to prepare, and wateb, and help. Nisture outaide porsues her course-rain and sunshine, heat and colld, come and go regardless of his purpose. The speds of weeds, of parusites, of diseases, of misehiefs of all sorts are everywhere; and always ready for a fitting seed-hand There they will grow to his great injury or even ruim. Bis seeds, and the plants and animails he breeds from them, are net only the prey of all these miachiets-nit climate, but they themselves are living creatures inde pendent of bim, possessing as species and even as individuals, characters and tendencies which are realisen that seems to remain bis own is his power of chore-the power of selecting the ohjeets he shail oultivatethe phwer of chmosing the tumes and seasons of the varions nperations hy which after long experieuren of thent natural histury, hie finds thas her cant promente ther growth. This perhaps is rather underatating hia certainly are tinnee which I have named. It has to de with living things, laving tendenciesand charactars and wills as your may almnat, say of theme own. fort, tom, wot only artifieially but by Nature, responding emaitivoly to natural as well mo artifcial infleonce, and she recovery and cure, thrnuzh merumstances and forcem Which the farmer canunt gude, tor which indeed be doen little more than make ready, watrh and wait.
To be a gond and smeresstial agriculturiat, therefore. needs tom only familari'y with the ordinary rontine of farm practise, and both industry and prompt tude in its direction: it need eapecially ( 11 , the quacity of
patience by whech her fill share of the farm work is given to Nature t.) accomplish; and it needs especialiy (2), the exerense of quick-aIghted nbeervation hy which the enrliest natural indications of what is groing on, the enrliest intimations of the natural tendency and more ment whether to the ghon or bad, are detected io tise living creatures whirh the firmer rultivatea. Inte.i. pence, activity, atul promptitnde in earrying eut the mintine of operatimes are necessary in every other business as woll as that of farming ; but none other uniess it tion have equaily to to with itee, कn neede the for its snccesstul prosecution - and in nune nther a there so much need of patience. I do not mean eontentment, but a willingness and ability to wait for the full effeet of the cootiess inthyences of Nature. A quiek and watchenal eye, and prompt activity at the proper time have to bie united with the facnity of waiting till the proper time in order to gond agriculture.

Many an example, hoth mere incidents and whole lives, could be quoted io illuastration of the need of bith these qualities. Many of us have, I daresay, seen men nf streng would have course not bred to the boaness, or experience in pursuit of the object which they had net themoelres
regardless of weather, prejudices, habits; enforcing the imported hands if the home-bred labouress wery insufficient-in the end correcting nt great post their blunders, and eonfressing that the kmot generally ent rather than wathathant than overomene, that the mete enemy, so to speak, and not the emmity nad been conctured, and that the nutural muthut by which men as well as mere material are comverted, and by which thinge of thenselves come romm, lingimg satisfactorily on the uew ohement when mat on thent in aced, is not only the cold of enurse it must he confersed that every neighbourthood will furnish instauces chongh and those too of men who have heen bred to the businecs where the natural method, as I have called it, has teaded to listlessiness and idhoiess, nud emled in Nature niot being used at all, but left almost altopether to therself. done by a discussion of this subject on a public occasio of this still no doubt from other walks of life. And indeed, in my bumble opinion, the influence of the Royal Agricullural Society over this great subject as a whole, is most likely altogether over estimated. It win certaigy be greater, for of the intelligent and well educated tenan than in that of the "emock-frock" farmer of 50 acre who is little more than a labourer; but taking the former case, let us ask ourselves whether such a man, with the 14 or 16 years' experience upon a farm of what is necessary for agricultural success, which he has had since his marriage, is likely to ask for guidance o advice from any one whatever as to the education) which he shall get or give his soll whom he destines to succeed hin, and whose requirements for such a position lie must know so much better than any other person. The fact is, that in agriculture, far more than in any other trade or occupation, the present generation o practitioners is engaged in the education of the next,
There are more now probably than ever who are entering agriculture as the business of their life from probably will be always true, that the bulk of farmers liave been bred by farmers ; and whatever faults there may be in the consequent uphringing of so large portion of the middle-class population in this country, mast confess my belief that it is a fortunate thing for Il who are dependent on the cultivation of the land for is the keynote of pretty nearly all I have to say upon as the keynote of pretty nearly all I havect, that I believe it to bo a fortunate thing for landowners, a fortunate thing for labourers, and fortunate thing for the next generation of tenant f.rmers, that the education of farmers from childhood
unpmards is almost entinely in the hands of farmersunwards is almost entirely in
There is perhaps no one who would hesitatecertainly none who would henitate less than I shouldto accept the picture which any large-hearted public himself of a mordel body of tenantry-I say ferw would Limself of a model body of tenantry-1 say few would as truly representing the chief end and goal of real ugricaltural progress; but even for him and for the
iscomplislment of his benevolent desires I believe it to be a fortanate thing that the education of the future generation of his tenantry, who are to be \(s 0\) many ateps letermined the progress to that goal, is directed and if his tenantry, whom he mny believe to be still far shart of the goal in question. For, before all things, it is luecessary that whatever education be adopted for them,
it should, as its result, confer professional ability and skill. The education he might desire for them might turn out unselfish gentlemen, able, inteiligent, courageous; but in addition to all thin it must tarn out farmers who can pay thoir rent and make their Gusiness answer aleo for themselves aml fir their abourers, or the whoe thing will bo a failure. And it is, feel certain, therefore, well that the education of hands of generation of farmers is almost entirely in the better than any other clase what is needed for profemsional success. It is of such men certainly that I would in the first place takec unsel in reference to the profesional education of any son of mine whom I deatived for a time when he mast clove his school life and bigin his necessary a farin ; and all I should contend fur (i) niversel agninst them, though I believe I should have arrangement of a is ace from thom) would be. first, such an degree of educational comnleteness, (on the impartance of which Mr. Dyke Acland has long since most usefilly nsisted) make the best posible nie of the school term ife umin; and, stcondly, such an arrangement of bis hie upon the farm as should, without interfering with his requirement of habits of ekill and judgment in dealing for his detaild of farm practice, leave room and cime tet ais nequirement of that larger, more liheral, and i., Tracticatilic mastery of the various subjects which the the rank of the farm includen, which will lift him from Iaster Agriculture journeyman cultivator to that of

It is to the mecond of these pointe that I have now to o begiu early ind, as I eaid, the life upon a farm neede ion. I do not in order to perfect agricultural educe of examples-for it at to prove this hy an induction instances which would be necessary for this purposebut the opinions of experienced men are the result of may have been ivduction, however unconscionsly they proceed to gren arrived at. And some such opinions 780, bear Tetbury, We lute Jolan Sinith, of Bowldown 180 and 1800 . His a nnual sent, and leadine him to have been a shrewil, intell. time, and learing man among the agriculturiats of that anka mathe enjoyed a correspondence with men in Major Ogilvie, of Ehan his own. In a letter of his to
passage, which, however extravagantly worded, is, I
think, worth quoting on this subject. He says simply enough :-

\section*{"I nover know a learnod man who was a good farmer, an
therefore I never lamented the wat of an education. Tb
time of iff to make men scholary in the time for \\ 

}

I quote this as the utterance of a shrewd, intelligent and successful farmer, notwithstanding the utter absurdity and fully of which many will pronounce i sense which bly because of the trustworthy gool sornd addressing agricultural students, or felt in any degree responsibly for their success in after life, as, if their teacher, I should be, I would not utter one word in praise of scientific instruction, if they were to infer from it that it could in any degree dispense with the absolute
and paramount necessity of practical knowledge and skill, aud of that long-continued patient observation of Nature and of practice from early years by which they can be best secured. Bet it is plain that the old farmer bowever right he was to insist upon the need of a know. lodge "that coines from Nature," could have known ittle of science, which he here refers to under the word "learning" and "education," if he supposed that it tendency was to maise men try to pat Nature out of
its course, and so outdo everybody. Science, which teaches ns the limits impased by Nature, is, on the contrary, the guarantee of true modesty and humility. I quote now a more modern example of a judgment on told me long ago by the Rev. J. C. Clatterbuck, of Abingdon, and it has always eeomed to me full of usefu trath on the sabject of agricultaral education. It it some years since I flret put it into print, and it then mmediately went, the round of the papers ; nevertheles tell it once more:
A young man frosh fom the University, who had taken

 doponde. Mr. Was porfoctly oorreot,
adrantago to an asriculcurlet, ecto the follo
Take now the recently declared opinions on this mab ject of living men. One of the most intelligent and successiul farmers in the West of England tells me:I left alhoul myyeet before I was fourtoen, and went at once
 In the way aror loaving sochol had athould intite deapair of

A North Lincolnshire farmer, who lass had 40 yearn' experience of the life of a temant-furmer, and is well known and respectod in hic county, says:-
"I attributs my miccoss, under the good providence of ood,

A leading Nurfolk farmer anys:-
"I have not beon anrecocomful, bat I attribute that mocoese In agreat mongure to the
An experienced Keatish farmer writer:-

Lastly, Mr. Clare Sewell Roed, whowe name is well known in thia room, anys :-
"My individual experience is admily this: I TRs sent for
 in manoing farmos and eatates in various parta of the country,

If I had passed my whole life in Norforle."
And similar testimony to any extent could be quoted from every county in the kingdom-but, indeed it is not wanted, for surely it must be easy to convince a man is instruction in the art and business of \(a_{j}\) riculture.

Of course I would not say that this is all that is desirable, but it is the thing that is required. And fluere be any displeasure at my occupying the time fhe this I most wis the assertion of a truth so obvious as this, I mast say that, obvious an it is, it has seemed me as if it were sometimes in danger of being forgoten. I venture therefore to submit to those who are interested in this subject of agricultural education, that the young men whom they are anxious to equip iva their agricultural career, have to gain their ag.g it; and that therefore the aim and end of ictureral education must be professional ability. I \(2000 l\). or 3000 l . on which he is to depend as a farmer, well educated-guaranteed as such by all the distinc tions that the universities can award him, a proficient vell in the various sciences with which agriculture is directly connected-he must be upwards of 20 years of hge. He is not yet a farmer, and taking him, as for the purpose of this argument I am entitled to do, to be an average specimen of human nature, I venture with some confidence to tell him that a thorough good farmer be uever will be. For agriculture is an art and not a science, and the years be has spent till now on schooling chemistry, and botany ought most of them to have been devoted to his apprenticeship to the business by which his 3000 l are to maintain him and his future family A large and liberal education is, I know (or, I should rather say, I have no doubt), an immeasurable benefit To any man ; but it is simply mischievous and crueland will uitimately come to be 80 judged by the young man whose case I have supposed-to attach to the words "agriculsural education," as a professional guidance for him and such as he is, any other than the simply professional meaning which they bear. I entiroly agree therefore, with the anthorities already quoted, in insisting on the need of an early apprenticeship to farming as bing the eseential substance of an agricuitaral edacation
The teatimonies I have quoted are, oxtracts from foller statements, and the writers would, 1 believe, all agree with me in adding a good deal to the bare asoertion of such a truism as this; and perhaps the best way of making such additions will be to point out the difference between the Norfolk and the Kentish farmer lnst quoted. The latter would send his boy into the district where he is ultimately to farm ; Mr. Sewell Read would send him to a distance from home, and he attrivutes the chief advantage of his own agricultural education to its having been obtained in many different parts of the country. I believe in the latter statement and the adrice which it conveys, as the safer and the better of the two. And reeing that it is generally impossible to obtain in shit way that wider necenary that the agricultural student should learn the inner truth which underlies the varying particulare and shades of mgricultural and all other experienoe, so that the essence of every act that he directa, and of every fact that he observes, may be underatood apart from This wrapping of mere circumstances which disguises it ing. Ther truth is the subject falter of scientilic teaching. The sciences of dead and living matter-chemistry, botany, physiology, and others-thus certainly are parto a sound agricutural education, becanse they include and classify and thns truls represent the facts with which the farmer daily has to do. Any agricalturist whn is also to a certain extent a botanist, a chemist, a physiologist, has his mind as well as his mere hands and eyes occupied with his business, and his judgment is surer, safer, and more confident in unusual or untried circumatances not only because it acts upon this inner truth which cir cumstances disgnise to the mere outward eye-but aloo bocanse by larger exercise and freedom it has thus iteel become an instrument of greater aptitude and power. ought perhaps to beg pardon for occupying your thme with truime of this kind, and I will therefore conclude this part of my statement with a short reference to the way in which the practical and scientific parts of a complete agricultural education the desirableness of uniting the two that makes institutions of the cluss of the Royal Agricultural College so valuable. Such institutions should, iu my opinion, be not mientific but agricultural colleges. Their purpone, aim, and end are to turn out agricuiturists; their business is to teach agri-culture-agriculture, certainly, and therefore anything that will throw light on agriculture also. It is, bowever, difficult, and perhaps impossible, to give that prepon derating importance to instruction in farm practice in any scheme for the arrangement of the time of 600 80 young men at an institution of this kind, and there fore I am inclined to think that the best result will be obtained where such colleges receive young men after three or four years' residence upon a farm at home or elvewhere. They would at the College have for a year or two opportunities of becoming acquainted with the sciences, and their relation to the art and husiness of the tarmer, while at the same time the routine of work upon theCollege farm would keep fresh their familiarity already aequired with the practical details of farming. Friling
this, the alternative is that such institutions as the
Cirencester College should be placed in districts, such as Torfolk and East Lothian, which are full of young men learning farming, and where perhaps Mr. Paget's halfime systern might be brought to bear, so that a certain portion of time being devoted to practical work upon the several farms, a remainder would be available during which students of agriculture could assemble from all the farms around as students of the several sciences taught ane central institution for the parpose.
I may mention that in Scotland it is not uncommon, and it is desirable everywhere, for young men having become acquainted by several years' practice with the work of the farm, to encer the office of an accountant at tunities of attending scientific classes at the university and elsewhere-thus uniting the two most influential additions that can be made to the equipment of thoroughly accomplished agriculturist.
I am well aware this is but ecanty treatment of my subject; but indeed no other is possible within the time allowed me; and I have accordingly done little more than aim at a certain degree of fairness in my
discussion of it, by giving that sume prominence here in the scheme for the education of the farmer, to the importance of practical instruction and skill, which it Had there been time I could bave urged at greater langth, and of course with much greater force, the professional advantages, both direct and indirect, \(i . e\). , and as giving a higher social and professional intluence and atanding to the farmer-of that more liberal and scientific knowledge of agriculture which can be obtained only by a union of scily, however, thongh aloo no doabt, to the correction of the many other faults and inperfections of this paper, the discussion following it will in all probability be directed; and all therefore that I shall at present add is the following conclusi
to which I think this complete consideration leads. A young man of 21 or 22 about to enter on a far is unusually well qualified both to make his business answer for himself, and to make it respectable in the eyes of others, who, having up till 15 or 16 been well educated at, a school, has since that time been resident on a farm, or what is better, been resident on more than one farm, obtaining a practical acquaintance both in the field and in the market-place with all that the farmer orders and his labourers do ; and who during the last year or two has been at such a college as Cirencester; especially if during all this time upon these farms he has been taking some interest in those sciences taught there to which agriculture is especially related, -and especially, also, I will add, it all along he has social as well as strictly prolessional duties, occupations, and enjoyments of country life.
Perhaps even now he had better go for a year with a salesmau, accountant, or other professional man, and learn by practice the order, economy, and punctuality for himelf tucted business before he enters on business man to have no more than 2500 l. or 2600 l. at his dis posal, it will have nevertheless ultinately well answered his purpose, though so mucls as 5002. or 600l. has been spent by him if necessary in this way, and his capital thus diminished to this extent.
3. The Existing State of Agricultural Education.Our third subject is the existing stat education in this country. If this is to be measured by result, a great advance may be generally claimed as having been achiered during the past 30 or 40 years. No doubt there are exceptional poor clay land districts of small farms in the country, whence neither landlord, tenant, nor labourer-neither producer nor consumerget much more per acre than they did half a century ago. Bat it is impossible for any agricultural historian to avoid the conclusion that on the whole the pro-
ductiveness and fertility of the country have largely increased within living memory. And accordingly the pretuses which our agricultural historians-Mr. Thompzon and the late Mr. Pusey - have drawn are sufficiently grown anuualiy in Kingland than it hasever betore yielded.

By way of datum line for comparison, I may here give a short account of what might be called, from all I have heard of it, one of the example farms of Europe-the
Wilhelmina Polder, in the province of Zeeland, Holland, which includes 5000 acres, and was enclosed from the sea nearly 60 years ago. Mr. Vanden Bosch, a shareholder in that property from the beginuing, and all the time the resident manager of it, who is himself both a highly edacated gentleman and a good practical farmer -has all along kept accurate accounts of this thoroughly well organised estate. The land is alluvial, and nearly all more or less clayey; it is all arable, and is cultivated in six farms upon the plan of a long and carefully observed rotation of crop, in which, besides our annual English crops, Madder occupies an important place. From the decennial averages which have been atruck, in fertility. That the property is gradually increasing in fertility. Thas, comparing the 10 years 1821-30 with the 10 years \(1851-60,30\) years asunder, I am told that the average produce of Wheat per acre has
increased from 31 to 36 busheis, of Rye from 31 to 35 .
of Oats from 61 to 62 , of Barley from 50 to 55 bushels while the returns of Beans and Peas have been stationary. It is, perhaps, necessary to add that some considerable additions of rather poorer soil have been made to the original area during the interval, so that the average increase of the same soil ought propery sent. It mast be admitted also that an alluvial soil, naturally fertile, is not the best on which to look for increased returns; nevertheless, I am inclined to think that there are few districts in this country, though generally managed in a much less systematic manner, where, owing to land drainage, guano, artificial manures, and purchased cattle food, the increased to be on this, one of the largest and best managed farms upon the Continent. If, for example, the Cotswold district be taken for comparison-where we have a comparatively poor thin soil, - benefited but
litle by land drainage, which is undoubtedly the greatest fertiliser of all-there is ample evidence to prove that the Wheat crop, for instance, which in the early part of this century did not exceed 2 quartersan and Mr. Bowly states that the produce of mutton in that district is double what it used to be, the sheep being brought out at a year old weighing as much as they used to do at two years old. So much for produce. Rents on the other hand have doubled within 0 years, and the expenditure on labour, of 6000 acres within the district, of which I have the figures since 1774, has increased fourfold. On this farm it was 8 s. an acre up to 1787,10 s. \(6 d\). an acre up
to 1794 , 13s. an acre up to 1800 , and between 1853 to 1794,13 s. an acre up to 1800 , and between 18
and 1863 it has averaged 30 s. an acre, besides beer.

This is but a scanty illustration of a great subject but I do not think it is necessary to lead a laboured proof by onllecting the multitude of examples which would easily be forthcoming to show the increased productiveness of English agriculture during the present century. This will be easily admitted by every one; and f professional agricultural education is to be measured by results of this knad, we may fairly put in a claim for considerably increased professional abality during the period in question. Unfortunately, however, for the optimists, it is extremely difficult to draw with accurate discrimination the proper inference on this point from the facts before us. We have had land drainage very extensively adopted as a fertiliser, and we have had some millions of tons of guano added to the soil, and some millios also I presume of artificial manures applied during the period under review. There can be little doubt that experience has, during this period, taught farmers the policy of greater liberality and outlay in the treatment of the land than used to be considered the safe and proper thing; but the increased produce thus obtained cannot be put down altogether to increased professional ability or to better agricultural education. For there are three things contributing to this result:1st, the natural quality of the land; 2 d , the character of the machinery and raterial available for its proper judgment, skill, and mind brought to bear on the management of the whole. The quality of the land, notwithstanding Liebig's warnings, may be safely pronounced at least as good as ever it has been. The machnery and material available for its cultivation have wonderfully increased in efficiency and value, and obtained, even though the professional ability of the tenant farmers of the present day should be pronounced no higher than that of their immediate predecessors. I therefore leave any attempt at determining the point under discussion by reference to results, and fall back on testimony. And I submit it, as at least deserving the serious consideration of all who are interested in improved agricultural education, that while the testimony of experienced men, many of whom can speak trom personal knowledge of two preceding generations, is quite unanimous and clear as to the immense strides made by the general body of farm tenantry in general education, intelligence, and social position, there is nut by any means such certainty or unanimity as to their standing in respect of professional education and ability than their fathers. The general are better farmers than their fathers. The general impression among
those whom I bave consulted is that the professional and technical ability when much inferior means were at the disposal of the farmer was at least as great in davs gone by as it is now.
I have been in the habit for 20 years and more of troubling those whom I have known to be the leading agriculturists and the leading agricultural authorities in every county in the kingdom with circular questions on pretty nearly every agricultural subject whether of annual or only occasional interest that has arisen during that period; and the question of agricultural education has been the subject of a corresponderice of this kind during the past few weeks -so that 1 am able to speak with some confidence of the existing status, on the scale both of general education and of professional ability, of the great body of English agriculturistg according to the beat men among themselves. And I repeat it-the universal testimony is that while there have long been well edncated
whole country the general advance of the teanat? the score of general intelligence, education andry standing, has been very great during the part is generations. The following are examples of the reerins which I bave received.
Mr. Fewster, of Nailsworth, Gloacestershire, whel have known all my life both as a publicspirited phel thropist, and as a man in coustant business relations \(n_{i}\). the Cotswold farmers, says-
"Looking back from my point of view, embrnen a
spect of two genorations, the advauce of the agricultaiks
education, in general intelligence, and in social stand
enormous, and the advance is still progreaniva Compt,
the present generation writh their fathers, the
morai improvement is very striking."
In the same district another, himself a tenant free says-
"I consider the present tenant farmer, in point of odoence social standing and real intelligence, to bo far suparior th
past generation of farmers; of unassuming nannern and
exterior show, he is too often looked down contempt by his professional or mercantile and a

It thus appears to he the general opinion that the present generation of young men among the tenantry to whom, on the score of general intelligence, every boly concedes a much higher social position than their fathen had, possess no such superiority as regards that profesaional ability or skill to which one is at first calture has undoubtedly of late years exhibited.

\section*{Agrictltural Societies.}

There are two other indices of which I have thought ns likely to point out the truth on this subject. The one is the statistics of agricultural societies in this
country, which however have but a doubtful relationship to it; and the other is the amount of sales which the first, connected with which 1 have collected a lot of inmmatetete, I will here however, is still unfortunately andin sucecess of will here only say that the great number of the discussional Fgricultural societies, and pspecially indication rather of the interest in and anxiety for professional information which prevails-than as a pronf that there is nothing more to be desired or required in the professional education of the farmer.
I eee, for example, that Dr. Voelcher and Professor Bree, for example, that Dr. Voelcker and Professor
Coleman. Professar Buckman too, and others, are frequently appliod to by local clubs for lectures on Profinus departinents of agricultural science and practice. Fniertaken to teach a class of members of the Kingscote Farmers' Club, who have sought his help, so much of experience. of chemistry as explains agricultural are rery often the result of public spirited effort on the yet, even soratively few iudividuals in each county; already spread over the country an agency where is Soriety may, if it chooses, use in any effort th may make tion. For this ne professional agricultural educalast few weels in reason I bave peraevered during the these Sorieties. I have now full information regarding about 1200 such Societies in England-not one-third will endearour to make the list complete before sending Promme of comareunication with the great any other On the Salrs or Boors.
On the question of the sale of agricaltural books,
- Which of course afficote the question of general edu-education-(and I hope I need not sar that while anxious ubove everything that this Society should do what it can to promote professional ngricult ural eduat ion, Thave sought for information at large, and simply in
order to ascertain the truth, and aun most cordially willing to hear the lessons which it teaches, whatever they may be)-on the question of agriculturni book sales, I have information from Messrs. Black, of Elinhurgh; Blackie, of Glasgow; Fullerton, of Edinburgh; I sugmans, lidgway, and Routledge, of Londom. I also Lomdon and Edinburgh, who are the publishers of Mr. Heury Stephens's valuable agricultural works, and I his subjerry indeed that have not information on his subject trom them, because I cannot add to my list Mr. Stephens's Book of the Farin, which is one of our standard agricultiral works, and has doubtless as large circulation as any book of its class.
I also applied to Mr. Churchill, one of the leading publishers of medical works, for information of the sales of profensional worke to the members of a
thoroughly well educated profession, that I might have some standard of comparison by which to eatimate the indication afforded by the figure of the agricultural publishers. Twenty years ago Mr. Churchill broughs out a set of professional manuals on Anatomy, Surgery, Chemistry, Phyviology, Materia Medica, \&c., by such inen as Golding Bird, Erasmus Wilson, Ferguson, Taylor, Fownes, Carpenter, and Royle. The number in the census tables connected with the medien profes. sion in England and Wales in 1801 was ubunt 36,000, of whom, however, only 15,000 or thereabout are doctora, surgeons, and apothecaries. The sale of Mr. Churchill's seven manuals up to the present time has been in all 103,500, or on an average 14,800 of each. They were all designed for the medical student. This is the only fact which I shall quote in illustration of the relation of the publisher to a thoroughly well educated profession. I doubt not the experience of Messra. Churchill is paralleled by that of other publishers of medical books.
But compare this with the experience of the publishers of agricultural books, who have so much larger a constituency. First, however, what is their public? There were 30,000 landownern, 250,000 farmers, 16,000 farm bailifs, and 500 (socalled) agricultural students in England and Wales in 1861. But many landlords fill public offices, under which they are returned, and so the tabular number is in this case declared defective.
It is probable, however, that there may be some of the class who might be better deecribed as swall farmers cultivating their own land, and this would perhaps diminish the number of the class on whom the agricultural pubishier would depend. I therefore take
30,000 as the true number. As to farms-of every 1000 holdings in ten English counties, there were only 220 over 100 acres each. I take therefore only 20 per cent. of the whole number in the census returns to be available for publishers. To 30,000 landowners, therefore, add 50,000 farmers, and some 10,000 farm bailiffs and agricultural students, and you have 90,000 altogether. If to this there be added the corresponding numbers in Scotland and Ireland, we may assume that
the "public" of an agricultural publisher in this the "public" of an agricultural publ
Now what are the sales of agricultural books? Messrs. Longuan have sold about 9000 copies of Loudon's sold 9500 copies of his Rural Cyclopædia, published 1818.52, in 4 vols. at 20 s. each; and 5500 of his Farmers' Cyclopædia, published in 1853.6, price 40 s. Blackie has sold 8500 conies of the Agricultural Cyclopælia, published in 185 f in 2 vols,, for 31 . i6\%. Of Professor Low's excellent book on Practical Agriculture. the first edition of which was published in Edinburgh, Longmans have cince sold 5091 copies up to June, 1861 Ot other books I udd the following lift:-

I bug to thank the publishers of theser molis for so frankly giving me these illuatrations of the demand for agricultural works. Of course there is a large number of wher books addressed to farmers which liave not had anything like the success of these. But I think that even here, considering the very large public to which these books are addreseed, and the contrasted demand for professional bonks in the medicul world, we havo evidence rather of an imperfect than of a satisfactory state of professional clucation in that of agriculture. If I hay the burden of the amallnes of the reading public for agricultural books to the account of proleasional rather than general orlucation, it is partly because that mublic inclucles 30,000 landowners as well as 60,000 Euglish fariners.
And I believe the result of the whole inquiry to be, that it is the promotion of profeasional rather than of general education that is most needed in the Englifh agricultural world.

\section*{What can the Agricoltural Society do ?}
4. The Relations of the Agricultural Sociely to the Subject. - I come lastly to consider how this Agricultural
Society may best promote the improvement of agricul. tural education in this country; and I shall not tax your patience for more than five minutes longer.

Three and twenty years ago a lecture on the importance of professional education for agriculturists whe delivered by the late Robert Jeffrien Brown of Cirenceater, before the local Farmeri Clab at Fairo advoçcy and subsequent energetic labours. The Royal Agrieultural Coilege has long been at once a eplendid illustration of the power of a local farmers club when once its interest is aroused, and a most unelui educational agency for the advantage of the agricultural community, for which we have to thank not only the intelligence and energy of its founders, but much public spirit and self.denial since. I do not refer at any length to its past services or present efficiency, for both are related by Mr. Lawrence in the current number of our Journal, but its history certainly may be cited na \(n\) proot that our local farmers' clubs may be must usefully taken into alliance with this Society in connection with the work of agricultural education which is before ito

What has to be done? There are probably 30,000 farms of 200 acres and upwards in this
country; occupied therefore by men of a certain substantial middle-class in society, whone sons may thus command a fair middle-class education. If their professional life average as much as 30 years, then 1000 young men of this class are every ycar draughted in this country from the rank of agricultural student or apprentice to that of professional agriculturist. Now we may assume that there is at leasta period of three or four years in the student or appren-
tice life of each when educational atimulus and guidnnce would be professionally useful; and it thus appears that there is always a constituency of 3000 or 400 yourg men in England open to that educational influence, which this Society might, and, as I believe. ongit to exert. To apply the rein and spur to this

How is it to be done? I know un other way of offering the stimulus and guidance which are needed thant the old-fashioned plan of offering prizes to candidates and determining their relative merit hy examinatinn. It is hardly possille, no doubt, for any dispassionate observer to avoid the conclusion that the fessional success, and of looked-for good social position, fessional success, and of looked-for good socia position,
are really the guidance and the stimulus by which agricultural education is, and will always be, efliciently promoted in this country. Nevertheless, it is consistent with all experience, both that valuable prizes and distinctions to be won at competitive examinatious are an effective addition to the natural rewards which elucation confers upon the student; and that the programme of trustworthy examiners is an effective addition to the
natural guidance which experience confers upon instructore.
I have, indeed, heard it asserted, that this systen of examination and reward is wholly inapplicable to the there is no possibility of testing agricultural knowledge and efficiency except in actual practice. The objection might be made with exactly equal force to those examinations throngh which naval officers take their successive steps in rank, and there certainly it is altoyether untenable. But indeed I am quite certain that all who have had any experience in agricultural examnations, whether they be professors determining the industry and capacity of a student before he is passed, \(r\) agents ascertaining the ability and qualifications of a bailff before he is engaged, must admit the power of an
examiner to ascertain whether any caudidate for the
rewards at his dipposal has been a diligent and successfu agricultural student or apprentice.
In order then to carry out a systern of examinations of this kind, which 1 believe would be perfectly efficient in agriculture as it is in other professions, I would have this Society seek the alliance of the leadinto eight or 10-I do not know how many-districts, which the Society visits in rotation. There are in each active farmers' clubs, with lots of vitality and energy The Hexham, Newcastle, and Penrith Farmers' Clubs in the north, the Wirral Farmers Club in Che Shire, the Farmers' Club in Gloucestershire, the Hungerford, the Dcrchester, the Botley, the Maidstone Farmers' Clubs, and many others in the south. Any of these, I am per suaded, or where there is more than one in any of th Society's districts-then two or more united-could, and I believe would, readily accept a commission from this Society in connection with this subject. I is surely not an extravagant supposition that in every one of the districts on the society's ist clubs in each from landowners and others interested in agricultura property, to be awarded by the Society's examiners in ubstantial scholurships and prizes to the most intellient agricultural students belonging to each district If only ten or a dozen young men in every district should at first come forward to claim these rewards, great
good would be done. But I cannot doubt that, stirred ap by the local agencies, which would secure just that lind of publicity which the scheme requires, largely increased numbers would ultimately strive for the honours and substantial advantaiged of nuccess before the local Royal Agricultural Society's professional ex minations.
I do not, however, preterld to aliwetist this intitter ift any detail. No dortbt there are pletity of alifficulties in thit way, but hone insuperable, 路 I believe. At any rate, I earnestly hope that thil great Society, which hide successfully accomplistred one indest serviceable piece of professional education dusing its career-I mean, erlucated the great body of the landowners of thid country into a thiste for agricaltural pursuits-wil
make thic effort which is expected from it to promote the professional education of those who are still motre directly dependent apon the cultivation of the land for their support.

We add the following report of the discussion which ensued:

Mr. Raminas Bariste thought the meeting should express its obligations to Mr. Morton for the very valuable
information which he had laid before it. He had great pleasure in proposing a vote of thanke to him for his varied and interesting lecture.
Mr. Dent, M.P., zeconded the motion. There conld be \(n \mathrm{n}\) question as to the very great value, and to the equally great fairness of the lecture. The remarks in
thie early portion of it as to the requisites for making a good farmer were especially valuable. He cordially concurred in whit the lecturer said abont quick-sighted apprenticeship, and about business habits being requisite to mate a man a good farmer. The great difficuity was so to educate farmets as to enable them to cultivate land with ability, and at the sime time to pay their rent and make a living for themselves. Having been
for a short time apon the Education Committee of the Society, he must say that the more they studied the question the greater were the difficulties by which it appeared to be surrounded. The chief difficulty was that while they wished to impart a good education on general subjects at school, ther desired also that early habits of observation should not be impaired, but if
possible strengthened during the school period, and he could quite understand that to keep a boy too long at school might tend to injute his powers of observation. Speaking, however, from his own experience of farmers -not small farmera, but men who farmed from 200 to 250 acres-he thooght very few of them kept their number of the soins of such farmers left school as early as the children of labourers; and, ats a natural consequence, their education was of a very meagre and indifferent deveription. The worst feature in the case Was perhaps that when these boys left school it was unable to obtain any experience of farming beyond the limits of a circle, say of 10 or 12 miles. If after leaving going on at a dist ne from their homes, it would be a great point gained. It seemed to him that the better to establish scholarships encourage education wa A suggestion upon that point had been thrown out by Mr. Morton, and the same idea had occutred to another active member of the Society, who was also on assistance of farmers in different localities-in fact that scholarships should be instituted by local authorities Wacting in conjunction with the Council of the Sociery. either succeedin 20 years he had seen twelve young men them, and he believed he was right in saying that not learn the buivers of farming. He had endeavoured to mpriess upon the farmers in his heighbourhood the
advantages different a wider range of observation, but he was always met with the remark that they could not be spared, as they were so useful, so teady and reliable; and that character o
them he (Mr. Dent) could from personal observation them he (Mr. Dent) could from personal observation
instly endorse. He did not deny that there had been justly endorse. He did not deny that there had been
considerable improvement in the farms he alluded to o late years, for there unquestionably had, but he could not help thinking that it would have been a grea advantage to the young farmers if they had spent a yea or two away from hoine in obtaining a wider range of
experience. In some letters published in the Agricultural Gazette on this subject he found the writer making great complaints that the young farmers of the stick sufficiently to their work. He did not see how the Society conld cure that, which was rather, he eared, a general tendency at the present day Farmers were increasing in numbers; many young min
ambraced farming as a pleasant occupation, and lisving embraced farming as a pleasant occupation, and should regard as the most agreeable part of the farming life the amusemerts of the hunting fieid, and this possibly might have given rise to the statement.
Mr. HocusND, M.P., after expressing the pleasure He had felt in listening to Mr. Morton, dhose observations were as practical as they wite lucid, remarke that all connection which should exist between the Rdyal
Agricultural Society aud the local Societies. The Agricaltural Society and the local Societies.
course in the liands of their relations-the present farmers; but if, through its connection with various beal sobieties, the Royal Agrictiltural Sobiety Wial enabled to send examiners through the country, those examiners would, more or less, be guided by the rela-
tives, who were generally members of the local Societies, tives, who were generally members of the local Societies,
and thus that Society and the local Societies acting in and thus that Society and the local Societies acting in
concert would carry out thie educationd views thich had beeu agreed upon, without requiring any riew dachinery, but merely taking advantage of that which the fact that while young men were employed in farming they took their recr eation like other people wh
lived in the country. He could not see gin harm in that-on the contrary he thought good would emanate from men meeting together and passing over parts of the country which perhaps otherwise they might neve ee. But there was another circumstance which affected the future agriculturist. Edacation in some shape or other was now entering more largely into
agriculture than it had ever done before, and in this country it invariably happened that a large additiona athount of capital was employed in any trade into hich improved education entered. Capital and educa ton combined were entering into the farming business, in the number of small farmes. Men of capital and education would not be sitisfied with farms of 100 or 150 acres, and it would be found that the introduction of machinery requisite for the working of large farms and the appliances of science in cotinection with agriculture, must have full and fair play. If there ore the Society desired to be prepared for the great changes which were taking place in the agriculturai world, it must either by co-operation with local societies, or in some other manner, aim a pon this respect were becoming tore It they looked to the advantage of the fature farmer they must endeavour to supply him with sciestee in connection with agriculture to a much greater exten than it had been hitherto supplied. Although, as Mr Morton remarked at the commencement of his lecture reparation for the harveat, once in the year, yet the harvest, and the preparation for the after crops, would be advanced to such an extent \(b\) the improvements that were now being made, that the inconveniences of weather and many of those evils to which farmers had hitherto been subject, would perhaps, ere long, be in a reat degree, if not entirely, avoided. On these grounds
 ducation for the sons of farmers.
Dr. Crisp remarked that until an agricultural college was established by the Goverament, which must be the case ultimately, there would never be a proper system of education for the agriculturists in this country
He would like to see such a college in with a regular staff of professors, where student would be enabled to take a degree, and he had no doubt that the beneficial effects of such an insti tation would extend throughout the country. The advantage of giving prizes was very doubtful. At
Guy's Hospital the prize system had been discontinued because it was found that when a student had to work himself up almost exclusively on any special sabject the devotion of much time to that subject was in arious to him in atter life.
Professor Coliemar entirely concurred in that part of ments of the whichr M . Morcon discussod the require ments of the farmer. He believed it wis a tendencs of the preserit day rather to forget that a man must be educated in the practical detaits of farming. But anleas he was broaght up to underatand every single after all the great thing to be arviral oto whil
as possible to see a stader shabled as entirely to the farm on which they were brougt a knowledge of scientific principles was equally tant. If a man was to keep aliead in the present if he was to he well up in the great discoveries whith
were being made, he must understand were being made, he must understand the reasons
every detail of practice, and look carefully process in farming. Having had mach everga the education of many young men in the institution which Mr. Morton had referred, he had obserped great difficulties under which those young th aboured, from the want of that general prelimine education that would enable them to graep scientific truths that were there presented ts the
He had seen, especially in He had seen, especially in the carlier days of the institution, young men entering who left the penem school at something like the age which Mr. Mort uggested as the right one, viz., 14 or 15 , baving atte. wards lived for three or four years on their fathen arms, and he was afraid spent a large portion of the time in huntirig and shooling. They came to the intitu opportunities unprepared to take advantage which they oughe offered to them, and the knomled over their heads. Therefoquired passer coupleh mportance of agricultural details, he beld it to bo great moment that there should be a good geone a knowledge of the practical details of farming if ariy an age as Mr. Morton had suggested
Mr. Moored did not agree with some of the previen peakers as to young men who intended to be pmotica farmers spending their time in the hunting field, and simitar aimatisementis. When they went to farmiog the hon atick to it and for himself, be never wat pupil without stipulating that there shonld be on sporting while he remalined with him. When the other day, Mr. Constable toid him that arrang ments had been midade by the local farmen' cla at Kivgeteote for a couribe of letitive de delivered by Mr. Churcli, the chemist of the Rope Agricultural College. This appeared to him to be education, and he hoped it would be imitated places. Sometime ago lie (Mr. Moore) was in in establishing fan agricultural library at Faringzian at which he was happy to say the average attendan was now between and ta home, which had proved beneficial.
Sir W. Stirlive observed that they coald not \({ }^{2}\) pense with practical industry by setting ap scientix acquirement as if that was to be bee prolly found tha gentlemen farmers were failures. It was the sume commerce, is which mien of great education nilom succeeded. Inversely, the lato Mr. Cobsen

Encomragement of Agriculture, Arts, Science, ManuHactures, and Commerce. Fourth Cowncil Meefing. Present, his Grace the Duke of Riclimond, Pre 1865. Viscomair ; the Marquis Camden, Viscount Sydney, J . Clarke Jervoie, Bart, M. M. Miffe, Br. Benyon, M. Mi.P.
Mr. Melville Portal, Mr: W. Barrow Simonds, Mr. Mr. Clutton, ; Mr. Druce, Mr. Middletnn, Mr. Spiers,
Bartelot, M.P.; Mr. Ramaden, Martiol Deedes, Lieur. Rigden, Mr. Woodunan, Lieut The and Mr. Pannett.
read and conflemed, the eop
taken into consideration, and some progress made in the eximination and revision of it.
The question of outlay in the purchase of plant and she ding was then brought on, and a letter read from Mr. Jonathan Gray, of Batb, with reference to the mode adopted in the Bath and West of England
Society, when it was resolved to hire and nut to Suciety, when it was resolved to hire and n
purchase. A long discussion then ensued as to amount of capital necessary to start with, and the following resolution was finaily adopted unanimously :-
'That members be invited to the current expenses of the Society nntil the annual subscription become due, January 1, 1866."
On the motion of Lord Eversley, the following Members of Council were appointed the Finance Com-
mittee for the current year, viz., Mr. Benyon, M.P.; mitlee for the current year, viz., Mr. Benyon, M.P.;
Colonel Lennard; Mr. Lyall, M.P.; Mr. Melville Portal, and Mr. Rigden.
Thanks having been voted to his Grace the Chairman, the meeting, was gdjourned to Wednesday, the 24th inat., at 12 o'clock. G.B. II. Shute, Secretary.

Bibningham: Institution of Mechanical Engineers. -At the late mee'ing of this Institution the l'ower to Cultivation" (hy the late Mr. Juhn Fuwler and Mr. David Greig, of Leeds), giving the results of Mr. Fowler's experience in steam cultivation during the last eight years, in continnation of a prevlous paper read by him upon the same subject.
Tho difficulties that have been met with in applying steam power to cultivation have arisen from the irregularitiog in the
level of tho ground, the changes neecsary in the position of
the machinery on the ground, the necessity for moving hoavy

or driving were attended with serious difficulties, from the
wear and tear of the rope and the grooves of the driving
Tulley. the valnable mechanical contrivance known as the "clip
drum," in which a sufficient bite is obtained by only half a
turn of the rope round the driving drum. This very ingenious
\(\qquad\)
\(\qquad\)
\(\qquad\)
\(\qquad\) the rope. and such as effectually to prevent any slipung. The
width of opening of the two rows of clips is adjusted for
working with different sizes of ropes, bv having ne rnw centere upon the body nf the druan itself, while the other
row is centered upon a ring, which is gerewed unn the body On that by turning round this ring in either तirection the increased or diminished to exactly the same extent in every exbibited, and a filll size specimen of one of the pairs of clips.
In order to allow for working fields of irregular boundary
\(\qquad\) the rope becomes reduced by the narrowing of the moundaries peed of fise of a pair of barrels geared together with a relative ore fnot length of rope from the ne barrel, wind up five feet length on the other; and thus all the slack is taken up and
the rope drawn tight before the implement can start to work
For retting heavy eogines moved about over ground where no it cinnot be broken by the full steam power, the steam itself being thus the weakest part of the whole machine; and the
width of the carrylog wheels is incresped to such an extont as to ensure carring the engive over the wettest and sifteat and Weight are also used in some instances, placed on the
opposite headlands of a field, and both constantly in action, diawing the implement back wards and forwards bet ween them,
instead of a single heavy engine at one side of the field with an anchor at the opposite side, as previously described. The firnt
ro, used for steam cultivation was made nf inn wire; but this
was so unsatisfuctory, from its boftuess and want nt dirability
was so cinsatisfuctory, from its anfuess and want of dirrability,
and also from its graat weight and the power consequilention
absorbed in dragging it, as to cneck for a ime the application of steam power to cultivation. Steel wire was then iutroduced
for the puipnse; and in consequence of its great strength and in the machnery bs which the ropes are driven, and alon in the
quality of the wire itself, one steel wire rope now lacts for the
cultuvatinn of from:000 (n) 4011 ) acres, accoring to the nature rove at ןresent userl, of which a specimen was exhibited, is 11.1nths inch diameter, and wotghs about 2 lb . per yard, ran-
ning on an average 9000 miles under a tension of \(25 \mathrm{cwt}\). , and costing about 2 dq . per mile run. The diffioulties that would

The Cullivation of the Turnip and Swede, with some Remarks on the Conditions which Promote their Successful Growth. Pp. 26. Bg Proctor \& Ryland.
W. Hodgeetto, W. Hodgetts, 22, Cannon Street, Birmingham.

This pamphlet is no doubt a trade circular, whose mnin purpose is to promote the sale of Messrs. Proctor \& Ryland's excellent T'urnip manure, but it is also a very good and useful account of the other conditions of successful Turuip culture; and the original object, which is very likely to be attained by it, is no reason why we should not call the attention of our readers to it as,a very useful essay upon the subject which is thit month occupving the attention of all arable farmers
 fair specinuen of the wat in whice the author hat accomplished his task:-

In ordinary seatoins fhe teval method of bowing the seed, as soon as the tillage operations are comoleted, appears to answer satisfactorily ; but when the seasons are unusually dry there is a great advantage ganed by modifying this mode of procedure, and it is a practice which has been extensively adopted on many of our best-managed light-land farms. The land haring been ridged and rolled, the mannre is spread over the surface, and the ridges are then split back again and rolled ready for receiving the seed but, instead of sowing the seed innnediately, as is the general custom, it is delayed for 12 or 14 days. There are one or two reasons for this practice which are worthy of notice. The chief inducement is to give time, so as to enable the natural moisture of the land o rite into the recently-wurked soil. If you examine and shortly after it has been worked in dry weather you find a moist layer of eatth on the surface of the inge which covers up a dry layer of earth beneath. When the seed is sown upon such a ridge the moisture of the upper soil causes the seed to sprout; and, as ite roots pierce into the ground beneath, they enter irier soil, from which they can procure no moisture, and, therefore, no nourishment. This causes a check in the growth just when the Turnip beetle is busy at is work ; and untess there should happen to be a fall f rain, the crop is sacrificed, or, at any rate, seriously injured. But when the ridges have been ready for sowing 12 or 14 days, generally the moisture of the soil will have risen into the ridge, and no such check can arise, but if the land should be too dry for the seed to sprout there it waits for rain, and when the supply comes it grows as if it were in a hot bed. Under such circumstances it is a matter of no importance how dry the surface may be at the time of sowing. Should the surface soil be moist enough to make the seed sprout, its roots find an increasing supply of moisture the deeper they go. We have known a similar system most successfully carried out When the Turnips were going to be sown on the flat and the secret of its success is that the seed cannot grow before the soil beneath it is ready to secure it from any check in its early growth.

There is, however, another inducement for adopting this practice. It often happens that two or three weeks before the usual time for sowing, the weather is dry and admirably suited for finishing the land for the seed, but hesitation is felt about doing it, because the more usual custom is to sow the seed as soon as the work is done. On these light farms it has been proved that advantage may be taken of such favourable weather, and, the p:eparatory tillage being completed, the land may be allowed to rest until the days fized for the sowing.

\section*{Calendar of Operations.}

Merse of lBrewiceshire: May 15. - Wintry weather, extending far into March, delayed the sowing and vigorous braird. April was bright and warm, with vome rain aboat the middle of the month, which inter-
fered with Porato planting, and on the 25 th the protected thermometer marked \(72^{\circ}\), the air being warm and growing. The werry May, however, was ushered in by the inevitable fronty nights which produce what is called Maydew, and since that we have been enjoying a most upseasonable week of raia and cold north winds. The downfall of two ufonths amounts to 4 inches. Wheat fields are fow and far between, but they Wheat lost no plant, and may be rather thick in the ground. Barley is, in some light land, damaged by wireworm; but Oats seem to have escaped the grub. Small patcbes of Beans are to be seen, brairding well but late. We have a splendid show of Clover generally; but a picce that failed was ploughed up and sown with Tares and Beans, which will come in as a fine change for weaned lambs. Our ewe flock was lambed on Turnips and corn, and there was not a case of inflammation, but the casualties among the lambs were very numerous, and have reduced an otherwise great crop.
Hoggs have done capitally with full Swedes and a little corn; and the half of them are away to market, after three weeks young Grass, prime quality of mutton, but leaving lighter fleecer perhaps. Last week's rain has largely prevented clipping, and some we know must have gone three weeks aince wasbing. a part of 2-year olds getting 8 wedee, hay, cake, and meal; with good promine of cut Clover to fall back upon next month, if prices do not please.
Corn of all kinds has measured poorly, and been difficult to sell all winter; and the rise in price has come too late to be of any use to farmers; but we trust a healthier feeling in the trade has net in, and will help the next crop.
It is now high time that we had begun to sow Sweder, but none but the lighteat soils can be touched just now, and the weather is far from promising. The operation will be at least a week behind the nsual time. J. T.

\section*{Notices to Correspondents.}

Brabla Coos: \(J W R\). Your queation is an advertisement. Apply to any poulterer.
 I should feel obliged if any of your readers or correspondents could informu me as to the cause, or prescribe a remedy for the great lofs I have had this season in lambs. Out of sor have lost 10 in about a month; they appear to be seized
alddenly, Iroop their heads, shut their eyea, stand motionfildतeniv, druop their heads, shut their eyea, stand motiontheir knees, pitch on thelr nose, and then fall sideways. They can take no food, and it is with much difficulty you can open their mouth to apply any remedy; they generally foum, or rather slobber at the mouth, sometimes have the acnur nlan. though not invariably. The finest lambs are
taken. Sherherda in the neighbourhood cannot account for 1t. My tutcher can find no canne why death should ensue, and all the consolation I can zet from any one is, "Lambs nlways did die on this gronnd." and they think there must be anmo prisnnous weed or plant, or something that kills them. I thould say part of the ground where they have been folded was flonded the bexinning of February last, well as where it hns. The lambe and ewes have heen on Trifolium. the ewes having Mangels and bay and strawchaff, half aud half, but now having all hav, Mangels, and Trif.lium. The Jambs bave hav, Linseed-cake, crushed Beant, and Barley, equal parts. TThe symptoms certainly asirt ine idea that nowo poizooura plant might bo indigenous from too much st that or determiontion of blood to the brain the ise of Barley, which has been known to produce similar effects. This, a post mortem examination should have revealed. Chance of sitnation and of food, with oily purgatives, offer the only cure that can be suggested. WOS 1
SIze or Fazme ras soomand: I. The following table ililustrates it:-

Wroms: Statist. The following are the rasults arrived at in a Paper by Mr. Purdy some time no before the Statistical
Society: -Mr. Purdy's paper conclude principal facts for the different parts of the United King Jom tozether. It was shown that men's wages in Figland and Wales averaged 118. 66. ; in Scotland, 128.9.d.; and in Irelants Tr. 1d. That in 23 years the rise in the English wages had only been 12 per cont. ; but that in Scotland, at Ireland orur 57 per cent. It was atrenuously maintained Ireland orur sis per cent. It was otrenuously maintained that the Euglish wagen were kept down by two causes, viz.,
the cruel snd impolitic seettlement laws, and the large expenditure firr out-door relief. Is it not manifest that when We distritute in England 3,000,0001, a year as untested relief among the labouring population by the hands of the ornployers of labour, we place at the disposal of the latter an
instrument as powerfill as it is pervicious for depressing the instrument as powerfill as it is pernicious for depressing the
sair wazes of the workman? It is well known that the lo wages in England are paid in the most pauperised counties But in Ireland, where there is no out-door relief, the leant and the most ranuerised provinces are on a par as regards the wagen of independent labour. In Ulster, men's wages Munster, the most pauperised has fawest paupers, and in week less. Taking corresponding districts ine only 1t d. a find that in Noring corresponding districts in England, we they are ouly \(98.4 d\). , or 30 per cent. less. Is there any escape
frous the conclusion?

TO HER MOST GRaCIOUS MAJESTY TEE QUERN.

IMPROVED PATENT LAWN MOWER FOR 1865,
AS RECOMMENDED BY THE JUDGES OF THE ROYAL HORTICULTURAL SOCIETY'S SHOW BELD JULY 20,1864
GRERNS PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judges at the Roral Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were given), and, at the same fime, fuggested a slight alteration, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Mesars. T. G. \& Sun beg to state that, owing to the great demand for their MCHCHINES in past years, they haw hern undile to execute orders with that deepatch due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangemunts in their premisce, whereby they trust to be in a pration to aend off all orders the day they are received.

\section*{PRICES OF HAND MACHINES.}

 Rarties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to provent them from getting darnagod : if retumed, two-thinds will be allowed for them

PRICES of HORSE, PONY, and JONKEY MACHINES, including Patent Selfodelivrry Box; Cross Stay eompletr; suitable for attaching to ordinary Chain Traces or Gig Harness.

The 26, 25 , and 30 inches can easily be worked hy a Donkey, or by Two Men, on an even Lawn, the 35 and 36 inehes by a Pony, and 42 and 45 inches by a Carriage Horse ; and, sa the MACHINES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaring the M.IClINSE.

Both the HORSE, PONY, DONKEF, and HAND MACHINES possess (over all other Makers) the adrantage of self-sharpening : the cutters being steel oin each siue, when they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite culje of the cutter against the bottom blade, when the MACHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The aboro MACKINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Ruilway Stations and Shipping Purts in Raghead; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

(Moule's Patent.)
manufactured solely by

\section*{WHITE \& CO.,}

29, BEDFORD STREET, STRAND, LONDON, W.O.
The pectliar Advantages of these Closets and Commodes over the ordinary
First.- That the deodorising material (dry surface earth, or clay, or other subsoil) is the best for the purpen and at the same time is the cheapest and within the reach of all classes.

Secondly. - The supply of such material to any house or premises may be much easier than the supply of were by a forcing pump, and its removal after being

Thirdly.-Its application by the means provided in these Closets is immediate and effective; so immediate that so effective that all ferment: nd all escape of noxious aises are entirely prevented.

Fourthly. -The expense of these Closets, in comparison with that of Water-Closets, is, as to the frst an rifing, and as instance, there is no expensive cistern required, and there are. ead pipes to burst in frosty weather.

Lastly--In all large Establishments, such as Hospitals, Union Houses, Schools, Gaols, and Asylums, a ret considerable sum may be saved annually in the production of a valuable manure.

The efficiency of these Closets is so great as to be scarcely credible to those persons who either have dot too hem or seen their mode of action.

Price of Apparatus without woodwork, 20s. per set.
***The different forms of Closets may be seen at the address above; and Prospectuses will be forwarded on application.

B. FollowsyiMS, Paritase and Victoria Nurscries, prepared to supply strong P., begs to announce that he is now Novelties, which he has nuuch pleasure in offering for the first The following four Fuchew FUCESLAS.
offered and cannour Fuchsilias are the most novel and distinct yet tion of Mr. Wyess, Garilener to Her Majesty, Buckingham Palace, certificates of maerit. Amonggst novelties and sacquisitions ind received
of late, this undoubtedly is the most distinct, but of late, this undoubtedly is the movet dies and and, \({ }^{\text {acquisitions introduced }}\) but present it must
not be looked at in the light of a florsst flower, but as the type of an not be looked at in the light of a flornst tlower, but as the type of an
entirely new race, producing its clusters of flowers quite erect. Its
babit is superior to the light varieties habit is superior to the light yarieties of the ordinary drooping kinds,
and it blooms profusely throughout the sits and it blooms profusely throughout the season, thus makng it a very valuable decorative plant, and invaluable for supplying cut flowers, previously sent out. No. 2 , a well-tormed flower, with great width of sepal. No. 3 is the finest proportioned double flower yet offered,
No. 4, quite distinot on sccount of fits serrated petale To.
No. 1. FUCHSLA ERECTA, rar. NOVELTY.-Tube and sepals pure soft rose, shadmg to a white base. A very nice proportioned flower, its habit good, producing large clusters of bloom; leaves marbled and veined; a decided acquisition.
No. 2. FUCHSIA AG.1.MEMNON.-Rich scarlet sepals, broad, and of great substance ; corolla very double ; colour dark p.
towards the base with flery crimson; habit first-class.
No. 3. FUCESIA MAJESTIC-Carmine scarlet sepsas, tube of great substance,
feathered to the base. Unele
yod coubtedly the finest double Fucheia yet raised.
No. 4. FUCHSIA SERRATIPETALA.-Corolla barrel shape, rich mulberry colour, each petal evenly serrated; scarlet tube and
sepals, the latter reflexed to the tube, showing the feat sepals, the latter reflexed to the tube, showing the feathered base
of the corollit. A grand flower for exhibition purposes. Price 7s. \(6 d\). each.
NEW SINGLE PETUNIAS.
STRYATA PERFECTA (Hollawn). -The production of Mr, Holland, Northumberland, the favourites of the past season. The variety now offered is quite distinct in character, having blush-whitte centre. The flowers are of a medium size, given ood shape, and constant. The seedling plant when exhibited waod shape, and high, and as much through, covered with flowers, thus showing from the Royal Botanic and Royal Horticultural Societies,
July, 186\%. Price 5s. SPLENDIDA (WrLLAMEs).-Very Large and ditinct flower, pure
white ground, having four bars or White ground, having four bars or club-shaped stripes, of rich carmine diverging from the centre, the outline occasionally
broken by a smallil bloteh; ; good free branching habit. Received
First-class ( ertifleate, Price PURPLE BEDD
height, with free branching huperior variety; being of medium heigh, with free branching habit, requiring no pegging down.
Petunia fet offered thed that it will be found the best bedding Petunia yet offered, has prepared a large stock to supply at
moderate prices. Price \(18.0 d\). each ; \(12 s\). per dozen. NEW CALCEOLARIA.
BIRD of PARADISF.-Colour bright orange-red, with a margin of yellow, the whole flower minutily spotted, medium in mize, good suitable either for bedding or pot culture. When grown as a fors, plant, its flowerng season may be prolnnged up to Christmas, a
time when such a string colour will be most aceptable.
Figured in flural Magazing Prour Now ready, post free, a NEW and DESCRIPTIVE CATALUGUE

MEETNOS POR THE ENSUNNG WEEK \\  \\ Linnean
Coral Ho
Pelarro

}

A FEW weeks ago, when attention was drawn to several kinds of Spot IN Orchids, one affection was pointed out which is more speedy in its operations than all the rest, and which attacks more especially the young leaves in the centre of the plant, reduoing the finest specimons to a hopeless state in the course of a few days. The cause of this was quite uncertain, for though in some individuals a Fungus appears on the fox-coloured diseased leaves, yet in some of the most virulent cases there is no trace of ans parasite.
After these remarks were published, we received information that Mr. Ruckee's valuable collection of Orchids was suffering from a minute parasite which attacked the roots, and we have subsequently received a specimen from his gardener which shows that the disease is identical, at least as far as can be judged from outward appearance, with the virulent affection mentioned above. The lea is covered with a white byssoid web studded with little snow-white balls, which is said to run over the Sphagnum in which the plants are grown, as well as the Orchid. This circumstance alone made us at once doubtful whether the fungous matter in question was the real enemy, and on examining the parasite itself we are still more doubtful, as it has no perfect fruit, and can be regarded only as a mycelium, and probably is a condition of some Agario. We know indeed that such production are often injurious, but as the disease appears to be specific, and is unfortunately far from being confined to one establishment, we hain what the any final judgment the of the mycelium may be, and whether the same Fungus appers in other colleotions.

It is needless to enter here into the minute structure of the parasite, Eketches illustrative of which have been exhibited at the Hurticultural

Society, aooompanied by the expreasion of a wish that Orohid growers would tarn their attention to the subject.

While on this matter it may not be uninteresting to state that the spotted leaves communicated by Major Clark, demonstrating the fact that spot oceurs on Orchids in their native place of growth, now they are dry are covered with black specks, each of which indioates the position of a fungous oyst in the parenchym of the leaf. M.J. B.

Aronest the many usefal and ornamental forest trees which have been introduced to Europe from foreign oountries, the DOUGLAs FIR is certainly one of the most important. It is perfeetly bardy in our climate, it forms a beautiful tree on our lawns, or in our pleasure grounds, it attains a gigantio size, and its timber is of very superior quality.
Such being the case, it becomes a matter of the first importance to a seertain, if possible, the reason why those plants of this and other valuable Conifers, whioh have been raised from seeds ripened in Britain, often become unhealthy, and appear as if their existence would be limited to a very ferw years. Mr. MoNar, of the Royal Botanic Garden, Edinburgh, prodaced evidence of the strongest kind, and laid it before the Botanioal Society (see p. 222), to prove that seedlings raised from seeds produced in Scotland had invariably beoome siokly in the Edinburgh Garden, and were evidently dying out, while others, which had been raised from Californian seeds, were in a healthy and vigorous condition, although growing under the same conditions and in the same soil. The
original trees in the Botanic Garden (introduced by Dovalas) as well as those reoently raised from seed direot from the American Continent, it was observed, are of a rioh green oolour, having straight clean stems, "while the majority of those raised from British-ripened seeds have thoir leaves somewhat shortened, and are of a yellowish-green tint, with bare undulated stems, and branohes more or less oovered with resinous warts, Many of the plants raised from home-ripened seeds have a sickly look and a stunted appearance, notwithstanding that many of them had reached the age of from 14 to 15 years. The soil of the Botanic Garden is naturally of a light sandy description, and it may seem curious that the trees of the Douglas Pine of foreign introduction should do well, while the British seedlings in so many
instances should dwindle away." instances should dwindle away."
We have lately had an opportunity of examining Garden, to which Mr. McNAB alluded in his pargh and unfortunately there can be no question as to the correctness of his observations. There can be no doubt of this being a faet, viz, that all the unhealthy state, and appear as if they would never form trees of any value, either for ornament or for timber. We found some beautiful trees of the same species in the most robust health, which had been raised from seed which had been imported from California many years ago by the Hortioultural Society of London through Mr. Doveras himself, who was the Society's colleotor in that conntry.
Nor is it the Douglas Pine only which appears to degenerate in this country. Abies Menzienii, A. nobilis, and others, when raised from homesaved seeds, show early symptoms of weakness and disease. Plants raised from the seed of the former, which had been produoed by a tree growing in the Keillour Muir Pinetum, Perthshire, the property of Willinar Thouson, Eaq., of Balgowan, and Whioh had been presented by that gentleman to and vigour of the parent tree. Of A. nobilis Mr. McNAB remarks:-" The seedlings vary muoh, but none of them possess the vigour of foliage exhibited by the large tree now growing in the Botanic Garden, raised from seed originally sent home by
Mr. Dovalas, or even the plants reared from layers and cuttings taken from the original troes. The British seedlings look well till they get about 1 foot high, at which size they begin to assume a yellowish tint, and finally decay. Many of the seedlings are now dead, the largest having attained the height of 3 feet."
Our correspondent, Mr. C. W. Stricimand, Whose letter we published a short time ago (see p. 292) thinks that other canses may be to blame for
the effects to which we have informsts as he has we have just alluded. He "these kinds of Fir
exceedingly
in exceedingly eapricious as to the soil in which they
will grow. Neither the Douglas Fir nor the Abies nobilis will live upon an oolitio soil. They
paper referred to \([\mathrm{Mr}\). McNAs's];
both thrive upon the they will
sandy loam, whioh belongs to the beds of calcareous grit." And Mr. StrickLAND proves his statement by giving us examples of his own experience. He had a number of plants of the Douglas Fir, grown from English seed, which were dying as fast as they could do on the oolite. When removed to soil whieh suited them they soon reoovered; their foliage is now of a healthy green colour, and they are growing vigoronsly.
Mr. STriCKLaND's observations are exoeedingly valuable to planters, and we can only hope that those who follow his example may meet with the same amount, of success. Still, however, we have one of Mr. McNAB's facts which cannot be explained on this theory. Whatever may be the nature of the subsoil in the Edinburgh Garden, it will be observed from the statements already made, that all the trees which have been raised from imported seeds, or propagated from them by cuttings or layors, are in a healthy condition, while those raised from home-saved seeds are fast dying out.
Granting it to be proved that seeds of these Pines saved in this country are liable to produce a diseased and short-lived progeny, it may be might prodare the effents in preation Th blossoms of the trees may have been fertilised with the pollen of other species growing in the same neighbourhood, and then a weak variety, differing from the original, may have been produced; or, as stunted unhealthy specimens are generally the first to produce seeds, they may have communioated their own constitution to their offspring. It is true that the specimen of Abies Menziesii growing in the Keillour Muir Pinetum oannot be oharged with being unhealtthy, for Mr. MCNAB tells us, it is without exception, one of the healthiest and finest trees in Europe, but he acknowledges at the same time that it is probable the female blossoms may have been fertilised with the pollen of other allied trees. And then, with referenve to the noblepprimens of the true Abies Douglasii which are growing in the Edinburgh Garden, they have not as yet produced perfect seeds; they are in high health, and if
means can be used to have their blossoms fertilised means can be used to have their blossoms fertilised
with their own pollen when they are in flower, the progeny might throw some light on the important subject under discussion.
Mr. Gorris, of Edinburgh, who has made Conifers a special atudy for many years, made some practical observations upon the subject at the meeting of the Botanical Society, which cannot fail to be aoceptable to our readers. As to Abies Douglasii, he argued that it varied mueh in colour of foliage as well as in habit and vigour of growth, even when raised from Californian seeds. This, he said, was the case with plants raised from Doveliss's seed, as well as from every supply of native seed he had seen grown. He was of opinion that weakness in the seedlings arose from the weaker or worst-growing subvarieties having produced the first and greatest quantity of seed in this country. And then he brought forward a fact that we have already mentioned, namely, that a robust, dark green, freengrowing plant in the Royal Botanic Garden-one of Dovecias's original plantshad not yet yielded perfectseed, but only two or three abortive cones. And until it, whioh he considered one of the right nort, produced good seed yielding a weak progeny, he could not admit that Britishgrown seeds neeessarily produced degenerate plants. The matter we have been disousping is really of considerable importance. Can we depend on homegrown seeds of these favourite Fir trees, or must we import them from abroad ? There must be many persons in this country who are able to give the results of their observations on this point. What is the experience of the gentlemen planters in England, Seotland, or Ireland? or what say our professional men, such as Mr. Barron of Elvason, Mr. Frost of Dropmore, Mr. Barnes of Bioton, and others who have long been rearing seedlings from the magnificent specimens in the
collections under their oharge? \(F\).
- Now that the energies of Exhibitors have begun to be directed towards Great Summer Shows, we trust that there may be no relaxation of the efforts hitherto made, with such excellent results, to render the South Kensington scientific Tuesdar Meetinas so thoroughly interesting as to induce a large number of the Fellows Doubtlir friends to support them by their presence. ourselves, that it would be an improvement were a little more time allowed for the inspection of the umerous intercing noveltice whioh are axhibited.

At present ladies and others who take special inveryin
in the subjects brought forward, their examination in comfort, for the room is genente crowded auring the whole time the plon genericy We understand that some slighe the plants remert templation, with the view of affording greater in c for a more complete examination than is no possible ; and we cannot but regard this as an im ment, which will not really inconvenience any We understand that on Tuesday next Mr. one will give some account of Cuitlanzinia pendr. \section*{secateur lecointe.}

WE have already given representations of one or tro forms of the Sécateur, a useful pruning instrument But the Secateur Lecointe now figured, from a sketch in the Reous Horticole, appears to have some advantage the ordinary flat sprim previonsly adopted. The inventor was led to derien
this kind of snring in order to avoid the annorance arising from the frequent breakage of the form usnally employd.

It is said thet this form of spring secures an easy and gentle action of the instruments, and hes the advantage of lastinglonger than others, from not being so liable to breat, while it secures a firmues and is not otherwise attained. A further improvement : pointed out in the fasten ing, which consists of stop which catches when
the two handles are drawn together, a projecting pan tion on the outside acting as a spring which in to pressed when the instrument is required to be opened. M. Lecointe, of Laigle, is the inventor.

SPRING AND EARLY SUMMER FLOWERLVG PLANTS.
It is very easy to write a list, but it is also essy to do a good deal of harm by so doing, for if a novice is induced to adopt certain plants, and then finds them worthless as objects of ornament, even in their bat state, it is ten to one but he will throw up the ex ment in disgust. I have seen the commonest aud most inconspicuous British and European recommended in lists of spring flowers, with thinge thas have never been introduced to the country scarcely wonder why good hardy plants are so mrey seen, when such wretched advice it given about them Fancy a confiding gardener making a bed of Nepow

The many fine herbaceous Peonies are very useful particularly where very showy flowers are prized; they will grow in almost any situation in a garden, sud consequently fall is with moy present subject. The
Auricula in its common forma, and all the pretty Primulas, single, double, \&\&c., will of course always hold a leading place among the floral beauties of April and May ; but the best things in the family for the sort of gardening I am adrocating are the many pretty and vigorous varieties of Polyanthus, and the finely coloured varieties of Primrose, which may be had no readily from seed, and do to well in shady places and shrubbery borders. There is one littic plant I would particularly recommend for neat evergreen perennia pretty pure white fris. And is furnish a water cress. It would perhaps agree better with my gelect lot for the choice spring garden. But as it can be grown as easily as the Aubrietias, it might be advantageously amociated with those moth aneful planta.
Clumps of Narcisus are very effective, and what i not always the case with "effective" plants, the flowers of wome species beautitul and fragrant when closely examined. Among the best of those that are thoroughly bardy, and require moving only about as often as we take the census, \(\mathbf{N}_{*}\) maximus, of the finest golden named. Scilla campanulata and its fine white variety are excellent plants to peep forth among low sbrubs, \&c. Of Tulips I should say the best is Gesneriana-it varieties, the freest and most easily got of them, are at least as desirable for the early garden as the varieties it eucoeeds. Some species of Iris do finely among shrubs it succeed. Some species of Iris do finely among sarubs is the best Cattleya flower more beantiful than a bloom of such fine epecies as florentina, pallida, or the varieties It germanica?
It is almost impertineace for one to recommend the Crocus, for surely if it is difficalt to paint the Lily, is no less so to gild the "large yellow Crocus," or lay many gardens, and fine ones too in other respects, without Crocuses, and if not, with none but the common one. This could never be the case if people generally only knew what exquisite effects are produced by mixing the finer varieties in linea, edgings, equal the colouring produced by an equal mixture of sur W. Scott, the large yellow, and the blue Crocur vernus. And afterwards you can mix your blue and white, and white and gold, and La Majestueuse and gold. Just consider how charmingly a neat geometrical garden might be embellished by a series of edgings of the kind but these fine Crocuses will look even better near the indefinite margins of shrubs and spring-lowering ever green berbs.

Cheiranthus ochroleucus and aurantiacus are two fine May-flowering plants, and the old double Walldowers are better still for spring work, becaus
they can be grown much more easily, are difficult to extinguish on light soils, and do well on banks and dry mounds, even on the heaviest. I have seen Omphalodes verna in Ireland, running wild among Lilies of the Valley in woody places, moist, and with a peaty sory Doubtiess, it would in many situations make very pretty early spring-liowering naturatised
ject. Lupinus polyphyllus, Galega offinalis-alba and orientalis are noble and very useful early summe lowering plants, which will grow in shrubberies, dc., with about as much attention as is nsually required by Forgandelion; they are moreow, but the most satig Forget-me-Nolt I have seen from these was vielded by Myosotis palustris, flourlshing with quite unwonted vigour and beauty amougst American plants in pea beds, ir a moist and somewhat elevated district; and by Myosotis sylvatics, treated as a biennal, and use to a great extent in the spring bedring at Cliveden.
And now a word about the effect to be had from spring-flowering herbs. It is quite a mistake to suppose it cannot be had from them. If well done anf puperior to any early flowering shrubs or tree that I am acquainted with. Wo have no right expect evergreen herbs like Iberis or Alyssum to flourish and bloom as they ought, when "pulled about," though they are worth growing even on that system. Erica carnea, Iberis Garrexiana, Alyssum the Wellington Nursery, if tastefully aspociated either as clamps or masses as usual on mixed shrubbery borders, or ranged in lines, would alone afford more effective colouring than any plants of the summer garden. Scarlet is absent, to be sure, but there is no white bodding plant can compare with establisbed lberis, no yellow with Alyssum, and "Purple King" the universal, monarch of summer blue is inferior to Aubrietia for yielding masses of colour. Neither should we lack loud colour as long as the fine varieties of Anemone coronaria were to be had. Lathyrus Sibthorpii is a very fine early-flowering Everlasting Pea, grown by Mr. Baxter of Oxford.
I have omitted many plants for the sake of brevity, but those mentioned, if grown as I suggest, are quite sufticient to make a garden highly benutiful and interesting in spring, and as "gay" too, as could be desired.
being as a rule too rakged, flimsy, transient, and trouble some. I know there are places where they sow bards of annuals round the shrubberies, which resalts in laving the said sirrubberies display an ugly naked margin for more than balf the year, but by uning the perennials mentioned, the borders are neatly furnished at all times, and the plants flower freely in due season. I may some day furnish the names of a linndred or so of the very best hards herbaceous plants in the country, of raried size, capnbilition, and timer of flowering, knowing as I do that the want of a really good selection-one
not containing a second-rate plant-is the great cause of these fine planta not being oftener neen. IW m. Robinson.

\section*{Home Correspondence.}

Farly Poas.-I have this week gatbered a fow very nice Peas from Sangeter's No. 1. The seed was sown in the second weok of December, and the plants have not received the slightest protection during the winter. Thomas Woodford, Gandenor to the Right Hom the
Earl of Winchilsed and Nottingham, Eastuell Park, Ashford, Kent, May 24.
Names of Peat- It is highly desirable that the number of sorts of Peas and other vegetables should bs redoced by discarding those which are (though not identical) too similar to others. Your correspondent "Quo" has therefore andertaken good work, in which seedsmen and gardeners should be equally willing to assist him, but it in by no means an easy task. It should be attempted only by those who are well
acquainted with the sorts already in cultivation, and all new kinds, or those offered as new, should be obtained direct from the parties offering them. This latter precaution could not have been taken in all cases by your correspondent "Quo," or he would not have fallen
into the errors published at po 388, wherein he says "Strathmore Hero and King of the Marrows appea identical," whereas the former is a white-seeded Pes and the latter a blue; and again, that Rerkshire Her is but a self of Tall Green Mammoth, whereas the former is much taller than the latter, with larger pods than any other Pea, and smooth seed of a dark King of the Marrows and Tall Green Mammoth, which "Qun" names as two Peas, are really identical. We would not imply that the sorts named above are so distinct that all should be retained-quite the contrary; but that in justice to seedsmen who have sent them out in good faith as being new varieties, no such varieties should be declared identical, because they were discovered to be somewhat inle, In refer to two new varieties of early Peas introduced this season, "Satton"s Ringleader," and "Carter"s First Crop," both of which are known by their raisers to have come from different stocks; jet they may some day be considered too similar to be both of them necessary in one garden. In our trial grounds Sutton's Ringleader came into bloom two days earlier than Carter's First Crop sown on the same day, under the same circumfuller than on Carter's First Crop. Nor is this the case in one trial only; yet we hear of another trial clsewhere in which the two sorts appeared to be equally forward and in other respects also very similar, while both of them are considerably forwarder than the other Early Peas recently introduced. When it is satisfactorily ascertained which is the earliest and best of these two very early Peas, and which of them keeps most true to ts character, gardeners will grow the one and discard the other as unnecessary, but it would be unjust to the seedsmen to declare them to have been but one Pea introduced under two names. An intelligent and udicious "weeding" of the numerons varietien or Peas now in cultivation would be as advantagenus to seensmen as to their customers, and none would be more willing than ourselves. Sutton \& Sons, Reading.
Blind Strawberries. - The term "blind" is often appiied to Strawberries when the flower-buds do not make cheir appearance much above the crom of the plant, and when they have apparently a great atruggle to expand, doing so imperfectly, owing probably to the plants not being thorougbly ripened in the autamn This immaturity will occur when the plants are potted loo in the season, especially if placed in too larke prots Too whether it be applied artificially, or when the plants
are allowed to stand upright during heavy rains. This case, for we are given to understand that the flowers fully developed themselves and were in good health. The failure then may be attributed not to any deficiency in their man agement the autumn previous but to immediate causen, probably too much water overkend whilst in flower this they are apt to ret in a Peach-house or a Vinery eapecially if they are set in front of the house, as your correspondent states his were. the house, this bowever, against the back of the can say that they have failed to set them. Did your correspondent fuini have the house whilst they were in flower? or did he give them too much water overhead after the expansion of the Howers? If so, the difficulty is solved. If be has not committed himself in any of these ways, there [We may remind our correspondent that the term
"blind" is also commonly applied to Strawberry flowers when the corolla is

How to Grow Celery.-Prepare a bed 6 to 12 feet wide, and as long as required; throw out the soil on each side to the depth of 6 or 9 inches, and fill up the trench nesrly to its surface with thoroughly decomposed manure; thoroughly incorporate soil and manure together; plant out the plants 9 inches by 12 apart on this surface, and thoroughly soak the whole with form an embankment 12 inches high all around this trench, and keep it constantly saturated with waterif manure water, 8 much the better, for depend upon it "good things come out of good conditions." As the plants grow, keep them loosely tied up, snd rub off all if left on would waste the substance and deteriorate the growth. The trench must not be allowed to become "puddle." If proper attention is paid to this point, and also to planting it out early. Celery can be grown to a very large size before November. It should not be earthed up at all till about three weeks before it is required for use; four weeks' time at the utmost will
blanch it as white as a Lily. In order to blanch it, the soil from the sides is thrown between the plants and nearly up to the tops of the leaves. So soon as the leaves fall from the trees, the beds should be covered entirely over with them, about 12 or 18 inches thick. You can then dig sweet crisp Celery all the winter, not a particle of frost reaching it. This is an American
mode of culture. How wonld it answer here? S.N.

\section*{Foreign Correspondence}

Freinch Gardrns: Paris, May 23.-There is rather a good story told here of a man named Victor, [who was set to straighten a piece of fencing that separates the
public footpath from the Garden flanking either side of the Avenue de l'Imperatrice. Victor went to his task zealously and indefatigably; and there can be no doubt that previous to the conmencement of his labours, the line of fence was in a very wibble-wobble state, and as it probably required a week's work or so, it was considered quite uuaccountable that it shonld not have been attended to sooner; but strange to say, although it is
nearly two years since he commenced it, he may still be nearly two years since he commenced it, he may still be
seen daily rivetting and shifting, being apparently as far as ever from its completion; for as fast as one end of the line is set right, he always finds the other end has been getting out of order.
M. Barillet seems to experience much the same difficulty with his gardens as poor Victor with his fence.
The Bois de Boulogne, Moncean, Vincennes, and numerous public gardens and squares, are continually taxing his ingenuity, and though ably supported by subordiand others, it is quite impossible under the circumstances that he can give that individual attention to each Which we are accustomed to see bestowed upon the annual allowance as 10,000 z. In general the garderiing tactics for the year may be said to be a fac-simile those in vogue during the last season, and while still adhering to my former remarks on the subject, I may take this opportunity of explaining that though Parisian gardening is good, the landscape gardening, as relates to the laying out of gardens, is bad; if, indeed, the volcanic surface of shrab-capped mounds, and grassy hollows, unduiating like the swing of a pendulum, is worthy of being classed under that name. Nor is
Baron Rothschild's place, laid ont by the painter Lami, a brilliant exception to this rule, for though there is a French garden, it is a representative of the tamest form, applied without any knowledge of the art, and in too weakly a condition to come within the pale of admired in the want of something better. I should be glad if I could praise it, and hope the park at Vincennes, as yet in progress, may prove an exception, but it would be premature to come to any conclusion on its merits, until matters are further advanced. Referring again to the bedding out, where there were beds of Caladiams last year are now Aralias, Cannæ have changed \&c., though in many instances among the Pelargoniams, Chrysanthemums, and Roses, the arrancements boen in no way altered. Some of your readers will cry out at this, but I do not think it a matter of the first it matters still provided the arrangements are good; and the beauty in Parisian bedding out depends upon the plants themselves, and not upon any skill exercised in their juxta-position. Trees come out with the same kind any the less beation and it never struck me they were any the less beantiful. To be sure I can't sympathise with the extreme views adopted by some writers, of podge." For all tricks and sort of floral "hodge there should be no licence given. On the contrary to the severest cenare. As an instance of the effect of mixing, I saw at Passy-though thmo were and brown, some 50 mass of Pansies, blue, yellow, Speaking theoretically one square, and in full flower nounce such a combination extremely benutiful, but
whether it was the quality of the brown that introduced the element of discord-and I think it was, for purple
and yellow contrast excellently \(\rightarrow\) or whether it was that and yellow contrast excellently-or whether it was that horticulturists have succeeded in eliminating colours this to the consideration of Elizabethan professors) the effect was intensely disagreeable, reminding one of n vgly carpet in an antiquated lodging-house
In the Tuileries Gardens there is nothing new to note. Still dusty and unpalatial, they have as little keeping up as is well possible. In the Champs Elysées the groups of Ponticum Rhododendron make a fine show, and afford another illustration of the benefit arising from homogeneous planting, though there is nothing so exquisite in a garden as combination, where such co

\section*{colour.}

I shall shortly be visiting the most wonderful gardens in the world, some of Nature's planting amidst the glories of the Alps. We cannot imitate them, the scale precludes that. Nor do we want to ; but we may take a hint from the broad masterly treatment of the masses; from the beauty and endless variety of the'detail, which however charming in itself, is yet always subordinate to the magnificence of the general scene-

Crystal Palace: May 20 (First Great Showo).Although this was a large and on the whole a good exhibition, it was nevertheless, with one or two excep-
tions, deficient in subjects of striking excellence, such tions, deficient in subjects of striking excellence, such
as have sometimes characterised digplaye of this kind held here in former years. The day was one of the brightest and finest which has been experienced this season, and there was in consequence a very large Miscellaneous
Miscellaneous Stove and Greenhouse Plants.-Of these there were extensive exhibitions, consisting for among the latter was an example of Allamanda grandiflora from Mir. Peed, covered with blossoms of large size, fresh and beautiful. That universal favourite Stephanotis floribunda was also in excellent condition in several collections, as were likewise Everlastings, Eriostemons, Pimeleas, Ixoras, and Chorozemas. Of Medinilla magnifica, loaded with long drooping clusters of pink inflorescence, set off by ample deep green foliage, there were one or two noblelspecimens. Acrophyllum venosum was also shown in good style in more than one collection, and we likewise noticed a good plant of Clerodendron Thomsonæ, the white calyx of which forms a striking contrast with the
scarlet corolla. This effect was, however, comparatively lost in the present instance by the flowers not being fully expanded. Combretum purpureum, an old-fashioned but really showy plant, was well represented on this occasion ; and of Rhododendron for mosum we noticed a beautiful bush, covered with blossoms of as pure a white as those of the white Indian Azalea, for which at first sight it might easily be mistaken. Rhynchospermum jasminoides was shown in
good condition, and among other plants was an example of Mahernia incisa, with the appearance of which most of us are familiar.
10 (Nurserymen): \({ }^{1}\), Messirs. Lee . Whitbread; ; M, Mr. Kaile
Rhodes ; 4, Mr. Baxendine. 10 (Amateur): 1, Mr. Carson;
2, Mr. Page; M, Mr. Chilman; 4, Mr. Wheeler. 6: 1 , Mr.
Kemp; 2 Mr. Smith.
Fine-foliaged and Flowering Plants.-These associate charmingly together, and when arranged with taste form a prominent feature of an exhibition. Among the fine-leaved plants present we noticed Cordyline Tree Fern Cyathea Smithii, and midribs; the fine Tree Fern Cyathea Smithii, and other arborescent
species; Theophrastas; Oreopanax dactylifera, with deeply cleft foliage, which in the young state is par ticularly handsome; and last but not least, a magnificent specimen of Alocasia metallica in an elegant terra cotta vase, with leaves of unusual size and beauty. This fine example of good plant
Aroards.-12:1, Mr. Williamin; 2 , Messrs. Lee; 3, Mr. Young
Heaths.-With the exception of two handsome hybrids, apparently belonging to the aristata breed, there was little novelty among these; there were, however, some well-grown plants of well-known sorts, among which may be mentioned ventricoss magnifica, depressa, and Sindryana, the last unusually well-grown and flowered.

Avards. -1011 Mr. Rhodes. \(8: 1\), Mr. Poed; 2, Mr. Page.
1, Mr. Wheeler;
d Mr. Mhilman
Azaleas.-These occupied conspicuous corners at the intersection of the nave and transept, and being large in size and full of flower they had an extremely effective appearance. Many of the light-coloured kinds showed an unusual disposition to sport, a fact which did not escape the observation of visitors, who seemed delighted with the many different colours which in magnifinstances presented themselves on one bush. Magnificent examples of well-known kinds were abundant, and joth Mr. .Turner and Mesars. Ivery showed new varieties, some of the best of which will be found noticed in another column.

 Esq., of Leicester,", showed a beautiful A. Turne which the plants were not so remarkable for lartion, Mr. Mr. Baker, gr. to A. Basset, Esq., Stamford Hill, is equally applicable to a fine group from Mr rema gr . to H. Gibbs, Esq.. of Regent's Park. With the Penng, tion of Phalænopsis Lüddemanniana, little novelty encep obervable.
 Pelargoniums.-Few new varieties appeared in th diferent collections of these shown on this occanion finely grown and charmingly flowered plants, both the class of Fancies and ordinary sorts. Mr. Fraseris plants were literally bouquets of flower, and thoes
from Mr. Turner were nearly from Mr. Turner were nearly equally fine. The cul others, were however not sufficiently advanced bloom, multitudes of buds being unexpanded. Among new kinds, Hoyle's Charles Turner, bright scarlet, with a dark top and white eye, received a First-lissa
Certificate, as did also Turner's Marion, rose, with white eye and very dark top, both flowers of good
shape, size, and substance. Elegans, crimson shape, size, and substance. Elegans, crimson fluabed
rose, with white eye and dart Turner, received a Second-class Cortificate. Then were also one or two other promising varieties. Aivards.-12: 1, Mr. Fraser; 2, Mr. Turner.
Roses.-Early in the morning these wereall that could be wished; but as the day advanced they suffered from the intense heatand brightlight, the plants beingin many instances exposed to direct sunshine, which soon proves
fatal to the beauty of full-blown Roses. They will stand and even require sunshine when in the bud state to give them colour; but in their more advanced stages perfect shade is indispensable. Owing to the want of this they did not as a whole look nearly so freah and beautiful as they usually do at a first May show. Mr. Wm. Paul's group and that of Messra. Lane mere, however, greatly admired, as was also a collection of plants in small pots from Mr. Turner. Messrs. Pana \& Son had good collections and also charming boxfuls of cut blooms.
Avoards.-10 in 13 -inch pots: 1, Mr. William Panl; equal 2 8-inch pots: 1, Mr. Turner; 2, Messrs. Paul \& Sor ; s, Mr.
W. Paul.
New Plants.-An extensive and highly interestiog collection of these was shown by Mr. Bull, who bad,
among others, examples of the new Japanese Accubar ; double-flowered Mimuli ; his variegated-leaved Verbens and Chrysanthemum ; the handsome Asplenium riophyllum ; the silver-striped Polygosatum verticillar tum ; Azalea Souvenir du Prince Albert, deep rose edg with white; the variegated Podocarpus macrophy
Retinospora leptoclada; the variegated variety Aubrietia purpurea; Maranta Vanden Heckei, and several other plants to which attention bas been lately directed in our reports of the Floral Committee of the Royal Horticultural Society. From Messrs. Ivery came wo pretty varieties of Athyrium, viz., Flix. compositum and Filix-foemina ramo-cristatum; a similar number of iscolopendriums, one or or rathe golden tinge in the fronds. The white double-flowera Deutzia crenata came from Mr. Shenton; Clemaiam rom Mr. Townsend; Beaton's Nosegay Peram from
from Mr. William Paul; and Lilium auratom from Mr. William
several exhibitors.
Miscellaneous Subjects. - Among these may b mentioned a fine display of neatly filled and win constructed plant cases from Messis. Barr \& Sugi an a beautiful stand of Tulips from Mr. from Messta
charming varietios of Fancy Pansy Downie Laird \& Laing.

Fruit.-Of this there was but a limited display. good Providence Pine Apple came from Mr. Mills,
to Lord Carrington: Mr. Page had a Cayenne, weig ing 6 lb , and a Queen 4 lb . A Queen of weight also came from Mr. Barnes of Candish furnished a good Smooth-leaved Cayne, m1 Dikewise a variety called Abacachi, which was the label to be "one of the most luscious of all Pio Apples." Black Crapes were shown in excall Among
dition by Mr. Clements and Mr. Hill. Aweres Muscats were some fine bunches, which wre cavell all more or less unripe. The best came from Mar. fery fine Mr. Horwood, and Mr. Tansley. bunches of Foster's Seedling, quite ripe,
tributed by Mressrs. Lane; and from M tributed by Messrs. Lane, and Swetwater. apparently Royal George, were shown Horwood, Mr. Turner, and Nectarines the only dish--came from Mr. Turner. Among Melons the beth a hybrid green-fleshed, and a hybrid scarletar. Lymin came froxa. Mr. Enstone; Mr. Horwood Melon growing had, however, also examples of good May Duke Cherries were contributed by Jackson, of Kingston. the most remarkable features of the sul

Gine dishes ; and some well-grown fruit was alos shown y Mr. Standish. Mr. Horm The sorts consisted of Si Newise showed good Quen, La Constante, Empress别 the top of the stage was fise row of well fruited plants in pots. Among Mis collaneous fruit whe an extremely fine cluster of Musa Cuveadishii, weighing no less than 'By int from whom also came several yellow and red-fruited kinds of Capsicum.

Rotal Botanic: May 24 (First Great Show).This Exhibition was in all respects quite equal to, if 3ot superior to its predecessors of former numerous and beautifully in bloom stove and greenhouse plants were all that could be desired; Azaleas were " mountains of flower," without that extreme formality of shape of which we had to com Pelargoniums considerably exceeded our most noguine expectations; while of new plants there was un extensive and interesting assemblage.
Miscellaneous Stove and Greenhouse Plants.-O these Mr. Peed, gr. to W. Tredwell, Esq., Norwood, had the best collection, conspicuous in which were
Isora Griffithii, with ample healthy foliage:and glorious hoads of rich salmon-coloured flowers; Allamanda grandiflora in wonderfully fine condition; Chorozema cordatum; and a well flowered Erica depressa. From Mr. Whitbread, gro to H. Collyer, Esq., came, among other large and fine plants, Clerodendron splendens, richly crowned with crimson-scarletblo flowered plant of Stephanotis floribunda; two species
of Allamanda, and some well-grown Cape Heaths. Various Heaths of unusual size and excellence were lifewise furnished by Messrs. Lee, who had, moreover, Acrophyllum venosum, charmingly in Hower; He daroma tulipiferum ; Aphelexis macrantha purpurea, remarkable for its unusually'large amount of colour Irora coccines, loaded with bouquets of scarlet flowers; and Stephanotis floribunda, the sweet smelling blossom came an admirable specimen of Clerodendron Thom sones, 4 feet in height, and 3 feet in diameter, loaded with elegant feathery spray, thickly studded with White and crimson-scarlet blossoms; Prostanthera multitudes of rich crimson flowers; also some other beautiful Heaths and Epacrises. Mr. Rhodes furnished a charmingly flowered plant of a variety of the yellow Chinese Azalea ; also Chorozema cordatum; the yellow blossomed Erica affinis, and Dracophyllum gracile From Mr. Baxendine came Erica depressa, with nume rous little drooping bunches of flowers, looking like chospermum jasminoides in beautiful condition bath \({ }^{28}\) regards growth and bloom; Clerodendron Thomsonæ, and Bignonia graudiflora, the last well furnished with thowy orange-scarlet blossoms. In the amateurs class Mr. Chilman had, among other well-managed plants, Adenandra fragrans rosea, Everlastings, Acrophyllum venosum, and Chorozema varium nanum, ail in excellent condition. Among other groups were Sllamanda Aubletii, some very fine examples o cranthe purpurea; Rhynchospermum jasminoides, and Clerodendron Thomsonæ ; the last, which was fully ex panded and altogether in' beautiful condion, came from Mr. Ingram, gr. to J. J. Blandy, Esq., of Reading In the class of six plants Mr. Kemp, gr. to Earl Percy,
contributed Combretum purpureum,
Stephanotis floribunda, and Allamanda neriifolia; and good plants Mr . C imilar description came from Mr . Wheeler and

of a few green leaves here and there served protrusion contrast and relief to the eye. A more free and natural habit of growth is also evidently being perimprovement in the general appearance of the plants. Mr. Veitch's admairable collection of eight, and Mr. Turner's group of six, both contained specimens which measured not leess than 7 or 8 foet in height, and nearly as much in diameter at the base. Of other plants, too, though not so large, there was abundance and being placed not only in the centre of the exhi bition, but also at its different salient points, the effect at first sight was one which we imagine all who were present will not soon forget. The names of Mr. Veitch's plants were Extrani, Criterion, Rosea superba, Chelsoni, Trotteriana, Mrs. Fry, Variegata, and Gledstanesii. Mr. Turner's six were Gem, Illustris nova Coronata, Barclayana, Arborea purpurea, and Italiana From Messrs. Lane came'a large collection of well flowered and extremeiy pretty little pyramidal plants, consisting for the most part of new kinds. Smal groups of the later also came from Mr. Turner and
others. These contained President, a striking novelty, with large rich salmon-coloured flowers of great size and substance; Louise von Baden, white, occasionally striped with purple, also a useful sort, large in size and rood in substance ; and others, such as Kinghornii Perfection, Adrance, Marr, Sir C. Napier, and Ro Leopold. Of these descriptions have already appeared in our columns.

Orchids. - The most conspicuous feature among these was a magnificently-fiowered plant of Dendrobium densiflorum, from Mr. Bullen, gr. to A. Turner Esq., of Leicester. This measured upwards of 3 fee in diameter and some 2 feet in height, and was literally covered with gracefully drooping racemes of rich orange-yellow blossoms. On one of the
best varieties of Bearded Lady's Slipper, were some best varieties of Bearded Lady's Slipper, were some
four dozen fine blooms, and the same grower had also good examples of C. Hookerse, different varieties of Cattleya Mossix, Lelia purpurata, Sacco labiums, and Vandas. In a collection from Mr Baker, gr. to A. Basset, Esq., which was first in point of merit, his flowers being on the whole in greater perfection than those on the Leicester plants, were Saccolabium retusum, with sir fine spikes of bloom
on it; the rare and beautiful Phalænopsis Schilleriana, with nearly 20 flowers on it; P. grandiflora, with blooms measuring quite 3 inches across; the rich orange-scarlet Saccolabium curvifolium; Cypripedium villosum and others; two excellent Vandas; the bright rosy-blossomed Trichopilia crispa; a variety of Sobralia macrantha, named splendens, with a large showy purple flower on it; the dark brown-flowered Oncidium crispum, various Dendrobiums, Vandas, and other plants. From Mr. Page, gr. to W. Leaf, Esq., Streatham, came a well-flowered example of Brassia verrucosa, with some 15 or 16 spikes of pale-green flowers on it; Oncidium ampliatum majus, a mass of large clear yellow blossoms; the orange-stained white-flowered Dendrobium formosum giganteum, and the rare Cypripedium Stonei. Mr. Peed furnished, among other plants, Cypripedium Hookeræ, with a greater amount of colour in it than usual. Mr. Penny, gr. to
H. Glibbs, Esq., contributed a beautiful collection, in which were the white-flowered variety of Dendrobium densiflorum, the rare Odontoglossum Phalænopsis, and nile colouring; the Brassia-like Odontoglossum nævium, a well-flowered plant of Cypripedium caudatum, and the rosy-crimson Trichopilia crispa. From Mr. Wilson, gro to W. Marshalh, Eag., Enfield, came the rare and beautiful Dendrobium infundibulum, fully noticed in our volume for last year ( p .269 ) Phalænopsis Lüddemanniana; Cattleya Aclandim; one of the best varieties of Cattleys Mossix with unusually large and fine flowers; and Cypripedium caudatum, with two blooms on it, each having petais at r to feet gr. to H. Stone, Esq., Leigh Park, was Cyrtopodium nevertheless by no means so fine as we have seen it from the same establishment twenty years ago. The beautiful Cattleya Aclandiæ and Dendrobium Devonianum, Esq. Mr. Wiggine, gr. to Walter Beck, Esq furnished a small collection of Waller Brown plants. as did also Messrs. Jackson, Wheeler, Chilman, and Robson. In these we noticed Phalænopsis Lüddemanniana; and Dendrobium primulinum, with pink sepals and petals and sulphur lip.

Cape Heaths.-These, though comparatively unattractive, were nevertheless well grown and flowered Among the different varieties were good examples of fastigiata lutescens, some of the better Vestphalingia, the different varieties of ventricosa, amons which magnifica is one of the best; Deronians, Webbiana
elegans, some of the different varieties of tricolor gretted that so little attention is still paid to the raising of new varieties in this once fastionable class of plants. Baxendine.
man;
ma,
lun

Hatre Mr. C. Whe Equal s, Mr. C. 8 mith and Mr
Rowes.-Seldom have we seen these shown in such charming condition they were on this occasion, remark which does not apply to one group only but to all. Indeed some of the plants in Mesars. Lane' collection, to which was justly awarded the 1st prico, have perbaps never been equalled either as regarde fine growth, or sise and quality of bloom. Time was and that not long ago, when plants drawn to "a face" were considered the acme of perfection. Now, how ever, it is evident that a better taste has been induced, and that a plant to be first-rate must not only be fine on one side, but all round. This was conspicuously the case with Messrs. Lane's plants, annong which Madame Willermoz, loaded with remarkably fine blooms; Paul Perres, Vicomtense Deonces, Victor Verdier, and Niphetos were models of skilful cultivation. From Mr. William Paul also came a beautiful collection, in which were Sanateur Vaime. M Willermoz in beautiful condition; Souvenir d'un Ami, and Leelia, the last with remarkably large bloome Gloire de Dijon in Memere Paul \& Son'a group wa finely flowered, as was also Charles Lawson, which is one of the best of all Roses for pot culture. From Mr. Fraser also came well-grown and finely bloomed plants. Charming Roses in 8 -inch pota were likewise shown by Mr. Turner; andjamong bozes of cut flowera, which came from Messe Lane, Mr. Wm. Paul, and others, rare many magnificent Rogen but mone equalled Alb rosea, which measured at least 5 inches in diameter, and came from Mr. Turner.

Pelargoniums.-Never before have such magnificent Pelargoniums been seen as were shown at this exhibition by Mr. Bailey, gr. to H. Drake, Esq, Shardeloes, near Amersham, Bucks. So mnusually fine were they, and so completely did they outstrip the whole of their associates in point of high cultivation, that the judges raised the \(7 l\). prize offered for them in the schedule to 101 ., in order to mark their appreciation of their extraordinary merit. These were managed exactly in the way described by Mr. Bailey in the papers whic he published in our colurans on the growth of the Pelargonium (see pp. 725, 843), and to which young cultivators will do well to refer. The plants, which measured between 4 and 5 feet across, consisted of Lord Clyde, Spotted Gem, Guillaume S everyns, Etna, Rose Celestial, The Bride, Sir Colin Campbell, Sane pareil, Fairest of the Fair, and Lady Canning. Amon these the last was theyfinest, and Spotted Gem, a kind usually considered a shy flowerer, was one mass of
blossoms, as were, indeed, all the others. From Mr. blossoms, as were, indeed, all the others From Mr Canning, Fairest of the Fair, Royal Albert, Guillaume Severyns, Prince of Prussia, Lord Clyde, Desdemona, Garibaldi, Fair Rosamond, Pizarro, and RembrandE Of Fancy kinds the same excellent grower had Roi des Fantasies, Lady Craven, Ellen Beck, Modestum Undine, and Delicatum. Mr. Fraser, Mr. Wiggins, and others also showed well-flowered plants

\section*{man): 1,
Tunaer
Mr. Weir}

Calocolarias.-Both large and small plants, wonder fully full of flower, and consinting of good and shows kinds, came from Mr. James, of Laleworth.

New Plants.-Messrs. E. G. Henderson showed several grey-leaved plants mitable for edgings, among which the best was Centaurea ragusins compacta. Mr. William Paul had a large showy Rose called Cour de Lion. From Messrs. Veitch came Dieffenbachia grandis, with ample leaves and mottled stems; Anthurium cordifolium ; (a Peruvian Adiantum, and Leptopteris superba, both beautiful Feras, the last with denee finely cut fronds. Mssociated with these were also Maranta Veitchii ; Bertolonia pubescens, a comparatively manll growing species, with dark brown leaves, prettily maro gined with green ; the silvery marked Peperomia maculosa; also P. acuminsta, a small species with green leaves stripgd down the centre with white; Retinospora obtusa nana aurea; and a Schismatoglottis with leaves mottled with white ; other plants, pre viously noticed, also came from the same establishment. Mr. Ivery again showed his now hardy Ferns mentioned above; also small plants of Aspleniam Adiantum-nigrum microdon, which we hope to see again when larger. From Mr. Bull came, among other things, the different kinds of new Aucubas, all of which have been already fully noticed by us; a slightly variegated variety of Lychnis Senno; Viburnum Lantana, with leaves blotched and mottled with
yellow; Ophiopogon Jaburan, having leaves striped yellow; Ophiopogon Jaburan, having leaves striped pigiensis, Ficus Porteana, Calonyction sanguineum, and Podocarpus macrophyllus variegatus, all notioed by us in former reports. The same exhibitor also showed Sphærogyne cinnamomea, with large stems and leaf-stalks; Amorphophallus rebrinus with mottled stems; a yellow variegated Privet; the hand
\({ }^{\text {some }}\) Aralia heteromorphs and other plants. From Mr. Thompson, of Ipswich, came Aquilegia ccerulea. dendron Thomsones called Bulfourianum, an improvement not only as regards the size of the white calyx, but also that of the scarlet corolla.
Seedlings.-These were confined chiefly to Pelargoniums, among which the following received Certificates, viz., Wm. Hoyle, maroon with light eye and dark top; Lady of Quality (Hoyle), clouded crimson, with a light eye and dark top; Clytie, a fancy from Mr. Turner,
delicate pink suffused with rose; Charles Turner, vivid delicate pink suffused with rose ; Charles Turner, vivid
crimson scarlet, noted above; and Elegans (Foster), pencilled crimson with a large white eye and dark top. King of Nosegays, from Mr. Watson, had well-marked
horseshoe leaves. Mr. Bull again showed cut blooms of his double Mimuli.
Miscellaneous Subjects.-Foremost amongst these was a magnificent wreath of Bougainvillea speciosa, Which being fastened to the roof of the tent in which it was shown, hung down in gay festoons, which were
the admiration of everybody. This came from Mr. Fleming, of Cliveden, who has succeeded in flowering it thus beautifully without the aid of bottom-heat. Of his plan of proceeding some further account will be given next week. Mr. Ivery furnished an interestPalms ; and Messrs. Downie Laird \& Laing and Mr. Hooper, Pansies. Some admirable examples of artificial flowers came from Miss Annie Brunies, of 6, Percy Circus, King's Cross Road.
Among Fruit, for which no awards were offered on H.R.H. the Prince of Wales at Sandringham; fine examples of Granadillas from Mr. Mart, Oxford Street ; a Pineapple, a few Grapes, two Molons, and large and fine looking fruit of Castie Kennedy Fig, which has
often been alluded to in our columns. This last came from Mr. Fowler, gardener at Castle Kennedy.

Enromological: May 1.-H. T. Stainton, Esq., F.L.S., Vice-President in the Chair. The Secretary America to utilise the silk of the Bombyx Polyphemus, which possesses a strong lustre, and of which each cocoon affords not less than 1500 yards of tissue. As many as seven waggon loads of the cocoons had been sent to the Technological meeting recently held at Boston. Mr. S. Stevens exhibited a Cassida which had arrived alive from India in a case of Orchids. Mr from Dr. Jerdon, who had discovered the nest of the remarkable genus Dorylus, which proves to be an anomalous tribe of ants, the workers having been already described under the generic name of Typhlopone ; the females still remain unknown. Mr. Stainton exhibited the nest of an unknown insect found upon occurrences of vast quantities of woodlice in a garden in which several months ago a quantity of peat was introduce \({ }^{\text {, }}\), the insects being found in that part of the
garden. Mr. Saunders considered however that peat was not particularly acceptable to insects as a plac number of new Hymenopterous insects, one of which from Swan River, Australia, allied to the leaf cutter bee, was very remarkable from possessing antenne resembling those of a buiterfly, with a knob at the tip of each. Mr. Hamlet Clark made some observations on the disadvantages resulting from the publication of monographs, and also read the desersects instead of new Phytophagous beetles allied to the genus Haltica. Mr. Bates read descriptions of four new species of Agra from the collection of W. Wilson Saunders, Esq. Must published by Mr. Walsh in America, on the just published by Mr. Walsh in America, on the
insects of different orders found in galls upon Willow insects of different orders found in galls upon Willow
trees, amongst which were not fewer than seven Lepidopterous insects, namely, three species of Gelechia and four Tortricidæ. It did not appear however, that these moths were the makers of the galls, but that their larve took up their abode in and fed upon

Handbook of the New Zealand Flora, \&sc., by J. D. Hooker, M.D., F.R.S., \&cc. Part I. Published under 8vo. Reeve \& Co. 1864. Pp. Irviii and 392.
Few more important steps have been taken towards the general advancement of Botanical knowledge than that which was recommended a few short years since by Sir W. J. Hooker of the publication in a uniform series of the Floras of all the British Colonies. Several have already been published or are in progress, and we may now expect the appearance of the most important of all, British India, which was in vagetable productions of Indis Corn possessions were in the hands of the East India Company, though an admirable commencement wark made by those most competent to carry out the

To render the
Hooker has included the plants of the outlying islands, which properly belong to the New Zealand gr.,up, viz.,
the Chatham and Kermadec Islands, those of Lord Macquarrie's Island. Dr. Hooker had already published in the Now Zealand and Antarctic Floras a large number of the species included in the present volume, but the accession has been considerable since their publication, and it is probable much remains to be done, though the Flora can never be a very rich one as regards Pbænogams. About a dozen genera have been added besides those which belong to the islands abovementioned, and it is perhaps surprising that the accession has been rather in species than genera, as in the original New Zealand Fera the on the side of genera as compared with many other Floras
As regards the relation of the species and genera recorded in the volume, compared with those of other countries, the following remarks extracted from the Preface are of considerable interest.

Of the 303 New Zealand genera of Flowering Plants described in this Part, about 252 (zontaining 222 species and 51 representatives) are common to Australia; 174 (containing 11 species and 32 repre sentatives) to South America; 31 are peculiar to the group (comprising 59 species); and six (with 20 species)
are found in the Pacific Islands and elsewhere, but not in Australia or South America.

Again, of the 935 species of flowering plants, 677 are peculiar to the islands; 222 are Australian and 111 American. There are further 51 Australian epresentative, and 32 American representative species.

Comparing New Zealand with Europe, these countries have 115 genera, and 58 species in common,
the latter including many water-plants and several land plants luding many water-plants and severa European genera the Veronicas and Ligusticum are the only ones that appear to be vastly more numerous in New Zealand than in Europe.'
Dr. Hooker, in conjunction with Mr. Bentham and Dr. Thomson, has long been employed on the collation of spurious genera and species, and the reduction of both within rational limits. The anthor of the present tation of Not without personal knowledge of the vegehe feels it necessary to apologise for many imperfections which may have arisen from a large portion of the pecies described being known to him only as herbarium specimens. But he says this is not the only difficulty with which he has had to contend.
admitted that one and the same species may be represented by two or more permanently distinct forms in one district; in other districts by but one of these forms, and in still other districts by forms which unite the characters of the most distinct forms of the irst district; and moreover that these forms are usually permanent under cultivation. It hence follows that the several claracters will have different values in the estimation of the observers in each district, and that there must always be differences of opinion regarding the clains of such forms to take specific rank. The as it relates to facts and not at all to opinions; it is that in examining dried specimens important and constant characters are often overlooked, unimportant and transient ones exaggerated, and that errors accumulate in the successive process of examining so many organs, in applying technical terms to them, and in describing, transcribing, printing, and even in correct-

\section*{og the press."}

To this we may add the fact that the judgment of man is not always uniform, and that the same specimen may at two distant periods be regarded from two totally different points of view, the arguments in favour of some particular concluaion being in themselves equally cogent, but capable of modification when the two sets of argument́s are combined. At least we can answer for ourselves that such is the case, and that we have sometimes wondered on the re-examination of a specimen at the conclusion at which we had formerly arrived, as we thought on good and certain grounds.
The volume is preceded by the Outlines of Botany which were drawn up by Mr. Bentham for the Flora Australiensis, and which were intended to accompany the Colonial Floras, in order that botanists at a distance from home might have some uniform principles from To facilitate
To facilitate research, moreover, classifications of the both and genera nre given in short and simple terms, both according to the Linnean and Natural methods, together with an artificial bey to the genera, as well as a natural classification, where it is thought, as in the little appendix at the end of each natural order or
genus, as may be most convenient.
We have reason to believe that the concluding Part rly completed.

D British Arms in North China and Japan. By D. F. Rennie, M.D., Senior Medical Officer of the

John Murray, Albemarle Street, 1864 Pp. 408, 8vo. An intelligent medical marle Street, 1864.
An intelligent medical man attached to a corps engaged just leisure enough such a country as China, and with just leisure enough to keep a diary of events as they occurred, was sure to write an interesting volume, if thing in the profeanion to England. There is some
many, the medical oflcer has daties which lio in mo many directions, and he comes in contact with 80 man opportunities of picking up information has pecalin availed himself of these, and can give. Dr. Reend account of scenes which he witnessed, hive a very de to tell the world how little progress has not afrai made in sanitary science, which comes particulari) ander his province, nor does he fear to spenk the trati about the effect produced by Armstrong gans, or ul He commences the rolume under his notice.
the disaster at the Taka Forts, with a brief account services, and arrived at Hong Kong, where, or rat lis services, and arrived at Hong Kong, where, or rather
at Kowloon, a Coolie corps was being the hard work of the army. He says, consists of an ordinary Chinese shirt, made of nankin, with the number and section to which they belon stamped on it, front and back. Their head-dress is conical-shaped wicker-work hat, made after the fashi fhose worn by the Chinese troops. They all rously : some pulling up their shirts and fanning vigochests and backs alternately, others pulling up the leg口 their capacious uuder garments for the purpose. At first the rascals were always desertin but eventually they became the most attached and efficient of servants and burthen-bearers?
The Doctor does not much like the Einglish soldiew way of carryiag his ammunition, and is much diggusted to ond that the "Zouave" cattle ship arrived with 85 oren "This result" that were put on board some 10 days befone traced to th, he says, "I have little doubt is to bo ife wherance of the requirements of nimin of disease being of that peatise their shent, the form overcrowding seldom fails to generate." Then be peculates as to whether these 85, probably saved from death of disease by the butcher's knife, are likely to prove wholesome aliment for the troops-a mois mportant question.
Pel-tang, where the troops landed near the Taku Forts, was found to be the most filthy foalsmelling locality that can be conceived, situated on the bank of river, with nothing but vast mud flats for mile around; but strange to say the troops were more
healthy there than in the beautiful climate and pure atmosphere of Talien-whan. Whence the Dr.opines that endemic disease is attributable less to tise external air that soldiers breathe, than to the internal. Even in the most healthy localities crowded tents appear constantly to have generated disease.
At the Peiho, "just as an Arms'rong had been firel he Times Correspondent rode up and exclaimed, 'What a magnificent shot! it has dismounted a gun.'
John Michel turned round and said, 'There las not single shot gone near the battery; I have watchel with my glass the effect of every one that has bee rea. This was confirmed by another officer who wi tanding with General Michel, and had watched th curse of the shot." When Brigadier Stavely examine position, and there was no sign of one of them harin position, and there was no sign of one of them having
been struck. Where the shots actually went was fonal out long afterwards. They went right over the battery and unintentionally did good service among some retreating Tartars, who had been dislodged by the French.
On the 18th of August two isolated cases of true Asiatic cholera appeared. Strange that this cholenie influence should not have spread among " 10,000 med in an atmosphere supersaturated with the foulest unripe fruits and raw vegetables from the laxariad orchards and well-stocked gardens in the neigb bourhood.'
Several seemingly paradoxical cases came under the Doctor's notice. Soldiers residing in malarious locesidie
and in low situations did not appear to suffer; ba when removed to the heights and freely exposed Them breeze, they were siruck with agues and fevers. and similar cases which occurred again and prodnced the Doctor to conclude, that the low isposition to feren a debilitating effect, and a predisposition \({ }^{\text {when }}\). exposed to currents of air; and thus, that whic have been found invigorating to persons in heallu these men in their debilitated state could not A very singu

Wo bave exceeded the usual limits of a review, and must, therefore, pass over Dr. Rennie's experiences in Japan, which are written in much the same style, and are ns interesting and as well worth reading as we hope be, from the notice and brief extracts here given.

\section*{flotists' floberg.}

In Mr. Perry's remarks on Wintre Variegated Prlabgoniums at p. 244, he ascribes to me the merit of
haviug raised Burning Bush. This, out of justice to the raiser, I must beg to disclaim. It was raised by Mr. Basket, gardener at the Ranger's house, Blackheath, at present the establishment of H.R.H. Prince Arthur, and from Mr. Basket I received the original plant, and distributed its offspring to the trade. I
fully agree with Mr. Perry that it possesses, along with its other merits (which I am quite satisfied to leave to the judgment of the public), the property of early excitement, and this constitutes it the earliest of any red-zoned variegated kind.
Having, since the distribution of Burning Bush, paid considerable attention to zonal and variegated give a few of the results of my observations. In doing oo I may baply. chance to scatter a thought-spore or
two on the surface of some more fertile brain, there to germinate and develop into forms of grace and beauty.
To begin with the zone or horse-shoe mark, which is the foundation for the more beautiful characters of fine foliage. What is the zone, and what purpose does it auswer in the economy of the plant? If we take the zone well developed, and carefully remove the transparent ekin on the upper side of the Jeaf, within deeper, we shall fond a mark, carefully avoiding to go chlorophyll (or green matter), and in separate cells. This may be proved by gathering a little on the edge or the white edge of a variegated leaf, with red paper. shall have occasion often to refer to this substance, and as I inow nothing of its chemical nature, except leaf-piguent), I will call it for convenience the zonal mattor
My observations have led me to believe that the zone is a store for this zonal matter, acting as any other Whether for hybernatory in the leaf, stem, or root, periods of drought, or any other requirements. And Onions, man manner as we have hard and soft-bulbed have in the Pelargonions with no bulbs at all, Bo wo and those with gonium deeper and less defined zones, where native habitat of those with deep zones will be Where only periodical supplies of food for zonal matter Where a mere that of the plain-leaved kinds will be that by the application of stimulants the Certain it is Afters for a certain period may be very much increased. leaf and at will decrease by diffusion throughout the or its effects ; and if the stimulant be discontinued, disappear.
In varlegated Pelargoniums with zozes, the area of expansion, the green parts being in its growth and the white parts least so. Hence the white portion quents contracted, and the zone bulges out, fre to the leaf wing either a cup-like or umbrella-like form those with Stronge a flat spreading leaf is required tendency, should tribed leaves, able to resist this
however, seen some of those with umbrella-formed
leaves very beautiful when the zone has been brizht. and the leares have imbricated woll one orer the oth9r. As the bseadth and depth of the zove is a principal desideratum in the higher-coloured variegated Pelargoniums, it becomes necessary, with this end in view, to hybridize with those having the deepest, thickest, and broadest zoues. But there are many we do not require zones; these should be crossed with none but plain-leaved varieties; and those with thin washy-looking zones should be at once discarded as injurious in either case.
I never could understand why botanists should have made two distinct species of these Pelargoniums : one under the nawe of zonale, and the other under that of inquinans. These distinctions appear to me very
trivial, the only difference being, that iu one kind an exuberant quantity of zonal matter: is stored up at certain seasous in a part of the leaf, while in the other there is noue of this exuberance, but what matter is present is equally distributed throughout the whole o matter may be considerably increased for a certain period by the judicious application of stimulants. Fo his purpose I have found nothing, better than sheep dung, either used as liquid manure, or applied whol just under the surface of the mould. Next to this stand fresh horse droppings used in the same way oow dung I have "not found so efficient. But bun light is the great generator of zonal matter out of these manures, as it is of chlorophyll.
If for exhibition, or other purposes, it is desired to have the greatest amount of colour in the zone at a
certain period, it should be contrived that the plants should be in a comparative state of rest, say from fou to six weeks previous, according to their degree of excitable in this respect-for some are much more so timed that they may have pretty well exhausted the soil. Then, after a fortnight's rest, apply the manure, and give them all the sun and air that can be afforded, keeping them as near the glass as possible They will immediately begin to improve in colour which they will continue to do for three weeks or a month, after which time the zonal matter will again begin to becomedissipated. And now the sun, which has assisted so much in the formation of colour, will con tribute also in its dissipation, both being perfectly healthy processes. So that when the leaves have bee got to their highest point of colour, if it is wished to keep their colour for auy length of time, shading from
the sun's rays must be resorted to, and in order to keep the sun's rays must be resorted to, and in order to keep the plants in health the application of stimulacedingl in their obedience to artificial treatment. Some ar extremely capricious, so that the directions I have given must only be taken in a general way, and experience must decide the rest. I shall next have
something to say as to variegation. John Hally \({ }^{\text {something }}\) Blackheath.

\section*{Cye aptay.}

Soms judgment must be exercised by the bee-master in the subsequent Managruent of his Hives and Supras (see p. 463). These should be inspected at least every night and morning. If the supers, after having been well filled with boed, appear deserted, it may be usually inferred that a swarm has departed. The emigrants from a stock which has fairly commenced building combs in its super, frequently leave so quietly and suddenly that they are very liable to be lost altogether. If there should be every appearance of a swarm having gone off, it should not at ouce be given up as lost, but search made in that and the adjoining gardens.

We have many times recovered swarms which had given no notice of their departure in the everings, as bees having hung suspended to the trees all night. These were discovered by finding the supers quite deserted by the bees, and a search being instituted. A super, or other means of affording additional accommodation, will not necessarily prevent swarming. It would appear as if some colonies are much less disposed to swarm, having sufficient room afforded them, than others treated under precisely similar circumstances. We have hives which, year after year, have filled fine supers of ;honey without having once swarmed; and we have others which have as often worked vigorously for some time in supers, and almost invariably bave thrown off swarms, when they were about two-thirds filled with combs and honey. In the first instances it is probable that the queens have been changed, when worn out, by the bees themselves; as, after six or seven years, we could discover no falling off in the strength and prosperity of the stocks, and the queens, when we had an opportunity of personally iuspecting them, exhibited all the outword signs of youth and health.

In our last we said that a swarm leaving a hive en gaged in filling a super, could only be considered as a misfortune. This, perhaps, expresses rather more than we really intended to convey. It certainiy is a misfor tune to have a partially worked super left with little prospect of being completed; but if thelowner succeed noloubted boon, though it be not exactly that which
he would have chosen. Should a swarm issue tolerably early in the honey reason, under such circumstances in about 10 days or a fortuight after being lucated in its new domicile, the super may lue given to it to be fuished. It should not be put on before, or the queen will alnost certainly make extensive use of the comb ready for her, and spoil them as honey combs for table use.
When removed at the close of the eenson, or when Wed, it should be carefully ascertained whether the tock has stored a sufficient amount for winter consumption in its 0 wn hive, as the bees of a young swarm are very much disposed to store nearly all their hone in the super, making use of the combs in the lower compartment for breeding purposes chiefly. Many a ne colony bas been sacrificed from this cause, the proprietor imagining, because he has been fortunate in obtaining a bor or glass of fine combs, that the stock hive must necessarily be also fully provisioned. No more common mistake, or oue ikely to be fatal to the well-being of an apiary managed on the depriving system, can occur. In the wretched bee summer of 1862, one onlr of all on numerous hives filled a super. This, which weighed 25 lb ., was removed with some degree of eatisfaction but on examining the stock from which the goldun
treasure came, there was almast literally no food owred in it. Much as this solitary supply wan required for our own home consumption, we did not besitate to return the whole to the stock hive, and the following year it repaid the consideration by giving a large uantity of fine honey.
It has been previously stated that perforated tuben, or other means for ventiluting eupens, are not only not required, but are usually quite useless. This doubt-le-s will be opposed to the views held by a large
number of bee-keepers. We can only ara that we have obtaived supers varying in weight from 10 lb . to 70 lb . which had not been ventilated in the lenst. The entrances of all supered hives should be very much wider than those usually used. Where large and deep supers are worked, the entrances, in the busient part of the honey harvest, may with advantage be. 7 inches or more in length. This enables the bees to ventilate the whole range of compartments. To some of our hives we can open entrances of 14 inches in length, but this space is only given occasionally. The usual contraotod eatracees in cottage hives should be omitterd, or fillod up if aready cut, and entraaces hollowed out in the floorboards of 7 inches in length by \(\frac{1}{3}\) of an inch in depth. These can be contracted at pleasure by moveable blocks or wedges of wood. In a large wooden tuper, a 2 -inch aperture may be made in the top; this may usually be covered with a piece of wood, but if the owner fancies the temperature to liave become too bigh, he may substitnte perforated zinc, changing it as the holes become filled up by the bees. But we have come to the conclusion, after many years experience, that ventilation does more harm than good, alway provided that the entrances are extended enough, and that too many boxes, with insufficient communication between, are not piled one on the other
Supers capable of holding 20 lb and upwards have been recommended, and a; a rule, we are convinced that more honey will be obtained by using supers of these dimensions than those which cuntain ouly a few pounds. With the latter, the powers of the bees \(t\) take full advantage of a good houey harvest are very considerably contracted. By the use of stnall-sized supers, the apiarian may think himself fortunate in ontaing frow any hivo a harce of for 20 lo , but 4 l
supplies of 40 lb . and upwards are by no means rare.

\section*{Garden Memoranda}

Mrsbrs. Waterer and Godfrey's Rhododendrons. -A magnificent exbibition of some of the very best of these useful and ornamental hardv shrubs is now open daily for public inspection in the Garden of the Royal Horticultaral Society at South Kensington, and with the exception of a similar show held here last year, we have seldom soen a much more effective or pleasing display. The plants are arransed under the fiue tent put up here purposely for such exhibitions, in much the same manner as they were last season. A straight gravelled promenade, 32 feet in width, passes along the centre, on either side of which are banks of Rhododendrons, encircling walks, and a boundary border, fillod with choice Conifers.
As may be imagined where thousands of Rbododendrons are gathered together as they are here, they necessariiy comprise many fine kinds Amonk scarlets or crimsons, the most brilliant are Blaudyauru, Brayanum, atrosanguineum, Archimedes, Vandgke, Barclayanum, and Ornatuw. Different shades of rose comprise Titian, Roseum pictum, Giganteum, Sir C. Napier, and Elfrida. Among pale kinds the best are still album elegans, delicatisaimum, and album grandiflorum. To samon-coloured sorts in the way of the flowers being very large and beautiful. Purples consist of Nero Lord John Russell, Currieanum, Sir I. Newton, and Ne Plus Uitra. Annong Lilacs the best are the semi-double Fastuosum, Onslowinnum and Everestianum, the last an old but still useful kind. Of pale centred crimson varieties, a class justly much
prizel, the best are concessum, Alarm, and Bylaianum.

These are a few of the best and most showy kinds- Worthy of notice among real novelties are
H. H. Hunnewell and Charles D cikens, both brilliaut crimsons; Lady Clermont, a richly spotted variety and Alexander Duncer, the last a large showy rosy crimson. We may ald that a pure white sort namerd last year Mrs. Clutton, sthat Mrs. W. Bovill and Lady F. Crossley, are goond adititions to the intense crimson varieties, as is also Charles Bayley to brilliant crimsons, The \(9^{\circ}\) of trost which occurred on the night of the 30 th of April last injured the buds of some of the
sorts, and exquisitely fine as the extibition jus: alluded to is, it would have been still more glorious had the season been more favourable, or no check been experienced.
As regards the cultivation of this class of plants, little need be said. Three points only require special attention: -1 , the soil must be loose and rich; 2, there must be free and constant access of moisture without staguation ; and 3 , there must
be litte or no chalk. In these three rules the whole art of growing Rtododendrons and similar plauts well consists. Pert is not now considered indispeusable; on the contrary, other sub-tances will answer the same purpuse, provided they ure in the same mechanical condit on, The reason of this is obvious. American
plants have delicate hair-like roots, which remain for yenrs without any considerable increase in thickness such routs cannot force their way through a soil which offers much resistance to their progress. Therefore clays, very stiff loams, and other adhesive compact kinds of earth, are unsuitable to them. Excluding these we have nothing left except sand, very sandy loam, anid lecayed vegetable matter; and those subThe only value of peat cousists in its being a good natural misture of what is wanted, and where it is readily procurable we need not say that nothing else should be employed. The substances just named will hower, auswer where peat caunnt be got.
As to manare, nothing suits Rhodotendrons better than thoroughiy rorted cow-dung well intermixed with the suil in wheb they are planted, and a mulching of Cocoa-nut fibre will ulso be found of mach service to them, especially in dry seasons. Rhododendrons like a damp situation ; there must be free and constant access of muisture, withont stagnation. All directions, herefore, which insist upon keeping the level of Rhododendron beds comuletely below the surrounding surfuce, when the sitnation is not naturally damp, are founded upon a correct appreciation of the nature of these plants.
The true difficulty, then, in growing American plants is not, as is generally alleged, the want of proper soil, for that may be made anywhere, but the want of a question whether a very material difference would not lue found in those places where American plants grow badly if rain-water alone were used in watering them, iustead of that from phmps and ditches.
Mr John Waterer's Exhibitios of Rhododen-BRONE.-This is now in great beauty in the Royal Botanic Gardens, Regent's Park, and is well worth of the leading vurieties of which it consists, next week

\section*{Miscellaneous.}

Newoow Pippin Apple.-I wish to say something in regard to the Newtown Pippin Apple, because come people are for ever cryme that this and that variety of fruit is "run out." Rach class of fruit requires an
appropriate soil, comprising therein the conmituents appripriate soil, eomprising therein the constituents
natirally adapted to its developinent ; and there are even varieties of the same species ef fruit which require a variation in mil. The Newtown Pippin delights in high culture, with manure and limen, and it is the neglect in cultare or the lack of the ingredients that penders the trep deficient in vigoar and unproductive. with az much suceess and that it will grow with as mulh vigour as it ever did, provided it receives the proper attention. It is, however, the natural character of b. th the varieties to grow slower than many nther kinds, and consequently to attuin to less size in an orehard than most others of the same age. The roughness of the bark of the green variety, which is the kind mostly cultivated, gives to the trees an unthrifty appearance, when, in point of faet, this is but a vatural
characteristic. I have felt impelled to make these remarks. after inspecting an orehard planted in 1816-47. This Apple has some peculiarities which I have not seen noticed. One is that the seeds do not come from the core clean, but hare more or less particles of the core adhering to them. The quality of the fruit varies very materially aceording to the sorl, climate, and treatment. When in its highest state, it: has a thia, smonth and pilished skin, with tender flesh; others, grown under less favourable circumsinnees, have a rough sinin, the texture of the fleh more tongh and breakug. W. R. Prince, in A merican " Rorticulturist."

\section*{Calendar of Operations.}
( For the ensuing week.)
Wakis, which promise to be troulh some this season, Tie not the unly peste wish which the gariener is
are doing great mischief. Peas, Carrots, Onions, and effectul good many people seem likely to have no crops left. We strongly advise all who are attacked by slugs to try the effect of lime-water, which does not at al
injure any crop, and immediately destroys the enemy To make the application efficient it is, however necessary to use it late in the evening and very early slugs are feeding. A couple of applications have sometimes been found to be perfectly effictual. Now is a good time to apply liquid manure to al growing crops. Guano is most useful mixed with
water. Over a couple of pounds of it pour as much water as will fill a watering-pot; stir it up, leave it for a few hours to settle, and then use it in a clear state. It answers all purposes for all crops that require manure. The time of applying it is when plants are in active growth, and the best way is to give it in the shape of small quantities at a time and often; under such treat ment it is surprising what progres young crops make in a comparatively siont space of time.
plower garden and plant houses.
Shrubberies now everywhere have a gay and dressy appearance. See therefore that walks, borders, and lawns are rendered equally attractive by means of good keeping. Indoors shading and watering wil require particular attention.
Auriculas - Those out of flnwer will not need much water, but still take care that there is a proper supply gather seed as it ripens, and preserve it carefully.
Calceolarias.-Shade from bright sunshine, and keep clear of insects. Herbaceous sorts ought now to be in full flower.
Carnations and Picotees.-Tie up the flower-stems as they advauce; remove dead foliage, and top-dress beds or pots which may require it, using a mizture of good loam and well-decomposed manure.
Chrysanthemems. - Where any scarcity of these useful plauts exists, it may be remedied thus: seleet ahout this time the tops of the strongest sloots for cuttings, putting four or five round the edge of a 3 -inch pot, and placing them in a gentle warinth when rooted, pot singly in the same sized pot, and keep become established; the tops may then be pincher out, leaving five or six joints to remain for lateral shoots; after a few days' hardening off they should be removed to an open situation, allowing the plants a sufficient distance from each other to prevent their drawing, care being observed that they do not suffer from want of water. About the third week in July shift for blooming into 7 -inch pots, using a smal handful of coarsely broken bones at the bottom.
Fccustas, - Specimen plants reserved under glass for the purpose of open-air decoration may now be planted sut. Those required in pots will well repay any aten occasioually using liquid manure.
HollyHocks.-Support such as need it; encourage liberal growth by the penal means, such as stirring the soil and applying wea

\section*{those for competition.}

Pelargoniums - There will now be 吾ely in flower Shade is ensential to brilliancy of colour and preserva tion of bloom ; keep the house clear of bees. Attend carefully to watering, and maintain as far as possible a moist atmosphere rourd the plants, by demping the floors, stages, \&c., occasionally.

\section*{forcing garden.}

Cherries - Spare lights placed now over trees of May Duke again-t walis would forward the crop very murh withnut further trouble than drawing the lights a little apart during sunshine, and pushing them close, and cloning the ends with canyas during the night Thay maze, however, be securely fastened during tormay weather.
Fics.-In favourable weather let these have plenty of air duriag the day, and abuudance of water, and except where fruit is ripening, use the syringe freely.

Melons -This peason has not been unfaviurable for early Melons, and with many these will be ripe. A second set of plants may therefure be turned out in the same pit
Praches.-Forced trees in pots that have ripened frait should be kept in the house till the beginning of next month. Give them plenty of water, and syringe once 2 day.
Pink-ñow in a good time to go through the whote stock of succession Pizes, baginaing with the langest. Let them be taken out of the pirs, and turn tham out and examine their roots in order to nee if a shift is required. After the larger plants have
received attention, follow with tiose of smaller size, prutting theu inte larger or, epallop jots menorling to che amount of vigour they ponsesa,
Viness. - Honses in which Grapes are nipening ahould be kept at \(90^{\circ}\) or even higher, with sulu beat, but if allowed to full down to \(70^{\circ}\) ut night, so muck the better. Onn nights following clear sumpy days like the present little or no fire will be necamany; anoid over
oropping, aud take care to keep red apider in check.

HaRDY FRETT AND KITOHEK GARDEN.
With respect to wall fruits, report says that caberpillars are divesting the trees of their leaves; where,
therefore, that is the case, apply the usual remedien before the evil has proceeded beyond hope of recovery Cauliflowers.- If beds of these are becoming gres crowded, pull out a few of the larger plante, othernit Oniovs. - A bed injured.
Onions.-A bed or border may now be preparel may yet be sown in light poor soil to cunue in toy pickling.
Pras and Brans.-As soon as these show flover, ninch off their tops and stir the ground well betweer the rows.
Strawberries.-Mulch with some sort of roug

\section*{}

IT will be seen by the report of last Monday discussion in another page that a general meeting of the Royal Agricultural Society hat dealered that the efforts of the society in eonnection with the educational paragraph in their Charter shall not be "especiaily directed to the promotion of professional (agricultural) education." Mr. Acland diu indeed point out that the motion to this effect, using as it did the word "professional" alone, miytht luereafter by a strict interpretation be held to exclude agriculture altogether! but this little bit of mere verbal criticism was the onity exepption to the cousideration which the suhject received upon its merits; and yet the motion was refused. The minority included such mon as Lord Feversiam, the late President; Lord Tredegar, the Presideut elect; General the Hon. A. Nelson Hood, the Chancellor of our Exchequer; Mr. Holland, M.P., the Chairman of the Education Cummittee; Mr. Wilson, Professor of Agriculcure in the University of Ediuburyh; and Mr. Frbarb Hobbs, one of the most aotive of pur Vige-Pre sidente; and it may thus be oansidered a mont effieient proteat. But it is not the less-indend, rather the more remarkable, that a proposal committing the Agricultural Society to a striotly agricultural course shouid not have been aoceded to.
Let us, however, console ourselves by the bolief, which those engaged in the mauagement of great bodies such as the Agricultural \(S\) ciety are rather apt to forget, that the real work of the eountry is being done, not by them, but by each ?nhabitant of the country for hinstlf. Agricultural education, whether in the sense of the majority or of the misority on this oceasion, is proceeding and will proceed protty much as it has done hitherto. It is the relationship of father and son throughout the country that is the real security for that-the real incentive to it-the real guide of it. And however the R yal Agricultural Suciety may act or refuse to act, farmers, more alive than ever to the value of education, will do their best for the general edncation of their children: and more alive also than ever, as they must be, to the difficulties of making a living off the land, they will do their best for the "professiopal" education of the son or cons intended to succeed them on the farma. It is in the latter pint, however, where so great a novelty (comparing the knowledge of ene generation with that of another) as the application of soience to agriculture is at length making itself felt, that external stimulus and guidence are especially needed. For, notwithstanding the many exceptions which every neigh-
bourhood cen show, it is the undoubted fact that the tenant-farmers of this country have risen and aro rising more rapidly than any other in that g neral edtucational standing and intelige nee whith the Sreity have thought proper to take under their enpecial patronage; but which, as we believe, nerds that patronage so much less than the striotiy agricultural education which they migit have taken up, and with which they are "professionally" connected. And small as the educational is,fluence of the Suciety over the great hady of English farmers may be, it would have betp more efficient if brought to bear un tieir own proper work, in the Reld whi hy property belungs to them, and on ground where guilanoe end incentive are really needed, than it is likely to be when directed to work which is not that of an agricultural society, but of the Universities, the College of Preceptors, and other educational bodien, which moreover is not in a field belonging in any proper sense to an agricuitural society, noz on ground where any help is wanted.

This wes well pointed out by Mr. Edmunds, of Kughy. He said the people are really all jaterested already, what they want is not guilance nor stimulus, but aotual schonls. Prizes and programmes are useless; for we are all anxious tnougin, and we all know what we are at pidinly enough ; the real difficulty is nut that there is no interest, hut that there are no sohouls. Our counties generally have nut the schouls which Surrey, Suffolk, and Sussex possess. His speech was in fact directel to the distiuguished and intluential individual men before him, not to the Agricultural Society in which, for a particular "prufessional" purpose, they had assuciated themselves. And useful as his remarks were, and doubtless will be, they wore el sarly out of order in the agricuitaral rooms at Hanover Square, where oertainly no soheme for the erection of coanty schools, such an Mr. Eduymps regommonds, ean ever properly be entertained.

Nolwithatanding the present failure of Mr. Mortox's motion, it in not unlikely that the discussion shich envued upon it mey had the Education Committee more anxiously to examise their ground, with a view to action in tha direction which it recommends ; and thus, as Mr. Holland explained, the thin end of the wedge may have been efficiently entered, and tome useful purpono may have been coomplishod, even though at the cost of present failure.

Let us, in conolusion, here give cordial expression to the grateful sense in whioh everybody regards the conduct of this and the other affairs of the Society during his year of office by the retiring President.

Sir E. Kerriser, in acknowledging the warm vote of thanks to him, moved by Lord FryersHam, congratulated himself on the fact that this educational question had arisen f,r cunsideration during his presidency. We are sur that the members of the siciety may well congratulate themselves upon it too. No one has mure unquestionably than Sir Edward Kerrisan the right, which actual performances confer, to express an interest in the genersl education of the middle class in country dietriets. And the subject of agricultural education-for that doubtless is the direction in which the labours of the Serety will henceforth turn-must also ultimutely benefit from the energetio spirit of the Edueation Committee which he has done so much to atimulate and direet.

On Wednesday, June 7, Mr. Straprord will stll by auction, at Wiliso's Roums, King Sureet, St. James's Square, the "Duchess" herd of the late Josepi Hegant, Esq., of Dawpool, near Birkenhead; and the highest average price that has ever been realised in this country for a whole Short-horn herd will doubtless be realised on that occasion. The 18 animals, then, to the disposed of are all (exc-pt Imperidl Oxford) desceudants from Duchess 51 st, purchased by the late Mr. Bolden at the Kirklevington sale; and the bulls Grand Duke, Cagriry Dure, and athers, used upon her produce, have all contributed to the nure "Duchess" blood, of which this is one of the only tw herds of whieh this country boasts.
The history of the Duchess family is the most extraordinary of any in the annals of the shorthorn breed; but it will be more proper to give it when the Dawpond sale shall have aditd auother seal to the wonderful testimony in favour ut a pure and unifirm descent which it cons.ys. AcanWhile we quote from Mr. Srbaffori's advertisement his assertion that this tribe "for purity and length of breeding stands unrivalled. With the
exception of IMPRRIAL OXFORD, the entire Dawpool Duchess 51 st,' bred by Mr. Bates, at Kirk levington, who purchased 'Duchess \(1 s t\) ' at Mr Chas. Colling's sale in 1810, and he originally obtained the furnily from the ancestora of the Duke of Northumberland. Animals of this tribe have gained the highest honours in the show yard, and realised the 'greatest prices ever attained at any public sales."
In illustration of this we may recall the fact that at the Tortworth sale a cow and calf of the Duchess family were sold for 1010 guineas; and that 10 animals of the family realised \(4420 l .10\) s., or upwards of 421 gg 。 each.
The small herd to be now either dispersed or disposed of in one lot are descended from Mr. Bolden's 13 Grand Dukes and Duchesses for whioh Mr. Hegan paid 5000l. three years ago. Some few descendants of this herd have been sold sinee Mr. Hegan's purchase. Thus a yearling bull hired by Colonel Pennant, with the option of purchase for 500 guineas, remains at Penrhyn and Mr. McIntosi owns another.
If the sale of Wednesday week should take place piecemeal, we cannot doubt that some of the highest prices known to Short-horn histors will be realised; and whether it goes in one lot or not, the
average price whioh will be realised will doubtless be the greatest which a single herd has ever made.

Mr. Steafford disposed on Thursday last of the herd of pure-bred Shorthorns, the property of Mr. Wexls, of Penshurst. The amount realised for the whole number of 32 animals was 10801.9 s,
viz., \(83 i l .6 \mathrm{~s} .6 \mathrm{~d}\). for 24 curs and heifers, and 244l. 2 s. 6dl, for 8 bulls and bull calves, being an average of 331.15 s . 3 d . cach for the entire herd. Among the prinelpal priees realised was 46 gs , for
Lot 4, Rosa (Rev. C. MARSHALL) ; 59 gs , for Lot 8 , Maidof the Valley (Culonel Leslie, M.P., Ireland); 70 gs . for Lot 10, Rosa Bonheur (J. Blyth, Berks); 60 gs . for Lot 15, Maid of the Mist (J. Heathcote, Hunts) ; and 46 ggofor Lot 3, bull, also bought by Mr. Heaticote. Immediately after Mr. Wells' sale, the small herd belonging to Mr. Waldo was disposed of at an average of \(35 l .1\) s. for the 11 cows and 5 bulls. The highest
price was 71 g3. for Lot 5 , Fathom, bought by Mr. \(p_{\text {awlett, Beds. It was a tine bright day, and a }}\) large company were present, who did ample justice to an admirable lunoheon.
A most instructive leoture on the qualities of the water avaiiable in irrigation was on Wednesday given by Professor Vokicker, the Consulting first referred to the great variety of opinions which exists as to the way in which water acts in irrigation. Its fertilising influence is attributed to the deposit of matters suspended in it-to the mineral matters dissolved in it-to the carbonic aoid present in it-to the warmth which is con-
veyed by it. The subject, in fact, has been most variously treated; and yet many a point throwing light upon it has been aitogether neglected. Thu it is often furgotten that, ufter all, it is the soi (and the relation of this to the water) to which the Grass produce is due. In some cases water on a sufficiently rich soil is thus more valuable than manure. A shower of rain is often more beneficial than many cart-loads of dung, which would, indeed, be useless without it. And on the other hand there is many a light porous sand, though full of dung, whish is rather impoverished than not by a fluod.
Professur Voelcker next discussed what it is that water does to the soil of a water meadow. It carries air into the soil; for it is to be understood that in successful irrigation the water yoes through the land as wtll as over it. This air converts the
org nie matter of the soil into food for plants; this it does chiefly by its oxygen. Moreover, it also converts certain inorganic matters of the soil into food Icr plants ; and this, on the other hand, it does chiefly by its carbonic aeid. Again, especially, water carries warmth to the plants of the meadow. This is of great importance during the winter and early spring months, when being warmer than the air it tends to promote the early growth of the Grass. And, lastly, water carries in itself the actual food of plants to them.
The waters ordinarily used may thus be arranged, acoording to the order of their merit, as
1st. Sewage-water, containing ammonia, phosphates, and potash.
2d. Drainage-water, which otten contains much valuable matter washed out of fertile soils above,
and which certainly ought not to be wasted, bu used if pussible on the lower lands in irrigation.
3 d . Water containing the debris of rocks, such as the water of the Nile, and also certain warp depositing tidal waters used on the coast of Lincolnshire and elsewhere.
4th. Spring waters, especially those which are of uniform temperature throughout the year ; because that shows that they come from a considerable depth, and having thus traversed a great quantity of earth, they are full of useful minera matter, dissolved out during their passage. Hard waters are not necessarily prejudicial. The pure ohalk waters full of lime, and ulso containing alkaline matters in solution, are excellent irrigation waters.
On the other hand, there are several bad waters which it is even mischievous to employ in irrigation. Such are bog-waters, not because of the tannin whioh they contain, but because of the sulphate of iron which they contain in solution Such also are very saline waters-in particular sea-water, which when it breaks in upon the land renders it infertile for several seasons.
To the discussion which followed Dr. Voelceer's interesting lecture, remarks were contributed by Sir Joun Jounston, who spone of irrigation as conducted on his estate by Dr. W. Sirite, the father of English geology, in particular instances where the clear spring water from chalk had been beneficially used on the sandy land lower down, and in others when water from the higher moor had, as Dr. Voeccier stated, actually injured the land over which it had been poured. Sir E. Kerrison called attention to the faer that the re-use of drainage-water which is now so rapidly leaving the uplands, and actually clogging up the outfalls, is one of the most important topics of the day. Not only for irrigation purposes-not only for the use of plants, but actually for the direct use of man and beast, it is beooming a serious question, as Mr. Bailey Denton had long been pointing out, how the present waste and injury can be obviated.

THE OBJECTS OF FARMING.-No. I.
When my neighbours are croaking around me, I am perhaps apt to take too sanguine a view of things ; but surely it is healthier to laugh as long as one cas, and not to sit down and cry. When last year there was a great cry for tenant right, I endeavoured to show in some letters on "Condition" how a tenant might farin highly and at the same time profitably, and secure the return of any capital expended in the improvement of his farm. This year it is the prices of produce that are supposed to be our ruination; but as 1 cannot, happily for myself, look forward to such an inevitahle climax, Gazette to give my reasons for preferring the presen range of prices, as being beneficial to the farmer and his farm.

The first and main object when a man tukes to a farm is undoubtedly to make a fair return for his capital-I do not say to make his fortune; for it is evident, from the nature of the occupation and on pu commercial principles, that such cannot be the rule.
The landlord is content to let his land at rents producing from \(2 \frac{1}{2}\) to 3 per cent. on his original outlay. If land himself, is it to be supposed that he would incur the risk of taking a tenant who may or may not prove a good neighbour as well as a good fariner, or the Wnoyance of valuations of damage by game, \&c.? Would he not be delighted if to his proud position of owner he could add the influential and attractive feeling of being the master of the whole domain, of employing whom he liked, cultivating as he liked, and mproving where he liked? It is because the margin of profit is so sunall that he is obliged to let, and for the sume reason the tenant is obliged to consider his position as part of the ordinary return of his occupation. The freelom of a country life, the variety of employment, the opportunities of an occasional holiday with the hounds or his gun, or at the weekly market-
even the duties of the various parish offices, with the sense of power and authority which is attached to them-all these conduce to draw tenants into the profession, and are accepted as equivaleuts for a low return in money. Nevertheless, the gradual rise in rents, and the progressive improvement both in farmers and in farwing, show that a fair return is to be made, and my present aim is to trace out how this is to be ecured.
The first object of a man entering on a farm, therefore, would be to find out how to farm it most profitably; and as all his profits must arise from the sale of his produce, he must consider what he can tionace cheapest and sell dearest. And this consideraprobubly never contemplated. Whetersion which be probubly never contemplated. Whetier he is an oldfashioned farmer, or a young man brought up on a farm, or even a townsman who is now realising his first
uoon the routine of a four-course or five.courn
rotation as an agricultural necessity sowing so many acres to corn, and threshing that the to pay the rent, are as certain to follow as the retu ont summer and winter. But should he be of an ingurn and philosophical disposition, and look a litelle cisire into the reason of things, be will mon see the the causes which operated some 50 or 60 years ago make these rotations so general no lorger exis The price of Wheat was then fixed, as tar as \(A\) of Parliament could fix it, at \(80 s\). to 100 s. the quarter,
and other corn in proportion, by which price fathers were induced to grow corn as ofter prices on coulders were induced were contented with and as often as they of three or four quarters to wh repaid hy a mop having passed away, he will soon find but these such crops are now no longer remunerative. When b adds up his rent, his tithes, and taxes-say \(2 l\) an acre his labour and other expenses, some 3l. per acre mony of Wheat carted off the land takes away with quarter of ammonia, the very essence of his manure worth at least 1l., or \(5 l\). for every load of Wheat ewt he will discover that these three or four quartera Wheat, which used to pay the rent of the farm, do on now pay their own expenses. Barley and \(\mathrm{O}_{\mathrm{a}}\) ts mill give nearly the same result, only that Barley, on good Barley land, pays better for malting, and being a shorter time in the ground robs the land less, and any portion of these consumed on the farm will not rob the farm,
He will then make the same calculation with resen the fallown make the same calculation with respeet which he proposes to turn into meat. He will charn them as before, with their proportion of the rent, en \(2 l\). \(8 s\)., expenses \(3 l\)., taking about \(5 l\). per acre; he will add nothing for manure, the carting, \&co, being incloded in the labour. He will then consider what he can sel these crops for to his own beasts, \(i . e\)., what they will pay him beyond the \(5 l\). per acre for fatting-any sum realised beyond this being his remuneration for time and skill, and interest of capital expended I endeavour to show this will promise hin much more satisfactory results than his three or four quarters of Wheato J. B. M.

\section*{FARM.YARD MINURE}

The following are extracts from one of a short course of lectures lately delivered by
Royal Agricultural College.

As matters at present stand with the farmer, it is only by a liberal supply of manure to land kept prooerly in heart that he can expect to rear remunerative cropes, He must work and he must weed-he mnst plougt grub, stir, roll, harrow; but unless he puts in the manure he may not be able to calculate on a due remard for his labour. Undoubtedly there is a system, that known as Lois-Weedon, and there are land having, as in ancient and why not imona times ben But science teaches us that the art of caltivating but science teaches us the rows of Wheat-that the mechaniod between the rows of Wheat-that the mich yar b working and pulverisation of clays, in which jear year crops of Wheat are grown without manuren amounts in reality to nothing but a mode of liberatin those elements of fertility in the soil, of which but portion are at one time found available or in a goldore condition, but which by the commingling of ing which react on one another, are liberated to a greter extent than ordinary. Combined with of cultivation, it appears to me that the juace addition of manure would wonderfully improve present system of cropping, although of course in This be danger course of rotations. Nix last is an important point to be attended to agriculturist of whatever grade, whether ten nt or prietor, because we have for centuries been dram from the land its more valuable constituent course, as this goes or, the cost of cultivation, being reduced in proportion as the powers by the et in the soil declive, will rather be iucreased efforts we must make to keep up the returns. is exactly what is now taking place. The
sums expended in fertilisers in British agricu however emizently successful in keeping the return up to and even beyond the mark of expect agricultural chemists have it al as doctors differ so to You are of curres amare that they divide into two grand theories. favours that known as the
Messrs. Lawes \& Gilbert oppose to it the theory." The mineral theory rests its entire maintains that if the inorganic constituents plant be sufficiently supplied, the plant will in nitrogen and carbon, the on that carboni acid and ammonia, Whereas the nitrogen assuming the existen supply of saline substance, with constant acculd rocky decomposition and disintegration that there is already a surplas pabulum in the soil, requiring are soils more or less des itute of plants this theory however that in general there exists an from this, of which plants are precluded
ricpating because of the difficulty of absorbing ammonia from the air, nincal salts crop to become more productive. No doabt the trin it is certain that of an excess of ficting theoriea. oineral manding excess of gaseous food; and that this cort can only be supplied by adding to the soil sub-
 To this demand we are olligeu to conforms under an avanced four times the amourt with which the farming cons a few years ago would have remained content. or well cultivated soil the plant, however, finds not lo well cal food, but the decomposing remains of only mineral in former years, which supply carbonic acid plaata amonia, that add materially to its development. Agricultural chemists formerly thought the of the as taken up from the soil by the roots of the plant nut be soluble in water, and that nothing eise was wilable for the growth of the plant. But Liebig' more recent doctrine is that the roots themselves posess an inherent power of solution over mineral substances, although it is indispensable that water should be present
Farmyard 3/anure has been termed by Dr. Voelcker a universal perfect manure, Mecause it contains and the elempents coploged from time immemorial for the purposes of fertilisation. Of the constituents of farmyard manure nitrogen is the
firt in value, phosp; horus the next; and the great object in its conomy or management should consequenty be to preserve the process or putrefactive fermentation, and are carried to the chango which occurs in the fermentation of dung-heaps is

And were it not that excelleat fixers of the ammonia
are formed within the heap whilst this is going on, considerable deterincation would ensue from the process. This manture, as Wive all know, is composed of excrementitious matters of the ised as bedding or litter for the animals. Thus, whilst 100 lbs. solid excrements of the cow, they are equal only to 91 lbs. of to only 16 lbs. of tbe liquid excrements of the horse. Still it is found that to apply for any length of time any one manure
is distasteful to the soil, and such continued application, pointment in the results. It has been estimated, in regard to 10 loads for a two.horse waggon, and a young ox or cow five
loads; that one horse fed in the stable yields 15 loads of dung, and one turned out to Grass \(7 \frac{1}{2}\) loads; so that, calculating at
the rate of 20 ionds of cattle dung per acre, or 1 S of horse dung, of an acre, and a stable-fed horse as much as five-sixths of an acre. A horse fed, however, principally on corm whll sield
dung equal in value to one which consumes twice as much
weight of hay; and it is quite obvious how the food of the or cake shruld be exastly superior in value to that of an animal subsisting on straw. The age ann character of the animal
produce also corresponding results. A full-grown animal the waste of its body. A growing animal not only does the
ssme, but moreover the additions required to build up its
skeleton, muscles and tissues. The matured animal does not separate the phosphate of lime required for the bones, or so with a fuil. grown animal tie inanure may be taken to represent the carbon wasted in respiration. All breeding and milk-
producing animals severely impoverish the food they receive, and hence their manure is of less value.
These facts I adduce to show you that the con under which farm-yard manure may be pro
ed, differ so materially as to render analysis useles
ourse, also, the proportions existing bin litter used and food consurtions existing between the straw or experiment found 961 lb , of dry mement. Dr its Volcue. Ereryto 6991 b , , and in one year to manure reduced in six months odtced it to 50 lb . In other experiments 100 cwt . of fresh
ung beamee reduced to \(\$ 0 \mathrm{cwt} .\mathrm{When} \mathrm{half} \mathrm{rotted}\),60 cwt .
hen "fat and cheesy," and to about 45 cwt . When completely ntrugen; but these are dissipated in the form of volatile orintain that since in the third 20 lb . Thus it is that theorists drainings from the to prevent the vass, of it is better to apply it
ithe gases and
thus also the protected manure yard dung of the opepen pit, as richer in ammonia and in folubie

Flax and Cotton Mixed. - As to the mixture of Flax and Cotton to make a middle cloth between the old low price Cotton and linen shirts, allow me to solicit your attention to the fact as to my proposed change in the manufacture of the union to that which I made 25 years ago in Ireland by warp of cotton and weft of Flax, or warp of Flax and weft of Cotton. The Flax yarn being epun through hot water is hard and stiff when dry, so much so that even when boiled and woven with cotton, which is 80 soft, that when the cloth is bleached, the soft cotton is so much reduced and damaged by the acids, that the linen thread cuts the cotton and falls into holes on being two or three times washed ; therefore, to obviate this, my aystem comes in, thorough success. First I take the Flux-straw green wood, and that, fortunately, by my new machine with. wood, and that, fortunately, on a run of hot water, and having discharged the natural green resin or gum, I wring it at the same end, by two wooden rollers, and from them I place it back in the same machine for the softening or bleaching, as it will be termed, which I do minutes turn out the Flax, Hemp, or Rhæa, white as snow and soft as silk; it then passes to my hackling machine, then to my cutting machine, which cuts it the exact length of Cotton, from \(1 \frac{1}{2}\) inch down to \(\frac{3}{4} \mathrm{inch}\), dropping \(\frac{1}{8}\) each; card all up together, either to be spun on cutton machinery by itself, or mixed with India or Egyptian Cotton, which cannot be spun unless son, 117, Great Dover Street, S.E.
Are Farmers Increasing in Numbers?-I read in Mr. Dent's part of the discussion on Mr. Morton's paper, read before the Royal Agricuitural Society on Wednesday last, "furmers were increasing in numbers. How can that be? Look north, east, south, and west, and see what has been going on for many years. In all those directions farm has been joined to farm in nearly every parish, and it is well known that the number of farms in England is decreasing. Then I say again-how can that be? There never was a time when so many young farmers retired from farming after a few 'years' practice as there are now. They very seldom (what is called) break, but they retire with empty pockets. Some procure employment as farm bailiffs, others set up jobbing, some go
to Australia, or perhaps to New Zealand; some get employment on the railways, some few of the best book-learned of them becume writers for the press; the new Highway Acc has given a few employment, and some become beggars. There is a pretty picture for you!-y time when the following words of Mr. Dent's would apply with anything like the force as now :-"Many young men embraced farming as a pleasant occupation, and laving plenty of capital it was not unnatural that they should regard as the most agreeable part of the farming life the amusements of the hunting field. And there never was a time when so many ouch young men" retired from such "a pleasant occupa years occupation as there are now I know some who started with large farms of their own,
who have not only sold those farms, but have retired who have not only sold those farms, but have retired have taken large farms and bave retired in a very few years with quite empty pockits. What a prety picture are these "young men," thus painted. They, of course, all kept their bailiffs. There then is the evidence that Mr. Dent is right. Farmer after farmer in both cases are making way, and giving place to others; in the latter case bailiffs and all go: but this is a sad "increasing in numbers." Why is it? It is because they have none of them been brought up as far-
mers. They have been sent to school to get a little learning, and in some cases a vast little, for the schoolmaster knew full well that the art of his teaching lay in that of pleasing the boys and their mothers. Many nothers now- a-days will not let their boys learn, and the schoolmaster, knows it, so he pets the boys to please them, 'and their mothers to provide himself with bread. As to practical farming, some mothers would think it a disgrace for their sons to learn it. It would burt their hands, it would soil their shoes, and it would deprive them of all chances of getting a wife to find them in bread; and besides all this, they jump at the conclusion that their sons must be farmers, whether
they practise it or not, for they think every fool can farm. So they can; but they are not real farmers who cannnt meet the rent day, or are obliged to sell farme and cut. William Smith, Foolston, Bletchley Station, May 2 ?

The Pet Lamb and the Cow.-It may be interesting to know that the lanb (see p. 414), which was removed from the cow, has found out the latter again, and that it renewed its tricks directly. \(B\).

\section*{Sorictics.}
royal agricultural of england.
The ordinary Annual Meeting of the members took place on Monday at the Institution in Hanover Square under the presidency of Sir Edward Kerrison, M.P There were also present, amongst others, the Earl of Feversham, Lord Walsingham, Lord Tredegar, Sir Walter Stirling, Sir T. B. Western, General the Hon. A. N. Hood, Mr. Dent, M.P. ; Mr. Holland, M.P.: Mr. T. D. Acland, M.P.; Mr. Raymond Barker, Mr. Beale Brown, Mr. Fisher Hobbs, Prof. Wilson, Prof. Voelcker, Mr. Rigdon, Nr. Claydon, and Mr. Wells.
The retiring members of the Council having been re-elected, and the only vacancy supplied by the election of Mr. J. Wilson,

Mr. Beale Brown snid he had a rebolution to pro pose-a resolution in which he thought there was no person in that room, or out of it, who would not cordially join, for it could not be possible to elect person more suited to be the President, or who would be more popular in that position, than Lord Tredegar. doue, and that donad Soce for agriculture than he bad under his lordsiiip's auspices, and at his own expense, was now rivalling some of the large Societies of the day; in fact the agricultural meeting at Newport was getting year after year of still greater importance. He proposed that Lord Tredegar should be elected President for the next yemr

Sir W. Stirling could have wished that some one greater influence and authority than himself had risen to second the motion, but from what he knew of his lordship, and what he had seen going on upon the most liberal plan witk the most enlightened intelligence upon his catate, he felt that it was impossible tor any one to doubt the admirable fitness of Lord Tredegar for the high and distinguished office of President of the Royal Agricultural Association

The motion was carried unaninously.
Lord Tredegar: I assure you when my kind friend Mr. Torr at our last monthly Council mentioned iny name as a candidate for the office of President, it took me quite by surprise. A few days before he had written me a letter to say that such was his intention, but I begged that on no account would he put my name forward, as my occupations in the country are so very numerous that I could liardly hope to be able to give the attention I could wish to this meeting. But as Mr. Brown and Sir W. Stirling have so handsomely proposed me, and as I have been unanimously elected, I can only say that no one has the interests of this Society more at heart than I bave; I have been 40 years a practical agriculturist, and I believe that in my own county I have done what I could to forward the interests of agriculture, and, as far as my bumbleabilitie go, I siall always, as long as I fill the office of President endeavour to discharge the dutits of that office in the manner best calculated to promote the interests of this Society
The Trustees and Vice-Presidents were re-elected, Mr. H. Hall Dare (Secretary) read the following Report :-

REPORT OF COUNCIL
Sisce the last Geleral Meeting in December 41 members from the list by retirement, nearly the whole nuraber of these baving joined the Society for the Newcestle Meeting only:
while three governors and 95 member have been elected, so while three governors and 95

The Council have determined that the Country Meeting in
866 shall be held at Bury St. Edmunds. The district for the Country Meeting of 1867 will include the
conanties of Derby. Leicester, Linooln, Nottingham, and
Rutland. tutan By order of the Council,
The Chairman exp?ained that the \(60 l\). prizes were to be given in two half-years, not the whole sum in one payment,
Agriculturat Educamon.-Mr. J. C. Morton: I wish to make some remarks in reference to the educa-
tional part of the Report, and I am encouraged to do so by the confident belief that the Council are ready not only to receive bat to welcome the criticisms of members that the Education Committee, whose resolutions on this subject have been adopted by the Council, have studied should, as our Charter declares, promote "the education of those who are dependent on the caltivation of the land for their support." And yet, had I been a member of
that committee, I must, both on the question of order and on the merits of the case, have been one of the minority who opposed the determination to act through arrived at. For, on the question of order, what is the education to which our Charier refers; and on the merits of the case, what education is it the promotion of which
is especially needed? I believe that in answer to both is especially needed? I believe that in answer to both
of these questions we must name the professional education of the farmer. And my remarks are intended to show that it is this which is referred to in especially rieeds our attention. Our Charter specifies several nhjects for which we are incorporated, farm practice and agricultural improvement. We with are fact a professional body, incorporated for strictly professional purposes. And I submit that this one edunition of which a certain ambiguity or indefiniteness of expression is laid hold of as sanctioning the idea that it is general and preliminary school training of the others, which clearly define our position as a strictly professional agricultural body. And to the sane conclusion the whole history of the Society plainly points. In the outset, when it was first contem plated, the letter of Mr. Handley to Eirl Spencer, and men at the preliminary meetings, were all full of reference to the details of farm practice-all pointing to the Society having been established for their im-
provemento Society to be rend in its Journal, show that this is the ider which its leaders have ever had. And the hisPusey and Mr. Thompoon, plainly shows that the

Society has all along been labouring within the strictly
defined limits of its professionally agricultural purposes. It was \(0:\) : these grounds that I declared at the last general meeting, and I confidently repeat it now, that the question of general middle-class education, whether the boys to be stimulated and directed be the sons of farmers or not, is as much outside of us as it is outside of Apothecaries Hall. In a letter subsequently published, Mr. Dyke Acland has pointed out that the authorities at Apothecaries' Hall do recognise the need of a good preliminary education; for they do not admit students to their professional career except after proof that they possess a certain general educational status. are not directed to the promotion of this preliminary education. Their efforts are directed solely to the promotion of professional education. Their prizes and distinctions are awarded not for proficiency in mathematics, languages, and so on, but for proficiency in the professional departments of study to which the students are thus admitted ; and therefore it is that I believe it is exactly as the promotion of general education is outside Apothecaries' Hall, that so it is outside of the Agricultural Society. For we too might very well claim from the candidates for our honours and distinctions that they should bring with them sufficient certificates of general educational attainment, notwithstanding that it is not for this but for proficiency in the different branches of an agricultural education that our honours and distinctions should be conferred.
But looking simply now to the merits of the casewhat is it which the young agriculturists of this country especially need? I feel certain that any one who shall set himself to collect the testimony of intelligent observers in our country districts must arrive at the conclusion that the general educational standard has been rising for many years among agriculturists, and farmers' sons are more intelligent and better educated than their fathers were; and no whip or guidance is wanted here at all. On the subject of their sufficient professional education, however, there is no such unanimous belief. As to the practical details of farming, it is said that young men, though better educated generally, are not better farmers than their fathers were. And as regards the so-called agricultural sciences, their agricultural relations have been so lately ascertained and worked out that there are very few
who can be said to have derived that professional benefit Who can be said to have derived that professional benefit arise. Here, then, is the educational field which is open to the Agricultural Society. Let us appoint examiners to visit any district which may invite us with a view to the award of prizes for proficiency in these two great departments of professional education. We should thus be keeping strictly within the limits of our Charter. No one could acense us of meddling with what is no affair of ours, and we should at the same time be at vork where work is resilly wanted.
I referred last Wednesday here to the fact that the country is already divided out for the purposes of this Society into eight or ten provinces or districts. I hope cultural their own local societies collecting a sufficient sum annually within their limits for the purpose of edncational rewards and scholarships; collecting, moreover annually the names of a sufficient number of young men-agricultural students-belonging to each, whose general education shall be such as admits them in practical skell and prof these prizes; whose rank from lacal authorities, partly, perhaps, by certificates rom farmers, partly by actual contests in ploughing, sheepshearing, thatching, hedging, and what not, ought as warmers to be able if necessary to teach; and, lastly, whose agricultural intelligence and scientific knowledge shall be determined by the Society's raveling examiners. Surely our connection with some such scheme as this would be keeping more within our
own proper field as an agricultural Society than that which has been so far sanctioned and adnpted of asking the Uriversities to award the Society's prizes for general school attainments. I beg, therefore, to move that in receiving the report which has been presented, the Society do desire that their efforts in connection with
the 7 th object specified in their charter of incorporation be especially directed to the promotion of professional education.
This is almost identical with a motion which I offered at the last general meeting, and which was subsequently withdrawn on the suggestion of Mr. Thompson, that the diseussion ought to be satisfactory without a division: and some explanation on that point may be due from me now. Mr. Thompson's suggestion was then assented to, first because the discussion really was satiswith thy and ought, I think, to have had more influence with the Education Committee than it has had. And, seonaly, because it was felt at the time that no real progress is achieved by too rapid a decision, and that which has since been carried out, wan really necessary to a fair conclusion. I feel bound to add, in the interests of this motion, which in now repented, that although I did not venture last December to persevere in an oppos, Mr. Dylse Acland, and othere, yet that it Thomp-
spirit of mere meddling that I press these pieme its formation, and have never vent from the yon part in its proceedings excert ventared to the agricultural education. And I in this one instanced I do not speak with any of that agricultural althoop which belongs to a seat at this table been without the means and opportunities of fare s? years it has been the business of For twenty years it has been the business of my life, may we
professional duty, to deal with respondence from all parts of the countrys, and wherever anything agriculturally noteworthy to E examination and report, so that a nicture of regisum condition of English agricalture, at least piecement in part, should week by week be published.
dition and wants of English agricult opinion of the dition and wants of English agriculture, formed in a way as this, is not withoatt a certain degree of
worthiness. I would beg pard it is solely in the interests of for this egotism, guilty of it. I hope that the members of thin \& will express the opinion that our operations in conn with every one of the objects specified in our Ch shold be directed with especial reference to the strith professional purposes for which we have been in porated as a Society. And to this end I have not rens which seem to me sufficient for the of for, but also declared the opportanities I horl desirable to a
I beg to move
: "That in receiving the Report nite has just been presented to you br the Councii Society do desire that their efforts in connection mith the educational object specified in their Charter Incorporation be specially directed to the promotion a professional education.'
Mr. Bealis Brown: I most readily fecond the motion. I think that education has for the let 50 years been very much at a standestill, and that among men, even of our own class, there has been a
very great mistake in having an education which mas not applied to any of the different situations afterwards to fill. As regards the education given at the Universities, there is a very great mistake in giving merely a general education, and though I do not libe to be egotistical, I must mention a determination mith I was once induced to come to, and which I have nerr had occasion to repent. My son was about being sent to Oxford, and he said he would take his degree his own inclination he would rather have Germa masters and learn the living languages than so th Oxford, because a multitude of those who went to to University never afterwards saw a Latin book, and the their study did no good. I came here one day to some distinguished Germans were present ; there a noble lord in the chair, and several other these foreigners. I would then willingly bave gire 500l. if I could bave spoken the language. The ran of this was that my son had his German teachers, mis every one who knows him will testify that the esper ment I made has answered beyond expectation farmer is placed in a thinly populated locality
only school within bis reach is the sohool wher labourer goes to, and the consequence is that he in ikely to send his children there. I know many men me ride their handred-guinea horses; men with larg and large capital, who cannot, strictly speaking, etter. When we have got such material to deas minh we must not attempt too general an education, and bin more the system is confined to the pure teacuing an
agriculture the more advantageous it will be. We m only, I am satisfied, speaking in this the views of nine enths of the members who are not present bere wid We do not want Cirencester Colleges all over the law but we want to have some teaching connected with these schools. I have seen in Irelem ome of the young men educated at Cirencester, and can testify that they are men qualified to farm in country; and in the one or two cases whe from wa has not been successful, it Ias satisfied from ave seen of those who have gone forth that they have seen of those who have govery part of tion where they may be settled.
Mr. EDmunds (Rugby): I think this Society in and to take a step of the utmost impcrtance ist of this country. last is much against general od will he tell us what mo are to have. What use would be the Cirencester or any other unless a boy first received a general tion? Some speak of a commercial certain people, and another edacation
classes; but I cannot, I confess, see between boys if they have the opportunity of of a tradesman as to the son of time, for after all time comes in and on till he is 19 and then go for a few yars the Society is lhw what taken. It was open to them either that education was properly one of their that education was properis one of the
with Mr. Morton, but I should not like to reject anything like a aiend to do anything more, I should regret that they olier these few prizes at all. Bat I still want to impress apon the noblemen and gentiemen present, they should enable the bors to reap the advantage they ought to ensble the In apaper I read before the Farmers' Club I urged posin as a daty upon the landowner as well as the tenant Grwer, because it must be to the landowner's interest the case unless the farmers are thoroughly educated. The system might do 30 years ago, when produce was protected, but now land is to be made profitable
ooly by intelligence. It is not to be done by running alter instruments and new mechanical appliances, but by common sense, and by the knowledge, as the doctors ny, of "What to eat, drink, and avoid." Our first duty, ench to see if he cannot in his own locality provide such choole as those in Sussex and Devon and elsewhere for the education of the rising generation. It is not that firmers do not appreciate the value of education, but
they bave not the means of getting it. Hundreds of men who live 30 miles beyond me, find that their boys do no good at the so-called classical and commercial accalemies in their neighbourhood, and send them to ha tentlemen who have influence in their own counties, to see if they cannot establish schools of this clam, and if they do so, they will be conferring the grentert benefit, not only upon agricalture, but upon looking at the matter in every point of view, I have come to the conclusion that you will do very little good proper examination can take place. I do not think the examination at Oxford, Cambridge, and the College of Preceptors is the thing wanted. If your object is to you will not attain your object by different examinations conducted in different manners; but if you could get the three bodies to meet together and appoint a
board of examiners, the competition would be a fair one. But I do not see how this is to serve the cause o general education. If you wanted to interest the people in getting a good education, these prizes might people, and what they now want are the means of getting the education they desire. It was said on one occasion by a gentleman, now present, that prize and I am afraid that the proposal in the Report will be as regards agriculture of very little use. If been suggrsted that you may eventually appoint providing a scientific education think better still, aid in cost of 401 . or 502 . a-year, instead of \(80 \%\). or 902 ., as charged at colleges like Cirencester, which is far a thinking man in the country but must acknowledge nnequalled, and they will give to for agriculture is greater impetus, if they adopt such a scheme as I have mentioned.
of Mr. Edmunds, that by in reference to the remark proposed, the teats would not be equal in all cases; nations examinations were the middle-class examithe prizes were to from all parts of the kingdom, and the Unizee were to be awarded separately at each of Mr. T. D. Acr
st the close of each half year plan was to award prizes ing examiners of their own, the Council availed themCambridge. The Cations conducted by Oxford and with the Oxford boys, but for all practical compete same. The prelimine two cases were very nearly the rpelling, history, and examination in reading, writing, arranged by the two Universities in concert with the Civil Service Examiners.
it Cirencester, and when it was first set up had lent to repaid. \(\mathrm{He}_{0}\) ery farthing of which had since been College had done nothinger, acknowledge that the (Norfolk), on account of the heary expense and its
remote position had been pet up in \({ }^{\circ} \mathrm{He}\) was glad to find that a college college or good school in every county. Education was believed if they wave in his part of the country, and he children to a good gave farmers who could not send thei indacement offered by theor agricultural education, the under the patroned by these middle-class examinations powerful stimulus to education
f the Charrman submitted that the original intention education of wan that the Society should assist in the assisted by grants from sons, but as that class was apply thought that the Society might.very properly of education portion of its fundety to the encouragement the mover of the gest middle-class agriculturists. While
in favour of professional education, the seconder had admitted that in many cases farmers could neither read nor write, a strong argument in favour of providing a instruction. It was perfectly true that the matter instruction. It wha perfectly true that the matter depended much more upon the establishment of good
schools in different counties and places to which agriculturists could send their sons than upon anything the Royal Agricultural Society could do. The examination tested that which the boys mast learn, and they included mechanics, as applied to agriculture, chemistry, and other subjects bearing distinctly upon farming. Th fouther deliberation tomselves in a position, and finding the examinations at Oxford and Cambridge were best adapted to the purpose in view, they had recourse to them, omitting the College of Preceptor and he trusted that by the next meeting the plan adopted would be shown not to have been unsuccessful It was only attempted for a year, subject to any modifications that might seem desirable, in the consideration of which attention would be'directed to the opinions expressed by Mr. Morton, whose lecture on Wednesday in his life listened to anything more practical and good. Of course, a particular examination for farmers could be established, but the question was whether farmers, as a class, would be satisfied with half-aday's examination as a test of a boy's knowledge of the business into which he was about to enter. They might be stimuated to edacation by these examinations and also through the influence of agricultural societies throughout the country, a most valuable suggestion of Mr.
Morton's. The recommendation of the Council must be regarded as an experiment, and he trusted it would not be condemned till it had been tried.
Mr. Morton did not object to what had been done his motion accepted the Report; it declared merely that the educational scheme of the Society should be directed specially to the professional education of the farmer. If they spent 200l. upon general education, his motion merely required that they should spend more
than \(200 z_{\text {o in }}\) in the promotion of professional knowledge.
Mr. Holuand, M.P. (Chairman of the Education Committee), did not think the funds of the Society ought to be expended upon general middlecelass education, the advantages of which should not be denied to the farmer, but which were open to him outside the Society. In rewarding efficiency at the University examinations, they were giving prizes where prizes and
certificates were already provided. As an Agricultural Society, all they had to do with was practical professional education. He referred to the fact that, in Devonshire, a scheme was being developed, whereby local funds would be provided for the award of prizes for proficiency in the various luranches of professional agricultural knowledge. The edge of the wedge was despair of the Agricultural Society ultimately directing its efforts in the same direction
Mr. Fowler said he was obliged, living in Backing. hamshire, to send his boys into Essex for their education, and he knew many others who were in the same position. He believed there was a growing desire with farmers throughout England to give their sons a good classical and general education as the best foundation
for professional acquirements, and the present was an for professional acquirements, and the present was an encouragement to middle-class agriculturists to have their sons instructed in something beyond reading
writing, and arithmetic. He moved the adoption of the Report.

\section*{Mr. Hrrsske seconded the motion}

In answer to an appeal from a member that there hould be a unanimous vote on the ground that Mr Morton's motion did accept the Report, and only urged upon the Council the importance of the protessional
education which all must admit, Mr. Accand stated education which all must admit, Mr. Acland stated that he too had wished for a unanimous vote-but the professional professions of law, medicine, or divinity. We could not consent to be bound by a word which might be inter preted against us in future discussions. The Education Committee had laboured assiduously for a twelvemonth with an anxious desire "to promote the education o those who are dependent upon the caltivation of the land for their support;" and he could not assent to motion which was in itself a dissent from the conclu sions to which the committee had arrived.
Mr. Borles did not think the ample fonds of the Society could be applied to a better purpose than the encouragement of schools in counties, and if that wer done there would be

After some further discussion, in which General Hood Mr. Fisher Hobbs, Mr. Grimswade, of Ipswich, Mr the resolution proposed by Mr. Morton was negatived by 16 to 12 , and the Report was unanimously adopted. On the motion of Lord Feversham, seconded by Mr Raymond Barker, a vote of thanka was passed to Sir Edward Kerrison, and other complimentary
motions having been proposed and carried, the meeting separated.

Was announced at the close of the proceedings tha lecture upon Irrigation

\section*{Farmers' Clubs}

Hengerford: The Operation of the Game Laws.-A paper on this subject was read by Mr. Henry Corbet, of Clab, from Farmers' Club, at a recent meeting of this Mr , from which we make the following extracts:Mr. Corbet said :-If we are in any way to mitigate the evis associated with an excess of game, we shall achiev this quite as much, or more, by the expression of public opinion as by any interference on the part of the Legisla ture. In fact, treating the matter as a farmer's question, we find that the law already goes with him. The game ond ine land is in the outset the property of the occupier and it is only by his own act and deed that he sigas such a right away. Of course I need not tell you that the position is virtally untenable, as one of the very first steps on the part of the owner or his agent will b to reserve such a privilege to himself. Nor, indeed, could I wish it to be otherwise; for, as I have already rural another place, any attempt to do away with our rural sporte and pastimes would be a grievous error, a none would oppose such a movement more than the farmers themselves. It is the practice of these pursuits that goes to cement the anion between the landlord and his tenant, that teaches the one to regard the other with a feeling something beyond the mere consideration of pounde, shillings, and pence, and that nourishes between them a stronger sympathy, and healthy tone of good fellowship. In plain truth, good landlord and a good sportsman should mean much the same thing, and I look upon it as a happy omen for any district where they can thus ring the changes one on the other. You will see in a
moment how nice a line there is to draw bere. We will admit that in the scramble for a vacant farm the ap plicant is ready enough to give up his claim to the game but he does so on the understanding that the landlord will feel himself bound to behave like a sportsman and a gentleman. There is no higher character for a Englishman than that which is embodied in these two congenial qualities ; and so long as that character is maintained, so long in the farmer insured. I care little for the influence of laws that may be set aside at every step by private agreement, or be fairly over squires and large landed solong as our country their actions by those principles which we habitually identify with the conduct of gentlemen and sportsmen. And here I am sure you will pardon me if I refer more fully to a paper I read some years since upon this subject, while in doing so it must be understood that I allude to this in no merely egotistical spirit, but rather in enrroboration of the somewhat strong terms in which \(I\) then expressed myself. That paper has been quoted in many of the London and local journals; it has been read at meetings of farmers clubs similar to this, and the arguments embodied in it adopted by others who abuse. In no instance have I founa my facts disputed, or the piciures I drew assailed; but, on the contrary
farmers and sportsmen have alike supported the view I took
The Buttue-I set out by attempting to show what is uso
and what is abuse ; what is fair sport and what is grievous in justice, as, in the first place, I want to ascertain what is thought justice, as, in the first place, I want to ascertain what is thought
of the battue by the great body of Englishmen thank God
there is no English word that deigns to recognise such

so far back as th
winter that Mr.
of The Fiell, an
himself thus in the colutlyn o practical eportsman, expressed as his text-word he says, "This may be held to be excellen
sport 'by some people, but I look upon it as a deaperate an
indiecriminate slaughter. What pleasure or sport can ther be in firing off one gun after another, without ceasing, as har game, w
are always, where is the sport in this wholesale murder? Ind always shall consider, the bat requifes no sportraanship at all; no expense of brains or
thought. You stick a mun, with several assistant gunners, a
little battery, and a masll magazine, in a convenient corver, little battery, and a small magazine, in a convenient corver contuining huudreds of foxes with horses and hounds, and epport would there be in turning a score of greyhounds into
large yard full of bares? What sport would there be in gaffin hundreds of salmon nut
the matre acts of kiling, and the necessity for the act of killing the only disagreeable part
ingenuity for the purpose of circumventing the wild bird watching the tutnred sagacity and instonct displayed in What is there left to the shooter but the mere pleasure
which exists in being a skilful marksman? What is he,
in foct, but a well-trained butcher? To me this mania for
slaughter-for I cannot call the modern taste for battues snything olse-ls positivoly repulsive, and I do not think the tast never was at a battue that I did not feel that 1 was a very
cold-blooded destroyer of life. I grant that the frenzy for
killing is very catching; that the enulation to be thought the best shot of the party is apt to lead ono away; \(t^{2}\) 2at
the shouts of the beaters, the skurry and rishing of game, and
constant fusilade, are all apt to get up an excutement, which has as much to do with real sportsraanship as dram-drinking manship now practised in this country, viz, deor-stalking. subject of satisfaction and congratulation. True, it is a
necessary consummation; but if it were not fur the chase and of mind and body brought into active play, what would that
act of killing be? Would any gentleman look upon it as a poor, wretched, unsuspecting buck while he stands gazing
unconsciously around bim? I never remeuber to have felt so The poor confiding
and lay down, licking the wound, and sobbing pitenusly.
necessary act of b
and killing of tame difference between this killiug of a buck and killing of tame-bred pheasants? It is oniy a question of
gize and the condition of the victim. An anmal has to be
killed before it oategory. Good sport is, of course, very desirable
sport, sufficient to satisfy any reasonable person, may pasily be hattuithout the sacrifice of a becatomb of victims. That the majority of gunners sre now but indifferent sportsmen; and shoot like a sportsman, can bunt his dogs properly, and break spealing out, and to the purpose, and let us always broken-hearted farmer, a Radical Member
of parliament, or a on one of the chief sporting papers of the time, and a journal then, assume farly enough that the battue is not sport, bu

Mr. Cobbet then quoted anotuer pasage to a simil effect from Bell's Life; and continued :- It is a remarkable fact that although, as we gather from fox-hunters, liberal M.P.'f, and others, the farmers are continually crying out against the game, such complaints never appear to reach the ears of their own landlords country squires. \({ }^{\text {Mr. Newdegate }}\) states that Warwickshire they were free from the crime of poach. ing," while " he warned honourable members that there was an under-current of agitation on this subject, under among the farming class, which ought not to be in. among the farming class, which ought not to be in-
creased. The House had been represented as having passed an Act exclusively in favour of large preservers. That, however, was not the case." Warwickshire, from this, would seem to be specially exempt from all the ills which game farms are heir to. There are no poacbers; the under-current of agitation ahould not be increased, as there is clearly no cause for it, and the game preservers. So says Mr. Newdegate, as one of the members for Warwickshire; while within the last few Teeks I was invited to attend upon a deputation of farmers who came to consult with certain Liberal members upon the evils of the game laws, and more by which it was the unjust operation of the new Act, servants. it was argued the tenants paid the landlords' chicfly from the these gentlemen, and found they came of Warwick, of Warwick, and that one of them was an occupier that the New Negate himself! I am told, moreover mainly supported by Warwickshirs men, intends to
discuss the abuses of the game laws during next autumn, and that a monthly publication will be issued,
showing up the acts of injustice continually committed under such a system. S" much for there being "no ponching in Warwickshire," and "the under-current is increasing nevertheless. But what is this agitation is increasing nevertheless. But what is this agitation
really worth? It is true enough that the Midland Coursties men whom I met in London have all position and character in their own district, as that the practical
farmers, who confirmed my views and pointed my arguments at our Central Farmers \({ }^{3}\) Club, are also amongst the first of their order. Unfortunately, however, men who thus dare to think and speak for them selves, and from their own experience, can carry no weight with them-at jeast so says Mr. Caldwell, him
self a landowner, as a quondam member of the Counci of the Royal Agricultural Society of England, and who delivered himself to the following effect towards the close of last year, when returning thanks at the Chippenbam Show as one of the judges of the day
"He had no syropathy with the soandalous attacks which
d been made upon the Duke of Marlborough and others, in reference to game. Farmers made their own bargains for their
farme, and if they went where gentlemen would have their game they could not expoet to raise large crops. His opinion
was, that if farmers took farms eqzal to their means, and
carmed well, there was not a real Envlish landlord who would
 he did this, ke was almost certain to bo helped to the
utmost ability of the landlord. No god was ever done
by writing in an underband way acainst this landlord or the other. In spite of The Times, the Mark Lane
Express, or Bells Weekly Messenger, he wnuld assert
that if they took the trenule to folsow out A. B. -C. D. - E. F.,
or any other complaining enrespondents. Rny other complaining correspondents who did not sigh
their names, they would find them to be broken-down farmers,
who could not who could not farm successfully, evert if they had good land at
108 an acre. Ho hoped that one and all wonld support thei landlords, and not join in any hubbub ot the kind: but if, after
using their best exertions, either of them met with a failure of any kind, if he ever went to his landlord and said. "My dear
sir, as this has been a very hard time. I hope you wril give
somothing back, he (Mr. Caldoell) was sure that he would bp
meet in a fair and liberal spirit." Now I happen to be in a met in a fair and liberal spirit." Now I happen to be in
position to give the most thorongh contradiction to the im-
plication convered in these remarks I have not soo mich
taken the trouble to followe put A. B.-C. D.-E. F., or nther correspundents complaining of the abuses attendant upon
gane-pereserving, as to have their communications come
directly hefore me in the hirst instance; and I may pay ferrlessly that these gentiemen are no more "broken down," bu
that they oceupy quite as respectable pooitions in Society i
they doy not even farm an suecessfully, as Mr. Caldwel
himoself. One case in
for whinh I am partly answertble, is worthy of mention. and
tevant-farmer, pand the Vice President ne a Farmers Club,

eating up his neighbintr's sizbstance, and spoiling the fair face

M
Mr. Corbert concluded as follows:-Surely the tim is coming when the farmer will feel that he ought to represented; and there is no time like the present, \(n\) a general election in July. Moreover, the pubhe join heartily in such a demonstration; for a system not expect to raise large we are told, a farmer "mns not expect to raise large crops," is not a mere quentin concerns the whole community. The people are den their due participation in the fair fruits of the conntm as the practice itself augurs but badly for the nationa welfare. What, as we learn from history, too surel foreshadowed the decline and fall of those might Empires of old? What but the effeminacy and retine cruelties of the noblee? When the Patricians, instend o associating their pastimes with the manly toil and
glorious excitement which had characterised the porsuits of their forefathers, hung languidly over the arena witness the mere shedring of blood, and to count up the hundreds of animals driven together for the purpse and that were slaughtered without a chanca of escine as fast as they could be cut down. And in what io tle wholesale cruelties and wanton sacrifices difter from the fashionable amusement of our own Patricians? true that we have outlived the brutalities of the ring and cock-pit ; but these were at any rate condone the display of a certain kind of courage; whereas !" the business of the battue we find nothing but what 1 owardly, enervating, and debasing-at best but the handiwork of the higgler, who drives his pitiful trnie, man's character.

\section*{Miscellaneous.}

The Hon. William Wedd Tuxford, of Adelaide, bas been elected a member of the Legislative Council a South Australia, one of the most honourable positions for a period of 12 years without interruption. As col for a period of 12 years without interruption. as ow
sequent upon his election, Mr. Tuxford was culled upon to second the Address in reply to his Excellone? speech on opening Parliament. Mr. Tuxford, whe claims depended mainly on his unceusing efforts is advance the agriculture of Australia, is one of the fin Adelaide, and a brother of the Messrs. Juxford, of Strand, London. 'The final scrutiny took place Supreme Court, when Mr. Tuxford stood fourth on list of 13 candidates, of whom the first eight gentlewin Council.

The Tiptree Hall Estate.-An agricultural joumal't Marc Lane Kxpress] says:-"It bas been undert for some time past that the Tiptree Hall Estate withe the market; but it is now proposed, through a commilum of noblemen and gentlemen, to purchase the propetis and present it to Mr. Mechi, as some appreciation survices in the cause of agriculture. Essex, mone, would be ready to join heartily ifference be me? monial to a gentleman who, whatever differenco derneanour and general bearing, and earnest faro agriculture, won the goodwill and respect of 2

\section*{pi county.- Essex Herala, quoted in it the} Pig Peeding Trough Extruordinary. H , West Street, in this town, there may process of construction, and Mr. Hazel will for exhibition in the course of a fortaigh is making for the inventor, William and is to be fitted with elevators at one end (previously cooked) in the trongh without enours for calculation being whereas it would ten men in the ordinary way. fattening for tho use of 2000 pigs feeding and fattening 50 trough, arranged in the form animals are penned in small divisions curve, and also outside the larger, necessity for the sublivisions withe
is cylindrical in form, and fitter ruptedly. This trough, it will be seen,
impliety and accossibility; and indep
enmmes scale on which it is being constructed, is entensting as an improvement in rural economy. I has no fout-resta, and steadied in that manner. This momense aron range has been entirely constructed by Mr. Hezel, and doess credit to the branch of local Mr. Herey to which it pertains. On comparing troughs a this construction with several others now in use, we Gid that they can be produced in Dorchester at twofifthe of the cost charged by the implement houses fserbere. Mr. Hazel, in the summer of last year, ensstructed a very novel cooking apparatus, also invented by the propristor of what the Times calls The English Porkopolis," by means of which many The English can be daily cooked, simply by an ingenious method of eatching the exhaust steain from the engine which grinds and prepares the corn, pulps the roots, and drives the various machines required for pig-feeding on a large sola. We ought to get pork cheaper, seeing that in one year 10,000 pigg can be fattened at this one trough only in the monster swinery. Dorset County Rypmo.
Treacle for Food.-The season of 1864 having been remarkable for its dryness in most parts of England, a scrious deficiency in the root crop was the consequence, obliging stock-keepers to substitute other linuls of food in its place. During the past winter I was in a similar predicament myself; and knowing that mots are more indispensable to sheep than to neat stock, I applied the principal part of my crop to the former, laring fatted oniy half iny usual number of bullocks; but I have been enabled to convert a large quantity of atraw into manure by keeping a namber of store bullocks through the whole winter, from the 4th of Nivember last to the present time, withont the use of any roots whatever. My plan has been (and is still carried on) to give to each bullock per day (divided into three meals) one pint of treacle dissolved in two gallons of water, and sprinkled, by means of a garden watermot, over four bushels of cut chaff (two-thirds straw and ane-third hay) amongst which a quarter of a peck of meal (Barley and Wheat) is mixed; the animals also having free access to water. The cost of the treacle w.1. meal together is about \(3 s\). per bullock per week. \(M y\) bullocks (two-year-old Shorthorns) have grown and thrived upon the above diet, to my utmost satisfaction; an. 1 even during the present dry and warm weather timy evince no lingering after roots or Grass. I am well aware that the use of treacle for neat stock is no new dimenvery of my own, as I learnt the system while on a Hist to a friend in Norfolk, where some graziers have reed it in combination with roots during many years \(T^{\text {nst. Per }}\) Phaps Flax-seed (Linseed) boiled into a jelly and "ned in a similar way, may be a more profitable "subit is attended with more expense and trouble. T. Cooke Rurroughes, West Suffolk, May 2, 1865.-Bells. Messenger.

\section*{Calendar of Operations.}

Mar,-Turnip Culture.-We quote here Mr. Fisher Hobbs's remarks upon the Turnip.fly, made many years azo before the English Agricultural Society. After eferring to the advantages of autumn cultivation and deep plonghing then, and of pulverising the soil in pring, in order to let surface weeds grow and be destroyed, he said:- "At the time of drilling the sped it is best for the land to be ploughed (but some prefer scarifying only), and the seed to be freqnently ly deposited. This is so important that I have freqnently known total failures from the neglect of so renmmend there is another point which I would strongly reenmmend, that is, in dry and sunny weather to plough nud sow early in the morning and late in the afternoon, hot never during the heat of the day. I know an years attended the most signal success has for several years attended this mode of operation, and where the is one of the neld ser failed to secure a plant, although he cast with his school, and still sows the seed broadseveral la his own band. This can be confirmed by several large farmers in the neighbourhood, who, placed before the notwithstanding the example thus from having them, continue to incur an amount of loss nbatinacy and pre two or three times, simply from the adhere to and prejndice with which they continue to and men. At the time of depositing the seed it horses invariable practice to use some description of artificial manure, generally superphosphate of lime, and I like-
wise and bedge trimmin 3 bushels of ashes per acre, made from different periods theeds, \&e., collected upon the land at now be persiods throughout the year. The roller may after the fdrilling great advantage before and sometimes mend the application of dry weather I strongly recomar immediately the young plauts appear, the horse-hoe ova or larves of the to for the purpose of destroying the maturit. When insects to prevent their coming to may sometimes be once the plant is well up, the roller still further to disturb the much benefit, as it tends retain moisture for the the insect tribe, as well as to periarin-pard manure young plant, and to consolidate period the plant requires frequent watcening throughout in day, andi if the enemy slows itself in any force, set
"Having described to yon ts annihilation.
daving described to yon briefiy my mode of pre.
vention, I will now proceed to give you the cure, which
is simply by the application is simply, by the application of one or more 'topdressings.' I have tried various experimente, steeping the seed, and top-dressings for upwards of thirty years, but though somptimes successful, I could not depend on any of them until I adopted my present system ; aud I think it is only fair that I should state that I derived the chief features as to the use of this top-dressing from my late bailiff, Mr. O. Hawkins, who came to me some nine years since with an especial recommendation on this point: in fact, he himself engaged to secure the Turnip plant from the ravages of the fy; adding, that he was willing to give up him situation immediately if hê could not do so. I can only add that for eight years, during the whole time he was with me, he fulfilled all he promised in this resnect. The following is Mr. Hawkins's recipe for a top-dressing: -One bushel of White gas-ashes, fresh from the gas-house, one bushel of fresh lime from the kiln, six 1 l . of sulphur, and ten lb . of soot, well mixed together and got to as fine a powder as possible, so that it may adhere to the young plant. The above is sufficient for two acres when drilled at in they-seven inches. It should be applied very early cast machine being the most expeditious mode of distributing it, or it may be sprinkled with the hand carefully over the rows. If the fly continues troublesome, the process should be repeated; by this means 200 to 220 acres of Turnips, Swedea, and Rape have been grown on my farms annually for eight or nine years without a rod of ground losing plants. The above is a strong dressing to be used when the fly is very Numerous experiments have been tried, and amongst them I recommend the following in ordinary cases, and intend to use it during the present season if necessary -fourteen 1 lb . of sulpliur, one bushel of fresh lime, and two bushels of rond-scrapings per acre, mixed together
for a tew days before it is used, and applied at night, for a few days before it is used, and applied at night, rows by hat of a mall drill, or strewed al water applieü in a liquid atate by means of water-carts during the night, and the horse-hoe immediately following the water cart. This has succeeded admirably. In consequence of the dryness of the climate in my neighbourhood (the rain-fall being on the average only about 16 inches annually), I usually sow on the flat; but the dressings above-named are equally a pplicable to crops sown ou the ridge. I would strongly impress the necessity of frequently applying the horwe-hoe. I am induced from the results of my experience to conclade that by care and attention the Turnip plant may be as effectually and as certainly freed from the ravage of the fly as seed Wheat has been for upwards of the last twenty years from smut and other destructive Fungi"

\end{tabular}

Packing Cases are charged at the following low rates, vi \%: for the 10 and 12 inches Mathine, \(3 s . ; 14\) and 16 inches, \(4 s\). ; 18 and 20 inches, \(5 s\).; 22 and 24 incheses. Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damadit if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

The 26, 28, and 30 inches can easily be worked by a Donkey, or by Two Men, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Carrige Home and, as the MACHLNES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (orer all other Makers) the advantage of self-sharpening: the cutters being steel on ench when they become dull or blunt by running one way round the cylinder, can be reversed acain and again, bringing the opposite edge of the cutter against the bottom blate, whan the MACHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person, in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping poth in Ingland ; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

\section*{patronled on five separate occasions during the season of 1864 by HER MAJESTY THE QUEEN.}
alexander Shants \& Son are gratiticu to find that in the large and increasing demand for their wellrited MACHINES, they receive a conclusive proof that their merits are every season becoming thure appreciated by the Practical Gardener.

A. S. \& SON, in introducing Improvements into their MACMNES, have been carcful that the advantages in point of durability, simplicity of construction, and superiority in the work executed, which have all along been peeuliar to SHANKS' MICHINES, should still remain.
hand machine

SHANKS' PATENT LAWN MOWERS are in daily use in the ROYAL GARDENS at KEW, WINDSOR, BUCRINGHAM PALACE, TTAMPTON COURT, OSBORNE, ind BALMORAL ; in the GARDENS of the ROYAL HORTICULTURAL SOCIETY at KENSINGTON; in the GROUNDS of the CRYSTAL PALACE COMPANY at SYDENHAM; in VICTORTA PARK; in BATTERSEA PARK; and in many hundreds of the principal Gardens in the kingdom, as well as abroad, where their merits have been fully proved and their success established.

PRICES-including Carriage to most of the principal Railway Stations and Shipping Ports in the Kingdom.

\title{
HENRY ORMSON, F.S.A., HORTICULTURAL BUILDER and HOT-WATER APPARATUS MANUFACTURER,
}

\author{
STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.,
}

\begin{abstract}
Truly grateful for the very libcral and kind patronage bestowed upon him, begs most respectfully to inform the Nobility, Gentry, Nurserymen, \&e., that it is is determination to spare no pains to merit a continuance of their favours; and that he may be enabled to execute his extensive and increasing orders punctually, and at the lowic possible cost (agreeably with the best Materials and Workmanship), he has erected a most complete set of Steam Power Machines, peculiarly adapted for the purpore of his Trade.
- H. O. begs to call attention to his superior manner of erecting every description of IIorticultural Building, and he trusts by unremitting personal attention to the den... his business, by using only the very best materials, by employing the most skilful and efficient workmen, and by the most moderate possible charges, to merita a continuanted the patronage so kindly and so liberally bestowed on him for many years past.

In the BUILDING DEPARTMENT his object will be to adapt all erections to the particular purposes for which they are required. He will devote equal attentis to the plain, inexpensive, practical erections of Pits, Orchard Houses, Greenhouses, Vineries, dec., as to the more elaborate and architectural erections of Conservatories, Wimes Gardens, \&cc., either in wood or iron.

The HEATING DEPARTMENT always ongages his special personal attention, and he feels justified in saying that in simplicity, safety, durability, and eowa of fuel, combined with thorough effectiveness, his system cannot be surpassed.

VENTILATION.-Knowing the absolute necessity for thorough Ventilation, he makes it a matter of first consideration.
H. O. having competent Draughtsmen and an efficient Office Staff, he is prepared and will be happy to forward Plans, Estimates, and Specifications by post or othermise e: to wait personally on any Ladies or Gentlemen who may desire to see him on their Grounds.

SATURDAY, JUNE 3, 1865.
}

Monnat,
Texsit,

Satchdas, - \(20\{\) Royal Horticultiral (Fint (oreat Ehow ais.

Variegation in plants has long been considered a disease. It arises frequently in a single shoot without any assignable cause, but when once the affection has established itself, cuttings will propagate it indefinitely, and in some instances it will be communicated by grafts to the atook.
A ourious case has just been communicated to us, in which a whole tree suddenly became variegated. There is a small-leaved variety of Elm, which is much used in China for making the celebrated dwarf trees, but which, planted in good soil and left to inorease in size at ics own pleasure, forms in this country a good-sized tree. It is this Chinese Elm, believed to be a variety of Ulmus campestris, which is the subject of the present notice, a sprig of which, from a tree 30 feet high, has just been sent to us. There was a hard frest sore few veara since, towards the end of the year, t Cork, which nearly killed some Lombardy Poplars from 60 to 80 feet hish, near which stood the Chinese Elm in question. Before the frost this tree had green foliage, but ever since, the whole has been variegated, though unfortunately in buch a way as to detract greatly from its beauty, and not to enhance it as in the case of the common Variegated Elm, which is sometimes extremely handsome. Our correspondent wishes to know whether anything can oe d:ne to restore it to its former verdure, butwe fear that the case is quite hopeless.
Mr. Fortune's large importation of variegated plants from Japan has given a new stimulus to the propagation of parti-coloured trees and shrubs. He has stated a curious fact respecting Podocarpus longifolius, which often produces shoots which are perfeotly white. In general auoh shoots are incapable of making fertile cuttings, but in the Podocarpus green or parti-coloured shoots are often developed from these albinos. Monsieur Veriot, who is the foreman at the Jardin dea Plantes, amongst other curious matters in his prize treatise on the production and fixation of varieties, states that if an albino shuot of the common variegated Ground Ivy is planted as a cutting, it will strike freely, but that the result
will be a green and not a parti-coloured plant, a very ourious fact, should it be confirmed. The subject is at present a very obsoure one, but it is one of considerable interest, and would probably repay a careful series of experiments. M. J. \(B\).

We have been reminded in reading Mr. McIvor's pamphlet on Cinchona culture, that there are modifications of some importance to be made in the seemingly simple matter of Packing Plants in Wardian Cases ; and though our great commercial gardeners may probably be quite au fait at arrangements of this nature, yet to the many persons who have less perfect experience in the matter, we have no doubt the hint Mr. McIvor's practice affords, may from time to time be turned to profitable acoount.
The difficulty which was experienced in the instance referred to, arose from the great weight of the cases when planted and packed in the ordinary way. It is true this was in India, and bears reference ohiefly to land carriage; but the very same difficulties may occur to a colleotor in the heart of any country, who may have to send plant cases from the interior to the coast for shipment; and thus the question may prove to be of wider interest than would at first sight appear.

The difficulty, as we have said, arose from the weight of cases when filled with earth, and the comparatively small number of plants which could be acoommodated on the planting out system. Hence it was made a special subject of experiment to find out a plan which would obviate the risk and reduce the cost of transit; and the issue of
these experiments, Mr. McIVor believes, justifies him in recommending his method of packing Wardian Cases. The plants, it is stated, are found less liable to damp off from excess of moisture when packed in this way; and the weight of the cases being reduced to about one-fifth, they are more easily handled, and less liable to suffer damage in removal ; and thus while the cost is reduced, a greater degree of safety is secured.

In the mode of packing which Mr. McIvor thus strongly recommends, the Wardian Cases are filled with Moss instead of earth to a depth of about 6 inches, and the plants, in the pots in which they have been grown, are firmly packed in the Moss, and secured with oross battens, so as "to prevent them from becoming displaced if by mischance the cases should be upset. The plants thus secured receive a moderate amount of water, and the sashes are screwed on, the glass being protected by battens, and secured from the direct rays of the sun by a covering of thin cloth, so as to admit a portion of the light. In this way they can be safely conveyed from the Neilgherries to Caloutta
or Ceylon, without the cases being opened; or Ceylon, without the cases being opened; but month, it is recommended that the cases should a opened morning and erening, so as to admit more light and air, water being adder only when the surface of the earth becomes dry.

The successful manner in which Bougainvill wa speciosa was grown at Swyncombe, under circumstances which seemed to indieate that strong heat, and especially strong bottom-heat, was essential to induce it to produce its inflorescence,
has no doubt led to the conclusion, on the part of has no doubt led to the conclusion, on the part of many cultivators, that some such application of heat is necessary to secure those glorious masses of
floral braots which place this plant in the front rank amongst ornamental creepers. We were agreeably surprised a few days ago to find this same Bougainvillæa blossoming at Cliveden, under circumstances which prove, at least, that a command of heat is not, as was supposed, the clue to its successful treatment. Me. Fleming's plant was indeed growing in a greenhouse conservatory, without any bottom-heat whatever, and yet its branches were most charmingly draped in mauve
colour, as those who saw the specimen shown by colour, as those who saw the specimen shown by
him at the last Regent's Park show can bear witness. How Mr. Fleming's plaut has been treated he shall himself tell, as he has been so obliging as to send us the partioulars :-
"A few years ago the readers of the Gardeners' Chronicle were startled by a glowing Leader on the beauties of Bougainvilima speciosa, Many I believe up to the present day consider the pioture there given to be overdrawn, but those who have lavourabuate enough to see the plant under mot only is circumstances, will agree with me that mot only is that aocount far exceeded by the real grateful to Dr. LindLey for bringing its merits so prominently before the public. The treatment
that had been given to the plant there noticed, and the great heat, both top and bottom, that had been afforded it, have, there is no doubt, deterred many from attempting to cultivate the plant, because they were not possessed of a stove with the command of heat there indicated. It is to enoourage such persons to give it a trial that these remarks are made.
"I have found the Bougainvillæa to grow and bloom magnificently in a temperate house, where little more than the frost is kept out in winter, and where no fire is used in summer, and also without the slightest degree of bottom-heat, the only difference being that it blooms much better. It will, I am convinced, prove to be one of our best warm conservatory plants, for when it once gets old and strong in the stem it will carry a great

length of its gorgeous mauve-coloured branches. Even in high-roofed conservatories, where the cold sometimes gets in at the top, I should not fear to grow it, as we have found it uninjured by \(3^{\circ}\) of frost. It should not, however, be overlooked that when making its growth the house should be kept as close as the health of its other occupants will permit. It will be, perhaps, most easy to explain the treatment given by adding a section of the house.
"The small spaces shown at \(A\) are 1 foot wide and 2 feet long, on each side of the pathway, at intervals of 10 feet (see ground plan). It will also be noticed that the plant is trained over the path alone, thus not by any means interfering with

the growth of the other plants on the stages. This plan I recommend as adding great interest to a span-roofed house. Some of our climbers are muoh more beautiful than many people imagine, but they rarely have the chance of fully developing their beauties under the confining system so frequently applied.
"The soil in the space A was prepared, but below the brick-case the roots were allowed to run all over the bed beneath the stage (C), which is composed of brick rubbish and the soil that accidentally got mixed with this in the alterations. This has no doubt a great deal to do with the success, because it provides a hard surface in the portions of brick for the roots to adhere to, and carries off quickly the repeated doses of weak manure water, besides facilitating the ripening and drying it well off in the cold winter months. Many persons encourage the growth of gross suckers, which the plant will invariably throw up when making its growth; but I find these to interfere with a good display of colour. While the growth is kept to the old stem all the vigour is thrown into the top-by far the best treatment for nearly ali climbers. Upon referring to the section of the house it will be seen that a great portion of top, and that is whree the main portiun of the coloner is; but to avoid that we are plantine several by the columns of a high conservatory to
allow the branches to fall down, which they wil do, and form wreaths 10 feet long.
"The Bougainvillæa is a native of the bion grounds of South Mexico, but it is almost hig ralised in Sicily and around Naples, where grows in great abundance against walls an: cottages, though it rarely shows its colours so find as it does in our houses, the sun frequently turg ing the mauve bracts to a dirty white, which alss happens with us if not carefully shaded. I may add that it is a most useful plant to cut fay for indoor-decoration, standing a long time in the rooms, and retaining its bright colour there. also travels well if carefully paoked; and house."

Wr announce, with regret, the death of \(y\) s, Charles Watrrton, the well-known Naturalist, whiris took place on the 27th ult., at his residence, Walten Hall, near Wakefield. For many years he has bomer
occasional contributor to our columns ; he mey regarded as an old Oak which will be greatly missed the world-forest. The dear old Squire died cittion upright on a sofa in the sitting-room. In his dens he was, as in his life, full of devotion, devoid of fer and regardless of pain.

Those who may be looking forward to join in the International Horticultural Exhibition whice is being organised to take place neat year in London, and of which we hope soon to be able to announce it particulars, may shortly have an opportunity to ootan some of the materials for which the foreign exlibtrion have become famous, the collection of M. Ouwelant, President of the Horticultura! Societs Laeken, being announced for sale on the 12 th of \(j\) and following days. Many large specimens of Portugi Laurel, Myrtle, Rhododendron, Arbutus, Clethra, Orange, Banksia, Grevillea, Laurustinus, Nerium, Pomegranate, Bay, Arancaria, \&c., are catalogued; as well as large collections of specimen Azalens and Camellias; and less extensive ones of Cycads, Phition Pandaners, Rlopalas, Aralias, Dracænas, Agaves, Tree Ferns, \&c., of many of which the dimensions are given. The collection now to be dispersed has won ? 45 medils at various exhibitions during the past eight yers. Those who have attended the foreign exhibitions mil no doubt remember the size and excellent condition of most of M. Van den Ouwelant's plants. It is, in faci, in materials such as exhibitors have here an opporetunity of procuring, that English shows are generaly deficient. We refer especially to the general abennow of large telling or effectively-placed specimens characteristic of different types of vegetation, such 28 would serve the purpose of toning down our own orer. display of colour.

Of Insect Plagues, the daily papers report the: the fields near Echten, in Holland, are being devastatad by an immense number of Caterpillars. The insects are unusually large, and of a striped appearauce. It also stated that Palestine and Central Syma
recently been threatened by scarcity both from to recently been threatened by scarcity bore stoppage

The original discoverer of this plant was Korthals who met with it in Sumatra before 1839-K who would have been so happy to have worke plants. We saw a sketch of his in 1856 at but were not allowed either o describe it A few months later we found the same sketch at Turnham Green, with and were most liberally allowed to of it. We dill so, and a very short, Bublished by us from the not fully lansid we But the mishans with the at an end. It happened to fluwer in
 De Witte; and a very inditterent drawing
rublished in the Amales, sufficiently incorrect to secure Tos not being understood, for it conveyed the impression that it bal two columns or a big knob at the side of hat organ, and teat it had no hairs. Subsequently we got a single dry flower through Prof. Miquel's welltoown kindness. In the meanwhile it was pretty well doeeribed at Batavia (where they Lad the deseription of P. samatrana), by Messrs. Teijeman and Binnendijk, gain ueder the name of zebrina. It was said to have beon found by Mr. Gersen in the province of Palembang in Sumatra Ath health specimen with a strong spike covered of High Cross, buds, in the collection of J. Day, Esq., of High Cross, Tottenham, cultivated by Mr. Stone; and we have now beforg us a plorious flower of the rarissima anis, Hortioultural Society on Tuesday last. The substance of the large flowers is thick and shining, as in Vand meris. The ground colour is a yellowish white, and both apals and petals have numerous transverse bars and phe of warm reddish-brown colour, nearly as in Vand enporin When the flower fades, these bars and spots in to orange, a colour retained in the dried state, The lip is white, as is the column. The side partitions of the lip have orange spots, the middle one shows four lines of purplish and brown stripes and blotches; while the bairs at the apex stand quite as dense as in good hat-brush. In order to render un enfant terrible, sows a fringed antherlid, as in Trichopilia. There are two varieties, one called Gerseni, with violet tripes; the other IILACENA, with Hilac stripes and a lilac bnee to the lip. What a wonderful assemblage would be formed by all these varieties, and those of \(\mathbf{P}\) Ladderannians, of P. violacea, and last, but not nopsis, P. pantherina, which boaets large red spote on a sellow ground. The merit of having introduced the apocies to England again rests with Messrs. Low \& Co.

atriking. I. \(_{\text {. }}\). Rehb. fil.

\section*{WINTER-BLOOMING LARLIAS.}

Leth superbiens is a magnificent winter-blooming family. Many growers and admirers of this extraordinary family will remember the splendid specimen that once
existed at the Horticultural Gardens at Chiswick, for mat grew exceedingly well, and flowered freely for many years. When the Orchids at Chiswick were 6old, this splendid specimen passed into the hands of r. . Warner, who has also, I believe, been very six to ning in its cultivation. This plant produces from spike 4 to 5 feet in length, and bearing from 16 to 20 flowers in a large bunch at the end. It blooms about November, and lasts at least three weeks in perBeing if kept in a dryish atmosphere.
Being a strong-growing species, it should be grown an arge block of wood, with a little Sphagnum fastened on by means of wire. Then it should be heary for this, the end of itmay be putinalarge pot, filling and covering 2 inches of the top with broken potsherds, be clippod to give it ar neat appearance. It might then ee rame on block or an inverted pot to the required during the The block should be kept well syringed weather, avoiding to wet therticularly during hot Anuch as possible, until the pseudobulbs are formed. Which come on very fast. Towards the end of neratur, should the weather prove cold, and the tem. tenoving the house become low, I would advise may get a fer enic a warmer house, where it解 thelese I believe the plant will endure almost as much
uatural habitat it has beon geon, hen in flower, quite covered with hoar frost. This therefore, may be classed amongst those which will do in a cool house, or better, perhaps, is one intermediate betreen a cold airy greenhouse and a hot humid Orohid house. In summer, during hot weather, it will require no fire-
heat, and should have plenty of air and moisture. A heat, and should have plenty of air and moisture. A
north aspect is most suitable, and a lean-to or halfnorth aspect is most suitable, and a lean-to or hat
span house, as being less affected by sun heat; it then requires less artificial shade. After blooming give very little water during the winter months. If the tompe rature does not go below \(40^{\circ}\) it will not suffer

As winter-blooming plants are always useful, I may mention a fow other; species which bloom at that season, and are very beautiful and neat-growing kinds L. acuminata has the sepals and petals white, and the lip white with dark centre. L. peduncularis is like a variety of the last, but of a purplish rose. L. anceps is a charming species, the sepals and petals rosy lilac, the lip purplish crimson, with a yellow centre striped with crimason. L. autumnalis has the sepals and petale purplish lilac, and the llip rosy purple and white. L. purpuracea is a very beautiful species, in the way o the last, but havinge, the flowers much darker.
The five last-named species lproduce flower spikes from 10 to 20 inches in length, and these flowers last two or three weeks. They all require to be to be treated generally as ! recommended for L . superbiens. Many fine Lielias are of the same habit as many Cattleyas, Howering generaliy with them in the summer months, and requiring similar treatment Some of these I may frefer to at some future time Thomas Brown, Exotic Aursery, Tooting.

THE ROOTS, LFAVES, AND RIND OF PLANTS
THe physiology of plants should be more studied than it is, Phytological lectures should be given. We see miseries in our gardens; and, instead of trying to obviate them and studying their canses, we spend use less time in mourning over them. The same time spent in considering the connection between cause and effect, and also the best remedies for prevention or cure, would be time better spent. Some people see but do not ohserve; others see and observe, bat they in our physio effects to right causes. is some excuse. Permit me therefore to direct attention to the roots, leaves, and rind of plants. "Whoso is wise will observe these thinge" (Psalm cvii)
The ronts of plants are as the foundation of a house. If these die, or do badly, leaves and rind can be of no account. The roots are the mouths and stomachs of plants. Noarishment is taken in by them from the earth by the aid of water, and produces sap. This sap, to be appropriated beneficially, denends on the healthy action of the leaves; insomuch that "good foliage and health are convertible terms." Were I to select Rose without knowing anything more about them, I should selest those with the best foliage. The leaves of the plant are its lungs, and perform the same offices as lung and an animal. There or vessels, between the leave and the roots. In winter a plant is in a state of abey ance, and the rind, before the bads barst into leaves performs sufficiently the functions of the leaves I suppose this to be the case, therefore, is a whole leaf with only one side exposed If their bark (or pro tempore supply for leaves) were injured, they would suffer much as other plants suffer by summer destraction of, or injury of ibeir leavea Foli roots and rind of foliaged plants must sumer, thei annual growth.

In the case of Rose plants the discoloration of th rind, after the leaves have been injured by winds or other causes, is somewhat different. The rind o Jules Margottin will look as if it had been dappled with red ink; Duchesse de Cambacerers and Madame Boll will be jaundiced in the rind; and othera, even the most robust, will be dark speckled. Such wood, wood that comes out of it, is of no ues the next year you must cut it all away. The winds were quiet her last year, and the roses baving a last summer, and straw-protected at the rot in wiater never looked more healthy. Thave not lost this Reve winter as established hos ars) or a budded Rose People mat study more the connection and sympathy betweon ots and lases, not forgetiting the importanc betwear roots a in ing ene-surfaced lear! of the rind, which is an interment as regards all plant If these remarks are imporise they are not less im whether ligneous or otherwise, they are mot portant as regards Peach trees. These are generally England very unhealthy. Here they are the beallinest best-foliaged trees about the place. They came into beautiful bloom a month later than last year the leaves aynchronising with the blooms. This they would always do, and should do, were the roots, rinit, and leaves properly protected. The rind should be protectod both winter and summer, the the from the severity of winter, in the last case from fierce torridity by eyringing. Moreover, the riud of the stump should, in such a summer as the last, bo watered
surface from cracking. The main wood also last summer wanted copious moistenings, no less than the broiling walls. Three times in a place, at 11 oclock every day, did my servant syringe the walls. This "as benefical to the fruit, stems, and foliage; it ept off bleck aphides, which, by destroying the over destroy the branch. By long attention to the health of my chree trees, now of European fame, have cured blister, and I 100 a good prospect of 500 Peaches, which, if I succeed, will make an average in aine conseontive yearl of over 4500 Royal Georges. Attend, then, to the "roots, leaves, and rind of plants." without this attention no plants can long flourish. any of your readers comicy this way are weleome to see the trees. Blistered leaves and frost-bitten rind of this Persian plant are, with starration and malpraning, the main cancen of its degeneration. My heets have been kept on at night all winter, and oftentimes during the day in severe weather. As regards 'each protection, Fir boughs only hang the damp; and covering, short of canvas or glam, that admit rain or he tender young foliage from the cutting winds and hoar frosts. A light covering, in some favourable
 What avail if the foliago 18 all blistered! It must all come off; and during the alssence of leaves the fruit and the tree must suffer : 8) true is it, "it one member the leaves especially) suffer, all the members must uffer with it." W. F. Radclyffe, Tarrant Rushton.

\section*{CULTURE OF THE NUT.-NO.II.}

\section*{Comlinued from p. 387.)}

AT the end of the second year of growth the young trees will require more room, and as lifting them will be a very necessary check to induce a compact habit of growth, and a tendency to a fruitful condition, they situation, at 30 inches apart, the ground being prickod up and mulched as before. The shoots must again be cut back to about 6 or 9 incher, according to their trength; and during the following summer tho requisite care should be taken to remove all the trong interior shoots, but not the weak onem, as they will form spurs for future bearing.
This brings us to the commencoment of the fourth year of growth, and here the foundation of future pruning operations must be commenced by shortening all the leading shoote to the length of 6 or 9 inches as before, and spurring in all the side shoots nearly close the stem, excent where any of the strougest ones re required to fill up a vacant space, so an to keop up n equally belanced head.
In the following sutumn the trees will be sufficiently advanced to be lifted, and planted in their permanent situation ; but at the same time they may be left another year with very great advantage, and being subjected to the same routine of pruning and management they will be nearer to a bearing condition, and will the sooner begin to pay. In either case let the planting be performed early in October, and the trees will not then suffer from the moving, if the necessary care in lifting is exercised to preserve all the fibrous roots uninjured. Some of the larger roots may be cut back, and all incipient nuckens must be completely removed before planting.
If the ground has been prepared as formerly recom mended, by draining and trenching, and has merely had a crop of Potatos taken from it the previous summer, it will only be necessary to clean and level the surface, and then to mark out the stations for the rees in rows at 10 feet apart, and the trees to stand the same distance apart in the rows; the trees in the second row being placed exactly opposite to the centre between two in the adjoining rows, that is, quincunx fashion. As however, when these are planter n a large scale, it may be necessary to use mect in no means for cleaning and tilling the spaces, there in ao objection to the trees being planted on the equare, but in that case it is advisable to make the stations 12 feet apart every way.

The holes for each tree must be marked out with greater diameter than the exteat of the roots, and the soil removed to the depth of somewhere about 8 inches, more or less according as the roots appear to require it. The guide will be the collar of the stem, which that point from whence the roots commence to radiate ; this should not be buried more than about an inch or two below the surface; therefore, it is easy to regulate the depth by placing the tree in the hole so that the collar is just above the surface of the surrounding level, which will allow of a slight mound. If the ground is fresh and unexhausted by frequent cropping, there will be no necessity for any fresth compost, but if, on the contrary, it is long cropped old garden ground, it is indispensable to have some maiden sol to put the top, in quantity the natural soil may be lain ond a good mulching of sufficient to allow fur sinking, and a go
The trees mar thus remain until the pruning season, which is generaily in Fehruary or very early in March, at which time ly duectel, and with the rulle vijued manner as aireaty, viz, the formation of an equally bolatucen] head. When the pruving is fivished, the whole of the soil between the trees, except that part cuvered by
the mulching, should be dug over with a steel fork,
and if it is determined to take a catch crop between and if it is determined to take a catch crop between
the rows, some manure must be laid on and turned in during the operation of forking over, and for a couple of sears, or perhaps more, there is no material objection to planting eingle or sometimes double rows of such crops as Potatos, Cauliflowers, Broccoli, and the Brassica tribe generally, together with Carrots and Red
Beet, or Lettuces, but nothing that would be likely to grow large or tall,, so as to shade or in any way interfere with the perfect development of the trees. For be planted, but only those varieties which do not run much to haulm, such as Flukes or Ashleaf Kidneys. On no consideration, whatever, would I allow Currant or Gooseberry bushes to be planted between the Nut trees, and yet it is often done, and indeed recom-
mended by some cultivators. That I suppose to be one reason why such of them as are fond of taking their catch crops, advocate the use of small trees in space to cultivate their favourites, and the trees intended to be permanent are left to struggle onwards through a host of adverse conditions, so that by the time they have driven the usurpers from the field they are often well-nigh exhausted, and very far from being in the coudition to which they would have attained under more generous treatment. Let me therefore strongly from their trees, and to bring them forward in good condition, to fight very shy of these catch crops, even When they are only the succulent vegetables: and if such must be had, to give them their legitimate space mutual hurt. John Cox.

\section*{Home Correspondence.}

Failure of British-raised Seedlings from Californian Conifers. - I have raised seedling plants from the particular symptoms of weakness or disease amongst them. Some plants raised from the Douglas Fir are irom 3 to 4 feet high, and in general show as vigorous
a habit as those raised from foreign seeds. Young a habit as those raised from foreign seeds. Young
plants of this Fir differ much in colour and vigour, even when raised from Californian seeds. As to the plants raised from Lawson's Cypress here three yenrs ago, they are growing very fast, and have the same at Stevens's sales in London. This spring I have sown about 2 lb . of cleaned seed of Lawson's Cypress in the open air, saved from plants growing here, and it is now vegetating thickly in the beds. As British-raised seed-
lings of these fine Conifers displas such differences of appearance in particular soils and localities, it becomes of great importance to planters to try and find out the cause. Some years ago I purchased two seedling Abies Mr. Barron, of Elvaston, the raiser. These two plants never ahowed the fine glaucous appearance and vigorous habit of the true nobilis, when compared with plants
of the same age raised from foreign seeds. seryman, who had other plants of the same batch of thedings to grow himself in his nursery, found that they never looked like the true nobilis, and believed that the cones of nobilis from which they had been Fir. Yerhapa Mr. Barron could throw some light on
Find raising seeds from the new Californian Conifers, As well as on the diseases attanking them when raised from British-grown seerls. William Tillery, Welbeck.
plants for forcing this spring I potted 300 Strawberry pots, and after they were well-established and had begun to grow, I exposed them fully to the sun in a kept them well attended to. They made vigorous growth, and the foliage was in first-rate health. No suckers were allowed to remain ou them, and as autumn throw off heavy rains. About old frame lights to December I placed the first lot in an early vinery, on a shelf against the back wall, near the glass. Some of too much danat is and want of lisht, the Vitribute to grown up and shaded theno. I am quite satisfied, however, with my first crop. I do not prefer a PeachIlaced at the back of a later vinery, near the glass, and in saucers; and when the fruit was set I kept the saucers filled with liquid manure water. Under this not wish to have a more successful crop of fruit than I had this spring on these plants. All who saw them pronounced them excellent. \(H . S\)
Garden Walls.-I purpose building a garden wall 18 inches thick. In length it will be about 40 yards. The ground is not level, there being a difference of some
6 feet between the two extrenities. Do you think shall make the wall wore serviceable for the growth
of wall fruit by bulding it houl fire-place at the lower end, with a flue in the wall
extending to a chimney at the other end ? what kind of fireplace would it be best to use?
Should there be more than ond
length? James Wintle, Gloster. [By building your
wall hollow, with a common furnace adapted to a flue, you will have the advantage of ripening the wood better than you otherwise could in your northern climate. The slope of the wall will ensure a good than one in a length of 120 feet.ll

Fork Great Flower Show.-Will you allow me to direct the attention of Rose growers in the Midiand and Southern counties to the efforts of the Committee
of this Society to let us in Yorkshire and the surroundof this Society to let us in Yorkshire and the surround-
ing counties see Roses in perfection, and to beg of them to attend and exhibit. In the open classes, prizes of 2l, \(4 l\), and \(3 l\). are given for 48 orma, and \(5 .\). , \(3 .\). and is also given, besides other liberal prizes. I need scarcely refer to the leading trade growers finding it advantageons to exhibit on new ground, but beg, on behalf of the Committee, to solicit the aid of amateurs as well. I would add that the Exhibition generally hitherto has been second only to those seen at the Regent's Park and Crystal Palace, and the liberal prizes again offered for plants must secure a great exhibition. A Yorkshire Florist.

Wasps.-Royal wasps, comprising I presume both seres - kings and queens, are everywhere most
abandant this year. I have myself killed 72 during the last few weeks. The course I have pursued with such aignal success is simply to protect myself with a pair of flower, or alight on a Gooseberry or a Raspberry bloom, to instantly close with them, and fearlessly clutch them within my hands. The most timid need have no fear of being hurt, for theirstings are powerless to penetrate the glove. Vespecide.
The Collinsias.-"Quo" would seem to be slightly flowering kind, and a very useful one as it is a springcourse, it may be sown in spring and flowered in summer like some others. Naturally, it comes up in autumn and flowers in spring. It "sows itself" in fact, and makes a good show of a distinct colour about the beginning of May, when verna is in flower. Colinsia bicolor is also best grown in the same way-by sowing in autumn. The spring-sown plants are not so strong or full of flower as those which have gathered strength during winter and spring. In Mr. Noble's garden, near Maidenhead, bicolor, graudiflora, and verna were all in splendid condition a few weeks since, and till very recently, if not yet, C. bicolor was Mr. Rogers's
favourite. C. verna cannot well be dispensed with for avourite. C. verna cannot well be dispensed with for the blue being of a striking tint, somewhat like that o the Siberian Squill. These three Collinsias are among the very best of all annual and biennial plants used for pring gardening. Wm. Robinson.
Early Peas.-There has been a good deal writton ately in your columns about the earliest variety of
Pea, some praising one new sort and some another, but
Pea, some praising one new sort and some another, but Early, although, so far as my experience goes, there is nothing to beat it in point of earliness. I picked a peck of good eatable Peas of this sort on the 266h of May, a early as the 20th, but not enough for a dish. If anyone has tried this variety against Sutton's Ringleader or Carter's First Crop, 1 should be gratitied by know hree. Two persons who last season Crew the Express by the side of Sangster's No. 1, assured me that they could not perceive any difference between them. There is no doubt that seedsmen sometime substitute one sort for another, not only of Peas but of ther garden seeds, which is one cause of the great do away with this now existige numerous varieties of Peas, Broccoli, Cabbages, \&c., which now cumber the seed lista, and are merely a source of confusion and annoyance to seedsmen and to gardeners. Half a dozen sorts of Peas judiciously selected are quite enough for any gardener's requirements, and if growers would take the trouble at the end of the present season to send to your Paper the names of the six sorts which they have found to be the best in quality, and for affording a regular succession, that would be one step towards \(B\). Wetting rid of many superfluous varieties. J B. Whiting, The Deepdene Garden. [Mr. Whiting's
suggestion is an excellent one. We slall be suggestion is an excellent one. We slall be happy to --Having this year tried Messrs. Sutton's Ringleader with other Early Peas, I find that it comes to table much earlier than other sorts. I made a sowing of it on the 24th of February last, and I gathered it on the pods. \(\boldsymbol{H}\). Harrisone haulm was covered with well-filled

I beg to send you a few Peas procured from. customer of mine, who informs me that he sowed them the third week in January. He states that he first gathered from them on the 19th inst., and that they were in blossom on Easter Sunday, April 23, a week to have the First Crop or Ringleader is reported No. 1 Peas. I may mention that produce from the same stock was offered in our market on Wednesday last, and again to-day, in such quantity, that the retail price is only from \(2 s\). to \(2 s\) s. \(6 d\). per peck. Robt. \(\boldsymbol{B}\) grown in Kent, has been plentiful in Covent Garde

Market during this and last week.] - Herewith send you a dish each of Sutton's Ringleader and Carte
First Crop Peas, both sown side day, early in January last, at our St and on the sumo You will observe that our First Crop Peas matured, and we wish to atote the peas are gathering on Monday the 15 th ulc we picked the fin mathering on it is the opinion of those We may aloo mark that it is the opinion of those who have
them growing side by side Carter's First Crop Peas are longer in Osyth Sutton's Ringleader, and consequently the pod tha You will, to a certain extent, be able to corroborate thi by the samples sent, both of which we pledge ore tio to be true samples according to our ple ourte called upon to state, in justice to ourselves, that We fer First Crop Pea is not two days later than Suttons it is rather earlier in your columns; on the contra We have tried Carter's First Crop and Suttols Pin Peas can discover no decided difference between them, therefore must consider them too nearly the anm,
Transplanting Machines.-The Scottish same. tural Society, it appears, appointed aicommittee arborica and report upon certain young trees, from 3 to to inspec high, transpianted by Mr. M'Glashen's pateut tam planting apparatus during the summer of 1863. Inrepont ing favourably of the state of health of the young tren operated upon, these gentlemen did well; bot and they add that they have no hesitation in the apparatus invented and patented by Mr. M'Glostre was eminently adapted to the purpose for which constructed, and superior in point of utility to other transplanting machine, their teaching becomes questionable. Have they never heard or read anything of Mr. Barron's transplanting machines, which been known amongst the most eminent planters for last 30 years, and still more generally since M ay \(180^{\circ}\) when diagrams of them were published in Mr. Barron't British Winter Garden? Since last December high to 15, have been transplanted in Norfolk by M Barron's machines, and every one of them is nom growing. If Mr. M'Glashen's apparatus be superios as the committee say it is, will they be 80 good a to say where trees of the dimensions above named and more successfully operated upon, can be seen? It is well known to many professional men that \(M\) Barron is the original inventor of this transplant machine, and by far the most extensive and successtal planter of our day. In proof of my statements I may mention that in 1831, at Elvaston Castle, Mr. Barron began bis operations by transplanting four Cedars Lebanon, upwards of 30 feet high : the same trees ar now over 60 feet in height. One was 48 feet acron the branches, and 6 feet round the stem. The sam trees were measured by Mr. Fortune a few montha apo and found to be between 9 and 10 feet in circumference Since that time Mr. Barron's machines have been counties also in and have been used in 2 B , Switzerland, and with uniform success when nventor's instructions have been fully carried ( Mr. Barron has removed Conifers and other trm upwards of 40 feet high upon a limestone formation where Mr. M'Glashen's spades could not be used, the second year after removal the same trees ame grown 18 iuches to 2 feet in the leading shoolo may add that a month ago a large Beech tree mis transplanted here by Mr. Barron's machines, and nila its removal it has grown already 5 inches upwards of 50 feet have also been transplantou fully. In the face of these and other facts that may adduced, I cannot but think that the geallemen posing the committee referred to, owe the public a namely, that of proving the correctness of thei ment as regards the superiority of M'Glashen's spps, ratus. Alexander
Myosotis montana.-Those who grow this fine plan in soil of ordinary dryness will be led to thing it a rit worthless thing. For a long time I have not seed and a good state, but I found it in great lusuramd beauty iu Mr. Farmer's garden a
since. It was growing, along since. It was growing, along with numerous old
choice hardy plants, bout which I may have somethin choice hardy plants, about which I may have som a loam, the bed well drainea, and sept always mo formed healthy bushy tufts, about 16 with fine - more that have seen any other Myono with fine large bright blue flowers. "Flowering early, even "with the Snowdrop",
perfection now at the end of May, growth and bloom make it a most
here well grown. William Robinsonv orable for art Melons, and with many these will be ripened crop gathered, thus giving tinue to admik set of plants being turned
my plants have, however, been affected by canted when such is the case I apply quick-lime to first scruping portion immediately the evil is perceived plants have plants have
health. \(H\). \(B\).
Caterpillar. I Havern in \(M\)
Caterpillars.-I have some Hawthorn trewid
emo them, but failed; a friend recommends tobacco, bat this in the open air will be, I fear, of little use.
Can you kindly belp tue in this matter? J. C. Prancis, Try the effect of smother burning rubbish to the wind ward of the trees, so as to smoke them thoroughly.]

\section*{Foreign Correspondence.}

Temperattab of Loxa during a short sojourn, by Profesor Jameson, of Quitn. In a letter to Sir W. Hooker.-Tbe Cinchona Condaminea trees grow on hills a short distance from the town; soil rocky, of micaceous schist. The low country is covered with forests, but the Lummits are covered with Ericaceous plants, including three species of Befaria :-

\section*{Societís.}

Royal Horticulturat: May 30 (Fortnightly Meet-ing).-J. J. Blandy, Esq, in the chair. Fewer subjects were exhibited on this occasion than at former Tuesday meetings ; but in point of interest the display was in no way inferior to its predecessors. The Rev. Mr the last meeting, remarked that it was fortunate that it was not in flower, or its offensive odour would have driven every one out of the room. The spathes of some of the Arade, to which this genus belongs, are neverthe lem remarkable for the brilliancy of their colouring, and in some cases, notwithstanding the poisonous chancter of the order, the tubers are cooked and
eaten like Potatos or Yams. What is called Portland Arrowroot is, he said, made from the fleshy corms of Lords and Ladies (Arum maculatum). As regards offensive odours it was added that the worst were to be found among Fungi, drawings of three of the most beautiful, Set disagreeable smelling of which, were exhibited The odour of Thelephora foetida was stated to be in
supportable. A specimen of this collected by Mr supportable. A specimen of this collected by Mr.
Berkeley in Aberdeenshire, and placed in the bed.room where he was staying caused it to smell, he said, worse than the Tomb of all the Capulets, and it had to be wrapped in as many as 12 folds of stout brown paper before he could attempt to take it home Gardenia radicans which was exhibited, some interesting Alpines from Messrs. Backhouse next came under eview. Among them were the dwarf Black Lily o Kamschatka, which was stated to resemble a Fritillaria more than a Lily; the Pyrenees Hyacinthus amethystinus, of a beautiful azure blue, and related to Ophrys fucifera, the Drone Orchis, from Prussia, pretty species of a class of plants on the singular structure of whose blossoms Mr. Darwin has offered some interesting observations; Linaria alpina, from Switzerland, a useful plant for rockwork ; and th orluguese Anemone palmata, with large showy last long in beauth looked as if they might peeud-Acacia Decaisneana, a cut specimen of mich was shown by Messrs. Osborn, was now comaented on, as were also certain freaks in the sportive genua Cytisus. C. Adami, it was stated, was not on the common Laburnum, the third form, C . Adami ing by from the cells of the first and second, becom together. In alluding to growth naturaliy graften ccasion from Eeyp to certain fruits shown on thy pportunity of offering Mr. Berkeley embraced the Am of the Sycamore Fig. In Scrip on the caprifica Amos is said to be 'a gatherer of Figs, but the term gatherer should, it was stated, be rendered scratcher rubbing the being induced by scratching or briskly thrust into the centre had also the An oiled straw sometitues the centre had also the same effect, and In referencerips.
gutatum, Mr. Wilson Saunders cularly Sauromatum offensive exhalations were given off immediately on was always attended by an increage of which perature, amounting to some \(4^{\circ}\) or \(5^{\circ}\) higher than that of the house in which the plants were placed,
as he had recently ascertained by repeated careful observations.
Mr. Bateman, whose observatious were confined to the Orchids present, commenced by stating that Young in his "Night Thoughts" had said that Nature never put on the livery of a mourner, and that pure black was seldom found in flowers; it was how ever present in the lip of the green-blossomed Coelogyne pandurata, a species from the reeking swamps of Borneo, and therefore one which he considered would not readily submit to cool treatment. This was shown from the garden of the Society. The next plants noticed were the new and beautiful Phalænopsis sumatrana, shown by Mr. Day, a full account of which together with a representation of one of its flowers,
will be found at p. 506 ; the yellow-blossomed Promenæa citrina, a plant that has not been seen for years; and one or two species belonging to the African genus Angreecum, in which is a prolongation of the sepals and petals in the sbspe of tails. Uropedium Lindenii, from Mr. Buller, Strete Raleigh, Exeter, with three tails to each flower-one at each side and a third in front-was next commented on. As regard the uses of tails, Mr. Buller, referring to Mr Darwiu's work on the fertilisation of Orchids, asked if they are not so many ladders to assist insects to reach the blossoms in which they are to operate; Mr. Bateman was, however, of opinion that if he were an insect he would rather ascend by the stems of the flowers than trust to the sickety tails in question A fine new Angrecum, discovered by Captain Grant during his travels in search of the source of the Nile, was next mentioned in terms of praise by Mr. Bateman. It has fine caudal appendages of great length, but of the beauty of the flowers themselves little could be said, as it was evident from the dried specimens which were exhibited that they had been pas their best when gathered. This has been named by Mr Granto The latter gentleman, who was present explained at Mr. Bateman's request that the species in question was found on trees covered with Lichens in low warm moist grounds within \(3^{\circ}\) of the equator Had he known that it was new, more of it would hav been procured.
Mr . Bateman then proceeded to give some account of Cuitlauzina pendula, hitherto a "Will of the Wisp" to botanists. Early in the present century, says the learned lecturer in his beautiful work, "A Monograph O Odontoglossum," two Spaniards-La Llave and Lexarza-settled at the Mexican town of Valladolid,
in the fertile province of Mechoacan. They were both attached to botany; but the younger of the two, Lexarza, was so attracted by the beauty of the numerous Ozchids of the district that to these he devoted himself with an ardour that would have done honour even to the Lindleys and Reichenbachs of our own day. As the result of his labours a little work"Orchidianum Opusculum" he modestly styled itpresently made its appearance, wherein about 50 species, all at that time new to science, were described with remarkable accuracy and sixill. Among the number there was a plant-Cuitlauzina pendula he called it-said to be of surpassing loveliness, and to characters of which were minutely given. As time went on and the rage for Orchids developed itself in Europe, a keen desire was naturally felt by cultivators oo add so fine a plant to their lists; but although many collectors visited Valladolid, and laid hands on nearly all the other desirable Orchids described by and on the cover of the latest number of Dr Lindley's "Folia Orchidacea" its name may be found in the list of genera "unknown to the author. About the same time, Dec. 6, 1862, I sadressed the Gardeners' Chronicle, urging some adventurous traveller to take ship for New Spain, mainly with the object of instituting another search for the cantalising plant that had hitherto eluded our grasp. Yet al this while Cuitlauzina penduls was amongst us, and indeed had been an established favourite for upwards of 20 years. But if so, it may well be ask full reply to this very natural inquiry, Mr. Bateman referred to a most ingenious article in "Bonplandia" by the younger Reichenbach, to whom all the credit is due of having solved a great botanical puzzle, and proved to demonstration that the Cuitlauzina pendula of Lexarza is none other than the Odontoglossun citrosmum of Lindley. The idea, indeed, tha Cuitlauzina pendula might possibly be identical with 0. citrosmum had more than once occurred to mre Bateman : but Lexarza's character of the flower-scape viz., that it was destitute of bracts, had always proved an insuperable difficulty. It seems, however, scapes of the other Odontoglossa that he met with
happened to be entirely clothed with large inflated happened to be entirely clothed occur ; the present plant, trals, and are exceedingl minute may in comparison be said to be alnos destitute of them. Under these circumstances, however undesirable the meddling with established namee may be, Mr. Bateman ssid he could scarcely see how, in common justice to Lezarza, we could do other wise than adopt his specific name of pendula, mor
originally gave it remains to this day the ouly one out of nearly 100 Odontoglossa that has flower stems which are strictly pendulous. Odontoglossum citrosmum, therefore, a charming specimen of which was shown on this occasion by Mr. Pilcher, gr. to s. Rucker, Esq., aud a smaller one by Messre. Jackson, must henceforth bear the name of 0 . pendulum. Of this there were mentioned some beautiful varieties possessing more or less colour in the lip.
May 30 (Floral Committee).-The long comparatively lost Promensa citrina, mentiuned above, was shown by Mr. Williams, who also had a well-managed specimen of the free-flowering and really beautiful Stat ce profusa. Amargllis ignescens, a glowing light searlet variety, striped in the throat with white, and a Maranta with andsome green leaves, spotted at regular distances apart on each side of the mid-rib with black, were hown by Mr. Veitch. From Mossre. Backliouse came, in addition to the plants mentoned above, a Chilian Gleichenia named cryptocarpa, with bandsume foliage ; a variety of Aspleniuin inarquale from the Mauritius; Lomariopsis heteromorpha, a neut-growing species, and Pellua rightiana A briaht criman amed Princess Victoria, was furnished by Mr. Wills, gr. to Sir I'. G. Egerton, Bart. ; Clerodendron Thomnona lialfourianum from Messrs. Jackson; and the Robiuia Decaisucana named above, from Messrs. ()aborn, Of Pelarzouiums, Elegans was shown by Mr. Nye, gr. o E. B. Fuster, Esq., of Clewer Manor, near IFindsor and William Hoyle, Charles Turner, and Progneas, by Mr. Hogle, of Reading. Of these descript:ons have been given in former reports. Pelargonium Rising coloured leaves, stamped with a well-matked reddishcoloured horseshoe, was contributed by Mr. Turner. Another bedding variety of zonale Pelargonium, named Wiltshire Lass, with fine globular trusses of charming pink blossoms, one portion of which does not decny while the rest of the truss is in perfectiou, as happens with some kinde, was shown by Mr. Keynes, of Salisbury. The new Phalænopsis sumatrana vamed above, came from Mr. Stone, gr. to J. Day, Eisq. ; and the ollowing Rhododendrons mos to last week, are now being exhibited by Messra. Waterer \& Godfrey in the Rhododendron tent, viz, Stella, Mrs. John Clutton, Charlos Dickeus, H. H Hunnewell, Lady Clermont, Caractacus, aud H. W Sargent. To theee, as well as to all plants just named, First-class Certificates were awarded; and to the following Second-clase Certificatos were given, vis, Ansectochilus nobilis, with folinge prettily covered vith silver veins from Mr. Willimas ; a neat ink-blossomed Masdevallia, Hyacinthus amethys inus, and "Sarana kamtschatica," alluded to already from Messrs. Backhouse. For Lomaria gibua, a hand some Fern; Odontoglossum (eitrosmum) pendulum from Mr. Pilcher, gr. to S. Rucker, Esq. ; magnificent cut blooms of Cattleya Mossiw, from Mr. Hodges, gr. to E. Wright, E.c... Birmingham ; and cut flowers of Orchids from Mr. Sherratt, gro to J. Bateman, Esq., Special Certificates were awarded. Mr. Turner conributed a boxful of large and bandsome Rose blooms, and plants of Bougannillea glabra, full of flower, in 5-inch pots-showing with what freedom this species blooms in a comparatively small state. It is not, how. ever, so handsome in colour as B. speciosa.

May 30 (Fruit Committee).-Dr. Hogg gave a short account of the different kinds of fruit shown, An oval Craven, stated to be a cross between Trentham Hybrid and perhaps the Beechwood, proved, on being cut, not to be good, although it was stated by Mr. Miller to be sometimes excellent. Varieties or dercription were, however, slated to be somewhat capricious as to Royal Gardens, Frogmore, was stated to be worthy of notice on account of its earliness. It ripens 10 days or so before the May Duke. The Belle d'Urleans, a amall variety, was, however, said to be oven earlier than this. From Mr. Chapman, gr. to his Highness Halim Pasha, came a collection of fruit, \&c., from Egypt, in which were Oranges, the quality of which had suffered from travelling, and fair apecimens of Sweet Lemon, and Loquats; the latter are sometimes met
with in our markets from Malta, but they are not considered so good as those from Egypt and the East. t was stated that both Lord Bagot and Mr. Bateman had succeeded in ripening the Loquat under glass in this country. Mr. Chapman furnished moreover ruit of the Pepper tree, Gram (Cicer arietinum) kind of narrow-leaved Hemp used for smoking and fur making "Hashish;" and other interesting orjects. Beautiful fruit of the Castle Kennedy FIV, a fine kind, very different from others now in cultivation, were shown by Mr. Fowler, gr, to the Earl of Stair, at Castle Kennedy. Mr. Fowler, the following inportant fact in reference to it, viz, that under forcing it ripened in about half the time which others took to come to perfection, all being placed under the same circumstances. Of Apples we noticed specimens of Sturmer Pippin and Winter there were a few Strawberries and other fruit.
The following Candidates were elected Fellows, viz:

\section*{}

Manchester Horticoliturai: May 17 and 18.This, the first Sluow of the season, took place in the
Botanic Garden, which was thronged with visitors Botanic Garden,
during both days.
Of Orchids nearly 300 specimens were exhibited special prize for 15 plants was offered on this occasion, and was won by Mr. Toll, gr. to J. A. Turner, Esq., this group was 5 feet higl, with three spikes of well coloured blossoms; V. insiguis had two spikes; Cattley Skinneri was also excellent, as were likewise Phalænopsis grandiflora, and the rare Odontoglossum nebu-
losum with seven spikes of bloom on it. Of equal losum with seven spikes of bloom on it. Of equal
beanty was the lovely Odontoglossum nævium majus, with eight spikes of richly coloured flowers; also the rare 0 . caudatum, \(O\). citrosmum roseum with several spikes of bloom, and a well-grown specimen of Dendrobiom Farmeri with fine green foliage and lovely clusters of flowers. Associated with these were the charming Dendrobium crepidatum, with drooping spikes of white and orange blossoms; a grand example of deni with tails 18 inches in length. Trichopilia crispa was also finely in bloom. Mr. Mitchell, gr. to Dr. Ainsworth, produced some fine specimens, which obtained a 2 d prize. Among them were Vanda suavis, with two spikes of very large flowers; a splendid plant of Uropedium Lindeni; the lovely Odontoglossum citrosmum roseum, with a magnificent branching spike of blosso:rs ; and Cattleya Skinneri well bloomed, one of the spikes having 14 flowers on it, unusually fine in colour. The collection also contained Oncidium sphacelatum with drooping spikes of bright yellow flowers, Dendrobium nobile, and a fine variety of Cypripedium to T. Jones, Esq., had a well-grown collection, to which au equal \(2 d\) prize was awarded. It contained a glorious Saccolabium ampullaceum ; Vanda suavis, a noble plant 5 feet high; a charming mass of Phalenopsis Schilleriana with mauve-coloured flowers; Oncidium toglossum nævium majus; Læelia purpurata bloomed; and fine plants of Cypripedium barbatum nigrum, and Aerides roseum and Lohbii. In the Class of 8 Orchids, Mr. Stevenson, of Timpley, was
1st with very fine plants, among which was a noble 1st with very fine plants, among which was a noble
specimen of Saccolabium guttatum giganteum, the charming Dendrobium S chroderii, with wonderful spikes of white and yellow flowers ; D. formosum, which is far superior to giganteum; Leelia purpurata; and flowers. T. Jones, Esq., was 2d. Among with fine were the charring Trichopilia crispa; Among his plants with unusually large flowers; Vanda tricolor; Cypripe dium barbatum ziganteum; Cattleya Lawrenceana, and Aerides Fieldingii。 Dr. Ainsworth, who was 3 d , exhibited a well-bloomed plant of Trichopilia crispa ampulaceum and curvifoliam, and Lelia ; surpuratian Baker, Esq., who exhibited some well-bloomed plants, also received a 3 d prize, Among his plants were
Vanda suavis, V. tricolor, Cattleya Mossix, Phalenopsis grandifora with two fine spikes, Chysis bractescens and Aerides Fieldingii, the last with a charming spike. Mr. Houghton, gr. to T. Kendal, Esq., who bad another 3 d prize, showed a wonderfully fine example of tricolor; also Phalænopsis grandiflora, with a Vanda spike; and Dendrobium Paxtonii. T. Jones, Esq., had the best single specimen in the shape of a fine plant of one of the best varieties of Cypripedium barbatum. Baker, who was \(2 d\), had a good plant of Aerides
Fieldingii. A miscellaneons coll shown by T. Jones, Esq., contained 30 Orchids, bloomed plants, for which a special prize was given and J. A. 'Turner, Esq., M.P., had a a similar award for a good exhibition. T. Br. Aiker, Esqu, was also a large xlinibitor in this class.
collections of ten. Mrio Cole \& Shere were three was awarded the 1st prize, Cole \& Sonsibited some to whom plants, among which were Erica Cavendibhii, 5 feet Erica suaveolens superbgh; the Blue Leschenaultia ; varium nanum, Aphelexis humilis grandifora, and a very fine specimen of Azalea Criterion. A 2d prize was
awarded to awarded to T. Kendal, Ess.., who had some noble 5 feet in diameler: Azalea Juliana, 6 feet high and Dracophyllum gracile, a large specimen equally large ; confertifo:ia, Epacris miniata, and other plants, all well bloomed. Mr. Baynes, gr. to H. L. Micholls, Esqu, Bowden, was also 2 d with some grand specimens, among which were Hedaroma tulipifferum, large, and in fine thewer; Azalea Iveryana, 5 feet high and 4 feet through, Bougaiuvilleat glabre inow A. Criterion, equally fine; ventricosa cuccinea minor, a beautifully grown plant.
In the Class of 6 and 1st prize was deser vedly and Greenhoused Plants the
 fine plants of Azalea magnifica, 4 feet high and as
mach through; \(A\). Empreis Eug

Ixora, with 40 heads of bloom on it; Boronia pinnata; was awarded to was awaried to Mr. Houghton, who exhibited a ine
plant of Franciscea confertifora; Epacris minata splendens, with rich-coloured flowers ; Ixora coccinea and Azalea Empress Eugénie. Mr. Johnson, gr. to H. Micholls, Esq., had a ad prize for nice specimens of
Azalea coronata, and other kinds; and Acrophyllum venosum, well grown and bloomed. In the Class of 8 plants, the lst prize was awarded to Mr. Baynes, whose plants were well arranged, and had a good effect. In the centre was a noble specimen of Dicksonia antarctica, with gracefully drooping fronds; a high-coloured
Croton variegatum ; Phajus Wallichii, with five spikes f flowers ; Azalea exquisita; Polygala cordifolia well-bloomed; and some well-grown Sarracenias Mr. Stevenson was 2 d with fine specimens of Aphelexis macrantha purpurea, Croton angustifolium, wellcoloured; Dracena Cooperi, a a splendid plant; Pimelea elegans, well bloomed, and seldom seen at our exhibitions; and the beautiful Alocasia metalica. In the Class of 6 Miseellaneous Flowering and Foliaged Plants, the 1st prize was awarded to Mr. Johrison, who had fine specimens of Vanda suavis, a very fine plant, 4 feet high; Dracena Draco, 5 feet high, clothed with foliage to the pot; Croton variegatum, Dicksonia autarctica, aud Phalænopsis grandiflora. Mr. Baynes was 2d with a graceful plant of Aralia leptophylla; ; fine mass of Anæectochilus xanthophyllus ; a wonderful specimen of Sarracenia purpurea, with large pitchers; and Cypripedium barbatum. S. Roebuck, Esq, who
was 3d,' had Rhododendron Gibsonii, well bloomed; Ixora coccinea, with fine heads of flowers on it; and Azalea Duke of Devonshire.
In the class of 8 Azaleas Mr. Hanmer was 1st with large apecimens, among which were Empress Eugenie, with larger flowers than usual ; A. Briliant, fine in colonr; ; A. Chelsonii, and Juliana well
bloomed. In bloomed. In groups of 6 plants the 1st prize was
awarded to Mr. Johnson for Illustris nova, Magnificent with very fine flowers, and Julana. For a specimen Azalea Mr. Hanmer was first with a wonderful plant of Extranii. Mr. Houghton was 2d with a rood specimen of Criterion.
Of Ferns Mr. Baynes exhibited some fine specimens. Gleichenia Speluncer was perhaps one of the best plants ever seen; it was 4 feet high and 4 feet through; also
flabellata well grown; Alsophila excelsa, and the lovely Cibotium princeps; Platycerium excelsa, and the love horn Fern, and others. Mr. Johnson was 2 d with Davallia aculeata, 3 feet high, and as much through Gleichenia flabellata, and Cyathea Smithii, a beautiful Fern. Mr. Roebuck was 3d with clean and well cul. tivated plants, among which were Cyathea dealbata the silver Tree Fern; C. medullaris, with distinct black stems; and Cibotium princeps.
Of Cape Heaths Mr. Houghton had fine examples of Hartwellii and ventricosa.
8 Pelargoniums were shown by Mr. Johnson and Mr. Houghton. They were not so large as we usually se them about London, but they were well bloomed.
Cinerarias were shown by Mr. Roebuck.
Among new plants Mr. Baynes showed "Anthurium cordifolium ; Mr. J. Shaw had a miscellaneous collection in which were fine specimens, especially of Paluns and Tree Ferns.
Mrs. Cole \& Sons exhibited collections of Miscellaneous Flowering and Foliaged Plants, well arranged or effect. Mr. B. S. Williams, of Holloway, exhibited large collection of new and rare plants, which were reatly admired.
A taiale was set out, as if for a wedding breakfast, loaded with all kinds Cherries, Strawberries, \&c. ; alsoं Bouquets and stand of ornamental flowers. For this a special prize was ver.
r. Toll slowed a fine collection of Amaryllis, to Hardy Ferne was awarded.
Hardy Ferns were also shown in good condition by
R. Thompson, Esq.; and there was a small exhibition Fruit.

\section*{Notices of 300ks.}

Flora Vitiensis: a Description of the Plants of the Fiti or Fiji Islands. By Berthold Seemann, Ph.D., F.L.S., \&e. London : Reeve \& Co. 186J.

The first part of this beautifal quarto book, which is to be illustrated by 100 of Fitch's ininitable drawings, has just been issued. Among the subjects figured in dllip first number, Hibiscus storckii, a shrub with elliptic serrated leaves and large rosy flowers ; and Elxocarpns Storckii, a tree with obovate oblong leaves, and large showy crimson flowers issuing in racemes from the older wood, would be well worth introducing to our gardens. The systematic portion of the text is varied by many interesting observations on the uses of the plants described. We take as a sample one of these assages relating to Calophyllum Inophyllum:-
tracted from valuable oil produced in \(F_{\text {jii }}\) is that extracted from the seeds of this tree, the Dilo of the Cashumpa of India of Eastern Polynesia, and the Cashumpa of India. It is the Bitter Oil, or Woondel of Indian cominerce. The natives use it for polishing arms and greasing their bodies, when cocoannto oil is throughout Polynesia and the Enst Indies restg unjon its
medicnat properties, as a liniment in rheumatism, pein can hardly be exaggerated, and recom in this reapece attention of European practitionerommends it \(\mathrm{l}_{0}\), by the Fijians in gourd flasks, and there sixpence per pint for it, paid in carged
cutlery. The tree is is one ittoral plants in the group its of the most com the square-shaped ones of Barringtonia sixed nis Pine-cone-like ones of the Sara Palm Wendl.). and the flat seeds of the Walai (Envitien dens, Bentb.) densely cover the wandy (Entadas oil never congeals in the lowest temperathers Fijis, as Cocoa-nut oil ofter does during the cool seaso It is of a greenish tinge, and a very little of it swill part its hue to a whole cask of Cocoa-nut oil. Its it mercial value is only partially known in the Fiijis, and ound out accidentally. Amongst the contribution suppornut of the Which the natives furnish towards been poured, which, on arriving at Sydney Dilo oil hai by the broker who purchased the other oil, was rejecter of its greenish tinge and strange appparance. being shown to others, a chemist, recognaising the bitter oil of India, purchased it at the rate of per tun ; and he must have made a good profit on it, gro ws to the height of 60 feet, and the stem. The from \(\begin{aligned} & \text { Dil }\end{aligned}\) 4 feet in diameter, generally thickly crowded epiphytal Orchids and Ferns. The dark foliage form a magnificent crown, producing a dense shade; and with numerous white flat is traly noble. "The leaves are torn in small pieeex soaked in water for a night, and then used for washing inflamed eyes" (Storck). The exudation from the
stem is, according to \(G\). Bennett, the resin of commerce, used by Tahitians as a seent Carpenters and cabinet-makers value the wood account of its beautiful grain, hardness, and red tinge Boats and canoes are built of it, and it is named with the Vesi [Afzelia bijuga, A. Gray] as the beet timber produced in Fiji. In order to extract the the round fruit is allowed to drop in its outer flebhy
covering, and rot on the ground. The remaing portion, consisting of a shell (putamen) somewhato of the consistency of that of a hen's egg, and enclosing the kernel, is baked on hot stones in the same way that Polyuesian vegetables and meat are. The shell is then broken, and the kernel pounded between stones the quantity be smail the macerated mass is plaod in the fibres of the Vau (Hibiscus tiliseens and contents ; if farced by the hand to yield up its of contents; if large, a rude level press is constructed placing a boom horizontally between two Cocos-and of \(t\), and appending to this perpendicularly the ibra of the Vau. After the macerated kernels have bead pacd of the fibres, and tiwo men taking hold of its e twist the contrivance round and round till the collecting into a wooden bowl placed underneath, hax been extracted. Of course the pressure thus bronga to bear upon the pounded kernets is not snffic great to express the whole of the oil, and there is atiil much waste."
Dr. Seemann's book, which owes its origin to the Majsion to Viti, undertaken by command of Hee Majesty's Government, will form a valuable contribur
tion to botanienl literature Of the Fivian or Vitian Florn tion to botanical literature. Of the Fijian or Vitian Monn litlle or notbing was previously known; but here we han not only the result of the author's own exploration but there are also included the materials accumaliat this country since Capt. Cook's first voyage wh South Seas, up to the more recent collection o Deutham, and Home. The whole of the plants of
Polynesia moreover, (from lat. \(30^{\circ} \mathrm{N}\). to \(30^{\circ} \mathrm{S}\).) hyve
 of this examination are prom ised to be forthcoming teat after. This Flora of Polynesia will incluade Belcher,

Part 19 has ap the mort Eighty maps have been constructed for it by our \(m\) an eminent geographers, with the latest discorerel Map emendations, including Murchison's Geological England and Wales, Lubbock's Star Maps, and capital Plans of London and Paris. In addition longitude of the principal places in the world maps are models of beautiful execution, all being skilfully engraved and carefully coloured. The plate) places it within the reacb of all gitudents of mint ever runk. The following maps tugether co this most valuable addition to our libraries:-
World on Mention do

We understand that Part \(\mathbf{3}\) of Mr . Bateman's beatifal "Monograph of Odontoglossum," which is in an advanced state of preparation, will contain 0 stellitum.

\section*{The \(\mathfrak{M p x a v y}\)}

IWAS a great unbeliever in the existence of Feryins WOBrers, but the case that I am now going to relate from my note book, for the beaefit of your readers, coms to prove that they do exist; but I should b ghod if some of your clever correspondents would interenting subject.
May 31, 1864, -No. 39 Stock. The young queen was Lignrian.
Jnne 3. I examined all the combs and saw the bean tiful queen, but \(\Omega\) s there were no drones in the hive, caught 200 as they came out of the old Ligurian stock, and put them down the bole at the top of No. 39 live.
June 17. Examined the combs and found no eggs in the hive, nor could I find the queen, now 17 days old. June 21. Examined the combs and found no egge nor queen iu the hive, but all the brood hatched.
June 24. Rxamined the combs and could find no eggs in the hive, nor any queen.
July 1. Examined ibe combs and found a few egga nd larve in worker cells in two combs, but none of them were sealed over; and some of the cells contained two or three eggs. I exsmined almost every bee, but
could not find any queen, or worker bees that I thought could hare laid the eggs.
July 7. Eramined the combs and found a few more egge laid in worker cells, and the bees had commenced Ing some over, but no queen was visible.
Jaly 9. Examined the combs and found some of th worker cells sealed over with droue covers; the rest of the brood consisted entirely of drones. I could not find any queer.
cells sealed namined the combs and found more worker of the cells contained covers, and more eggs laid; some five.
July 14. Examined the combs and found more drone queen sealed, and eggs laid, but could not find any queen. Having received some imported Ligurian locks, I took a frame out of one of them which son thined Ligurian eggs and brood, and put it into the hive Joly 16 .
Joly 16. Examined the hive and found the bees had commenced two royal cells on the Ligurian brood comb, a convincing proof that there is no queen in the royal cella.
July 18. Examined the hive and found seven royal July 23 . Fod on the Ligurian comb.

\section*{Garden Memoranda.}

Mr. Meredith'g, Ter Vineyard, Garston, mear Liverpool. - Who has not heard of Mr. Meredith, of bis magnificent Grapes, and of the prizes which they against a host of competitors, and in Parie, in addition to the Horticultural Society's Gold Medal as first prize, they received-enviable distinction-a Gold Medal from the Emperor, vaiue 20 guineas, while last season at the London shows they were honoured with no fewe than 11 first prizes! An account of the "Vineyard" from which such glorious productions enanate mus therefore necessarily possess unusual interest.
Eight years ago the ground on which Mr. Meredith' establishment stands was a Grass field, selected chiefly on account of its excellent position on by far the most
delightful side of Liverpool, from which it is screened by beautiful plantations, enriched with elegant villas, the residences of Merchant Princes of the great seaport Here Mr. Meredith began to erect his Graperies, which have been destined to show to an admiring public what the Vine can be induced to produce under skilfu years after planting the Vines, fruit was produced which obtained a first prize at Sydenbam; one of the buncher, a Black Hamburgh, shown on that occasion weighing 4ill lb. Soon after that the same Vines pro duced a bunch of the same useful variety of Grape weighing a trifle under \(6 \mathrm{lb} .!\) and more recently Chil of Hale, a promising seedling of Mr. Meredith's shown at Sydenham, weighed no less than \(8 \frac{1}{2} \mathrm{lbs}\), while three bunches of Black Hamburgh shown at the same place last September weighed together \(11 \frac{1}{4} \mathrm{lbs}\). Need
instances be cited further in illustration of the success of Mr. Meredith's practice?
As regards sspects, the best Grapes which Mr. Mere dith ever had were Black Hamburghs grown in house facing the east, where they received no sunshine after 1 o'clock in the day. On the other hand house with a west aspect, on which the sun did not begin to shine before 1 o'clock, furnished bunches of Black Hamburgh, Alicante, and Lady Downes, all excellent in their way; but not quite so perfect as those in the vinery just named. Even in a house facing the north, 117 ft . in length, and 19 ft . in width, glazed with rough plate glass, Black Barbarosaa, Lady Downes, Alicante, and Child of Hale have been produced, remarkable not only for large size, but for high colour and fine flavour These are all planted inside in a border made on the "piecemeal system," 2 feet 9 inches in width, and 3 feet in depth. This will therefore be widened as the roots increase in length. The Vines, being all young, were freely cat back last winter, and are this year puahing vigorously.
On a Vine trellis placed along the back of this house Mr. Meredith has had a capital crop of very late Grapes, consisting of Black Alicante and Lady Downes' Seedling in pots. These were started on the 14th January last year, and were ripe on the 1st of the following July. On the 1st of April last, fruit was cut from them in a comparatively excellent state of preservation, and shown at South Kensington, establishing the remarkable fact that, with proper care, Grapes will hang on the Vines ripe during a period of no less than nine months. These Vines have been allowed to rewain another yeur, in order to see what they will produce In this way a background, at once proitable and ornamental, is secured, aud that without any deteriora-
tion of the permanent Vines with which the house is tion of th
furnished
Concerning the warming of Vine borders Mr. Meredith has institated an experimental inquiry. In a house 128 feet in length and 17 feet in width, 80 feet of the border, which is elevated 3 feet above the pathway, has been heated by hot water in 4 -inch pipes laid in a hollow chamber below the soil; the rest of the border is not heated. The result, therefore, carefully observed and duly recorded, as it doubtless will be, cannot fail to be highly interesting. Other experiments relative to the same subject are also in progress here on a scale calculated the application of disputed question as borders is advantageous or not.
In the house just adverted to, most of the best varieties of Grapes in cultivation have been planted side by side in order to test their comparative merits, may be remarked that Mr. Meredith's place is essentially a vineyard where-

The amsrous Vine coils in a thousand sorts,"
and where multitades of young plants are raised and sold every year. Namberless pits and minor house are therefore devoted to crops of this descrip-
tion. Of Vines in pots ready for fruiting we obecrve an amaxing quautity. Which have, moreover, th advantage of possessing an unusually heallhy and rigorous parentage.
Mr. Meredith's houses are chiefly span-roofed, facing north and south, the Grapes on the former aspect ripeuing quite as eoon as those on the latter. They are efficiently heated by hot water, and ventilate both at top and bottom, the latter being so arranged that the air is compelled to pass over the pipen before it enters the house-an indispensable provision, eapreecialy long lengthe by mean of levers, no rapidly that a bouse 144 feet in length can be thoroughly ventilated in less minute, and so easily that the operation pleasure rather than a trouble to the nuerator. In short, to the facility and spred with which air can be
given to his houses Mr. Meredith attributeg much of given to his houses Mr. Meredith attrihutes much of
his success; the foliage, which is of the most ample description, thick and leathery, being without speck or blemish arising either from burning or other canses.
A house full of Grapes now colouring prounisen to prodnce some extraordiuary bunclies, distributed withs wonderful regularity over the whon of with leaves and fruis quite down to the moil. This house, which is spararoofed, is 65 ft . in length and 23 ft in width. The Vines are planted inside, Lat the roots pass into borders outside, raised a lirthe alone the
ordinary level of the surrounding around, sud coverat in winter with straw and glass to throw off superfluous wet or snow. Thus treated, a vigorous ront action is maintained, care being taken to keep the soil loose and poroue, so as not ouly to permit water freely to pervade t, but also air, Mr. Meredith's aim being alwnys to mitate natural conditions an much as possible. So impressed indeed is he with the importance of thi maxim that, contrary to usual custom, he does not even time, feeling certain that it not only serves in some measure to bhelter the stems from the burning rays of a sumumer sun shining fiercely throngh glaes, but thut it also keeps the stems damp by its retention of moisture A house of the same size as that last-named
What is destined, however, to be, and that at no distant date, the great feature of this place are two parallel span-roofed Vineries, each 144 feet, in lenzth and 26 feet in width, with a pathway 6 feet in hromith
ranning down the centres of them, both magnificent Graperies, equalled only by the great Conservatory at Chiswick, and which, when farnished with Vines lorded with fruit such as Mr. Meredith is justly ceechrated for, will be well worth a lengthened journey to see. One is olanted rith white Grapes, the other with black varieties-very young at present, but making a vigorous start. Surely such honses cannot fail not only to be
remunerative to their owner, but also highly instructive remunerative to their owner, but
to less fortunate Grape growers
Ripe Grapes may be had here all the year round new fruit and old not only "shaking hands," but keeping company for at least a month together. The first crops are furnished by Vines in pots, which yiel. fruit proportionately as fine as that from permauent Vines.

As respects borders, the materials of which they are composed are of the most ordinary description, consist ing merely of sound fibry loam, mixed with well rotted well supplied with liquid manure, wheuever its anplica tion is considered advisable. Varions depths have been tried by way of experiment, and all with equally good resulte The secret of Mr. Meredith's success fore does not lie so much in borders as in general good treatment

In addition to Grape growing, it may be mentioned that Mr. Meredith is a judicious and akilful hothous builder, the latter trade being forced upon hin by circumstances rather than selected from cloice. Noble men and gentlemen in his immediate neighbonrhood seeing what he had accomplished himself, naturally and rightls considered him the most capable person to effect what was wanted by themselves, and the result he has achiered in that way near Liverpool have been so satisfactory, that Vineries and other glass hon being erected under his superintendence in all parts of the country. From some of these houses most admirable Grapes have already been shown, and we not be surprised yet produce bunches if not superior at leas equal to Such a result fould only add increased brilliancy to the fame already earned by our great Grape grower.

Mr. Joun Watrere's Rhododrndrons.-These re now in great beauty not only at Bdyshot, but. also in the Royal Botanic Society's Garden, Regent Park, in which a charming exhibition of the very finest o these gay shrubs is submitted to public inspection. Among brilliant crimsons John Waterer atill sfands in the from rund may readily be picked out even at is of bloom with which it is surrounded. Other Crimsons similar to those mentioned last week at p. 487, are also abundant. Nereas, a lavender purple, with black blotels in the upper petals, is well worth notice on account of chod, dendrons. Among pure Whites, Chionoides is dendrons. Among pure Whites, but Mr. Waterer states that he has a new
seedling which in all respects ectipses it. This, how- desired to make large specimens in the shortest pos
ever, we dild not sep. Ainong others, Sidney Herbert, erimson; Jus \({ }^{\text {ph }}\) Whitworth, sputted lake; and Princess Ma-y of Car brilge, purple with a white eye, are Winderful arquisitions, as are also Mrso Jolin Penn, erimson, with light centre; the Earl of Shannon,
glowiug crimsnn; Annililator, scarlet, very bright and glowing crinsnu; Annililator, scarlet, very bright and
late; and Mrs. Fitzserald, dazzling rosy crimson. Madame Carvallio is also well worth attention, as is likpwise Faust, a light coloured variety, spotted in the upper petals with orange. The cullection is, moreover, charming kiuds in the way of Fleur de Marie, Concessing, Byloianum, and others of that beantiful class. A nong large standards is a magnificent plant of that favourite Khodedendron, Lady Eleanor Catheart. Nutwithstanding \(13^{\circ}\) of frost, which are said to have been experienced at Bagshot on the night of April 30, this expribition is all that conld be desired. The plants have, however, puslied into bloom so unusually snon this
season, that Monday next, the duy specially fixed by season, that Monday next, the dyy pecially fised by the suciety for their exhibition, should not be
by any who expect to find them in perfection.

\section*{Miscellaneous.}

\section*{The Tine in Australice. -For upwards of 30 years} past vineyards have been carefully nurtured and multiplied. No portion of this extensive region as yet under tillige has been found inimical to their
culture; and whilat the future is highly promising, as culture; and whilst the fuiure is highly pronising, as
well for Victoria as both South and West Australia, the surcess alrenly achieved spems mainly due to the earlier operations of thie elder settlement of Syhney, distant Albury the finest vineyards abonnd, whose productive powers appear to be very constiderable. At the furwor place there is a thriving plantation belonging
to Mr. Z minerinan, ulamut an acre and a quater in to Mr. Z manerman, ahnut an acre and a quarter in
ex'ent. It is well manajed, and cultivated like a trim garilen. In the season ot 1863 he cut for tahle use
froun 200 three year ohd Viney froun 200 three-yedr ohd Vinesy no less than 1600 l . of
the fineat Grapus; and us he gets an excellent price on the spos for all the wine he c.11 make, the pruceeds of this small estate amply suffice for the compfortable manteudnce of himself aud family. planting in Adelaide has attained to very respectable dimensions, and the area of chltivation is still annually
on the increase. From an oflcial return made to the local legislature, we learn that the land under this class of culture in March 1862 was no less than 3918 acres the number of Vines in actual bearing, 2,361,574: and the quantity of wine made in the season of 1860-61 is so to extend on every side, that the Grape now ranks next to Wheat in importance. The main impediment to an equally progressive advance in yuality is ascribed to the ract, that the demand is so qetive, there is no breter propertiea fully developed. The fecundity of the Vine in Australid. under favourathle circumstances, is working of many intivilual cases. For instance: at plot of 4.1 situate at a short distance from Adelaide, a plot of \(4 \frac{1}{\frac{1}{2} \text { acres was planterd in 1852. Thuse Vines }}\) yielled in the harvest of 1858 an average of 800 guthe to the acre: and of such a quality as, at 20 mouthen to command a ready sale at 7 s. per gallon. On the Fairtord estate, near the river 'sturt, within eight miles acres, which was planted so recently as 1859 . The soil here in a stiffish luan resting on a clay.slate formation. The Vines were trained on stakes to standards, the stems being carried 18 inches trom the ground. In 1000 gallons of wine were oblained, remarkable fur boch richness and delicacy of fldvour. And if we may a Vinery of two seres only on the master of Oaklands, river, unll about two miles nearer Adelaide, brought him 5130 gallons of wise, pure juice of the Grape aganat 4000 gall ns in the previous year of 1861 . This for the most part being an or 13 years ago, the soi depth, with a substratum of rel clay aud limestone ; growth. Denman's Vine and its Fighit

\section*{Calendar of Operations.}

\section*{(For the ensuing veek.)}

To preserve plauts in flower as loug as possible is at all times a matter of the utmost importance. Therethey shuuid be renoved to a cooler atmosphere than that in which they have been grown, and carefully shaded from glaring sunshine. To counteract the drying effects of hot currents of air, which are nuavoidable in sumoner, the air of the house should be kept moitt by frequently spriukling all available surfaces mode of proceeding must he purened a directly opposite injarious, and proceding must be pursued: moisture is then planions, shoud must be carefuly avoiled; and the full and free circalation of air aunongst them. Let no
blossous ret energies of a planter they fade, and never allow the uuless it is positively requirest. Planter of producing seed
sible time, should not be allowed to produce flowers until they have attained the desired size. All specimen plazts should have plenty of roour, and should be occasionally turned round, in order to prevent their growing one-sided.

\section*{flower garden and plant houses.}

Among gay shruios now in flower out of doors, few are more beautiful than the Pyracantha, which is every where this season unusually full of blossom, and in autumn its rich coral-coloured fruit is equally ornainental. For walls or for masses on lawns, or for the decoration of the background of rockwork, this plant is equally valuable. As plants in beds progress, some will require pegging down, and others tying up. Iu performing the first of these operations, the poiuts o: the leading shoots should be turned towards the north, as the young laterals will be drawn hy the light towards the other points of the compass, and by this means the beds will appear well filled from all sides. All young plants will be considerably benefited by stirring the soil between them, especially when it has been calked over by rain. which must be constantly kept in check at this веавоз.
Asters.-Shift any that may require more room into larger pots, and others may now be pricked out into open beds, protecting them, if possible, from cold wiuds until they get somewhat established.
Azaleas.- Where these have been forced for the purpose of producing an early winter bloom, they
should now be placed in a cooler situation, for if left should now be placed in a cooler situation, for if left
too long after they have set their flower buds, in a high artificial tetuperature, they will, in all probabilits, make a second growth, which is bighly detrimental, not fatal, to the production of next ye.r's bloom. Ellourage a free growth in the young stock, and all plants going out of flawer, by placiug them in a rather high and moist atmosphere.
Cnyerarias - A litt'e shade during the middle of
the day will be necessary in order to prolong the senson of flowering. Weak liquid manure may be given liberally, say two or three times a week. Louk well to seedlings, placing promising kinds apart from the nore common sorts for se d.
Dablias. - No exertion must be spared to promote the growth of these plants, for the queker the growth
the finer the flowers. Let the ground between the plants be forked over occasionally, and in dry weather do not spare the watering pot.
Fuchiras.-Keep these plants well watered, and shaded during bright sunshine. Late-flowering plants should receive a shift when required.

\section*{FORCING GARDEN.}

Melons. - Encourage those newly planted out with a moist warm atmosphere, so as to get them into full growth as quickly as possible; but plants that are eatablished should be kept cooler, adinitting air on
overy fivourable opportuuity, in order to secure short every favourable opportunity, in order to secure short-
jointed fruitful growth. Keep the shoots thin and regular, pinching out any that are not wanted, but avoid stopping the main shoots until they reach the sides of the pit, when by piacling out the points the laterals will start into growth and show fruit abun-
dantly; and by this time the plants will have gained sufficient strength to set and carry a fair crop. Do not exceed \(65^{\circ}\) at night, and admit air when the thermonmeter rises to \(75^{\circ}\), but do this very carefully on cold days. Endeavour to maintain a steady bottomheat of about \(80^{\circ}\), and keep the soil in a healthy state as to motsture. See to providing young plants for purcession crops.
Pinra.-Plants just showing or swelling their fruit will be cousiderably benefited by receiving liquid manure every alternate watering till the fruit begius to ripen. If the plants, which are just on the point of showing, are in pots, it will be an advantage to shift them immediately into larger ones ; to top-dress them with some rich turfy loam, or to turn them out entirely into the snil, which is by far the most preferable method. Where the pot system is pursued, many of the plants, especially of the young stock, will require repntting, and at this time they should receive a large shift, as their most active growing season is now approaching. After potting, a closer and moister atmosphere musti be kept up for a few days, till they begin
to root into the new soil. No plant stands in greater need of shading during bright sunshine thin the Pineapple; but as it is not only unnecessary, but injurious in dull weather, the canvas should be so adjusted, by means of rollers, that it cau be applied or removed at pleasure.
Vines.-If the fruit is all cut in the earliest house, warm iues should again be treated with a moderately warm atmosphere, and syringed daily, to destroy insecte, and to keep the toliage in a healthy state as recruit possible, that they may have every means of recruiting their energies for next senson. At the same time give liquid manure to the roote if they require their strength after having been forced at an unseason able period.
hardy frutt and kitchen garden
Birds and insect; both of which are now very actively at work, uut be kept in check. Oll spare
roots of Carrots or Parsnips may be turned to good
account by plant ng them in beds inferted with mimp
worma ; these will attract the und, if daily examined, whll in time clear the ground
of this nuisance. Broccolt.-So
Broccolt.-Sow now some good white kiad
supply the table during Octoher and also a little more of Kuight's Protecting, aud a sprint ling of some very late spring Brocecting. aud a spriut. Crlert. - These musi thering.
Those pricked out from the seed bed shine of mater. prepared beds, the surface of which, for 2 iuchave me should consist of well-rotted manure, soaked dees water, and rolled or pressed level pievious to pricking out the plants. If the weather proves sunng thef
should be shaded with boughe Stramberries - If bougha
beds and borders of these should now be the soil covered with so we clean material, for the double or pose of keeping the fruit free from dirt in wet weation and of preventing excessive evaporation in a dry o parching summer. Before angthing is put on the ground, however, it should be loosened with a for between the rows, and watered with liquid manure,

Wherenpon Mr. Hope replies, disclaiming alto gether the ridioulous idea of intimidation. It is however no flattery to bay that Liemig's opinion carries greater weight thau that of any other man alive on such a question as the present, and for this reason they cunnot pass over his opmosition in silence. Were the mattor a mere scientific discussion they would not care to put pressure upon him, and would abstain most carelully from every expression that could cause hin annoyance ; but it is a matter of butiness, in whioh they have expeuded a very large sum of money, and they must proteot their own intereats.
"If, therefore," sajs Mr. Hopw, "yna still lend the weight of your name to statements festructive of our ochene and at varlance with the facts, und refuse to give us a fuir chance of either convertitg jou (uut from your own chemical thaories, but from your erronenus views as to the Craigentinny Saude, and as to the - peration pmposed by our schome), or of proving froulu your own evidence in crosesamination, that your opinions upon our scheme are founded upon hearany evidence, sud are therefore valuelese, I say that wo murt, ill self-defence, do our utinost to destroy chat ruputation which indues poople to accept, withort quertion, as fracts, statements which are wholly devoid of any formilation, and I thiak it only right to add llast such is the love of fair play in this country, that we shall make the attempt with every chance of succeas."
In his reply Liebig calls attention to his past labours in connection with the utilisation of town se aige. The subject is no of publio interest, and his opposition to the Essex soheme has had no persoual motive. He adds :-
"Besides, no croweramination, so sou toom to tappowe, grases can be producod in pure soa-sand manured with sowage water; for do what you will, Soienose atar alt, cun only pro annce a judzanent th harmony with the lawn

> - II pro told a [to, flituring tale

The pamplifet wheh contains this correspondence opens with a communication from Baron Liebig to the Lord Maror upon the critique whech his nrevious lelters had received in a pamphiet addressed to S:r Joun Thwaites by Messrs. Napier and Hope before they came befure Parliament with their scheme. We refer to this communication only for the purpose of quoting a single sentence, which seems to us entirely characteristic of the writer. "The law of Nature," sags Liebia, "will alwass prevail, and outweigh the experience of practioal men." We veuture, with submission, to declare that this, as it stands, cinveys an egregious and most unphilosophical fillacy. "The luw of Nature" is a mere abstract ufference, often drawn from insdequate, and alw tys from imperfect information-" the experience of pratioal men" is fuet. We all koow that the course of eveuts is uaiform, and that the facts which accurate observers liave recurded d. constitute or indicate a law. Nevertheless, faith in this law supposes and must fullow faith in the facts in ividually on which the idea of lat is bult. Aud the right way to express the truth would rather be to say:- The law of Nature will prepail, but can never outweigh the experience of pratiual men." Let us trust to the facts of the practical man, it fur no other resoin, becanse on them are bult che "natural laws" of the scientitic min. There is neither phil sophy nor commun sease in setting the one against the other. We must credit that
which is indicated by our senses; and the prastioal man who deals with faots is not likely to be put down by the man of science who deals with the relations which he perceives amongst them. The latter may declare that science can after all only pronounce judgment in harmony with the laws of Nature; the former knows very well that Nature except that which is in accordance with those "facts" in which clever men believe that they read her laws.

The Society of Arts have issued a valuable report on the Cottage question, which has for many weeks been the sabject of discussion before a large committee of their number, whose names have been long before the public for their public-spirited and intelligent services in conneotion with this subject.
They have not thought it necessary to colleot focts to establish the unfitness of the greater part of the dwellings of the labouring classes as habitations for respeotable and well-conducted families, or to prove that the excessive overcrowding which now exists in such dwellings promotes crime and immorality, harbours disease, and materially lessens the effective power of the working-classes, by iojuring their health and shortening the duraon of their lives.
Nor was it considered necessary to inquire into the effect produced by these badly-construeted, ill-ventilated dweilings on the poor-rates, or into the amount of discontent which the admitted want of proper dwellings creates in the minds of the working olasees. Considering these facts as fully established, the Committoe have discussed the following points:-
(1.) The causes which sppear to retard the erection of proper house accommoodaction, and the improvement of oxisting
bouson, for tue working classes in town and country. bousen, for the working classes in town and country.
(e. The operation of inperial and local taxation on such
dwelling ; and the expediency of relieving them from all or a
portion portion of suche taxation.
(3). The effect of the inw of settlement and removal of the

It is with reference to only some of these points that we call attention to the comelusion at which it is declared that the question of charging the relief of the poor on the quastion of charging the one which peculiarly affects the building of cottages in the country. The present system has long been found one of the greatest obstacles to the proper
accommodation of labourers on the estates on which accommodation of labourers on the estates on which they work; and the Committee were prepared to recommend an amendment of the law by the parish to the union. The same views on this important question have been, however, generaliy recugnised by the Legislature, and they are likely to be carried into operation by the Bill now before Parliament. The Committee confidently expect
that many good results will follow from the that many good results

With this exception most of the topics which come under the attention of the Committee affect rather working men in towns than rural labourers, and we do not, therefure, quote at length those paragraphs in the report which relate to demolition of houses by railways, to workmen's trains, and to enforcing the sanitary laws. The fullowing shortly are the results of their deliberations. They recom-
1. That corporations, limitod owners, dec, should have in
creased power to soll land for the erection of dwellings for creased power to soli land for the erection on dwellings for and asantary regulations.
to fend money, at a rate nommissionera should be authorised for building dwellings for the labouring clinses, under suitablo cuarantees and with due regard to sonitary arrangements. 3e. That in all future railway aets, and acts for local 1 uprove-
ments. When houses inhabited by the working clases are

without the consent of the Privy Council, and that the amount of their salaries should be subject to the approval of the same anthrity.
That houses in which lodgers are taken, especially where
particular rooms in a house are over-crowded, should be particular rooms in a house are over-cro
brought under more efficieut ingpection.

We understand that the metropolis is to be provided with another Veterinary College, to be established at Chelsea. The following is an extract from its prospectus :-
"A preliminary contract has been concluded for one of the most desirable sites in the West-end of London, adjnining the new Chelsea Barracks, facing the gardens of Chelsea Hospital, situated about a mile from Hyde Park Coruer, and in the immediate prozimity of Belgravia.
"The great wear and tear amongst horses in the metropolis, their increasing value and number, and the enhanced price of cattle, sheep, and other domestic quadrupeds, for our rapidly increasing population, render it of paramourt importance that no effort should be "spared to secure the most approved mode of veterinary teaching and practice.

The number of Veterinary Surgeons in the United Kingdom is lamentably deficient; though this country possesses the finest animals in the world, there are most parts of Europe.
" Notwithstanding the far greater value of stock in England than in France, we find that the whole of her Majesty's possessions have less than 1500 Veterinarians ongaged in their profession, whereas France alone, without her dependencies, has upwards of 3000 .
"Owing to the great desideratum of a course of scientific education for agriculturists in the metropolis, arrangements have been made on the plan which has worked so successfully in Paris and elsewhere, of combining a coarse of agriculture with the curricalum of veterinary studies.

The Committee have great pleasure in announcirg that they have for this purpose secured the services of a gentleman so eminent in the department of agricultural education as Prof. Coleman, late of the Royal Agricultural College, Cirencester.
pursuits, whether in that many interested in farming where, will avail themselves of the great privileges thus afforded them, preparatory to or after a course of practical training in the ceuntry, and no effort will be spared to render the agricultural curriculum complete in all particulars,"
It is extremely probable that a course of lectures such as Professor Coleman is well qualified to deliver on the Practice and Theory of Agriculture, will be acceptable to a large number who come to London as students of those sciences with whioh agriculture is especially connected. In Edinburgh a large proportion of the University agricultural class are students of law, to whom a general knowledge of agriculture is important; and we cordially hope that Professor Coleman's lectures will be attended by many besides the regular body of veterinary students for whom the New College is especially designed.

The Stettin Show last week appears to
have been less satisfactory on the score of business transacted than previous Continental meetings have been to Euglish exhibitors. Lords WalsingHam and Sondes took the first and second prizes for Southdown Sheep; Mr. Taylor, of Somersetshire, showed Devon bulls; and Mr. Cerisp, of Butleigh Abbey, took prizes for Short-horns, Suffolk Horses, and Pigs. The Einglish Implement makers were in considerable force, and received medals for the machinery exhibited.
Messrs. R. Hornsby \& Sons received a Gold Medal for their
threshing machine and engine ; and Silver Medala were awarded

\section*{AGRICULTURAL EDUCATION.}

There is an admitted difficulty in inducing people to attend general meetings. What is everybody's business is nobody's business, and unless a man has some very special duty to himself to perform, the roatine proceedings of the day are apt to be left a good deal in the hands of the executive. To be sure, an organised body of dissentients will now and then combine to reject \& report, or dismiss a drector; but agriculturists, as rule, are not famous for organisation or combination and the attendance at the annual gathering in Hanover Square on Mndiay last was very fairly coustituted. present as usual ; and, consequently, any one speancil present as usual; and, consequently, any one sparking
from the ouside, as it were, had the greater opportunity of carrying his audience with hun. But bortuthis, there was clearly a better spirit observable, and a
liberty" when he ventures looked upon as "tatio a heir course of action to an assem offer an opinion as? Even Mr. Dyke Acland could hear tho his own frlisen an agricultural association out at nurse to the of \(l^{2}\)
sities questioned without at sities questioned without at once ri-ing to retpon remarkable for his absence, as the Presidesn some further experience, has come to a faritent, interpretation of the functions to be discharged
the chair. There is, however, even yet stronger the weight which will come to be attachonger prow discussion on the position of the Royal tus Society. Mr. Morton maintained that the Committee had made a mistake, and that tioned as might be their labours, they har which they were acting Upon of the institut which they were acting. Upon a division, eleven otom
members of the Society were found to be opinion, against sixteen who gave their the support to the Report. Still a dozen or so can be easily whipped up, and Mr. Morton mar brought in with him a few country friends in Berkshire, or some literary acquaintance in fiend sut readily have made up a respectable show of But it was not so, as we do not believe that Mr. II
had gone out of his way to canvass a single had gone out of his way to canvass a single innin in th
room, while at least a good ly half of his very mem minority was composed of members of Council. Amonm those who voted against the Report of the Edom Commaittee was Mr. Holland,
chairman of that committee; Lord Fevershan, the President of the Society ; Lord Tredegar, the Preid elect of the Society; the Honourable (ieneral the Cbairman of the Finance Committee ; Mrr Prim Hobbs, a Vice-President of the Society, who mor said more than any other member farmers on the Council; and Professor Wilion made agricultural education one of his particula ettadi If Mr. Morton required any warrant foe the conre is has adopted, he need only refer to this division liat show how many good men go with him. Conspicu on the other side was Mr. Edmunds, of Rugbr, wilu as at the Farmers' Club, spuke at some length anj with some ability on the advantages of a gener interest ; but, still atterly oblivious of ad interest he was addressing. His remarks and delos
tions would have come equally well or far bevr before a company of country schoolmasters, special meeting of the Society of Arts, as in an a semblage of agriculturists they were lamentably deficieco in application. Of course, everybody in these times in becoming alive to the necessity of a good sound loond tion, and the farmers, we believe, not leas than ther neighborrs; while surely the aim of a class insticutie should be to point this good grounding to the sctal business of life. Let the Royal Agricullural Socie: take up the lad when the schoolmaster has done wi him, only previously prompting the direction of
studies by the rewards held out for proficienc! studies by the rewards held out for proficiency
certain pursuits. Mr. Acland, it will be fons offered some hypercritical objections to the word pro fessional as introduced by Mr. Morton in his amen ment. Conveutionally, no doubt, "a profession." on Divinity a time, never descended in its dignity bunes Divinity, Physic, or Law; but a professioual educt in these days means simply no more and no less the or his positi) may lead him to adopt. Engineeniz Literature, the Arts and Sciences are all come to as Professions, and with these we m
Fow include the art of Agriculture.
For our own part we regard Mr. Morton's minonity as a majority; so little do we expect to see follorim the plan recommended by the Education Commitw so much does it read like a way how not to to it thi so slowly does the country promise to take to in the schems must die out of sheer inanity. its fate for the present appears to be sen in and correspondent, whose letter will be found
part of the paper, says:-" It is much to be that the effort made by the Royal Agricultu to promote sound education among young those who inoperative for the the Oxford exa are concerned. The examination takes p nonth, and students desirous of c mpeting gis sent in their names some weeks ago

\section*{C)TTESWOLD SHEEP.-NO. IV}
perbins the dispersion of this breed of sheep and their wool orer the civilised part of the globe, done too without the aid of atee of their value. Success, part:cu\(s\) the best guarautee of case, is the test of merit, for iustead of arly forced before the public, the public have had to of the greatest value in showing the importance of of cotteculd sheep, we cannot offer stronger proof than thin fact of their gradual inroads into other parts. Before the Cotteswolds were as much appreciated The practice was to offer them privately for sale or tire As the demand increased, sales at home by neil the trade in these sheep has so largely increased is to reader it more convenient to adopt the more buniness srstem of bringing them to market; iudeed, - 0 much has the latter plan taken with both buyers and sellers, that at one market several hundred were
The commencement of the ram selling begins about tho latter part of July, and for about three weeks the eales at home, sometimes at various places, two or three a day, continue daily.
If would be difficult to guess the number of these nms annually raised, but judging fraguely they must c.mber sereral thousands.

Formeriy these Cotteswolds were considered merely a local breed of sheep. Now, however, they have permeated through almost every county in England, countries, even so far as the antipodes; for in New Yealand there are established flocks of Cotteswold sheep 'رteswolds, and has ber established flocks. America hasestablished flocks of Cotteswolds under the patronage Standford Howard, Esq., of Boston, and Mr. Southam; whilst in Canaila Mr. Stove Guelph, Canada West, has cralia, Sweden, Germany, the Cape of Good Hope,
Ireland, Scotland, Valparaiso, the Cotteswolds Btand ia good repute. In England, within a few years, rolds been introduced to a surprising extent. In ilamorgansbire, Mr. Thomas, of St. Hilary, has had in established flock of Cotteswolds for more than owlands in this county that other breeds of sheep are the exception, Herefordshire, too, has very exten. sively adopted Cotteswolds, and amongst others the
tlock of Mr. John Wigmore, of Penyard Ross, stands conspicuous, Norfolk, again, has its established flocks Aylmer, of Dereham.
lerhaps, however, no other circumstance will show the estamation in which the Cotteswold sheep are held for use in other districts so much as the returns of those who sell them, and therefore we give a return
of those sold, from information obtained from Mr. Sellar, the extensive auctioneer of Cheltenham, last season. From this return we gather that for the Cotteswold rams, and these averaged 10l. 13s. 6 d . six counties and countries. This return represents the rusiness done by only one auctioneer, and had we been 0 fortunate as to get returns from other salesmen, oubtless the wide-spread use of these sheep would The use of the apparent.
The use of these sheep in other districts and toy popular caprice, montioned, has not resulted from neilitier blazoned before the public by the press, uristo have they been trumpeted before the agriculcheir success has depended entirely upon their own therent value.
The principal use of them in other districts they stand preeminent, as their undoubted purity of reater enables sheep breeders to calculate with the Cottesmold blood the results of a mixture of the \({ }^{3}\). of great consequence now that we have breeds of lescriptions. It bas been alleged that the Cotteswold

Since Mr. Ed steam cultivation, nearly all the feuces are adopted and therefore it is nearly all the fences are removed, purposeanswer admirably the Cotteswolds for this The use of the admirably.
every possible differenceold sheep so widely and under adaptability for ang and valuable as showing their to such causes as these that we attribute the success
of the Cotteswolds iustrating the effect of soil and climate as it affects
may mention from two authenticated cabes the altera
tion which soil or climate makes.
The one is a case where a Cotteswold sheep was taken as an experiment into Lincolushire, to cross with
that valuable breed the Lincolng. At the time he was somewhat close in the wool, and of course withous that peculiarity in the wool-the lustre. After this sheep had been in Lincolushire for about 12 months, he had acquired the lustre for which the Lincolus are so celebrated, and his wool instead of being thick and close had become long, open, and curly. Another instance we note is that of Linculas being brought un the Cotteswold Hills by a gentleman who came from Lincolnshire to farm a Cotteswold farm. He brought a flock of well-bred Lincolns with him, which had long, open, and curly wool, and full of lustre. However, in a short time the lustre left the wool, aud the wool became close and thick on the Lincolns-just the reverse of what occurred with the Cotteswolds when sent into Lincolushire.
This shows the effeet of soil or climate on the growth of wool, besides which the general appearauce had become chauged. It is so, perhaps, in every breed or variety of sheep, that the circumstauces of soil, climate, and management make sheep of the same ureed most unlike each other; yet, notwithstanding such changes, the returns from the Cotteswolds would, it is presumed, be satisfactory, or their extensive use would not have taken place. Still, although the triumph of the Cotteswolds in most districts is complete, yet we find in scarcely any of the established
breeds of Cotteswolds, but that occasionally Cotteswohi sheep from their native flocks are taken for use, and the distance from which customers come to purchase
native-bred Cotteswolds attests the importance attached to the use of those from the original stock.

We have endeavoured to give an account of the dis. persion of the sheep, but an account of the wool and its manufacture is scarcely less interesting. From thelength and strength of the staple, Cotteswold, in common with the wool from other long-woolled breeds of sheep, is used for what is known as "worsted goods," a term used to distinguish the goods it makes from the woollen cloth
trade; the former being combed, aud not a milled or trade; the former being combec, aud not a milled or not combed, but " milled" or felted. Strictly speaking. there is no "felted" material made, except such as bats, caps, \&c., which are made without spinning or wool, which is spun and woven, and afterwards "milled." The power possessed by the long wools to form a felt is much less than that of the short wool, because there are fewer serrations in it. The "coombere wealthy flake" consists entirely of wool from the longgoods, consisting of "damasks, cobourgs, camlets, goods, consisting of a damasks, cobourgs, canleta shades of colours for ladies' dresses for home consumpion and for export to France, Germany, North an South America, and the West Indies. It is used largely for making camlets, of which the Chinese and Japanese take a very large quantity. In fact the worsted goods go to all parts of the globe, the inferior parts being made into carpets, rugs, and blankets. Hallewell.
James, in his History of the Worsted Manufactures of England, informs us that the markets abroad for worsted goods are more numerous and widely dispersed than for woollen cloth; therefore it seems the
long-wool grower, in case one market becomes depressed, has other markets requiring the goods his wool makes, consequently there is no chance of this
class of goods wanting a market. Indeed, the fact that such a demand exists and is likely to continue, together with the circumstance that the supply of long wool has been so short as to become of greater value than the short wool, inspires the long reasonable hopes that the long-woolled sheep are likely,
for their wool especially, to give permanently remunerafor their woo
We have thus, imperfectly we fear, given some particulars of one of the oldest, and, we think, the most valuable sheep of this country; having traced them rom the time of Tacitus to all parts of the world, and heir wool to some of the least civilised part of its inhabitants-the Japanese. J. M. R.

\section*{THE AMERICAN CHEESE FACTORY.}

We extract the following particulars from the Trausactions just received

Cheese factory associations are organised in neigh"Whoods of 10 or a dozen or more farmern.
When it is proposed to start a tactory, several persons who are neighbours to each other get together
and talk over the matter among themselves. If enough are found willing to turn in ther dairies together, so as to make a fair start (say 300 cown), a committee is appointed to look further into the matter, to visit factories, and get all the information on the subject that can be had. A favourable report from the com-
mittee being had, they then organise, choose directors, of adopt some general ruies or plan for the guidance of the association. The next step will be the selection and the place for the ereestion of tha as superintendent, Generally
buhldngs on his own sccount, and to manufacture and tabe care of the cheese at a fixed price per pound,
demanding a contract on the part of the farmera to furwish the mils of the requisite number of cows for a certain number of yeurs.

The milk of about 400 cows, it is believed, is the smallest quantity that can be emploged by the manufacturer (when cheese making is his sole business), in order to ubtain a fair living compeusation for services, while the milk of a thousand cows can be mauufactured at but little extra expense comparatively.

In choosing the place for the erection of the factory buildings, two requisites are songht-grod water and convenience as to access and distance for the dairiea furnishing the milk. The site, above all, bhould command an abusdance of pure spring water. This regarded by those who have had longest experience at the business as imperative.
Even in fanily checse making a considerable quantity of water 18 needed in various ways about the dairy, for cooling milik, cooking the curd and keeping the utensila and buildings clean and aweet; but for the factory the quantity of water should be abundant and unfailing. It is usual to have a constierable stream of water passing under the manufacturing room, so ns to carry off the drippings of whey and retuse slop, so that there be no accumulation of filth or taint of acidity hanging about the promises. Where whey and slon are allowed
to collect from day to duy about the milk room, the stench at times becomes intolerable, and must do great danage to the milk, whach absorbs taints of every character with great rendiness. Hence means must bo taken to liave all the refuse matter swept beyond the reach of the premises.
"Some factories aro being built where dependence or water is placed upon wells of large onpacity, but chese are as yet experiments to be tried. At all events, it will be seen that much more labour will be required,
with greater liability to taints, than where spring water, passing in a considerable stream under the kuilding, can be had."
"Within a brief period several corporations have been formed for maling cheene under the genersl manufacturing law of New Fork. The atock is divided into small shares, and generally distributed as much an may be among the dairymen of the neighbourhood,
with a view of creating a general desire for the success of the institution, and enlisting efforts to secure patrounge.
"The concerns of the association are mauaged by a board of trustees or directors; the stockholders having no direct voice in the management, beyond the anual election of the trustees. The trastces appoint ne of their number president; elect a secretary and treasurer, and form committees to look after the diferent interests of the company. A superintendent
employed to direct the manufacturing and curing operations.

The actual cost of conducting the company's business is charged to the patrons in a general account. with a percentage on the amount of capital stock sufficient to pay interest on the investment and cover the wear and decay of fixtures.
"In this account credits are given for all moneys received for cheese, whey, or other produce, and the balance apportioned among the dairymen according to the amount of milk furnished by each. The interest and any surplus of the percentage that may not
necessary for repairs, are divided upon the shares of stock. It is yet to be determined whether this be
be more successful and satisfactory method of conducting the business, and whether the division of
duchers responsibility will result in want of proper care in management.

In view of the very general inclination among dairymen to avail themselves of the advanteges of the factory system of manufacturing cheese, it is thought a they are conducted would likely interest many of those whom this report may reach.
"Originally the milk received at the pioneer factory was wholly purchased by the manufacturers, it being estimated and paid for by the amount of curd it produced when pressed.
"This pian failed to give entire satisfaction to the dairymen, because of differences nf opiniou upon its prospective value in the fall market, but furnished sufficient data for determining every item of expense attending the manufacture, and for deducing the cardinal features of the commission method.
- Hence the dairymen were left to accept a price for their milk or curd which the manufacturers felt safe in offering, or allow them one dollar per cwt. © cheese manufactured and the whey, for performing the work of making, curing, preparing for market, selling the cheese, receiving and disbursing the moneys; the dairymen paying

Tho methods were practised together, each having about an equal number of adberents for a few years, the latter however gradually growing in favour, until it has become the general rule among the odder factories. In some instances slight variations in the detall of the original terms have been made."
The following is the report of a comparatively small cheese factory of the kind at "King Settlement, under the management of Mr. N. Leach.
"King Settlement Cheese Factory-Cominenced nperations on the 14th day of May, 1863, and closed November 10th-191 days.

\section*{Home Correspondence.}

Agricullural Education Essential to Agricultural Improvements.-I have read over the statements in reference to agricultural education that appeared in the Agricultural Gazette of last week, with great interest. The English farmer occupies a very different at the market and also in the field, to what he did a few years ago. To occupy the position that his calling entitles him to, his education must keep pace with that of others that he may have to do with; and indeed, when looking into the future agricultural improvements that will shortly take place throughout the country, it is necessary that there should be a corresponding importance attached to the further enlightenment of the class of men who have to set in motion these several and important improvements The first and most important object with every farmer siould be to increase the produce of the soil he occu-
pies, injury, by being for too long a time exposed to the weather in our uncertain climate. Then, to effect these desirable objects, and at the same time to diminish the labour expenses, there must be a greater amount of activity and despatch in the performance of the different operations on the farm; and to effect this, the power must be nearer to the objects it has to operate upon. The arable land should be together, and as near as possible to the farmstead, with a good road passing through it. The steam-power should be hired to perform the heavy portion of the cultivation of he soil, and also to thresh and prepare the produce both for the market and also for the stack Then, again, the pasture land intended for mowing hou'd also be open and free from high hedges, and as near as possible to the farm, drained and levelled that the mowing machine may work to the best advantage; the off-lying portion of the land should be in permanen pasture for grazing purposes. Had the agricultural mind been more directed to these important matters years ago, the present farming improvements in this country would be in a more advanced and satisfac. tory state than they now are. B. Ransley, Perrysfield Furm, Oxted, Surrey, May 27.

\section*{Eacietieg.}

Royal Agricultural of Yreland: May 25. At the Monthly Meeting of the Council a communication was received from Lord Donoughmore, intimating his willingness to accept the office of President of the Society for the ensuing year.
It was moved that a Committee be appointed to ascertain whether or not it would be advisable to hold a Show in Dublin next year, and report thereon to the next meeting of Council.

A letter was received from the Secretary of the Tip. perary Furming Society, relative to a distemper at present raging among swine in that county.
The Chairirans said it was the legitimate business of the Council to attend to such matters as that.
Lord De Vesci said the cases must be numerous and bad when the Secretary of the Farming Society called time attention to them. In a case of this kind no an should be lost; for they did not know the moment an epidemic of this kind might spread over the country.
He would propose that Mr. Ferguson should endeavour He would propose that Mr. Ferguson should endeavour
to find cases in Dublin, but if he did not within say three days, then Captain Thornhill should communicate with the Secretary of the Tipperary Farming Society, requesting him to have cases tor Mr. Ferguson's observation, and, on getting that, he should at once go down to Tipperary.
The resolution was then formally put and carried.
Implements at Exhibitions.-Sir Percy Nugen moved "that no agricultural or other implement or machine, having obtained a prize from this Society, can, without material alteration or improvement, compete again at the shows of this Society for a similiar prize." re was alvays of the same opinion with regard to standard cows and standard bulls exhibited at the
Shows of the Society. Once they obtained a prize, that was sufficient for their purpose. In the same way with regard to agricultural implements, no more moriey should be thrown away on them except some visible improvement should take place in their formation. He matter moved that the Council should take the what was the result, he believed that opening a discussion on the sibject, and ventilating the entire thing, would have the effect of preventing persons sending in the same machine for competition year after year.
onn cr said be had come to a very different and, although it was a question of commo sent, inclined to think the common sense was the other way. If they gave a prize for any implement, their ohject, he he did not see how they could they could get. Now, prize for the best impley could rerrain from giving a next time if it was the best that was exhibited in the yard. Suppose a man produced the best implement were they to strike h. him next year, althe hor the list and scratch inferior? Why, if they did that, they might be and give a prize year alter year for a they might go on
were all so bad they would be obliged to say thas! appeared to him to be common seuse t prize at all. the best machine. If they adopted such a give a priza that, they would at last be giving prizes to what contessedly the worst, so that the best machine mate would not come near them. It would, therefore, ben very dangerous abstract principle to affirm, and be prejudicial to the Society to carry out.
fallen from Lord Clonbrock. agreed with what pion who held the belt had a right to thought the chas was beaten.
Lord Clonbrock esnceived that it woald absurdity to give a vrize to an implement when it They would be giving prizes to confessed existema implements, when every person in the world ly infer was a better one in existence.

\section*{Labourers' Dwellings.}

Captain Vesey brought up the report from the or thate on labourers \({ }^{\text {a }}\) dwelings, from which it that after inspection of cottages in Leinster and \(C\) and Lord Clancarty.

Half-yearly Meeting of tee Socibty The half-yearly meeting of the Society was immediately after the business of the Council had ber disposed of.
Captain Thornilll, Secretary, read the report, referred the approaching cattle show at Clonmel,
the \(16 \mathrm{th}, 17 \mathrm{th}\), and 18 th August, as calculated of much service in that lncality. It also expree concern that the competition for the challenge crea gold medals offered for the improvement of laboure dwellings and farm buildings has not been more pener
The Professor of Chemistry, Dr. Apjohn, reported ta 61 analyses were made for members of the Society were superphosphates, 11 guanos, 6 oildoles, and others. The superphosphates were, with a aing
exception, of excellent quality, as is evidenced bs exception, of excellent quality, as is evidenced by th
fact of the mean amount of phosphate of fact of the mean amount of phosphate of lime used the manufacture of 100 parts by weight of saperphas. phate being 38.2 , the portion of this rendered solat being 23.8, and the resulting bi-phosphate amountir to 15.3 .

Of the 11 guanos only 4 were Peravian, and of theer three wer e damaged by contact with water. \(B\) remaining 7 were phosphatic guanos, containing b traces of a mmonia.
Amongst the six oil-cakes there was one from Pim Nut, and a second from Cotton seed. The former cit. tained a very large amount of oil ( 25.45 ), but a smi. quantity of the nitrogenised or flesh-forming cor ponents. The latter, on the contrary, incladed th deficient in oil, of which it contained but 3.4 per
It appears that the annual income of the Society \(m\) been \(2164 l\)., of which 4212 . has been spent on lxa the establishment.

\section*{Farmers' Clubs.}

Framuingham: Agricultural Machinery.-at the last meeting of this Club, Mr. Alderman Mechi intm duced the suliject of Agricultural Machinery is as Auxiliary to Deticient Manual Labour.
The President, in introducing Mr. Mechi, said: they wished to know what Mr. Mechi had done would refer them to his writings, and if they widel to see what be had done, let them go to iptit and remember that that was when be took it the
had not only benefited agriculture in the ways be ber mentioned, but he was always ready to rende assistauce at meetings of this kind-he was ever o lend himseif to the instruction of agricu asked, an indebted for his presence that evening
Mr. Mechi said. Had not your able and intelligata President assured me that the subject for this evenimit was pre-arranged and could not be altered certainly have chosen some otber, for realit me to be a bad compliment to Suffolk the economy of the use of machinery. I this conclusion when \(I\) considered that Sufitu almost the craile of agricultural and that the Garretts, Ransome celebrity form, havellent and implements. I can hardly think "a prophet hath honour except Possibly, however, these may be a
and therefore I will endeavour to illustration, or analogous reasoning especially steam-worked machinery substitute for human labour. fuily the importance of steam have only to pre-suppose barbarism. I do not mend, on the various implements of agriculture, so well known to you in this county
Scotland the use of the drill is not genera still macb broad-casting there-a
pars of the United Kingdom the introduction of ration and iocrease profit. Our great pumpioge engines bove work in Cornwall is registered monthly) show aullons of pounds of water one foot high. And the engimullions of poundsamined before the House of Commons' Committee on Sewage, said that by steam power 1000 cons of sewnge could be raised 300 feet high for 13 s . so 14 s . But if farmers are to provide themselves with deliate and oxpensive machines, such as steam engines, drilk, roapens, threshing machines, hay-making machines, and many others, andlords to provide suitable building the interest, protect them from the destructive induence of weather. In this respect, as well as regards protection for live stock, I must say that there is immense scope and necessity fir amendment. I do not mean chat landbrds should incur this extra expense without a fair interest on their capital invested, but first-rate farming cannot be properly carried oat except by the concurrence erea in this county, remain in a primitive and unsatisfactory condition, and do not harmonise with the prorestion visible in some other districts that I could uame. By. Money is overflowingly abandant in this country, and can always be had on good security. We seem always to have a large surplus to lend to foreigners to enable them to compete with us in corn growing and
manufactures. Why not use it at home? According to Mr. Bailey Denton, one of our best authorities on druinge at well as on farm buildinge, we have 20 millioas of acres still requiring drainage, at a cost \(100,000,0004\), sterling! Who, then, would venture to deny that this would pay the conntry infinitely better than any foreign loan. The losses to agriculture arising from the non-ate of proper implements are enormous. Many a thousand tons of hay are injured or spoiled for may be aid of corn and live stock-in fact it would fill many pages to detail the losses arising from the want of proper machinery. A conviction is growing that food for live stock should be duly prepared. It is surely hardly necessary any longer to argue the question of the superiority and economy of machine work as compared with human labour.
Sconnmy or Steam Porcer. - The mind is overwhelmed when it
attexpts to grasp the subject of all-powerful Steam in all it atterpth to " \&rasp the subject of all-powerful steam in all its
muli ilarinus beariag4-that mighty monster, compared with

 culture is our crooked roadd and smanll fields- - before we can
apply it wo must havo cur roads straight and our felds largo
and not over encumbered with timber. I could sueall for an hour on the enormous lose which oocurs to agriculture gone-
rally, to the necupiers difectly, and afterwamis to the landlords, from the want of having the farm buildings in the proper
positing and the fields of the proper size anil shape. I kivow what is going on in the way on staan cultiration in difforent
parto o f the country and know that men who have hare
heavg-land farms who found greant difficulty. fornacriy, in
 easy circumstances; but then they say. "Wo must have
ur fields nt least 400 yards long and be able to do
arger amount of work, and we must have our roads in a
acter coudition than formerly." For the hard work
 rom the use of steam in cultivation. I don't know of any
more important and proftable implemont tian Garrote' My man, by gething up early and working late, with two Wheat in one day. Compare the oost and effectiveness of this as compared with the hand hoe, is very advantageous, for one's worls at the critical and required time. I wonder that any farmer can do without it. I cannot. Farmers who do not
1 nso iron harrows make a groat mistako. They are much more effective and economical, especially on heavy lands, than the
wood harrows. I muat, in trutb, ssy, that looking through wood harrows. I muat, in trutb, ssy, that lonking thmongh machines or implements.
Mr. Mrerir concluded his valuable lecture as follows : I could go on for an hour or two, illustrating the ahort-comings of British agriculture in a great variety of ways; but as it is all down in my book, anid as one subject at a time is best for discussion, I will conclude with expressing my belief that we are, as yet, only on the threshold of agricultural perfection; that in days to come we shall greatly intenaify our farming. That immense sums of money will find their way to agriculture for the purposes of improvement; but then, ere this can take place, our landowners, and farmers ton, must give up a good many of their old prejudices and set more free from the political or party shackles that now confine and cramp it. Long leases to good men will attract and encourage the investment of capital. More enlightened views will be engendered by the establishment of cheaper and improved education. In this respect all honour is due to your county for the
raising of that admirable and elegant structure, the Middle-class College, that now graces the locality in which I read this paper. I know how many good and angacious men have devoted their time and their money to this noble institution, which will remain a proud and graceful monument to their memories. Agricultural ignorance is not bliss, and I foresee that the power of ready inter-communication and observation, afforded by cheap railway conveyance, by our improved periodical agricultural literature, which now contains a record of the sayings and doings of men forward in agriculture, by ready access to a good library of scientific, mechanical, and practical agricultural books, and more especially by giving to our labourers the power of being able to read and write, which many of them have not at present, I say that with all these good things in perspective we may safely look forward to a vast improvement in our national agriculture, highly conducive to the requirements of the British stomach and to the strength and welfare of this great nation.
Mr. 8. G. Stears said he would rather not sav anything, as if he did he should not agree with Mr. Mechi. He had always
stuck up for Mr. Mechi, and it was abominable to ask bim stuck up for Mr. Sechi, and it was soow whit way it must
for his balance-sheet, frr everbody knew which wors than any
bo; but he believed Mr. Mechit had done more the other man for the farroers as far as dousing the old Pol-
lard trees and eniarging the fields went but then ho wa nituated perhaps better than anyone clese: . We had the money turned out a failure he did not say much abnut it, but if
tor mere was one that answered a little there was a great row
ther made about it
After further discussion, in which many members joined,
Mr. Mecha naid. he did not expect eversbidy to believe that
ho made a profit of farming, but he could tell them honestly he made a prosit of farming, but he couid tell them honestly
he had done so for several years, and he considered that
farming was perfectl' unworthy of being quoted as an example farming was perfect.'y unworthy of being quated as an example
unless it was oroftable. Mr. Stearn had said that he had youee
back; but when be told him that in the year before last, back; but When he told him that in the year before last,
Which way the Year to which Mr. stearn alluded, be bad so
acres of Wheat which produced six quarters two bubhelo per accis of Wheat which produced six quarters tym buabel9 por
acre, and that his other corn crops were equally good-in fact, that they amounted to 640 quarters on 100 acres, and that he
had abundance of roots and hay and everything else on his har abudance of roots and hay and everything elve on his
170 acres of land, they would, he thought, sayt that did not
look like unprofitable farmoig.

\section*{3iebítbs.}

Catalogue of Samwelson \& Co.'s Patent Reaping and Mowing Machines.
This is a trade publication or advertisement, which we notice for the purpose of an extract on the enviug of time and labour by reaping by machinery. And, no
doubt, although it relates especially to Mr. Samuolson's machines, yet it is to a great extent true of reaping machinery in general :-
" In order properly to exbibit the economy of mechanical harvesting, as compared with hand labour, Mesgrs. Samuelson \& Co. sent a request to each of their astomers, on the conclusion of last harvest, begging to be favoured by a statement from each of the actual gain in money and time effected by their machinet. A very large number of replies were kindly returned, the whole of which have been carefully abotracted, with the following average renult:-
Average actual saving in wages offoctod by machine-In Reap.
Averago actual saring in wagos effected by machino-in Mo ming. 1s. 9 d.
time eifod br machine, 40 per cont. These figures represent the actual experiences of a largo number of practical agriculturista, who have kept an account of their harvest expences for the parpose of comparing then with the cost of hand labour. But no atatement of the saving on wages alone is a fair measure of the economy of machine harvesting. Our correspondents are unanimous in the opinion that there in also a large saving in grain, though this is very variously stated, it being difficult to estunato the exact amount with accuracy. Ir mowing, however, there seems to 3 to 5 cirt. of hay per acre is gained by the use of the machine.
" With these data to guide us, we take the case of a farmer who cuts, say 100 acres of grain, and say 30 acres of artificial Grass. .... The average price would would probably be about 118 . per acre for grain, and 3s. 6d. pel acre for Clover-the former tied and stooked, the latter mown. This price is supposed to include beer in those cases where it forms part of the harvest wages.
Cost of Work by Hand-labour
100 acres grain at
\(110 . .{ }^{2}\).

The gross saving on the 130 acres would be 201.198 ., or 35 per cent. . . . . Messrs, Samuelion \& Co. would again draw attention to the fact that these are not imaginary estimates, but are based on the actual average results obtained by a large number of pertone, and under every variety of circumstancee, during the past harveat."

\section*{Farm Memoranda}

Blemnereassit, near Carlisle, a Food Mand factory. - Blennerhasset is the ancient name of the farm. Perhaps it may be well to atate here why we have called it a "Food Manufactory." The various processes conducted upon it are carried on an differently from the old style of farm as it is possible to conceive, and the end of all appears to be to manufacture a given quantity of manure assisted by the atmosphere and rain-into a certain
quantity of food. Towards this end ateam has been adopted, in order to put the earth into the fittest state for what it is expected to do-act as the vehicle for this production. We are first taken into a 40 -acre field to see the Cyclops at work. Here is one of Fowlers portable steam engines, of \(12 \cdot \mathrm{horse}\) power, driving a grubber or cultivator, or scarifier, and doing its work mosteffectually, though there are some atiffish hills in the field. After the carifier or grabber-which Mr. Lawson prefers to the plough-has gone through it, the soil is left in a very open state, and in fine condition for future operations. As the euormous machine travels across from side to side in obedience to the wire rope, guided from behind by \(a\) boy, it looks as if it were gifted with life, though it is difficult to imagine anything with life forcing itself through the soil with the tremendous power that it goes along with
We proceed to a larger field, if we may so term it, for
it contains 180 acres. In this Mr. Lawson has hat plenty of ruom to carry out his syntern. The stearnprubliner has been over every part of it, and wome of the moil in as fincly prepared as if for a garden. The quantity of large stopes which were takenout of it was really enormous, and alone cont a nice little sum in the operations of taking out and removing. Thase stones have b-en utilised was much as possible, anu have entered largely into the conntruction of a road which Mr. Lawson hat eonatructed through the land. The 180 acres are haid nut in a nomewhat novel fashion. At first sight it is difficult to make out whether it is intended for a grain crop, or for a market garden, perhops we are mont every crop except Grass, and indeel there is that in the piece of ground wet aside for the orchard. Fifty acres of Turnips, 40 acpes of Potaton, 10 acres of Flax, 18 acree of Cabbugen, and many acres of fruit trees, Pens, Beans, Gonsuberry, Black Currant, Itanpherry, Bhonson trees Lettuce, and the usmal cereals. All low very healthy and promising, some of the Flas praticularly wn, though we donlit if a great prortion of this erop has heen put on the treenget up, be the orchird, we come to the farm buildingen and farm howe. The briblinge are all new.

There are mo stacks, but mer of the beed. Dintel harnn we hava neen in thin neightomerhoot. 'The shawd for cattle, horsen, young atock, sud pige is an ertansive alrealy thuda it ton amall for hia lurgen number of hornes and stock. The interi \(r\) is divided into nvenum, along which are the etalls for the calthe, horses. de. The toons on which the enttle are phaced are raisel from the ground, with a hollow space betweeth, as) that the auphalte fioor can be flashed with by means of an arrangement of pinen whioh run along
the building, in a fow minutes. All thewo washings are the building, in a fow minuter. All thewe wathings are
carred of by underground drains into the liquid mannre tanke Motal troughe for food and water run alone the fronte of the stalls. Whter pipes nud tup placed ahove these will smpply the whole of the animals with water in a fow minutes There is room to tie up about
80 beast. The eattle and their bedding is diatributed throughout the building by meens of a railroed, along
small wageons run, performing the work in a very expeditious manner. At one side of the shect is thie stable, and we were fortunate enough to see the horses in it daring their mid-day feed and rest. A better stable of powerfal, well-conditioned horse for farm work we have seldom seen. Adjoining this is the house for the stean machinery, the plongh, the grubber, the porters, the ancho ware, the breaknae of which and to swell the "incidental exprenses" of stenm cultivation.
We proceed to where the power is got which moves all the ennehinery abont the farm buildings. and which obtained hy water, and for this parpone a culting has been mado from the river Ellen, to which a deep underground channel takes the water from the turbine wheel, fixed about 30) feet below the surface of the earth. All is covered in, anil s shaft comes up throuth ghafts, fly wheela, more motion cogged wheels, nther dirumes, bands, cranke, pistonas, valves, connecting rode, more drams and bands, until it will-when the whole is completed-pump the water into a larce cistern, clevated on a tower which rises abnve the other crush the Oals, chon the straw, hay and Grass, thresh the corn, slice the Mangel and Potatos, distribute the liquid manure over the farm, and do other work whech an engine with a well-reculated mind, and properly attended to, ought to perform. It didn't need a cicerone to inform us where the two enormous tanks for the liquid manure were situated, owing to the "compound of villanous smells" which greeted The arrangements for the diatribution of this valuable ?iquid over the soil are very extensive and complete. Enormons quantities of 6 -inch and 8 .inch iron piping radiating from the powerful liquid manure pump now in course of erection by Messra, Haughton and Thompmon, of Carlisle, who fitted up the gaa-worke, and most other parts of the machinery of the farm buildings, apparently in a most substantial manner. Plugs will gatts percha hase will be fixed, and the liquis the of gatta percha hose will be fixed, and the liquid manure requiring it in a short time. Clowe to these tanks are the gasworks for supplying the farm-house and farm-buildings, for the Shorthorus here "chew the curd" by the light of coal-gas. All the buildings are well lighted, and all along the cattle stalls and stables there are suspended a large number of gas-pendants.
as it is, be found too small for the bonntiful cr paps to result from the spitit and expenditure of its owner.
The dairy next claims our attention, and lifere we see part of the produce of the Shorthorns we have before as usual, the quintity "set up" looks momething enormous. We counted 114 bowle, all filled, and which Was the produce of three milkinga. Here, as at the other places, all the approved contrivances have been
put into ase. Most of the mill is made into butter,
which Mr. Lawson tinds to be the most convenient,
as well as the most profitable. Handcock's butter as well an the most proftable. Haadcock's butter
pren of the largust size is used. A large roors in the upper storey of this part of the building is being fitted up as a inboratory for Mr. Lawson's use. It is large and well lighted, and would answer for lectures, for which indeed we believe bue intends to devote it ucca-
sionally during the winter season. After amother look around the buildings, we now go to another department of Mr. Lawson's operations. On such extensive farms as Brayton and Blennerhasset a large quantity of inanure is of course wanted, much of the composition of his boue manures, Mr. Lawson has fitted up a mill to erush, grind, and prepare them himself. He also intends to supply them to other
Fuur years ago, Mr. Lawson had not the slightest diles of being a farmer, and it was only after visiting Tiptren Hall, and seeming Mr. Mechi's operations, that is doing. He has visited some of the best farming districts in Eugland, and is now making use of the knowledge thos açuired. And now the end and ain of all this. Mr. Lawson, in addition in being au cothusiustic farmer, is also an equally enthusiastic atmount of capital, making all these extensive alterations, and devoting all his time and attention with the viow of putting the principle of C.-operation into force. He hae a strong conviction that lebour ought to share in the profita of capital, and believea amployed on the farm is to make them partnern. How far he may bo right or wrong we cannot may, but we believn the men do not yot seem to be alive to the probabin advantages. Probably the lapse of a few yerra inny effect a change. The kind-hearted and single mimed owner of Blennerhassett intends to con-
tinue lisa laboura in that direction, and hopes to see bis pet project adopted, actuated, as he evidently in, by prely philanthropic motives. Abridged frow the Wigton Adverliser.

\section*{Miscellaneous.}

2he Glaswevin Combined Implement for Small Fur. r.-This implement, for which the judges awarded a Silver Medal at the Dublin Agricultural Society's show to Mr. Bentall, was brought out at the suggestion of Mr. Bhlwin, of Glashevin. The following deserip-
tion of it is from a communication by Mr. Baldwin in then of it is from a communication by Mr. Baldwin
thathed report of tho C'mmissioners National Education:-There are, however, great dif-
ficulties in brinsing out an implenent that will act as a good plough and a good grubber. As a general rule, a combined implennent will not give as much satisfacgeparate implement. I do not recommend a combined implement of this kind to the large farmer, believing it is fir better for him to buy the best plough and the best grubber. But the circumstances of a vast number
of Irish amall farmers are very peculiar. We have in Ireland upwards of 400,000 farmern, not one of whom holds above 30 acres. The great majority of these do the great advantages which a successfol combined im plement would preseat to this class of farmers. When Mr. Waldron wrote to me on this subject, it occurred to me at once that of all the implements then in use the one which could be most cheaply adapted to his views was one of Bentalls, Heybridge, Maldon,
Fssex, which I had frequently seen in England. And accordingly Mr. Bentall wan the first-or one of the first-English manufacturers to whom I applied, and I must say he has evinced the greatest desire to meet small furmers of ment to which I am directing attention has a long bean of wrought iron, a section of which is like a \(T\) inverted ( \(\mathbf{\perp}\) ). This principle, it is well known, gives great strength, combined with lightness. To the bean
are attached two short wooden Landles. The shortness of the handles would at firsh appear to be an objection to the implement, as the ploughman has not the com mand over it which long handles give him; bat there is a wheel in front which enables a ploughman of no great akill to work the implement. The beam and handles are common to all the uses to which this implement is applied. Without the wheel they weigh 4 st. 8 lb . The wheel weighs 18 lb . The implement is converted into a common plough by attaching (by means of six bolts) to the under side of the beam plough-body (which carries share, mould-board, side plate, sole-plate, \&e., in one piece, capable of being attached or detached at pleasure), and by attachin, being \(6 \mathrm{~s}^{+} .9 \mathrm{lb}\)., the entire weight of the implement mounted as a common plough is \(12 \frac{1}{2}\) at. The implemont is converted into a ridging, or, as wo call it coulter and common plough bods, by taking off the the latter a ridging body. In this state it weigh 12 stomes, and is capable of forming and splitting drill very well at a emall expenditure of power. The monld woards are bolted together at the front, and can he
the true ridre form, except these lote

Shanks' Patent Lawn Mowers are warranted to give ample satisfaction, and if not approved of may be at onoc returned.
A. S. \& Son beg to intimate that their Warehouse at 27 Leadenhall Strect, is the only place in London where intending purchasers of Lawo Movers cand oliom fril atodk of from 150 to 200 Ilachines. All sizes are kept in stock, whether for Horse, Pony, or Hund lower, aud orders ure exceuted on the diay they are received.

\section*{GREEN'S PATENT SILENS MESSOR}

IMPROVED PATENT LAWN MOWER FOR 1865,
as recommended by the judges of the royal horticultural society's show held july \(20,180\).
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried of every Prize that has been given in all cases of competition. The Judges at the Royal Horticultural Society's Show, held July 20, 186t, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteration, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& Son beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that despatch due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, whereby they trust to be in a poition to send off all orders the day they are received.

\section*{PRICES OF HAND MACEINES.}

Packing Cases are charged at the following low rates, viz.: for the 10 and 12 inches Machine, 3 s .; 14 and 16 inches, 4 s ; 18 and 20 inches, \(5 s\). ; 22 and 24 inches, \(6 s\). Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damagod; if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONREY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

The \(2 \varepsilon, 28\), and 30 inches can easily be worked by a Donkey, or by Two Men, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Carriage Horse ; 20d, as the MACEINES make no noise in working, the most spirited animal can be emploged without fear of its running away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the auvantage of self-sharpening: the cutters being steel on each side, When they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the outter againat the bottom blade, when the CACHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person in two or three minutes.

\footnotetext{
The sbove MACHINES are made from the best materials, and of superior Workmanship; are delivered Carriage Free to all the principal Railway Statione and Shipping Ports in Rrgland ; are warranted to gire satisfaction, and, if not approved of, can be at once returned unconditionally.
}

\title{
LAWN MOWING MACHINES FOR 1865.
}

GREEN'S MACBINR

barnards mautine.

SHAMESE HACHMER

THE MOWING MACHINE IS NOW SO INDISPENSABLE, THAT NO ONE WHO DESIRES TO HAVE A WELL-KEPT LAWN (AND FEW THERE ARE WHO DO NOT, WOELD
FOR ONE SEASON BE WITHOUT ONE.

\section*{These Machines Mow the Grass, Wet or Dry, on Lawns uneven or othervise, in a much neater mamor than the Seythe, and at Half the Expense.}
J. B. Brown \& Co., as is well known, having had their name prominently connected with LAWN MOWING MACIINES, and having constantly bestowad attention to every peculiarity of detail affecting the successful working of all the various LAWN MOWERS, have most probably sold more of these MACHINES than anrme firm in England; and they may be permittel to add, with a certain degree of gratification, that no Machine they ever offered to the public has failed to give the most entiras hearty satisfaction. They have always acted on the one proper principle of selecting the best Machine, the one they could confidently guarantee, and then prominently place it before the public, and sparing no pains, nor expense, in pushing it into notice. These well-directed efforts have, as might be expectel, been attended with complete sacis The number of LAWN MOWERS they sold during lost season was much larger than they ever sold in any season previous.
J. B. B. \& Co. have resolved not to place before the public at present any one particular Lawn Mowing Machine. They are desirous, in these circumstancer, earnestir solicit an extension of the confidence which has always been so kindly placed in them; and would beg that all those naturally anxious to have the best Lawn Mower, wow confide their orders to them to select a really good and useful Machine for them-one that will do its work well, is easy awd pleasant in working, and may at all tines be dipenid. on, not liable to get out of order and need repairs, and that will last in such condition for yoars-these points boing all essential to a really good and economical Hachine. . business thus kindly entrusted to them, they would beg to assure their friends and the public, will be faithfully executed; and in order to insure more perfect condidence the will guarantee the Machine they send to be perfectly satisfactory in every respect; and if not found to be so, they will either exchangs it for a Machine of any oller irs: description, or of any other Maker, or the Machine may be at once returned unconditionally. Orders entrusted to J. B. B. \& Co. for the Hachines of any particular Jiker, wis have most careful attention in every respect.

\section*{OR}

NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES,

BY SPECIAL APPOINTMENT, SOLE MANUFACTURER

TO HER MOST GRACIOUS MAJESTY THE QUEEN.

GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judges at the Royal Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were givon), and, at the same time, suggested a slight altention, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& Son beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that depplth due to their numerous customers, but are now happy to inform them, that they have made suoh alterations and arrangements in their premises, whereby they trust to beint position to send off all orders the day they are received.

\section*{PRICES OF HAND MACHINES.}

To Cut 10 inches \(\quad \because \quad \because \quad \because £_{12} 1000\) Suitable for a Lady.

Packing Cases are charged at the following low rates, viz. : for the 10 and 12 inches Machine, \(3 s\) 。; 14 and 16 inches, 4 s .; 18 and 20 inetres, \(5 s\). ; 22 and 24 inches, 6.5 Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damgel if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.

The 26, 28 , and 30 inches can easily be worked by a Donkey, or by Two Men, on an cven and, as the MACHINES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening: the cutters being steel on esch ilk when they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade, file the MICHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person in two or three minutes.

The above MACHINES are made from the best materials, and of supetiox worlmanehip; are delivered Carriage Free to all the principal Railway Stations and Shipping pars in Eagland ; are warzanted to give satisfaction, and, if not approved of, can be at once returned unconditionally,

\section*{THOMAS GREEN and SON}

SMITHFIELD IRON WORKS, LEEDS; 2, FARRINGDON ROAD, HOLBORN HILL, LONDON, B.C. 19, EDEN QUAY, DUBLIN ; and HADWIN'S BUILDINGS, TITHEBARN STREET, LIVERPOOL

\section*{SHANKS' NEW IMPROVED PATENT LAWN MOWING, ROLLING, COLLECTING, and DELIVERING MACHINE for 1865.}
patronized on five separate occasions durine the geason of 1864 by HER MAJESTY THE QUEEN.

A. S. \& Son, in introducing Improvements into their MACHINES, have been careful that the edventagee in point of durability, simplicity of construction, and superiority in the work executed, which have all along leen preuliar to SHANKS' MACHINES, should still remain.

STANKS PATENT TAWN MOWERS are in duly use in the ROYAL GARDENS at KEW, WINDSOB, BUCKINGHAM PALACE, IIAMPTON COURT, OSBORNE, And BALMORAL ; in the GARDFAS of the ROYAL IIORTICULTURAL SOCLETY at KENSINGTON; in the GROUNDS of Ehe CLRYSMAL PALACR COMPANY at SYDENEAM; in VICTORLA PARK; in BATTERSEA PARK ; and in many hundreds of the prineipal Gardens in the Kinglom, as well as abvout, where their merits have been fully proved and their success established.

PRICES-including Carriage to most of the principal Railway Stations and Shipping Ports in the Kingdom.

\author{
SATURDAY, JUNE 10, 1865.
}
mabtines for the ensunva were.

IT is with deep sorrow, whioh will be shared with us by every gardener of high or low degree, that we announce the Dratir of Sir Josepi Paxton, which took place at Sydenham, on the morning of the 8th inst. No word of ours will be needed to increase the regret whioh will be feltat this sad event by those who had the privilege to know our dear lost friend, of whom it may be truly said that those who knew him best, will the moat deeply mourn his loss.

The peculiar habit of what were formerly known as Air Plants, but which are now more generally called Orchids, has often attracted notice. It was clear that there must be something in their structure which enabled them to derive a sufficient supply of food from the air for the development of such succulent leaves and bulbs, or such magnificent trusses of flowers, and though one function of their aërial roots was clearly to enable them to oling to the substanoe which they had chosep as their place of growth it was more than probable that these roots had some other function connected with nutriment, and that there must be something peculiar in their structure. Mohl, Schacet, Schleiden, Chatin, OUDEMANS, and others, have in their turn recorded something of their structure, and especially the last, who has entered on a comparative view of the subject; and we have now a vers complete treatise by Dr. Leitgeb, printed separately from the 24th volume of the Proceedings of the Mathematical and Natural History Class of the Imperial Academy of Vienna.
The air routs of Orchids in their strictly aërial
*Dlo Luftwurzel der Orchideen, von Dr. H. Lemarb. Itc.
Wien, 1864, pp. 46. Tab. Lith. 3.
form, for they sometimes enter the soil and change their character, have a peouliar white silvery appearance, shot sometimes with a pale green lustre from the subjacent cells, except at the tip, which for a greater or less distance is uncoated and green.
They consist of five distinot concentrio oylindrical strata, which are denominated respectively by Dr. Lisitaeb the root-coat (wurzel-hülle), the endoderm, the bark-parenchym (rindenparenchym), the core-sheath (kernscheide), and the pith. These vary more or less in different species, but the general plat of organisation is much the same in all.

The root-coat consists of a variable number of layers of cells, which ultimately contaia air, and many of which have either porous or more or less coarsely or finely reticulated walls, and are destitute of chlorophyll. In a few instances they are filled with a grumous coloured mass, which at length contracts so as to leave them partially filled with air. In an early stage the contents of all are grumous. The origin of these cells has 'been variously explained. Some have thought they lie above the true cuticle, but our author appears to have made out satisfactorily that they are developments by repeated cell division of the epidermis.

The endoderm consists mostly of a single layer of cells, which are of two kinds, the one thickwalled the other thin-walled, which in their position with respect to the other cells somewhat resemble stomata, and in consequence have given riee to the notion that it is the real epidermis. These cells are generally filled with granular matter. Next to these comes the bark parenchym, consisting partly of parenohymatous, and in a greater or less degree partly of coarsely reticulated cells which abound in chlorophyll, and, as observed before, give a greenish tint through the silvery onvelope.

The core-sheath succeeds, consisting of a sing'e layer of cells, some of which have the walls thiokened, while others, single or in pairs, are thin-walled. These latter agree in number with the neighbouring bundles of vessels, which are either perfeet spirals, scalariform, or reticulated. The pith consists of parenchym, which in old roots sometimes becomes thick-walled with large circular pores, or sometimes from retioulated thickening. Between these there are frequently intercellular passages aometimes flled with a red resinous substauce. The granular contents of the cells consist principally of staroh, which, however, in some cases only makes its appearance when the roots ohlorophyll vanishes.

Besides these structures, we have as in other roots a terminal hood (wurzel-haube) whioh is thrown off centrifugally from the cuticle, and which when immersed in water becomes gelatinous from a chemical action on the cellulose of which the cells are composed.
The surface of the silvery coat sometimes gives out excrescences or hairs, which latter have often a spiral structare, a fact which confirms the notion of its really being derived from the cutiole. In old roots the cont occasionally peels off, and it sometimes assumes a green tint, which is due to the formation within its cells of minute Algw, a sure proof that vitality is no longer very active in their walls, if indeed they have not become altogether effete.
It remains only to say a little about their functions. Of these one has been already mentioned. The spongy coat, pierced with holes, having its membranes torn, or pervious from the falling away of hairs, is in close connection with the external air, and probably has properties analogous to spongy platina, charcoal, \&c. Ceatin states that air containing ammoniacal gas is purified by the air-roots, and Dr. Leitaeb thinks that the beneficial effect consists rather in condensing vapours and gases than in protecting the subjacent tissues from drought, which has been supposed to be the principal function, an office which he believes to belong rather to the endoderm. In some cases, however, it is probable that this is a principal function, and in others that they are reservoirs of moisture, while some of the elongated thickened eells of the endoderm undoubtedly are oalculated to prevent evaporation from the barkclls.

It has been supposed that there is an inverse proportion between the number of layers of cells in the coat of the air-roots and the thickness of the leares, but though this sometimes holds good, it is It may bersal
the only plants in which air-root Orehids are not
are highly developed in many Arads, where they have in all probability the same functions, and there are analogous growths in some Ferns. M. J. B.

Nancissi are amongst the most varied and interesting of early-flowering spring bulbs, and they hybridize freely, giving rise to new varieties of a well-marked character. Our attention has recently been recalled to them by the receipt of a box of seedling flowers from Mr. W. Backhouse, of St. John's, Wolsingham, among which were comprised some of remarkable beauty. Mr. Backiouse has been good enough to send us some details of his experiments in hybridizing these plants, which we are sure will be read with interest, the more especially that spring flowers and spring gardens are now attracting some share of the attention which they so richly deserve. Mr. Backiouse

The Daffodils Narcissus major, Ajax. PseudoNarcissus, minor, and moschatus, cross with one another, and the produce seeds as freely as the parents. The colours are not merely intermediate, but of all shades between the colours of the parents, where these differ as in moschatus. I bicolor seeds badly, and is deficient in pollen, but from crosses of the other Daffidils with it I have raised some of the largest and finest of the class. These also seed badly, and their produce has a tendency to revert to the Daffodil. The roots of N. bicolor are very much larger, and shaped somewhat differently from the others, and the crosses from it have the same peouliarity; the colours of the seedlings vary from those of the parents, through white with lemon cups to almost pure white.

From the Daffodils crossed by N. angustifolius the kinds called footidus by Dean Hembert are produced, and the cross is intermediate between the parents when N. major and Pseudo-Narcissus are used; but with N . poetious the variety is greater, and some with very fine expanded cups occur. The variety seems to be also greater when some of the seedling varieties of Daffudil are used. These crosses seed very sparingly, but may oceasionally be got to produce seed by a cross with either parent ; those with the Daffodil having shorter cups than N. major or moschatus, and those with N. poetious or angustifolius being intermediate, and with generally a red edge to the cup. Seeds I have sown from plants not artificialiy impregnated produce the same result, some showing the Daffudil, and others the \(\mathbb{F}\). angustifolius type. The orange tints on some of these orosses vary in difforent seasons. On many the cup will one year be orange-tinted, and the next plain yellow.
"The Daffodils erossed by N. Tazetta produce plants intermediate between the two in general, bat sometimes the oup is not longer than in Tazetta ; the flowers on each stalk vary-two, four, and up to six occurring. These crosses vary in colour and size, according to the nature of the parent Tazetta, but the produce does not seed with me, except that last year one pod producing one seed occurred from perhaps a couple of hundred Howers. A warmer climate than mine might produce different results. No pollen is to be got from it to cross with the Daffodil parent.

The percentage of seedlings showing striking peculiarities, is but small from any of these crosses, and the colours only partially follow what might be expected from the parents; the cross from N. moschatus by angustifolius not being always white, and I have from footidus by angustifolius some with green flowers.

Before dusting with pollen I out out the stamens, except in the kinds which only sced when crossed; but in out of door plants, when there are numerous others about of the same genus, there is no certainty but that sometimes the bees may be the authors of a different cross. I have sometimes tied the mouth of the cup in the Daffodils for a time to prevent access, but in most cases the result shows the intended cross to have taken place.
Such records as these, and those of Dr. Herbert in the Botanical Register, and Mr. Leeds of Manchester in the Gardeners' Magazine of Botany, lead irresiatibly to the conclusion that among Naroissi at least, many of the plants received as species are mere varieties or hybrid forms. "There is no end," writes Mr. Lesps, "to the varieties and elogant forms that may be obtained. It is quite clear however that incomparabilis is no species; I think bicolor is no species; and that the number of species is very small."
coincide.
the production of fine hybrids of this beant in tribe of plants; and it may be mentioned theantice not ephemeral produotions like many mese ar florists' flowers, but will last for centuries mith very little care, as the common kinds have done in our gardens."

\section*{Fronds ovate, bipinnate, glabrous; pinnules roundiah oblass}

The fronds of this Fern are much like thase of A. Capillus-veneris in outline and generat treen t and there is also considerable res two in the form of tie pinnules, different, and the marginerous in recesses formed by the abundan
and apicar margia. in the young

It has been raised by Mr. Viitch, of Chelsen from specimens gathered in Equador by Pearce. We do not flud any published
nder amo which is intended to indicate the bay-like recesses formed by the sori.

Ginsogramad flextosa, Destaux. Hooker, Species Tin r. 129. Cryptogramma betrofracta,

Fronds firm membranaceous sparingly pilose, 3-4 feet long, the stipes purplish-black, gloses, and as well as the rachides sorvoto ; primary pinuæ \(4-5\) inches long, refracted, pinnules
 es to form a wing to the foriked; caudex creoping.
This very handsome Fern, which is of trailing or subscanThis eryit, and remarkable for its finely'cut divisions and its geniculato-flexunse rachis, is widely distributed over tropical America. In the Sierra Nevada it occurs at an alcitade of 7000 feet; and in woods near Cuença at from 8 to 10,000 feet, growing on the ground. It has been introduced to our gardens by Mr. Veiteh, of Chelsee, by whom it has been recently exhibited, on Which occasion a First-Class Certificate was awarded to apacice, and will probably prove a good grower, its habit being to produce strong root-fibres; while its elongated foonds with their innumerable narrow segments, will give it a place amongst the most elegant of its race. M.

\section*{TRANSPLANTING MACHINE.}

About two years ago it became an object of considerable importance here to have a suitable machine constructed for the purpose of transplanting trees and shrubs; the latter especially, being large, and consequently too heavy for the management of any nuaber of men who could find standing room for the purpose of lifting them. I therefore had recourse to better means by the construction of an implement similar in formation to the accompanying aketch, which suits the purpose perfectly. But in order that itr adaptation may be rightly appreciated, and the mode of operation properly understood, permit me to give a briet description of it.
\(\begin{aligned} & \text { The boz is made up of four equally formed sides, }\end{aligned} \left\lvert\, \begin{aligned} & \text { the comparison must be greatly in favour of parterre, } \\ & \text { of more }\end{aligned}\right.\)
tion of transplanting is rendered comparatively simple by means of this machin, which invariably docs its
work well. John Reid Haigh Hall (iardens.

\section*{GENERAL FLOWER-BEDDING.-NO. I.}

Althoven of late years the choice of bedding plants has been wouderfully extended, it is a matter of great surprise to many persons, that instead of a greater variety of plauts being used, the uumber has been diminished every season, and still continues to diminish A very few years ago there was a much greater
variety of plants used for bedding purposes, including many which are now entirely discarded, until for a summer gardea, I verily believe that if all the colours could be got from one single genus no other would be generally employed. This is, indeed, easily explained, for of late years outdoor decoration has been confined to one system, which may simply mean plant ing out in the eud of May and taking up in October and the class of plant that was found to afford most bloom in that short period, and could be most certainly depended upon, became the popular one. Nor do I blame gardeners for thus selecting subjects which always prove certain and satisfactory. Wo have indeed been travelling on in one undeviating courfe, and this has brought about a state of thiugs that does not appear to bo correct, aud which has given rise to much criticism, for which there was certainly some excuse It is a bad sign at any time when our sharp-sighted It is a bad sign at any time when our sharp-sighted
critics can find a point to harp upon-although it must in this case be held that they are most effective while they confine themselves to generalities, such as the glowing descriptions of garden perfection that the great Bacon's philosophy could conjure up in the Elizabethan era, when all appears to have been perfection. When they leave tlie philosophic part of the subject and descend to plain matter of detail, their occupation is gone.
If we are to have only one \({ }^{\circ}\) garden for the summer, and if we compare the material used and the difference

Polyanthuses ; Primroses, of ooloured variotioe ; mixed Wullfowers single red aud yellow, and dwarf Italian. This is the progress I lave mall in seed-solving up to this time, and one or two weeks of diffurence wall be of small importance either way. To those who way be disposed to adopt the system I shall bave more to say in continuation, as to growing and propagating, ace in contiuuatiou, as the gro

\section*{THE HAMILTON UR CADZOW OAKS}

Anborictltire has, in all times, more or less engaged the attention of proprietors of the moil. The many excellent and aged stmples of timber scattered over bill nad dale, and the selient postc.uns which many of them occupy as prominent foatures in the landscape, show that our furefathers gave them much attention. The (oak especially lias always been \(a^{\prime}\) great favourite; but if nut properly attenied to in youth, the mumerous forms of vegetation with which a forest abounds, and the struggle for existeuce ending in the diseomnture of the slower.growing plant, would effectually destroy the monarch of the forest. Henoe the necessity for the mode of seleotion adopted by the skilful arboriculturist. Moreover, the conmercial value of Oak entitles it to the proud position it occupies; for although such samples as those of which we shall pre sently epeak have never beeulooked uponin this light by the house of Hemilton, who could have realised : large amount for them in days past, they have had tho pleasure of pointing to tho forest wheh thay tenant as the only piece of ground which has mot been husbanded, and they the only trees in a fertile trate of country not disturbed by the hand of man for more than half a ceuturs
These Oaks stand on what remains of the Caledonian forest pur et simple, over which wild cattle of the original breed still browse. The appearanee of these animals is not strikingly different from the more common of the domesticated ones. They are all uniform in colour, having puro wbite bodies, of rather a smooth than a shagey character, with moderately long black cars, a jot.black muzzle, and black hoof I was rather mistrustful of making a minute inspection, judging their chatacter to be somewhat ferocious; but instend of this I found frightewed at my intrusion on their domain, as I was in making their acquaint ance. At times, however, am l learned from the workmen in attendance, the bulls are dispored to be ferocious, and then no one would be safe to wander in the forest. This is the period when they havo
eack being \& feet 6 inchess at top and 4 feet 2 inches at bottom, 1 foot 8 inches in depth and \(2 \frac{1}{2}\) inches in thickness ; these are fastened together at three corners hinges inch iron bolt passiog tho warng strong iron horizontally placed bolts and nuts, by which the ball of earth may be made tight. In preparing the tree or shrub for removal, the ball must be shaped to fit ezactly the interior of the box, each side of which has each fuare apertures at the lower edge. These are other fitted with two plates of iron-oue inside, the square uatside. That on the inside has a hole \(1 \frac{1}{2}\)-inch square, and \(\frac{g}{}\) of an inch from the bottom, that on the and made cleft to suit the square punch hole inside, and made a fixture by means of screws and nuts, and When the box is adjusted round the ball, 1t-inch square irons, 14 inches in length, are driven usual these apertures, entirely doing away with the proves to transplanting.
A place having been prepared for the reception of end boe, the next thing to be done is to take off the remainder of the two top bars, and push back the opposite the the frame till the wheels are exactly then be the centre of the box. The end bar should phoed adjusted, and the top bars should also be threed on the bearers perpendicular to the box. Two lower end, poass \(1 \frac{1}{4}\) inch in diametor, hooked at the and hook into rings attached theach of the top bars, bos. The nuts are then worked till the ball is raised above the felloe of the wheels, and may be removed at once. In most cases, however, the use of the screw room be diapensed with; in short, wherever there is bottom of the wheels down to near the level of the shane of the box, it is only necessary to raise the edge of that the end bar comes in contact with the hook may box, when a link or two of chain having a must now be pulled down into the ring. The shafts front in the same manner as low as possible, fixing at brought to the ordinaryer. The shafts can then be may be used for remoryl level, and one or two horses axle does nor removal. It will be observed that the ported by three iron stays, but is substantially supto the inf three iron stays, the centre limb being fixed In maide of the bearers.
In conclunion, I may remark that the whole opera
brilliant. At the same time it must be admitted that public taste has been seeking a change of late in favour of a more general system, and it therefore becomes necessary to consider how this is mont easily to be attained. I cannot agree with those who are continually crying down the extended use of Scarlet Pelargoniums, Calceolarias, \&c., in our summer beds and ribbons. They can never be replaced, however much the introduction of variety may improve the general effect. But if we take the first week in June and the last in September, as indicating the limits of the season for these summer plants, we leave several fine months without any display; and this perhaps is the very cause which has seemed to make some claange imperative.
Now there is scarcely any limit to the material for filling up this want, though it takes long practice, and careful observation and experiment, to bring so great a number of different plants into bloom together, in such a way as to be avnilable for our existing arrangements of ribbon beds, with edginge, baskets, and vases. Here we have succeeded to a certain extent in overcouning the difficulties by which the practico is besct. There are, however, drairbacks to encounter. For instance, amougst the lists which have of late been very liberally supplied, indicating the most useful plants for this more general system of bedding, I notice a great many subjects which are not easy to grow, and after a trial or so with them the cultivator will become discouraged. What I wish to impress is, that for this discouragement there is no necessity; for if one plant does not succeed there are others in plenty that will, and a little perseverance will soon discover them.
The system of General Bedding has this advantage, that if some of the early plants continue later in bloom than the usual time of planting, the beds thus occupied may be selected, previous to filling with the spring plant, as the summer beds for the most tender varieties. We frequently find that planting the latter out rather early injures them for the season. Whoever desires to make a beginning in this more general system should at once look to provide a stock sufficient for the beds in autumn. A commencement must be made by sowing seeds of many useful plants in beds or drills in some back part of the kitchen garden. I have sown up to this time Anemone coronaria, mixed, in boxes or borders; Brompton or Queen's Stocks; Cowslips of coloured varieties; Honesty, red and white; Pansies ;
periodical battles among themselvet. Curiously enough, when age begins to tell upon their muscular euergies, the strouger, despotic-like, assert their position, and any that flinch or waver in the battle are pursued by the conquerors aud ulti ruately gored to death. Like most other wild awimal they have an unueual affection for their young which of course is fostered and increased during the time of suckling to such a degree as would make it practically unsafe for any one to go near them. Their numbers aro kept within limits by the gun every season at Christmas, when the pour preople of the burgh of Hamilton are regaled with the most excellent and most substantial of all boef from the carcases of these animale
To return from our digressina. These Oaks cover more or less the whole of Cadzow Chase, which is com puted at 1500 acres! To ontimate the number of Oaks themselves, which still stand, each as a living monument of the past 700 years, over this space of ground, would merely be a speculative statement, but I am safe in saying they exceed 500 ; they are only, of course remnants of former greatness, for their wonted vigour is paralysed, the branches have become stunted limbs innumerable are fast decaying, leaf-buds are nof at all prominent, and the stunted appearance of the once vigorous sept-centenarians betokeus speed dissolution. The maiden soil of thim remnant of the Caledonian forest way remain untilled and unturned for a hundred, nay, even for a thousand years hence if the world be then undisturbed; the ancient breed o. cattle may atill be preserved as they have been here tofore, and browse upon its surface, but these famous old Oaks must die. It is a great pity that young oues we:e not planted a hundred years ago to take thoir places ; but why not now? "It is never too late to mend.'

We aro informed that David, Earl of Huntingdon, afterwards King of Scotland, planted these Oaks in the year 1140, which will make the survivors exactly had aretty good notion of the longevity of the Oak when he says :

Tho monarch Onk, the patriarch of the trees,
Shoots rising up, and upreads by slow degreces
Three centuriee he grows, and three he stays
Supreme ta state, and in three more decas.'
The largest of the Cadzorv Oaks measures 21 feet in
circumference at 3 feet above the ground. Another one growing close by its side measures 20 feet 6 inches. Both these Oaks, although fast decaying, are unbroken in the bole. The next largest one that I mensured people very comfortably in the interior, and measures 19 fest in circumference at 3 feet above the ground. Several measure from 16 to 13 feet, and in some solitary instances have all the appearance of solidity, wating.
Wanting. specimens I was very much struck by their diversified character. Scarcely two of them are alike in all others have knotty protuberances in a greater or less degree, clearly establishing that no tree when increased from seed produces an exact coung or itself, either showing a disposition to progress retrogress from any given desirable sample. The largest specimens alluded to were densely covered with these knots, which detract in some measure from the value of the timber. On putting the tape-line round the bottom of one heavily adorued in this way, ground, but 3 feet higher up it only measured 17 feet. One other example is the Oak called Queen Mary's Oak, under whose branches she and some of her faithful attendants are said to have taken shelter, when
pursued to Cadzow Castle. It is yet in a pretty good pursued to Cadzow Castle. It is yet in a pretty good
state, measures 20 feet at 2 feet above the ground, and is one of the cleanest and probably the loftiest specimen in the forest.

These Oaks, so far as girth is concerned, stand favourably in comparison with any of the Scotch Oaks whose dimensions are placed on record. Even Wallace's celebrated Oak in 1771 was just 22 feet. SirThomas Dick Lauder, in speaking of the fine Oak forest at Loch Garry, found some prostrate trees measuring 16 feet in circum-
ference ; and also speaks of one that was raised from the Caledonian Canal, under 16 feet of gravel, the frag. ment of which measured 30 feet round; and, what was most interesting, found to be in a good state of preservation. These Cadzow Oaks, however, differ in some respects from the dimensions of many; for
although they have girth to attest their longevity, they are not nearly, nor ever have been, the same in respect to altitude, either of bole or branches, which must be entirely owing to the climate, for it is impossible to obtain a better soil for root action than these Hamilton do with the proper growing of timber than many people credit, and it should be an ohject in the plarting of estates in various localities to introduce only
such wood as is suitable. Fine as these old Oaks are, such wood as is suitable. Fine as these old Oaks are, of the old English Oaks. Queen Elizabeth's Oak, for example, at Huntingfield, we read is 34 fect in circumference 5 feet from the ground; but it is needless to instance Oaks, which are numerous in many of the fine parks of England. I cannot, however, help alluding to what are considered to be the three finest living stateliness, as compared with the best of our Scotch Oaks. The "Great Oak," at Panshanger, measures
19 feet in circumference 3 feet above the ground, and is computed to contain 1000 feet of timber. The "Chandos Oak," near Southgate, is very nearly as large, and fully as healthy; and the "Bounds Park Oak," close by Tunbridge, has a straight stem, and measures 221 tt at 2 ft above the ground, and slightly tapers to 16 or 17 feet at where the limbs diverge. O course these Oaks are small compared to many in England, but there they are in the height of vigour nearly equal in girth to the largest samples of the Cadzow Oaks, which have for the last 300 years boen on the wane. J. \(A\).

\section*{Home Correspondence.}

What is a species?-Apecies is a word variously applied. Species in algebra are the symbols which represent quantities. Species in commerce are the
several pieces of gold, silver, and copper. Species in logic expresses an idea comprised of some general one called a genus. Species in optics is the image imprinted on the retina by the rays of light reflected from an object; but what is "species" botanically? The learned The learned have never yet been able to define what a vegetable is so exactly as to fix the line that distin guishes it from an animal. "Squeers," who taught his boys botany, does not define species. Genus is more
easily defined; it is a class of beings comprehending easily defined; it is a class of beings comprehending
under it many species. Were a genus invested with voice and reasoning powers, it might address us in reference to species-

Thou nam'st a race which must proceed from me,
Yet my whole species in myself I see."-
If this be so, then, however difficult it may be to
define species botanically, ?ne thing is certain-that all species must have features, however they may differ from each other, and also from all others, that proclaim only to have descended originally from one, and one genus. If genne be I believe to be the subdivisions of a bearing unmistakable relationship to the parent, but bearing differential marks, andip also the parent, but
bearing features of affinity to each other, and their species. Originally, all plants had the power o reproduction in themselves. What we call species, I suppose are nothing more than hybridso d have said
that the learned have found a difficulty in defining the exact line between a vegetable and animal; nor is this to be wondered at, since their modes of generation and appropriation of food are much the same. Would some learned reader oblige me by defining
knowledge of it is necessary to floral order or classification. W. F. Radclyife, Tarrant Rushton.

Ants.-Can you do my neighbours and myself a great kinduess by suggesting some means of destroying ants
which infest our wall fruit trees. I have lost in succes sion two sets of trees, and this year, although with the best endeavours to prevent it, I fear I shall lose my third planting. The insects congregate by thousands in the leaves, thereby destroying the trees. Henry st, Auber, North Petherton, Somerset. [Guano is said to
drive them away. Try the effect of giving the worst among your trees a good dusting with it by way of experiment, and give the rest several thorough washings with clean water ejected with force from a powerful garden engine. Guano afterwards strewn reascension.]

Disbudding Tines.-I have often thought that it would be a good thing if the frequent stoppings and restoppings of Vines could be got rid of. This led me to try how disbudding would succeed, and I found to my great, delight that it answered capitally. The way I acted was this: I took out every bud down to the one I hoped to prune to at general pruning time, with bunches were situated. I never mentioned to any person the experiment I was making, but as the plan proved so successful in its results, and saved me much record without any apparent drawbaci, I venture to record it. The whole of the sap seemed employed in the development of a fine leaf, which was able to elabo-
rate a good supply of proper food, and this rate a good supply of proper food, and this again
resulted in a good bunch of Grapes. By this plan, moreover, all over-crowding of branches is done away with, the juices of the plant are kept in their proper course, and a most healthy appearance and a well-regu. lated house of Grapes are the consequences. The best time for disbudding is when a good selection of branch and bunch cau be made. R. To, Gloucester
Early Peas. - Neither of the parties who informed Mr. Whiting (p. 508) that they could rot perceive any No 1 , Sarpenter's Express and Sanger's last yean have had the Express true. With me, both last year and this, there is a great difference between them. The Express does not grow so tall as Sangster's, and it is a fortnight earlier; it is 10 days earlier than
Dillistone's. I grew them all three side by side last year, under precisely the same treatment; and this year the Express has fully sustained its character for earliness. I sowed five rows each of Sangster's No. 1 and Carpenter's Express, on a south-west border, on Nov. 23, 1864; the Express was in bloom on May 1. and I gathered a good dish on the 26th, and nearly two pecks from it on the 30th of that month. I have only gathered the first from Sangster's No. 1 to day (June 6), and at the same time I gathered a peck from
the Express, sown on F'ebruary 8, while Sangster's No. 1, sown on the same date, is just podding. It is only fair, however, to state that Sangster's No. 1 is the best aropper, as the Express, like Maxwell. The only a moderate bearer. James I have not seen any mention made in your columns of Dickson's Early and Best Pea, a variety invaluable for its earliness-at least I have proved it to be so against other varietics. On account of my garden being low, and the soil cold and stiff, I am obliged to sow in sowed cut about a yard long and 6 incles wide. Sangster's No. 1 in turves on the \(3 d\) of February, and put them on narrow strips of wood into a Vinery which was started on the 1st of January. When they were about an inch or so high I gradually hardened them off, and finally planted them out on the last day of March on an east border, side by side along with a few rows of McLean's Dwarf Prolific, sown in turves on the 19th of January. The result is, that I began picking from Dickson's April 24th; I could, however, have picked mall dish a week earlier. The first dish of Sangster' was picked on the 28th of April, and McLean's Dwarf Prolific is just coming in, feathered with pods from the top almost to the ground. The three varieties form a good succession. Dickson's is not remarkable as an abundant cropper, but its earliness is sufficient recom mendation for it. J. C. Mundell, Hooley House, Coulsden, Croydon.-I send you along with this a
dozen pods of Sutton's Ringleader Peas, which were sown March 28th, and are now quite ready to gather, baving been only about nine weeks growing. Several other sorts were sown at the same time, amongst which were Daniel O'Rourke, which are now just showing dower. T. Fielder, White Horse, Binfield, Bracknell. hamed respectively Sutton's Ringleader, and Carter's First Cropp, and I feel compelled to say, by the strictest investigation, that they are not only similar, but identical. I have carefully examined and compared
in the following particulars:-The form estalistomen general colour of the seed; the exact time, size, above the surface and expansion of the first leaveatin the general appearance of the plants in both cases, an
size and length of stem; the general size and length of stem; the general form, size, col
and mottling of the leaf; the time blossom; and lastly, the time when the pods were to gather. In these particulars I have been able to fo was two days in atver. Mr. Sutton says Ringlead the appearance of the first blossom, but could the is days be clearly seen by making a careful surver of in hone In any given crop of Peas there monst some difference in the time of coming in blossome must we ought to be careful how we judge of a whole cm by the appearance of one or two individual plant slightly sheltered, and during the latter part of Jlam we were visited in this locality with very severe frow so that I should not have been surprised if the crop hem been destroyed. They lived on, however, and were blossom by May 1st, and wore in fair condition to gathe on the 24 th. On the same day (December 14th) and
in the same situation I planted Sangster's in the same situation I planted Sangster's No. 1, whic between flowering and gathering, First during the days more, which made a difference of cight dage distinguishing features of "First Crop" aretendency to produce flower-buds in the axils of lower leaves, and 2 ndly, its rapid growth in all it stages, and I am confident that by good treatment Pea may be made to produce very early.
acquainted with a gentleman who had the same sown in March, and it was ready to gather ame Pe same time as mine. Doubtless it would be desirable t reduce the number of sorts of Peas to those which most useful and really distinct; but it is also hish important that the number of names shonld \(m\) exceed the number of distinct varieties, and that should be taken to retain those names which ar vegetables are named without the leasi attention description. I would suggest the propriety of reiaining the name "First Crop" for the Pea under discusion, al eminently descriptive of its real character, AlphaPermit me to say (May 28) that I have gathered Pess from Wm. Paul's Tom Thumb, sown on the frat wed in March; the plants have not received the alighted protection. Thos. Slovee, Gardener to S. G. Sheppernh a row of each of the following Peas on the same dyry viz. Fcb. 6 :-Sutton's Ringleader came into bloom on the 29th of April ; Carter's First Crop on the lat a May; Dickson's First and Best on the 5th of May Dillistone's Early on the 7th of May ; and Sangstert No. I and Daniel O'Rourke on the 8th of Mas, Sutton's Ringleader was ready for the table on the 1st of May; Carter's First Crop on the 2d of June, Dickson's might be gathers and O'Rourke mill but Dillistone's, Sangster's, From this trial it appears that the three new sorts of 1865 are all aarlier than kinds previously in cultivation, and that Ringleader is the earliest of all.
near Reading, June 5 .

Turfing Peach Borders. - Although you hars answered your correspondent "W. G." concerniog turfing Vine borders (p. 488), will you allow me way a word in favour of turfing? My practice do in direction. About 25 years since I had charge of 9 of Morello Cherries, the border
and better fruit or more bealthy trees I ner saw before or since. About 1849 I planted a hosse Peaches here, and as it was in an out-or-thith Grass. I determined to sow the border down wo hesitatio has remained ever since, and thave saying that better fruit than those loces give \(9 \downarrow\) mide, often seen; the foliage is 9 inches long and
and as healthy as possible. I inclose a leaf [which is a picture of health]. If I had the chance (which I may have soon) I would have all vine and (then gitn sown down in Grass, because when covered wita long manure, or Fern, they become superabund moisture, but when turfed over the moisture is absorbed by the Grass, which the hea conductor as well, keeps the frost oubve all and is also a natural covering. Athe Earl of Dwim so well? J. Sto
Yarrow. This plant is called "Arrow Gras" in in parish, and is used by one old parishioner conjunction with gin, as an effective durcio id be the diuretic properties of the dra
gether assigned to the gin. \(H . W\).
gether assigned to the gin. H. W. C.
Wasps.- In your "Vespecide"
Wasps. - In your Paper of the 3 d inst. Which be
writes that he has destroyed 72 wasps, whic nnder sumes were males as well as femal impression that a months of April and early part
parden labourers for
\(p\) to May 1, and
1020 wasps, for which I paid \(4 l\). vexed to be informed that probab艮艮 you, therefore, hindy satib
now exist, even though we destroyed about 200 nests a showy and useful flower, which receive 1 and deserved last autumn. J. Mo, Addington. [You may make your mind easy respecting the wasps, as males (or kinga, as autumu, and all die before winter sets in. Tine past and present have been remarkable seasons with reference to the econowy of the vesplary. to be formed, and in August the workers swarmed rerywhere to an extraordinary extent; but an insidious disease, very similar to that known in the apiary under the name of foul brood, set in at the brood of many nests, so that in September we wer Dearly freed from the winged insects. Many females must, however, have been produced, since as soon as the warm weather set in in April last great numbers were seen, but May on the whole was cool, and they then spneared in fewer numbers. A considerable number of the small egg-shaped paper-like nests have bowever, already been brought to me, so that if we do not have heary rains to swamp the most probably be as much infested in July and Angust as we were last year. J. O. W.]
Bowgainvilla speciosa.-Mr. R. Huxtable, gr. to flowered a plant of this most perfectly in a Fernery, where the heat during winter is maintained at about \(30^{\circ}\). The plant in question is growing in a 12 -inch placed on a front platform, and is led up the rafter of an ordinary "lean-to" house. The soil in which it is growing, as near as I could judge, consiats of peat
lonm, and leaf-mould, with a little dung. The plant is covered nearly its entire length with the loveliest mave-coloured leaves or bracts, and is certainly as benutiful an ohject in its place as it is possible to con ceive. Owing to the bractg, \&c., growing out from should suppose that many plants have failed from the mismanagement of the top rather than the roots, a such wood if cat off or damaged in any way, would Robert H. Poynter, Taunton.
Roses.-My Tea Roses have done well this year, but the Hybrid Perpetuals are coming false to a degrce I never saw bofore. The evil is apparent in Senateur Céant, Madano Caillot, Prince Leon, Charles Lefebvre, Lawon, and some few others. I ain fearful, if I am aingular, that I shall cut a sorry figure in showing. I suppose the fine weather has forced them too much, Mills, Maidstone Teas? John Hollingworth, Turkey

\section*{玉ocieties.}

Rorar Homituctuvral: June 3 (Special Show of Pelargoniums).-This took place in the eastern Con servatory Arcade, which was well filled with finely grown well-bloomed plants of both ordinary and fancy two groups of miscellaneous stove and greenhouse plants, various cut Roses, and a little fruit, also gave In thal interest to the display.
in the Class of 12 Pelargoniums, Mr. Fraser, Lea Bridge, was 18t with beautiful examples of Festus, the Fair, Guillaume, Candidate, Bracelet, Fairest o Rose Celestial, Beadsman, and Lillie. Mr. Ward, gr. Eugénie Leq, Esq., Leyton, was 2d with Pline, Osiris, or Pios, Vala Enae, In groups of six the same exhibitor was 1st with Lord Clyde, Madarae Furtado, Nestor, Rose Capt. Cahill'; Mr. Donald, gr, to I. Barclay, Esgr. and . Weir, gr. to Mrs. Hodgson, were also exhibitors whis clase, as was likewise Mr. Fraser, who was 1st Eui Roseleaf, very bright in colour, crimson, Empress Pugenie, Sanspareil, Excelsior, Prince of Prussia, and Pizarto.
John Hew Kinds of 1864, Mr. Fraser furnished with rosy carmine; Profusion, rosy pink, with a dark blotch in the upper potals, and white throat : Rozine crimson. Wate eye, upper petals maroon, edged with but with coastguard, somewhat in the way of Vioia ere, and redder upper petals; Exhibitor. rose, white crimson, prize enpotted in all the petals. For these a 1st prize was awarded. Desdemona, large, and beautifully corered with bloom. shown as a single specimen by Mr In Fanceived a 1st prize
first rank, with fingoniums, Mr. Fraser also stood in the Lady Craven. Cloth plants of Delicatum, Bridesmaid, Funtaisies, Hebe, Celeste, and Multiflorum. Moi des Silver, bad also well-bloomed plants of Cloth of and Queen of the Valley. Mr. Cor and Rosabella, of Fenowed collections
Edgar, Mra. Dorling Mra Fraser had Ann Page and B'air Athol. Among seedlinge Ches Alezandra, Mr. Bull, was the gem; it is vivid scarlet, with, from fye, having a violet tinge round it, streaked or slightl fonthered and blotched in the upper petals, altogethe
a First-class Certificate. Sparkle, in the same way, is
also a pleasiug flower. Mr. Bull likenise showed large collection of new Zonal Pclargoniums, and examples of Beaton's Nosegay kinds came from Mr. IVm. Paul.
Of Miscellaneous Stove and Greenhouse Plank, Messrs. Lee sent a nice group, in which was a large Dicksonia antarctica, nracana indivisa, Alocasia
metallic, and various flowering plants. From Mr. Bull also came an excellent groun, consisting of Dractenas, one of which, D. rubra, was in flower: Palms, Platycerium alcicorne, Peperomia arifolia, Arancaria glauca, and a handsome Gloxinia named A. Bomard. U: Roses several fine boxes of cut blooms were slown by Messrs. Lee and Mr. William Paul; the latter had boxful of beautiful blooms of (iloire de Dijun. nother box from the same exhibitor contained aingle trusses of the yellow Noisette Celine Furestier, each truss having on it some half a dozen fully-expanded
blooms. In addition to these Mr. Paul had beautiful examples of Madame Falcot, Madame Villermoz, and Souvenir de la Malmaison. Mr. Catleugh, of Chelsea, furnished Lilium auratum, finely in flower ; and from Miss Macdaniel, Upper Norwood, came a frame o dried flowers and foliage, with the colours well preerved. Among them were Pelargoniums, Furget-me not, Larkspurs, Adiantum, and golden Gymnogramma Iugram, gro to her Majesty, at Frogmore, had a fine Smooth Cayenne Pine-apple, very good May Duke Cherries, large and fine British Queen Strawberries, and Prince Arthur, a conical-fruited sort; and Mr Miller, gro to Lord Craven, Combe Abbey, Bent Mere Melons.

United Horticultural: June 6.-An exhibition held under the auspices of this new Society, took place on this occasion under tents in Finsbury Circus, and Was all that could be desired, considering it was held in the very heart of London, almozt within a stone'
throw of the Bank. The Lord Mayor honoured the display with his presence in the morning, and during the afternoon there was a fair attendance of visitors.
Stove and Greenhouse Plants were shown in large numbers, and in excellent condition, by Mr. Williams, of Holloway. Among them were Statice profusa, Neottopteris australasica, in vigorous health ; various dee Variegated Yuccas, Rhynchospermum jasminoides, Alocasia macrorhiza variegata, and other plants, among which were two wonderfully fine specimens of
Dracrena lineata, and one of \(S\) phrorogyne latifolia, the last with leaves 18 inches long and 15 inches in width. Mr. Wheeler, gr. to Sir F. Goldsmid, Bart., M.P., furnished Ferns, Heaths, and other plants. Mr Howard, gr. to J. Brand, Esq., Balham, had, amoug other things, the beautiful variety of Clerodendron Thomsonæ, called Balfourianum; and a group of Stove and Greenhouse Plants also came from Mr. Wheeler gr. to J. Phillpot. Esq, Stamford Hill. Mr. Peed, gr o Mrs. Tredwell, of Norwood, and Mr. Rhodes, o Sydenham, contributed beautifully grown and well-
flowered Heaths; Azaleas came from Mr. Penny, fowered Heaths; Azaleas came from Mr. Penny gr. to H. H. Gibbs, Esq., Regent's Park, and Mr. Baker, of Edmonton, showed a large collection of Fuchsias, Pelargoniuma, Deutzias, and Hydrangeas, all compara tively small but well-flowered plants. Seedling Pelargoniums were furnished by Mr. Holland'and Mr. Turner nd variegated-leaved sorts by Mr. Hally, who had a fine collection, in which were examples of Mrs. Pollock and Sunset, the "latter with leaves equally handsome with those of the former. Cut Calceolarias came from ington, came quite \(a\) small tent full of C. aurea horibunda, charmingly in flower. Various Aucubas were exhibited by Mr. Wilson, gr. to W. Marshall, Esq., of Enfield. From Mr. Williams came the silvery-leaved Peperomia arifolia, 'Todea superba, the red-veined Eranthemum sanguinolentum, Anthurium cordifolium, and other comparatively aew and interesting plants. Mr. Fraser had beautiful exhibitions of Peiargoniums, both fancy and
ordinary kinds; Mr. Turner, Messrs. Panl \& Son, and A. Smee, Esq., cut Roses. From Mr. Aldred, Kilburn, came Amaranthus tricolor, with green, red, and yellow leaves ; and from Mr. Porter, of Epping, came cut blooms of Pansies. A small plant of Lilium giganteum n flower was siown by Mr. Kirtiand. Orchids were placed in a tent by themselves, and were intermixe with Ferns and fine foliaged plants. They were furnished by Mr. Williams ; Mr. Wilson, gr. to Wq. Mand Mr. Baker
Mr. Penny, gr. to H. H. Gibbs, Esq. ; gr. to A. Basset, Esq., Stamford Hill. In these collections were some extremely fine plants of Cattleyas, Saccolabiums, Aerides, Oncidium, Cypripedium, and Phalzenopsis. We also noticed the now sold om seen Broughtonia sanguinea in good condition-Trichopitia suavis, the rare and beautiful Dendrob. brom Mr Willinas came the long lost Promenæa citrina, and some small Anæctochili were shown by Mr. Aldred. Mesers. Barr \& Sugden had various handsome plant cases,
Hooper ornamental pots, I rias and Sparaxis.
Fruit, consisting of Pine-apples, Strawberries, Apple
in a good stato of preservation, Cherries, Peauhes, Melons, and Cucumbers, was contributed bv Mr.
Turner, Messra. Glendiuning, Mr. Smee, Mr. Tillery, Mr. Sulweil, an a uthers.

Potamtal of Eninbuthen : April 13.-Dr. Dickeon, Presidut, in the charr. The forlowing genthemen Thowson, Eqq. Nur-Kesident: M. C. (V) ke, E.e. London. The tollowng commanications were read:alled the Neve Forest. By pirt of Hampshire The author commenced by describing tise situation boundaries, extent, geology, scenery, and physical gengraphy of the New Forest, aul then pro that tho number of species known to mountel to 723 , of which number the hal hmmei collected 530. Having divideci the thora of the Forest into three groups-the plants of the heaths and mowns
 portant species in each division, and showed epecimen of many of the plan's he mentioned. Amonket tho-e were specimens of Gladiolus illyricus (Koch), acr handsome plant, only discovered as a native of thi country in the New Forest a fow years ago. The athor then gave a sketch of the flors of the sen coast, and of the cultivated parts of the dietrict, and remarked ou the few species found in those localities The western type of vegetation was seen to prevail and this was considered to be due to the dany humid climate. After alluding to the influence of the geolo gival formation of the Forest on its flora, the author concluded his paper by urging collecting botamints to
 The paper was illustrated by a map of the Fioress nit by numerous dried specimens is pimenter Contributions to the Flora of Otago (Now Zwaland) No. 2, Rare Cryptogams. By Dro Lauder Lindsay In this paper the author gave an account of some rare and Alge, which had been collected by him in Now zealand. Most of them had not been previously gathered in that country.-3. Under the Snow, or the Flowering of Plants in Closed Cases. By N. B Ward, Eisq. The author remarked-One of my bedroom cases outside the window has been most glorious for the last month or two. According to Mre. Somer ille, closed cases are as old as the creation. She maye that any one travelling high up in the Alps in early pring cannot fail to observe Leucojum vernum (Srow flake) and other spring flowers flourishing in little closed cases of snow, with here and there a transparent ey roof, under cover of which the flowers retain their beauty for a very long period. Now, this case of mine is a case in point, but the plants, instead of being surrounded by snow and ice, are surrounded by registering thermometer, is always within one or at the most. two degrees of that in the open air but the immunity from the effects of cold, arising
from the perfectly quiet and pure state of the atmosphere, is most striking. One flower of Cyclamen, which opened the second week in January, has not yet faded, and a double-blossomed Camellia, which fowered most beautifully in the ers of 1863 and 1864, is now covered with buds just expauding - not one of the buds has withered are ten vars. of Crocus, on double white Primrose, \&c. The Snowdrops are over. I was induced by the successful results of this case to build one of 50 feet in length at Chelsea, for the recep tion of innumerable lovely plants which do not require any artificial heat in winter, but which do want the protection afforded by the glass cover. Whis large case has now stood the test of two winters with most gratifying results. The aspect is the same as my own -viz, a little to the southward of east. Several varie ties of Camelline, six or seven species of Cyclamen, several species and varieties of Primula, and all the ordinary and extraordinary spring bulbs, fairy Roses, Japan Barberries, Palms, Clematis lanuginosa, \&c., are of Ferns, Lycopodiaceæ, dic., retained in their place upon the back wall by gaivanised wire. The amount of gardening labour required is most trifling, no pots or tubs being used,-4. Report on the Flowering of Plants in the Open Air at the Royal Botanic Garden. By Mr. M \({ }^{6} \mathrm{Nab}\). Mr. M‘Nab enumerated 39 specien of plants which had come into flower in the open Air from the 10th of March till tho William Bell, dated A letter was read from Mr. William Bell, dated
Buranic Gardens, Saharunpore, 28th Feb., 1865, in Which he referred tos eneciee of Loranth (apprwite) which grows vigorously on mauy trees in the neigh bourhood of Saharunpore; it is most partial to the common Mulberry, white Pimus longitolia and the Casuarina aro seldom infested by it. Mr. Bell also gave a description of a species of Orobanche, enother parasite, which infeste the Turnip roots in the garden aize. He stated that he had recently made more observations on the sexual organs of Ferns and Mosse and had been led to the belief that the antheridial and
these plants. - Vr. Gurrie exhibited twigs of Cupressus Lawsoniana with male and female flowers, and reported that these treen were this season flowering freely in Messrs. Lawson's nureeries and elsewhere in Scotland. -Dr. John Anderson, Calcutta, sent photographs Botauic Gardeu there, after the late cyclone.

Liverpool Horticulterat,-This Society held its first show on Thursday, May 25 , and the weather being fine there was a large assemblage of visitors. The
tents under which the disulay took place were tents under which the disnlay took place were
pi'ched in the park adjoining the Botanic Ganden, which was open to visitors, and must have afforded a great treat, as the cardrns, which are under the superintendence of Mr. Tyerman, were in fine con-dition-no fewer than 60,000 plants being used in skill.
As regards the show, all the plants exhibited Were grown in the neighbourhond of Liverpool.
Among Stuve and Greenhonse Planta were some good examples of skilful cultivation, but there were also others of which we camnot speak in such favourable terms. Some of the Heaths, Azaleas, and other hardwouded plants, were not well blooned: Gloxinias, however, were magnificent, some of the plants having upwards of 1 on biomm on them, charuing in colour
and well varied Fuchsigs were also lovely: they and well varied Fuchsias were also lovely: they
were shosth in the shape of pyrami!s, covered with fine fotige and flowers down to the rim of the potquite a eredit to those who cultivated thern. Calcenlarias wew very fine, especially Aurea flor bunda, which was well bloomed, and many of the plants measured 3 feet in diameter, withont a single stick to support them. These were rightly placed among plants
remarkable fur the beanty of their foliage. Pelarremarkable fur the beanty of their foliage. Pelar-
goniums were also goorl and well-bloomed. Roses in pots wers nice neat plants, furnished with some fine flowars. Ferns and fine-foliaged plants were conspicunos features of tho show, being well selecterl and great numbers by ladies; though pretty, they were great numbers by ladies; though pretty, they were
rather ton flat, and the introduction of a few more Ferns and sme graceful foliage iuto them would have been a deeided improvement. Designs for flower gardens were numerou-, and seemed to excitegreat admiration. Strawberries, Melona, \&c. There were also about 30 brace of nice Chenmbers, of which some were perfect models of fine chape. The chief vegetables were Asparagus, French Beans, \&c. Stands of Pataicies
were shnwn in good condition. Orchids were small in were shown in good condtion. Orchids were small in this neigh bourhood having been broken up. There are,
however, many new beginners, who promise to keep however, many new beginners, who promise to keep
this gorgenus class of planta well represented in future. The following is a list of some of the most successful competitors:-

\section*{Notices of 300K\%.}

Alpine Plants and Hardy Perennials. Jnmes Backhouse \& Son. 8vo. Yurk. 1865 .
In the present rage for bedding plants, which renders every good and well-kept gatden a mere counterpart of any similar extablishment, it is quite cheering to a botanist, nowt to mention a liver of the varied furms Which often render the vegetable kingdom so enchanting even to the uninstruetei, to have something in however cleverly the disposition of the different tints may be arranged. Those whon have attended the threes or focrety cannot fail to mave been the Horticultural Socrety cannat fail to have been charmed with many of the gems forwarded by Mesars. Back honse. AndroPrimula farinosa under two distinct fore Chamæjasine,
amethystinus, Lilium pulehellum, Narcissus juncifolius amongst other interesting species, attracted almost universal interest; and to those who admire the more chrious frenks of Nature, there were such plants as
Ophrys fucifera, Sarana kamtschatica, and others. The Ophrys fucifera, Sarana kamitschatica, and others. The
difficulty about the cultivation of the more Alpine forms is greatly facilitated by the plan suggested in the intronuction to this Trade List, fro
leave to make one or two extracts:-
"Very rapid and perfect drainage, combined with an equally rapid and continuous supply of water, are essential to thoroughly healthy development. On rock-
work thas may easily be accomplished by allowing work thus may easily be accomplished by allowing
water to eacape from a pipe at or near the highest, point in a very slender stream or fast drip, which will than when similar effects are aimed at by ordinary watering. Some species, such, for instance, as Eritrichium nanum, Cerastium alpinum, and those plants generally which have silky or cottony foliage, evidently dislike having their leaves wet by artificial means, especialy in Finter, as in a wild state they are either
buried during that season in dry snow, or subjected to trosts which destroy every particle of moisture. These must either bo planted wisere an overhanging ledge prosects them from suow and rain, or be grown in pots
which can be placed under a glass frame admitting full which can be placed under a glass frame admitting full
ventilation in winter. Not that these plants are teuder: they are nearly as hardy as the rocks themselves; but their winter alpine atmosphere is dry till the spring IW sets in.
Besiles the question of moisture and atmosphere, that of soil is generally important. Hundreds of rare A!pines lave been sacrificed to the idea that earth is ersential to vitality. We find that with many species the less of this they have, the better their chance, especiully at first when not established. Grit (coarse sandstoue crushed into every imaginable size and shape, from sand upwariss) is the lite and sonl of a large range of Alpines. When merely tinged with a hittle kept moist artificially by filtration from above, this material exactly suits them, and imparts a vigour that surprises the cultivator. Even river saud unmixed with anything often answers perfectly when the moisture is It has."
It has been a common notion that it was essential to the cultivation of Alpine plants that they should be under a north wall, a situation which certainly suits terrestrial Orchids and some others better than any other. But Messrs. Backhouse do not recommend it A very large pro
A very large proportion of the most showy species may be grown in an ordinary border in common soil, and nearly the whole range of Alpine plants may also be well grown in pots, where a garden is devoid of rockwork, which best represents their natural element. Whether cultivated in pots or on rockwork it may be well to state that after long experience and far too much of that kind of mistortune which usually attends experimenting upon new plants, we find that as a rule it is an error to place in the shade in summer for the sake of conlness, those species which inhatit very high mountain regions. These plants, as a class, hate the soft humid 'lifeleas" at
"Living naturally on lofty ridges they are constantly exposed to high winds and an atmosphere of erystalline clearness, through which the sun's rays dart down with a vehemence which often heats the rocks till you can scarcely bear to touch them. This brilliant sumshine in the davtime, alternating with excessively heavy dews or sharg frosts at night, is the sumuner condition of a large number of the rarest and most beautiful species in the:r native abodes. And these, born near vast fields of perpetual snow, receive a rapid and permanent supply of moisture at the roots, which is in a firm mass."

\section*{- \(\sqrt{5}\) larists' \(\boldsymbol{f l}\) lowers.}

Variegated Pelargonioms are getting to be great favourites, and the varieties are increasing in number and improving in beauty. Variegation cousists in the absence either partially or wholly of the green matter, or chlorophyll, in certain parts of the leaf. It is a understood, and shows many very curious apparent anomalies.

It is a singular thing that though we have had variegated-leaved Pelargoniums for this century past,
or perhaps longer, it is only within a very few years or perhaps longer, it is only within a very few years
that the zonal matter (-ee p. 487) has made its appearance in the variegated parts of the leaf. In the older variegated zonal kinds, in common with several of the new ones, it will le seen that in those parts of the leat where the variegation breaks through the zone, and the the leat, it tinued, should break into the white part of he leat, it terminates abruptly, and there is an equal obstruction both to chloropl:yll and zonal matter. But Raterly some boller zone bas appeared to pass the Rubconn (or rather the Rubicon has passed its bounds),
le.ding the way for others bolder still, matter appears as others bolder pill, until the zonnil chlorophyil as in its presence, thus layng the foundation tor our more beautiful forms of red-zoned and
tricolor-zoned variegations. I believe it was one of
zone, but I do not now recollect its exhibited the paik The two principal division nam.e.
eaves may be classed are those with whitenrlight variena ed edges and dark centres, and those with liglight lolotiond stars in the centro, and deep green edges. The formere wonld appear to act in connexion with what fr. Lirme in his "Theory of Horticulture," terms the superiorthre, of veins, having their origin from the netgboountiod having their origin in the bark. The former vema, traced by a white line down the inside clannmat be the leat-stalk, through the liber to the edge of the the latter by lines down the outside of the leaferills diffusing a light colour through the bark. Besiica, these there are spotted variegations, as in the caeed the Aucuba, a sonewhat similar condition |requentr occurring in the Camellia, but it has not yet in the atter case, I believe, assumed a permanent characte in the stripes and blotehes in the petals of flowenn Those in the Camellia flower may be distinctly trice in the young leaves when about half-grown, an! while they are semi-transparent. Indeed, so true are they to the character of the flower in point of colonr and disposition, that after laving raised a great many beelo lings, and taking a great interest in them, eviciced by them when your, have been in the habit of mark them when young, and noting down their colours,
course I do not pretend to judge what the character the fower will be, or even whether it will be single of double, neither can I detect the white spots on a red petal (these are not permanent, but like the mhite spots ou the leaf, only temporary variegatinns); but an, from experience, tell what the permanent colon will be, whether unicolor, bicolor, or tricolor; and id exactly how the stripes and blutches will be di-posed and their relative intensity
the lear is very evanescent; it soon fills with green disappear.

The first tendency to the abnormal condition in variegated plants (however they may be propyatel a/terwards), I have never known to tuke piace direet
from the sced, but always from what is usually termed a sport in some bud; and I have seen sufficient proi: to enable me to say that the tendency will sometines be in the plant and lay dormant for years before it shoms itself. As a case in point I may mention that I one marked a branch of Camellia imbricata, the flowers o which were very regularly and prettily spotted. From this branch I grafted several young plants, and martel each of them. They then showed no tendency to variegation, but two years afterwards the spottel variegation to which I have before referred extibtel itself, both in the original branch and each of the yan? plants simultaneously. Again, the plants of Nosegay Pent gonium SLella have very generally this season exnibita signs of variegation breaking out here and there, the tendency to which must have existed in the stod from which they came. This tendency to seldom takes its true and fixed character at once, generally begius with a blotch or single stripe in leaf, whinch it generally loses again if not ent ang the plants down to the leaf a fis is done, and the bud at the axil breaks and stil exhibits the tendency, it should then be stopped again the leaf which presents the most decided tendenct, is 80 on, repeating the treatment till a fixed charan of and struck as a cutting, or propagated in some way dy kee? from the parent plant, and it will then generally its character.

The seedlings from the white-edged variegted Pelargoniums, when true, generally come up alina without any green parts either in the to secure per leaves. These very soon perish, had to crossing with the green varieties. purpose, when zonal variegations are and it will then be found that a large prop it looked after, throw shoots quite variegate and other kindsing seedlings crosume their true charide for some time, but change about for another, now producing leaves all white wholly green, one-half the plant pnre white or yellow plotographed on its surface; but anter place to others more regularly variegated. uppear with light blotches or sta centre and radiating towards the
with light edges and dark bloteles former will throw light stripes dow young bark and come up again in younger leaf; while the latter w
stripe in the centre of the leaf. at the edge of the fortheoming fither form may at this stage such shoots as suit the purnose ant it will often be found that two branch are as individually distinct as tro - An'r dissimilar Jom Hally, Blackheath.

\section*{Che Apiary.}

Trens appenred last week (p. 511) a commanication Prom Mr. Carr relative to the existence of Firatile Woarms laccur has been known to scientific apiarians for a very long period, - probably for at least one hun. ireal !eara. 16 is, however, very rarely the lot of any thentify tie correctness of the essentions of Reim, Huher, and nthers on this interestiry point. Mr. Carr has Shereture bren fortunate in having the opportunity of closely observing one of these instances, usually so very dificit of ratifcation. Althongh I have been an been able to prove beyond the possibility of donbt the oocurrence of any such case in my apiary. But Mr. Woodbury, in a contemporary in July, 1860, mentions an instance "Thich quen-cells in one of my small aprificial swarms having turned out abortive, owing to tho inclemency of the weather, some among the work. ing bees have taken the opportunity of nsurping the colls. I preanim they will produce dronea, although lifd in the workers' cradles, two or three being deposisel in each cell. The depositing a plurality of eggs in a call is mot, however, pecaliar to fertite worke a prome ozus in one receptacle. I an mable to detect the difference in siz which is said to distingnish workers which have ass 'med the functions of royalty.
Writmer agaia in November, 1862 , in reply to a cor r.iss: "Ton these particulars, I my now add that the eques so laid were developed into small droner, as anticipatel, and that although \(I\) was never fortumate mongh to depect fertile wirkers in the act of oviposi-
\(t \rightarrow 0\), nor conld I ever identify such as were in that \(t \rightarrow n\), nor conld I ever identify such as were ins that such as to establish the fact beyond a doubt. Being perfectly satisfled that the eggs in question were really deposited by yorkers, and not by a small queen which noother nealed royal coll, due course, and the abuormal laying of drone egge soon came to an end." It is certain that the workers are unde reloped fernales ; and inflnenced by the knowledge of the
effect produced by a different food, combined with a cell varying greatly in its form and size, on the larvæ, which arp therety transformed into perfectly developed queens, it has been uaually asserted that some of the worker grubs lying near to these royal cells may receive the benefit of a portion of this royal food, and, as the hriter previnuely quoted states, "the ovaries of these sufficient stimulus to admit of their laying eggs, which bre unimpremated owing to their inability to copuNote with the mile bee, can only hatch into drones." Aotwithstinifing Mr. Carr's close observation of the be disposed to acimit that he has proved the matter beyond all possibility of doubt. It is necessary in the promulgation of such facts, that there should not be the cant loophole which may admit of any doubt being It mpy he said, for instance, that notwithstanding Mr. Carr's inability to discover the presence of a queen there might still have been one in the hive.
Thave little donbt of the correctness of his con queens raised in my artificial swarms have been so exceeding's sinall and diminutive as to be overlooked, time after time of eager searching for them. One case the queen day by day without success, I came to the At lomion thit there conld be no queen in the stock and ater a further search discovered a queen which harily at a.i larger than au ordinary worker. This give was commenced by laying the egga of drones, but of was hestroyed to make room for a better specimen

This faet of the occarional bot
pretence of fertile workers is one of the most conFarthenogenenen of the correctness of the theory females of this species have the bees. The queens or lay fertile egga without having been impreguated by that thes or male bees. We are assured by Siebol bility become ovarip of the workers cannot by any possiRga hy fertile workers is It unogenenis as connected with the honey bee Whikers from the assertisid that he succeeded in doine an and in capturin and lis assistant watcher agys. Huber states that he had bren reirnved, and in which they whad deterted the paphnring of rgg-laying workers, with the ione of the \(8 \%\) of She of them; and he says, "at length on sinceed. A bee appeared in the the good fortune to
laving. Before having time to lenve the cell we presented all the extermal characteristics of conmom pees; the only difference we could recognise, and that - very slight one, consisted in the abdomen seeming -83 and more alender than that of workers. On disseclion the ovaries were found to be double, like those of queens, but more fragile, smaller, and possessed were extremely fine, and exhibited swellings at equal dintancers. We counted 11 eggs of sensible size, some workers never lay the egge of commarit hees; they workers never bay the eage of comban hers; twey
produce nere but those of males." This has alwaye proceaced a puzzling fact to apiarians, and would probubly fur ever have remained a mystry had not Parthenogenesis in the honey-bee been discovered by Dzierzon, demonstrated hy Von Siebold, and accepted as undoubted by the majurity of scientific apiarians, What has hitherto been minolved in a sea of difficulty of the correctness of that theory. Apiator.

\section*{Garden Memoranda.}

The Comiegr Botanio Garden, Dublinv.-"If," said a great nurseryman and cuitivator, who lives not a hundred miles from Cremorne, while dis-nssing the merits of a group of Sarracenias at one of our great plant, without any hopus of pressirving its life, I would plam, without any hopes of press rving its hife, I wound This is perhaps the lighest compliment that could be paid to a cultivator, but is fully deserved by Mr. Bain, the talented Curator of the Dublin College Botanic Gardens.

In giving some account of this interesting place I do not intend going through the various houses and arrangement, for having to dilate somewlat upon spare for indicating the relations which the hoases and arrangements bear to the cardinal pointe, \&c. The garden was founded by the late respected and venc rable Dr. Mackay, who went to Dublin as assiatant botanist, to the Trinity College professorship in 1802 and established the garden a lew years later-1807. From lence it was that he sallied forth to explose the Flora of Ireland, and to find in it treasures like the Killarney Fern and many other filue plauts - more success than will probably ever again fall to the lot of British botanist, which led to the pablication of hio list of Irish plants, and eventually to that of his wellknown and valuable Flora Hibernica
The garden is sitrated to the southenst of the city and adjoining the best part of it, but this advantage is counterbalanced by a slight deposit of city smut, from which Glasnevin, on the opposite and Eafer side, is free. Adjoining are the Hammersmith works of Mr. Turner, who has erected some of our noblest iron plant-tempies, and within 10 minutes watk is Fir was held. The chief part of the garden is surrounded by a high stone wall, enclosing a square, but outside of thi on two sides there are wide slips of pleasureground divided from the main road by a mapsive iron railing on a granite base, the whole being about 8 acres in extent. It is not a public garden, nor a show garden, but the it is a worthy appendage; and surely the founding and supporting of such a garden is highly honourable to that noble institution
To begin witi the outdoor department, I have first to notice what a grand plant Lobelia Tupa is with Mr Bain-hardy.vigorons, and full of flower. A bush of it
9 feet in diameter and 5 high, which I saw at the time of 9 feet in diameter and 5 high, which I saw at the time of the best Tritomas, and of a front place in any garien. The soil is deep, dark, and free, resting on Calpe linestone, 5 feet of it "rootable," and no doubt this, do with the condition of the plant; luat ansborly who do with the condition of the plant; Mr. Gibson does takes as much trouble with it as wr. Giljon (oes
with his "subtropical" favourites, will suaceed and find it a better subject than many of those. I believe it was in the Dublin Gardens that the great merit of the Tritomas was first observed, and-with nut special and Mr. Bain than I bave seen them elsewhere. The walls round the garden are high, extensive, and exceedingly well hidden by climbers and a great variety of fine shrubs, many of which are in some place tender; but Mr. Bain. instead of nailing up his wall opposite and much less troublesome course of letting the shoots come freely away and forin handsome bushes, which effectually break the monotnny of the walls and adjoining garden. Of course the plants protect themselves much better in this way, and when many half hardy shrubs trained in the usnal way are killed by evere winters, these in the College Gardens are quite safe. In addition, scarcely one of the plants but was
mderendent of the main stem, the side shoots heing treely layered aloug the wall, nim thus insured from extermination by cold. Mr. Bain is most successfu with his layers, and never cuts the wood-nothing but the bark. Muguolias, Escallonias, Ceanothuses, Meliangrandiflora, Chimonanthus, and EJWardsias were finely
done in this way, many of them projectugg moth finc bushes. There is ne kusck of "the art of grniting on "f gard'um" wit! wh ch Mr. Bant is 1 , comeranat

 Whted one on exch side the stem; innacheel to the ald 1hint, above the decaying parto and designed by Mr. B. to act ne a pair of young and stroug leme when the old one goes. It was hisinly instruetive and p'easing to ste so much of eivill in che art of enridenIng comhined with accurate bo'anionl kuowledge, and full nequaintance with the Iriath Flura
Always on the look ont for an edible, a pris...nnur a fraguant, a ferid, a purgative, or a modictumb plant, I could mot miss the gn mbtities of true latap among the wnili plants. With Mr. Beiu it is pleniftul enongh to give away to hit plarmaceutical amument ancen. Here, too, running loosely amoner tho wall plants were the large flowering species of Clemntio, and probably such a ponition is the beat for thee plants, of which nuch fina varietien are now being sent sinoot large.leaved fine kind- 15 feet high nud benting red berries summer nad winter, resulting from \(a\) lubit th plant has of flowering in autuma as well us in mpring, is very interesting. From a hundred seeds of the plunt I learned that a few might be got true, the reat yielding this young tree formed be erafting Tasodinun distiehum Vir. pendulum on the a mumin torn. In that group of viduals seem perfect and symmetrical of their kind and Pinus nobilis, from a cutting, is also a perfuob looking specimen. Many of the Pines lonk deuse and istance bping is mine old specimens of P. excelsa for of the lower shoots having then! thatel th iie on the turf, the er spray springing from it in dense mansers.
 ffeets of gales, and the ten lomery of the wants to grow by layering, and in others, when the plait hat become too lanky, by hard cutting buele or by bendiwg down the stem and laying the side shoots. A aimilar adopted with some of the house plante, but in no caso if the plant frons its main stem furuished a good and sbapely specimen.
Here we are nuder a wall with plenty of Orubanche Hedereg growing on Ivy at its base, and a lot of larry Ferns between the shrubs and wall; nmong them the arizinal plant of the now videly distributed Athyrium F.f. Frizellize with its variousiy shaped fronde,-just the arme as when Mr. Bain firtt picked ont and propa gated those of the peculiar form. Among the Tritume and Sea Pea-not a despisable plant when luxuriant in the mixed borders, in addition to Lubelin Tupa, mav bo noted, as well worthy more extenderl caltivation, Yucce flamentosa variecata; the Santolinas, which are reall neat and useful plants for winter of any other feimen Enothera specios. Trifolium aniflorum, a distinet and retty species. Onosma tanrica; the fine Anemonel uch as A. sulphurea and vitifolia; Agapanthus, dning freely; Veronica Andirsoni variegate, forming
handsome bushes a yard hich and as mush themgh and sometimes surviving the winter in thit furte, hat more certain of doing so whell in a hlowhb, perhap a cornmon plant in some places ; and the white variety of Lathyrus latifolius, a most nseful and beantilul plant flowering, as it does, for a long time, in enneequence of rarely or sparsely perfecting the seede. Manturi on he tuif :and allowed to furm a flit snmy macs there running up the walls to a great hoight, this old plant lonks one of the best in the garlen. But we are asain under a wall, ou its north side, and agnin lonking ar. Ferus, this time on the wat. Ase, ahmont blout Mr. Bain-always trying to hammr his so. e" an prets -has with them, in crevices high up, Asplenium septentrionale and A. germanicum, in the luope of makne wall plante of bo th

The garden is perfectly flat, and for the greater part
 large squares, containing the nutural, British, and medical arrangements common to monbotani gan trees and shrubs arrangen according to the Linnean system, a pond for squatice, \&cc. The squares are surrounded by hedges, and in the narrow borders between these and the walks, are the choicest Alpiues, in very rare health indeed. The collection is nalers almost Varied, but very select; and in these hory are grown in little lines acrose the border, one species in eaclo, and then perhaps of a favourite plant there may he 6 ur 10 appurtenances of Alpme plant grawing, hat miver them more healthy, nroving that if Alpinn. 4te in the right soil and kept moist enough, All seasons. Mr. Han is however, very careful to keep them frequently divided and from and neat in the ground, as many are diaposed to become lesey time I have called in the autuma I have observed. "herbaceou
man," sage and experienced-lookiag, dividing these Alpines, and carefully replanting them, putting to or near the roots-wood ashes! an unlikely compound for subjects that dwell far above the trees. Divide, divide, would seem to be quite as common a resort with Mr. Bain as it is in the house that Barry built. What a treat it must be to see those little rows of this exquisite Piok, Dianthus alpinus; they have just been replanted, and are carefully shaded with leaves from the sun for a few days till rerooted. There is a Willow, Salix serpyllifolia, healthy, neat, and preading, but not more than an inch high, smaller and more delicate in growth than Lycopodium denticulatnm, The Soldanellas are very healthy and numerous; there Is an abundant little square of the true S. alpina. The choice and curious Petrocallis pyrenaica is plentiful: and so is Androsace Chamæjasme, with! Gentiana verna, and a mulsitude of some of the best dwarf Primulas; while things not so attractive for their flowers, but diatinct and curious, like the Megacarpea, Picrorhiza Kurroa, Carex Fraseriana, Swertia, \&c., are also far more abundant than usual-with the exception of the Prangos hay-plant, which is always scarce and oftener bsent

Mr. Bain does not, I think, grow any of his Alpines in frames. The culture of these choice Alpiues is evidently one of his favourite objects, and he succeeds to per fection, as with any other things he "takes to." It is, however, a choice thing that "draws him out." Looking over the boundary here the Festucas and Asters did not seem more healthful than usual, but then to grow these well it is hardly necessary to master the Theory of Horticulture," while, with our Alpine friends, some of the most learned fail. While on this subject it may be remarked that the soft and sweetly coloured Androsace lanuginosa has lived on a warm and sunny border for years, and was full of flower, in front of a mass of Commelyna ccelestis, looking very charming. of a mass of Commelyna coelestis, looking very charming.
Without going among the shrubs, of which there is a fine collection, it is easy to see what a neat and distinct one-full of flower too-this Atraphaxis spinosa, a polygonaceous plant, makes. If a rare plant, as I suspect, it made plentiful. W. \(\boldsymbol{R}\).
(To be continued.)

\section*{Miscellaneous.}

Claret.-Under the denomination of wines of the Gironde, part of ancient Gascony, are included the vintages of the districts in the vicinity of Bcrdeaux, many leagues in extent, and, of all the produce of France, these are most familiar to foreigners. Everywhere else they pass under the generic name of Bor deaux, but in England they are called Claret, which i either derived, as some suppose from Clairac, in Gas cony, from whence large supplies were formerly imported or is a corruption of the word clairet, signifying such st are red or rose-coloured. In its integrity Claret is a mixture of several sorts, specially adapted for use in this country, with a small portion of spirits of wine in addition. About 13 leagues to the north of Bordeaux the Médoc estate commences. It extends along the
left bank of the rivers Gironde and Garonne, and comprehends the most celebrated growths of the country including those of Châteaux Lafitte, Margaux, and Latour, as well as the vineyards yielding the secondary wines of St. Estèphe, St. Julien, Pavillac, and some others. Too much stress, however, should not be placed on the value of any particular name, as the varying influences of season, temperature, and other accidental causes often occasion the less esteemed growths to equal, and sometimes even to surpass those in greater repute A remarkable instance of this occurred in the fine vintage of 1815, wherein a fourth growth in rank on the Margaus estate so far exceeded all the others in high character, that it became almost priceless. The entire crop was purchased by a merchant of Bordeaux, and after 15 years in bottle it was still in such perfection as to surpass in a remarkable degree any other claret ever brought into this country. From the frequent meution of claret wines by old writers, a large proportion of the best red growths was probably of that description. As long as they were drunk without an admixture of water, it was of little moment whether they were of a purple or rose colour; but the modern custom of using all the ordinary kinds in a diluted state has led to a change of practice in this respect, and the farmer strives to supply tkem as high coloured as possible. To attain this object the fermentation is protracted, and the principal ingredients tampered with; the consequence is, that many of these wines, though abonnding in body and colour, retain from the beginning the germs of early decay, and the decomposition of the liquor is accelerated, acidity is prematur ly engendered, and notwithstanding they might possess considerable stamina, the major part of such wines do not keep well. Still, many French vintages will continue sound for a considerable number of years: Roussillou has been drunk a century old iu high perfec. Denman's Fine and its Fruit
of the Eecargots Snails in Paris.- The consumption of the Eecargot, or Snail, has within the last few tiat they enter into serious competition with at Paris the wine shops in serious competition with oysters at
Burgundy, and Chrounds in the provinces of Poitou,
than 400,000 dozen of snails to the Paris markets, where they readily find purchasers. M. Payen, the
celebrated analytical chemist, has demonstrated that these molluses, when boiled, furnish a substance infi ritely richer in nutritive matter than that of oysters. The Grocer.

\section*{Calendar of Operations}

\section*{(For the ensuing week.)}

SHifTing where necessary must now receive attention. A compost, consisting of three-parts fibrous peat, in a lumpy state, one part free turfy loam, and a little silver sand, will suit most kinds of hard-wooded plants, with the exception of Heaths, which succeed best in peat with In potting take care to secure thorough drainage, over which may be placed a little broken or pounded charcoal.

\section*{FLOWER GARDEN AND PLANT HOUSES.}

Now is the time to encourage rapid and sturdy growth in hard-wooded plants. A constant stopping of gross shoots will be necessary, in order to equalise the distribution of sap and encourage the lower parts early bulbs now ripening, if turning yellow, should be taken up, or the greater portion of their leaves trimmed away. Verbenas, Petunias, and such things should be frequently pegged down where
AURICULAS.--Let these now occupy a cool shady situation. Green-fly, to which they are subject, must be kept in check. If infected remove the plants to a pit, in order that they may be effectually fumigated.
Balsams and Cockscombs.-These must now be encouraged to grow freely, giving them a little weak liquid manure occasionally, and accommodating them with larger pots as they may require them.
Camelitas - Keep these close, moist, and warm, until their growth is completed, when more air and lees moisture should be given in order to cause them to form flower-buds.
Carnations and Picoters.-Let the main shoots of these now be carefully tied to neat stakes. Remove dead leaves and top-dress with fresh sweet soil. Destroy green-fly.
\begin{tabular}{l} 
Cinerarias.-Cut down such as are out of flower to \\
inin two or three inches of the surface. Stir and \\
\hline
\end{tabular} top.dress with light soil. A north aspect is the best at this season. Take cuttings as soon as they can be had for early flowering plants.

Daflias.-Keep these regularly and well watered and secure them to stakes as they advance in growth.
Globe Amaranthus.-These may receive the same treatment as Balsams and Cockscombs.
Hollyноскs.-Give these a good watering, and then mulch afterwards, giving them a good soaking once or twice a week according to the weather. Tie the plants ostrong stakes.
Pansies.-Propagate these whenever cuttings can be obtained. They strike best on a shady border under small hand-glasses.
Pelargonidms.- Plants in flower will require to be carefully shaded. Water freely every morning and give as much air as possible in order to dispel stagnant moisture accumulated during night and dull weather Stake and neatly tie the later flowering plants. Seedings should now be selected, discarding any which are not decided improvement on known kinds.
Tulips - Uncover all out of bloom, but protect from heavy rains, which might be ivjurious.

\section*{FORCING GARDEN.}

Fras.-Give abundauce of water or liquid manure, if in pots or tubs.
Melons.-Set shy sorts, and sprinkle frequently to keep off red spider
Mushrooms.-Let old beds be examined as soon as they begin to go out of bearing. If, upon removing the soil, the dung appears decayed or exhausted, the bed should he immediately renovated; but if, as often happens, the beds are found in good order, solid and full of spawn, they should be watered moderately: with tepid water, if they are found to require it, and in a day or two afterwards the surface should be covered with 2 or 3 inches of loany soil. In hot weather the house should be kept as cool as possible, without throwing it open ; in order to assist in effecting this, the paths aud walls should be sprinkled frequently with cold water, and the evaporation allowed to escape at the top. Continue to collect horse-droppings, and let them be stored up to make new beds, or to renovate d ones.
Peaches.-Give frequent waterings to these in their last swelling; continue to pinch luxuriant shoots, and to use the fyringe liberally.
Pines.-In shifting let great attention be paid to having complete drainage; no after-management will compensate for the omission of this. Take care to thin growing stock in due time, giving abund ance of room to plants approaching the fruiting period. Pines swelling fruit will now enjoy liberal waterings of clear liquid manure once a week, with fine syringings occaionally, more especially between their stems.
Vines.-Grapes just colouring should be assisted by a high temperature during this fine weather, accompanied, however, by an abundance of air; a moderate
amount of fire heat should be provided should the
weather become wet or cold. hardy fruit and kitchen garden. Give the wood of Peaches a thorough thiuning; This, and keeping down insecte, is the for nearb success.
Celery.- Take advantage of showery weather, shcoil Peas-Sow for young plauts.
Ridge Cucumbers.-These, Gou required Marrows may be planted now; the first tegeabio usual way on prepared beds of rich soil, with temporary protection of handlights; the last in racu places where proper stations for vigorous growth cis secured.

\section*{Che Agrícultural Gasette \\ SATURDAY, JUNE 10, 1865.}

THe short report in another page describes the Hereford Meeting of the Bath and West of England Society as a wonderful success. The weather has been most propitious throughout the week, and the attendance of spectators has been very large. The number present on the three earlier days, when the price of admission was \(2 s .6 d\)., amounted to no lewer than 16,220 . At the annual dinner of the Society on Wednesday a
very admirable diecussion of the Agriculture Education question took place, to whioh Mr. Hollasd, M.F., contributed a telling speech in support of the professional view of the subject.

We understand that the locomotires ox Roads Bill will come before the House of Lords on Monder, June 12. It has passed easily through the House of Cummons, assisied especially by the Borough members, whose constituents are the least beneficially interested of any in the powers which it confers. We earnestly hope that there will be no hesitation on the prapt of the great lords of the land to grant thene powers, oarefully hodged against abue an the Bill undoubtedly defines them, on whioh agrioultural progress, in the arable districts of the country, is so much dependent. Noble lords will oertainly bear in mind what immense progress has been made by every art and manufacture so soon as ateam power has been sucoessfully applied to it. It is the neoessary condition of agrioulture that steam power for oultivation must bo locomotive ; and to refuse this bill is literally to refuse that great advantage to agriculture and to landowners which bas been experienced in mauufactures and by millowners.
The entine which is to cultivate one field after another, even on the same farm, and still more if upon adjoininy farms, must be allowed to traverse the intervening roads duriag working hours; but let this be permitted under the reasonable restriotions which the Bill imposen. Mr. Aveling's locomotive, shown at Hereford during the past week, oame across the island from Rochester without harm to any one. Let any lack of that care which its driver exhibited durinit his four days' journey be made, as this 13:1t makes it, a penal offence; but do not let us alt.ggether luse the great adrantage of using these steam-engites on our farms, as we whall if any timid magistrate is to retain the power which the exiating law confers of stopping them apon our ruads.
On Wednesday last Mr. Stmafrord disposed of the herd of Shorthoras belonging to the late Josepi Hegar, Eaq., of Jawpoul, near İirkenhead. The cows and helters were sold in fuur luts, of three each. Grand Duchesses 5th, 7th, and 8th, realised 1900 guineas ; 9 th, 13 th, and \(18 t h, 1300\) guineas: 10 th, 1 th th, and \(17 \mathrm{th}, 1800\) guineas: 11 th , 12 th , and 14 th, 1200 guineas,-or \(542 l\). 10 s apiece! The five bulls fetched 1590 gnineas, or 333l. 18s, each:- the whole 17 animals making \(8179 l .10\) s., or 481l. 3s. each. The cows and heifers were all bought by Mr. E. L. Betts, of Preston Hall, Kent, who also purchased the American bull Imperial Oxpord for 450 guineas. Mr. Bland, of Coleby Hall, Lincoln; Mr. Wauker, of Berkswell Hall, Coventry; Captain Gunter, and the Duke of Devonsume were the purchasers of the other balls and bull oalves.
With the exception of one of the bulle, Imperial Oxford, the entire herd is descended from Duchess 51, bought by Mr. S. E. Holnen, of Lancaster, at the Kirklevington sale in 1850. This cow, besides breeuing many high priced animals, as Focrti Duke of York, sold for America for 500 guineas, and others-had no fewer than 13 descendants remaining in Mr. Bolden's herd in 1862, which were then sold to the late Mr. Hfgan for the sum of 50001 . She was one of Mr. Bates's celebrated Duchess family, descended from Young I)uchess, bought by Mr. Bates at Charles Coliling's sale in 1810. This cow was the result of an almost unparalleled " in and in "breeding, to which, indeed, the owners of the original herds of Shorthorns were forced to resort in the comparative absence then of strains of pure blood. This, conducted with consummate judgment and skill, has resulted in cunferring on those herds a wonderful power of reproducing in their offspring the qualities which they inherited. The fullowing was the pedigree of Young Duchess:-

got by
Comet,
155
The numbers are those of bulls in Contes Herd Book. No. 252 is Favocrite, 186 is Datis bull, a son of Favourite. It will be scen then fat for three generations, excepting Dasisi bull, Favocrite was the only bull employed, and

Foung Duchess was in fact the produce of half brother and sister, the different mothers being themselves related both to one another at.
Since tue Ketton sale, in 1810, other crosses had been employed by Mr. Bates upon the Duchess blood, but his family of that name was a wellknitted, closely related strain of uniform and characteristic excellence at the time of his death, when among others, Duchess 51, the mother of this herd, was sold to Mr. Bolden.
The following are her descendants in the present sale-the cows and heifers in the catalogue being printed in italies, and the bulls being printed in mall capitals-the numbers being those of bulls in the Herd Book. The animals printed in common Romar letters are dead or not in the sale.

The writer procteds thus to anticipate the sale of last Wednesdany. He says:-
As to the average likely to be made by Mr. Hegan's Shorthorns, epinions vary. We adhere to the conviction expressed in these columns three weeks agn, that it will greatly exceed all previous averages at Shorthorn silus. The largest hithertn oitnined were at the sales of Mr. Charles Colling's herd in 1810 ; of Mr. Robert Colling's in 1818; of Lord Ducte's in 1858: and of Culonel Tomneley's in 1861. At Charlas Colina's 47 animals averaged 151\%. Rs. Old. At Robert Col-
InNa's, 61 averagell 128l. 16s. \(5 \frac{1}{2} d\). At I oril Ilucir's,
 56 averaged 1281. 7s. \(7 \frac{1}{2} d\). Up to the present date, Charles Colifing's taps the iiat. Incil I:rcir's f.lls ghort of it only by 8 s. 1 dd. ; whilst Robert C'olding's is just 8s. 10d. more than Ciolonel 'Towneler's.

Mr. Straffoin, the Elitor of the Herd Book, officiat:d at Lord Dectre's, as well as at this sale. His name is itdeed connected with all the most memorable examples of high-priced Shorthorn stock known to the present gencration and we have now to congratulate him upn the latest ilustration be ha obtained from Shorthorn breeders, and given to them, of the great market value of well-bred stock.
It will be seen, from the anonuncement at the head of this article, that the anticipations indulged some weeks ago hive leen more than verified.

THE ORAESTS OF FARMING.-NO. II.
If three or four 1 marters of Wheat sold off per acre, or their equivalent-four to five quarters of Barleyaold to the maltster, are foumd not to be paying crops at present priens after deduecting the ralin of the manure taken off with them, let us try a fodmer crop by the same criterion. Taking the same average land and the same amount of expenses, viz, \(5 l\). per acre average crop ofen tons of roots as the pronluce. What is their value as food? Theoretieally they may be said to enntain about 4 lb . of nitrogen por ton, and to be cam?lte of producin; 20 to 24 lh . of n.eat (leard weigh:), at present prices of \(8 d\). per lb. equal to \(14 s\). to 1 fis. per ton, and instances of such returns may be readily procinced; but I prefer to rely on moro every lay exnerience, and will take what I think all firmers will allow to be a far return from cittle or sheep kept warm and dry, aud properly attemled to, viz, a atone and a-half of increase, or 8 s. per ton.
Tins will bring in a return of 81 . per aere for the 51. expended, and improve instead of impoverishing the condition of the land. The same reasoning will apply to hay. Pians, and other erops, grown generally for stock, the feenting prices of which will be the best gruide as to thir genemily received value cconomical foods for cattle, and
the prices of which will be found to be general
equally remunerative to the grower, if the equaly remunerative to the grower, if the value of the has not to bo charged to the cost of produch and Mariey is a striking instance of this different at a price but little short of why for the last fere rear some 10s. less per quarter. Now if the Birlera calculation is right that a bushel of Barley will stone of pork, worth eovi 48 . 6d., it is a parody glance that the extra 10 s . per quarter received for quarters of malting Barley sold off is no equis den reckoned at now writing on the sulject of slock feedi 1 aum nol content myself with thero instances of what I I mow is the general conviction, that fat animals will oring home the feeding price of the food consunued
and leave their manure in addition and leave their manure in addition. As long as this the case it will be evident that these fodder crons any where corn boll on wheat, and I may add wil. pir will bring in at 28 s ., \(7 l\).; four quarters of Birleg about the same ; two tons of Clover hay 61 beare the after-feed; 20 tons of roots, as above, \&l. All 5l. per acre over the whole farm, leavina od outhay of considered a fair profit on canital and ramuen for time and managernent. Let this then be the firs onject of the preseut farmer : to produce as much ma: s he can, to send his produce to market on four liga Wheat for foule wheel he and hot grow any quantity of his land by successive fallow crops th.t he deepend sure of a full crop of five or six crops then hores and land is so rich that he can afford to send of sith twee the 200 lb . of nitrogen which they will have extracel
out iupoverishing his future crops
aggestious I amm running my head making these prejindices of the ohl sehoul, who tell me that the rue must be pid by the Whent crop, that the land ismi robbed if the straw is left in the yards, aud thatitis well known that animals are but a necessary erib, hept for the sake of trading this straw into dung, bus paying nothing for their k epp. All I can eag is that thas is a changeable world ; these ideas may hare been true when Wheat sold at luns. the quarter, and neat at \(I d\). the lb ., and in process of time ( I am no proplet) may be true agriu, but they are very far from true now; and while present prices rule, that man onls mill succeed who can take alvantage of them. He tho camnot dnes not deserve success; if he cannot buy the necesary stocik he should not have entered on en large a farm ; if he has no accommodation for them lo should setthe that with his landlord; if he lacks the judgment to huy aud sell he is nut up to his busines; that if he poscessea thege advantaces he will thrive nad be coutent w th things as they are, and bis land wilbe yourly in better condition and better prepared for th
change, if ever that change should arrive. J. \(B\). \(H_{1}\)

discussion.

\section*{NATURAL HISTORY OF GUANOS}

The flllowing is a passige from oue of a sbort course of lec-
tures lately deliverad by Mr. Wallace Fyfe, before the
Royal Agricultural College. Royal Agricultural College.
Goano is the leading article in the artificial manure market. It is a natural enough substance, but classed with the artificials, to distinguish it from home made manure. It is now 22 or 23 years since the first crop of guano (pronounced Huano) was imported from the Chincha (fronomuced Chinka) Islands, on the coast of Peru. These islands comprise three rocks, the joint rea of which is under 3000 statute acres; and the quantity of gaano still apon these rocks is commonly estimated at 15 millions of tons, valued at more than 100 millions of money. I may cite, however, the foilowing account communicated by my brother, Lienconant Thomas Wallace Fyfe, now of the East Inin ervice, to Mr. Samuel Parr, the Nottingham chemist as given in that gentleman's
the Chemistry of Soils and Manures."
"Last gear Capt in Fsfe visitcd Perlu, and brought overffrom the Chincha Ielands a cargo of guano. His accuuut of these
Islands is tutaly different from any I have ever yet seci pubb Iliands is tutaly dinferent tran being exhausted inply, on thears,
which most writers assert, he says that the supp ly, tively ppoaking, is inexhaustible, the bed of guano being in
many places more than 10 feet thick, and two of the three
principal islinis being yet untonched. On equbing the cliff prineipal inl nt is being yet untotuched. On e anbing the cliffs
an innumerable quancity of skeletens of arge marine animal were presented to his view, such as those of the seal and walrus or sat-harse, stiking ne out of the surface in such quantites
that the piace appared to be completely white all over a and
these lumpis frequivent: y met with in Perruian guane, which are
no doubt tice aecompsed skeletons and vertebrae of these
the guano bird makeat its nest. These holes extend fo or 6 ward
 The in fetching fish from the sea to feed their youngy in es,
The immense that the air seems completuly with the m. liy this account on which the most implicit
relianee can be placed, yout will perceive," continues Mr. Parr "that guano
 excrement of birds. It is evident, frotn this brief sketch, that
the supply of guano will he at resent by no meang limiter, aud therffore it rests with yoursolves (meaning the farmers)
to petition Government, through your respective members of
Parliament, io endeavour to devise meanas to get it imported Tho this country at a cheaper rate.
Thus far Mr. Parr. I may add that up to the 1st of June, 1858, the total shipments of guano had amounted to \(2,608,659\) tons; the losses on shipment were, however, equal to 10 per cent., pet proceels at an 1 , \(p\) conl, net proceeds, after paying all expenses up to 1856 , sear alluted to (1858), the P'eruvian (oovernment was guilty of a piece of gross injustice to England, its best guann customer, in selling guano in the United State ifile, while charging England 13l. 58., making a difference in price of over 400,000 l. a year. This matter was, however, brought under the motice of Lord Derby's Goverument by Mr. Kernaghan and Mr. C'aird, whereupon Mr. Seymour litzgerald hadi the prices very fromptly equalised at 121 . but in 1863 the Peruvian Government again raised them to 13l.* My brother is absent on an East India voyage-indeed I daily expect to hear of his arrival at Point de Galle, in Cey lon, otherwise I might have had some more special infurmation to offer you regarding the Peruvian monopoly. I find, however, that in a strbsequent note to Mr. Parr he has forwarded confirmatory statements respecting his estimate of the supply. He says:-

It is stated by Mr. B. R. Wilson, the well informed Fnglish Consul at Peru, that though it is supposed that athout 3 3nou
tons 4 -year have been carried for centurics frow Clincha, of the islands in question, to the onpmsite const, it is estimated 7 milliues is still upon the island the ennrmons quantiry of 40 mililiuns of tons. But exclusive of theese there are cither islands more to the south Whence guano is shipped for
Arequipa, nand which are still far from bellig exlianted. and
vast deponits have been near Lumar or Cobiju; so that miking erery allowance for
exaggeration. the supply of Guann cmnot, for alt practica

It must be admitted, however, that the imports for British consumption alone represent only about onethird of the guano trade of the country, as carricd on by Messrs. Thomson, Bonar, \& Co., and formerly by Messrs. Giblis it Sons, of Liverpool, the agenta or lessees of the Peravian Government. This trade took is existence from the attention which Liebig first directed to the subject of gunao. But Messrs. Giibbs \& Sons only began their trade in 1842, two years subsequently to the appearance of Liebig's work. Already, nowever, in 1811 guano had, accurding to the keport of the Council of the Royal Agricultural Society for that year, been tried on 60 English farms; and these would seem also to have been preceded by a few former trials, extending over the two or three preceding yearsseverul cargoes of guano having at upwards of 20l. a ton in these years hy Mr. Myers. Gibbs \& Sons, in 1862, importe! only 182 tons of guano. In 1862, the 20th year from the commencewonsumption had, however, reached 435,000 tons for the year; of which from one-third to one-fourth only was retained, however, for the United Kingdom. At the outset of the guano trade the price ranged from 10l. to \(15 l\). per ton; from 1846.48 it was at its lowest point, 92 a a ton; during the next four yeare, 1849-1853 lo. \(5 s\). ; it reached 101. in 1854, 11l. in 1855, \(12 l\). in 1856, and its highest recent point, 13l., in 1857. It has since slightly decined, and in the language of the rade circulars, now rules at about 12 .
Not contented with the Chincha deposits, the Peruvian Government are still extending their exploration of the Guano Islands, and constantly biinging valuable eposits to light. We read in the "Commercio" of Lima, June 13, 1863, that the engiseers found the uano on the Lobos Islands extend on a large part o he surface to a depth of 10 to 12 feet, and in some pirts to as much as 40 feet deep-the guano of the himer strata being naturally inferior, owing to the influence of tho mists, but in the deep deposits the quality is superior. On both islamis the first-class guano, value 6l. a ton to Peru, is calculated at about three milions of tons; the second-class, value 4l., at Lout one million. The Macabi group, next explored, ear Malabrigo, had the whole guano first-class, not inferior to that of the Chmehas. Here the engineers broke the borer employed in their examinations, after having penetrated with great effort to the depth of 130 feet withont touching the founcation rock, and in these excavations found crystallised ammonia at 30 feet deuth. All this guann was of first quality, and the stock not less than \(15,0,000\) tuns.
On the Guaniape group, opposite the point of St Helena, the quano was also foumil to be of the first class and the stock, juifging by the height and extension of the deposits, which commence at the very sea, not can than 2,500,000 touz. The Lobos Mslands. gut both at Macabi and Guañ.ape gronps the depth of water is considerable at the foot of the rocks, so that, us at Chincha, by means of shonts, the leading will he rapid into the United hingd.um since 1sess, the impertatu ns of that year, 3ї,

11th Nov. of 186
and the gnano will not nuffer any waste. The data furnished by this exploration may teach us what to expect, perhaps of yet farther discoveries, or what further resources exist, in case
the seizure of the Chinchas:-

Lobos Ielandes,

\section*{Tons \(8,000,000\) valued at \(£\{6,000,000\)}

For 2000 years the Peruvians have known and applied this guano, of which our agricultural experience extends over 20, cad perhaps it may not he altogether
futile to cast a glance at the history of its utilisation in its own country.
Acosta is the carlient historian who notices the method of manoring the land adopted in Pern, at the arrival of the and hille of the fislands contiguous to the coast are 80 coveriog he describes as an unnterrupted heap, often some Yards deep, of the excrement of sea fow
for the purpose of loading this dung. so
 coast, from the other dide of Arequipa an far as Tarapaca, other manure than the dung of marine birds, large and snuall, in imanaense
land upon th

of
ensues, are loft soatcered in immense numbers on the beach.
The great object of the Peruvias being to manne tho Hhant
rather than the soil, they abutained an much as they could from
indiscriminatelyscattering their guano on the surfsce or in any
other way using it as a topdresing; because practice had
taught them that a aubstnceso volatic easily evaporates, an taught them that a aubst nce so volatile oasily e caporates, an 1 Peruvians were enabled to cuitivate the same lands for the same crope (Maize and Millet) and render them permanently
productive. To their terraced seed lands no repose was given.
In the province of A requipa, wheréguano is applied, Maize y ields manured with hcree dung does not exceed 18. Much depends Voyage to the south Sea" (1712, 13, 14) it is stated that it
(Capelcum baccatum), or Medze and more particularly the Ax ingredient in their stews the Pernvians could not exist, The
mode of 'application to this plant is worthy of recital. The plants are laid slanting on the ground, in order that the tom; as much gilann is then put to each as will rest in the nally, a gond handful when the pod appears. As it never
raine, great care is taken to bave tho plante watered, for the
andiluted salts in the manure would be And practically there is nothing different in our modern modes apply it in the dry form with sifted earth or ashore for a diluent 1i14, describes the port of Aricas as deriving its best revenues from the criture of birds called guano; and having storehouses to which the article is brought
tranaported to varinus parts of the neighbouring eoast to
manure the land. The pasupporta manure the land. The insupportable smell of the ordure of he thinks, to the tickness of the town, which, he says, the inhabitants might avoid by firing upon the birds, but they
prefer sacrificing their health to sordid cain. Foreigners
unaceustomed to the smell appear to be afticted with headaches. Humboldt notices that it bas the eftect of causing mentioned that during bis visit to the Chincha Islands he Sunday perhaps, obtain possession of a ship's boat, and pull two or three miles nut to
oncesaw crawling on the gails of a vessel in which one of the Tweed, full well merit the appellatiou. The Norfolk Howards fresh air. In "Ullois' Voyages," part, it gonealoft for a little hat they inflise warmeth into tho land with the dung of seaand their ding - glanu, a general termanoong the Indians, which is daily increased, and as the quantity collected in a shnrt time the deposits are regularly replenished, because been, he says, on some of these islands nhen they were the article was. Thas dung is used on the lands sown with
Maize, and by their being qerved with it the crops are con-
siderably increased. A small quantity is put round each plant, astural history of this valuable substance is, however, the coast, whetco Kelso, stared hat the best of all guann was exported, and d'Orbigny says, "It would be difficult to explain the country. of birds which we nere in blation nores; but in Aneriea this is not the case There the great virgin state as regards fishing, and perhaps abounding in the withtan eay means of obtaining a subsistence. Hence it follows their various tribee sctually 80 numerous that at certain seasons

We bave already adverted to the circumstances under which guano was introduced into notice ia this that Lord Stanley, now Earl Derby, mentioned it at the dinner of the IRoyal Agricultural Society, at Liverpool. Cargoes shortly afterwards began to nrrive, and in October, Liverpool and London agents were at work with long explanatory circulars recom mending it to our agriculturists. An eminent Glasgow merchant, who, unhappily, was in the bit of thrusting many of his letters received in the course of business into his capacious breeches pockets, is said to have re ceived a circular enclosing a sample of the article neat as inported, which of course began to give off fumes of such an insufferable character that the bearer inc on tinently thrust his fingers in to see what he had got, but the ammoniacal salts bad melted the paper, it was solt and tender, and the fingers of the Glasgow mer chant encountered what he believed to be the coplas packageaway. It was, however, picked up and perused and laid no small part of the foundation of the impetuous importer's fortunes.
The agricultural, like the mercantile experiments, first made with this extraordinary fertiliser, were only too fattering, and gave rise to a rage of speculation in both directions. In mercantile enterprise some South-western Arrican traders having discovered excre mentitions deposits on various secluded points, par ticularly on the island of Ichaboe, an egg-shaped barren rock, bare of soil, denuded of vegetation, about 1200 yards in circumfereuce, and situated about 3 miles from the mainland, with superficial formations supposed to consist of the accumalated voidances of seal, gannet and penguin (a helpless bird, that will taik and fight with you-hence what the sailors call "talking like a
penguin," instead of getting ont of the way), commencing from about 6 feet above high water mark, and rising to the configuration of the island-the island in the course of a few seasons was completely cleared. Any guano now obtained from that quarter-and there is still an occasional parcel in the market-consequently consists of the annual deposits mixed with sand and other matters.
The same may be said of the Bolivian already men tioned. At first the importations were equal to Peru vian; now, they are much lower in quality. And indeed, the only samples of the fobos Islands qualities which have reached us, are about mpon a par with these secoud-class guanos. Nor can we expect the first-class kinds to appear so long as the chief arrange ments exist at the Chinchas. What Profeasor Anderson said at Kelso last year was this: "Peruvian guano must always be the most important of all artificial manures, because any cessation of the import would have the effect of enlancing the price of all otbe manires, and more especially sulphate of ammonia and nitrate of soda, which would rise enormously in price

As regards the supply of phosphated guano, there which is available information. The best is Bolivian it comes to us. There is a very valuable kind contair. ing about 60 per cent. of phosphates and 1 or 2 of ammonia, which merits more altention from farmers than it has recelved. The great objection to these

BATH AVH WEAT OF KVGBANO AGBHCLTLURD.
HebrFordi! Jume 8. - A bentiful week has made
 but a grat mexal enjoyinent. it in more liantin merciy workn of Art. the horticultural alow and tho manic nre charming additions to it, which mate it mush moro generaly attiactives and thos, though it wan hardly to be expected that the numbieen nllemding liere would equal theme of the previoun year in the yard at Cliftom, yot the Hereford Mreting in quite one of the rapecial sucsemes of this energetic Socioty.

The entries in the live etoek department of the Bhom. yard are as mumerous as usual, owing enpecially to the large and execllent elawes of Mereford cattle-as sood together. And the implements exhitited, thonzh int in compptition, for the awardy of prizos oflured hy the So-iety, are the largest and in st striking cillection of as ricultural machinery that has yet heen wituensed in the Show-yard of this society. Taking the several clakses in succesaion, we come harnt upon are amaller Farther from home than ueval, they are a Naminer collcetiom, only 24 animuis in all, Mr. Arand Mr . Farthing's old bulls being reapectively lot and 2d in the class of old bulle. A reunarkably good The berd of the late J. W. Buller, Ead., in 1s! in the 2d class; and a neat litte yearling lolonging to Mr. Firthing in firat in the young clase. The cown are a rery good clase both in number and 1 mily. Mr. Farthing was again 1 st and 2 J , and Mro Abariat Sunith
3 d ; and the mame uminea reappenr in tho class of yenrlinga.

The Short horm Classes, hardly equal to former yenm in the buils. The Lomj) Cisuschanor, mold a calf at the Babrabam anle-a largo and mavive but aomewhat pately red and white bull, remarkably good over the oing is lat in the oldan. Mr. Sharpe, of Courtlanda, Eant Grinstead, Whin takes several prizer inte Sussex. Thue 28 priz, bril, exlibited by Mr. J. Read, of Southam, a somewhat fate
sided ronn, was literally saved from ihe butcher for use on a dairy farm and subsequent exhibition here. Mr. (iarnés younger brill Gowdowar, lat in his clees, is a light roan, long bedied, with lienvy quartere, and plenty of good hair. The Cow class is an extraordinary collection of good aximale, 13 in nutaber with Mr. Slratton's Diadom easily firct, roand as barrel, with well sprung sib, pplendid bosom, heavily fleahed everywhere; the irat and recond young beifery by Mr. Lowan and Mr. Lyen are and Mr. Sharpe are again frat and second respectively in the class of rearling beifers.
The Herefordo are a splendid show, exceeding in number, and is some respects in quality, the show of
 beifers compete for the Society's pri7"e, amd 55 entries, 4 of them pairs of heifers, compete for the local prize. Mr. Baldwin's Battigesa, Mr. Taylor's Tambabine,
and Mr. Duckhan's Commodore are retained in the memory after a walk round the classes. The first in particular is a marvellous specimen of even quality and symmetry. The winner in his class at the Batterse: Show, he has never failed of wimin: homours since At Leominster, Ludlow, and Hereford after Batterse in \(186^{2}\)-at Worcester, Exeter, Warwick-hire, Fve in 1862-at Herelord in 1863-at Bristol, Newcastle Warwickshire, and Hereford in 185 1 , and now agan at Hereford in 1865 he has carried off all the prizes, an never looked better than he does at present. Comaro DORE is another younger excellent specimen of the breed, with perhape hardly tho size one looks for at his age.

The Sheep and Pig Classes must be shortly charac terised as many of them unusually good. The long woils, both Coiswolids and Leicesters, and especially the former, are farr'y represented. The Southdown are generally a poor show ; there are fair classes both of Shropshire and of West Country Downs ; anl the horned classes are pretty well filled. There are 5o entriet of Pins in which the Berkghire breed is wel representod. The prize list is given belons
The Horse Classes disappoint, both as to number and quality. The agricultural stallion class contains severn powerful specimens of Clydeedale, Suffolk, and othe breeds; and one of the classes competing for the local prizes (colts foaled in 1853) contains a few good animalic

In the other departments of the exhibition ahont 15 entries of wool, half a dozen of Hope, to or 50 of perry and cider competed for prizes There was a tolurable competition for the sheep-shearing prizes, and a compratively mall competition for the horse-sloeing prizes. The Ponltry are a large and attractive section, buing a large tent with spectator.

The Implimemp Yards and trial grounds are crowded with a most interesting collection. All the leading manufacturers are present; the long row of locomotive steam engines engag. it in threshing. grindug, sawing, pumpins, \&-, in the departur int of machinery in motion, is one of the most ex randmars sights ever exhibited at an agricultural meeti, \({ }^{\text {g. . In }}\) ploughe and cultivatore, worked both by liorses and liy steam, are shown at work. Measrs. Fowler's steam plonghami cultivatar, drawn tiv their so-cuiled 8-horse power stoam engine, and Mearm Howardis ateam plough and caltivator, drawa by Clayton \& Shuttleworth's 10 horse power engine, made excellent work.
One of the moes interesting of the items exhibited in the other trial ground is the self-delivering reapes on Hussey's principle, showa by Meara. Hornsby; the corn being delivered ill sheaves by a set of trave.lin chaine which carry the cut corn at intervals of tho flat platform on which it falle, leaving it in well-made sheares upon the groand well out of the way of the horses.
The following in the Prizo List in the live stock department:

\section*{}

Agrioulture, Ancient and Modern-a Historical Account of its Principles and Practice, exemplified Old Norfolk Farmer.
The 13th Part continues a description of the summer season on the farm. The details of shepherding, of
dairying, and of harvesting occupy attention. The cultare of early summer and of itte-sown crops is described-Early Potatos, Rape, Cabbages, irc. The Pigzty and the Poultry-yard have a chapter to themselves; and Harvest Home is celebrated. The 9th section of the book is then reachad, including "varions subjects in connection with agriculture"-and thus affording another illuatration of the iuvolved plan in which the contents of the whole performance are
arranged. These "various subjects" include the auxiliary plants" - Millet, Canary-teed, Madder, Mustard, Poppy, Suffron, Tobncco, Sunflower, Weld, Carraway, Wood and Tenvel ; also "Forests and dotail, the conclusion of which must be looked for next fonth.

\section*{Farm Memoranda.}

Homp Farm, Newtownbarry, Wexford: May 31 1865. - The month of April was perlaps one of the finest ever known for farming operations. We had not much
rain, but the temperature rras high, writh very heary dews at night, and although wiuter only left us with March, it nown after all an early spring. Our Mangels, which were of the drill by 1 April, were vinible from end Yellow Globe) was not steeped, nor diul any rain fall and contrang to which speaks well for its genuinenesa, seed was deposited two inches method of planting, the of the present month has been considerably under that of April, with a good deal of wind and cold rain, and would hade bave not made so much progrens as they hould had the weather been warmer. But as the snil here is for the most part sharp limestone gravel, the cropping are great service, and all descriptions of out the month has fulfilled the conditions of the first has it, that doggrel rhyme of the neighbourhood, whicl

\section*{A writ and windy May}

We live in hopes that the result will verify the last May, and cominmenced thewing Swedes on the 13th of ridges, or was all prepared in the autumn, and the ridges, or drille as they are called here, made before required. In one field the only spring preparation put on the farm run the horse-hoe between the ridgen broadcant over all, manure, sow the superphosphat
seed. As the other fleld was not quite and drill the
frst split the ridges, and harrowed them down and hand-picked the weeds. We then spread the compost,
which was prepared early in the winter by mixing the which was prepared early in the winter hy mixing the
deposit of an old open town drain, an old bauk in the field, together with all the Cuuch Grass gathered from the field lust autumn, and 100 bushels of lime per statute acre-the artificial manure, phospho-guano (haich is coming greatly into use thas sown broadcast, and the rilges re-made and the seed drilled at once. In passing, I would remark that those who are not in the habit of autumntilling their land for the succeeding root crop could carcely conceive the beautiful condition of the soil for although, as was before stated, the soil is a sharp limestone gravel, it ploughed up in a manner quite loamy, in consequ
To obviate the difficulty complained of by the Messra Proctor \& Ryland in their pamphlet, of the surface soil being moister than the layer underneath, we invariably deposit the seed from \(2 \frac{1}{2}\) to 3 inches deep, and into the
dry layer, when such exists, and have never fuiled to obtain a plant from the above cause, when we hav adhered to this rule, but have suffered considerably when the appearance of the weather has led us to depart from it, and the rain has not fallen.
The heary rains which have fallen within the pas week have caused the Swedes to grow rapidly, and they will shortly be beyond the reach of the lh. ane a strong regular plant, and as we always act upon the principle that it is easier to cut ont twenty plants than to pat on in, by liberal seeding, we have no gaps to fill up by
transplanting. Sheep shearing was finished on the 15 th . The ewes came out of their fleeces in good condition, but not so the hoggets, aithough they had been well wintercd. And here I may remare, that we lost a great many lambs in the autuwn with diarrhoex never found) are a disgrace to the farm, and we have put then in an out-of-the-way field, where we hope no one will see them. I am sorry to say we were not the in the neighbourhood lost more than ourselves, and it appears to be a general thing upon the pistures of the limestone gravel atter
dry summer. At the tine the disease first showed itself the lambs were getting 1 lb . of Linseed cake a day éach, and were as fine a lot as could be found. We have atill our wool on hand, and hope to realise a higher price when the market is fairly open, as buyers are active and we know a neighbour who has already sold a mized lot, with ewes predominating, at 18.90 . per 1 b . The last 23d for shipment to England, and as our roots were all consumed by the midile of \(\Lambda\) pril we turned them to an carly piece of Grass and gave them 4 ibs. Linsecd cake and \(2 \mathrm{lb}_{3}\). crushed Oats each per day, and during the last 10 days they received in addition a plentiful supply of Trifolinm incarnatum carted to them on the Grass, and being nice weights (abont 5 cwt .), and well made up, they just suited the season, and paid us better than those we sent ont earlier. Store cattlo are easies goo and are now at a price graziers may hope to nuake a fair return for their summer's Grass. J. E.

\section*{Miscellaneous.}

Bat Guano.-A letter from Vesoul, Haute Saône, France, etates that a deposit of guano from bats has just been discovered four leagues from that town, in grotto belonging to Commandunt de Beaufond appears that this dark cavern has beeu for ages frequented by bate, and that the matters accuncuated analysis this guano possesses considerable fertilising powers.
How to Apply Gwano. - For drilling, it must first be mixed with four to six timen its weight of well-sifted inould. Charcoal in powder, either from peat or wood, is also a most excellent article to be mised with the guano in the proportions indicated. It great porosity hows it to retain the volatile moisture from the air. chiser to absorb consiterablo to plants in their early growth. Before mixing, the guano must be finely priverised, which may casily be done with a common arden roller upon the floor of a barn or shed, or even by beating it with a common shovel. A layer of ashes \&c., is then sprend evenly upon the floor, and a quantity of the fine gyano sifted over it. This is followed by another layer of mould or ashes, and another of guano, antil the requisite quantity of both is used. The whole must then be repeatedly turned with ermit, it is nom thoroughly mixed. If time will permit, it is now preferable to leave the mixture for it will be ready for ase. In using guano with the drill, care must be taken that the mixture falls below the sced, and that an inch or so of soil intervenes between them, otherwise the Horneli of the gare modern drills are well adapted for Hepositiug anano and other concentrated manures The above mixture is generally sufficiently damp to fall exactly where the hand directs it. When this is no the case, a small quantity of water should be added
manner, and the manure harrowed in; the seed is then rilled as usual. Perhaps the preferable mode would be to broadcast two-thirds of the guano applied, and to rill one-third with the seed. The young plants would hen have enough manure under the drills to serve the early stages of growth, while the guano sown broadeast would supply the wants of the plants in a more mature direction in the soil. NesZitt.

\section*{Calendar of Operation:}

\section*{JuNr -Grase Lands. This is a peculiar month to the} grazier: his pastures need to be well watched, and to bo stocked accordingly. If the season is warm and genial, bis pastures will frequently grow with such rapiaity as to destroy a great portion of their nutritive value; he must, in that case, crowd on all the stock it will in any way carry, and must ease it in the best way he can devise afterwards. It is a provident plan on any farm to allow some one field to take ite course, and become a sort of "make-shiff ;" if the season should subsequentiy become dry, and pastures decline, this field is the resource upon which to fall back, and ease the other pastures. The rough Grass will preserve it from drought, and the Grass itself, being well grown, will cause the stock to thrive. It is unpardonable to have Grass lands encumbered with Thisties or weeds, which may be so easily eradicated with common care. As a general rule, Thistles should be spudded in dry seasone, and pulled up by the roots (with "tweezers" or other wise in wet ones. The droppings of the beasts, horses, bic., ought never to remain unspreal louger than a day abound, the crows will geuerally accomplish this operation in looking for insecte. The early meadows will his month require mowing

Live Stock.- Horses will he hard at work now, and supposing them to have been properly attended to, will have manatained their strength on a full allowaree of Oats and green fcod.

Cattle ought to be thriving on the Clovers, Vetches, Ece, brought to them, assisted, as these are, by the daily allowance of oil cake, or Bean and Linseed meal, given with them. Where the soiling system is not followed, all atock will now be at Gruss, and chongy needing constant attention biring notico bere it is shepherd, there is little requiring notico bere 16 is necessary to relieve the fields by turns, as stock take to the pasturage with increasedul to bave a field prepared in this way for the lambs when newly weaned.
cheep must be washed and shorn early this month. Large sheep may be shorn for 38 . of 4 s . per score; or, of course, less, provided their meals be supplied to the shearers, which is the common practice. They should be well washed a few days before shearing. The following months, as the fly will be active among them Sheep have been destroyed before now by not more than 12 houre of the nndisturbed ravages of a "blow" of macgots. He should have a "mercury stone" to rub into the places where the sheep has been struck; or a dilute solution of arsenic may be applied after the maggots bave been dialodged by the shepherd. The little black fly will, in almost all districts, but particu larly in a woody one, be very troublesome to the head and flanks of the Ebeep. Water, strougly mixed with asafoctida, very thinly mixet white paint, or their own or cows dung thickly besmeared, are good applanead and preventives; the dung \({ }^{\text {1s }}\), The lambs must all be dipped in a prepared mixture of arsenic, soft soap asafootida, about three days alter the ewes are shorn, the ticks being then mearly all in the fleeces of the lambs. A mixture of consistigg of 1 lb . of arsenic 2 lb . soft soap, and 4 oz . of asafoetià in 20 gallons o water, will suffice, and be very effectiv. Some th summer fatting sheep will now be fit for markel.

Pigs will continue to be fed in the yaras and stied, on Porer sorried to them, and on the few Mangel Wurzels which may still be left.

Doultry.- You will now be able, at pleasure, cithe to dispose of chickens, or to put some up for fatteming in coops. Keep young birds from the hot sun: let thei walk be ns much as possible in shady phaces. loung geese of the first cluteh are now ready for table; you succeeding eluteh of ducks is now realy for use.

Dairy Farm.-This may be constuered the height of the season for dairy produce. Immediately atter the change of food from hay to Grass the milk was poor, and inuch larger quantity was required to make the samb weight of cheese. Now at least 20 gallons less of milk will make a hundredweiglit of best cheese than wath equired a month ago. Coraris tho cher is grown, hay-making commences, and if The cows should have that is cut at the enl of June. Ne cowe the amount as frequent a chauge of pasture as possibe, though the of milk will be increased for the better. In hot days保 we bronght op to the sheds during the day, where they be brought up to abundent mupply of Rye-grass, or erviy cut meadow Grass. The cows are put to bull in his and the following month. Cheeseralug is now at its height. The spriug cleeses should be carefully atteaded to, Kept oil over them, and regularly turned; thoy lio
best on a plaster floor, and should at first be slightly covered. The temperature of the cheese-room should be kept at \(60^{\circ}\) Fahr.; this is best done by hanging wet clothes near the windows or doors. Although haymaking commences in June, the great bulk is made in July; and as on the good or unfavourable weather now, and also on the good or bad management of the farmer, depends entirely the good or bad condition of the cows during winter, that month is thus, of course, one of great importance. Half the farm is usually mown, as it requires about as many acres of hay to keep a given number of cattle through the winter as it does acres of Grass to keep the same number through the summer, As soon as a field is cleared of the hay, the cows are immediately turned into it for a day or two, as a considerable quantity of Grass is left by the mower near the hedges in cases where they are wide and irregular. By the end of July the early mown fields will (provided the weather has been propitious) be found to contain good after-grass. This is greatly valued, as the cows always increase their milk on this food. Through the summer single Glo'ster cheese is ready for consumption at about two months old; consequently the first made will soon be fit for the factor; it is generally sold as soon as possible, as the loss of weight by keeping is very considerable. During this and the foregoing months the cows have nccess to the bull; this is done either by allowing the ball to run with the cows, in which case he should be tied up at night; or, which is the best and safest plan, he may be tied up, and the cows brought to him. In this, as in the other hot months, great attention must be paid to keeping the milk. For this parpose the dairy should be kept as low in temperature as possible. The milk, as soon as drawn, should be cooled by placing the pails in cold spring water, as otherwise it is apt to sour in a very short time in electrical states of the atmosphere. The greatest care, too, should be taken that the dairy be kept perfectly clean-that no meat be placed in it-that no drains open near it-and that the dairy manager remain in it no longer than is really necessary. If mills should sour, a small quantity of carbonate of soda may be added, and well mixed, to check the souring process and re-dissolve the partially formed curd. And it is a good plan to dissolve a little carbonate of soda in the water with which the dairy utensils are washed.
Highland Sheep Farm.-In good situations and favourable seasons, sheep-shearing may begin towards the end of the month; but as cold wet storms, which would be death to newly-shorn sheep, are not unfrequent in ligh districts, even at this advanced season, take care not to begin too soon. Hill sheep are generally washed by swimming them repeatedly through a dee pool, about twenty yards broad. Unless the ground be free from earth rubs, the shearing should not be delayed above three days, lest the fleece should get soiled. The lambs are remored previously; they would be hart in the pens were they beside the ewes. The sheep are "buisted," or marked, with the usual stock letter: a the same time, and to save trouble afterwards, put a mark on those ewes which are to be drafted in autumn. Black-faced hoggs should have a letter burned on their horus now. Be very careful not to shear in warm, close places; such a practice is very apt to produce scab on hill sheep. One man should shear 60 sheep per day. Be careful in the management of the fleece, remem. bering that the best-managed clip brings the best price. An exact account of all sheep is now taken, and the shepherd's books balanced.
Wedders may be clipped now also.

\section*{Notices to Correspondents.}

Heiont of Cart: Loader. A good labourer. digging a sonl yards yards probably 2000 square feet in a day, from 10 to 12 earth per diom. The same man, if he had to fill a wheol barrow, could not lift more than from 16 to 20 cubic yards, while it he had to throw this earth over the side of a cart or a waggou, he could not manage more thau one-fith part of the weight he lifted in the firat, case ; and of course the higher higher the over Which the material has to be thrown-the the more will be the labour connected with the shifting of a given weight of material. To Iower the edge and bed of the vehicle one foot, would lessen the Labour of filling it by a firth or sixth part, a mont important difference; and when, as in strathons Northampton cart, compared with the is to bo carried merits of the two, on the toone of two foet, the relative menits of
Land Drainame: Student. The following is the late Mr. Paine's description of its results : - Ist. Draining obliterates poor productive land. 2 2 . It renders the ground fit for aubsoilin or deep cultivation. 3d. It removes hurtful matter, and causes a circulation of nutritious matter to the roote of the plant eth. It increases the temperature of the soil. Sth. 6 th. By draining, moisture is kolt in improved by draining. in dry summers. The soll itsoif becomes porous the plants moisture in dry weather better than where the suil wa entirely impervious.
alt and Lime: Clayland. When the action of the cne upon the other is completed, the galt is converted into a much more nctive substauce-carbrnate of soda; and of that it per acre, a quantity which would be produced bo rather completed; only a sroall portion salt. Birt the process is not docomposed, and therefore you may the sait beconues thu ealt pors acre, along with as much lime (within 80 or 100 bunhels) as you like. Our plan would be to alake the lifes months before use.

\section*{EARTH CLOSETS AND COMMODES.}
(Moule's Patent.)
manefactlefed sulely by

\section*{WHITE \& C 0 .}

2!, BEDFORD STREET, STRAND, LONDON, W.C.

\section*{The peculiar Advantages of these Closets and Comonodes over the ordinary}

First.-That the denthrising matcrial (dry surface earth, or clay, or other subsoil) is the best for the purpose, and at the same time is the cheapest and within the reach of all classes.

Secondlr.-The supply of such material to any house or premises may be much easier than the supply of water by a foring pamp, and its removal after being used may be entirely without offence.

Thirdly.-Its application by the means proviled in these Closits is immediate and effective; so immediate that no offensive smell need escape into the rom or building in which they are used ; and so effective that all fermentation and all cscape of nuxious gases are cntirely pr wented.

Fourthly. --The expense of these Closets, in comparison with that of Water-Closets, is, as to the first cost, trifling, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are no lead pipes to burst in frosty weather.

Lastly.-In all large Establishments, such as IInspitals, Luion Honses, Schools, Gaols, and Asylums, a very considerable sum may be saved annually in the prosluction of a valuable mannure.

The effiriency of these Clusets is so great as to be seareely eredible to those persons who either have not used them or scen their mote of action.

\section*{GRAY'S OVAL TUBULAR BOILER.}

INTERNATIONAL EXHIBITION, Class IX., No. 2119.
Mr. Gray begs to call the attention of the Nobility, Gentry, Nurserymen, Gardeners, \&e., to his NEW OVAL TUBULAR BOILER
acknowledged by practical judges to be a great improvement on every form of Tubular Boiler yet introduced proved itself superior to all other Boilers for quickness of action and cconomy of Fuel, doing its work with onethe
less the amount required by any other.

Extract from Report in Gardeners' Chronicle of International Exhibition, May 24, page 4;6. "The upright form or Roiler is usually made on a circular plan, but the oval form given to Mr. Grar's rariety of it is said to me a square it seems feasible that the Boilers on the oval plan should bring the tubes more completely withen range of the bmm nute a shis being so, the change, though a slight one is no doubt an improvement."

They are made of all sizes, which, with prices, may be had on application.

thess
MACHINES are in Daley dir \(\Delta T\) THB ROYAL GARDENS, CRIBTAL PALAOK gardzkis in

In again submitting these MIACHINES to the notice of purchasers, Mfssrs. Sivirelson \& Co. wish to state that they do not make annual changes in the primip their LAWN MOW ERS. Experience has fully proved that the general design on which their MACHINES have been built for many years past is the best, and ther has been given therefore rather to substantial improvements in manufacturc, reduction of the draught, and increase of durability by the use of malleable irnn in metal, than to the production of ephemeral novelties. Their LAWN MOWERS are superior to all others for lightness of draught, elegance, and circurostances of ground and weather, being self-cleaning, and not liable to derangement in the gearing.

Illustrated Price Lists, with Selections from several thousand Testimonials, free by post on application.

\section*{HENRY ORMSON, F.S.A.,}

\section*{HORTICULTURAL BUILDER and HOT-WATER APPARATUS MANUFACTURER}

\author{
STANLEY BRIDGE, KING'S ROAD, CHELSEA, LONDON, S.W.,
}

Truly grateful for the very liberal and kind patronage bestowed upon him, begs most respectfully to inform the Nobility, Gentry, Nurserymen, \&c., that it in determination to spare no pains to merit a continuance of their favours; and that he may be enabled to execute his extensive and increasing orders punctually, and at the it possible cost (agreeably with the beat Materials and Workmanship), he has erected a most completo set of Steam Power Machines, peculiarly adapted for the pupa of his Trade.
H. O. begs to call attention to his superior manner of crecting every description of Horticultural Building, and he trusts by unremitting personal attention to tre detion his business, by using only the very best materials, by employing the most skilful and efficient workmen, and by the most moderate possible charges, to merit s cutimal the patronage so kindly and so liberally bestowed on him for many years past.

In the BUILDING DEPARTMENT lis object will be to adapt all erections to the particular purposes for which they are required. He will devote equal ulatin the plain, inexpensive, practical erections of Pits, Orchard Houses, Greenhouses, Vincries, \&e., as to the more elaborate and architectural erections of Conservatorim, Wims Gardens, \&c., either in wood or iron.

The HEATING DEPARTMENT always engages his special personal attention, and he feels justified in saying that in simplicity, safety, durability, aud enus of fuel, combined with thorough effectiveness, his system cannot be surpassed.

VENTIIATION.-Knowing the absolute necessity for thorough Ventilation, he makes it a matter of first consideration.
H. O. having competent Draughtsmen and an efficient Office Staff, he is prepared and will be happy to forward Plans, Estimates, and Specifications by post or otherrie:s to wait personally on any Ladies or Gentlemen who may desire to see him on their Grounds.

FOR OR MSON'S PATENT JOINTLESS TUBCLAA
At the Intrematiomal Eximitios.

\section*{PATENT JOINTLESS TUBULAR BOILER}

Has now gained the highest standing reputation for Power, Efficieney, Safety, and Jeconomy of Fuel. There is not a single juint exposed to the action of tive t which renders these Boilers far more safe than any other Tubular Boiler ever invented. Mar be seen in successful operation in the Gardens of many of the Nobility and our in England, Ireland, and Scotland. They are made of varions sizes. Prices on application.

Plans, Specifications, and Estimates on application.

\section*{The Garuentsg Chromitle.}

SATURDAY, JUNE 17, 1865.

A short time ago we took an opportunity (p. 482) to draw the attention of our readers to the unhealthy progeny of exotio Frr Trexs which had produced their seed in Britain. We return to this important matter to-day, in order to make some observations whioh seem to have a practical bearing apon the subject.
It appears to be one of Nature's laws that all plants which are destined to have a short period of existence hasten to produce their flowers and seeds in order to perpetuate their kind. Annuals or biennials which are to exist for a year or for two years only, take care to bloom and seed before they die. Aud, moreover, we may observe that as a general rule, all trees which produoe their seeds early, and while they are yot young are not
likely to attain a large size, or to have a very prolonged existence. And jet, at the same time, these trees may be apparentiy inally to individuals which belong to species naturally long lived, and which attain a large size.

Again, plants which become unhealthy, from Whatever cause, may frequently be seen covered with seeds, thu bastening their uwn death in order to leave behind them representatives of
themselves. Indeed the knowledge of this circumstance is often used by gardeners to restore the vigour of unhealthy specimeus. They pluck off the blossoms and prevent the plants from axhausting themselves by the production of seeds, and in this way a plant is oftentimes restored health in spite of itself.
We are acoustomed to oonsider all the plants of a species to be exsotly alike, but this is a very mistaken idea. If we auppuse, for example, that seeds have been produced by any individual species, which has been even tertilized by its own pullen, jet each seedling will difter in some respects from every other, in the samio way that every member of the human family differs from his neighbour. Who ever saw two men exactly alike? The difference consists nut only in form but also in constitution. Sume are tall, while others are dwarf, some are strong and healthy, while others are sickly or diseased. And as a general rule the peculiar qualities of each will descend to, and be mherited by, its offspring
Such being the case in this "strugglo for life" in the vegetable kingdom, it lecrmes a matter of the first importance io take care that the eeeds of all our plants, and of forest trees in particular, are collected from healthy and vigorons specimens, and iu lucalities where they arrive at the greatest state of perfection. Unfortu nately seeds are much more readily and easily procured from plants such as we have alluded to above, than from the more valuable and longlived individuals. Seed collectors at home and abroad are much more likely to get an abundant and ready supply from individuals that produce seeds while young, or in consequence of ill-health, or from otber causes detrimental to the speoies, than they are from those which we are accustomed to call the true kind, namely, that which attains to the highest state of perfection as regards beauty of form, size, and the production of valuable timber.
It is to be feared that the main object with collectors of seeds is to procure a quantity of that which is good-looking and likely to germinate, have produced it. And yet the condition and constitution of the parent tree-whether it is of its full natural size and in perfect health, or whether it be what we would call an inferior or worthless variety, or a specimen in ill-health-is really of vers great importance to those persons who may become the possessors of plants which have been raised from its seeds. We would, therefore, venture to impress upon all who collect Fir seeds, whether in the Highlands of Scotland, or in Califurnia and other parts of the world, that it is a matter of the first importance to select as well as collect their seeds from specimens which grow in the best localities, and which are healthy in oonstitution and fully grown.

Whatever may be the ultimate verdict of our experience as to the value of home-grown sceds of exotic Fir trees-whether we may fiud that owing to olimate and other intlucaces they are worthless in this country, or whether in certain localities they may be as valuable as those of foreign growth, as some information from practical men which has come to our knowledge would seem to indicate, we have one thing to look forward to with no little pleasure. In these days of steam transit to every part of the globe, we can have no difficulty in proouring abundant supplies of our favourite Pine seeds direct from the countries to which the trees are indigenous. California and other parts of North America, the Indian Himalayas, together with China and Japan, are all accossible to collectors, upon whom we would once more impress the importance of selecting their seeds from healthy and full-sized trees. \(F\).

We have received from the Hon. D. Fincrim a pletelg doublo is any double hase could be. The and to have possooned a larier than ordinary, which latter were vory aumetous petals, prubably
replacing the stamens. No trace of styles or fruit is to be seen. The fluwer was produced subse-
quently to the others on the tree. The same tree farnished another malformed flower, which Mr. Finci has been good enough to transmit for our examination. The flower stalk bears at its extremity a circlet of tive perfect stalked leaves, smaller than the ordinary ones, and destitute of stipules; within these are two smaller leaves, immediately outside the calys, who:e segments are of the usual form and appearance. The petals also are normal in number and form ; there are numerous stamens, and five styles, but no traoo of ovary or fruit. The explanation of this second H) wer seems to be this. An attempt was made to form a luaf-bud in the first instance; the seven leaves outside the calyx are portions of this bud. Then comes the true calyx, and the other organs of the flawer minus the fruit. The energy of the plant had been expended in the formation of the leaves outside the llower, and hence the swelling
said to flourish even where the water is frozen
Apinagia Preissii is said to have boen fou
South of Europe, but this requires confirmation in the
said, this Apple Crop in Devonshire will, said, Lhis year prove a failure, in consequence of the
prevalence of what is called "blight" prevalence of what is called "blight." The trees in the appearance, for instead of clusters of very melanchly scarcely anything can be seen but riddled leares giey mildew. This destruction of a useful and and able crop will prove a great loss. The "bliglen". caused by the caterpillars of a small winter moth, Chei matobia brumata. The remedy suggested for rid of these agents of destruction is to burn rubbibg under the Apple trees in early spring-a praction adopted with great success by Mr. Barave, gardener to Lady Rolle at Bicton.
-We may remind those ladies who intend to offered by the Proprietors of thie Journal, and to be varded at the Royal Horticultural Society's Special Show on the 24 th of June, that Moniday neert the 19 th inst., is the last day for giving notice of their intention to the Gardea Superintendent is South Kensington. The conditions will to mim in our advertising columns.
- The parers state that M. Havssuasy is LUXEMBOURG to his hobby of Parisian "enbellisitments." A large partion of the garden will bu taken by the municipality for building purposes.
- Aspanagus thootes are very often the subjects of fasciation, a flationed and dilitod condition of the stem, due in some caser, but not Gardeners will be familiar with thoots into one. Can the with this appearance tioned in the subjoined extract from the "\$onral of the Society of Arts," Juue 9, 1865, be the result of fasciation?:-" Enormons liends of Asparagus have recently appeared in the Puris market, and many guesses lave been made respecting the mode of their production, It
of the top of the flower stalk, which under ord1nary circumstauces contributes so much to the furmation of the sueculent fruit of these plants, has not taken place.
Pumolorically these aberrations are extremely undesirable; fl rally, hardly less su; botanically, they possess much interest. We may note by the way that double \(\Lambda_{p}\) ple blossoms are nut mentioned in Dr. Seemarin's list of Double Flowers published in the second volume of the Journal of Botany.

A curious plant was lately sent us for determination, which we at once saw was some Podostemad, and the opportunity of a closer investigation seems to show, though the specimens are in a wretched atate, that it is that form of Marathrium utile, Tul., which is figured by Telasne at Fig. 2 of the second plate of his admirable memoir. The species is found in New Grenada, where it is called Gramina de aqua, or Waterweed. In an early stage of growth it has large ollong coarsely lobed and toothed green fronds, which bear at the point of confluence with the rhizome bunches of Howers, the peduncles of which are dilated above and cup-shaped. It derives its specific name from the fact that oxen greedily devour the fronds, while a soothing drink said to be useful in fever and affections of the bowels is prepared from them.
Podostemails are amongst the most remarkable of dicotyle? \(0 n s\) from their having the halit of Liverworts and Scale Mosses (Jungermannix). They are aquatic plarts, for the most part attached to rocks or trees in ravids, and sparingly, if at all, stuplied with vascuiar tissue. Some of the species bear so close a resemblance to Cryptogams that one is figured by Willdenow as a Liverwort, under the name of Blandowia striata, while "Deutsch3land's Flora," and a third, Dicrea Wallichii, is published as a Liverwort by Taylor in the Transuctions of the Irish Acadeny. Tristicha alternifolia was also described as a Cryptogan by Willdenow.
There has been a good deal of speculation about the affinities of these curious plants. Dr. Lindley considers them as allied to the Elatinaceæ, but some good Botanists regard them as more probably reduced Lentibulariaceæ, an opiaion which was unjustly ridiculed in a review by Asa Gray of "The Introduction to Cryptogamic Botany." TelasNe, in his admirable treatise, does not express any distinct opinion on the sulject, thongh he inclines to Geraniacear. The spece:es are almost entirely confined to the tropics, anil only in a few cases are found in stagnant water, of where water has subsided, and never in liggons.
T'wo-thirds of the species at present known are foumd in America, the others are scattered over Asia, Mespeially the western parts, the Mascaren Iolatula, I whazasear, and Sontb Africa. Of the extratropical pecies two necnr in Sunth Africa ; and one, which his a
wide distribution in the eist of North Anerica from
mended to cultivate the plants not together, as in the ordinary mamer, but dispersed amongst other vegetables in his garden, and that the success wes beyond all his expectations. The cause of this is not evident, but it may be suggested that probably the experiments were tried in a very warm soil in the soth of France, which supplies Paris with an enormous quantity of fruit, l'eas, and Asparagus. Having guce ceeded in obtaining a gigantic growth, the grower tried a further experiment. He placed over each shool, as soon as it appeared above ground, a glass bottle, rather a short tube with a bottom to it, pressiug the latter down as far as possible into the ground. The consequence of this treatment is thie production of enormons heads, each sufficient to make a dish itself [?], and in some instances weigling nearly pound. This colossal Asparagus is said to be equal Havour and as tender as the finest known kinds pro. duced in the ordinary manner."

\section*{THE LATE SIR JOSEPH PAXTON.}

In the death of Sir Joseph Paxton, which occurred at Rockhill, Sydenham, on the 8th inst., and was briefly noticed in our columns of last week, bee country, and the lovers of horticulture and lano hell gardening more especially, have lost one who Ho justly earned for himself an European repuation.
was, indeed, the "Priuce of Gardeners" of the present century, and filled the high and houourable position to which he had attained with the greatest courtesj being alike distinguished for his urbanity and abill the and for the marked success which attended sind works he undertaok to perform. We feel con who there is not au individual, high or low, whed knew his kind and generous disposition, but haw that a sigh, or let fall a tear of sorrow, on learno from amongst us.
It is now 42 years since the writer of these rematrs had the pleasure of making his acquaintaace, while memory retains its place, the happy find an spent in the soci
never be effaced.
As several erroneous accounts have sppared respecting the early part of Sir Joseph's profestionity career, we avail ourselves of the pressan of fucts within to correct them, by a brief statecuent of facts wiman our own knowledge. He sprang from rootat Milton Bryant, Bedfordshire, where year 1801
was a farmer, and where he was born in the ye Having to gain his livelihood by the sweat of his the he zulected garduning as his professiou, and farden of Sis of 15 was for two years employed in the gat Batlosided Fregory Oshorne Page
Park, near Milton Bryant. Woorlhall lack, wear Watton, Herts, the beant re-idence of simmel smith, Fsers., in whose gar lens inmler the charge of Mr. Willian (ritial-one day) most snecessful fruit and line grownired duriog th continued for thre yeara, and aoquired
thorough protion knowlodge of the mont importaut brauches of horticulture. On leaving Woodgariener there. In the autumn of 1823, being then 22 Jears of employment in the garden of the Duke of Somernet at Wimbledon. About this time the Horticultural Socioty obtained a lease of some ground froin of the experimental garden at Chiswick, and the ervotion of the various stoves, greenhouses, and pits that mere considered to be neoessary for carrying out excellout field presented itsolf for study and improvement to those young men who, like Paxton, had a denire to obtain a thorough knowledge of all the not fail to take advantage, and, on the recommendation of Juseph Sabine, Esly. who (up to 1830) was the
Howorary Secretary of the Horticultural Society, ho was admitted on the 13 th November, 1823, for improvement in the new garden, and was promoted in 1824 to be foreman of the Arooretum. Here it sas that he had the good fortune to become known to him patron and friend, the late Duke of of the garden, and frequently applied to Parton for infurmathun respecting such trees and shrubs as seemed now to him, or with which he was unacquainted. The inpariably distinguiehed, combined with his greast intelligence, and that genuine manliness of deportment frourable impression upon his Grace, who in 1826 ongeged him to superintend his extensive and princely Mr. Paston had now crintitiog his bnowledge and skill as a practical gardener, as well as his natural genius and good taste in landecupe gardening and garden architecture. observes, "the wild Derbyshire region in which Chatsworth stands became the wonderful place which drew viaitors from far and near, and set the example of that princely development of grounds and plaisances which familiea Its fountains and Italian terraces ; its rich woode laid out and managed with such marvellous care; ; its huthonses, where the Victoria regia was first
compellod to blossom; and the great conservatory, which was the precursor of the Crystal Palaces in Hyde Park and at Sydenham-all are now become familiar ebjecta of admiration. But while Chatsworth aftracted left freely personages as visitors, its grounds were still close at hand, and Paxton used always to dwell proudly upon this trait in the character of "my
Duke," as he called him, who was willing to slare with tho "humblest of his countrymen his own passion for
flowers."
Will the glories of Chatsworth the name of Paston waill long be honourably associated. He had an innate of his great merits that ho koew where to stop and let Sature have har own wey. Of the truth of this remark abundant evidence will be found in the many deaticus, scenes which have been created from his But it was not ad under his superintendence. that Paston gained the favour and esteem of his munificent patron. He had an opportunity of displayfinancial arrangemeuts which he sugg regard to some wore attended with so much success, as to induce the Duke to intrust him with the superin eudence of his arge estates in Derbyshire. weary of eciation of his worth the Duke was never eputation was as his praise, and hence Paxton's mongst those of his own clase, who were the best practical judges of his works.
bition when the scheme of the first Great Exhihouselold word. At the name of Paxton became a erecting a house of peculiar construction, which he plang the Vied the growth of that most remarkable 240 designs that were sent in to the Building Comrequined for the with their views of the kind of structure to him to submitposes of the Exhibition, it occurred jections. The result is that would obviate all ob monder ature was erected in Hyde Park, and was the to arer and admiration of all who had the good fortune articleo which it contained. One of the mont striking and the in the Palace of 1851 was the crystal fountain Elin treenutiful transept which covered the two large been reported now remain to mark the spot. It has Wat desizned by Mr. Parry, and uot of Mr. Paxton, ronf in the not the fact. It is perfectly true that the theetiogs with the liuilding fosmraittee it was sur gested try the the that the transept situonld incluale the hia oftiise; and while the latter arrauged the ground phas so as to bring the trees iuto the centre of the
building, the formor was contriving how they were to
be covered. At loanth he hit upon the plan of covering the transept with a circular roof similar to that on the great Couservatiry at Chatoworth, and made a sketch of it, which was copied that night by one of the draughtsmen, and shown to Mr. Brunel, whom ho had agreed to meet on the ground the next day. Wo have should not be deprived of the merit to which he is justly entitled. For the great services he rendered to the Exhibition her Majesty was graciously pleased to ojnfer the honour of knighthood upon him.
When the time arrived for closing the Eshibition and removing the building. great efforts were made to retain it, and edapt it for a winter garden, or as a place of amusement and recreation for the public; but as this was contrary to the agreement that the Govern. mont had made with the residente in the neighbour hood, the idea upon which Sir Joseph had set his mind was reluctantly, given up. Nothing daunted, however, he soon obtained a far more aligible site for
the purposes he contemplated, and being supported by the purposes he contemplated, and being supported by his Crystal Palace reconstructed in a more substantial manner at Sydenham, amidst terraces and fountains and a glorious landscape of surpassing boauty and axtent. This wan his orowning work; and we doubs it as one of the best monuments that could possibly have been raised to perpetuato his memory.
Of late years much of Sir Joseph's time was occupied with other matters than those relating to largest operations of the day, among which perhaps the most couspicuous was the formation of railways but his greatost delight was to walk through the favourites he cultivated in early life. There he seemed in his element, and his benign countenance-the true index to his large and liberal heart-was always hailed with pleasure by those who had the good fortane to be employed under hitu. He has been often heard to say any plantas he dide in that of the Victoria regia, of which he obtained a young plant from Kew on the sd of signed to its tanls, and by adopting the mode of cultivation which his skill and experience suggested, he had the gratificatiou to perceive a flower-bud on the lst of November, and was proud to think his name would be associated with this magnificent aquatio, as On the 14th of November a leaf and expanded flower were exhibited to her Majesty and Prince Albert at Windsor; and another flower opened on the 17 th, asif to from Ireland on that day.
Sir Joseph was an industrious writer on horticul ture and botany, and, we believe, was also conuected with several literary enterprises, among which it may be mentioned that he was one of the founders of the spread of education, and used to attend and give instruction to the young men in his employ, as well as oxamine and comment on the papers they lad prepared for discussion at their evening meetings. Indeed nothing pleased him more than to lend a helping hand those who were desirous or profession. He was a Vice-President of the Royal Horticultural Society, a Fellow of the Linnean Society, and a warm friend as Benevolent Iustitution.
In 1854 Sir Joseph Paxton was returned as Member of Parliament for Coventry, and contivued to represent that ancient city until his death. He was a Liberal in politics, and voted in favour of every great measure Frich he thought likely to benefit his fellow mau too mich to say that the taste for Botany and the pleasing pursuits of gardening received a greater me fothrough his exertions, backed as hoble atrou than fister hand improvement for which the gardening world is indebted to S.r Joseph is the introduction of cheap hothouses for the million,

His remains now rest in peace near the beautiful scenes whic

O'er these his gentle spirit liugers still
Flinging holier interest o'er the grove,
Slinging tine heart to poetry and love
Bindiag us prize the farrite scones he trod,
Ald view in Nature's beauties Nature's God.

\section*{VARIEGATION.}

Tha cubject of variegation is so very interesting tha venture to give a little of my experience, und if

In looking over the various furms of variegated plants, we find they come principally from China and Japan. We ourselves have occasionally home sports, but in those countries it naust be ated form of Ecelum ieholdi caue out, it was stated, if I am not mistuken, by Dr. Siebold, that he had 'made' it, and Lis experience
among plata may be coneldered that of a greal autho. rity. Now, from close observation I have no hesitstion in stating my belief that the dwarang ey item, no much carried out both in Chins and Japan, aro the chief canses of the profusion of variegation to be found both countries. Thke the Chinese Elm an one axample. I have seen this frequently, both at nome and on old, 2 foet high, very much in ahape like a bush on the side of a higt hill, which oold wind and poverty had
offectually dwarfod, and growing in flat China dibhe 2 inches deep, I foot wide, and 13 iuches long. I have carefully noted one of these that had been on the place for 70 years, and from one small branch of which came invariably every year a variegated shoot. If this shoot was propagated as a cutting the whole variegation left it, and rampant green shoots were Cormed. But when grafted upon the Duteh Klm, it oot only retained its rariegation, but was much improved Take, again, the variegated form of the Elder. This is easily propagated, and retain its variegation to a certain oxtent, but by comparing a cutting plaut and a grafted plant it will be found
that tho latter in mo muda better as pot to romerable the other.
The variegated forms of Scarlot Polargoniums may also be taken in illuetration. I counot may that I nee 11 s. 1 mpliod to these generally, but thero aro no plants which afford
such an ample field for ntudying the effects of variegation as these. Let us, for example, take the well-known varicty Madame Vaucher. The brond black zone in ite leaf recommend it as a likely variety to cross with. particularly if we ann transform the broad black zone nto a red one, and the green ground to vellow. For this purpose we crose it with United Italy, Mra. Pollock, ic. It is a most prolific sooder, and the result is that in a batch of scedlings we get a quantity of fine looking variegated plants ; these, however, never get beyond the second or third rough leaf. Next to these in white one, and to these I wish to draw attention as being a puyzle in variegation. If the plants are encouraged to grow on, by the time they are a foot high it will be found that on one side there is a stripe similar to a piece of Ribbon Orass, and if the eye is in this, the corresponding lesf will be variegated-it may e one half, or even a stripe of the smallest dimensons, still perfectly true to that portion of the white stripe in when they break, the shoots are cither varie. gated or partly so, according to the pesition of the oye in the stripe; but it will be found that these variegated buds reqquire a great amount of coaxing to of this sort, it will very soon outgrow the variegated part ; but the old stem will continue to show where his now growth commenced, and where the stripe appears', to have been absorbed in the exuberant growth of the whole plant. This will continue up to
the autumn, when the plaut is relifted; a check then takes place, and the variegation afterwards again makes ita appearance. \(F\).

\section*{TRITONIA CROCATA.}

This is now rather an old plant, but few, if any, new plants in its way is so useful for conservatory decorafar better than those frequently introduced with high praises and higher prices, is a mere truism among chese "good old things" than to have found them. However, at Ciiveden a short time since, I had a very lueky fiul. There, in a long span rooned hause -a most brilliant and novel effect was produced by a number of plauts of Tritonia crocata, in 48 sized pots. The plants were placed at intervals of a few feet, along the edge of either bench, a few inches from the fromt and behind the small row of dwarf flowering plants that ran along it. From each small pot sprang about dozen brauched flowerspikes, and of these the heaviest laden and fullest in flower fell over and below the front edge of the bench ; others were drooping horizontally, and some were nearly erect, so that the passage straight through the house was most gracetully ringed with flowers of a brilliant orange scarlet-almost as effective a colour as that of Tulipa Gesueriana. The individual flowers too are large, and altogether tho plant is more desirable than any of its order that I have seen used for greenhouse ornament. It is a great room embellishment, and droops over the edges of vases, dic., vers gracefully and effectively.
This Tritonia is readily forced, "and may be had in flower six months of the year." The plante seem to have been cultivated in the simplest manner. 10 or 12 bulbs replacel with the fresti soil in 48 sized pots. Being of easy propagation, a stock will not take long to get, and that accomplished, say to the extent of from 20 to luts pots, nccording to the wants of the conservatory, subject for its decoration. I may add the flower stems were not staked, and that the plants are grown in cold pits when not in flower or required for forcing William Robinson.

\section*{Home Correspondence.}

The late Sir Joseph Paxton.-By the death of Sir Joseph Paxton, horticulture has suffered a great loss, and a fitting tribute ought to be paid to so great a name by erecting a lasting testimonial to his menory, and selecting for ils site the Horticultural Gardens. It making this suggesteat Loudon has been overlooked in this respect. My small mite will be gladly given to carry out an undertaking sodeserving of public supportio stimulate others abler than myself to work it out
Dale, F.R.H.S., 3, Garden Court, Middle Temple.
Vespa arborea.-Some of your correspondents would perhaps kindly mention whether or not they have noticed this wasp in unusual quantities this year. copic observation, great numbers have passed through my hands, and of these many have been Vespa rufu, and several V. arborea. The former of these is scarce in this neighbourhood (the district of Gloucestershire between the Severn and Wye), but the last so very rare that in
the course of many years I have not been fortuate enough to meet with a nest, and only once or twice with a specimen of the wasp. \(\boldsymbol{F} . C\)

The Yellows in Peach and other Fruit Trees.-In orchard-houses and in trees in the open borders where chalk is in the ascendant, the leaves of fruit trees of all kinds will occasionally turn to a sickly yellowish hue. With trees in pots this is often owing to the earth being saturated with too much water. In such cases the pota should be placed on bricks, so that the drainage is free. The simple cure is to dissolve 1 oz . of sulphate of iron in a pint of water, then mix this with five gallons of sive evenings; this soon brings on a change to that most pleasing of all tints, bright green-two quarts at each watering to a tree in a pot will suffice. A gallon
to a tree planted out will not be too much. This disease, under the nane of "chlorosis," las been treated of in your columns; still a few plain directions as to the remedy may not be out of place. T. R.

Ants.-I feel much pleasure in being. able to give your correspondent (p. 532 ) a remedy for ants-a have tried guano, soot, Elder leaves, and nearly all the prescriptions recomuiended for driving away or killing
ante, without effect, with the exception of boiling ante, without effect, with the exception of boiling water poured into their neste, which when they can be discovered my present method of ant-killing, and your readers are heartily welcome to it. It is simply the entirely supersede that disagreeable nauseous compound, the tobacco water of all the gardening calendars, nud has more than once appeared in your columns. Take of water, and while cooling dissolve in it 4 in a gallon soap. Pour it into the ground wherever ants are scen; Numbers will be killed and the rest driven away. fully believe that quassia water, which is clear and does not stain the leaves, would be efficacious without the
soap. As quassia chips are very cheap, a large quantity of the water should always be kept ready either for ants or aphids. In syringing fruit trees when the fruit is at all advanced in growth, care should be taken to wash them well with pare water, within 10 minutes after applying the quassia, or posaibly a very bitter In order to get rid of these, procure some small birds, open them down the breast, and place them wherever the ants frequent. In a few minutes the birds will be covered with multitudes of ants. Remove these and enbstitute fresh ones, or shake the ants of the carcase into boiling water and replace the bait. By following this plan up closely every ant will soon be got rid of. Edvard Bennett, Osberton, Worksop.-Chloride of lime mixed with water, and poured out of a watering
pot three or four times a day, or whenever a hlack ant was seen on the floor of the Grape-house, destroyed them. M. L.
Peas.-In accordance with the snggestion of a correspondent, that the beat four sorts of Peas for suc session purpose Sustected, we would recommend for the pixon's Yorkshire Hero, and Waite's King of Marrows. Ringleader is selected for sowing first, not merely because it blooms earlier than others, but because it fills its pods and ripens off decidedly quicker than any other sorts, excepting Carter's First Crop, which is the next earliest, In our trials of all the new Early Peas we have found Ringleader ready for gathering first in every instance, and it gains upon its competitors even more in the ripening of than in its earlier stages, so that we have Broccoli coming Early Turnips, and another of autumn Broccoli coming on on ground from which Ringleader
Peas have been cleared. Advancer is recommended for a aecond crop, it being one of the best and earliest of the wrinkled kinds, though not vearly so forward as the Marrows are also thed. Yorkehire Hero and King of rery prolific, and they are largep than any of the preensare a constant sugh for esoll of these sorts will \$ Som, Roading. - I hare only tried Sutton's Ring
\(\left\{\begin{array}{l}\text { leader against Dillistone's Early, both of which have } \\ \text { been judged by several intelligent gentlemen's gardeners, }\end{array}\right.\) been judged by several intelligent gentlemen's garde least difference between the two. William Foster, Stroud. The Crops.-With me the first Peas were Carter's, he second Bishop's Long-pod. Potatos planted the last week in November are dead ripe; I believe them to be Wheeler's Gloucestershire Kidney. We began using them on the 1st of this month. They were grown on
a bauk facing south-east. W. Taplin, Glantioy, Cardigan, June 14.
Ladies' Prizes. - As the day of competition for the Ladien' Prize is 80 near at hand, perhaps you will allow me to suggest that a good deal of leniency must be those who have tried the experiment, know the extreme difficulty of preserving a plant in beauty of fuliage or flower, when the plant is required to be kept in the house, under the ladies' care, for two months. \(A . K\). [We hope no one who has been preparing to compete never won fair lady, so neither will faint heart win the Ladies' Prize.]

\section*{Societies.}

Rotal Horticultural: June 10 (First Great Flower and Fruit Show).- Treades, which were but scantily filled, owing no doubt to the strong objection exhibitors have to showing on Saturdays.

Among Miscellaneous Stove and Greenhouse Plants, Mr. Fraser, of Lea Bridge Road, exhibited a magnificent plant of Phænocoma prolifera, covered with a profusion of bright crimson flowers. In the same collection were also the scarlet Clerodendron Kæmpferi, Stephanotis floribunda, Statice imbricaca, a large Boronia serrulata, and Allamanda cathartica. From Mr. Baxendine came Hoya bella, Rhynchospermum jasminoides, and a small plant of Clerodendron
sonæ. Messrs. Lee, of Hammersmith, furnished, among other thinge, a large bush of Erica Cavendishii, Ixora coccinea, a noble Alocasia metallica, Dicksonia autarctica, Imantophyllum miniatum, with two glorious heads of rich orange blossoms, Heams, Ar to Earl Percy, contributed six good plants, among which were the Oleander-leaved Allamanda, .. and Stephanotis foribunda, in fine condition.

Of Orchids there was a very poor display, and several of the prizes were withheld. Among them were Aerides Lindleyanum and Larpentæ, Calanthe veratrifolia; Phalænopsids, including Lüddemanniana Vandas, Saccolabiums, a few Oucidiums, Brassia verrucosa, Ladies' Slippers, Cattleya Aclandiæ, and othersin all but a mere handful.
Of Roses there was a tolerable muster, emnecially of Cut Blooms, which were excellent. Mr. Francis, of Hertford, and Mr. Wm. Paul were the only competitors in the Nurseryraen's clnss. The latter had a charming plant of Comtesse de Barbantanne with about Sansal, Paul Perras, and Marquise de Foucault, pale yellow. From Mr. Francis came Souvenir d'un Ami, Clénédolé, Charles Lawson, Paul Perraa, La Reine, and others. Mr. Terry, gr. to W. G. Puller, Esy. Youngsbury, also exhibited good plants ; and some beautiful Hybrid Perpetuals in 9 .inch pots were shown by Messrs. Paul \& Son. Of Cut Blooms, Mr. W. Paul exhibited no fewer than 10 boxes; Messrs. Panl \& Son, eight; Messrs. Lee, six ; Mr. Clarke, Brixton Hill, the same number; and several came from Mr. Cant, Colchester, Mr. Batley, and Mr. Fountain, gr. to Miss Wood, Hanger Hill. Mr. W. Paul contributed beauti ful trusses of Gloire de Dijon and Celine Forestier; and from Mr. Cant came a charming boxful of Cloth of Gold, which was deservedly the admiration of all who saw it. Mr. Clarke's Roses, of which several blooms of each kind were shown together, were also very effective.
Pelargoniums, both Fancies and ordinary kinds, were shown in good condition by Mr. Fraser, who
contributed Fairest of the Fair, James Lodge, Prince of Prussia, Lord Clyde, Lillie, Mira, Lightniug, Bracelet, Mer Polaire, Leander, Angelina, Douglas, and Lizard. In the Amateurs' Class the beat exhibition came from Mr. Ward, gr. to F. G. Wilkins, Esq. Legton. Who had Spotted Gem. Bracelet, Patroness, Viola, Lord Clyde, The Bride, Picaic, Rose Colostial,
and Madame Furtado. Mr. Marlow, gr. to G. Wigan, Esq., also showed Pelargoniums, but they were not sufficiently in bloom. In Funcies, Mr. Fraser had good plants of Delicatum, Miss in her Teens, Undine, Cloth of Silver, Roi des Fantaisies, and Hebe.
New and Rare Plants were contributed chiefly by Mr. Veitch and Mr. Bull, and formed by far the most interesting part of the Exhibition. Most of them, however, have been already described in our columns. Mr. Veitch had his new Pleroma, which is altogether different in shade of colour frou P. elegans ; Bertolona pubescens and guttata, both beautifully apotted in the leaf; Maranta Veitehii; Goodyera Veitchii ; Gymmogramma fexuosa from Eouador, with finely divided fronds: a Peruvian Begonia, with rich velvety leaves veined with white; a spenies of Philodendron with large deop-greon velvety leaveg veined with white: Adiantum oolpodes; a red.veined Ggmnostachyum,
plants of small size; Anthurium
with very dark the beautiful Aucubas sent From Mr. Bull arter Siebold and others a cubas sent home by Dr. Don Cupania undulata, Costus zebrinus femina Vernonia with parallel lines of white, Pandanus Blaves corered Rohdeas with silvery striped Jenves, Sphærogyne cine momea, Maranta Van den Heckii, Bertolovia mana ritacea, Woodsia polystichoides Veitchiana; a variegated
Privet, Sedum, Aubrietia, and Viburnum ; Fiens Pa teana, Peperomia arifolia, Calonyction sanguinem Anthurium cordifolium, and other planta, chielfy E. G. Pelar Henderson had a rosy lilac flowered Iry.leared decided acquisition, being a free flowerer, and different in colour from any of its class : also Centaurea ragusina compacta, the variegated-leaved Cheiranthus Marshalis and a small Richardia with leaves spotted with whith, a rose tinted variety of Hydrangea japonica likeriva Ipswich, furnished Primula Parryi, a Thativpson, Rocky Mountaius, having beautiful rosy purple flowers; and Pentstemon grandiflorus, also from North Amerio, having large ilac flowers, and glaucous tinted learea Mr. Salter, of Hammersmith, had his variegtad Sedum Telephium, in which the leaves are yellow edged
with green, and a variegated Polygonum filiome with green, and a variegated Polygonum filiforme. An Abies, a seedling of A. Douglasii, was shown by Mesm niums by Mr. Fraser.

Among Miscellaneous suhjects'were Palms, Economic plants, Petunias, zonate and other Pelargoniums, from
Mr. Bull ; Pansies from Mr. Hooper, Bath, and Mr, Weymouth; blooms of herbaceous Pæonies from Measrs. Paul \& Son ; Cacti from Mr. Hurn; variegated Begonias from Mr. Marlow ; an interesting coilection of hardy variegated plants from Mr. Salter ; and plant. chees, window-boxes, and ornamental garden potter from Messrs. Barr \& Sugden, and Meesrs. Hooper \& Co., of Covent Garden.
Of Fruit there was little. Mr. Ruffett, gr, to Lord Palmerston, had a good Providence Pine, and Y Standish sent Charlotte Rothschild, a Moscom, and
Ripley Queen. The best Black Grapes were Blaak Hamburgh, large and well coloured, from Mr. Obbome Finchley ; Chanpion Hamburgh, with immense berries, from Mr. M. Henderson ; and from Mr. Sage, get to Earl Brownlow, and Mr. Allen, gr. to E. Hoprood Esq., Manchester, were also good bunches. In Wise
Grapes Mr. Sage was 1st with very good Musete, Grapes Mr. Sage was lat with very good Musata, , It.
Horwood \(2 d\), and Mr. Tansley 3 d with Canuon none of these were, however, ripe. Peaches diiffy the first-named kind Mr. Hill, gr. to R. Hanburg. The Poles, was lat; Mr. Allen 2d; and an Bita Prizs was awarded to Mr. Allen for threx dishes of Violette Hâtive. Iu Nectarines, Niotwo Hâtive, highly coloured, from Mr. Allou, Whas
and Elruge from Mr. Allen, gr. to J. B. Glegg. E 2d. Mr. Hill had an excellent dish of May Duta Cherries; Mr. Ruffett was 2d with Belle d'orlens n strawberries Mr. Hill was lst with a Myat's Pino Apple, a variety remartable for its fine flavour, Apple, a variety remarisable for molstad. field Seedling, a pale red variety, came from \(\frac{y}{}\), Dwerrihouse. The only dish of Figs was one ourbib Castle Kennedy, of which we have spoken in from terms on former occasions. This camelfed Fowler. Of Melons, the hest Green-1iesued Mr. Wills, Oulton Purk. Scarlet Gem was 18 st and In the Class of Miscollaneous fruit, Mr. Stand had Cherries in pots, loaded with fruit were Frogmore Early; Cleveland, small; Werder's Early Black, and Mr ; Will erder's Early lack, and other early Grapes, weighing 21 lb .; Mr. Horwood, a bask Muscate ; and an extra prize was Henderson for Frontignans. Mr. Dwerrionse bited, not for competition, sover reen.fleshed sorth Hybrid Melon, a five-looking green-lestubers good aize ; and Mr. Hill a brace of Cur on De Mr. Henry Cole, C.B., in the chair.ware furnished by one different kinds f that interesting class of plants, Mr. Batome menced his lecture on the great Indian gen drobium by reading from Rumphius
having reference to Orcuids, which grow upon trees, and th the ground. The former, from
growth, might be denominated patr rustice it was mitatod that there wai To the patrician class Mr . Bateman referrod we were wont to pluck by the Fears. If it were true, be said, that cradle in the mountrins of Armenia, head waters of the Fuphrates and Milton was right when he plaoed no tree. Orchide Gardon of Eden. It was not, ho
between the 15 th and 16 th centuries that man begen to take any intelligent notice of them.
The discoverers of America were too much the fol. The discoverers of an to observe what was growing on' the trees under which they passed. Hernandea, a Spanish botanist, early iu the 17 th century, was stated Orchid, a rude representation of which may be seen in a frontispiece to his work, and of this Mr. Bateman exhibited a magnified drawing. One of his plants was doubtless Stanhopea tigrina, and another a Lwlia,
although Hernandez had dragged them from the trees to the ground. They were described under barbarous names-the Lzelia, for instance, as Cortico-atzontecaxotchil, which should make us thankful for such names as we now have. Turning from the new to the old world, and again referringi to Rumphius, Mr. Bateman said that that author propounded a theory
which, if not his own, he endorsed; noticing certain resemblances which Orchids bore to birds, beasts, and insects, it was supposed by him that they had their origin in the droppings of these animals-an ingenious theory, it was said, certainly, but not more more modern writers. Angrecum, a genus confined to Africa, was the name given by Rumphius to all Orchids with which he was acquainted, but names were still wanting for those of the east and west. The
latter Linnæus called Epidendrums, or tree livers, from epi, upon, and dendron, a tree; of these he thought, when the world was fully explored, there might be a hundred species, little dreaming that the time would come when we might have that number of genera with twice as many satellites. Another Swedish botanist, name of Dendrobium (tree life), from dendron, a tree, and bios, life, these forming the subjects of Mr. Bateman's discourse. These are to the Eastern world what
Epidendra are to that of the West. Orchid-producing countries, Mr. Bateman said, might be advantageously divided into districts similar to those into which Sir
Rowland Hill had divided London. Angrecums he placed in Africa, or the S. (South) district; Epiden drums would represent the W.C., or Weat Central while Dendrobiums might be said to occupy the E.C or East Central district. Ground Orchids of more temperate regions might fill up the other letters.
Epidendrums or Dendrobiums had doubtful whether Epidendrums or Dendrobiums had the pre-eminence in point of numbers, but now Dendrobiums, he thought, mentioned, did not form the standard by which the merits of these two great genera were to be estimated beauty must be taken into account, and in this respect the Dendrobia have greatly the ascendancy. had at one time in cultivation, he stated that he had now only three, while of a similar number of Dendrobiums nearly all are still in his Orchid houses.
With regard to these two great genera he said that, independea \(t\) of other distinctions, the uninitiated might easily know an Epidendrum from a Dendrobium by their different modes of flowering. In the former the blossoms are always produced at the end of the stems, of which the spike that carries them is in fact a prolongation; while those of the Dendrobia invariably Some produce one bulb with a leaf at top, and a spike of flowers issuing from the side, as, for instance, D. aggregatum; a secoud class has two leaves at top, as in
the Australian D. speciosum; others have four or five leaves and racemes of flowers springing from the sides of the pseudobulbs, as the beautiful \(D\). densiflorum, and there are others again in which the pseudobuib disappears and is renlaced by a stem flowers, as in the case of the charming \(D\). Mr. Bateman. The more recently imported species, Mr. Bateman stated, were really the most beautiful, in that respect cunsiderably beating most of the be exceedingly local. Even in Ceylon, where few Would think of looking for novelty, Mr. Thwaites had of which other day discovered Dendrobium Macarthiæ, appeared in figure, prepared from dried flowers, had was stated to be "Wis-sak-mal," and Mr. Bateman trusted that some enterprising young officer or collector would soon be fortunate enough to obtain it, and send a good supply of it to Stevens, for sale. He then obtusum, but he said the latter had no connection with pected, and the he (Mr. Bateman) had long ago susD. Wardianum in future it should bear the name of biuma, from the D. taurinum, or Bull's head Dendrocame under the E.C. district, or the Philippines, next of which are used in personal adornment. For the last twurpose some Orchids have blossoms that will Roses; and it was of those of either Camellias or experiments with the vierv of ascertaining the kinds best adapted for this purpose. What are called Bridal were neat ang which Pbalenopsis stands at the head, Of the alluded to.
botanistes, not more species of Dendrobiums known to
cultivation; a few gems may therefore at present in
nent, a rast nues, a very large island-nearly a contihave yet been introduced, and some of these are said to have tails, which, according to Rumphius' theory, they doubtless obtained from the Birds of Paradise which inhabit the island. Mr. Bateman then alluded to D. Hookerianum, a species found in Sikkim Hima laya by Dr. Hooker, and also to D. Falconeri. Turning to Borneo, dried flowers of a Iarge and beautiful species found there were exhibited. Also a leaf, measur ing some 15 inches long and a foot wide, of a species discovered in Borneo by Mr. Thomas Lobb, which Mr. Bateman christened at the meeting D. gigas. the flowers of this nothing is at present known.
As regards culture, it was stated that Deudrobiums could not be said to belong to the class called cool Orchids, inasmuch as when growing they required a considerable amount of heat and moisture. When their growths are however, made and ripened, they may be kept for many weeks in succession even in a cool Vinery.
With respect to preferences for certain classes of plants, it was mentioned that some had them in one direction, some in "another. Mr. Bateman's hobby was Orchids, among which some liked Dendrobiums, othere Lady's Slippers, and so on. Of Dr. Klotzseh, who preferred Fungi, or Foongi as he called them, to all other plants, an amusing anecdote was related; and the wisest of men, Solomon, amid the distractions of his Court, found, it was said, interest in plants, even from the Hyssop on the wall to the Cedars that grew on Lebanon. With these, and a fow other similar remarks, Mr. Bateman concluded his highly interesting lecture, for which a vote of thanks was moved by Mr. Wilson, and seconded by Mr. Franklin.
Mr. Bateman in returning thanks called attention to some Orchids just imported by Mr. Veitch from the north coast of Australia; one of these was known to bear most beautiful rose-coloured flowers, and the
other was D . Hillii, of which a representation is given in the "Botanical Magazine," and which produces a spike of white fragrant flowers resembling an officer's plume.

Royal Botanic: June 14 (Second Great Show).One of the finest of summer days induced a large and brilliant company to attend this Exhibition, which, considering the bright days and cold, even frosty nights which we have lately experiencod, was in most respects all that could possibly be desired. Of Orchids there was a magnificent assemblage. Stove and Greenhouse Plants were plentiful. Roses, especially those in a cut state, excited universal admiration. Ferns fitly filled up shady nooks; Pelargoniums lit up the centre of the picture with warm and glowing colours, which the Azaleas on this occasion failed to supply; and there was a good display of fine fruit.
Stove and Greenhouse Plants.-Among these were some admirable examples of Allamandas, of which the best was grandiflora, the large clear yellow blossoms o which were very effective. Gompholobium splendens, nother yellow-flowered plant, though much less showy, is also well worth growing, as is liknwise the old-fashioned Sollya livearis, whose bright
though small are produced in wonderful profusion. though small are produced in wondertul profusion. Among fragrant white-bloss or even equal the charm ing Stephanotis floribunda, of which we noticed several well-bloomed specimens. Rhynchospermum jasminoides was, \(\vdots\) however, well represented. Rich deep purple of the most charming description was to be ourd in the round showy blossoms, each as large as a crown-piece, of Pleroma elegans. It is, however, yet rather too early for this fine plant, which may be
expected in better condition in July. Phænocoma expected in better condition in July. Phænocoma
prolifera appears to be flowering uusully well this prolifera appears to be flowering uusually weil this
year, most of the plauts shown being loaded with blossoms, a generally speaking rare occurrence, while in colour they are unusually brillinut, expecially those on a fine plant of this useful Everlasting from Mr. Fraser. The Willow-leaved Ixora, with great heads of charming rich orange-salmon bioasoms, fores of that companion for the scarlet-flowered species of givat genus, which had moreover a third repres showy as I. rosea; this is, however, not named. Of the useful genus Kalosanthes we only noticed one plant, the whole of the varietios being autumn flowerers. Of Hæmanthus puniceus, a showy Cape bulbous plant, one specimen was also exhibited, with four fine heads of bloorn on it; of Clerodendron Thomsonæ there were several well-flowered plants, together with goo examples of Aphelexids, Heaths, Azaleas, and others.

Fine-foliaged Plants.-Aunong plants remarkable for the beauty of their foliage, independent of Ferns, one of the best was Alocasia macrorhiza variegata, with large-sized leaves, onehalf of which was in some instances creamy white, the other green, giving the plant as a whole a peculiarly striking appearance.
examples; likewise Palms, Dracænas, Curdyunees, Marantas, Caladiums, two of the best of which are the Chantinii; various Pandanuses, and the graceful Fernike Grevillea robusta.

O.chids.-Of these there was a nubie bank, which would, however, have been all the more effective had a ew of the smaller plants put in to make up groups of twenties been absent. It is evident that, as a rule, 20 kinds are too many for any one exhibitor to furnish kinds are too many for any one exhibitor to furnisa
in good condition. In \({ }^{\text {a }}\). Bullen's group from Leicester were Brassia Henchmanni, with flactspotted pale green flowers; a large Aëriles olo. ratum; Cuelogyne asperata, with crean-colourel lowers and a ciunamon-blotched lip; the clear
yellow and orange Dendrobium chrssotoxum; Slippers and Saccolabiums; Dendrobium Parishii, Moulmein species, small, but finely in flower; the clear yellow Oncidium ampliatum majus; Uropediusa Lindeni, with five flowers, having noble caudal appendages ; and Trichopilia crispa, miscalled gloxininHora. From Mr. Baker, gr. to A. Basset, Eqq., came a beautiful plant of Cspripedium superhiens, zaiscal.'. graudiflorum; the slender green-taile 1 Dandrochinum
fliforme; Trichopilia coccinea; aud various fune examples of Aerides, Sacculabiums, Phalænopsis, Vandas, and Laelias, Mr. Page, gr. to W. Leaf, Esg., coutributed a well.grown plant of the pretty rosypurple Howered terrestrial Orchis foliosa, which was hown some few years ago in such fine condition by Wr. Williams; the rare Cgpripedium Stouei ; the ellow-stained winte-blossomed Dendrobium formosum giganteum; and the scarce, rather than beautiful, Phalrenopsis rosea. The gem of Mr. Peed's collection was Oncidium sessile, a clear yellow-flowered species, seldom seen in such good condition as it was on this occasion; the same exhibitor also had Odontoglossum
hastatum, miscalled Oncidium albo-violaceum. Penny had a beautiful group of 12 plants, among which were Cattleya citrina, with three cauarycoloured blossoms; Odontoglossum Pia'ænopsis in beautiful condition, together with Cattlega Moss: 2 , and the pretty Odontoglossum navvium majus. In other roups we noticed Odontoglossum pendulum roseum Cattleya Aclandiæ, with five richly-coloured flowers he magenta and crimson-blossomed C. superba; the rare Dendrobium Dalhousianum, and its near relative in point of colour D. moschatum; the beautiful new white and orange D. iufundibulum; and Cubosyac asperata, miscalled C. Lowii. From Mr. Veisel cams some charming plants, especially one of Auguloa Clowesii, with no fewer than 16 large clear sellow blossoms on it, the usual number being three or four an excellent Vanda suavis, Cattleya labiata, Aerides Lobbii, and a fine variety of Lady's Slipper.

Ferns.-These consisted of large plants of Cibotiam cheidei, princeps and Barometz, Alsophilas, Platycerium grande, and alcicorne ; Pteris cretica, with loug narrow grass-like leaves; the varieg ited P. argyrea, Adiautum curvatum, the red-veined Drynariz un rbilMessrs. Ivery, of Dorking, showed an interesting collection, and also some new varieties of Po!ystichum

\section*{Awards.-12: 1, Messis. \(A\). Henderson \& Co. 12 ( 1 mateurs) Mr. Hill, Gr. to R. Hanbury. Esq. \({ }^{2}{ }^{2,}\) Mr. Young: 3, Mr.}

Heaths.-Among these were some well-grown plants, especially in the exhibition furnished by Mr. Rhodes. E. tricolor Wilsoni is still one of the beet of the class to which it belongs; few whites beat the old Jasmiuifiora alba, Shannuni and Vernuni; ventricosa magnificn is still one of the lest of the veniricusa gular E. viridis one plant was shown, and of the yellow E. Cavendishii and depressa many examples were exhiited. With the exception of Speuceriana, which can ow hardly be called uew, no novelty presented itseli.

Roses.-Those in pots ware by no means so fresh or good as they were in May, owing doubtless to the sunuy weather Te have hau. Cut blous in intinstances wonderfully fiue. From Mr. May, gr. Eo C. MT.
Wriory, Reading, Were charming blooms of Triomphe de Rennes, Li Boule d'Or, Souvenir d'Elise, Comiesso Cecuo Chabrillant, Souvenir d'un Ami, Madause
Verdier, and Deroniensis, all in great parfection In the Nurserymen's class, Mr. Turner stont greatly in advance
noble examples or se

Suntenay, aud Alpaide de Rotalier, the last a large
flower, in colour somewhat like Duvhesse dorleans. Azuricis.-10 in pots: 1, Mr. Turner; 2. Messra. Land

Azaleas.-These were greatly past their best, with the exception perhaps of six beautiful plants from Mr Veitch, most of which were still in full flower.

\section*{}

Pelargoniums.-These were good for the season, especially a group of Fancy kinds from Mr. Bailey, to whom the judges again awarded a large silver gilt Delicatum, Clemanthe, Princess Aoyal, Arabella Goddard, Madame Rougier, and Roi des Fantasies. In the Nurserymen's Class, Mr. Turner had Delicatum Evening Star, Arabella Goddard, and Zoë. Mr. Fraser's best plauts were Madame Sainton Dolby, Delicatum, and Miss in her Teeus. Among ordinary kinds Mr. Turner had Fairest of the Fair Lord Clyde, Viola, Desdemona, Pericies, Ariel, Glowworm, Fair Rosamond, and Guillaume Severyns.
Mr. Fraser seut Mer Polaire, a showy kind, rosysalinon with a white eye, and spotted on all the petals; also Couleur de Rose, a bright rosy-blossomed sort; Matilda, Rose Celestial, and Prince of Prussia. From Mr . Bailey came a magnificent specimen of Sanspareil; also Lord Clyde, Spotted Gem, Lady Canuing, Glowworm, Lady Thaunton, and Guillaume Severyns. Mr Wiggins had also prettily grown well bloomed plants.

Fuchsias.-Of small, tolerably well-grown plants o these we noticed two groups, one from Mr. Gardiner, gr. to J. Stutter, Esq.; the other froin Mr. Wheeler, gr. to Sir F. Goldsmid, Bart.
New Plants were numerous; most of them have, however, already been reported on in our columns. Mr. Bull again showed his handsome-leaved Aucubas and silver-striped varieties of Rohdea, Acer pseudo-platanus Leopoldi, the silver variegated-leaved Smilas macro. phylla maculata, and other plants. From Mr. Williams came, in addition to the Smilax just named, Fieus leuconeura, a largeleaved kind; Colocasia longiloba, with pale green sagittate foliage ; Anæectochilus Turneri, with leaves charmingly veined with gold ; and a handsome species of Gleichenia. Mr. Veitch had a valuable collection, in which were Bertolonia guttata, Ureeolina aurea, a yellow-flowered bulbous plant ; a handsome species of Philodendron, Perrania palmata, Oynogramma ilexuosa, and one or two of Dominy's pretty hybrid Aneectochili and Goodyeras. Messrs. E. G. Henderson also furnished new plante, among which were Richardia hastats; the variegated variety of Cheiranthus Marshalli ; and Hydrangea japonica rosea. Seedlings.-These were cliielly confiued to Pelargoniums, of which Mr. Bull contributed a large number of zonal varieties, of all shades of colour from White to brilliant scarlet. Mr. Windsor had Exhibitor, rich salmon scarlet ; Sir R. Peel, scarlet; Great Eastern, Gladiateur, and Pink of Perfection, all promising kinds From Mr. Holland came Rosalie, salmony scarlet. Of other sorts, Mr. Nye, gr: to E. B. top, laced with crimsin, aud white eye; Gladiateur, a dark kind with a white eye ; Atalanta, clean-looking magenta rose, with white eye, and small blotch in the upper petals; and Alabama, rose with white eje and dark top. From Mr. Wm. Paul came various Nosegays, among which were Pillar of Beauty, Gem, Duchess, Mrs. Wm. Paul, Orange Nosogay, and Amy Hogg, all valuable additions to their particular class. sparcler, a charming kiad, was shown by Mr. Bull,
and Messrs. Downie, Laird, \& Laing had the handsome rose.coloured Pelargonium called Wiltshire Lass. From Messre. Carter was a very dwarf free-flowering double Tropaolum, called Double Tom Thumb, which looks as if it might be an acquisition. A handsome Petunia with a white star set in brilliant crimson was shown by Mr. Clırke, of Brixton.
Misceillaneous Subjects.-Foremost among these was a grand exhibition of Lilium auratum from Mr. Turner, includiug at least two very fine varieties of that of plants in ordinary cultivation, beautifully spotted, and with yellow bands running up the centres of each division of the corolla, of wonderful width and brilliancy. The other had more red in the stripe than is usually met with in this Lily. Others were beautifully spotted large, and showy. These, as they deserved, were the admiration of evergbody. Hanging baskets, well filled, came from Messers. A. Honderson and Mr. Young, and we also noticed stands of Pinks, Pansies, Verbenas, and cut flowers of herbaceous plarts. The last came from Meesras. Paul \& Soon, and the Pinks and Pansies from Mr. Tarner and Mesars. Downie, Laird, \& Laing. From Mr. Ball camo an interesting group of
\({ }^{\text {Pruit.-Of }}\) Black there was a good dieplay, especially however, partieularly were excellent; white kinds, however, particularly Muecats, were for the most part
green aud unripe. It is to be regretted that Grapes of
this description, which are never in perfection before the middle of July or so, should be cut so early
Pine \(\mathbf{A p p l e s}\), These were few in number but good Providences weighing upwards of 8 lbs. came from sereral exhibitors, and some good Queens were shown from Bicton and other great gardens.
 Mr. Standish.
Melons.-These were shown in large numbers. Among hybrid greon-lleshed kinds was a seedling from Mr. Pottle, gr. to B. D. Culvin, Esq., which in point of flavour was excollent. It is a fine-looking yellow-skinned variety, evilently related to the Hybrid Cashmere section. Among scarlets Gom is still the best.

\section*{Arawas.-G

Mr. Kaile.}

Grapes.-Three wonderfully fine bunches of Black Hamburgh, weighing together 9 lbs .3 oz , were con tributed from the Earl of Stairs' garden at Castle Kennedy, by Mr. Fuwler, to whom a lst prize was ustly awarded for them. Equal with these were placed three bunchos from Mr. Montgomery Henderson, and magnificent examples of the same variety also came from Mr. Meredith. Mr. Hill, gro to R. Sneyd, Esq., and Mr. Meads, gr. to R. Currie, Esq., contended with Black Prince, and each of them was again awarded, as on a former occasion, an equal 1st prizs. Mr. Meade's three bunches weighed together 8 lbs. 14 oz. From Mr. Meads also came admirable examples of Trentham Black, a good and useful variety of Grape. From Mr. Allport, gr. to H. Ackroyd, Esq., came Frontignans, black as jet and fine both in bunch and berry. Among White Grapes were three beautiful bunches of Fuster's Seedling, from Mr. Lane, long, regular, and handsome in shape, and altogether excel. lent. Mr. Pottle furnished good Golden Hamburgh, as did also Mr. Fowler, and we remarked several good sxhibitions of Buckland Sweetwater, of which one came from Mr. Pottle.
Awoards.-Black Hanburgh: Equal 1, Mr. Fowler and Mr M. Henderson; 2, Mr. Meredith; equal 3, Mr. Osborn and Mr
 3, Messrs. Lane. Muscadiae or Sweetwater: 1, Mr. Duttle
2. Mr. Osborn; 3, Mr. Embrey. Frontignaus: 1, Mr. Allpurt Messrs. Lane; 3, Mr. Ingle.
Peaches and Nectarines, -These were not very plentiful; but they were for the most part finely ripened and well coloured. The Peaches from Mr. Joyce, gr. at Braintridge Park, to which the 1st prize was awarded, were remarkable for their large size. No name was attached to them; we are therefore unable to say with certainty what the variety was.
 Masters. Nectarines: 1, Mr. Lyun; M. Mr.
Mr, Hill and Mr. Turner; oxtra, Mr. Allon.

Cherries,-Among these the Blacis Circassian and Elton were the best in their respective classes. Among other sorts we noticed Belle d'Orleans, and Frogmore Early, both remarkable for their earliness.
\[

\]

Strawberries.-These were not first-rate, being dull in colour, and by no means large in size. The best came from Messrs. Turner, Waddowson, and Pottle Among the varieties were President, Omar Pasha Empress Eagenie, Eclipse, Keens' Seedling, and Sir Harry. Examples of Sir J. Paston, a new kind, were also shown ; it is said to be as early as Keens' Seedling, on which it is reported to bo an improvernent both in flavour and siz: ; and it certainly appears to bear carriage better than that still useful variety.
Figs.-Foremost among these were examples of the Castle Kennedy from Mr. Fuwler; also Whito Mar seilles, which was better on this occasion than Loe's Perpetual or Brunswick.

Essay on the Trees and Shrubs of the Ancients. By Charles Daubeny, M.D., F.R.S. Oxford. 1865. Some few years since Dr. Daubeny published a series of
lectures on Roman husbandry, comprising among other things notices of the plants mentioned in Virgil, Culumella, and other Latin authors, as well as a list of plants noticed by Dioscorides. The present volume is intended as a supplement to the one just mentioned and, from the factities which Oxford presents for such undertakings, no less than on account of his ow scholarship, Dr. Danbeny has produced a volume of much interest to the horticulturist and to the classical
student. student.
We cannot do justice to the author in these columns, but we miy briefly allude to some of the topics that come within our scope. One of the most remarkable circunstances alladed to by the Professor is the fact that so many of the fruit trees cultivated in Italy, in those early tines, were introjuced from other countries-for instance, the Cherry, the Peach, the Olive, the Vine, the Fig, the Pomegranate, and otbers, for which the climate of Italy is well suited.
Under the head of iגarn (Abies pectinata) Dr. Dau
diffelence beuween this and the circumstance that it is destrer trees in resen cut off, but not by the removal of the baving it vided that the stump and root are left in tire tree case it will throw up fresh shoots. of Firs as a pojudicial tioned by Theophrastus practice. Dr. Daubeny's book conclades with a setting farth the arguments in favour of his notion that yno is possible to extend their duration by from conditions. These opinious of the learned Promes have already been made public by himself in colomas for October, 1864. In an appendis is givea catalogue of the trees and shrubs indigenous to G m and Italy, with their ancient Greek and Latin broormen We earnestly hope that Dr. Daubeny, than whem one can be better fitted for such research, will contix his labours in this department, and thus clear mom of the uncertainties that still beset the subjam

\section*{On Ammobroma, a New Genus of Plants allid Corallophyllum and Pholismx. By Jot Torm Reprinted from the Anuals of the Lycen of Nit} Hist. New York, vol. viiio, June 1864.
Under the name abjve cited, Dr. Torrey has demile a leafless parasite of great botanical interest, and \(4 \%\). rantly belonging to the Monotropa family, If found in abuadance in a sandy desert near the had the Gulf of California. The whole plant, excopt the top, is buried in the sand, and is parasitical on the nom of an unknown shrub. The stem is thick and ina two to four feet in height, of a dall orange collom, covered with little scales. It expands aboveintorm: shallow cup or receptacle, which is densels lined small pedicillate purplish ebracteate flowers.

As this plant is not likely to be cultivated in : country, we omit further details as to its carm: botanical structure, but the interest athane Gus not merely tecluical, for, Writes Colonel Gem, of the most nutritious and palatable of veratables, is eaten as such by the Papigos Indians. It is furtity described as being very luscious when cooted, resembling in flavour the swee

\section*{however, it is far more delicate.}

\section*{Cye Aptary.}

Wrlu you kindly," writes Mr. J. H. Heati, gire informationou the foll SWARM, following the suggestions in \(y\) April 15 by removing the queen, with a broota and bees, into a nucleus bor of four frames, ad thereto some empty combs, and leaving to raise another queen. This morning, the nucleus doing very well, but on exam hive there are but three royal the
thome, so far as I can diecern after the contain neither egg nor worm. of this? Do the bees in such worms or eggs from other cells and depo newly formed royal cells? Or, supposing be abortive, will there be any dying from the bees being incapable nymphs from the brood within the Fearing an untoward result of my firs this line, I shall be anxious for your reply to how to proceed to insure a ravourabuerie In replying to our correspondeat that he the first place whether he 313 . directions given artificial swarm, a sufficient num obtained by placing the new swar parent stock, which latter must removed to a cool, dark situatio apiary. We do not usually form a because unless the queen號 breeding interfered with and checked, there loss to the owner in the math thus remored stock-hive. When the queen is do not cond Reman columns, 1861, p. 755, and Murray
Conifers, Proc. Hort. Soc. Londion
be light of a nuclear. If our correapondent will read the direcrs, he will see that to form a nucleus we recommend very dilferent plan of proceeding. By allowing the neen to remain in the parent stock, her fecundity qemnins unchecked; bat by placing her with a limited population in a confined space, her energies are sadly paralysed. The plan adopted in this instance by Mr pleath is a very good one, provided it is carried out in its integrity, so as to obtain a swarm as nearly possible approaching a natural swarm in strength. to contain no egga or larvæ, we should suppose them to be abortive. Bees very frequently, in the first stage of their excitement, construct the rudiments only of royal cells. We have had an instance where several
royal cells were formed in the centre of a newly conatructed drone-comb, which had been filled with drone eggs by the queen just prior to her removal. The grubs in these royal cells were fed for some time, but, 8 might have been expected, came to nothing.
Whetber eggs or young worms are ever removed by Which we elhould cells into royal cells, Which we ehould not ans have asserted that they occasionally are so. We are not disposed to coincide in their views, but in the absence of proof cannot assert to the contrary.
Even if these three royal cells are abortive, there
would be, at the time of Mr. Heath's writing, no reason would be, at the time of Mr. Heath's writing, no reason
to fear for the ultimate safety of the parent stock. When the queen was removed there were, doubtless, thousands of eggs as well as small worms. As worms three days after leaving the eggs are capable of being trunformed into royal larve, it is evident that a
period of at least five days may elapse from the period of at least tive days may elapse from the abandoned of royal cells being properly constructed. Before this reply can appear, Mr. Heath will, in all probability, have discovered a fresh batch of royal cells,
in each of which he may have been able to discern a minute worm, almost covered with an opaque jelly or custard-like substance, being the food supplied in lavish abundauce by the attentive nurse bees.

In the contingency of the bees failing to raise any queen, actually occurring, which we do not for a by giving a comb, contaiuing eggs and young brood, from the new swarm, from which the bees must be brushed or shaken off, to the stock or queenless hive, in place of a comb containing brood approaching to the swarm. Or, if attainable, a sealed royal cell, carefully cut out from another hive and attached to one of the brood combs, would be better still, as entailing a very considerable saving of time, and hasteuing on the
recroiting of the hive's diminished and still diminishing population.
In a sabsequent note, Mr. Heath writes, "I have again examined the hive on the 6th, and found on the same adjoining other royal cells, one of which is close reverse side of the frame, and in these latter three I can observe a white, opaque jelly, apparently surrounding a there is a constant bees are very busy over these cells ; bead is a constant succession of officious nurses, plunging idea that if there be such a thing as 'killing with lindness,' these embryo princesses are in much danger of auch a fate."

Union of Swarms.-One of my atocks dying in the wniter, 1 cat out the dirty comb, and allowed it to remain onits ond stand. On the 28th of May a splendid swarm and inpting to collect anywhere, flew across the lawn, and into the deserted hive. The box was well filled With bees, who went to work merrily. On Tuesday, super was prepared to be put on that evening. About quietly, and were successfully hived in a common aitched hive. No sooner was this accomplished, than a fine trees about fire but in half an yourds offo. These bees were also secured, thore than There was no fighting, and the hive was cluatering all orer with bees, large masses of them united wrarm orer the oated into Which they have almost filled with combs in addition to iarge-sized super nearly completed.
and being Ligurians, it into the box had departed, the sing Ligurians, it was easy to see that this was It turned, it up. ang a few bees flying in and out of the box, bees already ntored in the combs, and I concluded these inspected robbers Seeing pollen carried in, I claster of bees, about enough a to form one one
of the nuclei recommended in your colomus remained behind ans. The queen had undoubtedly Ligarian blood in her, I was glad to allow her to little swarm received some addition to its day this rompaber the hive they which pomibly out from. They worked not
stock by autumn; but being troubled with a tolerable abundance of swarms, I at length added to the box large-sized second swarm, letting the queens take their chance of sovereignty, so that whether the Ligurian or the black queen has fallen a victim to the irrevocable decree that only one queen can be at large in the same hive must for the present remain doubtful. The Ligurian was aged, or I should have taken more pains to ensure her bafety. Apiator.

\section*{Garden Memoranda.}

The College Botanio Garden, Dublin, (Concluded from p. 536). -The houses are full of which is going to lift itself thro Palms there is one being no hope of getting a Palm-palace from the Government, it is necessary to devise other means of preserving it, and so it is cut or ringed very deeply all round, a few feet above the soil, the head supported by beams resting on the sides of the house and passing on each side under the head of the plant-and all this in the hope of getting it to emit roots above the incision, so that it may be lowered and preserved from the rubbich heap for ten or a dozen years. I remember having neen a large Dracæna Draco undergoing the same process in this house some years ago.

In a cool airy greenhouse the Killarney Fern, planted in such glazed cases as we growing, and to a very unusual size, and fruiting perfectly and abundantly. This most interesting state of the plant is produced by giving plenty of air at both sufficiently op of the glazed cases, keeping the plants keeping them quite so dark as tisey frequently are. Mr. B. has long recommended that the plant should be aired as well as kept moist. Here too are plants of the variety Andrewsii and the Waterford var. Blandfordia flammea is very attractive in this house, and the back wall is handsomely covered by the large and fine Ruscus androgynus of the Canaries, with broad leaves and gracefully weeping shoots - the Alexandrian Laurel, gccording to Mr. Bain. Kingia australis, the Australian Grass-tree, with bold and erect flower-spike, is exceedthe house, as I do not know of its being elsewhere; and the Xanthorrhoes is no less desirable, with its slender and elegant leaves, from those that hang down and hide the pot to the perpendicular ones. These plante, though large, were not old enough to show the stem but from the youngest stage they are beautiful, and here they were as healthy as the wildest Rush. We grow and exhibit the Bonapartea and many othe Kingia and Xanthorrbœa are absent from the benches in a free state, it cannot be said we have the most elegant. Cordyline indivisa is kept very cool, especially in winter, and is a noble plant; and Protea cordifolia, with a neat though free habit and handsome rourded leaves reminding one of the much smaller though fine-leaved Crassula marginalis, seeus
well worth introducing to the choicest private collec tion. For the accommodation provided-seven houses, there is a very good collection of miscellanenus botanic garden plants, good Cycads, succulents, \&c. ; but Mr. Bain is very partial in his attentions to plants, and here is one great favourite-Cephalotus follicularis, proportionately more vigorous and healthfol than any Palm succulent or other plant in the house-a coo or intermediate stove. It need not be said the
Cephalotus is rarely grown well, but as it is here Cephalotus is rarely grown wastness. Occasionally one may see a plant with a fow healthy pitchers, large and green, but here is one in a large 60 -pot with such an abundance of them that, like young birds in a nest, they are overlapping each other for want of room, hanging down the sides of the pot-nearly hiding it! and all darkly coloured, with here and there pinkish bars, indicating natural and complete health. There are plants of various sizes, from almost inconspicuous bits with little pitchers less than a quarter inch in length. Now and then Mr. Bain displays a whole panful of the Cephalotus, to the astonithment of rare-plant-loving people. There is no greater proof of merit in a culti-
rator than to succeed with plants like Cephalotue, and not only sncceed in growing, but in propagating them from year to year in abundauce; and much more merit than in preserving in the best health any number of plants merely requiring the well-understood routine attentions as to wateriug, soil, and temperature. We have, I fear, of late years paid all attentiou to principles, at the cost of often forgetting the peculiarities or idio syncrasies of individual species; and thus a plant which Will not accommodate itself to the couditions so agree able to the stove, greenhouse, or hardy suljects, This is the case with a great many hardy, or reputedly hardy and half-hardy plauts. To tell all that Mr. Bain Enows of the Ceprialotus is out of the question for anybody but himself, for he is perfectly acquainted with its hotany, plysiology, pathology-in fact with all the ologies hat lave anything to do with it. He modestly says that anybody cau grow it, aud I have heard clever people say "if you keep it rool enough it will grow," but the "cold" is plentiful cuough, anit nobody grows the plant half so well. Preparations had just been made (Sept. 1) for its increase by cutting up roots about as think as a packing needle into very sbor seeds, on the surface of peat soil in 48 -pots. covering slightly, keeping moist, and placing on the front shelf of the house, where they are slightly shaded by a thick benm. They would begin to grow about the first wees in January, and potted on would continue on the same shelf till perfected specimens, unless it is thei lot to be sent off to other gardens, for, as this is tho propagated, very persistent demands for them come in from all sorts of people. For some time during the warmest season Cephalotus is removed to the tho greenhouse; during the rest of the year it lives in the cool stove. Most of the plants were covered with bell glasses talted up at the bottom. The house looks to the south-east ; but perhaps when I say that Polytrichum commune and other little ilosses grew freely and firmly green with minute mucous vegetation, this will give the best hint of the conditions that suit it

Here is Dionæa muscipula, the most curious Venus's Fly-trap, a native of the Southern States of America, and generally as troublesome a subject to tame into subjection as any of its gallant countrymen. It is in quite as perfect health as tho Cephalotus, with abundant firm and stubby leaves, and some of the specimens having small collections of insect-life caught in the traps, atrong enough to hold ssaall butterflies, centipedes, \&c Grown in peat soil, with a little Sphagnum and very small potsherds, it is kept somewhat cooler than the Cephalotu-" a small, slose hothouse destroys it will grow in almost any soil," says Mr. Bain, "if the other conditions are observed." It is sometiues pro-
pagated from the leaves and petioles, which give off buds when inserted as cuttings, but the chief mode seemed to be by division of the stem, by which stronger plants are obtained, quicker, though less plentifully than by the leaf-budding process.

From these favourites we must go to larger subjects, wondering, if Dionæa and Cephalotus should ever become common to gardens, what Mir. Bain will find to replace them in his affections. Ot course in that case we should not want him to keep up the stock for us. H says these, the Sarracenias, dcc., are easily grown, which may be true enough when once their mode of culture is that he 1 suspected on them before succeeding-the stock of each has been made from a very small beginning -must have beer great. The Sarracenias are all beautifully grown, not so large as the Bowden plants, but of deeper colour and more stumpy habit, presenting mor the aspect of ald with pitchers very large but very dwarf and firm, is grown in the cool stove or warm greenhouse ; potted in peat of course, with the lumps of soil raised well above the top of pot, as in the growth of Cattleyas, \&c. should be slowly grown, and likes a little extra heat in spring." S. rubra, a very distinct one with fragrant flowers, is the easiest of all to cultivate. S. purpurea of which there are beautiful plants, "requires to be there cool, but may have a little heat in spring, provided there is plenty of air given." S. variolaris and one seemed to be in that moist condition in which Mosses love to vegetate. Mr. Bain has not got the curious Darlingtonia, never having had but a dying morsel to experiment upon; but it would be highly agreeable to him if, from its native cointry or elsewhere, a few Gardens, where I doubt not they would soon be scen in antural viour. In the sa ne house with the Sarra cenias, Disa grandiflora was very strongly grown and flowered in a large pot of moiat peat, but Mr. Bain considers that a plant which any one oxa grow.

Having first poepod inw a hot pit, which wai being struck from eyes that fine piatit Coccoloba pubike the, and in whick an attompt with the Strychnos Gutta Percha Nutmeg, and other hot-country plants, we will look into the Orchid house, which in this garden is always intemeting. The house Epidendrum vitellinum-the best variety, and with

Cattleya violacea, both plentiful, the Cattleya being flowered in succession from the begimng oing adonted Christmas; and the same course plentiful species, the result is a more constint supply of flower than is usual. Fiven Mr. Findlay, who has, I think, the neatest lot of Orchids in any botanic garden, hod not so much flower. Apart from arranging such successions of bloow, Mr. Bam the Vandas are more frely than otber of peat, are getting menty of gun and light, and look very much firmer and dwarfer that we commonly see them-the flose formed ous the leaves mate in this honse having beens sent here being very striking. There are fine Saccolabium, with good specimens of the best sorts of Vanda and Aerides, al apparently in a riper and harder state than usual, which is of course conducive to the free-flowering tendencies spoken of. Mr. Bain says he geta abundance of flower from his Orchids summer and winter by giving plenty of air and light. The Dove plant is blooming very freely; Odontoglossum pulchellam is of twice the there in flower : also a beantiful blue-striped Amaryllid of Brazil, Griffinia lyacinthina, surely better wnrth growing than many common members of the family With the Sand-box tree, the Ivory-nat, Oalophyllum Inophyllum, C'inchonas, the Clove, and other highly interesting plants anong the Orchids in this house, wa Fiens nympheofolia, with handsome large leaves and very distincte aspect, one of the oldest and best of the genus, though uncommon at present.

And here is the Ouvirandra in profusion. When it was first sent out Mr. Bain got a small bit from Mr Bewley, from which all his plants and all those he has
"sent out" have originated. Very woon afterwards he was the only one who could spare a specimen of the plant in the neighbourhood. About London this plant does not-nearer than Kingston-seem to grow vigorously, though at Chelsea and elsewhere much attention has been paid to it, and all sorts of soils and positions given it. Mr. Bain's plants are grown in the purest soft-water flooded over several times daily, and drawn off by a tap in the bottom of each pan weekly or thereabouts. I
Messrs. Jackson's gursery at Kingston the two specie are freely grown and thonmed in water with (when saw it) a green surface, as if it had not been changed for many days, and in large inverted bell-glasses in the Orchid honse; so that the water could not be very warm. By Mr. Berry, at Furres, in Morayshire, it is grown, and very freely, in water of a luigh
temperature-not lower than \(80^{\circ}\); and at Dangstein and elsewhere in tarks without any speeint attention yet in some places, though all these methods and all sorts of snils may be tried, the plants dwindle away and perish. The canse is prolmbly some peculiarity of the water; if not, what elve? The plants here are perfectly clean and hard-looking, though not so large as they are in other places where the plant is wel managed, the heat in the Orchiddlouse being, in Mr Bain's opinion, insuffeient to grow it to a large Ouvirandra in all stages, from the tiniest mortel hal nn inch long, upwards, all in free health, and all growing on firm lumpe of Dublin thountain peat. Each of the large mil establi-hed plants could be liftert ont with its adierent lunp of pent, and underneath these being crocks, of course there was not a partiele of mud or any impurity about the plants, as is often ennsidered mecessary-some peoplo using river-mud or soil. The pan ste shaded well in sumbier, "to prevent the attacks of conferva;" and this is worth remembering, for that often injures ani kills the Ouvirandra. W. R.

\section*{Miscellaneous.}

The I'ine in Madeira.- The island oblained its name from the first discoverers, who, finding it thickly studded with trees, called it Madeira (wody). Set on fire ly them on landing, a large portion of the foreat for a long tume, and thus the way was cleared for the reception of the Vine. The Sugar-cane, however, having found its way here fiom Sichly, Madeira was firat distinguished for producing the bent augar known. For a long time this product was the principal commodity which it yielded to commorce; but after the rivalry of the West Indies remiered its colture mo longar remunerative, the residents applied their undivided energies to the production of wine. It wan not till a much later period that the merits of their vintages became generally known, and acquired that preeminence to which their inuate excellence juatly entitled them. Several varietien are raised, and both quality and flyour are influenced by the preculiarities of site and soil. The north bumdary of the island, though sufficiently fertile, being exposed to cold winds and foge from the sea, is leas smitable to Fime culture than the southern part, where all the choice phantations are aceordingly located. Most of the red frapes are appropriated to the manufacture of white whes; but a portion of them are converted into tinta, or red wine, wheh, as long we it retains its cnlour, is sufficently agreeable, thomzh White orts deficient in the higit aroma for which che the gronuds fronting the honses en lines of planted in
so as to lie horizontal to the sun's rays They thus afford a canopy for those who walk under them, yielding delightful shade in that ardent climate. On tree, to screen them from the violence of the wind, but some of the plants are supported on frames not, more than 3 feet hiuh. Fruit ripens as high as 2700 feet of elevafion, Ond wine is mate at 2000 . On certain rock gromads, open to the full influence of the sun's netion, the celebrated Malmsey is grown. As the Girapes from which it is obtained riquire to be over-ripe, or partially shrivelled, they are allowed to hamg for about a month later than these ned in the manufacture of the iry class. Of this wine there ate three sorts, the produce of three varieties of the plant: when of the best kinu, it is most fragrant and delicious. One farm is appropriated for the exclusive supply of the royal family of Portugal. The very highest quality Malmsey is raised on the south side of the island from "nit avalanele of Of this class very little reaches this country. Denman's Vine and ite Prwit.

\section*{Che \(\mathfrak{A g r i ́ c u l t u r a l ~} \mathfrak{G a z e t t}\)}

What has Mr. Mechi done to deserve a testimonial from the hacds of his countrymen? It is plain that some people believe him to have laboured and acoomplished muoh; for his Grace the Duke of Sutherland, Lords Eesex, Houghton, Lonsdale, the Venerable Archdeacon Huxtable, Mr. Le Neve Foster, Mr. Alderman Sidney, M.P. Sir T. B. Wesrrari, Bart., atid many others, are a committee for arging his claims ; and a dozen men met the other day in a room, and subseribed 2000 d. towards the satisfaction of them, There are, howeter, no doubt, a great majority who have looked upon him hitherto merely ās an eloquent but random speaker upon agriculture, in whom strong social instinct, imperturbable good nature confident aelf-assertion, a ready utteranee, an upon the surface of reoent agrioultural progress, and to keep him there during the period of ohange or even revolution, which has been experienced in British agriculture by the current generation.

If Mr . Alderman Mecrit had been merely this -if he had merely fullowed selfishly-or it may be, unconsciously, for the gratification of his own atrong instincts-the bent of natural taste, one might have accepted the results of his speeches, gatherings, publications, multifarious efforts of all kinds without much feeling of indebtedness, simply rejoicing in his prosperity as a man of busiuess and society, or regretting any disaster which had overtaken him, without feeling personally called upion to express in any tangible way the sympathy which either lot excited. Now, it is doubtless true, that a grent deal of what Mr. Mecert has accomplished really has been done without much strenuous purpose. We cannot doubt that it has to a great extent been sheer exuberance and overflowing vitality-his own keen enjoyment of agrieultural society and lifo-which, along with a gemeral and indefinite good-will, has been the real groundwork of his achievements-the foundation without which no definite benevolence, however intelligently and powerfally directed, eould have leet sucoessful

But in addition to all this (no doubt animated by it, but) urgent and effective on its own account, there has been throughout his career a genuine and intelligent philanthropy which has won for him respect even frum the most sareastic of his critios, and which has at length culminated in the snceess of the great publiv institution founded by hitm, wholib anniversary was last week celsbrated.
Mr. Alderman Mecui has no doubt been in the van of agricultural progress rather as a flag-bearer or a trumpeter than as a regular fighting man; or, if the latter, it has been in guerilla warfare, not acourding to "the rules of the service," that his principal successes have been achieved. We look upon him in relation to the regular rank and file of the agricultural forces in this country pretty much as a Garibaldr in relation to those regular armies by whioh not only vietories but their resalts are consolidated and made sure. He is, however, the more likely on this acoount to exeite strong feeling one way or the other; and thete is thus, we are glad to think, the greater probability of success attending the effort which is now being made in his behalf. It is not with the immediate occasion of this effort that we have now to de; or with the circumstances which were about to enforce the sale of the Tiptree Hall Estate. The immediate object whioh Mr. Garrett and his other agricultural friends have now in view is to prevent that sale-to raise such a sum as may replace the property in the hands of one who has made it a sort of watchword in the agricultural world.

Mir. Mecei has "served his time" as an agricultural soldier, and has well earned his discharge with more than mere thanks. It is now more than 20 years since his letters describing the purchase of the Tiptree Farm, the condition of the land, and the means proposed for its improvement, were prablished in these columns. Since then, useful essays in agricultural journals, cyclopædias, and papers-admirable speeches at agricultural meetings all over the East of England, in the North of Eagland, and in the North of Scotland-lectures before the London Farmers' Club and the Society of Arts-continual agitation of the great social and professional questions of good landowning and good farming, goud cottages, good drainage, town sewage, \&c.,-direct contributions to good social feeling between town and country, and other separated classes, by many hospitatle annual gatherings-and last of all a laborious canvass of the country, and the consequent suocessful foundation of a great benevolent institution for the especial benefit of agriculturehave followed one another without intermission.
In the manner of all this-along with plenty of honest inconsistency and lots of rattling volubility there have been displayed an undisturbed good nature, which has often been severely tried, and as oapital an illustration as has been ever seen of straightforward and transparent simplioity both in the man himself and in the voluminous English writings he has published.

As to the matter of it all-we cordially agree with the statement in a ciroular which the Committee of the Mecir Testimonial have published, that:-
Annong the various branchen of agricultural improve ment upon which he has expended so much time and capital, he deserves especial credit for the indomitable energy he has displayed in conducting a sorids of experiments by which the utilisation of town sewage, the great importance of deep drainage, the clearing hedgerows of useless timber, and the autumn cultiva tion preparatory to root crops, have been made familiar to all practical farmers. By these efforts, as well \(\bar{u}_{\bar{j}}\) by thê lectures he has delivered, and the papere he has read befote the Society of Arts and Farmers' Clubs throughout England, a healthy stimulas has been given to agricultural improvement, -the fruits of which are visible on every side in the increased invertments of capital, and in the caltivatieit of the soil.

This statement does not include any reference to the Royal Agricultural Benevolent Institation, which we owe to the energetio benevulence of Mr. Alderman Mecii. Let us quote from the speech of Earl Spencer, who presided at its anniversary dinner last week, the following statement of what has been aceomplished here. Lord Spencer suid :-

Mr. Alderman Mreft had felt how much an institution of this kind was wanted by the agrientural bony with whom ho Was asociatad, and he had sucoesefulysexeried ridims to say that
 expect to find sigrot many, who hd fallen into distrest from

The noble Chatracar coneluded by saying that the success of the Institution was in a great measure due to the continued exertions and ability hoped the company would include his name in the toast he was proposing. - The toast was warmly responded to, and the Secretary read a list of subsariptions amounting to about 3900 l.
We think enough has been said, both to show that English agrioulture is largely indebted to Mr. Alderman Mechi, and to prove that our readers may well sympathise with the effort that is now being made to present him with a substantial token of the good will and respeet in which he is held.
Mr. Moves's earth eloset is, perhaps, more a horticultural than an agrieultural sabjeet-a matter concerning the garden rather than the field -and yet it has received discussion in another column at the hands of an experienced agricultural writer and a good praetical man.
The subject of house-sewage is of great importance to cottagers and householders in the country, where a sufficient supply of fertilising matter for the growth of greedy vegetables is a real difficulty, and one which is thus successfully overcome.
We have seen the utmost fertility seoured for a considerable area of garden ground by this alone, where some little vigilanee has been exercised and interest taken by the master of the house in the nubject; and we strongly recommend the use accordingly of the invention which has been patented by Mr. Moule, and is manufactured, as the advertisement declares, by Messrs. WHITE \& Co., of 29, Bedford Street, Strand, W.C.
It is quite true, as the advertisement asserts, that the deodorising material (dry surface earth or olay, or subsoil), excellent for the purpose, is at the same time the cheapest, and within the reaoh of all classes; and that ;a very considerable advantage, not only in large establishments but in mere cottages, may be thus obtained by the manufacture annually of a large quantity of valuable manure.
It is not in the least probable that earth will ever be substituted for water in dealing with the refuse of whole atreets or towns, but wherever there is a detached house, surrounded by a garden, it is plain that the plan of Mr. Moule is at once offeotive, coonomical, and remunerative.

\section*{agricultural education.}

The following, from the columns of the Heveford Times, is a
short report of the diecuavion which took place laet weok at the meoting of the Bath and West of Eog glapd Agricultural Mr
Mn. T. D. Achasd, M. P., referring to the subject of the special education of the son of the tenant fariner, obser wed that in the Dean of Hereford they met a man Who was known far and wide as having done more than
any other individual to improve the system of educa. any other individual to improve the system of educa-
tion, and who had greatly benefited the agricaltural classes. Now that the Dean had laid the foundation of a real and practical education, it was for the parents of children to judge whether it would be best for them to give their children the advantages of the improved eystem, or place them under the care of ignorant mohoolmasters and schoolmistresses. He was sure that the good school would be at once appreciated by the parente, in preference to older and more imperfect found one In their Preaident (Lord Taunton) they found one whom the Queen lad chosen to guide one of the mont difficult inquiries ever submitted to a com. mission for consideration, and intelligence guided him mitted for inue in the very complicated subject subman precent whowe name way clowely connected with
the progress which had been made in the improvement of systems of education, viz., Mr. Holland, M.P. for
Evesham, who he was glad to say had taken up the subject most ably. They did not agree altogether as to details, but they were entirely agreed as to the main object, viz., to assist the farmer in educating his son in a school where he should learn something connected with his business. He did not think Mr. Holland would differ from him, but that what he said would find an echo, viz., that business was business; he meant bysiness could only be learned in business, and that he did not believe it could be learned in any other way. Still, it was a most difficult matter, and very perplexing to know how best to advance the knowledge of the young farmer, so that he may be enabled to pursue his calling under the most advantageous circumstance3, and appreciate when he becnme older the education which had been imparted to him. First, assuming that the youth was a good, honest, and virtuous Englishman-though how he was to be made that he would not then stop to say-they had to teach him to feed animals, to understand and to do farm work himself, to understand the management of those who had to do it, to teach him to distinguish good market man. Upon his being properly instructed in these matters depended his success as a farmer. How this was to be done was the problem which had caused so much difficulty, and he believed that the solution of it was of national importance. It was a subject of intense difficulty for the reason that there were some tenant farmers to whon the expenses of a boarding. school were too heavy to be incurred, and who had no other means of early educating their children. The education must be early in life. The time was come when they ought to think about it, and he believed there was a more general readiness to give the subject the closest attention. The Royal Agricultural Society
had taken some important steps in the matter, but they would excuse him if he said that he felt a little proud when he reflected that their Society had given the start to the educational movement; for it was at the Tiverton meeting, in 1855, that the distinguished nobleman, Lord Fortescue, first started the question of improving the education of farmers' sons. Thus they found that their Society laid down the principle in 1855, that skill
in business must be acquired in practice. The Royal Agricultural Society has since then been carrying out the principle then laid down. He had to apologise for bringing the subject before their attention, but he was reminded of it by what fell from the worshipfnl Mayor of Hereford, in his address in the arts exhibition on the first day of the show, viz. :-"That the exhibition was itself a school of instruction."
Mr. Holland, M.P., said they had had that evening many satisfactory speeches in connection with the question of agriculture, and he, who had worked all his life, whether right or wrong he would not say, in connection with it, felt gratified at the way it had been received that evening. He was gratified with the reception the remarks of the various speakers had different some 15 or 20 years ago at that been very calturists were satisfied with following in the ways of their forefathers, but now, as Colonel Acland had remarked, they desired all the scientific knowledge relating to their profession. What had brought about that great and important change? That the change in the law had produced a great change in agriculture was manifest, but at the same time agriculture up to a few years ago, was quite an isolated profession, and from the very nature of their trade, agriculturists could not communicate with their fellow men, and could not exchange ideas the same as the manufacturer and the merchant did. Consequently, agriculturists seemed to be an ignorant class. The reverse is the case now. He thought that within a short time agriculture would stand where she ought to stand-on a level with the sister arts and sciences. They had heard from Mr Acland a good deal respecting what ought to be done in connection with the edrcation of the farmers' sons, and they had also heard from him what ought to be done and what could be done by the Royal Agricultural Society. Now no difference existed on that point bpinion that it ass necesarary for a youth to have a cood general, sound, and religions education, to fit him for any walk in life, and au especial kuowledge of that peculiar line in which he would have to pass the greater portion of his time. It elevated him and gave him the advantage he ought to have, and which every enlightened man must have. He (Mr. Holland) thought that the funds of the Royal Agricultural Society ouglit to be expended on all matters intimately connected with agriculture. They knew that if a man were left to himself and had not the advantage of being able to communicate with his fellow manas to what was going on, he soon became quite an isolated and ignorant person. This had been the case with agriculturists, but this Society, and small local Societies, provided members with the opportunity of interchanging their opinions, and thus brought about a large amount of intelligence. By the introduction of machinery they were able to compare the past with what might now be done, and thus see in what direction their own task lay. Their task was to keep pace with the

Mr. C. Wmbe Hoskyns, like Mr. Acland and the English Agricultural Society, which had years taken a very deep interest in the subjed for education for the class referred to subject of po matter of course, considerabie difference of but in the main they all might be said tecting was agreeably surprised recently upon reading education to find that that he had come to the upere the more the subje the truth of Colonel Acland's viz, that a business must be learnt in a broine education and an acquaintance with a good the best farmer; but there could be woulde : schools of instruction bearing directly would be of great service to the youthfal there coula, Mr bolland thast as to the for education had a great influence upon the ery earl) boy's career; but it did not make him a good tom agriculturist.

\section*{HOUSE SEWAGE.}

When will the subject of sewage, as human areres are now commonly called, receive a practical and in an off-hand, but so far as it went very soly \(n\) the question of deodorisation by dry material, nod substance he referred to as a disinfectant ashes. This is not a now idea, as it has long practised more or less perfectly in town and offices; but let us, see how it can be more value of the matter to be thus dealt with this it is not necessary to enter into the resed onest of the liquid sewage which now runs in streams metropolitan main drains and the minor unde conduccors of proviacial towns and cities, present temper of aldermen, corporate b rally, and vestry boards, the more reasonabie e! practicable any suggestion might ikely would it be to meet with considence much less approval. When the facts of expenditure of \(7,000,000 \%\), sterling in the metmon with proportionate sums in smaller to wns, and hasis the purpose of conveying sewage in a form whicul to where it is of no use, have been fully realia fair hearing. We do not be maides, with the load of responsibility which erparint and lecturers, and speechifiers, have heaped on theirme shoulders, but prefer to allow them and their sdm to deal with their own difficulties in respect nvestments, for in no other way it appears and their extravagances receive that effectail which they deserve. Nor is it necessary w the estimated value of these substances by ma or although the agriculturists of this country been held up to public ridicule and cen "stopping the way" to profitable sewage utid do not require two sentences to be said the material be come-at-able in an orm. It is, therefore, only as a reminder men that we say, the whole aim and end of oping the resources of the from Perve ertilising it by bringing guano from ront and and other substances from the utmost earth, in addition to husbanding our bing ha is simply for producing food for sustaining Human food, therefore, contains what wo the essence of all our native productions the far-and-wide gathered fertilisers fields are partially or fully restored. the simplest possible conclusions to realis minds that whatever unnecessary wable ins in in our system of domestic economy occut the elements of physical life to run in the they have done their assigned of system.
The Providential order of Nature under mice sind live, multitudes together, is full for the it for our instruction. If it were poss city tants of London or any olnortion of fires; hey now do, with the exophesis, were prevent those aërial changes which fires no their health would sufter, and thor by by digestion, and that slow combed be ystem which sustains the reque tances which remain become repusive, pondingly injurious. Of these rem contaminating and volatile and subullo the confined air of collective dwounds generated. It is here where the become beneficial to health, for the affin form matters have for the cary are form of smoke, and the carbonic acid
urely Larcless to the people who, without such charged from rains. During the past dry year mauy counterat.ng iutluences, would have their lives clear and cistinct cases of poisoning have been jeopardsed. Thus, it may be gratifying to learn that traced to the tlowing of cesapools into the wells the rery atons, visible and invisible, which we complain of bor bue. are preserratives against pestilential disense3. And thus we may learn how to use similar substances, but which we can easily command and con suol, in a more health-preserving as well as more profit able way, for the purpose of reproducing human food. soot is one of the very best deodorisers we have, while coal dust has some of the same power, at the same time that it is a good absorbent; wood ashes, too, and charred vegetable refuse are tain to soot from coals as disinfectants, While they contain alkalies that sstion of offensive and injurious scents. How now do wo proceed in a general way? Put soot on the fields at \(0 \%\) a bushel as it is, and after throwing the dust of our fires in some corner we put them in a manure juat is it may happen as to place, while we dig a hole or pit for holding out of sight the very valuable mate fiar making harmless and portable. As we have said, corporate bodies may bo left out of our present con s:derations. But what an amount of waste both of fertilisers and health annually takes place in villages, blocks of houses, and single cottages, by thus overlooking our resources, and not adapting our means to our requirements.
It is possibly clear that if we were to make our cesapools out of the ground, or nearly so, instead of in the ground, the valuable fertilising substances, nearly all of which we now lose, night be saved in their entirety, and this without any offence to the senses or danger to health. In nine houses out of ten, enough calcined refuse and dust arise to make perfectly innocuous the accumulations of ejecta which the daily refuse which now goes to the dust-bin or the dung-heap regularly scattered in the receptacle sug gested. This may be formed of plain brickwork aud opening at the back can be conveniently arranged; or, where room is limited, a metallic receptacle for removing bodily when full may be adopted. And where a little expense is no object, a few mechanical arrangements way be adopted for allowing a systematic distrbution of this natural deodorising material from a chest or hopper made at the top of the closet.
It is not necessary to go into figures to show the know it must be good if taken proper care of ; we know tho that our fields, from the close cropping some of then have had for several years, either require to be rest)red by being kept down in pasture, or by having returned to them the elements which have bcen
lost in the way indicated. If we were farming near a village or number of houses, and we were sure retaining our occupation, from having a lease or other sccurity, for 21 years or so, we wo egreement at once for as many of these places as we could get; and while we wouid agree to give, by way of encouragement, the owners of them some small sum per annum for their refuse, we would under proper perfectly inoffensive to the inhabitants, at the same time that they would be convenient for carters to empty them with cleanliness and ease to themrequired but ordinary weather nothing woum ashes of fire-places and the house dust. The soot which accumulates hot weather. reserved for changeable or excessively hot weather; and if this were not sufficient, a small mhock of dry powdered clay might be in reserve for allaying any offensiveness or loss of fertilisers from to ns itation. The practical part of this system seems to us to be so simple and easy that it is a matter of astonighment it has not spread before now into one of general adoption. The Rev. H. Moule is pressing this sabject in Dorsetshire, but he damages the prospect of to the soil in plan-that of carrying domestic refuse urging wach complications as drying sheds and using the sume clay five times over! His material (clay) which only be referred to as an auxiliary, instead of The importance the main article to be used.
leodorisenportance to health of the dry system of Fery one who and removal is something startling hompools the under ground. In villages and at country got from wells or household purposes is generally drins will draw we only recall to mind that 4 -feet 12 yards, we may juder in tolerably of the effect of a clay 10 or frently jards off, the the well that may be a less number of ne more deep water of which, too, may be 8 or 10 feet lrain of that deaving the well wall equal to an open from contry villages, at farm houser and cottages, green We know rill ammoniacal and sulphuretted mixtures. castric or trphoid fores or low surfaces wherein arise solely from the way the tom absent, and which water of wells used ebb and flow in subterrana curents according as the surface soil may be orer
rain occasionally to flood the cesspool and conver it noxious contents unobserved, from being underground to the well, while the average of rain has not been enough to so flood the land-springs and well that the amount of matter which lad found its way there was not diluted enough to be only injurious, but remained destructive to human life.
If it be only for the latter considerations this subjec is worthy of the most serious attention by every familly. And when it is considered that if farmers and villagers and other householders would work together this now common source of destruction to life may be assumes an importance which partakes of the character of a patriotic and otherwise good work. Where this has not been already begun, the present season is good time to commence, that a stock of compost may be in readiness for the Turnips of the coming summer and the Rape of the following autumn. W. G

\section*{agricultural education}

\section*{The following is the ultimate report of the Education Com} mittee of the Royal Agricultural Society. We publieh it,
anxious that the experimeut it indicates should recelve anxious fair tria! ]
1. The Committee have revised the report placed before the Council on the loth of March, and have again taken into consideratiou the various subjects which were discussed upon that occasion.
2. In consequence of the late period of the year at which this report bas been 1 eferred back to thein, the Committee cannot recommend any examination in practical agriculture in 1865 , and are not prepared to advise the appointment by the Council of a Board of Examiners until a trial has been made of the existing examining bodies.
3. The Committee recommend that a sum not exceeding 100l. be given for Society's prizes amonyst candidates who have passed the Oxford or Cambridge Senior or Junior Examination.
4. That a sum not exceeding \(100 \%\). be given for special subjects enumerated below,* to candidates at the Oxford and Cambridge Examinations who have passed the Preliminary Examination.
5. That a sum of \(100 \%\). be left in the hands of the Committee for additional prizes in connection with these examinations, or for expenses atteudant thereon.
6. Every candidate shall be recommended by member of the Royal Agricultural Society of England; and must be a persoa in some way dependent ors the cultivation of the land for his support, or intending to make agriculture his profession.
7. In the choice of special subjects, the Committee being necessarily restricted to those in which candidates are examined at the Oxford and Canbridge local examinations, have made their selection with a view to the encouragement of proficiency in such branches of science as are applicable to the study of practical agriculture, and calculated to prepare the mind of the student for the proper reception of that practical educa of the working of a farm, and thus enable him to test the value of such theories as may be presented to him.
8. The subjects chosen will be especially meful to machine makers, manure manufacturers, and others who it is honed will be attracted to these examinations though more indirectly dependent upon agriculture for their support than the actual cultivators of the soil.
(Signed)

\section*{EXPERIMENTS IN CATTLE FEEDING}

Last spring Mr. A. Smith, Stevenson Mains, who has given much attention of late to the fattening and reaing of stock, having a pretty large quantity o Potatos on band about the time when he wa beginning to feed off his cattle, thought of trging how they would thrive on a Potato diet, with the usua quantity of oil-cake. The cattle were accordingly fed off with the Potatos, and Chrove so well on them that he resolved on testing the qualitios of the root still further this season, by feeding from first to last entirely on Potatos. He at the same time, for his own guidance in carrying out the pulping system, to which he is a convert, made a separate experiment to test its vaine a A lot of cross-bred Sthrthorin stirks, rising two years A lot of cross-bred Sthort-horni stirks, rising two years
old, were boght by him at the Linton Oct ber market old, were bought by him at the Linton Oet, ber market
last autumn, and divided as equally as possible with regard to condition, size, and so forth, among thre courts. The lot numbered 20 , six of which were to be fed on Potatos, seven on pulped Turnips, and seven on sliced Turnips, with the usual allowance of straw in each case-the pulped.fed cattle getting theirs chopped. From the moment ther entered the courts, up to the month of March when the whem the frs time, and in the same proportion, got oil-cake and Barley-meal to finish off, the cattle were kept excluaively to their own kind of diet.
A very short time served to show which was the most nutritive article of food. Almost from the first the Potato-fed cattle took the start of their neigh but cars, and, to use a racing phrase, were never others. They took to the Potatos with the greatest relish, and vever pave the slightest indication "boven" all the time they were being fed on them. In fact no beasts could have given less trouble or anxiety from the day they were put into the close till they were taken out in the early part of May-a period o about seven months. While the experiment was thu satisfactory with regard to what we may call the No. 1 court, it was not less so as on pulped Turnipa These containing the from the heginning, evinced Tuperiority over their neighbours fed on the sliced Turnips They were decidedly in better condition, and brought more mone pertape the best test of all that they had been better fed. The cattle, as we have said, they had been better fed. Courte, were placed as nearly
when they went into the cothe as as possible on an equality, and their difference of condition at the end of the experiment was solely due to the difference of feeding. The average price obtaine for the lot was \(171.5 s\), each. They were sold privately, the value put on them by the purchaser-a dealer o juilgment-being as follows:-No. 1 court, 171. 15s. 16l. 15s. In other words, the Potato-fed cattle brought 10s. a.head more than those fed in the ordinary way.
The value of the experiment consists of course in the expense of raising the different lots, because \(n 0\) iuducement is federed to make any change court, Turnips to Potator. This point can be satisfactorily answered. Each of the courts was supplied with a daily allowance of Turnips carefully weighed or measured, and it was found that while in the case of the No. 3 court the seven cattle consumed 11 cwt . of Turnips per diem, those in No. 2 court were well and better fed with 9 cwt., or 2 cwt . per day less.
was a direct saving in the cost of the Turnips, but it
also saved-a matter of some consequence-the expense of carting the extra quantity from the fields, which could be ma they lay in their drilla. As a set-off against this, there is, no doubt, to be placed the cost of the pulpiug, but this is not a very serious matter. Sterenson Maine, but has a one-horse power machine, which he finds answer extremely well. The amount o work it gets through is large, amounting to about 3 tons per hour-amply sufficient for the wants of a pretty large number of cattle, we stould fancy. There machine, when it is in motion; but making every allowance for these items of expenc.it the system, that quite convinced, from is, when properly coaducted, in every way more profitable to pulp than to give arne the Turnips simply sliced. His experiment this year seems to prove
that not only can they be fed on a less quantity of Turnips, but that they bring a better price when fat than the others.
Taking the value of a ton of Turnips at 10 s . - the average weekly cost of fecding the No. 2 cattle amounted as nearly as possible to 4 s . 6d. per head, calculation can easily be made, and will be found as stated. But the Potato.fed cattle slow a considerably greater saving. The courts were put under the chargo of a careful and experienced cattleman, whose instruc. tions were to note down exactly the amomnts consumed that the six cattle in the No. 1 close only consuane.l a weekly average on ibous as the expeuse per weet of per ton, gives \(3 s .1 \frac{1}{2} d\). as the expeuse per week of feeding
each beast, and feeding it 17 . per head better than with food that costs \(2 s\). \(4 \frac{1}{2} d\). more money weekly. It is also to be remarked that the Potatos used were unbeen selected from them, and were only available for the starch mill, or for feeding purposes. So satisfied is Mr. Smith with the result of his carefully conducted expuing it next year on a larger scale. He has no doubt as to its being the most profitable as it is undoubtedly one of th
cattle for the market.

\section*{Home Correspondence.}

Sgricultural Education. - Permit us who have been very much interested in your papers on this subject to thank you. Although you are in the minority at present, still your advocacy will in the cally wrought out, to the advantage both of the tillers of the soil and the landlords. The Highland and Agricultural Society of Scotland is as much at sea in the Agricultural Society of England, and amongst other propositions for the advasicement of theoretical agriBritish Agriculfurist by a landlord meuber of the Highland Society, advocating that some of the funds of the Society should be given to this and that parish school, this and that acalemy, and this and that
aniversity. The small pittances proposed, of 102 . \(15 l\)., and \(30 l\). respectively, provoked a derisive smile in valuing the realings aud teachings of the masters of such seminaries at such a low figure, especially when we take into consideration hat probably at the Universities) could not have a special
fee from the scholars for any of the agricultural branches tanght. \({ }^{\text {2n }}\) Upwards of 20 years ago a considerable stir was made in some schools and ncademies with agricultural classes. The teachers had great difficulty in turning their teachings to an important practical end, We were in daily intercourse with pupils and teachers then, and have watched the progress of the former
since they left the agricultura! class, an 7 have falled \(t\), see any benefit arising therefrom. Indeed wo know for a certainty that although they committed to memory the answers to the questions in that admirable little the late Professor Johnston, of Durhum, not me has read his valuable "Elements," far liss his far more valuable "Lectures" oa the same subjec's. We are
aequainted with one teacher at present who has plits of ground from the principil heritor of the parish, which the teacher hands over to his most deservin pupils, who crop it as they choose, and retain the produce. When the master was asked bane time ago if he would like to have more ground, he replied, "I have plenty," although there are only six or eight small plots in a school numbering from 60 to 100 pupils. We state these facts to show the absurdity of wishing to spend money thas, on what would not be of the least benefit to agriculture. Last year we met an acadenaical teacher, who took two or three of his agricultural class pupils many years ago to pass an examination before Professor Juhnston or the Hirhland Society at one of their shows. The boys had been instracted in Johnston's Catechism, and got much praise for their examination. I inquired o! the teacher he suniled and said, "Oh, I don"t suppose anything of the Hoyal Agricultural Society's examinations at Came
agriculturists are concerned. A number of years ago, after having spent a five years' practical apprenticeship ith three different farmers in Berwicsshire, we went and Low. In our attendance on these teachers we and Low. In our attendance on these teacherements were an effective mastery of the subjects professed to be taught by the former, and the almost uselessness of attending the lectures of the latter. In the veterinary astion with such a varied and extensive yard or infirmary practice, as clinched firmly on the student's minds the class-room teachings. The 3000 yearly cases brought before us made a visible impression, while the Professor made us administer, and seated on our benches. The demonstrator of anatomy, with his specinens before him, and his nuseum a step away, also the dissecting room down stairs, could easily spoken of. And the piarmaceutical chemist, with his laboratory, lamps, tubes, tests, \&cc. \&sc., on his table, endorsing all he advanced with that tangible and visible illustration which the most obtuse could easily understand. And to crown all, we had weekly class examiaations by the teachers in the unisersity we had an hour's lecture five days a-week, and nothing more. It strue we had a good museum, or collection of implements, seeds, plants, and paintings of animals to visit as often as we liked; so far as the class teachings and improvement thereon were concerned, we might just as well read Professor Low's text-book in our own rooms, nd neither wasted time nor spent class fees on at ony benent. We much regretled that there with Professor Low's class, where we could lave gone frequently to rivet on our minds the teachings of the Professor. It seems an exceedingly difficult matter for such large and influ. entia! Societies as the Royal and Highland Agricultural to do what the individual Professor above referred to the present apathy of the two Societies, and do not agree with what is being done to foster the agricultural education status, we hold that there is, in such cities as London and Edinburgh, or indeed in any large city or town, all the elements whereby the practical and theoretical education of agriculture might be most
materially advanced, and at a cost within the reach of materially advanced, and at a cost within the reach of either be rented, or the entrée to a farm at all times, by au arrangement with a first-rate practical farmer at a fixed fee, say ten guineas a-year for each student. Such largetowns, where the students could attend the classes of accredited teachers of veterinary surgery, agricultural chemistry, botany, and other classes which the Societies may prescribe or the student may desire. The manager hour's daily lecture in a room fitted up in the farm, that lecture to be on the business or work of the farm being that day pursued. Weekly examinations to be the Societies to be granted to those who pass a creditable examination at tho annual ineeting. Such a course of
agricultural instruction would not cost more than twenty gainens a-year for each student, the student paying these tickets for entrée to the farm and class room, and boarding and lodging himself where it may course, which we consider would soon be self-supporting, and if landlords were giving a preference, in choosing tenants for their farms, to those holding diplomas or cortificates of a first-class agricultural educational status, much outatrip what is being done. P. \& ' T'

\section*{Soricticg.}

Egsex Show at Rrentwood,-The meeting of this flsurishing Society was held in the town of was the best that has hitherto been held. The entries were very large, the attendance good, and the weather the cattle classes, pigs were very good, and so were the sheep, considering although is nore a bumerous, were not quite so cood as at some preceding shows. There were however some very fine animals, particularly in the cart-horse class. The winner of the prize for all England was a very fine Suffulk with good action, belonging to Mr. C. Boby, and which beat the prizestallion in the Local Classes, which also competed. The latter was a fine iron-grey lorse,
belonging to Mr. Ellphick, which beat with some difficulty a capital Suffolk, belonging to Mr. Richardson. There was a fine cart mare and three-year-old filly, belonging to Mr. John Ward, which took prizes. The pairs of plough horses were very gool. Mr. Pason's pair of Suffolks beat a powerful and active bay and grey, In
In Cattle, Mr. Joln Clayden took several prizes in Short-horns; also Mr. Bramston, M.P.; Mr: Bearblocks Mr. Cristy, Mr. Taylor, and all for good animals.

There was a large entry of Sheep, and a great variety
blished out of originally four distinct breeds, ibst
what can be accomplished by vigilauce and an What can be accomplished by vigilauce and art
breeding. The Downs of Sir T. Lenard, Lord Bry
brooke, Mr. Bramston, Mr. Sewell, Mr. Mon brooke, Mr. Bramston, Mr. Sewell, Mr. Clayday
others, were very good. The Lougrools of 4 , fe
and Mr. Sacket were conspiens. Mr. Badham were conspicuous.
Nw and pigs, which class, although applendid it numerous, was yet very good.

The entries for stock very much erceod arevious years, but the implements were very sber favo prietor, Mr. Hill, and the inhabitants of the little the by their efforts in the way of decoration and 0 was well attended, and went off extremely Hon. \section*{Wool: its Growth and Managemont. By F. Maunder,} Barnstaple. Pp. 20. H. Allnutt, 200, Fleet Street.
Mr. Maunder gave the substance of this pamphlet in a lecture to the Bideford Farmers' Clinb some months ago; and in publishing it for general circulation he contemplates chielly the case of light soil farms in erposed climates though even to the nccuniers of deeper lands in more genial climates, he believes it may suggest useful ideas. The principles on which the author founds his recommenlations are (1) the need of adapting the breed of sheep to the climate (2) the importance of providing abundant food and avoiding overstocking; (3) the avoidance of shearing lambs, which is, it seems, a common practice stili in
Devonshire. The lecture is the production evidently of an: experienced practical man, and we cordially recommend it to our readers.
We take the following extract both as a specimen of the style of the author, and as teaching a truth of great agricnltural importance:-
"The Adaptation of Stock to Climate. - We have bere a principle which lies at the foundation of
all stock breeding, and which cannot be too deeply pondered. It is, that the soil and climate of every locality, of cvery farm if you please, has a tendency will take the liberty of adding, that such animal is the most profitable and desirable the farmer can have; and I will go further and say, that a mistake of no such magnitude is committed by farmers as that of con-
tinually bringing upon their farms animals for which their farms are not adapted, and by which, consequently, heavy losses have been made. It is in fact a common vi-either from a laudablinge of ambition to surpass their neighbours, for farmers to procure tups altogether too high bred for their farms, whose progeny is always, from too preat delicacy, suffering and receding to that point which is natural to the soil and climate. I say alvays suffering, for of course it a succession of too against nature being continuous, so must bo the suffering ; attended with loses fild natural to the soil and climate. It is no doubt gratifying to be able to say, "I nold my loggs for so much," but the answer would be mach less fattering in many cases were the question put, "how many hoggs did you sell?" and return, which should alone be regarced as satisfactors I am aware that in a great number of cases the diver gence from the proper course is not very great, still it is a divergence which may as well be corrected; but there are other case where the evil has been of such vast magnitude as to entail enotmond losej-where whole districta, not individual farms, have suffered in this way.

Dost see the mark! Rivet your eye to it
There let it atiok, fast an the arrow would,
Buidipar Kmownex

One such indeed lies at your very door-is within the range of your own observation. I refer to the district stretehing from alout 6 miles west of this, away towards Holsworthy and Camelford. What lias nccurred in this district? A few briceders, possensing chace farms in the parishes of Kilklimmpton, Moorwinstow, and the yet warmer climates of Poughill and Stratton (I speak of what was done years agn), set up as breeders of rams, as their farms were the beat in the district, and every farmer who aspired to have a good flock, no matter how poor and exposed his farm, concluded he must resort to them for his male arimale-but bow were theac animala produced? These breedert, zcalous for improvement, and equally ignorant of coneequences, recorted to the owners of the choice flock in tho warm and rich district around Exeter, who, in their turn, reworted to the wost select avek in the Midland Counties. Well, theo Went-country breedert turned out each euccemive year the progeny of these animals so selected, which were spread over the
bleak hille, and unfertile weals aoile of the district in qleak hille, and unfertile woak soils of the district in the value of the Exeler dintrict-and what was the consequence? -the deterioration, so far as bardihood of constitution went, of the great majority of the flocks, to be followed, when unfavourable seasons case, by the sweeping away of rast numbers of these useful animale, the mainstay of the farmer, by disease; and hence, at the prosent lime, I oin informed that the number of theep in the district in question scarcely excueds one half what it has been at some former periods-the result of overlooking the great truth, thet the firsh of
all considerations is, adapting the animal to the farm."

\section*{Farm Memoranda.}

Towk Dairies: \(A\) speculation.-No more than a quarter of a century since the practice of town dairymen was to purchase aged cows, shut them up in any available shed, feed them for the production of a large quantity of milk, and breed from them. The life of a town dairy cow often extended over several years, especially when the feeder, having accumulated capital, was in a porition to have a farm, where a certain number of cows could be kept for two or three months prior to the period of the birth of a calf, which was in it turn either to supply the veal market or attain the age of a breeding cow or a fattening bullock.

Contngious diseases were thus unknown. They first sppeared about 1833 ; so that \(u\), to that period the cows itt town sheds suffered simply from occasional accidents or local disenees. The mont malignant affection was that obeerved in very abondant milkers after a long period of existence in the dark dungenne termed town dairies. That malady was plthisis or consumption -a disemse rarely seen now-a-days, owiog to the rapidity with which young stock in killed out.

The lung disease-contagious pleuro-pneumonilbrought about a great change in town dairy managemento a check was at once given to the accumulation of stock. Cows did not live to breed, and if purchased lean, were soon consigned to the knacker or the sansage shop. Breeding from town cows ceasod; and whereas formerly about 10,000 cows would live on for three or four years in London, the same number barely survived ten months after the intruduction of foreign plagues in the metropolitan diaries. The bulls which were once rept in the town dairies 800 n proved anprofiable, and the trade adapted itself by purchasing heavy, young, and fat cows ready for the butcher at any moment, when seized with illness. The mortality bas attained such not aller their practice to suit a new siate of thinges whereas many discovered that farm cows for the first four or five months after calving always secured such an abundant supply of milk as to meet much of the loss entailed by disease. Milk dilution and other queationable practices eoon eambled the dairymen of large cities to carry on thriving bnsinesses, and accumulate wealth.
The discases, however, continue. Cows which were once worth from 102 . to 161 , are now fetcling from \(14 l\). to \(30 l\). The dairy and breeding districts of the country have been thinned. The veal trade has passed entirely into the liands of the foreigner, and instead of ncreasing our supply of fat stock, it has in no way kept pace with the country's requirements.
There are two means whereby hopes may be entertained of bringing abont a beneficial change in these The first is by adopting adequate legislative means to check the progress of contagious disease, and compelling town dairymen to treat their adimals in a proper manner.
The second and more promising method is by demonstrating how animals may be kept in health, and wholesome produce supplied at a cheap rate to the public. This demonatration can be readily and profitably afforded, to the great benefit not only of the mill consumers, but of the British stockowners generally who bave not vet learned how to deal with plagues which are constantly curtailing the farmer's resources. A rational, enlightened syatem of farm and dairy management adapted to the wants of our growing population, would confor a lasting boon on British agriculture, It would coonomise our stook, spare more neas les hasardous and more prostable, and enable us to produce a largor quantity of wholewome animal food
thau we can 80 long as the presens management continues.

No trade is more profitable than that of a town dairyman. Were it not so, how would the thousands of our cowkeepers have withstood the enormous annual losses they have sustained? These losses can with great certainty be curtsiled ; and 1 am not aware of any form of investment which will better pay than that of furnishing adequate capital for an improved method of town dairy management. What this should ba may next eagage our attention, and it is proposed to divide the subject under various heads:-

Position and nature of building
Broed aud general character of stook.
Purchase and sale of utock, and method of preventing contag

\section*{Feeding of cows.}

Labour.
Collection, carriage, and sale of mille.
Distribution of manure, liquid and solid.

\section*{Secondly.}

\section*{Total expenditure in buildings, stock, \&ce.
Do.
do foeding and manag \\ c. Do. receipts in trade.}
a. Position and Nature of Buildings.

It has been proved by the medical officers of health in the metropolis and elsewhere, that human health suffers from cow-sheds being permitted to remain in the heart of any large town surrounded by the houses of the people.
The advantages afforded by railways enable us to secure cheap ground apart from human dwellings, though the distance from town, it possible, should not be large. In fact, suburban districts are sufficiently open to admit of proper dairies being established there, with a view to a direct supply of milk dehvered, with the aid of horses and properly-constructed vans.

The building should include spacious, well-ventilated and properly subdivided cow-sheds, divided into various yards. These must afford separate quarantine accommodation for newly bought atock; a second yard for the first transference from the quarantine shed; and, lastiy, the stabling for standing stock of cows. Proper stabling for horsea and storehouses for provender are essential.
In addition to this, a largo well-ventilated dairy, with proper atensils, ample provision for washing and scalding tubs, \&c., complete the requirements. It is desirable to have space in the several yards, or adjoining them, for the movement of stock, and moderatesized paddocks would be desírable.
Whenever a very extensive dairy is established, a manager's house and laboureris' cottage would constitute a very necessary part of the buildings to be erected.
All the erections must be of a most economical description, and it is as undesirable as it is unnecessary to spend large sums in solid matonry. It is estinated, in round numbers, that five, or at most sir, thousand pounds would cover all the expenditure in providing accommodation for a dairy of 1000 cows and its appurtenances.
b. Bremd and Geripal Charaoter of Stoor.

The best cows for town dairy purposes are cross-bred Short-horns and pure Ayrshires. Some good Alderneys might be desirable; and excellent cows can be obtained from healthy districts in the north-west of France. There is no objection to Dutch and German cows, except that they would require great attention, with a view to prevent the introduction of the contagious maladies which it is our primary object to prevent.

As a rule, the standing stock of a town dairy should be large sized, of the best milking qualities, in fine condition, not lean or too fat, and of a hardy cross-breed. The pure Ayrshires, Alderneys, and other cows of choice small breeds, are specially useful for the abundant supply of a rich-coloured cream.
c. Purchagr and Sale of Stook, and Method or Preventing Contagious Diseases.
Of whatever breed the cows may be, they should be purchased of mature age, rather young than old, and direct from the breeders. Public markets and faira must be avoided. Healthy breeding districts should be alone resorted to, and the animals conveyed in special trucks thoroughly disinfected, and not with any train by which other eattle may be travelling. It is these precantionary meanares af first which will oxable any one to avert disease, and buy stock at the lowest price. All the cows must be bought within a month, and asually within a fortnight, of the period of calving. The travelling is apt to bring on parturition, afforded to acclimatise the snimal, and prevent that very common dinease amongst woll-fed gond railkers, vis., milk fever.
The newly-bought animala should be sublivided into lots, varying from two to eight at most, in the quarintine sheds, and kept there not less than 40 days. During this period they should all be inoculated, and aubjected to other special treatmeat for the prevention of pleuro-pneumoinia.
The cows would then be draftel into the second yard of sheds, where they would also be kept in sipall lots, not exceeding 20 in oue stable; and lastly, they would removed between the fifthe whence they would only be calving to be resold, the fifth and sixth month after

Any animat seized with sicknes, howery sheds altogether apart from the establishment in which the genoral stuck is congregated.
The early reselling of cows has been found to be the best policy in town dairies. The expense of accommodation and maintenance is too great to enable a town dairyman to keep on cows when yielding little milk and in any healtiy and properly conducted establish nent all the best cows should be permitted to breed and be sold to farmers who would beep them on to the next period of calving, when they might again return to the dairy whence they were drafted. The period of reselling varies much with different animale, but as a rule it should not exceed the sixth month from the date of calving.
Cows, such as have been here described, would cost on an average somewhat under 18l. each, if Ayrshires; and foreign stock from healthy districts are included Short-horn stock alone would be dearer, if of first quality, as it always should be.

The calves, amounting at least to 90 per cent. on the number of cows, would realise over head from \(10 s\). to 12 ., and even more

When the cows are resold, a deterioration in price of 33. or 43. might be calculated upon, to that the cast and loss on the stock would stand thas:-
Cost of 1000 cows, say at 202 . each
8 sale of 900 calves at 158. each
Sale of 1000 cows, say at 166 . each
\(\ddot{£} 675\)
16,000
£20,000
16,000
\({ }^{£ 16,675}\)
Loss on Stock
£3,325
It is not safe to calculate on less than 10 per cent. of casualties of all kinds, which would increase the loss on stock to 5325 . This allows a wide margin, as it preo supposes that all animals taken ill would die and prove absolutely worthless, whereas undoubtedly the majority would recover.

\section*{d. Fesding of Stock.}

The staple articles of food in a town diry must be draff, meal (especially Bean and Palm meal), Turaip, Grass, and straw.
The cost of keep in the vicinity of London would not exceed 14s. or 15s. per week for each cow, and, taking the Jargest sum, 1000 cows would cost 750b. per week, or 39,000l. per annum.
The keep of 16 horses required for the establishmen would amount to \(720 k\). per annum, making the tatal annual expenditure in live stock provender \(39,750 l\).

\section*{e. Maragemrnt, Labour, Collection, Cabnian,} and Sale of Milu.
Any extensive dairy requires a shrewd general manager specially acquainted with atock in health and disease. In a company the expenditure attendant on a board of directors must be incurred. Laboarers should be calculated at the rate of one man or woman to every six cows, at all events, for milking. In any district a large number of women can be socured at a trifling weekly expenditure to milk the cows, and by this means the cost of labour is reduced. This practice is in force in Edinburgh, Clasgow, and other large cities. Combining the expenditure of management and labour it would amount annually to somewhat under 54002.

The cowe would have to be milked twice daily, and the milk in part placed in the dairy, and in part taken off at once. In a large city like London, the sale of the milk might easily be effected directly and indirectly. In either case it would, as in Glasgow, be placed in corked barrels, with a patent stop-cock, so that no dilution or adulteration could be practised. Then either the milk is taken round to houses with a horse and van, or respectable agents are appointed in various districts for the sale of the milk. It may prove best to anite the two systems.
For the purpose of transfer of mille, not only are proper cans or barrels eseential, but well-constructed spring Vans, to prevent nunecossary jolting and churning of the milk.
1000 cows would yield on an average \(61,000 l\). worth of milk per annum. This is calculating the milk at 1 s . per gallon, which is considerably below the London retail price.
The manare of 1000 cows can readily be distributed in any agricultural district, and would fetch 45046.108 . per annum. From the Veterinary Reviow.
[The Capital required appears to be estimated as follows:-

as well as most other farmern under similar ciranmetancon, aro mes miotaken. In such woather tho a crisp, rustles, and handies like hay before tho cap is eufficiently
dissipated for it to be in a state fit to be pue inco large ncocte generally heate too much, and sornotiones beomes mowburnt.'
The above remarks, though written mo many jears ago, are still essentially applicable. The differences in the process which have aince arioen the hay the more frequent and repeated use of the hay-tedding rachine, in place of such a costly ataff of hay-makers. This, and the mowing machine and the horse-rake, of course have introduced a great change in the practice of hay-making; though it still depends on a repeated moving of the Grass, \(s 0\) that it sluall dry each blade by itself as rapidly as possible.

The cost of haymaking varies exceedingly, accord ing to the quantity of the crop and the nature of the weather. I have in Gloncentershire let hundreds of acres at 10 s. an acre, for mowing, and making, and pitching to the waggon. And 10 s ., with beer, is common price for ordinary crops; such a contract is
bowever, a compleie speculation on the part of thow who undertake it; they will do well, and make good hay, if the weather suits them; but they will do ill, and make bad hay, if the weather is againat them Amnng the beavy crops of Middleser farms, a guinea to 25 and even 80 e are somelimes paid.

As to the practical detaile of hay-making it in neces. sary to add that, whether mown by hand or horse, Clover mown for hay must not be shaken abroad. The swathem are turned the second or third day, and, perhaps, again turned the fourth or fifth day after cutting. 'They are then put in amall cocke, and carried with as little rough shaking as posable, 80 as to retain the leak morokell.

Merss of Berwickshime- Untensonable rain delayed Swede sowing until the 20th of May, when we had a few remarkably warm daya, reachirie \(748^{\circ}\) on the 23 d , and \(2 \frac{1}{2}\) inches of rais from N.E again dreached the land, and lost us another weel If the weather mend, as it promise this evening, work must proceed on Monday with less nicety, the season is far gone for swedes, and lith preparation is made for Turnipa. it is nine jea May, on which occasion we lost a fortnight entirely but a wet harvest tims helped the Turnip erop. Inctead of being lialf done, we doubt whethar ons fourth of the break is sown yct. Clippers cannot be got, and we Bear that in many ases the ficece was a lot at night when weather permitted we If you would make your hay come out of the atack of a fine
cilour. and the beauty of the flowers to appear, the hay you colvir. and the beauty of the flowers to rppear, the hay youl b: cociked in the hoat, and rematu till the next morning; then thit is collocted swhich othorvioe would heat in the stac
of coubs, the beunty of the colour would bo done sway
have not incurred any damage of that sort. Ewes are fat and cast good fleeces, but lambs are scouring from the great rankness of Clover. Lean hoggs are much too dear to buy, even if mutton continue at \(8 d .\), and a Jarger breadth must be mown for hay. The best sort of cattle may have left 1s a day for their Turnips and meal, after paying for cake. Early Barley has fallen off very much these three weeks, and much of it, on strong soils, was little better than red. land before Monday's rain. J. T.

\section*{Notices to Correspondents.}
** It is announced that the entries for the Great Horse Show of July 7-13 at the Agricultural Hall, Islington, close on Saturday next, June 24 , before which day, therefore, ntending ex. addreas. \(A\). \(B\). They are acrid and bitter weeds, a disadBurtarcups. R. R. Fey and cet Clovers and Grakses to grow, and feen them hard down with sheep and cattle receiving cake. That, after drainage and liming, is the nrincipal way to improve Grass land and rally good for garden ground.
LAMB DIBEASE: Hereford, Wo repeat Mr. Spnoner's instruc tions:-It has been a very prevalent disease, similar in its character to the gapes in chickens, and the hoose in calves, and, as in thenl, should be treated by adopting means for the destruation of the entozoa, whose presence may perhaps be indirectly ascribed to the wet seasons which prevailed up to the past aummer, and the unwholesome provender thereby
produced. Any medicine given to destroy worms in the air passages acts by being absorbed into the system. In the case of worme in the windpipe two objects should be sought for-one to destroy the enemy, and the other to strengthen and support the system which is being subjected to such de bilifating and exluausting infuences. In the case of chickens, some sreak of the good effects of tobacco smnoke introduced so die of the remedy. In calves a cure has been effected hy administering lime-water, and probably it would be equally effectual for lambs. The dose for a lamb would be about two ounces dally, and about two drachms of salt should be given at another portion of the day. This treatment should b followed for some days. Better atill is the plan of adminis tering oil of Iturpentine, which, being taken into the
stomach, is ktomach, is moon absorbed throughout the system. The an ounce of linseed oil, a scruple of ginger, and five drops of oil of caraways, mixed up with two or three tablespoonf:lfs of linseed gruel. This dose may be repeated if required several times with intervals of some days. The lambs should be allowed half a pound of lingeed cake per diem, and should be otherwise carefully teuded and liberally fed. By such Laying Down Land to Grass: Warvich, Till the land, and get it clean and in good heart, and then some time in mist weather, cart on a lot of bits of turf from a good pasture, three inches square or so ; spread them and tread them in their place right side up, one in every square foot. Roll the land, and cart on some compost, and spread it out of the cart, them in: it will sooner be peend bush harrow and other way, and one acre of good pasture may be made four if, bowever, you should resolve to sow and depend on seed alone. you bad better use the following mixture for your stiff land, and sow a thin crop of Barley with it:-Aira cespitosa lutescens, 1 lb . ; Aloyecurus pratensis 2 lb .; A rrhe natherun, avenaceum, 21 b . , Dactylis glomerata, 3 lb . \({ }_{2} \mathrm{lb}\). \(;\) F. Ioliaces 2 lb . F 8 lb . ; L. perenne, 5 lb. . Phleum pratense, 2 lb . : Poa nemo ralis, 21 b. ; P. trivialis, 2 lb : Trifolium pratense perenne, LTKSEMD FOR CALVES: \(R\). In answer to pour question w quote the following from a former correspondent:-It shoul laying down a rule to his herdsman as to calves. A master call has been known in some cases to prove fatal. the gervant ought to be competerit to judge what quantity it will be right to give from the effect produced. My opinion is that no calf ought to have Linseed till over a month old. I find however, from experience in the rearing of calves, the lese Linseed I used the more healthy they were. I believe it very good for masured animals if rightly used, but for calves for often imagived. In boiling linseed it sometimes gets too much fire, which renders it too gluey to incorporate well with the milk; the calf turns shy and will not drink it ; it is then too often handed over to its neighbour, who drinks more freely and gets a double quantity, and, as you will readily suppose, disorder is the result; hence the propriety appetite. With regard who knows how to treat a sickly plan I have adopted was to crush the seed, place linseed the in a tub, pour on a gallon of cold water and lot it stand 24 hours, then add a jittle warm water, and stir it well together, it is them ready to mix with the milk. That quantity is sufficient fur four strong calves, mixed with from 5 to 7 quarts of milk at each end of the day. If 3 quarts new and 4 quarts skim milk could le afforded, OPEN BOARDED. FLOORs.
Mechi's mensures:-For Bullocks: The following are Mr. 4 inches wide, \(2 \frac{1}{2}\) inches thick, 2 inch openinga, For Sheep and Pigs: 3 inchos wide, \(1 \frac{1}{}\) inch throk, \(1 \downarrow\) inch epen2 ings. Crose plecos to which the planke are nailed about 2 foot apart. The planks may be rather thinner and narrower, because there is a great strain with are bettar as above; at present on boande. to calves (li inch ocks. Thave bullocke, 150 pige, 100 sheep. Oat or hard wood igs., 30 able to Fir.
Turnips per Acre: Render. The folloming table gives the Information you desire:-Col. 1 is the distance between the plant occupies, or equeen plants in rows; 3 , space each plamber of Turnips per acre ; 5 , average they grow; 4, Turnip in lbse, necessary in order to produce the tore onch owta of crop per scra standing in col. 6

as recommended by the judges of the royal horticultural society's show held july \(20,1864\).
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judgest : Royal Horticultural Society's Show, held July 20, 1864, awarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alten: : which has been done, and Messrs. T. G. \& Sor consider thoir MACHINES now as near perfect as possible.

Messrs. T. G. \& Son beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to execute orders with that despa due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangements in their premises, wheteby they truat thin position to end off all orders the day they are received.

PRICES OF HAND MACHINES.

 Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting dams if returned, two-thirds will be allowed for them.

PRICES of HORSE, TONY, and DONKEY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.
To Cut 26 inches
" 28 .. .. \(\quad . \because 1300\)

 and, as the MLACHINES make no noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the MiCHINE.

Both the HORSE, PONY, DONKEY, and HAND MACIINES possess (over all other Makers) the adrantage of self-sharpening: the cutters being steel oil nedi when they become dull or blunt by running one way round the cylinder, can be reversed again and again, bringing the opposite edge of the cutter against the bottom blade. the MACHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperienced person in two or three minutes.

The above MACHINES are made from the best materials, and of superior wortmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Pu in Rngland; are warranted to give satisfaction, and, if not approved of; can be at once returned unconditionally,

Weighs but 8 lb .
Will throw 8 Gallons of Water per minute 50 feet, when worked by the power of One Man.
It will draw water horizontally, if necessary, through 300 feet of Suction Hose, and force it through Delivery Hose, to an altitude of 100 feet.

\section*{ORDERED BY THE WAR DEPARTMENT AS FIRE ENGINES.}

In proof of the real utility and efficiency of the HYDROPULT as a Garden Implement, I beg to call the attention of the public to the following unsulitited Editorials from gentlemen whose testimony must have weight with the readers of the Gardeners' Chronicle:-

Ediforiar, written by Robert Hoge, LL.D., F.L.S.

The IIrdropulx.-The great sceret of successfur indoor gardening consists in the free and jndioions use of the syringe. A greenhouse or conservatory that does not enjoy this luxury becomes a misiserable lazar house of vegetable incurabies. Vermin and filth hold unbounded sway, and port culture, the days of "collections," when the use of the syringe was yet limited or unknown. What at tmine for red spider, scale, and greenfif! What fumigations and consumption of tobacco and tomheco paper,
washings with tobacco water, and all sort of remedies were resorted to! We regard the introduction washings with tobacco water, and all sort of remesios were resardeding. To this is due the success of
of the free use of the syringe ess one of the events in modern gre orchard hoves management, Vine management, and Plant management, but the old gyringe with its

Editorial, written by the Re
The Hidpopur. - When we formerly noticed this instrument, we did so from merely secing it nt the Proprotor's; since then we have had an opportunity of testing it personally, and can bear testimony
to tho excellence of the invention. The force with which it throws a strean of water is almost

Edrtoriai, written by Shir
The Hydropeli,-This is an invention introducod in a most spirited manner by Mr. C. P. Berros. It is at once a fire ongme and a garden engine, is always ready for use at a monients notico, is neat in guccession without fatigue, the mechanical power etiployed being economised by combining the an succession without fatigue, the mechanical porer eriniofed the hand and the resistance to the foot, betwea which the instromennent is placed and used, An double action pump. From the sole to the handle the Hydroult mensures 24 inches, The two brai. cylinders measure 12 inches in length, and 34 inchos in breadth. At the topp of these cylinders
Indis rubber tubing is attached, on one side to feed, on the other to discharge the water. It will Indis rubber tubing is adtached on the the this little contrivance, which is pretty as a toy, and can be carriod under the arm as easily gs a trumpet, will throw from seven to eight gallons of water per minute
slow suck and squirt, is now as much out of date in modern gardening af an old dage meyur in unt
 equal the Hydropult, sent us by Mr. Bcrioy. It is powerful in operation, and so cep in perfect :c to work, that one never gets natigued. With such an instrumen ferniums in our consermatre

\title{
GREEN'S PATENT SILENS MESSOR
}

\section*{NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES.}
by spectal appointment. sole manufacturer

TO HER MOST GRACIOUS MAJESTY the queen.

AS RECOMMENDED BY THE JUDGES OF THE ROYAL HORTLCULTURAL SOCIETY'S SHOW HELD JULY \(20,1864\).
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Judges at thRoyal Horticultural Society's Show, held July 20, 1884, awarded them a First-class Certifleate (no Prizes were given), and, at the same time, suggested a slightaltention. which has been done, and Messrs. T. G. \& Sow consider their MAOHTNES now as near perfect as possible.

Messrs. T. G. \& Sow heg to state that, owing to the great demand for their MACHINES in past jenrs, they have been unable to execute orders with that depati: due to their numerous customers, but are now happy to inform them, that they have made such alterations and arrangementa in their premises, whereby they trust to be io. position to send off all ordere the day they are received.

\section*{PRICES OF HAND MACHINES.}

Packing Cases are charged at the following low rates, viz.: for the 10 and 12 inches Machine, \(3 s\).; 14 and 16 inches, \(4 s\).; 18 and 20 inches, \(5 s\).; 22 and 24 incheo, fs. Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damagel if returned, two-thirds will be allowed for them.

PRICES of HORSE, TONY, and DONKEY MACHINES, including Patent Self-delivery Box ; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harness.
\begin{tabular}{cccccccc} 
To Cut 26 inches & \(\ldots\) & \(\ldots\) & \(\ldots\) & \(£ 13\) & 0 & 0 \\
\(n\) & 28 & \(n\) & \(\cdots\) & \(\cdots\) & \(\cdots\) & \(\cdots\) & 16 \\
\hline
\end{tabular}

The 26, 28, and 30 inches can easily be worked by a Donkey, or by Two Mcn, on an even Lawn, the 30 and 36 inches by a Pony, and 42 and 48 inches by a Camiage Hore: and, as the MACHINES make no noise in working, the most spirited animal can be emploged without fear of its running away, or in any way damaging the MACHINE.

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening : the cutters being steel on ondite, When they become dull or blunt by running one way round the cylinder, can be reversed again and again, briaging the opposite edge of the cutter against the bottom blade, when the MAOHINE will cut equal to new. Arrangements are made that the cylinder can be reversed by any inexperianced person in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and shinter Pomp in England; are warranted to give natiofaction, and, if not approved of, can be at once returned unconditionalls.

\section*{SHANKS' NEW IMPROVED PATENT} LAWN MOWING, ROLLING, COLLECTING, and DELIVERING MACHINE for 1865 ,

\section*{BOBY'S PATENT DOUBLE-ACTION HAYMAKING MACHINE}

Received at the recent Meeting of the Royal Dublin Society, at Dublin, the FIRST and LARGE SILVER MEDAL (no other Medal was awarded to Haymakers) ; also,
ELEVEN FIRST-CLASS PRIZES and MEDALS were AWARDED to this MAOHINE in 1889 and 1864.

This Machine is extremely simple, and its working is at once understood, as all levers and eccentrics are entirely dispensed with It is light in draught, and so constructed that it leaves little or no horse, and guaranteed to work in the heaviest crop. Four Hundred of these Machines have now been sent out, and not a single Machine has been returned as inefficient. The travelling wheels are made of wood, and are very strong.
Price, delivered free to any Station within 200 miles of London, £14 \(\mathbf{1 5 s}\).
This Machine requires no Roller or Screen to keep the Grass off the front.
Mllustrated Catalogues of Haymakiers, Coin Screens, \&c., will be sent free on application to the Manubactory : ST. ANDREW'S WORKS, BURY ST, EDMUNDS, SUFFOLK.

\section*{MEETINOS FOR THE ENSUING WEEK. \\ }

ONE of the questions proposed for discussion at the Congress to be held at Erfurt next September is "The history of the DEVELOPMENT of sOME IMPORTANT FLOWER, as the Stock, the Aster, \&c., from the first beginning to the present condition of its varieties." Fow questions oan be conceived of more interest either in a botanical or horticultural point of view, but we very much doubt whether any one is competent to give such a complete account as would be really useful. It would be very possible perhaps as regards the Stock, for some German nurseryman or botanical director to show how the smooth-leaved forms originated, or by what steps the strains of what are called German Stocks or Intermediates arose from the Ten-weeks and Brompton; but we doubt very much whether it is now possible to trace the origin of these latter races from their wild parents, any more than we can recover the history of the different varieties of Cabbage which have become so many permanent races. The same may be said of Chrysanthemums, Camellias, and other important plants, fine forms of which were in the firstinstance imported from the East, where they had been cultivated for ages, though many have been raised by intercrossing in our own country.

Our best chance is to take some plant of more recent introduction, \({ }^{\text {? }}\) as the Dahlia or Chinese Primrose, as there are several botanists still remaining. who can recollect the simple forms under which these beautiful flowers first made their appearance. We can ourselves remember
distinctly, some fifty years ago or more, how the single scarlet or lilao Dahlia was prized, and how carefully the tubers were preserved in winter; and forty years will carry us back to the original form of Primula sinensis, as figured in the "Exotic Flora," with its regular calyx and corolla, before any of the sports to which seedlings gradually gave rise had made their appearance.
Changes from the normal to abnormal forms in general take place slowly, and the early changes are seldom accurately observed. We are sometimes, however, in a condition to notice their first indications. An instance or two may not therefore be out of place. Some years since we raised a Tulip from Portuguese seeds, marked Tulipa transtagana, but which turned out something totally different, and as we could not refer it accurately to any described species, we have distinguished it as T. Welwitschii, though we are not certain whether it may not be a wild form of T. suaveolens, though it blows later in the year. We have had this under cultivation for several years, and the flowers now show an inclination to become double. The first indication was an increase in the number of sepals and petals from three to four, with a corresponding increase n the number of stamens, while an additional more distant petal sometimes appeared as a bract on the stem. The stamens now began to vary in number, and then one or more, without, however, any regularity, assumed the nature of petals; and we doubt not that further cultivation will induce further change. These appearances have taken place especially in bulbs whioh were not placed in the ground till the end of January, and we intend, if possible, to reserve a portion till the same time next year to see if a greater change takes place in these than in bulbs planted, as is usually the case, in November. All the seedlings, without exception, have been self-coloured, but if we mistake not, in some of these late-planted bulbs there are indioations of breaking, a condition which may be considered analogous to variegation. It is wellknown that change of soil is often conducive to this process in what are called breeders, and it would be extremely interesting to notice whether soil like that of Hounslow Heath, which seems to have a peculiar tendeney towards inducing variegation, is equally effective as regards the breaking of Tulips.

Another instance may be adduced in whioh we are anxiously watching the progress of a variety of Paparer nudicaule received from Vancouver's I land. The bright deep orange petals with their pure yellow base and stamens, make this an attrac tive plant, and if a good double flower could be procured, it would certainly be a great acquisition. A tendency to become double exists in many of the seedlings, and it is hoped that by insulating the seed, we may at last produce something valuable. This tendency does not appear in any increase of the normal number of petals in the whorl of the corolla, but in the more or less com plete conversion of some of the stamens into petals. In some cases a pollen cell still appears on the edge of the new petals, but in others all traoe is lost.

We have lately paid some attention to the mode in which Primroses become double, and as far as we have yet been able to observe, it is by an almost constant suppression of the female organs, and an increase in the number of whorls of the stamens, yet in such a way that the new stamens are always opposite to the old, according to one of those exceptional cases which certain French botenists have endeavoured to explain by what they call dedoublement (deduplication), as if a now stamen was constantly formed by the splitting or unlining of that which went before.

It is curious that these new petaloid stamens have a tendency to become tubular, and in consequence one or more new individuals are often produced within the tube so as to give the appearance of a quantity of florets with imperfeot stamens, and a central abortive style which is itself often tubular. We observe this to be the oase in the common white, sulphur and lilac double Primroses of our gardens, as well as in the Chinese Primrose, a variety of which was exhibited at one of the Tuesday meetings of the Royal Horticultural Society in the spring, in which these florets were extremely conspicuous and ornamental.
In the double Pansies we find that the additional petals are partly due to transformation of the stamens, and partly to a disintegration of the ovary, the separate divisions of which become petaloid, but still exhibit ovules at their edges.
The fixation of such forms where they do not admit of propagation by cuttings is a matter of
great importance. No one has done more in this direction than the late Munsieur Vilmorin, an interesting acount of several of whose nimmerous experiments has appeared lately in M. Verlot's Memoir, which obtained the prize at the Cungress Memoir, which obtained the French Imperial and Central Suciety of Horticulture. M. Verlot is well Centran as the Chief Cultivator at the Jardin des plantes, and we hope to give some account of his laates, axt week, especially as it has an obvious memoir next week, especially on the question before us. MI.J.B.

The Ruot-pruning of ligneous plants in general, and of fruit trees in particular, especially if the latter happen to be at all of a fast living oharacter, has become an established feature of modern practice, and one to whioh the cultivator has resort with tolorable cortainty of sucoessful issue, if his object is to induce that modified luxuriance of growth which is most favourable to a state of fertility, that is to say, to the development of the floral or reproductive rather than the mere nutrient organs of the plant. It ia however, we believe, something new in hortioultural practice to apply the principle of Root-proning to the culture of Bulbous plants with the view of promoting the more perfect development of their flowers, as we learn from the Revue Hortacole has been done with vers marked sucoess by M, VATIN, of Bessancourt, iu the case of Hyaciaths grown in water
M. Vavin, it appears, exhibited last year before the Suciélé d'Hortioulture of Paris, two Hyacinth bulbs, in glasses, in which they had been planted at the beginning of November. He had found that the leaves and roots grew out freely, but that the flower spike remained stationary, and he therefore determiued to cut back the roots to withia about an inch and a half from the base of the bulb, after which it seems the Hower spike developed itself marvellously, and attained a high degree of perfeotion ; those plants which had been left to themselves, uncut, flowering as usual, many of them very indifferently. At the time these examples were brought forward, the season was too far advanced to submit the new plan to any practical test, but M. Vavin was requested to repeat his experiments again this year, and the result has been to confirm in a very decided manner the utility of this root-cutting process, the leaves boing kept dwarf, und the Hower spike thrown well up above them. Several varieties were grown acoording to the new plan, and others were left untouobed, and as to the result, it is stated that the former have been most suocessful, blooming in an irreproachable manner, while the others have presented the usual proportion of failures. M.

\section*{tioulars:-}

The flower spike is allowed to protrude itself while the plants remain in a place which is not heated, but is exposed to light.

When the Hower spike has grown up about 4 inches, the plants, being well established, are exposed to greater heat.

If the leaves overtop the flower spike, the bundle of roots is cutoff olean, at about an inch and a half below the bulb.
M. ANDBf, from whoas acount we have gleaned these particulars, accords to M. Vavin the merit of discovering this mode of culture, observing that in horticulture there are no little things, but that this apparently simple fact must have an important bearing on vegetable physiology. No modern book, he observes, indieates the cutting of Hyacinth roots, or offers any innovation in the culture of these plants. Saint Smon only (La Jacinthe, 1768) appears to have approached this new mode of culture, when he observed that "roots are absolutely useless to the vegetation of the Hyacinth," an opinion which at the time was strongly combated. "I do not regard," said he, "the roots of Hyaeinths as the suetion-pumps by whioh the sap is carried from the ground into the bulb, but on the contrary as the exoretory vessels which serve to release the bulb from the too great abundance of sap which is introduced into it by the spongy body placod in the centre of the roots. * * It will not be diffioult, I imagine, to make a bulb flower without the help of its roots." M. Vavin, though he did not actually attain to it. The explanation of this seeming anomaly may be found in these two facts: first, that in the Hyacinth bulb the flower-spike exists ready formed at the time we plant it, requiring only the stimulus of a litule heat to bring it forth; and, secondly, that the real action of the roots is to nourish the leaves and enable them to perfect a Hower-spike for the
succeeding year. Henoe, the leaves being the
stronger and more vigorous of the two sets of organs which are in active operation in the developing bulb, and having work of their own to accomplish in co-operation with the roots, naturally to some extent divert the proper nutriment from the weaker or floral organs ; and hence, too, it seems to follow, that to give the ronts a moderate and timely check, is to place autriment, or nearly so, flowers the whole store of nuted in the bulb for the which has been accumulated in the It is, as in our very purpose of giving them birth. vegetative and the reproductive systems of the plant, and when we require to have the latter developed beyond the natural mean we must the former in check. Let it be remembered, however, that such a practice could only be wisely attempted with bulbs like the Hyacinth, which are not valued after the flowering is over. If there is to be a reourrenee of blossom in another season, a juster balance between the two powers we have alluded to, must be struck.

Tife remarkable failure of the Strawberry Crop, which has ocourred in the present season to an unusual extent, is not easily accounted for ; even experienced cultivators appear to have only vague conjectures respecting it. We have visited places long celebrated for the production of Strawberries, near Isleworth and Brentford; as well as the extensive tracts of land which once belonged to the Monastery of Syou, land which had been well chosen for gardening purposes, for it is deep, rich, warm, with a of od aspect, and is in short in every respect highly favourable for fruit trees and vegetables. Here are heavy crops of Pears on young trees, on middle-aged, and alsu on some above a hundred years old, which are yet healthy and vigorous, so congenial is the soil to their growth. But as regards Strawberries, the crop even here is considered light, and in the case of certain kinds the failure is co uplete; so much so, that upwards of 100 acres in the above-mentioned boality have been dug up and the ground filled with other crops. There are two sorts of Strawberries, the names of which will bec sme memorable; one is Sir Harry (Underwood's), the other is called Sir Cuarles Napier. Buth were considered to be good, but latterly Sir Charles has become the greatest avourite, and is planted most extensively. This spring the plants appeared healthy and vigorous; but on 100 acres there is ns fruit. The blossoms were not killed by frost, for there were none to kill-no Hower scapes were produced; nor could the failure be ascribed to bad soil, fur there is none in that locality; it cannot even be attributed to bad cultivation, for that is out of the question with such noted market gardeners as cultivate the land in this district. With their usual promptness and energy they dug down the Strawberry plants as soon as the absence of fructification was observed, and put in other erops. So much fur the favourite Strawberry Sir Charles Napier. No variety, perhaps Keens' Seedling not excepted, ever rose so rapidly in the estimation of ztensive cultivators, and we believe none has so rapidly fallen. Whether it will again be grown to the same extent as it has beon is a question which time must determine; a similar catastrophe may not occur again.
In the meantime however, attention is likely to be direeted to Sir Harry. This sort we saw very fine in Mr. Myers' ground ; the fruit measure upwards of four inches in circumference, and the rop was abundant. It is a good foreer, and coninues in gathering for three weeks, the quality is ikewise very good; on the whole this variety is highly deserving of cultivation.
Another sort, the Empress Eugenie, is large and bearing tolerably well; but it is too coarse in appearance, and not well-flavoured.
Noarlet Strawberries are always muoh in demand for preserving. The Grove Eud Scarlet, easily distinguished by the wide serratures of the leaves, is even this year bearing most abundantly. It will grow anywhere, and where other sorts will not; it will bear very well between rowi of Raspberries. Its cultivation for preserving should not be lost sight of.
Of other fruits Apples are a thin orop. Pears are very plentiful. Plum trees are surrounded with stakes, propping up the branches, whioh would otherwise bo broken by the enormous quantity of fruit they are bearing. In short, with the exception of Apples and Strawberries, all kinds of fruits in these grounds are abundant; and the same remark applies to other districts in the vicinity of London, and also to Kgnt.

Currants is greatly on the increase. One London house alone takes more than 50 tons. The variety preferred is the Black Naples,
In Essex we are infurmed that Peas aro attacked by mildew. In Surrey they are a scanty orop, and owing to the hot dry weather the orop, such as it is, will soon be over. Strawberries generally did not produce blossoms here any more than they have done in Middlesez; and in instances where they did, the plants are dying off In consequence of the very hot dry weather Gooseberries have been attacked in some places by a sort of red spider, so as to render it exp=dient to dig up the bushes. Cherries do not swoll nearly so well as they ought in a great many cases. But more unfortunately, the Putatos begin to exhibit some symptoms of disease.
- Mr. Bateman will, we are informed, give an account of the remarkable Rafflesia Arnoldi-the largest of known flowers, and singularly enough borne on a leafless plant-at the meeting of the Royal Horti. cultural Society next Tuesday.

The English seedling Rosa Privcoss or Wales was spoken of in high terms in our columns when it was first submitted to public view, and it hes been thought by some rosarians that too much was then said in its favour. We had an opportunity of seeing it again a few days ago in the nursery of the raiser, Mr. W. Paul, of Waltham Cross, and me can aver that no finer blooms, in regard to size, form, and smoothness, than we saw on this occasion, need bo desired, while the remarkably vigorous and free. blooming habit pointed it out as a variery particularly adapted to our climate. It is sometimes a little open in the centre, but not always, and as far as we could see this is its only fault. The Rose named Dr. Lindley, by the same raiser, which was also bearing some fine blooms is remarkable for an intenso depth of colour towards the base of the petals, giving a
 singular circumstance in the case of the variety named Lord Macaulay, and should be glad to learn if there are many \(R\) oses subject to the same kind of freak. When this Rose was first brought out the colour was one of those rosy tints in whith shade of purple is evident. When we sam it a fer days ago it was producing blooms of the most glowing rimson without any shade of purple, sometimes on he same plant with blooms of the ordinary colour, and sometimes on different plants. We were informad that these crimson flowerm open and die off of this glowing colour, and that the diference is not dut to the age of the blossoms as might have been supposed.

\section*{New Plants.}
293. Odontoglossum aloriosem, Lind. ff Rehb. fih. Bonplandiu, ii. 278.
Paniculatum, sepalis oblongo-ligulatis acumiuatis stalisitis labello a basi cordata ligulato acuminato, basiu veratil utrinque angulato, ceterum bine illins denticulato, basio depresso quadrilobulo nunc quarridentito ante basio c humaza clav
unidentato.
Our friend Linden was the first who declared this to be a very distinct epecies. When we had named it, we were much reproved by many, who thought it the same

plant had opened its great stellate pallid ochre-colonred orown-spotted flowers, 800 n a \& Co., no one doubted sbast it was a very Mears. Low . The colours, indeed, not quite so delicate as in the unrivalled Odontogio nævium; yet the flowers are quite peculiar, andots. It certainly it ranks among the best of Ohows, a.d,號 of the grand shows,

must be 0 . nebulosum ; but since our information is rery sight, and our hypothesis wanting the last, proofan authentic specimen, we shall do much better to retain Dr. Lindleg's name, which we know is authentic.
Odontoglossum Warnerianum was dedicated by us to R. Werner, Esq., of Broomfield, near Chelmsford, who kidily sent us flowers on two occasions. It may come
from Merico or Guatemala; and we learn from J. Butaman, Fsq, that it is found in several English living Orchids.

impossibility of raising healthy plants of Douglas Fir and Picea nobilis from seeds of home growth, I fearlessly state that there is not an atom of ground
for such an opinion to rest upon. Had some of our for such an opinion to rest upoll. Had some of our
philosophers read more, and written or said less, it philosophers read more, and
would have been better for us.

This subject was taken up and unanswerably refuted by me in the Gardeners' Chronicle of Aug. 20, 1859, six years ago, and you cannot do better than reprint that articie. I shall only add that a fow facts are worth a cart-load of opinions; but if any, or all of jour readers will favour me with a visit to Elvaston Nursery, close to the Borrowash Station, on the Midland Rail way, I shall be happy to show them many thousands of facts to prove what I have written, in the shape of the most vigorous and healthy plants that cau be seen, both of Douglas Fir and Picea nobilis, and not a diseased or unhealthy plant amongat them. The plants of P. nobilis are of the "most lovely glaucous colour imaginable. William Barron, Xlvaston Nursery, Borrowash, Derby.
[We reprint such parts of the leiter referred to as bear directly on this question.]

I think without egotism I may venture to add, that having been the most extensive grower of Picea nobilis, I have also been the most successful. One reason for my obtruding upon you and your readers is
to correct an erroneous report, which I find rather to correct an erroneous report, which I find rather
extensively circulated, vizo, that seedlings of Picea nobilis have been raised by \(m e\), which are not true; but hybrids between nobilis and the Silver Fir, or some other species.' Seeing that few people like to acknowledge mistakes, and that the author of this blunder may not favour us with his name, allow me to say that it is untrue, as I never did myself nor allow any one else to fertilise the cones of \(P\). nobilis except with pollen gathered from the same tree.

The same year (1851) in which I raised my first cones of P. nobilis, I had cones on Piaus monticola, but no male catkins. Having at the same time catkins on P. Lambertiana and P. Ayacahuite, I impregnated the cones on P. monticola with pollen gathered from these trees; and I had as the result three small trees distinct from each other, and from their respective parents. This experiment has been mentioned to several, and the plants have also been shown ; whether this may have been confounded with P. nobilis or not I cannot say.

It is generally admitted, both in the animal and vegetable economy, that unhealthy parents generate a diseased progeny. But I think fow have hitherto recognised the possibility of decidedly healthy parents bringing forth a diseased or debilitated offspring. Nevertheless this is the case when certain conditions are not fulfilled, which are indiupensable for the production of a healthy progeny. I have long been convinced of the existence of this law in the vegetable, and believe it equally applies to the animal economy. Having had cones on the Douglas Fir for some years before I could succeed in getting good seeds, I was convinced that either the cones or catsins, or both, were njured by our late spring frosts. Consequently, about 14 or 15 years ago I had an awning raised over a tine healthy tree of Drummond's variety (a much deeper green than the one collected by Douglas*), and at the right time I impregnated the \(00 n e 8\), and was repaid by a few hundreds of young plants. Amongst these plants I soon observed a certain number to constitutional dobility. The same plants, though now 14 years tional debility. The same plalthy bushes ; whilst those old, are dwari stuntich showed constitutional vigour from the first are now hoalthy fine trees.
"And amongst my first seedlings of Piesa nobilis I had about the same per centage of plants which from the first manifested a constitutional weakness by a stunted growth, and at a certain period of grow bay eaves became brown at the margins and tips, I have continued to grow those plants under the Douglas Firs before mee circumstances, were healthy, vigorous, and of a good colour from the first, continue so. In a batch subsequently raised I have hrowth have shown the act apparance already described. These plants are now three years old.

Having some time ago discovered the true cause of this debility, viz, defective impregnation, I adopted means to secure a more certain and general distribution of good pollen, and now I have a magnificent lot, two years old, free from all debility, without a single exception; some of which I send for your inspection. Be it understood, that in all the other lots I had from the same trees (other cis, abilso debilited equal) healthy and vigorous plants, also debilitated for arborists, and at the same time explodes a pernicious theory now gaining ground, viz., that pernicis from seeds of Douglas Firs of home growth are worthless compared with imported seeds.' \(P\). nobilis has exceeded three feet in growth with me this year and in an avenue composed of Cedars of Lebanon, * These plants are very distinct, and off great value as a cin. is of a warm o: yellow green, with cones when in a young atate with dingy purple scales and bracts. Drammond's variety is of a doep yer green, and silvory uncor teen and free from the having tiner
purple tinge.

Araucarias, and Cryptomeria, the large plants o l', nobilis, with their very silvery hue, stand out in bold, and I may bay enchanting relief. William Barron, Elvaston Castle, Aug.15. [We endorse this statement. Some seedlings of Abies nobilis which have been submitted to us by Mr. Barron are perfectly genuine and in vigorous health.]

CULTURE OF THE NUT.-No. III.

\section*{(Conduded from p. 508}

THE nast great consideration is that of pruning which combines the continued formation of the main branches according to the rules before detailed, and the general pruning with reference to the production of ruitful wood.
When the side shoote are spurred off pretty close to the main stem, there will frequently spring out five or aix slender twigs, often full of female blossoms. Sometimes there will be formed a cluster of buds nearly close to the stem, many of which buds often produce clusters of fine fruit. These conditions are equally desirable, and are the objects specially to be sought for, and towards the attainment of which all pruning operations must be directed. Thus, whilat the formation of the body of the tree by the extension of the leading branchen is made one object, the production of fruit-bearing buds by close cutting is the other. In favourable situations, and on dry subsoils, these fruit bearing buds and twigs are sometimes produced in very large numbers, and if left would soon exhaust the energies of the trees, and hence, in order to keep up the supply, a considerable proportion must be annually spurred in; for it is better to ensure a crop proportioned to the strength of the tree every year, than by taking a glut in one season, to weaken the tree, and probably lose a crop for a year or two afterwards. Care must be taken at the same time to keep the
head well furnished with leading brancies, as the diameter of the tree increases.
In plantations of limited extent, where the pruning can be got over in the course of a few days, it is best to defer the operation until such time as the male catkins are sufficiently forward to give out pollea. This generally happens towards the end of February, at which time also the female bloom is plainly distim guishable, and the shaking of the trees in the operation of pruning will distribute the pollen, and very much achitate the setting of the nuts; but in plantalions of there is a little army of prumers to be had, to commence pruning much earlier; in fact all through the mild weather after the leaves are off the trees; and there is no objection to this, provided the operator takes care to leave a good supply of the male cathins. A little practice will soon enable the pruaer to diso tinguish which are the most likely buds to produce female bloom, and to regulate his operations accordingly, bearing in mind to keep the tree well open in the centre, and the branches well furnished aud equally balanced. All the leading shoots must be shortened every year more or less, according to their strength and the required form of the tree.
During the time occupied in carrying out the above operations there will be considerable management needed about the roots. The Nut tribe is generally vary much inclined to throw out suckers, and these must be annually removed down the roots, an operation which may either precede or follow the pruning, and may very well be done by an
ordinary labourer, without taking up the time of the ordinary labourer, without taking up cme placus, when removing the suckers early in winter, to draw away the soil from the roote, and leave them exposed for a time, and previous to covering up again to apply a good dressing of rotten manure. Opinions vary much as to the necessity, or otherwise, of applying manure at all to the Nut tribe, and various reasons are assigned, cogent enough either way, where the culture is on a small scale, and carried on for home consumption and agreeable relaxation; but it is wrong to suppose, where the culture is on a large scale, and expeoted to be a profitable ingestment, that there is any land so good in condition, and congenial in its character, as to be able year after year to throw out a pemunerative produce without the assistance of manure in some form or other. For this reason I approve of the practice of applying manure as above detailed, but for economical reasons it would be too tedious an affair for plantations reckoned by the acre, in which it is necessary to attain the same end in a less expensive manner, which may very well be done at the annual digging after the pruning is done, by spreading manure and lightly forking it in over the surface of the ground. the very best dressings for the purpose, and be lasting one, is woollen rags, which may very well it used alternately withoe colled shoddy is also an exaction. The subata cellent dressing. A large grower dressing of shoddy and me that he calculated a good ares and woollen rags, on a plantation this would probably be value of his crop by 200 l .; this would pressing, which at three times the awuld scarcely be half exhausted. Ho further stated that on more than one occasion he had oleared 500 L on the year's crop, after paying ever expense, and he concluded that in the long ruu it beat

Hops, "but." he observes, "you see I farm high, and I always find, that the more I put into the ground the more I get out of it."
The crop should be taken as soon as the husks have changed colour and become yellow. The nuts should he gathered when quite dry, and spread out on the floor of a dry chamber, The drying room of a malt-houss, or an oastbouse is excellent, because it may sometimes in very damp weather be necessary to put on a little heat. They should be frequently turned, and at each turning care must be taken to pick out every one that becomes
black. When the husks are dry, and the fear of heating is past, they may be put together in larger quan tities, or in barrels open at the top, and be placed in a dry and cool place. Mouldiness is the great thing to guard against, and is the result of the husks not being thoroughly harvested. When put together da
quantity, heat is generated, and mould follows.
There are several varieties, all more or less well required; but for profitable culture on a large scale the Lambert Filbert, called more commonly the true Kentish Cob, is one of the best, if not the very bost variety in cultivation. It is of a large size, a most abundant bearer, and with proper management will
keep cood for two or three years. Some very fine keep good for two or three years. Some very fine samples of the Nut tribe were exhibited before the
Royal Horticultural Society a few years back by Mr. Webb, of Reading, which struck me as beiug grea improvements on some of the older varieties, and it is probable that some of them may be found to possess such good marketable qualities as to be equal to the above sort for culture ou a large scale. Pearson's Nottingham Prolific is also a very good varietr, and well adapted for garden culture on account of its dwarf
habit; the Nut is of good quality, and the tree an abundant bearer. For early purposes there is none better than the Cosford Nut, which is a thin-shelled early sort, and a great bearer. John Cox.

\section*{Home Correspondence.}

Conifers from Home-grown Seed. -Mr . McNab and others deserve credit for laying their observations respecting Conifers raised from home-saved seed before the public. I find in conversing with those who have had opportunities of specially studying the subject, that considerable diversity of opinion exists regarding it, the majority, however, being unwilling, without more prof than has as yet been produced, to condemn think that it would be well before concluding that home-grown seedlings of many of the finer Coniferm are useless, to circulate them over the country, in order
that they micht be tried in different soils and situations. There are certainly some difficulties to c'ear up in how the old Abies Donglasii, its layers, and plauts of it raised from foreign seed thrive so well, while plants raised from home-grown seed succeed so badly with exist in the soil or subsoil than is apparent, or that some other cause not easily discovered may account for the ill health of the home-raised seedling plants. I am induced to make these remarks becanse the few seed lings we have raised here from home-grown seed are in general thriving as well as those from foreign seed. We have seedlings of Abies nobilis from the old plants
both at North Berwick and Riccarton, in full health. We have also seedlings of Abies Douglasii, raised from seed taken from the large tree at Scone Palace. Some of the plants of Douglasii, not in first-rate health on thin poor soil, when removed to richer, damper, and deeper soils, snon bectme dark green in colour, and grow freely. In Mr. Mitchell's nursery at Stranraer, I saw the other day about 1000 young plants of Abies nobilis in fine health. I was lately conversing with a landed proprietor, whose estate is in a neighbouring
county (Kirkeudbrightshire), who told me that he had a large number of Abies Douglasii, very healthy, and making extraordinary growths, all from home-grown seed. With fasts like these before us, caution altogether condemned, and excluded from cultivation I am often sarprised at the strong language used by some writers against grafted Conifers, which were greatly disliked some 20 years ago. Mr. Barron, of
Eivaston, and many others, have however produced in large numbers as fine specimens from grafted plants as from seedlings. I will be glad to show any one who entertains the slightest doubt about this matter nearly 20 acres planted with the rarer sorts of Conifers, more than half of which have been home-grafted, thriving we have, and forming in every respect as fine trees, many of them upwards of 20 feet in height.
Archibald Foovler, Castle Kennedy, Stranraer.
There can be no doubt that seed gathered from fullgrown trees in their native climate will produce more uniform and better plants than those raised from home aved seed, but good seed of esteemed varieties will always be difficult to procure. There does not seem to y seedlings from home should seeds of Coaifers well-grown in this country I observe that plants from home those from imported seed. In the more variety than
healthy young plants of the following sorts, all from home-saved seed, viz:-Pinus insignis, Abies Douglasii, Picea Webbiana, and others. Cupressus Lawsoniana in a young state seeds very freely, a circumstance whit ndicates that it will not be much of a tree in Britain Cupressus Goveniana is anet in proving the merits or demerits of seedlings from home-grown seed of Conifers may, by sending me their addresses, have a pinch of seed from last year's cones of Picea Webbiana grown here. 0.

Wasps.-In your impression of the 3d inst., "Vespe cide" communicates to us the intelligence that he had killed 72 waspa. I have been silent a week or two in the hope that an abler pen than mine might tel "Vespecide" that he had done wrong; instead of that however, "J. M." tells us that he has committed stil. greater destruction amongst the wasps, and I can assure " J. M." that his doing so is of infinite benefit a greenfly, buge, and other insecta that infest our fruit trees, Roses, and other plants. Haviug a nursery of upwards of 80 acres, it may be supposed that cannot escape the attacks of insects of many kinds, and If find wasps to be my greatest friends in clearing them off. I have seen large quarters of Larch, Spruce, and other plants badly blighted, and every trace of the blight cleared off again in less than a fortnight by wasps, which are amongst the plants by thousands from morning till evening. I take every means to protect and preserve the wasp nests in my grounds, and if every body would do the same we should have less blight, more fruit, and healthier trees. Excelsion
Acacia armata.-Admirers of this pretty Acacia are perhaps not aware that it is wonderfully hardy and frost-proof. We have had two plants of it out all the winter, totally unprotected, and they have this season een beautifully in bloom. A. L., Monkstown, Dublin.
Horse-radish.- Will some correspondent have the kindness to inform me whether there is any certain mode of eradicating Horse-radish from my garden, which is quite overrun with it. I have tried digging to a great depth, but have failed, as I find the roots go down into the rock. Is there any known poison, which if applied would kill it? Would boiling-water be effectual? or salt? Northleach

Araucaria imbricata.- I have now in my grounds a tree of this, about 25 feet high, and 18 years old, which bas three cones on it; they increase in size
rapidly. E. B. Curteis, Leasam, near Rye, Sussex

Vespa arborea.-If this is the wasp that bnilds a susponded nest, it would appear to be plentiful here, as within a short distance there is one in a hedge, and another hang from the upper end of a stone trough placed on end. The common wasp seems this year to make its nest projecting out of the ground. Why is is ? C. P., Nailsworth, Gloucestershire.
Earwigs.-For the last two or three years my bedding plants when first planted in beds in the lawn have been attacked by earwigs so furiously, that sometimes in a single night a bed of Calceolarias is nearly devonred. Last season we destroyed upwardi of 7000 of these pests ; but this year they appear again in most 100 of them by trapers, and we daily destroy from 80 to 100 of them by trapping them with flower-pots turned filled with Moss. Can you kindly state the best mode of getting rid of these nesects, the time of year they breed, the places in which they breed, and the colour of their eggs as well as the number each female produces? The works on entomology that I have seen give but very scant information as to their habits G. J. Andrews, South Slreet, Dorchester. [The present
dry hot spring has produced earwigs in innnense profusion, or, to speak more properly, has offered ro check to the hatching of the eggs and growth of the young At the present time (2lst June) all the specimens visible (and they swarm even within the Museum here) are in the pupa state, with rudiments of wing-covers Small bits of Elder twigs with the pith scooped out, laid about the flower-beds or hung against the walls, are excellent traps. The females deposit a comparatively small number of eggs in holes in the earth, and brood over their young when hatched, like a hen over her chickens. I. O. W., Oxford.]

The Hamilton or Cadzow Oaks. -I am pleased with " J. A.'s" report of these Odks (see p. 531). I was
very much struck with their fine appearance two years ago, when my friend Mr. D. Mitchell, the gardener a Hamilton Palace, took me and some other friends to see them. They are, as " J. A." says, of large size; in the hollow trunks of some of them plenty of room can be found for a party of six or more large-sized men to go in and stand comfortably. These trees are well worth seeing; they are wonderful old specimens, and to \(m\) mind are handsonce; for I am a lover of wild natura growth such as is to be found in a forest like this, where wild cattle still graze. All honour, therefore, to the noble Duke, the owner of this primitive forest, for affording us the opportunity of gazing upon such fine wild scenery. I love the Oaks, the brave old Oake that live in the forest so green; long may they stand and be spared from the woodman's axe. \(B\).W
Early Peas.-How anxious all gardeners are to gather the first dish from the open ground we know and when an advertisement announces something new, that is to arrive, as the "consummation devoutly to be wished," a week before any other, how eager they are
price I bought Carpenter's Express, and At a gre price I bought Carpenter's Express, and allow me t express my grief, that, sown the same day in follomi the same day, and were fit to pather simulted William Masters, Canterbury.- It was praneonit Messrs. Carter this spring that the early Peas shond by carefully tried and proved under our superintond bo at Waterloo Nursery, Kilburn, a fine open spence ground with a subsoil of stiff clay. We communiate our intention to Messrs. Sutton, of Reading, an Endy forvarded to us stocks of uter, Peas. Messrs. Fairhead, hearing of tho expry also wished their varieties to be teasted. We procare Carpenter's Express and Dillistone's Early Prolif from the raisers. One long row of each of the fullo ing sorts were therefore sown side by side on the 15 t of March, viz. :-Sutton's Ringleader, Fairhend's C queror, Dillistone's Early Prolitic, Carter's First Ear Express, Fairhead's "Hardy's" Early, aud Dichen First and Best. The following five, viz, Dilliston Early Prolific, Sutton's Ringleader, Carter's First Cro Fairlead's Conqueror, and Fairhead's Railway, proved to be the same Pea; their height ( 2 feet), tim
of flowering (13th of May), colour of the foliage, of growth, measurement of the pods, shape of the latter, number of Peas contained in each poil, pecaliar property of producing a mass of pods from bottom th top, the whole crop being fit for use simultaneonsly flavour all alike-all fully confirm, as far as our trial and judgment are concerned, the conclusion at which m have arrived. Throughout all the stages of thei growth there could not be found a shade of difference We therefore consider that honour should be given b whom it is due, and beg to assert that to Mr. Dilistone belongs the merit of having sent out the earliest Pea known; for if turned out by machinery these rarieties could not be more alike. We now come to Sangster' No. 1, Dickson's First and Best, Carpenter's Expreas and Fairhead's "Hardy's" Early ; these we treated exactly alike, one long row of each being planted side
by side. Except that Sangster's No. 1 and Carpentert Express have flowers of a whiter colour than the othen, there is absolutely not the shade of a difference amons these four sorts. They are of the same height ( \(3 \frac{1}{1}\) feet were in flower on May 20 th, and in style of Orowth, flavour, shape of pods, sc., all are that seven successive gatherings may be picked from then day
after day, \(i\). e., the whole crop does not come in the others, the five early varieties being fit for use on tho 3d of June, while the four later sorts were not depends upon locality, snug and warm borders, dyy subsoil, and similar contingencies. A. Henderons Q Co., Pine Apple Place, Edgware Road.-
Carpenter's Express direct from Mr. Carpenter, and gre it two seasons by the side of Saugsters No. , , ome 22 or 23 years ago, when Cormack's Prince of Walen was sent out I remember supplying Mr. Whitiog win some seed of the Easly May. The two sorts were soma ander precisely gimilar circumstances, and With all was no perceptible difference between ther. our boasted new sorts, Peas are no earlier non they were 40 years ago, for I then gathered the 17th of May, and if our much praised new to sather much earlier than the old ones, we ought to pa and Peas in April. I have this year grown sangster on the Dillistone's Early side by side; they were sown on the 26 th of May from an open field, Sangater's being ten days later than Dilistone's. The best Early 1 © March, to be Sutton's Ringleader ; sown on the 12a Sargsters? was ready to gather at the sand Early nothing in opinion is equal to Nutting's No. 1, a dwarf wrink Marrow and iree Dearer, with large pods and a delicion flavour. Richard Gadd, Salvington, Wor ining. Messrs, Sutton's Ringleader ought to of it seed List as a first-crop Pery on a \(h\) border it flowered about the middle of April, and I could har gathered a dish of Peas from it as early as the ef that May ; I did not however do so before the 2 I made another sowing of the same kind the first reek in March alongside of several early varieties, and Ins gratified by gathering Peas from Ringleader waresler days before the others. D. Bain, Gardenes sorts of Peas for succession (p.556) ar would, however, direct attention to useful of Peas. Sutton's Ringleader, which is proper designated "First Crop," is of medium according to circumstances from 2 the cultivation Little Gem is a light-blue wrinkled variety, of goo flavour and very early. Withels of First Crop. tread very closely upon the hee on fing, acording to
dwarf, growing from 9 to 15 inches the nature of the soil, \&c. ; it begins to bear filleh the ground, and the pods are large and

Prom what I bave seen of this Pea I believe that it will much per acre as easily protected to save the first blossoms, by which means considerably in advance of Peas. Alpha, Nt. Osyth, Essex.thint that the discussion respecting Early Pens any real ing the varieties later in the season, say Aprili, or even the beginning of May. Sow the early ruiecties at the same time, and in whall get at the "one." I. think ind then I think we sualion is not to be trusted to cn the different localities and soils, and varieties Westport.
Bed-rooms (see p. 536). - Your correspon and "J. F.," should shat his windows before \(50^{\circ}\) clock; leare it there, with the door open, while he shake artains, beats the walls of the room with a towel, in any other way ronses up the gnats. Then the may be closed, and, the enemy being
Fotes on the Flora of Kildare.-Last year I gave yon some account of a number of plants found in that Dublin and Meath. Inow mention some found in the ower part of the county, or tbat adjoining the counties in this district is of a light description, lying on what known here as corn gravel. Much of this gravel has bern dug up in old times and spread on the surface of e land as manure; whether the soil was improved have favoured the growth of plants seldom at the other end of the county, Conspicuous
these is the White Campion, Lychnis dioica me corn fields in a sheet of dioica mon Hemlock and Magwort are also most common in ditchees and on headlands; so also is the Bladder
Catchfly. Some of the hedges are fragrant with Sweet Catchaly. Some of the hedges are fragrant with Sweet
Briar, which is by no means common at the north end of the county, and there may also be met with occasionally a plant of both the common and the Mealy officinarum may be gathered by the cartload on old boildıggs. Asplenium Adiantum nigrum is also quite balaris is a common weed on many walls in the neighbourbood of Ballytore. London Pride, Saxi
fraga umbrosa, grows on the roadside from Kilkea to Baltinglass. It seems to be quite indigenous, having 0 appearance of ever having been planted where I saw it growing. I may just mention in passing that at Kildare) Chelidonium majus literally covers some of the Rilkee Bround the town. In a meadow adjoining Listern ovata are now blooming in the conopsea and ppecimens of by far the most beautiful few very fine our native Orchids, viz., Ophrys apifera, or Bee singularly efrikect of this blooming among the Grass is eractly lize a bee, contrasting beautifully with the outnative gem, winich maintains the dignity of its princely mily \(\ln\) this its Emerald Island home, is well worth Eildare.

\section*{Foreign Correspondence.}

under cultivation; the vital importance of aspect is
therefore fully explained. While on this subject it sloould be observed that a hollow or land-locked valley is also unsuitable to the cultivation of Cinchonas, because the cold air generated at night on the sides of the neighbouring hills, being of greater specific gravity than the warm air, rolls down and fills the valleys, displacing the warm air and reducing the temperature of the valley to an injurious degree.
A moderate amount of rain (irom 60 to 100 inches in the year), following uniformly in showers, at not too great intervals, is most beneficial for the growth of Cinchonas. They delight above all things in showers and sunshine. Long continued rain is decidedly njurious, as also continued drought, but of the two the latter is to be preferred, as the plants thrive well ander artificial irrigation.
The best range of elevation is from 4500 to 7500 feet, but different species require different elevations-our experience indicating 4500 to 6000 feet as best snited for the red, yellow, and grey barks and their varieties; while from 5000 to 7500 feet promises to be most favourable for the varieties of the Crown Bark. These elevations are named from our observations on the Neilgherries, where an altitude of 4500 feet in a \(66^{\circ}\) Fahr 6000 geet \(66^{\circ}\) Fahro, 6000 feet giving a mean temperature of \(59^{\circ}\) about \(53^{\circ}\) Fahr. The temperature of any given locality is a more certain guide than elevation.
The only difficulty in the successful management of Cinchona seeds is their impatience of any excess of moisture, and therefore it has been found necessary to take some trouble in the preparation of the soil for their reception. The method which we have pursued with the greatest advantage is as follows:-The soil used, composed of earth produced by rotten leaves, was sifted and mixed with four times its own volnme of sand. The leaf-mould was in the first instance exposed to the sun for two or three days, and thoroughly dried; it was then heated to about \(212^{\circ}\) Fahro, in order to destroy all grubs or larvæ of insects. The leaf-mould and sand in this state of moisture were mixed together, and the pots filled; the surface lightly pressed down, and the seeds sown thereon, being covered with a sprinkling of sand. The pots were then plunged into beds of moist sand on a bottom-heat of about \(75^{\circ}\) Fahr.; word, but when the surface became dry they were merely sprinkled with a fine syringe, just sufficient water being given to damp the surface, but never to penetrate or consolidate the soil. Under this treatment the seeds began to germinate very strongly on the sixteenth day after sowing. The least excess of moisture causes the seeds to damp off in thousands. As soon as the seeds germinate they are carefully pricked out into fresh earth, from 25 to 50 seedlings being transplanted into a 5-inch pot, and then treated in every respect the same as the seeds, that is they are never watered, the surface being merely sprinkled and the pots plunged in beds of damp sand, as before stated, to keep the soil in that medium state of moisture in which it was when first placed in the pots. The
necessity for this care is to prevent the seedlings from damping off, to which they are very liable when treated otherwise. Treated in this way our seedlings have made an average growth in one year of over 30 inches, while many seedlings raised and grown on a retentive soil have not attained the height of 3 incles in the same period. As soon as the plants have attained a height of from 10 to 15 inches they are propagated by being layered. In this way they were found to root readily in about
six weeks or two months at the latest, and the plants six weeks or two months at the latest, and the plants
by being bent down, break or throw out shoots from every bud along the whole length of the stem, and not only this, but many latent buds are developed and a fine growth of young wood produced for succeeding layers and cattings. In this way each branch or shoot is treated as it gains sufficient size. The principle of layering we have adopted is somewhat different from that usually Cinchonas flowed so freely that if merely place? in the soil it was apt to canse mildew and rot. To remedy this, a piece of perfectly dry brick is placed into the cut as soon as it is made; this absorbs the juice an effectually prevents the ill effects above mentioned.
Cuttings of from three to five inches in length, if planted in beds in the open air and partially shaded, will form roots in from three to five months, and when a rapid increase of the plants is not an object, this is perhaps the safest and cheapest plan of propagation. With the aid of a propagating house, the youngest making cuttings, as young tender shoots, a fortnight or three weeks old, form roots in a very short space of time, the majority of these cuttings being invariably rooted within a month. The earth in which these the cuttings on being made are placed around the sides of the pots, the cut end of each being pressed firmly on a piece of dry brick. The cuttings are now carefully watched, the surface and the leaves being moistened by a fine syringe when the atmosphere in the frames appears dry; they are however never watered, it being very necessary to ensure success to avoid this, as we have invariably found that when the earth is
once watered it causes the cuttings to damp off, and
seriously retards their rooting. When the cuttings are placed in the frames, they are exposed to as much light they can bear without flagging.
It occurred to me that the plants could be success fully propagated by leaves with the bud attached; and as this method offered very considerable advantages in producing a large number of plants from a limited supply of wood, we resolved to attempt the experiment which has been carried ont most satisfactorily. By this method fine plants are obtained in every respect sembling strong healthy seedli.gs. The period required to form roots is nearly the tame in all the species varying from three to six weeks. It is not indispensable hat a leaf be attached to the bud; this is no doubt a great advantage, although we have strack many bads without any leaf attached.
The usual way in which we prepare the bude is to remove the point of the shoots for a cutting; the stem is then divided near the middle of each internode, split down the centre, and immediately placed upon the brick in the pot; the bud itself being covered with about finch of soil, while the leaf of course pro jects above the surface. The pots are then plunged in damp sand, and treated in every respect the same as the cuttings.

The question as to the way in which the land should be prepared for the cultivation of Cinchonas, is one that has been much discussed since the beginning of this experiment. We have advocated that the land should be entirely cleared of forest, at least so much of it as may be planted with Cinchonas. In situations such as are subject to occasional storms and high winds, perhaps it might be well to clear small patches of a fow acres in extent here and there throughout the forest, in order to ensure shelter. The only objection to this system exists in the liability of the trees left standing on the borders of the patches to be blown down, and damage the plants within their reach. The system o cultivating Cinchonas in partially cleared land is liable to the same objection, for the forest trees when de prived of a portion of the support upon which they were accustomed to lean, are also liable to be blown down; and morevver this system has the further and more serious objections of shading the plants too much from the sun, while they are subjected to the damaging effects of the drip, during the rains, and the roots of the forest trees immediately fill up and choke the holes into which the Cinchona plants are placed, thus depriving the young plants of all nourishment. In our experiments here, we have planted a considerable extent of land in this way, but I fear with such bad results as will ultimately render it necessary to clear away the remaining forest trees. In the greater part of our operations, the whole of the forest has been felled, and on that which is planted, the growth of the plants has been much more satisfactory than that of those placed under any degree of living shade. I therefore feel convinced that the open system of planting will be the only successful one, especially on the Neilgherries. It is true, that while the plants are young this system has also disadvantages, which should not be overlooked. I refer to the excessive evaporation and radiation during the bright and cloudless season, when our dry and cold weather prevails. We have hitherto combated this difficulty by sheltering the plants with a temporary shading of Bamboo or Fern. Many hundreds of ou plants, however, have passed throngh this dry season without any protection whatever ; and although their growth has not been so rapid, their health is quite equal, if not superior, to that of any of those protected by artificial sbade, and it is probable that during the spring and rainy season the growth will be more rapid in the plants without shade than in those which have been shaded.

The best season for planting is the early part of the ear, or after the ground is well soaked by the first blishers; this gives the plants time to be well estamed before the setting in of the dry weather. mornings or evenings until they become established.

\section*{Eoctrtíg.}

Royar Hormooltural : June 17 (Special Show of Azaleas).-Of this it was stated in a notice posted up at the entrances, that " the unusual forwardness of the season has made it impossible to have a full show of Azaleas this day, which therefore will not be considered as a special show day;" and there were only such plants as occurred in a very pretty collection of stove and greenhouse plants and Orchids, from Messrs, Lee, of Hammersmith, who also contributed half a dozen boxes of beautiful cut Roses. A simular exhibition came from Mr. G. Clarke, Brixton Road; and Mr. Bull furnished a numerous collection of new plants, Ferne, Dracæna Sic, and a fine pan of Trichomanes speciosum.
June 20 (Election of Fellooss).-Sir Nentworth Dilke, Bart,, in the Cbair. The following candidates were elected Fellows, Eliot; Mrs. Fergusson ; C. Newton, Rsq.; Lady Pigot; Viscount Powerscourt; G. Taylor, Esq.; Walter B. Williams, Esq. ; and Mrs. Winsor.

Birmingeam Rose Show.-It will be seen by an advertisement in another column that the last day for intending competitors to make their entries for the forthcoming Show is Friday next, the 30 ch inst. All
Rosarians are necessarily interested in this imnortant
exkibition, which, in consequence of the spirited and judicious management of the committee, is generally quite equal to those held under the auspices oreeable opportunity for professional and amateur Rose growers in the Midland C cunties to yearly study the progress made in th

Select Orchidaceozs Plants. By Robert Warner, F.R.H.S. ; the Notes on Culture by B. S. Williams
London : Reeve \& Co. this noble worl a
of garden plants, Parts 8 , most popular familie 8 in terms of commendation of the earlier Parts of the in terms of commendation of the earlier Parts of the
work, and these later ones are fully equal or even supe. rior to the former, both as regards the selection suljects and their execution. In the 8th Part are given figures of Calatithe vestitn, the yellow-eyed and res eyed varieties; Odont.glossum Phalænopsis, charm ingly rendered from a plant grown by Mr. MeMorland Angrezum sesquipedale, the remarkably long taile Midagascar species introduced by the Rev. W. Ellis ; an Miltouia Moreliana, less Lappily represented. The 9 Part contains Anguloa Clowerii with stout erec almost Tulip-like blossoms; Chysis Limmingliii, most delicately and charmingly coloured plant; the well-known Cœlogyne cristata, one of the finest of what Mr. Bateman calls Bridal Orchids, and Mr. Leach' high-coloured Disa grandifi ra superba. In the 10 th and concluding Part is a good illustration of the rare Gale. andra Devoniana; Epidendrum Skinneri, superbum, fine variety introduced to Mr. Veitch's collection by \(M\) Skinuer; Arpophyllum giganteum, remarkable for it dense cyliudrical spike of small shelldilike flowers and Lxolia purpurata, one of the grandest Orchide se introduced. A particular feature of this book, as distinguished from the somewhat similar one of Mr. Batemar now publishing, is that the cultivation of the plants fully explained. We give the remarks on Galeandr Devoniana as a good sample of the kiud of information to be found under this head in this charming drawing room picture-book:-

Galeandra Devoniara is one of those Orchids rhici lose their leaves annually. The stems grown in this country are usually about 2 feet in height, and the foliage is of a light-green colour. The Hower spik proceed from the top of the stem when the growid completed, and bear numerons flowers, whose lipple.
creamy-white, beautifully pencilled with purple creamy-white, beautifully pencilled wilh purple. for several weeks, if the flowers are kept cool and free from damp. For its growth, it requires a good suppl of moisture. We were delighted a short time diaden to H. H. Gibbs, Esq., Regent's Park, in a cool hooce, with Olontoglossun, Lycaste Skinneri, dic The plant was growing on a block of in pots; but when krown in this way it requires a great deal on had beer impork mast be kept moist. This from which figure was taken, we have known for several years, and it has always been grown in a pot. The plant requirea a good season of rest. Mr. Picher, gardenis plant Rucker, Esa, of Wandsworth, informs us that thime sometimes rests for six montbs, and during this timo he keeps the roots quite dry, or gives but just sumien a moisture to keep the bulbs plump. When the pot too commence growing water may be givea, the time they are grown about 6 inches high, more water may be given, and during the ped to get dry. growth the plants should never be alowed by drynew occurring at this stage, the growth becoming is consequence weakly; but after the growth las ofrom completed, less water will suffice. We tuit may hare better when kept near the glass, wh is then stronget, all the light possible. The growth is then
and this is also the means of bringing the flowers and this is also the mean sometimes makes two grom th in one zear, but does not always flower from both. The second starts before the first is completed. Sphagnam, material for potting is good fibrous peat and the gether, with go then a little Sph put over the crocks to keep then open. So potine the material should be carried one or two and firmly
rim, and the plant placed on the top and down. This latter is a poiut of sone importa the cultivation of Orchids, as it causes more vigorously; besides, it loose, the fing G leandras is get injured. The best time for potting (hey be make fresh roots. They require to be repotte the soil gets in a close or sous roots washed cases be shaken !way, and the be with all Orclic repotting. This, indeed, shousisfactory condition. Boik Mr. Tull and Mr. Pilcher grow their pland ther will do end of the East Indian house; but we find from \(50^{\circ}\) to with less heat, that is, in a temperature fielieat, \(55^{\circ}\) in winter, and in a duoase simmoer.

\section*{lat rerica has been \\ Hedbook of British Plants, designed especially for} Soiools, Science Classes, and Excursionists. Cbeltenham: Norman \& Sons. 12 mo . Pp. 213 . Cwellemect of this little book is "to supply the want of brief, simple, and cheap introduction to the study of British plants, especiallases established in various parts and for the science classes Department of Science and Art." The contents are arranged under three heads: - Matural Orders, prised by the contraction of oft-repeated words, a very prge amount of information respecting our native plinn, moreover, is perspicnously arranged, and appears to be generally trustworthy. Altogether this Hand. companion for the field student. We notice a few misprints, which should be corrected in another edition, minprinta, which for instance, as Pasonia, Enothera, E Fopodium, Sunate, Suoda, Lasrefly trustworthy guide; an ay fler ofera, and of English names, would moreover bo in improvement, and would not sensibly increase its bolk.

\section*{The Kpiarn.}
"I ATTBYPTED," says a Devonshire clergyman, "to form a small ArTitrcial Swarm by removing from a frering on it. I searched carefully for the queen, and was, I thought, certain that she was not on the comb. This with the bees was placed with two empty combs in a small bor constructed to hold four frames, and a few young bees that had only just left their cells were
brubhed off into the nucleus from another brood comb, which was returned to the parent atock. The small awarm was confined in a dark room for 12 hours, and mas then placed on a stand closely adjoining the old bive. I inspected the combs of the nucleus at intervals of two or three days for nearly a week, but no royal cellis were commenced. Hardly any bees seemed to Lave the hive to work. On calling in the aid of an
axperienced bee-keeping friend, the reason why no royal calls had been formed was very soon made appurent. He at once pointed out to me a fine queen
on one of the combs. The bees were very few in number, not enough to cover all the brood and eggs in one comb. We then proceeded to examine the parent hire, and discovered a few royal cells in an early stage the queen's energies were paralysed, and that until a arger popalation was present, there would be little apperance of work. I was disposed to return the queen to the stock hive, substituting the brood-comb meet the we had seen the royal celis. This did not meet the approval of my friend, who advised me to malse the beat of the present state of affairs, and trust to the plan of gradually increasing the strength of the thata very great risk attended the returning the queen to the ord great risk attended the returning the queen and that the probabilities were that she would be at once marificed. Deferring former subjecta, and the hive aliowed to remain is to his judgment, matters were Atter helis that my plan would have been the best. onarm did not seed to sealed brood-combs, but the sobsequent visit of my friend, he informed me that fat, and on again inspecting the soon and too or utarred. Weat deal of the brood was chilled of the brood-combs with the queen to the stock copal celle. I shall be anxious to see if the queen is math perish." if this thould be the case I fear the stock making himself perfectly cortain of the absence of not corering her prood-comb selected, by previously disand the one from which the young bees were dislodged grop to cover the brood to start with. Wa oldatock, which tend placing the nucleus so near antire population, as many to lessen the already dimiThther than to the would naturally prefer to return to When it to the new one.

Our Correspond improbable.
the nucleus by the addition of brood-combs was very committed in giving any additional brood-combs, when there were an insufficient number of bees to hatch out the brood already there. It would have been better to have waited until the majority of the young bees had nucleus. Then one from which the bees were actually enaerging from the cells should have been added, and a week allowed to elapse before a further addition was
\(\qquad\)
When it was found that so much of the brood had become chilled or starved, perhaps it was as well to try
the experiment of restoring the queen on the brood. comb to the old stock, substituting a comb with royal cells. Even supposing the queen ahould be destroyed, it is most probable that other royal cells in a tolerably advanced state would previously have been constructed on other combs in the hive, so that she would soon be replaced. The chief disadvantage accruing
from such a result would consist in the cessation of all breeding in both the parent hive and the nucleus. The loss of a queen at such a time involves the loss of many thousands of bees, though the hives themselves may eventually make sufficient progress to be able to stand the succeeding winter. Should the death of the queen occur in consequence of her being returned to her subjects after an absence of more than a week, the chief advantages arising from raising artificial swarms is lost. It must be the fixed object of the apiarian who works on this system in no wise to check the fecundity of the queen at the head of his colonies. If the plan of building up small swarms into stocks sufficiently strong and well provisioned to stand the winter be systematically followed, the utmost breeding power of the queens of all the stock hives will be requisite. If queens are removed
with the swarms, such swarms must be sufficiently large to cause but little check to the queen's breeding. We should be glad to hear whether the queen was the result of the experiment generally.

\section*{Garden Memoranda}

Mr. Veitceis Nursery, Coombe Wood.-Coombe Wood is situated on Kingston Hill, one of the most commanding and not the least beautiful sites in the neighbourhood of London. As a spot of ground for nursery purposes, it is unquestionably one of the inest that could be selected, both as regards soil an the numerous and varied examples of nursery produce which is classified and arranged for the convenience visitors, presenting as a whole a singularly pleasing effect. It may be said to be one of those fertile valleys with equally fertile slopes on either side, where certain forms of vegetation delight to revel; which neither the parching heat of summer accompanied by drought, no accasional periods of deluge, materially affect; and where, we opine, the inclemency of winter will not be foit very rigorously. All these things can be easily accounted for and understood when we consider that no stagnant water can remain in such a piece of ground; moreover, the first stratum or soil is of that yellow gravel, and thed with a certain proportion of many dendrons, and Roses greedily feed. It is of that plastic consistency that it is sufficiently retentive in periods of drought to hold water, and what with the sand with which it is incorporated, and the gravel above, it cannot fail to be thoroughly aërated, and in such a condition as to ensure successful plant-cult sutrounded with wood-here and there a dense patch occurring in the landscape, with thand Wimbledon Common in the distanco-such as a landscape gardener or a landscape artist would delight to work upon. Mr. Veitch, influenced by such ideas, contemplates building a villa in an elevated position of the table land, as the square block of ground unplanted teatifies, and he has all the immediate surroundings laid out so charmingly
and yet present a suitable dress-foreground for the Some people say there is sc
Some people say there is "method in madness," and Idon't see why there should not be method shown in the best example of nursery stock. has come within m observation; but Mr. Veitch is proverbially a methodical man. The arrangement of what one might call the forest of plant houses at Chelsea, and the unexceptionable order in which every thing is kept, fully couvey a resolute determination to have everything done orderly and well. The natural position of Coombe have been an attempt to flatten tine little undulations and introduce straight walks, and otherwise resort to the strict formula of square and rale. \(O a\) the contrary, this large amphitheatre-like block of ground is divided up into principal walks, whec
follow the natural curvature, and are intersected again and again, forming divisions which are planted with nurslings, those that require shade and shelter in suitable positions; and such as are more at home in exposed localities likewise provided for and attended to. Broad mixed shrubbery borders line either side of the principal walks. Along each side of the centre walk, in the dell, the borders have a very imposing effect planted in this way, the back rows lined with Araucaris imbricata, of which there are hundred of noble examples from 4 to 6 foet high, which would make most excellent individual plants for lawns of all descriptions. In the front of these stand unique plants, of their size, of Picea Nordmanniana and Pious lasiocarpa, a most noble companion for the former plant, having rather a more silvery appearance, and a littlo more pendulous habit. Associated with these are numerous plants of the noble Pinus Pinsavo, and an extra fine variety of Picea nobilis, showing a more
robust habit and being closer in the branches and denser in the leaves than the older sort. Positively these plants above mentioned are revelling in such a way at Coombe Wood as to resuscitate my old love for Conifere. In front of these and close upon the walk
is a line of Thuja aurea, running quite 1000 feet without intermission, and appearing in the distance as if these little compact bushes had been dipped in gold. so beautiful was the variegation, and so admirable the contrast from the background of fresh and lively green.

In other borders I noticed the fine dark bue and handsome habit of Abies orientalis, a most beautiful decorative lawn plant, and numerous specimens of the handsome Thuja Lobbii, the branches weighed down, forming graceful festoons with the weight of its numerous seed vessels. Cupressus Lawsoniana, one of the most elegant and one of the hardiest of the Cypress tribe, had flowered and fruited much in the same manner. Thuja elegans is well named, for it is an in fine condition. A very fine pyramidal-growing plant, not commonly seen in our parks and pleasure grounds, is Arthrotaxis selaginoides; it is one of the densest growing of our Cypress-like plants, well meriting a place. Another most excellent small-growing plant i the drupaceous fruited Juniper, having a fine conical habit, like a pigmy Araucaria. Salisburia adiantifolia laciniata is a nice addition, having finely laciniate leaves of a pale green with yellow edges.

Not to be needlessly prolix, let me glance a moment at a few miscellaneous things of an out-of-the-way character. large again as more common sorts, and colour a deepe tint of rose. The Japan Bambusa, called Metake, is an ornamental plant likely to succeed well in shrubbery borders, and in the vicinity of lakes and such-like places. It has a long grassy Carex-like flower stem, here luxuriating beautifully, showing itself suitable aither for a shrub or wall. Cytisus scoparius albus is much the finest and densest bloomer I have seen, and well worthy of general cultivation; so is the beautiful white-flowered Cistus formosus, with its five sanguineous spots, and quite hardy. The evergreen Embothrium
coccineum, with its trumpet-like scarlet flowers-a charming companion for the Honeysuckle, coming as it does from Chili, should be nearly if not quite as hardy as that favourite flowering plant. Then, of course, who would not grow Barberis Darwinii, for it is the most free-flowering and the best of all the smallflowered Barberriea. Tropæolum speciosum is a fine plant for autumn decoration, and having nice broad leaves looks well throughout the season. I aling and flowering on a wall, producing numerous yellow flowers - it is also said to do well as a shrub; for a sabclimber it is a most useful plant. Rhaphiolepis ovata must not be omitted as one of the most distinguished of the Appleworts, having dense masses of white flowers with pink stamens. Lilium longiflorum variegatum is a very handsome form of the longifiora breed, and looked remarkably well, growing in a low
pit. Aralia Sieboidii, with its fine palmate deeply incised leaves, has stood out unscathed, and if it can be depended upon it will be an acquisition; and last but not least decorative under this paragraph is
Pentstemon speciosus, with"immense spikes of cerulean blue, and as close as the beautiful Tritoma Uvaria.
Rhododendrons, Ghent Azaleas, Heaths, Kalmias

Roses in splendid order, with blooms, such as are not raual this season out of doors, perfect ; Hollies of every hue and lescription, presenting a beautiful variegated appearanco as a whole, and every other

Quick to the finest sample of Cunifere, are here Quick to the finest sample of Cunifera, are here that are under cultivation.
With reference to the recently introduced Japanese novelties it may be interesting and useful to say a word upon those which have stoor in the trialground uninjured all last winter. Of the true Japan
Aucuba there cannot be a doubt of its hardiness and Aucuba there cannot be a. The limbata variety, which its usetuluess as a shrub. The simpata variety, which Thujopsis dolabrata, and its variegated form, are unquestionably hardy in the great portion of Britain ; so is the celebrated C'mbrella Pine (Sciadopitys verticillita), which looks in its younger stages at least very promising. The beautiful Retinosporas, of which the golden pisifera is a splendid representative, appagolden pisifera is a splendid representative, appa-
rently iudicates sufficient hardiness of babit to stand rently iudicater sufficient hardiness of habit to stand its varre'ies are great acquisitious, from their free habit and Holly-like appearance. Nor must I omit to note that beautiful dwar! shrub Euonymus and its varieties. It is unquestionably one of the finest introduations in its way from Japan. Several of the Ables tribe from that country are apparently hardy enougb, but they are too small to justify a very positive opinion. If these introducti ns, which have recently flooded our exhbitions, prove hardy enough for our climate,
they are worthy of all the rewarts that have been they are worthy of all the rewarts that have been
heaped upon them. All honnur to such men as Veitch and Fortuue fur the enterpriping spirit which chnractorised thoir proceedings, and gave to Fngland a batch of novelties, inchuting the glurions Latium auratum, which was in itself worth a pilgrimage to the most remore parts of Jupan, I was very much indebted to Mr. Feitch of his courtesy early in a aummer, or rather spring morning, in driving mo
peep at Coombe Wool. A.

\section*{Miscellaneous.}

The Preservative Pouer of Ferms.-Doubtless many of the readers of this journal when passing the shops of large fruiterers in Loudon and elsewhere have observed Apples, Pears, and other fruit packed in hampers containing Fern-leaves, and had they but inquired why these leaves in particular were used, the more intelligent of the vendors wonld probably have told them they assisted in preserving the fruit from mildew and
deoay. Some years ago, when residing in the Iole of Man, I noticed that the Bracken (Pteris aquilina) was in large demand for packing the fresh-caught herring
forwarded daily by steamboata to the Liverpool a rently, during a brief s journ at Frodsham, in Cheahive, Brackens were collected on the Overton hill to line the hampers of new Putatos transmitted to the Manchester markets. Upon my return to the north of Kagland, in a year when the Posato
disease was threatening the destruction of that valnable esculent, the reotor of a parish in my nelgbbourhood at my suggeation induced one of his farmors to "hog" his
winter Potatos on the ground where they grew, and to cover them with Bracken instead of the customary straw. The farmer, sceptical about the result, only covered half the "hog" with Ferns, leaving the other half protected by straw; earthing and sodding up the mound to exclude rain and frost. Winter arrived, and when it was discovered that thowe Potatos which had been stored in Brackens were sound and good, whilst those protected by straw were so much decayed as to be searcely worth the labour of removing. To me this experiment was very satiefactory and suggestive. That Ferns contain some peculiar preservative property there can be little doubt. Both the Bracken and Male Fern abound in alikaline matter, which was once used by the manufacturers of soap and glass, and their astringent properties are well known to country people, and the dressers of leather. I believe the aroma from this family of plants to be repugnant to most insects, and inimical to the growth of thowe species of Fungi known as mould. I cannot now recall to my recollection ever having seen the larvee of any lepidopterous insect feeding upon the fronds of our common Ferne, nor do I remember having noticed insects of any orders resting upon them unless it were for shelter during shower of rain. The peculiar odour thrown off' by Ferns must be familiar to all who have wandered near their place of growth. Is it due to an essential oil? The Russian leather so much prized in this country for its enduring properties and grateful smell is said to be prepared with oil distilled from the Birch tree, and it has been stated that bales of this valuable leather frequently lie for months in damp warehouses at the London Docks without spotting or being otherwise injured by mildew. That essential oils of all kinds will prevent to a great extent the growth of Fungi, we
have but to mix a few drops in our flour-paste, and see how long a time we may keep it unattacked by their aporules, Ferns boiled up with our paste would antiseptic properties, and dead ase. Hups, also, possess in them for a lengthened period without showing any

Fern (Lastrea Filix-mas), when administered in the form of powder or decoction, is a powerful anthelmintic, and is frequently made use of for the expulsion of that pest of our race-the tape-worm. The young unexpanded fronds of this Fern when cooked are said to be equal to Asparagus. Dried Ferns make a most enduring thatch or outbuildings on the farm, and should be largely used for the bedding of all animals affected with entozoic diseases-the pig in particular. If in some
parts of Germany and Denmark Beech leaves are used o stuff mattresses in which fleas and bugs cannot exist, I think the poor of our own land might profitably collect the dead fronds of our Ferns for the same purpose, and ensure the same immunity from these midnight tormenters. H. M., in Hardwicke's "Science Gossip."

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

As daylight and sunshine bave now arrived at their limax for this season, stove plants which are in a growing state should be supplied with the maximum amount of heat and moisture, in order that they may the nooner complete their growth, and have a longer period to ripen it in. Water should be freely and
frequently sprinkled on every evaporating surfaoe, with a view to counteract the dirying effects of abundant ventilation. Incessant exertions must be made to keep insects in check, particularly red spider. The blooming season of many plants may be retarded by ninching off the earliest flowere, thereby husbanding their strength and inducing them to make a longer season of growth.
plower garden and plant houses.
Out of donrs the most pressing work at present will be that of high keeping. Walks should be in good order, lawns neatly mown, and flower-beds well attended to both as to watering and the regulation of shoote of vigorously growing plants.
Calceolamas - Stirubhy and half-shrubby kinds that have flowered may be out back, and placed in a cool place, partly shaded, to make cuttings.
Cingrarias.-Those that were cut down early will now be throwing up suckers. Take cuttinge, as soon as ready, and insert them in small pots in a nice sandy compost; place them in a cool frame or under a handglass ; keep them close and sprinkle occasionally to prevent flagging; pot off as soon as rooted into a light compost, composed of two
mould ; add sand liberally.
Dahlias.-A constant attendance to watering and securing the young plants from wind is all that will have to be done for a few weeke. Both the thinning of the side shoots and mulching the plants with rotten manure will have to be attended to at once. Commence destroying earwige, before there are blooms for them to disfigure.
Hollyhocks.-These should be mulched and then thoroughly watered; the latter operation should be repeated
Panstes, Take off young cuttings as thay are obtainable, and atrike tham under small glansea in a shady situation.

Pinks.-Water copiously during the time the buds are swelling: weak liquid manure may be applied beneficially

Pelargoniuns.-With many it is now no small matter of anziety to prolong the bloom of theme, and if we can asaint them butalightly, that will afford some satisfaction. Many of the finest kinds are probably still in perfection, and it is most desirable that shading should be attended to carefully, for one munny day may injure the flowers beyond hope of remedy. It is equally desirable that the atmomphere of the house should bo kept cool.

\section*{PORCING GARDEN.}

COCUMBERS,-Pay great attention to thinning and regulating the shoots; go over them at least twice a week, as they soon get crowded if neglected a few days. Guard against red spider, by syringing the plants and frequently sprinkling every part of the house. Attend to plants in frames. Keep linings well made up; earth up, peg out, and train shoots of growing plants. Water when necessary.

Minons.- Keep up the top temperature, and a bottom heat of \(85^{\circ}\), and a moderately moistatmosphere to the successional plante, and give occasional waterings. Those plants which are ripening their crops will require less water and a drier atmosphere. If it be desired to obtain another crop from them, cure must be taken that the soil does not become too dry ; water should be given to the under portion of the soil, by means of holes made with a tin tube.

Peaches.-Use the syringe freely to keep down the red spider, and tobacco smoke to destroy thrips. The foliage must be kept healthy, to ensure success in the crops of this and future seasons. Should mildew make its appearance in the late house, dust the plants with sulphur immediately.
PInEs.-When the bottom heat is declining, it may be recruited by surfacing the beds with a few inches of new tan ; as, indepecdently of its own fermentative power, it absorbs a considerable quantity of heat from the sun, and attracts the roots to the surface, where they revel among the new material. In addition to these advantages, it checks evaporation, economises
labour in watering, and reeps the roote in a mon equable state of moisture during hot weather. syringe must be freely used every fine afternoon, and
the pits shut close for an hour or the pits shut close for an hour or two, to compena the plants for the loss they sustain by eraporation during the day.
Vines. - Let late Vines be supplied with a sufficien: sheant of heat and moisture to keep them growing : healthy rate.

\section*{HARDY FRUIT AND KITCHEN GARDEN.}

Persevere in the system of gradually remoring superfluous shoots from wall fruit trees, and in or that the proper balance between the crop and t
capability of producing it may be maintained, it capability of producing it may be maintained, it \({ }^{\text {mian }}\)
be necessary to disbud more or less severely as the trees are vigorous or weakly; for exampl vigorous trees, full of life, and evidently having a re accumulation of sap, must have an outlet, or else th will be a risk of obtaining only strong unfruitful wool Stop and thin therefore with great caution

Cabbage.--Sow now for Coleworts. The Rosette is one of the best
Celery.-Earth up this as it requires it, selecting a dry day for the operation.
Endive.--Sow now for a full crop.
Potaros.-Let these be earthed up as they require it, using a three-pronged hack instead of a sharp dat hoe, which it is a common practice to use, although if is liable to cut off the young strings which lie ves the surface of the ground. The soil for earthing should be drawn from the centre of the space between the ridges.
Strawberries.-Of these there is scarcely a third o! a crop this season; take care, therefore, of what there is by well attending to the plants with water.
Winter Greens.-See that Brussels Sprouth, Sapops, and Broccoli for autumn use are got in. The man plantinge, however, to stand through the be better deferred for some time yet; as when too early the plants become gross, and are more hable to suffer from frost.

\section*{The Sgricultutal Gatette}
mreting por ter ensuing wrik.
Famply, June 30 -Bedfordshire Agricultural Bociety, at Bedford.
In some notes which we published in 1862 on Clovers will be fuund the following remark "So useful are the species (of Leguminosre) which we now employ in farming, that it seems to us a fine field for experiment, not only with the view of improving those we already possess, but with the further object of producing new forms, and bringing fresh species intu cultivation.'
Having ever kept this object in view, it may not be out of place to offer a few remarks upon our experiments and observations connected with this interesting family of plants, so far as they affeot the farmer. Our last series of trials were started last spring (1864), in which 120 plots were devoted to the Leguminose. These, on account of the soil, which is light and sandy, and the extreme drought of last summer, made but little progress the first season; this year their progress has been very different, and the following Table of some of the agrarian forms, which was made up on the 1st of May (1865), will, it is hoped, be not devoid of interent. It may be remarked that the results were made up on the 1st, beoause it is just about that time that many forms might be made most useful to the farmer. It will be seen that the figures represent the height to whioh the various plants had attained on the 1st of May, whioh it
should be explained was made as general and even as possible, and not noted upon a mere extreme case. The weight was estimated by cutting a given space as close to the ground as may be done with a scythe, and weighing the specimens immediately that they were cut.

Experiments mith the Clofer Allies.

This Table refers to as many as 26 examples, which, it should be remarked, were scarcely in Hower on the 1st of May; at the same time the height and weight of some of the specimens at that time is sufficiently remarkable to deserve a few notes of comment.
The Clovers as a rule were poor, a circumstance which was then accounted for from the fact that our soil is not well adapted for Clovers of any kind, being in all probability deficient in lime. The poverty of the crop is however also owing to the remarkably large quantity of Orobanche (Broomrape) that is now to be seen in all our plots of Clover. It did not make its appearanoe in the first year of the growth of the crops, but within the last few days it has so overwhelmed the plants as to make them much less in quantity than on the 1st of May
The parasite in question is every where to be met with, on all our hedge banks and in most Clover fields, but how it got into these plots in such quantities, and how it commences its attacks upon the foster parent, is a great mystery. It is impossible that it could have been derived from the seeds in all the cases, and it thus becomes a curious subject for investigation how so large a plant as the Orobanche first commences its life upon the smaller-stemmed foster parents upon whioh it is found, and how it adapts itself to plants of suoh varied forms and properties ; for not ouly is it found on Clovers, but on other plants of very different natural orders, such as lvy and Composite, and we have now a specimen established on an Oak-leaved Geranium in a greenhonse, which was grown from a cutting last year.
The next plots to which we would direct attention are those of the Sainfoins. We were not prepared for such good results on such sandy soil, but they have encouraged us to try it in the field on a larger scale, though we can find no precedent for so doing among the farmers of the district-indeed, few amongst them had ever seen the plant growing. The light weight of the Burnetas compared with the Sainfoin is a signitieant hint to buy seed freo from this pest, as it soon gets possession of the soil, and yields but a small weight of produce, though it spreads and looks a great deal, which however we should think of a very low nutritive value. The two plots of Ladies Fingers' are remarkable for their mass of produce; the seed was sown thiokly and its thick bottom growth-entirely without flower on the 1st of Mar-has told in the weight. It is now in fine flower and very vigorous, maintaining its pre-eminence smid our plots, as the Clovers around are ruined by the Broomrape, from whioh the Ladies' Fingers have been wholly spared.
In some previous notes in these columns on this plant, we dwelt upon its hairiness as against its value as an agricultural plant. Now it is but right to say that these notes were penned from observations upon the wild examples, but as our cultivated specimens are almost devoid of hairs and exceedingly succulent, we are inclined to
* The Clovers for the most part were poor, but this is ancountad for ia mo

Introduced Into this series by way of contrant
Eroe from parasites.
think much more highly of the Anthyllis than formerly.

It certainly has done so well this spring as to induce us to try it in our fields, in the hope that it may take the place of some of the worn-out Clovers, for it may turn out to improve still more in cultivation. My two plots were derived, one from seed from the cultivator who introdaced the plant to the notice of farmers, the other from the Messrs. Sutton. Their behaviour is much the same, the difference in quantity being perhaps due to difference in the quantity of seed and in quality of soil, as the two
plots are a good distance apart. It should here be mentioned that in these, as in the other cases, no manure was used. The Vetches usually do well on our soil, but they were so injured by birds that the crop was very poor. The Narbonne Vetch has leaves as large as the Horse-bean, and grows at first upright, in the same manner; it might, we think, be drilled in the same manner as Beans, and form a very useful crop either a a winter or spring Tare. We have now a bed sown last April as much as 16 inches high and quite upright. The Vicia Cracca, Cow Vetch, is a every sy mptom of a good, easily grown, and useful soiling species.

The Melilots, we think, are not made enough use of; we have repeatedly found them to grow most readily, and, indeed, we were so pleased with their mode of growth and flavour as to recommend a small portion of its seed to be mixed with Clovers and Rye-grasses (seeds) for the sake of flavour.

We have this year a 50 -acre field of seeds, in which was sown with the Barley of 1864 Rye grass, Broad Clover, and Hop Trefoil, with On account of the drought, the Clovers utterly failed; much Barley however came up, not merely from shed seed but from the unexhausted stools o the old plants, and also a sprinkling of the Bokhara Clover, which does not seem to be affected by drought like the common Clovers. The Ryegrass and the young Barley is thus flavoured with Melilot, which though a rough will be a sweet hay, nicely flavoured; and both the Barley and Oats in the young state appear to have much, if not all of the virtues of their respective seed diffused through the whole structure of the plant, which on drying thus becomes a nutritive hay.
Our experiments on these plants are still oontinning, and as we hope ere long to transpose some of them from the more limited space of experimental plots to common field oultivation, in which they will take their rotation in the usual method, we shall be glad, to this end, to hear of the results of any trials in the same direction. \(B\).

The provision which Natare makes for the accomplishment of her processes is so abundant that they are rarely made more certain or more perfect by artificial assistance. The work of fertilisation in the Wheat blossom, often carried on in the midst of inclement weather, is one of them. That it is capable of artiticial direction is plain, from the saccess of experiments in hybridising. Cutting out the anthers of one flower before the pollen has escaped, and substituting others full and just ready to burst, you obtain both the natural and an artificial result. It is however obtained by careful individual and timely attention. No wholesale or large-scale process would be efficient, and when M. Hoorbrenk declared in the Journal d'Agriculture Pratique last year that he had obtained a largely increased crop of Wheat by an artificial fecundation conduoted in the very roughest manner, few in this country believed him to have read his experiedce aright. Mr. Lawes nevertheless submitted his process to an experimental test; and as the season of Wheat blooming is close at hand, we quote the following account of it from his paper in the Journal of the English Agricultural Society. In the first place he had plots of land in crop, on which 12 years' experience declared that he might expect identical results from uniform treatment. Over three pairs of the plots his experiment extended, and the following is his statement:-
"The duplicates being again manured exactly alike as in former years, plots \(12 a, 13 a\), and \(14 a\) were sub. mitted to M. Hoorbrens's process; whilst plots \(12 b\), the directions given, the mode of proceeding was as follows:-To a rope long enough to stretch across the plot to be operated upon, pieces of woollen twist 2 feet in length were attached so close as to touch each other,
thus forming a ort of fringe 2 feet in depth. Before
wio the wool was smoared with honey, and the rope
thus prepared, was stretched across the plot and trailed over the growing crop when in bloom in still weather.
It was thus drawn up each of the plots to be operated upon Jus 2 , down on July 4, and up again on July 6. The following Table gives the produce obtained with, and without the process of artificial fecundation.
Produce of Wheat per acre on Duplicate Plots, one
ARTIficially
Harvest 1864.

"It is seen that in neither of the three trials was any increase of produce obtained by means of the fecundating process. Indeed, there was in each case rather more without it, though the diference was so slight that
it might arise from causes unconnected with the it might,
treatment.
"It may, perhaps, be said that, as the season was one of much more than average productiveness and the crops were all unusually large, it was unfavourable for such an experiment. In answer to this objection, it may be stated that the land is capable of growing more produce still, and that all of these plots did grow considerably larger crops in the previous year, 1863, as may be seen by refereuce to the report in
Number of the Journal, as above referred to.
"In conclusion, it may be remarked that it would seem our neighbours, the French agriculturists, are now going through a stage which in this country was passed through some few years ago. The artificial application of electricity, seed-steeping, and other marvels, which were to double the prodice of our fields at little cost, have had their day with us; but the British farmer is still toiling on as formerly, earning his bread by the sweat of his brow and the liberal use of manure, without which he does not find his crops increase."

\section*{AGRICULTURAL EDUCATION.}

Wo gladly give publication to the following forcible atterance on a very important aspect of this subject which has appeared Fipmathise with the urgency of the writer, in his argument that good farmers can be made only out of good men; and
the ludicrous injustice of which he is guvilt in his personal the ludicrons injustice of which he is guilty in his personal
ertilcisms may be readily forgiven for the sake of the energetic assertion of wholesone truth with which they are
accompanied. Mr. Morton certainly need not care, for the sake of personal justification, to reply to an attack levelled
at the mere man of straw which has been made to bear his name.]
Mr. J. C. Morton more than once in his recent address seems to apologise to his hearers for occupying their time with what he considered truisms. He will perhaps be surprised to learn that at least one practical farmer thinks that his main positions, so far from being truisms, are not truths, and that the whole drift, teaching, and advice of the lecture has been read by that individual with something like heart-sickening and despair.
An awkward misgiving seems to have several times come across Mr. Morton's mind-the thought that he was recommending a training that might make a good ploughman, but would not make a man; but he pat it from him and went bravely on. A boy he confessed must be sent to school; there was no help for that but he must be got out of it at 14 or 15, and sent to learn the practical work of a farm.
You are at present writing articles on hypothec, game laws, and other farmers' griovances-Why do Why do they constantly take land, knowing that it is too dear? Why do they give their strength, and their time, and their brains, and their capital, for less remuneration than other people, and either occupy land by the year at the mercy of another, or sign leases with conditions such as those which have been quoted in the North British Agriculturist? Mainly, I maintain, because they are educated just as Mr. Morton wants them to be educated. It is singular that Dr. Begg seems to think with Mr. Morton, and in his somewhat too famous address, he advised that Free Church students should be sent to some country minister who had a great gift think Dr. Begg's proposal would be still more disastrous in its consequences than even Mr. Morton's. Dr. Begg supported his theory of education by an aneedote which, so far from doing so, goes, in my opinion, a great way towards demolishing it. The driver of a coach from Bristol to Bath was asked by
a passenger a great many questions regarding the
objects which attracted his attention. that? "What is the name of that
description of manufactory is this? description of manufactory is this?
answer, "Dun"t then Is passenger, getting nettled, said rather kno man there anything you do know?
man, "I knows how to drive the coach." This is Begg's idea of a clergyman, and Mr. Morton's farmer! A more helpless being it is hardly posiat
to conceive. Even Coachy would find it out when railway whistle first shrieked in his ear, and waen shrill notice to quit. Mr. Morton takes care to \(b=\) us in no doubt as to his meaning. He sags truly tha; there are as great social differences among farciers m between proprietors, and these vary from a Dake is forty-shilling freeholder. But it is not the stap frock farmer he is speaking of, but lads whose fattem can start them with 3000 l. on a farm. Supposing tis

part bickward Tares-then Oats or Barley fullowed by autumn-sown Rye, or winter Barley, fed and followed by Turnips, thus giving two green crops in one season. Trefoil is often mixed with the Barley-sown Clover. The tenant, as should be the case elsewhere, is not tied to any gystem of rotation; it is manifest that the land must be kept in good heart, to secure ou a soil of no great natural fertility, an urbroken succession of
summer and winter food for the sheep stock-the summer and wiuter food for the sheep stock-the
most trying time being that of necessity that begins with the lambing and ends with the yearly stle of the wether lambs and the draft ewes. The latter are sometimes fatted on such farms, but they are usually sold in store condition to be fatt ed elsewhere, and very often to bring one lamb where it is the practice to buy
them to put them for a cross to a Cotswold ram. With exceptions and certain modifications the above is the practice on the Wiltshire and Hampshire, and other sheep-breeding districts. In certaiu portions, and especially on the higher levels of the chalk range, the
land is of a stiffer character, often requiring draining. On such soils the fatting has rather found favour than the breeding and rearing of sheep, a practice deemed best fitted for a heavier sjil ; but, tempted by the high prices of store stock, many farmers have changed their practice in favour of a breeding flock, often with this
difference as compared with that already described: the wether tegs and draft ewes are fatted on the farm, which thus in made to furnish its quota to the consump. tion of mutton as of wool. This is very often the practice in the richer land of the vales under arable cultivation: such soils will necessarily carry more sheep per acre, though some have the disadvantage of not
offering so sound and healthy a lair to the flock, consequently they are retained longer either in the standing fold, or kept in yards in the homesteads.

There is another point which favours tie increass of breeding on the stronger soils, as compared with
lighter land:-On the latter, though affording the best lair for a flock, it is difficult to secure the growth of sufficient green food during the whole summer, especially in dry seasons. The Clovers burn, the Vetches are Rye-grass will not grow freely, and but fur the crop of Saiufoin, or some such crop, the flock-master will find the greatest difficulty in providing for his flock without any break, however well his rotation may have
been previously managed. In soi!s of a stronger character, when really well tilled and liberally treated, this difficulty will be diminished; and though under the pressure of foul, wet, and ungenial weather it will be impossible to retain the flock in the open feld, yet if sheep breeding continue to hold out the prospect of good profit as at present, the increased labour and Whenvience will be amply repaid.
Where the farm has a
Where the farm has a certain amount of pisture attached to the arable land, the difficulties will be soils will bear, will hold out far iuto the summer, to the manifest economy of the other green food produced on the farm. On such farms sheep jards will be preferable to the standing fold, though the two may both find a place where the flock may be protected and where it may be had, and with due super rision and attentive care will obviate the evils to whech sheep for a time confined may be exposed. Again, the larger produce of straw ou such farms will be an advantage where these arrangements may be found necessary. Draining thi land is taken for granted as essential, where required, fitted to carry stock, or whether it be found necessary fitted to carry stock, or whether it be found necessary
to adopt a system by which they are maintained elsewhere.
This, as will be seen, has a direct bearing on increased breeding. Take an example of a well managed farm in the vale beneath the chalk bills, on soil known to geologists as the upper green sand, generally forming low range of hills or undulations under the chalk range. The farm consists of 450 acres, of which 100 are in moderately productive Grass pasture; the rest is cultivated on the four-course system, with modif. cations to meet the requirements of the stocis. The natural fertility of the soil and advantage of chate at a lower elevation, and the 100 acres ores as Sinfoin farmer to dispense with any crop such as winter Oats or wiuter Barley, or antumn-sown Rye, or Trifolium or wiuter Barley, or autumn-sown Rye is is able after incarnatum on the Wheat stubbles. He is able after these crops are consumed so followetimes Mangel or Tares after Rye, as an exception followed by white Tarnips, giving three crops on the so-called fallow. As the sonl is sufficiently strong to grow Beans, Turnips and Rape are sown between the rows. This quantity of cood accounts for the fact that on the cousumers) (large improved Hampshires and great cousumers) are maintained throughout the rear; that over 50 wether tegs are made off fat. The draft ewes would be fatted also, did not the high price easily obtained by their superior quality cause them to pass in store order into the hands
of those who use them to breed another or two more lambs. This is done in addition to the maintenance of over 30 milch or neat stock always kept on the farm, the practice being not to buy artificial food, but to mintain the stock by the produce of the farm.
It is contended that it is by extending systems now in action rather than trying to suggest new plans or untried experiments, that the great ohject of increased sheep breeding will be accomplished. The same will be true of the best system of breeding, and the maintenance of nost stock on a given area, whether it be on the Cotteswold range, the counties of Sussex, Kent, Leicester, Norfolk, Suffelk, Shropshire, or other placess
where this branch of faraning is successfully carried out. J. C. C.

\section*{(To be continued.)}

\section*{THE GROWTH OF BARLEX:}

On Thursday evening of last week Mr. Caird, M.P., thus called the attention of the House of Cominons to the merits of the Birley crop in the scheme of English arable farming:-He suid that he had declined to offer any opinion on the subject of the Malt Tax in the discussion on the Budget, as Le eutirely approved the remissions made by the Chancellor of the Exchequer. But the right hon. gentleman, though he had since modified his language, spoke so strongly against the policy of any future reduction of the Malt Tus that he olt desirous of presenting mome poin!s on the subject for his consideration. He held that a tax which impeded the growth of Barley was injurious to the agriculture of this country. Of all corn crops, Barley was the most friendly to the farmer. It was the shortest time in the ground, was the least exhaustive of the soil, was sown at the best season for cleaning nr cultivating it, while it formed the best preparation for Grass, and was the most suitable to follow green crops. Inde. pendent of its own value, Barley farming thus promoted which husbandry, and the growth of those crops which were necessary for the production of meat,
dairy produce, and wool. Now the production of meat in this cuantry was becoming every year a matter of increasing importance. Previous to the great development of trade and industry, the consequence of recent fiuancial legislation, a large proportion of the working classes in the comntry could not afford to sat meat more than once a week. It would be a most moderate computation to say that a million of persons were so oircumstanced, and when by better wages these persons were enabled to eat meat daily, the increase of consumption so far became at once sixfold. Prices were thus rapidly rising, and larger demands wero yearly being made upon the farmer for fat cattle and heep. Oae penny a pound on the price of meat was equal to one million and a quarter sterling on the aunual consumption of this metropolis, and if they took that of the United Kingdom they would find that the increase of every penny would cost the people not less than 10 millions aterling. Here was far more than an equivalent for the loss of the Malt Duty to the revenue. If, by a change in our mode of agriculture, we could to some extent meet the increasing demand for butcher's meat, we should be fully compensated. And wo must reckon not only on the increasing appetite of the existing population, but on the demands from the increase of population. That went on at a rate which woald absorb every three jears the whole of the fat not meet the demand. The imports of foreign stock cem to have reached their maximum. The same causes were at worls abroad as at home in prodacing an iccreased domand for butcher's meat. Increased wager everywhere were followed by increased consumption.
Now, the substitution of Barley for Wheat in his course of crops would at once enable the farmer to ncrease his production of meat. In former times, ander protective duties, Wheat, from its comparatively high price, was unduly forced into culture. On clar and especially it was looked to exclusively, so much os hat many farmers thought such land unsuited to Barley. But the gradual rise in the price of Barley, and the fall in that of Wheat, had encouraged the growth of Barles on clay soil, to the great advantage of the farmer and the more economical and and caltivation of his farm. He could plough and sow in better geason, and might grow green and cattle where, under the old Wheat system, that was impossible.

A Barley farmer could scarcely be a bad farmer. His corn crop not only was less severe upon the land, but it was preceded and followed by green crops and Grass, which restored fertility. He, therefore, maintained that it would be an immense advautage to, Brition dainy produce, and te if Barley could, to a large extent, be substituted for Wheat. He was quite aware of the fact that Barley had risen in value more than any other kind of corn, and of the force of the argument which the Chancellor of the Exchequer had based upon that fact. From 1800 to 1850 one bushel of Wheat was worth two of Barley. Since 1850 Barley had more nearly approached the price of Wheat, and as Barley yielded a much larger produce than Wueat, a crop of Barley now realised as much as Wheat. It was no natis factory answer to say that this had been accomplished. uader the disaivantages of a heavy exceptional tax. The

Owners and occupiers of clay land in this country needed all the fair play they could get. daty , be grown with conore profit than Wheat, was zo reason for continuing an exceptional tax. Barley was the wine crop of this country. As the people became better off they took more of it, and that was the reason that the price had risen more than that of any other crop. Bat it woald for this beary daty.
Agriculturiste did not ask any class advantage-any return to protective duties They asked simply to be placed on the same footing as the Hop.grower, the Potatogrower, the coalowner, or the ironmaster-
that our raw produce should not be subjected to excepthat our raw produce should not be sabjected to excep-
tional taration. With regard to the argument of tional taration. With regard to the argument of
injuatice to Scotland in the matter of the spirit duty, that had not been advanced by any Scotchman. consumption of whiskey in that country was decreasing and that of beer steadily increasing. He was informed that the quantity of malt used in Edinburgh in brewing beer had risen from 32,000 quarters in 1854 to 150,000 quarters in 1861, and that from two cansen,-first, the increased price of spirits ; and, secondly, the improved quas orie which all wise men commended, and any policy which would tend that way would not be unjust to Scotland. One word with regard to the interests of the consumers of beer. In every country, except the mass of the people. In Scotland, Ireland, on the Continent, and in North America, mills was much used. But it could not be had by the people of this country, and every year milk was beconing more searce and dear. Home-brewed ale was an excel-
lent substitute. An hon. friend of his, who had had much experience, told him that he never knew a bad He had not the temptation of the beerhouse his money, and take him away from his family. He must for these reasons venture to urge upon the Chancellor of the Exchequer a reconsideration of this question when he should again have a surplus to dispose of. A heary tax on an article of home growth-the wine of the country - Which in Englnnd drove the people to the public-honse, and which impeded the best and most reproductive system of farming, could not bat deserve the most careful consideration of the House.

\section*{DRAINING ON LOW-LYING LANDS.}

At the recent quarterly meeting of the Carmarthenshire
Farmers' Club, the subject for discussion was "The draining of the low-lying lands in Carmarthenshire, aud the best way

I BELIEFE it is an acknowledged fact by all practical men, that drains should always be cut with the greates fall of the land. We should then find out the greatest fall and cut our drains down that line. Then comes queation, which is likely to remain unsettled, for a time at least. We commonly read that one law only is applicable to the drainage of all lands, independent of
the soil or subsoil of those lands. Men are frequently sent down to this country by the Lands Improvement Commissioners - men who are considered experienced and competent-to ascertain whether the land requires draining, and these men lay down rules for draining Which can only be successfully applied on certain soils in England. It is a fact that these men, who have
sometimes never been in Wales before, lay down and insist upon rules as if this country was as dry as some of the most favoured English counties. They say, for feet deep, and from thirty-five feet to forty feet apart and they expect the land to be thoroughly drained in this way. If we refuse to adopt such a rule they will the money. I mention this to show the fallacy of the moners. I mention this to show the fallacy of coming here to tell us arbitrarily how to drain our land. We should bear in mind that the depth of the drain does not compensate for distance. From my own experience I conclude that our drains should not be less than 3 feet deep under any circumstances. I say 3 feet, but I go deeper myself; I advocate 3 feet as the minimum depth, and 18 feet to 24 feet as the distance apart, according to the nature of the subsoil-whether porous or otherwise. In this country, where the rainfall is considerable, we require ourdrains closer than they need our land"here too dry. We frequently read and hear that land is sometimes made too dry in England by draining, but that is not the case here. It has been shown satisfactorily, in writing at any rate, that fact, made so dry that it could not carry the same quantity of stock for many years as it did before it was drained. I do not think that can ever be the case in this country, where we have ar rainfall to the ancumed depth; I keep a rain yange, and from careful driest summers on record-was 40 year-one of the not with all this rain ever be afraid of making our matton and wool at the present high prices, we carnot
make it too dry in any part to carry sheep. I therefore recommend for clay soils, mired with boulder stones, drains not less than 3 feet 3 inches to 3 feet 6 inches
deep, and not further apart than from 18 feet to 21 feet. I do not think a greater depth is required. I have tried a greater depth and greater width apart, and reason why I have been so much bullied by my friend for using pipes in preference to stones. They say,
" What is the use of them if you are obliged to redrain "What is the use of them if you are obliged to redrai your land?" Now, they make a slight mistake here.
It is quite true that I bave been obliged to redrain a great quantity of land, not because the pipes failed but because I followed the advice of a man sent down as an inspector from the Lands Improvemen out any experience, and I foolishly took his advice, believing him competent and able to advise me, and in every instance the result has been a complete failure.
He directed, in fact insisted on the drains being from He directed, in fact insisted on the drains being from 33 feet to 36 feet apart, and consequently the land was not more than half drained. I have since cut intermediate drains, reducing the distance to 18 feet, and that land is now all thoroughly drained. Now if this had been properly done at first, the drains would have been about 21 to 24 feet apart, instead of 18 feet apart. As it was I had no alternative; I was obliged to go midway between the old drains, which of course made
it more expensive. This land is now well drained, sufficient even for our very wet Carmarthenshire climate. I would make one remark here of great importance. In laying out the drains for a field it is customary to begin three or four or five yards from the hedge. Now I think this is wrong, and I would recommend you to begin by running the first drain through the hedge row, or as close to it as possible. It
slould not be an open but a covered drain, for if open it would be nothing more than a ditch. If this be not done, the soil near the hedges will always be undrained and produce noxious weeds. Besides, without this the drainage of the land would be incomplete, and that which is worth doing at all is worth doing well and解 the ditches should be perfectly dry, for if they are not the water in them wy the force of capillary attracto the adjoining land, by the force of capillary attraction, and thus spoil it,
as there would alrays be a fringe of wet and undrained soil surronnding the field. I cannot too strongly urge this point on your attention. It will repay you handsomely to attend to the rule that the first drain should run right through the hedge ditch.
I will now proceed to the next point. Nothing has proved a greater stumbling.block in draining than the roots of trees, which continually force their way into
the drains. They more readily choke pipe drains than stone drains, because the duct is smaller. believe I have discovered an excellent and effectual remedy for this in coal tar. Some of my friends have laughed at me, but that does not matter, for I am thoroughly convinced that the remedy is efficacious, We commonly see a fine Oak or Elm tree growing on or near a piece of land requiring draining, and are loth if they are left standing, and a drain is anywhere near them, the roots are almost sure to penetrate it. I discovered my remedy by accident. and I now either paint the pipes with coal tar, or I first cover them with 3 or 4 inches of clay and then paint the clay. I have opened drains painted with tar, and have found roots approach the tar, but never piercing it. They seem to
have gone up to it, and then stopped as if they had come into contact with fire. There is great prejudice in this country against pipes, and it is not altogether without foundation, as there have been many utter failures. But then, it should be remembered in all fairness, that where such is the case it is to be attributed to carelessness or ignorance in laying the pipes in the drains. Mr. Wileon, a neighbour of mine, drained a quantity of land under the Lands Improvement Commissioners, I think at the cost of from 20002.
to 3000 . The drans were marked out by one engineer, and another was employed to see the work properly executed; a man connected with them, employed to lay all the pipes in the drainges, was now of what took place some 10 or 12 years ago. The men cat two or three perches in the course of a day; and the pipes were at once laid in them, beginning at the bottom. This was the course followed day after day, until the whole was done. Why, I should think the drains in numberless instances were choked before they were half finished. That is one reason why pipes have not answered in this county. For myself I adrocate pipes simply on the score of economy. Stones course pipes must be carefally laid, beginning at the upper end of the drain, not the lower, and then be well covered over with from 5 to 6 inches of clay. If there is no clay in the field it should be carted there. How could the water, it had been asked, enter the pipes if they were covered over with clay? Any man who has taken the trouble to inquire and to observe, will find that the water always enters into the pipes from the bottom. The water rises or is forced into the pipes, by the presure from above of the air and soil, and finding in the pipe a vacuum, it forces its way into it from
beneath. I cover my drains with clays, and tread it beneath. I cover my drains with clays, and tread it
down, so that no water can penetrate them from above

I drained half a field in this way, and the otber t with stones. The stones were well broken, and
from 18 to 20 inches thick at the bottom of
drain, the men going again over drain, the men going again hammer, and breaking them they were then covered with compact and hand already described, to prevent the soil and roots in the expense of draining with pipes and thater tones. I find that pipes cost me about and that \(m\) the land. I do not advise the use of pipes and smaller bore than two inches. contingencies which may
the ang occur, such, consider aid ne sight displacement of a pipe joint, I do not thin arisable to use less than a 2-inch bore. I do not \(m\) to say tbat so large a duct is at all required to the quantity of water that is likely to pass through for that, but it would not be judicious to use so

Well then, it costs \(8 d\). per perch for 2 inch pin or from 58s. to 63s. per acre; and the laying of them estimate at a halfpenny per perch. That includes joints from the laterals into the main drains, require time and great care in the laying. Por indtro the main drains require to be the depth of the reel reely from one pipe into the otber, and thare ebonld admit the mouth of the pipe of the lateral drini nto it, both then to be well set with clay and mal as to the cost of stone drains. At a load of stones to perch of eight yards, I estimate the cost at 10 d . perch, exclusive of cartage. I pay 5 . quarrying and \(2 d\). to the owner of the quarry, and them, and about \(6 d\). for carting, making together 18 . per perch, as compared with \(8 \frac{1}{8} d\). to \(9 d_{0}\). per perch pipes. That is a consideration when we have a large quantity of land to drain.
The cost of drainage is the next queation, and the most vital part of the whole in some peopla's opinion I should be glad if I could pass over this part of \(m\) I should be glad if I could pass over this part of my draining is a more expensive improvement, if propar done, than many suppose. Now, assuming that thew re 100 perches of eight yards in an acre, om the vould be if the drains are 18 feet apart, the closing, and sodding, at \(1 s\), a perch, would amonats \(5 l .-100\) perchell would require \(\$ 500\) pipes, allo mall percentage for breakages, at 25 s . per
 and. To this may be added at least \(2 l\). per acer drained with stones ; a very great price I think. not come here to-day to advocate any parich system as the best, but merely to suggest some 13 ind, then, that I cannot drain my land satisfactoril less than from \(8 l\). to \(8 l\). 10s. an acre. I am at this moment draining some peat land, with a blae ubsoil. I put the drains at 24 feet apart, while friends the engineers from the Improven 00 fions would no doubt insist that they dous that drain it part, belieng pore is required the drain at one end of the field.
The next point refers to the formation of oride ron in the drains, or, as it is commonly called, mid water. This deposit soon chokes the drains, and is act a worse obstacle to contend with than roots of reet already alluded to-whether made of pipes or man ding that covering up the with clay, as I have already described, so as to the air as completely as possible, will lesse entirely prevent the deposit of this oxide, which contact with the air. The water holds iron in solum and until it is exposed to the air it does not bece druies oxide. Therefore the less air we admit
Iess oxide of iron will be depos the subject, the ber
i now come to the last point of the and into means of converting this theory a conme to break up the land after draining, lime it, and sow it with Grass seeds. Now I dissent fro.n this practice. If you intend it for has nent pasture, as it should be, for mall strean rumnig If pronerly drained, dres account be ploughed ears; but if it is broken up, it does not matter reatment it has and what quantity of Grass sed soil be of a peaty nature, two or three years form a good natural sward or surface or \(\operatorname{I}\) do not say it will take 18 or 20 years, and thoug so far as that, I feel sure it will take a great mare put a plou field I intend for the Rushes and all other weeds mowed possible, and keep it in hay tbe first yad
March or beginning of April a good guano, which forces the Grass to grow in It

top-dressing with lime or compostlent to plan, immediately after from eight to ten pounds of Grass seed per acro as a renovating mixtrure. great change takes place in the vegetation by removing the
surface water, and we should aid nature by supplying thee
seeds. There is another little matter that escaped my memory

advancod for planting Potatos. Ho allowed the land to
remain as it was, and in August it was covered with a fina sward of Grass. The surface had not been burnt, nor were there any seeds whatever sown in it, still there was a capital swathe of hay, containing Dutch Clover, Cow. Grass, dc. Asto
the remarks of Mr. Hughes and Mr. Jones, respecting the
injury to sheep on made pasture, some of my best sheep land is fresh mado. In fact, my sheep almost prefer it to other
land during very wet wather. At frrat I Ihd them driven
dit down to it in the evening, as the surface was so much more
dry, and they soon found out that it was so, and often remained there a considerable time. - Abridged from The Welshman

\section*{Home Correspondence.}

Locomotives on Public Roads.- [Mr. Smith, of Woolston, thus writes in reply to a letter of Mr. J. A. Clarke on the subject, which had appeared in the Times:I have read Mr. Clarke's letter upon the above question. I shall not trouble myself to go into the question as to the wisdom of working locomotives on public roads for the sake of making the introduction of steam power to the cultivation of the soil the most costly possible, but I beg that you will allow me to quote and question the following words from Mr. Clarke's letter :-

I need not say that this contract system is the only means b
In 1860 I addressed a letter to the farmers of Ingland. It was published lin our leading agricultural papers, as well as
" Before showing the best practical application, I may state that 5 acres on heavy and 7, on light land have been found to
be an average day's work; that september, October and
年 March are the best months for applying steam power to the
culcivation of the soil ; that, antor deducting sundays and a
few days for threshing and stopnages by rain, the working days for September and October may be put dcwn at 45 ; this,
multiplied by 5 for heavy land and 7 for light, gives 225
acres and 315 acres as the quantity of land that can be cultiacres and
vated once over with a set of apparatus within those months.
By this it is clearly seen that, if steam power is to be generally applied to the cultivation of the soil, every large farmer must
possess a set of apparatus of his own. Two or trree small
 wait. and if the
Now flot I
Now, from the practice I have lad the large farmers
am fully convinced that not only the large farmers
must possess apparatus of their own, but so must the
smaller ones. Two whose farms join may join in the possession of a set, or hire one of the other, according to arrangement. To that extent the "contract system" may do, but no further, for "the months of September and October will not wait," and I am the more fully convinced that "if the work is to be done well, it must be done' in thoss months." The days of November, December, January, and February are no slaort, dirty, and dark that it will never be done well in those months. A little work may be farmed well, must during the rest of the year be in crop. Besides those short, dirty, and dark days before referred to, there is another point of vast' importance -that of smashing up all the land in September and October as roughly as possible, the larger the lumps
the better for the land that is to lay through the the better for the land that is to lay through the
winter before seeding, so that it may freely admit the percolation of the water and the action of the atmosphere during the whole of the four winter months. Who are the men or company of men who can find tackle and hire it out only in September and October-about 45 days in a year-and make it pay? By way of retaliation, Mr. Clarke may perhaps be inclined to ask-How can individuals be expected to buy tackle that cannot be worked well for only so short a period during a whole year? They can, for they can find other employment for their engines, in threshing, grinding, \&cc., during the winter months on their own farms; and where they use common portable engines, the extra outlay for setting up cultivating tackle is but a mere trifle, eapecially if the sale of horses is taken of evidence to bring to bear upon this point fore thery of evidence to bring to bear upon this point, for there are hundreds of "medium-sized holdings" in this country being worked well by farmers who possess tackle of their own worked by common portable enginea Now, let us contrast this with the hiring or contract system that Mr. Clarke talks about. It has been tried and found wanting. The Gloucester and Durham Companies, for instance-they are thinga of the pasto Private individuals have tried it with locomotive engines, but all that I have heard of have proved failures. It is true we have the Wakefield Company, but where is their regular work? Where are their regularly cultivated farms? They have done a little experimental
job work, a bit here and a bit there, and that is all. The fact is, Mr. Clarke has no case whatever for the "contract system;" he jumps at the conclusion that, because some threshing has been done by contract, cultivation must. He might just as well tell us that the "contract system" is the " only one " now-a-days by which the
British farmer caa stock his farm with oxen and sheep. British farmer cau stock his farm with oxen and sheep. We all know the man's position who docs so-that he is about to quit his farm with an empty pocket. So much for the "contract system" in farming. The day is coming when the farmers of England must be farmers again, by stocking their own farms not only with but with machinery. The hiring or contract system is rotten at the boitom, and the sooner Mr. Clarke gives over crying up a system which proclaims
to the world that the farmers of Fangland are so poor that they cannot stock their own farms the better Williain Smith, Woolston, Bletchley Station, June 12.

\section*{Farmers' Clubs.}

STatndrop: On the Advantages of High Farming. -Mr. SUsige Milbank said-It is clearly to the advantage of the farmer that he should produce double the yield of his crops on the same acreage as he did in days not far remote: practically he doubles the extent of his farm, whilst he pays only the same rent, same tithes, same rates. It is true that the high farmer employs more labour, more machions the aid of steam power, both for calcivating his fied and for utility in his homestead; but these are in themselves no smali advantages either th the occupier
of the land or the country at large. He thus not only circulates more freely the honest penny of labour among the industrious poor, but he diffuses increased intelligence and increased comforts amongat that class. The principal results of high farming are : an iucrease of crops, both Cereal, Grass, and roots; deep drainage and amelioration of soil ; more shelter and better stock a satisfactory balance-sheet; and a happier and more contented class, from the feeling of having successfully carried out and applied the same sonnd commercial principles in farming as in any other industrial pursuit. I think it quite necessary for every farmer to keep accounts. I am quite sure for larger profits he must cultivate higbly both his pastures and roots. I think pastures are generally too much neglected, not sufficiently drained, and most inefficiently limed. 1. As to roots, say Mangels or Swedes, 1 am sure gra would follow a more liberal management. I am quite in favour of autumnal cultivation for roots. we should plough in, from 12 to 14 inches deep, 20 loads of best farmyard manure per acre in autumn, and add in the spring, as a refresher, 10 loads per acro of the same in the rows, with an addition of 2 cwt . of of the sameres as a top-dressing. Such is my bones or superplop I an assure yon it pays. Those invariable custom, an 1 cas last had paso will been who saw my Turnip crop this last had season will bear me out as to the enormous yield I obtained. One acre, which I bad measured as a fair sample of 18 others, yielded me 28 tons. I think I bad some of the finest and most bulky Swedes I ever saw. I top-dressed

Barley with a mixture of nitrate of soda and common salt, 2 owto half and half, with a surprising resulto the difficulty of f may in the autumn on which to draw our future riches. will tell you how that may be done. Fill your pastures with fattening heifers, and tie them up at night under sheds. Cive them their suppers and breakfasts of Bean monl and cake when you take them in and before they go out in the morning. It is wouderful how quickly dews, beeides a good residue from their tails (laughter.) You may langh; bat, depend upon it, it is as necessary to attend to the tails as to the mouths of fattening pourishment - that the food goes further to fatten when there is leno waste of the tiscices by exercise; for less food is required or rather consumed by the flame of life to enpport animal warmeth. Cooking food for cattle is also excellent, especially for milch cows. Food thus prepared is more digestible, and consequently more easily assimilated by the system. In fattening stock I ain in favour of giving much leas roots than are usually given, and much more cake and meal. The chemist tells us that the Swede contains 75 per cent.
of water, and 25 per cent. only of fattening quality. Many farmers give as much as 150 lb . of 'Turnips por day to each three years old bullock. I much prefer giving only 56 lb . to 80 lb . of roots, and that they consume my straw with avidity. By pulping I save all danger of choking. I add to thin 12 lb . of oil-cake and 4 lb . of Bean-meal. I like keeping as many 'Turnips on my land as I can, upon which to fold my sheep. It saves cnrtage, and I think
it more profitable. Sheep fed off Turnips, well corned and ealed on the land, in my opinion prepares the land in a very satisfactory manner for large yields of cereals. I ain a great advocate for oilcake. This laat year, on 120 aeres of land, I have consumed corn produce of my farm. I thought it the best and most efficacions way to get my land into prime order I think turning our cart horses to Grass in summer a mose pernicious plan, both as regards the land and the horses. Tine injury that horses do to the land by pastures, is incalculable. Good horses have been ruined by kicking each other, and other accidents incidental to galloping and play, both to themselves an 1 often to stock. I am very fond of irrigating an aye or two with liquid manure to produce Italiau Rye grass for my cart horses. This Grass never purges,
a id is much relished by them. I can easily, by heavy showers of liquid manure delivered by my hose and engine from the tank, get four abundant cuttings. Horso dong is in much request for my garden, whilst the urine replenishes my supply in the liquid manure tank. This is thus saved for useful reproduction, neather. The horses are also spared the fy samner weather. The horses are also spared the fly pest, and
are ready for work at any time. By cutting Grass it is surprising what number of stock may be maintained in eummer. I flad in this plan a true economy, by othervise partly carried off by this and evaporation. These are some of the advantages of high farming. I am utterly opposed to making moadow land hay. There is an enormous and positive loss thereby. That why juicy Grasa should not be considered more natritious than when dried and sun burnt, often in the north of England badly secured. I think hay may be made from Clover and the artificial Grasses extremely useful; but I ain now alluding to haymaking on permanent Graseland. I do not, of hill diatrictse for say but that in certain localities, hill diatricts for instance, or under peculiar and special cireumstances, these observations would have pages, of course, allude generally to the agriculture of England, and that of mixed husbandry in particular. I think it whould be part of the education of the farmer to have a knowledge of the Grasses, that he may renorate old pastures, and eradicate such inferior herbs as are little better than weeds. It is a great advantage to high farming-the covered-yard system. It is a positive gain that stock should ripen quickly from extra warmth, and that manare of the best description
should be made and allowed to accumulate without lose by exposure to rain or other atmospheric influences. I calculate a cartload of average good dung made by amimals feeding on cake to be worth \(30.6 d\). per lond. I have had mine, made by animals under skylights, analysed by Professor Voelcker. He assured me that he should consider its value to be about 5s. per load. The covered-yard system, then, is surely a greatt advantage in high farming. I think, to achieve any great
results in farming, it is necessary to derive the greatest posible advantage from the soil; to obtain which there should be jearly consumed on the Parim, oil cakee, by which I include Rape, Cotton, and Linseed; purand aide to the well as purchased manures, as adjuncts one pound per acre in the purchane of the artificials would command a greater success than many would calke possesses at least as great, if not a higher manurial
value than Linseed cake. If you are troubled by an over abundance of game defeating the inroads of hares and rabbits. The latter ought, as vermin, to be utterly destroyed. I am decidedly opposed to the free use o nitrogenous manures I much prefer bones and all the phosphates. Guano and the nitrates should be ueed roangly, and chiely as top-dressings. Professor injurious to Grass land, for that wherever there was injurious to crass lo forel of leaf the lost much of its nutritions quality and weight. There is still much room for improvement in the poultry department of the farm, and many cottagers might lee barn-door fowls for proflt. The country loses annually from \(60,000 \%\), to \(70,000 \%\). in the purchase of foreign egga. Now, I do think that thim is hardly creditable, and I cannot but feel nurprised, even in the matter of eggs, that John Bull should submit to foreign yoke However, it is a matter of both reflection and congratulation that high farming is conducive not only but it also tends to the health and morals of the com munity. Where intelligent and improving landlorde erect new and capacious buildings, arranged on the best and most approved plan, they will command superio tenants, who will consider the comforts and well-being of their farm dependants. A more Christian and Godfearing community, by the force of superior example, set by reflective and educated men, will work a grea and beneficial change in rural society. When I see large, well-squared fields, hedgerows free from timbes well-drained land, spacious and commodious buildings, late-roofed, the tall chimney of the locomotive enginethere I perceive some of the advantages of high farming I hope the day will come when all our lands will be ploughed by steam. If I have omitted any mention of the sewage question, it is because (being in abeyance) any remarks now would be premature. Still 1 canuot utilised. It is a great point gained that sewage water should be diverted from polluting our atreams, but it would be an increased blessing if it could fertilise our lands. We know that night-soil from towns under the oid aystem of cesspools was most valuable. It would be a matter of great regret if such valuable deposits as our home guano should, under the improvements of the day be lost to agriculture. Gentlemen, in concluding, I feel how cureory has been this glance at the adrantages of high farming. Still \(Y\) hope that these truths which you upon such and that more universally act extend so as to be able by increased resources to contend with foreignimportation, and successfully so, in supplying the ever-increasing demands of our ever-increasing The Vio
The Vior Cmairian thought they ought to be excellent paper he had read; but at the same time he would like to see that gentleman's balance-sheet. It might be all very well to look at agriculture as a science, but he looked at it as a matter of £. s. d. Agriculture
was not like fox-hunting or growing Pines, but it was a business, and if they did not mako it pay they had better let it alone.

\section*{1Rebíclos.}

The Great London Question of the Day; or, Can Thames Sewage be converted into Gold ? By A. B. Granville, M.D., F.R.S., \&ce. Part I., Historical. E. Stanford, 6, Charing Cross, S.W.
The History of this subject covers now a great many years. The late John Martin drew plans more than a quarter of a century ago which are pirtually those since carried out by the Board of Works : and it is to vindicate his right to the credit of much that has since been claimed by others, as well as mass of continental information, obtained directly from official sources, and never before published, as will throw a decisive light on questions still perDr, Granville's pages have been written.

John Martin's plan "consisted in excluding all the town or house and strect drainage from the river, and receiving it into a grand iron sewer, lying parallel to the rivar margin on either side, and which, on the
northern side, commenced at the bottom of College Strees, Westminster, and terminated into a vast recep tacle near the Regent's Canal.* The sides of the great sewer were to be constructed of iron caissons-the bottom paved with brickn, the top axched with sheetiron with aufficient iron ribs; the internal dimensions to be on an average 20 feet wide and 20 feet high; the top to serve as the foundation of a quay connecting the two extremes of London. The whole leagth would measure 4 miles and 200 yards on the left, and \(3 \frac{4}{4}\) miles on the right tank. Two years after (1830) another plan was proposed for preserving the purity of the water in the Thames by constructing covered drains also to receive the sewage. But that plan was evidently a mero reproduotion of Martin's idea, which that highly imaginative artist, after having had leisure and opportunity to study it more closely, was called upon to

House of Commons on the 7th of July, 1834
Simultaneously with this attempt to ren bluaders of the despoilers started that, when properly collected, the exoluded foai
drainage of London might be applied to rainage of London might be applied to useful pap mos It converting it into a fertilising agent for the himple It soemed a simple and natural idea that the cart should receive back, in manure, what is takeo anm from it in produce; or as Liebig, many yens lany said, ' we mast restore to our fields what we neemeni, Werract from them in the ebape of corn and allle We must return our sewage to its right place, and tha it will be well with us.' A truisin, by the bye, whes the present author publiely predicated and insistad upon, in a printed report, more than 25 years befine in the course tronted of the With these inpressions, when next tion before the Sewers Committee in 1831, John Jamie threw out a hint that 'it would be highly advantageoes to any person who should be of a speculative turn, \(h\) form a company for the purpose of farmung the semage
to be couverted into manure.' But neither himelf nea eady to undertake sucis a apeos. lation : nor did there exist just thell sufficient date published to enuble any enterprising individuain on devise the manner and the meaus of converting the sewage into available manure. Its renl value on land was yet to be defined; the price it would fetch coold hardly be guensed at. Whether it could be brougt together and be rendered manageable without injary to the community were problems yet to be solvel. "
Having thus shown that Mr. Martin had virtually foos. stailed both the sanitary and the agricultural authoritu who have since discussed the question, Dr. Gmavilh proceeds to enumerate all the plans which have been devised and published and developed sinee 1821. They are very nunerous. Six metropolitan comminiono had investigated the subject. "One bundred and sixtor plans were sent in to the second commission for dealing with the whole question; yet not satisfied with such wealth of projects, the Governmeut appointod refrean who, by means of advertisement, obtained an addifiona. supply from no less than 263 different correspondena, 139 of whom proposed plans more or less elaborate fir the drainage of the metropolis.3 Those whice hine been at length adopted are based upon that of inter ception, which Mr. Martin had so loug agu suggestad

The fifth section of Dr. Granville's parophlet describe a journey of 3500 miles through the oentral Concinain respecting the use and value of town sewage.
We quote the following passages on the utilisstion and money value of night-soil a
the experience of Strasburg :
"At Strasburg, a coinpany of middlemen engegu to empty the cesspools, of which every house has and
two (built air and water-tight), once a year for nothing, and pays, moreover, 6 fruncs per charette, conkinive 96 baquets of the capacity of 4 gallons exa, farmers quantity the company sells afterwards 14,000 hooses in
for 10 frases.* Now, as there are Strasburg, 10,000 of which have cesspools affordioy the soil in question (which is always semiliguiu), suf posing the latter to be emptied only once a year, and
to furnisb each three charettes oulf, at 6 Irates we have \(10,000 \times 6 \times 3=180,000\) francs which the compan pays yearly to the inhabitants of a town baving lation of 70,000 souls. But as the cornpany rese the farmer the said soil for manurin 10 francs per charette, it follows that this articleo traffic produces yearly at Strasbus , The averayd just about \(4 \frac{1}{2}\) franes for each inhabitant. mixed which I have assumed, may be adopted with nefory, founded on fact."
The system of collecting house waste in detall quo the Strasburg plan is no longer possible in our het towne with their combined water supply and drainage-but the wholesale
out by an enormous surplas irrevocably adopted, need not water, whic waste. The water itself may become the carrie fertilizing matter directly to the plants, loubt in lachetable growth; and we do loubt that is recoverable in this way, as in the other continenta brous
cities.

Having laid so much stress on the all-important step of draining the seaboard marshes to a level lowe than the surface of the sea, I will now place before you the objections raised to it by Italian engineers. The tirst objection stated to me was, that or or the sand banks on the shore into the drains, and overpower any engine used for pumping the water out of the land. It angine used hardly be said that this difficulty, if it arose, would be overcome by simple engineeriug.

The next objection was the great cost of working steam-engines in consequence of the high price of fuel. always be borne in mind that the advantages would be so great that any excess in the cost of fuel would only reduce the proat, withe Peat, how ever, is capable of becoming, in the absence of cheap ever, is capable and coonomical fuel, and as it forms in many cises the staple soil to be drained, some facile means may be found of converting it, by compression or otherwise, to such a use. There is one feature in the question of draining the Italian marshes which has not been considered with the attention it deserves. On land in Eagland were reclaimed originally by the application of windmills for pumping, and there appears to be every reason, since decided improvement in wind machinery has been recently effected, that as long as the price of coal ranges between 40 s. and \(45 s\). a ton on the Mediterranean shore, wind should be regarded as the chicf if not the only motive power to be depended upon. It inay be remarked, as a favourable circuinstance, that along the Mediterrauean coast there is, at certain periods of the day, and with remarkable regularity, a brisk wind our an equally regular wind off the land, with well-made machinery, to do good service.
"It was also stated, as a third objection, that thorongh drainage would render the marsil lands too dry for Cotton growing. It is unnecessary all sites Englishmen, that with water pressing intain depth from the surface, as regulated by drainage - with evaporation necessarily great and cipilary attraction equally active-and, moreover, with an atmospleere so charged * Perhaps the best evidnce of the adrutage to be guined by the nation from the draing ge of the murshes is to bed by the
in the fact, that in one dastrict, only partialiy iuprover mublic works performed by the Government, th
propiotorz of lind has inorencod 1300 in 18 yess.
possible to render land too dry for vegetable life. The dir of Suath Italy is like a vapour bath-so great is the proportion of moisture-and as experience has shown that the atmosphere penetrates a drained soil with astonishing freedom, the soil would derive a bonead roin the bealthy moisture of the atmosplere, of the injury arising from stagaant wetness. Irrigatio., ightly applied, would supply any conceived deficiency. It cannot, lowever, be too well understood that Cotton
is not an aquatic plant, and though fond of a certain is not an aquatic plant, and though fond of a certain
degree of hanidity, is averse to a sodden bed. Nature, in fact, han provided the Cotton plant with a mechanism of its own for the exclusion, from its blossom, of rain and dew, at the same time that it has given it an appetite for moderate and warm moisture.

\section*{Miscellaneous.}

The Dawpool Herd. -The following letter from Mr. McIntosh, of Romford, appears in Boll's Weekly Messenger:- The judicious infusion of fresh blood into first-class Short-horns that have been unduly bred in-and-in is of great importance. It is now upwards of 20 vears since I first visited Kirklevington, Warlaby, Killerby, Fawsley, and other emiuent herds, and passed many areeable days among them, and I causay that my early impressions have changed but little. I have always admired the grandeur and style of the Batees's, the substance of the Boothe and the neatness of the Kuightley sort ; yet at Kirklevington, Warlaby, and Fawsley I have seen animals that were tos much \(B\) tes, too much Booth, and too much Knightley: in other words, too closely bred. To Mr. Bates and Mr. Booth I even dared to nay mo, and my remares were received quite as favourably as could have been expected. There is perhaps no man more fond of pure breeding than myself, and I admit that nothing is to me more captivating in a catalogue than a list of renowned sires of the same strain of blood, one following the other; yet to perse vere with that, at the expense of perisads losing in a great measure constitution, form, and breeding power, seema nothing less than absurdity. Accordingly, for some years I have been endeavouring (and I hope successfully) to get a few leading tribes, so as to have the material within man reach. I was fortunate enough in the last year or two in securing four of perhaps the purest of the Fawsley blood, and they are breeding well. awe only one Booth, and she has a suort pedigree; but I think she is likely to breed well. I have had the most striking proof of the necessity and utility of fresh blood, within my own knowledge. A few years since, I bought a cow, Lady Sale, a small thin-lleshed animal, but very neat, and the blood I wanted to possess. I put lier to Bates bulls; and the produce, two heifere are very good, with plenty of the right sort of tlesh, and particularly neat in the offal. I think, from all this, you will readily collect my opinion of the Grand
Duchesses with the Booth and Cherry blood. Go whore they may, there can be no doubt, if proper judgment care, and atteution be bestowed upon them, as to the result being satisfactory. They are unquestionably a moe valuable herd, and scarcely to be met with in a life-time

\section*{Calendar of Operations.}

\section*{Jone-Blax Culture.-We fill our column this} Jonk , memoran la on the management of Flax Culture, taken from the essay of the Rev. N. M. Brown in the Journal of the Agricultural Society:
Weeding. -Flax must be carefully ten led from firs to last. Neglect at any stage will ruin the crop. Al kinds of weeds should be removed before the crop pard and retaius the bend or "set" it miy get from being trodden upon. Weeders should face the wind, and tread upon the plant with bare feet oaly; and thus treated it will soon rise again from the ground and how all weeds I kuaw of none more injurious than "sparrey. With its merciless tendrils it clasps every stalk, and
chokes them almost to death. Worse still, it bids detisuce to all weeding.
Pulling and Rippling. -The time to pull Flax is before it is absolutely and completely ripe. Some, however, act foolishly in taking it up whilst it is yel green-thinking that the sample of dressed max in more silky and oily. By this they lose much more in quantity than they gaiu in quality. It is well to allow of the stalk to be yellowed and bare, and the capsulea to be changed to a light brown before pulling. Then the crop will be most remunerative both in fibre and Cunni, Eight active hands will be sufficient to pull Cunningham acre (eqey should place the handfuls slightly aro in a da. make it the more easy to handle thema at the rippling
of the North of ripule none of their Flax. They affirn that the proces injures the ends of the strick, In other counties, dressed Fax ever, they ripple all, save vast quantities of precious seed for erushing and feeding - and look upon their Flaz after all as but little impaired. The clinate of Ulster being very damp and chaugenble, the fariners of that Flax-growiug province have uever upon a large scale attempted to rear Flax-seed for sowing purposes. For crushing and feeding only have they taken off the bolls. By rippling the Flax at the time
of pulling, the bolls can be conveniently had for these objects, and thus the crop, without being stacked, is ready for the dam or rettory at once.

Where seed for sowing is not the object, the following details as to the speediest and cheapest method of taking off the bolls or capsules may not be uninteresting :- The best rippling-comb is made of round iron three quarters of an inch in diameter. The teeth should be at least 16 incless long, blant in the point, \(t\) of an inch asunder, and set in a row 18 inches long. The following directions for placing or fixing the comb for use may be serviceable. Take a cart to the field when the Flax is being pulled; take off the wheels, and lay the body flat upon the ground; let the comb be fixed to a strong piece of wood like a short plank, bind this plank hard and fast across the box, tying down each end to the arm of the axle that is lying on the ground; then one man can take up his place between the sharts, and another facing him behind, and they can pull their handfuls alternately through the same comb. Twice through is enough for any handful. The seed drops into the box, which can be emptied when full into sacks, and the bolls earted into the open "shed" or "winning" loft. After being rippled the Flax should be carted at once to the steeping-dam. If it be allowed to stand for any length of time, the wonnded tops will blacken in the stook, and the fibre will be more or less injured. Whether rippled or not, it is a mistake to allow the pulled Flax to remain for days in the stook. If it were possible it would be all the better to have the whole crop taken up on the same day, and in a few hours rippled and committed to the water. The bolls should be deposited in a dry, airy place, and frequently turned. When dry they can be broken and the seed separated fro'n the husks, which with the refuse seed, make capital food for almost all the animals of the farmyard. If there be no convenient way of drying the bolls, they can be taken at once to a common kiln, dried and ground in a mill, husks and seed together; and in that way, though the seed is lost either for sowing or crushing, yet the very best kind of provender is secured.
In some parts of England the farmers dry or "win" their pulled Flax for some days in the field, in the same manner almost as a white crop, and then put it for a time into narrow stacks, that the seed before being taken off may ripen and mature upon the stalks or straw. Where the quality of the seed is a matter of great importance (as it always is in seed for sowing), this mode of managing the Flax when pulled is to ve highly commended. It is the only method in which first-class seed can be secured; and although it is the opinion of some that the quality of the fibre is much impaired by allowing the seed to ripen thus upon the straw, yet it will be found, after sufficient experience, that this is a mistake.
Many again consider that the farmer should go no farther than the pulling of the Flax; that at that stage his skill generally ende, and that then the factor, spinner, or manufacturer, should step in, purchase the Flax when pulled, if not on the foot, and carry through the remainder of its management by his skilled labour. This is an admirable theory, and if it conld be got to work satisfactorily, would no doubt be advantageons to all parties. But in Ircland it has been tried and has utterly failed, the merchanta who made the attempt having been obliged to give it up. Two crops, as similar as possible on the foot, may be very dissimilar in their yield. Say one is grown upon a very old pasture, or upon ground that never produced Flax previously; the other upon strong well-tilled land, that carried a similar crop some four or five yeara before. To the eye both seem much alike. The best judge perhaps could not tell which is the better crop, and the proprietor of the one might expect as high a price from the manufacturer as the owner of the other. Yet in reality the crop grown on the ground that till a year ago had been an old pasture, is likely to turn out to be twice as valuable as the other. This one stumbling. block was fatal to the whole scheme.
Moreover the expense of carting Flax-straw to dams or rettories at a great distance, and the difficulty of getting sufficient spreading ground or drying spparatus for great quantities of steeped Flax in any one apot, are additional impediments that stand in the way of the application of the theory.

\section*{tices to Correspondents.}

Apatie: WW F. The foot note at p. 641 ought to have stated it to be a phopphite of lime.
Clovea is Pastures: Enquirer. Bonedust will bring it, even more cartainly than ashes. It is, of courae, a dearer but a very efficient Grasoland dressing.
Gryoenins: \(X\). It is in a cortain sense a refuse of the candle wanufacture, being that part of natural fatty matters facturer. Its non-illuminating power renders its presence undesirable, and its uses for other purposes roake its separation a doubly importint consideration. Among its uses is said to be its fitness for pig feeding. Which is being tested in Edinburgh in comparieon with coddiver oll.
Mowing Machives: TLJ. We do not know any which lays the Grass in swathes: but in most there is a guide rod Stable Dino: A \(H\). Five fanced duvg is very much injured. portion on to the end of a ridge-formed heap standing on abnut four yards width of land, and piled upridgewise assteep asily will lie, covering it up on both sides with earth as it coater. It keeps the manure of its full original goodnees and saves it from the injury of five-fanging, which is owing to axceanive local fermentation.

\section*{EARTH CLOSETS AND COMMODES. \\ (Moule's Patent.) \\ manufactured solely by \\ WHITE \& CO.}

29, BEDFORD STREET, STRAND, LONDON, W.C

\section*{The pectllar Advantages of these Closets and Commodes over the ordinary \\ Water Closet are:-}

First.-That the deodorising material (dry surface earth, or clay, or other subsoil) is the best for the purpose and at the same time is the cheapest and within the reach of all classes.

Secondly. -The supply of such matcrial to any house or premises may be much easier than the supply of wise by a foreing pump, and its removal after being used may be entirely without offence.
Thirdly:-Its applieation by the means provided in these Closets is immediate and effective; so immediate that: offensive smell need escape into the room or buiding in which they are used; and so effective that all fermentation and all escape of noxious gases are entirely pret.

Fourthly. - The expense of these Closets, in comparison with that of Water-Closets, is, as to the firt roct trifing, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are t lead pipes to burst in frosty weather.

Lastly, -In all large Establishments, such as Hospitals, Uriion Houses, Schools, Gaols, and Asylums, a resconsiderable sum may be suved annually in the production of a valuable manurc.

The efficiency of these Closets is so great as to be scarcely credible to those persons who either have not us: them or seen their mode of action.

Price of Apparatus without woodwork, 25s. per set
**" The different forms of Closets may be seen at the cddress above; and Prospectuses will be forwarded on applicain.:

SATURDAY, JULY 1, 1865.
}

\section*{}

We give a prominent place to the following letter from a distinguished foreign correspondent, on the question of International Horticultural Exhibitions, as it may convey some useful bints to the promoters of the London meeting of 1866, which is now in course of organisation, as well as to those of others which are to follow:-
"The great International Exhibitions of Brussels and Amsterdam were high garden feasts. Every one who was present will retain a lasting remembrance of the courtesy, kindness, and hospitality shown to them by our exoellent friends the Belgians and the Dutchmen. But as there are more of such exhibitions in contempiation, one may hope to do more good for the grand question of gardening by proposing to the judgment of competent men certain alterations for future exhibitions, than by simply repeating once more the gratitude we sball ever feel. We know very well that this task is a disagreeable one. Every one who proposes improvements risks being ranked amongst the dissatisfied and querulous. Nevertheless, our wishes for the general improvement are greater than would be the satisfaction of being acknowledged 'de bons enfans.
"Such Congresses combined with exhibitions can only mean the promotion of gardening. Hence our first claim is to see pamed two Presidentsone a most distinguished practical gardener, or a really intelligent possessor of some garden; the other an excellent botanist, but a garden botanist, a man who understands garden questions. Let the elder of the two be the President, the younger

The Vioe-President ; and name as many Honorary Presidents å you like (or none at all-quite at your convenience), but if so, take them from amongst both practical and theoretical men. We wish onee for all to see avoided the appearance of a supremacy of botanists over practicians in these reunions of both.
We regard it a great fault if, as was the case at Amsterdam, the members of the Congress are divided into separate practical and theoretioal sections. But if this really must be done, no one will disagree with us that it is still a greater fault to have the meetings of both sections at the same time, so that no one can deal with both. Gardening can only be promoted by the friendly interecurse of gardeners with mon of science, botanists, agriculturists, chemists, meteorologists, architects, \&c.

Since liberty is the mother of every good thing, we venture to say that every one should be allowed to speak about what he thinks proper. We should hope that common sense would induce the speakers not to talk the poor anditors to death. The rule, not to speak more than 15 minutes, provided the meeting does not allow more, appears to be a very good one, for "truth may ba enolosed in a nutshell." We would not see the Committee involved in responsibility by accepting and publishing the themes beforehand. Experience has proved that many do not attend who had intended to do so; that many are not present when they ought to be; and that many eome who oould not promise beforehaud. Then it must be more agreeable to the Committee to have no responsibility of this sort. How grieved must have felt the excellent Dutch botanists, who are quite au nivears of science, when in their programme (p.9) they were compelled (?) to announce: "critique raisonné et réfutation sur la théorie des boyaux pulliniques," proposed by M. Lemarre? Surely their grief was only surpassed in intensity by the general silence, full of entempt, which followed M. Lemaire's speech. He could not understand how a pollen-tube could penetrate so quickly through a long style! If he could not, why had he not taken some lessons from a botanist? 'Jor such extravagancies we claim the sharpest criticisms of the press, whose duty it is to take vengeance for such anachronisms. We demand from every one who takes part in such a meeting, the very basis of all wisdom, to know where one begins to know nothing.
"The greatest prudence should be used in the selection of jurors. What a crowd of jurors did one see at Amsterdam! Were they all competent and were they well classed? We remaked Mr. V., of a splendid nursery, renowned for the importation of foreign plants, jud,ing Onions. We saw Mr. K., one of the most experienced Orohid growers, judging bouquets. We saw men who are anxious never to expose their precious bodies to the unhealthy heat of stoves, amidst the stove plants, - one even admiring the magnificent "Piperacer," whose name he had learned to be Cyanophyllum magnificum.
"Take few jurors but men of expericnee, knowledge, and good will, and set them to such sections as they really understand. Make one hour's pauso after the scrutiny; let the Secretary then read once more the verdict, and give every member of the section the right of asking a second judgment if any doubt has come over lim about the justice of the first.
' The jurors should neither be gardeners who have no reputation, nor rich men who possess gardens without having any knowledge, nor such botanists as are not quite au fait in garden questions-least of all such as deal only with Cryptogams. Let obsoure gardeners improve their experiences; let rich men enjoy their spurt; let botanists do their useful or useless work: allow them even to describe the same species in three different genera of one monograph, let them work out splendid memoirs on the botanical physiognomy of lands they have never seen, let them write about plants they do not understand; but never, from an ill-placed courtesy, allow such men to sit in judgment apoar the honour and wealth of the exhibitors." H. \(G \cdot R\).

No faculty is perhaps so rare as that of being able to look with equal impartiality on both sides of a question. Half the mistakes of systematists arise from this circumstance alone ; and in Botany especially we shall still have thousands of false speoies to lead us astray, till those who propose them, turn their eyes from books and Herbaria to see what takes place in free Nature and under cultivation.
Pariations in plants arise frequently in
gardens under our eyes, whichare at first sight more important than those which are considered quite sufficient for the gropusition of a new species. A shoot ocours on a Rose, differing from all other in having opposite leaves (Rusa cannabifolia) branches on the Honessuckle or Mulberry bear leaves differing strangely from the primitive form ; plants with oompound leaves, as the Ash or Arum trifoliatum, produce simple leaves; the number of divisions is abnormally increased, as in the five-leaved Strawberry; or trees with spreading or erect branches produce seedlings in which they are ouriously drooping. And so on, with respect to a hundred other deviations. It is the horticulturist's business to avail himself of these changes, if they are such as either for ornament or utility suit his purpose. It is to attempts in this direction which date besond historic times, far more than to hybridisation, as is often alleged, that we owe the greater part of our most esteemed culinary or staple plants; and the great point is to fix the distinguishing properties so as to hand down any new objects of interest to future times. So long as they admit of propagation by grafling, budding, or cuttings, there is comparatively little difficulty about it, as it is simply carrying on what Nature has already effected; but the moment that the only method is by seed, not only admixture by intercrossing with other varieties, but the tendeney which all plants under cultivation have to vary, comes in to try the horticulturist's skill. We are greatly indebted to Monsieur Verlot for the mass of information on this subject which he has brought together in the treatise to whish we alluded last woek.

In the case of hybrids, the preservation of any particular form in health and purity is a matter of extreme difficulty, as hybrids fertilised with their own pollen, to the exclusion of any other, have in themselves a tendency to increasing wralsuess and variability. Ifybilisation between distiuct genera if possible, as the case of Brizanthus erectus, from Menziesia corrulca and Rhododendron Chameceistus, and that of a successful crosing between Kalmia latifolia and Rhododeadron catawbiense, seem to prove, is not likely to lead to the formation of useful varieties of ornamental plants, as the result is at any rate completely sterile.

The same cannot be said exaotly of hybrids between two distinct species, though there is an lity, as there is a tendency to increased sterility by interbreeding. " In some cases the two specific
essences are so loosely internixtel that different essences are so loosely intermixted that different ters of the pure parent species in different parts. In a hybrid, for instance, of Datura Siramonium and D. levis, M. Natdin found eapsules whioh were spiny on one side, and smooth on the other. supposed hybrid origin from C. Laburnum and C. purpureus is very doubtful, and it is believed rather to be due to an accidental branch which sprang from C. purpureus grafted on C. Laburnum. True hybrids, it is clear, must be limited by the charaoters of their parents; and though they may be the source of variations, they are not likely to lead to the creation of races, or of true permanent varietion.

When, however, we have intercrossing between a species and its varieties, we have frequently immense fertility, and an almost unlimited difference of produce, and one of the principal objects of the cultivator is to avail himself of these differences, and either by skilful intermixture to increase any valuable qualities as much as possible, or to make them permanen
In causing the production of new varieties, those indiriduals must be selected which depart most from the normal form. A seleotion again must be made from the second generation with the utmost oare to exclude every individual which shows a tendency to reversion; and this process being repeated a certain number of times, we shall obtain a race which has in a great measure lost its hereditary tendencies, and, on the contrary, is extremely subject to vary. Selection can then be made amongst those individuals which possess either the qualities which we propose, or which have some distinguishing merit; and the same course of rigid seleotion being applied to these, accompanied by as perfect isolation as may be
possible to prevent the access of strange pollen, we shall have a tolerably permanent variety, One of our most eminent horticulturizts, who has prid par-
ticular atteution to rasing varieties of Azalew, in which he has

seed with great care to keep it pure, ezactly as is the case with our culinary vegetables, which, as almost every one knows, cannot be kept pure from seed raised in small gardens, where there are no opportunities of isolation, and where the soale is not sufficiently extensive to insure a tolerably uniform result; whereas on a large area the plants which exhibit a contrary habit oan at once be ruthlessly destroyed. It is in this way that M. Vilmorin suoceeded in obtaining many varieties of ornamental plants, which have been of great importance in horticulture.
There is, however, a difficulty, which Monsieur Verlot states as follows:-
"Such are the rules from whioh the intelligent florist must not depart. We must add, however, that selection, such as we have indicated, has the grave fault of resting on external charaoters only, the only ones unfortunately which are appreciable. The observations of M. Vilmorin show that plants perfeotly like each other, obtained from the same self-impregnated parent, present different aptitudes for reproduoing the parent. The seeds of a oertain number of plants of a Camellia Balsam dotted with crimson, whioh was produced acoidentally anngigt those of the variety dotted with violet, were collected and sown separately. All presented in the highest degree the characters which M. Vilmorin wished to fix, nevertheless the seed of a certain number of them gave only a mixture with the violet-dotted variety from which they had originally sprung, whilst others reproduced only their parent, and that in perfection. The same was the case with the double Tagetes, which M. Vilmorin only succeeded in obtaining constantly double by sowing separately the seeds of ohosen individuals, and propagating from those only which had produced none but donble flowers. Out of six plants two only were pure.'
So difficult is it to conquer entirely the hereditary tendency.

We must distinguish carefully this fixation of varieties from attempts at fixing the results of hybriuising. Where there are other means of propagation, which may be called mechanical, we may succeed, but where they can only be raised by seed, we have to contend against inherent weak ness, aterility, and variability. In intercrossing on the oontrary, constant oare and intelligence may lead to new races and varieties, which with continued application may be made permanent. M. J. \(B\).

Those of our readers who are interested in Muscology will be glad to know that Dr. Schimper, a great authority amongst the Mosses, is now in this country examiniug the chief herbaria of these interesting plants, and visiting the localities of the rarer species,
He has already been engaged in carrying on his investigations in Irelatid, wheace he proceeds to Wales, and thence to Scotland. One object of Dr. §okimprr's visit is geological, namely, to ascertain if there is any throngh two glacial periods, with an intervening period in which vegetable life was luxuriant and animal life abundant, as appears to have been the case in other parts of Europe.
-- Mr. Buteman has pointed out recently in the Dendrobium marginatum is properly the Dendrobiom xanthophlebivm described in our volume for 1857 (p.268). The stems as they get old, lose the sparse clothing of black hairs which are evident daring their early stages of growth, and hence the true position of the plant was not ascertained, and this led to a new the prior one of D. zanthophlebinm.
-We mentioned briefly on a former occasion that the Collections of Natural History, formed in South Africa and Brazil by the late Dr. W. Burciell, during his long travels in those countries, have recently been presented by his surviving sister to the National Museum of Botany at Kew, to which we should also have added the New University Museum of Oxford. The botanical collection consists not only of an immense number of specimens, dried in the ordinary manner for the herbarium, but also of seeds, sprigs, branches, sections of wood, \&cc., illustrating the characters of the consists of quadrupede, a large number of bird skins, serpents, ishes, and nearly 20,000 specimens of insects. Al minute care with reference to their geographical distribution, times of capture, periods of flowering, \&c. accompanied by notes; forming an invaluable illustration of the botany and zoology of these two countries.

Mr. Berkilety has suggested a series of expe riments in order to test the Exfects or The MyceshuTh of Foigir upon growing plants. He recommends that young trees, such as Peaches, Plums, \&c., should
be potted in different composts in which speot seil
rom Mushroom beds, fragonents laggot stacks, imperfectly rotted leaf-mould, baw form part. Some useful results, he believes, might enen

This treat gross for its gormanCrery gardener cultivation in fields than in gardens, but the grourdener finds it to bo feelds than in gardens, but
to have tender and juicy Cabbages ought to trench
or dig deeply, bestowing on the ground at the same time a liberal supply of manure, with abundance of of hot manure and water during the prevalence autumn and weather. It is of great advantage to in shallow trenches, and convenience of supplying liquids; when the plants are earthed up the ground is level, and less liable to be injuriously affected in hot weather. The method of growing Cauliflowers in Cheshire, in deep trenches between raised beds of Potatos, is a confirmation of this principle, the large heads thus obtained being much esteemed in the Liverpool and Manchester markets.
It appears that the ancients placed great faith in the medicinal qualities of Cabbages. According to Daubeny's "Roman Husbandry," Cato valued them as a medicine both raw and cooked; and although he does not appear to have been aware of the mode of converting them into sour-kraut, of which Germans are so fond, yet he recommends them to be eaten raw with vinegar before a feast; for, says he, if you wish to eat and drink freely, it removes all the evil consequences of excess. Such appears to have been the general
opinion of the ancients. Thus Galen tells us that opinion of the ancients. Thus Galen tells us that
there is a natural antipathy between Vines and Cabbages, so much so that the one will die in places where the other has grown. Boiled in water, Cabbage acts, Cato says, as a purgative, and macerated in the same, aloue if there be fever, or with wine if there be none, it is a cure for the colic. Similar statements may be found amongst the writings of the old herbalists although we moderns do not attach much importance to the Cabbage in the way of medicine. Quo.

\section*{THE CRIMEAN IRIS.}

This beautiful early dwarf spring. lowering plant is found upon the upland flats of the Crimea, and in some parts of Turkey and Austria. During the late war these beautiful Irises, with the now famous Crimean
Cowslip, were frequently sent home by the officers and Cowslip, were frequently sent home by the officers and
men; and although they are plentiful in the trade, yet a much greater value attaches to certain plants as souvenirs, than to those that can be purchased. They bear the name of Iris pumila, and occur with flowers of various shades of colour, as dark blue (atroccorulea), red and blue, pale blue, yellow (llavescens), and some
In some soils these Irises are what are termed miffy growers, but under any circumstances they require greater care than they and many other lowgrowing border plants generally get in these great bedding days. They will not gro vin cold wet soil. To of diameter according to the number of plants, to depth of 2 feet. From 6 to 9 inches of this space should be filled up witi old lime rubbish, rather fine, and on this should be put a piece or two of turf, and the rest filled up with a mixture of good soil, as loam with a little sand and some old dry cow-dung and leafmould, well mixed up together.
At the approach of winter each crown should be partly covered with ashes. About the time they come Into bloom, say the first week in April, according to the season, the ashes may be sufficiently removed, to
prevent their being unsightly. These pretty little plants make fine edgings to small early beds ; and they move well unless treated in the ruthless manner adopted with so many of our little spring beauties, when their blorming season is over, as if there was not another spring coming on, and they would be no more wanted

\section*{to assist in beautifying it. \(F\).}

\section*{Home Correspondence.}

The late Sir Joseph Paxton.-Though I give the late Sir Joseph Paxton more credit for tact than trlent, still there cannot be a question as to his deserving a lasting Memorial from the million. I believe, however, with the writer of his brief history at p. 555, that he has left a more lasting Memorial erected by himself than his admirers, whatever they may attempt, can
accomplish. But to erect this Memorial at poor doomed Chiswick would be folly ; while at South Kensington it would be entirely out of place. No; if ever there is a montiment erected to the memory of sir Joseph, let there only, can be found that breadth of outline which would have satisfied his eye when alive. Let it be there that the Memorial of our late friend is set up, and arring the millions ef handiwork. The site should be the termination of the great central walk, which appears to me to have been left uufinished for the

New ELar
Peas.-On the 7th of February I sowed the following varieties of Peas, viz., Dickson,s First and Best, Carter's First Crop, Sutton's Ringleader, Dillistone's Early Prolific, Sangster's No. 1, from Holborn. On the following day I also sowed Dickson's Favourite, and come of Dr. Maclean's new Peas, viz., Princess Royal, Dwarf Prilific, and Wouderful. Immediately after sowing severe weather set in, and it was at least seven weeks before any of them appeared
above ground, which they did in the following order, viz., 1st, Carter's First Crop, and Sulton's Ringleader; 21, Dickson's First and Best, and Dillis-
tone's Early ; 31, Daniel O'Rourke; 4th, Sanzater's No. 1; the other four kinds coming through the soil together a few days later, the time occupied in pushing through the ground being from 12 to 14 days. On the 5th of May, Carter's First Crop and Suitou's Ring. leader were fully in blonm ; Dickson's First and Ilest about three days later; and Daniel OTRomke, and Sangster's No. 1, were about two days later than Dickson's. Dillistone's Early。 (the seed of which was obtained from Mr. Dillistone, of Castle Hedingham) gave the first indications of flowering immediately on the heels of Dickson's First and Best, and just at this juncture, after a heavy fall of rain, it started into igorons growth, and, strange to say, reached a height of from 5 to 6 feet, and came into bearing the last of all the Early kinds; it produced a good crop, but the
Peas were small. On the 1st of June I Peas were small. On the 1st of June I gathered a Ringleader. I also got a few from Dickson's First and Best, from which two dava after I was enabled to gatirer as good a dish as I had previously from the other two With regard to the general characteristics of these Peas it might not be out of place to state that I fully believe Carter's First Crop and Sutton's Ringleade to be in all respects identical, and thrs is the opinion of every one who has seen them. It was
also noticeable that wherens Dickson's First and Best was entirely free from "rogues," the other two had plenty among them, the character of the "rogues" being the same in each case. These three varieties wer grown in good deep loam, well manured last year for Onions. The average height of the three kinds was
 were ready for gathering about a week later than the son's Favomite, Princess Roval, Wonderlul, and Maclean's Dwarf Prolific, all of which are now nicely in bearing. Dickson's Favourite is an abrundant bearer, having long pods averaging ten peas in each. With ine it grows from five to six fee high. Princess Royal is a large white round marrow Pea, \(3 \frac{1}{2}\) feet in height, und an abundant cropper, the pods being st.out and well filled
with Peas of excellent flavour. Wonderful is very similar with Peas of excellent flavour. Wonderful is very similar to the foregoing, excepting that the Peas are wrinkled; these are both first-class varieties aud deserve t) rank A 1 in seed catalogues, Dwarf Prolific grows about \(2 \frac{1}{2}\) feet in height; it is an abundant cropper, but has smaller pods than the other two and is not si hardy I may mention that 1 grew Macleau's Advancer largely last year; this searon I have seen it. growing in the
gardens of Sir W. Heathcote, Bart., M.P., at Hursley, Hants, and while I admit its great earliness as a Wrinkled Marrow, it is, uevertheless, so dwart and so spare a cropper in the drier region of the south, that I do not think it can be long caltivated there. I am also growing Veitcl's Perfection, Yorkshire Hero, Hairs' Dwarf Mamonoth, Prince of Wales, and Lord Raglan, but they are not yet sufficiently advanced to enable me to say anything about them. By way of reply to Mr. Whiting's suggestion (see p. \(50 \kappa\) ), I would say that the best dwarf l'eas for succession or general ase are Dickson's First and Best, Sungeter's No. I, Lord Raglan. Alex. Dean, Maybush, Southampton.

Anisoplia horticola.-This insect, known here by the name of "Chory," has been very destructive to Roses in the neighbourhood of Thetford and Brandon, I propose trying to destroy the larva in the autumn by Common salt to the grass underneath the Rose bushes safely you inform me what quantity of salt I may the destruction of the Grass? and whether that quantity will be best applied by watering the ground with salt-water, or by sowing the salt over the ground and leaving it to the rain to wash it in ? Diss. [The Chovy beetle is very similar in its habits to the
common Cock-chaffer, Melolontha vulgaris, its larva feeding on Grass, and being a soft curved fleshy crub with six short legs near the head. We fear your proposed application of salt will be attended with much danger both to the Grass and Rose trees, even supposing that you are certain that the larve are reared in that situation. It would be useless at all events to do this except when the insect is in the larva state at a much later period of the year, and then we would recom-
mend the turf to be carefully pared off and the eartio turned up so as the more readily to admit the salt water, or, better still, gas.tar water. J. O. W.]
Constitution of Timber Trees.-I an very glad to see that you have again relerred to this most important subject. I some time ago mentioner some instances to show that failure of health in young Conifere may, and often does, arise from external influences rather than
from defective constitution; but I neverthelesg fully concur in all that you and your correspondents say, showing how much also depends upon herectitary constitution ; and I have long made a practice of only sowing acorns, or other tree seeds, which are gathered from individuals remarkable either for size or beauty of growth. Your remark is very true aborosindividuals, it seems to be a universal law of Nature-witness the way in which children teem in the filthiest contrs in this city. But what we much wast is some
evidence that can be relied upon as to how their tendency to degenerate (or the contrary) affects trees. Now there is one tree, a foreign Conifer tho, the Larch, which has been so extensively planted, and in
which these influences have been so long observed and acteld upon so far that it is now grown extensively from
foreign as well as English seed, that surely there must by this time be some evidence to bo obtained as to the comparative merits of seedlings raised from foreign seed, or from the seeds of English trees, whether old or young, healthy and vigorous, or stunted and
decayed. Perhaps you might be able to collect information on this subject; at any rate, I hope that any of your readers who have made any observations, however slight, upon the quality of Larch, and the seed which has produced it, will send the results of those observations to you, remembering that one distinct fact (such 33 that in a certain plantation and under the same conditions as to soil, age, \&c, such a percentage of trees per-centage of those raised from another kind of seed were not so), is worth a dozen theories or supposed facts. I may add another remark respecting the trees from Which seed is collected; that in Coniferæ, especially, it is not at all impossible that the seed from old trees will produce more vigorous plants than that from young before they produce a single sound seed, and the proportion of perfect seeds to dead ones in a cone, appears to increase with the age of the tree for a very long from young trees will not produce such healthy plants as that from old trees, but this, like everything else about the question, can only be decided by evidence, which is no doubt rather difficnlt to obtain, but which orghit to be sought for on account of the great interest and importance of the whole subject. C. W. Strickland.
[We shall be glad to publish any facts bearing on this interesting and important question, with which our correspondents may favour us.
Wellingtonia gigantea.-I have a little Wellingtonia, not 3 feet high, with 13 cones on it. Is this rare? have not seen any before in fruit in so small a state. Wasps.-My employer has for many years been in the habit of paying his garden labourers 1d. for every
wasp or hornet captured and destroyed in or near his garden up to the end of May. And this season I have paid on his account, for 1793 wasps and hornets, l. Last season the number caught was also is, that we are sellom much troubled with these destructive jnsects during the months of August and September, when most gardens are usually infested
with them. Isast season, during the months nnenwith them. Last season, during the months menheard from all parts of the country, so trifing were their numbers here that although many of the never found necessary to use any means to exclude wasps, nor to in any way protect the fruit from their attackg. Therefore, I think there cannot be a doubt
that were the practice of paying a small premium for the queen or female wasps during the spring months to become more general, their numbers would in the course of a
\(P\). Ge. Culford.
irgilia lutea.-A specimen of this is growing on the lawn of Colonel Webb, Milford House. Its
height is about 40 feet, and the diameter of the head about 36 feet. It has a clear stem of about 5 feet, with a round compact head, which has this year been completely covered with long drooping bunches of pure white flowers, many of them being nearly 18 inches in length, and from 10 to 12 inches wide at the shoulders, The foliage, being of a lively green, contrasted favour-
ably with the pare white blossoms. It is also ably with the pare white blossoms. It is also ornamental trees. Mawrice Fowng, Milford Nurseries, Godalning.
Culture of Early Peas-My experience in early Pea growing extends upwards of 20 years. During Thagland, and Wave grown many sorts, both in Scotland more), Prince Albert, Early Emperor, Early Frame Daniel O'Rourke, Sangster's No. 1, Dillistone's, \&c I sow about the end of November or first week in the ground in 6 -leet spaces, leaving 2 feet for a ridge on this 2 -feet space I put a quanlity of half-rotten length. I dig this darly in, and mix it \(a l l\) feet in soil. It is then formed into a ridge, rising from 9 inches to 1 foot above the natural level of the ground. I then make a shallow farrow on the crown of this
ridge with a No. 3 spade ( \({ }^{(13 t)}\) ), and sow the Peas in this furrow. I have often been troubled with mice and rats getting at my Peas; to prevent the former Peas. them off, for the last three years I have procured a piece of galvanised wire netting, \(1 \frac{1}{2}\)-inch mesh, which I stretch and pag over the ridge. This wire will last
many years. I cover the wire with finely sifted ashes and I do not take it up till I clear the ground of the Pens. The ridge or raised-ground system appears to
me to have at least Peas receiving too much advantages; it prevents the like to ramble amongst the leaves in spring, when the period bave no effect which asinally occur about that three softs nide by aide, treated exactly year I have grown
were sown on the aame day, vizo, Daniel O'Rourke,
Sangster's No. 1, and Dillistone's Sangster's No. 1, and Dillistone's; the last has
beaten the two first by 10 days or a fortnight, beaten the two first by 10 days or a fortnight, tried. A. Barclay, Streatham Castle, Darlington.-I beg to endorse all that Mr. Whitinglhas said (see p. 503) abont the precocity of the Dillistone Pea; after growing be without it for a first crop. There can be no advan. tage in having a Pea in bloom so early as to be killed by frost. What we want is a Pea that shall produce pods fit for use in the shortest time after lowering, and I never met with Dillistone's equal in that respect. I always start and grow my first crop of Peas in a cold frame in open draining tiles up to March. As early in January as I can I make my first sowing: a man, holds two bits of board at each end of the tile into which a little mould is thrown, and upon this the Peas are sown and the tile is filled up. pressing all down together. The tile is then placed in the frame, and others succeed it till the frame is filled up. When all are in, the lights are put on and kept there till the Feas are u , after which air is given upon all favourable occasions, till the lights are removed altogether in March. About the middle of that month a drill or drills are opened to receive the Peas thus prepared, and by putting the hand to one end of the tile and slightly pressing it, the Peas come filled med up. Sticks are placed to them, and the Peas Why it should be I am not prepared to say, but I have always thought that this transplanting process has had a very beneficial influence in bringing on the crop. I
use tiles so extensively that I have mometimes had the floor of a 10 -light vinery covered with them. I prick off into them my tender and half-tender annuals, either in bunches or singly. I, however, take care not to allow the annuals to stay so long in them as to be drawn: in short, as soon as they are ready I remove them to a cooler place, and many of them are put out ander walls till wanted. R. I., Gloucester.

Conifers.-I have read with interest the lettera which of Copifersed lately on the subject of the cultivation I do not recollect to have seen noticed, and which I think are of importance. 1st. Which of the new Conifers are likely to prove valuable as forest trees 2d. On what soils are they fonnd to flourish in their native conntries, from which we may deduce on what
soils to plant them? 3d. In what parte of the British Isles are the several kinds likely to prove hardy These questions are of small consequence as long as Conifers are planted for ornament in Pinetums, but are of first-rate importance when planted out by the housand on a hill-side. A great benefit would, therefore, I think, be conferred on your readers if some of your experienced icorrespondents would answer the questions I have put. \(C\).
Ancient Daklias. - The first Dablia I remember to Tave seea was a single purple, at Jenkins' garden in the Now Road, Marylebone, near the Yorkshire Stingo. I must then have been between 12 and 15, or in other 1806. The Dallia in question was then considered to be a great wonder. Old Subscriber

\section*{Foreign Correspondence.}

Gardenting in Canterbury, New Zealand.-The past summer upon the whole has been a favourable one to vegetation. Although we have rather a scarcity of
rain, and have been visited by a few hot Nor'swesters (which, by the by, are of frequent occurrence in Now Zsaland, doing at times a considerable amount of damage, not on account of their heat alone, but the fury with which they blow), yet, in spite of these drawbacks, everything, with one or two exceptions, has thriven well, and amply repaid the husbandman for his toil. The season of 1864 and 1865 has especially been a good one for fruit, of which, considering the young state of the colony, we have had abundance. Peach ir es have been loaded with beautiful fruit. I visited one gentleman's garden aftera strong wind about a week ago and saw the ground under the trees literally covered with dead-ripe Peaches. The gardener was giving them away by the peck. The Peach is grown here as standards, the same as Apples are at home. \({ }^{\circ}\) Of Cherries wo had a full crop, which sold well at the commencement of the season at \(2 \mathrm{~s} .6 d \mathrm{~d}\). per lb . Gooseberries and Currants very good; Strawberries rather scarce Apples large and fine. The growth of fruit trees in general has been very good, which promises well for next year's bearing, Cherries alone being slightly affected by a species of the Aphis. The kitchen garden crops have bean a complete success; every vegetable indigenous to English gardens thrives remarkably well here. Nor must Flora be forgotten. I think we can boast of having nearly all the beaukiful varieties of annuals and biennials which you have at home to adorn and grace our flower gardens. The old garden favourites Pelargoniums, Verbenas, Petunias, Heliotropes, and similar indispensable flowering plante, are now getting quite popular here, and will be found in most of our best gardens. Bulbous plants, as far as my obser ration has gone, will flourish better in this colon chan in the mother conntry. The hot sun and loamy nature of the soil appear greatly to favour them.

During the past summer we have hail three home cuitural shows, which would fairly rival many of yon
best provincial exhibitions. The display of plants in pots justly claimed our warmest of flow there were on each occasion many well.grown and Pelargoniums of the leading varieties, and mata very beautiful, what would be called plants at home, but which thrive admirably heron the open air. The collections of nativa plantere in very interesting. One of them contained no ferer the 72 distinct species, many of them very beautiful show of vegetables was very good, especill last exhibition, which took place on the eially at the in March. It was by far the the second wee was a collection of plants exhibited by G. Gould, En introduced for the first time into the colol ship Glenmark, which lately arrived here from Lond Among these were several fine plants, viz, Fallion purpurea, in bloom; two large plants of Farfugine goniums, and other well.known planta an example of Foxhunter Verbena with
trusses upon it. The show of cut flome doze good. There was a superb collection was ver exhibited by Mr. Hislop, nurseryman, of Christchnith consisting of 100 species, all in pots; they obtained the 1st prize. The fruit class was well filled up, the being many very good collections. The best try fruit contained no less than 33 varieties of Pear, of Apples, 8 of Plums, 4 of Peaches, 3 of Nectarim 3 of Siberian Crabs, 2 of Cherries, Cape Goomeberin Mulberries, and Filberts. The Apples and Pears nen of a prodigious size, the former measuring 15 iachen 1 circumference, and the latter a little uader 14. Eich exhibition, both in produce and in a pecunaiary poin view, was a complete success. The attendance at the March Show was very limited, it being a wet day and popular attention is just now turned to the Wem Coast Gold Fields, to which a rush is taking pleas thousands have fled thither to seek cheir fortunem the bowels of the earth, with the cry at their tongul end of "Earth, yield me gold." Undoubtedly the atoon of plants suffered a little from this cause floral exhibitions will tend greatly to the adraoce of horticulture, and at the same time will create mithin us homely recollections-reminiscences of bygone ders A commendable taste for gardening has spr he has obtained his t ar lace on he has obtained his \(\frac{\frac{1}{4}, \frac{1}{9}, \text { or } 1 \text {-acre seotion of land, }}{\text { got up his cottage, invariably crops the remainder }}\) garden produce. Within the past year or two very beautiful and extensive grounds have been out in the suburbs by the well-to-do classes of tho community. One well deserving of notice \(I\) ming mention, belongs to one of our chief patron of gardening-J. Drummond Macpherson, Esq. ( gardener I have the honour to be), a gentlems
private virtues are no less conspicuous tha attachment to every noble cause. This gentleman seat is very beautifully situated about six mile which is planted an avenue of trees; the park to planted with trees here and there, which hare a rarg picturesque appearance. The mansion
centre of the park; the garden, which
occuples 5 acres, \(3 \frac{3}{4}\) being pleasure and vegetables; the flower garden is laid taste and judgment, and is rich in flowering and specimens of the Coniferous tribe, among which found fine plants of Wellingtonia gigantea, Cu Lawsoniana, C. torulosa, C. McNabiana, C. Lindiey macrocarpa, C. sompervirens, and C. Gavenniperas niana, J. Oxycedrus, Biota aurea, and Araucaria Mr. Macpherson has, at considerablo expe ported from England seeds of the followiag, have been sown in season, an P Pinea, P, pondo doing well, viz., Pinus Pinaster, P. Picea, Pertians, P. insignis, P. rigida, P. amabilis, P. Lambertrus Doo Junipa, A. Menziesii, 1 ja Picea grandis, P. Pin P. Nordmanniana, Cryptomeria japonica, and others. Of Roses I may name Madame Laffay, Plantier, Duchess of Sutherland, Fulgens, Griffiths, William Jesse, Cloth of Gold, Queen

\section*{JeLT 1, 1855.]}

THE GARDENERS' CHRONICLE AND AGRTCUITURAL GIITRTTE
of Waltham, Baronne Prevost, and other equally well-
known kinds. known kinds.
A, Mrards.-12: 1, Mr. Bristow ; 2, Mr. Sooith; 3, Mr. Ingle ;
Ornamental vases of Roses were furnished by Mr. Ingle, Mr. Turner, Mr. Marlow, and Mr. Vocking. Tasteful arrangement was conspicuous in all of them, more especially in those from Mr. Ingle and Mr. Turner, to which first and second prizes were awarded in the order in which the names stand.
Of Roses in pots there were only three collections, weather, came from Messrs. Paul \& Son, who had a Weather, came from Messrs. Paul \& Son, who had a
first prize for 25 in 8 -inch pots, and a similar award for 12 sent out in 1864. Mr. Francis was second for a collection of 25.
Royal Horticultural: June 24 (Dinner Table
Decorations).-The following critical remarks concern. ing these have been kindly furnished by a correspondent possessing much taste and judgment in such matters.
"Sir Wentworth Dilke's prizes for Table Decorations have had a trial for, I think, upwards of four yeare, during which time considerable improvement has been manifested; but I am sorry to find how fow are the number of lady competitors with simple and elegant designs, while the successful exhibitors are generally found among the great professional vendors of china and glass ware, who spare no cost in the getting up of their elaborate displays.
"The lst prize was awarded to Messrs. Phillips, of Oxford Street and New Bond Street, for a very elegant service of white china, decorated with remarkably good taste, and possessing several features that were novel to me. This service consisted of a centre piece, sufficiently handsome, some very graceful white baskets, and boat-like dishes, with a Cupid at evch end, filled with simple summer fruits. Some beautiful glass was also introduced. The novelties I spoke of are these-1st, there were three little holes in the edge of each plate, forming a tiny reservoir of water, into which a single flower, without a stalk, was inserted-pretty enough to look at, but I should say ill-adapted for use, which ought to be the prime
characteristic of a plate. 2d, there were small tubes characteristic of a plate. 2 d , there were small tubes
filled with water, into which the ztalk of a somewhat larger flower wis placed, and the tubes so arranged that the effect produced was that of a festoon hanging from some part of the china vase. This was very pretty.

The 2d prize was adjudged to a lady (Mrs. Dalton, of Ealing), and I hope you will not think me the possessor of 'green eyes,' when I assure you that her table consisted of a little parterre-like arrangement of small saucers, filled each with some bright-coloured flower-the lines of pink Roses, scarlet Pelargoniums, blue Coraflower, white Roses, bright yellow Coreopsis, and purple Petunias, intersected one another diagonally, and the spaces between them contained a flat dish of
Gooseberries and other small fruits. The lady in question had evidently borrowed her idea from some pattern of Berlin-wool work. I quite allow that the colours were good and well arranged, and that the idea admits of as much variety as worsted work in general, but I was vexed to see the flowers so ruthlessly wasted, where wools would have done quite as well, or, if where wools would have done quite as woll, or, if carried my dishes of fruit to the flower border and shared them with the birds.
"The 3 d prize was gained by Mr. Chapman, of Norfolk Street, Park Lane. It consisted of a superb centrepiece, standing upon a large looking-glass base of good vith Stepla a 3 -incu deep trough as all edging, filled With Stephanotis and Roses intermixed with green
leaves. This collection was very fine everything in good taste, and the whole extremely costly, Orchids being freely used in the decoration of the side pieces.
"Mrs. Read, of Lower Grosvenor Street, had a very pretty white clina centre-piece, standing in a large
looking-glass platter. It was decorated round the bottom with Ferns and very simple flowers, a tuft of white Pea by the side of some bright yellow flowers, and a tuft of Pelargonium. In a kind of basket above, some Cyperus alternifolius variegatus rose out of a bed of Roses and Ferns. I thought this table worthy of the high commendation which it received, notwith standing the little? mistake of putting flowers into highly-coloured china vases, which is a juxtaposition to be avoided by those who study effect. Messrs. Dobson \& Pearce's (of St. James's Street) table was also highly commended. Enclosing the principal group there was a sort of framework of zinc or leaden troughs, each about 18 juches long, and 1 inch wide and deep, the side pieces being straight, the ends curved after the manner of a looking-glass frame.
These troughs were filled with Moss IVy, and Lycopods, and a few blue Cornflowers. The idea was pretty, but it seemed out of place for a dessert-table.

One illustrach which a table should be set off, was remarkable for the introduction of a novelty not altogether to my taste. A crack was made in the handles of some poroelain baskete. In each bed for Mosses and Lrcopods. I thought the handle of a China-ware basket the last place where one would wish to fiud earth or Mosees." This came from Messrs. Naylor \& Co., 7, Prince's Street, Cavendish

Square, whose table, notwithstanding the real blemish aluded to by our correspondent, was nevcritheless commended by the judges. It was set out for a Strawberry party, and was furnished with cream and sugar in elegant glass fervicee, while in the middle Was an neat device in glass, supported by bacdsome side pieces filled with flowerg Mr. (i)ode, of South Audley Street, bad an extensive exhibition of elegant white china in the shape of chandeliere, hanging baskets, launs, Cupids, \&c. ; aul oue little artificial was oruamented with rewarkably good artificial Glowers, consisting of Roses and Azaleas made of paper, so well executod that many persons were deceived by the akilful imitation. These came from Miss A. Brunies, of No. 6, Percy Circur. Miss Weatherfield, of Southampton Street, Covent Garden, had a tastefully arranged table, the little finger-basing Lily which were each furnished with a white Water table decorated with Lilier, Fernas, and striped another Reeds, on which were handsome red-coloured dasses and two white china chandeliers filled with blue candles, a bad contrast.

Of the two 10l. prizes offered by the Proprietors of this Paper for plants cuitivated entirely by ladies, that for the best fine-foliaged plant was won by the Viscountess Doneraile, with a charming mass of Gymnostachyum Verschaffeltii, s beautiful plant with leaves prettily veined with red, and in most excellent health. The same lady also had Alocasin metallica, Dracænas, and other plants, all in very fino condition. To Miss Williams, Sutton House, Highgate, was awarded the prize for the best Orchid, the example contributed by her being a beautiful Acrides afline, with two spikes of flowers on it, and well furnished with green healthy foliage, indicating that to Lycaste Skinneri and other Orehids known to be suitable for rooms
this forms a valuable addition, Considerable col lections of other plants were also exhibited, all showing how well such things may be grown by ladies who take a pleasure in their cultivation. Foremost among these were a Lycopodium crsium in beautiful condition, from Mrs. McKenzio, of Alesaadra Park ; a Maiden-hair Fern (Adiantum cuneatum) in a whom a lst prizz was awarded last year ; and a large specimen of one of the Guld Ferns (Gymnogramma chrysophylla) in robust health, from Miss Hepburn, of Clapham Cummon. Mrs. Lermitte, of Finchley, had a vigorous Fiancoa ramosa, throwing up numerous spikes of flowers, about to expand; Todea pellucida and other plants came from Mrs. G. P.
Bidder, of Ravensbury Park. An India-rubbor tree, Bidder, of Ravensbury Park. An India-rubbar tree,
one of the most euduring of planta for town windows, came fro:m Mrs. Iarood Jones, of Cadugan Place; and a small :group of plants was contributed by Mrs. Bretlett, of Hammersmith. Among Orchids were, in addition to the Aerides just mentioned, Calanthe veratrifolia, a Bearded Lads's Slipper, and Oncidium divaricatum, the last finely in flower and in good health. In a Ward's case were Polypodium Dryopteris and other Ferns, from Mrs. Vallunce, Bayswater, in fine health, although stated to havo been in their tiny prison house for more than four years.

Among Miscellaneous subjects were beautiful boxes of cut Roses from Messrs. Lee; and Muscat and Black Hamburgh Grapea from Mr. Beasley, gro to J. Wood, Esq., Twyford Abbey.
Lennox, M.P., in the chair. The Cbairman announced that an old friend of the Society, Mr. Strachan, of Teddington, had made a bequest of some valuable books to its library, to which a similar present had also been made by the late Sir Joseph Paxton, whose death was adverted to in terms of deep regret. Mr. Bateman, in the absence of the Rev. Mr. Berkeley, offered a few remarks on the different flowers exhibited, commencing with Mesers. Jackman's charming race of hybrid Clematises, of which two new examples were prodused on this occasion, viz. :-Prince of Wales, violet with red bars, and rubella, deep velvety maroon, both large and extremely haudsome varieties, to which Firstclass Certificates were awarded. The lovely C. Jackmanni, Mr. Bateman said, promised to blossom in great profueion on a wal in North St:ffordshire, and as blants for situations of that kind nothing could or suitable than these Clematises, which were stated to be perfectly hardy. If intermized with the pale blue flowers of C. lanuginosa, it was considered that an excellent effect would be produced, owing to the admirable contrast mado by the different coloured blorsoms. Other high-coloured Clematises similar to those raised by Messis. Jackman, were also shown by Mr. Townseud, of Hornsey. To the common Snowball tree, it was stated that Mr. Fortune had contributed a most beautiful perfectly hardy rival in those of the ordinary kind, from which it also differs in other important particulars. Examples of richlycoloured leaves weve then introduced, in order to show the effect which a dark background has in setting off to advantage ohjects of a lighter shade. We have at least three hardy trees which furnish furnle or redcoloured leaves, viz., the Purple Nut, Beech, and what deservod to be better known than it is, the Black Meple of Japan. By way of contrast with these deep rich tints, what light ones could be better than those of the Golden Holly, Yow, Ivy, Yellow

Bramble, an eflective bush, and Honeysuckle (Lonicera aureo-reticulita) ! Others, such as scer Negundo, white varie gated-leaved iree, ande many time be doubled, would doubt'ess be found. With materials such as these, not tender requiring glass protection, but hardy, beautiful syivan scenery might be created which even persons with comparatively limited means might afford next exlibited loy Mr. Bateman, whosaid that theymight next exhibited found useful for indoor decoration in summer, on account of their ability to withstand heat. Some account of the discovery of the genus Kalmia was then given, together with the effect of its first introductior on
Lianzus, who named it after his frieud Kalm, its dis coverer. Among Orchids shown on this occasion by Prof. Reichenbach Luisia Psyche, with insect like blossoms placed close to the stem: and a Trichopi ia, bought by Mr. Bateman at one of Stevens's sales, under the mame of T. Turi-alba, foot it was found. This was also shown by Mr. Williaws as T. picta, a name which Mr. Bateman said Turi-alba must henceforth bear. Mr. B. remarked that in an evil hour he had been induced to purchase from a continental nurseryman, a plant under the uame of 'r. picta, which however, turned out. not to be that species at all but a plaut not worth cultivating, while T. Turi
alba, or picta, which has a lemon-soloured lip, spotted with red and yellow sepals and petala, must be con sidered to be a real gain to our collections of Orchids Other Orchids shown either in the shape of plants or in cut state, consisted of a summer-flowering variety of Lycaste. Skiuneri from Mr. Veitch, Dendrobium Dalhousianum, and D. Pierardii-the latter with five long pendent spikes, on each of which there were some 60 blossoms. This fine specimen was shown by Mr. Day of Tottenham, from whom most of the Orehids contri-
buted on this occasion came. Nr. Bateman stated that he had kuown this species of Dendrobium for many years, that it still held its own as regards beauty, and that Major Trevor Clarke then described a fow horticul tural "odds and ends" which he had contributed Among them was a tall stem of Liliurn testaceum o excelsum, a perfectly hardy plant, which he had cultivated in his garden in Northamptonshire for years. It
was certainly hardier, he said, than the common White Lily, although it has the unjust reputation of being somewhat tender. Auother plant to which he directed attention wasa specimen of one of the climbing parasitica Aroids of the Tropics, viz., a species of Philodendron, a ripe fruit of which was also exhibited. The latter resembled that of Monstera deliciosa, figured at p. 962 of our last year's volume, but is much smaller. It it would give, it was said, to cream ice a sensational flavour. Tise fruit exhibited, it was remarked, has a quality which would prevent it from being with the same irritation spicu'æ which exist in the pip of the Briar. Two very inconspicuous-looking object a spike of Gladiolus in a bottle, with three terminal flowers, left, as Major Clarke said, blooming alone like the last Rase of summer. The first was a seedling from a curious old plant, Mathiola fenestralis, crossed with the common garden Stock (M. incana). It ha not yet flowered. The Glactiolus was the produce of
one of the handsome rosecoloured garden Gladioli, one of the handsome rose coloured gorden Gladioli, It is interesting in this case, said Major Clarke, to be able to confirm an observation made by one of our chester, to the effect that the splendid colours of cardinalis are not fully transmisted to the offspring, which he attributes to the interbreeding of cardinalis, had, however, produced a favourable effect in the present instance. The seedlings appeared to be early summer flowers, with the large and hand some habit of the autumnals. The two objects in question, he observed, are definite and authentic hybrids between two known plants, and he wished to call upon his brother borticulturists to lose no opportunity of bringing such instances to these Tuesday meetings. No person, he said, who had not really valuable such contributions are-valuable because they are facts. He invited Fellows to bring to these meetings objects of scientific interest of every kind, whether bill and valley, river or forest, illustratione of Nature's wild and wondrous changes Such objects are too rarely seen on the tables of the R. H. Society, a circumstance which he attributed to the horticultual sufficiently turned in that direction. In the early part of this season, he said, an observation was made by the present day. Now, this remark was, he believed, gardeners both in the nursery profession and in the gardens of our country gonilemen-so clever
that no country on the equal; but the man who will the eat the can find their during a lifetime to legitimate horticultural experi-
ment, both within and without the walls of this to produce his results in this room-who will initiate and perfect revolutions in our art-who will raise generation after generation of the fruits of the earth,
season by season, improving and improving-this man will have deserved well of his fellows. These are the men alluded to by Mr. Bateman, and Major Clarke believed with him that they are rare. Such men however are rising-
over-intellectual age.
Mr. Bateman then directed attention to that wonder of botaniste, Raffesia Arnoldi, of which Fellows of the Society will recollect a was model stood under a glass case for many years in a corner of the large meeting room in Regent Street. This singular parasite was
discovered in Sumatra by Dr. Arnold, who was attached to Sir Stamford Raffles' staff in that country After having resided a while in Sumatra, Dr. Aruold was one day met by a Malay servant, who came run ning to him with wonder in his eyes, saying, "Come sir, come, a flower very large, beautiful, wonderful!"
He went about 100 yards into the jungle, and was shown flower growing close to the ground under the bushes, which was truly astonishing. Its whole substance was very thick, the petals and nectary being in but few places less than a quarter of an incl in thickuess, and in some places threequarters of an inch. ubstance fles was hovering over the mouth seen 3warm of flies was hovering over the mouth of the
nectary, and apparently laying their eggs in the substance of it. It had precisely the smell of tainter beef. The centre of the nectary gave rise to a large pistil, at the to \(\rho\) of which were about 20 processes somewhat curved and sharp at the end, resembling a cow's horns. The most astonishing part was, however the dimensions of the flower, which measured a ful yard across. The petals, which were subrotund, were
12 inches from the base to the apex, and about a foot from the insertion of the one petal to the opposite one Sir Stamford and Lady Rattles, and Dr. Arnold took inmediate steps to be accurate as regayds measure ment by pinning four large sheets of paper together and cutting them to the exact size of the flower. The nectary would hold 12 pints, and the weight of thi prodigy was calculated to be about 15 lb . A guide
from the interior of the country said that such from the interior of the country said that such
flowers were rare, but that he had seen several and that the natives called them
takes three months from the first appearance of the bud to the full expansion of the flower, and the latter is said to appoar but once a year at the end of the rainy season. It has no stem of its own, but is parasitic on the roots and stems of a ligneous species
of Cissus or Vine which winds round the trunks of trees for support. The parasite appears to take its origin in some crack or hollow of the stem, and soon shows itself in the form of a round knob like an egg then acquires the size of a Drumhead Cabbage, an fter a time the full-blown flower is developed. Afte p. 238 , and April 22,1865, p. 368 , where some further account of this plant may be found, Mr. Bateman went on to describe the difference between Parasites
and Epiphytes, and concluded by saying that it and Epiphytes, and concluded by saying that it f this wonderful parasite, and called upon the Chairman to use his Parliamentary influence to obtain one for the stoves at Kew.
June 27 (Floral Committee).-In addition to Mr Day's Orchids, Mrr. Veitch had Cattleya quinquecolor a hybrid raised between C. Aclandiæ and C. Forbesii, in appearance almost intermediate between the two A continuous-blooming bright purple Cyclamen named Peakianum was shown by Mr. Holland, who had also the rare and pretty variety of Asplenium Trichomane named Harovii. Solanum vescum, a variety in tine way
of S. laciniatum, from Mr. Macintosh, of Hammersmith of S. laciniatum, from Mr. Macintosh, of Hammersmith
is a promising plant with purplish lilac flowers, which is a promising plant with purplish lilac flowers, which Mr. Wm. Paul showed some of the late Mr. Beaton' Nosegay Pelargoniums in good condition, especiall Indian Yellow, a rich orange-salmon sort, and Duchess, a fine kind with a larger amount of crimson in the blossoms than the last, both charming varieties. From Mr. Smith, of Hornsey, came Pelargonium (zonale) Chieftain, a fine light scarlet with a well-marked horse-
shoe stamped on the leaves, and La Grande (Nosegay) shoe stamped on the leaves, and La Grande (Nosegay) boautiful kind with globular crimsonsscarlet foral Batley, of Rugby, came cut Verbenas ; and Mr. Gill, of Bradford, showed Beauty of Eagland, one of the best of white kinds, remarizable for the size of its pips and
truseses, and the purity of its colour. The Rev. W. H. Girldestone, Ryde, Isle of Wight, furnished a bears tiful variety of hardy Fern called Athyrium Filix wemina fissidens irregulare, which he had found in the West Highlands. C. M. Walker, Esq, of Hornsey, had Polystichum munitum new to our gardens, and Pleopeltis hastata, with elegant trifid fronds. From Mr Williams came a brown spotted small yellow-blossomed Lily from Japau. Mr. Sitone, gr. to J. Day, Esq., had Promenæa citrina, with no fewer than 40 yellow blossoms on it; Dendrochilum filiforme, ornamented with some 50 pale green drooping tails; Aerides Lindleyanum, and the carious Phalenopsis Cornu-Cervi. Simal plants of Phalæaopsis amethystiua aud Odontoglossum
beautiful boxfuls of cut Rrom Mr. Wm. Paul noticed Princess of Wales and Dr t p. 578 of our last week's Number, Lindley, rotic dition. To many of the plants just enumeratifed coo First or Second-class Certificates were awarded.
June 27 (Fruit Committee). Fruit June 27 (Fruit Committee).-Fruit of a se Early Bigarreau, was shown by Mr. Ingram north-east wall this was as early as the May Duke it is said to be a heavy cropper. It was awarded First-class Certificate. \(A\) similar a ward was also mas buted by Mr. Wills, gr, to Sir P. G. Egert, Among other fruit were some very large and British Queen Strawberries, furnished by Mr. Tillom the resuits of planting in small pelbeck. Theso no the fruit to two or three on a plant. From Mesery Alice Raspberry, a seedling fromples of Prince Wales, and like that variety promising to be abundant bearing late kind. Some good Cabbeg Fulhana. Lettuces were shown by Messre. Osborn,
The following candidates were elected Ordinar Eellows, viz.:-Thos. Dyer Edwardes, Eso. Jm Edward Oppenheim, Esq., Cologne, a Foreign Momber Mancherser Horticultoral.-This second shon of the season was held on Friday and Saturday last, in the Both
 aumber some 70,000 , promise well for a fine dieplay: Findley, the Curator, who has shown great tasto in the mutites

Paungee of o Working Life. By Charles Knight.
Tol. 3.
\(P_{p} .328\). Bradbury This is the ph. hird. Bradabry \& Evanans, 1865. Kaighte ", Pasesges of a conclaing volume of Mr.
Century?
It Cutary", It is not so much the antobiography of a letue obererer upon the progress of hiss ocountry during
 Pederes therefecorend neold sease, each as it came out. Our

 Sot markedan an eragazaine" and "Penny Cycloeinly spread far and wide a taste for, but they
 rediopzi, is abeope demand for good, Bensible, and useful \#urk foherep pace wity enormous, it. In An the supply has hard To thiontry way steened in a kind Mr. Knights of bruarly days
 literem himeof reniedy this dangerouss state of thining, to hiel lowene heveren depepaired of his country, but clung mont erent hatat wholeaome and interesting literature the weit iongs corruptreciated, and drive out of the
tomernoit of this thand imonaral publications. In mong gld to ononteot with a number of able might was

the good work includes the well-known and honoured the generation in which they lived; and the passing reminiscences of these worthy men throw a charm around the passages of a working life.

If the third volume should appear less animated than its predecessors, it must be recollected that the period of struggle is always more exciting than the calm which foliows after victory. The battle of education has been won, and popular reading is now the order of the day but there was a time when every step in this direction was cavilled at and dreaded, and flonds of ridicule were schoolmaster abroad." This state of things is happily past and gone.

The volume before us commences with the year 1844, when Mr. Knight was publishing a series called the "Weekly Volume," but his venture proved a failure for want of purchasers. He tells us that the sale of books at railway stations was then unknown. The publisher, however, learut a lesson from this fuilure, viz., that abrislgments do not pay. He also came to another important conclusion, viz., that the "system of competition for prize essays, so far from being an encouragement to struggling genius, only holds out a temptation to mediocrity to move out of its proper course." Pictorial works, on the contrary
he found very successful. He thinks they only he found very successful. He thinks they only of wealth.

In the course of preparing materials for a work called "The Land we Live in," Mr. Knight made pleasant excursions to many places in Great Britain remarkable for historic assoc and castles, such places as Stonehenge and Abury, the White Horse and Bannockburn, and he has a pleasant chat about each. This he looked upon as a branch of his own historical education. His "Half Hours with the Best Authors" contains characteristic specimens of 300 various writers, 40 of whom were living when he wrote. This work was accompanied by short bio graphical notices, and he loves to tell what he
recollected of Walter Savage Landor, Samuel Taylor Coleridge, Dr. Arnett, Wordsworth, and Macaulay, as also what he wrote of Tennyson, Douglas Jerrold, Dickens and Thackeray, prognostications which have since been fully verified.

Soon after the famous 10 th of April, 1848, Mr. Knight brought out a weekly journal entitled "The Voice of the People." Miss Martineau gave him valuable assistance in this work, but alas ! in less than a month this voice of the poople was for ever silent.
Soon after the Irish Rebellion Mr. Knight visited the sister country in company with Douglas Jerrold. They were struck with the misery all around, and as much surprised at the intelligence of the little ragged urchins, who came rushing out of school with, "Plase, sir, to hear me my lesson," "Plase, sir, examine me il history." They answered extremely well, and earned sixpence for their pains, when a chorus of voices When the cholera visited London in 1819, and again in 1853, Mr. Knight was publisher to the General Board of Public Health, and drew up an address, homely and practical, which he called "Plain Advice." It had a circulation of above a hundred thousand.

The sale of Shakspeare's house gave rise to some amateur theatrical performances, which will long be remembered among the literary characters who took a part in them. The Exhibition of 1851 natarally calls forth a few remarks upon the progress of the nation but the Paris Exbibition leads Mr. Kaight to speak more fully of his own department- the printing and publishing trades-in as sitting to examine witnesses in reference to the abolition of the newspaper stamp. Belore the duty was abolished, Mr. Kuight found that there were 261 country newspapers in 120 large towns and cities, but that 350 populous towns had no local newspapers whatever. Eight years after oup 679. It seems that some of these were printed on one side in London, and finished up with local news and a local heading in the country. Another, and as he thinks a better plan, was then adopted of sending down stereotyped matter from London at eo much per column.

There is much interesting information on the newso paper business, and especially that important part of it phnected wis the Kuight always regarded the newspaper as a great educator of the people. But we must draw our remarks to a close. The object of these "Passages" was to trace the progress of popular education and the diffu sion of knowledge, and a wonderful tale it \(1 s\), and extremely well told, by one who was early engaged in the work, had his heart in it, and toiled at it strenu ously for half a century. During this time he was brought into contact with a vast number of interesting and remarkable characters, and about most of them he has something pleasant to tell us. There is an index of 550 names of persoris who were contemporaries of the author, and Mr. Knight was in
associated with \& majority of these.

The 2d Part of Mr. Batemau's splendid Mono graph of Odontoglossum, which has lately appeared,
contains Fitch's exquisite figures of the following
apecies:-O. pendulum, O . hastilabium, O . grande, O . nævium, and \(O\). cariniferum. The first of these is the plant commonly known in our gardens as O . citrosmum which being identified with tolerable certainty as Lexarza's Cuitlauzina pendula, as noticer at p. 509, the author has christened O. pendulum. O. hastilabium is New Grenada plant, of which Mr. Blunt has sent pecimens with flower stems half an inch thick and 6 feet high; it grows at least 4000 feet above the sea evel. Of O. grande there is indeed a grand representation, and the now well-known plant deserves all that has been done and said for it with pen and pencil. Some fine natural masses lately imported by Mr. Skinner are mentioned as being intermixed with creeping Ferus-a very useful hint to cultivators. Of O. nevium, which with its fine spotted flowers, is finely depicted, it is remarked that the var. majus passes insensibly into the ordinary type, while O. gloriosum, which has sometimes been confounded with it, is a perfectly distinct plant (see p. 578). O. cariniferum, a less beautiful ppecies than is a Central foregoing, is figured for the first time. It is a Central American plant, has branched panicles of purplish brown flowers, with a yellowish-white raniform iip, and succeeds perfectly under cool treatment both at Farnham Castle and at W andsworth. The next Part is anuounced for apeedy publication.
The 2d Part of Dr. Seemann's Flora Vitionsis carries on the text as far as Myrbaceæ. We select from it a few scraps of popular information on the uses of the plants treated of. The leaves of Colubrina nsiatica, it is said, are used by the natives for washing their hair to destroy vermin. Titis saponaria is put to a similar use; the thicker parts of the stem are cut into sbort lengths, and roasted on hot stones, and when thus rendered soft they produce a lather almost equal to that botanical error, that the plant is supposed not to yield ruit in the lower coast recion of the tropics "In 1864," writes the author, "I saw it at La Guayra, Venezuela, one of the hottest parts of the world, where t was growing well, and producing abundant fruit." Pometea pinnata, the Dawa of the Feejeans, forms entire forests, and not only yields a useful timber but an edible fruit, of the size of a Pumegratuate, with rather a glutinous honey-like taste. The most prominent place amongst the native fruits is however assigned to the Wi, Spuudias dulcis, whose fruit has a fise Applelike smell and a most agreeable acid flwour, rendering bighly suitable for pies. Dracontomelon sylvestre produces a fruit esteemed by the natives, but most insipid to European palates. The flowering of the Drala, Erythrina indica, is the general signal for planting the Yams, and one of the natural phenomena upon which the Feejean calendar is based, and hence the tree is found near almost every village, either wild or planted. The roots of Pachyrrhizus trilobus, which grow horizontally to a length of 6 or 8 feet, and the thickness of a man's thigh, aud have a slightly starchy but insipid flavour, are eaten like Yams, and are much sought after just before the regular crops come in. The
leaves of Derris uliginosa pounded and thrown into water are used for stupefying fisb, to facili tate their capture. The Vesi, Aizelia bijuga, one of the sacred trees of the Feejees, produces the best of the woods fornd in the islands, being almos indestructible. Of Inocarpus edulis, the Feejean Ivi, the kernel is eaten either baked or boiled, or grated and made into puddings or bread. The stem is most singular: when young, fluted like a Grecian column when old, furnished with buttresses of projecting wood. Acacia Richii yields a bard wood, and supplies the paint which the natives ase for blacking their faces when they wish to look particularly smart. A long account is given of Oncocarpus vitiensis, a poisonous tree, with the properties of the noxious species of Rhus, and which bears a name equivalent to Itch-wood. The plates include some fine Araliads of the genera Nesopanaz and Nothopanax.
In the May Number of the Botanical Magazine the following plants are figured :-Cypripedium levigatum, a handsome Philippine lsland species introduced by Mr. J. G. Veitch; it is allied to C. Stonei, and has glossy green unsputted leaves, and 3 to \(5 \cdot\) fliwered seapes, the flowers huvil,g a dull yellow lip, purplishotinted narrow petals 5 or 6 iuches long, and a broad ovate cream coloured upper sepal striped inside with purple. Arum palcestinum, an Arad tound near Jerusalem, and having broad hastate-sagittate leaves, and an elomgated spathe, green outside and deep purple within. - Rhaphio lepis ovaia integerrima, an evergreen shrub with thick bovate obtuse leaves, and terminal panicles of large white odorous flowers; it comes from Japan, Bonin and the Korean Islands- Hypastis sanguinolemta, pretty little Madagascar Acanthaceous plant, knownin gardens as Eranthemum sanguinolentum, the course of the leaves show a bro the flowers are pale purple, fithe pricipal the rodt.-Aucuba juponica.
The Number for Juve contains a handsome figure of Cypripedium concolor, of which some rocount will shontly be given in our columns. The following plant of subshrubby habit, and the aspect of Barba cenia, with keeled linear spiny-margined leaves, and white somewhat bell shaped flowers. It is a native of Brasil, and was flowered at Glasnevin by Dr. Moore.
by Mesars. Low \& Co., and haviag nigro-hirsute stems, short unequaily emarginate leaves, and lateral fiowers in pairs, white with a riek orange lip, which however is green at first, a culour retained by its side lobes; these flowers are scented like Wallilowers.-Acanthus montanus, a rather handsome herbaceous plant from Western Africa, with pinnatifid or sinuate-lobate leaves, and terminal spikes of large rosy lilac flowers: it has been flowered at Glasnevin by Dr. Moore,-Raillardia ciliolata, a curions slirubby composite from Hawaii, wich nodding heads of yellow flowers having protruding crimson anthers.- Anemone angulosa, a beautiful hardy herbaceous plant of the Hepatica group, remarkable for its large blue flowers; it is a native of Hungary, and has been blouned and exhibited during the past syring by Mesars. Backbouse \& Son.

\section*{Tye Apiaty.}

Bees in Nero Burlington Street.-"On Wednesday afternoon, nbout 5 oclock," says the Times of June 23, "not a little excitement and astonishment was caused in New Burlingtnn Street by the circumstance of a drawn up at a restaurant. A man having procured a hive, set to work, and with assistance succeeded in securing the whole of the unexpected risitors and took them awny. A swarm of be es is rarely if ever eeen in the streets of London, but it is not an nncommon ocenrence for a swarm to stray considerable distances. Street, tho real faets of Meesrs. Neighbour, of Negen bees on its way into the country, they temporarily placed the hive on the leads of their house, giving the becs their liberty. From some reazon best known to the bees, they atddenly issured from the hive, and after flying abmut for a few minutes, the swarm colleeted on astonishment and dismay of the driver and his fare. A man in the employ of Messrs. Neighbour was fortumately able to secure the bees in a hive, and
eonsing them to a place of safety. The cab-driver enngin them to a place of safety. The cab-driver
vala appeaserl hy belmg liberally compensated fur the loss of his fare

The leading journal having brought this little circumstance conapicnously before the prolic, it becomes desirable that the real facts of the case should be made known, but there are, we should imagine, but few who would believe that the swarm flew from some distance in the country to alight in the heart of London.

Suffication of Bees.-The following case of an entire swarm being destroyed by suffocation happened a few weeks since in the apiary of a clerical friend. Having * Nutt's hive, the centre boz of which was tenanted
hy a weak stock of bees, he was desirous of adding to its population, and accordingly very injudiciously hived n swarm in one of the side boxes, with the intention at some future time of effecting a janction between the tro families. IIe saw the bees apparently quietly settled in, and left them, as he thought, all right. He hat occasion to go away until the evening, and on his retnrn, to his great grief and mortification, he dis covered that the whole of the bees were lying at the bottiom of the hive in a state of suff cation. Every to, but in rain; they were all dead or dying. Being certan in his own mind that he had given) them means of egress and ingress, for a long time he could not account for their diying of suffocation. On of the entrance was effectually filled up by Mason Pees, so that all exit was effectually prevented, and no atmission of air could take place. The consequence was the loss of a valuable swarm of bees; but my friend was far more affected by the seemingly cruel manner by which they met their death. Apiator.
The Rosecutler Ree in London.-I was waiting the other day at a railway station on one of the lines round London, when I observed a Rose-cutter hovering front of the platform roof, and carrying a piece of the for its nest in its mouth. Presently it disappeared up an irom tuhe nf about the thiekuess of a quill, formed by a strip of sheet iron which covered the ridge at the junction of two sides of the sloping top of the lamp, and which, for the sake of strength, and to make a kind of coping for the ridge, was drawn together, or fluted, so as to presentining un the pipe a minall pipe. The insect after again empty-morthed, and fiew off to some gardens near. Jresently it again appeared with a fresh contribution to its nest, and deposited it in like manner. A third picce of leaf was larger than the two previous, and as there was come wind, and the entrance of its hole was so sitnated that it must fly right into it, there being no space outside for alighting, it tried in vain to hit the aperture, and at length retired, I suppose to "shorten sail ;" hnt as the train for which I was waiting arrived while it was gone, I can say no more of the
pmgress of this somewhat difficult work of inseet architecture. C. J. G., Bury St. Edmunds.
Alexmader boyle. Nerbwith-Many like your arg pazzled how to
xmanage the stewarton hives. Two of the larger comapart-

of the swarm, we shourd be inclined to doubt, a super wil do more harm than good. At any rate the small one would
be the best. Fourteen inches in diameter by eight inches deep for the single octagon stock box. Three feet high
inside might do for a bee shed, but a little more roon is inside might do for a bee shend but a
advisable. Octeghons are measured from thic parallei sides.

\section*{Calendar of Operations.}
(For the ensuing veeek.)
MoST of the hardier kinds of greenhouse plants out of doors may now be set without any kind of shading. It is a mistake to place established plants behind a north wall, under the shade of trees, or in similar situations; on the other hand, however, it is essential that the pots be protected from the sun. They should be plunged in beds of sifted coal-ashes ; and take care to place them far enough apart to ensure a free circulation of air amongst the planta.

\section*{flower garden and plant houses.}

Calceolarias out of doors, are, we learn, threatened in some places with disease, and the insect world is still unusually active. Close and frequent inspection will, therefore, be reguired if anything like success is to be attained this season. This is a good time for grafting or inarching Oranges, Camellias, Azaleas, choice Rhododendrons, \&ic. Until a junction is effected, the plants should be plunged in a close moist heat, rather stronger than that required for growing them in, and carefully shaded.
Achimenss, -Keep up successions of these mong lon as possible. While growing, they like a warm roist atmosphere; but during their floweriug season they do perfectly well in a comparatively cool and dry ituation, such as a close greenhouse or conservatory As regards soil, light turfy loam, peat, leaf-mould, thoroughly decayed cow-dung, and silver sand suits them perfectly.
Amaryleis.-These deserve more than ordinary attention. They succeed perfectly in any light, tolerably rich soil, in which there is a good proportion of abry loam. Twenty-four sized pots suit them best Plants in smaller pots should therefore becarefully moved into the size just named
Annuals. - Late-sown kinds intended for lautumn flowering should be thinned out or transplanted, before they crowd one another, and become too weak to support themselves.
Carnations, \&c.-Fen plants are` more generally useful than the hardier kinds of Carnations,' Picotees, and Cloves. If pipings of them are taken off about this season, they sometimes strike as freely as Pinks but the operation will be more certain to succeed if the handlights are set on a slight hotbed, or the pots plunged in a frame where there is a gentle bottom- heat. points which require special attention are, that the cuttings be taken not later, on any account, than the expanding of the first flower; and that they be carefully shaded from every ray of sunshine. The most certain method of propagating them is by layers; but it is equally important that it should be done early, as the plants root sooner, and thereby become better established before winter.

Chinesf Primutas - Old plants of these should now or soon after their partial repose, be shaken carefully out of the old soil, repotted in light sweet compost, moderately rich, and placed in a warm frame for a few days, till they have begun to produce roots into the new soil, after which they must be removed to a position near the glass in a cold frame, and kept close till the plants are thoroughly reestablished. These plants succeed best in moderate-sized pots.

Pelargoniums - Many of the finest kinds of these are still in perfection, and it is most desirable that shading should be attended to carefuily, for one sumy day may injure the flowers beyond hope of remedy. It is equally desirable that the atmosphere of the house stould be kept cool.

\section*{Forcing garden.}

Cuccurbers.-Pay great attention to thinning and regulating the shoots; go over them at least twice a week, as they soon get crowded if neglected a sow plants and against rei spider, by syringing the house. Attend to plants in frames. Keep linings well made up, and train shoots of growing plants. Water when necessary.
Pbachess-Admit a free circulation of air through ruit isouses during dry fine weather; but where the ruit is just ripening, ventilating during the night and in damp weather should be effected by means of the ront lights, keeping the top sashes closed to prevent cold dews froun settling on the truito The foliage in long as possible by syringing, and guarding against insect depredations.
Pines,-Having selected, to meet the demand in winter, those plants which are now showing or flowerog, and those which shortly promise to follow their example, a portion of the atrongest and best rooted of those remaining should be picked out to succeed them; these should be potted immediately if they require it, and grown on steadily without any check any of the smaller plants which are in immediate need of potting should also be attended to. Keep up an uninterrupted succession by planting a few suckers occasionally in a brisk bottom-heat, Where the
planting-out system is practised, there in mo dificulty
up reeping up the succossion ir all vacancien are fill among the successions
Vines,-Where crops are swelling let the the borders be frequently examined. If the soite o dry, let the surface be carefully loosened with a fort and watered with licuid manure. Examine thit bunches of swelling crops, thin crowded clusters,
remove small berreis.
hardy fruit and kitchen garderg.
Water growing crops freely with liquid mander this is the best time of year to make use of is, and rith the addition of the occasional showers which mo mo now experiencing, improved growth may be expeced be the result.
mainery. - Now that rain has come plant out for tic main crop.
required.
Turnips.-A good breadth of these may nom sown.
Watercresses.-A supply of these for autumn and winter may be easily obtained by planting some strong young tops, about 4 inches long, in a line at the foo of a north wall. The cuttings should be of pieece which have protruding roots from the joints. Wates. cresses will grow freely in such a situation; and in where natural ones are a considerable distance of these will be found useful.
Winfer Greens,-Take advantage of the present showery weather to plant out Broccoli, Savory
Cabbages, Cottagers' Kail, and other winter Greens, not already done.

SATURDAY, JULY 1, 1865.
How to increase our Sheep Stock? This question, to which our correspondent "J. C. C." returns an answer in another column, appears to be one of more than merely national importance. We learn from a Delhi paper that it is the great question of the day in many parts of India as well as here. "The subje t of providing mutton rations to the European troops serving in the Iudian provinces" is declared to be urgent as a State necessity, and forcing itself on the notice of Government. The subject of providing mutton rations to John Bole and his family at home is equally urgent in the mother country.
There are doubtless two causes in operation to which the increasing price of meat is due at home. one of which at least is also producing its effect in India. On the one hand, there is the increasing demand for it as an article of food, and on the other there is the diminislied quantity of the supply which is offered for sale. "For the past six years," says the Delhi paper, "and since the large iuflux of European soldiers and other meat consumers into the country, sheep have risen threefold in price, and fallen off considerably in quality. Enquire of any manager of a sheep club of some standing, and he will tell you that sheep of six and eight teeth, that is of three and four years of age, are scarcely, and with great difficulty procurable, and then only at a most extravagantly enhaneed price."

It is the increased consumption which is the principal operating cause of the enhanced price of muttun in India; and accordingly the pedy proposed by the Indian juurnalist is farms should be instituted in all suitable places, farms should be instituted in all suitable places, breding and sheen-feeding, on a scale adapted to the increasing wants of the people.

In this country, where the increasing price of mutton must of itself gradually direct increased attention to the meat manufacture, and where Government interference is not wanted, it is
sumption, but also, and most likely chiefly, to a diminished stock of sheep. Our correspundent attribntes this for the most part to the increasing prevalence of cross-bred sheep. All ewe lambs, he says, ought to go into the brecding flock, but cross-bred lambs are not adapted for breeding; and thus, he says, in the long run the sheep population of the country has diminished, and the price of mutton accordingly has risen. This may have had some of the influence he attributes to it; and the prevalence of disease in sheep, and of abortion in our breeding flocks, has no doubt also contributed to the result. But as it is not mutton only, but every sort of meat that has risen so materially in price, no explanation can be pronounced sufficient which does not explain the increased price of beef and pork as well as mutton. To the iucreasing meat consumption of the country, which does affect all kinds alike, and thus offers a suitable explanation of the circumstances, there must therefore be added the scarcity for at least two years in this country of all kinds of food for the livestock of the farm. The showers of the last two days, whioh have we hope been general throughout the country, may be in time to help the root crops, or at least to save them from the utter destruction which has been threatening them; but the Grass and hay crop of the country is this year even shorter than it was last summer. And the diminished supply of cattle food, the raw material of our meat, has had and must have the very same effect upon the price of the manufactured article that the searcity and cost of raw cotton have of late years had on that of Calico.
The true remedy for scarcity of meat was elaborately stated so long ago as the 11th volume of the Journal of the Agricultural Society. It consists, first, in good caltivation of the land, and in the increase of its fertility; secondly, in the liberal cultivation of a good rotation of crops, including an ample produce of cattle food; and thirdly, in the right administration of these and other foods to well-bred animals. As long as all the food we grow for cattle is annually consumed by them, the question of cross-bred as againgt pure-brd flocks does not affect the meat market. It is in the increased growth of cattle food, and the increased use of grain and cake and other auxiliary foods, that the publie can alone expeet to find a remed y for dear meat, and it is thus that the farmer can alone expect to reap the full advantage of the existing state of the meat market.

In the "Canada Farmer" for March, 1865,* the intending emigrant to that colony has the completest possible information given to him as to what he should do, where he should go, what he should buy, and how he should set to wurk to make a new home, and to make his occupation in it and around it profitable. It is an elaborate and indeed exhaustive statement on all these topics; and every point, whether implement, machinery, or house, or the progress of the farm from forest land to open field, is fully illustrated with well-executel woodcuts. We have never met with so complete a manual for circulation among intending emigrants to Canada ; and being often asiked for information by men about to leave us for one or other of the North American colonies, we gladly give this prominent advertiscment of a nublication where they will find all the advice they want.
There is first an address to the tenant farmers of Great Britain; and this is fullowed by articles on Canadian climate-on life in the backwoodson ohopping, logging, and burning-on fencing and putting in the first crop-and on "the farm in good order"-on rural architecture-and on many other topios-all liberally illustrated with good engravings. The chopping and clearing of land is rather the work of the native agricultural population-who as soon us they have made a farm out of the bush stll it and go further inland. The following is a passage from the opening address of the Editor to his readers:-
"It is to replace this hardy and adventurous race of primitive settlers, that we require the Tenant-Farmers of England, Ireland, and Scotland. We want parties to take improved land, and to cultivate it with the skill and energy which they have showa in the olers country. Men of the class of our eake what the are content to sow and reap, and speaking, they know little or nothing of farming as a science. The modern improvements of British husbandry, by which the average yield of land has been douhled, are to them hidden mysteries. All they look for is immediate success. They know that when their
" Supplement to the "Canada Farmer," Vol. II., No. Toronto: March, 1865
present farms fail them, the forest is open to them, and
The lands improved by this class of persons always be purchased, and are well worth the money asked for them. The soil throughout Canada is generally so good. as to be but litule permanently injured by the imperfect course of farming it has received, The plough has very seldom gone to a depth of 6 inches, so that, to an old-country man, with his a mine of richness, close to the surface, which is as yet unexplored. Our soil is such that it yields readily to atmospherical influences, and our climate is such that one year's frost and sun will produce double the effect produced by these agencies in Britain. Hence a course of deep tillage, accompanied by judicious cropping and manuring, will in two or three years give the apparently worn-out farm all the virgin freshness of newly cleared land, and far greater productiveness. The buildings on such properties are generally poor ; but they are a beginning, and there is too often around them a store of future wealth in neglected manure, which by its resulte, when carried nut on the land, will go a long way towards renovating the farm steading.

These older farms are situated in well-improved sections of country, where there are good roads, mills, manufactories, markets, clurches, schools, and all the appliances of civilisation close at hand. Fine healthy situations can always be secured at a moderate
outlay. An examination of the letters and statistical information contained in this publication, will show all inquirers the rates at which these advantages can be obtained. Prices vary in different parts of the Province, but it is not too nuuch to say that for from three to four years rent of land in the old country, the freehold of a good improved farm can be purchased in Cauada. Nor is it needful to have all the cash in hand for such a purchase. You can alway get from five to 10 years' time for paying a large portion of the money. The universal chastom of the country is to sell farms with a portion of the money paid down, while the balauce is takeu in yearly instalments, the unpaid amount being on interest at 6 per cent

On the arrival of an emigrant farmer with capital in ses open to him
The first, and most advisable, is to purchase improved property.
"The second is to purchase wild land, and improve it himself.

The third is to rent a cleared farm.
"We shall proceed to say a little on each of these courses, though they are discussed and contrasted pretty fully elsewhere in these pages. The emigrant farmer need be under 110 hesitation when, on his
arrival in Canada, he sees a farm that he thinks will suit him. Let him at once go up to the house, ask for the owner, and say, 'If this farm is for sale, I should like to buy it,' The owner will of course say that it is not for sale, that he is not at present thinking if he can get his price- But depend on it, he will sell if he can get his price-he may not sell to-day, or
to-morrow ; but leave your address, let him understand that you will pay all or a large amount of cash, and in the course of a week or two he will be looking after you. One need never hesitate about asking a man if he will sell his farm, or almost anything that is his in the way of property. The customs of the country allow question ere if of property is flattered by th question even if he perseveringly refuses to sell.

We do not quote at any greater length. This is sufficient to show that the reader is well instructed in these pages as to the best course of proceeding for him on his arrival in the new colony. The prospects of an industrious agricultural family seem to be as good in Canada as in any part of the world.

\section*{HOW TO INCREASE OUR SHEEP STOCK.}
\(I_{T}\) is not intended to attempt any description of the various breeds of sheep peculiar to certain localities, or kept or bred by the choice or judgment of the flock-
masters of England. Sheep breeders have earned for themselves bonoured names, and a strong cluim upon the admiration and gratitude of the community. The names of those who are here still, or who have passed away, such as Bakewell, Ellman, the late justly never be forgotten. It is to be hoped that the judgment, the skill, and the perseverance which they have displayed may always be found among the farmers of will hinder or interfere with that attention to the purity of blood and quality of stock which has raised the reputation of the breeils of English sheep far above that of any other ceuntry. It is difficult to trace any effect to its definite and absolnte canse. It may never tends to the reduction rather than the increase of the and as asurity of breed, aided as it is by judgment Though it cection, tenda to its increase.
swell us it cannot be denied that judicious croming, improvementection, has been the secret of much recent fot it cannot, be adopted has the sheep stock what it is,
variety of type, form, and size which makes \(n\) lock purposes, and consequently tending to the very contrary of that which it is desired to further and to recommend.
It may be laid down as a rule, that every ewe lamb that falls should be fitted to be the mother of future generations: we may be content that in such a matter the exception should prove the rule. Take one of the very best instances in favour of this practice, in one of
the last recognised crosses, whose fizity of type has so far been allowed as to claim a recognition as a separate class in the prize list of the Royal Agricultural Society -the Oxford Down. In skilful hands, such as those to whom these prizes are awarded, a very fine animal has been produced, and perpetuated through many generations, and they have justly established their claims. But it will not be denied that the peculiar features of the original stock which furnished the crose, the Down and Cotteswold, are too apt to show themselves, so much so that great difficulty is experienced in keeping these
effects within bounds, and it is said on good authority that when submitted to judgment they are looked on as cross-bred sheep and no more. This is not said in disparagement of this stock, which is generally allowed to be ofter a profitable and therefore useful class of sheep, but is spoken of here as tending to prove the position that cross-breeding as a system tends to lessen rather than increase sheep breeding.
Turn from the breeders, whose names are to be found in the prize list of the Royal and other Abricutural Societies, and from their prize animals and between flocks, and go into the district which lies chalk range on the other, where the cross between these two breeds finds most favour. The first cross, as a rule, is confessedly the best. The question now arises-what is done with the ewe lambs which ought to furnish mothers for future flocks?-as a rule the lambs are sold as they fall, and very generally are hought by those who fat them all. As an instance, farmer of much experience sold 100 wether tegs at market away from home, where they were pronoun sed
the best sample of such stock (that is, the first cross between the Cotteswold and Down) that had been seen there. Contrary to his rustorn he kept the ewes, and was tempted to breed from them; though his rams character and wisely be returned to of a very inferio crossing the best draft ewes of the Hampshire breeders with the Cotteswold ram. It might be said breeding from the draft ewe is in itself a gain, sometimes it may
be, but what is contended for is that even the best be, but what is contended for is that even the best
cross breeding leads to the indiscriminate sacrifice of the ewe, which in flocks like those of Sussex, wase, Hants, Gloucester, Leicester, \&c., is not the request, from the large price of wool and the fatting qualities said to belong to this cla:s of animal. "Breed from the best natives, cross for fatting," is a recorded saying of Mr. Frost, bailiff to H.M. George the Third at a time when the first great movement in the commement of sheep stock seems to have had its rience of that day, is true doubtless now. The practice of the eastern counties, so important as sheep districts, is essentially the same as that of the locality taken as an illustration. There are many instances of gentlemen whose parks offer the best opportunity for breeding the Sussex Down, who have been tempted to cross their flock, some with the Shropshire, producing at first at least a creditable animal ; others using long-woolled or cross-bred (call them Oxford Downs), or other varieies, all leading in the same direction, producing ewes anfitted for the great purpose of their sex, the increase of their kind. If the Dorset ewe is crossed with a Sussex or other Down sheep, for the parpose of pro-
ducing, rearing, and fatting off early lambs, the object is easily understood; or if the cross-bred ewe is put to the same purpose the object is understood-the lamb and the mother usually go together to the shambles, and the sacrifice is made to the luxury of the
world. The object of dwelling on these various phases of practice is to give prominence to a point not often noticed; and this is done with greater confidence, because the increase of pure breeding as a system must tend to improvement, as general cross breeding tends to the deterioration of the stock, and furnishes such ewes as are best fitted for increased production.
The extension of the practice of breeding may be recommended as leading by natural consequence to an improved and liberal system of cultivation. The chalk
range of Bucks and Herts differs very little in soil and range of Bucks and Herts differs very little in soil and seems no reason why the farming of the former might not, as to sheep stock, follow the example of the other Nay, to a certain extent there is a movement in that direction, which ought to receive every encouragement. Of the stronger soils under the plough, it rather in the details of management than on any There is sometimes an impression that the laying down come of the stronger soils to permanent pasture would ncrease the amount of sheep stock; it might, if non were before kept. There are instances of strong soils, on which, in the memory of man, scarcely a sheep was
kept-the naked fallow prepared the way for Wheat kept-the naked fallow prepared the way for Wheat
was tertile and productive, and sheep as a stock folds in the fields, or by a yard at the farms, by tand. of the earliest lambs of the district (fallinead, Christmas) are sent to the London markot \(n_{3}\) for feeding or breeding ou the farm. There a
portions of Essex where the soil where scarce any sheep are lept; might be so housed during the winter and inc \(_{x}\) summer artificial crops. The present season in the this head to the farmers, even of light am Valuable flocks must be of the Turnip rather than be broken
regret that this bas been done the autumis have lessened with the necessity; fur difical the straw, from the unexampled dryness or Barley meal, malt dust, and dellaff cutting, the stuff, including in some cases Wheat, the fory feel. throughout the winter in standing folda, or pate home, have maintained their condition at compiratirn moderate cost, have astonished their masters, and said led shepherds to express a hope that the ne season may be as good as the present.

The decisio of question is al all in the hands of the farmers of England-they m. naturally and justly follow the guidance of thes
judgment in the course in which the greatest amount of profit. Landlords, if they b landholders, should do all to foster and enesuraga, br their example and other means, the extension of then breeding, which, under the present aspect and prospece of British agriculture, assumes the character
national duty, as it must be, as it ever has been, national duty, as it must be, as it ever has been,
ingredtent of agricultural prosperity. J. C.C.

\section*{OBJECTS OF FARMING.-No. III.}

Ir, then, our usual crop of Wheat is shown tn proden loss, while our forage crops bring in a profit, are we duction of meat for our profits? Theoretical the inarket gardener camot afford to grow Wheit, ab the nearer our farming can approximate to gardening the better. But in practice we find several biodranes to such a proceeding; garders produce is consumet the land, and the necessary manure brought bick in the consumers; farm produce has to be eaten oin farm, and we find that overcrowding is evea m: deleterious to animals than to man. I believe the gran mortality among them which we have of hate fans
experienced, especially in the case of pigs, may be tracel in a great measure to this cause. Not only our riuln trucks and steam boats, but all our hovelo and yunti have been unduly crowded from the necessity of increasing our stock of fat meat, and forcing it at a early an age into the market. Consequentiy, ualesem sheds are roomy and thoroughly ventiated, the andion
disease are generated in them, which result in ner loss. Irrespective therefore of the expense of fith buildings, and the greatly increased ca the system of feeding cannot be carried to this axom Neither is it necessary for our purpose, a phical or inquisitive friend (see No. 1., p. 490) mill on a little consideration. Wuen he g for the fee simple of a farm of 400 acres, or rent of 400 l a year for the same,* he purclases or reat: besides the buildings, roads, fences, and improvemed of previous possessors, that annual fall carbon and nitrogen, heat and light Providence showers down him whether be be good farmer or a bad oue, and whether it be receivelur used with gratitude by the thrifty, or misused unthankful and the evil. This annual out-pouring a fertility may be reckoned at about 40 lb . of nitroge its prese, taking its most valuable consticuent per acre (a curious approximation to the annu and contains the amount of this substance neces the formation of a quarter of Wheat or Hence a quarter of Wheat per acre, or a ton of his be removed from the farm annually appreciable degree deteriorating the
suil. The original rotation of in-field our ancestors was a modification of this, whereby of about 2 quarters wis taken of every second yms the land during the alternate year being left rest. A great advance again on this was whereby the land, being kept very clean an cultivated during the alteruate year is made by feeding stock to raise these introduced 40,80 , or 120 lb . additional of

an extra bushel of coru．Here then we ms on which we can build－1st，That the a farmer can sell the more money he will That he may sell off every year as many That he may hay as he holds acres，without conjuring its condition ；and upon these，as a ited to bis particular holding．
the great variety of farms as respects nd otber contingencies，it is impossible to y invariable rule as applicable to individual nces，but I will give as an example of my a moderate farm or at 400l．a year，and fairly or pasture，rentings．We have seen that from sueh wie extreme produce that could be sold of of hay off the Grass land．We have also seen of hay of the Grass land，We have also seen of cultivation．But if he grows 60 or 70 acres Vetches，Cabbages，\＆co，and feeds some 50 his yards and 400 sheep in his fields，giving \(m\) in addition 15 ton of oilcake，and a rick of hay cut up and mired with his straw or chaff，and if he con－ aftting 100 pigs，and keeps the manure from being mhod out by the winter rains，the extra produce of whe rised from this amount of manure should be 700 ghe would make 900 qrs．in all，or 6 qrs．per acre orer 150 acres of land；but making every fair allowance for depreciation of manure through ex posure，and for the and 700 grs．net，or five grs．over 140 fully expect to rap 700 qrs．net，or five qrs．over 140 acres．The anting animall，and feeding them on his own corn or an equiralent of imported corn，would not only realise Watcher at the prorn in the sale of the meat to the normously increased crop of corn，viz．， 5 grs，over two thirds of his land，instead of half that quantity over half the farm，and by caltivating and heavy manuring woold grow over the remaining one－third of his land roots and green crops enough for his use，thus leading to a three－course rotation of crops－one year green crops and two yenrs corn－as the most paying as well as the moot improving system；and I believe I can show that there are ferr farme of good average staple and condition on which this rotation would not be a great improve－ ment on those now in vogue．J．B．JM

\section*{ON BARLEY AND MALT}

\section*{Tho following letter has been addressed br Dr Voelcker to the I mee to enclose the results of analysis of Barley} The sample No．1，I understand，is raw Barley， and moples Nos 5，7，and 9 are malted Barley，called adilo malt，of the respective ages of five，seven，and sine ingh，No． 14 is brewers＇pale malt， 14 days and 16 days old，having gone through the whole process of Thes sumples \(5,7,9,14\) brewers＇malt．
The samples \(5,7,9,14\) ，and 16,1 am informed，are Yon will ohserve that Barley．
fried will observe that the Barley，not having been waidure than malt，contains about 3 per cent．more componition of Barley and malt will be found in the In the malt markich the several samples contain．
Why shoat half a per cent．higher than in the Barley In which it is produced．
lorger，and in No 9 （No．7）the sugar is perceptibly Whilut No． 14 No． 9 it amounts to nearly 8 per cent．o malt moarly 10 per contains about 91 ，and the brown brewers＇ ryer，it thno per cent．of sugar．The proportion of the different samples are given in the enclosed tabular In the of resalts．
the colomn place，I beg to direct your attention funming matter in Barley no ind proportion of fiesh－ to me for anple of Barlay which you have anarorming matter thas contains somewhat less alimants，and appreciably amnt of these important con－ Xo．9，containing the highest proportious of flesh－ lo the matters．
aben 11 per cents．more flesh－forming notice there is hat inaley from which it is made．It matters than for in miterg，and that highest proportion of flesh may bo noticed，whe me gradual rise in these compounds 9 ，atericed，Which reaches its highest point in \(y\) not be coucceeding samples．These differences hiok ing that they are very great；still，I cannot help he conclusion that the feeding valy marked to warrant alting process has length of time during which the At all events，theoen carried on．
abould be better 9 ，being richest in flesh－forming sample
解 better than richest in fiesh－forming matter，
four remaining samples of malt on the other，so far as dependent on their relative proportion of flesh－forming matter．
As I have not carried out myself any practical feeding experimants with a view of testing the relative feeding properties of Malt and Barley，I am not in a position to corroborate or refute the theoretical opinion here expressed．I may，however，be permitted to say that， according to the testimony of trustworthy men，malt possesses the valuable property of rendering other food
more digestible，and of preserving the bealth of fatten－ more digestible，and of preserving the health of fatten－
ing stock．In order to fatten animals as economically ing stock．In order to fatten animals as economically
and profitably as possible，it is necessary to gupply them liberally with a variety of food．The excess of food conveyed into the system during the fattening period often greatly impairs the digestive powers of the animals，and endangers their health．Mait greatly assists the dissolving action of the stomach，and thus supplies the absorbing vessels readily with liquid food．
According to Payen and Persaz，the eminent French chemists，malt contains but \(2 \cdot 1000\) ths of diastase，a compound which，not admitting of quantitative deter－ mination，is not mentioned in my analytical results．
Notwithstanding this trifling quantity，the diastase of 1 lb ．of malted Barley，according to Liebig，is capable of converting into sugar 5 lbs ，of starch．I believe， therefore，it will be found that the cellular fibre and husk of grain is more easily and thoroughly exhausted of starch when the crushed grain is mixed with a small proportion of malt than otherwise．The full fattening effects of the grain will then be realised，and none of the starchy particles be carried off with the frees．We can thus understand why a small proportion of malt produces very striking effects when added to other less digestible food

I am inclined to think that malt improves materially the feeding value of other less digestible food，not so much on account of the sugar it containg，as in virtue of the peculiar dissolving action which it exercises on other articles of food．Too large an amount of sugar in food，it appears to me，may probably have the effect of nauseating；and as brewers＇malt contains much sugar， it is likely that，however beneficial in small doses，such malt onght not to be given to stock in large quantities． In conclusion，I would remark that it is very desirable to institute careful feeding experiments，with a view of ascertaining positively－1．To what extent small doses of malt improve the feeding value of other food． 2．In what quantities malt should be added to the usual allowance of food in order to produce the most beneficial effect；and 3，Whether or not large doses of malt have the effect of acting rather injuriously than beneficially．
The experience of feeders of stock appears to indicate that large doses of brewers＇malt produce such an un－ desirable effect．

\section*{OF EMIGRANTS AND EMIGRATION．}

There is -1 1st，the direct benefit to the emigrant and 2 d ，the indirect benefit to the home－stayer．
1．The Emigrant．－A competent workman no sooner arrives in any of the colonies than he finds ready and full employment at wages which，if economical and provident in his labits，leave him a large margin between income and outgoings．Taking the agricultural as the lowest type and worst paid of English workmen，the farm labourer on reaching a colony obtains for his work both money payment and ample rations，the former alone generally averaging more than his total highest remuneration at home．He is thus at once relieved from all care on the subject of procuring food． Meat，which in England he tasted perhaps once a week only，he now has every day，and three times a day he likes；and the weekly wages，which in England had to provide him with food，hoasing，ond clother，can now be devoted to the purchase of luxuries，or，it prudent by saving a portion of his income for a time，be can soon reach a positiou enabiing him either to buy a smal plot of land for himself，which he cun always obtain for a few shillings per acre，or to join in the renting of \＆
fortune．A fers years thus laying the foundation of a fortune．A fewy years of more or less，rude success，
during which the emigrant has learnt self－reliance，and he，who which the emigrant has learnt self－reliance，and ，who would probably have passed his life at home as a mechanic，or，perchance，risen to the dignity of a fore－ man，and unless by special fortune never attained to ans social or political importance，perlaps never possessed a vote，becomes in the colony a person of meana，can afford to purchase a good house，good furniture，to live well，even luxuriously，is entitled to vote for local officials and the legislature enters into the discussion of public matters，and gradually comes to have an opinion of his own，which he enunciates in the press or in speeches at public meetings，and every little place has its newspaper，in which argumentative colonists carry on their discussions．These discussions determine his choice of a member for the legislature，if himsel desirous of remaining a simple citizen，but if ambitious， he feels that no impediment exist to his becoming a legislator himslf．With character and sufficient educa－ tion he may succeed in leading a local assembly，but if limited in his oratorical powers he must be content to be a silent member，though not the less useful．Thus men，whose whole life would probably have been restricted to the questions of daily wages and the pro－ priety of strikes，or a low murmur about．their exclu－ sion from electoral rights，gradually open their minds to questions of revenue，taxation，political freedom， colonial rights，exploration，harbours，fisheries，boun－ daries，settiements，education，the improvement of estates，and the generul public good．These briefly are some of the advantages which accrue to those who emigrate．

2．Homestayers．－The advantages to those who re－ main at home are numerous，although apparently less direct．First，there is the withdrawal of a large per． centage of competitors from the labour market．The law of supply and demand obtains，in the case of labour， as in that of other commodities．If a given number of employers have need for，say nine men，and ten work－ men apply for the work，the employer will reduce the wages of all the nine required to the lowest possible amount；the labourers，in fact，compete with one another as to which one shall be left out of work；but if the employers have work for nine men，and only eight are obtainable，the employers compete with one another for the services of the men by offering induce－ ments，generally in the form of increasing their wages． Hence the importance of emigration，from a labourer＇s point of view－transferring the competition from the shoulders of the workman to those of the master．That this has been the case during the last 10 or 15 years will be evident，if we investigate the present rate of agricultural wages，and compare it with the rate which prevailed at the former period．I am aware that another cause besides emagration has been operating in the direction to raise wages－I refer to the introduction of machinery into agricultural pursuits．When threshing was done by manual labour，one man was almost as good as another，but the man who can drive，stoke，or foed a threshing－machine is no longer a common labourer but a skilled workman ；and unless his wages be raised above those of a mere labourer he will speedily seek some other engagement－his intelligence，his mind，must be paid for．With a diminution of demand， fewer permanent hands being now required upon farms，the great reason for wages being higher at the present time than formerly can only be from the fact of large draughts of men having been enticed from England by the prospect opening to them in our colonies，and by that means withdrawn from the home－ labour market．

From Mr．Morton＇s paper，read before the Society of Arts on 8th Dec．，1859，it appears that the wages of agricultaral labourers through out Great B itain have risen，on an average，about 20 per cent．between the years 1849 and 1859．All this proves，says Mr．Morton， that the labouring force in agriculture is better paid than it used to be，and that the encrmous extension of machinery and of steam power lately has not been to the injary of the farm labourer．
Not ouly have wages been largely improved by emigration，but there is another point of influence upon social life which must not pass without mention Speals to a person in whatever sphere of life we may it will be almost instantly ascertained that a brother， sister，relative，or intimate friend is settled in some distant colony；and with such emigrants the dwellers at bome keep up a correspondence more or less regular， bringing about a knowledge of the world and its vary ing interests vastly different from that which obtained only a few years ago，when it was not unusual to meet
with persons whose geograptical knowledge was bounded by fat whits of that within the last 20 years I have a fact when I say that wion mitry reeident, the proprietor of the farm he cullivated, who, living within 25 miles of a railway, and a seaport to which steamers were ranuing daily, had never seen either a railway, a locomotive, or a steaun-vessel, and an I found that his utmost idea of a steam-vessel's mode of propulsion was by sweeps, as he termed them, similar, as he supposed, to che smal world which the emigrant obtains are scarcely lese different than the expansion which is taking place in the minds of the home-stayers on the great interest which affect our country. Further, every man who emigrates may be said to support one at home, by becoming a purchaser of English manufactured goods, and thas are the home-stayers benefited; to how large an extent will be more apparent when we bave treated of the commercial results of our colonies. In fine, the phybical, moral, and social condition of both these two great parlies to which we have referred is rapidly
clianging, and, I believe, improving. Here are two little incidents which, from their coming under my own notice I may relate as bearing on this part of the sabject. In the depth of a bitter winter a group of labouring men were haddling round an inn fire, at which they were kind y permitted by the host to warm themselves, add on lounging about, I was informed that they could not get work, and were not allowed to go into the Union until they had been out of employinent six weeks. They
added that there were 40 men in the like distress in that parisb, a purely agricaltural oue, the coveted wages when in foll worls, for which they were so were frequent that autamn and winter; if my memory serves me correctly, eight were counted in my evening appalling to reflect upon such a state of things? Starving men burning abundance. In my own mind have often contrasted this sad condition of matter with the cheering prospects indicated in the following simple tale, for the accuracy of which I also vouch. When I was in one of our colonies an Irish emigrant once solicited me which I assented to do." "Tell him" said be, "if he has not plenty of work, to come out. Tell him we came out safely and comfortahly Tell him, sir, it is a beautiful country. Tell him there is plenty of work lere;" and then he related various family, dc. "Well," said I, after penning all the subjects as he dictated tlsem, "anything more?" Considering awhile, he said, "Nothing, your honour, thank tell him there is plenty of pork aud potatos." A great truth lurks under this last sentence, for our pliysical well-being is at the foundation of all civilisation, science art, and the amenities of life.
3. Who shosid Emigrate?-This leads me to offer a Every person falls into one of two classes, desirable dead-weights. Men with families likely to settle down permanently and become the backboae of the colonies are desirable, and if possessed of moderate capital so much better. Very desirable colonists are those working men who have a sound knowledge of some handicraft, as
bricklayers, carpenters, masons, blacksmiths. Farm labourers, shepherde, are also valuable; and subordinate to these, all men enjoying good health, and able to do a hard day's work of any rough kind. Of the female class we should like a supply of country domestic ser. wash, and ron, boil a Potato, make a pudding, and roast a joint To such we should be quite willing to give high wages some prosperous mechanic or successful farmer. Speaking as a colonist, I may say there are whole groups of people we do not want and would much rather be with out. Of profesional men we have more than enough. Legal men are so abundant at home, and the chances of orerflowings of uncertain and rare, that no wonder th of every opening posible in the colonies. Again, when it is remembered that every emigrant veasel must carry a surgeon, it will at once be scen how superabundant must be the members of that profession in some of the colonies. 40,000 emigrants go to Australia every year, conveyed in 160 or 200 ships, and as many of the surgeons do not retarn, but remain in the colonies, We may form some idea of the yearly addition to the medical branch of the community. The needle women, the sempstress class, are not of value to not used to domestic work, they find little occupation and are a burthen to us, For joung men who have not learnt a trade-men of the pen only, we bave but ittle room ; there is always a large supply on hand and as living is comparatively dearer than at home in the the mont disadvantageouely placed of any class
in they lnow no trade or handicraft, and are, a a rule, physically unable to do laboriou monent unatilled labe far wore off than the com of the Society of Arts.

\section*{Home Correspondence.}

The Karth Closet.-Allow me, through-you, to thank your correspondent, "W. Go." for several very valuable emarks in his article in your Journal for June 17. respecting the importance to health of the Dry System in villages and country hoases. From those very causes which he has mentioned, I have known the rate of mortality in one small village in "Dorset to have been, on an average of 10 years, 33 a per thousand. been from the first my main object ; and when I added wealth as a second object to be oittained by the earth yatem, I had especial reference in all individual cases to the cottager himself. I believed, and still believe, that by using earth as the medium of preserving and moving house manure he would vastly increase the produce of his garden. Indeed, this is no longer a matter of mere belief or opinon; it has become a matter f frequent experience. I object greatly, therefore, to "W. G.'s" idea of the farmer buying up this stock of manure from the cottager. For I now many villages in which the privy vault affords the only chance of his obtaining manure. Let the farmer seek it partly from his own houses, partly from ailway stations, and from public institations, and (notwithstanding your opinion, Sir, to the contrary, I ray) let him seek it in towus. for partly from the great and he pion of the little cost of the earth system compared with the water system, and now rom the greatly increased simplicity in working the former, I feel persuaded that it soon will be in operation in towns. "W. G." says that I am pressing the subject in Dorset. In this, I beg leave to say, he is ndeed by the advertisements of Messrs. White \& Co and it is forcing itself not only in England but in various other parts of the world. For instance, the paper which I had the honour of reading before the Society of Arts in the year 1863, has been reprinted by the Supreme Goverument of India; it has been translated by the Government of the Punjab into the language of that country, and it has been the means of introducing the system into, I believe, possessions. This does not look much like my possessing the prospects of the system, my W. (t." says I am doing, by insisting on drying sheds and on using clay, and on the five-fold repetition of the use of it. In this too he is not a little mistaken. I
assert that common surface earth and clay, if dry and sifted, are the best deodorisers, and within the reach of every person. That their deodorising capabilities are plete deodorisation in each use of a closet. And this am sure cannot be said of ashes. At the same time ashes, if not added in a very large proportion, will soon produce fermentation and a very offensive smell. And every one who has tried the two will say that their
manurial value is very small compared with that of saturated earth. If people like to use ashes many experiments that they will find several incouveniences arising from them, especially if used in chambers. If they like to use the very small quantity of soot which each house or cottage is likely to produce, I don't forbid it. But they must expect smell of soot, even if it should deodorise other matter, is not very agreeable. As to the frequent use of the same earth, that is necessary only where, as in the case of towns, there may be a difficulty in providing a sufficient quantity for the single use, and where it is an object with a view to facility of carriage to condense the power and value of the manure. One remark further as to what "W. G." says as to making our cesspools out of or above ground. There is now no need of this, nor any need of a shed (excepting in some such cases as those above mentioned) for drying and mixing the earth and excrement. Your earth or ashes must be kept under cover, neither is there any need, with ery few exceptions, of a mixer. In a steady following up of practical experiment and observation, I have cound that the best plan is to fill up the old cesspool to the depth of no more than 3 or 4 feet, and to make in it a bottom of coal ashes and tar, or, if you please, of cement, and in making a new one to observe the same ule. Have an opening to this either behind, or, as in two cases I have, make a trap door in the floor of the privy. Let the deposit of earth and excrement fall into in detail and chamber. Let the earth be applied deposit, and there never will be the alightest offensive mell, while you may leave it there if you please for a twelvemonth, and within two months from the falling of the deposit even the paper disappears. You say, sir, that the earth closet is a horticultural rather than an agricultural sabject. If you could see, indeed, the produce of some gardens in Dorset in which the system has been in use for two, three, and four years, you would say still more decidedly that it is well worthy the atten tion of every one who has a garden. But if you were to hear the observations of the many agriculturists who have seen the recent improvements made in the machinery of White \& Co.'s closets-improvements both in simplicity and efficiency-and who have seen also
my arrangements of the paults on my own preatimy
and in my parochial scloolroom, youn would and in my parchial schoorroom, yon moll
is equalls worthy the attention of furmer farmer, on seaing a model of the machinery and tb arrangement of the vault, said to me, "I had no conoe facturea I Let these models be sent arol thara, and anothan. farmer must adopt the plan. Hewry Monle, 29, Bather
The Proper Quantity of Seed.-Experiment
sperience have taaght me that the fulness of experience have taaght me that the fulness of a
does not depend upon the quantity of sed sol on the quality and condition of the soed sown, more limited degree, on climate and the period sowing. Every agriculturist should, as a question profit to himself, try on a small scale comparative gas tities of seed, and it this were done generally (which to the country at large, and a proportionate gain to farmer himself. We often hear complaints of losese a thin crop, but never by a thick one, although the farmer' 0 often subtracts considerably
Wher pront. I related last year that a peck of ne per acre, dibbled at intervals of about \(4 \frac{1}{4}\) inche Wheat per acre, and 23 采 tons of straw ; in fuct the thickest and heaviest crop of corn and straw on my farm It was seen at various periods of its growth by man agricaltural and other visitors. During winter, a sing slem only having appeared from each kernel, the lan at a distance appeared as if unsown, and we wer one asked why we had omitted to drill that partien portion of the field. In the spring each stem radiate its shoots horizontally, to the extent in some instano of 30 to 48 stems, and ultimately became the best on the farm, and, which is often convenient in har ing, about four days later than the thick-sown por in October, at the same time as the rest of the fied mi late in the masth. we repeated the experiment o a heavy-land Clover lea, as last year. The groond was rough and hard, and very dry, and althonz a kernel was placed in each hole, oniy abjot one half, or half a perk per acre, came up. Of cours we auticipated a partial failure, but spring came, and
each stem threw out horizontally a large na ber of shoots, so that now it is admitted by all who see it then it will exceed in produce the adjoining crop, dril five oushel per acre. It appears to be about four o five days later than the rest. I invite all who feel crops in July, because, on public grounde lamentable to waste so much food as we do in पas or injuriously thick sowing, and it teaches us the deeper cultivation, drainage, and unwashed mana ave more influence on the crops and on the sed spite of drought dry) than momise abundant is a cood hory land season and particularly fayouratl to the stiff cracking clays. Thin hot soils, expeciuls where shallow ploughed, must suffer considerab week ago I was in company with some (good) praction farmers who astonished me by gaying chat, 7 buishels of Oats and 4 bushels of Barles per acre As I only put in 6 pecks of Barley and 2 bustelis of Oa per acre, I presume that the astonishment was Even at present low prices a self-taxation to the ex of some 7. or 8s. per acre is surely worthy sideration. I do not wonder at my friends finding gep in their Clover, caused by prematurely According to Mr. Caird, the average increaso corn crops is 8 for 1-one million quarters of sed produce nine millions of corn! This is discreditable us, for surely one good seed in properly caltivated 3 cannot produce so little, if it be allowed safficient on to develop its growth. Forty for one is nearer increase on my farm.
J. J. Mechi, Tiptr June 27, 1865.
A New Clover.-I herewith send you a specimes a new Clover which I saw yesterday growing near Biggleswade, and which appears to me to be wo of nat. Mr. Malden, of Biggleswade, directed D attention to it, and he intends to introduce it nett rea to the public. Its history is this:- Some yearo neighbour of Mr. Malden found it among some Clover, the seeds of which had come from as it appeared to be a new variety be se that time the present has grown it yearly since entirel it. It is a remarkable thing, that although there hardly a good field of Clover in the neighbourboud this field carries an uncommonly heavy Red Clover, still, all kinds of stock eat it and thrive upon it. I suppose it is difficult to say has caused the numerous failures in the this season, whether it is frost, or the withstand all ruch evil influences, it may great value to farmers.
enables me to determine, the plant is "Trifol striatum," being a native of England grows on dry pastures and fields. The 16 -ace fiel 196 Biggleswade was sown with it in spring, be gla Michaelmas. Wheat, and wishes to see it.
practitioner in the neighbourhood of Brietol, wrote me all dying of intestinal fever; that there was a lot of 10 pigs that had taken the disorder, that six had died, and that the remaining four were not likely to recover. Next day I went over to see the patients, and had an opportunity-the only one I have had ot observing the disease in the living subject. saw them from day to day until they had all died;
and with regard to the disease in the living animal I could not give you a better idea of it than by saying that it is the exact counterpart of typhoid fever in man. The phenonena are very nearly alike. There sently refer: but of difference to which 1 sball pre closely, only that this disorder in the pig appears to be more rapid in its course and more deadly-killing, in
fact, in a much shorter time. The pig began to droop fact, in a much shorter time. The pig began to droop
and sbivered more or less very distinctly, suddenly became very prostrate, lost its appetite, got thirsty, and seemed very unwilling to be disturbed. The master of of the disorder these pigs suffered from headache; and though this seems to be a curious atatement, I have no doubt that it was a correct one. For in studying two of them at that stage of the disorder, one could hardly fail, from their heavy look, the fixed way in which they held their heads, and the resistance they offered to their heads being disturbed, to come to the conclusion symptoms were generally atten led by diarrhoea, which from the first was more or less profuse. If it does not invariably occur from the frot, in all cases I have observed, diarrhœaz never failed. Indeed, it soon became extremely profuse, and one of the leading features of the disease. The discharges were at first of a light yellow, and strikingly resembled the light cherry yellow discharges that belong to typhoid fever in man. As the disease advanced, various modifications in the colour of the evacuations ensued. They became more or less of a dark green, and towards the end in many cases of a deep chocolate or dirty red colour, which tinge arose from the occurrence of
hemorrhage in the inteatinal ulcerations. There was another symptom, and it is important in a disease like this, where investigations are new, to fix upon outward signs that may lead to its early recognition. This symptom I regret not having witnessed myself; but it occurred in all the pigs, and I am told that it is a constant symptom characteristic of the disorder in its
very early stage. I do not know on what day, but apparently it was the second, third, or fourth day, the akin of the pig between and around the ears became of a red colour, passing into various shades of purple or whole surface of the animal, and is especially conspicuous on the flanks and other parts not much covered with hair ; and it appears to liave earned for the malady a particular soubriqnet. Two or three pig fuctors visited
these pigs, and they at once said, "Oh! we know this these pigs, and they at once said, "Oh ! we know this
disease well enough; we call it the soldier," from a fancied resemblance in the skin of the pig to the military red. As the disease advanced, diarrhoea became very profuse; the prostration increased, and I fancy that delirium intervened. The pigs seemed to me to be quite out of their mind, if one may say so. In the later stages of the disorder many became paralysed in their hinder extremities, and so weak as not to be able to stand.
In the pigs I examined the characteristic alterations were entirely confined to the mucous membrane in the intestinal canal, and they affect two principal types. One is the type in which the disease appears to originate in the isolated follicles or small mucous glands of the intestines; and in that way it occurs in a scattered form. These follicles become the seat of a particular cellular formation, and that stage, which is the first stage before ulceration enters in the stomach, is soon followed by a condition of things in which all the liseased mucons glands pass into ulcers or open sores. In the progress of the disorder, these ulcers assume very peculiar charactere indeed. They have been variously likened by friends of mine to different natural objects. For example, to Columba root sliced and stuck on to the intestines, to the marks which the iron used in firing a horse produces on the akin, and to the Lichens which attach themselves to the bark of trees.
Now, these are all the facts that have come imme diately within my own knowledge. But if the information which has reached me can be relied upon, there are two points of very great importance in the natura history of the disorder : first, that it is virulently contagious; and, second, that it is quite peculiar to the pig. I have heard of instances where it lass swcpt play the pigs in the homestead, as if were plag ; yet no other creatare on the farm, whetbe really seems to be a disorder that is peculiar to the pig. The disease appears to lave been known to pig factor in Bristol and its neighbourhood for a considerabl number of years: but in their experience until lately only occurred in isolated, or what doctors technically call sporadic cases. Within the last year or two, how ever, it has become furiously epidemuc. I am almost but to repeat all that a largely concerned the 10 hat 1000 15,000 rade have assued 0 the couts

18 England of this disease in the course of the last 18 montbs; and if that be the case, surely it is high time that the disorder should be seriously inveatigated. I would here offer a speculation, bat merely as a conjecture, which I think may turn out to be true, as to the causes of this disease having become so rife during the last two years. Within 10 or 15 years the discovery has been publicly announced by Dr. Farr, and generally accepted by the medical profession, that typhoid fever in man is much more prevalent in dry seasons than in Wet: in fact, that it never becomes widely epidemic over the whole kingdom, except in very dry seasons. And the reason I believe to be this. All those contagious disorders are caused by organic poisons which are thrown off from the body in various forms, passing by the bowels in a liquid state. In that liquid state all these poisons perish and rot very quickly. But there is a fundamental law which has never been sufficiently dwelt upon in relation to all these epidemic disorders, Which is this, that when once these poisons pass into a their pate, if they can be kept dry, they will retain familiar pors for almost any period. Thus wo are all good for two years. Now my conjecture is that the poisonous germs thrown off in this disorder of tho pig within the last two years have pasaed into the dry state and in that way been rapidly disserninated over the country. In bringing these observations tions of a practical kind; because this is sugeminently practical Society, and what you want to do with the knowledge acquired here is to turn it to practical and useful purposes. I venture, therefore, to say a word or two on the subjec: of Prevention. I have stated in my belief this disease is the comnterpart of typhoid fever in man. And this is quite ascertained as a settled thing in the case of typhoid in man, that it dischartagious disorder, but chiefly propagated by are the analogues one of the other, the same would hold good of the disorder in the pig. I believe that it is a contagious disorder, and that it is propagated mainly by the discharges from those sores in the intestines which constitute the very essence of the disease. It is the poison which finds its way through the system of the animal, and is cast out of the system into the soil. If pigs in the early stage of the disorder sre sent by steamboat they taint the steambont; in like manner they taint the market, the stye, and the drains of the stye. The suggestions, then, I would offer are these:-
1. Try to recognise the disorder in its eir'iest stages. 2. Separate the sick from the uninfected without the least delay.
3. And this is fundamental to my mind, because when once this disorder enters a farmyard it goes through all the swine in the place-immediately slaughter the affected animals.
destroy these precautions will be in vain if you do not destroy the infections discharges from the intestines of the diseased pigs.
You may separate the sick from the uninfected, but if in dry weather you turn your healthy pigs at the end of two or three weeks into the stye or the yard where the others had been ill, you will find the disorders

\section*{break out anew.}

And now permit me to express a hope that the Royal Agricultural Society will take up this matter, and placs
the investigation in the hands of my distinguished the investigation in the hands of my distinguished
friend Professor Simonde, than whom there is no man in Europe more competent to conduct such an inquiry. The members of this Society liave great opportunities. You know that mankind is infested by that remarkable group of disorders which are called epidemics to a fearful degree-small-pox, ecarlet fever, typhoid fever, and tuphus fever. Physicians have pronounced thent to be inscrutable. You have in animals diseases, epizootic diseases, that are the exact counterparts of these, analogous in their nature, propagated, and destroying life in the same way, and belonging to the same family. But in studying these diseases in animals you have the enormons advantage of all the problems that arise being put to the test of experimental investigation. You know we cannot experiment upon men and women as we can upon pigs and bullocks. I think this disorder among pigs is one of the most interesting of the whole group; and I believe that if it were subjected as opportunity occurs to the test of experimental inquiry. results would come out that would not fail to be of the highest value to the agricalturist; whilst they would also possess great scientific interest in their bearing on kindred diseases in man of a far bigher and a far wider range.
Frofessor Smonns said: It was in the early part of 1862 that the attention of the veterinary profession, and of himself in particular, was first called to this matter, in consequence of the virulence of the affection in the county of Berks. The deposits on the intestines were like Fungi on a tree, or thescar on a horse's leg after the operation of firing, or slices of the Columba root alluded to by Dr. Budd. But they were to a far greater extent than any of these similes would convey to the mind. From 1862 to the present time the disease had been extending throughout the whole country, and be did not know a single county that was not suffering more or less from the affection. Certainly it existed in all the southern, midiand, and most of the northern counties, for he had seen animals from all
those districts. It was for this reason that in the Report of the Governors of the Royal Veterinary
College to this Society last year the following paragraph was int roduced:
Was intronfucen:-
"Althongh what may "be calle 1 the established epiznotics
hare been lea proealent. a peculiar dieesse in the mature of have been leaq provalent. a peculiar diee ese in the nature of
diphtherra has affected pigs in several parts of the ountrys
This dizease however, has apparently passed its clionas, and seems now to be on the decline. The eanaitary measurres rocuemmonded by the Profeesor were attended with marked benefit
by kooping the malady in check, furt further investigations by keopinge the rogy are required, and in thio, as in other analogoy

He quoted that passage in order that it might be seen that the Council had not only been alive to the existence and ravages of the dibease, but had been from the various members of the Society. The disease was there spoken of as being of the nature of diphtheria and it was so described because he had found that the deposits apon the mucous membrane, when seen in the early stages, bore a close analogy to the depnsits which were seen in diphtheria. And lie did not see why in a diphtheroid disease those deposits might not bo 10 any part of the intestinal track, as well as upon the
fauces. In fact, the poison might exist in varinus parts of the body. With reference to the contagiousness of the disease he quite agreed with \(\mathrm{Dr}_{\mathrm{r}}\). Budd, and further he agreed that probably in dry seasons it was more had explained. He fornd, however, that it was contagious as weil in winter as in summer-that it made as much progress in wet weather as in dry, and that
pigs differed considerably in referenca to their susceptipigs differed considerably in reference to their susceptirarely attacked aged pigs. It had in some cases spared all the old pigs on the farm, whilst it had swept of therefore, that the farmer ran the risk when his herd of pigs was attacked of huving all his pig s!ock swept away. Anmals that were upwards of six months
old resiated the disence in a most remarkable manner. old resiated the disemse in a most remarkable manner.
Ife bad seen the discase among pigs that were bept in the best possible manner, and fed upon the best possible food. The animals were washed two or three times a week to keep them clean, and the greatest care and attention wrere bestowed upon them; they were, in fact, treated just as they would have been if the owner had been going was a fact of some value-because it indicated that no condition gave security to the animal. It would appear that with regard to susceptibility, it was not but why young pigs should be suaceptible, whilst ohd pigs were not, he could not say. The symptoms had been most accurately described by Dr. Budd; and it was important that farmers should early recognise its exisof course the sooner the disease was recognised and the animals suhjected to it were got rid of, the better. By that means a large source of mischief was cut off places where the pigs had been kept should be thoroughly washed, floors, walls, and draius; and no sound animals should be put there for weeks after the others disease, he had found great benefit to result froin the use of small quantities of a very homely remedy, namely, sulphur, on account of its antiseptic action. It should be put into the animals' food twice or thrice in the week, and sulphite of soda should be used on he alternate days.
Mr. Frere suggested that carbolic acid, being an antiseptic, might be useful.
Professor Coleman mentioned that he had been lately informed of three cases in which it had been used with advantage internally and externally.
Dr. BrDD wished to add that he believed this particular disorder was propagated chiefly by tho discharges from the intestinal canal, and that persons who got the matter about their shoes were frequently the place to another. At prement the complaint was very rife in the South of Ireland, and it was thence that vast importations of pigs took place into the port of Bristol.

\section*{Farmers' Clubs.}

Wraton: Jsne 13,-Cultivation of Flax.-Mr. Wruson said - Wben Wheat was \(\varepsilon \circ\) unremunerative, it was of much interest so the farmers of this county to study the growth of Flax. Many of his neighb urs already grew it, though they grew it only for the seell, and grew it upon all kinds of snil; some of it of very good quality. His frient Mr. Jennings, of Thornby villa, hadgh manner, dressed some of it for the fibre, which be had got made into cart and plough ropes, the only fault of which was that they were too long. Mr. Jennings
found that the seed he grew was inuch superior for found that the seed he grew was much superior for
feeding calves to the seed he could buy. When he boiled it, he made a jelly so stiff that it could be lifted with a fork, while the bonght seed produced a thin
weak jelly. Mr. Jennings laving only grown the Flax
for seed, had for meed, had not made any calculation as to the cost of exbaust the proifitable, and it was not observed to letter from a friend who had gromen a quantity of Flas,
and had a net profit of from 20l. to 40l. an acre. He told him that there was no ground for the cry that
was raised as to Flax exhausting the soil; it did not exhaust it more than any other crop did. As to the steeping and scutching, they were quite simple operations when they were understood. Mr. Wilson went on to qnote from the report on the recent discussion of the subject by the Royal Agricultaral Society. He thought rettories and scutching mills would be the great difficulties, so that the farmers need only have to grow the straw and take it to those who would prepare
it for the market. The cost of the carriage would be very little indeed.
Sir R. Bersco, Bart., said he did not think there was a more remunerative crop, if it were properly under-tood-but there was no more losing crop when it wa not properly managed. The fermentation of Flax was
a very difficult operation. Many preparers of Flax thought they got a fine fibre, but when they came to try it it was unsound. This was not the case with the Flax before him. Now, as to the profitable nature of largely grown. The farmers grew it as their Wheat rop, and found it very profitable. Mr. Wilson mentioned that what they wanted was rettories I If this
was the case, he feared there was not much likelihood of its being carried outo No one would erect rettories until he could be assured of the regular supply of straw. The farmer could not expect to bave rettories erected unless he were to bind himself to grow a regular quan ity of straw, and the rester would have to bind hinsel to keep the rettory going. Still, a farmer might grow
it for seed, and when a man had got to growiug it for seed, he had got a long way towards producing it for fibre. When it is grown for fibre it must be grown that it might spread. Flax grown for seed produced coarse fibre. That which was for fibre shonld be long and fine. It has been said that Ireland could not grow sed, but Ireland could grow seed as well as England only they did not want to grow seed; they were ton cunning to do it. They wanted to have fibre. The
climate of Cumberland was well adapted to the growth of Flax. There was just the quantity of moisture wanted. It wats not too wet, so as to make the Flax lie down on the gromid aud be wasted. The great hing was to have machinery to prepare it. One acre of Flax requares about \(1 \frac{1}{3}\) acre to prepare it upon and
dry it. The way to do it would be for each man to prepare what he grew himself. He would have to take land sufficient if he had not enough on bis farm. On nost farms there would be sufficient water. He did stecped it, dried it, and scntched it themselves; just as they did with their wool. As for injuring the land that was a great mistake. He did not think there was
any crop which exhausted the land so little as Flax did. They nust remember that whatever land they put it upon, it must be ploughed at the back-end of the year, so that they allowed it to have the benefit of lying all the winter. Then after that they came upon it with the roller, and put the seed in, giving it the very lightest touch of the barrow afterwards; drawn over the land by men. A clay bottom was undoubtedly the
best, as nobody could doubt, and off good land they would have Flax that hung in the hand as if it was lead He had grown Flax to be worth i02l. per ton, and he had grown it to be worth orly \(50 l\). per ton; both on the same land; grown in the sane way in every respect, but not put into the water at the same time. The watering or steeping made all the difference. There was one thing that was mentioned in the paper he
would allude to, which was mowing the Flax. Such a thing could never be done. It could never be separated for dressing if it were mown. The Chairman proceeded to explain and illustrate how the operations of pilling, sheaving, watering and breaking were performed. He How there would be no real differlty except in watering. How were they to get over it? He thought that a together and have a man over from Holland to teach them how to manage their crops. That the Flax crop would pay he did not doubt.

\section*{Farm Memoranda.}

Coybrrd Yards. - Better Heaith of Cattle.-That cattle kept in covered yards enjoy better health than others kept where the cover is only partial is established by abundant evidence.
In support of this view, we quote the following from communication with which we have been favoured Our buildings are 130 feet by 103 feet Red Hill:Cour buildings are 130 feet by 103 feet, and afford accommodation for 190 liead of stock; and to give you last seven years the farrier's bill has not averaged 20 s.

But there is yet another class of opponents to the covered-yard system, who, while adrcitting the general well-doing (f the cattle kept in them during the winter, argue that what is then gained is lost in early summer, when the animals are turned to Grass, from their great
susceptibility on exposure to cold. The writer's expentence, and also that of many others whon he has addressed on this matter, is dead aguinst this view With much more apparent justice might it be inferred that milch more apparent justice wight it be inferred

Warmer atmosphere, would catch cold when tomal
Grass; yet, as a general rule, such is not the Superiority of the Manure made in Conered . By far the greater proportion of ordinared Tandemanure consists of straw and water ary fay boing the excrements of the cattle. Under ats about 20 lb . of straw per dien is found litter a quane animal; in open yards more than trice que ercrements give the to as is generally supen manure, it will be readily seen why that mater cover is normally much superior to that made ante open air. We say, "normally," because in the case the original value is maintained, but in the othe lost by drainage and waste
It would be superfluous to dwell on the deteriont nifuence exercised by rain-water falling on manore, The curiou in this matter will find ample informing by referring to the researches of Way, Voelcke other modern writers on chemistry; the practical men, opine, will be more gratified by a reference to resolat aressings of equal quantities of manure ander the same conditions as to the food and are of nimals, but in one case under corer and in thothe in open yards, Lord Kinnaird obtained the follonies
tur

n, Oxon, in a comos ation to the writer, says:-" You are aware that Itm at my farm an open yard as well as my large covern yard, and when I first used the manure made in the atter I was startled to find my crops for which it her been applied so lodged as to be almost wortiless. Sine then I have sometines been at considerable expene to have that made under cover and in the opeu eithe mixed or applied conjointly, so as to insure an equab crop; or when the covered-yard manure is used rep. rately, the quantity is invariably reduced, so m guard against my previous misfortune. I ment nanage ny covered manure so that it will 'spit' o with the shovel when required for use, so that I her save the usual labour of twice billing, carting, to emptying."
Mr. J. C. Garth, of Haine's Hill, Berks, in eferem to the covered yard of his home-farm, writes:-"f manure is first-rate, but as I have not made an actor rial, I cannot decidedly say how much it is better the that made in open yards; but perhaps one of the prit cipal advantages of covered yards is the great superioniy of the manure. The cattle should be littered every or every other day; the liquid is then all aboorbor the straw. The dung is good and short, and fit to be drawn on to the land without the expense and waste making dungheaps. I consider this system of manne naking is also more healthy for the cattle, as in ope yards the liquid runs about emitting efflavia and taioture the soil, whereas in covered yards it is all taken op by the straw."
Mr. Chancellor bays:--'s The late Mr. Jamee Bendel always stated, as the result of bis lengthened experi nce (and he might be considered as one of the pioneens of the system), that one lond of covereura manure was worth more than two rosd and heated has always been advanced as an argumen gainst covered yards by those who have not the them, but I never heard it used by any one wholuh The truth is, it keeps infinitely moister than in opm yards in a dry season. I have often seen the mand when being emptied come out like 'black butter,', and vith perhaps the exception of the top layer, quite fit wo put on the land."
Mr. H. S. Thompson says:-" When first I begut wh ase manure made in a covered yard, it was pat on white 'Turnips in the usual quantity, and they wa stimulated by it to an unnaturally rapid \(g\) excessive size, which were very prejudticial to the keeping qualities. This taught me the lesot manam has since been abundantly confirmed, that than the inade under cover is fully one-third stron? which has been exposed to the rains of winter yards. Before trial it might be supposed that why bo made under corer would turn out dry and If the quantity of straw used is in reasonable to the number of live-stock kept, it will be found that the manure turns out in first-rmon he explanation is easy, the most cortilising contains are washed out by rain as fast as formed by the decomposition of the heap; and The writer's experience fully bears ou statements. In the case of animals, alike fed alike, but kept in open or in cove the make will in a great mpasure vary with the uinfall, which not only, by its deteriorates the quality, but also for large additions of litter; bnt on the Whole, and

mith of Woolston, the first farmer who cultivated his ase and making a weginning of ordering a wind. mbers are at wourghs ing Great Britain alone, while , India, Anstralia the Continent, but, en years ago, Instralia, New Zowler, having drained de a lit in the earth, 30 inchaning plough (which
circular earth, 30 inches to 4 fiet deep, with
pipes strung on a rope, leaving them
embedded in the soil, and completing the drain at a
single operation), was single operation), was beginning to turn his attention to ploughing by steam. Before he died, in the end of last year, the firm of which lie was the founder was turning ont steam-ploughs at the rate of sis per week. Messrs. Howard of Bedtord, who began to manufacture some years later, have sold about 400 sets of steam in the field. apparatus, and other manufacturers are now in the field. The progress of steam cultivation, extra-
ordinary as it may appear, is easily accounted for when we consider that its cost is only about one half the cost of cultivation by horse-power, that its quality i to ther, and that the crops produced by it are greater, acre. The question, indeed, is not why steam cultivation has extended so fast, but why it has not extended faster. Nor is the answer difficult to find the great ratarding cause has been the expense of the apparatus. This we find stated as under in the report W the last great competition of s.eam cultivators at Worcester in 1863

From these figures it is evident that the first step to be taken, in order to bring steam cultivation into more extensive use, is to reduce the cost of the ap. paratus. With this object in view, Mr. Leslie of in apparatus for applying steam or other motive power to cultivate the soil, and to actuate wheeled carriages." He has since had a cultivator constructed. He
states as the result of his experionce that a complete steam caltivating apparatus, exclusive of the engine, may be made for a sum not exceeding \(150 l\). stationary steam engine of 10 -horse power may be apparatus 3101 ., upwards of \(150 l\). less than the lowest priced steam cultivator above mentioned. He states, moreover, that where there is a fixed steam engiue
or water-wheel of sufficient power on the farm, it may be used to work the cuitivator, the poitable or sel propeiling engine necessary under all the fystems a common use being in these circumstances dispensed with. To show how this is accomplished, it is necessary to explain that, in all these systems, motion is com-
municated to the ploughs or cultivating implements by making the steam-engine wind up a rope of iron or steel wire to which the ploughs are attached. O account of the weight of the wire rope, and the friction incident to its use, the stean-engine must be placed in or close to the field to be ploughed; portable, and, in some of the systems, a self-propelling engine is thus rendered necessary. Mr. Leslie dis-
penses with the use of wire rope, and adopts in its stead the endless hemp rope running at a high speed, first used by Mr. Atkins of Chepstow, in 1843. The hemp rope is not attached to the plough or cultivator, but communicates motion to a horizontal pulley supported on a frame or carriage to which the cultivator is attached. The motion is transmitted by a train of wheels to two propelling wheels, also in connection with the frame, and provided with teeth or spikes for laying hold of the ground. In its transmission the motion is so reduced in speed that the hemp rope rans 20 yards for every yard the cultivator advances. As the speed is reduced, the power is increased, so that if we the propelling wheels would be 20 times greater than that of the hemp rope. On account of the comparative lightness of the liemp rope, power may be and the whole of a moderately sized farm may be cultivated by a steam engine or water-wheel at the steading. Besides the propelling wheels, motion may be communicated to another wheel (also in connection with the frame), which, being mounted in the lower forked part of a vertical spindle, may be turned, so thnt its axle may be parallel, or at right angles, or at any and which is used both for steering and for turning the machine. Usually this wheel is not driven, but when the machine las to be turned, it is placed at right angles to the propelling wheels and thrown into gear when the turning is complete, it is thrown out of gear and replaced in a position parallel to the propelling Wheels. The machine also raises or lowers the cultiva-
ting implement, and it is so arranged that the attendant inay, without making any signal to the engine driver start, stop, or reverse it, and turn it to the right, or left, completely round, if necess:ary, the rope rumng all thas a great advantage over the common methots of steam cultivation, all
of which require the engine to be stopped when the plough has to be stopped, which is, of course, at the end of every furrow. To the frame or carriage above mentioned, propelled and guided by its propelling and steering wheels, which may be called a steam-horse, any cultivating inplement may be yuked; arid the patentee proposes to use it for drawing carts or waggons for conveying or distributing farm produce or materials
over a limited area-thus still further displacing hurse over a limited area-thus still further displacing hurse
power. The inventor claims to have produced the first steam cultivator, dُriven by rapidly running rope,
capable of being efficiently steered or guided, and of experimental machine was constructed by Mr . Alextuder Lelinghon, machinist, Turriff, and the cultivator or Lrulthor, which is attached to it, by Mr. James Duncan, Brantsmithy. The cultivator has five tines, with diamond-shaped points, 6 inches broad. With a horse palling the rope, it is propelled with ease throngh the hardest ground, breaking it up to the breadth of \(4 \frac{1}{2}\) feet, and to the depth of 9 to 12 inches. Banff. shire Journal.
Tillage and Ammonia. - This same gas has one remarkable property among others-it loves those, and fulls on those, and blesses those who prepare for it and receive it kindly. It falls with the occasional shower, not to mention the nightly dew, but like that dew it hates a stale surface. On a rond, a neglected fullow, on any hard impervious sun-baked surface, it absolutely refuses to perch or settle, so if you wish to attract its sweet and sovereign influences, stir the surtace-nay, keep it continualiy stirred; and no matter how coarse the subsoil you have brought to the top, the quantity of ammonia you may absorb in a single summer is such that, you may langh-or mourn, as your please-at neighbour Drychaff's dung-cart, that creaking hearse that is carrying to the field the dead body whose departed spirit has descended weeks and months ago upon your acres, by the care you have taken to attract it. Yor may "call spirits from the vasty deep" and from the dry land, and from every dung-hill, or other mass of decaying animal or vegetable matter for milem around you; and "they will come when you do call for them," which is more to the purpose-if only you will do one thing-keep your soil in the condition to attract, receive, and retain them. Hoskyns.

\section*{Calendar of Operations}

Wheat and other grain crops are now in full ear, and their productiveness depends on other influences than those which the farmer exercises.
Peas will be ready for harvesting towards August. They are mown, or cut with hook and crook into bundles, and left to dry, being turned daily till ready

\section*{cary.}

Beans.-The wiater-sown crop of Beans will also be ripe by the end of July. They may be let to reapers to cut, tie, and stook, at from 78 s. to 8 s . per acre, according to the crop. They are generally "bagged," as it is termed, by a heavy hook, which is struck at the standing corn in succeasive blows, driving a yard depth of it up against the crop, across perhaps half the width of a ridge, and then employed to gather that which has been cut into a sheaf, which is laid on a band of straw or of Bean-stalks, which had been previously prepared. The Beans should thus lie for a fow days, till ready to be tied and shocked. The crop may be cut as soon as the attachment of the seed inside the pod connecting it with the plant has withered. This will be before the stalk is dead, and so much the better, for leafy Bean straw is good fodder. Any Rye that may have been left for seed will also probably be ready for the sickle.

Carrots and Parsnips may receive their last horsehoeing, or deep hand-hoeing in this month; and children should be employer to go over each row, singling plants that have been left double, and pulling young plants that have appeared since the first hoeing. This germinating, and sending up its shoots all through May aud June

Mangel Wurzel must be horso-hoed at intervals during this month.
Turaips must also be hand and horso-hoed. The early part of this month is the period for hoeing the bulk of this crop.
Rape should be hoed as soon as sufficiently high not to be covered during the operation, and then it should be set out as Turnips are, excepting that in "singling two or even three plants may be left together
may continue sowing it aring this month.
Flax is to be pulled as soon as ready, which is generally by the end of this month, before the seed bolls hare ripened. The seed may be soparated by rippling in the field at once, or after the Flaz has dried in shock, or in the following spring, on the Courtra method, after remaining in the rick all winter. Rape or autumn Turnips may be grown on Flax stubble after the removal of the crop.
Haymaking concludes this month.
Tares, Lucerne, and Clover continue to furnish keep or stock.
The end of this month will give rather slack work for the horses, which may, therefore, be employed in hauling lime, \&c., if any is needed, for spreading over the stubbles after harvest. Draining tiles, too, may be fetched and stored away for use in autumn. They can sometimes be obtained the cheaper for their
purchase now. This is also a convenient time for purchase now. This is also 2 convenent time for cleaning out rivers and ditches, as the weakm to stand amongst water and mud without injury.
Hops.-Horses may now be introduced with advantage, for the purpose of moving the earth with the nidget (a kind of scarifier), between the rows of Hops. If the weather be dry the grouud cannot be stirred too frequently; in this month, and in dry weather, labour "tells" most effectually on the crop.

Tearles must be kept clean by the use of the spade if they require it. Both the young plants of the first year, and the nearly ripened crop of the second year, must be attended to in this way

Grass Lands.-All pastures on dry subsoils will require thinning considerably this month ; but on cool subsoils they will carry an equal quantity of stock with the preceding month, and the animals will also do far better. This year, however, the drought is making them as bare as they"were last July. Great care will be needful to regulate the stocking, so far as to preserve the pasture good. Aftermath must not be stocked until fairly grown.
Live Stock.-Towards the end of the month the labour of the horses being easier, their allowance of Oats may be diminished. The other stock receive a continuance of past treatment. This is the month for weaning the lambs, and no better practice can be adopted than to let them remain for two or three weeks on the best of their own summer pastures, or the run of a field of aftermath during the middle of the day, taking care not to give them access to it until the dew is off the Clover. The ewes, on the contrary, must be placed for a week or two on the worst pasture, in order to cause their milk to dry up.
Fatting Sheep may be drafted as they become fat, and sold. All the flock will need very careful attendance for foot-halt-the ewes for disordered udders, the lambs for "scouring." After weaning, lambs should immediately be salved or dipped to rid them of vermin. The ewes should now be removed to the barest pasture on the farm, and kept rather poorly until near tupping time; but bofore doing this, they should be carefully examined one by one, and the aged and faulty ones drafted out, that they may be sold.
On the highland farms sheep-shearing ought to be completed by the middle of the month. Crossed lamber, early dropped, may be weaned now. On farms where no lambs except the smallest are sold, but all are kept either for breeding or for wedders, early weaning is desirable. It not ouly enables the ewes to get into good condition, but the lambs also stand the winter better, if put on their own resources some time before it begins. Those to be kept for stock are earmarked now, and branded on the face, if this is done. If the lambs are kept in a hirsel by themseives during the winter, their ground must be cleared of all stock some time before they are taken to it. Let them be carefully watched at first, in case they break back to their mothers. If they are to graze along with the ewes, keep them at an outside for two or three weeks after weaning, and then allow them to return to the ewes. In some districts heavy loss is frequently sustained among loggs, from a disease called "s sickuess." It has nearly disappeared since the old and young sheep were permitted to graze together. The wedder lambs, whon weaned, are taken for a month to the highest parts of the farm, where the pasture is now in perfection. Those treated in this way stand the winter best. In the meantime, if ewes have grazed the ground where they are to be wintered, have them reasoved, that it may be fresh when the hoggs are brought.

\section*{Notices to Correspondents.}

\section*{EARTH CLOSETS AND COMMODES. \\ (Moule's Patent.)}
manufactured solely by

\section*{WHITE \& CO.,}

29, BEDFORD STREET, STRAND, LONDON, W.C.
The peculiar Adyantages of thrse Closets and Commodes ovrb the ordinaity Water Closet arb:-
First.-That the deodorising material (dry surface earth, or clay, or other subsoil) is the best for the purpose, and at the same time is the cheapest and within the reach of all classes.

Secondly.-The supply of such material to any house or premises may be much easier than the supply of water by a forcing pump, and its remoral after being used may be entirely without offence.

Thirdly.-Its application by the means provided in these Closets is immediate and effective; вo immediate that no offensive smell need escape into the room or building in which they are used ; and so effective that all fermentation and all escape of noxious gases are entirely prevented.

Fourthly. - The expense of these Closets, in comparison with that of Water-Closets, is, as to the first cost, trifling, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are no lead pipes to burst in frosty weather

Lastly:-In all large Establishments, such as Hospitals, Uuion Houses, Schools, Gaols, and Asylums, a very considerable sum may be saved annually in the production of a valuable manure.

The efficiency of these Closets is so great as to be scarcely credible to those persons who either have not used them or seen their mode of action.

Price of Apparatus without woodwork, 25s. per set.
** The different forms of Closets may be seen at the address above; and Prospectuses will be forwarded on application.

\section*{JOHN WARNER \& SONS, London, Manufacturers.}
J. W \(\triangle R \mathcal{N} E\)
and SONS
Fave mach improved the construction of their GARDEN
ENGINES in some important partieulars for this Season.

They may be obtained of the Trade generally throughout the Kingdom at the following prices:-

\section*{GREEN'S PATENT SILENS MESSOR}

\section*{NOISELESS LAWN MOWING, ROLLING, and COLLECTING MACHINES,}
by special appointment.

TO HER MOST GRACIOUS MAJESTY the queien.

as recommended by the judges of the royal horticultural societrs show held july \(20,1864\).
GREEN'S PATENT LAWN MOWERS have proved to be the best, and carried off every Prize that has been given in all cases of competition. The Juages at thr Royal Horticultural Society's Show, held July 20, 1864, swarded them a First-class Certificate (no Prizes were given), and, at the same time, suggested a slight alteration, which has been done, and Messrs. T. G. \& Son consider their MACHINES now as near perfect as possible.

Messrs. T. G. \& Sos beg to state that, owing to the great demand for their MACHINES in past years, they have been unable to exceute orders with that despatel due to their numerous customers, but sure now happy to inform them, that they have made such alterations and arrangements in their premisees, whereby they trut to bo ina position to send off all orders the day they are received.

\section*{PRICES OF HAND MACHINES.}

Packing Cases are charged at the following low rates, viz. : for the 10 and 12 inches Machine, 38. ; 14 and 16 inches, \(4 s\). ; 18 and 20 inches, \(5 s\). ; 22 and 24 inches, 68 . Parties providing themselves with Lawn Mowers are recommended to purchase the Cases in which to stow them away, when not in use, to prevent them from getting damagel: if returned, two-thirds will be allowed for them.

PRICES of HORSE, PONY, and DONKIFY MACHINES, including Patent Self-delivery Box; Cross Stay complete; suitable for attaching to ordinary Chain Traces or Gig Harmess.

The 26, 28 , and 30 inches can easily be worked by a Donkey, or by Two Men, on an even Lawn, the 30 and 38 inches by a Pony, and 42 and 48 inches by a Carriase fome and, as the MACHINES make no noise in working, the most spirited animal can be employed without fear of its ranning away, or in any way damaging the \(\mathbb{I} A C H I N E\).

Both the HORSE, PONY, DONKEY, and HAND MACHINES possess (over all other Makers) the advantage of self-sharpening : the cutters being steel on each ride When they become dull or blunt by running one way round the cylinder, on beversed again and again, bringing the opposite edge of the cutter against the bottom blade, wher the MACHLNE will cut equal to new. Arrangements are made that the eylinder can be reversed by any inexperienced person in two or three minutes.

The above MACHINES are made from the best materials, and of superior workmanship; are delivered Carriage Free to all the principal Railway Stations and Shipping Porth in Rngland; are warranted to give satisfaction, and, if not approved of, can be at once returned unconditionally.

\section*{The (Gatienteg Chromitle}

SATURDAY, JULY 8, 1865.

OUR readers are already aware that there exists an intention to hold in London next year an InTrenational Horticultural Eximbition, which will give English cultivators an opportunity of appearing in friendly rivalry with such of the Ccntinental growers as feel disposed to enter into the competition, and which will give the scientific horticulturists and botanists of the Continent an opportunity of experiencing the hearty weloome with which the Horticulturists of Great Britain have determined to receive them. The movement, we are glad to say, is making very satisfactory progress amongst us; and as the meeting of the General Committee held on Saturday last may be taken to have affirmed the principal features of the scheme, we may briefly state them for the information of those who have not yet given the subject their attention and support.
It has been decided, in the firt place, that there shall take place, probably some time in May, 1866, and most likely in the week falling between Epsom and Ascot races, a Horticultural Exhibition on a muoh more extended scale than
those which we are in the habit of witnessing in this country. In order to give this Exhibition, however, a fair chance of financial success, it will be necessary to extend the time during which it is to be kept open beyond the single day to which our shows are at present generally confined; ard we believe the committee, as at present advised, have fixed on four days as the most desirable period for its contiuuance, and have framed their prizo schedule, which wa hope to see speedily issued, in accordance with this idea. We understand that the prizes are on a most liberal scale, the total amount to be offered considerably exceeding \(2000 l\)., and we can have no doubt they will be heartily responded to at the proper time by our cultivators, great and small, throughout the country. In accordance with the plan adopted on the Continent, and in order to give the meeting as much as possible an international character, the leading botanists and horticulturists throughout Europe are to be invited to take part with our own adjudicators in distributing the awards. We trust that no effort will be spared to make this show a thorough success ; and that the plant-growers and fruit-growers who have won for England a world-wide fame, will make it their business to see that she dots nut. hold a second place on this great oooasion, when the eyes of ali Europe will be directed towards the result.
In order to give the distinguished foreigu botanists and others who are invited to partiopate in the exhibition, aad our own leading men of science, mutual opportunitics of mecting and establishing the friendly intercourse which it is so desirable should exist between those engaged in the same pursuits, and who, though separated by space, are united in purpose, the Committee have deoided to hold both morning Congress meetings, and evening Conversaziones or receptions, the details of which have yet to be settled. It has been however adopted as a general principle, that for the morning meetings, of which probably two will be held, papers on subjects determined beforehand, shall be prepared by emiaent botanists or horticulturists, and that these papers being previously printed in English and Erench, and circulated, shall be read, or taken as read, and a discussion on their particular subjects invited.
Other features of the proposed arrangements are, that there shall be a Banquet, at which the foreign visitors will be entertained, and in which Jadies also will be invited to share; and further, that Excursions shall be organised to places of interest, especially in a horticultural point of view, or that at least an endeavour should be made to obtain free access for our foreign friends to some of the more accessible and renowned of English gardens.
These are in brief the general features of the proposed London International Exhibition of Horticulture, to which we heartily wish success, because it cannot fail, if only it is judiciously carried out, to tend greatly to the advancement of the interests of gardeners and gardening.
In order to its full success, however, not only is it necessary to obtain the hearty co-operation of British cultivators, but also the hearty support of our wealthy classes. Suoh a scheme as that now proposed cannot be carried out without considerable pecuniary aid from those who can well afford to give it, and who we are sure need only to have the object fairly pointed out to them, to induce them to render all the aid of this kind which oan possibly be required. We therefore commend to the especial notice of our readers, both those who are patrons of gardening and those who are themselves occupied in its pursuit, the two subjoined paragraphs from the prospectus which has been issued by the committee :-

That a Subscription List be opened for the purpose of obtaioing the funds necessary to the formation of a liberal prize-list, the erection or part erection of the necessary exhibition building the entertainment of foreign visitors, and for the working expenses of the Exhibition and Congress and that a Guarantee Fund be also entered on.

That gentlemen subscribing Ten Guineas shall be entitled to one dinner ticket of the value of \(3 l .3 s\). ; to one card of invitation to each of the soirées, available for one gentleman and two ladies; and to eight tickets of admission for the openin? of the Show, when the admission by payment will be One Guinea each tioket. Subscribers of Five Guineas, or Guarantors of 50\%, will receive one card of invitation for each soiree, available for one gentleman and two ladies, and four tickets for the first day of the Hortioultaral Show. Subsoribers and Guarantors of smaller amounts will receive in proportion."

We may just add, that a very considerable
number from both the olasses of persons we have number alluded to, have already given the Committee promise of naterial support; and our advieo to promise of "nateriand du likewise."

While the gubject of Varirgatron is recoiving the consideration of our readers and correspondents, it may be interesting to invite attention thas briefly to a brochure" by M. E. Morren, extracted from the Bulletin de l'Académie Royale de Belgique ( 2 me serie, Mome zix. in insts that a distinctiun is discussed. M. Morren insists that a drawn between true variegation resulting from the absence of colouring matter, and that "coloration" which is due to the presence, in the superficial tissuas of the leaf, of faid oolouring matters. It is interesting moreover to notice that a variegated state of the leaves soems to be in sonse measure incompatible with the production of double flowers, the co-existence of the two phenomena not having been hitherto recorded in any wild uncultivated plant. Among the few instances known of plants with spotted leaves and double flowers, are Kerria japonica (a single flowered specimen of whioh, with wholly green leaves, was shown at the late Exhibition at Amsterdam, thus Cheiri, Ranunculus repens, and Tulipa suaveolens.

Theviranus remarked that variegated plants are of slower growth and of 'more stunted habit than others of the same species with healthy leaves; moreover, that they are more sensitive to cold, and flower less freely. This is quite in accordance with the remarks of "F," at \(p .555\), and with the observations of hortioulturists in general. No strictly aquatio plant, it appears, has yet been probably due to the uniform conditions under probably due to the

Sinall atrophied seeds give rise obeasionally to parti-coloured offspriug. This has been shewn in the Colocynth, in Rye, \&e., while Schleiden has recorded the fact that young Bieoh trees whose foliage had been destroyed by slugs, produced the following year spotted leaves.
Variegated plants are usually propagated by means of cuttings, layers, or grafts, and comparatively rarely by seed. In order to make the results more certain, it is desirable to weaken the plant in some way or another, and to remove any green shoots that may be formed as soon as they show themselves. Herbaccous or short-lived plants are more rarely found with variegatel leaves than others; and generally only a small proportion of the offapring inherit the peoularises of this rule Barbarea is an exception.
M. Morren cites the existence of hereditary variegation in seedlings of Barbarea vulgaris, Symphytum officinale, Borago offioinalis, Ligusticum Levisticum, Fsopodium Podagraria, Astrantia media, Veronioa madagascariensis, Ilex Aquifulium, Acer pseudo-Platanus, Celtis australis, Alyssum maritimum, Buxus sempervirens, Salvia Cheiri, \&o.-a list that includes plants of very varied habit' and aflinities, and one, moreover, that might no doubt be greatly extended.
In many of these cases of hereditary variegation the edges of the carpellary leaves bearing the ovules were discoloured ; and hence, says M. Morren, one reason why the new plants produced under such circumstances, are peculiarly liable to inherit the characteristics of the parent, and why greater constancy is displayed in oases where the variegation affects the borders of the leaves in contradistinction to the disc. The inflinence of the female element is greater than that of the male in perpetuating varie ration ; and not only is the mottling of the foliage thus handed down from parent to offspring, but also the particular kind of varie-
gation. These eiroumstances, bays M. Mornen very justly, lend sapports to the theory of Atavism.
- Thr late Mr. CANTY, whose death took place a short time ago in Norton Street, Liverpool, enjoyed an extensive practice as sargeon in that towns where le was much esteemed by all who had the pleasure of his acquaintance. Alchough his house was hare been supposed to offer little encouragement to horticultural pursuits, Mr. Canty contrived to erect three Orehid-L ruses, of different temperatures, in his haele yavd, where a laige number of valuahle plants were successfully cultivated. S.mne of these have already been figured in recent botanical works. Had Mr. CANTX of making furt would no doubt heve had the satisfaction of making further contributions to the science that he Bruxellics, 1Soj. Pp. 13.
loved so well, for shortly before his death he received other parts. These are now the property of his son, other parts. These are now the property of his
who happily inluerits all his father's love for plants.
-An Exhibition of Window and House Gardenriva by the working classes is to be held at the Gardens of the Royal Horticultural Society at South Kensing ton on Monday next. The Society has appropriated 50l. to be distributed in prizes. A Committee, which has been formed to carry out chis of ect, which they have every reason to believe will be induced to do so from the interest felt in the matter by the parochial clergy and others, a sum of at least 4000 . Whl be required for this purpose. For this sum the Com mittee have been making an appeal to those who have the social and moral good of the working olasses at heart.

We are glad to see that the subject of Sompiers' Gardens is receiving official attention. A War Office return shown that in the military districts of Great Britain and Ireland 48 acres of garden ground have been allotted to troops, and 61 acres to individua non-commissioned officers and others. There is much more, however, yet to be aecomplished in reference to Soldiers' Gardens.

\section*{New Plants}
298. Cipriprotum concolor, Parish M8. Bahmam in Bot. Mag. t. 5513.
(Acaulia corifolis tessellata) pedunculo puberulo unis. bfflowo, bracteis ancipitibus aontis phlosulis ovarise pilosis breviorihus. soples minutisolmo bidentato, petalls ellipticls obtusis, Isbellit sacco ootio libero retuso, ceterum amplo obtusato, laciniis posticis lato falcatis in ostio saleai abscouditis,

The history of this plant is as yet recent. It was discovered on Feb. 13, 1859, on limestone rocks n Burmab, by the Rev. C. S. Parish, who sent a drawing of it, which we were kindly allowed to
 We also saw at Kew the very nice reppeneutating
of the plant, which was prepared for the Bothiel Magazine, and has since been published. Rchb. fit

\section*{GENERAL FLOWER-BEDDING-NO IH.}

There is a wonderful charth in variety, and that o place where a little forethought is not capablo developing it in a greater or less degree. It han bee considered that the prevailing taste, and a cerlais
necessity of attempting to meet this in the necessity of attempting to meet this in the ratia
patterns and forms of our ribbons and beds, reat measure excluded variety from gardens, but these cffer no sufficient reason why it abrould not be found beyond the limits of the furmal ganden There is a certain extent of ground and shrabbem attached to almost every place, varying acerding to its size and pretensions, in and amongst which time is always the means of introducing, at shelterat points, a portion of that variety which we are anxion now to recommend as giving an immense anomet additional interest to a garden establishment.
Let us take a point with plenty of shrabs over-much sun. How pleasant to drop upon a litte round clump of Eucharis amazonica, with here and there an expanded truss of its noble white flowers a opon a similar group of the beautiful.leaved Begonian of Neriums, or of Agapanthas umbellatus ar, if the cion tion be more shady, of a good group of the besutice Convolvulus major, rambling up stakes similar to Pm or a round column of Gourds, with their curions and ia many varieties beautiful froits. Some of the Sohrams too are pretty, and may now be had in great varie! and there are Daturas, and such-like things avalabia. There are no doubt parts of England in which al' thee
may not succeed, but some of them will everywhere, If may not succeed, but some of them will everywiere, If the material, such as short Grass, horse droppings, leave \&a, into the ground before they are planted.
no use planting them in the cold ground. Their rase cannot penetrate our heavy ungenial earth.
where the sun never comes, how beautiful to find a buh of Polypodium aureum, with a good edging of Lremod, or the ground covered with some low grow
Pteris, that can always be sown beneath the stage in a cold house, and lifted in patclies. Tien is also great variety to be gained
out or plunging in sheltered and appr.pr. places such plants as the Chusan Paim,
Australian Palm, \&c. Their effect is surp. and without detracting at all from the \(p\)
portion of the general bedding arrangen
which they would be out of place, the
thus used, great additions to any grounde.
We really make very little use of the fine s
in many instances, noble introductions, years. Let us instance thee wisme. whill enable im persons to have them grouped in shated fia and against architecture how grand their elfer The moving them in and out at stated perich attentions to half-hardy plants. The gresi poin consider is to keep them from whis Her may even in some sense take a florty w Nature, and imitate what we may imay occur in their native wilds when a tap gets broken off, viz, that some kindy
examine, to Sir William Hooker, at also a wild flower, dried Feb. 1864. Both show, what we have long since nown, that well-managed Orchids are often much finer in our stoves than in their original habitats More than a year since Messrs. Low \& Co. imported living plants, under the name which we are anxious to see attached for ever to the plant, from It is a little plant with the well-known glaucous green leaves of old C. venustum, spotted purplish beneath, and covered with dark green markinga on the upper side The fower itself, standing often two together on a short hairy peduncle, is very large for so small a plant, measuring nearly 5 in. in circumference. It is very distinct from all the related species, in having elliptical blunt petals, such as are found in the American plaited-leaved species, C. spectabile, and passerinum (though not so broad). The colour is a very pallid ochre-yellow, with nany little dart purple specke, most aggregated cowards the middle line of both sepals and petals. A
dark yellow stain marks the centre of the staminode, dark yellow stain marks the centre of the ataminode,
whose posterior limbs are purple. Let us add that the sepals have a copper-brownish hue outside. The species bas neither the showy colours of Cypripedium Hookerw, nor the curious forms of C. Lowii, Stonei, or phitippense, and yet it is so very striking that it must be admitted to every collection. No doubt, as Mr. Bateman so happily suggested the other dny, those who have no space for a general collection of Orchids, may at least grow the Cypripedia.
We have to present an apology to our excellent friend and correspondent Mr. Stuart Low. Let us be candid: we suspected from the leaves alone that this species was nothing bat a variety of the old \(C\). venustum. Now we are glad the flowering plant has shamed ns for having formed this opinion. The first blossoms borne in Europe were produced in the garden Wh S. Rucker, Enq., under the care of Mr. Pilcher, at t with J. Day. Feq and we boon reprab ind flowers, both obtained through the kindnese of Mr. Day.

had ben the principle 1 am attempting to inculcate Reichenheimii would have refused to yield, under my reatment, 60 ff wers to the spike; nor would a plan of O. Pescatorei have produced 100 flowers, which have
kept in perfection the last 18 weeks; por would the equally rare \(O\). cordatum have grown to a size to produce 24 spikes, each averaging 12 flowers, just now in the height of beauty.
The great majority of the more rare and valuable Odontoglots evidently belong to what one might call a alpine region, and that too in proximity to the oquinostial line. There will be therefore less variation of temperature in that region than in any other very much qualified by air currenta, which must exiet at the altitude where the plants are found. It has always been the writer's opinion that want of success in the cultivation of the plants in question was more attributable to summer than to winter treatment because for four months the pseudobulbs were so dried and shrivelled up in a high and dry heat that no skilful after treatment could induce them to become plamp. The young growths are proportionately affected by the sluggishness or partial cessation of the supply of juices which the pseudobulbs are continually giving out to assist the development of fresh leaves and bulbs, and consequently the vitality of the plant is impaired. Let it be thoroughly understood that this is not influenced by the want of nutritive matter at the root, but is simply and solely the want of sufficient humidity in the atmosphere, aggravated as it generally has been by the presence of too much heat. Orchids are so totally different a class of plants from any other, that one requires to be expliait on this point, else some people might suppose that if the vitality of the roota was unimpaired, the leaves, \&cc., would beright enough. The contrary is the fact; for the leavell and pseudobulbs are offen all but irretrievably ruined when the roots are in good condition. It is absolutely essential, therefore, fo phere for each kind of plant, whether coming from that extensive hilly range in the interior of New Granada, or the low and flat districts of tropical India.
The difficulty in keeping some of the more doice Odontoglossums cool enough in suoh a hat summer a this is apparently proving itself to be, is so great that I am not surprised that our Continental brelluren have so miserably failed in ever getting them to put on a respectable appearance. No amount apparently of artificial moisture and judicious ventilation, with their extremely hot sun and arid atmosphere, oan keep up the requisite supply of humidity to prevent shrivelling of the bulbs. I have had the greateat difficulty limagin. able in this way with Odontoglosenm Pescatorei. find it to be the most difficult of all the "cool" plants. The bulbs on the Meadow Bank plant are quite the size of those of O . grande, but what with 13 weeks support of 100 flowers, and two vigorous yolang growths, the demand upon the energy of the plant was almost out of proportion to the supply. I stick to the invariable rule wisely promulgated years ago (by whom I do not know) of having the bulbe and leaves of every Orchid dry during the meridian heat of the day. It is one of the zolden rules of Orchid practice, and let it be widely and gene rally known. How to obviate this shrivelling tendency ongaged my attention for days. I have axperimented upon dozens of plants, some to good and some to mo good purpose, but to experiment upon an unique plant almost worth its weight in gold, incurred a responsibility of the gravest nature. I revolved to apply a stimulant in the shape of a little liquid manure any material damaze, if the roots refused to absorb the ammenia with which it was charged. To my great relief and joy I maw, after the space of eight days, that it had a beneficial effect ; and I have since repeated the doses fortnightly, and the plant is more luxuriant than ever. However, no haphazard appliances of this kind must be resorted to. So lons as a plant is doing well, when it requires to be re-potted, or re-basketed or re-blocked, do not disturb the conditions which have componded auccess aforetime; by 11 means lot after manarement be ae similar a passible, for experience has taught mo that I have had more lousen than gains by attempting to improve the conditions of a plant that was doing woll.
Now, and not during winter, is the time to keep what are technically called "cool" Orchids cool. Ventilation should be thoroughly efficient during the day, and partiel daving the night Moiature whould be applied in abundance both mornings and evenings, so that leaver and psendobalbs may be thoroughly charged for the heavy perspiration that is going on daring the day shading from the sun's rays is also equally necessary though enbodued light is of much coneequence toward induoing solidity of bulb. James Anderson, Mfoadow

\section*{Bans.}
[HARDY ORNAMENTAL PLANTS.-NO. I.
If in, I believe, generally admitted that come modia cation of the monotony of our fiower gardens by th introduction to them of a fow graceful planta, is, to say the least, desirable; aud rerdure and beauby of form and thee a littio more the charms of the flowerin plants which must'always be the important feature of
flower garden. One or two of your correspondent have discussed this importaut question iucidentally by drawing comparisons lietween the "old mixed border and the parterre," and of course award the palm to the latter.
Now, as the worst bedding arrangement conceivable is better then the old mixed border, as generally managed, and as nobody ias for some years at all events, advocated the claims of the old mixed border against those of the popular system, this mode of reasoning on the subject is very like building up a
house of cardboard for the knocking it down again.

The question, if fairly put, is a very nimplo one: Is it, or is it not desirable to add more beauty of form to our flower gardens by introducing to them a few good plants of elegant habit, flowering or otherwive, so as to allow of a little more freedom and beauty of loat to "set off" our brilliant Pelargoniums, Calceolarias \&c., with greenness and grace-either iutimately asso ciated with them in the beds, or otherwise? I believe the general answer to this would be " yea, if it can be done well." Then who shall may we have not the plants to do it well?
Mr, Gibson has clearly shown at Batterses what aro the capabilities of our house plants in this direotion. When discussing his arrangement ins that mauy hardy plants might be used with the best effect, and that in fact it would be possible to have some very charming effeots without the expense or trouble of wintering and protecting. Some of the "sub-tropical" plante, such as Aralia papyrifera and the Castor oil, it should be borne in mind, are to be raised in quantity almost as easily as bedding plants themselves.

The euitable hardy planta ave of variom typen of character. I aball bagin with a fow of Fern-like lenf and aspect.
If Adiantum cuneatum oould be grown in "the open as freely as Stachys lanata, what a beantiful scarcely oil be tor to scarcely call him clar or ingenious who falled to uso pound a nostrum for so growing this boautiful and popular Fern, but we have a plant which bears it as strong a reecmblance as it is possible for any not a Fern to do (indeed I am not sure that there is another Fern so like it at first sight), a plant moreover which is as hardy an a paving stone, and will bear any amount of wind, eun, or exposure-Thalictrum minus. It forms compact, roundish bushes, from a foot to 18 inches high, very symmetrical, and of a slightly glaucous hue, It is a British plant and may be grown in any soil. It requires oue little attention-to pinch off the slender flower stems that appear in May and June, and that is all. Not alone in its aspect as a little bushy tuft does it resemble the ".Maidenlair Fern," as A. cuneatum is often called ; but the leaves are almost pretty enough to be passed off on the uninitiated, when mingled with flowere, for those o the Fern; they are atiffer and move lasting, and well suited for mingling with vases of flowers, \&c There are probably several "forms" or vars of this plant, some of them, it may be, not answering this description, but I have the plants from which it wa taken, and they may be propagated to any extent Within the past few days they have been shown to Mr. Williams of Holloway, and other cood plantsmen, who fully agree with me as to the merito of T. minue.

Quite distinct in habit, and far more beautiful in leaf, is Tanacetum criapum, with gracefully bent leaves, cut as fine and looking gs beautiful as those of Todea superba and groen as an emerald. It is as free growing and hardy a subject as any in our gardens; it does best fully exposed, and probably the only way in which it can be benefited after planting - in doep and rather moist soil it is bent, bat will grow "anywhere"-i by thinning out the shoots in spring, so that each remaining ons hall have free room to suspend its exquisite leaven thinned thus, it looks much bettor than when the stems are crowded, and of course, if it is done in time they attain more individual strength and dignity.
Artominia annua is a plant which has lately come out with a high ohmractar from the meedsmen for it groefulnese, and it is an elegant plant as far as I can judge, but quite inferior for distinetion or beauty to dither of the foregoing, which bave the additiona advantage of being perennial.
Meum athamautioum is one of the moot elegant and gracafully cut plants in an order second to none other for these qualities. The leaves are divided so finely a to appear as if they were made of vegetable hair, and the plant is dwarf and neat in habit, from 6 to 12 inchee or thereabouts; easy of growth in ordinary soile, and perfectly hardy and per gial. It is probable that in dry seasons it might so ofl to but for rockroction with autumnal flowering piante, but is invaluable as a mixed arrangoments of
Dielytra eximia is a dwarf and nently habitod plank with a dense and very graceful leafage, far more so than any other plant of the order in cultivation, and thaluable as flowering plant too, an the brightly coloured flowern remnin on for a long time in spring and early summer. It generally grows from 12 to 16 inches high.
To go attop highor, fow plants are more gracoful
than the best Ferulas-glauca, Ferulago, and tingitana; they are very noble ohjects in any position, but most suitable for such an arrangement as that at Battersea or the margins of sbrubberies, \&c., for though very beautiful in summer they would probably go off much too soon for the continuous growers of the flower
garden. But no doubt the leares of these and of other Umbelliferous plants might be improved and much retarded by pinching off all flower stems as soon as they appeared. W. Robinson.

\section*{Home Correspondence.}

Strawberries.-I believe, with you (see p. 578), that the failure of the Strawberry crop has been general but not universal. Here it has been very good. I have and country people since Whitsunday, beginning with Sir Joseph Paxton. They are still plentiful. Eliza (Rivers') is still the most successful; Wonderful and Eagenie are not yet exhausted, and have borne fine crops. Your occasional Correspondent, Mr. Adolphus Kent, came here on the 26 th of June, and I had three good sorts intact for him, besides as many of the three preceding as he was pieased to eat, namely, John Powell, a seedling of my own, and Frogmore Late Pine, all delicious sorts; also some Scarlet Pines, extra delicious, and the highest flavoured and most Pined trawberry that bas ever been here out of more than flavoured sorts here except the old Pine, and not one of them is equal to the Scarlet Pine, kent out, I believe, by Dr. Roden. There is no difficulty whatever in accounting for the general failure among Strawherries.
The spring frosts cut off a great many blooms and frosted the stems of some that were set beneath the berry. Still this is not the whole cause of failure. People did not water their plantations during fruiting time last year, nor after fruiting. Hence, with the eart I watered mine abundantly during fruiting last season, and close after cropping I cut off what runners there were, and covered the straw with hlack dung, and watered the plantations copiously. They then made new crowns, established new roots, put on new leaves, which got hardened before winter came, and shot the wet off the crowns and roots, and prevented Zero from doing any mischief. Hence, with no end of water, I have had, notwithatanding spring demolitions, most abundant crop of fine Strawberries in chalky soil. The Frogmore Pines came out after the severe frosts were over, and they have swelled every berry. They are a fine crop. This variety bas superseded all late sorts. When ripe it looks like crimson and gold. Eliza, taken at all points, is still the best Strawberry in Eng. land. She has always been my friend, and also that of
the public. I have never meen her, year after year, put out by anything. W. F. Radclyffe, Tarrant Rushton, near Blandford, Dorset.
The late Sir Joseph Paxton.-The Daily Telegraph has told us that the late Sir Joseph Paxton was not a man of genius, and your correspoudent "F." (p. 603) gives him " more credit for tact than talent." Tact ho undoubtedly possessed in a large degree, but surely he are usually applied the words "genius" and "talent." Let me ask what is genius?-what is talent? In fined:-" Genius is applied to the nature, the natural powers or faculties of a man; the powers or faculties with which he is born. The natural bent, disposition, or inclination of the mind; the power or faculty which bears or bringe forth or produces, \&cc." "Talent, the mental wealth or strength; or means or powers of, or skill in aequiring or atttining; faculty, ability, or capa-
city of mind." Tried by these tests I think it must be admitted that be possessed some genius and much talent My acquaintance with the late Sir J. Paxton commenced one year prior to the foundation of the Gardeners' Chronicle, 25 years ago, and one point in his character strong'y inpressed me from the first-an
honest iadependence of mind, combined with a natural politenesf, which never degenerated into servility, that lowest of human acquirements, too often assumed for the nonce to gain a sinister end. In this I believe consisted his true nobility of character, and this probably contributed largely to his success in life. While on this topic permit me to suggest that a committee of horticulturists and others who appreciated his labours, Bbould be at once formed to raise a suitable memorial to his
memory. There cannot be a more fitting place for it than the grounds of the Crystal Palace. I know many horticulturists and others who would gladly contribate their mite in recognition of the services of one whose genius and talent has shed a lustre over gardens and gardening, and the Crystal Palace Company will miss a grand and legitimate opportunity of doing honour to the memory of the designer of the beautiful structure powerful influence in aid of the scheme. William Paul, Waltham Cross, N. [Hear, Hear.]
Chiswick Garden.-It was wilh great pleasure y saw some months back an advertisement for a Superby some excellent and encouraging remarks by yourself, eve of great readers to believe that we were on the pleasing reminiscences of the old place induced me
lately to pay it a visit, as I had not seen it for some years. The collection of fruit trees, no doubt the fivest in
existence, are in admirable condition, and do the veteran Thompson great credit. The houses, on the whole, were in tolerable condition, but crammed to excess with bedding stuff for South Kensington. The Vines in the arge Conservatory were on the decline, and I only wonder they have lasted so long. As for the vegetable or market garden department, the less said the better
The once fine arboretum and grounds are in a state The once fine arboretum and grounds are in a state that would disgrace any nursery garden : the shrubs
and everything of value that could be moved have gone; and though years bave elapsed since they were taken, time bas not yet been found to fill up the holes made by the Horticultural Exhibition to be held at South Kensington next year, will bring the principal Continental horticulturists to this country and as the great name of Chiswick will cause many to visit it, it is high time that it was put into a state fit to be seen. The fact of the Exhibition in question being held in connection with the Kensington (iardens, may be the means of redeeming the Society rom the bad name it has got with horticulturists. An Old FES
Wasps.-Surely your correspondent "Excelsior" (see p. 580) cannot be in earnest when he tells us that we should protect and preserve wasps \({ }^{3}\) rests. I am
afraid if such pests were preserved that gardeners would find it a matter of no small difficulty to send a dish of sound ripe truit to their employer's table mean of course ont-door fruit, as there are means, although often difficult of application, of preventing wasps from entering fruit houses. Out of donrs the havoc they make among fruit of all kinds is well known. I do not dispute "Excelsior's" information that wasps devour insects of many kinds, as 1 myself can testify, but the good they do in that way will never compensate for the fearful destruction they make in our fruit crops, and I am sure that every grower of fruit will do well to persevere in destroying every wasp and wasp' nest he can discover. The mischief they commit promises to be even worse this year than last, as there
was an unusual quantity of large wasps about during was an unusual quantity of large wasps about during the months of April and May. G. IV
Table Decoration.-Will you allow me to offer a few remarks on the table decorations lately exlibited at South Kensington? The matter, as was to be expected, has become a contest between tradesmen, and -I wish to hint to them that comfort, convenience, and practicability are just the points not to be iguored but to be considered. In the country flowers can be got easily enough, but people do not want them on their plates, in their finger-glasses, or their napkins. And in London, where they are made up with wires, fingered in the process, and consequently dirty, the idea is the reverse of refined. A few Pelargonium petals in a napkin may spoil an expensive dress, and glutinnus Water-lilies in a finger-glass would prevent your using it. People who give one or two parties in a year might go through the labour and expense of covering the table with metal troughs of various shapes filled with small cut flowers, but trouble of this kind cannot be taken often, and the apparatus is too cumbersome where the result is so perishable. Some of the tables were so covered that if you had taken a glass up you could liardly have found a place whereon to put it down again; and others so dotted over with specimen glasses and cut flowers that no one could have reached anything from the table without knocking them down like ninepins. Many persons suffer even from the smell of a moderate quantity of flowers What would be the fate of such at one of these over-
whelming floral displays? I think every one must have been satisfied that the lst prize was rightly awarded. But oh! the trouble and inconvenience of set of plates each with three holes for three water vessels for as many flowers! Flowers are always in the way upon one's plate, even if no earwige and spiders come out of them. Real good taste is always compatible with comfort, and without good taste there can be no true elegance. I do not offer these remarks ill naturedly, but it seems to me the largest quantity of glass or china, combined with the largest quantity of flowers, is not what the proposer of these prizes had in view. A Lady Reader who heartily loves Flowers.
Roses.-As regards these, Lord Macaulay's native colour is rich glowing crimson: it, however, some times becomes very dark. It is a highly improved substance, fuller in the centre, and of er habit. The growth and foliage are good. It will stand sun well for two or three days, showing the value of substance. Lord Clyde is exactly like it in growth and foliage, and is also of great sabstance. It is glowing scarlet crimson, and does not alter it coloar. Lord Herbert is blooming bere; and though beantif good for substance, is full, well folded, and Teautifuly formed; its growth and habit are good. These are three worthy Roses. The following are also hret-rate and good in every respect, viz., Madame Victo Verdier, Pierre Notting, and Rushton Radelyffe, of which I have six plants in full and beautiful blonm These are fine and well worthy of adoption, as are like wise La Duchesse de Morny, and the two crimson purple Roses, Eugene Verdier and Baronne P. de
time, the pick of 1864 and 1865 . It will, bowere Rose in any family. W. F. Radclyffe, Tarrant Ruching

Roylar Bonamio, Regert's Parix: July 5 (Third equal to it it as this Society is concerned, was quite Trait, which predecessors, more especially as regards
}

Brownlow. It contained Muscat Mrd Sage, gr. to Earl Grapes, good Peaches and Nectarines, a Queen Pine Apple, Bigarrean Cherries, Brown Turkey Figs, a hasbrid Orion Melon, and British Queen Strawberries. Mr. Miller, gr. to the Earl of Craven, furnished beautiful Trentham Black and Musent Grapes, a Queen Pine-apple, British Queen Strawberries, Violette Hâtive and Grosse Mignonne Peaches, and Combe Abbey Hybrid Melon, an extremely well- flavoured variety, with a skin as thin as that of a Peach to Lord Palmerston, who had well-grown Queen and Providence Pine-apples, Black Hauburgh and Muscat Grapes, fine Gallande Peaches and Eiruge Nectarines, charming Black Circassian Cherries, Crimson Queen Strawberries, and a Windsor Prize Melon. From Mr. Bannerman, gr. to Lord Bagot, came Black Hamburgh, Golden Hamburgh, and Mnscat Graper; a Queen Pine-apple, Golden Perfection and Hybrid Cashmere Melons, Elruge Nectarines, and Royal George Peaches, and British Queen Strawberries. Mr. Dawson, gr. to Earl Cowper, contributed a Providence Pine-apple, White and Black Grapes, fine Violette Hâtive Peaches, and Downton Nectarines; a Scarlet Gem Melon, and good examples of Frogmore Late Pine Strawberries.

Pime-apples, - These, though not particularly remarkable as regards weight, were both numerous and good. Mr. Barnes, of Bicton, furnished several Queens, ripened out of doors, where they are placed immediately after flowering. Mr. Barnes states that specimens their size, than kinds ripened in-doors, to which they are quite equal, and in some instances even superior in flavour.

Grapes.-The glory of these was a bunch of Black Hamburgh shown by Mr. Meredith, of Garstorn, near
Liverpool, weighing no less than 9 lbs 8 oz . It was Liverpool, weighing no less than 9 lbs .8 oz . It was
shown stalk downwards, aud had six shoulders, each equal to the size of an ordinary buuch, the whole forming quite a pyramid of jet-black berries covered with a beautiful bloom. To Mr. Meredith, therefore, belongs the merit of having shown the heaviest bunch of Black Hamburgh Grapes yei recorded, and the judges marked their sense of his marvellous success by awarding him the highest medal at their command. The same exhibitor had also the best Trentham Black ever yet seen, and wonderfully fine Buckland Sweetwater, but to R. Sneyd, Esq., had splendid bunches of Black Prince, Black Hamburgh, and Meredith's variety of Black Alicante. From Mr. Osborne of Finchley came Black Hamburgh, Buckland Sweetwater, and Snow's Muscat Hamburgh, the last large and finely coloured. Mr. Allport, of Doddington, Cheshire, contributed very fine Black Frontignans and Ingram's Prolific Muscat, the latter bearing a striking resemblance, both in size of bunch, berry, and colour, to the former. Muscats were still green, the ripest of them were only just beginning to change colour; but of Backland Sweetwater we noticed several bunches with that bright rich golden tinge which it is highly desirable to find in Muscats, but which on this occasion Lane, who of late years have exhibited excellent Grapes, had fine examples of Chavoush, a new and promising white variety. Mr. Pottle, gr. to B. D. Colvin, Esq., had extremely well-grown specimens of Biack Prince, three bunches of which weighed \(9 \mathrm{lb}, 50 \mathrm{oz}\); they were not, however, quite in perfection as regards ripeness. Three very fine bunches of this Grape were also shown by Mr. Hill.
 Henderson, \(; \mathbf{8 ,}\) Mr. Wallis.

Peaches and Nectarines.-Thess were good; but in many instances small. Among Peaches we noticed a dozen fine fruit from Mr. James, gr, to the Duke of Leinster, and a good basket of Nectarines from Mr.
Masters, gr, to the Earl of Macclesfield. [The varieties of both of these kinds of fruit did not differ from kinds shown in former years.
Awards.-Four dishes of Peaches: 1, Mr. Allen; 2, Mr. Hill

 stone, \(\mathrm{Lsq} ., \mathrm{Mr}\). Knstone, and Mr. Budd, gr. to Lord Darnley.
Melons. -These were for the most part deficient in
flavour, a circumstance probably attributable to injured foliage through red epider, which during the late hot
has been unusually troublesome in many A wain,
worth,
fleshed:
Hodes J. Duak-

Plums.-The best of these were Jeffirson and Victoria, the former of which came irom Mr. Robins, gr. to Sir G. Kerrison, Bart. ; and the latter from Mr. Ingram, gr. to J. J. Blandy, Esq., of High Grove, Reading.
Rigs.-Among these we nuticed Brown Turkey, Lue's Perpetual, and White Ischia.
Avoards.-1, Mr. Orman, gr. to R. Holland Esq. ; equal 2, Mr. Che, gr. to Earl Howe, and Mr. Hutt
Cherries.-These were shown in excellent condition, looking kind. We also noticed large black, attractiveand Black Eacle also noticed Knight's Errly Black Bigarreau were conspicuous white sorto Elton and

Strawberries. - These consisted of Filbert Pine, Admiral Dundas, Bicton White, Sir C. Napier, Iitile. man, Enppress Eugenie, Eleanor, Goliath, British Queen, Sir Harry, and Crimson Queen, all good, more especially the four frst-named kinda.
4, Mroviks.-1, Mr. Bailey ; 2, Mr. Widdownon ; 8, Mr. Budd ;
Miscellaneous Fruit.-Under this head may le classed some Raspberries, Gooseberrics, and Red and White Currants, from Mr. Masters, gr. to Earl Macclesfield; and Mr. Lynn, gr. to Lord Boston; Prince of Wales Raspberry from Mr. Cutbush; and two good dishes of Raspberries from Mr. Young, gr. to R. Barclay, Esq.
Orchids. - These were not so mood as they were
Orchids. - These were not so good as they were at
he last show held here. Among them were Cattleya crispa, with white sepals and petals, aud singularly crimped lip; C. superba with five blooms on it; C. Harrisonix ; a fine Brassia Henchmanni, green, spotted crispa, and the rare Acrides Schrüderi, Trichopilia crispa, and the long-tailed U ropedium Lindenio These
came from Mr. Bullen, gr. to A. Turner, Esq, of Leicester. From Mr. Page, who showed in the class of 20 kinds, were Cypripedium Stonei, Phalmnopsis rosea and nthers, and fine examples of Saccolabium Blumei. In a collection from Mr. Peed, gr. to Mrs. Tredwell, was the same finelydiam sessile prccuced at the show hel June, still in beautiful conaition, and the yellow Penny, gr. to H. H. Gibbs, Esq., stood first in groups Penny, gr. to H. H. Gibbs, Esq., stood first in groups
of 12 with a fine collection, in which were Anguloa Rackeri, bearing five blooms; Aerides Lobbii, with fine branching spikes; Cattleya Mossix, and the new clear yellow-coloured Trichopilia picta, which promises to be a valuable acquisition. From Mr. Wilson, gro to W. Marshall, Esq., also came Trichopilia picta, finely in flower; the charming terrestrial Cape Orchid Disa grandiflora; Anguloa Ruckeri, with six clear yellow blossoms on it; Cattleya Schilleriana, with dark velvety sepals and petals, and purple lip; Lelia purpurata; and various fine varieties of
Bearded Lady's Slipper. Mr. Wiggins, gr. to Walter Bearded Lady's Slipper. Mr. Wiggins, gr. to Walter
Beck, Esq., contributed Cypripedium Veitchii ; the yellow-stained white Cattleya Wagneri; Dendrobium tortile, with pale lip and singularly twisted sepals and petals ; and Cypripediam Hookerx, with six blooms on Dendrobium Farmeri, with orange and cream-coloured flowers; the rare D. Dalhousianum ; and Epidendrum nemorale majus, with long narrow pinkish lilac sepals and petals, and crimson-veined conspicuous lip. In small groups was a plant in bloom of the Chinese Renanthera coccinea. This came from Mr. Hill, gr. to R. Hanbury, Esq., The Poles, near Ware. The sanc exhibitor also sent a well-bloomed Calanthe veratrifolia, From Mr. Ingram came the beautiful Cattleya superba; Mr. Whitbread sent some good Vandas, and Laelia purpurata'; and Messrs. Jackson \& Son, Stanhopea oculata, and varieus fine Cattleyas and other plants,
 Mrs. Smith. 6: Mr. Mill; ; Mr. Ingram ; 3, Mr. Whitbread,
gr. to H. Colyer, Esq. 4, Mr. Wheeler, gr. to J. Philpot, Esq.
(Nurserymen): 1 , Messrs. Jackson.
Stove and Greenhouse Plants.-Of these there was the usual display, enlicened here and there with wellflowered Kalosanthes, than which nothing can be more useful for autumn work. Allamandas, Stephanotis, and Dipladenias are also still charmingly in bloom, as are likewise Ixoras, both white, red, and orange; Mussenda frondosa; Clerodendrons, and Hæumnthus puniceus, the last with 16 fine heads of orange
blossoms. This came from Mr. Ingram, gr. to J. J. Blandy, Esq.

Fine-foliaged Plants.-Some admirable groups o these were exhibited, especially one from Mr. Baines,
gr. to Horatio Micholls, Esq., Bowdon, Cheshire, and gr. to Horatio Micholls, . Esq., Bowdon, Cheshire, and
another from Mr. Veitch. In that from Mr. Baines were
magnificent example of Alocasia metallica and macrorhiza variegata, the last in splendid health ; the stately Theophrasta imperialis in glorious condition; Caiadium Lowiil (see p. 580, 1863) unusually fine, the leaves of the deepset green, prominently and beautifully veined with white: Gleichenia Spelnncæ, and different kinds of Ferns
Mr . Veitch furnished Crotons unusually fine in colour a graud Theophrasta imperialis; the marbled stemmed Alocasia zebrina; Pandanus javanicus variegatus Ferns and Palms. From Mr. Yates' garden at Highgate, came various species of Zamia and Encephalartos, Dion edule, Cycas revoluta, Marantas, and the Rushlilike Littra juncea. In other groups we noticed
the beautiful red-veined Gymnostachyum Verschaffeltii, the beautiful red-veined Gymnostachyum Verschatfeltii,
wonderful bushes of Croton angustifolium, Anthurium leuconeurum, with large white-veined deep green leaves the handsome Maranta Porteana, Iuccas, Palms, Dracman, and Ferna,
Swarde-10: 1, Mr. Baines : 3, Mr. Taylor, gr. to J. Yates, Teq. ; 3, Mr. Ingram, gr. to J. J. Blandy, Maq. ; 4, Mr. Young;
E, Mr. Carr. (Nurbergmen) Mo: Mr. Viltch; 2, Mesars. A.
Henderson; 3, Mr. Bull ; 4, Mr, Mhodes.
Ferns.-Beautifal collections of exotic varietiles came from several growers, and after the fatigue of a warm summer's day, a look at their healthy deep green leaves was quite refreshing. Mr. Bull, Mr. Willians, and Messrs. Henderson had each charming groups, which were also contributed in beautiful condition by from Mr. Barnard, gr. to J. Taylor, Esq., and Mr. Young, gr. to H. Stone, Esq. The sorts were not different from kinds shown on former occasions but being for the most part large in size, the effect Messrs. Ivery, of Dorking, came a very fine collection of British Ferve, consisting of fine varieties of Athyrium, of which they por different kinds, Polystichums, Aspleniums, Lastreas,
Polypodium Dryopteris, and one or two varieties of Royal Fern.
Awands-12 Exotic Forns: 1, Mr. Bull ; 2, Mr. Williams
3. Messrs. A. Henderson. Amateurs, : Mr. Barnard; 2 ,

Fuchsias.-Of these several collections were shown, consisting of tolerably well-grown, moderately-sized fairly-bloomed plants, but our exhibitions of these want better and younger plants of newer sorts.
 Fiast Greenwich.

Pelargoniums-Ordinary kinds and Fancies were shown in good condition for July, and there rather Zonal varieties. Of ordinary kinds Mr. Fraser had Pericles, Lord Clyde, Royal Albert, Bacchus, Bessie, Marabout, Desdemona, Festus, Perdita, Landseer class Mr. Bailey had Malle. Patti, Etina, Pericles, Guillaume Severeyns, Desdemona, Beadon, Royalty, Conflugration, Regina furmosa, and Scarlet floribunda,
Of Fancies, Mr. Fraser had Hebe, Miss in her Teeng, Cloth of Silver, Madame Sainton-Dolby, Bridesmaid group of the newer kinds Among Scarlets, the Mrs. Lermitte, of Finchley, we noticed Eugenie Mezard, salmon, edged with white; Tom Thumb, Rubens, Scarlet Globe ; and Mr. Martin, Mr. Bull, and Messrs. F. \& A. Smith, had charming collections of zonal varie ties, among which Orion, a new salmon kind, received a Certificate. Mr. Wm. Paul furnished fine examples of his new Nosegay sorts, and Messra E. G. Henderson and Messrs. Saltmarsh each showed a group of tricolor leaved sorts.

New Plants.-These were not wo namerous as they were on the last cccasion. Fuchnis Enoch Arden, a good dark variety, with a large wide-spread corolla Hendervon \& Co. came a pale yellow variegated variety of Gardenia florida and othar plante. Mr. Geo. Smith had Gronde, of which mention has already heen made in our columns. From Mr. Yeitch came an in teresting group of plants, in which were Rhodo the Umbrella Pine (Sciadopitys Princess Alexandra some Fern called Leptopteris superba, Anthurium Scherzerianum, Bertolonia gittata and pubescens, the yello v.flowered bulbous plant Urceolina aurea, the variegated variety of Euonymus radicans, the hybrid Cattleya quincolor, Calathes Veitchii, formerly noticed by us; Osmanthus ilicifolius, and other plants. From Mr. Morse, of Epsom, came the Coppardii, each frond of which branched more or less at the tap, thas forming a compact incuryed erent-like proliferum Holee, Athyrium Filix-foemina diffisoum, al tine varieties of the hardy genera to which they belong.
Mr. Bull had a new Radish, in which instead of the root the seed-pods, which have the flavour of a Radish are eaten. Its pods are stated to grow 3 inches length of ioetween when fully grown attain a
during summer in this country. The same exhibitor also had a pretty white and pale blue Lobelia, called Silver Gem ; various Ferns, Cycas Riuminiana, from the Philip ines - Globbs radicans variegata, wlth long great leaves faintly streaked with yellow ; Sphærogyne cinnamomea with stems covered with cinnamon-coloured hairs, and ample Melastoma-like leaves; the handsome Bertolonia margaritacea; and variegated Verbenas and Chrysanthemums. Trichinium Manglesii, a Swan River Amaran thus-like perennial (see p. 555, 1864), came from Mr. Thompson, of Ipswich, who stated that the woolly, white nd crimson-colonred flower heads continue in perfection for meveral months, and that they may be preserved when cut for a considerable period. This plant, it is said, will succeed in the open ground. From Mr. Williams came Dracena lineata, a stately plant, Ferns and Aloes, Roses.-These were confined to cat blooms, of which there was a good display. Among them were beautifu blooms of Maráchal Niel, a new and most valuable ddition to vellow Tea Roses; Vicomtesse Decazes Charles Lefebrre, François Louvat, Madame Charles Wood, Baron Gonella, Madame Charles Crapelet, Maurice Bernardin, Madame Furtado, Pierre Notting, Isabella Gray, Leopold I., Gloire de Santenay, Madame Victor Verdier, Maréchal Vaillant, and Duc de Rohan. 2, Mr. Fraser. \(25:\) 1, Mr. Exell, gr. to J. Holling Mrorth, Esq.
 raser
Heaths.-The cultivation of these appears to be better attended to than it hitherto has been, and the result was a fine exhibition on this occasion of finely grown well-bloomed plants. To old well-known varieties, however, nothing new has recently been added.
Avards. \(-10: 1\), Mr. Rhodes; 2, Messra. Jackson ; 3, Mr. Lee : 4, M, Messrs. F., \&s A. Smith; 5 , Mr. Baxendine. 8: 1 , Mr
Peed; 2, Mr. Wheeler; 3, Mr. Ingram ; 4, Mr. Chilmau.

Miscellaneous Plants.-Among these was an interesting collection of well-grown Sarracenias and varieEsq., of Bowdon. The former consisted of Sarra cenia Drummondii, flava, variolaris, and purpurea the last a fine mass of pitchers; Dionæ., muscipula and Anæctochulus Lowii, intermedia, and xantho phylla. Messrs. F. \& A. Smith had an exhibition
of Balsams ; and Messrs. A. Henderson various Cala diums. We also remarked various well-filled hanging baskets, and groups of Kalosanthes and Achimenes From Mr. Barnes came a collection of Conifer cones, gathered from trees in the admirable Pinetum a Bicton. Magnificent Carnations and Picotees wer shown by Mr. Turner, and seedling Verbenas by Mr Perry. Conspicuous among the laiter were C. Turner pink with crimson eye; Glowworm, scarlet, with yellow eye; Mazeppa, scarlet, with bold white eye; and Cleopatra, rosy crimson, with large white eye. Messrs.
Downie, Laird \& Laing had very fine blooms of Holly hocks: and Mr. Hooper, of Covent Garden, cut flower of Petunias and annuals. Examples of double-fowered Petunias came from Mr. August, Beddington; and Clematis blooms, large and beautiful, were contributed by Mesprs. Jackman, of Woking.

Brmitwaray Rosis Show.-This, the fourth annual erhibition of Roses, was held in the Town Hall on Thursday and Friday last. As a whole the display was most satiefactory, and a decided improvement on that of last year, the competition being well maintaine throughout all classes. Taking into consideration the great heat we have experienced daring the last few weeks, the blooms were generally remarkable for fine colour and substance of petal; perhaps a greater number of now Roses was produced at this show than we have met with elsewhere during the present season. I Nuxserymen's collections of 96 varieties Messrs. Paul \& Son were first with a very fine stand, containing among others excellent blooms of Madame Victor Verdier, Marécbal Niel, Eugene Verdier, Lord Clyde, Louis Van Houtte, Laurent Descourt, Pierre Notting and Charles Lefebvre. Mr. Keynes was second with good collection, in which were fine specimens of Vitry, Lord Herbert, Alfred de Rougemont, Mrs. Dombrain, Paul Desgrand, Jaune d’Or, Joseph Fiala Prince Henri des Pays Bas, and Abbé Raynaud.
Awaids- 1 , Messrs. Paul \& Son; 2, Mr. J. Keynes; 3, Mr.
Oranston ; 4, Kesers. V . \& A. Diclewon.
In 48 Threen, Mr. Keynes was first with very fine blooms of Alfred de Rougemont, Prince Henri des Pays Bas, La Phocene, Duchesse de Morny, Baronn Gonella, and John Standish. Messrs. Paul \& Son, who
took the second position, had Arles Dafour, Madame took the second position, had Arles Dafour, Madame
Furtado, Maréchal Niel, Beauty of Waltham, and Lord Herbert, in good condition.
Awards.-1, Mr. J. Koynes; 2, Messra Paul \& Son.
In Collection of 24 Threes, Mr. Keynes had beantiful blooms of Duc de Rohan, François Lacharme, and John Standigh. Mr. Cranston showed good ezamples of Mademe Eontin, Charles Lefebvre, and Baronne Gonella.
A wavrds. -1 . Mr. Keynes;
Collections of 24 Single Blooms were well mastsined and consisted of many beautiful varieties, the names of which have often been given in our columns.

In the class limited to nurserymen residing with 15 miles of Bimingham some good flowers were staged
 R. Mr. Hewitt; 2, Mr. Vertegans; 3, Mr. Parker ; 4, Icman
Purkins \& Son.

The Amateurs' Classes were well sustained; in 48 varieties the Rev. S. R. Hole was lst, with excellent looms of Maurice Bernardin, Clar!es Lefebvre, Triome de Rennes, Princess of Wales, Turemne, Madame Vidot, Le Rlione, and Vicomte Vigier
 \({ }_{\text {M, Mre }}^{\text {M }}\)
No portion of a Rose show is more interesting to visitors than the collections of nerv Roses. On thi far in advance of all other competitors. The most nominent were-Lord Herbert, George Prince, Pad Desgra:ud, Joseph Fiala, Pierre Notting, Claude Meillon Laurent Descourt, Engène Verdier, Senateur Farre Maréchal Niel, and Priace Henri des Pays Bas.
Awards, -1 , Mr. Keynes : 2, Messrs. Paul \& Soni; 3, Yr. 0.
atley; 4. Messrs. Perkins id Son.
In 6 tur of
In 6 trusses of a new Rose, Mr. Keynes was again lot with nice blooms of Prince Henri des Pays Bas; Mr. Crano. ston taking a \(2 d\) prize with Madame Boatin; and Messrs. Paul \& Son a 3d with Madame Victor Verdier. Various prizes were given for vases and baskets of Ruses, as well as for bouquets for the hand, ladies onls Tlie competitors.
The Hall was tastefully decorated with ornamental plants, and the galleries were filled with chaste and elegant desigus in glass and wirework.

\section*{Noticts of 3B00ky.}

Astra Castra. Experiments and Adventures in the Atmosphere. By Hatton Turnor, The Prince's Own Rifle Brigade. 4to, pp. xxiv. and 530. London: Chapman \& Hall 1865. Viv. and Scous woodeus and photo-zincographed plates.
The curious title Astra Castra (The stars are my Canopy) is part of the motto of the barouets Lindsay Astra castra, numen lumen), now represented by sir Coutts Lindsay. The object of the book is to give as complete a history of balloon experiments as the present state of our knowledge on the subject wil allow, and this from every point of view, æsthetical philosophical, theoretical, and practical, not even omitting more strictly amusing matter, and the various sallies of ridicule with which this, like all other usefal experiments and projects, has been met by those who find it much easier to laugh than to observe and retien and at the same time more paying, as far as any immediate result is involved, in the applause of the moment.
The opening chapter, which treats of the dama navigation as compared with the dawn of aeroatation egether with the clairvoyance of terest Great puin experimentalists, is not without insthing which can b any possibility bear on the subject, not only in clasica authors but in those of the middle ages, and afterw the in more modern times, so late as 1783 , just beto year first successful balloon ascent was made-the ytu may be observed in which the composition of Whet was discovered indepondently and Cavendish

It has been supposed that so early as 1607 some one had made a commencement of sailing over a high steeple in a boat, far less picturesque in all probecin than the crescent boat of Wordswith; more probeblo evidence comes to be examined, it is far me forward by sails, like that of Mr. Oxenden, which was tried on Newmarket Heath, and some of the adjo roads in 1820, of which wo frequently heard of Cambridge in the following year, from a broti projector and builder.
Most amusing accounts are given of the early ascents eath had then by such melanchly arrumane which hapwezed in 1786 , made a very deep inpr and is thus recorded by an eye witness.
"This first and boldest of aëronauts (Monsieul Rozier) desired to crown his successes by the pawn of the Chanuel, but trivial accidents aud Mear winds delayed his start for several mongland. while Blanchard had crossed from England many taunts he was subjected to is youthfil and on the 15th June he started at 71
Romain under unforourable circumstances; his is tie to earth having been the hand of the
ysieonfort, to whom he had rofused a seat in his car,
in spite of his earnest entreaties, and who remained to in spite an account of the melancholy death of his Arrasiemy of Sciences.
"Thousands of people watched their flight with poculiar auxiety, for another step would have been gined in Montgolfiere succeed. The advocates of the Montgolifere had now had two years controversy with those who thought the Charliere the best; and it was in his bold attempts

About 30 minutes only had elapsed since they had left the earth : the S.E. current that carried them out to sea had changed to S. W., that again brought them spectators, maybe more swift than any that ever emanated from so large a multitude, for at the same iratant all beheld the machine in flames; and after many swift, wave-like motions, it fell a shapeless mass apon the ground, on reachin
occupants were found dead.
There is an enormous mass of amusing and instructive information respecting all the most remarkable ascents, from these early commencements up to the
present time, aud of attempts to regulate the course of balloons and other aërostatic machines, as also to put then to some useful purpose. Till some method is likely to take place very soon, they can be only used for local purposes, and the most promising are those which are connected with warfare, either simply as enabling generals to gain a bird's-eye view of an army, or in connection with an electric telegraph as in the late lamentable war in the United States.
e must not forget the cognate subject of parachutes, on which our author gives not only historical but scientific details, his friend Mr. Ottley having appended a note on the comparative resistance of
fluids to bodies of different forms. The accidents, like the lamented one of Mr. Cocking, so far as they arise from oscillation, have, however, not depended so much
on any defect of form as on a first irregularity impressed upon the machine by the unequal expansion of the parachute during the time immediately sucA sumall portion of the book is taken up by notes on tation, concluding with somedisuggestions to the religious mind from the subject at various points of view.
For these, we must refer our readers to the itself, with the remark that they evidently are the result of a sincere and unaffected tone of mind, mode of statement.
By some accident or other a complete description of
the numerous plates, many of the Ordmanous plates, many of which were prepared at appear in the book, with the sour ces from whence they
are derived, though these are given in Several are reproduced from old and rare books or finished style the vignettes, which are in a far more friends or brother officers most part to the pencil of instances they do great credit. It is invidious to slecthed by Charles Fairfield, of the rapidity and ere-witnesses. Thill wo found with its vall vaious matter from grave to gay, and heavy binding, it may be observed, make it rather material ponderosity the table, than for the hand. Its measure of its worth, for it is highly creditable,
especially to so young an author,
Geology as a branch of General Education. An Address
br David Page, F.R.S.E., F.G.S. W. Blackwood \&
Sons, Edin Sons, Edinburgh and London.
Geology, and so long as cap lital writer of class-books on of scietice, one may be disposed to excuse him for
may be disposed to excuse him for

Boors Received.-Dr. Webster's Dictionary of the

College. Rarts V. and VI. bring this popalar illus.
trated dictionary very nearly to the end of letter N. and, according to the prospectus, complete one half of the work, - The Natural History Reviev, No. XVIII., contains notices of works on the Zoology of British India, Hall's Life with the Esquimaux, an extremely interesting narrative, written in a charmingly simple style, and adorned with mang original sketches, by a
kindly American, who won the hearts of the simple folk among whom he lived. A notice of M. Jordan's recent work, gives rise to an article on Species and Sub-species, which will be read with interest; as will also another, by Dr. Thurnam, on Synostosis of the Cranial Bones, for its bearing upon the Neanderthal skull, and anthropological questions connected there-with.-A Dictionary of Chemistry, by Henry Watts,
F.C.S. Parts XXV., XXVI., XXVII., carry the work from the conclusion of the metals to the end of the oils. We observe that it has been found impossible to limit this comprehensive dictionary to the 3000 pages and three volumes originally contemplated. Chemistry is an ever-growing science, and to do justice to the subject, it has been resolved to extend the work by another thousand pages, forming a fourth volume. The Geological Magazine, Nos. XI. and XII., contain
several original articles and reviews of more or less general interest, with the reports and proceedings of the principal geological societies and feld clubs, and the first volume of the magazine is announced as ready.

\section*{dflorists' Jflowerg.}

Carnations and Picotees.-The cultivation of these chaste and beautiful flowers has much declined of late
years in the vicinity of London. The seeming difficulty of their cultivation has, perlaps, been the great cause of their disappearance from gardens, but, if so, such should not be the case, for with a little care they may be grown wherever the sun and air has free access, and
in the environs of the metropolis they might be a source of much pleasure to the amateur, as well as of profit to the cultivator for sale. No doubt the Rose has
been a great antagonist; so have bedding plants, and been a great antagonist; so have bedding plants, and
the gaudy Gladiolus and Aster. Our northern and midland florists grow them largely and to great perfection, but in the south a few stands at the metropolitan exhibitions in July are all we are favoured with, unless we take a trip to the Royal Nurseries at Slough, and there we see them grown in perfection, every bloom a model, and the marking and lacing so delicate and striking that the visitor cannot help falling in love with them. The season being at hand when their blossoms will be in perfection, and their propagation proceeded with, a few words in their favour may be useful.
Their cultivation is simple enough, but to excel both patience and attention, without which it is impossible to excel in anything, must be exercised. I am inclined to think many cultivators have failed from
using richly manured soil, a sad mistake if such has been the case. Pure maiden yellow loam (the top spit from a pasture with all the fibre), some well decomposed leaf-soil, three or four years old, and silver sand with the addition of a little well-rotted cow manure, five, six, or seven years old, will make a good compost to grow them in, say four parts loam, one part leaf-soil, one part old rotten cow manure, and sufficient silver sand to make the whole porous. These ingredients should be well mixed and allowed to remain in a heap
exposed to the winter frost. In frosty weather the exposed to the winter frost. In frosty weather the
crust should be taken off every moming and laid aside until the whole heap has been frozen through. This will assist to destroy the wire-worm, the most destructive enemy of the Carnation and Picotee. These wireworms should be earnestly sought after every time the compost is turned over and destroyed. If had the means I should subject every turf of loam to
fire-heat in a retort or oven, so as to slightly char it, a safe way of destroying any insects or larvæ deposited in the turf; it would also be much improved by the process, as the plants when potted in charred soil would have the foliage a deep green, almost black, and their vigorous appearance would show they enjoyed it. In describing their cultivation I will commence with the propagation. From the middle to the end of July mode of propagation usually practised, and is the safest, although when there is a superabundance of Grass some propagate a few from pipings (cuttings) in the same manner as Pinks. Most persons are acquainted with the process of laying, which is simply cutting off the leaves four or five joints from the top of the shoot, and then cutting with a sharp knife obliquely through the joint where the leaf was attached to the stem-in fact, splitting it, commencing with the cut
about half-way between the joint, and carrying it a little way through the joint. Some sand and loam, about equal parts of each mixed together, should be in readiness to put under the layers. As soon as cut as to open the cut already made rather widely; this will materially assist their rooting. When the whole of the shoots in the pot are covered neatly with the sand and loam, water well with a fine-rose pot. If dry weather sprinkle lightly the young shoots every evening, eariy, to keep them red nicely, and early in Sepweekser they should bu potted off into 4 -inch pots, two plants in each pot, and atood out of doors in an opea
for this fully exposed to sun and air. The compost silver pothing should be loam only with su chont be ample, and the soil pressed tightly into the pots. Early in October they should be placed in winter quarters. Some Melon or Cucumber frames, with the boxes placed so that the lights shall be at an capital place for them. The frame should face full south. In watering, use a spout not a rose, and be careful not to allow a drop of water on the foliage during November, December, and January, or they will probably get the spot-a very troublesome disease. Give plenty of air by taking off the lights in fine weather, and tilting them on wet or foggy days If frosty, a mat should be covered over each light; and if the frost is severe, it must bo allowed to remain ontil a thaw has taken place, and the frost is quite out of the frame. W. \(\boldsymbol{H}\).

\section*{(To be conlinued.)}

\section*{Che Kitary.}

Eariy in the forendon of June 13, I was rather puzzled at receiving by train, a small bos of about
6 inches long, 3 inches wide, and 2 inches deop col on one side with perforated zinc, from which a very audible buun proceeded. The box was directed to me and on the card "By fast train ; live bees; with care," was to be seen in large letters. The railway labels, one being pasted over the other, gave me no clue to the place from which the passengers had been started, but at length I made out that they had come from the
distant county of Durlam, and had travelled so far into distant county of Durham, and had travelled so far into
the very south of England without losing one of their number. Still, as no letter had arrived apprising \(m\) of the intention of the sender, whoever he might be, I was at a loss to know what to do with the emigrants Being very much occupied that day, I must confess that at first I looked upon them rather in the light of a nuisance than otherwise, as involving the necessity of my devoting to them some of my then valuable time.
However, I thought it best to endeavour to ascertain the precise character of the bees thus forwarded to me By substituting a piece of glass for the zine cover,
discovered that the bees were Ligurians. "Well", thought, " some kind friend has sent me a Ligurian queen, intending that it should be placed at the head of a stock of common bees." After looking at the bees, which were about 50 in number, for a minute, I caught
a glimpse of the queen, certainly a rather nice-coloured yellow Ligurian; she quickly plunged among her companions, and I could not gain a second view of her. Soon after this the north country post was due, and
I waited fora letter which might explain matters more fully. As I expected, a letter arrived, and I recognised the handwriting of an old friend and correspondent. The tenor of his letter was to the effect that he, having s third swarm issue from one of his Ligurian hives which he did not require, had captured the queen in order that the swarm might be returned, and had forwarded her to me, thinking I might be glad of the opportunity of placing her at the haad of a colony of common bees. He assured me that the queen was from a pure Ligurian mother, so that I was the more willing to form a small nucleus, and gradually build it up into a respectable stock.
I had only one hive from which a brood-comb could be taken, and from which the young bees were actually
emerging. Oze of this character was selected and placed in a nucleus, the little box with the queen and her 50 suljects was placed over the central aperture in bees to descend among the combs. The nucleus was shut up for about 12 hours within doors, the bees being confined; the following day they were liberated, and flew in and out very actively,
On the 1 tht, at 1 o'clock, I inspected the combs, and, including those which had hatched out from the brood-comb, there were ouly about 100 bees present. The queen was not be found, and I began to fear she had succumbed to the perils of her journey, but at length thought it was prubable that she might be out on a matrimonial flight. The combs were carefully looked over more than once, but no queen was to be seen. There being so few bees every one could be
examined, so that I know the queen was not at bome. I looked again at 4 o'clock the same afternoon, she was then present and very active.
On the 16 th I had a good view of her majesty, and found her improving considerably in size and colour, so that I began to be pleased at the acquisition, and interested in the experimeut of building up this diminutive batch of forced emigrants into a populous colony. Owing to the very small number of bees which were in the box, 1 found a great deal of the brood to be both
starved ; the queen remained active and livel

On the 17 th the stock from which the brood-comb had been taken was again visitcd. A comb, baving on never left the hive, was lifted out, the old bees were got rid of, and the very young bees only were added to those in the nucleus. The cover was put on, and at first all appeared right. But my attention was soon
called to a very ominous buzz in the small hive, and the cry of the queen was constantly to be heard. Kuowing that she must be in jeopardy I lifted off the lid of the box and soon discovered the princess at the bottom of
the hive, struggling fearfully against the assaults of a lot of the irritated young strangers. In her terror she rushed out at the entrance with two vicious little creatures trying with all their might to sting and disable her. I succeeded in saving her from their attack, and catching her, carried her at once into a close room. She escaped out of my hand in the room, but fortunately could not fly away. I placed her in a small queen box, and put in as companions, a couple of bees which had been
brought in on my hand, but in a moment one of them was fastened viciously upon her, and her life saved only by the prompt crushing of the little termagant. Getting rid of the other bee, she was placed alone among the combs in the nucleus box. I was greatly in hopes that this would prove successful in putting a stop to the aggressive policy of the young interlopers, and that time would work a salutary change in their dispostions. On the 18th the lid of the queen box was slipped off, but the bees were not otherwise disturbed. On the 19th the combs were searched over, but there was no was found to be in progress, so then I knew that the fate of the queen had been sealed; probably she had been really strugg at the time of the savage assault on her not sacred person. The bees seemed very contented, and well pleased with their act of regicide; and the royal cell was evidently the centre of a great amount of attraction, as there was some difficulty in clearing it of bees, so as to see what progress had been made. The work for which the nucleus had been formed having thus failed, I had no further use for it, and the bees and combs were summarily transferred to another artificial swarm, materially adding to its strength. I was sorry at the fate of this queen, and regretted having made the attempt of uniting to a valuable queen, even bees that had never once left their parent hive. There is had I been content to let the bees hatch out from the comb first given; and eventually to add advanced broodonly It always too great a risk to the queen to attempt to strengthen a weak nucleus or other swarm by uniting bees to it, but I was hardly prepared for the result which followed the union of young bees that had only juast emerged from their cells.
There is nothing like experience, and I trust that no such accident from such a cause may ever again occur in my apiary. Apiator

Alexander Boyle, Narbeth. The reply to your inquiry (see
p. 608), should be read thus:- "Only one entrance is left
open, Unleas your hive has become tolerably well filled,
Fhich, from the small size and lateness of the warm, we
should be inclined to doubt, a super will do mose harm than should
good."

\section*{Miscellaneous.}

The late Duke of Devonshire and Sir Joseph Paxton. -About 20 years ago, by the direction of the late Duke of Devonshire, I copied the following from the original in his Gracess handwriting:- "Joseph Paxton was born the 3d of August, 1803, I made his acquaintance at the Horticultural Society's garden at Chiswick, where he was placed in 1823 . He was chiefly employed in training the creepers and newly-introduced plants on the walls there, which first excited my atten asked Mr. Sabine, who was then at the head of the establishment, whether he thought that young man would do? He said, 'Yonng and untried,' but spoke so favourably that I had no doubt. The young man had made a large lake in 1822, at Sir Gregory Page Turner's place, near Wobarn. He came to Chatsworth in 1826. You shall coach for Chesterfield, and arrived at Chatsworth at half-past 4 o'clock in the morning of the 9th of May, 1826. As no person was to be seen at that early hour I got over the greenhouse gates by the old covered way, explored the pleasure ground, and looked round the outside of the house. I then went down to the kitchen garden, scaled the outside wall, and saw the whole of
the place, set the men to work there at 6 o'clock, then retarned to Chatsworth, and got Thomas Weldon to play me the waterworks, and afterwards went to breakfast with poor dear Mrs. Gregory and her niece the latter fell in love with me, and I with her, and thas completed my .first morning's worl at Chatsworth before 9 o'clock.' He married Miss Sarah Brown in
1827. In a very short time a great change appeared 1827. In a very short time a great change appeared there had been none, fruit in perfection, and flowers Twelve men withfbrooms in their hands on the lawn began to sweep, the labourers to work with activity The kitchen garden was so low, and exposed to floods from the river, that I supposed the firot work of the new gardener would be to remove it to some other place,
but lie made it answer. In 1829 the management of the woods was entrusted to him, and gradualls they 1832 did I take to a prospect of destruction. Not till old greenhouse was converted into a stove, the greenhoose at the gardens was built, the arboretum was invented and formed. Then started up Orchidaceæ and three successive houses were built to receive the in Greasing nmmbers. In \(1 \& 35\) the intelligent gardener, John Gibson, was despatched to India to obtain the Amherstia
nobilis and other treasures of the East. The colossal nobilis and other treasures of the East. The colossal
new conservatory was invented and begun in 1836; the following year Baron Ludwig was so charmed with its conception that he stripped his garden at the Cape of
the rarest produce of Africa. Paxton had now been employed in the superintendence and formation of my roads; he made one tour with me to the West of England, and in 1858 contrived time, having gone hrough Switzerland and Italy, he trod in Greece Turkey, Asia Minor, Malta, Spain, and Portugal. In his absence he managed that no progress should be checked at home. A great calamity ruined the expedi tion he bad set on foot to California; the unfortunate Wallace and Banks, young gardeners from Chatsworth having been drowned in Columbia River. He went with me in 1840 to Lismore, and in that year the conservatory was finished. The village of Edensor was new-modelled and rebuilt between 1839 and 1841, and the crownin rorks have been the fountaing and the rock-garden. After I had copied what precedes, I inquired of the Duke if he knew the amount of wages Paxton was receiving from the Horticultural Society in 1823? The answer was - Only 18s, a-week, as I wa informed by Mr. Sabine." As I knew that the Duke of Devonshire (by whom I had been most kindly aided for the last 18 years), would not be offended by the queation, I asked what wages he had himself given the young and untried gardener in the first instance and his reply was, "I think 25s, a week, and a cottage." Of course his Grace afterwards rapidly advanced Paxton's wages, and eight or ten years subsequently the young labourer of 18s. a week, and the new Duke's table. J. Payne Collier, in Notes and Queries.

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

Ir need scarcely be repeatel that a garden can afford but little enjoyment unless good caltivation and cleanli ness form its chief characteristics. Roses covered with aphides, Cabbages spoiled by caterpillars, Gooseberry bushes stripped of their foliage by similar means, are matters of but too common occurrence. What possibl enjoyment, then, can be derived from such gardening To reap pleasure, and profit likewise, such things mus not be permitted to exist ; ordinary attention, combined not be permitted to exist; ordinary attention, combined ravages of such pests. The first evidence of the presence of our foes ought to put us on the alert, and perhaps there is no more effectual or better remedy than hand picking. In a few hours, in the early stage of the evil, by careful picking, one person will do as much as ten will when the mischief is permitted to exist for only a
few days. Distributing freshly slacked lime over the soil few days. Distribating freshly slacked lime over the soil
will also, to some extent at least, check the migratory movements of caterpillars. Red spider is another of the enemies which deface the foliage of many plants, and particularly those against walls with projecting coping. Although this is not so easily discovered with the naiked eye as a caterpillar, it is nevertheless a more destructive and more anconquerable opponent. Still, it is taken in time, it can also be subdued, and even expelled. Water and sulphur are the only known practical subjugators. If these are applied early and Indeed, where it can be applied with impunity through powerful syringe or garden engine, water alone will completely subdue this tiny pest.

FLOWER GARDEN AND PLANT HOUSES,
Mow, sweep, and roll lawns, and tie or peg down half.hardy plants as they advance in growth. Do not allow any of these to extend themselves outwardly so
far as to injure edgings, whether of Box or turf; and ar as to injure edgings, whether of Box or turf ; and annuals have been planted or sown in vacant places, take care that the latter are not injured by the encroachments of guickogrowing plants. Any annuals or ther half-hardy plants, whose season of beauty is past, should be immediately removed, and their place supplied
from the reserve garden, planting sufficiently close to from the reserve garden, planting
Dahlias.-Give these weak liquid manure, and with a small three-pronged fork occasionally stir the surface of the soil. If the plants are required to produce flowers for exhibition, it will be advisable to disbud early, if the variety is at all under-sized, but when the rariety is large and coarse, fewer buds should be emoved.
Polyanthusiss.-Should the weather prove wet these plants may be parted. Do not use a knife in the peration, the ivory handle of a budding knife will be ound a suitable instrument. When planted out, in hady suitable situation, do not let them want for moisture; and a temporary screen will prove highly Roses - These plants are established.
Roses. - These should be again gone over, removing all gross shonts that are not likely to flower this season dead flowers, and those which have done flowering. Young strong growths of autumn-flowering Roses in masses should be pegred down; and thuse of the summes-llowering linds, as the Moss, Provence, or Gallica varieties, should be layered; the whole surface of the beds should be forked over, and if a good soaking of liquid manure can be given, its effect will be ver apparent in the greater permanency of the colours, and in the lengthened period of blooming.
Whitr Licirs. - These should be taken up and replanted once in two years, an operation which should be done as soon as the old stems are decayed. Beds fo these plants should be made of rich loamy soil, contain
ing a good portion of sand or burned clay, and chared refuse. In planting,
and below the bulbs.

\section*{forcing Garden.}

Pnnss.-If the heating apparatus of any of the houses in which these are growu is defective, or eren affords a good opportunity for making the necesing alterations. It is acnoying enough to have the state of things disturbed at any time, but this is not equal to the vesation arising from an old boiler baratino a set of pipes or tanks giving way, in the middio winter: especially when due forethought and observation would have prevented the catastrant Withhold water from plants which are ripening their ruit; and the soil in which plants in other stagea are growing should be frequently examined, to see that the constant syringings do not make it too wet, and therebs endanger the health of the roots. Do not, on the other hand, allow them to suffer from want of mointure sither about the roots or in the atmosphere; and la them be supplied with a bottom heat of \(85^{\circ}\).
Vnsess. - The most important thing at prevent is to keep red spider in check; where this has been proporly attended to duriag the last tbree monshs, and when syringing was not continued too long, the bloom will be uninjured, and the appearance of the fruit will by tbis be considerably enhanced; besides whieh, the plats are in a much better condition to perform the functions necessary for ensuring a good crop next season. Let this be kept in view during the rest of the autamn, as it is still more essential that the foliage of late Vines should be kept in the highest health to the latat period possible. Attend, when necessary, to the miter. ing of inside borders, and of those on the outside which may be covered with tarpaulin or other materin, useful during summer.
hardy fruit and kitchen garden.
Remove superfluous wood from wall trees, and keep nsects in check. In the kitchen garden push forward all kinds of planting while the weather is showery and the soil in good condition for the operation. Liquid manure will be found very useful now; applications of this, together with deep stirring of the ground among growing crops with a fork, is a sure way of realising the best reaults.

for the time less interest may be taken in them, or less comparative importance may be attaohed to them.
As old friend who is ongaged in laying down land to Grass in the southern Province of the North Island of Now Zealand, wrote to us for some information about Grass seeds. We sent him some abstracts of trade circulars, which supply all that is known about those adapted for ultivation in Great Britain. He was more partioularly anxious to have Grasses which would afford good winter keep for sheep in a climate where snow never lies, and frosts rarely ocour, and where all the field orops grown in England can be successfully cultivated. Its natural pastures are characterised by a paucity of Grasses and an absence of Leguminose, which in other countries afford so muoh nourishment to herbivorous animals. It is a well-known faot that the natural pastures in Soath Afrioa, Australia, and New Zealand are so unproductive that from one and \(a\)-half to two and a-half acres are required to keep a sheep. We do not know what steps may have been taken to improve the pastures of Australia near the seats of population, but very marked success has attended the sowing down land to English Grasses in the cooler and moister olimate of New Zealand. In the following notes we have endeavoured to keep the interests of these countries in view:-
In Allen's American Farm Book (New York, Saxton, 1863), the author, after expressing his regret that so little has been done to ascertain their numbers and comparative quality, says (page 97):-"Their superior richness and enduringness may be inferred from the health and thrift of the buffalo, deer, and other wild herbivore, as well as from the growth and tine condition of our domestic animals throughout the year when permitted to range over the woods and through the natural prairies and bottom lands where these Grasses abound. The writer has seen large droves of French and Indian ponies come nto the settlements about Green Bay and the Fox River in Wisconsin in the spring, in good working condition, after wintering entirely on the natural Grasses and browse north of lat. \(44^{\circ}\).
Dr. Darlington, of Pennsylvania, who has written on the subject, enumerates the following species in the order of their value:-1, Meadow or Green Grass (the wrongly-named "Blue" Grass of Kentucky), Poa pratensis; 2, Timothy, Phleum pratense; 3, Orchard Grass, Dactylis glomerata; 4, Meadow Fescue, Festuca pratensis; 5, Blue Grass, Poa compressa; 6, Ray Grass, Lolium perenne; 7, Rod Top, Agrostis vuigaris; 8, Sweet-scented Vernal Grass, Anthoxanthum odoratum.

It appears advisable to quute Mr. Caird's remarks on the so-called Blue Grass, Poa pratensis, which is first on the aforesaid list, from his
"Prairie Farming in America" (London, Longmans), page 56 :- "The Blue Grass is a rioh thick suogulent Grans, of a bluish colour, which grows with great success on the limestone soils of Kentucky, and is found to succeed admirably on the Prairies" (in Iliinois State) "when laid down as pasture. It improves every year, and yields feed for six months, besides half feed during the winter; " and again at page 72, "The Blue Grass I find everywhere spoken of as best adapted for the prairie. It is sometimes sown on the fresh prairie after the Grass has been burnt uff, the ground being first well harrowed. But though this occasionally suoceeds, the process of breaking up the prairie and sowing it out after one or two corn orops is preferred." And lastly, at page 82, "The Blue Grass (Poa pratensis), which is indigenous on the limestone lands of America, will usurp the place of all other Grasses on such soils in the course of years. It is said to yield a greater return of beef, milk, mutton, wool, or pork than any of the sultivated Grasses."

The Cocksfoot, No. 3 in the list, flourished in all the States bordering the Atlantio as far sonth as Georgia.
Besides these, AuLBE ennmerates the beantiful Ribbon Grass, Phalaris arundinacea, valuable in alluvial swamps; Gama Grass, Tripsacum dactyloides, valuable on naked sand beaches; Guinea Grass, Sorghum halepense, considered by some to be "superior to any other grown at the South." Bermuda Grass, Paspalum dactylon, Crab Grass, and Winter Grass are valuable in the Gulf States. "The Muskeet Grass found growing on the plains of Mexico and Texas is considered one of the best of the indigenous Grasses."
"Grams (La Grama, or the Grass of Grasses) is held in the highest estimation by the Mexicans. It attains a medium height, and is deemed the
ranst nutritious of the natural Grasses in our southwentern, frontier prairiss, in California, and parts of Mexico. It grows on dry, hard, gravelly soils, on side hille, the swells of the Prairies, and the
gentle elevations in the valleys. The principal value is found in the numerous seeds, which are retained in the pots with great tenacity long after they are ripe, serving as a luxurious food for all the granivorous bea
"The Buffalo Grass is found intermired with the Grama, and seldom grows more than a few inches in height. It forms a thick soft herbage, on which the traveller walks with ease and reposes when weary with delight. It yields a rich sustenance to countless herds of wild horses and cattle, buffaloes, deer, and antelopes."
Tornillo, or Screw Grass, belongs to the table lands of the same region; "it is taller than the Buffalo, with broader leaves; "it is most valuable for its riponed seeds.

The Prairie Grasees abound in the western prairies, and are of great variety, according to the latitude and circumstances under which they are found. They afford large supplies of nutritive food, both as pasturage and hay. They possess different merits for stock, but as a general rule they are coarse when they have reached maturity, and are easiily injured by the early frosts of autumn. Some of the Leguminosm, or wild Pea vines, which are frequently found among them, yield the richest herbage. We are not aware that any of these Grasses have been cultivated with success.
"The Puny Grass may te mentioned as one of the best of the winter Grasses in our western States. It grows in close, thick, elevated tufts, and continues green all winter. It is easily detected under the snow by animals, from the little hommocs which everywhere indent its surface."

In Bouth America vast herds of cattle and horses are depastured in the Llanoes or savannahs of the basin of the Orinoco, until vegetation is burnt up by the heats of summer; the pastoral riches of the basin of the La Plata are still better known. It is possible that some useful Grasses are to be had from these two localities as well as the slopes of the Andes. Besides these, may we not look to the slopes of the Himalaya Moun
and the boundless plateaus of Central Asia?

It is very evident then that the continent of North America abounds in Grasses and forage plants suitable for domestic animals, and that out the whole of the island continent of Australia, from Victoria to the tropical shores of the Gulf of Carpentaria, have a wide field for experiments. If
it is pessible by a judicious selection of foreign it is pessible by a judicious selection of foreign average number of sheep (one to every two or two and a-half acres) in Australia, millions would be alded to our national wealth, for colonial and imperial interests are identioal.

India, which is awakening to new life under the fostering care of British energy and capital, has its requirements, and one or two good things may be welcomed by the English grazier.
Though the question may at first sight be termed a colonial one, still it is one whioh the mother country ought to feel an honest pride in originating and faithfully directing. The poor fever-stricken patient will bless the movement which has led to the successful cultivation of the Cinehone in British and Dutch India; and this Grass question, if equally successful, has for ite object to feed the hungry, clothe the naked, and fructify commerce in many channels.
Some of the wealthy Australian colonists resident in England should hold a meeting, appoint a committee to collect subseriptions for the preliminary expenses, and try to enlist some leading botanists, in particular the good-will and co-opera-
tion of Sir W. Hooker, Direotor General of Kew Botanic Carden, by asking him to appoint, or sanction the appointenent, of a well-qualitied Botanist at a liberal salary to examine the books and specimens contained in the library and
herbarnum, and to make a "report on ueeful forcign pasture Graeses and forage plants, with notes on suci others as may be considered worthy of experiment in the British oolonies." Such report would eupply reliable data fur all luture operations, whether for collecting additional information and seeds by consular agenoy, or for
the proper selection of a productive field for a apecial collector, sfter the sucoessful examaple of the London Horticultural Society, and one or two epecial associations for the introduction of useful and ornamental trees and shrubs. The committee would then be in a safe position for bringing the
the Colonial Governmente, neither of whom won be likely to withhold peounisry support were guided by soience and einarduitrisio prident forethought

\section*{DRY WEATUFR AND DEEP CULTIVATION.}

\section*{\(H\) iu is it thai in spite of the long-continued drough} wneat, Beans, Oats, and Barley, Tares, and Cab bage luxuriate? I attribute this mainly to deep drainage, deep cultivation, and unwashed manure; something is also due to the cold heary clay, but even on my light lands my advantage is conspicuous. I have 17 acres of Mangel also looking admirably. We are of great value to the country. After drainage I attach great importance to deep cultivation-I do not mean bringing to the surface the unaërated and ill-con ditioned subsoil, which is almost poisonous, but by breaking it up in the track of the first plough, with a common iron plough (minus the breast) drawn by four strong horses.
Take as an instance a hegry-land field of 7 acres, from which we hav jur supportod by Wheat ; I manure this heavily with
shed manure, then by the process of trench-ploughing shed manure, then by the process of trench-ploughing
which I have described, the subsoil and upper soil get partially mized, the manure falling in among the subsoil, where it is most wanted. I then harrow and roll the land, and now that rain has moistened it shall plant it with strong Cabbage plants out of my sed bed. I thus never fail to have a strong crop of Cabbage after Tares; in fact, two most yaluable green
crops within the 12 or 13 months. I then guano and get a strong crop of Barley or Oata
The good efect of this deep cultivation is felt and watch the under plough you will see, boiling up as it were from below the ordinary ploughing, a hnst of oots of strong-growing weeds, whinch would oniy have been docapitatod by ordinary ploughing, and would soon
reappear in compotition with the growing crop. In this deep double ploughing lies the secret of my compara. tive freedom "from strong-rooted weeds, and consequently improved crops. By this means we get rid
of Couch Grass. Experieuce lyas taught me the great value of a crop of Cabbage, and the certainty of a good crop as compared with the uncertainty, in ou dry climate, of a Swede crop. I have now a fine crop of Cabbage, planted out in March, which will be ready in harvest, when other green food is scarce.
We pulp all our Cabbage, and then, mired with ohaff, \&ce., it is a forcing nutritive food-a fow London or garden Cabbage cqme earlier than the Cow Cabbage. People talk of the exhausting nature of Cabbage, but I ike exhausting crops that make use of the subsoil, and produce great quantity and good quality. The follow ing com erop will succeed well if properly manured It is only where little or poor manure is used that these complaints are heard; with plenty of fat stock manure, and some artificiele, there is no fear of pxhaus I have by any crop.
I have said in former papers that heavy-land farms are really good stock farms. They produce in the driest summer plenty of Beans, Clovers, Tares, and Cabbage, all which, when cut up, are excellent fond, and I never miss an abundant crap of Mangel. But then, on such soils, there must be under-cover feed ing for bullocks, and proper winter shelter for all
stuck. The systen of turning out bullock stock, either in winter or summer, is a great mistake. This I can assert from long practical experience.
The interest on proper sheds, and the cost of bringing lome and "cutting up or pulping, is quite overbalauced by the more rapid progress of the amimal on a smaller quantity of food, and the superior quality of the she i-made cake manure, which we al ways cart direct from the shed to the land, thus avoiding dung heaps
and twice carting. This manure beats guano comand twice carting. This manure beats guano com
pletely. With sheep out of-doors in summer we can manage well by folding, and cutting up where the food is long.

In heary crope animala turned out hava truly five mouths, reckoning four fect and the body as destroyers, if not consumers, of food; we certainly require great Reform in this matter in our genergl agriculture. Referring again to the necessity for incorporating the
manure with the subsoil, I am a decided believer in Liebig's theory that it is very difficult to get manure through the cultivated soil into the subsoil. The surrace soil retains it, and consequentiy deep-rooted it there. It is no doubt owing to the asgacious prac tice of that bright friend of agriculture, the Rev. Samuel Smith, who truns baek the ploughed soil and incorpo mase the manure with the subsoil, that he grows such Tarmous and unfailing erops of roots.
Take a vertical section of our ordinary soils aud what do we see?-a few inches of daris upper ploughed o sigu under stratum being pale, dense, and showing t. This proves what I have stated, and urges upon as the propriety of both tilling and manuring the I
Yesterday's fine mins have dene wondens for vegeta-
ion. My bailiff said to me, with reference to the henvy crop of Taren and Wheat grown before the
he was right, seoing that we were selling our and beef in proportion. and beef in proportion.

\section*{OBJECTS OF FARMING. - NO. IV}

IF I withhold my name and address from these com. munications, I beg to assure the readers of the Agricul-
tural Gazette I have no wish to state anything behind the mask of an incogito which I cannot prove behind accurate fact, or to escape from honest criticism ; bat I confess to a great objection to the idle questionings of those gentlemen who will not think for themselves, and the unreasouing hostility of others who late anything new ; and being a bad correspondent cannot undertak to any real 'searcher aftar truth who will apply to the Editor, sufficient|instances of what I have asserted or may assert, to prove, without compromising my neighborns that I am no Quirotic amateur, but a real farmer,

Doubtless the last winter and spring succeeding wo summer, have read a very serious, though I hope important, lesson to all stock farmers. Those who were frightened and sold off their stock will not reap the bitter fruits following on yards without manure, and land without condition ; while those who persevercd and
bought food for their usual amount of stock, and eked out by pulping and mixing with straw-chaff their diminished produce, will have realised by this timos fair return for their increased expenditure, and the prospect of future abundance. The present season np nart of its predecessor. Should this be the case, all animal products may be expected to be evell dearer
than at present, and I would venture to expect my brother farmers to prepare their plans accordingly. In looking around us we can already see, if we molld us in colours, how upon laud clean, deeply cultirated, and manured, the dark green crops are blowing into hue, interspersed with the dark Thistle-beds or crimooned with Poppies, proclaims the idleness, the ignorance, the untidiness, or the poyerty of the cultivator, in acconts too plain to be misunderstood. What if our summer from these digressions to our 400 -aere farm, and first to the 200 acres supposed to be Grass. We saw that 200 tons of hay was the utmost that could be taken off yearly. If near a town op good market where hag in selling at 67, a ton, it will be cheapesi to mow the whole, soiling the stock up to midsummer, and restoring to the land by feeding with cake, and by carting on town ashes, composts, \&ic., a sufficient compensation for what is sold off. If at a distance from such advantages, mowing a part in its turn will the rest fed by stock will be yearly improved, bearing in mind always when we calculate the profits on a ton of hay sold off that it has to pay not only rent and taxes and the expenses of making and marketing, but also about \(1 l\). per ton for the manure which is carried off by it, and that this 1\%. is equally taken from the Gram jand if the hay is fed in the yards and the manure puth Nevertheless, on the principle first enunciated of elling what is dearest, it will pay handsomely to sell hay at \(6 l\). the ton-the present price in towns.
The 3-course rotation of cropping, alvocated on the 200 actes of arable, will be looked upon by many andord and agent as ruination to the land. I shall endeavour to show that, on the contrary, if fairly and honestly carried out, it improves the condition, Still, keeping in recollection that he cannot sell off more than 200 qrs. of corn net in any year, and that he should ell what is dearest, the farmer will at present price (if Barley land) grow annually one-third, or 65 acres of Barley, and one-third, or 65 acres of Wheat, and if of 5 quarters of each. If of good malting quality, Barley, thanks to the duty, will fetcl a price qual to the Wheat-say 10l. an acre, or for 300 quo Wheat and 300 of Barley a totalsum of 6000. must not sell off more than 200 qra, net, therefore and equivalent for 400 qrs. has to be returned to the land This may be done to noune extent near a town by most ing back horse manure, or by guano, but tue economical way will be by purchasing cake or chaapet corn for feeding.
the roots, Vetches, Cabbages, \&ce., grown on the remaing ing one-third of the 200 acres wore consumed in 50 beasts, 400 sheep, and 100 pigs, besides the farm horses. The consumption of the
year would pronably amount to some 700 tons of rode 10 acres of Vetches and
mulped up with the straw of the farm, and some 30 ton of hay, together with some 500 (qrs. wf tail curil, , mala incal, or mixed corn (dredge), which can be parchana a little over 1l. the qr., and perhaps 10 the afterinath of the Arass, but by far the largest portion would go to the winter manure heap, and eventually on on thas arable land, And I have no hesitation in aftirming these
foods would be amply paid for by their sale, and that tho duag lett 600 qras. of corn sold off, costing only the arting.
ting. broaching no new doctrine. Instances of this rostem may be found in almost every district in England, fid are generally reported as a success. I am only an siods to induce farmers straight to ruination, and to aep the objects I have tonched upon constantiy before ther ejes. I feel confident that at present prices of arn and meat, farming is a paying business; I have annot be more; it requires judgment and and I an well imapine the exercis of them ron now. And can meat return to \(4 d\). the lb ., and of Wheat to 10 s. the bushel, the farmers of that day will ar out as we do, and with more reason, for such a ge woald tend to reduce again the condition of our prodective capacity of 2 or 3 qrs. per açe. J. B. M.

\section*{AGRICULTURAL EDUCATION \\ AND AGRICULTURAL SOCIETIES}

On course, the annual Exhibition itself is virtually ducation. But it has been felt more and more that theo wirdes of breeding, feeding, and growing, and himself should keep \(u p\) with the material and scientific progreass A farmer of the 19th century must be of treetlamp, a tinder-box, a stage-coach, op the fine fastmiling jacht warranted to reach Leith harbour, wind permitting, in seven days. Some of our readers trill bestow a passing regret on the old-fashioned reoman, a practical man, as they suppose; able to get good crops and keep the land in good condition ; knowing lis business well, but nothing else. But the old English farmer, like the old English gentleman, is to
be accepted with larga qualifications. There was always a sad mixtnre in the class. Some were all one could wish-some were tolerable, and some were so-and-so; but there were also idle and stupid fellows among them, as well as profligates, fools, and downright knaves. Any one who can look back a little way farning was full of misery and disappointment, and that the class itself was not one to be wished back again. It is the landlords, the best judges of their own interests, who wish to improve the men to whom their lands must be intrusted. They have spent immense they naturally wish the master and manager of the costly enterprise not to be the only unimproved thing costly cargo, to a drunken or blundering captain, or one bigoted to old systems of sailing. It is not less important to see what hands you leave a farm in; and everybody knows how difficult it is to find a good tenant when one happens to be wanted. The land is in good condition; there are excellent farm buildings, perhaps a steam-engine. All will go to wreck if the At all events he must know his business. So the West Country farmers started a magnificent College at to recover; itself. But it is not enough, - for the same reason that Universities are not enough, and Public not enough, if there be and the strongest building is done for education fails if the groundwork be neglected. the farmer's son in int, but also most difficult, to take to an agricultural college, or to any place where ge is that educated for his profession, the very simplest book lecture he can hear, will be ali gibber or the dimplest ordinary vocabulary of a farm is very linited, and a enry to any advancement upon it. The unprepared fessional studies in order to pick up the suspend his proof elementary knowledge, and good teachers will be Farting their wisdom papon him till he can acquire how him. A boy eyes to see what they tell him and school and three years at a University without learning anything, simply because he is always supposed to When, for want of previous he is hearing and reading, hearing sounds and srevious preparation, he is only this case, there is important as sound elements are in all day in the open air, conversant with amosement in its gross and palpable forms, and suffers a special indisposition to confinems occupation, caged bird, any. He is a fish out of water, or rather a in his reins, his lungs gasp for fresh gir, his eyes catch ment. His appetites he exists only for life and moveand enjoy. To are strong. He can work, and classifications, and cords and declensions, enumerations, brain. You writo them on sand, and cobsebe next tide of
is no foundation. This must be first laid. But here is the difficulty. Farmers don't like schools. They don't like the village school; it's all Bible and Catechism, with just a little writing and arithmetic. Neither do they like paying even so little as 30l. or
\(40 l\) a y year to find their boy learning nothing they can discover, and the companion of small town tradesmen, the class they most contemn.
Of course a man may be a gogd farmer and not able even to read and write. But in that case he will, anyhow, be a narrow-minded man, incapable of improvement, much at the mercy of educated rogues and fools, and entirely out of the question when it comes to scientific agriculture. He will have to lament his want of education a thousand times, for the unlearned farmer is himself the last man to join the cry against learning. Conscious of his natural powers and his merits, he will justly grieve that for want of a little scholarship he has never got his dae place. But there are some very ordinary and obvious reasons why a farimer should have the best education he can get compatible with a practical training. He is quite as prone to sensual indulgence, to idleness, to passion, to folly, to pride, and to extravagance as other men, and has as much need as other men of the cheap, easy, and harmless amusement to be found in books. A farmhouse can be very dull, and a farmer can be visited with the "blue devils" like anybody else, and then, if he cannot employ himself or amuse himself, he gets into mischief. The rural homesteads of England are not always the happy innocent places that our poets dxeam of. They itself las its rank and sullen weeds. We wish we could see a way to snme system by which the young farmer could be a schoolboy and a farmer still, for, though he wants book-learning, he cannot do with it alone. Neither the ordinary school nor the ordinary farm is a sufficient preparation for an agricultural rollege, and
the objection is thought doubled rather than obviated the objection is thought doubled rather than obviated
by the proposal of preparatory schools for farmers' sons. The Royal Agricultural Socicty meets and meets, and talks and talks, without coming to a solution of this difficulty. The only thing they are agreed upon is that a farmer in these days must be an educated man, and that, in order to derive the least bemefit from pro fessional instruction, he must first be well grounded in the rudiments of knowledge. The Times.

\section*{MANURES AND CROPS.}

The following are passages from one of a short course on lectures by Mr. Wallaoe Pyfe before the Royal Agricultur al College.]
Mr. Lawrs' recommendations regarding the applica tion of artificials in the promotion of specific crops I. That for plants cultivated for their primary organs-leaf and stem-Mendow Grass, Clover, Cinquefoil, Tares, Cabbages, and other fodder plants-the manures should be substances yielding ammonia rapidly, such as Peruvian gunno, sulphate and muriate of ammonia, dung from stall-fed cattle, salts of lime, with phosphate of ammonia, soot.
IL. For plants cultivated for their intermediate organs, that is, bulb or tuber, as Turnips, Mangel Wurzel, \&c., the proper manures are phosphates, sulphates, and carbon-such as inferior sorts of guano, superphosphate of lime, well rotied dung
III. For plants cultivated for their ultimate organs, i.e., their seeds, as Wheat, Barley, Oats, Peas, Beans,
Tares, Clover seeds, \&ic., the manures ought to consist of organic matter, slowly yielding anmonia, as, for instance, residuum from highly manured green crops,
Rape-cake, dung from stall-fed cattle Johnston, who tested some of these last applications, found the returns from 1 bushel of-

A variety of circumatances, some of them failures and some the improvements in agriculture-Clover sickness on the one hand, and deepening cultivation on the other - are driving out our rotations from four to six-shift intervals. We shall, therefore, consider what might be the ordinary application of manures in a six-shift rotation; this woald require very green crop, les or as frequently happens with this crop, after the breaking up of old pastures, which have been known to yield invariably the largest Oat crops. Mangel and Potatos might follow next; the last would require to be manused with vegetable and nnimal manure from the previously prepared dung-heap at the rate of from 20 to 30 tons per acre, according to mixtare of animal and vegetable matter which shoold be applied at the same rate per acre in a well decomposed condition. The calture of Wheat after these fallow crope is a simple procees, and for manure it would be chiefly dependent on the residue from these,
with additions of substances slowly yielding with additions of substances slowly yielding
ammonia. For Turnips, Carrote, sen the land is to
be limed at the rate of 30 bags of shells per acre after Lime, althe Wheat crops.
Lime, "although as we shall see presently an important agent in promoting the fertility of the soil by
calling into action its nutritive principles, and greatly improving the quality of produce, must be employed, however, in moderation, because over-doses too often inevitably occasion scourging crops and ultimate barrenness. In the six-shift rotation the quantity mentioned can be applied only once, and in this manner. The lime shells are carted to the farm during summer, and there mised with an equal bulk of earthy matter, Couch grass, and other weeds for decomposition; road scrap-
ings, ditch-scourings, the earth and root fibres of old headlands, and old hedgerows that may have been levelled-everything adds to the variety, and for this purpose there is good in everything. This mixture is of far easier application to the land than mere carth mix. ture, and the line more easily managed in windy weather. This application of lime is not, Lowever, manuring for Turnips; it is a mere amelioration of the land for the onsuing rotation. The Turnips are to be manured from the previously prepared and well-dcomposed dungheap at the rate of 25 tons per acre for Swedish in the hollow of every fifth drill at 9 -feet intervals; then spread out equally in the hollows of all the five drills with light three-pronged forks, so as to be iminediately covered in by the double mouldboard plongh splitting the drills down the centre. By harrowing across the former drills of root crops a rich soil for Barley is diffused over the undunged intervals, and assists materially its production as fitth in the rotation, since its success, like that of the Grasses, generally depends more on pulverisation than on fresh manuring. Grass for soiling, and hay, having been sown down with the Barley, may be depastured whilst young with one of the most enriching things known, the sheep, whose "golden feet" will do it no injury, whilst those of cattle would poach and destroy the young
plants. Nor must sheep be suffered to crop the plants. Nor must sheep be suffered to crop the eat the crown spikes of the young plants and destroy their vitality
This is the common and natural mode of apply. ing manures; but few are the farmers who can yowaddition and in sid of these old-world manures the artificials of the day, or lag behimd in the race of production. In addition to the imported substancis soda, a white saline substance found in Peru, applicable as top-dressings to Grass lands and young corn. It is frequently adalterated with common salt, which hownitrate of potash (saltpetre) will simply flare up if a pinch be thrown into a hot fre, so that the adulteration can readily be detected. Nitrate of soda ought to be composed of nitric acid and soda in the proportions of 54 nitrogen and soda to growing crops when applied in spring, as a top-dressing, at the rate of 1 to \(1 \frac{1}{2} \mathrm{cwt}\). per the price of this salt ha affected, I find, by unremunerative results to the
importer and by advancing freights: and a very serions importer and by advancing freights: and a very serions
deficiency has cousequently occurred in the quantity shipped from Iquique, which, as mentioned in our last lecture, has, from a place of guano export, become Liverpool, together with small supplies on sale, articles of commerce so situated, to immense speculation, and prices this spring had advanced from 35s. to 40s. a ton as compared whe fact is that this most valuable of all top dressings for (irasses
and cereals is not to be had under \(15 l\). 108 , to \(16 \%\), ton; but even at this high rate this powerful stimulant can be confidently recommended for cereal and bay crops, and especially for the latter, used to a profit eveu 1851 have ron thus

With regand to sulphate of ammonia, the recenk restricted use of gas in the manufacturing districts of England, consequent upon the distressed state of the
cotton manufacture, is stated to hive seriously iaterferd with the use of this salt. But, as exhibited at my last lecture, Prof. Church has kiudly provided me fron brighter and more pur ly crystalline than the sulphate of ammonia of cominerce, inanufactured from blood, and well calculated to slow the innate value of blood manure generally. Sulphate of ammonia is now better understood and more highiy esteemed Grass crops and as a misture with phosphatic manures for root crops. Many, indeed, prefer it to nitrate of soda as a top dressing, being considered less iujurious to the young plant
whilst in a tender state-but the price of lite years has Whilst in a tender state-but the price of been somewhat higher than even mitrate of soda, for we can obtain very little of it in a native state, small
curable from the Mediter ranean; still there is a down. ward tendency in the cost of this material from extended consumption and manufacture, which, under existing circumstances, at least place it on a par with nitrate o ooda, for which it is readily adopted as

But next to farmyard and guano, bones are the grand resource of the enterprising British farmer, as their yearly increasing consumption, whether in a raw or manufactured state, completely proves. The imports show an increase in 1863 over previous years of about 10,000 tons; and the great quintities collected in the Jarge towns throughout the United Kingdom are considerably augmented by the daily increase in the use of batcher meat. At present the largest portion of our supplies are drawn from South America, the Mediterranean, and the Baltic ports; and although the Baltic bones are most in demand, because they bulk largely when ground, owing to the barbarous habit of selling bones by measure, and their consequently producing more bushels to the ton, the bones from other quarters chasing by weight instead of by measure, farmers could thus secure a manure as good in all respects at from 5 s. to 108 . less per ton. But bones are on the rise from the increasing demand, having lately advanced 10s. per ton. The imports into the United Kingdom were:-
1885
lisis
1850

Bones may be rendered more immediately active by boiling to remove the fat; and we have in the Museum a specimen of cleaned bones-but nothing is equal to
their conversion into superphosphate. With reference their conversion into superphosphate. With reference Baron Liebig, to which I referred in a former lecture. It is incredibly fierce:-
"England is robbing all other countries of the conditions of their fertility. Already, in her eagerness for bones, she has turned up the battle-fields of Leipzic, of Waterloo, and of the Crimea; already from the catacombs of Sicily she has carried away the skeletons of
many successive generations. Annually she removes from the shores of other countries to her own, the manurial equivalent of three millions and a balf of men, whom she takes from us the means of supporting, and squanders down her sewers to the sea. Like a vampire she liangs on the neck of Europe, nay, of the entire world, and sucks the heartblood from nations, without a thought of justice towards them, without a shadow of lasting advantage to herself.
"It is impossible (be proceeds to say) that such iniquitous interference with the Divine order of the may perbaps overtake England even sooner than the countries she robs. Most assuredly a tune awaits her, when all her riches of gold, iron, and coal will be inadequate to buy back a thousandth part of the conditions of life which for centuries she has wantonly squandered away."

> (To be continued.)

\section*{Home Correspondence.}

\section*{- Present Appearance of the Crops.-We have had a} fne soaking rain in this neighbourhood, which fell heavily all Wednesday nigbt last, and continued with to saturate the soil thoroughly; our Turnips and Swedes were just at a standstill, but even in the short time which has elapsed are wonderfully improved, and at present the prospect is fair. Not so, however, with the corn crop; there is some good Wheat, even-headed, straw even on good Wheat lands. On full half the Hampshire soils the straw is very short, the head the light andends and gravel it is decidedly bad, with much Poppy and other rubbish; it will not be an average crop. Barley is very indifferent, short, thin on the ground, and of uneven growth, full one-third under the average. Oats are the worst crop I ever remember during over 40 years' experience; they are generally complained of in this district, and many not hesitate to state my conviction that under the most favourable circumstances this crop will not reach three-fifths of an average. Bcans are lofking well, and allowing for all the improvement the fine rain can effect; it would have been an awful business for everything had the drought continued a week longer. Potatos are looking very well, and promise an abundant yield. Our hay is of excellent quality, but a very light crop except the Sainfoin, and meadows on a deep soil, which are a good average; but taking the whole
crop, we shall not reach more than two-thirds of an average shall not reach more than two-thirds of an shire, July 3. - The Wheat crop generally in this district is very thin, having been mach injured ly must be below an average, buter and wireworm, and at first sight be supposed, as it is well set, particularly and ahort in the straw. Barley are light in the ear but will yield well. Beans are onder the in the straw, very much so. Mangels are healthy, but want rain

Turnips destroyed by fly. Hay a short crop, but well
grederick F. Hallett, Brighton, Sussex, July 3 got. Frederick F. Hallett, Brighton, Sussex, July 3. deficient. Wheat a fair crop; bad on the light lands. Barley good. Oats ball, nearly a failure. Beans under average. Peas the same. Hay under average, well saved. Roots promieing. We had a fine rain last
week, which will very much benefit all crops. Potatos much healthier up to the present time than they have been for some years. When harvest will be here canoot exactly say, but I should think in a month from now. We have had a glorious summer up to the present. James Eames, Lynch, IFidhurst.

Crops in South Hants District, July 4.-The Wheat crop in most cases where a full plant promises to be an abundant crop, and although in many places the plant
is deficient, yet the crop has improved wonderfully and carries a good ear, which under the influence of the present splendid weather will probably yield over an average crop, Oats are everywhere very deficient, in my opinion owing to the dry seed time, and cannot under any circumstances yield an average crop. Barley : This crop exhibits a fair quantity of straw where the land has been done well, but is going off prematurely, is patchy in colour, and not likely to produce a good malting quality, and will barely reach an average
crop. Winter Beans are well podded; spring Beans crop. Winter Beans are well podded; spring Beans
and Peas are in some cases attacked with aphis, but the crops are not damaged like those of last year, and will probably yield an average crop. The crops of hay are very light, both of field and pasture land, but the crop has been well harvested, and will prove of very superior quality. Potatos are looking very healthy;
the early crops which have been dug are rather small in size owing to the late dry weather, but seem to be entirely free from disense. The plant and promise of Mangel Wurzel I should say was never better. Swedes and Turnips on the whole are promising, and may Bursledon, Southampton.

Water Economy of Great Britain.-The springs upon which our rivers depend fur the latter part of summer and the autumn supply of water are now beginning to decline from their maximum height,
obtained from the winter's rain and snowfall. Those who take an interest in meteorological science and its practical relation to the great social question of water supply will, doubtless, have observed and perhaps recorded the height of water in their wells at different periods of succeeding years. Such of your readers as have done so will greatly oblige me, and I trust do
some public service by communicating to me any some public service by communicating to me any
tabulated information they possess, with a view to its use on an inquiry into the water ecollomy of the country. If observations were made and recorded of the height of outbursting springs and of water in wells, we should learn how the winter's fall of rain and snow ruled the subterranean water levels
in the water-bearing strata during the summer and in the water-bearing strata during the summer and
autumn seasons; and as the time cannot now be far off when our works of drainage will be designed with some regard to the storage and utiliaation of the water we
heedlessly discharge in winter, I hope I shall succeed not only in collecting any information in possession of those who have recorded their observations, but indacing others now to observe the height of water in their wells relatively to the height at this time last year; and further, to
observe once each month for the remainder of the year the same relative conditions as far as they can. All records will be most thankfully received; and let me remind your readers that the drought of last year and this will in all probability occur again, and that it is the duty of us all to provide against an evil which is being augmented by our own acts. J. Bailey Denton, Woodfield, Stevenage. [We shall be glad to publish in these columns any information of the kind for which
Mr . Bailey Denton asks.]

Finances.-Mr. Barnett presented the Report, from which it appeared that the Secretarg's receipts during the past month had been examined by the Committee, and by Messrs. Quilter, Ball, \& Co., the Society's
accountants, and were found correct. The balaice in the hands of the bankers on June 30 was 1367l. 5 s. 6 d The balance sheet for the quarter ended June 30,1864 and the statement of sabscriptions and arreare were laid on the table, the amount of arrears then due being \(480 l\).
Prize Essax.-The winner of the prize of 201 in Class VI. on Water Supply was announced to be the Rev. J. C. Clutterbuck, Long Wittenham, Abingdon, The papers marked "S" and "Ora et labora" were commended.
Plymouth Meeting.-The complete plan of the show-yard was laid on the table, the contractor having reported the whole of the sheds covered in, and all in readiness for the opening. Colonel Challoner reported 10 . 10s. each for the Public Dinner to be held in a marquee near the Hoe at \(6 \mathrm{p} . \mathrm{m}\). on Tuesday the
18th inst. be taken by the Society. The Steward of Forage having reported the failure of the green crops on which he depended for the sapply of the show-yard, the Secretary was instructed to call his attention to the absolute necessity of procuring some green food, at whatever distance it may be growing. The Local Committee were requested to authorise the contractor to close the show-yard imme.
diately where the diately where the footpath crosses the yard. This
report was adopted. It was moved by the Earl of Powis, and carried, that the President be authorised to present cards of admission to any officers of the French squadron expected at Plymouth, and that the President be authorised to give free admission to any men of the French squadron in their proper dress or uniform that the French Commander may think proper to allow to attend the Show.
Houss.-Mr. Barnett stated that the Committee recommended that the staircase, hall, and basement be made clean with such whitewashing and painting as may be required; that the secretary's and clerks offices be thoroughly cleaned, and such other parts of the house as require it.

Show-yard Contracts.-Mr. Randell stated that the Committee reported that no definite reply has been received from Mr. Manning to the request that he would give the prices of offices enumerated in Report of April 4th. The Committee therefore ask for a continuation of the unlimited authority given to them in reference thereto. They regret that the powers of the Surveyor appointed for the purpose of examining and reporting upon Mr. Manning's charges have been toagreat extent neutralised by the Secretary having signed an agreement to pay to him the fnll amount claimed, and
they recommend that in future no such contract be signed until it has been submitted to the Survegor. The Surveyor, notwithstanding such agreement, to be instructed to report fully as to Mr. Manning's bil
The following noblemen and gentlemen wr appointed on the general Bury Committee:--Sir E. Kerrison, Bart., Chairman ; The Earl of Powis, Lord Cheshan, Lord Feversham, Lord Portman, Lord Trede gar, Major-General the Hon. A. wish of the with what they believed to be the general asrangement which had had resolved to give up the atween the society had existed for so many years Which the Transactions Mest been Blackwood, and under dournal of Agriculture-and given to members at au
annual subscription of 8 s . Under the new arrange ment the Transactions would be published indepen
dently, and sent free to all members intimating a vish to have them. They would be issued in an annual number, and, as at present, the contents of two years would, along with the list of members, constitute a volume. It was due to the Messrs. Blackwood to report, that they had always discharged their duties to the satisfaction of the directors, who, in a forma resolution communicated to these gentlemen, and recorded in the books of the Society; have stated that they "cannot permit a connection such as bas existed between the Society and Messrs, Blackwood since 1828 to terminate without expressing their sense of the able and satisfactory manner in which these gentlemen have invariably discharged their duties, and of the friendly relations which have existed between them and the Society over a period of nearly 40 years."

\section*{The Show at Inverness.}

Mr. Hall Maxwell reported that there was every prospect that this exhibition would be carried out in manner satisfactory both to the directors and to the public. The entries already made were as follows:-
325 head of cattle, 125 horses, 850 head of sheep, 38 swine, 288 poultry, 700 implements. It was expected that the implement department would not be so well represented, the locality being so far north; but the entries were already 700.
The Show of 1866 is to be at Glaggow, and that of 1867 is to be at Aberdeen.
Chemical Department and Firld Exprriments. Professor ANDERSON reported that during the spring months tively little had been done in the more general inquiries. They had had samples of Grass grown in different fields, and
had been prosecuting inquiries intn tho composition of the
Bean plant at diferent periods. He bad instituted a conBean plant at differant periods, He bad instituted a con-
piderable number of field oxperiments, the result of
which, be Which, he trusted, would be for the interests of agriculture
the heading of the completed. This led him to refer to
thopriveme-field experiments. The subject had been taken up by the directors. Some time ago. in consequence of proposals he had made, a committee had
been appointed for the purpose of organising an efficient system of field experiments. The report had been submitted to the directors, and would, he trusted, be adopted and
carried out. He might explain that they proposed that ricts of the country-these experiments to be carried out or a precisely similar plan with any other agricultural experi-
ments. They proposed to commence caulfously in the first iustance, and tio divide the county into districts in which the
oxperiments will bo carried out. It was proposed that a field experiment committee should be appointed by the 太nciety, to that in each of the districts a local committee should be country should be under the immodiate surpervision of the peneral committee for their instructinus being rroperly simuld make the necessary arrangements for their publication. experimouts very considerable amount of labour both to the experimenters analysis should be made in all matters necessary to elucidate
the results, and this would add considerably to the work the results, and this would add considerably to the work

The Veterinary College.
Sir Alexander Gibson Maitland reportei:-It affords the Virectors much pleasure in being abinary College, under the able supervision of Professor Dick and his staff, continues to sustain its high character as a

4. Tiler Medal to Genrge Mencies, Bullions, Dunferm line, firs sheaf elevator
5. The Silver Medal to A. Brockie, Fala Mill, for improved

This concludel the business, and the meeting separated at two o'clock.
BedFond.-At the annual dinner of this Society, after the very successful meeting held on Friday last, the following remarke were made on Prizes for Labourers, Bedfordishire Agricultu
Eucation. Mr. Whitbread said :-
At the next meeting, which will be held in October, certain prizes are to be giver to agricultural labourers. Of these abourer who has reared the largest family of children without having recourse to assistance from the parish; the second prize was for those labourers who after those two followed prizes for skill in draiuing, place last he had nothing to say; they were very goon, But was it a lair subject for a prize that a mere two to that bargain. Why not conaider the master as well as the services
of the man? Was it right that s man after 50 years of faithfui of the man? Was it right that a man arter
service - nearly a whole lifinme ahould come to this
Society and have the opportunity of winning a paltry prize ? If Society and have the opportunity or wist was the right man to do 8o. Then, as to the other brize, for a man whe he would ask any
the largest family without parochial relief, heonsidered that a genize should be given by this Society under such conditinnswhether any one prosent would san by thair own. They ought
gauge the fe日lings of the poor man
have a spirit of independence upng the subject. It seemed to have a suirit of independeuce upna the aubject. it seemed
the labourer, and savoured of the time when chey looked more ouly parish for relief than to their own exertions, and the
ould regarded was the workhouse. After further recoarks he said he would make a suggeation. Giver prises to the labourers for their skill. Give thom prizes for gardening; not give them prizes for rearing thelr famillies. He wonld suggest that tbe prisos be given to labourers for cultivating their gardens and allotments ; any condition that tended to
stimulate a man to exerense his akill and make him induscrious would be to exercise his skill and make him industrious would be far better than the prosent. Lot this yoar pass
over; in the meantime he asked them to take the matter into
Mr. Canrles Howard said : If Mr. Whitbred had mixed with the labourers during the last 20 years as minch as he (Mr. H) had done, he wrould have formed a vers different opinion to
that to which he had given expression. He had had worked on the farm be necension. He for 56 years; be had received all the prizes the Society could give him, and he
believed that his conduct and success had very great influence upon the agricultural labourers of the locality. He could made by the honourable prizentleman, were obrectly appreciated by the labourers. It must be remembered that they wero
not s., highly cducated ss some other clasees of the upon the points adverted to ; perhaps with advancing whether other prizea might not be wisely qubstituted for the
wresent, but so far he believed they had done present, but so far he believed they had dnne a rist deal of this. great plaasure in being identified with an association like and. and he had pleasure in saying that in cultivation this ofunts rere not scouainted with will be intoresting to those who birthpiace of all agricultural facieties. Wo go brok to the cime of Francis Duke of Bedford, the great patron of agriculture, Whose sheep shearings at Wobura exercised so all parts of Englând, and distinguibhed personages from the the farmer brought to bear on all matters connecter with field Club, then the Royal Agricultural Society, and the approaciing that perion of the year when the crops would be lew that 28 a season of jovfulness and had no doubt, would to many of his brother farmers it would be one of great
anxiety. He could not digguise the fact, that the farmers anxiety. He could not disguise the fact, that the farmers
would have to suffer from a short supply of labourers, and if hey were to compete with all the world, and that was really appliances. He would rather soms one else had spoken upon estates in this county the seythe and the reaping machine were prohibited implements. He could tell those gentlemen to whom his remarks referred, that one farmer had lost a conHe corld tell gentlemen how this prohibition had arisen: but they might. depend upon tinis, that they must not expeot to preserve their came unless they had the farmers with them. Mr. Henry Corber had attended a great many shows in orses for agricultural purpoese shown that day were the best good indeed. He wad known the Beal hacknoys were very years, and therefore he was qualified to spask of the show at Biggleswade last year, when the stock occupled a
little bit of \& feld, whilst to-day the exbibition was wonderful. After his dutios he went mund and looked at the other stock, cattle, sheep, and pigs, and found that all were vary good. He raspect to certain prizes for labourera. He entirely differed from him, and was quito sure it wouli be a great mistake if those prizes were discontinued. He bad heard gentlemen in being given as prizes, but he hoped the Committee of this been made in the list.
The Mayoz (Mr. James Howard). - Speaking of the spread The Maror (Mr. James Howard).-Speaking of the spread years great effirts have been made to extend and improve the edncation of the poorer classes, and much, very much good
has been accomplished; no corresponding effurts, however, has been accomplished; no corresponding efforts, however,
hive been made to bring a superior ediscation within the hive been made to bring a superior ediseation within the
reach of the farmer or other middle-class people in rural istricts. If it be a national advantage t, give a good cace
tion to the labouring classes, surely it is a matter of no
inconsid rable importance that the farmer should be ablo to inconsid'rable importance that the farmer should be ablo to Middle class School, where the sons of farmers could receive a suparior elucation at a reasonable charge, has been felt and
met. The Suffolk people have buit a splendid school of thit kind at Franulingham, where about 300 youths are receiving a first-rate and appropriate educat on, and where the charge
for board, lodging, and education is only 25 !. a year, which for 300 days in a year is jusi 18 . Sd. a day. He thought that in Bedfordshire they could soon have a similar schnol were they
to set about it vigorously. He simply mentioned the subject had only one other question to name-that is the prizes to labourers touched upon by Mr. Whitbread. He was an advocate. and s staunch one, for the prize syatera as applied to ohjection to rewarding labourers for length of service and
bringing up a large family. He maintained that the offer of any prize should carry with it an incentive to exertion, and he felt confdent no genclemen present would maintain that these labourer. If a man is to be rewanded for what have been and not by an agriculturai society.
Mr. JoHs How ARD maintained
deserving of commendation, and tid not see why he highly as deserving of a prize so s farmer was for fattening pise, for having admirsbly nerformed the dutios of a parent undor tryIng dimculties Ho entirely disagreed with feeping one situstion for 30 or 50 years should in future be diecuntinued, as he
verily believed that it tended to encourage men to be good labourtrs and so deserve the long earvices to their masters and their

\section*{Farmers' Clubs.}

AbERDKEN: The Game Lases.-Last week a meoting of tenant-farmers, and others intereated in a modifica tion of the game laws, wes held here-Wm. M.Combie,
numerously attende
Mr. Coreravn, Mill of Ardlethen, moved thefirst resolution, as follows :-
"That hares and rabbits ought to bo excludat form the operation of the kame laws; that their preservation being in-
evmpatible with good farming, is contrary to the nublic gond. and that, therefore, all contracts having for their ohject the
preservation of bares and rabbits, ought to be deelared illegal." He eaid-This resolution proposes "that hares and rabbits be excluded from the operation of the gane laws ;" but although it proposes that they be taken from the game laws, it by no means proposes that they be extirpated-quite the reverce, for wir would be extremoly sorry to see the day when our proprietors and their friends could not enjoy a good day's sport on our farms; we take a pride in showing them a good head of game : all we wish is, that having hares and mbbits taken from the game list, we may have a legal right to put them down to such an extent as that our crops do not suffer from them. We are all aware that a bad feeling often exigts between proprietor aud tenant where there is a large stock of game, and this arises in a great measure from a misrepresentation of facts; or, at least, from having them highly coloured by the gamekeeper, who invarinbly has the ear of his master. Now, if this resolution were carried, and the tenant hid an interest in the game, he would be found to be The proprietor's bost keeper, and the services of the deplored feeling at present existing between these parties, and which is so detrimental to the interest of both, would in a great with. The reasons assigned in this resolution for having hares and rabbits excluded from the game list are, "that
their preservation being incompatible with good farming, is contrary to the public good." Now it requires me to say a little on the part of the resolution, to a me ' ing of intelligent farmers such as the present, th show them an overstock of hares and rabbits is incompatible with gooll farming. What a disheartening thingit is, after he has improved his land by drainating high cultivation, having the seed put in the ground in good
condition, and his hopes under Providence of a remunerative crop, to find morning by morning as he passoe over his field, that, instead of benefiting lis family and country by making two blades of Grass and corn grow instead of one, he has not been able to make the one grow, for day by day as it eprings up, night by
night it is nipt equally apparent that an overstock of hares and rabbits "is contrary to the publie goon," for it must be allowed hy all that the farmers are the manufacturers, in the
mW state at least, of beef and bread. Now. instead of being discouragei by having their Grass, Turnip, and grain crops deatroyed, as I have been describing to not rather to be encouraged to produce as much as possible of both theso necessaries of life, so that their price might be kept within the means of a large and moral point of view. I at once say that with the professed noacher I have no sympathy as a poncher. He may at first be, and often is, an honest industrious man, and a respectable member of society in his own sphere of life; but no sooner does he begin to poach thanthe throws aside the pick and shovel, as he finds by the quantity of hares and rabbits, that instead of earning 30 pence at his former employment, he can by taking his gun and netg carn 30s. per day; finding poaching thus pmfitable, he continues until he is convicted ; once convicted, he loses all self-respect, and ultimately rushes into crime. Now if we could by thking hares and rabbits from the game list take temp. tation from the porchers, and instead of having them what I have been describing them to you, pests in society, have them honest and industrious men and good members of society, would we not deserve the support of the community in this movement? Gentle"and that therefore all contracts having for their object the preservation of game and rabbits ought to be deelaned illegal." Some may think this rather and necessary; for in my opinion if it is declared illegal to enter into any private contract for the preserration of hares and rabbits, the taking of them from the game list to-morrow is of very little consequence
inde can carry it, by being united amongst ourselves, by moderation in diseussing it at public meetings, such as the present, and by showing that we are asking only what we are in justice entitled to.
Mr. J. W. Baretiy, Auchlonsan, seconded. He said-The gnme laws contribute more than any other enuse to breed ill-will and disagreement between land blame the landowner so much as the laws which expose the landlord to great temptation. To nne thent he lets the land, to farm, to sow, and to reap the crops, which, as the fruit of his industry and the means of his livelihood, are to belong to him, and yet the same land to a second tenant to rear animals to feed tenant, which belong to thy and truly belong to the first property can helong to himas really and truly as any property, of which we heard so much ine rights of
with these laws? Many landlordo, honour to them, resist this temptation and allow him to kill the gam to whom they really belong-the man who feeds and
maintains them; but the great maj rity cannot resist maintains them; but the great maj rity cancot resisy the temptation of an additional rent, which they may think comes from land, but which is in reality wrung iation increase in wealth, and the temptation of high shooting rents increases, it is hard to say where game preserving may stop. There are several phases of game preserving may stop. The where the landlord reserves the game for the fair sport of himself and friends, and this, I believe, is what was originally contemplated by the game laws. Were their operation confined to this law, nobody indeed would object. Such visit give opportunities to the landlord for observation and friendly intercourse with the tenant, which cannot fail to be highly beneficial to both It is not against thi phase of to-day. We do not wish game exterminated, we wish only that they shall not be preserved to excess, and this can only be attained by the modification of th law we propose in the resolution now before the meeting. The second phase is where the landlord let the shooting to a tenant, who is almost invariably a stranger. When the landlord lets the game he over steps the fair limit, and places himself in a false position. The land which he has already let he lets a second time to another tenart, wo, uame eat of the game laws, can by means of game eat up an destroy the crops which belong to the first tenantand the source of his livelihood. The game lives on the farmer-on the crops which belong to him, and the sportsman comes and claims the garne as his. Be the laws what they may, it cannot he denied that the landlord, when he lets the shooting on cultivated lands, is reaping where he never sowed. There is still another phase of game preserving, happily
unknown, I believe, in this countr. I allude to the unknown, I believe, in this county. I allude to the case where the landlord preserves the game to excess-
feeds them on his tenants' crops for the purpose of making a profit by selling them to the game.dealer Gentlemen, I do wot care to characterise this mode of game preserving, its injustice is only equalled by fe meanuens. The resolution before the meetios affirms that game-preserving is incompatible wit good furming, and therefore contrary to the public good, and against the general welfare of the community.

After illustrating these propositions at further length, Mr. Barclay concluded-The question aris! 8 how are we to have this resolution carried into effect ? I answer simply by sending to the House of Commons men who really and truly represent our interests and wishes. We have the matter to a great extent in our own hauds. How cau we expect the game laws to be otherwise, when for generations farmers have been sending to Parliament as the representatives of their wishes and interests men who were repledged by their private interests and by the prejudices of caste to maintain and extend the operation of those obnoxious laws.

The resolution was put to the meeting from the chair, and carried by acclamation.
Mr. Werster, Newlands, Fintray, proposed the next resolution, as fullows :-

\section*{"me law cases."}

After some introductory observations as to the origin of the game laws, Mr. W. proceeded :-No doubt landlords profess that the reservation of the game is part losel rent, but this is not so easily understood wheu closely examined. They let the ground, but reserve no claim on the produce, and, consequently, can have no claim, because they take an equivalent in money for he use of the ground. And to institute a claim to the wild animals, under such circumstances, is simply to set forth a claim without a justifying reason, and at the same time to forun a conglomeration of interests without a possibility either of ascertaining or maintaining the line of justice between the laudlords' and the tenants' interest in the soil. Mr. W. referred to the earlier Acts of Parliament, and to those more recently enreted; but maintained that no law could be effectual \(r\) permanent when based on an immoral principle. And will any one venture to assert that the laws are based on a moral principle that permits, nay more, protects a landlord-first to let his ground tor agricultural purposes, and then to convert it into a game preserve at his own pleasure and for his own pront, or common ocourrence in Aberdeenshire to find a large district of country all leased to agricultural tenants, with the exception of a few patches of plantation, and the whole lot, or what is called "the shooting," set in tack along with the mansion or some ancient seat. In one case which came under my notice, the lease extended to five jears. The tenant on entry stationed watchers on every country range or hill-side to see that the enantry, \&c., did not disturb the wild animnls whilst eedink on their crops. If any person dared to injure any of those atimals called game, then the thunters of a national code of lawn were immediately invoked, and executed against that inilividual. The otber part of the watoherg' duty was to destroy such auimals as might be orpected to interfere with the game. In the exe
their own homesteads; and as the tenantry ciosi by the hundred and throve beautifulls multiplan and rats and mice also increased and were unturlen about the house, the feeling of an overtixed teamet rose almost to the revolutionary point. By thr sim
the first three years of the lease had passed a watcuers were then dismissed or coaverted into then to catch the formerly wild animale, and for a conpide. able time an expert trapper could have easils, nu actually did box, hares and rabbits, every maghi bi of time, which was forwarded to the London lengrt The whole or nearly the whole money nalue the. obtained was, in the first place, a sum wrestel ton the tenantry, but the sum, although han fod to : tenants, would not have been equivalent to the loss, because amongst Turvips for examplo the \(-\frac{1}{2}\) animals seldom eat more and often less than th Turnip, and the remainder is lost. Mr. Webse went on strongly to condemn the practice of intrducing clauses into leases binding the tenants, the with succeas withstanding any Act of Parliament to the conian giving examples of instances of this sort existiug : Aberdeenshire. Mr. W. theu read the resolutine cated in the precelution is change such as that ind peace and harmony among the cultivators of then which is essential to the public interest and the up building of a united community. After consideria the game laws, I am astonished that the proprietore the soil have not in a body and with one voing
demanded to be released from sitting in judgment in game cases. There could not be a mure invidion position, than a proprietor adjudging a tonant to puy penalty for slaying a hare that had fed on the tenani crops
Mr . Cochran, Little Haddo, seconded. Surels ath What has been written by such an authority as on powers be taken from the Justices of Peace, and thu all cases be tried ly the Sheriff of the Counts on in testimony of nut less than two wituceses.

\section*{Mr. Canipbell, of Blairton, then moved-}
"That a commit tee be appointed for the purpzese nf trow
 resolution.
In supporting this motion Mr. Campbell sail- \(\mathrm{Tr}_{\mathrm{f}}\) purpose of protecting our own interests, but a the interests of the community at large, againes th1 bann of all freedum, class legislation ; for und at edly our game laws are a class law. Ynder our presont system, a farmer's capital is almost smothores in the swaddling clothes of old feudal custome an! usages, so that it is no comparatively unremuentive. Wo often hear of limdlords complaining tha not get tenants of sufficient capital, so as to give is development to the soil. Now, it is mell kooma thas capital is abundunt, and always speedily drame I channels where"its'course is free and unubstructel, naturally directed from those encumbered op sum. Thold that every law or custom that tends to olstave the producing of food for man from the soil ounhit be abolished. In connection with game, the quettim presents itself-Is our legislature warranted in prol ing sport for our aristocracy at the expodords mon the million? I have always find a legitimate amount of would a bright day for agriculture if landion would trust more to the energy, enterpuise, and faith of their tenantry, and less to the arou or wos law to coerce them.
bink the sport would beswetened with the bat he was coursing through his tenants' crops, will bis tenants' best wishes, rather than doing so strength of law. It is certainly not a ate sur harith that such absurd laws should exist in at. Grmers, a representative Government.
30 years; but I am ashamed plind following of our landlorave them in their class legislation. other class of the community the
present? Undoubtedly not. I would arouse us from our lethargy, 1862 might be sufficient to do so

Guenon to illustrate his whim the individual cow, and the the milking properties of hinder part of the udder, reproduced, as if there was really the of practical importanice in them. We presumae mader in not practically here presented to the Euglish soglist dairy manacically acquainted with the subject of rer Caeshire, Otic and well established industry,}

Western and Midland counties; or he would hardl give such undue prominence to the fameles and whimical discussions of amateurs.
A seusiblestraightforward account of the practice of the best farmers in our dairy dietriets would be worth to the English farmer far more than all the novel ties and surprise that can be culled from continental writers. Hers are 17 out of 100 pages on the cow devoted to a cousideration of the "escutcheon," or the pateh of upward hair on the buttgoke of the cow.
On the ether hand we have to report the substantial excellence of the ohapter on the buildinge of the dairy farm, where the author is evidently muoh more original and satisfactory.
The following, on the eropping of a dairy farm in quoted from Mr. Harding in the Journal of the Agricultural Society:-

A farm of 150 acres in this county (Somerset), of fair quality, divided into 110 acres of pasture and 40 of arable, would, some yeara ago, probably have been stocked with 30 cows, 5 or 6 heifers (to keep up the stock), besides a few horses. The arable course would have been 1 fallow, 2 Wheat, 3 Beans, 4 Wheat again, 5 Clover, mown twice, then fallow adain, Barley being crown occastonally on suitable soll." It was thought that on the pasture land no more cows could be kept than the one half would maintain in summer, the other half being mown for winter keep; that would give (allowing 3 acres per cow) 90 acres for 30 cows, and 20 acres would be left for the young stook and horses. The arable land at this time received the greater part, if not all, of the manure.

A farm of this description would now keep 50 cows, The larger part of the arable land would be in Graws and roots, corn being grown only on the decay of the Grass plant, which, instead of being mown, would be grazed by the cows, and admit of being stocked a fortnight earlier in spring than the meadow Grass; the straw would be cut into chaff and mixed with roots, meal, oil-cake, or some other subatitute to make it equal in nutriment to hay. The roots would be chiefly grown by artiflial manures, and a portion of them fed off by dry sheep, so that a considerable part of the yard manure could be spared for the pasture land. Although I have spnken above only of an increase of 20 cows, I know some farms on which the extra number is even latyer.
"Where the farm is wholly pasture, as is the case with a large number of the dairy farms in this county, there cannot be as large an increase of produce as is stated above. Yet even here, ns the land is made to carry as much is cock as possible, the increase in the nearly all their land and sell the cows in the autumn looking forward to replacing them in the spring of the year. This neems to be an expensive mode of increasing quantity of milk, the Grase is of far more valuo than the hay:

Others, again, lave adopted the plan of preserving a few acres of aftermath (nfter being fed once) till the spring; the young Grass is thus drawn up by the shelter which the old affords, and consequenty comes
to feed carlier than it would otherwise do. This feed is valuable for turning out the esws by day; it thus both lessens the consumption of hay and increases the yield of milk. Among my acquaintance, the farmer in Leicestershire, and makes both butter and cheese. His farm is a loany soil, not much affected by drought , so that it is generally in a growing state throughout the summer. He keeps only cows and young stock. The cows have the first feed of every field, the heifers following them in the round of the farm, A man brings on the rear to clean up the droppinges so that
the field is clean and fresh for the cows on their next round.

The building of houses and yards for the accommodation of the cow has not a littie tended to an increase of produce, inasmuch as it has enabled us to keep the stock of the land during the wiuter months.
Grass consequently grows earlier in the spring, and Grass consequently grows earlier in the spring, and
enables us to mow earlier, so as to secure a better feed on the after Grass. The introduction of artificial manures has rendered us great assistance, especially for arable lands, although Boe pave been used on the pasture, but not to such an extent, nor with such pasture, but not to such an
success, as in Cheshire. Bexides all this, nearly all the wet lands have been drained, and the wide and useless hedgerows grubbed up, so that our atmosphere has helping drier and more healhy. Nature a longer summer and a shorter winter. A large quantity of cheese is made from some of the hills which formerly only fed a few half-atarved sheep and cattle. Some of these improvemente may seem to be of small importance to the casual reader; but when carried ont through a whole district, as in this county, the effect is great, and these, I believe, are the chief cansen which have led to a few years 25 per cent."
The following is Mr. Horsfalls description of the mode adopted by him of managing his permanent

Clover is not so much sown on dairy farms as it wonld mo
could be eafely foid by cows.
pastarem, which are heavily stooked during the sumunee senson:-"The heme pasture of barely 15 acrea carries
my 20 milk cows duriag the day. They are houved during the night. This clearing the pastures by night hat in some degree the effeot of change of pasture, and prevents their lying so much on the Grass they eat. adition to the 20 milk cows, 20 ewes, with their lambs, graze and fatten on this home pasture of 15 acren. Thene ewes are suppliel with halt a pound of rape-cake each per day. It will be ubserved that the dung from the cows is likewise curiched by the extra food given to the cows in stall. Several titnes during the ceason a labourer is sent round the pastures to spread about the dung; for this operation I prefer wet Weather. My other pasture are also rich feeding pastures, and carry a beast and an owe with her lambs per aere. During July and Auguat the coarse tufts of Grase in the pastures are mowa and carried home for fodder for my homes. I prefer this pasture Grate for horses to that from aftermath, which is too relaxing. These pasture mowings more than auffice fur the bulky food for four or five horsee during July and August, The surplus is partly eaten by the cattle, the remainder being converted into hay, and mized with cut straw for ateaming. After this mowing of the tufts the pastures assume the appearance of aftermath, and the animals grage with appetite over the whole. Late in autumn, and early in spring, the ewes are continued on these pastures, which they graze quite elose. They are housed during nevere weather and at night on boarded floors, and turned on the pautere daring the day through winter in fine weather.
"To tiese frequent outtings of my meadows, sud indebled grasg of my pisteres, 1 am in some dejre

My successful use of rape-cale their produce. my attention to be given to the cultivation of the green Rape plant for fodder, of which I produce two crops during the year. The sowing for one is made towarde the close of June or early in July, after early Potatos, or on other vacant ground enriched with the fresh excrement from my cattle. The produce from this sowing is cut towards the clowe of September, in Octoben, and oarly in November. To mocerthis the quantity, I measured out 400 equare yards. which was cut in dry weather; the produce was upwards of \(1 \ddagger\) ton, being more than 16 tons per nere. This cuting whe made before the crop had attained its full growth. The average over the whole would be mor

Towards the close of July, or early in Augnst, I sow Rape in a meed-bed, for which I use the headlands of crops, which are horse-hoed. These plants are taken from the seed-bed, and planted after lifting the Potatos in September or October, and produce a erop during the early part of May. Though the operation of planting out is somewhat tedious, yot the produce being available at a time when green food is scarce, I find its cultivation remunerative. My produce thit spring crop is cut in time to be t llowed by Cabbage spring crop is cut in time to be \(t\),llowed lyy Cabbage
and Kohl-rabl. The propertice of green R ipe as food for sheep are well known. In Morton's Cychopedia I find a complete analysie, showing it to be rich in flesh and fat-forming constrtuents. Dr. Voelcker charac terises it as richer in fatby mattor than any other green crop ased for food. Daring the month of Ootober, and early in November, I give it both to my millt and fattening cows; they derour it with reliwh. I have as yot found no green
senson of the year.
"In cultivating the Cabbage and Liohl Rabi, I find it advantageous to plant them in rows of 4 feet to 4 feet 6 inclees apart, with Putatos between each row. As the Potato forms its tubers and expands its foliace, whilst that of Cabbage and Kohl Rabi are comparatively small, I obtain an abundant crop of each. On the l'otatos being lifted the Cabbages nearly cover the whole "The

The produce of the Cabbage exceeds that of any other vegetable 1 cultivate; yet on account of its flavour
I limit its nse to a less quantity than that of any other green food. The Kohl Kabi, though not equally productive with the Cabbage, is in flavour somewbat more agreenble."

We must add that the work is difficult to read by an English farmer, owiag to the retention of foreign weighte and measures, which ought to have been comvertod into English terms for English readera.

\section*{Miscellaneous.}

Curioms Accident to a Horse.-A singular accident se a horse of mine and his subsequent recuvery ares \(I\) am ansured, of such interest that I have been requested to ask your insertion of the case. About a month ago the horse in questioll siipped and fell in his the lowe his head doubled under him, fracturing the lower jaw across-transversely from behind the tuvh on the one addition there was a deep flesh rent across the gums. An attempt was made with a splint to bring the bones into juxtaposition, but as in ten days there was no evidence of any union, the ends of the horg
threequaters of an inch apart, and the horse having lost condition considerably, I sent him to Mr. Cox, the veterinary surgeon of Mount Street Grosvenor Square. He at once decided that the only alternative was the removal of the fractured bone. This
he most skilfully effected the same day (19th of June), the horse, of course, heing under the influence of chloroform. As he describes the operation to me,-"I first made an incision at the edge of the gum, close to the teeth all rond and continued dissection until the teelk, he vessels were then becured, and the jagged ends of the presenting bone ecured, and cawn off to form a smogeth surd with sutures. Since the to cover the end, and secured with sutures. Since the operation the horse has shown no evidence of pain or
even discomfort, has fed nuinterruptedly well, and regnined his condition, the wound is all but completely healed, and be will return home towards the end of thin week, until which time he may be seen in Mount Street. Aithough the whole of the lower incisor teeth, and one tush are gone, there is no external deformity resulting, the lips and chin being in natural position. There may be some difficulty in bitting him, but a simple contrivance will no doubt overcome it. Should you think this statement worthy your acceptance, I venture, in acknowledgement of Mr. Cox's skill, to ask your insertion of it in The Times. M. W. Wilson, Cirencester, July 3, in The Times. The following is a more technical description of the caso :-
"On the 19th of June the horse was sent by rail to London, to be submitted to Mr. John Roalfe Cox, veterinary surgeon, of Mount Street, Grosvenor Square, who found the following oxtending from behind the tush of the one side of the mouth to directly in front of the tush nn the opposite. The fractured ends at this time were separated to the extent of an inch, and tongth of the fracture-i. eo, from tush to tush across the monit. There was offensive discharge from the wound from the large portion of bone broken off being now dead, and the sloughing condition of the fleshy parts. The presture of the bandage used in endeavours previously to counfine splints had
also occasinned deep wounds in the gums. Mr. Cox, determining that union of the fracture could not take place, propnsed an operatinn as the only alernativo to save the horee, as be decided us to act upon this advice as affording a last chancz of saving a good hunter, particularly as it would subject him to no suffering. Mr. Cox purposing to give chloroform, in accordance with his invariable custom in the numerous operations coming under bis bands. On the same day of his arrival in London the operation was performed, the horse being fully under source of suffering. The incision was first made at the edge of the gum, all round, and close to the teeth, and dissection conticued till the broken bone was released. The bleeding vessels were zecured, and the jagged and irregnlar edges of the presenting end of the broken jaw sawn off to form a
smonth surface; the soft parts were then made to cover the smonth surface: the soft parts were then made to cover the
stump, being confined by suturea, thios completing the operation. The horse on awaking from chloroform gave no indication of suffering, and has continued from that date to do uniuterruptedly well. the wound rapidly healing. He has markedly gained condition, and is, to all appearance, free from inconenience, feeding as heartily as any horse upon corn, bay, allowance of nourithment from the first. There is not full slightest external deformity resulting, the lips and chin being in natural position, nor could any one divine from outward appearance that such all operation had been performed, The purtion of bone removed embraces all the lower incisor teeth
and one of the tushes."

\section*{Calendar of Operations.}

July.-Summer Feeding for Horses.-The following dietaries for the summer months were contributed to us some years ago, and have since been published in the Journal of the English Agricultural Society :
It is to be understood that an asterisk (*) by any o the figures intimates that the grain was crushed, or the green food cut into chaff; and a dagger \((t)\), that the roots were given boiled or steamed. It is a capital practice to cut Rye, as soon as fit, into chaff along with hay or sweet straw, and mix the whole up with crushed Oats and Beans, giving the whole thus mixed in small quantity at a time, and thus gradually accustoming cattle to their change from dry winter food. Vetches cut when young should be allowed to wither before being used in the atable, otherwise they prove at first to be physic rather than food:-

The Work of the Dairy can now be conducted with The work of the calves not being expected to interfere with it, as in all well-regulated dairies they are now old enough to do without much milk, and the cows having the advantage of pasiurage, the cheese is expected in this month to be of prime quality. If any of the cows should be late calving, their milk should inot be used for cheese for at least a fortnight, new milk always having a tendenry to make it heave. Cheese is now made twice a day. The cheeses pass through three presses in order, advancing a step in their progress at each meal or making, till at last, in four or five days, they come out of the pressez, and are put upon the shelves. They are generally salted 24 hours after they are made, though this is done by some at the end of 12 hours; the cleese after this is returned to the vats and put under the press, care being always taken, according to what has been said, to put the newest cheese lowest in the press and the oldest uppermost. The brine, which drops from it when in the last press before it is taken out and planed on the shelves for drying, is quite clear ; the quantity is small, and ought to be put into the remetjar verhaps every two or three days, which keeps up the quantity, and is thought an improvement to the cheese. When the cheeses are taken from the salting-presses they are put on shelves in the dairy for a day or two, where they are turned once in 12 hours. They are then taken to the cheese-loft to make way for the new ones. In the cheese-room they are turned once every day ; and in general in a month, or less in dry weather, from the time they are taken out of the vat, they are ready for scraping. This is accomplished with a common knif, first moistening the cheese with a wet flannel, and must be done carefully all over the cheese so as to take off the roughness that may be left upon it from the cloth or any other cause, leaving it quite smooth on the surface and sharp at the edges; the sooner this can be doue the better. In order to get cheese into a state of forwardness for the factor, it will only require wiping round the edges and an inch within them once a week after this scraping; and it should be turned over twice a week, or even oftener in damp weather. Care should be taken to allow the blue cuat to remain on the top of the cheese; this blue coat is considered a sign of richness by the factors. In some districts it is customary to paint the outside of the cheese with Indian red ; this should be mixed with warm water to a thin paste and rubbed on with a piece of flamel, and should be done inmediately after the cheese is scraped, before any grease arises upon it, and the same treatment should be adopted as it not painted. In most cases it is better to postpone making thick cheeses which weigh about four or five to the cwt. till at least the month of June.

\section*{EARTH CLOSETS AND COMMODES.}
(Moule's Patent.)
mantfactured solely by
WHITE \& CO.,
29, BEDFORD STREET, STRAND, LONDON, W.O.
The pecullar advantages of these Closers and Comoodes over the ordmary Water Closet are:-
First.-That the deodorising material (dry surface earth, or clay, or other subsoil) is the bebl for the purpose, and at'the same time is the cheapest and within the reach of all classes.

Secondly.-The supply of such material to any house or premises may be much eavier than the supply of water by a forcing pump, and its removal after being used may be entirely without offence.

Thirdly.-Its application by the means provided in these Closets is immediate and effective; so immediate that no offensive smell need escape into the room or building in which they ase used; and so effective that all fermentation and all escape of noxious gases are entirely prevented.

Fourthly. - The expense of these Closets, in comparicon with that of Water-Closets, is, as to the first cost, trifling, and as to repairs almost nothing. For instance, there is no expensive cistern required, and there are no pipes to burst in frosty weather.
Lastly.-In all large Establishments, such as Hespitals, Luion Houses, Schools, Gaols, and Asylums, a ver! considerable sum may be saved annually in the production of a valuable manure.

The efficiency of these Closets is so great as to be searcely credible to those persons who either have not used them or seen their mode of action.

Price of Apparatus without woodwork, 25s. per set.
** The different forms of Closets may be seen at the address above; and Prospectuses will be forvarded on application.

\section*{JOHN WARNER \& SONS, London, Manufacturers.}

OFFICES : 60, THREADNEEDLE STREET.

The Intarnational Financial Societvare are authorised to receive Subscriptions for the Share Capital of this Company, Which has been
Incorporated by Special Act of Parliament, for the purpose of
 Thess Concession from the Metropolitan Board of Works to
To
 the Corupany.
The Concesion ha, been vested in the Company on cuncition of the
paz:nent to Mestrs. APTER \& Hort, under the provisions of the Act,
 of exion in in tuly pa in inp Shares of
tingent per centare of the net prolits.
The Concession rectites, that in the opinion of the Board, the
Works propser by Mesrs. Nepme \& 1 ope are calculated to efiect the three following ohjeets, namely:-
i. To \(i\) Seret the Sewage from the Thames.

On paym of 10 each.
According to the calculations made, the eventual revenue of the Company to estimated at abo
and management at \(\& 50,000\).
Applications in the annexed foru should be left with the Bankers Who will not, however, recelve any applications unless accompanied
 the baliance returnable to the applicant will be appired towands parment of the amolnat due on allotment. II In aces where an allotmeit is made, the deposit paid on appleation will he liable to forfenture if
the balanco due on allotmeat be not paid within the term fised by

 the Serip Certicentes subicect to c.
tofore paid thereon to forfeiture.

\section*{METROPOLIS SEWAGE AND ESSEX RECLAMATION compant.}
fotar of Applacaplon por Bhanams,

to the drectors of the metropolis sewage and essex reclamation company.

\section*{Gentlemen,}

Having paid to
the sum of \(£\) - being a deposit of \(£ 2\) per Certifleate on Certiffeates, I request you to aliot to me - Certifleates of s100 each, in the HETROPOLIS SEWAGE and ESSEX reclamation company, in conformity with the Prospectus issued by the International Financial Society (Limited); and bereby agree to accept subject in all respects to the terms of the said Prospestus) such Cortilicates or any leas number that may be atlotted to me, and to pay the sum due on allotment thereof, at such time as may bo fixed by the Letter of Allotment, and to pay the further sum of \(£ 10\) per Certififate on 2 d October, 1805.

1 ann, cientlemen,
Your obedent Servant,

 First Commissioner of Workg, it was, on the petition of the Conne
tion of the Clit of London, first sent before the Reforeen lis tion of the City of Londo, frst sent beerore the Reforoent in hey reported as follows :-
"The Referees are of opinion that there are no objedines.
an engineering pornt of view, and that the estimate is ginc The Referees were Mr. D. IIassand, Esq., M.P.; Sir Thumu: The Referees were M. D. IA Assanb,
CRAGG, Bart. ; and Col. Stcart, M.P.
The proposed undertaking was then mquired into by yivecc can House to "inquure into tho most useful and 1 urfofitrble mean end itan seware on the North Side of the Ater a long and patient inquiry, the Committee summed wf:
Report as follows :

 The Committee consisted of -
 approval of the scheme.
The scheme was again inquired into very fully by a conemen.

 and only 4 against it, His Royal Highress the Princo of Wides ber:
one of the 40 , and giviny to this Bill the countenance and rupct: one of the 40, and giving to this Bill the countena
his first vote ever recorded in the House of Lords. his first vote ever recorded in the House of Lorus.
Of the value of Sewnge as a Manure, there 18 , as stated in 3 . 2 as: article upon this scheme, pubished in the Tines of the 2d yarch... "no dispute." The only question in regard to the sewaro being, as the Times says, whether that value is " 400 , (uver \(£ \pm\).
 Metropolis; or roughly of aoud \(£ 2,666,666\), as the yearls matuen
 is greatly exaggerated. However, the cuivert whach the
have contracted tor is
feet

 enabled to utilise at least \(1: 0,000,000\) tons of serace per aci r:t
from this they luok for an eventual aut prolli to be ensue from this they li:ok for an eventual
Board of upwards of \(£ 650,000\) it year.
The experience of to years' application of seware upou pur ne
sand, and other soils, near Fdinburgh, and of several your varous soils near croydon, shows that when the compank sopentio

 the firmers along the line of culvert, which in the sumht rat, of
would produce not less than fill, unlo a yeur, nahiz a

prepared to give \(2 d\). per ou for suchi quantities of
surted him to thand
hated authorities; at which rate the
less than One Mullion Sterliug.
Another rough estimate of the realsable raine of semare ratic
 all round, wCuld produce \(\pm 500,000\) a year, so
return of \(£ 720,000\) arrived at by independent calcu
as possible the mean between these twu estimatea.

(Moule's Patent.)
manufactured solely by

\section*{WHITE \& .OO.}

29, BEDFORD STREET, STRAND, LONDON, W.C.

\section*{The prculiar advantages of these Clobets and Comodrg ofrr ther ordinary \\ Water Closet are :}

First. - That the deodorising material (dry surface earth, or clay, or other subsoil) is the best for the purpose, and at the same time is the cheapest and within the reach of all classes.

Secondly.-The supply of such material to any house or premises may be much casier than the sumphy of water by a forcing pump, and its iemoval after being used may be cintirely without offence.

Thirdly:-Its applieation by the means provided in the ("h sets is immediate and effective; so immeriate that no offensive smell need eseape into the room or building in which they ate used; and so ellective that all fermentation and all escape of noxious gases are entirely prevented.

Fourthly, - The expuse of these Closets, in comparison with tiat of Water-Closets, is, as to the first cost, trifing, and as to repairs almost nothing. For intance, there is no expensive cistern reyuired, and there are no pipes to burst in frosty weather
Lastly.-In all large Establishments, such as Huspitals, Uuion Honses, Schools, Gaols, and Asylums, a rery considerable sum may be saved annually in the production of a valuable manure.

The efficiency of these Closets is so great as to be searcely credible to those persuns who cither bave not usui them or seen their mode of action.

Price of Apparatus without woodwork, 25s. per set.

SATURDAY, JULY 15, 1865
GEETLNG FOR THE ENSUNG WEEK.

The discussions respecting what is called Sportanfols Generation have been so numerous and animated in France, that Monsieur Milne EdTVArds has given in one of the numbers for the present year of the Zoological portion of the Annales des Sciences Naturelles, a sketch of the progress and actual state of the question respecting the production of living organisms in the way of the prodion ang he hally treated spontapeous generation, thoughart of the eighth volume of his work on the phrsiology and comparative anatomy of animals, which is at the present time in the press.*

It is clear that the words Spontanenis Generation are essentially incorrect. With a view to more precise cotions on the subject, three distinctions are made, in the following terms :-
1. The formation of a living being by spontaneous organisation from inert or dead matter, without the concourse or influence of any already existant living being, may be called " agenesy." 2. The formation of living individuals in consequence of the disscciation of parta, which, consti-

\section*{- Bince the abnve was writtell we have recelved the etcond}
tuted by the vital action of an animal or plant, and having participated in the vital power of this being, should preserve the faculty of living and of being developed so as to realise certain organic formis, after it had been struck with death und its organisation destroyed, may be called "necrugeny.

The formation of particular beings by the physiological action of a living organism, which should transmit to them the principle of life without impressing on them its own urganic characters, (the new being would be prucreated, but would not be of the same nature as its parents, but would constitute \(a\) new species), may bo called "xenogeny."
In the first case life is the mero consequence of chemical combination, in the other cases life is communicated to inert matter by a liviug being, while in necrogeny the vital forco is latent in the molecules of which living bodies were composed, but which have beome free by their death and subsequent dissociation.
The notion of spuntaneous generation is still popular, and was almost uaiversal till the beginning of the 17th century. At present its more scientitic partisans contine it for the most part to microseopic forms of plants and animals, but this was not formerly the case, as bees and other insects, especially those which are parasitic, together with a large portion of cryptogams, were fully believed to have sprung from "rranic or inorganic matter; while it is only within these few sears that the nature of intestinal worms and their various changes and migrations have been fully reoognised by the scientific, though the ignorant still look on the hosts of aphides, earwigs, or other plagues whioh occasionally infest our fields and gardens as mere blights produced by certain eonditions of the air. If we confine our notions to microscopio organisms, it may be confidently asserted that the evidence adduced by observers like Pastedr, of the abscrice of any symptoms of living organisms in iufusions, where proper precautions have been taken to exclude all possibility of access from living germs contained in the atmosphere, and at the same time to insure the destruotion of any which may exist in the infusions themselves, are not outweighed by the opposite experiments of Poucher and others. When hoiling has been carried to a proper degree, when the walls of the vessels are perfectly clean, when the neck is termetically seaited and bent so as to make access a difficulty, when any germs contained in the air are intereetited by some suhstance like cotton wool, or where air has not been admitted till it lias passed through sume thuid destructive of life, as sulphuric acid, or through red-hot tubee, no organisms at all have been produced, or if any, only in proportion to the imperfection of the means taken to exclude the possibility of the access o germs. Experiments, too, made at great heights where germs may be supposed to be few in num ber, or in other incalities, have all fended to the same result. It is true that claims are made in an opposite direction, but the same scrunulus care does not seem to have been taken as by Monsieur Pastaur, whose experiments have been repeated with the must perfect curtirmation of the conclusions at which he arrived.
As regards the s. cond hypothesis, if the constituent molecules of ormanic bodies were really of the same rature as the minute organisms which appear in infusions, or were capable of attaining it by develument, there mirht be something rational about it. But, whatever may have ceen thousht when microscopes were extremely impsrfect, there is not a shadow of argument for the belief deriven from arture, added to which it is found that they are reproduced like larger organisms.

Imperfect observations have sometimes led to enntrary opinions. One is mentioned by Mrlne Edwards which deserves notice here.

As an example of the errors which it is diffcult to avoid in researches into the origin of microscopic beings, the results announced some years ogo by M. CIENKOWSKI, and atterward refuted by himself, may be cited. On observing starch grains under infusion, he found that they becane surrounded by a membranots envelope, and then gradually dissolved and were replaced by Infusorin Thery focts were contirmed bo other microscopists, and were cunsidered as demonstrative of the producticn of animalcules by way of srontaneons reneration from the constituent mater srontantarch erains. Jut further etsearches mace them enter into the common categury; for the same naturalist showed that the preiended envelepe with which the grains ssended to surround
themselves was in reality a pre-existent animalcule, which spread itself over the amylaceous body for the sake of nourishment, so that the little living beings whioh were dereloped in this manner within the cell, were derived from this animalcule, and not from the included amylaceous matter."
The only arguments for the third supposition of xenugeny, except by some slow process of elimination or natural selection which does not enter immediately into the question, are derived from the imperfect knowledge of intestinal worms, but the doctrine of alternation of generations, and the clearer notions which we now possess as to their nature, completely satisfy all doubts in this direotion. Not only is life transmitted, and organised bodies are always the produce of bodies endowed with life, but in all cases where it has been possible to follow ont the several steps of filiation, individuals have been found to be of the same species as those from whence they were derived. Doubtless the progeny are capable within certain limits of variations, but whether these are such that a mollusk can beoome a fish, or even that one species can be the parent in the process of a long series of changes of another acknowledged species of the same genus, is a question altogether apart from that of the oocurrenee of spontaneous generation, so far as it comes within our own limited sphere of observation, and our comparatively infinitenimal partiole of time \(M, \mathcal{J}, B\).

Time was, and that not long since, when it was stated that Malformations among Orchids were rarer than among most other plants, an assertion the correctness of which we have often doubted, and the falsity of which is dails becoming more apparent. So far from true, indeed, is the generd statement just alluded to, that it is hardly possible to go into any moderately extensive collection of Orchids and not find some flowers more or less curlously deformed. Orer and over again wa have seen lipiess tlowers of Aerides, of Dendrobium, or of Cattlera; while, on the other hand, there has sometimes been a development of one or more supernumerary lips. Such an instance is now before us in a flower of Aerides sent to us by Mr. Currex. Again, there is one whole section of Dendrobium, with regular flowers, affording illustrations of primordial regulacits of form is oever departed frum. In the reproductive organs we have often seen out of nearly 100 specimens of Ophrys aranifera gathered by ourselves at random, 40 had more or
less deviation from the ordinary form. We need not here allude to the exceeding botanical interest and singular famile, but we hope to induce cultivators to direct more attention to them than they have hitherto done, as the field is a promising one. Duuble Orchids hava been found lately, in some of which there has been a multiplication of the
segments of the perianth at the expense of the segments of the perianth at the expense of the
reproductive organs, and in other instances there has been not only this increased number of petals, but new flower-buds have been formed in the axils of these petals, thus entirely altering the character of the flower, and giving it a richness and luxuriance of aspeot that would delight a florist

Then reverting to the subject of Peloria, there is the congenital Peloria already alluded to, and there is the true Peloria, where a flower becomes regular by the inerease in number and consequent equalisation of its irregular parts, Thus We have Orchids as regular as a Lily, as regards
their perianth, and we may get, in course of time, their perianth, and we may get, in course of time,
Orohid flowers, all of whose segments shall be in form like the lip. Nature often shows a partial change of this kind, and there seems no reason Why the change should not be more complete. By a little attentiou, Orehid growers mignt produce in this already varied family, new forms vieing in beauty with, and exceeding in interest, the hybrids with which the patient skill of Mr. Dominy and others has already enriched us.

The Rev, Gerard Sytrte, of Osmaston, has sent us a pristed memorandum containing a hint for the preservation of Hyacinti Bulbs in a vigorous state, which he informs us he has practized for two years, and has found remarkably successlul. The hint referred to is as follows:

As soon as the fluwers wither, take the bulb out of the earth or water in which it has bloomed, wash it and the roots clean, and lay it on the lid but dry place. Turn the bulb frequently; and when the rons, sud leaves, \&oc have dried up,
and, when the bulb is perfectly dry, lay it by in a drawer, closet, or basket, antil the following autumn. By this method, the exhaustion of the bulb, after flowering, is saved. Bulbs planted in September yield better flowers, and bloom, if anything, later in the spring."
This memorandum was printed for general distribution at the Osmaston Garden Show, at which Mr. SMitia exhibited 16 Hyacinth bulbs, the marketable appearance of which, as we are informed, greatly surprised many gentlemen who had bsen accustomed to the shruaken ill-looking results of lajing-in by the heels. A sample of the bulbs prepared in the manner thus indicated by Mr. Hakrison, the gardener at Osmaston Manor, was obligingls sent with the foregoing memorandum. These bulbs are plump and firm, and excepting a little hollowness in the crown, quite equal in appearance to the imported bulbs of medium quality. We shall be curious to see how they bloom next season.
- The mode in which the beautiful Dried FLowers are obtained, which have for some time past appeared for sale in the shops, has been thus deseribed
in the Journal of the Society of Arts:-"A vessel, with a moveable cover, is provided, and having removed the cover from it, a piece of metallic gauze of moderate fineness is fixed over it, and the cover replaced. A quantity of sand is then taken sufficient to fill the vessel, and passed through a sieve into an iron pot,
where it is heated, with the addition of a small quantity of stearine, care!ully stirred, so as to thoroughly mix of starine, careluly stirred, so as to thoroughly mix
the ingredient. The quantity of stearine to be added is at the rate of \(\frac{1}{2} \mathrm{lb}\). to 100 lb . of sand. Care must be taken not to add ton mucil, as it would sink to the
bat tom aud injure the flowers. The vessel, with its cover on, and the gauze beneath it, is then turned upside down, and the bottom being removed, the flowers to be operated upon are carefully placed on the gavze and the sand gently poured in, so as to cover the Howers entirely, the leaves being thus prevented from
touching each other. The vessel is then put in a hot place, such, for instance, as the top of a baker's oven, where it is left for 48 hours. The flowers thus become dried, and they retain their natural colours. The vessel still remaining bottom upwards, the lid is taken off, and the sand runs away through the gauze, leaving the flowers uninjured." Thiseprocess, by means of which the colours are inigreat measure preserved, is, it will be seen, an adaptation of the old plan of drying in hot sand.

We understand that Dr. H. G. Reichenbace,
Hamburgh, of whose skill and learning amongst Orchidaceous plants onr piges bear evidence, has been
elected one of the Vice-Presidents of the Imperial German Academy Naturæ Curiosorum.
- At a recent meeting of the French Academy of Sciences, M. Corenwriner, in a paper or the Sar-
gassum bacotprrum, sought indirectly to prove the existence of phosphoras in the ocean by an analysis of Seaweeds gathered far from the shore. His results phosphoric acid, which it was argued could only have been derived from the sea.

DOUBLE-GLAZING, AND ITS EFFECTS.
Your Paper of April 15th contains an article froms Mr. Warner, of Broomfield, enumerating the many and really very considerable advantages derived from the double-roofing of hothouses.
Mr. Warner also gives some details of the application of this system as carried out at Rockville, the seat of Thomas Bewley, Esq., near Dublin, and concludes by inquiring "whetier in other countries, on the Continent,
the system has had a fair trial, and with what results?" the system has had a fair trial, and with what results ?" As an answer to this inquiry, as far as Berlin (the dusty and monotonously situated capital of Prussia) is concerned, I should like to malse the few following Pemarks:-
Double-glazed roofs are and have been for a long time extensively, and, as far as hothouses are regarded, alnost exclusively in use here. In fact, successful cnltivation of the more tender and valuable of tropical plants, such as Orchids and Palms, could hardly be thought of without the aid of double glass in a climate lice this, where in winter the thermometer very often, to \(15^{\circ}\) metimes very saddenly, sinks as low as from \(10^{\circ}\) to \(15^{\circ}\) Fahr. below zero, such intense cold being, mareover, frequently accompanied by the most cutting
north-easterly winds, lasting sometimes uninterruptedly for days; while on the other hand in summer a scorching temperature of from \(75^{\circ}\) to \(80^{\circ}\) Fahr. in the shade, out heated dust and sand, which search their way through the smallest crevices, is mothing uncommon here.
To protect tender p'ants from the vieissitudes of such ar unfavonable climate, double-glazing is evidently of the greatest importance, atid consequently is generally had recourse \(t\) ) in this place and its vicinity.
Horticultural structures erected on this principle are existing here of almost every desc iption, from the stately Palm tonses of the R ,yal Botauic and of Mr Bursig's ariens, down to the so.called common "pits."
of iron, and with the exception of the doors and of nom throughout: the intermediate space being glow 6 inches for the sides and a little less for the rone atray? additional glazing, as far as regards the sides of in adilding, is fixed on the inside, in the shape of the framed sashes, which are made of a size not too of irom too heavy to be conveniently handled. The extra for the roof, which is constructed on the ridgasis furrow principle, consists of sashes framed they are fastened on by iron loops and small wo nte wedges. These houses are merely shaded by moolet taken off until fall, when the weakness of sunsinin renders their further presence unnecessary.
In the Palm house of Mr. Borsig's Garden the troo walls forming the front side of the structure are plame ar distance of about two feet from each other, 3: arrangement which admits of the whole being crased stationary, since the jutermediate space will be \(\pi\) th enough for a person to move in for the purpose cleaning, \&c., but as so much valuable space is lost b, this arrangement it can hardly be recommended.
Next to these two Palm houses, I slall mention the Orchid houses, which in this vicinity are all doable. roofed, without exception, and I know of but ne instance where the outside sasbes are regularly taken off during the hottest summer months. Most of them houses are also built of iron, a material winich, in m opinion, will at no distant day totally supplant woo! is the construction of plant houses, its use admitting these structures being erected in a far more elegant and graceful style, consequently admitting a far greates outlast wood, especially in hothouses.

The greater number of Orchid houses here are djargenerally of wooden sash windows, which are manty made of such a length as to reach from bottom to th
I perfectly coincide with Mr. Warner in his opiuta the space between the two roofs requiring to be mide as air-tight as possible. Too much importance cmoon be attached to this point-it is the only means of \(m\) ducing, or at least of regularly securiag, that cation vaporous moisture which is so condu. the health and vigour of Orchids. This sin-tiph.
glazing of double roofs not only offers the advantagon glazing of double roofs not only offers the advantin remarks, but also of a saving of labour, since it renten a good deal of the splashing of water about the hoom unnecessary; and through this very poiut, joined is another storl more important one, tbat of land excluding all draught, it becomes the inapprocin
means of preventing spotting to a great extelt, frim my opinion, and as far as my experience in the calti vation of Orchids extends, blis worst of plagues am the many which so considerably aggravate tho is chiefly caused by over moisture combined with draughts.
Double-glazing, if it is well executed, will render good deal of the watering at the roots, and marly all the syringing everhead, unnecessary, the precipitated moisture which we netice turn ant
Orchids in the morning will tenfold and in the nat natural manner replace all that we could difoct by syringing.

The most striking proofs of the beneficial influeta of air-tight double-glazing are furnished by the excellent state of heath and vigour wis five loxmint
of M. Reichenheim enjoy. This collection is caltivated in a span and doub of biols irou house, the walls of which are constructed the loret and buitt with cement, into a layer of whie of glas aro directly the iron sash-bars of berewed fast at top to strong iron bar ruaning lengthways. This very simplin mode of construction offers the advantage of offering but very little obstruction to light and 8 .nnshine, and (ine being easily made air-tight il, as in this fowed mis the same material.
The only objection to this sort of a roof is, that precludes all passibility of cleaning the iuner surtace of But here, a fact which oes directly g gaiust the opinion But here, a fact which goes directly against of some of our best cultivators
itself upon one's mind, viz, that so-called Exst Indian Vaudeæ, that is the geners Fsonth Saccolabium, Aerides, Phalæuopsis, Angrecu, are concerned) intensity of light is not at iumer surlsces of this roast not absolutely neecscary, the since the honse was built, a period of nine or ten the glass having to a certain degree be the collection cultivated ander far as the above-named genera are regarded the finest in Europe, if not for the size of the planten least for exuberant health and
exempt from all spot and insects.
Fear of intruding too for space induces to conclude these remarks, which I hope may at c.nntribute something towards the propags by system already so warmly recommend, for the bened of plante, plant and olve plant growers,
piversal application. \(A, R . R\)

\section*{ZTGOPETALUM MACKAII.}

Ters is a fine minter-blooming Orchid. The length of t:me it lasts in bloom makes it a valuable plant for decorative purploses be divided, if required, and potted in gool ricll fibrous peat, in 8 or 10 inch pots, with
 rith the young growth during the latter parc of the summer, and flowering in December and January; the per ection. As they make the most part of their growth winter they should have a moderate supply nd that, when required, should be applied in The flower-spikes grow about three feet the moraing. The flowers are about four inches across in beight, and the fowers are about four inches across, spitted with brownish crimson; the lip large, nearly
roun l,'recurving at the point, French white, beautifully striped and veived with rich violet. A few plants will perfume a house; each spike bears seven or more the temperature in winter should range from \(40^{\circ}\) to \(50^{\circ}\) bs nigbt, with a rise during the day, a little air heing given on mild days, and adinitted just over
the pipes, and not by the side lights on the lerel with the shelves, as the cold air coming in con'art with the plants lis apt to be very injurious to their growth. The temperature in summer must
be guided by the weather. If hot and dry give an bundance of air and moisture, and dispense with fireheat. There are many varieties of this plant, some iaferior to the one described. The following species are well worth growing, viz.:-Z. brachypetalum,
Z. crinitum, Z. crititum corruleum, Z. maxillare, Z. stenochilum. These are all free-flowering kinds, chiefly flowering in the winter months; and they Z. Mackaii. T. Brown, Ewotio Nursery, Tooting.

GARDENERS' ROYAL BENEVOLENT

\section*{INSTIIUTION.}

 citution was one of a very venorolent Institution,",
hal neither to contend with poverty charaeter,
Althnor with
 occasin that his tasik of head garducult one. He had to strike that hard this esir pockets, and to canse. He had to strike that hard rock, that stream which refreshes
hile it fructifies. They had 57 plants under their care, which burne their fruit. They were not young plants. That
for thoss plants referred to was required for fresh cuttings , and which menerg) 30 were women care of, Of those 57 plants (the

ope
to

 garden lately in which all were tried against one or two old sorts. Not one of the new Peas were superior to the old ones. Dickson's was certainly the best of the new ones, but that evidently is only a gooil stock of an old Pea well known to London and provincial market gardeners. To my brother gardeners I would there fore say, let us in future keep our \(3 s\). \(6 d\). and \(5 s\). in oar pookets the first year, and I have no duubt the second season will see these valuable acquisitions gone the way
of all short-lived thinga. I myyelf shall still keep to my old favourite, D.niel O'Rourke, which I have grow for some years, and which after this season's experience evidently requires no puffing to hold its own aguinst itw host of synniymes. L. H. R., Gurdener, B hetstone.
Ants.-Permit me to say a word in behalf of these While thinning fruit from an out-donr Peach tree a month ago, I noticed ants in all directions; I watchod them, and discovered that they congregated upor young shoots covered with green fly, which some wer carrying in their moutho. A week later I could find neither ants nor green fly, although the tree had no been touched in the meantime; a week later still the green fly had reappeared, and so had the ants. At the present time the tree is free of both; the young shoots have been slightly wounded in place日, and nnme of the have been slightly wounded in places, and anme of the
leaves have fallen off. Amongat my Camellia trees I have one unhealthy, the leaves having a kind of scale insect upon them; upon this tree only there are ante, and they are attacking the scale. I cannot see tha they have as yet done any harin to the plant. I think, therefore, that this is a proof that they do monne good and buds of Roses, before the flower is expanded. A Subscriber

Earwigs. - The best mode of destroying these is the following, which I have practised for many years. Take pieces of dry Bean straw 5 or 6 inches long, tree from joints, that is, open from end to end; or what is atil better, pieces of the stem of the Cow Parsley, cut when dead at the end of the summer. Lay them between the branches of trees or plants, so that they cannot be shaken out by the wind. Every morning go round with a small water pot or jug of boiling water. Blow through the tube, pea-shooter fashion, and shoot th earwigs (which take refuge in the tubes during the night) into the boiling water; by this meana you may destroy thousands a day. Fuwls or ducks will eat the dead ones. II. B. R.
Bonapartea juncea.-A specimen of this gracefulleaved stove plant is now in flower here in a 12 -inch pot. The flower spike first showed itself on the 29th of May, since which time it has continued to lengthen very since which time it has continued rapidly, and it is now 5 feet long. The first flower opened on the 5th July. The plant has been here upwards of 39 years under ordinary stove treatment Three years ago it was shitted into its present pot, and many of the loose roots that had been formed on the outside of the ball were cut away. It was repotted in peat and loam. James Ticehurst, Dynevor Castle.

\section*{Foreign Correspondence}

The Cimate and Vegetation of Ootacamund. There seems to be considerable difficulty in raising hill plants in lowland countries; this I thank depends in a great measure on the want of natural sunlight. in on winter here the sun in the day time is most intense, so much so that when I first came I often experienced great inconvenience from its glare. Might not horti culture gecerally be more benefited by a greater expo sure to light? The winter is also our dry season. Thi season has been extended much beyond its usal tine everything appeared burnt up, and to my inexperienced eyes seemed to promise well for a very barren aspect during summer, but a few thunderstorms have completely changed the whole aspect of vegetation, the Grass has become quite green, and things are growing most vigorously. Some of our most delicate planta, a most vigorously. Some of our most delicate plati, B , Hymenophyllu'n, Pteris argente1, and other delicat
Ferns, seemeil completely deprived of life, the Pteris Ferns, seemed completely deprived of life, the Pteris
especially. It is found in great abandance in the clefte especially. It is found in great abandance in the clert often visited its hybitats when the rocks under the full glare of the sun became so heated that I could scarcel place my hand upon them, and the little soil was so contracted by drought that I could easily place my hand contracted by drought that I could easily phace my hand between it and the rock, yet both the Pteris and
Hymenophyllum are now growing fast. Although the days are so hot in this se?son, the nights are very col and chilly, frost occurring sufficient to nip Acacias, Geraniums, Fuchsias, \&c., and to kill Tropæ slams com pletely. I should say that frost occurs only in valieys or level spaces on which the condensed atmosphere can settle dorwn. Yet notwithatanding all this we have seautiful plants of the Saccolabium rubrum at a much beautiful plants than the grardens, blooning splendidly greater elevation thas in later habitat I have seen on trees and on ring wild. They were situated on the two plants growing wild. They were stheir roots pene trating into a little earth derived from deraying Moss, and held together by a few bunches of Grass, and Froming one I gathered five spikes of flower, and from the I found also Coelogyue corrugata in bloon. From what Iittle I have seen of Orchids in their native habitate, I would recommend for their culture in the growing seaso
a moist and quiet atmosphere at a temperature of from \(60^{\circ}\) to \(65^{\circ}\), with a few degrees depression at night under this treatinent they make their growth. As and
antumn advances I would gradually nlow them to dry, at the same time elevating the temperature gradually to \(75^{\circ}\) and \(80^{\circ}\) by day, \(60^{\circ}\) at night, giving them all the light possible, with a free circulation of air. As to sifter, but the richest part to be taken and broken into pieces the size of walnuts; with this I would mix a ortion of leaf-mould quite pare. These are the icleas that think any one wond naturally arrive I blould seay that the nights of the resting feason are cold with keen currents of air. I think this treatment wouhd suit Saccolabiums, Ccelogynes, Castleyas, and all others of a similar character. It is also, I believe, more essential to maintain a steady moisture in the atmo phere than much at the roots. I believe that far less attention is paid to the resting of tropical plants than in a high temperature, \(75^{\circ}\) or \(80^{\circ}\) in the day, \(65^{\circ}\) or \(70^{\circ}\) at night, dry at the roots, with a free circulation of air. I am aware that the majority of garden structures will not allow of much ventilation in winter; in this respect it is necessary that they should be constructed differently, so that the air may be warmed before entering the house. It is essential in the case of large or stragyling plants that they be pruned in the resting
season as soon as they shed their leaves, in a judicious season as soon as they shed their jeaves, in a judicious
mamner; this will greatly tend to their well-being and keep them within bounds.
You speak of Acanthacere being difficult to cultivate I believe their cultivation may be rendered easy by light rich soil, moderate moisture at the roots, and a moist uniform atmosphere and a hot dry reating atmo-
sphere, with a free circulation of air. In the case of large collections of plants I would recommend that after the large planls are properly arranged, the spaces between be filled with roots, rocks, or whatever would
allow of circulation beneath; over this I would put a coating of peat and leaf-mould, and plant it with Selaginella, judiciously introducing a few Ferns.

The natural exhalations of deciaying substances like peat and leaf-mould, increased as it would be by the penetrating roots of the Selaginella, would prove of vast advantage to, as I stated above, a large collection of
plants, and alinost compensate for that rigorous indiplants, and alinost compensate for that rigorous indi-
vidual attention capable of being given to plants in smail collections. Such are my ideas on the cultivation of tropical plants; there are plenty of clever, practical men of greater ability and longer experience than myself who could suggest greater improvenents. G. B.

\section*{Eorictics.}

Ropal Horticteturat, : July 8 (Show of Fine-
folieged and Variegated Plants).-A more charming foliaged and Vuriegated Plants).-A more charming
exhibition of plants remarkable for the beauty of their leaves than this wus could scarcely be conceived; and gay flowering plants were also contributed in considerPelargosianas.
In the Class of 12 Ornamental-foliaged Plante, Mr Bainef, gr. to H. L. Micholls, Esq., Was 1st with the remarkubly fine collection which he exhibited the other
day at the Regent's Park. Messrs. Lee had a beautiful 21 group, in which were Alocasia metallica Theophrastas, Mhopalar, Dracena indivisa, variegated Yucca, and Pinc-appto, a fine Bird's-nest Fern, Alsophint anstralis, Orenparax dactylifolium, and
Cirdyline iudivisa. Mr. Bull came 3id with a collection, in which were ;tall specimens of Dracæona antarctica and other Ferne, and Sphærogyne cinnmomes, the stems of the latter covered with a thick lerruginous down. Mr. Carr,gr. to P. L. Hinds, Esq which were Sacclarum officinarum or Sugar Cane Cissus discolor, Sphærogyne latifolia, and Muse Cavendishi.

In the Class of 6 Plante, equal 1st prizes were given
Mr. Donald, gr. to J. G. Barclay, Esq., Leyton, and
Bainef, the latter exhibiting his fine Sarracenias nd Auæctochils, noticed in our report of the Royal Botanic Show. Mr. Donald had Alocasia metallica, the White variegated A. macrorhiza, Croton, Maranta, and Barclay, Esq., came a large und fine Alocasia metallica, the pretty white Caladium argyrites, a Rhopala, and Dieffenbachia; and in a collection from Mr. Taylor, gr.
to J. Yates, Esq., Highgate, were the Rush-like Littwa juncea, Curculigo recurvata, and Maranta zebrina.
In groups of 6 Plants (Nurserymen), Mesars. Lee Croton pictum, Latania rubra, Khopola corcovadensis, and Cyathea Smithii; Mr. Bull furnished, among othere, Arancaria gracilis.

Dracænas and Cordylines, of which collections were shown, consisted chiefly of D . terminalis, ferrea, Draco,
rubra, and Veitchii. The Cordylines were confined principally examples. Of Pulms, Mr. Bull exhibited a collection, conspicuous Brahea dulcis, and the Date Palp, Fine specimens of

Cycas revoluta were exhibited by Mr. Taylor, who also had a gigantic Sabal Blackbarniana; and Mr. Young bad the Date Palm, Chamærops chinensis, and a large plant of Thrinax elegans.

Caladiume, consisting of Chantinii, Wightii, poocile bicolor splendene, Schmitzii, argyrites, Belleymei, and Lowii, came from Mr. Carr, Mr. Young, and Messrs,
Lee. A collection of 12 hardy variegated plants was Lee. A collection of 12 hardy variegated plants was
contributed by Mr. Salter, in which were variegated Gedum Sieboldii, Japanese Honeysuckle, Ivies, Coltsfoot Fortune's Bamboo, Jasmine, Sedum Telephium, and others. Mr. Bull furnished Aucubas, Enrya, Euonymus, and his variegated Chrysanthemum and Verbena.
Zonale and other Pelargoniums came from Mr Fraser, who had good plants of Herald of Spring, Clipper, Roi d'Italie, Amiral Protet. Malakoff, and L'Abbé Kirensi, scarlet; Rendatler, Eugénie Mezard, Souvenir de Nancy, and Henri Etienue, different shade of salmon; Virgo Marie, white; and Rose Rendatler. From Mr. Salter cane Amelina Griseau, a fine larg Mite with a conspicuous saimon eye; Hulle. Mare desuresnee, deep rose. In the Amateurs' Class, Mr.Ward, gr. to W. G. Wilkins, Esq., Leyton, was 1st; Mr Hawes, gr. to J. Noble, Esq., Finchley, 2d. Among
variegated varieties, Mrs. Pollock, Glowworm, and variegated varieties, Mrs. Pollock, Glowworm, and
Sunset were the best of the tricolor-leaved sorts; Alina Mountain of Snow, and some others of the whitevariegated kinds were also exhibited in good bloom Nosegays came from Mr. Salter. Among nurserymen Mr. Fraser and Mr. Hally were 1st and 2d; and Mr Ward was 1st in the Amateurs' Class.

Among Miscellaneous subjects, Messrs. Lee exhibited good collections of Heaths, Orchide, Ferns, Ixoras, and Statices; Mr. W. Paul and Mr. Clarke, boxes of Roses, the former also showing Beaton's beautiful Nosegay Pelargoniums; Messrs. Downie Laird \& Laing contrıbuted beautiful cut bloons of Hollyhock; Mr. Salter, hardy Ferns; Mr. Bartlett, Hammersmith, very fine pans of Adiantum cuneatum; Mr. Bull, the new Radish (Raphanus caudatus), noticed at the last Royal Botanic
exhibition; Mr. Thompson, Ipswich, Trichinium exhibition; Mr. Thompson, Ipswich, Trichinium
Manglesii ; Mr. Catleugh, Chelsea, Lilium auratum Mr. Hooper, Bath, Carnations and Picotees; and Mr. Taylor, Highgate, the singular large woolly cone-like fructification of Dion edule. Among New Fuchsias of 1865 Messrs. E. G. Henderson Dhu, and War Eagle, all with violet purple corollas and reflexed scarlet sepals; Light Heart, with blackish purole corolla; and Rose of Denmark and Lucy Mills, light kinds. A rose-culoured bedding Verbena called Ariel, and a pink-coloured Stella Pelurgonium also came from the same firm.
Fruit was represented by a good Queen Pino from Mr. Ford, gr. to W. Hubbard, Esq., and threo dishes o Black Currants, one kind being a seedling which is snid to hang a month later than any other sort. From the
Society's garden came a collection of 40 sorts of GooseSociety's garden came a collection of 40 sorts of Goose-
berries, most of which have already been described in ur columns (see p. 795, 1864).
Miss Smith, Tooting, exhibited some beautifullyexecuted artificial flowere, and Mr. Lowe, Maida Hill, a neatly-filled plant case. A fine plant of Barnes variety of Phænocoma prolifera came from Mr. Bainer, and a last were shown as single specimens.
July 10 (House Gardening).-This was an exhibition of plants belonging to the working classes of arrangements in each parish were under the superintendeuce of a local committee, through which the exhibitors communicated with the Society, and the result was an extremely interesting Show of plants, filling not ouly one side of the Conservatory, but also a large portion of the western arcade. St. George's, Blooms bury, one of the competing parishes, stood in the firs rank; but fair specimens of London window gardening also came from All Sainte, Mile End New Town Trinity, Marylebone; St. James's, Ratcliff; St. Mar garet's, Westminster; Christ Church, St. George's in the East; Chelsea; St. Bride's; Brill Market, St.
Pancras; Curzon District; St. John's, Notting Hill; and Pancras; Curzon District; St. John's, Notting Hill; and St. George's in the East added their Pelargoniums, Fuchsias, Mignonette, or Nasturtiums to this great work ing.class plant demonstration. Theerhibitors were classed as follows, viz, Parents and Adulte, Children who Attend any School, and Domestic Servants. Three prizes of the respective value of \(10 \mathrm{~s}, 55\) s., and 28.6 d , were awarded in each of these classes in all the competing parishes
for Pelargoniums, Fuchsias, and Annuals, which were therefore the kind of plants of which the Exhibition chiefly consisted. We however also noticed specimens of the well-known " Nettle Geranium," Myrtle, Creep ing Jenny (Lysimachia Nummularia), and Muok Annuals were for the most past confined to French Marigolde, Nasturtiume, and Mignonette. Of Dahlias in pote, for which a special prize was offered, we remarke one or two plants with three or four blooms on them;
and there were also one or two Roses in pots
device" consisting of a villa residence with boundary wall, eutrance gate, and garden in front was contribated from Coram Place; and although the plantations of Pelargoninms with which it was decorated were higher than the house, and blue Lobelins overtoppod the fince, it nevertholess

Others similarly planted contained no residence Viewed as a beginning from which better resalts mas yearly be expected, this exhibition did credit to all concerned in getting it up; aud the Society also deserves the warmest thanks of all who take an intereet in improving the working classes for allowing it in held in its at present gay garden at South Kere Dynevor, distributed the prizes to the differens exbibitors to whom they were awarded, a ceremony which was honoured by the presence of her Majes: the Queen of the Netherlands, who seemed to pay grait gave an appropriate address on the occasion. Ho mid that it might appear to be a very slight matter to ncourage the growing of flowers, but it was attended with great results. It was of much inportance to accustom people to cultivate their tastes and to make
their town homes approach the more radiant appearance of those in the country. They were told in the worde of Lord Bacon that-

\section*{God made the country,}

In the Bible it was written that the earliest condition of man's race was in a garden, and lastly that man lived in cities. The latter should therefore be made an attractive as possible; it was not intentided that the houses of the poor should present anything squalid op anpromising, but that that class should be encouraged to pav more regard to the duties of home life. They could not enjoy the luxuries of the rich, but they could enioy their little gardens-the gardeus which belonged to the world, and which the world enjoyed, and this woold not only be cheering but ennobling. He was not oveaking of the time which would be saved from the ale-house, bat men would be freed from such temptation, and they would find a blessing in their homess. Luxaries were made to be enjoyed, and the cultivation of Llamen would make the poor man's home one of happinem The poor man"s hore should be lighted ap with good and pure Christian feeling, which the rich would do mell to foster. In the cultivation of flowers children grem to advantage, their tastes were developed, and graat
oocial advantages were thereby obtained. It would be social advantages were thereby obtained. It would be
well that both rich and poor should cement one common sympathy aud common regard for each other's welfare, Some few years ago it was said to bo impossible to grow flowers in the smoke of London, but flower culture bas been developed, year by year, and would no doobt be continued. We should see, it was said, flomens raised some day just as they might be seen in the country. Although the interest taken in this more ment might appear a small matter, still it was not a a, for as already stated it led to something greater.

July 11 (Fortnightly Meeting).-The Rev, Mr. Dis, one the prize list, remarked that worth inspecting, especially Mr. Bull's collection. Larkspurs and Poppies alone, he added, would repay a visit. The Rev. Mr. Berkeley read a transla of a paper published in the Comptes Rendus on rom Mr. F. P. Hoore w read, in which he stated that about seven or eig. years ago he had bought some raisins with which to make wine; he boiled them and pressed them, threw the residue away. From the latter howerer plants had sprong up, some of which were pold simin are now bearing fruit. Mr. Berimself; but in his the marc was not boiled but treated with boiling w. Neverthele ss chousands of the seeds had germinat nextadverted to a double.blossomed Geranium sy 1 wa Which was shown by Messrs. Osborn, and crimsont kind from Mr. Reid, of Sydenham.

Cape species Referriug tut
of which were shown by Mr. Wm. Paul, Mr. Berk tated that and Pey was worthy of notice, being an exquisite peach, a shade deeper in colour than its parent, not so large. This was named
The others were Dr. Lindley, Madame Emile Boyau, a valuable light blush H Perpetual. A plant in fruit of Podophyliam was shown by Messrs. Osborn. Mr. Nhorn, charge of it, said that he had been acquain this species of Podophyllum for upwards of had and that during these last 10 years never, particular attention to it ; be ben able to fruit it now. than that of a Victoria Plum. This plant, sa Short, is very difficult to propagate, on acconn reat reluctance to mutiation or intexfer to th being long and fibreless. If these, he said, ar irjured, even ever 80 slightly, it ta fertilisation, again into a hent vithin two hour the expansion of the flowers there fruit. Mr. Berkeley stated, that in its uative co is culled Wild Lemon, on account ness or acidity which belongs to tasted on this occasion, ever, proved to be iusipid. It is related to the
meaicine now in great repute in America, and latel iutroduced to Kistle Kennedy Fig, specimens of which bave often been exhibited, Mr. Berkeley remarked that pot only that but many other valuable fruits were re not at all known in the south of Eagland This he attributed to the ancient Scotch having
frequent opportunities of introducing them from frequent opportunders. He ind instanced some fine varieraes of Gean trees growing on the Marquis of Huntley's estate int Aberdeensinre, several or These he se certain were not indigenous to the country, but mported. He next alluded to a Puff ball shown at the ut meeting. Most people were prejudiced agains Fungi, but this in a young fresh state, he said, was an extremely good esculent, and in Italy, where it grows It is the Lycoperdon Bovista of botarists, and posseesing it does properties similar to those of chloroform, it is requently used in this country for stupefyilic bees Ir. Wilson Saunders then directed attention to what ee said are by some called an ugly class of plants, riz, the Dirstenias. They were nevertheless invested onmetimes singularly cut leaves, and their fruit was of the same nature, as far as fructification is concerued, as that of the Fig, to which they are near relatives. Of thes he had one or two rare species. They possess antidote against bites of serpents ; but it must be in a Blooms of Bignonia Cherere, a valuable conservatory climber, from Mr. Fieming, of Cliveden, were next alladed to in terms of commendation.
July 11 (Floral Committee).-Mr. Bull showed handsome plants of Dicksonia antarctica and cinnamomea looms of Holls Lownie Laird \& Laing came beautifu Pea, a very fragrant lighly-coloured kind, was shown Mr. Brown, of Sudbury. Mr. Ansell, of Kentish Town, furnished cut blooms of Antirrhinums ; and rarious beautiful Orchids were shown by Mr. Stone, gr.
to J. Dar, Esq., of Tottenham. Foremost among these was the rare jellow and reddish-brown blossomed Eriopsis naned E. rutidobulbon, a native of New Grenada, and associated with it were Bolbophyllum psittacoglossum and Cypripedium Stonei, both fine plants. Fola in the gardens of the Society came a Brasa-
of nodosa, but evidently different and perhaps an undescribed species. Mr. Bull had, in addition to the two Ferns mentioned above, Pe pretty dwarf Phegopteris sancta, an Aspidium from Para, and Stauranthera grandiflora, with lilac blossoins gtained in the throat with yellow. Mr. Thompson, of Ipswich, again showed the lovely Trichinium Manglesii. Houred leaves charmiectochilus - urna, palecoppery rose veins; a new Gleichenia, Lilium auratum, Fleming campotted yellow Japanese kind. From Mr. Ardy Coneme a very fine Nosegay Pelargonium named mark Constance, a beautiful scarlet sort, with wellmarked horseshoe leaves. Dowager Duchess of Sutherland, another rosy-crimson Nosegay Pelargonium, was inds forn by the same exhibitor. Both are cbarming July 11 (Fruit Committee).
peimens of their new Raspberry. Cutbush showed lich, although a very early sort, was stated to be Triles. in flavour to that of its parent, the Prince of as a seeding Strawberry was also shown, but it Peaser ripe, and was invited again next season. Some and Potar os were produced; but as no cards were hey came them, we could not ascertain from whom Lieut. Gollowing candidates were elected Fellows, viz, Cotton HazelWoned; H. Whiting ; Esq. W. Bent, Esq.; Mrs. P. M. Williams, Esq., M.P

Mr. Chilman. gr. to Mrs. Smith, of Ashstead Park; and Mr. Page, gr. to W. Leaf, Esq., of Streatham. Ferns, other plants were contributed by Mr. Williams, of Holloway: groups of Kalosanthes, Fuchsias, \&ce, from Mr. Fraser; and Fuchsias, Nosegay Pelargouiunes, and Calceolarias were shown by Mr. Geo. Smith, of Hornsey. Oue or two Cannas came from Mr. Prestoe, and handsomely-flowered plants of Lilium auratum were shown by Messrs. Carter, of Holsorn. Mr. Forsyth had the beautifnl Calceolaria aurea floribunda. Mr. Buxton, of Wandsworth Road, had a basketful of Mrs Pollock and Sunset Pelargoniums, edged with blue Lobelia; and some handsomely made up bouquet were furnished by Mr. Rhodes. Hollyhocks were exhibited by Mr. Mortimer, gr. to A. Smee, Esq.; and Mr. Porter, gr. to the Hon. J. Ashley, Epping, had a collection of Pansies. Among Fruit were dishes
of Nectarines, Peaches, and Strawberries, from Mr rillery, grines, to the Duches, and Strawberries, from Mr. Young, gr. tn W. H. Stone, Esq., had two Pine-apples and two dishes of Nectarines. Good Black Hamburgh Grapes were shown by Mr. Lewis, of Stamford Hill Mr. Newton, gr. to G. J. Grainam, Eeq., Enfield Chase, sent a beantiful collection of fruit, as did also Mr. Mortimer, gr. to A. Snee, Esq. From Mesers. Lane \& Son were fruit trees in pots, loaded with ripe produce. Finally we noticed some well-grown Cucumbers from Mr. Porter, Mr. Fry of Lee, and Mr. Vocking.

Linnean: May 24 (Amiversary).-G. Bentham, President, in the chair. The auditors reported that the receipts during the year, including balance at last anniversary, hid been 1780l. 7s. 7 d ., and the expenditure during the same period 1365l., of which lications. The Secretary reported that since the last anniversary the Society had lost by death nine Fellows and one Foreign Member, and five Fellows by withdrawal, and that 19 new Fellows had been elected. At the ballot which ensued Dr. Baird, R. Heward, Esq., Dr. Masters, H. T. Stainton, Esq., and Dr. Thomson were removed from the Council, and in their place the following were elected:-Rev. Hamlet Clark, Dr. Hoge, A. Newton, Esq.. J. T. B. Syme, Esq., and Dr, Vinen. The following officers were re-elected, nannely, \(G\). Bentham, Esq., President; W. W. Saunders, Esq. Treasurer; G. Busk, Esq, and F. Currey, Esq., Secre taries.

June 1.-G. Bentham, Esq., President, in the chair. The President nominated as Vice-Presidents for the ensuing year, J. J. Bennett, Esq., Dr. J. D. Hooker, J. M. D'Uuban, Esq., was elected a Fellow. The following papers were read :-1. Remarks on the best methods of displaying Entozoa in Museums; and 2, On Animal Individuality : both by Dr. Cobbold.--3. Contributions towards a Monograph of the species of Annelides belonging to the Aphroditacea. By Dr. Baird. 4. Synopsis of the Diptera of the Eastern Archipelago discovered by Mr. Wallace. By F. Walker, Esq.

June 15.-G. Bentham, Esq., President, in the chair J. S. Baly, Esq., and the Rev. W. Colenso, M.A., were elected Fellows. : Mr. Syme exhibited a living plant of tershire, and Mr. Redhead a living plant of Cystonteris crenata, from Norway. The following papers were read:-1. Descriptions of 52 new species of Phasmida, from the collection of Mr. Scunders. By H. W. Bates.

On two new Tropical African Genera of Anonaceas. By Prof. Oliver.-
procured in Cumberland Sound by Mr. N. Taylor, and procured in Cumberland Sound by MT.J. Taylor, and -4. Supplementary Observations on the Spherice of the Hookerian Herbarium. By F. Currey, Esq.-5. On an examination of the skeleton in the Twrbot, Halibut and Plaice. By Dr. Traquaire; communicated by Prof. Huxleg

4 Treatise on the Construction, Proper Use and Capa bilities of Smith Beek \& Beck's Achromatic Micro. scopes. By Richard Beck. 8vo. London : Van Voorst. 1865, pp. viii, and 144, tzb. xxviii.
The object of this work, which may be considered partly as a trade catalogue, and partly as a very useful and instructive treatise, is as the Author states in his Introduction, "to give, by a clear and concise description, combined with superior illustrations, the most complete direetions for the use of Smith Beck \& Beck's achromatic microscopes and the accessory apparatus." The student must not, however, suppose that the whole of the very expensive appliances are necessary for the investigation of delicate tissues. An object glass of one-fifth, will, it properly managed, show him almost everything he wants; the loss of light with higher powers being seldom compensated by increased apparent magnitude, and the size of spores and tissues varies so much that an approximation as regards accurate measure-
ment will be quite sufficient for his purpose. The case is, however, very different for the mere microscopist, who without any very definite scientific object in view, really stands in need of every possible assistance in the comparative examination of test objects, or of the comparative examination of test objects, or of the
tion, while advanced inquirers in Biology will be glad of every accession of microscopic power in the investigation of the obscure organic forms which are the first indic tions of living beings. The young possessor indeed of an achromatic microscope will find many little hinte in this treatise which will be of great assistance to him in his studies.
For example, the different views of the Podura seale, which is one of the most useful test objects, will be extremely useful, as they ahow what very different appearances the same object may assume under different circumstances. Six views are given, the first of which represeluts the structure when the adjustment of the object glass is correct and the object in focus. Four of the remaining figures represent either the appearance when the adjustme: is still correct, bo the object a very little within or beyond the focus that when the adjustment is incorrect under simila conditions ; or in the third place that which is presented when the object is in focus but the adjustment incorrect The aixth figure is of less importance, giving th appearance when all the adjustments are correct, bo when the focus is altered the least possible amoun either way.

The stadent with a new microscope will at once be able to judge of its condition with this plate in hand, a the object is one which is procurable with the greatest facility.

There are excellent representations of other vage table or animal subjects, as of the Diatoms, Plenrosigma quadratum, Navicula rhomboides, Pleurosigma formo sum, of Coniferous wood, of the seales of Lepisma saccharinum, and of the upper extremity of Demodex folliculoram

There are moreover two most exquisite plates, one of which represents a Diatom, Arachnoidiscus japonicus, to which attention was first drawn by Mr. Deane, of Clapham, who found it in considerable abundance on some seaweed used in Japan for soups, and which has been found by Dr. Harvey on some marine plants from the Mauritius, from which locality the specimens were derived which have afforded materials for the figure The other, which is intended to show the effeot of dark field illumination, is devoted to some Polycystina found in an extensive fossil denosit in the inland o Barbados. Of the true character of thes. beantiful microscopic objects, which are cither closely allied to Foraminifera or possibly are derived from sponges, little is known, but as our author remarks, "this doe not detract from their remarkable beauty as microscopic objects, nor from their value ar illustrating the adrantages of a peculiar illumination, for which purpose they are introduced."

There is still a plate to which we must advert, \(n\) it shows how illumination from above may be employed in the determination of saperficial stracture, the three figures of Podura scale showing the change of appear ance in the markings when placed in different direction to the light.
On the same plate is a figure of a simple splinter of Coniferous wood, the account of which shall be given in the author"s own words. "The ordinary lucifer matches are mostly made of Deal or Pine, and the most beautiful specimens are easily obtained from them Small fractured pieces of woody tissue are much superio to any sections, and in the present instance the shap of the longitudinal tubes, the form and arrangement of the circular disks or glands, together with the trans verse medullary rays, form as a whole, and when unde instructur tive objects. It is impossible to reprete to aspearance in a drawing, but we are fairly entitled illustrations of the same subject."

Beautiful, however, as the drawing is, the stadent would not do well to rest satiafied with a mere super ficial view. Sections are absolutely necessary to show him the real structure, and his success as an observer of minute tissues will depend very greatly upon his skill in the manipulation of really useful sections.
There are many other matters to which we might call attention, as for example, the details about polarisation, which are of extreme interest. We must however, content ourselves with giving a caution with respect to the use of high object-glasses. A very sligh blow is safficient to render them totally useless. To much care, indeed, cannot be taken in changing the object-glasses, as if they should chance to slip from the screw upon the stage ever so small a distance their condition is almost sure to be altered, as will be seen at once by the appearance of prismatic colours on the flat surface, arising, we believe, from the derangement of the Canada Balsam with which the lenses are com-
bined, even if the lenses, which are extremely brittle, are bined, even if the lenses, which are extremely brittie, are not themselves fractured. The achromatic as a too rapid turn of the depressing screw upon the stage may render the object-glass perfectly uselesg, as we have more than once known unhappily by experience.
The most important addition which Messrs. Smith \& Beck have lately made to their mich object-glanses of 1.20 th of an inch. "This high power is constructed for the examination of those object which reqnire the greatest amount of amplification, but not that extreme angle of aperture which involves the employment of the very abict The the mos carefal preparation of the object. The \(1-20\) th wil djust through any covering gla
.005 inch thick, and when in focus there is sufficient space between the fromination of ordinary preparations. its use in the examination it can be employed with the same facility as an object-glass of half the power. In Plate XXIV, are illustrations of two objects from the animal and vegetable kingdoms, shown as they appear under a 1.20 ch , with the No. 1 eye-piece, the linear magnifying power being about 900 linear. Fig. 1 is the under side of the head and thorax of the Demodex folliculorum, a minute parasite infesting the sebaceous and hair follicles of the human skin."
The remaining figures represent the sting of the common Nettle. "It appears at first sight somewhat surprising that these hairs, which are known to enter the human skin with so slight a touch, should have a blunt bulbous extremity; but this is the very provision for the peculiar effect they pioduce. When any slight pressure ia brought apon the extremity of the hair, the ulting point admirably adapted for entering the harp the same time making an aperture at the extremity of the hair, from which the contents of the cell escape and enter the puncture."
Messrs. Powell and Leahand however have constructed a microscopic object-glass with 1.50 th of an inch focus, of which an account will be be found in the "Reader," 4th March, 1865. Dr. Beale states that it defines well. "The light for illuminating the objects to be examined is obtained by the use of a condonser provided with a thin cap having an opening not more than 1.30th of an inch in diameter, and when the object is covered with the thinnest glass made by Messre. Chance, of Birmingham, or mica, there is plenty of room for focussing to the lower surface of thin specimens, which can alone be oran transparent objects. Particles too small \(\mathrm{Dr}_{\text {. }}\) Beale euggests that the further careful study, by the aid of these high powers, of the development and increase of some of the lowest organisms, and the movements which have been seen to concur in connection with certain forms of living matter(Amceba, white bloodcorpuscles, young epithelial cells, dic.) will lead to most raluable results
It is in this direction that such high powers are likely to be useful, and not for the examination of ohjects which are not either extremely minate, or which admit
of boing very finely divided. Indeed, in Dr. Child's investigations respecting the Production of Organisms in Closed Vessels, read before the Royal Society on the 27 th of April, it is expressly stated that Powell and Lealand's 1 -50th has already shown something like an leaves, he thinks, no doubt as to their organic character. They are, however, by no means calculated for beginners, or, indeed, for any but very advanced
observers, whatever their advantages may be in the hands of experts.
The Secrets of Angling. By A. S. Moffat. Pp. 321. 8vo Adam \& Charles Black, Edinburgh. 1865 .
There can be little doubt that the lovers of the gentle art will consider this a valuable and thoroughly practical book. It is written by a gentleman who is
enthosiastic in his admiration of the sport, and issues fortin, rod in hand, on a fine April morning, "serenely happy," full of hope and expectation. But better still willing to impart to his brethren of the rod the secrets of angling, which he believes have contributed so much to his own success.

Allowing that it might be possible to capture an occasional fish, unacquainted with the usages of civilised life, in the waters of some outlandish stream, with a line of yarn or packthread tied to a broom stick, Mr. Moffat would have every operation performed systematically and well, with its proper implementfor he says:- "I do not call that sport in any acceptation of the term which is conducted in a slovenly manner or with inappropriate tackle. Neither do I choose to fullow the example of those who are in the habit of dispersing with every knick-knack appondage which
is not absolutely necessary, and are constantiy compelled is not absolutely necessary, and are constantify compelled
to resort to the most clumsy and awkward methods of to resort to the most clumsy and awkward methods of
accomplishing what might otherwise be done with neatness and ease."

Accordingly he devotea the first chapter to a description of fishing apparatus, of which he gives several requisites, in the way of contume and tackle for each kind of sporto.
He nexi states the genaral characters of trout, and as a careful observer give his opinion as to "how trout spend Christmas," and the like
"Bobbing for eels," as practied in the Tweed, which is certainly a singular sport, is thas described. "Taking a moderate-sized stucking-needle, with about a yard o worsted yarn, he proceeded to thread a quantity of
worme upon it, by drawing the needle and worsten sight through their bodies from head to tail and sliding them close upon each ocher, until the latter was condoubled it up into five or six loops, and tied it in the centre to a piece of whipeord about three feet long, but which as a rule must always be of sufficient lengt
to be fished, and no more ; the other end of the cord animated loops, very much resembling the hair of Cerberus, hang like fingers from the cord." The boat was moored broadside to the stream, the gunwale brought within two or three inches of the water, and three or four sets of the singular tackle dropped into the stream, allowing the worms to rest on the bottom. Willie said it would take a quarter of an hour for the eels below to feel the smell of the worms, and make their way up the stream, and sure enough in about that space of time " we were literally beset by legions, which seemed to congregate from all parts of the water, and kept up an incessant tugging and tearing at the worms, like a pack of hungry bounds at a carcase." When the eel has had time to gorge the worm and a portion of the worsted, the apparatus is quickly hauled up into the boat, and the fish, unwilling to relinquish his supper, drops off, and wriggles about till he gets his quietus. This sport can only be pursned on a dark night, and suggests the queation, "Can fish smell?" which Mr. Moffat anhesitatingly answers in the affirmative, first, because these eels could not be made aware of the presence of the worms by any other sense in the darkness of the night; and secondly, because the commotion among the eels down stream, caused by pouring blood into it, truth of this is corroborated in a variety of ways.

Our piscatory friends agree with us in thinking that there is much good sense in the following remarks upon the proper flies for each season :-

Many accomplished anglers, and authors as well, are under the impressiou that on every river certain peculiar flies will be more alluring to trout all the geason through than any others that can be offered them; and this mistaken notion is most prevalent with southern sportsmen, where the rivers are ill-adapted to fly-fishing, and where that mode of fishing is but point, in 'Fly-fishing, by Ephemera,' not one of the flies in his list, with but one solitary exception, the dark dun, has the slightest resemblance to any aquatic
insect that God ever created; nor, in the clear oftinsect that God ever created; nor, in the clear oft-
fished waters of the North would thev have even an ephemeral chance of filling a basket at any season of the year. My own opinion, derived from long experience and a close attention to the matter, most decidedly compels me to arrive at the conclusion that unless the artificial flies resemble as closely their ratural prototypes frequenting the waters at the season fished in, as the art of the dresser can make them, the imaginary whales in his wash-hand basin. Some sportsmen, however, argue that trout will seize with avidity anything resembling an insect moving through the water, regardless of its shape and colour; and that the artificial representative of one fly is quite as good as
another for trout." another for trout.
"It is true that in some bleak mountainous parts of natives will occasionally try to gratify their powerful instinct for insect food by hazarding a snatch at any thing having a resemblance of insect life, however slight But try such nondescript libels upon Nature's ""That Grizzly King," or "Green Mantle," will produce among the fish no other emotions but fear, surprise, or disgust at the grotesque and monstrous lusus nature.

If the trout, as some assert, seize indiscriminately anything that bears a resemblance to an insect in motion through the water, how comes it that perhap one particular fly upon the cast of a certain colour, wil day's fishing, while the others, equally well dressed, and equally resembling living insects, will scarcely take oue? a fact patent to every experienced fly-fisher."
Again, "the sportsman often tries in vain the most beautiful flies, while the fish keep the water al fly. Hime a the trout are feeding voracionsly, and in an hour or two his creel is flled. He may depend upon it that no artificial fly, unless it closely resembles
the natural insect frequenting the waters at the season fished in, will ever be successful.
oubt may appear strange that the same identical fly, Which had so fine a flavour at \(20^{\circ}\) cloos in the afterwater, and excite the appetite of every fish in the of it, should not be equally palatable at \(100^{\circ}\) clock in would say, the fly-fisher will almost invariably find that those flies which have last appeared upon the water, especially a day or two after their first débit, will be in previous favourites will comparatively be disregarded." We think the above remarks will convince the whicious reader that Mr. Moffat deserves the succese the chief element of success is to study Nature by the light of common sense. We cannot go into the comor use as dipping baits, nor into the and beetles,
 Muffat furnishes a short description of the that Mr. Burder rivers, from the Tyne to the Whiteadder
states the result of his experience of the partical port which each may be expected to afford.
He very properly finishes his work, by giving a fen lessons on the art of preparing freshly caught calmo the fish in perfection, instead of crisp and firm, an as will generally be the case after it has uuder flabhy, shaking of transit, and the ceremony of lying in the shaking of transit, and the ceremony of lying in state
at the fishmonger's shop. There is also a recip at the fishmonger's shop. There is also a recipe for preabundance. and for potting the fish in auch to grea that it will keep good any time.

\section*{- Flortsts' \(\sqrt{-l o m e r s . ~}\)}

Carnations and Picotees (Continued from p. 631) By following the directions already given, the plate
should by the middle of March be in fine condition for shifting into their blooming pots, and should be plact in them at once. If the directions given respecting the compost have been attended to, a fine heap oi soil will be in readiness. The pots generally used are \(10^{\circ} \circ^{\circ}\) ( 9 -inch), and 12 's ( 11 -inch), placing two plants in 16 -pot, and three plants in a 12 -pot. Press the sol tolerably firm in the pots, and stand them on bed where the sun and air has full access, using coal asbe to stand thom on, so as to prevent worms getting in
Cover at night by turning a pot of the same size ope that containing the plants, taking it off in the mornin unless very cold or wet, when it must be tilted, allow light and air to reach the plants. This night covering should be continued until the middle April. The cultivator must, however, be guided by the weather, and if frosty nights continue, the coreri must also be continued until they have passed,

With careful watering (rain water only, or meter sun and air hours at least to the influence of the plants will become stout and well establishod, and will be benefited by having the surface of the soil in the pots stirred up and cleaned, top-dressing with a litt of the same kind of compostas that used for potting. The next operation will be staking the flower-stems as show themselves, not allowing more than three to en plant if intended for exhibition ; each stem will carr two or three flowers according to the variety; must be learnt by experience. When the buds are fairly formed, use weak manure water once a wee only remember it must be weak ; this will tend to strengthen the plant, and assist to increase the size 0 the flowers. The most exciting time will now be hand, and the buds will require careful watching th they do not burst and disfigure the bloom. By bari ing is meant the splitting of the pod or calyz from to to bottom on one side only. To prevent this, a 8 mm band of matting, worsted, or india-rubber is phan around the pod, splitting it evenly down to the flow ap if pola for a cirgule carl flowers open, if required for exhibition a circuar ander cut in the centre in a star-like manner, is placed und the petals, to keep them in position and prevent hair
falling down ; the diameter of the card should be too 3 inches.
Shading will be required not only againt the rys of the sun but also against heavy rainso Chana, such as is used for cheese cloths, is the best matair and have a tent over them open at all sidea.
tent is just what is required, being made 80 as to used for the Tulip bed, where these are grown, then to come in for Carnations and Picotees, Id an like the stage, as being made of strips of wood, has full play under the pots, and dries the roots thes always congregate amongst the drainage, and materially injures the plants. There is nothing lit cold bottom and coal ashes to stand the pots on . bed may, however, be raised so as to bjet of the
flowers nearer the eye, this being the objec stage.
The insects troublesome to the cultivator that require careful watohing are the wireworm, the fir arwion green maggot
hints given before, to expose the in winter to the action of the frost, and use en pieces of Carrots or Potatos, and bury them just und the soil when the final shift is given, and look them every morning and destroy any worms that be trapped. The second (greenfly) will appear ige hearts of the plants, frequently early in oparts destroy them at once, or if they attack them whe throwing up their Hower stems, remove third \(口\) or shed and fumigate with tobacco aught and carefully destroyed, as they eat flow buds hearts of the plants but the young tem until ful buds, and continue to foed petals destroyed is vexing to see foces of Bean-sh anything hollow, or even a small flower pot , of Moss, will be the best traps to catch them.
over these every morning and destroying them last appearing olly in spring anu su will mako carefully looked for, as
travoc in a few hours, bringing to an elld all hopes tryin e: pectations as to any fuwers it ather at heart, of

\section*{pothe the and enersuit of floriculture}
to the pursuit of foricul writing only, perhaps, for the Thus iar of the choicest kinds, and such as every one calinutor aford or find time to pay attention to. Fo moch as delight to have a Carnation, Picotee, or Clove to place in their bouquet or button hole, the common to place in such as can be raised from seed will suffice Vary pretty varieties can now be obtained from seed, Vary priscipal portion of which is saved in the neighbourbood se some time in May, in a nice compost such sown in pots somed for Pelargoniums, and about the middle of August the seedlings should be planted into bods in rows I foot apart each way, or in bunches in the borders, taking out the soil 2 feet deop, and adding some fresh loam and manure. If severe weather occur in protection, allowing it to remain a day or two after a protection, aken place, will be the only attention they will require, excepting to look out for slugs and snails, both of which are very fond of all the Dianthus family, ond especially treat Carnations, \&c., as a delicacy
destroy, therefore, all you can find in the vicinity o the plants. Early in March see that the plants are pressed firmly in the soil, as they are liable to be dramn out of the ground by action of frost ; top.dress florer spikes and buds eccording to the strength the plant, if fine blooms are desired. If quantity is required, thinning, of course, will be out of the ques-
tion. When in bloom mark any varieties which it may seem desirable to propagate, and layer them in July as noted in the cultivation for pots. All the Dianthus family deteriorate in quality if not propagated every season, and the young plants grown on Clove will require exactly the same treatment, if it is to be seen in perfection.
Stakng the flower spikes and watering in dry wea ther, using weak manure water twice a week, and also sprinkling overhead with clean water through a fine plants and improve the size of the flowers. W. \(\boldsymbol{H}_{\text {. }}\)

\section*{Che \(\mathfrak{m p t a r y}\)}
"I wilu feel much obliged," says a Correspondent "for information on the following case. On the 9th of June two swaris came off from separate hives, which seemed to work well in their respective boxes, About sereral places. What is the cause of this? The largest lot, about 30 yards away from the others, dispersed atter a short time ; one cluster, about the size of a sugar swarms of hived, and added to the smallest of the vell for a time, when the bees gradually ceased work ing, and for two days half of them clustered outside the returned to the box, but still do do not work they have now the bees in the other hive, and the outside of the box on their leaving, was covered with wax! Did the two queens fight, and both get destroyed, or what should ment? Is the Ligurian, or yellow Alp variety, as profitable and easily managed as the common Englis apecien? If so, could you inform me whether they Tre expensive?
others, swarm that came off "about a weels" after the gh you do not say so, was no doubt hence the reason had most probably several queens places. It is possible that even among the small have been more than one the first swarm there may with regard to such one princess. It is never easy, the real state of the case may be; but we should magine it ivery likely that all the queens were addition of the commotion which ensued on the examine the interior of the hive, no one cang tell how atreners exactly stand. A case such as this forcibly ercept those which afford the no hives should be used hires properly work of their interiors. With frame five misuperiy worked the mystery could be solved in queen, steps cond should there really prove to be no or in fact at be lost from such a cause at this season he year. it is not easpect to the bees clustering outside the bor, hive after the addition from their returning within the forced out by the internal a super, that they had been locasionally cluster ontside from mere idleness. The Forking vi queen does not always prevent bees from awarm of that year, in a set of collateral bolony, a first Was thereliy deprived was added in a similar way, and bones about eight wee a queen, remaining without super was rem two side boxes and a super. After the ining saitable red, a small bit of brood-comb, con
bell-glass, and placed over the central aperture. The
bees immediately commenced the construction of royal cells. It was also remarkable that, whereas the bees had not been observed to convey a single load of pollen into the hive for many weeks, almost immediately on the introduction of the small piece of brood-comb, polilen was carried in, and the bees appeared to be greatly cheered and invigorated. In due time a queen was hatched out, and that colony continued to prosper for many years.
As your hive had possessed a queen sufficiently long to have laid a considerable number of eggs, we should ane the thould perisi, even posing that the queen or queens were sacrificed. If the bees cease to carry in pollen, or do so only in very smal quantities, we should try what the addition of a small piece of brood-comb would effect. It is best, if practicable, to fix it among their own combs
The bees which clustered outside the box must have previously filled themselves with honey for the purpose of secreting wax, and having no other use for it, must have applied the wax in the manner you state. We have occasionally seen a somewhat similar misapplication of their labours. It seems to be done partly with the object of obtaining a good support for their holding on, on what would otherwise be comparatively a sunooth surface
With respect to the Ligurians, we believe them to be in all respects a saperior variety. The bees certainly re far more beautiful, and we believe them to be more rolific than the common brown bee of Europe. But is difficult to keep them pure, unless the apiarian is prepared to go to a great amount of trouble, and to imagine that the expense of these bees is not so great as it used to be.

\section*{Garden Memoranda}
S. Rucker's, Esq, Wandsworta.-Mr. Racker' name has been so long associated with plants in general runuing notes on his charming residence at Wandaworth will, it is believed, not be uninteresting to the genera reader. It is a well-known fact, that he still maintain the valuable and extensive collection of Orchids that tions of the present day; and that his zeal and love for that remarkable race of plants has in no way abated Fully alive to the exigencies of the time he has extended he house accommodation to such an extent as will satisfactorily meet the wants, in point of temperature, of the numerous and beautiful additions which recent
years has furnished to the tribe. Although he does not now send to our "Great Exbibitions" the splendid collections which were the pride and the boast of the old "Chiswick glories," he is ever ready to contribute his quota to further the cause, as witness his exhibitions from time to time to the scientific meetings of the Royal Horticultural Society-which, by thelway, are by far the most successful of all their experiments.
It is one of those residences which might be properly called suburban, being situated at one end of the village, or town, and therefore in immediate proximity to numer ous others of less preteuding appearance, and infinitely less interesting to the horticulturist. The ground, however, belonging to and surrounding the residence is not so limited in its range, extending, as it does, over considerable acreage, and possessing more or less of the seats On looking at the mansion, situated as it is close to the public road, one does not anticipate much in the way of landscape, more particularly when we consider that the locality is so valuable for building purposes, being easy of access to or from London either by road, rail, or boat; und, in fact, forming one of its most agreeable surprise to find, on entering the precincts, all the appurtenances belonging to a kitchen miniature
The flower garden is a square block of ground very artistically designed, presenting a little of all the features of decorative gardening so combined as to make a harmonious whole, which is probably, the most difficult of all tasks that come within the range of the landscape gardener. The mansion, partaking somewhat of the Italian style of armalities in dealing with the parterre to render the whole in keeping. On the one side, as a boundary, we have the park scenery already referred to which is partly screened by an irregular bank of Rho dodendrons, which looked magnificent in" foliage, and were bristling with huge heads of seed-vessels-the
remains of what had but recently been a gorgeous display. On the opposite side there is a dead wall a a boundary, part of which is covered with a glass promenade filled with suitable material at all seasons to Pelargoniame, Fuchsias, and other miscellaneous plants figuring more prominently at the present time; while the wall that runs parallel wion public ruad i nicely screened with trees and underwood, both evergreen and deciduous. Confronting the house on the remaining side of the square is a very handsome block of span-roofed houses, with an octagon centre, designed and constructed with much taste, and at the interfere with the well-being of the plants. The flowe
garden panel is laid out into a series of detached beds on grassy groundwork, admirably flled with bedding Dlants; and being interspersed with Roses, which
Iuxnriate in great beauty, Rhododendrons of sorts, and some of the handsome-growing Ericacese, with some of the more prominent and suitable herbaceous plants, di not look quite so stiff and formal as some othe attempts at parterre Hower gardening that could be named. But what was vastly more pleasing, on tha beautiful carpet-like lawn were the select specimens of Coniferæ. Araucaria imbricata is a magnificent apecimen, over 20 feet high 1 presume, and of faultless symmetry. Equal in point of merit, though of much less size, is Wellingtonia gigantea and Picea Nord manniana, while Cupressus Lawsoniana and numerous others, planted in suitable positions as individual specimens, show how well such things are suited to the climate, in that locality at all events. In keeping with the style, and to give a finish to the picture, groups of standard Sweet Bays and Laurels, along with an occasioual specimea of the golden-banded American Aloe, stood in front of the range of houses referred to, a apacious gravel waik.
Entering by the door in the centre of the range we find an aquarium, large enough almost to grow the
great Queen Lily (Victoria re, gia), but as the house is set aparí for Orchuds, Club-mosies, the lesser members of the Nymphal Aliance, there is nuch more general interest excited in this way especially since the furor for blooming the Vietoria hits raised above the water, and han raised above the water, and hanging gracefully down-
wards, canght the eye; while several of the beautitully which are good, testified skilful culture, and toned dowit that pecuiliar rustic-like appearance which the pseudo bulbs of many of the Orcbids, some suspended from the roof in baskets and others in pots on the side, presented Dendrobium moschatum was in splendid bloom, an The finely-tormed labelluin, densely covered with long hairs, makes it scarcely less interesting than the larger (nlthough not so fine in point of forme) Dal housianum. Camellias, in capital order as regard well gotrup specimens, and in the most exuberant health, filled a house adjoining; while an excellent show of miscellaneous atove and greenhouse plants in anothe house of the same range, made up of the most simple materials, hoth as regards colour of foliage and flower such as Pelargoniums, Fuchsias, Dracænas, Coleus and Crotons, had quite a fairyland appearance, and reminded me that such were the colours and such the material for a gas-light demonstration.
Emerging from this range by a back door, we come to another square plot of ground completely occupied with plant and fruit houses. The East Indian house which is among the oldest of the lot, was undergoing repair, being about to be widened at least 4 feet, thus giving greater breadth of stages and passages. This has at all times been an interesting honse, full of rare plants, and generally in very good order. Unfortu nately a very bad form of Fungus had been making althouciu Mr Pipher hat plants day by day, trying to check its progress, his efforts did not seem to be attended at that time with complete success. This is the same Fungus that Mr. Berkeley alluded to at one of the Tuesday scientific meetings blants had not that vigorous appearance which we ave seen in time past; but, nevertheless, many of the arest of these tropical gems, such as Vanda or Renan thera Lowii, which was showing several bloomin spikes ; Aerides Schröderii, Fieldingii, and others, wer still in the best possibie condition.
The Cattleya house was as usual most interesting containing many excellent specimens, not tire least beautiful of which was the splendid peach-coloured, sumumer-flowering labiata. Nor was the chaste Wagner the least interesting of the group, where the inauve whte can equal the fowers of a cood Phalznopsis; but a white Cattieya is a very desirable object, and we have the bast and purest representation of it in Wagneri Leelia purpurata, in the month of June, when well nanaged, is always a gorgeous object, and when a col ection has it represented in numerous varieties, it here, the effect upon the eye is very bewitching. Lalia Boothiana, or Cattleya lobata, as it is sometimes called, is a very distinct thing, having deep purple lines radiating from the centre of the lip, and was here in ne condition: so were several varieties of hossis which althourh the most common, is not the leas ornamental; the array of colours shade out 50 charm ingly, and yet
contrust well
wo new north-aspect housen have been recently added. They are about 12 feet wide, and of considerble length, whole all that could be desired. Never before was seen uch splendid examples of cultivation as the various orts of Pleione grown here. P. maculata especially, which is the grandest of the genus, much more beantifn and rare than even lagenaria, aud
was a picture of health, having
also were the finely flowered plants of Odontoglossum citrosmum (pendulum), which had been shorns at the scientific meetinge, some with three apikes from one growth, and hancing in the most graceful manner. Nor
was nevium majus less beautiful, from its free-flowering was heviun majus less beautiful, from its free-flowering
nature and liandsome crimson-spotted spider-like nature and liandsome crimson-spotted spider-hike
flowers. I never supposed that O . pulchelium was half so beautiful until I saw Mr, Rucker's plants, which were not only blooming profusely, but what large fins flowers of great substance! The best variety of this is really grand, and everybody should grow it. Then this is really grand, and every body should grow it. Then
what a host of Epidendrums, and so many good sorts too, are also congregated here! If Mr. Bateman were to see them all in flower, he would surely grow more than his two pets-vitellinum and I forget the other. One here named inversum, of a crean-coloured ground with pink markings, and bearing from 12 to 15 flowers on the spike, was quite beantiful; and so iwas macrochilum, and its rose-lipped variety. Of Oncidium sessile too much cannot be said for fine form and rich hue of yellow; it is one of the handsomest of the genus, and is well grown at Wandsworth.
There were one or two other houses where a miscellaneons stock was kept, including numerous little things that thrive best on blocks, such as Sophronitis, of which there was a large assortment. Instead of the hollow drain tiles which predominated for this sort of purpose on the occasion of a previous visit, there were now
substituted scquare flat hlocks of wood, which are not yet superseded for cultural purposes by any other material.
Grapes and Peaches are cultivated here to some extent. Vegetable forcing has also to be attended to, and the usnal supply provided for the table from the ordinary quarters of ground allotted to vegetable calture. The whole place was scrupulously neat and reguire a considerable staff to keep up. Mr. Pilcher, whilst ministering so well to the wants of Mr. Rucker, must feel a great pleasure in being under an employer imbued with so much correct taste for the
heantiful, and sparing mons to procure all the rarest and choieest gems of Nature. A.

\section*{Miscellaneous.}

Dr. Leichhavdt.-The discovery of fresh traces of the traveller Leeichbardt in Northern Australia has revived nublic interest in his fate, and at Melbourne meetings have been held to concert measures for a renewed search aft.r the distinguished and intrepid explorer It is estimated that a sum of \(3060 \%\). will be required to fit nut a suitable party and maintain it for two years, and the sympathy of the ladies of England is sought by " committee of ladies at Mellourue, of whom "Mrs. Cutts, 119 William street," acts as Honorary the subject, in which he points out as ground for hope regarding Leichhurdt's fate, that Mr. M'Intyre, interior has earned a lasting fame, fonnd in \(22^{\circ} \mathrm{g}\). and about \(1^{\circ}\) westward of M'Kinlay's track, the faint traces of horses or cattle nn a spot, not known to have
heen traversed by any explorer. Pursuing his course aloug a new S.W. tributary of the Flinders River, he further met with two horses, grown aged, roaming in undisturbed liberty, while for hundreds of miles around, none are known to have been abandoned by any returned traveller. Yet, to the mere fact of these two horses being found at this isolated spot, perhaps no great importance would have been attached, had not subsequently the momentous discovery of two Leichhardtian trees, on the eastern main branch of the Flinders River, rendereci it sufficiently evident that these animals must have belonged to Leichhardt's expedition. Under any circumstances the fact of Leichharit having reached a position on the waters of the Flinders liiver so far north as \(20^{\circ} \mathrm{S}\). has been distinctly proved, by finding traces of him 350 miles in alvance of the supposed locality at which the death acene Was said to have occurred. Dr. Mueller suggests that the searching party should, during the next cool season, pass, if possible, to the tropics, to take advantage of the northern summer rains; should be strong enough to repel any attacks of united native tribos who may collect around it; should comprise several aborigines not unaccustomed to the agility of hunting life; shonld commence its searches from that point on the Flinders River where Leichharilt's marks were founda pmint within two months easy travelling distance from Mount Murclison; should never cease its inquiries, never relinquish its search on any likely spot, until. beyond all doubt, the existence of any of Leichhardt's marks within the hunting territory of the occapying tribe had been ascertained; should enjoy the advantage, now well recocnised, of commanding the auxiliary use of iromedaries in reconnoitring those horses; should be mindfinl to avoil the scrubby ridges overgrown with Gastrolobium, a bane not known to
Leichhardt, from which explorers now, by caution, may escape; should not contmin ton large a train of beasts of burden, that it may move with swittness across those suffice for a linaited period supply of water will only man who disdains material advantages, and is actuated by a deep appreciation of the duties devolving on him as a sacred trust.

\section*{Caleudar of Operations. (For the ensuing woeek.)}

As the best season for moving evergreens is at hand, the planter, especially if econony of space is an oliject, must study well beforehand every step which he intends to take; and every plant he commits to the soil should have been previously well considered in reference to its
ultimate growth and effect. The inexperienced are too ultimate growth and effect. The inexperienced are too
apt to plant without forethought, and many of the objects which they looked forward to admire, are killed or smothered by others of more rapid and luxuriant growth. They should therefore endeavour to make themselves acquainted with the dimensions plants ar likely to attain. Small mardens require great skill in the to ith of then win they are to be ornamented, and much judgment should be exercised in the selection of them; therefore, instead of attempting to produce quantities of one kind of plant, to the exclusion of others, it would be more satisfactory to limit the numbers of any particular kind, and thereby afford space for greater variety. The planter ought especially to avoid the too abundan plain hand, however, he need not confine himself to too small plants; these would produce a monotonous effect.
flower garden and plant houses.
Plants bedded out are now coming fast into great beanty, which is enhanced by neatness. Take care therefore, that Verbenas and similar plants are kep within proper bounds, and that weeds and decaying blooms are constautly removed as soon as they make their appearance.

AURICULAS.-Seellings which were put out in pans \(r\) boxes in spring will now have attained considerable size, and mav be potted off singly. Let the soil used be good loam and leaf-mould well mixed, to gether with a little silver sand, and when potted let the plants be set in the shade until they have become somewhat established.
Chinese Primulas.-OId plants of these should now be shaken carefuily out of the old soil, repotted in good light coupost, moderately rich, and placed in a warm frame for a few days, till they have begun to produce frame for a few days, after which they must be removed to a position near the glass in a cold frame, and kept close till the plants are thoroughly re-established.
Pinks.-Plant out rooted pipings on beds of well prepared soil. A second crop of pipings may also be inserted where an increase of stock is required. Seed should be gathered and placed in a dry airy situation should be gatl wanted.
RaNUNCElUSES.-It often happens that amateurs have seedlings, the roots of which are so thin and small as often to be overlooked in the soil. The way to lose none, is to get a fine wire sieve, into which a quantity of the soil containing the seedling roots should be put, then have a tub of water, in which place the sieve, moving it about in the water; by this means every particle of soil passes through, leaving the roots behind It is but little trouble, and many fine sorts are thus saved, for it sometimes happens that the weakest are best.

\section*{forcing garden.}

Cocombers.-Continue to thin and regulate the shoots; go over them at least twice a week, as they soon get crowled if neglected a few days. Ghard against red spider. Attend to plants in frames. Keep linings well made up, and train shoots of growing plants. Water when necessary.
Peaches.- Where the fruit is ripening, ventilating during the night and in damp weather should be effected by means of the front lights, keeping the top sashes closed to prevent wet from settling on the fruit.
Pines.-A portion of the strongest and best rooted should now be picked ont for succession; these should be potted immediately if they require it, and grown on steadily without any check; any of the smaller plants which are in immediate need of potting should also be attended to. Keep up an uninterrupted succession by planting a few suckers occasionally in a brisk bottom-heat.
Vines.-Let borders be frequently examined. If the soil is too dry, let the surface be carefully loosened with a fork, and watered with liquid manure.
hardy froit and hitchen garden.
Water frequently with liquid manure ; the occasional showers which we are now experiencing may be expected to produce a beneticial effect on all kinds of green crons. Suckers should be caretully removed from fruit trees of every description; it is not sufficient merely to cat them off level with the surface of the soil, as such a mode of treatment only causes them to throw up a progeny ten times more numerous. Io do the thing properly the soil should be pared away, the remored traced back to their origin and carefally are of inferior varietics, they may, if kind and healthy, be budded with other and better sorts, and especially with such as are found better sdapted to the peculiaritios of soil and situation. In all cases strong healthy shoots should be selected upon which to perform the operation.
Celsery.-Give Celery crops one or two good waterings with liquid manure. Only those rows or beds which are intended for early use should be earthed up at present. With regard to the main crops, if the soil
is at all heavy, this cperation should be postponed unti]
the plants have attained full size, when the plants have attained full size, when it may be finished off at once. This effects a considerabie enving
of time, and the Celery does not rot in winter same practice equally applies to Cardoons.
Strawberrics.-Prepare ground for new phate tions, and plant now as soon as convenient. Strant berries do best in a rather strong, rich, and deep ail Where the soil is naturally light, improve it, therefone, by adding marl or strong loam with plentr of mnamer
Rows of Strawberries along the edges of walks look and are very convenient, as the fruit can be gathered without treading upon the ground, while the quartem are relieved and made available for crops which it desirable to place a little further from the eve. th earliest plants produced by this year's runners shoold be selected, and in separating them from the pareat plants, a few inches of the string should be retained to assist in fixing the plant in the ground. If they en planted on quarters, the rows should stand 2 feet aper each way. This will allow room for intermediate rom of Endive, Spinach, or dwart York Cabbage thi autumn, and the plants will require all the room nes spring. By allowing plenty of room the fruit is finer cleaner, and more abundant than when the plants aro allowed to crowd one another and entirely shade the surface.

\section*{Che Kgritultural Gazette.}
mbeting for tre ensuing wbek.

THE great annual meeting of the Rnyal Agricultural Society of England commenced quietly enough on Wednesday last with a preliminary trial of Reaping machines on the grounds at Woodford Farm, Plympton St. Mary, about four miles from Plymouth. There are here some 80 acres of land in four large fields, made ready with crops of Rye and Winter Oats, Clover and Iiye-grass, and bare fallow respectively for reapers, mowers, harserakes, hay tedders, drills, manure distributors, aarriages, and horae-hoes-the elasses of tools whioh this year come under the inspection of the Saciety' judges. These trials ooeur too late in the week for us to attempt a report until our next publication, when a full description of the competing implements and their performances will be given. The distance of the ground from the town interferes materially with the interest which the general public can exhibit in the competition ; but the comparative quiet iu which the judges consequently work, is no donbt favourable to the trustworthiness of their decisions.

The show-yards, on the other hand, are very conveniently situated, occupsing 35 acres of upland near the Saltash lioad-the summit of which as seen from the higher part of the town appears as if covered with a cloud of canvas. The show is as extensive and will he as instructive and useful as ever, though we cannot suppose that it will attract so large a number of specrators as during a time of less public excitement it would have done. No less than 3000 yards in length of shedding are provided for machinery, and about a mile in length for live stock. And the strictly agricultural show, which is thus as good and large as ever, has the advantage of being this year held in a place full of unusual local attraotions. There has never yet
been a show-yard whioh has commanded sa magni-
ficent a landsoape or one fuller of points of national interest. This, and the expected arrival of the French Heet during the Show week, and above all the promised visit of their Muyal Mirgnesses the Prince and Privciss of Walrs, will signalise the Plymouth meeting of the Royal Agrioultural Sooiety, and insure for it the attainment of a great success.

Plymouth: Thursday, July 14.-The rain has been falling all day, so that nothing has been done to forward the work of the implement judges. First the reaping machine trial was postponed and then the attempt to start the mowing machines, of which fourteen sto d ready to attack the heary coarse and foul Grass crop prepared for them, was mbandoned. It will be hardly possible for the judges to acoomplish their task before the ond of the week.
A Royal Commission, whose report we shall immediately publish, has been sittiag in Ediuburgh ever since the beginning of the year, taking evidence on the agricuitural, commercial, and social effects of what is known in Scotland as the Law of IIspothec; which enables a landlord to compel repayment to himself by a purchaser of grain bought by sample in open market from any temant against whom a right of hypothec has been executed by his laudlord for arrear of rent
The English Law of Distress, in suob oases, gives the landlord a right over the tenant's property only as long as it remains on the farm, and coases when aold to, and in the possession of a bona fude purchaser; but if purchased by a person in collusion with the geller, with a fraudulent intention, then the right of recovery still remains with the landiord. In Scotland, on the emtrary, if a tenant be placed under the bar of hypotheo by his landlord for arrears of rent, no corn dealer, miller, or any other porson, oan purchase grain from him by sample or otherwise, even in open market, without being aubjected to the liability either of returning the grain or paying the landlord for it, even altnough he has already paid the price to the persou from whom the corn was purohased. Further, this law gives the landlord a preferable olaim over his tenant's property, to the excluaion of all common oreditora-the Crown, auperiors, farm-servants, and oreditors for funeral expenses, alone being excepted.
The obvious operation of such a law is to exclude the business of farming from participating in the advantages of ordinary mercantile transactions The tenant can neither purchase goods nur borrow money upon the same conditions as the mauufacturer or merchant, because of the existence of a lam which concedes the privilege to the landlord of stepping in, whenever an arrear of rent vecurs and taking possession of the whole property on the detaulter's farm, and retaining it, or selling it for his own behoof, and in full payment of those arrears to which the hypothes extends. Agrioulture thus becomes severed and isolated from other branches of industry; and those engaged in it are deprived of the unfettered freedom which charas terises the commerce of Great Britain.

The ordinary term of taking possession of a farm in Scotland is at Martinmas (11th Nov.) The tenant cccupies the farm for 18 or, at least, 15 months from that date before heing called upon to pay any rent. Thus a person enteriug a farm at Martinmas, 1865 , would not be required to pay rent until Candlemas of Whitsuntide, 1807, and then only a portion of it. From the nature of this engagement it seems not unreasouable for the landlord to demand the most unexceptionable security from a tenant for the payment of his rent; but unfurtunately out of this lonn-credit system has arisen a special law which exoludes all ordinary ereuitors from participating in a share of the effects of a bankrupt tenant until the handord's claim is settled in full.
And what inare been the practical eflects of this system on the bu-iness of farming in Seotland? Its first effeet undonbtedly has heen to induce farmers to vecupy land with comparatively small capital, in consequence of the long-aredit system, which gives thera the privilege of sowing, reaping, and seling the first crop of a new lease before any rent is asked. The obvious effect of this privilege is to encourage corapetition for land among indiriduals whose capital in nine cases out of ten is greatly inadequate to stook and improve it properly. This competition so fostered has not unfrequently presented the anomalous fact of land rising in price, white the value of corn, \&c., may have been long and rapidly diminishing. The Law of Hypothee has therefore contributed greatly to the existence of two evils-the first an unnatural competition for land, and secondly an
ocoupaney with a oapital generally muoh beluw What is requi
improvements.
The ultimate effect of removing the Law of Hypotheo entirely from the statute book of Scotland, and substitating in its stead the more rational and equitable law of distress, as in
England, would be beneficial to the interests of England, would be benefioial to the interests of the farmers themselves, by restrioting the compe-
tition for land to that point at which the capital omployed must necessarily correspond to the requirements of the particular sabjeots upon which it is to be expended. Were this law abolished a landlord would reasonably require an instalment of rent at the end of the first six months' occupaney, instead of at the end of 15 or 18 months, as at present, and consequently the capital required in such a case must not only be sufficient to stock the land with cattle, horses, implements, manures, seed corn, \&e., but also leave a surplus to pay a half-year's rent. The law of distress would, under such circumstances, be perfeetly competent to protect the landlord against any default on the part of the tenant.
As matters are at present, a tenant, with a 15 or 18 months' credit from his landlord, who has a preferable olaim over all common creditors to his tenant's effects, is placed out of the pale of an unfettered trade. In proportion to the amount of credit afforded by the landlord, and the extent of preferable elaims guaranteed to him by law, so must the commercial status of the tenant be lowered in the estimation of all with whom he may have dealings. The banker freely lends money to the manufacturer upon ordinary seenrity, because he knows that, happen what may, he has an equal right with other oreditors to the effects of the individual he has trasted. "With a farmer this can never be the case as long as the law assigns to the landlord the "lion's share" of his effects in the event of a sequestration being taken out against him. The manufacturer may, and often does, surmount a bankruptoy, and future prosperity sometimes enables him to clear off old scores, but the case of an enterprising tenant who has run himself aground in consequence of his very efforts to obtain greater scope for improvement, is a particularly hard one-he needs time
to extricate himself from his present difficulties ; to extrieate himself from his present difticulties;
his capital is not lost, it is only invested in his farm, and will reproduce itself sooner or later, either in part, in whole, or with increase according to the skill displayed in laying out, bat he falls on "evil times -a bad harvest, or a fall in the price of farm produce occurs, his outgoings exceed a position to meet his landlord's agent at rent day, He cannot go to a capitalist or banker to ask assistance, because the landlord's right of hypothec
stands in the way; and finally he is thrown upon the landlord's merey, who may, under such circumstances, dietate his own terms. This is by no means a fanciful picture, it has a stern reality of frequent occurrence. Is the landlord to blame? certainly not for adopting a course which the law recognises; but, assuredly yes, if the tenant's defalcation can be satisfactorily proved to be the result of improvements, the benefits of which are still unrealised. Let landlords concede remuneration for unrealised improvements, and the Law of Hypothec, bad as it is both in principle and practice, would press much more lightly on the tenant, while at the same time his status in the commercial world would be greatly improved.
It is, however, probable that the Law of Hypothee will he very materially altered, in consequence of the publicity which the recent Commission has given to its evils. And no such mere palliative as a recognition of what is technically understood as tenant-right will be accepted as in the place of that essential restriotion, or, perhaps, final repeal of it, for which we may now look.

THE WEATHER AND CROPS OF 1865.
THE climate of the spring and summer in the eastern counties has been remarkable for unusual extremes. A Wet March, with none of the dust which is said to be so valuable, alarmed Barley growers, as well as heavy-
land farmers. Seed time was fast passing away. The severe frosts, however, alternating with the rains, mellowed the ground; and a sudden change to the most genial weather shortly allowed the spring sowing to be completed in beautitul condition, almost at the In the , and at less than the usual cost of labour. generally of rapidly, and the Wheat, which lost plant to on the corn daring the winter and wet aprings had been wonderfoily
restored, even on the most defective leas, by the favourable weather and the timely use of the roll and hoe. On April 17th the pastares were already green, with a bite for cattle on rich land; Rape and Turnips were running to seed; Pear and Cherry buds bursting; the Oak was ready to be peeled, and Lucerne was 10 inches high.
On the 3d of May everything had changed for the worse; there had been no rain tor five weeks. Vegetation, instead of having been refreshed by April showers, was everywhere suffering from the effects of sharp frosts at night, often followed by a blazing sky all day and excessive heat, with frequent changes to cold, dry wind. Shrubs transplanted in autumn, and looking well hitherto, were dying, unable to bear the excessive expiration from their leaves, exposed to a dry burning atmosphere. Forage plants, checked by the frosts and scorching air, made no progress; on the 5th of May Red Clover was not ankle high, Trifolium was stunted, even Tares would hardly hide a partridge; Grass in the pastures was shrinking on the ground. We had experienced the climate of Cavada in the sudden termination of winter and the rapid growth of vegetation. The Wheat, browned by the long and severe winter and ungenial spring, started into luxuriance. But the plant lived too fast; the drain on its constitution was too great; it became enfeebled and unable to bear the successive frosts and scorchings. Stunted, checked, and forced into abnormal maturity, its stems were formed without that "tillering" at the root, by which, in favourable seasons and on good land, a thin plant of Wheat frequently thickens into a bulky crop.
At this period the prospect for harvest threatened \(t\) become deplorable. The Wheat lost its luxuriant and spreading appearance; instead of covering the whole of the ground, it shrank and became meagre and upright. If the adverse weather had continued, the next stage in the starvation of the plant would have been the turning yellow of the lower leaves and the apparent widening of the spaces between the rows, marking out the field in straight lines, down which the eye would reach further every day. From this last staye there is no recovery. I never knew
anything but a very light crop when this climax was reached in the early part of May. This year, however, the last stage of premature old year, however, the last stage of premature old
age, without hope of rejuvenescence, was not quite reached. In the second week of May (the 10th) the rains came, followed by hot, forcing weather day and night. So sudden a change, and one so rapidly beneficial to the crops, has not been witnessed since 1847, when a late dry spring was followed by unbroken fine weather until a very abundant crop had been safely harvested.

The blossoming time this year was very favourable here, and 1 believe elsewhere generally. The ear is remarkably well set with grains, and does not appear to have suffered froun the ravages of the midge.
Notwithstanding these redeeming circumstances, it will be found, when harvest arrives, that there is no hope of an average crop of Wheat. There will be a deficiency of stacks, not merely from the shortness of the straw, but from the falling off in the number of the ears. The best crop will be on the strong clays, properly designated "Wheat land," but even on such land there is not one field in fifty that has straw and ears enough on an acre for a large crop of corn. The deficiency cannot be detected withont eye to estimate the crop from the outside. To the uninitiated it is "a beautiful field of Wheat" when ripening for the sickle, whether there are seven or 10 sacks to the acre. But there are few fields this year that would satisfy the eye of the critic, who looks in vain for a close and even hend of ears, apparently so level and solid that a cricket ball might be rolled from one end of the field to the other. On light land and on soils out of condition I venture to say that "he who runs may read" the unmistakeable signs of a wretched barvest in the scanty crop of straw. In many instances Where the prospect in spring appeared quite hopeless, the plough was resorted to, and large breadths that were spared will not produce half a crop.
This failure was not entirely owing to dronght. 25 th of May on the sides exposed to the north and east, and this was attributed to the effects of blasting winds and a severe frost on the \(3 d\) of the month.
Barley, as a spring-sown and less deep-rooting plant than Wheat, is less able to bear drought. It has suffered considerably, and during the last week of the drought it was, in many instances, shrinking fast on the ground. These warm rains will do much for the crop and improve the prospect of its yielding a good malting quality.

The Oat crop is notoriously and hopelessly deficient. Pulse crops will be uneven and generally light in Beans on strong land, my impression is that the May rains came just in time to clothe the short haulm with abundance of pods.
The hay crop is as bad as possible; upland pastures, worst seasons, have totally failed this year, snd the tock had to be turned in to gnaw off the straggling "bents" that took the place of Grass. This failure was not owing to the drought only, which was almost a severe late year as this, but to the angenial wes

April and May, the daily scorchings and night frots sirocco.
It is early to speak of root crops. They prome better than last year. Common Turnips and Smedes
bave grown rapidly since the recent rains. they have grown rapialy since the recent rains; they hed
been previously at a standstill, and must bar been previously at a standstill, and must have boas
swept off by the fly, but luckily the enemy was nol force at that time. Mangels are adapted to hot land in a district where the rainfall is low; hot wean suits them; they are looking well where early mom and well farmed.
Red Clover has yielded very light crops of hay; that intended for seed, which is largely grown here, looking better since the rains, I am afraid the yoong the drought of last year.
In conclusion, my estimate of the crops is as follors: Oats, Wheat, and Barley, deficient in the order they are written; winter Beans good; hay very bad; rot July 10

APPEARANCE OF THE CROPS
Devonshire: Tavistock, July 6.-At present Wheat crop is looking well, and promises to be all averact crop. Barley promises an average where got in earl,
and on land in good condition; latcusown does nct ;rum well. Oats are likely to be a slight crop, very abort of straw, and after lea almost a failure. Potatos are frim from much disease, and look not amiss, but owing the drought they are likely to be small-at leant to early ones. Mangels are promising to becowe a tair crop. Turnips have been so much eaten by flea and have had to be resown so much that there cannot bo: be a light crop of Swedes, and of common Turnipo w. can say nothing yet, many remaining unsown. Hiy i a plentiful crop and remarkably well saved. Hasturs
are getting bare, but as we have nice rains now wo my luope for amendment soon. John Benson.

Dorsetseire: Symondsbury, July 7.-The preats appearance of the Wheat crop in this neighbourthod is most favouruble; although the stalks may not bo the ears are large and full, and will, seasons, stim yield plentifully and be of good quality, only in spits at all laid. The Barley crop, which appeared a fier days ago most luxuriant, is (with the beautiful storm we have had), gone down, and will of course be thin in grain. Oats most uneven, more so than I ever remen. ber to have seen, and will I fear be a disappointing crop, for if the old saying be adopted that who'd preserve the king and queen must cut the 0 when they are green," the sample and bulk will be very unequal. The Beans ceased to
abruptly, but the first pods appear to be filling nicels. Peas a very poor crop. Flax not 80 heavy as last year, still I think the crop of seed will be un average one. Turnips most promising. Mangel Wurzel univeralif good. The eweleazes are bare of Grass, but the present prospect of winter food is very different from that of last year. Hay secured in beautiful condid
and a sreater crop than last season, so that I thind the and a greater crop than last season, so that price of sheep will be high during the autum; cow. leazes would have been very short of Grass had rain not come when it did. Altogether, on taking 8 review of our present prospects, I think I am justitee -West Bucknowle, Corfe Castle, July 6.-All crop are quite an average in this neighbourhood, and harvea will be early. W. J. Toss.-Bradford Abbas, Jur -The appearance of the crops Wheat promises a well-eared crop, and as yet we hase not noticed the presence of any of those pests or 4 ppis as the wheat-midge (Cecidomyia tritici), clear form
Corn of all kinds seems to be remarkably clat smuts, mildew, and other fungoid attacks. Ba promises well where not too late sown, and the exp rience of the past and present summer has sio resuls that all the early-sown samples afford the best brea ix-rowed, or Winter Barley, of which a
was sown for sheep-teed, is now fully ripe, and the crop was sown for sheep-teed, is now fully ripe, but the loos continuance of dry weather has made them exceediigg
patchy. Maugels now promise well, and alse from the surface grub, which was last year 80 troubles regard to this latter pest on our own farm, that we are experiencing a greater immuit neighbours, because we have been caref,
every cause of disturbance to the rooks, uch signal service in devouring these devastation grubs. Swedes are generally much destroved by the fy or flea-beetle (Haltica nemorum, and cultivated but unless where the land wa especially when the land has beeu
vivusly to getting in the seed, as it so to clud that indeed the effect
same as though some had been boinn ailes
The finest promise we have seen for after steam cultivation in the winter, the seed was got in and was sown broadcast with three hundred.weight ?
cre of Proctor's turnip-manure. The roots now join rank, and sever completed. Much hay has been got ngother in good colade as was at one time anticipated.

ESSEX: Romford, July 6.-I report for this neighEssEx : Rombat and Barley good, Oats bad, Beans nd Peas average, I Turnips average. Itink I shall commence and arrest on the 16 th proximo. We are cutting winter Barley. We plenty of antumn feed, \&c. Collinson

\section*{Hall, sen.
Hasts:}

Ealing, July 7.-Wheat thin on high lands, good on strong soils, whether such soll average. Barley a fair verage crop. Oats bad, unless winter Oats, or sown in ; Beans middling crop; Peas pretty good; Mangel fair promise: Swedes a fair prospect, but in places ijoured by grub and 26 days without rain. Turnips a oud plat and, frop; Potates March, 91; April, 66; May, 298; June, 2.98 otal, 15-16. W. C. Spooner.
Merse of Berwickshire: July 1.-The past month is the driest on record. The showers of the \(2 d\) oor neighbours in Lothian had some rain, we had literally but two or three drops. After the heavy rain in the end of May the weather continued remarkably warm, and Grass got very abundant, and continues so
where not early bitten by ewes. Stock is in good coudition, and lambs doing much better than in spring, when losses were heavy. The threatened luxuriance of Sats on deep land has got a decided check, and on ery poor indeed. There is not much Wheat to be seen; the plant is sufficient, but looks ragged and unequal in shooting. What is early sown on deep of Turnips it is difficult to speak; strong land has wrought very unkindly. Some pieces of Swedes are ready for the hoe, but the great breadth has been scorcled and fea-bitten to a degree unknown in our been tempted to risk second sowing, but their seed, ns well as Yellow and White Turnips in general, will be nowhere unless we have rain soon. Beaus and Tares tand the drought best of all crops. J. T.
Scrary: Hoe Bridge, Woking, July 10.-I think the crops in this neigh bourhood have never been more rarions. The Wheats on the old Clover leas plaated where the plant is good, and the land of good holding exture, and well done by, the crop is good, and exceedingly well headed, and the ears well filled; but this is the exception, as I think the greater part of the crop is
thin on the ground, short in the straw, and, especially on the poor sands and gravels, very bad indeed, and be said of the Barley, -very average. The same may whole I think we shall have an average crop. Peas very good indeed, and nearly fit for cutting. Beans have had fur years. grow, good; Oats, the worst crop we breadth sown. Sears. Mangel goord, and a large "pland hay about one-third of a crop, and poor in quaity. Meadow hay a good average crop, fair
yuality, and well secured. Stock very healthy, and eru moderately plentiful, the late splendid showers

\section*{Trigira Ross:}
orth no such season as this We have had in the hen the harvest was concluded in July, and when in cot. Last the crop was plucked because it would not and not without reasore loud complaints of drought, mossally short and reason, for Barley and Oats were and lititer that scarcely a stack is now seen anywhere, officiently is nearly entirely used up. Although thus atraw is ngain to be for the new crop, the supply of carlier, and although year the drought set in much crop, it is much lighter than that of to be our bulkier gathered at all, will requing, and on many fields, if With a continuance require as in 1826 to be plucked. on light soils seema impossible, as they are now rapidly
mithering away has stood out better earlier sown Barley on deep soils vested; bat the later, and can be satisfactorily harground is not done well, whilst on the lighter fields the all is uearly affected alike. No now be, covered. And Whether at getting better off than his neighbours, for mithout it, all southern exposure, with top-dressing or has the thatage at all, it is on the side of the man who carliest largest breadth of autumn-sown Wheat, the sheltered farm. Tho most advanced crops, and the best Larveited heavier than that of grain, and is com-
amidst sunshine and heat that with us are
quite unusual. Hay on the iigbter soils became so
withered, and appeared so suitable as fuel, as to lead a farmer to express his fear that his mell when mowing might by fire struck from the stones with their scythes ignite his crop and burn it up. The Swedes, and all the Turnips sown before or within the first few days of June, brairded regularly, and with rain would yet do
well; but all the Turnips sown about the middle or well; but all the Turnips sown about the midale or
towards the end of June have brairded very irregularly, and cannot now braird until we have an abundant fall of rain. The Swedes have been singled, are yet fresh, but much needing rain. The earlier sowings of common Turnips are being hoed, and the pieces of the later sowings that have brairded will also soon be fit for the hoe. Potatos are looking pretty well. Cattle, both fat and grazing, have been selling well. Seldom has there been a better demand or higl er prices than at the Muir of Ord in June, but from the continued drought and Warcity of Grass, grazing stock must necessarily fall.
West Sussex: July 11.-Haymaking is over and has been made well; the crop is rather light, especially the Clover, but since we finished we have had some fine showers that will bring on some after Grass, and where there is a plant of Clover we shall get a good cat. Swedes and Turnips are doing well where put in ratber early, but thone put in later than the end of May or
beginning of June have not come up regularly, and do not look so bealthy. Mangel is good in some places, and very bad in others, altogether not up to the mark. Wheat looks well and has had a good time to flower; some of it il laid, but not to the extent that wn should have expected, and there is no doubt we shail have a good crop. Barley is also good, but very much laid. But Oats were never known to be so bad; some have been cut up for hay, and some fields have been so over-run with rubbichy weeds that they have been ploughed up, and the best that I have seen do not look like thalf a crop; and where they, are best cut, as they are not coming at all together. Peas are generally a good crop, and some are now being cut, but the best crops are hardly fit ye'; they were all turning off too rapidly, when we had some fine
showers about a fortnight ago, and since then they have filled up very much. Potatos are stil healthy, and promise well. There are still some is well up, and all are ready for harvest. The land has been so clean that we have got tirrough quicker than usual. Cattle feed is rather short in some places, as the weather continued rather too long dry, but we may expect to have it more plentiful through the autumn. All kinds of stock are still dear, especially sheep; full-mouth ewes of fair quality, which would come out middling fat at about \(8 \frac{1}{3}\) to 9 stones of 8 lb , cannot be got for less than 38 s. to \(42 s\); and to keep them a year with extra foor, and sell them fat at about 44 s . or 45 s ., and perhaps 36 s . for each of their lambs, after losing from 2 to 5 per cent., does not leave much profit; if we were to charge anything like fair value for the roots, hay, calke, \&cc, that
they must get, they will leave the balance on the wrong side. Where the land is good, perhaps wether fatting does better than buying old ewes to lamb down, and then fat; but when the land is not so good, perhaps the latter is the safest plan. Harvest will begin about the last week in July, and to be above average; Barley, the same; Oats not half a crop; Peas nearly average, but very unequal; Beans, few grown hereabout; Mangel promises well; Swedes
variable; hay light, but good. Not much old corn left in ricks. \(G\). S

\section*{MANURES AND CROPS}

\section*{(Concluded from p. \(630^{\circ}\) )}

Liming. - No more extensive practice apart from the ordinary routine of fertilisation is known in agriculture than the application of lime-and no wonder, its effects are marked, and indeed marvellous. So great a stimulant is lime that an overdose of it, as it is called, is a well-knowu method of raising scuurging crops and proil inat exsiona class of pants that Liebig designates one class of Lhey are represented by Lucerne, Clover, Beans, Peas, and even Potatos-but lime is found ouly in the leaves of the Potato, very small traces occurrin in the tubers, which belong under Liebig's classification to the potasis plants. The Clover sickness to which we have so frequently referred is sometimes occasioned by defictency of lime in the soil; so also is Anbury and.Toe in Turnips-a disease whencequence of its beiug parenchyma of the shoots and tap roots in search of lime for its skin. A crop of 2 tons of Clover removes 130 lb . of lime from the soil ; and the best applicatiou superphosphate of lime. Gypsum or suiphate of lime is also found highly beneficial. Lime absorbs moisture from the atmosphere with incredible rapidity; and a ton of quicklime when slaked acquires three times its original bulk nad weighs 25 cwt. The only advantage, however, gained by slaking lime is its reduction to a fine powder, which enables it to be more evenly sprend.
But slaked lime very soon attracts carbonic aciii from: the atmosphere, and becomes once more carbonate of
driving off the carbon in burning the carbouate of lime or mountain limestone in king as 100 lb of this when pure contains 44 lb . of carbonic acid and 5 ll lb . of lime. Lime, therefore, by the process of burning loses the whole of its carbonic acid, and a ton weight is reduced

The general opinion regarding the preseace of lime in the soil is that an arable soil ourht not to possess less than 1 per cent. of lime; and that 8 tons of burnt lime per acre would impart this proportion to 6 inches of soil. After a heavy liming no farther addition will, however, be requisite for six or eight years. A crop at the utmost removes only from 1 to 2 bushels per acre of lime, and the land at this rate gradually reverts to the condition in which more lime is required-faster-for the lime by its own specific gravity uniformly descends below the active soil, and there, upon digging a section, layer upon layer of each successive liming the land may have undergone will be found deposited. Litne not ouly enables crops of soperior quality and bulk to be produced; it enhances the effect of undecomposed manure, by calling into action that which may have been lying dormant. Manure, however, ought never to be laid upon the land immediately after liming, because quicklime will drive off all its ready-formed anmonis. Lime destroys marsh and heath planta, such as Mosp, Heath, Bent, and sour Grasses, brings up sweet herbage, with natural Clover, and completely renovates the herbage. All fodder is found morn autritious when grown upon laud sufficiently limed. The quantity of lime required varies in proportion to the dryness of the soil, its stiffness, and the amount of vegetable matter is contains. Poor arable lands are soon worn out by repeated liming and
cropping. To exterminate Moss, sour Grass, \&c., the lime must be applied in a live state. Generally speaking, the more completely and immediately quick lime is incorporated with the soil, the more effectually the slaking is accomplished in connection with the snil the hetter. In overspreading Grass, however, where there is no intention of destroying the herbage, it is better first to slack the lime in the open air, reducing it to a powdery condition, and applying it in the form of mild lime. In this state the quantity of quicklime still contained in it, should, however, be sufficient to effect the necessary chemical changes in the so1l; for on this its ultimate efficacy depends. Quicklime should never be applied to light or thin soils, sands, or gravels.
Magnesian limestone has an effect similar to mountain limestone. It is a carbonate of magnesia in combination with carbonate of lime, and becomes caustic in burning; bu's must be used more sparingly than lume destitute of magnesia, since it re-absorbs carbomic acid more slowly, and remains longer caustic. Its application is more properly made to arable than to Grass land, as Wheat, Barley, and all cereals require maguesia for the perfect development both of their straw and cora. Chemically supplying to the plant neutralises the humic and other acids naturally formed in soils, converts inert vegetable matter into stimulating food for plants, and aids the mineral decomposition of iron, mangauese, alumina, potash, soda, ammonia, and
silica iu soils. To its perhaps over-stimulating effects in fact, may be traces the origin of the adage "Lime enriches the fativers butimpoverishes the sons." Lime, however, does not necessarily exhaust the son, unles exhaustion it produces is only perceptible in cases where the sole application to the land has consisted in laying on successive doses of lime, and where the supplies of
other manure have beentoo scanty. It is where limealone has been applied that abundant crops are followed by exhaustion. The presence of mid hue in the soil assists in the formation of nitrates ; and the production of nitre or saltpetre is dependent upon those properties of lime whereby nitric aeid is engendered from vegetable That invaluable salt, nitrate of lime, is always to be found in old compost heaps. "Under ordinary circumstances," says Protessor Way (Journal of the Royal
Agricultural Society) "and with the presence moisture, lime is capable of liberating one half the ammonia contained in a soil. In the case of ammonia locked up in the soil, lime may be the remedy at the command of the farmer, his means of renderng immediately available stores of weath which can otherwise only slowly be brought into use. In this view lime would well deserve the somewhat vague name that has been given it, namely, that of a 'stimulant,' for its application would in some sort be an application of ammonia would lead to all the diaastrous effects which are so justly at tributable to it. I do not wish to push this assumption too far, but if there be any truth in it points out the importance of employing lime in smal quantities at short intervals, rather than in large doses once in many yeara.
Sulphate of lime or grosum is the most abundant Very large quantities of the pure gypsum quarried in Dertyshire, Mr. Parr tells us (Letters to Farmers), in an unburnt state and ground to powder are sent
to London not only for adulterating flour, sugar, iezonges, \&ic., but for mixing with Peruvian guano,
which it is supposed by some to render genuine by taking a pound or two of value off the ton. This aitulteration is carried to an incredible extent. Chemi-
cally, the composition of gypsum consists of 28 parts lime, 40 parts sulphuric acid, andants lime, sulphur, and sulphuric acid. In a burnt state when it has lost all its water, it is the well-known plaster of Paris. Burnt gypsum dissolves less readily than unburnt, and much wypsum dissolves less readily in both instances required, since a gallon of water will not take up into solution exceeding three drachms of unburnt gypsum. A dressing of 3 cwt . per acre will benefit Cluver on some kinds of land, as it will
other green crops requiring sulphur. As an addition to the dungheap, gypsum in small quantities is an important agent in fixing ammonia. It is, however, better suited as a fixer in the liquid manure tank, siuce it acts only in the presence of an excess of moisture.
Agricultural salt, an article cheaply, extensive!y, and it would appear effectively used as a top-dress. and upon pastures, is by no means a pure material, but presented to us in the less concentrated form, in which it is thus mixed up with impurities,
it is the better adapted for a manure. Mr. Duckham uses it extensively on his pastures in Herefordshire, but he has informed me that though the results, as the appearance and increase of the herbage, serious risk to breeding ewes, which cannot be too widely known. This fact in his experience he has had confirmed to him by that of the agent for a nobleman in Wales, and of another practical farmer in a different part of the country, so that there can be no doubt that of ewes either dropping their lambs prematurely, or if going to maturity bringing forth a diminutive and traced to the employment of salt as a dressing for Grass. Mr. Wallace Fyfe, at Cirencester College.

Growing Deans as Summer Food for Stock.-1 referred to this last year, and again revert to it in the on a moderate ecale to satisfy their minds and their pockets. Beans, when well podded during this month and August, and passed through the chaff cutter, render unnecessary any other food for fattening animals; when bullocks can get a good supply of these they will not eat their usual supply of cake. It is the most
nutritious food, and those who believe in chemical analysis can readily understand this. Many a farmer who is getting rid of his stock at a low price from a dearth of green Clover or Grass, would find to his Bean crop, either for bullocks, horses, sheep, or pigs. But will it pay? I believe it
be the most effective plan for getting full value for
your Bean crop. My bailiff said two yers a your Bean crop. My bailiff said two years ago, when 15l. an a rre as compared with other feeding stuffs. The whole crop is thus consumed, stalk and all. The Beans set to cut very ahort lengths, so that the chaff-cutter selves are divided. It is this particular crop, so properly grown on stiff clays, that render those soils admirably adapted to the requirements of live stock in the critical months of July and August. My good friends, who so often say "show us your balance sheet," will please tak note of this as one of the elements of successful farming One acre of green Beans affords food for a great head of stock. J. J. Mecki, July 5.
The W eather and Crops in Fesex and Suffolk.-The long-luoked-for summer rains which fell on Friday and Saturday last, it is hoped universally, have proved bene Providence ought not to be forgotten, nor too fuli'y and earnestly expressed to the Giver of all good. Wheat, the most prominent, and of greatest consequence to be noticed, is from the extreme dronght and heat superor earlier than they have been for nearly 30 yearg, when about that time, I forget the precise year, much Wheat had been cut on the 10 th, and carted and stacked by the middle of July, as it is probable it will this year. Fur want of labourers to cut and swathe curn in
due and proper time, it will be necessary to have recourse to the free use of the reaping machine. Ou the heaviest and richest soils, Wheat is a very full crop, and barring a few, and in some cases many light and grainless ears, occasioned by nothing else but by being sown extravagantly thick, it is quite unprecedented and up to the mart, and an average of 7 qrs. per acre will be realised. On the light and poorest soils, where the
continued frosts despoiled asd weakened the plant, about \(3 \frac{1}{2}\) qre, and on the whole as a mean, and on mixed soils about \(5 \frac{1}{3}\) qra, or \(1 \frac{1}{3}\) qris. above the common average of all years (4qrs. per acre). It baving escaped all injuries from storms, hail, and frosts at all the longert days, or season of iss blossoming (an uncommon occurreace in this country), its ears are well set, from 20 to 30, and some even to 100 -fold, with but very few abortive grains, or what is commouly termed the "red
gum." The folidge, too, of the plant contiaues appearance, and not of a rusty or dirty yellow hue (mildewed) as it generally does in this climate as it approache maturity. All crops too are stauding rare occurrence, but does not inply that it is safe to
sow above 1 bushel per acre to secure the best of
results), and will tell well in the measure and quality. A handful of ears will handle this year as if the straw were laden with leaden bullets than feathers, like common ears of corn do in ordinary seasons. A pretty correct eatimate may be roade of any growing crop of Wheat by cutting a handful of ears, small and great promiscuously, blindfolded or inaiscriminately, or in the night; ard if they will average only so soach square yard, the estimation, reckoning 18,000 grains to quart, will be nearly, omitting fractions, 50 bushels, 1 peck, 5 quarts per acre, and of course more or less proportionally as the number of ears and grains vary on the said square yard. Or as equally true a calcula tion may be made by cutting, threshing, and measuring the produce of a square yard, and multiplying it by 4810 for an acre. Rule:-about half a pint found to be the result of the said yard in round numbers, onnitting the fractional parts, any: the quotient, by rule of three, will be
40 bushels per acre, and so on. Barley, on the whole, will be of a full average and early crop. An acre-field in this neighbourhood is already cut, as also Wheat on the marshes, self-sowed, is already cut and estimated at 5 qrs. per acre, 2 qrs. per acre being supposed to be bird birds on accur of its precocity. Oats will prove below grain however will be short of straw, but yet of firstrate quality for fodder and cattle food, also for braiding Early Bens and Peas are an average crop, as no lice or other vermin have infested them during their growth as they did last year. Eirly common field Peas are a full crop, but the latter and more delicate varieties of gardeu Peas have suffered by the heat and drought, having never expandel;their blossoms, occasioning thereby in most instances where the land is poor, crippled, short, secundine or abortive pods with but one two, or three Pens. Hay and Cluver are extremely short,
occasioned not only by dronglit and heat, but more especially by the severe frosts of the 1 st and 295 sh of May, and at other intervals (when Walnuts were destroyed, as they often are) during that month Let us hope and trust that by a kind Pro pensate for this supposed loss when rain comes. pensate for this supposed loss when rain comes.
Margels will certainly be an abundant and full planted crop, from the land being deeply ploaghed, dunged, and pulverised before winter, and will be the heaviest ever manifested in this county since their introduction. Turnips may yet be a crop, and free from amber, finger-avd-toe, \&c., though the grub, that formidable enemy, is greatly to be feared again this season. As yet they Pure a failure in plant, owing to the ravages of the fly Putatos being small, will consequently be short of
weight and measure, and I fear they are not yet safe from disease, as, contrary to former experiences, and as anomalous as it appears, the very earliest kinds, of fected with the usual malady, to an extent of one-fourth the entire crop. The lateral ones, however (though this is doubtful), may do better, as was the case last year a!ter extreme drought. Fruit is forward, and wil ipen well. Experimenter, Maldon.
Water in Wells.-I see that Mr. J. B. Denton requests measurements of wells. As I have some
experience in this operation, I beg to suggest that the measurements be made to the surface of the water, and not to gauge the depth of water, except the first time The test tackle is an ordinary measuring tape, which may be extended by the addition of the requisite length of twine, or, best of all, the twisted silk used by hoemakers, to the end of which a small float of wood say 6 inches square and \(\frac{1}{2}\) inch thick, should be
attached, the end of the string passing through a smal hole in the centre of the float. To the end of the string a bullet or small weight may be tied, whici when allowed to sink a short way into the water, and then drawn up till it touches the under side of the float, will show the depth to the surface of the water with the greatest accuracy, and there is no operation in which accuracy is more necessary, to make the observations really useful. J. C. Clutterbuck.

\section*{Foreign Correspondence.}

Beenos Ayres: Chacra de "Los Alamos," May 25.The gratifying acknowledgment you made of my paper invitation to me to "report" occasionally, induces me again to take up my pen. The present highly interesting movement for the utilisation of sewage, and the have determined me to describe the treatment of the plant in these countries, adding some suggestions with the object of leading to attempts being made to introduce its more extended cultivation in the south of England, say the Maplin Sands, or other lands in the course of the London sewage culverts-lands on which The variety of Lucerne almost universally grown in
Trops. these countries is the Purple-flowered, and in a nooist genial spring it frequently attains at the period of full hower a height or length of stem of five to sir feet. The after cuttings, which are several, according to the parpose to which it is put, from (3) three to (6) six
the absence of moisture and the hot sum cons
this. The uplands are very much more under influence, and the sumamer crops much lighter on hem than on somewhat lower lands
The Lucerne (Alfalfa) is grow to a very large exter on the slopes of the Cordilleras, in San Juan, Mend regularly irrigated from the mountain are laid do depastured for very many years. of Alfalfars in these districts. The present owaen fathers having laid many of them down, hinn lands of Buenos Ayres, without either irrigntion manure, the Alfalfars (Lucerne meadows) are mon year after year, and are of much shorter duration. 10 15 years will usually see the most of them ont universal practice is to sow broadcast 25 lb , to 3 of seed to the acre. I have this season laid dom 4.0 acres ( I am still mowing some 80 acres 1852-3), on a piece of sloping ground, and as \(m y\) till and appliances have been of a superior style to usual practice, I will describe them as the best metho
first took a earthed up with Howard's ridging ploughs. The being gathered by cutting the Maize, \(\bar{I}\) allowed tim for the roots to be partly decayed or softened, and then ploughed with "general purpose" plonghs, subsoiling th higher part of the slope. I worked the land with an extra strong Clay's cultivator, and fined Nicholson's jointed roller and frequent harrowings. the spring, when all fear of frost had p.ssed, I put my seed, at the rate of 25 lb . per acre, with those excellent little American seed sowers, not un a coffee-mill, which distributes the seed evenly and we I covered it with a chain harrow, and rolled with t previously named roller. My seed was the hill.grown seed from San Juan, which I much prefer, as being of much longer lived plant than that of the plains. Tt unusually dry, so much so, that Lucerne meadomi their vigour at the same level yielded scarce anything a
all after the first or spring mowing; neverthelem, there was a moderate degree of moisture in the coil the time of sowing, the seed germinated well. best samples of seed are anything but pure, contain a considerable quantity of Charlock and other wee but as the majority of our Grasses and weeds a annuals, it is not of so great consequence, and men especially as the yield of Lucerne is but nominal first year, though at the same time it is desirable mow it two or three times in the season to cause ground The earlier weeds having burst into flower put on the mowing machines, and cleared the ground and I have since repeated the operation twice. I has now after a fine rain (the Lucerne having had a hard straggle through the long and severe drought) s be tiful even carpet of emerald colour, the Lucer covering the ground, and so strong as to bid detianco occupying the ground that weeds will have little chane and the spring mowing will leave it thorougly clome will smother everything.
In the broadcast thick sowing adopted we look for wo results, i. e. the smothering of all weeds and Grasses, and the less coarse growth of the plant, wid enables us to get a beautiful class of hay, whica not be practicable under the usual syecsitates aloo constant hoeing, which would be impracticable where Iabour is so scarce

Haymaking of Lucerne is a totally different metio rom that of meadow hay, which the more yon mo shake, and turn, the better it is, as it dries the mo rapidly, and the mowing cannot injure it, wheress less the Lucerne is moved the better, except in was The effect of moving Lacerne lay when the strong and the heat great is to sluke oll ant mecter leaving the bare stalk. The spring and autumncr having been cut with the mowing machine, I antil the flower is withered and the pulpiness of and stalk has passed, which accordiug
and weight of crop may be a day more or less. I then put on the horse rake and follow with the lowing des make up lightly into small cocks. The follo into one. I double the cocks, or I put three or four shakin? according to the state of the hay, but witho ther ope far sman cocks at once for the stack, ead handed the curt in the same mass or flake, and the stacken the curt in the same mass or flake, and
receive it and place it in the same way,

\section*{mowing machine half a day or one day}

解 now after the mower, carry the morning-cut hay to the stack in oon the following day. In parching weather stacking can be done after the morning slightest movement wou
from the masses or fiakes
In this way I preserve the colour as well as the lea, and even the flower entire and with coloras the day comes out
The great enemy of Lucerne hay is wet. The alight
(rin) at the stacking moulda it. It is requisite if in the field to so fur loose it cut of cock,
ind tolerably thoroughly in the cock (after once slightly wet it has a greater terdency to feirg even slightly wet sun). I have gone into these loe leaf if exposemaking because of the acknowledged Jetails of the layymang Lucerne hay, and because I have (ond that by these methods I have been entirely I seldom leave the field for half-an-hour "getting" of my Alfalfa hay. Lucerne will thrive on loam, of course, is thay, perhaps, ascepted. Al loam, or even sand, provided therest; but a lights sandy loam, ompact subsoil, will produce capital ars; more especially if there is a fair and good proIt will bear a considerable amount of water provided thes not stagnate on the surface, or under the surface. am disposed to think it will bear any reasonable amment of irrigation by pipe or gravitatıon, and proreiv best land may prove to be a light porous surface nil; and on such lands it could advantageous y be laid ande or Barley, or Rye, which growing more in the siman than the ear under the influence of sewage "onhl make zood "soiling" for cattle, cut at the time if anonting the ear.
The voing Lucerne plant would be the better for the oupport of stwe other ruots and branches than its own in the first ycar of irrigation on this class of soil. Broad. drilling, as the ground would be more fully occupied by the plaut, and the soil consolidated by its roots, Moreover, under sewage irrigation, plants far apart would attain to a very rank growth, precluding any possibility a griol hay, though periaps equally good as thinwouil not be advisable on drilled and hoed Lucerne. 1.ucerne, under all circumstances, should attain to its full rigour before iny animals are turned on it to gruse, but after it has attained full maturity, say 3 yeans, I believe that it may, even on irrigated lands, be grazed occasionally, and at some seasons of the year wilhout material detiment, provided it is not eaten close, and animals not put on to it until it is well grown, and the surface sufficiently dry and consolidated. Anything like puddling is in the last degree prejudicial to Lucerne, and a plant in a hole made by the honf of a
horse or ox, and lull of water for days, would have but poor chance of life
In choosing the ground for sowing I shonld give a prefurence to a gentle slope, especially if the irrigation weltected ly gravitation; it may, indeed, be sown on considerable slope, the ground being sufficiently firm Allurin flow of the sewage
Allurial deposits containing a quantity of shell lime very favourable for sowing Lucerne
Sot only is lime a principal coustituent of the ash intumence on it. When a large a most favourable applied as a manure, the presence of lime is the more teeestary; the duration, the length of life of the lant, will be inaterially influenced by the presence of consideralle proportion of this alkaline earth in the considerable proportion of this alkaine earth in the
subsoil, a heavy dressing of lime turned under 8 to 10 -iuch sod or furrow, or worked up with the previous to sowing, wonld not be undesirable.
As in all probability along the line of the sewage mpply a large number of animals will be maintained part "suled" for six or seven months of the year, there can be no doubt of the value of Lucerne if it can be ralurs, that grown. So great, I conceive, would be its areful and thorough trials on the most prominent varieties of soil and in the most suitable positionsposibly a close proximity to the sea would lessen the shiond the crop from frosts.
should feel greatly induce the trial I shall rejoice, and them would greatly obliged if gentlemen undertaking nluable Paper, where I might hope to liave the gratificaMany them chronicled. Alamos, May 25, 1865. anny thanks.-The cultivation of Lucerne is well anderstoud and practised in South Eesex.]

\section*{Farmers' Clubs.}

Istirgran: The Horse Show, July 8-13.-There were here in all nearly 400 entries, divided into 10 eallions: The first class devoted to thoroughbred conching stock; the third to riding for roadsters or hones up to heavy weights, park hackes, and ladies and upwards; the fifth to hunters of five years old the sixth to the fifth to hunters of four years old;
in match cobe, and pairs; then a class for weight-carrying meres to bry that in each aud all of ithes not too were with eve the finest specimens of horses to be in a fer words. Foremost among the thoroughbred
stallions is Caractacus, a winner of the blue riband of the turf, who took the 18t prize last year, and takes it again this. Scottish Chief takes the 3d prize, and though not now in training still looks as small a horse as ever, considering what he has done. The 2d prize goes to Diophantus, who ran so well in the Derby four years ago. Lord Clifden is also here, looking sadly fallen off in form. In coaching staliions one of the
best shown is Prince of Wales, belonging to Mr hest shown is Prince of Wales, belonging to Mr.
George Holmes. There are some fine specimens also George Holmes. There are some fine specimens also
skown in the minor hall. In riding horses the whole class is not only very numerous but very excellent. Among hunters Lord Spencer takes the lst prize with Brown Stout, a magnificent animal standing ove 16 hands high. It is among the hunters of four years old, however, that the best animals are to be found. This class is superb, as are also the weight-carrying cobs, some of which are the very perfection of what these stout, middle-aged gentlemen's horses should be The class of carriage horses is small, but very good The ponies, as usual, form the most numerous and the most popular class in the building. There are three classes of these animals, and nearly 100 have been sent in for competition. Times.
The following is the Prize List:-
thoroughrbred stallions.
Judars.-Lords Chesterfield, Falmonth, and Portmmourh.
 Mr. H. Goodchild, Stud Farn, Enfield (Dinpuantus); 3d, 25i.,
to Mr. W. Dinald, East Acton (Scotienh Cbief): exiria prize, coaching stallions.
Judges.-Mr. Harvey Farquhar, Colonel Naude, and Captain
 ynu (Young Perfection).

MIDLAND: Sewage of Towns.-At secent meet ing of this Society, Mr. Nave said: Having felt ansious to investigate to the value of sewage, he had mado inquiries from the occupier of tho moden at Saltley to which it is applied (Mr. Burbidge), who informed him that 40 cows and two horses were kept on 30 acres from the 22 d April to the 8 th of May16 days, and that that was all the stock which had been upon the land since last autumn. They were now being anved for mowing, but would not average 10 cwt . of hay per acre, and that of inferior quality. He thought the detemoration of that it was high time teps were taken to prevent further mischief, for to think of selling sewage which produced such injurious ffects was altogether out of the question. In conclu sion, he suggested that night soil or other masnuris
deposits should as far as practicsble be kept out of the sewers, and he would add that the original system of "petties" was sound in"principle, but wanted improvewater should be kept out of them and the dry ashes from each dwelling put in continually. These would deodorite the night soil, take up the urine, and thereby procluce a large supply of valuable manure without any nuisance or annoyance. This could then be conveyed to any distance with one-third of the trouble it caused in a wot state. Perhaps he might be told that plan was too late; but if Mr. Bannehr was correct when he said "only one-thirtieth part of the houses were provided with water closets," there was ample room for experiment.
Mr. WM. Fowler, jun., fully agreed with one opinion, in which all seemed to concur-that the general introduction of the water-closet system in lieu of the old-fashioned privies and ashpits was a national misfortune. He, lowover, believed that system to be permanently established, and the question now to be considered was what was the most fensible aud practicable way of denling with it. He doubted the practicability of any systom of interception whatever, which would on the one hand effectually prevent the pollution of rivers, and at the same time economically and profitably utilise the whole manurial elements of the sewnge of large towns. Any syatem which fell short of these two requirements was not worthy of serious consideration. His own belief was that so long as the present system of sewer age continued, no effectual mode of disposing of it so as to prevent the nollution of rivers, and at the same time to utilise the manurial elements, was possible excepting by means of irrigation. The whole philosophy of the question appeared to him to be embodied in the admirable report of the committec of which Lord Essex was chairman. By way of comparison he would take the case of Croydon, which be supposed might be considered one of the most successful instances of the utilisation of town sewage in the kingdom: but the circumstances of that place were peculiarly favourable.
The whole area is upon the chalk formation, and is of so porous and absorbent a cbaracter that when heavg storma
occur a very large proportion of the rainfall is taken up by the occur a very large proportion of the minfall is taken up by the volume of the scwage. The whole level of the conntry, and
particularly of the farm on which the sewage is usen, is remarkably adapted to the purpose, and the soil itself is mo suited by nature for the reception of the sewage that it is not
even necessary to drain it, except to a very limited extent.
The farm is situaled about two niles from tho town, and tho The farm is situaled about two miles from the town, and the
sewage is led with a rapid fall, by means of a carrier, partly aewage is led with a rapid fall, by means of a carrier, partly
open and partly covered, for about a mile. It then urdergoes a rough process of filtration through gravel and atraw, in a
series of tauks, by means of whlch the snlid prion is sepa-
raied. Thenee, by meaus of au npen carrier, ilic liouid sewage raied. Thence, by means of an onen carrier, the liouid sewage
is con eyed to the upper end of the farm, and by a series of field, aud mo, by wall outlet, gutters, in led owee the whole
surface of the land, draining off into the main diteh or carrier sur the upper end of the field next below the one under imripa-
ation. Tho sewage is always thas run over the land at least twice, and sometimes oflener, before it reaches the river, by
which meaus it is rendered so free from impurity that the fish live and thrive at and below the nutlet into the river, as if no
guch town as Croydon was in existence. A small portion onl of the farm is in pernuanent turf, and nearly the while of th
remninder is arable land laid down with Italian Kye-grass, which four, and sometimes five, crops in the year are cut, and good autumn and winter grazing afterwards got, This farm, lense at \(4 l\). per acre, and re-let it also upnn lease at \(5 t\). per acre
having in the first instanceallowed the tenant \(3 l\). per acre toward the cost of const ructing the carriers, and levelling and adapting (about \(10 c 0\) tobs per aunum) is sold at 13 . Gd. per ton, and this notendance to the works, so that \(250 l\). per annum is clear profit
to the Board. The tenant is under covenant so to use and polluting the river, an that even inard times nf heavy rain or
sudden storm every drop of the sewage is run over a grater sudden storm every drofn of the sewage is rinn iver a greater of sewage is estimated at about one million gallons per day aud dass, and is obliged to be an whether it requires it or not. It
is estimated that abnut four or five thousand tons per acre is poured over the land in the course of the year. The population
from which it is derived is from 17,000 to 20,000 . The sewage
is of capital quality, consistiug only of surface water drainage, being free from all noxious ingredients arising fiom

With regard to Birmiogham, there was no alternative but to carry out the same system upon a far more extensive scale, and under much less favourable circum stancef. The Corporation must possess themselves, by compuleory purchase if necessary, of a large tract o land-probably not less than 1000 acres, which they must lay out and adapt it specially for the purpose of utilising the sewage: they must level it, and drain where needful, construct the necessary carriers, and then either let it to one or more tenants, or failing that occupy it themaelver until the practicability of carrying out the system advantageously has been demonstrated and he did not doubt the ultimate success of the operation. In conclusion, he begged leave to move the following amendment in the words of the report of Lord Essex's Committee:-" That the right way to dispose of town sewage is to apply it continuously to land, and it is only by such application that the pollution of rivers can be a

Mr. Chrssuire moved as a further amendment, "'Ibat this weeting is of opixiou that any plan for utilising the sewage of towns which does not embrace the interception of facal watter before it
arrives at the main sewers will be a complote
failure, whether viewed as an agricultural, commercial or sanitary measure." He disagreed with Mr. Bannehr that the value of seware was in the urine, and quoted
Baron Liebig and others to substantiate his views. Baron Liebig and others to substantiate his views.
Ho asserted that the solid was the important fortilising matter, and that the great increase in the mortality of towns was owing to the collection o solid excrementitious matter in the) sewers creating sower gas; gastric fever being merely a polite name for what cught to be called sewer gas fever. He maintained that ine only means of dealiong with was by interception-to deal with it at the starting point, and they could not fail. It might be done with. out any inconvenience or nuisanes; and by that could be sent to any distance and in an unlimitedsupply. -Mr. Adams, in supporting the amendment of Mr. Chesshire, read a report from Mr., \({ }^{\prime}\) (eorge Gore, F.R.S., relative to the value of urine and foeces of human beings for manurial purposes, the data from which had been obtained from reliable authorities. It was to the effect that the per centage of valuable manure in fæces was about \(27 \frac{1}{4}\) parte, and in urine about \(5 \frac{2}{3}\) parts, and that one part by weight of feces contained as much manure as five parts of urine ; 8 \(\frac{1}{2}\) parts of urine were produced for every one part by weight of fæces : that, combined with the data just mentioned, showed the vidual is to that of the urine as 1 is to \(1 . \%\).
Mr. T. B. Wrieht thought it was quite possible for any one to agree practically with both Mr. Fowler and Mr. Chesshire, for the reason that they referred to two entirely different matters. Mr. Fowler was prepared to doal with a state of things already in -the system of sewers through which the sewage of large towns passes. The question they had to decide then was, what they would do with the sewage? They would be compelled to use it in such a way as would not be a nuisance to the country, and especiaily to prevent its polluting the rivers. Public opinion, as far was, with regard to the largest cities and towns, that if they were to use the sewage matter with adrantage, they must avail themaselves of the powers given by the Legielature to local governmente, and obtain land on which to employ it. They had heard a reliable stateruent of what was being done at Croydon, which he was informed other gentlemen from this locality besides Mr. Fowler had thoroughly investigated, and which had been fully described in our agricultural journals. They had also the Rugby and Edinburgh experiments for examples. As regarded the great
scheme determined upon with respect to the sewage of London, he saw that Biron Liebig's opinion was that it would not be successful, because it would be found Marshes productive on the plan proposed. Whether that was correct or not he could not eay; but many practical men had arrived at an entirely different
opinion, and they considered that newage coald only be advantageously used on land set apart for the purpose, on which a large quantity of succulent Grasses
could be grown. By this means the supply of mili might be increased, which the Chairman would bear him out it was desirable to do. In addition to the produetion of milk it was contended that those Grasses might be made into hay, and that some of the artificial processes recommended for drying might be used, so that the crop would be readily transported a considersble distance. He agreed with Mr. Chesshire that in order to secure the health of towns, it was most desirable that some better moethod of dealing with refuse should be adopted; but as the water-closet system did not extend to more than a small part of the town, he thought the meeting would see there were two distinct things to deal with-first the refuse matter taken off in our sewers, and the other that which remained. They must necesearily have a system of sewers in towns, and whether the inhabitants would give up the present plan to commence another at an eriormous cost, he was not prepared to say. He thought it was desirable that the meeting should express an opinion on the matter, and that the Corporation must escertain whether land could not be obtained at some reasonable distance, on which to use the sewage.

Mr. R. FowLRR, Jun., said that for 18 or 20 years he had applied the sewage from the outlet at Saltley to
50 acres of land, near that place, and he believed that when properly applied and attended to, a great benefit arose from its use. He thought the sewage matter of the greatest value to farmers, but as to the interception, that seemed to him like looking for a needle in a bottle of hay. His meadows were never so good wim they had been these last two years, since the intercepting tanks had been built at Saitley, and the matter from the watereclosets kept off the land.

The Quartorly Jowrnal of Soisnce. No. VIL July, 1865.
The current number of this most interesting quarterly Pournat contains papers on Spectrum Analysis, on the Planet Mars, on the Causes of Pestilence, on Zoophytes,
on the. Watar Supply iu the New Red Sandstone Districts, and on the Depredations of Insects. This
iast communication we shall transfer to our columns, Besides these we have Chronicles of the various Science nd Industries. The Chronicle of Agriculture during the past quarter refers to Dr. Anderson's experiments
on Uric Acid, Dr. Voelcker's Lectures on Potash Salts in Manure and on Irrigation, Professor Coleman's Lectures on Cattle Foods and on Grassland Management, Mr Bailey Denton's on Shelter for Cattle, Mr. Morton's on Agricultural Education, and Mr. Beale Browne's on Flax Culture
We refer thus especially to whatever is strictly aricultural in the volame; but the rest of the work is fall of matter in which any man of intelligence, whether he be agriculturist or not, must take great interest and we feel certain that no more serviceable volume can be named by which the cauntryman can bo kep informed of what is going on in the centres of though and activity all around him.

Agriculture, Anciont and Modern: 4 Historioa
Account of its Principles and Practico, \&c. By
"The Old Norfolk Farmer." J. S. Virtue, City Road and Ivy Lane.
The 14th Part just issued contains the continuation of the chapter on Arboriculture; and then, with that curious incoherency of arrangement to which reference has more than once been made, it discusses the subject of Farm Buildingo. At the elose of the chapter on this subject there is a pigorous condemnation of the bothy system of some parts of Scotland-the frightful account of it by Mr. Scot Skirving - the report experience by Mr. Henry Stephens, and, as favourable as any in its condemnation, the terms of praise in which its defenders have described it. The following is Hugh Miller's testimony regarding it:-

The talented and lamented Hugh Miller was for many years a bothy-man, and, as a witness of the system, he was fully qualified to give a correct and
truthful account of it; and what does he say of it? Bothy life almost never fails in cssentially injuring the character of the farm-servant.' ". 'The farmservant might be elevated far above the degraded level of the bothy, and unless means are taken to check the spread of the rainous process of brute-making which the system involves, the Scottish people will sink, to a certainty, in the agricultural districts, from being one
of the most provident, intelligent, and moral in Europe, to be one of the most licentious, reckless, and ignorant."
We add another extract from the account given of the lack of cottage accommodation in the country

But what shall we say to those landowners who, instead of building suitable cottages for the peasantry on their estates, destroy those that to exist for the express purpose of compelling them to reside in other
parishes, for the avowed design of reducing the present parishes, for the avowed design of reducing the present cannot give it a softer term-had its origin in the Scotland is concerned, by which the sinall occupations were thrown into large stock farms, and thus a number cottages, the occupiers of which were no louger required on the land, were pulled down. 'The removal
of these,' says Mr. Skirving 'became almost a matter of necessity, and on all the valuable land they have long since disappeared. But because some old cottages had to make way for the plough of the improver, it seems, unfortunately, to have got into the heads of most of the owners of the soil, that all old houses should be pulled down; and it does not seem to have occurred to them that at least an equal number of new ones should have arisen in their stead. The work of
demolition, which was af first confined to houses that demolition, which was af first confined to houses that were not' required, or which were absolutely in the way, and ween continued, and houses which were required and which were not in the way, have been pulled down. The systematic destruction of cottages having once
fairly begun, has been ruthlessly carried on, the motive for so doing being entirely changed. Formerly, a house was pulled down because it was a useless obstruction : it is now levelled for the avowed purpose of driving away the inhabitanta With some men, fortunately a small minority, this cottage destruction seems to have become almost a mania. Increase of appetite has grown with what it fed on; and after such proprietors have levelled every old house they could lay their hands on within their own possessionis, they have of villages, situated in their neighbourhood, and immediately on getting possession, have warned out the occupatts, and pulled down the dwellings. The Rev. the Duln smith, chairman at a recent dinner given to he Duze of Argyle by his tenantry, was enabled to congratalate them on the fact that his Grace was not a
-devastator.' The word is an expreasive one, and I sladly borrow it. The large landed proprietor who acts as I have just described is really a 'devastator,' and the greater the wealth which Providence has entrusted to bis care, the greater the misfortune to the ighbourhood in which his property is placed
Seotland, the inhabitants of the cattages districts of pulled down being driven either to reside in towns or to emigrate. The consequence is inevitable, that enough able-bodied labourers ure not left to cultivate the soil, and betiveen the 'devastator' and the bothy, the oue driving the peasantry away, the other preventing their
becomes every year, and every s the most cousiderate land who are looked un the example. Mr. Skirving says, 'It wasuple s? that one such, residing in a Midland connty, remart down every old house I can lay my hands an, 'I pri have rooted a goonly lot out of the vill and Accustomed as I was to such operations, I was starth to hear the sentinent so openly avowel by so excelem man. I anxiously asked, what motives induced ham to do so? 'Olh,' replied he, 'old cottages are part misances ; the farmers want them to stand, th may fill them with low fellows who work cheaper th proper servants do-that is the secret of the what outcry about the old houses; they want to colled al of poor wretches to work at reduced wages, and is tumble-down cottages just become nests of pame pilferers, and poachers.' By the merest accident, urning over the leaves of an old volume shortly atte. this conversation, my eye fell upon a passage dencrive
the very village above alluded to, and the contrast my certainly curious between the present and the mes mode of dealing with it. 'During the last 14 jeam says the writer in 1792, 'the village has incresed s more than 20 per cent. This has arieen from the liberi encouragement given by the late proprietor to setllen on his estate. * * There is no village in this comer where the inhabitants have improved more of late jue in coinfurt and convenience. Formerly, their dwelling
were no better than small dirty hovels; now thes in all neat commodious houses, generaily with two anars mente, and well lighted.' It is this village thas is not voted a nuisance; it is the 'neat commodious hana of 1792 that are being got rid of, and that br and entimable country gentleman.

We have before referred to this subject (vol, i, prol and have pointed out the demoralising effect moch 1
syatem must produce apon the mind of the laboure. What can bo expected from a man, helples an dependent as is the agricultural labourer, when he the simplest and most common claim of hamanity, il his case, set at nought by the man who by his poition and power, ought to be his protector, instead of tii devastator.' Undoubtedly, when a labourer is drim from his parish to seek a lodging 3 or 4 miles from hi work, which distance he has to walk morning
night, his ability to perform the accustomed tast mot be proportionately weakened, and his constiutin injured. And thus the farmer, and through him laudiord himself, sutere from the systen

\section*{Farm Memoranda}

Mr. Pouroz's Property in County Gaimare-li the west of Scotland, purchased certain eatates in the county of Galway, which had been brought to wh through the medium of the Incumbered Estatace Count The lands acquired by Mr. Pollok in this may amonas altogether to about 28,000 acres, and may bo said to consist of two estates-namely, that of Lisway, siluated about five miles south from Ballinasloe, a town long celebrated for its large cattle, sheep, and hore fairs; and that of Creggs and Glinsls, which lie treaty mula of Galway and Roscommon.
Although there were some considerable graving fanb on these estates, particularly the Lismany property, whe Mr. Pollok became the proprietor, the leading fenturn as in the case of many "estates in Ireland, wert number of small holders-some of whom hela from the landlord, while others were \(811 b-\) teana patch, who merely possessed a cabin and athe maps of the estates at hiat tim shows that the surface was cut up into

that, from the position upon it, as Mr. Pollo' considers
markets-were it for no other reason-it is more prothan to dispose of it in its natural state. But in carrying out this principle even the home-grown supplies are found insufficient for the purpose, and therefore he expends about \(3000 l\). a year in the purchase of grain, bay (which it is cheaper to buy in that district than to grow), and cake. The grain is all prepared for use at a splendid mill he has erected at Ochilmore, near Lismany, which is driven both by steam and water power, and fitted up with all the best machinery for milling par. poses of every nature. This mill is kept almost constautly at work for the use of Mr. Pollok's farms, and is a most important auxiliary in the conversion of grain iuto meat.

There is, of course, an immense quantity of farmyard manure annually made at Ganaveen, but even that supply is assisted by large purchases of artificial matures. Upwards of \(500 l\). were paid last year for superphosphates, \&c, used at Ganaveen; but besides this there are always considerable quantities of bone. dust ground at the Ochilmore mill for the use of the different farms, - a number of people making a trade of collecting bones throus lout the country, which they sell to Mr. Pollok. A few years ago, when he had more of the property in his own hands, Mr. Pollok was in the habit of importing large quantifies of guano direct from the Chincha Islands for his own use; but he can now get on without doing so, having let some of his
farms, and being better sapplied with home manures. From being mostly a tract of exhausted lind, Gana veen is now in fine heart, and improving in this respect every year. Mr. Pollok does not grow much Wheat upon it, but his Oat and root crops have been very proluctive and heavy. Turnips "are grown in great perfectinn, not only at Ganaveen, but on all the farms
on the estate; and Mangel Wurzel and Field Cabbage, both of which are most valuable crops, are suceessfully cultivated. Of late years Mr. Pollols has adopted the plan of sowing down his Grass seeds without a crop where permanent pasture is the ohject, and finds Vetot, answers remarkably well. A small quantity of each to the implerial acre-are sown witin the Grass seeds, which nltows the sheep to be put in the field soner than would otherwise be the case. Iasst year
the seeds were sown early in April, and the sheep were put on the crop by the 4 th of June. They were allowed the run of the field, and the quantity of stock which the land maintained throughout the season was some imperial acres in the same way. When the sheep are fed on Turnips during winter, they are not netted on the crop, but get the Turnips cut and scattered on a
Grass field, as the land does not suit folding, which appears to be generally the case in the limestone districts of Ireland. With cut Turnips on the Grass, and crushed grain and chaff in boxes, the sheep thrive well, and improve
much importance
It las been stated that the farm of Ganaveen is unter Mr. Pullok's own management; the other places on the Lismany property which are still in his hands are looked aiter by his agent, Mr. Algie, each farm having a resident steward or grieve. I'he most important of these farms are Ballyhoose and Kylemore, which form one continuous tract with the lands of Ganaveen and Lismany. Bullyhoose contains 1000 acres, and Kylemore 400 acres, and on both places a consider. able extent of bog or Moss has been reclamed. The steading at Ballyhoose is built on the covered-in principle, enclosed by a high wall, against whioh are placed ranges of sheds, divided into hores for cattle. The system followed on all the farms is much alike, there being perhaps occasionally some difference as to arrangement of tue stock ; as, for instance, at Kglemore, where the cattle lient are chiefly dairy cows, while at Billyhoose we find beasts in preparation for the butcher, with some young atock. There is a flock of sheep on each tarm, and it is at Ballyhoose that the boasts from this property, which Mr. Pollok propares for the Christmas lat shows at London, Liverpool, and Dublin, are brought up to the mark, As excellent tilery has been erected on that part of the eatate, and aso a very handsome school and schoolmaster's house.
Among the other improvenents on the Lismany estate, the drainage of a large extent of what are termed "callows" in that part of Ireland, id perhaps not the least important. The callows consiet of low well as being always in a damp state in the driest seasons. The term "haughs" would not be applicable, as callows are more of the nature of a marsh or swamp than the haughs which lie on the margin of a Scotch stream. A portion of the callows on this part of Mr. Pollok's property lie too low, and have not sumeient portion has veen laid dry by means of opening up and straightening the course of a sluggish river which ran through the land. This cutting was 20 feet wide, and feet deep, a deal of it being through selid rock, which of coura the fie expense considerably. Having the next step was to thorough-drain the land by 4 feet parallel drains with pipes, and the result is, that a tract of land whioh formerly was not worth aispenee an acre for the most part of the year, is now good pasture, Highland bullocks, in particular, doing remarkably wel
upon it; and thus those hitherto unproductive landi atuist in no small degree in that vastly increased production of meat for the use of the community which has been a natural consequence of \(\mathbf{M r}\). Pollok's andertakings.
The Highland cattle fed on the Lismany estate are bred for the most part on his property in Argyleshire, but he has also a large number of Galloway benst which he breeds on his Irish lands. The heifers of both breeds are put to Short-horn bulls, and the crosses produced in this manner have placed Mr. Pollok's name high in the list of exhibitore at the Christmas fat shows. For several years he has carried of the leading prizas in Dublin, finaly winning a \(50 l\). challenge cup, which had to be competed for and won three successive years before it could become the property of any one. That cup was won with crosses of the Short-horn and Galloway, beating pure Short-horns. Mr. Pollok has given another 50l. cup to the Royal Dublin Society in lieu of that which he won ; and although he lias not competed for it himself, it was a heifer bred by him, but nold to Dublin salesman, which took it two years in succession. She was a cross of the Sbort-horn and Hereford, and this cross is also being partially carried out by Mr Pullok through some pure Hereford cows and heifert which he imported from the West of Eugland. The crosses of the Short-horn with Galloway and Highland cattle have also beeu exhibited success'ully for some cattie have also been exhibited surcess thly for some those he has in preparation at present for coming exhibitions are fully as good, if not better, than any he ever had, some of them being extraordinary miunals. It is a great pity there are not ritore of those crosec are very remunerative. The Journal of Agrioulture.

\section*{Miscellaneous.}

A Veteran Sportsman.-Mr. William Thurston, of the White House, Dymock, Gloucestershire, died ou Sunday morning at the ripe old age of 92. In that honse he had lived all his farming days; in that same house the "Man of Ross" was born. Mr. Thurston was a veteran sportsman of the old schuol, weed the thay when the horn of the honter avakened the ectio of the dales at the hour of early dawn. It was he whot tangh the late Sir Joscph Thackwell to ride to hommes, itirl gave that impulse to his daring spirit wheh afterwards grew into those deeds of valour that obtained a nation" thanks. Aud many a huppy reminiscence of the old man can Mr. John Cam Thackivell, the present Master of the Ledbury Hounds, call to mind. Otten in the freedom of after-dinmer talls has Mr. Thaekwell been heard calling bock to the old huntsman's memory the beauty or swiftness of some favourite hound, the length of some well-remembered run when they were the only two in to witness the death. And not gportsmen alone "ne'er forgot the poor." Gloucester Chronicie.
Pioneers of Steam Cultivation. - They ought at farmers to feel very much indebted to those gentement who had spent their time and their money in endeavouring to bring agricultural implements as near as possible to perfection. Messrs. Howard had taken great pains, spent a great deal of money, and done a great deal of good: Mr. Fowler, a man of ten thousand, had fagged also due to Mr. Williams and others, for the evergy which they had bronght to bear on the improvement of steam culcivation. Rut all the honours were not due to those men; great honour was also due to the man Who started the hare. The development of steam powe as applied to the land had been a very nice little game throughout; there had been a great deal of annsement as well as benefit, and some credit should certainly b given to the man who started the hare-Mr. Sinith, of Woolston, as well as to those who had made the rud ning. He (Mr. Dring) was, be believed, the first tenant farmer in Euglaud who boucht, in a humble way, a se of steam tackle. That tackle was provided for him by Mr. Smich, and though he had lrad it for some yearis, be was prepared to run it against the apparatus of any modern manufacturer. Mr. Dring, of Spilsby

Threshing Machines and Hand Labour.-The way to find employment for labourers is to improve agricul tare in all its details. No doubt, so far as the prepara tion of grain is concerned, the employment of machines diminishes labour; but as regards the whole art of farming, of which this is but one small item, the remelt is very different. Fverything which cheapens any of the processes, and therefore the products, of any bunf products, to attract capital to their manufacture; and the invariable result of that is to give increased scope for the employment of labour. This is a real chain of cause and effect; and

\section*{Calendar of Operations.}

Jutr.-Food for Cows.-The milking cows by thit time may be turned to the mot forward Grass in the richest pasturos, and as their supply of this food must be varisble, depending very much on the season being a forward one or otherwize, a good dairy farmer should protle siven in the yards then the cous come to be little given in the yards when the cows come to
milked will give them abundance of greeti food, as it
found they refuse hay. Even when they have not a full supply from the pastures they will not readily make a good meal of dry food after tasting the green; and if
it is not sufficient to satisfy them, they roam about it is not sufficient to satisfy them, they roam about
restless and uneasy, and of course fail to yield anything like a full supply of milk; and as the produce this month is considered very good in quality, the quantity should be by all means secured to be as great as possible.
It is of great importance that good water should be supplied to dairy cows. A stream that has been some little while exposed to the air after rising from the spring before running through their pastures, is considered the best water, and the drinking place should have the soil removed and filled with clean gravel or sand, so that the water may pass through pure and fresh. Cows much prefer drinking from a narrow trough or hole, and are shy of going to a large surface of water, though there should be abundant access and egress to and from the watering place, or the master ows will often damage the others in meeting them.
Food for Calves.-The weaning calves should get fed now as described last month, the only difference being in the case of the older ones, which may be gradually getting a diminished quantity of linseed or oatment; this of course being less needful for them as they become atronger and more able to eat other food provided for them. They should have a sunny field to min by day, with some Grass to pick from it, hut through this month it has heen found that they do better on finely-cut Swedes or Mangel Wurzel and good hay on which they will feed plentifully, having the moisture of a little skim-milk or the mixture of Linseed or Oatmeal, which, thongh much diminished in quality, should be given a little warm, though it should become gradually cooler as the calves get older. Should Grass be supplied at this time as their staple food, it is found to produce too great looseness in the bowels, to which calves are particularly liable, and carefully guarding against this is very essential to their starting into strong growth. They have been found to do far better in small numbers together, on account of their great disposition to feed and lie constantly very close together ; and their readily taking any infectious disorder renders caretul attention to what may appear trifles in the rearing of calves very desirable. A strong, healthy herd of dairy cows, which have been proved to be far more useful and profitable when weaned or reared on the farm than if purchased at market, and brought on the farm at almost any age, will be thus obtained. They should have warm sheds by night, in which to receive their hay and roote, and it has been found a very good plan to tie them up to give them their milk, as it makes the animuls quiet, and each one then gets its proper quantity undisturbed; and if convenient to allow them to remain tied for a short time afterwards until they like to eat their hay after haviug their liquid food, all the better ; as it prevents their sucking each other's ears or Ekins, which is often productive of much harm.
Swine.- It is calculated that about one pig can be d diry Supposing whey for every 50 cows three breeding sows, reckoning that each one would have eight yonng pigs, might be kept, giving them a run in any rough Grass under orchard trees not much used for other purposes: their pigs receiving as much of the sour whey as they will drink, will make strong growing pigs. The whey is much better for pigs' food when old, or at least some mixture of it should be so; and if it be used daily from the vat, which is as often getting replenished from the dairy, it makes a very wholesome drink for piga, on which they will grow and do remarkably well, And as the pigs are emall to begin upon it, and do not drink so much as afterwards, a stock collects for their larger appetites, and this with the wash which large farm houses must supply, with garden refuse thrown in it in the summer in addition, is fourd enough to keep the number of pigs mentioned, viz., about one of the age and description given to every two dairy cows in milk

We quote from Fallarton's work on Dairying, review d last week, a passage suited to the preseut
season on Summer Soiling:season on Summer Soiling

This mode may be explained as simply consisting of the permanent housing of the animals throughont the rummer, with the exception of a Blort run in a paddock or yard, for an hour or so each day; the animals being supplied with cut food, as Rye-grass, Tetches, Clover, or the like; supplemented with dry fools, as hay, Bean, Pea, or oatmeal and oilcake. There can be no doubt that this system is much more economically carried out than that of pasturage, which we have already described. The following remarks, as to the mode of best securing the advantages of this system, will here be found nseful. 'In conducting,' says the author of 'British Husbandry' 'the soiling eystem, it is desirable to give the food oftew, and in mall quantities, as otherwise the cattle will blow upon and reject it; added to which, if it be given in such abundance as to clog them, it will not afterwards be relished, and the keasts will consequently suffer in condition. Attention should, therefore, be paid, to bave the remains of the food immediately removed, when the stock have done with it; or, indeed, rather before they are quite satiated. Cireen food, it should be observed, should be sparingly given at frst; as otherwise, the greediness of the cattle, when put to it known as 'hoving, Thus Tares, Lucerne, Clover, and
all those Grasses relishing to cattle of every description, and equally favourable to health, may prove nozions if taken in too great a quantity. The air which they engender swells one of their stomache, the tension obstructs rumination, and its effects cause death if speedy assistance be not given to facilitate the evacua tion of the condensed air, and the passage of the blood in the large vessels. Straw should also be given as fodder in order to correct any disposition to looseness in the bowels; and we have heard Ithe tops of the common Heather recommended as a condiment which prevents all appearance of scouring.

The different varieties should also be occasionally changed; for animals like the various qualities of food, and if these be judiciously mingled, as circumstances and the successive growth of crops may adnit, the appetite will be provoked, and the health and thriving of the creatures will be thus progressively improved. Indeed, were green crops of the several varieties to be regularly cultivated throughout", the year-what with fog reserved from the pasture, Rye-grass, winter Tares, Kail and Lucerne in the early part of spring; Clover, spring Tures, Sainfoin, and the further cuts of Lucerne during summer; the aftermath of the meadows, and Clover for the sutumn, together with the crops of Turnips, Mangel Wurzel, and Potatos for the winter months; the process of feeding, even without any assistance from hay, need never stand still.

In the early part of the season, when Tares and Clover are either inadequate to the support of the stock, or that it may be thought expedient to change them gradually from dry to green food, a portion of these Grasses may be mixed with the hay or straw on which the cattle are fed: and if the mixture be made up over night, the dry provender will be found to have acquired a sweet vegetable taste, and thus rendered so moist and palatable as to be more readily eaten ; but it is an error to suppose that straw, given before Grass and Turnips, will have any good effect upon the oattle; for they, in a short time, will refuse to eat ito When Grass, whether natural or artificial, is to be given, it should be cut twice in the day, early in the morning and late at night, so as to avoid the withering heat of the noonday; for, if not more nutritious, it is at least more palatable in a fresh state than when stale, and the danger of hoving can be guarded against by due circumspection in the quantity to be given at each (time. 'Attention should also be paid to the due proportion to be cut ; and until that fact be ascertained, it is a good plan to measure out each mess, and to chalk down the quantity in weight which the basket, cart, or other vehicle employed for carrying the food, contains of the various articles used for that purpose. The practice will at least have a tendency to teach "farm servants to observe method, the value of which is of considerable importance in all business, and in none more than in the various brauches connected with husbandry.' Peoplo object, indeed, that such a mode of feeding is troublesome, and that the old way is more easy and convenient, but we are yet to learn the branch of good manacement which can be executed without some trouble; or to see the same profit derived from slovenliness as from care and attention."

Haymaking.-If every blade of Grass could be ex posed as soon as cut to a temperature somewhat under that of boiling water until perfectly dry, and then packed away under a water-proof roof, the bay would be as good as such Grass could yield; the whole nutriment which the Grass contained would be present in the hay, undiminished by washing or by fermentation. For the best hay there is needed the best Grass, cut when containing the greatest quantity of nutriment, and dried rapidly and perfectly. To this end the Grass fields of Herts, Middlesex, and Surrey, where the best hay is made, are cut soon after they are in flower and perpetually tedded and shaken out, no two blades being allowed to stick together while drying. The hay, with certainly a little loss of colour, is thus simply dry green Grass. It heats hard!y at all when put together, and so far us the food is concernen that was in the field, it is all and undiminished in the rick. Just in proportion as it resembles this, is haymaking good.

remind his friends that his great aim has alwayi boen to preserve the
onginal character and highi reputation which his Flock had for so many yeara enjoyed before being handed down to him from his For the information of distant Purchasers only, the Auctioneer their best sttention to a hifhly remunerative Raw Trade by private sale, and few, ir any,
yielded a latger number, or a hifgher class of lmproved Hampalare The Firet Elole will take place on FRIDAY July 21, 1865, and will EWh the Second Sale on Augurt 16, 1866 .

\section*{J. B. BROWN \& CO.'S NEW PATENT B B LAWN MOWER.}
guaranteed to aive perfect satisfaction,

AND IF NOT APPROVED OF MI
be at once returned.
J. B. Brown \& Co. having so very successfully introduced, at the recent Meeting of the Bath and West of England Society at ITereford, last month, it NEW PATENT B \(\operatorname{L}\) LAWN MOWER, of their own manufacture, beg to mention that having now nearly supplied the large number of the BB MACHINES orlend on that occasion, they can now reccive a few more orders for the present season.

The Hereford Journal, dated June 10th, thas notices this new Machine:-"Messrs. Brown \& Co. are well known in connection with the best Lawn Mowing Mrsin these very useful and now almost indispensable Machines, which save so much labour and at the same time so much improve the appearance of the lawn. Messrs. Bromın show a new Lawn Machine of their own manufacture, which attracted much attention on account of the compact arrangement of parta, ita light and cles.ant appearance, and n workmanship. It is worked by means of well-made geared or toothed wheels, which we believe to be more desirable than the use of chains, which are found to stretch andbr so frequently, and cause much trouble. The working of this new Lawn Mower is very light and silent, and we have no doubt it must become a great favourite."

The NEW BB PATENT LAWN MOWER is manufactured by Messrs. Brown \& Co., in London, on their own premises and under their persomal suparintniden. is worked by means of geared or toothed wheels, is very noiseless, and is guaranteed to give perfect satisfaction in every respect.

\section*{PRICES-including Carriage to all the principal Railway Stations and Shipping Ports in England.}

10-inch Machine 12-inch Machine 12-inch Machine 14-inch Machine
J. B. Brown \& Co, continue to supply the LAW, MOWERS of other Makers, particularly GREEN'S and SILANKS', of which well-known Machines they have alme, stock on hand, from which orders can be at once supplied.

The \(14-\) INCH LAWN MOWER is the favourite Machine this season, and the price is \(£ 510 \mathrm{~s}\)., for either the B B, GREEN'S, or SIIANKS'
** Every Machine sent out is Warranted to give ample satisfaction, and, if not approved of, may be exchanged for any other size of Machine, or for the Machine of any other Maker, or may be at once returned unconditionally.
J. B. Brown and CO., Offices, 18, Cannon street, City, London, E.C. NEARLY OPPOSITE ST. SWTTHIN'S LANE and "LONDON STONE," and near LONDON BRIDGE.
WAREHOUSE (where Machines are kept in Stock), 149, UPPER THAMES STREET, E.C. OPPOSITE the CITY of LONDON BREWERY, and close to the LONDON BRIDGE STEAM BOAT PIERS.

\section*{GREEN'S PATENT SILENS MESSOR,}

GRPIAN'S PATENT LAWN MOWERS have proved to be the best, and have carried off every Prize that has been given in all cases of competition Above 26,000 have been sold since the year 1856 .

Invite lovers of Ornamental Planting to an inspection of the varied forms and foliage of their unrivalled Collection of the above, to which they have for many years devoted especial attention. PRICED CATALOGUES, consisting of upwards of 1500 species and varieties, may be had on application. THE NURSERIES, FULHAM, LONDON, S.W.

question. Higher powers of the microscope must be used, and the mind divested as much as possible of all foregone conclusions. He does not consider the argument of much force that as knowledge has increased, supposed cases of spontaneous generation have vanished one after another, till it is restricted to the very lowest organisms.
Till the experiments have been repeated, it would be premature to adopt an opinion unfavourable to Pasteor, but it is quite elear that the question cannot be left where it has been by M. Pastever or by the Aoademioal Commission. M. J. B.

We have received from Mr. R. Pabrer a very curious Monstrous Cucumber, of which some account may be interesting. The fruit is about 9 inches long, curved nearly at right angles to the shank, and marked by two very prominent ridges, which run from end to end and terminate at the apex in two rather large well-formed leaves. There are traces of a third ridge and of a third leaf.

At first sight, it would appear that these leaves are enlarged sepals, and so indeed they may be, three being deficient; the ridges on the fruit would thas correspond to the atalks of the leaves. Not a trace of corolla is visible, nor of style or stigma, but we find that on
cutting the fruit across at various parts, cutting the fruit across at various parts,
the three placente are readily seen, strictly parietal in the smaller part of the pepo, and inflected in the thicker portions, just as in an ordinary Cucumber. The ovules also are piesent, but in a rudimentary condition. The fruit seems to be formed in the same way as in many Rosacer -at its lower part by the expansion of the Hower stalk, and above br the dilated and confluent leaf (or sepal) stalks. This may be inferred, because on cutting across the fruit the ridges may be seen to alternate with the placentro, and on tracing these ridges upwards they lose themselves in the midribs of the leaves. It is immaterial whether the foliar organs at the top of this fruit be considered as sepals or as leaves. The formation of a succulent fruit and of imperfect ovules without any other floral organ being present, is nothing unusual.

Gardeners, like other people in the world, have their Hobbres. With them some genus or tribe of plants becomes extremely fashionable, and everything else has to give way to make room for it. If the favourite plants happen to be what are called florists' flowers, they are so changed in a few years that their former friends are scarcely able to recognise them. Rough Howers have become smooth, narrow petals broad, and irregular blossoms are now quite round. But at last a time comes when taste or fashion changes, and our favourites are all but discarded for new beauties and new fancies.
The Dutch, at one time, were aimost crazy about Tulips, and gave extravagant prices for a favourite variety. In our own conntry, and our own time, we have seen the fanoy for Pansies, Auriculas, Dahlias, and other things of a like kind wax and wane. Perhaps we have been longer constant to Pines and Ferns than we have ever been to any other tribes of the vegetable kingdom. And certainly these families well deserve to be a principal object with the collector and cultivator. The pleasure which a lover of Ferns enjoys we can almost fancy to be of a higher order than that enjoyed by the admirer of flowers; and then the lover of Pine trees not only has a pure source of enjoyment for himself, but he confers, at the same time, a great and lasting benefit on his country. What a strikiog and pleasing effect has been produced in many portions of our landscapes by the planters of these noble trees! Who is not proud of the collections we possess in our parks and pleasure grounds? We look upon them almust as we look upon our national property, and are grateful to those whose taste has led them to make such collections.

The taste for new plants would seem to be of the most permanent kind. For these we ransack every quarter of the globe which it is possible to explore. We are always craving for something strange and something new. Those parts of the are staged are always crowded with visitors, and one of the first questions we hear asked is, "Where are the new plants?" or "What is there in the exhibition which is new or rare?" And it is perhaps well that this enthusiasm should exist amongst us. It is no doubt quite true that many plants are introduced from time to time which have no permanent value, which are cultivated in our gardens for a short time only, and then die
out or are discarded. But even these introductions ephemeral though they be, are not without their use. They afford a certain amount of pleasure while they last, and at the same time they give us an idea of the productions of foreign lands. But there are other plants of foreign origin, and their number we aro glad to say is very large, which have a more permantnt character, and which are really of great importasoe. If we take for example hardy plants alone-herbs, shrubs, and trees-we can soarcely imagine the void which would be prodaced upon our scenery were all those of foreign origin suddenly to disappear. And if we were to lose at the same time all thnse things for which we are indebted to the skill of our gardeners and florists at home, the void would be greater still. As to half-hardy or tender plants, were they to go off in a body, can we imagine what would be the state of our greenhouses, conservatories, and stoves? In these days of taste and luxury, what should we do without Camellias, Azaleas, Orange trees, Pelargoniums, Verbenas, and hundreds of other floral beauties, for whioh we are indebted to foreign countries? And yet the time was-shall Wo oall it the "good old time?"-When these things, and all the pleasures attending them, were unknown in the gardens of this country.
If therefore those outside the gardening world -and we suppose there are some such benighted individuals-and even some iuside, are inclined to smile at our enthusias:n and inoonstancy, we can point with some little pride to the general rasults What, let us ask, was the state of our parks and gardens a hundred years ago, or shall we say 50 , or even 30, compared with what they are in this year of grace 1865? The change which has taken place for the better is marvellously great.
