is rendered useless as manure, except ferred upon it that it is rendered usoless as manure, except will practiailly render it valueless.
Lice in Cbicker-housis: M R. We hardig know what to advise to rid the houses of the rest. We have always found lime-washing effectual when thorouguily done. It must be well worked into all crevices; holes which the brush cannot reach must bo stopped, and tas oper if the foula are rupplied till the desired result takes place. If the fowla are supplied in the douse and in their run wis, with which shnuld be mixed four or five pounds of black sulphur, they will use it as a bath and rid themselves of their visitors. \(J B\).
Rust on Wheat: a Shepleced. We fear there is no help for your fiend, but a well-grown and vignrous crop is probably your liend, that a wother to the ruivechicf, anal so fir good atricultuse may dimmish the litulity to rust. The works o
the Rev, Mi. J. Jerkeiey, his witinus in the diseases o plante, contain all that is known ou the subject.

HALLETT'S TRADE WHITE PEDIGREE WHEAT.
} MARK. (ROUGH CHAFFED).

\section*{NOW OFFERED FOR THE FIRST TIME.}

This is a fine Millers' Wheat, in addition to possessing the extraordinary productiveness of the original Red Peligree Wheat. Straw of medium leugth and very mym being laid by bad weather. A \(\dot{W}\) inter Wheat only.

SEED REQUIRED.
If Drilled in September, 4 Bushels on 10 Acres.
- If Drilled in November, 4 Bushels on 4 Aeres.
" October, 4 " 8 "
Jote--The ORIGINAL "RED" PEDIGREE WHEAT will be supplied if specielly namod, otherwise the above new White variety will this yean, in all cases, be in
Price, including Bags:-ONE GUINEA a BUSHEL, or SEVEN GUINEAS the QUARTER by the (quarter or IIalf Quarter, delivered in Bags, sewed up and ache the Brighton Railway Station, upon receipt of Cheque or Post Offee Order, without which it will not in uny case be sent to unlnown Corvesplondents. Less than a Bubhel vilm be supplied.

\section*{trade}

\section*{CHEVALIER PEDIGREE BARLEY.}

MARK.
This has boen "bred" in the same manner as the PEDIGREE WHEAT, viz.:-by repcated annual sclection, re-startine in cach year from a single graiu.
Although grown upon a poor thin soil (resting immediately upon the chalk), which upon neighbouring farms produces Barley rarely weighing so muelh as of lbs. pat. and fit only for grinding, the PLDDIGREE B.ARLEY last year [this year's crop not yet threshed] weighed 57 lbs . per bushel, and produced \(80 \frac{1}{2}\) bushels per acre.

Besides its astonishing productiveness, chanacteristic of all the PEDIGREE CEREALS, it possesses remarkable value for the maltster, not a single grain failing to genin and all growing equally.

Although only a very limited area of it has this year been grown, it will, in deference to a generally expressed wish, be at once offered to the public instead of waiting:... next year, and a Subscription List has been formed, to which gentlemen desirous of securing any of it for drilling next Spring, would do well at onee to add their noen which, however, will not involve payment until it be ready for delivery, of which due notice will be given by printed circular.
\[
\text { If Drilled in March, } 1 \text { Bushel in } 3 \text { Acres. } \quad \text { SEED } \quad \text { REQUIRED. }
\]

Prtce : \(\sim\) TWO GUINEAS a BUSHEL (including Bag), delivered in Bags sewed up and sealed, at the Brighton Railway Station, upon receipt of Cheque or Puth: Order, without which it will not in any case \({ }^{b}\) e sent to unknowon correspondents. Less than a Bushel will not be supplied.

Note.-As the quantity is so limited, it will, until exhausted, be sent out to Gentlemen in the order in which they have joined the Subscription List.

\section*{CLIANTHUS DAMPIERI IN VARIETIES．}

\section*{MESSRS．E．G．HENDERSON \＆SON}

\section*{NOW PREPARED TO OFFER SEEDS OF THIS SPLENDID PLANT} in its remarkable varieties of colouri

From the various reports of a White flowered vaninty，it has been eagerly sunght after as a first－class vordtr，hut not until the present has it been offered in ite genuine diversified features．

The party from whom the prewent Sced is purchased by E．G．Hendm：Rsos \＆Sos exhibited the White flowerei ：mety in Alustratid，which excitcd great intereet and admiration，and it is from the original White－flowered Whet that the present additional varicties now offered were derived；it being foriginated six or seven other shades，varyine the Sced produce of the Trimenn：including the varinus slades of searlet，and crimsen with the white，to white bondered with rielt rwas \(\therefore\) ar indined from the collection of plants from which the Secd now oflerel is produced，prow ch that the aperies wots into arions torms，including some of the mont whexpeeted Necrelties yet coftered．

One of the me，t beautiful varicties oriwinated in the group referrect to，the Serel from which is includel in that \(=\pi\) offrel，is white throughout the centre spaces of the \(1 l o w e r\) ，very tlegantly and uniformly belteci with roery Mnen，thus rimding an unique and exquisite combination of colour，with the brilliant black boss－like blotech on the ．．n of the upper lobe A Figure of this variety will be published separately early in September，uffording a beautiful setrat of of the varieties included in the Seed now offered．
For the protection of the Public the Seed will be sent out in Packets，with the Sewl of the Firm，to ensure its genuine source．

Packets－First Sixe， 24 Seeds，5n．；Second， 12 Feeds，Bm．6d，
P．S．－The Seed now offered having been produced from Cultivated Plants in Australia by the Raiser of the arieties adrerted to，is simitar in quality and colour to that obtained from home－grown or English plants，and iffers from that rullected on its native saudy plains，in buing of a richer brown tint，and more plump in substance， thr milte boing often gathered prematurely，and generally of a paler hue．

\section*{The Gamenerse Chromite.}

SATURDAY, SEPTEMBER 9, 1865.
mefting for the ensuing week.

Tre Great International Fruit Show of Edinburgh has, we are happy to reoord, proved a grest stecess. We speak of it as a Fruit show, because it was in respect to this particular feature that the exhibition has stood out prominently in adrance of all previous gatherings of the same kind. No exhibition which it has been our lot to mituess, not even the really grand display which
thok place some ferv years since under the auspices twok place some few years since under the auspices
of the Horticultural Society in St. James's Hall, couid for a moment bear comparison with the Edinbrgh Show in respect to the profusion of high-class ruits ander which the tables groaned, thanks to the spirited competition amongst British gardeners - for although an 'International' display, in fact as well as in name, it is due to our home growers to say that the managers were indebted to them for Indeed, since the foreign fruit glory of the show. Indeed, since the foreign fruit which was sent in, mas contributed by a British gardener, it may be said that the display was entirely due to the skill men who cultivators. All honour to the skilful The principal able to achieve suoh suocess.
The principal features of the exhibition will be cond noticed in detail in another page; but we to the glorious from inviting attention in this place were its crowning feature. We particularly refer is those furnished by Mr. Fowler, Mr. Mereditr Mr, Thomson, Mr. Riceards, and others. Mr.
Fomier's Muser. burghs were superb, and we doubt if more perfect erer adorned good Grape growing than these have There adorned the tables of an exhibition room. clusters produced some wondertul examples of huge with a bunch of thr. Fowler taking the lead Tell supported by Mr. Gra, weighing \(12 \mathrm{lb} .9 \frac{1}{2} \mathrm{oz}\)., Castle, with a Barbarossa of 10 lb .12 oz . weight.
Resides these, of nearly equal size were various other examples Aroongst the Grap
be flarour only, the walm was berits were decided amongot Alexandria and Duchess of Buccleuoh and Black Frontites; and by Muscat Hamburgh Tere some Hamburghs of which thacks. There exceedingly fine burghs of which the flavour was petition werally useful, have no chance in combas been made, richer varieties of which mention possession of the finest decision rests upon the mith and have been better had those varieties shown in separate classes. Te should neparate classes.
IPlendid examples of Pine mention one or two prize ofiered by the Areherfield, by whom the \(10 l\).
was won. They were shown in pots, the fruit being in an unripe state, but their sturdy vigour and perfectly swelled fruit, showed them to be models of high cultivation.

Though too late for many of our choicest exhibition plants, there was nevertheless a :very good display, both of plants and cut flowers, the Gladiolus and Hollyhock being the most prominent amongst the latter. Amongst the plants, Statices seem to be more freely grown in the north than in the south, and are very effective, some remarkable specimens being staged. But what appeared to us to be perhaps the finest examples of plant-growing in the show were an Anæctochilus Lobbii, from Mr. Lees, of Tyuningham, which for sturdy vigour, size of foliage, and density of growth, has not we believe been ever equalled at our flower shows and a Nepenthes Rafflesiana, clothed with pitchers, which came from Mr. Mitceerle, of Hamilton.
Some idea of the magnificence of this exhibition as regards the better sorts of fruits may be formed from the number of entries, which extend to about 140 in the various olasses of Grapes, the show cf which was extraordinary, to 7 amongst Pineapples, to 13 for various collections of Fruits, to 30 for Peaches, to 16 for Nectariues, to 8 for Aprioots.
The day proved auspicious, and a crowded company thronged the Hall and Assembly Rooms in which the show was held, we trust with the most beneficial results as regards the exchequer of the Society-the Horticultural of Edinburgh--by which the show was promoted. The thanks of the gardening world are, moreover, due to the managing committee for the stimulus their wellconsidered plans, so efficiently carried out, have given to British Hortioulture. We shall hope to see such gatherings repeated.

There are few subjects on which we have more inquiries than FUNGI, whether as regards their classification, their esculent or deleterious qualities, their cultivation, their apparently anomalous mode of growth, the peouliar forms they sometimes assume, or the various diseases of which they are more or less ostensibly the cause. A few obser. vations on some of these subjects may not be illtimed in the midst of this extremely prolific Fungus year, a year not only remarkable for the number of individuals, but for the rare and interesting forms of which it has been productive.

We may pass over the subject of classification as little adapted to the purposes of this Journal, but in respect of wholesome or unwholesome properties no demand is more frequent than that we should give some general rule by which good and bad kinds may be distinguished. The housekeeper in general cuts the Gordian knot by rejecting everything except the true Agaricus campestris, whioh. to satisfy her requisitions must have beautifully pink gills, and look rather ruddy when bruised. Even that, however, is often rejected, while some culinary martinets will pass nothing except what comes from the Mushroom bed, though as dangerous spocies sometimes appear there as in the fields or woods, for it is a great mistake to suppose
that it invariably yields one species only. The truth is that no certain rules for discrimina tion can be given. We must in general reject those which have an acrid unpleasant taste, or which are on the verge of decomposition from age or the attacks of insects, but evea here we may be too nice, as something depends on the mode of treatment, and something on individual oonstitution. No one in England would think of eating Lactarius piperitus, which if bitten by a dog in gport, as we have ourselves witnessed, will make it foam at the mouth as if in an advanced stage of hydrophobia, and yet, from being pickled in salt and vinegar, this species is eaten, as indeed are many species of bad repute, with perfect impunity by the Russians, who depend often on preserved Fungi for a great portion of their food in winter. But even the Russians exercise a certain degree of disorimination, and do not venture on such kinds as the Fly Agario, or those red-pored Boleti which turn blue when bruised, though some other species of the group, which fow in England would venture to eat, are a favourite lenten food even with the higher classes, as they afford a good substitute for meat during their rigid fasts.

In some genera, as for example in Russula, the wholesome and unwholesome species are often so nearly allied to each other that even the praotised Mycologist is occasionally at fault. But as the Nurseryman will often excel the Botanist in the nice discrimination of varieties, and at once recog-
scarcely see even when pointed out, so the peasant in countries where various Fungi have their market value can at once by mere tact disoriminate between the wholesome and unwholesome and if he fails to do so, or makes mistakes on purpose, the market inspector is pretty sure to set him right. The only safe rule with Russulæ, some of which, as we may learn from Mrs. Husser who had great experience in these matters, are of surpassing excelleace, and acceptable where other food is loathed by invalids, is to ascertain by taste whether they leave a burning impression on the palate like that of Capsicum, for some of them are not acrid at first. We should advise however experimentalists in this direotion, like professional wine tasters, not to swallow the morsels which are tested, or they may suffer considerably. Dr. Badram once experienced great inconvenience from simply swallowing a few of the spores of Lactarius vellereus, whioh is a most aorid species.

We need not say muoh about cultivation. Directions are to be found either in separate treatises or in general works on gardening. The great objection to artificially grown Mushrooms is, that if proper care is not taken in gathering they are apt to be gritty. Attempts have oceasionally succeeded in making the spawn grow through turf, but success can only be partial, as some of the requisites for an abundant produce can searcely be secured under such a method. Undoubtedly lawns may be inoculated with fungous spawn, but the constant mowing is not favourable to development, and the varieties which are most likely to succeed form barren unsightly patches or rings, Whioh, except in some remute part of the grounds, where they might be of less consequence, would at once call for their extirpation. This was the ease in one instance where the experiment was tried, and it is curious that the spawn penetrated to so great a lepth, and was so strungly scented as to make it a task of some difficulty to destroy it completely, a difficulty which was much increased by the overpowering odour.

It is often a matter of surprise to persons unacquainted with the habits of Mushrooms to see them spring up abundautls in frames or in other situations where no spawn has been placed intentionally. But the truth is, that the spores of some of the Agarics require to pass through the stomach of some graminivorous animal in order to their germination, or at least they germinate better under suoh ciroums!ances, as is well known to be the case with the seeds of some of our native plants. As regards the spores of the common Mushroom, it is quite clear that the stomach of the horse is peculiarly favourable. Wherever horse manure is used, or horse droppings are mixed with soil, as from road sweepings or any other source Mushrooms often spring up abundantly, and sometimes in such quantities as to be very annoy ing to the gardener who wants to have a crop o Melons or Cucumbers, and not Mushrooms where Mushrooms should not be. In some garjens they come up everywhere, so as almost to do away with the necessity of any artificial cultivation during a portion of the year, while the comminuted straw in the stables is so rioh in spawn that there is no need to apply to the seedsman for Mushroorn bricks.

We have formerly given figures of some of the different varieties which occur in Mushroom beds. Our attention has, however, been lately called especially to what may be called monstrosities in cultivated or field Mushrooms, by specimens, drawings, photographs, or descriptions. In some cases the caps are joined together, the stems growing in two opposite directions; in others there are gills at the tops of the cap, as well as beneath, in one or more distinct hymenia; in some the whole pileus is changed into a solid ball covered with fructitication, while in whole beds the gills are completely obliterated. The last case is the only one which is of any real consequence to the Mushroom grower. The others are merely interesting in a morphological point of view, and are very important to the systematist, but the last arises from the attack of a Fungus which is closely allied to that which is so often brought home from New Zealand on caterpillars, and which is utterly destructive of the crop, and most probably the infected specimens are unwholesome.
The last point mentioned, the agency of Fungi in the production of disease, is one on which we are frequently called to make observations. There is a question agitated at the present moment, which is of considerable importance, namely, whether the Fangus of the Savine has any relation to the Restelia which is often so destructive amongst Pear trees. The question is just like that
of the connection between the Berberry Acidiam and Wheat mildew. On such points we do not consider that at present there is sufficient reliable evidence. We have, however, no right at once to speak dogmatically on the subject, and it is highly desirable that information should be collected. A correspondent has just sent us a very aggravated case, in which the Pear trees affected were most diseased on the side which was nearest to a Savine bush. It is, however, as far as the question is concerned, absolutely necessary not only to show the vicinity, hut that the Savine bush was infested with the gelatinous fungus (Pudisoma) which is supposed to be a condition of that which appears on the Pear. No conclusion can be drawn from mere vicinity, and it is necessary to take into the question the nearly allied forms which appear on the Hawthorn, Quince, and Mountain Ash. -2M. J. B.

We find Mr. Bull's New Radish, to which allusinn was made by us at p. 630, thus referred to in the last number of the Journal of Botany:-"At the last great flower-show held at the Botanic Gardens, Regent's Park, Mr. Buiz exhibited a newly introduced and unnamed kind of Radish from the East Iudies, the fruit of which, stated to grow three inches during a single night, was recommended to be eatea instead of the root, as in the ordiuary Radish. From specinens kindly placed at aur disposal by the exhibitor, we find the plant to be Raphanus caudatus, Lin., of which, books of reference inform us, the leaves are eaten as a vegetable, and the seeds are pickled. The petals are veins, and the fruit is several feet long. We fancy this is the firet time that this annual has been introduced, and there is no reason to believe that it canuot be grown with us in the open air."
- Attention has recently been called to the poisonous properties of the Boa AspHodet, Narthecium ossifragum. Cows which have eaten of the plant have
died after a severe attack of dysentery, their milk turning as bitter as gall; and cats known to have partaken of this milk have died also.
-The Rev. R. T. Lowe states in the Journal of Botany, that the proper focal habitat of ARUM CANARrense is Madeira. In the Canaries it is rare and
local, in Madeira it is common and universal, occurring on moist shady banks, under walls and hedges by roadsides, and in damp sheltered places, from 500 to 2000 feet above the sea. The plant is called in Madeira Bigaloa or Bigalhoa, aud arrowroot is occasioually prepared from its corms; but it is justly accounted a
troublesome and noxious weed, and very difficult of extirpation.

\section*{-We have now, observes the Canadian Naturalist certain knowledge of localities for Heather, Calluna melgaris, in Massachusetts, in Cape Breton, and in Newfoundland; and we have the teatimony of tion of the nativity of this plant in America may be considered settled.}

\section*{- A griat International Show of Fruits,} Goumds, Roots, Vegetablizs, and Crreals, open to Dublin International Exhibition, on October 3d and following days. 'The Exlibition of perishable Fruits and Vegetables is to close on the fith, and that of Kpeping Fruits, Roots, Gourds, and Cereals on the 17 th of Octuber. Among the special prizes announced are Large Silver Medals-1, for the best collection of Fruits and Vegetables grown by any Botanic or Hortio cultural Society in any part of the world ; 2 , for the Fruits and Vegetables from any of the Colonies; and 3, for the best and most complete representative collection from the Presidencies of India. Besides the Fruits and Vegetables usually invited on such occasions, the Committee offer prizes for Collections of Fruits, Roote, or Vegetables, modelled in wax, or in any other material ; and for Preserved Fruits.

We learn from La Belgique Horticole that M. J. Drerr Schoo! of Horticulture at Vilvorde, in succession to M. DY BAVAY, deceased.
_A correspondent forwarded to us recently an interesting "sport" of the flowers of Eccremocarpus was deeply divided into five equal oblong segments, alternating with which were five stamens of equal length. In some of the flowers only four perfect stamens were present, with a rudiment of a fifth. The other parts of the flower did not deviate from their ordinary condition. We have here, therefore, an instance of nagular Peloria, in conjunction with a more complete separation of the petals than is usual.
- In an interesting paper lately published by De Bary in the Mfonatsberichts dor K. Alkado der Fiasensohafts. Berlin, the anthor asserts that Wecidium berbaridis can be produced by sowing the sporidia of If this obyenvation should be confirmed, it will go far
to justify the opinion of those farmers who consider the
Berberry as prejudicial to the growth of Wheat by producing fungoid disease in it.

dis Bertolonii comparabile. dis Bertolonii comparabile.
There are some Orchils so very bizarre that if we had not seen them alive or dried, but only in oriental drawings, we could but belieye them to be iniaginary. So it is with a few Luisiag, which add to the common babit of Vanda teres, instead of the, alas! so indifferent flowers of most Luisias, such as are quite peculiar, being bright coloured, and having much elongated netals. We had till now but two such species, still to be introduced, both described by Dr. Lindley. One is the Luisia volucris from Khasia, whose fowers the same author so well observes lonk like little birds with narrow outspread wings. The other, L. burmanica, has green flowers with many blackish-purple dots and streaks, and is only known fron a drawing of Griffith's, but no doubt soon to be introduced to England by the Rev. C. S. Parish or Colonel Benzon. Our specles has green flowers, with very large petale, comparable to the spread ears of a rabbit, and a very singular large roundish green lip, full of blackish violet-purple spots,
the large plants, and of some only on the feeble one the gathering may last two months at most. In onde to get fine Asparagus, they are to be gathered ome every day, or every other day, or every third day is thest, according to the degree of temperature, it Under the to obtain rosy, red, or violet Asparegan of the knolls by an inch or two. In order to get grap ones it will be sufficient to let them grow during foo or five days more; they will lengthen and beome green. At all events the red, rosy, or riolet colone will be the best guide. The second dressings aro be made as in the preceding years. The props are be put as soon as the necessity is felt, and the stalk with regard to the increase of their height and weigh must be firmly tied, so that the wind may not dibtar hem and that they may not be broken.
In the month of October following the dry sa: are to be cut off at 14 inches above the ground. Tt plantation is to be cleared, and the shelving beds an to be turned up by raking up the earth of the tnotis which have been raised on the plants for the gathern? Then the manure is to bo soread in the mano already indicated; the digging up of the shelving bee is next to take place, and the manure is immediate to be covered ove
Sixth Year.-When the Asparagus plantation obe have reached its sixth year, it will then be in \(f\) productiveness. The feeble plants, however, mo constantly be taken care of, if it is wished trengthen them. The forming of knoils is in th place in March during fine and dry weathes: knolls must always be 14 inohes high, peckoning for he subterranean stock

Nevertheless, the care to be taken is to be the samos in the preceding year, as well with regarl to the kool as to the props. As for insecte, the will be less to be feared than durio the first years of the estabistmen of the Asparagus plantation. 1 beetles can no longer lay thelr on the stalks of the Asparagus, घinec
they are cut during two months, and when they run into seed the time o? the laying of eggs is passed.
In the month of Detober the shelving beds are to be turned of in conformity with the manuer siom for the preceding jear; the shelring beds and the plants are to be dungel as has been explaiued for the fourth year. As the Asparagus plantation may last 15 or 20 years, the opentions and the care to be taken are to be repeated from year to year io the manner above indicated
With regard to the Aspargus planted ou beds or separately, the
reminding one of a Persian or Turkish carpet. It is introduced to England by Messrs. Tow and Co, an was exhibited the other day at the Royal Hortieultural Society's scientific meeting. H. G. Rchb. fil.

\section*{NYMPHAA GIGANTEA.}

Taxs remarkable plant is nearly always met with in a state anything but suggestive of the aptitude of its specific name, the flowers being rarely seen, and the leaves not half the size of the common Nymphæas. Even the best aquatic places have failed to make anything of it, which is remarkable, considering with what strength and rapidity the other species grow. Walking throug Glasnevin with Dr. Moore the other day, fully interested, of course, but without the slightest expectation of having anything to record of the garden in addition to that published last autumu, we suddenly came upon Nymphæa gigantea in full flower in the open air! Since my visit of last year a small cemented tank has been made outside the Victoria house-on the front border, in fact, and in thi, some tropical Water Lilies, Euryale ferox and Nelumbium are doing bealthfully, but better than any of them the hitherto difficult-to do gigantea, with three of its large soft blue flowers fully expranded in the sun. The tank is not heated by a pipe, but the overflow of the Victoria house, in which there is a grand specimen this year, is conducted into it, warming the water to some extent, of course. The leaves were quite clean, healthy, and thick, and the flowers stood erect from a foot to 18 inches above the waler. What a difference between a garden preseuting one with fresh interest of this kind in addition to its usual attractions, and public gardens which merely present us, on per haps a large scale, with what may be seen in every private establishment. W. Robinson.

\section*{M. LHRBAULTS MODE OF CULTIVATING} ASPARAGUS.

\section*{(Concluded from p. 771 )}

Fifth Year.-The making of knolls on the Asparagus is to begin in the month of March; the knolle are to be 14 inches high, and their diameter is to be in conformity prith the dimensions of the plants. The ends of the dry stalks, which have been left the preceding year, to mark the site of the plants, are to be taken away; and the feeble ones, which have been marked out at the precoding laying bare, are to be carefully looked to.
The gatheming is to consist of the heads on all
manure is every year to be spread on the plants alons. observing all the precautions indicated for the cull vation in full beds or the open ground.
Generally, in a well-established A sparagus plantation the gathering, reckoning from its beginning, is to taso place during two monthe, whatever may be is placed. It mastances under which the plantacion is not rers great; the chief object is the care which must be taken. The main point is to get good plants, in ordes to obtain good produce. By properly following her laid down here, satisfactory resuits will be obaiad
To sum up: the ground requires manure; hu and must be dug up, meliowed, and sheltered from dryan and the plants must be kept free from the atmat insect means of giving to Asparagus a rich and luxurant vegetation
There are to be found three chief varieties remarkable Asparagus, viz., the Common one lame fine ; the late Dutch Asparagus, improved, and L'Hérault's Early Asparagus, This last which is very precocious, very productive, and to be recommended, has been obtained from seed from its exceptional size and flavour it has ounc honourable mention and several nedals of théraut, 1t at, the horticultural exhibitio
Rue de Calais, a Argenteuil.

\section*{THE STRAWBERRIES AT YABY, YORKSII} Two years ago I furnished you with a brief rane of the best of the Strawberries grown at larile serm. late Mr. Nicholson took a great interest int the berry, and had formed a collection of mion the principal growers of France, Belgium, \(A\) me and Great Britain, and the collection as left by Ir. by Mrs. Nicholson, and many seedtings Ny icholso are now being proved.
Niche of the best of these seedlings is named Alioe Nicholson, a cone-shaped fruit, of a luscious rich ands and a good bearer. This is a lue-favoure Yarm handsome ruit. Gloria is another Prince lings, and in growth is akin to blac, with a and Hautbois flavour combined, and a gous Prince Victor is another seedling, and bas large handsom
fine Stherwersy in gravin hert
believe from Belgium, and is called "Premier on the It is quite unlike the British Queen in growth or is quite unike its flarour. It is a large, handsome dink coloured Strawberry, resembling Keens; in habit and shape, but distinct from it, and cropper; and with its fine flavour and large
a decuded acquisition. Lord Murray has a Queen style of fruit, with a rich sugary flavour, molarge and very free bearer, and a good hardy gort. well as the dry sumper would admit, and was conwellered by Mrs. Nicholson and her foreman to be first not in flavour. Titiens, sent out, I think, by Messre, E. G. Henderson \& Son, has fine fruit, but deficient in tur ar. Ingram's Rilleman has very fine fruit of Von Geart is an Alpine cross with prominent seeds, and parin fiapour, bat bears well. Choix d'un Connoisecur is ciut in flvour. Refresher is a French kind, resembling Empress Eugéne, with very large irregularly shaped fruit, which is very juicy, but not superior in flavour to Hearrs. Stewart \& Neilson's seedlings, is a very fine art with rich sugary flavour. Blandford resembles the Ritish Queen in habitand fruit, and has a brisk sugary
Arour and fine fruit. Kimberley is a large, showy, finerr pping Strawberry, but is poor in flavour. Comte ic Zaus is a very heavy bearer, and has very large fruit urfe, handsome, sweet, juicy fruit, Rivers's Eliza and If Constaute both keep up their characters as firstcias kinds; and Marguerite is a large, free-croptimpon Cluster, raised by Mrs. Clements, of Bodmin, it a free bearing kind with large fruit of a brisk
plasant flavur. Sir Joseph Paxton, one of Mr Ingram's fine seedlings, is a free bearer with handsome fruit of rich sugary flavour. Crimson Queon is a large. fruited good sort for sale, but shauld be frequently I hinitr, Very innch reeombles La Constante, send has a full Hantbois flavour. This seems a very promising Sind, It has not been a productive Strawberry at Yarm, iÖ̃, the former especially. Many kinds were not in good character, so that 1 have not alludel to them. Hee of the best Strawberry growers in Yorkshire, Skipton, grows La Constante and British Queou superbly, and this summer, when Strawberries generally
failed, he had an abundance of fine fruit. He treats thme tho things as annuals, and plants a new batch of ranars overy year, and gets fine plants and very fine cin, but then be gives them liberal growth, and waters cupiously during the dry summer weather, Two years suate chielly to the one-year old plants for him supply. Williom Deam, Shipley, Yorkskipe.

serve my garden and stable. The water comes from the completely doined over, and and the tanke are 5000 gallons. The water is obtained by pumps in the I asual way. On using the water for domestic purposes offensively; that which had been the least previously used smelling the worst. No offensive matter can drail into these tanks, which are all bricked and cemented Can auy of your readers tell me what is the canse of chis smell, and how it is to be prevented. N. B. A.
Coning of Thujopsis borealis.-I have four plants o this, bearing a quantity of cones. This morning gathered 65 ripened cones from a plant 2 feet 6 inches gathered 22 cones from another plant. I have s great inany plants of this Thujupsis, but none are bearing cones except those just mentioned. This beautiful Conifer withstood the severity of the winter of 1860 and 1861 uninjured. Charles Burgess, The Nurseries, London Road, Chellenham.
Wasps.-Here, as in Worcester, we have almost : total immunity from wasps, though in the spring queens were unusually pleutiful, and we anticipated the terrible annoyance from them experienced last year. To
the surprise of all however, until within the last forto night, one was rarely seen; even now we have but few, and those very small. Last season I had 64 nests destroyed around me-this year I have not heard of one, T. T, Bocking.
Swoet Bays.-Fermit me to inquire through your Journal, whether the female of the Sweet Bay tree Laurus nobilis, is generally found to be hardier, and to attain to a greater size than the male plant? There are two trees of it near Mr. James Randolph's house at Milverton, which neasure above 30 feet in height, and their trunks from 2 to 3 feet in circumference a yard from the ground, and these, and all other large apecimens of it in the west of Somersetshire, as far as I can ascertain, are female, and remained unscuthed by the severe winters of 185960 and \(1860-61\), when many male plants in the neiglibourhood were killed. It may be of
much practical importance to those who are formiog shrubberies, to learn whether this has been experienced other places. R. C. A. P.
Flower Borders.- At The Cedarg, Wright's Lane, Kensington, is a trim little border laid out by \(\mathbf{M r}\). Newton, on a plan similar to that represented in your columns at p. 819. It is kept gay with bedning
plants in summer, and in winter it will be furnished plants in summer, and in winter it will be furnished
with occupants suitable for that season, means bein, provided for allowing the winter crop to be planter before even the summer crop is of the ground, and vice
versa. A croquet ground has also been male lawn, without its formation being readily visible when not in we, a poin

\section*{Foreign Correspondence,}

Nbw Zealand Gardening.--We have received file of Lyttleton papers, in which occur some interesting sketches of antipodal gardens, which we shall Wilson's nursery gardens, which date their origin from the founding of the city of Christchurch, some 14 years ago, and are not only the oldest established, but by far the most extensive nursery gardens in Canterbury; and
the largest and best stocked in New Zealand. They are three in number, and comprise about 19 acres, all in the highest state of cultivation. The gardens forest trees, evergreen and deciduous flowering shrubs and plants, and are the source whence has been derived a very large proportion of the fruit trees which now fill the gardens of the province with a profusion of fine fruit, and of the forest trees which ornament Christchurch.
The nursery garden in Cashel Street is securely enclosed by a very lofty and wellkept Gorse fence within which there is a closely planted line of lofty Australian Blue Gums and Lombardy Poplars, whose dense foliage and branching arme, completely inter twined, afford the mest complete shelter from all winds. Immediately in front of this screen there is a broad belt of fruit trees, running round the Pears, Planes, Cherries, Peacher, Nectarines, Figs, Filberts, Medlars, Quinces, and Almonds, besides immense quantities of Gooseberries, Black, Red, and White Currante, Masp. berries, Strawberries, and other small fruit. A pacions Grass walk, 726 feet long, stretches from the entrance gate to the eastern end of the garden ; at right angles to this walk, and at distances of 132 feet apart, the garden is intersected with lofty and went nursery compartments. These consitt of bed, 18 feet in width, with 4 .feet intervening foot-paths. The beds in some of the compartments are all laxuriaut growth or from have already enumerated. Other beds are flled with forest treee, such as English and monsy-cupped Oaks, English Ash, including some very tall-stemmed Ash treee, apon the summit of whim soue Weeping Ash are growing gracefully pendent. There are also quantities of the Scotch and English Elm; and, also, the Weeping and Amerioan Lime treen, ith Mountain Ash, Horse Chesnutg, and sweet or

Spanish Chestnuts, besides Horubeams, common and purple-leaved Beech trees, with Lombardy and Black Italian Poplars; the former mainly remarkable for their handsome upright habit of growth; and the latter recommending itself by its rapidity of growh and the large size to which it speedily attains, rapidly yielding timber, well suited for very many purpaces of utility. Side by side with some of these will also be found quantities of the Norway and other Maples, besides the well-known and Landsome-foliaged English Sycamore, and the noble-leaved Platans orientalis, some four feet high, and the hiret, so far as we hnow, which have yet bean grown it New Zealand. We also noticed some beautiful Birch trees, about seven feet in height, with
quantities of English Laburnom and L quantities of English Laburnom and Locust tiees of all ges and sizes. The latter not only makes a very becomes a lofty tree, when thinly planted, rapidly excessively hard and most cenduring character, and argely used in the States of America for the purpose of ip.building
Amongst Coniferous trees were considerable quantities of the Pinaster, and still more of the hardy
Pinus inaritima, which will yet clothe with lusuriant green the slopes and summits of our driest and ever shifting sand-hills, for which this highly ornamental tree seems to possess an eapecial preference. Thele were inudreds of Walnat trees, from 5 to 12 reet in height; these have all been rained from the weil. known French Walnuta grown and fruited so abundantly at Akaroa.
Of hedge plants large quantities of Thorns, Privets, Portugal White Brooms were grown, having their respective uses for the purposes of protection, ornament, or shelter. First amongst ornamental evergreens the handsome flowering plants we noticed quantities of of the still more beautiful variegated IOllies, budded or grafted apon the common Green form, and presenting the well-known varietios
of gold and silver-edged; the hejgehor and broadleaved Dahoon II lly, these bein. admired ormanemts of all well-kept ornamental (iras lawns. Also some hundreds of the noblest of all benatiful evergreens, the Rhododendron ponticum, and other similar varieties of this handsome flowering occupant of all Englishatherberios. In clowe proximity to these were many humdreds of fine large nlants of the common English Laumel, a fumiliar and well-
known evergreen, asierting its right to a place in all shrubberies and ornamental grounds by its lagge and baudsome shining green leaver; a quantity of fine plants of the Laurustinus, esteemed not moce for its handsome evergreen foliage than for its admired peculiarity of blooming profusely throughout the whole of the winter; and 20 me plants of the well-kuown Portugal Lamel, a!d the egually familiar Bry Laurel, or Sweet Bay, and near to thew plants of the Aucuba
japonics, or gold Japan tree. In aldition to these were the handsome climbing and delightfully fragrant Wistaria sinensis, the broad-leaved Photinia serrulata, the hudsome-dowering Weigela rosea, the still more ornamental snow-ball Guelder Liose, with plats of the oarly spring-fiowering scarlet Pyrus japonica, many hundreds of the Spirma corymbosa, the New South Wales May, besides other varieties of the Spiren recently introduced from England. Among climbing plants were Rhus Toxicodendron, or Poison Oak ; three
varieties of the Euglth Ivy; besides several sorta of climbing Roses. There were also handsome Chinese Arbor-vite, and the stiil more handsome Evergreen Cypress, besides the most beautiful of all Cypresses, the Cupressus Lambertiana, and handsome specimens of Pinus insignis, and of the equally ornamental and lofty Pinus excelsa. Amengst coniterous piants in pots were quantities of Pinasters, Scotel and Suruce Firs, Pinus maritima, Stone Pines, and many other of Pinus, Cedar, Cypress, Juniper, and other similar plants
and trees, precarzous to transplant unless eatablished and trees, precarrous to transplant unless established nost perfect certainty of growth. We further chserved plants of the American Osaze Orange, of the evergreen and deciduous fruit-bearing Barherry, of the Pumegranate, of the handeome Rase Acacia, of the sweotsmelling Buddlea globosa, of the Salisbaria adiantifolia or Maiden-hair tree, with quantities of Box trees, and Siberiari, Persian, and White Lilacs, hroad-leaved Anserican Thorns, besides a large number of budded plants of the double searlet, double white, and single carlet Thorns, the latter especially, from its great profusion of brilliant scarlet bloom, forming one of the most handsome flowering trees for a Grass lawa. and space, however, would fait
The garden fronting on Madras Street is aurrounded with a Sweet Briar fence, immediately within which a lofty row of Blue Gums and Poplars afford excellent helter. The border in front of thewo is planted all round with some 400 of the newest and best sorte of Pear and Plam trees. The Peare comprive over 40 varieties of the choicest new French varietion, many in tull bearing. The remainder of thie nureery ground in nostly filled with young grafted or budden fruit trees, with large quanticies of Dumson and Mussel Plums, with some thousamds of Lombardy and Black Italian Poplara, common Willows, Weeping Willows, and the
the Huntingdon Willow, mainly remarkable for rapidity of growth, the lightness and whiteness of its timber, and the numerous purposes of utility to which it can be applied. Prominently noticeable, however, amongst all the productions of this garden are some 25,000 English Ash trees, in remarkable health and vigour, and standing from 3 to 10 feet high. These we hope will
soon be distributed and planted over the country, to soon be distributed and planted over the country, to
afford in after years a supply of Ash timber, so indispensable in all the ordinary farming operations of every community, from ils extreme toughness and remarkable elasticity. So necessary is it, that we are obliged to import annually from England and Awerie nany hundreds of piunds worth of this timber, for
Passing over many other interesting plants in this garden, we proceed to the more recently formed This is bounded by a Gorse fence, and planted with a broad border of forest trees and evergreen shrubs; shelter in all cases being one of the first considerations in Mr. Wilson's gardening. The laud is fences, and each of these compartments is filled with forest trees, comprising Ash, Oak, Elm, Beecb, Lime, Acacia, Maple and Sycamore, besides many thousand seedling Pines. We were also glad to notice about a thousand young trees of two years growth of the Ailantus glandulosa, or silk-worm tree, so much used нs a handsome arenue tree on the sides of the streets of towns in America, and which, we doubt not, will also be largely used in Canterbury, when its merits as a hardy ornamental tree are better known. Near these, a larg quantity of the Gleditschia triacanthes, or three spined Acacia, were growing luxuriantly. This is a
bardy tree, with a handsome small green foliage, which secures for it a posstion on planted lawns as an orna mental tree. Portions of this ground are also devoted to the growth of vegetable seeds, and especially to the growth of Therns for hedges; upon \(1 \frac{1}{d}\) acre of ground 175 busleels of Haws had been sown last spring.

\section*{Eacietits.}

Edinburger International Horticultural SHow.-As the leading features of this, in all respects, great display of Fruit, Plantr, and Vegetables, are given in another column, we will at once turn our attention here to details. The principal prize of the day, testithe collection of fruits in 20 sorts. Three dukes and a "commoner" were represented in this contest-
Buccleuch, Portland, and Roxburgh, geainst Nisbet Hamilton, Esq., of Archerfield; but the contest virtually lay between the first and last of these, Mr. Thomson, of Dalseith, being placed 1st, and his brother 24. The Dulkeith collection contained three first-rate Pines, including two Smooth Cayennes and a Queen, the latter weighing \(6 \frac{1}{2} 1 \mathrm{~b}\)., a most magnificent fiuit, in extra fine condition; Mascat Hamburgb,
Raisin de Calabre, and Lady Downes', Grapes; Crawford and Bellegarde Peaches, Elruge Nectarines, Moorpar Apricots, Victoria and Jefferson Plums ; Trentham Apples; Jargonelle Pears; Morello Cherries, and Red and White Currants. Mr. Thomson, Arcleerfield, had three Smonth Cayenne Pines; Muscat, Raisin de Calabre, Hamburgh, and Lady Downee' Grapes; Barrington, Bellegarde, an 4 Noblesse Peaches; excellent Moorpark Apricots: Victoria and Kirke's Seedling Plums; white
Marseilles Fig; two Cocoa-nut Melons and Munro's Hybrid; Jargonelle Pears; Morello Cherries; two sorts of Currants; and two soris of Gooseberries in dishes separate from the box case which the principal fruit was shown in, and which in this case and that of \(\mathrm{Mr}_{\mathrm{o}}\) Wm. Thomson looked so remarkably elegant. Mr. Tillery and Mr. Rose had also good aseortments.
For 16 sorts exclusive of
For 16 sorts exclusive of Pines, Mr. Melville and Mr. Mark, was 1st with a very fair assortment an, Tulliallan, was 2 d with a lot Bo award. Messrs. Cook, Holeyn Hall, Newcastle; Lees, Tynninghame; and some others, also had good collections.
For the best six varieties of choice home-grown fruit consisting nif two Pines, two Melone, four bunches of Grapes, 12 Peaches, 12 Nectarines, and 12 any other fruit, the prize offered by the Gardeners' Chronicle, there was singularly only one competitor, Mr. D. Thomson, but his collection was superb, and well merited the 102. award. The Barrington Peaches Moorpark Apricots, and Muscat Grapes were particn larly fine.
Among the most interesting exhibitions in the rooms, however, were the collections of "eight varie ties of Grapes, two bunches of each." Here the North and the South were pitted one against the other in admirable rivalry, Mr. Fowler of Castle Kenuedy winning honours tolerably easily against the redonbtable champion Grape grower, Mr. Meredith, of Garston. Mr Fowler's sorts were Muscat of Alexandria, shown in splendid condition; very well finished Trebbiano and Syrian, weighing respectively \(12 \mathrm{lbs} .9 \frac{1}{2} 0 \mathrm{zz}\), and 9 lbs,
6 f oz. ; very good Flack Gibraltar; excellent Muscat Hamburgh, Lady Downes', Black Prince, and Black Barbarossa, all fine examples of cnitivation, and worthy of unqualified praise. Mr. Meredith had Chaptal, a
finely finished; Muscat of Alexandria, Black Prince, Child of Hile; good Muscat Hamburgh, and Black Alicante. Messrs. Lane \& Sons, Great Berkhampstead, and Rose, Floors Castle, also had collections. For the best four sorts Mr. Thomson, Dalkeith, was 1st, with Lady Downes', Muscat of Alexandria, Tokay, and Blac Hamburgh; the other lots in this section not veing quite so praiseworthy.
For the best couple of Black Hamburgh burches Mr. Meredith had, as he always has, wonderfully finished samples, distancing his opponents considerably; Mr Richards, Grimston Park, Tadeaster, and Mr. Fowler
Castle Kennedy, were 211 and 3d. For Musats, Mr Fowler had splendidly finished bunches, and so had Mr. Thomson, Archerfield, who was placed 2d. Mr Anderson, Torwoodlee, Galashiels, had very fai amples of both Hamburghs and Muscats. For early Frontignan there was scarcely any competition, Mr
Meredith having ly far the best. For Muscat Hamburg Ir. Fowler was unnis!akeably first, with excellent bunches, but not quite equal in point of size of berr and finish to his exhibitions of former years. Messre. Lame \& Son, and Johmston, Terregles, were \(2 d\) and 3 d Vor Tokay the exhibition was a poor one. Mr. Mathesn being placed 1st, and Mr. Phipps, Ingestre Hall Stafford, 2d. For single exanples of Hamburgh and Muscat Messrs. Meredith and Richards maintained their position in the one instance, and Messrs. Fowle and David Thomson in the other. For Black Alicante wherein there was a spirited competition, Mr. Green hields, Culzean Castle, Mr. Melville, New Galloway and Mr. Meiklejolm, Dilkeith, were placed in the orde in which they are named, all showing excellent produce For the heaviest bunch of black Mr. Greenshield had Barbarossa, 10 lb .15 oz . Mr. Meredith hat a very
fine sample of Hamburgh in this class, well finished, weighing 4 lb .12 oz . For the henviest bunch of white Mr. Fowler had White Nice, 11 lb ., and Mr. Meredith Child of Hale, 81 b .10 zon , both wonderful bunches. or the fiuest flavoured White Grane Mr. Thomsom, Dalkeith, and Mr. Anderson, Torwoodlee, had equal 1st with Duchess of Buccleuch and Muscat of Alexandria,
the former a long slender bunch with small berries, but, exquisitely flavoured. There were 14 entries for this prize. For the finest flavoured black sort there were 11 entries, Mr. Fowler being 1st, with Muscat Hamburgh; and Mr. Tillery 2d, with Black Frontignan For the finest bloom on a Black Grape there was a apirited competition, and singularly enough an amaten tyro in Grape growing, Mr. Meiklejohn, Dalkeith Was 1st, with Black Alicante, and Mr. Willohere Caver Carr 2d, for Hamburgh.
A black and also a white seedling came from Mr Melville, Dalmeny ; the former was said to be a cross between the Champion Hamburgh and Grizzly Frontignan, with large berries, a little after the character of the Grizzly; and the white was a cross between the Canon Hull Muscat and the Syrian, but not ripe enough to be in a condition to adjudicate upon. The Royal Vineyard was also shown by Mr. Williams, of London, but it was not sufficiently ripe.
Of Pines there was not a large exhibition, neither was there anything very meritorious among the samples shown, the best coming from Mesers. David Thomson. Peacock, of Castle Dykes, Fowler, of Hare wood, and John Gavin Donibristle-the latter showing Providence, of rather squatty monstrous form, having apparently three crowns.
Peaches were very creditably shown, especially such sorts as Barrington, Walburton Admirable, Violette Hâtive, and
Avards.-1, Mr. Peacock, Castle Dykes; 2, Mr. Wemyss
Nectarines were not quite so well shown as Peaches the Elruge, Violette Hầ'ive, and Violette Grusse being the most prominent.
Avards.-1, Mr. Oswald, Marthly; 2, Mr. Pencock, Castle
Dykes; 3, Mr. T. Millar, Cally Gardens; 4, Mr. Temple, Drkes; 3 ,
Balbiruie.
Apricots were chiefly Moorpark, with some samples of Turkey and Breda.
Avards.-1, Mr. Walter Allan, Ratho; 2, Mr. Cooke,
Gloag Drylaw House
Plums were very well represented, especially Kirke's Seedling, Jefferson, Coe's Imperial, and some good Greengages, Victoria, Washington, anii Magnum Bonum,

\section*{Awards. -1 , Mr, Melville, Dalmeny}

For collections of twelve sorts of Pears, ripe or unripe, Pare were seven competitors-Mr. Scrymgeour, Holme Parls, Reading, having by far the finest coloured samples, including Beurré Rance, Gansel's Bergamot, Vicar of Winkfield, King Edward's, Van Mons Leon le Clerc, Beurré Bosc, Marie Louise, Beurré Diel, Duchesse d'Angoulême, Flemish Beauty, Willians's Bon Chrétien, and Louise Bonne of Jersey.
For collections of 12 Dessert Apples, three of each, ripe or unripe, Mr. Scrymgeour had the following in Golden Nonparoil Blenleim Orange, Ribston Pippin, Golden Nonpareil, Golden Russet, King of Pippins, Fearn's Pippin, Nonpareil Russet, Court of Wick, Margil, Golden Lustre, London Pippin, and one unnamed. Mr. Cramb, Tortworth Court, had also capital samples, the best of which were Orange and Ribston Pippins, Summer Pearmain and Golden Russet.
a very spirited competition, Mr. Cramb being a rety Mère de Nonage, Waltham Abbey Seedling, Alexander Brabant Belletleur, Dumelow's Seedliug Gil, Alfristem,
 collection. There were 15 competitors
Messrs. Carstairs \& Sons and Mr. William Brona competed for the Fruiterers' prize, each havine a nificent assortment of both home-grown and fore ruits of almost every kind, which occapied a large portion of the Society's tables, and in whid
much interest was excited. The two firms we much interest was excited. The two firms were plomet qual 1st.
Messrs. Lane \& Son showed a very excellenthy managed plant of a Vine in pot, which, considering the distance travelled, was in all but faoltles a dition. The sort was Black Alicante,
Mr. Meredith showed a very excellent collection both Hamburghs and Muscats, the former includia Richmond Villa, Champion, Old Black, Pupe's, Dutco Mill Hill, Victorin, and Wilmot's, all extra fine finithe
but the old variety and the Mill Hill were decidedly but the old variety and the Mill Hill were decidedily
best. In Muscats there were the old Escholata, Trovéren, Hâtive de Saunur, Tokay, Bowood, Ciot and Canon Hall ; the latter and the Escholata havin the largest berries, and the Hâtive de Sanmur smallest

The only foreign collection, as before noticed, micmer that from Mr. Henry Knight, Château de Portchen train, which included 13 sorts of Pears: Bearré Dind Louise Bonne of Jersey, Duchesse d'Angoulème, and Foudante de Bris being the most proninent. I Grapes, which had suffered considerably in transit, were Muscat of Alexandria, Tynninghane Musaat, Burch ardt's Black Prince, Black Monukka (a curious oblong smallish berry), and Chasselas Rose. Apples consisted of Reinette du Canada, Api Gros, Api Rose and Ay Noir (a violet-skinnell sort), and some others.

There were from 12 to 14 entries in both Scarlet and Green-fleslied Melons, Mr. Thos. Shannon being Turnsit the Teurele hybit Weir Shegles hybride. In Green-tleshed, Mr. Tho Weir, Slateford, was the most succ
beautiful sample of Veitch's Perfection.
The plants in pots, cut blooms, and vegetables were arranged in the Music Hall proper, the spacious orchestr being filled with Coniferous plants, the dull green of which was enlivened by spikes of Gladioli and foliage plants, contributed by Messrs. Lavson \& Son and Jas. Dickson \& Sons, Edinburgh. Conspicuous among the flowering plants were the 12 specimens sent by Mr. Leed Tynninghame, which included one of the best-bloome plants of Renanthera coccinea seen for some lime, wit several long spikes of highly interesting flowers; capital Phalmonopsis grandiflora; several excelpan specimens of Statice, including Holfordii Rattryans; several Heaths in fine health and foll d bloom, including Marnockiana, Austiniana, and variety of Aitoni Turnbulli; with a very large plan of Oncidium luridum guttatum, magnificently flowered The 2 d prize went to Mr. Black, Dalhousie Cash whose plants were much inferior to the premalkeith Heaths were only shown by Mr. .ing one of the bea plants of Ausinion in the country, an
coloured Marmockion and Retorta majo
For eight plants with fine foliage, Mr. Mitherl Hamilton Palace, tonk 1st prize with noble specimens the Alocusia zebrina, Croton variegatum, the fues high, and clothed with magnificent pitchers gated Pine, a good Cordylime indivisa, and a hand If Dasplirion clancum. Mr. Thomson, Daikeith, ad Leen, Tynninghame, were equal 2d ; the former he hitte most noble Pandanus elegantissimus, and having one or two splendid Anæctochilus, growing
shallow pans with Club Mosses banging over the off shallow pans with Club Mosses banging
a pretty mode of growing these plants.
For eight Ferns, Mr. Mitchell was 1st, with tw noble plants of Cibotium princeps and schiedel, Bird's-nest Fern, several Adiantume, do.; Henderson, Millbank, and Mr. Lees extra fine plants of dwarfer stature, which Mr. Lees has space to enumerate.
also good Tree Ferns.
Fuchsias were pretty well represented, the older not such as Souvenir de Chiswick, Rose of Cabliment Wiltshire Lass being among the best; while perfectio Zonal Pelargoniums there was am interesting eshiotitum including the rose and white Rose Rendatio white Madame Vaucher, the orange-scarlet Pan Lathern the salmon and white François Desbois, and Jiddrie H the best coming from Mr. James Gorienderson, Mill woul The variegated sorts were Sunset, Flower of Spring, pot plant; Cloth of Gold, and Queen of Queen Engladioli were beautiful, and came England, and Ireland; Messrs. Downiea Co., latter were far the most elegantly set up, and painted stand, the spikes tied to horizontal were Hebe, Madame Souchet, Lord Raglan flower, Prince of Wales, Maria, Impér Linné extra fine, Penelope, Raphael

Princess Frederick William, Diana, Charles
Madame Vilmorin, Roi Leopold, Madame Chateaubriand, Duc de Malakoff, Bertram, Dickens, Reine Victoria a splendid white with le blotch, Mazeppa, Comste de Morny still an ifctave flower, Rebecca, and Edulia. There were some 16 lots stage awarded by the judges.
Dallias were magnificent, but the struggle lay between Ncisrs. Downie \& Co. and Mr. Harrison of Darlington. The former were successful; their blooms, although not The foll wing were Messrs. Downie \& Co.'s :-Criterion, Anne Kevnes, Harry, Alexandra, Baron Taunton, Willic Lord Derby, Leab, Excelsior, Leopard, Delicat, Ne Plus Ciltra, Miss Robarts, Inperial, Garibaldi, Charlotte Dorling, Golden Gem, Scarlet Gem, Mr. Harrison's Criterion, Lord Derby, Lady Gladys Herbert a very beautitul crimson. tipped flower, Golden Drop, Lady Lilian Powlett, Hero, Earl of In the gardeners' list Mr. John Thomson, Preston Towera mas lot, with extra fine blooms, especially his Delicata, Miss Henshaw, Bellona, Duchess of Northumberland, Norfolk Hern, Bub Rıdley, Goldfinder, Favourite, Stella Colas, and Clarlotte Dorling. The best Fancies also Cime froun Messrs. Downie \& Co., viz., Prospero, Queen Yrs. Reid, Startler (Keynes'), Startler (Perry's, Pauline, Reliance and Gem.

\section*{Homers the best coming frod, both as spikes and as cut} Mr. Tuouson, Preston Tower. The following are and names of the best in the exhibition:- The Queen,
Glory, Mr. Chater, Beauty of Mitford, Counter Craven, Lord Longhborough, Masterpiece, Lord
Rokeby, Mr. F. M'Kenzie, Lord Clitden, Mus, Roleby, Mr. F. M‘Kenzie, Lord Clitden, Mrs. Adair,
David Duig, Mrs. Cheap, Sta: stead Rival, George Keith, John Cowan, Farl of Breadalbane, Mrs. Sharpe, and Orange Pertection.
Rases were shown in tolerable numbers, but they were very deficient both in size and texture, Several misceilaneous articles were exhibited, the most promiby Mr. porp Curea, with a score of spikes full of bloom, by Mr. John Currie, Salisbury Green. One of the most nished by Mr. Lees, of Tyants in the country was furPortei, a magnificent plant with from five to seven spikes with abuut nearly 20 inches long expanded producing flower mod to Mr. Lees by Mr. Williams before flowering it for Phalenopsis amabilis, and it now turns out to be this at Broomfield. The remaining subjects mossessed lers iterest.
The Vegetable department was represented by sam. ples of excellent produce in the several classes, but The dinner, which took place at Slavark.
tretring, was served admirably, and was attended by a rery large gathering of horticulturists from the three piget the chair ; and Mr. J. Cibanpbell Swinton, occuThomson, acted J. Campbell Swinton, and loyal toasts, together with the health
ord Provit and Lord-Lieutenant, Chairman proposed the hast
"The Horticultural
Society of The best commendation of the Society, day been concluded. That Show, he which had that fiend sitting beside him, Mr. William Paul, who had rarts of thowledge of Shows in England, and in all of froit and its general excellence, to anything he bad ever seen in any other country in the world. The result What he believed the prize list would beasure of saying teen exhibited were remable specimens of fruit which bad did not say this in the least invidiously, but at the same tever seen morlaim this for Scotland, that he had and of Grapes eapecially, than he had seen at this temarks in kindness and good humour, because if these aght to have sent them, and better fruit to show, they bunour they had oblo competitors were entitled to the \({ }^{n}\) counection with the toast he carrying of the first prizes. With was sume talk of an amalgamation of the Society altural Suciety of Scotland, namely, the Royal Hortihe believed would be for glad to see the union, which or an mamalyanam replying. expressed limself in favour ruceress which justly taken credit to Scotland for the pelitione, but he beggerd at the had gained in the come
 sardeners he hader him who had turued out the best
he had ever known; and there were English
gardeners present who were not second to any Scotch "Health he knew. He concluded by proposing the name of expressed the great pleasure he had had in making this his first visit to Edinburgh
Mr. Campbell Swinton proposed "The Judgee," coupling with the toast the names of Mr. Moore, London, who had acted as one of the leading judges in the fruit department, and Mr. William Paul, who hat acted in a similar capacity in the floral department of the show. Mr. Moore briefly acknowledged the toast Mr. Paul did not hesitate to say that he had never seen equalled the exbibition which he had that day wit nessed. It was remarkable not only for the presence of good specimens of horticulture, but for the entir leading prizes had been taken by Scotch that the because he believed that that circumstunce would on the one hand, have a good influence in Seot lard by giving confidence to Scotch cultivators who might hitherto, in their diffidence, have considered that they were not equal to English cultivatorsalthough he had never thought so; while, on the other hand, it would be an additional spur to English cultivators, and, therefore, be believed the caus. of horticulture would profit. He complimented the Horticultural Society on the successful manner in which they had got up the exhibition, in which they had shown that they were not only first-rate horticulturists, but that they were also good men of business, and not unskilful diplo matists. Referring to the great progress which had been made in horticultural science during the last 20 years he ssid that, wonderful as had been the progress whicl had been made in the past, a still more glorious future was open to horticulturists. Perhans much improvenent might not be made in the cultiration of the plants and flowers, which they had aiready brought gir near per fection, but much might be done in the improvenent of races by hybridisation and crnss-breeding, and he earnestly appealed to practical gardeners to study this branch of horticultural science. He expressed his regret that there was so little sympatly existing
between scientific and practical horticulturists, and arged that more attention should be paid in the train gh of gardeners to their scientific instruction.
Mr. Thomson proposed "The Horticultural Press," coupled with the name of Mr. Hibberd.
Professor M'Lagan proposed the Exhibitors, for which Mr. Meredith replied, expressing a hope that good many of those Scotch gardeners, who hid conspeted so successfully on this occasion, would visit the Greater also briefly replied.

Royal Hortioultural: Sept. 5 (Floral Committee),
-To Messrs. Downie, Laird \& Laing was awarded a Special Certificate on this occasion for the fine collection Solanums and other plauts which was shown by
hem the other day at the Crystal Palace. From them the other day at the Crystal Palace. From
Mr. Coombs, Hackney Road, came two tricolorleaved Pelargoniums in the way of but inferior to Mrs. Pollocts; Dablia Mrs. Lund, shown again by Mr. Burgess, was found to well maintain the good character it had received when it was first exhibited. Dahlia Fanny Sturt, red tipped with creamy white, Dahlias Master of Arts, bronzy purple, and Blushing Dablias Master of Arts, bronzy purple, and Blushing
Fifteen, large rosy lilac, both from Mr. Turner, had had also Dahlia Conmander, bronzy farvn, from . Bragg. Mr. Keynes received a First-class formed flower of a blush conn, a medium-sized finely carmine. Mr. Eckford, of Highworth, contributed Dablia Lady Mary Wilde, white, tipped with purplishrose, for which a Second-class Certificate was awnrded. The same exhibitor also received a First-class Certificate for Verbena John Keynes, brilliant orange-scarlet, with a conspicuous white eye, and a Second-class Certificate for Mr. Gladstone, dark scarlet, with large white eye. Mr. Bull was awarded a First-class Certificate for a cheerful-looking Fuchsia with oberry coloured sepals and a double white corolla. Mr. Perry had Verbena Champion, a dark maroon-coloured sort, for which a First-class Certificate was awarded. The pale-blossomed
Stanhopea granditlora was shown by Messrs. Lee, and Mr. Veitch received a Special Certificate for the charming Cattleya exoniensis. Mr. Wailly c intribnted blooms of Tropæolums, Mr. Leach two Japanese Lilies, and Mr Willsun Hydrangea with leaves bordered with white. From Mr. Macintosh came a neat floweriug dwarf Antirrhinun called Tom Thumb, a specimen plant of Plumbago capensis, grown in the form of a bush, without any
support froin sticks, and blooms of China Asters, a besutiful collection of which is now in full flower in his nursery at Hammersmith.
Sept. 5 (Fruit Commi̇tee).-Mr. Macintosh, Mr. Clarke, and Messrs. Lee all exbibited Peaches from standards, ripe and good, a circuinstance doubtless owing to the warn dry summer which we have experienced.
From Mr. Clarke came a large Seedling Peach, from a atandard, concerniug which it was stated that it might be worth trial against a wall. Fro:n Mr. Wills came Pine-apple Melon, and good Watharton Adinirable Peaches were shown by Mr. Whiting, of Buttersea Rise. From the Gardea of the Society came a fine collection of Figs and four or five varieties of Con-
tinental Grapes, two black sorts among which were about as good in flavour as the Black Hamburgh. A portion of a Pine-apple was exhibited showing a fungoid affection of the pips, the central portion being apparently sound.

Wilis Horticultubal-By the hind permission of held Right Hon. Lady Herbert, of Lea, this Society Park Prik, on the 24 th ule. Rain fell in torrents the day before, but the weather was fortunately fine on the dyy of the Show, at which there was a large attendance of visitors.
The Show was held, as all Shows should be, under canvas in four large marquees. The tent containng the gentlemen's gardeners' pruductious we shall call No. 1. Mr. Cross, gr. to Lady Asbburton, bad the bonour of getting the 1st prize, a Siver Cup, value \(5 l\). 5 s, for a hater collection of Stove and Greenhouse Plants than is generally exhibited at a country Snow. Hu had several govi Ferns, among which we noticed Cibotium princeps, one of the most graceful and elegant of the tribo; Dicksonia squarrosas. Dicksonia antaretica, and a good Dicksulias squarrosa. There were likewise une or two good Palns, together with fine specimens of Maranta rasciata, Alochsia macrorhizs, \&c. The 24 prize, another cup, value \(3 l .3 s\), was taken by Vr. Challia, who sent a remarkably fine Eucharis amazonica, with ovely white sweet-scented flowers; also Lappageria oosea, trained on a flat trellis profusely covered with In the Amateurs' \({ }^{\prime}\) Claseimen of Sphæerogyne latifulia. In the Amateurg' Class, the Hon. and LRev. H. Bligh received a silver Cup, value 3l. 3s. fur a group of 8 Stove aud Greenhouse Plants. The other exhibitors in this class had some well-flowered specimenv, giving evidence of good cultivation. The side tibles or this tent were devoted to cut flowers. Mr. Kernes most Damlins, taking the Cap and the lat prize in pach of Warmines in which he exhibited. Mr. Wheeler, of Warminster, made a strong effurt in the open classes. but ouly succeeded in obtaning a 2 d place. The heavy rains of the previous day had somewhat marred the fuli beauty of the Roses, still some very good stands were shown. Mr. Keynes, coming in bere agan, took the Silver Cup offered for the best 24 t russes. The names of the sorts of which it consisted were C'harles Lefebvre, Devoniensia, Myurice Bernardin, Comesse Overofl, Madame C'has, Woud, Triomphe de Rennee, Auna de Diesbuch Baronue Adolphe de Rotbschild, Celine Forestier, Madame Victor Verdier, Suuvenir de la Mulmison, Vamqueur de Goliath, Cloth of Goh, Malame Vaiembuurg, Madume Sertot, Jules Margottiv, M-dame Callat, Maréchal Vaillant, Madame Boll, Sceur des Anges, Baronue Pelletan de Kinkelin, Gloure de Bordeaux, Senateur Vaisse, and Gloire de Dijon. The other exhubitors in this class were Mr. Wheeler, of Warminster (who took the 2d prize), and Mr. Tiley, of Bath.
Passing to tent No. 2 we found a splendid display of Fruit. The chiet attraction here was the contest for the silver cups offered to gentlemen's gardeners for the best eight dishes of various fruts; there were eight com. petitors, Mr. Penfoid, gr. to Viscount Fulkestone, being lst; he had two splendid bunches of Muscat Grapes,
the berries in which were remarkably fine. Mr. Pray. the berries in which were remarkably fine. Mr. Pray
nell, gr. to - Digby, Esq., of Skerborne Castle, occupied the 2d place with a good collection. \({ }^{\circ} \mathrm{Mr}\). Chard, gr. to
Sir F. H. Bathurst, and Mr. Ctrallis also showed Mr chons. A silver cup, value 3l. 3s., was given to fruit. In this ten which was a crowd the whole day; to each buuquet was appended some appropriate motto. For Cut R-ses in the gardeners' classes Mr. Cbard took the Ist prize with some superb blooms.
The third tent contained Miscellaneous suhjects, such as Ferns, Litiums, varieguted plants, Fuchsus, Pelargoniums, baskets of cut flowers, \&: To Mr. Mould Devizes, was awarded a Silver Cup for Fuchsias, Mr. Wheeler being 2 d .

Into the fourth tent amateurs' and cottagers' produc tions only were admitted; this portion of a country
flower show, always so interesting, was exceedingly good here, the vegetables being very fine. Two military bands were in attendance.

Worthing Hobticclfural.-Considerabie interest was excited at Worthng on the 6 th of Septenber by the Flower Show, which, for a first attempt in this direction, proved a great success. It was expected that any great novelty should characterise the show, but there few of which it may not be unintaresting to some of our readers to call attention.
The first thing which struck us on entering one of the two marquees was a very creditable collection of fine-foliaged plants, amongst which there was a specimen of the variegated furm of Cyperus alternifolius, Which would have commanded attention anywhere I'hie, like a very good collection of Ferns, amonght which Niphobolus chiuensis and Elaph glossum callæ-
foliun, were very striking, were sent by Mr. C. Young of fiolian, were very striking, were sent by Mr. C. Young, of
Leigh Park, near Havaut, and deservedly obtained the lat prize.
Awongst specimen plants was a beautiful exumple of Rondeletia from Mr. Eduey, gr. to Mrs. Fitzpatrick,
its elegance, though not so striking as many of its neighburs.

The Orchids were many of them excellent specimens, but one or two unfortunately were in such an unhealthy condition that they rather detracted from the general effeet. Amongst a collection sent, by Mr. Wilsorn. gr. to W. Marhall, F.q., we noticed especitlly a nice sample of Cypripediun concolnr, and a gnod specimen of
what was once consilered a grent rarity, and which now always commands attention, Epidend run vitellinum.

A smaller collection, from Mr. Cameron, of GondA small, had excellent specimens of Vauda sutvis, Cuttleya crispu, and Oncidium Lanceanum, while in that from
Mr. Fung, which obtained the 2d prize, there were Mr. Yung, which obtained the 2d prize, there were
nice examples of Saccolabium Blumei, var. Dayanum, and Aerides suavissim:m.
Next to the Orchits was a very sterling group of specimen p!ants from Goodwnod; amongst which the pirk curd white Madagasear Periwinkle, though almost and conspiruous, while Begonia semperflorens was distinguishable lor elegance and adinirable growth
The collection of Vgetables was very small, but not quite withont interest. The Onions and Tomatos were both worthy of praise, and there was rmong the Gourds a specimen under the name of Cittle Melon, by M. Vilmor:.n uader the name of Mielonríe, and agreeing with the Ohio and Valparaiso Guurds in having buff shining sueds. These were sent by Mr. Brice, who exhibited several other matters of interest and amongst them a plant of Cotton in fluwer and fruit, Which was, however, too much drawn up to do it Apples, but these were quite thrown into the shade by Mr. Gadd's Cryatal Pulace collection (a truly magnificent one), which were not, however, exlibited for
The Muscat of Alezandria Grapes and the Black Hamburgh, which obtained the 1st prize for Mr.
Bristow, gr. to E. Orme, Esq., of Brnadwater, deserve especial notice; and, abuve all, a branch loaded with lovely Praches, which was said to give but a faint idea of the splendour of the tree which bore it. On the whule we were extremely gratified, and the general impression seemed to be one of great satisfaction,

\section*{Notices of 3300\%\%.}

The illustrations pablished daring the present year in La Belgique Hortioole, in addition to Renantiera Lowii, a duble plate; Aphelandra ornata, and Delphinium Brunonianum, whicl have already appeared in Euglish works, are- Billbergia pallesoens, a Bromeliad intronluced from Braz.l by M. De Jonghe, and pule green flowers just tipped with blue. It will take but seoundary rank ip point of ornament. - Thyrscoanthus rutilans, now well known in gardens,-Dianthus
cincinnatus, a very large and deeply-fringed furn of Indiun l'iuk, of very large and deeply-fringed forta of calyculutum, a very distinct and croamuntai Bromeliad, introduced from Brazil by M. Linden. It produces a \(t_{\text {nle }}\) of crect green leaves which are remarkably obtuse with a distinct acumitate point, and has erect scapes bearing each a roundish head of bright yellow flowers, an Apple called Des deux Jumelles, a very bandsomelooking fruit, yellow aud deep red, and said to be of exquisite flavnur; it ripens att the end of December, anud las's till F bruary.
In L'Horticulteur Frangais the illustrations areBouvardia leucanthx splendida, a fine orange-scarlet hybrid.-Delphinium Triomphe de Pontoise, a semidouble berbaceous Larkspur with a dense spike of flowers, of which the outer sepals are bright blue, the inner ones clear piuk, so that the flowers appear to be formed of a rosy star set in blue.-Lithospermum frutiposum.-Poire Princs Impérial do Prance, a hand-some-louking turbinate fruit obtained by M. GiégoireNéris, ripening in December and January, and said to be of guod flyvour.- Pelargonium Fndivelieri-anum-Knor ltoniarigida.-Iresine Herbstii.-Libonia -Sunt Marie de Varinties of Gloxinia: Amélve Newmann, and Marie de Lapngerie, in winch a whon! of wedgeshaped petaluid rettred bowies colus between the calex and the proper corolla tube.- Salvia dissimilis, a very Frepohhmuing searlet Sage.-Gurrua elliptica.-Cereus and sit 1 ny-buts ti wers.-Ungnadia speciosiz, an ornameatal Texan tree, very nealy related to etseuluz.

Florists' Flowers in Ibeland.-The correspondent who furnshed you with particulars respecting the show of the Royal Horticultural Society of Ireland held at Salthill on the 24th ult. states, in reference to Gladioli, that Messrs. Dickson of Newtownards are the most successful growers of florists \({ }^{\text {g }}\) fowers
in Ireland." I beg leave to take exception to this atatement, and to convince the writer that be is in ermor. I have to state that we have this year won 26 prizes for floristas flowers from the Royal Horticultural Society alone, while Messrs. Dickson have won only five, If addutional proof be wanting, it will be found in the fant that we have for years past been awarded the medal offered by the Society to the winner of the greatest number of lst prizus in flor ists' flowers.
The writer in question also takes exception to the encouragement given to florists' flowers in Ireland, compared with that bestowed on large groups of stove and greenhouse plants. Now, if he bad inquired farther into this aul.ject, he would have foumd that the classes of plants just named get the lion's share of the prizes in the gitt of the society (see the schedule fur he had previnusly stated, that these prizes, taken exception to by him, were subscriben for and offered by the seedsmen and amatturs for Gladioli, and that the only large prize offered by the Society fur florists' f.,wers was the Cup won by us for 36 Dablias. He conde also have found, if he looked abont him, that
prizes offered hy the Society for florists flowers, particuprizes offered hy the society for florists classes of Roses, Dahlias, Gladidi, Hollyhocke, and Asters, are totally indelequate to reward the numbers who grow and exhibit in these classes. A. Campbell, Churchill Nurseries, Glasnevin, Dublin, Sept. 6.

\section*{Ube Sutary.}

The following hints relative to the Removal op Supers may be of use to some who have not yet deprived their kees of their surplus honey. There are
many donbtless who lave experienced the stme difficulty in this operation as I have often done. To obtain a super quite clear of bees used with me to be a matter of very great difficulty, and to involve the spending of several hours in effecting it. It need unt be so tedious thesired in the course of a quarter or half an hour.
Whether the super enhsist of glass, wond. or straw,
ently draw a fue wire bet wreen it and the addpter or top of the stok hive. Without, undue jarrins, remove the super to a partimlly darkened 100 m or arbour, iuvert it on a table, and place an empty straw hive over it, It is not necpssary to wrap any coth round the two
hives, or to do anything to ensure the entire imprisonment of the bees. If the super be a glass one, rap slowly but with some force on the table all round it,
place the super on a board for the same parpose. In a fow mhute, usually, a loud humming noise will be heart, and the bees will bave commenced ascending into the straw receptacle. I find tind they ascen more rapidly when a strasy hive which has contamed some combs at some time or outher is used for this
purpose. So sonn as the bees have fairly commenced streaming up into the upper live, it may be tilted up and the ascent be watched. A few gentle puffs of smoke blown among any lingerers will hasten their
dislodginent, but this is by no weans raco
ary. When the majority have goue ur, whe ary. When the majority have goue un, whe
off the upper hive very cautiously, and bn out the bees in close proximity fo and koxk atock. This may be done in vari us ways. Apres may be spread in front of the hiive a-ac gh is 4 hightilig boart, and the bees bem, kn:ocintd on a quickly find their way into the eatramer. On iheng
be dislodged on the top of the adapter, from whint be dislodyed on the top of the adapter, from whinit:
vill gradually desiend into the sroek. As it is niy \(m\), never to lvave an atapter on a thive durio g the astally, immediately atter having eleared the super ts bees, proceed tor remove the alapter; putting on \({ }^{\circ}\) permanent winter cover or top-board, the bers 2 nocked out sudfenly on the surrace of the bare, ald speedily disappear among the combs. After a : ninutes the proper top-board why be gently parind aver the upper surface of the hive, taking care the crad 10 bees.
Any bees that may have heen l.ft beind in she super are whesty succeed in reaching their old home.
If the super be constructed of woud or straw, th rapping may be performed on it insteal of the bondi table. It should not be very violent; a stad succession of blows, which at the samp tuma cios: strokes.
The great advantage of this plan is, that the oppritor need not leave his super for a mmute, untili it is pert fectly free of bees, and it may thell be carried off to place of safety within doors; whereas, with the 0 system, from the enormous time it consururd, it wo frequently necessary to leave the super for hurr, ad with very ereat danger from the attacks of robber bee The fuller a super is of combs, and the graice the population which may happen to be within it at the time of its removal, the more easily, as a rule, पind the dislodgement of the bees be effected.
In all these operations the bee-kerper should be very effectually protected from the attacks o: the inturisted defenders of their hard-earned stores. Buing thps pres fectly secure, the necessary confidence is ensuren, without which any plan of operations may fail.
The more summarily the bees ure treated at tuse times the more speedily l find the affair to be acen a. plished. If not properly protected, the operator niay be driven off ill then manipulations, and that which shou, be rails hom instead. Apiator.
Bees and Fruit.-On Tuesdas lagt thousands of bes altacked my Apricots, making in a short spice of tius and havoc among them, and althangh the trees and fruit have been made secure with wadding and netring sime their first one to visit them tor suggestir first appearance here on tues lay. Nined is paus near the trees, and also along the This appears to have the desired effect, for althumbld the mans of treacle and dipper raps are smate: ing all day with large quantities The Peaches are not aservelected eating me it appears remarkable that beps sh uld hic wholesale fruit destroyers ; at least gucia a cir. Tre hase has never come under mober very fer in the imanc an beehives in the gardens, and very time I lived nib the Marquis of Camden at Widderness Park, we k-pl large cquantities of bees in the gardeth, yards of a Peach and Apricot wall, heverth never remember to have destroyed the truit
true that I have seen now and then a golit. on fruit, but I never before wilnessed such were feeding on one Apricut. Indeed the teee numbered the wasps that they drove them amal, should a solitary one be found by then on whe suid they set on it and threw it to the ghondents maver
be glad to hear if any of your correpmen similarly

and and varieties
onder one would hesitate to pronquace encomuman, however wreat in point of numbern, but
justifying the dignified position the unique, fully Chronicle accorded them lass someons. Mr. Warne is certainly fortunate in holding wuch a Btock, for although some individual kinds will find their equal in other establishmente, still no collection is so uumerons or so uniformly good. One of the most beautiful and distinet among them is called Marianæ, with white sepals and petals, and a very beautiful labellum of orange and crimson. Another, christenei kermesina marginata, has fine peach sepals anil pctals, with a gorgeously beautiful lip of carmine, having : distinet frilled edge of white. Rothechildiana and Lawrencians sre also excellent sorts. Interinixed
annong these were two unique plants of amiong these were two unique plants of Jeudrobium clavatum and chrysotoxum, each with mure. than 20 spikes in full flower. Associated with them, in dower, were capital examples of one of the loveliest of all Epidendrums, and one that should be in every Orchid collection-prismatocarpum; the charming rare, and striking Broughtonia lilacina, with fine
rosy-pink flowers and rosy-pink flowers and a pretty radiated eye, flowering profusely on a block of wood; the brown, yellow, and black Epidendrum alatum, with immense spikes; the curious beetle-like-formed Brassia cinnamomea; a splendid example of Bearded Lady's Slipper, with very large inflated labellum and last among the flowering plants, and prettiest o them all, Chysis levis. This is a much finer thing than is generally supposed, eclipsivg even the rare and beautiful Limminghii; ground colour of sepals and petals sienna, with yellow towards the hase; li broad, crimson and yellow suffused. Some fine specimens of Odontoglossum citrosmum and rospum were in flower, but none of them quite so high-coloured as the plate in Mr. Warner's "Solect Orchidacoous Plants," which is rather overdone. Of Leolia purpurata, elegans, and all the intermediate section, there are numerous specimens, all in very good order, some of them very large plants. of the famous Ladia superbiens, which was once the pride of the Horticultural Society, and from there transferred to Mr. Fairrie's collection in Liverpool, where the writer has seen growing, but not in mo exuberant health as it uow uanifimests at Broomfield, to which collection it has altimately come, we may state that it is flowering
freely, and is as dark.green in the pseudobulbs and freely, and is as dark.green in the pseudobulbs and
foliage as a Musselburgh Leek, and yet it is a plant that will cover 7 feet by 5 of space upou the table No signs of "wearing out" or retrogression, or degeue racy in this somewhat aged specimen,
Many plants were equally striking in the house referred to, and in a narrow one adjoining the little tropical aquarium, where Ferns, especially several of the Adigntums, were standing on raised pots of pedestals clear of the water, in excellent condition.
Among Oncidiums in the adjoining house were a Among Oncidiums in the adjoiuing house were a
capital unguiculatum, Wentworthianum, the beautiful Batemanui, and the more rare cheirophorum. Among Lælias, as betore remarked, are some extra fine batcles of elegans; not the least prominent 83 a variety is the chaste dark-lipped Schillerinva ; a good Lawrenciana in the way of cinnabarina-growth; a splendid autumnalis superba, and an equally fue anceps; as well as beautiful plant of Depdrobium macruphyllum
giganteum,
Tise Lycas
these and other temperate Orchids were growing contain some very good plants, but by no means so large as individual specimens, or in so excellent eondition as I had been led to anticipate. After seeing these and others grown under different circumstances, my opinion is only confirmed, that perpetual shade even in summer, when the Vines are growing and maturing, is in a cortain degree prejudicial to consolidation of bulb, so well manifested in the case of
oft-wooded plants under similar ausoices, which soft-wooded plants under similar auspices, which
become "drawn from insufficiency of lighto. There is a good collection of sorts of Lycaste, some of them which we have seen of extra fine cualitr. Pleiones
are largely grown, and in very good condition-lagenaria, maculata, and Wallichii forming the chief in naria, maculata, and Walkchii forming the chief in were cultivated in this house at one time, but they have now a house for themselves. They are much other rare and benutiful genera, but they cunstitute goodly group of sorts including grande, Invleavii. Warsecwiczii, neviun, Cervantesti. Ehrenhergii, condaThm, Karwinki, and tha oblonstulued arme vinaum. bunclies of fully average size, and apparently alto jether
free from the inroads of insect peats, which redounds much to the credit of Mr, Blake's management, for where plants and fruit are combined, more than ord. nary vigilance is requinite,
The last thing we notice is two detached narrap houses, which furin receptacles chiefly for sickly plaats, any extent is completely free from thrs constinutiona? derangement, and Mr. Wamer's, although genorally well manuged, forms no exception. Curioudly anouygh spanding out in bold reief are plants of Saccolabium the best ponsible condition, as it were retting nnot at defince, und yet in theivery centre of its influence. no yd yet ia the.very centro its infuence.
not nearly the mme amount of recent impor. tations in this collection that one bow a-day stumbles upon, the ereater portion havine been intro. duoed for some time, and bearing the character of established plants, many of them vers rare and very vaiuaible. A very simple moie of commerting this heating pipes in use here, is quite elf.ctive, and does nut neeessitate akilled labour. A thick Indiarabber hand is introduced at the ond ot each pipe, and \(j\) mamed into the fancet, whech must expand as the water gote heatod, to fll up any inequalitien in the matron, as the whole, at loat from mera casual inspection, seomed to be quite watep-tight. 1.

\section*{Miscellaneous.}

The Oriental Plano.-Amonget the tivilar treem most remarkuble for their size and heauty, I may mentinn the Orienlal Plane, the Platanme of Plinv, and
 every where in Italy, and indeed, in countrlee much len favoured by climate, wat, Pliny enya, fint brought across the Ionian Sea to the luland of Bhimmetirs. one of a small group lying off the coast of Apulia, of volonic origing, and so mearly in a line with the phlemas of Veonvius and Vultur on the Italan continent, that I should be tempted by its exintence mi iway b.tween the twn comentries to extend the line of yneous action existing in that gharter from Italy to Albania, and to supposo these islansitu bo a comuscinus link between the two. The Pisne Tree, Pliny esia, wat first planted at the tomb of 1homede, whin was hurlid there, when, aceording to the fablo, his companions were turned into sea-fowl, which atili frequent the shrine of the heno, and seem to discriminute between Greek welcome, but puroning the latter with loud and clamon ous cries. The Plune-rree was afterwards impunted from thence into Sicily, and had become in the time ol Pliny so naturalised on the contiment flut even the Morimi, nation of Belgic Gual, on the shores of the British Oeean, were taxed for the privilege of emining it shade. The sizut which these trees had attnined in the tinan of Pliny was remarkable. In lycia the civity in the interior of one of them formed a species of houre, 81 feet in width, and hard been filten up wifhome., in Which, it it added, the pro-consul of the havinue, Licinius Mueinur, entertainad 18 permins of hin remine
at a basquet. Dr. F. D. Clarke also deserabes a mavellous tree of the kind in the island of Cos; and another in the 8traits of Thermopylpe "f of unkown antiquity, welfo awn in its origin, and one of many that may have four ished upon the spont ever siuce the Lacermananian soldiers were seen at the fountain combing thes hair, and amusing themselves with gymuastic exe:cises." Probably, homever themagnificent aray of the demerip ion now exinting on the shores of the Bosphorus, called the Seven Brothers, where, it is ga: I, fimitry de Bouillon with his army of Cruauders, in 1096 encamped, must surpass in beauty aud interust all thowe instanced by the writers of antiquity. The largest of them is 90 feet in height, and 150 feet in circumferenter, indicating the usual rate of \&rowth of the len, is the luhend of years of duration. Phay mentions yhen, Plate, winieh had even been propagated by cuttiuga. This statemeat,
however, appears apocryphal. More aresit seems dae however, appears apocry phal. More arsilit seems dae
to his report al to dwarf Planatrees (Chammplutuni) existing in his time in Italy; for it is nell known that the Chinese have long possessed the art of grewing stunted varieties of the Jarger trees by pruning their roots, and by employing other means of arrentiuy their developm

Bog Plants.-Butanists who valne the Surrey henth a beng ane of the beat "gromadx" in Fuztan (lor rare plante, hud betier make the nont if thes time. We are told that the value of pent as an articie of tuel is being again discussed in scientific quarters.
time ago, the rajority of the engineers who examined the matter said that peat was all but worthless. The Building Newos thinks that this was because they only Bried the dried pent, full of coarse fibre, instead of the condensed peat from which the roots have beeu taken away, and out of which all moisture has been squeezed. This can be sold at the price of coal at the pit's mouth (what pit's month we are uot told, although of course the price in Staffordshire, for instance, differs from that at Newchstle). There are, it seems, 140,000 acres of peat near London, from 5 to 15 feet deep, which will not long be left unworked, if (as the Building News asserts) the heating power of condensed peat is to that of coal as two to one. It has been tried in steamengines of all kinds with a saving of 50 per cent.; while, as it contains no phosphorus, and next to no sulphur, it does not injure the irouwork with which it comes in contact. This absence of sulphur makes it invaluable When converted into charcoal for making steel Further, it makes no smoke, leaves no cinders, and seoms altogether a most satisfactory succedanenm. We fear the peat-growing plants of The country close round London used to be one of the wildest, south of the Trent at any rate. We can remember the Cotton-grass abundant in a wet corner of
Hasr.pstead Heath; but Epping Forest enclosed, and the henths pared for fuel, the plant and insect gatherers will have to go further, aud probably fare worse. Reader.

Ladanum is an exudation from a species of Rock Rose (Cistus creticus, L.) which abounds on the drier slopes of the northern mountain mass [Cyprus], most abundantly to the westward, at elevations between 2500 and 5000 feet. It is also found not only in Candia (where also Ladanum is collected), but in Rhodes, Nicily, anit Greece. This resin has been known from use in the island, is mentioned by Herodotus and Pliny, It is a seeretion from compound hairs, compose? of many cells, which cover the under sides and margins of the leaves, as well ats the petioles and young shoots, and is cellected from the beards of the goats which ieed
upon the plants. In Candia, as Tounnefort has long ago told us, the Ladanum is collected by a sort of rake, or coarse brush witk leathern thongs, with which the brushes are beaten. According to Pococke and other, a somewhat similar instrument is used in Cyprus, in which long strips of wool are the vehicle for detaching tire resin; but these instruments are certainly no longer in use in this island. In connections with the Ladanum plant, Dr. Unger enters into a curious discussion respecting the derivation of the name of the 18land, upon which depends, as is well known, that of copper (æs Cvprium), and of the Cypress (Cupressus). The name Kúmpos is identified with Gopher, a Hebrew word, which was applied to a shrub whose flowers and fruit were used to make oin men Pliny describes this Gopher or Cupros shrub, and hi description evidently points to Lawsonia alba, Lam.
the well-knowa Henua shrub, which is certainly not a native of Cyprus, and though abundantly \(A_{s}\) there was never ang demand for this plan in western Europe, it could never have been an article of trade between Cyprus and the West, so that Pliny must be in error, and some other plant must be Jooked for. Now, as Pliny hinself, atter following Herodotus in giving Arabia as the native country o Stoholon, aud that the true resin is obtained frou Cyprus, and that in both countries it is obtained from the beards of goats, Dr. Unger believes that the name Cupros properly belongs to the Ladanum cistus, one of
 History Review.
Inn Sign.- The following is a copy of a poetica nvitation on the sign of The Beehive, an old imn a Abingdon, kept by William Honey:-
- Withnu this Hive we're all alive
Good Liquor makes us tunny;

If you are dry, step in and try
The flavour of our Honey."
Notes and Queries.

\section*{Calendar of Operations. \\ \section*{(For the ensuing week.)}}

THE heavy rains which we have had recently have unfortunately greatly impaired the beauty of bedded out plants, and even valuable specimen plants placen temporarily out of doors will soon be better under cover should the weather again set in stormy and wet. Before housing such plants, however, see that the drainage is in a state of efficiency, and that the pots are well washedi. A little top-dres-ing will also give the whole an additional appearance of neatness. A few late cuttings of choice bedding plants may still be put in, and arnong these do not overlook the Nosegay Pelarsoniums Stella and Cybister, which are not only effective in beds and vases, but also make valuable pot plants.

\section*{flower garden and plant houses.}

Hyacinths and other Dutch bulbs, if not already got, should now bo procured and potted. Orange trees intended for forcing for the decoration of the conservatory or greenhouse should also receive atteution. These should be largely grown for that purpose. Look care-
fully after red spider. It is easily got rid of by laying the affected plant on its side, and well washing the water with the
Asters. - These will now be beatifully in flower in open borders, and where fine blooms are wanted for exhibition, shading will be required during this bright weather. Truffuut's White Perfection is an extremel showy useful sort, as are also Victoria, rosy pink, and the different kinds belonging to the Giant Emperor class.
azaleas-Get these now tied into form, In doing this, however, avoid too much formality. Also attend to the staking and training of specimen plants of other hard-wooded kinds as leisure time can be found for that purpose.
Heaths, - Look carefully after the watering of large specimens of these in pots, which are soon injured by being either over or under-watered. Examiue them often and carefully, and where they are found to be dry, water thoroughly, so as to moisten the whole of the ball also look sharply after mildew on comparatively sort enemy is perceived.

Hollyiocks.-Continue to increase these both by means of cuttings and seed. The latter should be sown as snon as it is ripe.
sind kind called splendens, which is extremely useful for mixing among Chrysanthemums. It is a good practice to place the largest specimens of this in a slady situation out of doors for a few weeks in autumn; plants so treated will be found to bloom more strongly and last longer in beauty than others drawn up in a warm house
Tree Violets.-Keep these clear of red spider, by a lieral use of the syringe, and by giving them plem vigorous health.
Tucips.-Bulbs of Van Thol and others of that class used for forcing may be potted. Place them on coat early early in November they may be placed in heat.

\section*{forcing garden.}

CUCUMbers.- Where a supply is required during winter, vigorvas young plants shonld be seeured at once from seed, as plants that have been bearing through the autumn, however promisung they may look, seldom answer well for winter fruiting
Figs. - Where any are ripe keep the atmosphere as dry as can conveniently be done, and also let the trees be on the side of dryness at the root, but avoid such a degree of drouglit as would be likely to injure the foliage or the bearing wood for next crop. Keep the shoots thin, so as to expose the trees fairly to light and air, but avoid stopping at this season. Keep the atmosphere moist where fruit is swelling, washing the folage well with the syringe frequently to prevent red spider, and give plants in pots or tubs a liberal supply of manure water.

Pines.-Any necessary re-arrangement of plants growing in open beds should now be effected. En courage plants expected to show fruit nest January to make vigorous growth, for these should be sufficiently advanced by the beginning of November to allow of keeping them rather cooi and dry, so as to check and thoroughly ripen their growth. Plants which have been prepared for fruiting, and which it is desired to get up at once, should be encouraged with a moist warm atmosphere, keeping the soil about themr roots in a healthy state as to moisture. If artificial treatment must be resorted to in order to get the plants to fruit at the desired time, there is no method so certain or so little injurious as keeping them cool and dry for a month, and then affurding them a moist warm temperature and a brisk bottom-heat, giving sufficient water at the root to properly moisten the soil. Take off and pot, or plant out suckers at short intervals as they can be obtained of sufficient strength for that purpose.
Vines.
house and if a little fire ripening of the wood is an objec much more efficacions now than later. Except, however, in the case of young Vines with a very gross habit it will hardly be necessary to use fire heat if the weather is dry. It will now be adviable cover thi borders of houses in which it is intended to keep ripe
Grapes for any length of time, so as to prevent the soil from getting saturated by heavy rains. Look over ripe Grapes frequently, particularly un damp weather, cutting out auy tanted berries immediately they ar perceived, and keep the atmosphere as dry as possible, using gentle fires when necessary, with a free circula a warm temperature is nearly a injurious as damp, therefore use no more fire-heat than
may be absolutely necessary.
hardy fruit and kitchen garden. Pay every attention to getting the wood of Peaches and Apricots well ripened, by exposure, shortening, \&c Prepare for planting all kinds or fruit trees, by getting the ground in grod order for the different kinds.
Apples and Pears.-Most kinds of Apples may be gathered during this and next month. Pears shoulit however, be left on the trees as long as the weather continues favourable for their ripening.
and prepare a shed or pit to plant a quantity first upproach of frost.
Potatos.-No opportunity should now be loat \(f\) getting Potatos that are ripe out of the ground, ani stored in a dry condition. They may either be kent in narrow pits, with a little dry earth sprinkled amep. them, or in airy dark shels. Before storing, howerer, take care to separate the bad ones, fortuuately very scarce this season, from those that are sound.
Salading. - Plant out Lettuces and Endive for spring use. If planted on the sloping sides of wide ridges they will stand better, damp being quite destructive to them as frost.
state of the weather at chiswick, Near london Por the Week enaing Sept. 6, 1865, as obsivar the Horticultural Oiren

servatory. It is probably onl

frequently, for the purpose of supporting the animal; but in spite of everything done the case grew rapidly worse, and died in seven days from commencement of the attack.
The other cow continues to progress favourably: No medicines have been given for a week past, and beyoud a little giairy discharge from the eyes, the animal would be pronounced free from all indications of disease.
In similar cases to the two quoted the use of ohloric ether has been followed by improvement. In many instances the secretion of milk has been restored and the further development of the disease arrested; but in other sheds animals showing the same symptoms have been treated with the agent without any benefit resulting. Chloric ether may be given in doses of two ounces in a quart of water once or twice a-day; it will not be necessary to continue its use for a long period, because the case will either improve or become hopeless in a day or two-at least it is the result of our experience that when an animal grows worse under treatment it ever again ra!lies.
For the sake of further exemplification we may refer to a series of cases that were placed under treatment in a private establishment a few miles from London. About the end of July the disease broke out, and one cow died soon after being attacked ; four others followed in quick succession, and on Aug. 6 there were three cows, three calves, and one bull affected with the malady. The calves were evidently dying, and were not considered fit cases for treatment. The bull and three cows were properly isolatel, every precaution being taken to prevent contact with the remaining eight cuws which were still healthy, aud treatment was at once cornmenced. The bull and two cows had drachm doses of carbolie acid, with tincture of gentian and ginger, three times a day. The remaining ouw was in a shed some distance from the others, and in her case sulphite of soda was given in doses of two ounces in water three times a day; gruel with ale was ordered but before any benefit could be gained or indeed expeoted from the measures pursued, the animals became rapidly worse, and in the course of a couple of days were all dead.
At intervals of a few days the other cows were attacked, and successivels placed under treatment. Quinine, brandy, port wine, gruel, and Linseed tea were exhibited abundantly in each case; wo trouble or expense were spared, but all in vain. The last two cases were under treatment by a surgeon of eminence, who was sanguine as to the result ; these animals were dying wheu last seen, and are since dead. At the present time, out of 20 fine healthy animals in a beuutifully open situation, accommodated in sheis kept scrupulously clean, with all the advantages of good meadows, pure air, and unremitting attention, with every appliance that science could suggest or money purchase, out of those 20 attacked one only remains-a living evidence of the utter powerlessness of medicine to cope with this disease.
Again, the malady appears under another phase, and the treatment is remarkable for its success. Three cows and a heifer give evidence of the existence of the disease in its early stage. One cow was more depressed than the others, but all the cases were considered to be worth treatiug. Accordingly carbolic acid was ordered in doses of two drachms, with two ounces each of tincture of gentian and tincture of ginger, three times a-day. This system has been pursued for a week. Of course the usual nutriments-gruel, Linseed -tea and ale were given when the appetite failed, and three of the animals have nearly recovered, and the worst case is progressing favourably. In another locality experiments on a large scale have been tried, the stimulant and tonie systems of treatmen have been adopted, without the slightest benefit nut a single case has recovered.

On the nther side of the question, again, we may quate the case of a farm, on which there are about thirty animals left out of a hundred and fifty Twenty of these recovered under a tonic and antiseptic system of treatment, consisting priacipally of the employment of tar-water, which may be taken as the equivalent of a weak solution of carbolic acid. The other ten animals either escaped the disease altogether, or had it in a mild form.

Again, in many places distant from London, in parts of Norfolk and Suftolk, we found animals recovering under the free use of sulphate of iron or dilute sulphuric acid, in addition to the necessary supply of nutriment

In the City of Lindon a number of animals were treated in one shed with no better result than the
preservation of one cow, whioh the owner, in defiance alike of reason and common sense, insisted upon having bled. In fine, to sum up our conclusions to the present moment, we may state that every plan of treatment that has been tried has succeeded and failed. The fortunate experimenter who meets with a certain phase of the disease in a particular locality, will, speaking of his method acoording to its success, assert this power to cure 50 ) per ceat. or more. Another, laking a more extended view, is content to save one-third; another, who has fallen upon the malady in its worst form and seen shed after shed deserted, is silent upon the subject of treatinent altogether. And it remains fur those who have observed the course of the disease from its commencement, and have marked the results of every system of treatment-who have seen the bumbastic pretensions of the ignorant meet with miserable failure, and the well-directed measures of the scientitio utterly inadequate to cope with the emergency, to make the humiliating confession that the medical art has met with an opponent who refuses to succumb.
By continental veterinarians of the highest standing it is admitted that in spite of the opportunities affordel by repeated outbreaks of "murrain," no remedy has yet been found in which any reliance can be placed, and it may be after a painful experience that English veterinariany as a body may in the fature bo obliged to iudurse the opinion of their continental brethren, whin are entitled to speak on this subject with authority.

Barnet Fair: Sept. 4-7.-Ryasunable fears being entertained that diseased cattle would be sent to Barnet, an application was made to the Privy Couucil by Mr. Geacey, late Hirh Sheriff of the county, to taka proper ineasures to prevent their entrance as far as possible. Acsurdingly Professor Brown was instructed to organise a system of inspection, and the effect of this has been altogether to prevent any attompt to introduce diseased animals. It was deemed neeessary at the outset to make very comprehensive arrangements, sufficient in fact to meet any emergency. For three days previous to the fair all the roads by which cattle could enter were oarefully examined, and all outlying stock w.re inspected by Messrs. Dafe, Hirst, and Stanley acting in different directions. By Saturday night a must complete system was arranged barns and sheds were iu readiness to receive diseased cattle when seized, means of slaughtering and burying were at hand, veterinary inspectors were appointed to stations which commanded all the roads along which oattle could pass, and a large budy of polioe, both horse and foot, were ordered by Sir Ricifard Mayne to affurd every assistance.
On Monday moraing at 6 o'olook the inspector assembled at Barnet, and proceed \(d\) d to their stations accompanied by a sufficient number of police to render auy attempt at opposition on the part of the drovers abortive. The cattle began to arrive soon after seven, and continued to pass at interval till nearly twelve o'clock. Each drove was submitted to a rigid examination, but no case of disease was found. The inspection was resume on Tuesday and Wednesday with the same results, although from intelligence brought in by sume of the inspectors there is reason to believe that diseased animals were on the road, some having been laft dead in meaduws at a consiserable distance from Barnet. The lots to which they belonged are reported to have gone in a direction away from the fair. On all hands it was remarked that so few cattle had not beeu seen at Barnet Fair for nearly half a century. This cireumstance is undoubtedly due to two causes in the first olace owners of healthy stiock were chary of sending their animals to a placy where they would run the risk of being infected; and, secondly, those in possession of diseased animals would hardly care to send them where th:y would be certain to be discovered and seized.
The few animals that were sent fuund a tolerably ready sale at fair average prices, and it was noticed that they were particularly healthy. It is prubable however that there is no reason to regret the smallness of the number, for no system of inspection, however rigid, can prevent the sale of infected animals-that is to say of animals that have been exposed to the influence of the disease, but in whose systems the polson lies dormant, and who perhaps will show no symptoms of the mulady for days to come. It is to ve hoped that all who have purchased store atock have taken the preaution to place them in quarantine,
and intend to keep them quite isolated from other stoek for two or three weeks.
Veterinary inspeetion at fairs and markets is of the ereatest importance under present circumstances; hut it is a grave question how far fairs or markets for store stook are to be countenanced during the progress of a disease so fearfully infectious and so deadly in its effects as the cattle plague. In one serise animals in which the dist aoe is developed are less dengerous than those that are the suhje ets of it in the incubative stage, because in the one case the animal is disoovered and destroyed, while in the of her the malady way break out among stock which have been plaerd, under a fal-e stnse of securitr, in the midst of a previously healthy distriot. These points we commend to the serious consideration of our readers.
The Inspectors who assisted Professor Rrown were Mensre, Stanlfy, Dale, Hirbt, Lupton, Skflton, Priestanan, Woodger, jun., and Рroctor.
The police arrangements were admirably carried out hy Irsifetor Richasds, of Barnet, and the Veterivary I spectors were unanimous in their auknowledgments to him and the men under his direction for their very valuable assistanoe, and support.

The following letter from a correspondent illustrates one of marry ways in which panic re-
garding the Ca'tle Plague is proving mischievous. garding the Ca'tle Plague is proving mischievous.
It is a great loss and difficulty that is here pointed out, but it is hard to say how it can be avoided. \(\mathrm{O}_{\mathrm{n}}\) the one hand it is plaiu that the contact of two healthy herds cannot do any harm; but on the other the facility and danger of infection are so great that we do not wonder at the owner of a herd placing all animals that have traversed any yublio thoroughfare in rigid quarantine :-

The great alarm crented by the cattle disease is, I fear, leading. at least in this neighbourhood, to another evil. Last, week I heard of some of my neighbours finding great difficulty in obtaining the use of a bull. This week the difficulty bas oceurred in my own yard. One of my cows was sent again to a yard where she had been before, and the cowman was met by the answer, "no more cows will be admitted this year. Now there is no illness in this meighbourhood that I am aware of; my own cows, eight, are all known to be well and of a gond Guernsey breed, aud there is no illness in the yard to which they have been sent. I have since desired inquiries to be made at every place in the district known to keep good bulls, and we has now passed, and we must wait some weeks, before which I must buy; but it strikes me that this general refusal is tending, even though it is late in the senson to perpetuate the difficulty in the supply of animal food which at preseat exists, and that you might lettiug in all cases where it is clear disease does not exist."

THE CATTLE PLAGUE.
[We continue to publish the letters of Correspondents on the subject.]
1. Lord Gbinville thus writes to the Times:-
"On my return from Coburg yesterday I requested my bailiff to draw tup a statement of what has occurred during my abeence at a farm which I lure at Golder's Green, three miles from the Regent's Park on the Finchley Road. Having perfect confidence in the accuracy of Mr. Panter's statement, and thinking it
may merest the public, I forward it to you for may interest
"When I left England a month ngo there were bout 130 milch cows in four sheds. In the two largest and best managed I fonnd only one cow yesterday. His Royal Highness the Duke of Coburg informed me last week that \(u\) hat he believed to be the same disease visited Coburg last year. No one could trace its origin, and no medical treatment was successful. Air and water uere their ouly remedies. Sume men had died from eating the meat kiiled at a particular stage of the disease. His Royal Hieliners liad seen a horse die in four houre, killed by flies which came from the carcase of a cow which hat been allowed to rem ain above ground. The disense disappeared in the autuma as unsteriou-ly as it had come.

\section*{COTSWOLD RAM SALES.}

The auction sales for the present year, of this famous breed of sheep, have nearly concluded, and considering the depression under which the agricultural interest has so long laboured, there appears to te little reason to complain of the prices obtained.
July 24, at Little Badminton, Mr. William Tayler sold about 40 sheep, for Mr. Francis Francomb, at an average of \(13 l .0\) s. 9 d.

July 26, at the Cross Hands Inn, Old Sodbury, Mr. William Tayler sold about 40 sheep, for Messrs, G. \& W. Limbrick, of Horton, at an average of \(12 l .19 \%\).

August 4, at Sierford, Mr. Villar sold 51 sheep, for Mr. Handy, which made an average o! 13l. 5s. \(2 d\). Last year, the average was 10 l .10 s .10 d .

August 5, at Northleach, Mr. Acock sold 40 sheep, for Mr. James Walker, which made an average of 16l. 10s. 6d. Last year, \(10 l\).

August 7, in Cir ncester market, Mr. Villar sold 30 sheep, for Mr. M. Cole, of Ashbrook, at an average of 7l. 15s. 8d. Last year, 8l. 12s. 4d.

August 7, in Cirencester market, Mr. Villar sold

16 sheep, for Mr. J. M. Read, of Elkstone (the historian of the "Cotswolds"), at an average of 9 l .17 s .10 d .

August 7, in Cirencester market, Mr. Villar sold 10 sheep, for Mr. Ratcliffe, of Sapperton, at an average of 9 l . 14s. 3 d .
August 7, at Cirencester market, Mr. Villar sold 22 sheep, for Mr. Akers, of Water Eaton, at an average of 6l. 17 s.
August 7, in Cirencester market, Mr. Villar sold 11 sheep, for Mrs. Baxter, of Fyfield, at an average of 15l. 18. \(6 d\).
August 7, in Baunton, after the market at Cirenceater, Mr. Villar sold 44 sheep for Mr. Porter, which made an average price of \(17 l .5 \mathrm{~s}\). One of the sheep, lot 5, realised 77 guineas. Mr. Porter's average last year was 10l. 18s. 10 d .
August 7, in Cirencester market, Messrs. Moore \& Hill sold 20 sheep, for Mr. Clark, of Frampton Mansell, averaging \(7 l .10 s\).
August 7, in Cirencester market, Messrs. Moore \& Hill sold 20 sheep for Mr. John Barton, of Kemble, which averaged \(7 l\).
August 7, in Cirencester market, Messrs. Moore \&

Hill sold 20 sheep, for Messrs. Porter, of Coin Aldwyns, which made an average of \(67.158 .0 d\).
August 7, in Cirencester market, Mr. Acock, solid
sheep, for Mr. William Garne, of average of \(7 l .18 s .2 d\). Last ye, of Kilkenty, at Angust 7, in Cirencester Market ir od.
sheep, for Mr. Tayler, of Turkdean, averaging 10, 2e, 101 August 7, in Cirencester market, Mr. Acod 12 sheep, for Mr. Thomas Barton, of Colu st. Dean
at an average of 87 . \(5 s\) s. \(4 d\). at an average of \(8 l .5 s .4 d\).
August 7, in Cirencester market, Mr. Acock sold : average of 11 l . Last year, of Culn St. Aldwyns, at a August 7, in Cirencester
sheep, tor Mr. G. Hewer, of Le Gore, at an avenald 18 sieep, for
12 l .1 s .6 d .

August 8, at Ewen, Messrs. Moore \& Hill sold sheep, for Mr. John Howell, at an average price 11l. 19s. each. Last year's average was \(12 l\). 19 s. August 9, at Coates, Messrs. Mloore \& Hill sold sheep, for Mr. Henry Howell, which made an average f 9 l. 2s. Last year, 10 l .17 s .3 d .
The following is our usual comparative statement of the sales for the past 9 years :-

In 1854, Mr. Garne, of Aidsworth, realised 21l. 78. 3d. each
of 20i. 148. 1d. for 30 sheep. Mr. K. Lane

At Oxford, Mr. Jonas Paxton disposed of some very fine animals from four different breeders.
Mr. Paxton first submitted 42 superior Cotswold skearling rams, bred by Mr. R. Lord, which fetched an average of \(8 l .98 .3 d\)., the highest figure being \(15 \frac{1}{2}\) guineas, and the lowest \(6 \frac{1}{2}\).
Thirty first-class long-woolled ram lambs, the property of Mr. W. Gillett, of Southleigh, were next disposed of realising from \(10 l .15 s\). to \(3 l .5 s i\), and veraging \(5 l .58 .8 d\).
Mr. Paxton next offered 30 long-woolled ram lambs from Mr. C. Gillett, of Lower Haddon. Prices varied from \(5 l .15 s\). to \(3 l .10 s .\), the average being \(4 l .10 s .9 d\). The last sale consisted of 20 Cotswold shearlings, bred by Mr. Thos. Akers, of Black Bourton, who made his début this year with some very superior rams. They realized from \(5 \frac{1}{2}\) to \(14 \frac{1}{2}\) guineas, averaging \(7 l .15\) s. \(10 \dot{d}\).
Wilts and Gloucestershire Standard.

\section*{HEALTH OF STOCK IN 1864.}

The following is greatly abridged from the returns in the "Veterinary keview" for August 1865 :-
Bedporpshire: Leighton Buzzard.-Diseases among horses and cattle have been much less prearent than uosseas
Thousauds of pigs had died within a radius of 10 miles, Prousauds of pigs had died within a radius of 10 miles, presenting the following symptoms :- loathing, of food,
prostration of atrength, staggering gait, and cunstipation oun
the tirst day, succeeded on the second by diarrhces die in a few days, and present red blotches on the lunge liver, and mesentery, and marks of extensive inflammation of the bowels.
Chestre: Crease. - Pleuro-pneumonia has not been so prevalent or fatail as in someno provioumonia years. Foot hot beend so
disease prevailed among the cattle and pigs on three or furur disease prevailed among the cattle and pigs on three or four
farms. Black quarter bas prevailed to a slight extent, but farms Black quarter has prevailed to a slight extent, but
splenic anoplexy has not beeu met with. Sheep have been
heal quick breathing, loss of power in the limbs, and discoloration
of the body. Cobswali
Pleuro-pneumonia has been Contagious diseases infrequent. cattle are frequently imported from Spain. Slack, quougter,
dropping after calving, and red water, were occasionally met dropping after calving, and red water, were oce
with, and diarrhoea in calves was very prevalent.
COMBERLAAD : Aspatric.- Contagious diseases not prevalent,
with the exception of eizizotic aphtha which with the exception of epizootic aphtha, which occurred
extensively amoug cattle and sheep. Black quarter was extensively araoug cattle and sheep. Black quarter was
exceedingly common among yearling stirks,
und splenic apoplexy attacked half a dozen animals on badly drained land, proving fatal iu all cases but one, in froun four to six bours.
Red water in cattle was very prevalent on the same kind of
land as splenic apoplexy. Diarrhees made and as splenic apoplexy. Diarrheas made great bavoc among been very prevalent in pigs. Rot has occurred to a limited extent among sheep; in the previous year (1863) it was very
Dergyshrre: Bakersell.- Pleuro-pneumonia and epizootic
aphtha have beesi much less prevalent than usual. \(\quad\) This I aphtha have been much less prevalent than usual. "This I
Itribute to the farmer beivg moore cautinua in the purchase of
Itioh and other stock, that have broupht it intothe hovi and other stock, that have brought it into this neighbour-
Black quarter prevalled extensively in autumn.
There was litte parturient fever, but much red water among There was litte parturient fever, but much red water among had reandered the natural grasses moore indigestible. Many
lambs perished from fiaria in the bronchia. Many were saved
by the early administration of turpentine and tincture of by the ea
asafoetida.
Devonshire: Torquay.-Pleuro-pneumonia was extensively prevalent in the district during the summer and autumn. The
majority of cases proved fatal. All of them, I believe, were majority of cases proved fatal. All of them, I believe, were
pruduced by contagion. Calves sufferexi considerably from diarrhoea. -Cutlompton.-Pleuro-pneumonia rarely visits the common, leading often to litigution and recovery of damages for the contamination of stock.
Dorsitratias: Bridport.-Pleuro-pneumonia has appeared in oniy one dairy of 58 cows, on a farm where it was never
seen before, where there has been no stock imported for several years, no cases for several months within several miles of the place, and no public road through or near the farm.
Two of the cows died two days after I was called in. Thirty others were slightly affected showing itwas called in. Thirty rale; but none of these died. The 56 remaining cows were dosed every four hours for three successive days with flax and gruel, and an ounce and a half each of sweet spirits of nitre
and oil of turpentine. Those affected were well blistered with and oil of turpentine. Those affected were well blistered with
mustard. Sheep suffered extensively
from epizootic aphtha remaining lame for months, and becoming greatly emaciated. While treating some cows for epizootic aphtha, "I put nitrate
of potass into a cistern for them to drink, and wash their of potass In arder to test the trength of the fuid their cautiously dipped my finger into the fluid, and put it into my mouth. A day or two after this, my mouth became fearfully
vesicated; and the vesicles underwent similar changes to those of the cows, \&c. I bad not the least hesitation in pronouncing my complaiut to be eczema epizootica.
Duriam: Stochton-on.Tees.- A great many cattle, both fat and lean, have suffered from pleuro-pneurnonia. Though the cattle, as a rule, are hurried off to the slaughterer, thus in part
concealing the provalence of the disense, yet great numbers bave come under my notice. The reesult is not ouly loss to the farmer, but the rilentiful supply of food unfit for huinan consumption. I believe the disease to originate cbiefly in contagion ; and this affection, as well as foot-and-mouth disease and scab, has been very prevalent in the Stockton and Darlington markets.
Essex : Southninster, near Mallon. - Very few cases o
heuro pneumonia have been met with. Epizootic aphth pieuro.pneumonia have been met with. Epizootic aphtha
greatly less than in the preceding year. Markets generally pretty free from these diseases. Diarrhood in calves was rather
frequent, they being purchased from other counties when young, and subjected to long abstinence, counties when very Pigs suffered considerably from affections of the respiratory

Hampshire: Alton. - Very littls wenro-pneumonis epizootic aphth. Sheep have suffered from foot-rot, and pigs have perished in large numbers from a fatal disease.
Hertrord: Bishop-Stortforl.- About 20 cases of pleuropheumonia; the best, were sent to the butcher, and the others 10 or 20 at a fair, one with success. When a farmer bought on satisfactorily. Epizootic aphtha is treated with chall aud atoong tarm horses in the spring; they were treated successfully by blistering, and giving calomel, ammoniat, and sweet spisits of nitre.-GGreat Berkhamxtead.- Epizootic aphtba has quarter and diarricicea in calves existed to a limited extent Parturient fover was less prevalent than usu.u.l. Amongst pigs
an epidemic and highly infectious enteric fover has been an epidemic and highly infectious enteric fover has betn
extrenuely fatal, destroylug, in many instances, from 50 to 80 per cent. It is most fatal in young pige.
Hintinodon: St. Ives. - Pleuro-pueuinnnia has come less
been very prevalent. The markets usually contain disente dropping atter calving, ophth ilewia in cattle, and diarthoea, bat been met with, but in nol great numbers.
Kent: Lewisham.-Pleuro-pneumonia was very prevalent It large dairies where they are constantly purchaving thing for a farmer to buy ten or twelve Dutch beasts, less than a week all of them will be affected with ple pneumonis. Fuot-and-mouth disease has prevailed large extent, both in cattle and pigs: scarcely a farm escup Diarrboea in calves rather prevalent. - Rochester.-Very to cases of contagious diseases; two of pleuro-pneumonia, and of foot-and-mouth disease. I never hear Diarrhce occasionally among calves artificially reared. G mortality from parasites in lambs during the wiuter mo Lancaster: Liverpool. - Pleuro-pneumonia extensivels sent into the raarket diseased ean usually be restrate past year, having been brought by pigs from Irelan farm servints had it very severely. Diseases of
an 1 digestive organs were below the average.

\section*{WHEAT EXPERIMENTS, 1863.4.}

The following extracts from Professor Church's report in the Volume lately published for the Agricultural Colte
referred to the other day, will be read with interest.]
Have we any ready method of selecting corn fo ced so as to enable us to get a larger and better crop? One criterion may at ull events be adopted without difficulty, that of density
I have submitted the question, "Do the denser grains yield a larger and better crop?" to the test of actual experiment, and the results obtained will furnish the best answer.
The results obtained in two series of experiments, in wheh the seed-corn had been selected in accordance with this principle, are recorded in the present commu. nication. One small series of experiments was made in the well-cultivated but unmanured soil of the Botanic Garilen of the Royal Agricultural College ; the second, and more extended series, was made on four different Gields of the College Farm.
In the series if Botanic Garden experiments four arieties of Wheat were sown, each variety occupying a separate plot. Sixty seeds of each variety were planted by hand, each seed being placed about \(1 \frac{1}{2}\) inch in depth, and nearly 12 inches apart in the rows. The 60 seeds included the three qualities selected according to their density, 20 seeds of each being taken. The three rows in which the sfeds were sown were 16 inches apart, and were assigned to the several qualities in each plot as in the annexed diagram:-

\section*{\begin{tabular}{l|}
\hline \(\mathbf{B}\) \\
C \\
A \\
\hline
\end{tabular} \\ Medinm density
Low density \\ High densty}

The seed of highest density was named \(\mathbf{A}\) in each instance, that of medium density B , and that of low density C. The varieties sown were

\section*{I. Hallett's Pedigree}

\section*{II. Browick's Red.}
III. Fenton White.
IV. Cotteswold-grown Mixed.

The three different qualities of there varieties will be goozen of in the subeequent part of the account of the garden experiments as Hallett's A, Hallett's B,

Hallett's C; Browick's A, Browick's B, Browick's C and so on.

After describing the methods employed to select seed higher densily, the author proceeds:
The seed was sown on the 10th October, 1863. The plants soon appeared, those from the different qualities of each variety not presenting any marked differences However, the numbers of " \(A\)," "B," and "C" plante that were living on the 10 th June, 1864, showed some variations, which are given in the folluwing lists:Number of Plants living, Jume 10, 1S64.

\(\begin{array}{ccc}\text { IV. Cotteswold-grown } & \text { A, } 15 \\ \because & \text { ", } & \text { B, } 17 \\ \text { " } & \text { In }\end{array}\)
From the 80 A sceds of the 4 varictios sown, 55 plants were From the 5013 seeds of the 4 varietios sown, 59 plants wero
living \(=73.75\) per cent. rom the 80 C nceits of tho 4 varietios sown, 30 plants were
living \(=37.50\) per cent.
Here it will be seen that the dense seeds \(A\) and \(B\) show a most marked superiority over the light seeds \(C\), lut that tho densest seeds, A, did not vield by 5 per cent. so many plauts (living June, 1861) as IB. This may be accidental, but, ns we shall point out presently, the average yield of good corn from the A qualities was greater than that from those classed as \(B\), even though the nuinber of plants was less.
During the periods of growth and ripening, every care was taken to prevent injury to the Wheat plants. Hach experimental bed was enclosed, when the season had advanced sufficiently, in \(a\) large cage of tanned notting. The ears were gathered as they ripened; the first cutting took place on the 20th of August. In order to avoid undue prolixity, I have placed all the more importint facts regarding tho crops obtained in the form of a Table.

increasen in size and weight for the first two or three years." The bearings of these observations on the results which I have obtained witl be evident presently

The following are the details regarding the farm experiments with the high density Wheat:-
No. I. Old Kent Red Wheat.- This was sown October 21,
1863. The plot was d acre. A top dressing of 1 ewt. sodium

 No. III. Fent.n Wheat.-This was sown Oct. bor 24, 1863. The phot was \& acre. No top. Irescing was apphed. 2 buskels
 WHEAT EXRERMEXTS, 186364.
(Farm Eeries.)

\section*{}

From the results contained in the above Table, c llated with those before given, especially those lerived from the Butanic Garden experiments, it may be siffly concluded -

That an average extra return of about 13s, per acre may be obtained hy submitting the seed sown to
the particu'ar process of selection described in the present paper.
2. That a very high standard of density is not required to secure the extra return; in practice the will probably be sufficient to insure this result.
3. That the process of selection of see. by density is ensy and inexpensive; in some cases it might, however, be adrantageously left to the seedsman.
. That an acelimatised seed-Wheat (No. IV. in both series) yichls a considerably heavier crop than Wheats grown under different conditions of climate, soils, \&o. The great diffrence, however, between the "Experi-
mental" and "Ordinary," in the case of IV., arose from mental" and "Ordinary," in the cass of IV., arose from
the process of selection telling with special effect upon this particularly badly dressed original sample.

Lond Walsingham's Lambe-In your Leading Article of last Saturday you say Lord Walsingham's lambs drop in January. You have been misinformed. I nevcr
knew of any dropped in that month, and seldom till knew of any dropped in that montl, and seldom till
eeveral weeks afterwards. Henry Woods, Mertom, near eeveral weeks after
Thetford, Sept. 4.

Yorkshire Agriouldwral Sooiety. - The letter of Messrs. Ransomes \& Sims in your Paper of the 26th ulta, reapeoting the unfair trials of machinery at Doncaster, is neither answered by the Council ot the Society nor the Secretayy in whose hands the entire management of the yard is placed. Either the materials for trials were deficient or the time too limited, and
either of these faults could have heen obviated by a practically infurmed man at the head of that department, which other similar societies possess. The thing seems a complete farce to offer prizes for competition and bring machinery from all parts to compete, and then make no preparation, or at least none such as to give avy satisfaction to the public. The local papers don't speak ouk, and they won't interfere until the exhibitors leel disgusted at the bacl management and leave the Society altogether, as soveral alre
Myers \& \({ }^{\circ}\) Sons, Saudhuttow, Thivot.

The Cattle Plague.-Nothing, I think, can be move madlike, let the prevalonce of the malady have proceeded from what cause it may, than the act of prohibiting foreign cattle to set foot on our shores during the present crisis. If this were allowed, a further great rise in the price of meat of all descriptions must inevitably follow. There is as much good reason to know this, as to believe that the price of grain would and must go fearfully high, were We to forbid all at once any more iupportations of Wheat, \&cc. Enough surely is already instituted for the partial annihilation of the present generation of cattle, in that all having any real disease or fancied ailment are to be immediately shot and buried. Rather, I should say, it is mere highly necessary for her Mujesty's Government to foster the continuation of importing foreign supplies of all healthy cattle, and moreover to enact a mandate prohibiting for at least one year (to be extended longer if necessary) the alaughtering of any sucking caives, lambs, or piga, till proper for human food matureage, less insipid, and more
green food, indigenous Grass and Clover, also Turnipsand Mangel especially, abounds everywhere since the late incessant rains, for all foreign beasts which may be imported, as well as our own cattle; the former comprising all the necessary natural aud physical elements conducive to the wants and comforts of every kind of amimal, without having resort to the various condiments and oleaginous daimlies, such as Linseed meal, \&c., which I contend have often given rise to disease in cattle, and render them, by their being over fatted, unwholesome the eaten. It is a well-known fact, that better fatter beasts have not and cannot be procured than those that have been only Grass.fed, when plenty of that has have beed, as it does at the picient time, to supply their wants. My lumble cpinion is, that every poss:ble means ought to be resonted to to augmeat the stock, rather than to diminish or reduce their numbers, otherwise, what, I would ask, is to cat up the over abundance of natural green food (which a kind Providence has uudoubtedly especially provided for the emergency) now clothing the surface of the carth? Amongst which may be moticed the most supeilative crops of Mangel Wurzel, euch as were never before prodiced, and that universally, since their introduction into this country. And what mast be the searcity and enormons price of meat ere long, if tha stuck shonld continually keep being reduced by disease, condemation of death and destruction to 1 wheh appear so, and the prohibition of the usual supplies of lean stock from abroad? I have before intimated in a former paper, and it is still my impression, that if all stalled oxen and cows as well as loose were turned out for the next warm month to Grass, as isolated as possible in different pastures, corn eddishes, lanes, commons, and wastes, where medicinal horbage most abounds suitable to their wants, to be partaken of at their will as theis natural instinct invites their appetite, avoiding as much as may be
swampy situations, choosing rather elevated spots for swampy situations, choosing rather elevated spots for he lut epatarage (as imported) a general improvement in their health will shortly be olservable, and but little more will be heard of disease in cattle. I sincerely wish as sure a remedy and process of cure could be
divised for the sad chronic disease in the ill-fated Putata, which has been so prevalent for the last 21 years, and this year as rife as ever. This I consider is a greater calamity than the former, as it uffects both poor and rich, withoat any provision being made for he losses of either. Aftermaths are now abundant, and Clover rowans, if carefully watehed not to be got up in bad order from fog-damps and rain, will fully connterbalance the short crops of spring hay to be eked out witb Turnips and Mangels for their comfort daring the ensuing winter and next spring. A. Bardy, Maldon, Essex, August 27.
Beet Sugar.-The statements given in the communiantion of "C. F.," daiel Falmnuth, 11 th August, and inserted in your last Number, are too inaccurate not to
throw doubts on the conclusions arrived at. The enclosed printed paper, drawn up with the utmost care from official documents, liberally furnished by the French Government, shows that the quantity of Beet sugar made has never yet ( 1863 beiug the largest year on record) reached half the figure given by "C. F.," whereas much as stated by him. I am not aware what quantity of root is produced per acre, but should say it must be more than eight tons, which would uat give more gross than aine pound - too littla, one would think, considering the cost of cultivation and manufacture into raw sugar, one hundred-weight of which I can buy at 25 s., delivered in London. Much inquiry justifies me in stating that light, not heat, is the great atmospheric pabulum of saccharine, and that a cloudless sky dis. Rassia where this kind of agricultural industry is most practised. With the exception of 1865, that condition caunot be said to prevail in the United Kingdom, and heuce all attempts "so far have failed. In my neighbourhood Sugar Beet some years aga was grown for distilling purposes, but did not answer, acre fur acre
being found much in favour of Barley. To tempt an unnatural branch of Agriculture by remitting the duty would, to my uind, be an economical blunder, and still essult in disappointment. Fred. Scheer, Stafford House, Northfleet, Kent, September 5.

\section*{Foreign Correspondence}

DIEPPP: Sept. 2. . . I have seen more than might be expected of that part of Normandy that liea fertile tract, well-cultivated, and the Wheats (above an average) all housed in fair order. The face of the country presents a succession of rounded hills, divided y smali rivers on their way to the sea. The table ands are very extensive. There are no hedges, mo hedgerow timber, but the whole surface has a parklike appearance, from the circumstance that every homestead, and every village and château, is embowerel in well-defined plantations. These, of various size, at unequal distances from each other, and often with a backyround of forest, would, if all the arable were
meadow land, maise the traveller suppose he was riding through a park as big as Hampshire.

After Wheat, Oats seemed most genernl. The Barley may have been carted, at any rate I naw mone
by the wayside fields within eyeshot. Beane were but
few. The patches of green erops bore a sorrombein
unpromising aspect, but there was a plent unpromising aspect, but there was a plentifal thith of now and then, and a hare crossed the road patition the carriage-a sign of good look.

The material prosperity of the part of Frome visited is very striking. Le Havre stretches into country as Liverpool has done, whilst the stualler tome improve in proportion; but intelligent French oom plain that they are over-regulated in everytling, and the the political leading strings are kept painfully tigbt. The passenger truffic between the two opposite bbe Diep eve every week day, aud vice versit - thathen fon Dieppe every week day, and vice verst -that is, foun-
and-twenty steamers a week. the one I came one and-twenty steamers a week. The one I cane over 12
brought \(130-a\) common number. A lithlo 400 were in the same boat. Say the average is 120 diem each way, and the weekly number is 2180 , rection. ing both to and fro.

In the manth of June, 1814, I crossed from Cahin Dersons on board. Then those sailing packets meat twice a-week. Look at the difference! Theu sit dorn and calculate the difference betwee: the present nt and what it will be when people will be able to round the wolld in a week!J. M., Coldred, Dower.

\section*{Eacietity.}

Edinburgh: Cattle Plague.-We understand the in Edinburgh the number of dairymen who have joinal the Mutual Assurance Association is between 80 and 90 and that they have paid deposit money on mexil 1100 cows.
It was stated on authority some weeks ago that the number of cows in Edinburgh byres was about 2800 we have heard from trustworthy sources that there un now not more than 1500 or 1600 . The rest have at
been put away since the panic about the Rinderpab be en put away since the panic about the Rinderpas
began; some of them have been sold fit at a god price, a great maty more have been sold at enormom sacrifice, and others have boen destroyed. Up to the preaent time we believe that not fewer than 150 or 10 Rinderpest, while more have "gove to the dogs" ont the impression that they were labouring under of lith to be attacked by the plague.
Up to last week the disense was coufined alams entirely to dairy cows, and stockowners were under that affected by it. This is a delusion. On Monday nigb we went oat to see some grazirg cattle in the neppl bourhood of Kirkliston, and we then found thas th out of a lot of six had died from Rinderpest, and tho
were sulfering from the same disorder, but they were sulfering from the same disorder, but the
appeared to be recovering. Scoltish Farmer, Sept, b.

\section*{Farmers' Clubs.}

Mtorand: The Cattle Plague.-At a special mentng on Thurnday last to consider what steps it is advisable to take with reference to the existing cattle plague-
Mr. Happme said he did not believe that the present epidemic among cattle was a now digense. Ho thought the causes of it were to bo found in connection with the carriage of catile from toreign countries and their conveyance by rail in England. They knew that at the railway stations there were very disagreeable were made of open fibrous timbur which retained the urine and other excrementitions matter of tho auimals. So long as trucks were made of this material, he believed whitewashing and the uas of chloride of lime were usoless. The trucks ought to be conted with iron. He very much regretted that our veteriamy surgeons and persons whom we looked to in such emergencies 80 little understond the present epidemic.
Mr. Councillor Lowe thought it would be acknowlodged pretty generally that in many of the homesteads of this country sanitary presautions were generally disregarded. For cattle sheds to enclose the place where the manure was deposited was a very serious mistake, as the effuvia arising from the manure heap to a very great extent passed into the lungs of the animals. He thought the disease would, amougst other things, call the attention of farmers t.) the importance and aecessity nothe remark he had to make was, that with a view to pre-
ventiug the contagion, it would porhans be as well for ventiug the contagion, it would perhaps be as well for
farmers, as far as possible, to abstuiu fon sending either fat or store cabtle to tairs or markete for a shert time, and to invite butchers to visit their hosses to buy any stock they might have to dimpose of. He thought the practice of collecting a large number of amimals together, either at markets or fairs, at the present time, muat of necesoity increase the probability of infection.
Mr. Stamugy, veterinary surgeon, said there was animals than there was in his early dayn. This was aspecially true of horned cattle, piga, and sbeep. With reference to the present epidemic, it was reesonable to cattle which were debilitated by crossing the sen under unfarourable conditions of tranait. He thought it wam notsuficient that imported cattlo should be inspected
at the port of debarkation. They should be again examined before being admitted into any town; because the symptoms manifested themselves very suddenly, and an animal which appeared to be quite well to-day might show symptoms of the disease to-morrow. With respect to treatment, it would be found that a great number of beasts had been cured, and he was quite sure that if the animals were taken in hand before diarair, and were properly nursed, many might be cured.
Mr, Masfen said: As to remarks with reference to the homesteads of most farmers and their sanatory state, no disease of the kind they were considering was engendered at a farm house. There was no doubt in his own mind that the disease was either imported or engendered on hoard ship. He attributed it to the sudden change from heat to cold-the animals, after being transferred from the hold of a ship, travelling through the country at the rate of 20 or 30 miles an bour in trucks, the abominable state of which was well known. He was satisfied that the disease was brought to this country by the cattle imported from abroad. He found that Dutch stock had always been subject to disease, but the London dairymen, although aware of this, bought them, because the profit on them was so great they were willing to run the risk. He had no doubt the sceds of disease were aown in thousands of cases from improper treatment on board ship, and in carriage by land. There ought to be inspectors to see that the cattle were properly treated, not only on the voyage bat after landing
Mr. HUNT (Hunt \& Parker), veterinary surgeon, said the origin of the disease in this part of the country might be traced to one cow-another indication thit the disease was virulently contagions. The first outbreak was at West Bromwich, where it was traced to a cow purchased at Smithfield, of which the dealer said, "to be candid, it was Dutch." That animal was placed
in a dairy, where the disease soon appeared. There were 15 cows, the owner of which, when the disease broke out, sold them, and they found their way into the Birmingham market. Six of them, which were sold to Mr. Bayliss, of Arley, all died, and contaminated the farm on which they were and the farm next to it, and now the disease had spread to five farms in that locality A person in the district bought two calves off an infected farm, and introduced them into sheds, and there siz
cows died. In every instance in which he had had an opportunity of investigation, the disease was to be traced to contagion. This being the case, it was clearly of the utmost importance that every precaution should be taken to prevent the spread of the disease. The Corporation of Birmingham had certainly done all they could. But it was necessary that more should
be done by farmers themselves. A veterinary surgeon night pass an animal as healthy now, and in two or three days afterwards it might be dangerously ill. Under these circumatances he insisted that quarmatine was necessary. Farmers should keep animals purchased certain time. Fourteen days was the period for incupneumonia. With respect to the importation of cattle, no one was wild enough to think of stopping it; but
there onght to be a system of quarantine. He did not think the state of the railway trucks had caused the disease, but if not improved they might be the cause of aggravating it. With respect to the treatment of the disease, be thought they had better not attempt any thing of the kind. They must endeavour to trample it out. He was for the destruction of every animal that showed symptoms of the disease. Curative measures might, as had been said, be effective if adopted soon enough; but the difficulty was as to taking it in time, for as soon as acute symptoms appeared it wa3 evident to the accustomed eye that the animals must die : the marble coldness of the extremities, and the utter prostration of strength were such that no reaction could be hoperl for. In the first case that came under his notice at Plymouth, the cow was milked at 5 o'clock in the evening, being then apparently in good health at 9 o'clock it was ill, and by 7 the next morning it was dead. As a rule treatment would be hopeless, and he therefore would have no dallying with the disease. He was for strict quarantine, and for the immediate denth and burial of an affected animal, so that it should not be a means of spreading the contagion.
The Chatrman, by way of giving practical effect to the discussion, submitted the following resolution :be taken by the municipal anthorities in every place where cattle are congregated together, whether the disease has appeared in the locality or not."
Mr. Wright said-It appeared to him that the first question which it was necessary to clear up was thisHad a new disease appeared amongst our cattle, and was it really aud truly the Rinderpest, as the leading authorities contended? If this were so, then the history of that disease, as Professors Simonds and Gamgee, as well as others, had fully explainel, clearly showed that none but the most stringent measures with it ns it appeared in different localities world by no means meet the case, as the causes which led to the extension of the evil remained untouched. He Who would visit the cattle markets. Suppose
cattle in the same market might take the infection or it might be carried away in the clothes of the persons attending the market, and in this way the disease would be rapidly conveyed to all parts of the country. Professor Gamgee had pointed out the measures adopted abroad on the appearance o the diseare : the infected districts being closed against the introdaclion or exit of stock; no markets are allowed to be held, and even a check is placed upon the movements of the people in such districts. If the circumstances in which the farmers of this country were now placed were of the same character, then some extraordinary steps appeared to be necessary, and he had noticed that at one county meeting it had bee suggested that Parliament should assemble to take the subject into consideration. Noticing what had been stated by Mr. IIunt with respect to destroying any animal suffering from the disease, he (Mr. Wright) might refer to the opinions of Delafond, quoted in the North British Agriculturist of the previous day, which were to the effect that in treating affected cattle we multiply the centres of infection and the channels of communication, and that veterinary hospitals do not of infection.
The Chairman then moved, "That egriculturists be requested in their several localities to assist in corrying out the Orders in Council, and to carry out the sanatory measures recommended by Professor Simonds and othe authorities."
Mr. Hunt suggested that a sentence should be added to the effect that to attempt curative treatment was nadvisable.
Mr. Lowe seconded the motion, and it was carried.
Mr . Homere stated that 58 cows out of 60 affectedin the opinion of Professor Simonds-with the disease
question, were cured in Derbyshire.
Mr. H. Lakin spoke of the importance of consulting skilful veterioary surgeonf, and not the halfeducated cattlc-leaches practising in some localities. He was very pleased to hear the remarks of Mr. Wright with reference to that profession, and he had been in communication with Professor Simonds as to the best meana of sending some of its analified members into the
country districts in the present emergency. Abridged country districts in the present

Sparkenhor: Sept. 7.-The Annual Show of this Society was held at Loughborough on Wednesday and Thureday of this week. As the shows of the Royal Society are held in different towns in this country, so does the Sparkenhoe Society divide its favours amongst the towns situated within its province. The Society may well feel gratified with the reception it has this year met at Loughborough, the inhabitants and gentry o the locality being determined not to bo outdone by other places in generosity and taste in the welcome it has accorded to the Society in this its first Show in
Loughborough.

Triumphal arches were erected over the principal streets, and the amount of flags, garlands, and othe festive decorations everywhere apparent, was a thing worth looking at.
One of the chief features of this exhibition is the department in which prizes offered by the local landed proprietors are competed for
The Duke of Rutland, Mr. Packe, M.P., Mr. Herrick, Sir John Harper Crewe, E. B. Farnham, Esq., and Mr. Middleton offer prizes to be competed for by bond fude tenant farmers and labourers. Ploughing, digging, draining, hedge cutting, sheep rearing and allotment culture are encouraged, and the labourer who serves the longest
reward.
The show of agricultural implements was very fine and we may say that for quality and weight the root shown were fully equal to those shown, or we m? ght Globe Mangel Wurzel of Mr. Claridge were reall beautiful. The Swedes were generally coarse, but the lst and 2d prizes were awarded to well-grown roots from Mr. Eaton, Castle Donnington, and the Agricultural Colony Reformatory School.
The Cabbages were very fine; 1st prize went to Mr Eaton, Castle Donnington; 2d, the Agricultural Colony, Whitwick.
The show of Potatos was the chief feature of the root department, and seldom have we seen better Potatos than were this year exhibited at Loughborough Mr. Dobel, of Loughborough, offered a special prize for the best collection of Potatos, and this brought toge the a first-class aesortment, the prize was awarded to Mr Shak Epear, Loughborongb. The Agricultural Colony showed in this class a very good collection of 15 varieties.
The show of Beasts was not as good in point of numbers as was expected; this was owing to the fear of contagion now so general. Some very good Shorthorns were exhibited, Mr. Packe, M.P., the President of the Society, competing with some capital beifers and a bull that would not have disgracell a Royal Show. The 1st prize for aged bulls was awarded to a grand
red bull of Mr . Boswortb, of Dishley, and for quality red bull of Mr. Boswortb, of Dishley, and for quality, extra prize.
In Cows the 1st prize went to a beautifully even cow of Mr. John Lynn; \(2 d\) to a cow of Maynard

Some very good Ye
The Class of Cos
is to be regretted that the plague notused willed, und this exhibition, as the milking cows from tha panie hire dairy farms are considered fully equal to thicme In other county in England.
In fat stock, the 1st prize was awarded to a horn. There were some very ined was very poor indees we may say that it would be difficult to sid so a animals of this once famous breed exhibited mat usually shown at the shows in Leicestershire,
classes made in themselves a canpital eep and Simis sheep do not como out well in Leicentertion nothing in a name, and the show of this wer, there together as good a lot of sheep as need be The 1st prize ram of Mr. Lynn and Mr. Cresme \(2 d\) prize animal were something superb. came out in large numbers and excellent Colonel Dyott had the 1st prize Shropshire ram in section for aged animals, and seldom have we seen petiog keenly with Leicesters on the ground much honour accrued to the production of the genin Bakewell. A prize for the best 20 ewes broud Thery good assortment of capital brood eme The entries of Swine were confined altogether capital pigs of the Jarge lreed, and the Agrieultern Colony, with Mr. Isynn, of Lincolnshire, showed some grand animals in the sections for stuall breeds.

The show of Horses was very good indeed \(s\) capital hunters were exhibited, and the trials of jumy Of agricultural horses there was a good diepay, the young animals here were really very fine. prize to the blacksmith who shail, in the opinion make and deal of local interest. Tho black-miths performel their work on the ground, and the competition nas witnessed by a large number of the visitors.
On the whole, we think the members of b Sparkenhoe Farmers' Club and the Ioughborough fit may well feel satisfied with this week's Show. policy of saving expense should again induce the C to overlook the policy and good taste of engaging fire rate judges, and from a district outside their provino The dinner which was largely attended, wa bel in a pavilion on the Show ground. \end{tabular}

The average dividend from the whole ten agricultural atates was 1s. 9 , d. per pound, while the average dividend frum the ten commercial estates was 6: 33. per
pound. There wonld be a larger sum involved in the wumercial than in the agricultural estates; but these are the dividends per ponnd. Recently, in dealing with the farmers, we have been aware of the preference the wadlord had. Not long ago we were not aware of the great rive we ras; but our eyes have been opened
reently to the fact in ways which we could not mistake. reently the
Lindubtedy we must regulate our prices in conse. quence of that isk, if we understand our business. We fi. d that the risk upon agricultural estates, as compured Fith commercial, is something like four times as great; their business, they will put on larger profits. Some few agriculturists with whom I deal avail themselves of casi prices; but, unfortunately, as Ayrshire is situthat are able to avail themselves of such terms. If the law of bypothec were abolished, I do not think they Tould be all able to pay cash, but I think they would then be in a position to come into the market and get
credit on the best possible terms, which they certainly credit on the best possible terms, which they certainly of the law of lyypothec. I have not thought much over the question, whether the rights of parties under existing leases should be reserved. It certainly would apply harshly that existing leases should be interfered with, but it would come very awkward in practice if they were not interfered with. I should think that, if Ithe law were to be ebolished, all should come under it. Ithink it should apply to existing leases from the time it came into operation; but it might be a prospective repeal, not to come into operation for a certain number recirity, and I cannot see any principle on which he collture are any security. The circumstances of agricolture are very much altered of late. Formerly the tenon the farm, with was the heaviest item of outlay upan the farm, with a little for lime; but now the greater extent than the landlords do, and I do aot think it is reasonable that the landlord should have any additional security. I do not think that any bis land for nind be drawn between a man who ties up milh the for nincteen years, and a man who is dealing mulh the tenant from day to day. It would be for the tened; and's interest if he left his tenant free and unfetin the and for this reason, that it is a well-known fact, employed upon farming in Scotland, that the capital the case upon it is quite insufficient for it. That i bat ing eneral business parties are in a position to go in apon the lest terms for credit, which tenants are not, roder the law of hypothee as it stands; and I hold that
it mould be for prietor that his the advantage and interest of the prothe marliat on the tenant should be prepared to go into the manket of the best terms for credit, to supplensent Ceedit is of capital that there is for the business. moold get il more readily in all business, and no class ior this law. Calendar of Operations.
Verge or Bendar of Operations.
beea general for a fockatise: Sept. 2.-Hurvest has belpfol to the a fortnight, but last week was more Oasion. Under a viven rerop than to the labours of the Oith mere cut wet or drecollection of last year's shake,
were cut wet or dry, but a few fine airy days have
come in time to prevent sprouting, except in sheltered cutting was a week earlier, wuch corn badly sprung in stook, and growing Wheat extensively mildewed.
until it was dead weather delayed the reaping of Barley until it was dead ripe, and it is only the Clover that keeps it from being it for the stack. We carted some yesterday in good order, but were stopped by raiu A splendid wind, however, has enabled us to finish the field this evening. Oats being cut green will be longer in the winning. Reaping is now all but finished, and light machines have done some service, for Irish Lands have been scarce and dear. These hand-delivery sheafers are most in favour, being simple of management; but there is much room for improvement in material and workmanship. For ripe and twisted Barley the machine is much better than the hook.
On all poor clays and light bungry gravels spring corn is very poor in every respect. On better soi's Oats improved very much after the July rains, and have come to be an average crop, but with a tendency stooks but poorly, and was uncommonly twisted for such short straw. The colour will not be what was expected. Wheat is a well-planted standing crop, of a fine yellow here, except it be a rare piece of spring-sown, which is getting black in the straw, and may as well be cut green as it is. The extent under Wheat is very small, and on so called Wheatsoils there is none at all, owing to October tlouds. Algust came in dry, with cold nights; but since the middle of the month we have had a milder temperature, and 3 inches of rain, which wetted the ground a little at times.
The prospects of the Root crop are entirely dependent on an open winter. Swedes got through, in fair crop on free soils. Chay the flata, and will be a ago were regularly fallowed, are now forced to grow Turnips; but a dash of rain in May lloored theus, as infed it came at the worst possible time for us all. Turnips nowhere. The and blanky, and their White Turnips nowhere. The great difficulty, on all hands, will be to find early winter keep, for our most pronising is to be seen many a field hurriedly prepared to reap tle advantage (?) of early sowing, which can never come to anything but a few leaves.
In vew of cat cate plague, fewer cattle may be kept; though one may steer clear of it by avoiding fairs and foreigners. Sheep command more attention than ever, and ewes will be dear, owing to plenty of
Grass. Lambs are dull of sale just at present Grass. Lambs are dull of sule just at present but the rise in the earlier fairs was \(4 s\) s. above last year, which leaves much less for the feeder than for the breeder. The disproportionate price of lambs is said to be due to the introduction of sheen-feeding in dis ricts hitherto devoted to dairy farming. Wool sold with sone difficulty at \(3 d\). per lb. below last year's prices; bred hogg, \(2 s .3 d\).
Clover hay wes a good crop, and some of it well got; but a portion is still a-field in the cock. So is old-land hay, which is grown in parks around mansion houses and is sold by auction in half-acre lots "to suit purchasers."
Putatos have looked well all summer, but they are now getting black in the shaw. J. \(T_{\text {. }}\)

\title{
NEW TARIFF OF GLASS AND HORTICULTURAL GOODS. THOMAS MILLINGTON, GLASS AND COLOUR MERCHANT,
} 87, BISHOPSGATE STREET WITHOUT, LONDON, E.C.

\section*{J. B. BROWN \& CO'S NEW PATENT B B LAWN MOWER.}

J. B. BROWN AND CO. having so very successfully introducel, at the reecent Meceting of the Bath and West of England Society at Hereford, in June last, NEW PATENT B B LAWN MOWER, of their own manufacture, brg to mention that having now supplied the large number of the BB MACHINES orderdula occasion, they are now receiving a few more orders for the present season.

The Hereford Journal, dated June 10th, thus notices this new Machine:-"Mossrs. Brown \& CJ. are well known in connection with the best Lawn Mowing Madiner these very useful and now almost indispensable Machines, which save so much labour and at the same time so much improve the appearance of the lawn. Mrssis. Frown? show a new Lawn Machine of their own manufacture, which attranted sauch attention on account of the compact arrangement of narts, its light and elegrant appearanpe, and workmanship. It is worked by means of well-made geared or toothed wheels, which whe bell sofrequently, and cause much trouble. The working of this nêw Lawn Mower is very light and silent, and we have no doubt it must become a great favourite."

The NEW B B PATENT LAWN MOWER is manufactured by Messrs. Brown \& Co., in London, on their own premise3, and under their personal superintenden?. is worked by means of geared or toothed wheels, is very noiseless, and is guarauteed to give perfect satisfaction in every respect.

> PRICES-including Carriage to all the principal Railway Stations and Shipping Ports in England.

J. B BROWN AND CO. continue to \(\quad\) 24-inch Machine .. always a stock on hand, from which orders can be at once supplied.

The 14-INCH LAWN MOWER is the favourite Machine this season, and the price is 1510 s., for either the BB, GREEN'S, or SIIANKS'
* Every Machine sent out is Warranted to give ample satisfuction, and, if not approved of, may be exchanged for dny other size of Ifachine, or for the Huchiw of any other Maker, or may be at once returned unconditionally.
J. B. BROWN AND CO., OFFICES, 18, CANNON STREET, CITY, LONDON, E.C. - NEARLI OPPOSITE ST. SWITHiN'S LANE and "LONDON STONE," and near LONDON BRIDGE.

WAREHOUSE (where Machines are kept in Stock), 14S, UPPER IIIAMES SLREET, E.C. OPPOSITE the CITY of LONDON BREW LERY, and close to the LONDON BRIDGE STEAM BOAT PIERS.

\section*{meetings for the finsuing wele}

We hear with great pleasure that her Majesty the RLebs has been pleased to permit the
2mnunceraent that the Great International Horti2nnuuncernent that the Great International Horti-
culural Show and Congress of next year is under Her Majesty's patronage. Her Majesty has akn most liberally contributed Fifty Pounds to the fand raising to pay the expenses.

We have just received, through the kindness if Dr. Greville, from the neighbourhood of Brandon, one of the most magnificent Fungi we ever saw-SParassis Crispa, and which Fiess and Krover the merit of being described by
hol as most delicious. Four recimens only were found at the roots of a large Scotch Fir, in a wood of a hundred rears' growth, consisting of Scotch Fir mixed with remarkable amall Oaks. The specimens were so Pemarkable that they were gathered by the Letp \(\mathbf{r}\) on Mr. Ampunst's estate, and sent to a rillage flower show at Bridlington, without any Inspicion that the species is of such extreme rarity ccourred before in Berkshire, which was fipured in the Intellectual Observer. Which was figured tomever was very small in comparison of these, Te of which Admiral Mrtrord, who sent it 18 inally to Dr. Grevilles, informs us measured 18 inches in diameter by 14 . At the first glance theoks more like some beautiful Madrepore or is real affinities are with the from other Fungi, bu Frem a strong rooting the genus Clavaria.
or mom a strong rooting obconical base, 3 inches or more in diameter above, spring in every direclamin radiating which anastomosing foliaceous flattened abore, and divided wrinkled below, branched sanded crisped and into innumerable more or less are sometimes and often recurved lacinix, which arder side thes but not always wrinkled on the Ite spide, though both surfaces are equally fertile. large opaque globose nucleus. The whole forms a
tesily Learly hemispherical mass of a delicate cream colour, at the as the plant approaches decay, especially frured by SCBEFFER pallid ochre. It is well from specimens very inferior in size to that before When smell is peculiar, at least in the plant be fatin. Like other Fungi, the Sparassis should are given extremely fond of it. given for its culinary of it. No directions
would doubtless require the same treatment as the large Clavarix, which are generally dressed in France, according to Roques, with butter, Parsley, Basil, and other herbs, not forgetting a soupcon of Garlic, occasionally mixing with the butter a tew spoonsful of stock while the Fungus is stewing. When it is tender it is served with a mixture of cream and yolk of egg. It might also, doubtless, be preserved in vinegar for winter use like the Clavariz.

The other European species, Sparassis laminosa, which attains equal dimensions, and also forms an hemispherical mass, is found about the stumps of Oaks, and is distinguished by the laminæ being much less divided above, and by no means crispea or recurved.
Sparassis crispa is produced abundantly in the neighbourhood of Prague, where it is often brought into the market, and is highly prized. Sparassis laminosa is muoh rarer, but equally good in quality. \(M . J . B\).
The more saiient points of the Prize Scheciule put forth for the International Eximition of 1866 have been already noticed, so far as regards those portions relating to flowering and urnamental plants. We will now glance over the other subjeets among which competition is invited.

Taking Fruits first, as the most important, it may be observed that the season fixed upon, being such as will afford the most gorgeous display of flowers, falls full early for the production of great quantities of fruit. Hence, except by some extraordinary effort on the part of British cultivatorsand we by no means admit that the word 'finality' belongs to their vocabulary, or that they have reached the limit of their powers-hence, we say, it is scarcely to be expected that so good a display of the better kinds of fruit as that which has been recently witnessed in Edinburgh, for instance, can be brought together. We do not, however, despair of seeing a thoroughly good fruit show, all the more meritorious, let us observe, from the fact that its production will have required some increased effort on the part of the growers. Taking a rapid glance over the prizes, we may note that they seem to be fairly liberal, and such as to lead one to infer they will be liberally responded to. After a collection of various Forced Fruits, which must necessarily be of a miscellaneous character, there follow fire classes for Pine-apples, destined we hope, amoug other influences, to draw southwards some of the admirable examples of Pine-growing to be seen in and about the northern metropolis and elsewhere. Grapes come next: first, two classes which represent collections, then half-a-dozen classes representing the different races of Gripes, then single bunches, and Vines in pots-alturether affording abundant inducement fur a noble display of British Grape-growing. This, it must be recollected, is a feature of our national gardening through which we ought to make a strong impression on our foreign visitors; and both on ihis ground, and on account of the impulse which a little warm rivalry will give to the develonment of Horticulture even amongst ourselves, we would urge Grape-growers to give the matter their most favourable attention. Melons, Peaches, Nectarines, Figs, Strawberries, Cherries, \&e., with
Tangierine Oranges on the tree, invite the further attention of our forcing gardeners; Orchardhouse trees come in as a representation of a still somewhat novel phase of fruit culture, and may be made to contribute largely to the beauty and variety of the show; while, finally, illustrations of the mode of training fruit trees, which generally form interesting features in a continental show, are also sought to be introduced to our Engli:h Exhibitions.

Vegetables we need hardly particularise. Prizes are offered for such as are likely to come in season at the time of the Show, and both forced and naturally-grown kinds are expected. The most interesting portions of this Show will probably be the collections; but such subjects as the largest Asparagus, the heaviest Rhubarb, and buth the longest and handsomest Cuoumber, will afford scope for an exciting contest between growers of specialties like these.

The eighth section, for "Bouquets and Objects of Ornament in Natural Flowers," will afford those persons an opportunity to exhibit who take up such subjeots as table-decoration, bouquet-making, and the like. We would, however, invite the attention of amateurs and of lads gardeners in particular to the classes for Winduw Jardinets and external Window-boxes, the fursishing of which may afford them amplo seope for an exhibition of good taste.
Another distinct feature of this prize list to
which we would direct the attention of gardeuers, and especially of youn ryardeners, is the designs for laying out grounds, both public and privat, which the Committee have decided to invite. It is quite true that our young friends mar not surcessfully compete agaiist those mure practised in the art of laying out grounds, but it is a suliject which it is of the utmost importance to them to understand, and it is hardly possible they can compete without manifest adrantage to themselves. In the case of Garden Implements and Garden Ornaments, the Suoiety of Arts, in its capacity of patron of inventions, will distribute some 50\%. as prize money.
We have only to add our carnest desire that the well-to-do friends of harticulture will strengthen the hands of the Committee (as indeed ther are doing) br providing the sinews of war in the shape of liberal subseriptions-f ir nothing of this kind on a large scale like the present, can be carriod on in a satisfactory way withort chbundant funds; that the Committee, whil carrsing out the scheme in a liberal spirit, will avoid extravarant expenditure of every kind; and that the horticulturists of these Isles will do their duty when the day of exhibition enmes round.

\section*{- We have today to record a most gratifying} episode of the recent Edinburgh Hortmuitnal Exhibstion, which the exigencies of our publshing arrugements prevented us from doing in oar last nupression, namely the Prasestation To Mr, Thomson, of Dalkeith, of a mark of esteem and segard, by several
gardeners who had served as foremen under him, and who are now themselves filling important and respor.sible positions. The general assembly of horticulturists in Ediuburgh, on the occasion of the Show, afforded an opportunity to give something of a public character to this well-earned mark of respect, and accordingly the subscribers, together with many of Mr. Thomson's friends, met at the Douglas Hotel in St. Andrew's Square on the 6th inst., when he was presented with a handsome gold watch and appendages. Mr. Rose, gardener at Floors Castle, occupied the chair, and in a tew appropriate remarks introduced the sulyject. Mr. Dalziel, in making the presentation, relerred to the uniform kindness which Mr. Thomson evmeed towards those placed umber him, and alluted to the readiness with which, at all times. he had communicated to them the benefits of his great professional experience - not only when entrated under hina, but after they had left lin'm to occupy imporThe situations elsewhere. In accepting the gift, Mr. Thorsons stated that when he had first heard of the propusition, he had felt the same nbjection to it which he had to testimonials generally; but when he found it was the spontaneous duing of those who had so long and so creditably acted as foremen at Dalkeith-none of them for less thin two or three years, he had laid asile his scruples, atid had agreed to accept the gift in the saume spirit which had actuated the givers. The watch bore this inscription:-" Presented to Mr. William Thomson, by nine of his late foremen. September 6, 1865;" surrounding which, incorporated with the decorations of the device, were the initials of the subscribers, namely, Mr. H. Rose, Floors Castle;
Mr. Dell, Stoke Ruchiort, Granthan; Mr. D. Rrown, Corehouse; Mr. J. M'Intosin, late of Riby Castle; Mr. W. Prentice, Shugborough Hall, Rugely: Mr. W. Dick, Wynyard Fark. Durhmm ; Mr. J. Morbison. Anchincruive ; Mr. H. Knfght, Châtean Pontchartrain, Paris; and Mr. J. Srmpsov, Wortley Hall. It is most gratifying to see men filling Mr. Thumson's bigh position in the Horticultural world thus securing the grateful esteem of those who serve under them, not nnly firer professional instruction inparted, but, as in this case, for the kind considerate treatment which all who know Mr. Thomson will be quite sure marked his dealings with those who were called upon to act as bis subordinates. It would be well for Horticulture if such examples could be indefuitely multiplied.
- From time to time during the past two years we have seen more or less perfect specimens of a curions SPOrt IN THR GLoxinia, in whicu one of on the outside of the c rolla, between it and the calyx. sppeimens of this kind were exlibited at one of the recent meetings of the Floral Committee. The most remplete account of these singular flowers that we have seen is contained in a paper of Prof. E. Morren's, in the 19:h volume of the second series of the "Bulletin de l'Académie Royale de Belgique." From this account, it appears that the supplementary pieces just alluded to are really members of a second imperfect flower, placed outside the original one, anentioned," says M. Morrex, "there was formed a flower bud in the axil of one of the sepals, and this bud has given origin to a separate corolla, partially adnate to the primary corolla, and slightly atrophied, but enclosing never theless a rudimentary ovary." Iu other flowers the arpearances are still more singular; in these, it
seens as if screral axillary flowers were produced between the calyx aud corolli, each of the Eupnlemen. tary flnwers bing in so reduced a condition, that one petal alone remains to represent the corolla When
these imperfect petals are of about equal size, and When they become coherent by their edges, they form a"c catacorolla" on the outside of the true corolla. In were first brought under M. Morrem's notice in the establishment of M. L. Reicerenheim, of Berlin, and in which one coroll was enclosed within an outer one, as happens in Datura ceratocaula, \&c. Now the outermost corolla, "catacorolla" as M. Morreen terms it, alternates in position with the true one; and
whereas in the original blossom it is the inner surface whereas in the original blossom it is the inner surface that is brightly coloured, in the supplementary one on exterior is tinted with bright carmine. These " races have been obtained by removing all the ordinarily shaped flowers, and insuring the due fertilisation of those which presented the deviations above mentioned, till at length in the fourth generation the rudimentary outlying petals have been combined into one simple-looking, though really complex catacorolla.
This is truly one of the most extraordinary result of the art of the cultivator that has been put on record, and we should be thankful to those who would sindly transmit specimens to us, in order that we ma trace out the different stages in the production of hose in-hose Gloxinias.
843), The question raised in a recent Number (see female plants of the common BAY LaURRI, is one of such importance, both in a physiological and in a cultural point of view, that wo hope the inquiry made by our correspondent may elicit some valuable infor mation. It was the opinion of Kniart, that in the Melon, the Cucumber, and similar plante, a high temperature favoured the production of male fowers sonance with our correspondent's opinion ; bat it i clear that before arriving at any definite conclusion, large amount of well-authenticated evidence must be obtained.
One objection that might be raised as to the existence of a different constibution for female ass contrasted with male plants is this, that in the case even of
dicecious plants, like the Hop or the Willow, male blossoms are sometimes found on the female trees. In sothe of the Willows this is partieularly common; and moreover it frequently happens in these trees that there is to be seen a gradual transition in form and function, from the stamen to the pistil. This change can hardly be the result of any alteration in the constitution of the plant, but merely of some external agency acting for a short time, for in the next season perhaps no such transitional forms are to be seen. Again, the Hop plant has been noticed to produce female flowers in one season, male and female flowers in the succeeding summer, while in the third ear male blossoms only were produced.
In the Primaroses, Linume, and Lythrums, studied so carefully by Mr. DARWIV, the flowers are functionally If not structurally unisexual, but we have yet to learn fution are manifested by the plante in question. In order to limait the subject, however; within the bounde asaigned by our correspondent, we have simply to ask those of our contributors who may have under their observation large Bay Laurels unscathed by the winter of 1860.61 , to be kind enough to tell us the sex of the shrubs.

\section*{BRITISH ASSOCIATION.}

Tre meeting of the British Association, which has been held this year in Birminghan, commenced on the 6th inst. The business of the General Meeting was opened from which we select a Presidensages. After referring to the early labours of the Assreciation he observed :How many questions have we asked-uot always in vain-regarding the constitution of the earth, its with sharpened eyes the peopled space around-peopled with a thoussand times ten thousand starse; now floating ing the polar ice-the desert sand-the virgin forestthe unconquered mountain; now sounding the depths of the ocean, or diving into the dark places of the earth. Everywhere curiosity, everywhere discovery,
everywhere enjoyment, everywhere some useful and therefore some worthy result. Life in every form, of every grade, in every stage; man in every clime and and that which has passed away; these subjects of high contemplation have been examined often, if not always, in the spirit of that philosophy which is slowly raising, on a broad security of observed facts, sure inductions, and repeated experimente, the steady columns of the temple of physical trath.
\({ }^{16}\) The light and heat which are emitted from the sun reach the earth without great diminution by the absorvtive action of the atmosphere; but the waste of heat from the surface of our planet through radiation into space is prevented, or rather lessened, hy this same atmosphere. Many transparent bodies ardmit freely heatrays derived from a source of high temperature, but stop the rays which emanate from bodies only slightly warmod. The atmomplere possenses this
quality in a remarkable degree, and owes it to the quality in a remarkable degree, and owes it to the

Dr. Tyndall has placed in the clear light of complete to the history of the earth and of the other planets is obviouts: The vaporons atmosphere acts like warm clothing to the earth. By an augmented quantity of vapour dissolved, and water suspended in the air, the waste of surface-heat of the earth would be more mpeded; the soil, the water, and the lower parts of he atmosphere would grow warmer; the climate tike what has been supposed to be the state of land sea, and air during the geological period of the coal measures. Such an augmentation of the watery con tituents in the atmosphere would be a natura consequence of that greater flow of heat from the interior, which by many geologists, mathematicians, and chemists is supposed to have happened in the earlier periods of the history of the earth. The history of suns and planets is, in truth, the history of the effects of light and heat manifested in them, or
emanating from them. Nothing in the universe escapes their influence; no part of space is too distan to be penetrated by their energy; no kind of matter is able to resist their transforming agency.

As we ascend above the earth, heat, moisture, and agnetic force decrease, the velocity of wind augments and the proportion of oxygen and nitrogen remains the name. The decrease of heat as we rise into the air is no it been very limited or very accordant. Lesplie considered it matbematically in relation to pressure Humboldt gave the result of a large inquiry at points on the earth's surface, unequally elevated above the sea ad finally, Mr. Glaisher and Mr. Coxwell, during many balloon ascents to the zones of life-destroying cold, far above our mountain tops, have obtained innumerable data in all seasons of the year, through a vast range of vertical height. The result is to show much more great elevations: thus agresing in general with a view of Leslie, and yet throwing no discredit on the determinations of Humboldt.

Researches of every kind haves so enriched metebro ogy since our early friend, Professor J. Forbes, printed his suggestive reports on that subject, and so great have been the benefits conferred on it by the electric bservatory at Paris, and the office so lately presided over by Admiral Fitzroy in London, the messages are arriving from all parts of Europe to declare the present weather, and furnish grounds for reasonable expectation of the next probable change. Hardly now within the sas of Europe can a cyclone begin its career of devas tation, before the warning signal is raised in our seaports, to restrain the too confident sailor. The gentle spirit which employed this knowledge in the cause of humanity has passed away, leaving an example unselfish devotion, in a worl which must not fail through any lack of energy on the part of this Association, the Royal Society, or the Government. We must extend these researches and enlarge these benefits by
the aid of the telegraph, bringing the ends of the world together
Nature one compretensive plan ; one anivergal rnle in unexhausted series of individual peculiarities. Such is the aspect of this moving, working, living system of force and law, such it has ever been, if we rightly interpret the history of our own portion of this rich
inheritance of mind, the history of that earth from which we spring, with which so many of our thoughts re co-ordinated, and to which all but our thoughts and hopes will again return, How instructive the history of that long series of inhabitants which received in primeval times the gift of life, and filled the land, sea, and air with rejoicing myriads, through innumerable evolutions of the planet, before in the fulness of time it pleased the Giver of all good to place man upon the earth, and bid him look up to heaven.
"Wave succeeding wave, the forms of ancient life sweep across the ever-changing surface of the earth; revealing to us the height of the land, the depth of the sea, the quality of the air, the course of the rivers, the extent of the forest, the system of life and death-yen, the growth, decay, and death of individuals, the beginning and ending of races, of many successive races of plants and animals, in seas now dried, on sand-banks now raised into mountains, on continents now sunk beneath the waters.

Had that series a beginning? Was the earth ever uninhabited, after it became a globe turning on its axis and revolving round the sun? Was there ever a period since land and sea were separated-a period Which we can trace- When the land wass not shaded by
plants, the ocean not alive with animals? The answer, as it comes to us from the latest observation, declares that in the lowest deposits of the most ancient seas in the stratifled crust of the globe, the monuments of life remain. They extend to the earliest sediments of water, now in part so changed as to appear like the products of fire. What lite? Only the simpler and
less specially organised fabrics have as yet rewarded research among these old Laurentian rocks-conly the aggregated atructnres of Foraminifera have been found in what, for the present at least, must be accepted as of all knopsits of the oldest sea. The most ancien
low, we may evin thay lowest, type of animal onsein
sation:
And what is the latest term in this loys serie. successive existence? Surely the monumerts of ere. of the rocks; the cities which have taten the caremin holes in the ground, or heaps of stones and timber in ake; the ships which have outgrown the ceme is that whs modelled from the floating trunk of a tree, earth, after it had undergone many chation upon the earth, after it had undergone many chatigit, and ature

Ever since the days of Aristotle, the analogs nes ing among all parts of the animal kingdom, and in eneral sense we may say among all the forme of th Related as all living beings are to the element in ntide they move and breathe, to the mechanical energin a nature which they employ or resist, and to the nol general conformity of structure, some frequentlo ring resemblance of function, muat be preeent cannot be overlooked. In the several clame analogy grows stronger, and in the subdivisions of the classes real family affinity is recognised. imallest clivisions which have this tamily relation in th ighest degree, there seems to be á line which cireas scribes each group, within which variations occur, from
food, exercise, climate, and transtnitted peculiarition Often one specific group approaches another or seven others, and a question arises whether, though distinct, or rather distinguishable, they almays hom been so from their beginning, or will be allayion antil their disappearance.

Whether what we call species are so many original creations or derivations from a few typess or one trpa imself a naturalist of eminent rank. It had bem often discussed before. Nor will any one think lightil of such inquiries who remembers the essay of Linnew - De Telluris crbis incremento,' or the investiontion of Brown, Prichard, Forbes, Agasiiz, and Honker
regarding the local origin of different species, genera, and famities of plants and animals, both on the lan and in the sea. Still less will he be disposed to under uccessive races of living forms more or leass resembling our existing quadrupeds, reptiles, fishes, and mollass, which appear to have occupied definite and differen: parts of the depths of ancient time; as now the tige: and the jaguar, the cayman and the gavial, live on ifferent parts of the terrestrial surface. Is the livine nammoth which roamed over Siberia and Earope asd North America, or of one of those sub-Himalayan tribe which Dr. Falconer has made known, or was it a specie welling only in circumpolar regiont \({ }^{\text {P }}\), Can omestic cattle, horses and dogs, our beasts of cham and our beasts of prey, be traced back to their soume older types, contemporaries of the ura, If \(80, \mathrm{th}\) and hysena on the plains of Europe? If 80, , It not so, by what characters are the living races sapartio from those of earlier date?

Specific questions of this kind must be anment before ghe general proposition, that hise forms of are indefinitely variable wion That such evidence will be gatbered and rightig interThat such evidence will be gatbered and nor will aor be too hasty in adopting extreme opinions or toat which of the final resuit, who remember how olten that whint is true has been found very different from natiles of as plausible, and how ofen our of atety. danger we have plucked the howesitions which were erea present moment the three propositions whicy be suceces present to the mind of Edward Forbes maserved pheop

its fine clean evergreen leaves, and rich yellow
in rs entitle it to a high place as such
THe mot fuecessful example of caltivation, as far is Ne most this plant, which I have seen, was at Woolaston the deat of Sir John Beruers, where it was planted the chitectural conservatory, and was blooming in profusion, its rich yellow blossoms forming a rast rith the Lapageria, My own experience extends to the stove, but Mr. Shepherd, the conservatory was the more suitable place its rich handsome fringed yellow flowers to Jratage.
Tre specimen at Woolaston Hall is planted out in a is iv every spring to get a good push of young wood from which the flowers are freely produced from the May until August. The plant is an evergreen himher, and under successful treatment is exceedingly sriking, nuch more so than
:productions. \(J\). \(F_{i}\) Sept. 9 .

\section*{THE LONDON PARKS.-No. IIL}

The Regents Pabk.
TIME wis when the smoked aind dried Londoner fond it necessary to go in the country to enjoy pretty fowert and green trees. The time is approaching-
indeed it is at hand-when the country must come to iown to see the highest examples of modern gardening set in verdant groves, and breadths of the areenest tarf, sweeping away over breezy height or
iomn towards the Weeping Willows that droop o'er to glitening boat-enlivened water. "The pent-up moreching of the present condition of this once hapless creature, the niext time you are in London on an early summer mnrning just walk through Portland Place
iuto this mhise park. If the glorious foliage of the aremne of Chestnuts is fully out; and evtry tree is
atonned with spikelets of silver tinted with crimson, so moch the better, but it matters little, for on either side is beautiful garden, richly but tastefully embellished with trees, and shrubs, and flowers, while plenty of mintemplate. Thère is a reireshing rush of water from the hose with which the gardeners are watering, summer shower. The walks too are moist and cool and the flower garden of the richest nobleman in the comntry does not offer a greater luxury than may be had here by the poorest Londoner.
This is very well, but look to the west and you will see an equally desirable sight-hundreds of young men and the park is devoted before breakfast. Then go further north hy the fishers, old and young, down to where those fond of a pull on the water are enjoying the chest-
expanding exercise; and then up again across tlat wide and breezy expanse of green in front of Holford House, passing all sorts of folks who come out to take the places, who have no bed but that afforded them by the Then when the parks are opened-houseless wanderers. the gymnasium is enjoyed, and what thoroughly dellicions breeze sweeps the top, where many go to have a breath of air before commencing their sedentary
work, and you will have some ides of what has been done towards improving the people's condition in this mportant respect. A still better idea may be formed begoing 12 hours later, in the evening, when old and ronng awarm out after their day's work is completed. but juat think that the people of country towns; Condon was a great city, yet then the serving maids wot out their washing to bleach on the cleau green mere Leicester Square now shows itself black (Sourky; that cows grazed within a stone's throw Regent's Park was away beyond green-pastured on in the country." And ail is now absorbed in one mighty whole, rendering it almost impossible for the free frer in central London to take daily exercise in In extent upwards of these grand parks.
In extent upwards of 400 acrese, of pure London clay, laste for modellint stuff for little mudlarks with a morld for the gardener-it was no ordinary task to mbellish this park with trees, \&c.; but it has been rell done. The planting as a whole is sufficient and Ponlogical Gardens the trees of the Botanic aind pardens in the park, contribute to the various villa
The Weeral effect. and beaptiful Weatlows by the water farnish a distinct he Lonion parkure it is fortunate they do so well in expanse to having "its own sweet will" on that fine "ertmacott's drinking fonntain, by any further planting decidnuas flowerinough the planting of a few hundred dantify the park Ampriment be introd spring, and they could without margine. What inced in inatural groups around the
an Hewthole Cherries and Peachep, Almonds, Ameri-
an Hawthorn, Chinese Pear, son-in addition to their
great floral beauty, is the fact that they do as well in London as in the country, because they are at rest during he seasor of smat; and burst out into leaf when the clear air of spring returns. They flourish in the Botanic
Garden, as may be seen near the Maseum, while it is Garden, as may be seen near the Maseum, while it is
nearly impotsible to treep the life in a Pine; or preserve nearly impostsible to keep the life in a Pine; or preserve
in evergreen in glistening health, without which it is not worth growing. Benides, these deciduons treen and shrubs are the most desirable from an assthetic point of view, as they display their beauties at the season when people resort to the parke; they are more beautiful When unfolding the leaves of spring, flower profusely and brilliantly, Which evergreens do not, and are at
least as well to look upon in winter as evergreens perithing from aconmulation of dirt apon their lungs.
A good piece of water is indispensable to a first-rate park, and the Regent's Park is well supplied with about 22 acres of it on the sonth-west side. It is well arranged, and seen from the Hanover Gate direction and other points, very beautifal, the terminations being bidden away beyond woody islands and winding eaches. In winter, during a long frost, is presents one of the most animated sights conceivable-then, particnarly on Sundays, almost every modification of the species from a Ratcliffe rough to a. DatchWoman may be seen whizzing over the ice in a state of high glee, The only nnfortumate feature is that the soil which was excavated to form the lake has been thrown ont in the form of a wide flat ummeaning heap, relicved indeed to some ettent by being covered with trees, and would perhaps be noticed by few but for its edge coming very and brown. To what excellent nse the material taken rom an excavation of this sort may be put is perhaps better illustrated in the adjoining Botanic Garden than elsewhere. There what was taken from the pond basin forms a perfectly natural-looking and picturesque mound, particularly btriking when seen from the east side of the water, and which enables the visitor to catch, beyond the indefinite northern margin of the garden and Primrose Hill, a bedutiful view of the ops of Hampstead and Highgate hills, with their churches, \&c. If a well-defined and unobjectionable boundary is an important desideratum in great city parks, the Regent's has one peculiar advantage, for no ther is nearly so well situated in this respect. The stately wall of noble terraces which encompass it every side but the north, are almost exalted enough to give even sutch a large expanse some advantages shelter, while the dignified architectural aspects of most of these seen through the park foliage is perhaps the best marginal view to be had in any London park And where the terraces cease, in comes the canal by way of a boundary sunk at the bottom of deep woody slopes, which furnish charming vistas from several o Rosaceouses, particulsuy private gardens, come into the picture in early summer. The shady plantations along the canal, in which Hawthorns are a feature are also good additions to the park, particularly when the May is in flower. By the way this fine native plant, of which there are scores of acres in the Phoenix Park at Dublin, is not at all sufficiently nsed in the London Parks.
The great central avenue or broad walk, as it is called, is unquestionably the centre of attraction, as well as the chief artery of the Regent's Park. It is on of the finest features in any known park, and onl wants continuing actoss Park Square and Crescent to the end of Portland Place to open up a combination of street, garden, and park scenery, which could not the to gratify even the inteligent foreiguer used to the best aspects of continental cities and gardens. This must have been contemplated by Nash when he designed the park and terraces, and the most remarkable fact in that so obvious and necessary an improvement has not been long ago carried out. It would be difficult to suggest an improvement of this fine and well-kept avenue excepting in one trivial respect-the gate where it is crossed by the Chester Road are much to narrow, and there is often a perfect jam here on Sundays, when great crowds pass up and down to hea the band and enjoy the promenade. They should be replaced by gates that could be thrown back the whole neorly the whole breadth of the walk, and withou being expensive
Four rows of trees briginully ran dong each thate of his broad walk, from its sodith end to the drinking fountain. To make way for the geometrical garden designed by Mr. Markham Nestield, the two central -ows on each side as far as the Chester Road were cut away, the greater length of the very agreesble shady avenne remaining intact-I hope to contuue so. Thas the garden and shade lovers woald both be propitiated: there would be plonty of shade for Sundst or week day promenders, ant gardening for the million at the ime time. Bus the srove is old, and the arenue ar time. But the bhary grove novelts of the park present. As regards position and treatment they are distinct from any other known gardens. The situation bas been objected to, but certainly none other could have been found in the park better suited for a geowetrical When the entrance is opened into Portland Place they will form a capital gradation from he bett and most imposing streets of London to the park menery to tho nork. Doubtiees many would prefer an oppoifte ityle of garden, but where the
ground does not invite the "English,"" " natural," or better nma it pernctrical gardeell sum or a better name,-lt is, unless done well, and at great recognised laws of the subject, a formal gardeu is the only one that could be tolerated within aight and call of Portland Place. W. Rotinson.
(To be continued.)
THE SCOTCH FIR-PINUS SYLVESTRIS
Tex Sootch Fir is a woll-known and highly charicteristio tree, not only on account of its timber, but also on acoount of the extracts which ate obtained from it. In Norway and Sweden, where it abounds to great extent, and also in the fortestan of Germany, oil of curpeatine and pitch are extractod from it, and form prominent articles of commerce. It is amongst the wost common, the most hardy, and most useful trees that Britain produces, valuable not only on sccount of appearance, regerdleess of the soil, situation, and climate where it growe. It is a hardyevergreen, with leaves two in each eheath, from one to two inches long, of a light-green culour, remaining on the tree for two years, which is aiso the case with the fruit or cones before they reach maturity. These ought to be gathered in November or December, at which time there will be both grean and ripe cones on the same tree--the green the produce of the flower that bloomed in May, the ripe ones the produce of last year.

In our modern artificial forests, the Pinus sylvestrin that is now in cultivation, cannot properly speaking be termed the true orlginal indigenous scotch Fir but a variety of it; and inferior as a timber tree to
the ancient kind. Not only is the nlder apecies more majestic, but it is also more rare than the formor-in fact nearly extirpated by the constant thinnings and improvemente that this country has andergone within the last 100 years. Now, with a very fow exceptions, true old Scotch Fir is not fonnd soutia of the Tay in cotland. Pines in general all have a conical form When planted in an open space ther aro closely sit with branches from within a few feet of the groind, forming a very symmetrical prrami ? The
original Scotch Fir, when planted clusely like the other, prunes itself to within a few yards of the top and spreads or rather is flattened by the aetion of the air bearing upon its top, making the latter appoar lize "bonnet." The variety always has an uprigat appearance, and seldom or never wenrs the bonnet. The bonnet forms one of the chief markin towards the base, the indentures in which get shallower as they ascend the stem, until about halfway up where the bark is sumoth, and jellowish-brown in colour, coming off in reales about the size of a crown piece. It is true that all Pines when planted in an exposed situation have a deeper covering of bark than those that are sheltered, but the Bonnet-headed Fir chiefly wears the thickest coat towards the base. The modern variety has for some time baek been largely imported from the Continent, where the seeds are gathered and sent to our nurserymen, who rear chem or the use of our forests; hence, in my opiaion, the introduction to this couatry of the inferior variely There is also another variety of the original called inus sylvestris montana, or dwarf Mountain Fir which some assert to be nothing more than the ordinary variets of Scotch Fir. It is, however, distinct pariety, which can be distinguished from the astal kind by jts dwarfer appearance and more loosely set branches. If unpruned, the lower branches are enerally as large and as strong as the leading or top hoot, and lie horizontall
The variegatod Scotch Fir (Pinus sylvestris variegata) is another variety which exhibits some of tre it daracteristics of moncaaa, As an to be of great magnitude, but merely to be enployed for embellishmont; it is perfeotly hardy, and posesses the same drantage over the climate as eylvestris does. Both it and P. gylvestris globosa are very insignificant timber rees, 8 , they never excoed more than 6 feet in height; they are, however, very ornamental, and well deserve more attention than they at present receive.
It has been asked in your columns, "How or why is it that timber, say of the Scotch Pine, grown in the north of Europe, is of so much greater value than that of the stime tree grown further south?" This is a diffoult question to answer. As regards climatic infiuence, if in a hot locality, the sap will crrcuiate quicker than in a cold one, and the wood will grow faster, and thus become soft. On the other hand, il have situations the sap will circulate butsewly, bat and a tendency to midide the timber toore durable. The best timber is grown in a dry eandy soir of Scotch fir delight in a dry saady soil, and they will frow in a very dry situation. The leaves being small and tough give of very little moisture by evaporation, which roil It a dietinct pariotyine is proved by the mature of the Lithuanian and Harcourt soils, which are both aike; moreover, trees transplanted from the Baltic to

Leir southern relations grew in, still retained their superior value. In the plains of Riga, where these
trees have been planted by the hand of Nature, they trees have been planted by the hand of Nature, they
are in general all very old, having long reached are in general all very old, having long reache
maturity, a fact whicb, taken together with thei climatic advantages, renders them superior in durability to their more rapidly-grown relations in the south James Grigor, Bedford Nursery, N.W.

\section*{AMHERSTIA NOBILIS.}

THis grand tree, which has come to us from the East Indies, has been known in a living state in this country about 30 years. I believe that for the first plant that reached Eugland alive, we are indebted to Mr. Gibson now Superintendent at Battersea Park, who stucceeded in bringing it from the Botanic Garden at Calcutta to Chatsworth. Although, therefore, not a new plant, yet it still remains exceedingly scarce in our collections is not equalled in beauty by any of them, if surpassed by any plant in the vegetable world. This family yields us many other fine things, such as the Browneas, Colvilleas, Buubinias, Erythrinas, Poincianas, Mucunas, Wistarias, \&c., all strong-growing plants, either shrubs, creepers, or trees; yet, fine as they are, the Amherstia ranks above them all. The immense pendulous flower
racemes, of the riclest vermilion and yellow, give it so racemes, of the richest vermilion and yellow, give it so
remurkable an appearance, that when once seen it is not easily forgotten.
The late Mrs. Lawrence, of Faling Park, was one of its most successful cultivators. The splendid collections of Orchids, Heaths, Azaleas, Stove and admiration in the tents at Chiswick and Regent's Park, and for which we were indebted to the skill and love of plants possessed by this indefatigable lady, have never as yet been replaced by the efforts of any one seen-if not in all its grandeur, for space did not permit of that, at least showing much of its beauty. At last, allotter to it, and the plant was presented to the Royal Botanic Gardens at Kew, where it grew exceedingly well for some years, aud flowered beautifully, until the house in which it was planted required repairs, and the Amherstia had to be removed into another, which proved too cold and arid for it, so that it suffered seriously from the removal, and never regained its former health and beauty
If obtained as a young plant, it should be grown on acain in the midule of summer, not giving too large a shift at one time. The branches shonld be tied upright, and when they attain 8 or 10 feet in height, and are of where it is intended to be grown. I should advise a large slate slab for the bottom, say from 4 to 6 feet nr more across, depending on the space. A groove should be cut
from the centre, so as to form a cross, deeper towards the edger, so as to draw off anys staguant
water. The sides of the tub might be made of wood of the size required to give a moderate shift.
The depth should be abont \(2 \frac{3}{\text { feet, and plenty of }}\). ago muat be used; the plant in the beginniug should be kept well up, as it is sure to sink. By the time it so high, and when it requires its final shift I would recommend slate put together with bolts and nuts, as being much more durable, and more easily taken to pieces, should the roots at any time require examination. plenty of grit or sinall stones, beaten up together merely picking out the large rank roots. The plant shonld be trained on wires, the length-way of the house, shoots are required to fill the wires on the roof, the points of the shoots should be tied downwards to induce the plant to break. This will check the flow of sap, and cause it to break readily.
It is rather impatient of the knife. The branches should be all trained on the wires, as its blossoms are It is a plant that roots rather freely if strong cnttings are taken, with a little heel, when they are ripe or about three parts ripe; they should be plunged in
strong bottom heat under a glass. strong bottom heat under a glass.
The house in which it is grown should not be too to prevent the young leaves from burning. The syringe must be used freely on all occasions when the tempeThis is high.
This fine plant is worthy of any trouble or expense, and the house in which it was grown would deserve the be suitable for growing all moderate-sized Palms, Ferns, and other fine-foliaged plants. Thomas Brown, Exotic Avursery, Tooting.

\section*{Home Correspondence.}

Fines Extraordinary.-An early Vinery at Stoke Park was started in the September of last year, Although this was not out of the ordinary way, forcing previous seasons, yet on this nccasion, from some cause or other, the Vines did not show any fruit. I believe
the root. In the month of May this season, a fresh
border was made outside, and young Vines were introduced. The old Vines being planted inside were pruned and left to take their chance. A little extra heat was put on to push the newly-planted Vines, when, strange to say, the old Vines broke again regularly all over, and bave now, September, a fine crop of Grapes beginning to colour. They are vigorous and healthy, with fine foliage, and the bunches are of a good average size, and n every way resemble a late crop. 15
