Bulbocodium vernum.- When in Messrs. James Dickson \& Son's seed warehouse at Chester I saw your correspondent's note (p. 819) about the difficulty of getting this plant true, or getting it at all, and I imme diately asked if it was to be had at Chester. They had it I was told, " in the nurseries at all events," but having already traversed them, we were obliged to find out Bulbocodium among the "mixed bulbs" lately arrived There it was sure enough-dark-brown-skinned sturd bulbs, which could not well be mistaken for anything else. I found it catalogued at \(3 s\) s. per dozen. I have had it cheap enough from London houses; no doubt all respectable bulb-sellers have it; and I am quite sure hat in more than one place in Holland it is sold at 5 s or 6s. per 100, or even less! As before remarked, it is most distinct in colour among small early spring
flowers; the hardsome buds appeared above ground during the past spring, several weeks before the snow departed, and I have no doubt that if a demand for the plant arises, the Dutch will grow it plentifully for us, and make it as cheap as some of the Crocuses. When the flower is fully expanded it is not nearly so pretty as when the buds are unopened, but one way or other it most attractive for several weeks in the very dawn of William Robinson. - I I beg to say that I see by a book of miscellaneous memoranda made in Switzerland that the plant in question is to be found only at or near Branson, near Martigny. The observation of under the name of Bulbocodium vernum, reminds me that very early in the spring I found a group of two or three roots of what I supposed to be Bulbocodium, but which I have since thought might have been unseasonably flowering plants of Colchicum autumnale I saw plants of the true Bulbocodium in flower in pring on the same day on which they were gathered at Branson. There is a Mr. Thomas, son of a Swis botanist, living at Devens, near Bix, in the valley of
the Upper Rhone, who supplies seeds and plants of all the choice Swiss plants. Doubtless the Bulbocodium might be procured of him by any one travelling in that direction. J. H. Maw, Broseley.
Large Peaches.-Last week I gathered from a tree very heavily laden with fine fruit, a Peach measuring \(1 \frac{1}{8}\) inches in circumference, and weighing 10 oz . The roots of the tree in question have been continually
chopped by digging the border in the regular order of ropping, a circumstance which places it on quite different footing from that at Lambton Castle, which is growing in a turfed border, and from* which (see p. 772 ) Mr. Stevensou also gathered a large Peach. W. Umney Gardener to C.
Odontoglossum citrosmum roseum. - My attention has been directed to a remark in your last paper (p. 847), to the effect that the flowers of this Odontoglossum, figured by me in Mr. Warner's worl on Orchids, were too highly coloured. In justice to myself and to that work, allow me to say that the colours were carefully copied from a specimen sent me by Mr. Warner from his collection, and if the colours wera more intense than nsual it was Na!ure's faultnot mine. W. H. Fitch, Clayton House, Kew.
Evergreen Oaks. - Can any of your correspondents tell me if the following evergreen Oaks, mentioned in the catalogue of Messrs. Osborn \& Sons, Fulham, are sufficiently hardy and suitable for planting as single specimens in parks, viz., Quercus sclerophylla, Q glabra Thunb. (Gardeners' Chronicle, 1843, p. 911),
Q. glauca Thunb., Q. serrata Thunb., and Q. sideroxyla Humb. and Bonp.? This place is about 500 feat above the level of the sea, and is much exposed, especially to N.W. winds. In the winter of 1860-1 the shrubs here were much less injured than they were in Man. chester, where I reside, or even in low places only a few miles off. The Common and Portugal Laurels were not hurt, nor was the Aucuba japonica, but this
last was in a sheltered situation; Laurus nobilis one of which has now been planted about 5 years, and is 8 feet 4 inches in height, and about the same in diameter) lost the tips of their were to the length of 3 or 4 inches; Laurustinus were killed to the ground. The Gum Cistus has been killed in milder winters. On referring to your back volumes I see that two Q. sclerophylla were killed down at when the lowest temperature was \(+15^{\circ}(\mathrm{p}, 437)\), 1802 , when the lowest temperatare was \(+15^{\circ}\) (p. 437). It Staffordshire in the ground at (1854 p. 141). Bagshot it was injured in 1853.4 ( 1854, p. 358), and silled back to the old wood in 1860-1 (1861, p. 146), when ells me that the lowest tero (p. 47). Mr. Standish tells me that the lowest temperature in his nursery was \(+3^{\circ}\) in 1860-1, and \(+2^{\circ}\) in 1859.60). At
Abbotsbury, Dorset, it was 698). Quercus slabra was killed \(1860 \cdot 1\) (1861, cres Nursery, Edinburgh, in the winter of Golden
(1853, p. 279). At Hafodunos, Denbight not injured in 1852.3, lowest temperature (1853, p. 261) ; "all but perished" in 1853 p. 614) ; and was not hurt in 1859-60 (1850 (1853 p 293); at Tum 1852-3, at Biddulph Gso Vi p it was not injured at Bacshot (1854, 278). In 1853 Bicton not injured at Bagshot (1854, p. 358 ) ( \(\mathrm{p}, 437\) ) 1854 wide. In 1860.61 plant was 8 feet high and 8 feo p. 830), where Dr. Hooker tells mo at Kew (1591 temperature was \(+7^{\circ}\); at tells me that the lomen demperature was +7 ; at Abbotsbury, Dorset (185 Torquay (1861, p. 434), where Mr. at Bishopstore gardener, informs me that the Mr . Garland, +13 . Mr. Standish, in his "Practical Hire Planting Ornamental Trees," states that in the autuma of 1851 there was a fine specimen of Q. glabra, thre feet high, at Holkar Hall, near Lancaster I thee from the above accounts that the three Japan Ois Bay, though ther miphts... at least as well as the Bay, though thev might be injured by wind; I. Q. sclerophylla wnuld be bardy eniona , Arboretum, Vol. III., p. 1943, think sor \(g\) in a dry and ston place any of the Himalayan Oaks mentioned in Hav "Arboretum," p. 1933 (Bohn's edition), been into duced, and are they likely to be hardy ? A short time go (p. 792) you recommended the Japan Maples to be extensively propagated; there is here a small plant Mr. Veitch's Acer japonicum polymorphum, apparent raised from a cutting; would they not make muct larger trees if grafted on the Sycamore? Charlen Palmer, Sterokley Grange, near Leighton Buzzard Bucks.

New Strawberries.-Fragarians, like Rosarians, loo with anxiety for novelties. Strawberry raising is very iuteresting occupation ; but it is also a very hear less one. Mr. Rivers told me, that out of the thonasand of seedlings which he had raised, he only "gained" wo really good ones, viz., Eliza and the Royal Hantboic The case is much the same with'seedling Rosen I have a list of Strawberries to be sent out by Mons. F. Gloede, aux Sablons, Moret-sur-Loin France. Of those marked thus (*) portraits h been made. 1. Boule d'Or (Boisselot): fruit larg sometimes enormous, roundish or cockscomb, brig buttery, melting, very sweet and highly flavoure Plant very hardy and of robust habit, bearing well and ripening at the medium season. Perlaps andsomest Strawberry raised. 2. Carniola mag de Jonghe) : splendid fruit of large size, oval, cole right glossy vermilion, seeds prominent; flesh solid pink, hollow at the core, juicy, meiting, sweel, a bearer. 3. La Mauresque (de Jonghe): fruit medium size, oval or conical, dark red, nearly blac when fully ripe, seeds projecting; flesh bloch-red olid, juicy, very sweet, with a rich Hautbois flavon Plant exceedingly hardy, and a good successional beare
4. Sir Harry Orange (Makoy): this fine Strawher esembles somewhat the famous Sir Harry, exc tavour is exquisite and unrivalled.
5 Topey (de Jonghe), Exuitremely nended. 5. Topsy * (de Jonghe): fruit medium projecting; flesh |pale red, solid, juicy, sweet a delicious in flavour. Plant very
ripening at the medium season. Nantes* (Boisselot) : fruit of fair size, oval or latiendit bright glossy crimson, seeds projecting ; flesh uicy, sweet with a brisk delicious arom ppear by description to be the six best. No. 6 and is one of the very best foreign sorts, talsen at all points, that has ever been here. It is o descent. Its description is quite true. This year my crop totally. Though a stalwart plant folage, and its beautiful snow-flaked tresses above its It is a puich the Siberian hoar frosts cut them up. rurner, of quick eatablishment, and the hardy and healthy. I recommended it in a previon article. Strawberries that expose their blossoms ac precarious croppers in valleys. They are best for tig situations. Spring frosts do me more mista plant winter frosts. Observe, nothing is said of the pio cropping of No. 4. No. 2 is the best for shape. is too flat at the apex, but appears to be
Peaches and Nectarines from Standarls. - I have sent you three sorts of Peaches, and three of Nectariua grown on my bush trees in the open ground
any protection whatever. They produce large whicb make a good succession to eartier Nectarioes ad Peach Ilman, Strood, Kent. Pize was not equal to that of fruit grown on wall-trees.] A few years young Peach tree growing here, eviden tre planted it into an open space in my sitchen garden where it is now a bealthy sbrub I have to-day counted 111 fin

\section*{been grafted, and grows on the north side of a} Houghton Rectory, near Huntingdon.
Punting Peat Land.-Apart, from the direct pecmfits derived from judiciously executed planta. otherwise valueless mountainous districts, prepared peat bogs, the thinnings of those 25 or 45 years ago, now selling for importaWiales and other places, as "pitwood" are in its original state, and from 10 to 20 per interest on the capital expended in making and after such plautations; besides having by and shade rendered the lands which are beside un. olberwise contiguous to them fully double their burcer, to suy, we have hundreds of thousands anes of such lands in Ireland now comparatively millions to the present owner or his descendants in the County Mayo especially plantations are far too notwithatanding the many favourable sites for
, both on mountains and in deep bogs. There are towerer other properties which I could notice, with whree condition I sin intimately acquainted. On the hang landa belonging to the Earl of Arran, at and -ifives anazingly. In many pisces the Scotch Fir and wone of the Spruces shed their seeds, and produce of the kingitom on dry barren lands the Lareh performs the mme oftice. Among the most extraordinary things I have seen or read of, I have lately discovered in the ceatre of a wood, on a deeply drained and partially arivenine bog on Lord Arrans property-it relates to
Pitudodendrons. A few years ugo a few plants In panticum were planted in this open space, and such was the rapidity of their growth, and the precocity of the r habit, that although when planted out they were occupy the whole ground, except where occasionally remored to other places as urderwood, and the spaces thus cleared became studded over with myriads of seed.tran, whuse rupidity of growth would astomish any one not previously acquainted with it. These seedlings are being encouraged by transplantation and otherwise, and in syear or two more there will be an adequate supply of Bhododendrons to form underwood in some 600 or acres of woods. Wherever the spare plants
planted out as underwood their growth is truly astonishing. The Superintendent, Mr. Warde, hardy Rhadioduced some of the more rare and less thriving with equal rapidity. In this locality I found kereral Fuchsias growing most luxuriantly, flowering confinconsly during the summer and autumn, and they woch plant of ripe seeds. In one case I found one thit plant covering a space of nearly 40 feet square, and m, on the side of the celebrated Mount Nephin, the hignest mountain in Connaught. I may add, that I plave lound the Aucuba an excellent underwood in such better aid the Silver Fir, when headed down, is atil I have found old trees of at on bigh but by their shathes shaded soils, to produce seedlings in Many of these young plants I have nexa up, and without more ado planted them out Hotel, Driblim underwood, Edward Carroll, College 2he White Nice and Sypian Grapes.-In your account at p. 841 of the recent Edinburgh Fruit Show, you lad in Grapes with a bunch of the Syrian, weighing OZ; ; and I understand Dr. Hogg also thought ice; and it is generally so-called in Scotland. As confusion has arisen in regard to these two names, ang to call the attention of the pomologists in I remember seeing Mr. Fowler's Grape so cleared up. lyli, krowing abundantly on aged Vines, and called Rwbert Pre Nice, at Vallyfield, the seat of the late Sir Previous to that date I had become Hopetoun House, which Grape in an old Vinery at have often was probably planted before names; and I have reason to know rian, as I first learned it, is still sold varieties both grow to a great size in bunches, in other reapects a whitish or pale amber colour it to be confounded. Wre extremely different, and ought the deacrintions. It is worthy of remark, however, that descriptions in the London Horticultural Society" edition, are more accurately descristive " 1842 , and in Drogy, When the names under the Scotch nomenclature, than of the century authorities in Grapes in the beginning peechly, it is well known, grew the ineries or would be interesting to know this question. J. S. ['This is a question ich requires to question. J. S. [This is a question aball be ghorts being, we believe, very general. We

Wax Modelin
Wax Modelling.-In answer to your inquiry (see .848) as to books on this subject, I beg to state that perhaps the article "Wax Modelling" in the second volume of the First Supplement to the Penny Cyclopædia might give the desired information. The process is described at much leagth for anatomical models (which is nearly the same as for fruits) in the latter part of the article, with a description of the sligh difference requisite for fruit, and the unanuer of makiug wax flowers is also mentioned; at the end of the article n "Modelling," in the same volume, are a few line about modelling tools, and the composition of modelling wax. E. O., Chepstow.
Wood ashes.-Can any of your correspondents give me information as to the benetit, or otherwise, of wood ashes in mixing with soil to be used in transplanting Conifers, and the proportion to be used in a loamy sand entirely free from lime. G. \(H, B\).

\section*{Eocietís.}

Glasgow and West of Scotland Hobticut TURAL: Sept. 13.-This, the last show of the season, was held as usual in the City Hall and adjoining rocms As a mixed show of flowers, fruit, and vegetubles, it was one of the best ever held in Glusgow-there being 1100 entries in all the departments. The plants in pnts exhibited by Mr. D. Mitchell, Hamilton Palace W. Paterson, Esq., Ashville, Patrick; Mr. Clark, Botanic Garden; and - Todd, Esq., of Patrick, Were
very creditable at this late eeasou of the year. Mr. Mitchell was the most successful in flowering specimens, with a fine plant of Bugainvillwa glabra, Ixora coccine Erica M•Nabiama, a fine Odontoglossuin grande wit six ppikes of bloon, and a very handsome Vinca alba grown in the way of a pyramid, which looked exceedingly neat as a plant, and was full of bloom Mr. James Kirk, gr. to Mr. Paterson, had a fin Lapageria rosea, a very good variety of Lilium auratu
with five fully expanded blooms, and a nice the all but forgotten but lovely Torenia asiatica From the garden of Mr. Todd also came some good specimens, especially in foliage plants, which took first position. In the Botanic Garden collection, which was sent merely for exhibition purposes, were a good Pbilodendron pertusum, Pleroma elegans, Colocasia antiquorum, with fine large esculentum-like foliage, supported on a pale-green stem ; the chaste and graceful Pundanus graminifolius, the pretty Coccoloba platy. clada, Cephalotus follicularis, Miltonia Clowesii, and several good Ferns.
Among Orchids and new plants Mr. Paterson con tributed a very nice assortment. including a seedling Cattleya, in the way of Mr. Veitch's C. Brabantiæ Phalmnopsis cornu-cervi, so named from the staghorn form of the flower-stem; the pretty long.bulbed an scarlet-lowered Sophronitis gcandidora; Vanda Rox burghii, Epidendrum prismatocarpum, and some other Mr. Mitchell had Maranta Van den Heckii, a very graceful and interesting addition to this class foliage with white veins; and Alocasia longilobs, dwarter-growing species than zebrina, with an equally beautiful marbled stem.

Foliage plants were contributed in considerable numbers. Philodendron pertusum, Dasylirion glaucum, Cordyline indivisa, and Alocasia Veitchii, of Mr Mitchell's, being fine plants; while Mr. Paterson'
Sphærogyne latifolia and Aralia pulchra were equally praiseworthy
Not the least interesting feature in the exhibition was a lot of from eight to ten devices of different design, all of them very much superior to what one is in the habit of seeing, and causing probably more lounging on the part of the public than anything
elise. The 1st prize one, from Mr. Alexander Macallum, elise. The 1st prize one, from Mr. Alexander Macallum, was a most artistic design, remarkable both for the idea, Gothic, with a square foundation, and four square buttresses planted in each corner, thatched with the leaves of Tradescantia zebrina-a capital hit-and decorated in various ways with the flowers of Everlastings pasted on, while from this square eight columns in the Iorm of an octagon supported the very handsome spire, relieved at the haunches with abutinents; the whole being decorated with green Moss, flowers of Swee Peas, and other thi
Florists' flowers were numerous, and probably on the whole fully better represented than we have seen them hitherto. Dahlias took precedence, Mesgrs. Downie \& Co. with their gorgeons stands eclipsing everything else exhibited. Mr. Paton, Patricz and George White, Paisley, as nureerymen, also had fine stands. The gardeuers were scarcely behind the nurserymen in point of excellence, empecially Mr. aid Mr., Gogar Bank ; Mr. Gibson, Fairhill, Hamilton ; and Mr. Eadie, an enterprising amateur from the Albert Allotiment Gardens. Chef among the sorts were Baron Taunton, which was the finest bloom in the room among at least 600-Chention, Anna Keynes, Willie Austin, Mrs. Wyndham, Jemuie Austin, Beauty of Hilperton, General Jacknor, Delicata, Lady In Herbert,

Scarlet Gem, Golden Gem, Cornet, Cyguet, Bellona and Mauve Q.teen; George Wheeler, a very distinct mauve; Stella Colds, Princess Alice, Favourite, Cygnet Delicata, a charming novelty ; and Lady Maude Herbert. It would really be a difficult work to eclipse these sorts. Fancies were a good exhibition. especially Nurah Creina, Angelina, Regularity, Ebor, Qusen Mab, Pauline, Startler. Hercules, Patens, San Bartlett, Octuroon, Mrs. Joy, Unique, \(\mathrm{O}_{\text {reen }}\) of Sports, John Salter, Garibaldi, Formidable, Statiord's Gem, Mrs. Reid, Prospero, Prince of Wuler, and Reliance.
Gladioli were briliant, some of the sorts being most chaste, beautiful, and fiuely formed, such as Madane Basseville, Madnme Landevoisin, Madame de Vatry, Hé'èue, Jannes Veitch, Mazeppa, Napoleon III. atill au effiective sort, Le Poussin, and Velled.
The cut Howers of Aunuals were quite a show of themselves-the Giobe Amaranths, Clarkias, Seabous, Pblox Drummondii, Linum grandiforum, Calandrinia discolor, white and purple Malvas, aud wawy other things put up in nice bouquets were quite beautiful. Herbaceous Cut Flowers were also effective in the make ap of this exhibition, chief among which was Achillea Eupatoria, Veronica corymbona, Clurgsocoma Lillosyris, Crucianella stylosa, Tritoma Uvaria, Delphinium Barlowii, Dracocepbalum speciosum, Sedum Fabarin, Statice atifolia, Rudbeckia Neumauni, Auemone japouica, Lythrum spicatum, Valeriana rubra, Lychnis duvied alb.a Hore-pleno, Phloxes of sorta Gladiolus, and even Liliam lancifolium, which is said to be burdy ia the fur west of Scotland
Hollghocks were rather puat their best, atill Mr. Glase, gardener, View Park, and Mr. Cbarles Mclutosh, gr. to the Earl of Morton, Dalmahoy, haid gond apikes Clifden, Vanguard Wm. Blackwoon, Loril Rokeby, Queen Piet ria, Queen Beauty of Mitford, Jaune d'Or, Countess Craven, and Princess
Pansies were not up to the usual style of excellence, but we noticed fiue blooms of Lizzie, Miss E. Cuchraure, Rev A. Dombrain, Whllace, Countess of Rosslyn, Perlicetion,
Princees Mury, W. Bi Speirs, Alex. M \({ }^{6}\) Nub, Charles Princees Mury, W. B, Speirs, Alex. M6 Nab, Charles Invincible, C. W. Ramsay, Cupid, Mrao Muirhend, Miriam, Yellow Model, Lady L. Dundas, and the Rev. T. Findlay for mo. Certificate war a warded to James Gibson, Fairhill.
Roset were a much better exhibition than at Edinburgh the week previour, good blooms of Triomphe de Rennes, Adam, Devonienis, Clara Sylvain, Souvenir d'un Ami, Moiré, Victor Verdier, Madame C. Crapelet, Julie Mansais, and others being shown.
Fruit was a fair exhibition, the best by far being exhibited by Mr. J. Colquhoun, of Argyll Arcade, who had a table which, whether we regard it for the artistic manner in which the fruit was set up, or the individual samples, was unique. All the fine Grapes of Mr. Meredith shown at Edinburgh were there, with a dozen Pines of good size, wonderfully fine Peachen and Nectarines, immense Pears, of which Duchesse d'Angoulêne, Beurré Diel, and Bon Cœour were the best; equally fine Apples, including Eaperor Alexamder La Gloire du Monde, King Pippin, and Prince Pippin, with samples of most other sorts to be had in the market. Baskets of fruit were well shown, but are not so effective as fruit arranged on stands such as Mr. Thomso had at the Assembly Rooms, Edinburgh. Mr. Mitchel was 1st, and Mr. Johnson, Terregles, 2 au , the latter Pines were well represented, Mr. Peacock, Castle Dykes, being placed lst with two good Queens, although Mr. Johnson had much larger fruit, weighing respectively 5 lb . and 4 lb .7 oz , bat not fully ripe. Grapes were feeble in comparison to the Edinburgh collection, although Mr. Heuderson, Castle Wemyas, had a very excellent case, contaiuing four sorts, two bunches each, of Black Hamburgh, Muscat, Lady Downes', and Golden Hamburgh, the berries of the latter sort beginning to give way, as it always does, when fully ripe. Mr. McConochie, Cameron House, was 20, with Hamburghs, Muscats, Black Prince, and Frontignans. Mr. Williams, of Holloway, gave the 1st priz. of \(10 l\). for this lot, and the Society the 2 d of \(5 l . ;\) it certainly was an easy victory. In Black, Mr. Cassele, gr. to J. W. Deans, Esq., Kilmarnock, was 1st, hnd Mr Mitchell, Hamilton, 2d; while in Muscats Mr. Heus
derson was 1st, the other competitors beiug nowhere in derson was 1st, the other
comparison, for fine finish.
Peaches were a very remarkable exhibition, eape cially those coming from Mr. Campbell, gro to Admirable, weighing in oue example 13 oz , und the six in the aggregate weighed 4 lb .9 oz . Mr. Halliday, gr. to the Earl of Mansield, Scone Pal ine Barrington and Royal George, and also orchard fruit grown in an iron hoose, of the Maway Nitchell had also good Barringtons
Peare, Apples, and Plums were fairly represented,年 these som recently at Edinburgh were so much aperior that we need not particmarise.
Vegetables were also a large and a good exhibitiou and as a whole very creditable to the growers.
The Show was attended duriug the day by a very numerous company, which were brought together not having been made with the neveral railway companie
for reducrd fares to parties visiting the Show. Much credit is due to the Directors and the indefatigable
Seareksry, Mr. Hugh Campbell, for their exertions in promoting the cause of horticulture so well.

\section*{Noticte of Bookg.}

British Conchology: or an Aocount of the Mollusca which nowo inhabit the British Tsles and the
Susrounding Seas. Vol. III. Marine Shells, comprising the remaining Conchifera, the Solenoconchia and Gastrropoda, as far as Littorina. By J. Gwyn Jeffreys, F.R.S., \&e. 8 vo , pp. 894, tab. ix.
This is a third and most welcome instalment of very valuable work, which we have already had occasion to notice in warm terms of approbation. It contains a
good deal of popular as well as scientific matter, some good deal of popular as well as scientific matter, some of which is quite worthy of transcription.
The volurae is divided into two parts, the first of which, containing natices of the remaining Conchifera, comprises several approved articles of tood, at least articles which, though not of general use, are locally appreciated.

The Solens, or Ravor-shalls, were formorly in great request, and were eaten boiled or fried, though, according to some, the best wray is to roast them on a wood fire till they gape. They usally burrow in sand at the verge of low water mark, not perpendicularly, but in a hunt requires considerable alertness, for if you cannot approach near enough to catcl them when partly exponed to view-and this is not easy, their muscular strength being, in proportion to their size, far greater
than that of man, -and you delve with your hands than that of man,-and you delve with your hands
a fter them, they will probably beat you in the race The 日take is much more important to them than to you, and it calls for all their energies. Fishermen entice them out of their holes by a pinch of salt, making
(as they say) the razor-fish believe that the tide is coming in. Reaumur, however, considered that the salt irritates them, and causes a painful prickly sensation in the mantle, which induces then to rise to
the surface, and endeavonr to getrid of the ammosance by expelling the salt backwards. He also noticed the blind instinct which the Solen has when taken out of his hole, and held between the fingers in the open air, suspended vertically; it protrades its foot several times in succession, as if it were in the act of burrowing into its native sands. The recoun tells us that the lurking-place of the Solen is betraved by a hole in the sand agreeing in shape with the aplitures of its tnbes or siphons. Where the water is in order to see these marks more olearly. He then steadres hunself by leaning on a staff with his left hand, and feels for the Solen with his naked right foot. This he catches and holds between his big toe and the rext; struggles of the Solen to escape are so violent and the shell sosharp that very often a severe wound is inflicted
More than one species is still sold is foreign markets, but the yellowish brown S. vagina is acrid, and not

Mya arenaria is another littoral siliqua.
Mya arenaria is another littoral species which sometimes occurs in immense quantities, as on the muddy sands near. Daustaffuage Castle. It is eaten in many parts of the world, and is collected largely as hait,
Five thousand bushels are annually brought to Boston market (U.S.) as food for man, and much more than 10 times that quaatits is salted and used as bait for fish. It forms one of the namerous articles of Chinese diet, being brought to market after boing boiled for a is the buse.'
Mya truncata, which often occurs in the aame locality, is aloo admired for its rich flavour. It ofton occura in a foesil state, and "is dug up in such quantities on a farm near the Crinan Cumal as to be carted and ueed for manure. At Lochgilphead the leathery siphon is pre served in the clay filling the interior of the shell."
One of our rarest and largest shells is the magnificent Saxicava norvegica, which is occusioually fished up on the eastern coasts, It is ased for various purpopes by ravity it commander a ready sale with the sholl dealers. "The long-line fiahermen every now and then capture fised in the tough leathery sheathe of these enormous carious eand they thus increase not a little their precarious earninga, I apecimen now in the collection of Mr. Bean was kept alive fur some time, to the smusement of mauy, trom ifs faculty of qquistiong water to the ceiling.
some pages are, of couree, derated to the question how the Pholedes managa to excavate holes in sub. staneen of such a diffarent chemical conatitution and texture as clay, peat, chalk, limentone, sandatone, sca Mr. Jeffeys is satiafied that it is done principualiy by the toot, the action being simply mechauical. Pholas dactylus is much eaten in France and served at the best tubles, though it is little in request in this country Solene, luminoms, bat probably from the aceidental No part of the phosphorescent animale
which relates to the Ship-worme interesting than that
of the pallets in Teredines, we cannot help thinking, we take into consideration the close resemblance of the shell of Xylophage to that of Teredo, that the mere presence of a calcareous tube in the latter is not a sufficient reason for placing them in distinct families.
This however is meve matter of opinion; the ravages This however is mere matter of opinion; the ravages
which they commit on wooden structures exposed to which they commit on wooden structures exposed to
salt water are too notorious facts. It is most desirable that the habits of these creatures should be thoroughly investigated with a view to palliating the evil. They one year destroyed Government works at Plymouth and Devonport alone to the amount of 8000 l. 'In 1860 it was proposed by a Committee of the British Association" (of which our author was the Chairman) "to have certain experiments made in the dockyard at Plymouth with a view to prevent the further destruccost the countred of Government timber, which grant had been voted by the Association for such purposes. Permission to have these experiments made was asked through the Port Admiral, Sir Thos. Pasley who expressed his entire approval, but forwarded the application to the Admiralty. It is scarcely credible that no answer was received for bearly a month, and iven for it."
Whoever has read the evidence before the Committee on Gunboats will not be surprised at the result of the pplication. "Great Britain," says our author, "unlike other States, "does not count a single naturalist in her national assembly; and the Government will not, unless urged by popular pressure, take the initiative,
or even forward any plan of public improvement which out of the regular groove of routine."
We must, however, pass on to the second part of the
olume.
It will surprise many of our readers to find that Mr. Jeffreys pronounces the common limpet to be
excellent food when roasted, and we need no longer expend so much pity on the Irish because in time famine they have had recourse to limpets, especially as is notorions that at the time when they devoured these mollusca the finest fish were frequently rejected
"Roasted limpetr," says our author, "are capital eating. A few years ago I was a guest at a dinner party in the little island of Herm. This consisted of fine limpets, laid in their usual position, and cooked by being copered with a heap of straw, which had been set on fire about 20 minutes before diuner. There was also bread and butter. The compauy were a farmer, two labourers, a sheep dog, the late Dr. Lukis, and myself. We squatted round the smouldering heap, and left on
the board a couple of hundred of empty shellis. the board a couple of hundred of empty shells. The limpet used to be eaten by the Faroese, and in Ireland and the north of England the consumption was prodi-
gious between 20 and 30 years ago, according to the accounts furnished by Mr. Pattersa and the late Dr. Johnston. The former estinated that \(11_{4}^{\frac{1}{4}}\) tons of boiled limpets were sold in one season about Larne county Antrin; and the latter states that nearly
12 millions bad been collected yearly on the coast o Berwickshire, until the supply was almost exhausted. These quantities were exclusive of what were collected to feed the pigs and poultry. The Shetlanders are either more fastidious or prefer real fish; they will not even imbued with a similar prejudice; for we find in the life of Sir Walter Scott that the "iphabitants of the rest of the Orcades despise those of Swona for eating limpets, as being the last of human meannesses."
The beautiful sea-ears adhere to the rocks lise limpets, and form an article of food where they are abundant. They require however a great deal of stewing to make them tender. The shells were formerly in great request for button making, one merchant alone taking from 4 to 9 tons annualiy, but the true mother-of-pearl shaills.

The volume closes with an account of the Littorine, one species of which furnishes the periwinkles, which are so popular in Loudon amongst the poorer classes. The consumption is quite enormous. The quality varies axtremely, the larger ones bearing the greater prices. Many curious details will be found in Mayhew's "London Labour. \({ }^{34}\) The collection of them employs very many hands in the North.
The supply is about 2000 bushels per week for six nonths, from March until August inclinive, and about 500 bushels per week for the remaining six months. The number of persons employed in gathering is at leat 1000 (ehiefy women and children) and quite as many more in selling. The best gathering grounds are the roasts of Scotland, Orkneys, Shetland, and Ireland. The trudo price varies trom 28 . to 88 per bushel of
8 gallons heenpud measure. When the supply is greater 3 gullons heenpec measure. When the supply is greater Jeffreys with the particulars) "now and then send their surplus stock to Southend, and have it land on ground and of stherinur the marks ; but the cost of carriage amad onthering the stock and bringing it aqain to
market 18 considerable, and it is often cheaper to throw way what is unsaleable."
We must, Lowever, elose our extracts from this interebing work, which we ean recomanend cordially to former, they cannot but admire the imegards the

\section*{The Spatar.}

The latter part of the present summer has a very extraordinary one as regards the sur
Food available for Bres. extended period which we have natter of very been favoured matter of very common remark th the 20th of June there has been a very linite a tion of honey in the flowers; comb buildin2 was an entirely discoutinued, and honey ceasent to be soon after the above date. Soine supers r any rate in the south of Englanis ace late swir Fortunately actuaity oneenmb during the month of May and June was almost mon? cedentedly large, so that the mijurity
as well as of stock hives, were as well as of stock hives, were enabled to stom a sufficient supply of food for the coming winter
There has seldom been a season in importance of strongly populated cilonies commencement of the season has been men clearly demonstrated than in this one which has mane passed awny. The period of the honey harvest was arly and so limited in duration tolerably strong stocks were enabled advantage of it, so as to be remunerative to the awners in the filling of supers. The swartus whit filled May and the early part of June very rapid eir hives, and from arge size have been taken. Not 80 , how espect to those which arrived after the 15 th ot 11 all, and very many of then will have no chane surviving the coming winter, unless liberally. with food. To those who have mare than one of sul them, followed by liberal feeding, as soon as powith so as to induce the bees to add a little to their conle as well as to store and seal a sufficient supply for thich equirements, As a general rule we prefer follonim his plan to the oue usuatly recommended, of tuiting sue poorly provided swarms to strong or old established
stocks. We have frequently found that a culony con posed of two weak swarme, and sufficiently suppliad with food, forms a very remunerative hive the foltoming eason. The feeding iueluces to late breeding, and thee late-bred bees live on far into the spring, seeping up arge population until the spriug-bred bees liecome trong in numbers. Early swarms may usuaily be expected, or if a good and early honey senoon shoold
occur, the bees are enabled to take prompt advantige of it.
The food we profer for autumnal feoting is compered of 6 lb . of log sugar, 4 lb . of water, and 1 it . of hores clear run from the combs. The surar and water an boiled together for about five minutes atter the boiling heat has been reached; when removed frou thie fre th honey is raded, and stirred in white the hquin io ion The food must be allowed to cool before it is given palatable to the been They will frequently take dont from a well constructed feeder, mary pounds in mo course of a single night.
When the object aimed at is the supplying of sufficient quantity of food to a hive already well
with combs, it is desirable that it be administerad apeedily as is consistent with sa!ety from the attacks roubers; that is to say, as much may be given the evening as can be taken down by the herd dul. night, an
weight.

On the contrary, if the hive is deficient in combr, smaller portion of food may be suppleal on mand occasion, and the feeding be continuen weinhed both
lunger period. The hive should the whind betore and atter, and no reliance be placelo amount of food to which it has been trented.

The bottle-feeder is the onf most to be ree mmendew in An ordinary pickle-bottle is filled wi moath is covered with very fine a is plu in the hive, and the bottle inverted over it. If promer) done, not a dron will escape intu the live, allhonsl, the bees are enabled to take down the liqua A smiller sort of bottle may be msed feeders should be closely coverad oy as much as possible, attracting the
bees. If thas protected, it is no
bottles should be removed every neomiug. It is 12 are however, to contract the entrances ui ull mire effetualif being fed, which
to repel invaders.
Bees and Fruit.-Mr. E. Bennett, of Obberton, Worksop, mentions (see p. 846) as au unnsmal circem iy Wiance that his Apricots have nearly suffered from a ainnilar attack. information that my Peaches,
anes on the ground, have been

Peaches. I have not noticed a similar fact in any vers, although the temptation on the Peach walls un: wanting, and I attribute the evil this season to arrity of wasps. In former years I have been 2n saltirn hang bottles of beer and sugar on the trees, et the rrnit from being devoured by multitudes and large flies; no doubt the bees have the absence of their enemies, and have taiken arly spring brought out a number of here \(=\) :ee eirly siring buanght out a number of queen 3 mart have been destroyed by frost or other causes dore they laid their eggs. A Subscriber, Dublin.-anoyod by bees, which have been almost as destructive to frit wasps were last year. With us they began miti Gooseberries, of which they entirely destroyed evera, ds fast as they have ripened. I have never been nnlarly annoyed, though there have always been many kept in the neighbourhood; and I have lived in phes wherp they have been kept in the garden, but I Fr no recollection of fruit being hurt to any pxtent them. We have had no wasps lrere until within the few days, when a few weakly ones have or liave also been very deatructive to the D. Ephill, Moreton Gardens, Dorchester. and Plums at this place (Apricots being dave been subject to the attacks of bees this
We have several bee-hives in the gardens, and shave had, but this is the only season in which lave destroyed the fruit. If we had had more aps the bees would have been driven away. When Cund ene or two bad fruits I eat them into small ein preference to the whole ones, and by adopting plan I have suffered but little damage from A. North, Holmeroood, Tunbridge Wells.-_

Roral Gardens, Frogmore.-Afterreviewing botanic pratens and nurseries, fine plant places, and Alpine Wailshments, let us go to Frogmore and put what
Teilizence we cau pick up there during a single visit Wa anticle or tivo of moderate length.

\section*{Te will first walk through the main rat}

and terminated its ange of glass warul greenhouse, containing a Luculia planted The is breaking freely. "Does it flower freely ?"T..: nominhetimes appear tof trusses from it for Christmas appear to be the way to grow Luculia hauk you, Mr. Iugram fils, this sort of to mrite a bookt on the subject." We pass on into :unt pasage, and pl:nted in Vinery-Yines over the Harch, and get only about six weeks' rest in The honse is clearert the Pines have done fruiting, Tuo with fruiting plazty. A great number of the \(\therefore\) ront frees are planted out; these are in pots \(?\) totwately enough into the bed, which is warmed Totwater pipes laid among flint stones, with \(\therefore t\) about a foot in then leaf-mould and a little loam in all these in depth.
mily and simultaneously; so are the back.wall ittora by turning with a handle a worm, The purnose, Ettached to a simple apparatus Every second light is also let down the er copper ropes, but the back-wall the most particularly efficient, as the rall, fitted with gratings, just above the Thus in winter the houses may be matter how the wind
bars are copper, and hollow to counteract expansion, \&c.; the houses are furnished wire rops with tap over each, and every years, ago, which is certainly someAnd if they of either, no housey are better silapted for ilfere ale sushall corridure fing the clear light of that you pasa along without causing any for aceotamodating yout plants or miscelAn metimes a branch of a miscel are not hext honss is introduced, and as these
later than the tree itself. Let us pass on through a Plum house planted with various kinds, remarking Frogmore either for in-door or out-door west Plum at or preserving or cating; and let us step into a house here, some of themg Penches and Nectarines raised become useless from the attackes of wasps aud other Finery are collected promiscuously for sowing. Vinery upwards of 100 feet loug changes the seene
very agreeably, with its imposing crop of Black Hamburgh, planted inside the house, the roots being allowed to run out. A crop of Kidney Beans is mnually raised in early spring on the floor of the house. The Beans are sown in rows, 16 feet long, across the border, and exactly beneath the middle of the sash between each two Vines. This is of course done before the shade of the Vines begins to darken the houses. Strawberriee are foreed in all these houses they are placed near the front and near the light on arrow iron stands above the little perforated pip which runs over and supplies the large evaporating troughs. The iron stands are about 9 feet long and 4 inches in width; they are made of two iron lathe with three crossbits, just the size to place Strawberries, ce., on, neat, and cheap too, for of course woode these have only cost a little more the ere this; and the iron. In a Peach-house we pass, along with old
the favourites, the new Yellow Peach lately raised here large in size, of rich flavour, and somewhat like an Apricot in appearance. Uthers of these early Vineries are also used for getting crops of French Beans; and in the 8th large house passed through there is heavy crop of Muscats, very late and green, hut they are not to be cut till October and November, and there is plenty of heating power to ripen them off then. W now come to the excellent house for the Superintendeat, which is very appropriately placed in the centre
of the great range. Would that other leadin gardeners' houses were nearly that other leading find some of our nobleat families put their taleners into houses which a City merchant would hardly think good enough for his groom, and this too in whees which the gardener's skill has mado famous for benuty. A Frogmore the house is worthy of the place and its Superiatendent ; one side looks over the masin gardens, the other through Roses and climbing plants and across the tops of freely-flowering bushes of Hibiscus syriacns into a sort of sublimated "Melon ground," 8 acres in extent, containing the minor ranges of glass and forcing arrangements. On a vegetarinn discovering this spot he would surely cry "Fureks ! if there is an elysium on earth it is here !" while the mere searcher
after the beautiful could hardly be much less pleased, from the thorough appropriateneess of the arrange mento ind unity of the scene. There is yet the half of this great 1130 -feet range to do, but the houses are fac-similes of those on the east side of Mr. Ingram's house, and in some cases identical as regards their contents. All are used as fruit houses, and contain excellent crops of Pines, Grapes, and Nectarines, in most cases planted when the honses were first mado. This is too quick a way of gliding through the largest range of glass, but bear in mind that there is yet a host of houses, and "five miles of trained trees

Let us next wander through the Cherry, Melon Asparagus houses, \&c., in the finely walled garden behind the main range, and have a look into the contain excellent crops Queen and Smooth Cayenue being the kinds mos extensively cultivated.
Some of the younger stock is grown by the aid o lung linings, but the latter have a hollow cast-iron slab for a margin or retaiaing boundary, which gives them a neat appearance. All the Pines looked in first class condition, partieularly the planted-out stock e ruiting plants. These are grown in very deep pits with means of lining at back, which is bowever rarely used. They are planted in loam from the Great Park,
mixed with a portion of fresh pig-dung laid over about 4 feet of Oak and Beech leaves, with a large open pipe running round the front and sides of the pit. Looking nto those grent Pine pits from the back they presenter quite a tropical aspect, the plauts being unusuzlly lean and luxuriant.
The Cucumber houses, half spans with copper bars, and of course full light, seemed just the thing for their work. A lot of rough boards are laid across the well raised pit in the centre, and on this the light rich
mounds of soil are placed. If they had been put on the "dead" soil or surfice at the same height, of course they would be much colder and more liable to get sodulen. Along the back wall a narrow high pit is raised well up towards the light, and on this the plants re put out in like manner
With all the rruit and verstable growing armangedevoted to plant-culture for room decoration, \&co
and pits forms nearly a continuous line ahont 4 fuse high, and against it the first orop of Peass is raisednu: it is emplosed in ripening off a crup of Tomatos, and thus yielde good service.
Potatos are fureed in well-built cold pits; after they re dug out, Melons are pupped in for late fruiting, to
grand reserse in case of very severe weather out of doors. There are noble Cherry houses, span-roofed tall, and built as weil as these in the great range. The trees are now plangent out of doors for the summer and the borders of the horses have fust bummen preparatory to planting themes with Chrysanthemums for furnishiug cut flowers
The air-loving Cherry is accommodated hy haring large hinged aashes running contibuous' 5 , which can in a moment be thrown fully oper. S'rawherries are also grown here on the lictle iron stands as in the warnuer houses.
A late house of W'est's St. Peter's is maide to accommodate Strawberries when the Grapes are cut in February, Thite Figs are grown againat the back wall.
In the houses for forcing Asparagus the ronts are packed thickly in the central pit, which is heated hy hotwater pipes, and covered with loose materinl; while under the benches and in other parts of the house Rhubarb, Ac., is grown, and the shelves are used for large cropis of Banil and Knotted Marjoram, which must be had in quantity at nll seasons; Kidney Beans and Strawberries being in front laere as usual All the boilers are snddle borlers, which last about 15 years ; and as fuel, coke is burnt to avoid sinut, \(\&\) e A great deal of Asparagus is grown in low span-remfed wooden frames placed on dwarf brick walla, which, however, sink deep into the ground, and form a 1 irrow, chamber between each bed. Thescil in rhose frameenvered pits is ahout 5 feet derp, and very rieh; and any particular bed can be heated at pleasure by the hot water running through this elesely wonden corered chainber. On the whole this plan seefns an excellent one for ohtaining intermediate crons of \(\Lambda_{8^{\circ}}\) nara; ans.
In many gardens where economy is a lealing eansideration. and money and men not to he hal for at y in a most troubleso: e, expeusive, and rommera Way, - by the use of pots and other modes of spre ialing then at no small labour. Here it is very different. Just beside the chamber through which the ni es make way from their furuace to those Asparagus heds wooden shutters. Into this the Seakail route for all seasons are packed as clusely as they can stath when except to raise the shutters and cut away. No cover is required above the shutters except in very severe weather. When done, cuttings from the roets are replanted, allowed a year's repose and free growth, in d Musy are then fit, to dig up and force agralio. The Mushroom houses have arched brick roofa, string
slate slielves, and are provided with means of heatiog by hot water, which is, however, very sellom used. W. \(\mathbb{R}\).

\section*{( \(T_{0}\) be comtinuer.)}

\section*{Miscellaneous.}

Alexandrian Laurel.-Another varipty of Laurns is called hy Pliny taxa, and is deseribed by him as having small excrescerce sprouting from the mildle of the eaf, and forming a fringe, as it were, hansing from it. Now thas description applies so well to the Ruscus Hypoglossum of modern botanists that we shonld be inctneed Oidentify the two plants; but it is remarkable that Pliny afterwards states that anotlrer sn-called Lanrel, namely the Alexandrian, by some termed the I.ie in is Also designated by the naine of Hrpuctattion, wililat Dioscorides describes the plant he culls '18oia Pisa, baving leave like the Wild Myrtle, and mon them small twisted appendages ( \(£ \lambda\) cocs), frum which the small twisted appendnges (extees), from which the
flower issues. Pliny, ton, in his 27 ch book, c. 67 , speaks dower issues. Pliny, ton, in his 27 hr book, c. of, "ppaks
of the Hyparghttion exactly in the same terme as lioscorides, Lut he just afterwards allules to thi ldæan plant, as though it were distinct from the former. In another place Dingcorides mentions thim Alexandrian unurel as synonymons to the Chamedaphme, and describes it as having its fruit phacerl in the middle of the leaf, a deseription which would apily to the II. Hy pophyllum of Linment, which has a flowir springing from the centre of the leaf like the R. Hypinzlottion, wat is destitute of that tongue-shaped bratten wheh is charecteristic of the latter. From the circamatance of the frnit growing from the leaf, the Alexmotrian Laurel is called by Pliny carpophyllom. Nurentheless others have preterred to identify the Alex.medrian Laturel with the Ruscus racemostrs, although in that species the flowers do not spring from the leat as in the two other species. Perhaps, if wo believe that the
ancients realty distinquished these threc speci ; Ruscas, we may be dupnoed to believe with

 Hypmginsanm, of which later he gives a carreut drawing. Diubeny's Trres and Shrubs of the Ancients.
The ('aroh or St. John's Breat (C'erito ii Siliqua, L.) is a natior of the islan! ( (Cy: mat), cwowne the tops aud fillos of the dry hilhe, which are meatuble of ent iva ton. I its wild state, bioweser, the fruits are almont dry

the condition of the wild plant. The cultivated plants are, therefore, all graited, and this is done not only in gardens, but to the old plants on the hill sides, the branches of which are lopped off, and a twig of the plant to be graftel inserted into the stem of some of the large branches. This rough sort of grafting seems to succeed well with this hardy plant. The
Carob cultivation is chielly carried on on the Carob cultivation is chiefly carried on on the
south coast, and large sheds are built near the ports on the coast, to store the pods in previous to exportation. In the island itself they are not much eaten, but are used for feeding cattle, and the preparation of brandy by distillation. For the latter purpose they are largely exported, chiefly to Trieste. The produce has amounted in some years to about 5000 tons; but as the export is a monopoly in the hands of the Turkish Government, which pays the cultivator a wretched pittance, it has of late been found more profitable to cut down the Carob trees. Natural Eistory Review.

Assyrian Botawy.-A most carious fact in natural history has recently been brought to light by the decipherment of Assyrian inscriptions. The history of the artificial migration of plants-a very interesting
and intricate subject-has been carried back to a period and intricate suhject-has been carried back to a period
of great antiquity. Kūl \(\bar{\AA} \boldsymbol{1}_{1}\), a Mendaite writer in the fourth century A.D., tells us that the Kings of Assyria were aceastomed to bring back with them from their campaigns in foreign countries any plant which they thought would be valuable and usefinl ; that in this why, for instance, the Cherry was transplanted from the banks of the Jordan to the gardens of Nineveh and Bubylon. These statements are strikingly con-
firmed by an inscription of Tiglath Pileser \(I\)., an firmed by an inscription of Tiglath Pileser I., an
Assyrian monareh, who was carried captive to Babylon, B C. 1110. The King therein says:- "The Pine tree, the Likkarina tree, and the Algum tree, these trees, which none of the former kings, my fathers, I subdued, and I planted them in the groves of my own conntry, and I called (the plantations) by the nume of groves; whatever was not in my own country I took and placed in the groves of Assyria." identificution cau be maintained, it will be a proof of the occupation of the Malabar coast by the Aryans as early as the 12 th century b.c. This will not be the only case in which ethnology has received important aid from the botanical department of natural history. The northern home of our Aryau ancestors is borne
evidence to by the fact that the "Birch" --the evidence to by the fact that the "Birch "-the
denizen of a cold climate-is the only tree having the same name both in Eastern and Western Aryan, i.e., both in Sanskrit and in the various languages of Europe. So, again, we learn from the fact that "Flax" (Lat. linum, Greek \(\lambda\) ivov, Goth. lein) is known by different names in Eastern and Western Aryan, that the separation of the forefathers of the Hindús and of the Greeks and Romans took place before either bad exchanged an agricultural for a pastoral life. We have reason to hope that the present researches into the early records of mankind may throw some light upon the primitive history and
the cereals. A. Sayce, in Ncience Gossip.
The Castagno la Nave.-In June,
employed on the Quartermuster-General's 1811, being employed on the Quartermaster-General's staff in Sucily, and engaged in making surveys of various localities, I
visited Mount Etnu, and of course did not neglect to visited Mount Etna, and of course did not neglect to Cavalli, which seemed to me, as it had done to other travellers, not what was expected--a single tree, but apparently a cluster of five distinct trees, since reduced, \(I\) understand, to three. A late traveller has remarked, and I think with good reason, that a large tree may have existed on the spot, and that on its destruction in some of the many couvulsions that have so often shook Etna to its very centre, the present cluster of trees sprang from its root. But it is not of the Castagno di ento Cavalli that I am about to speak, it is of a more wondurful production of Nature in my opinion, which stands within a few hundred yards of that celebrated tree; it is the Castagno la Nave, a noble patriarch of the forest. This tree rises in an unbroken stem for about 40 feet, then divides and throws out lateral branches to an enormous extent. It appeared to me, as I viewed it, to be comparatively a young tree, from the vigour of its growth and absence of decaved branches. I was accompanied by a friend, and, after contemplating with admiration this splendid specimen of the vegetable kingdom, we proceeded to measure it with a surveying tape, and at four feet from the ground it measured 54 feet in circumference. I need scarcely add, that \(I\) entered this measurement in my note book. I took a drawing of the Castagno di Cento Cavalli, which shows almost beyond a doubt that this never was a single trunk, but a group; but from some cause which I do not now remember I neglected to add its noble companion to my other sketches; drawing of this tree in the portfolio of my triend Lieutenant Wright, of the Royal Staff Corps. On reading "Murray's Handbook of Sicily," which has been recently published, it is there stated that this very tree was caretully measured within the last year, and Was found to be 57 feet in circumference at 3 feet from
the ground, nearly at the same height that 1 measured the ground, nearly at the same height that 1 measured
it, thus showing an iucrease in girth of 3 feet in 53 yeara If, therefore, we take for granted that the growth was the same every 53 years, the calculation
makes the tree now 1007 years old. But if we presume that the tree increased in bulk somewhat more than 3 feet in 53 years in the early period of its growth, which, by the by, does not appear to be generally the case, for I have examined the annual rings in the trunks of many newly cut down trees, and found them on an averuge of equal thickness throughout, except towards the south or sunny side, where they are generally thicker, on the same principle that plants grown in a window will always increase more towards the light,
but even allowing this, it would still make the tree nearly 1000 years old-no contemptible age; and although it is now showing symptoms of decay, for it is said to be partly hollow, yet it is not impossible but what it may, if the lavas of Etna spare it as they have hitherto done, live some five or six conturies more. Cap Smith, in Intellectual Observer.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

THE principal operations in regard to ornamental grounds for the present will be mowing and clearing up, and if anything like neatness is to be maintained, sweeping up of leaves will soon require daily attention. Gweeping up of leaves will soon require wly freed from weeds and Moss ; roll them frequently so as to keep the surface hard and smooth.
flower garden and plant houses.
Notwithstanding the extreme heat of the weather, shade may now in a great measure be dispensed with Acacias and other winter-fowering plants having been subjected to a period of comparatively dry treatment, to ensure their blooming profusely, should now or soon be pretty liberally supplied with water at the root, in order to get them into flower during the dull season, when they will be much mo
apring, when flowers are plentiful.
Annuals. - Where these have sown themselves on borders, let them, if possible, be retained; they will bloom early and strongly in spring, especially the Californian kinds, and may then be transplanted, if desired, to other situations.
Bedding Plants. - Cuttings of Calceolarias and zonal Pelargoniums may still be put in where stock of such things is deficient. Cuttings of Calceolarias taken from plants in the open ground are, however, liable to damp off in heat; but they will be found to do very well in a close pit or frame, where there is the means of applying a little warmath when necessary to dispel any scarce plants which it may he desirable to increase while there is a fair chance for rooting them ; and also be prepared to protect choice Pelargoniums and other things which it nay be intended to take up and winter.
Chrysanthemums.-These should now occupy attention; let them be tied into form, but not too stiffly; where the flower-buds are too thick, thin them out; keep them well watered, in order that they may not lose their leaves.

Hollyhocks.-A few of the very choicest sorts of these may soon be taken up, potted, and wintered in a cool house ; they will be exceedingly useful for
furnishing cuttings, and these if got in early in spring will make excellent plants for next season.

\section*{FORCING GARDEN.}

Pines.-As has been frequently mentioned, plants swelling their fruit should be assisted with a brisk temperature, say from \(65^{\circ}\) to \(75^{\circ}\) at night, regulating this according to the state of the external temperature, keeping the house rather close on sunny days, and allowing the thermometer to rise to \(80^{\circ}\) or \(85^{\circ}\) before giving air freely. Also endeavour to proportion the moisture to the temperature, for a high dry temperature is not favourable to the swelling of the fruit, and there is no chance of getting well-swelled heavy fruit without plenty of warmth and moisture. Main tain a steady bottom-heat of about \(85^{\circ}\), and use every care to keep the soil in a healthy state as to moisture When watering is necessary, use clear manure-water give sufficient to moisten the whole of the soil, and avoid frequent dribblings, for when this system of watering is practised it is nearly impossible to keep the under soil in shealthy state. Use the syringe sparingly, and only to dew the plants, as heavy syringings after this season are apt to keep the surface soil so moist as to render it diffeult to judge as to when water should be given. Any young plants growing in pots which may require repotting should be seen to at once, so as to allow an opportunity of getting them established in fresh pots, while they can be kept tolerably warma See that the balls are in a proper state as to moisture before repotting, as neglect of this is a frequent cause of young stcek fruiting prematurely. Keep moist and rather warm for a time after shifting, so as to encourage the formatiou of fresh roots.

Vines.-Before wet, comparatively sunless weather sets in, we would advise covering the borders of houses in which it is intended to keep ripe Grapes for any length of time, so as to prevent the soil getting saturated about the roots. Look over ripe Grape: frequently, cutting out any tainted berries immediately they are perceived, and keep the atmosphere as dry as possible, using gentle fires when necessary with a free circulation of air; but a warn temperature is nearly as injurious as damp, therefure use no more tire heat than may be absolutely necessary.
hardy fruit and kitchen gardey Get all spare ground deeply trenched and ril so as to expose it as much as possible to the wenc. putting in plenty of good rotten manure, planted.

Appliss and Pears.-Gather these as ther: fit for storing. Also examine those in the frues: as there will occasionally be found a few decurias: few weeks after housing. and these should ber
as soon as perceived. Keep the froit as soon in order to allow of the the fruit roon cos. 2 off by the fruit, which is considerable for a fer mer at first. Where it is intended to matro frosb pared of trees this season, the ground should be used for planting should be thoroughly ex the action of the weather, so as to have it in im. state when wanted for use.

Letruces.-Brown and Bath Cos, as well an irn mersmith Cabbage, for early spring work, should technically termed proud.
Strawberries. - If not already done, clean dress plantations of these, clearing away all runners, giving a good dressing of manure when nom
sary, but be careful to select that which sary, but be careful to select that which is thor whes
decayed, and which can be covered withons is necessity of digging deep or injuring the roote

The steamer Suwanee arrived at Esqumalt on the 24th, and was to speedily join in the search. The South Carolina planters complain that the negroes refuse to work unless uuder military compulsion. The entton erop is not expected to give more than balf the ordinary yiell.
NEW BRUNGWrom. - The Royal Gasette containe a Iong minute addressed by the Execntive Govern nent of
New Brunswick to the Lientenant-Governor in refirence

Mr. Carivell's derpatels of the 2 fth Jume hast. n this miuute the Council call attention to the fact that a Parlimment was specially elected to teat the opininn of the penple upon the Confederation by an overwholming majority, because mable to discover in it that, it "gave promise of either moral ar material advantage to tho empire or themselves, or that it atforded a prospect of improved
administration or increased prosperity." Loyalty, as much then as now, animated the people of New Branswick and if there was a secesity for they would place all their resources at the disposal of the Inperial Government; but they did not believe that the Quebec plan of Confederation would either render their strength more available on increase

The Government also chaim that, Candian local eximencies were the sole motives and cromatwork of the cheme; and while giving respectul attention to the wishos of the Inmerial (tovernment, they must unhesiantonomy proiest ayanst the destruction of thein own antonomy: The Executive say that the rigit of stlf-
government would be a mockery if the province were enmpelled to yield on these all-important questions to the wishes of the mother country. In reply to this ninute, \(M r\). Cardwell, writing on the thl Augnst, says:-" I still confidently anticipate that the serious consideration of the province of Aew Brunswick will be riven to the earnest and friendly suggestions which, on be part of leer Majestys Guvernment, it has been my dutiv to convey to them through yon."
hat the smanish steamen rumotred from Havamuah that the spunish steamne overdue from St. Domingo hat been neized at, Samana by the Hny ci revolationists. Mexico.-Advices from Vera Cruz to the 20th
Angust announce that the Imperiaises harl reoceupied Iacambero, completely ronting the Republican army of the centre, with heavy loss in men, and capturing all its artillery. The Imperial tromps had also been victorious in an engagement near Tezan, but had received a Anstrian lancers and a company of Mexicin infantry were compelled to surrender to the Juarists. The Imperialists occupied Hermansilla on the 12th, throwing open all the roads into the interior of Somora. The main Republican army, commanded by Pesquiera, has jnined the \(x\) mperialists. Pesquiera Hed with 200 men. The town of Zongolica, in Orizaba, had proclamed against the Empire. The Mexican Estafutte asserts that the Emneror Mnximilian has determined to send an official personage to W'ashington, in order to ascertain the attitude of the United States Government towards Mexico. More friendily feelings are reported to exist between the Federal and Imperial officers along the Rio Grande.
Perv and Chill.-The Chincha Islands have been seized by Montero, the revolutionary leader. The loading of guano was not, however, interfered with in any way. Between 40 and 50 ships were anchnred off the
port. Montero, with his squadron, on the 10 th of \(A\) gust was craiaing in line outside the abipping at Callan, but had flars of truca tlying. Its forer consisted of the steam frigate Amazman and two heavy st emom corvettes, the Union and America. The Govermment squatron at anchor inside comprised the steam frigate Apurimac, a monitor, a turret vessel, an l two or three steam trans. prats. All had their steam up, and a good deal of stir was exhibited. The officers went on board the Pacific Company's steamer Peri to wateli Mr. Casso, late Peruvian Consul in Chili, and would have sended him had not the Peru been a mail steamer. Inring the night enme additional hoavy gnus wore monnted on day castie and other warlise preparat..ns mink, hasmes went ou alinut as usual. Nontere bad given notice that on the 17 th August he would attack the castle and squadron, and the Government had ortered all vessels

2 shift their berths out of the line of fire. At Lima Montero's presence off Callan did not scem to occasion the slikhtest concern. Rapid progress was waking in the constraction of the great iron floating dock in the port of Chllio. In conspguence of the disturbed state of affairs the port was closed every evening at 6 P.m., atter which no enmmuntication was allowed. s.ame Blakely gims of the largest size had been landed on the mole at Caltho, and were being rapidly monnted for its defence. the beat informed persons did not think that Montero "could be successinl. In the northern ports the revolution was hardly noticed.

French Visitons to the ('ristai. Patace-On Tuesilay a large hoily of excursionists irm Calais visited the Crystal Pah.ure. T:口 hoats, which left Calais at 4 A.M., oonveyed upwards of 1400 persong, and two speciat brought them to the Palace about 11 chack. The excursionists were amompanied by ti.e bami of the Supears Compiers of St l'ierre. Among them were inany Frenchwoman of the working clasaes, in their fanint and picturcsuna rustume-white starched cans, bright shawls nver the shondiars, carring: some inches leng, and remarliable pettionats. Fipee were rheety fishWumsen and lace girls, many of whom hat never before heen three miles from home, and they appeared to enyoy the attractions of the Pulace much more than ordinary English visitors do, and in a different manner. Tbey
seomed especialiy to criticise the statuary and other works of art. After inspecting the various courts, the excursionists assembled in the centre transept, when the band of the Company and the French band performed. The Prince and Princess of Waler, the Prince and Princess Louis of Hesse, and the Princess Hilda of Anbalt-Dessau visited the Palace at mid-day, and after taking luncheon in the new dining-room overlooking the terrace, witnessed the display of the great fountains from the windows. The French serenaded the Prince and Princess as soon as they heard of their presence. Their Royal Highnesses took their departure by the half-past 4 train from the new High Level Sration for Victoria. The French excursionists left the Palace at \(60^{\circ}\) clock, and expected to reach Calais between 10 and 11 at night.
The Cattle Disease. -The City Committee, at a meeting on Friday, resolved that sanatoriums should be erected in such districts of the metropolis as might be approved by the medical officers. The committee met again on Saturday, when subscriptions to the compensation fund to the amount of nearly 1300l., in cluding 1000l. voted by the Common Council, were acknowledged. A motion for the immediate construction of three sanatoriums-one for the northof London-was carried unanimously. At a meeting on Monlay the committee decided that compensation should be made only in cases where the death has occurred since the commencement of the fund, and where the owners had given notice to the committee.
The cattle stricken with disease will be bought at fair prices and removed to the sanatorinms. Wednesday it was resolved to appoint a veterinary surgeon to each sanatorium and to provide ambulances for the removal of infected cattle, On Tuesday a long docoment prepared by Dr. Thudichum, under
the direction of the Lords of the Council, was published. It is "a memorandum on the principles of disinfection as applicable to the cattle plague." A supplement to the Gazette, issued on Wednesday night, contained an Order in Council, by which it is henceforth permitted to import into Ireland hides of cattle from included in the prohibition of a former Order in Council. On Wednesday a Mr. Russell and his servant were charged before the magistrate at Greenwich with removing a diseased cow along the high road, contrary to the Order in Council. It seems that this animal, as well as another, also diseased, had been sold to a butcher. They were fined in 9l. 10s. and costs. The oxen landed lust week from the Rotterdam steamer continue in a healthy state. They will be elaughtered and the meat sent to market, before the term of quarantine disease has broken out in the north of France. As active measures were immediately taken on the farm extension may be prevented appearance, it is hoped its received a communication from Rotterdam stating that the authorities there are so alarmed at the progress of the cattle plague that, with a view to stop it, they have
determined on closing the market altogether for the present

The Supply of Mile.-A new company is forming for the purpose of supplying milk to the \(3,000,000\) of people in this metropolis. It is said that from the mapid extermination among dary cows the supply of made to avert such a result. However independent made to avert such a result. However independent assert that infants require it, and that no good substitute can be discovered. If the overworked mothers fail to support their babies, and rows are not at hand to yield a healthy supply, the children must perish, or survive with ill-nourished systems to suffer disease in future. Any measure, therefore, calculated to favour At present \(5 d\). and \(6 d\). per quart are prices at which London milk is supplied; and it is said that such a price will leave a handsome margin of profit if several cows are kept under a good system. The proposed "Dairy Company," of which Dr. Larkester, Professor Guengee, and several practical farmers and dairymen are directors, is intended to meet this want.
Elopfment with a Groom.-A fem days since, at the Wandaworth Police Court, the Rev. Mr. Crosse,
Rector of Oek ham, Surrey, charged George Smith, his groom, with the abduction of his daughter, and with carrying away w:th him several articles which were years oldur than the groom, who is a mere boy of 18 , Was examined in court, and proved hy her evidence that the elon?ment was planned by her, that she had
that hired the single room in which they were found living at Wandsworth, and had ordered the hanns of marriage to be put up for them in churcb. She stated that she had been accustomed to ride out with the prisoner, and that an attachment had sprung up between them After this evideace the cbarge of abduction was of course at an end, but the prisoner was remanded property. The young lady meanwhile returned to onk Mr. Wrngse withdrew from the case again came whole affair, wheh ilerived all its interest from the undne publicity which had been given to it, was con-

Miss Crosse returned to her father's she declared that she would marry George Smith, at: all events when she was 21 years of age. Her father thereupon consented to the marriage at once, and the reguisite licence having been obtained, the ceremony was performed on Thurgday at All Saints 'Church, Wandsworth. The with bundreds of people who could not gain admission, and many carriages, carts, and waggons were assembled such was the excitement and curiosity created by the event. On the conclusion of the ceremony the bell were rung, and as the bride and bridegroom walked to their lodging they were loudly cheered, and their path had to be cleared for them by the police. The bride groom soon afterwards appeared at the first-fioo friends for their kindness to him since he had been in Wandsworth, and hoped they would all live long and be happy. This short speach was followed by renewed cheering, and it was some time before the police could

The Fychow Grant.-Chang Woo Gow, of Fychow ne of the tallest men ever seen in Europe, arrived in England a few days ago, and had an interview with the Prince and Princess of Wales on Tuesday. He is between 19 and 23 years of age; his beight is 7 feet 8 inches; he weighs about 20 stone; is well
proportioned, and presents, from the mere loftiness of his figure, a very remarkable object. His features approach the European type more nearly than those of his countrymen, and their expression is unusually gentle and even feminine. He is accompanied by Mr. Chisholm, who has had charge of him since his departure from China, and who states that he is a person of respectable family, refined manners, and considerable accomplishments. He was brought up, it appears, as a scholar, and he now employs a considerable portion of his time in writing. His gigantic stature may be regarded as a hereditary quality, for his father and grandfather were each as tall as he is himself, and he has a brother now serving in the Imperial Chinese army who, although he is 6 inches lower, outweighs him by not less than 100 lb . He had also a sister who was 8 feet 6 inches in height, and died about a year ago. He has with him two secretaries, a wife, and a female servant, the latter
of whom exhibits a specimen of the famons Chinese feet, the length of them not being more than about 4 inches. The party also comprises a dwarf high, with strongly marked Chinese features. The interview with the Prince and Princess of Wales Marlhorough House on Tuesday evening was onc of singular interest, the whole of the Chmese party being attired in their robes, and retaining their headcoverings, in accordance with native custom. once, with a view to observe his height more correctly, did the Prince desire that Chang might remove his hat His Royal Highress also expressed a wish that he would write his "chop," or signature, on the wall of the room, which was promptly done by Chang at
height of more than 10 feet from the floor, with pencil lent him by the Duke of Cambridge, whn did not conceal his astonishment, when, in compliance with the wish of the Prince, Cbang-Woo-Gow opened the door on the arrival of the Commander-in-Chief. The Princess accepted from Chang a letter of compliment in daughter of the Prince and Princess of Hesse, accepted fan from the Tartar dwarf, Chung Mow
Extrnsive Jewel Rorberibs.-For some weeks past the authorities of Scotland Yard have been enyaged in the investigation of circumstances under which several heavy robberies, amounting in the total to between 4000 . and 5000 ., have been committed. Great secrecy has been observed; but all efforts at detection have thus far been fruitless, with the exception of this fact, that the robberies have been effected by one
person. The man is described, by several who have noticed him, as being about 5 feet 10 inches in height, slimly built, complexion olive, well dressed, and invariably wearing a wide-awake hat. His visits have hitherto been confired to Belgravia and the parks, gaining entrance to an open window generally at the rear of the mansion by means of a
water-apont or a porticn, which latter affords vast facilities for the enterprise. The lonurs apparently selected by the thief have been between 6 nolock and 12. On one occasion when surprised at his work he sprang from a window a distance of 40 feet from the ground, leaving his boot marks deeply embedded in the garden mould. He appears to disdain companionship in his visits, and does not encumber his pockets with anything heavy, however valuablediamonds, precious stones, and jewellery being the mansion of Lord Palmerston, in Piccadilly, 8002 worth of jewellery, and, probably by mistake, his lordslip's Kensingten Palace, where Glasgow. In August, from Kensingten Palace, where a eentry is always on duty,
300l. worth of jewellery, the property of the Duches of Inverness. In the same month from the manaion of Lord Southampton, in St. James's Place, 1201. worth of jewellery, and from the Grosvenor Hotel, Pimlien, in the eame month, 3000 ), worth of jewollery.
The Public Mealte. - The Registrar-General' Return states that in the week that ended on Saturday Sept. 9, the births registered in Isondon and 10 other
deaths, 2528. The anited Kingdom were \(35 \mathrm{sin}^{2}\); week in those 11 towns rate of mortality it: living, being 20 per 1000 in London, 24 in Edinbers 23 in Dublin, 29 in Liverpool, 31 in Manchester, alford, 21 in Birmingham, 32 in Leeds, 20 in
26 Hull, and 24 in Glaspow. of 973 boys and 932 girls, in all 1905 childre registered in the week. In the corresponding 10 years, 1855-64, the average number, correets. nerease of population, was 1888. The deat tered in London during the week were 1179 . Tu years was 1228.

The present return is ther below the average.

\section*{Jrobinctar.}

Bristol.-On Monday a despatch was re London stating that Lord Palmerston, who had oce sented to open the Working Men's Industrial Exhb
tion on the 19th inst., will be prevented by an f gout from keeping his engagement. pointment was naturally very great, not only in then but also in Bath, which his lordship had accep nvitation to visit on his return to town hoped that Mr. Gladstone, who was invited to cloe Exbibition, would act for his lordsbip at the openter ut he bas declined the invitation
Chatham. - At the Borough Police-court on Mondy Sarah Eliza Drew was charged before the cound 8th inst., in the parish of Gillingham. The primene on being placed in the dock had a very despoodit look, taking no notice of anything passing in the coms but keeping her eyes fixed upon the floor. Four mith nesses having been examined, the Chairman asked th prisoner if she had anything to say, she made no and was committed for trial at the next Maid assizes for the murder of her infant.
Derby.-On Saturday evening Mr. Samuel Thampry son, aged 29, of the firm of Thompson and Frie builders, in this town, and Mr. Kobert Dickenica aged 51, foreman to the firm, were killed by bee napped asunder while it was going at a rapid pac near Shardlow, about seven miles from Derbi. jury at the inquest returned a verdict of Accidenta Death.

Devonport,-Sergeant \(P\). Shurlock, of the ns: Regiment, who was shot by a private in the lamank that it is expected he will slortly be able to cir evidence in Court. The prisoner, Nichael Foy, wa brought before the magistrates on Friday, oformed the Bench that the ball passed hetween tw ribs withont fractaring either; and just tonched the urface of the lung, but did not injure any
Gloucester.-The triennial festival of the thre choirs took place in this city on the \(5 \mathrm{th}, 6 \mathrm{th}, 7 \mathrm{tb}\), ani 8th inst., under circumstances that somewhat disturom the usually even tenor of these gat one clerical, other artistic. With regard to the first, the pre bishop, who is a High Clumrelman, intimated tur with his presence such performances within cathedral, and left for the Continent before the appointed for the festival. The dean (Dr. Law) for Low Churchman, had similar objectious, and wi the me time doubtful whether he would ultimate's the cathedral for the purpose; burse absented himself from the festival. Canon Erans master of Pembroke College, Oxford, who in residence, mace an exchange
cauon, and also left before the testival. canon was in Wules, and only two canons out regard to the artistic difficulty, Madame Dolby and M. Sainton, Mr. Sims Reeves, Weiss declined accepting the terms
the conductor, and the result was that was ispued without the nymes vocaliste, withont whose aid
possible that these gatherings character for high art which they have gain a long series of years. Notwithstanding the back the festival took place with con with more than their usual liberality, atration against what they denou Titiens, Madame Rudersdorff, Miss Lonis Miss Julia Elton, Dr. Gunz, Mr. Santley, Dr. Wesley officiatin
opening sermon was preached Kennaway, vicar of Chipping oratorios were given in the roll Duige ;" Wednesday, Mendelssoln of Olives" and "Rabyinn
"Flijah;" and Friday, Hundel's "Mes
picces in the other evening concerts was
 Nicht", "Zauberfiote" Spohr"s "Azor and Zemira," The festival closed, as usual, with a hall on Friday The collections amounted to 856l. 58. 7h d . Godilying.-On Thursday evening, the 7th inst. arderous assault was committed upon \(\mathrm{Mr}_{\text {. }}\) and Mrs , inderwood, general shopkeepers of Hascombe, a little ailed Oliver. It appears that the man entered the bop and demanded some beer, and on heing refused his demand immediately sttacked Mr. Underwood, and iaticted upon him seriousp quickly brought his wife to Coderwood's cries for and the assassin rushed upon her and stabbed her sereral times in the neck and head, clusing wounds of oo dangerous a character that her life is considered mecial beuch of magistrates on Saturday. He is a man fsmall size and partially afflicted with paralysis of the ight side, but is described as being of a very rionate and vindictive temper. It was stated that trounded persons will probably not be able, under the most farourable circumstances, to appear before the ore remanded.
Mancersstir.-At a meeting of the Cobden Memofil Committee in this city, it has been unanimously Yr. Marihall Wood. The total subscription was roonnced at 43772 ., of which more than 3000 l . has boou paid into the bank.
Nommarar.-At the meeting of the General Com= mittee of the British Association at Birmingham on Monday, it was resolved that the next annual meeting of the Association should take place at Nottingham, in mompliance with a pressing invitation from the leading reeeived from Southampton and Dundee, and Sir R. Murchison, who said he was charged to advocate the claims of the latter place to an early visit from the members and associates, expressed a hope that it might
begratified the year after next. Mr. F. Gallon then moved, and Mr. J. P. Gassiot seconded, the nomination of Mr. W. R. Grove, Q.C., F.R.S., as President for
next rear. The motion was unanimously adopted. ir. Grove acknowledged the honour done him hy this choice, and promised to do his best to make the meeting at Nottingham as successful as any of its
predecessors. The Duke of Devonshire, the Dake of Ratinnd, Lord Belper, the Speaker of the House of Coomone, Mr. Webb, Mr. T. Grabam, and Mr. J. Hooker,
mere elected vice-presidents. The Nottingham and Midland Counties Working Classes Art and Industrial Bshibition was opened in this town on Tuesday by Lord presence of the leading gentry of the district. A protbrough was formed at the Exchange, which proceeded Iond Belper delivered the inaugural Address. At its marquee which company partook of a cold collation in a marquee which had been erected near the building.
Reading. - The Reading opened on Wednesday by the Bishop of Oxford. A portion of the Town Hell has been set apart for the her Mifjesty's collection at Windsor, the Tinted V enus fibson, and other works of sculpture, many valuable ppointinge, and other objects of interest. The industrial portion of the exhibition is nearly swamped by the
attractive Loan Collection. At the conclusion of the Bishop
of Mrlisperry.-Miss Emily Sophia Blake, only daughter on Tuesday night, the 5th inst., from the an exceedingly attractive person. Late on Tueaday Mr. and Mrs. Blake were alarmed by hearing 2anny, screaming loudly, while her body was in a state of frieidity, and exhibiting symptoms of poisoning by and \(M \mathrm{Mr}\). W. M. Coates, who spplied all the urual
remedies in *hectier she had taken any mature. On being asked She bad done so; but she was afterwards privately When she by Dritted that she had talken three pills. Dr, "They were her who gave her the pills, and she replied "Mere to keep me well." [Mr. Storer was the Jate in them were left, and she replied that there was a box on being asked if thable drawer. The box was found, and
thlen the pill the box from which she had tell into pills, she said it was. Shortly after this she pot Roberts, Mr. Coatem, and Dr. Blackmore, made Tipal organs in a healthy, when they found the primmoplld appeared to har sure, whe the symptor Tomach and its from poisoning by stryclinine. The a5;, together with the pills found in the box, forwarled
io Porsores r-realed the fact that ther analysis. The examination \(t\)
he pills with any intention of commike did not take she had written a letter to one of her annts respecting a journey to London, and was in very gond spirits walk on the Thesdare her death. She was out for a walk on the Tuesday evening, and was met by various persons, who observed nothing unusual in her appear-
ance. She also had a romp in the kitchen with the servants before she went to bed. Mr. Storer, the person who, according to her statement, gave her the pills, was for some time an assistant to Mr. Blake. It is stated that he proposed to marry her, but his suit
was rejected by her father ; and his conduct not being was rejected by her father; and his conduct not being
satisfactory he was dismissed. He left Salisbury for Falmouth about three weeks ago. After be was gone Mrs. Blake received a telogram from his sister stating
that he was very ill, and was in a desperate state that he was very ill, and was in a desperate state of
mind respecting the young iady. It is said that Mr Blake had no strychnine in his surgery; and thas, if the pills which occasioned Miss Blake's death were prepared for her by Mr. Storer, the poison must have purchased for the purpose. The following are bome purchased for the purpose. The following are some
additional facts respecting Mr. Storer. About two years since he entered the employ of Mr. Read, cbemist and druggist, Salisbury, where he remained as assistant for about six months. Previously to his engagement chemist, of Marlborough. While in Mr. Read's employment he conducted himself with great propriety. He left Mr. Read's, and was for some time an assietant in a chemist's shop at Cheltenham. He subsequently returned to Salisbury, representing himself as a duly qualified
medical practitioner, and was engaged by Mr. Blake as his assistant, with whom he remained until a few week ago. A warrant for his apprebension was issued, and on Thursday he was brought before the city magistrates charged with the murder of Miss Blake The prisoner insisted on making a statement, in which he admitted that he and the young lady were attached to each other, and that her father refused his consent to their engagement. He admitted also that at her request he had given her digestive pills, but he indignantly denied that he had administered strychnine, or had ever had the poison in his possession. He was remanded, pending the result of the analygis by Pro. fessor Taylor. An inquest was held on Tuesday, and adjourned.

Sheppredd. -The anrual Cutlers' Festival took place in this town on the 7th inst. In returning thanks fo the toast of the Lord Lientenant, Earl Fitzwilliam alluded to the rule prohibiting the discussion of politics at that board, and said it made the feast like an indigestible "Welah rabbit." Mr. Roebuck, in acknowledging the toast of the Borough rembers, said that it was his notion that he should best conor their views and the views of country at large if he indulged in
making that Welsh rabbit that Lord Fitzwilliam had referred to palatable. He then proceeded to speak as follows:-

My notion about the matter is a very different one to that
he noble earl. Instead of as a Welah rabbit I shall illustrate their meeting as like salad. in which the tart vinegar, the pungent pepper, and the amooth oil, and the wholesome salt
can be beaten together, making an agreeable condinent-that
exact exactly what I wish to do on this occasion. I have no
doubt that there are many in this ronm who have gnne across
the Cliannel in a storm, and have felt the the Clamnel in astorm, and have felt the vessel as it goes over
the waves creating great discomfort to their spprit and their
body, and when they land the very railroad seems to be body, and when they land the very railroad seerms to be
bounding up had down, and they cannot divest themselves of
the notion that they are atill upon the oceann, that is my
feeling with respect to the prosent the notion that they are still upon the ocean, that is my
feeling with respet to the prosent election, I have gone
chrough all the difficulties, and I have landed and the
land still seems moving und and dow, but still I have
arrived at that calm state of the nerve that makes me

o which I think they are destined.
Sunderland.-An inquest was held in this town on Saturday on a child three years old, which had been entrusted to the care of an old woman called Robson who took care of illegitimate children. The mother was a married woman called Lawson, but who did not live with her busband. Cries were often heard by the neighbnurs proceeding from the rooms where the child was kept, and on entering a sickening
spectacle was discovered. In one ronm lay the daughter was discovered. in a state of druukenness, and in another the woman herself, helpless from age and disease, with the child, which whs ervered with removed to the workhouse, where they diel. The postomortem examinition showed that there was not a drop of blood in the child's body, and that parts of its flesh were absolutely eaten away by vermin. The that if in summing up said that the law in the case was or neg nother knew that her child of inother person, such mother was responsible for that nerglect, and conld not throw the blame on to the father who contributed to ts support. The jury returned a verdict-That the child died from starvation and neglect, with the knowledge and consent of the mother. This is equivalent to a charge of Wilful Murder.
Swansea.-A reprieve has been obtained for Francisco Giardienari, the Italian seaman convicted at the ast Assizes for the murder of his fellow seaman, Peter Moitcl. The sentence of execution had been previously espited for a month, and Sir George Grey, the Home Secretary, taking all the circumstances of the case iato
consideration, laas advised her Majesty that the capital sentence nught not to be carried into effect.
Weston-strerr-Mark.-On Sunday morning it was discovered that three gold watches, a gold pencil-case, and a purse containing some gold and silver, the property of various persons residing at a hotel in this own, were missing. The alarm was given hy Mrs. Weaton, a lady living near Taunton, who awoke on Sunday morning abont 5 o'clock, and on going to the table upon which she had placed her watch, tound, to
her disinay, that it was gone; and that her gold pencilcase was also missing. Mrs. Weston at once gave an alarm, and the landlady being called up, an examination f the house was made, when the doors and windows of left on Suturday night. Acting on the suggestion of the police, the inmates of the hotel were roused, and it was then found that two of the inmates who had neglected to fasten their bed-room doors on the previous bight had lost their gold watches, and that another gentleman had lost his purse. The house and premises
were again searched, but without, effect, and it was were again searched, but without, effeet, and it was lave committed the robbery. It is supposed that the thiet laving robbed those rooma which were unlocked, returned to his own room, and raising the window, lowered the booty to a confederate, stationed at the outside of the hotel, who at ouce made of with it. liy
this trick two advantages were secured-first, that the receiver of the stolen articles would get off safely with them; secondly, that the actual thief would escape all chance of suspicion, and might safely challenge a vigorous search of his boxes and perzon. The police are endeavouring to trace the guilty parties, but at present there is no ground for suspecting anybody.

Whitby.-On Tuesday night the 7th inst. the house No. 4, North Terrace, Whitby, at present occupied by Mr. T. H. Coles, of London, was entered by some expert
burglar, who eucceeded in carrying off plate and
jewellery to the value of \(170 \%\). The gold watches and diamond rings were abstracted from the bed-room in which Mr. and Mrs. Coles were sleeping at the time,
although the door was locked, and the koy left inside. although the door was locked, and the koy left inside.
Wrasi.-On Saturday morning the mail train, which drops and takes up the bags of letters at this town by a mechanical contrivance, while passing through the station at full ppeed, took up the bags for the North in the usual way, but fiiled to catch those from the South intended for Wigan. The long leatherm envelope containing some half dozen different bage of letters for distribution in the district consequently fell on the line, was caught by the wheels of the carriage, and was cut, ripped, and slashed in a thousand directions. The
letters were mutilated and dispersed, tattered envelones, letters were mutilated and dispersed, tattered envelopes, being atrewn along the line for a distance of a mile or two. Many huncred letters were recovered intact, but a vast quantity were so totally defaced and torn as to render either contents or address totally indecipher. able.—On Tuesday, as eight men and boys employed at the California Pit, Pennington Green, were ascending the shaft in the cage, the wire rope, when the cage was within about 45 yaris of the top, surdenly slipped off the cone-shaped drum on the shaft, and though the engine was immediately checked, the cage fell down the pit, Buapping the atecl wire like thread, and then dash-
ing down at a fearful rate to the bottom, a fall of fully 270 yards. The men and boys were of course killed on the sput. The rope, which was of steel and about \(3 \frac{1}{4}\) inches in circumference, had been on the drum since the 13 th of May, and was in good working order; it was calculated to resist a strain of 10 or 12 tons, but this, the jerk by which it was broken. The drum was of conicall shape, and the slipping of the rope which caused conical shape, and the slipping of the rope which calssed lad's string when he winds his pegtop.
Wolverhampton.-On Tuesday a coroner's jury
returned a verdict of Wilful Murder against returned a verdict of Wilful Murder against
Robinson, who killed the young woman Harriett Seager on the efith ult, by cutting her throat. One of no signs of insanity abont Robinson, who, while the coroner was reading over to him the drpositions of the witnesses, diverted himself in trying to catch a fly on
the quilt of his bed in the infirmary. He is however the quilt of his bed in the infirmary. He is however
not yet in a condition to be removed.

Worcester.- A man whogave the name of Kennedy was apprehended at Birkenhead on Saturday night on suspicion of being the Rev. A. J. H. Morton, who recent!y absconded from Worcester with a gold watch and chain, which he obtained under false pretences from the wrong man bad been apprehended; and the prisoner When brought up at Birkenhead Police Court, on Monday morning, was set at liberty.

Tur Fenians. - In consequence of a report that some Fenian demonstration was about to be attempted on
the west const, and that a body of disbanded Feaeral ooldiers had landed in the neighbourhood of Gulway, the Channel fleet, under Admial Dacres, consinting of the flag-ship and five iron-clads, lelt Spithead on Tueaday for Bantry Bay. The \(6 \cdot\) gun sloop of war Gladiator, and the ganboats Highlander and Rose, left Queenstown last week to cruise on the west coast, and her Majesty's serew
frigate Liverpool, 42 ,guns, unexpectedly sailed into Cork harbour on the 7 th, and has since left in company with the gunboat Sandlly for the west. On Thursday, on the invitation of Lord Fermoy, Lord-Lieutenant of the county, who occupied the chair, a meeting was held at Cork to consider the existence of a secret organisation danger ous to the public peace. The attendance was bsing present, including the Earls of Bandon and Shannon. The proceedings were private, and did not oceupy more than an hour. They resulted in the unanimons adoption of a memorial to the Goverument, praying for an insmediate increase in the police and military force of the country.

The Commiselonnatbis in Ireland.-A movement has been set on lunt in the army in Ireland to organize an institution similar to the Corpe of Commissionnaires in Englaud, to be called the "Army Pensioners" Employment Society," with the object of providing a home and suitable employment for partially disabled soldiers resident in Ireland, the head-quarters of which is to be in Dublin.

\section*{Ecotlanx.}

The Scottise in mutonal Memorial to the Prince Consort.-A meeting of the general ceutral committee for promoting the Scottish National Memorial to the Prince Consort was held a few diays The secretary read a report of the stepe taken in connectien with the Memorial, stating, at alrendy known, that her Majesty had selected, out of the desigus sabmitted to her, one by Mr. John Stoell, her Majesty's
scalptor for Scotlant, for senlptor for Scotland, for an equestrian statue on a sculptured with inseriptions sund buareliefs, and with the Queuris Prifl, meat the soene of the great Volantee
review at Holyrood in 1860. The meeting ananimous Buccleuch to convey to her Majesty the respectful expression of their gratitude for having taken 80 mncl trouble and interess in this national work. It was also resolved to carry ont her Majesty's wishics with respect. to the site and design, and to appoint a committee, enter into contracts with the artists concerned, and make such advanced from the fund from tirite to time as they might think fit. The sccretary reported that the amount of the fund in the bank was 12,981l.
Thi Orgat Mothant it the Kiax, - A meetime of the sescion and members of the Tron Church,
Glasgow, was held on the 7 th inst, to consi!er the propriety of introducing an organ in the services of the congregation. It was unanimously agreed that a sum of not less than 5002. should be raised for the purpose of procuring a high-clase organ. Upwards of 100 guineas were subseribed before the meeting broke up. Services, in which the organ was used for the
first time, in Maxwell Church, Glaggow, took place on first time, in
Friday night.
Murder at Sea.-A brutal murder has just been committed a short distance at sea, on the north-east coast of Scotland. On Wedneslay afternoon, the 8 th inst., the schooner \(\mathbb{N} y \mathrm{mpl}\), of Montrose, left that port sisted of four-the captain, John (ireig; the mate, Andrew Brown; and two seamen, Pert and Raphurn All appears to have gone well until towards evening o Weduesday, when Pert, who was at the belm, was suddenly startled by hearing a loud smashing sound, and on looking forward was horrified to see Brown, the mate, with an axe in his hand, striking at the head of Captain Greig, who had been lying dozing on deck Quick as thonght the mate, with, three furious blows, completely smashed his victim's head literally to
preces. With the assistance of Raeburn, Pert, after preces. With sugle, succeeded in wresting the axe from Brown, and threw it overboard. The murderer, still in a wild passion, assumed the command, complied with. He ordered the vessel's course to be altered, and this being done they sailed northwarts. when 1 aporen, when, with the consent of Brown, a pilot was haileil,
and the vessel was anon moorell in that port, nearly opporite, indeed, the house of the murderer's mother Pert ami Rreburn immediately on getting nahore pro ceeded to the Police Office and gave information of the deed, when in a very short time Brown was apprehended in his mother's residence. He acknowledged his guilt by saying, "It was me that did the deed; but I have seen my nother, and I hope I will see her again." No
motive is known for the slocking affair; but Brown, motive is known for the slucking affair; but Brown,
who is about 25 years of age, was well known in Stonehaven as very quarrelsome, particularly when in drink. Captain Greig was a fine, promising man of 30 , and aon of the owner of the vessel in which he met his fate baving decided that the prosecution of the case belongs to Forfarshire, the crime having been committed only a mile and a lialf off the Forfarshire coast.

The Garicultural gazette

We receive almost daily broadsheets recording the successes of the Champion ploughmen at rariuus local matches. Messrs. Howard and Rhasome, at enormous cost, send the best, ploughs
they respectively can make, and the best ploughmen whose services they can hire, and the best pairs of horses they can possibly procure, to one after the other of almost all the county meetings during the autumn months, and they are then at great expense to advertise the important fact that
Brows has beaten or that the prizen Jones in the Champion class some's or to Mr. Howard's ploughs in the hands of John Smith, ploughman to Mr the neighbouring farmers.
What is the exact amount of public service rendered by the enormous expenditure which may be some additional interest thus excited looally in the issue of a personal competition, and probably a somewhat large attendance may ve attracted to the field, and thus the life and some extent invigorated-and all these results are no doubt locally desirable. But that English agriculture generally is improved and benetited It matters nothing whatever, we believe, to any Carmer in thething whatever, we believe, to any Massoure's and Howard's ploush and team respectively, shall carry off the prize in the nolaion of Messrs. C, D, and E, the judges of the they use are buth first-rate, and each of them will eapabie very best tillage of which a plough is the wort in the second place auy differences in drive than \(A\) and \(B\) respectively and the teams they drive than they are to the ploughs they hold; and
in the third, the juilgment of Messrs. C and D and E cannot be accepted as infallible.

These judgments, therefore, we do not care to place on record in our columns. The competition between these rival firms conducted thus is not in the interest of English agriculture; it is purely a persoual matter ; and we submit that manufacturers who object with us, especially in the case of such a tool as the plough, to the unsatisfactory annual competitions before the very best judges which the National Suciety can procure-are in the highest degree inconsistent in wasting their money for the attainment of these local distinctions, in every respect so much less satisfactory. Success on such occasions may be a very good trade advertisement to catch the eye and custom of a certain class. But all our aimmust be to warn this class that they are being caught by a bait, which, to use an old definition of the fisherman however costly it may be to the fool at one end ur the rod, is altogether worthless to the greater fool who swallows it.

Now that the subject of the Cattle Disease is fairly before our readers, we may devote a short time to the consideration of certain collateral matters which have yet received but little attention ; such questions as the means by which the infection is carried from one place to anotherthe steps that have been taken for preventing the spread of the malady-the amount of risk inourred by consumers of milk and beef-the prospects of the continuance of the plague among our stock; -these are points which concern the public, and the agricultural public particularly, and after what we have previously written upon the origin, nature, and treatment of the disease, we are not acting uneasonably in assuming that our arguments upon the sul.ject stated will be perfectly intelligible to our readers.
The first question proposed is difficult of solntion. The appearance of the disease in an isolated shed containing only one animal, which has not been taken out of it since it was first admitted, is puzzling, and in the mind of the owner the conclusion arrived at is that the disease is "carried in the air," because, as he observer, "no diseased animal has been near here, and the cow has never been out of the shed." This one case, whioh actually ocourred a few days ago, may be accepted as an illustration of a class of cases varying but little in their details; the animals in each instance being in small groups of twos and threes, kept in sheds away from other stock, never taken out, and as far as could be ascertained, never exposed to the intluense of infection. Without accepting the onus of tracing the process of the contagion, or attempting to explain in every case how the animal became infected, it is nevertheless, in most cases, apparent that infection has been at work. The mere circumstance of the majority of animals escaping altogether during the time the disease was raging in a virulent form, is in itself opposed to the idea of the malady being an epizootic. Again, the influence of contayion is evident in the prevalence of the disease among large masses of animals, to reach which it has often passed over small groups. In many localities two or three cons kept in private establishments, although aurrounded by diseased animals, have remained for a long time safe, until their owners have indulged the hope that they would altogether escape; their turn has in many instauces arrived at last, but the manifestations of disease in them have commonly been less violent than where large numbers of animals wer* collected together.
It would seem as though the infecting matter ated in some cases in proportion to its bulk, to use a mechanical form of expression. Where a large number of diseased animals are associated together, the extension of the disease in their vicinity is narked by all the characteristios of the ather where unly a few animals are collected together, and become affected, the extension of the disease from suoh a centre is often less sure, and the affection when communicated is less rapid in its course and less virulent in its nature.
The difficulty of accounting for the outbreak of an infectious malady is not alone felt in reference to this disease of cattle. Small-pox in man is admitted to be eminently infectivus, and in the ovent of an individual becoming affeoted in spite of all preeaution, no attempt is made to explain the circumstance on the ground of the spontancous origin of the malady, but, on the contrary, all the wits of the family are taxed to tind out " huw he could have caucht it." \(\mathrm{N}_{0}\) doubt is ever eutertained for a moment that it
has been " oaught," that is to say that some kiad of transmission of infectious matter has taken place from a diseased subject to the previously healthy one, and whether all the facts are opposed to this idea or no, the impression remains the same: "the person has the suall-pos, and he must have caught it from some one," and all argument stops at this insurmunatable obstacle; but with the cattle plague-although, without any question or doubt, the disease is as infectious as small-poxthe same system of reasoning is no lonyer in favour, but rather the reverse: "the cuw has the plague, and as no diseased animal has beon near her, it coust be ia the air," is the deduction that meete with an universal assent, even from those who, if met by the same suggestion in reference to smallpox, would treat it with a contemptuous sneer. When, as related in the history of small-pox, an Indian suffering from the disease was landed on the Mexican ciast, and the disease scourged thousands of the inhabitants off the face of the land, we wonder if the unlortunate atmosphere or the more miserable Indian deserved the greatest share of the blame; but admitting, or at least not denying, that the air may be a carrier of cuntagious or pestilential matter, there must be the source. There is no reason, certainly no satisfaction, in assuming that in a country previously free from a malignant disoase there exist the elements of an immediate and spontaneous outbreak. If then we allow that the pestilence must be introduced - and there is singularly good evidence that in this oase it was introduced-it may be further granted that pestilential emanations may be oarried by the atmosphere, by the olothes of individuals, by the woo of a sheep, and to go a little further, by the proboscis of a fly; there are no limits to possibilities, but we hold to, and we advise all whom it may concern to hold to, the theory or the faot of contagion-to look upon the oattle plague in the same way as they look upon human small-pox; to treat each diseased animal as a centre and source of pestilential matter, and to disinfect it, if they can, or failing that to bury it deep out of sight at once. Had the oountry been alive to the real danger at the outset, the plague had been mothered out of existence at its origin. Small-pox iu sheep has thriee been so trampled out of the land-once slowly and with hesitation ; a second time promptly; and the third time on the instant of its appearance, a few hundred sheep being the price of its extermination for the time; but this cattle plague has no malignant pustules to mark its presence, its signs are obscure at first, and lookers on cannot admit that such slight symptoms of derangement can portend any serious result. Every amateur in medicine knows a remedy for this blood disease: purify the circulating fluid, oxidize the blood, cleanse the cow-sheds, let in the light and air-the air, by the by, which is accused of carrying the disease. Give tonios, give sedatives, give purgatives; drenoh the patient with nutrinent - keep it short of food; use brandy-avoid all alcoholio fluids as poison. These are the confusing and contradictory suggestions so freely offared; bitterly responding, as a comment apon all, we have the ever-increasing suffering of the dying animals; the haggard, despairing look; the never ceasing groans, the faint struggle at last of the conquered life, and the stillness that mooks at the efforts of misdireoted scienoe-if haply instead of this there has not come before the quick sharp stroke of the axe, that ends the suffering at once.
In the puolic mind there seems to be an entire want of appreciation of the fact that the cattle plague has a period of incubation, that is to say, it may remain dormant itu the system for a certain number of days and then appear; therefore that an infected animal may be bought in the market next Monday, to all appearance perfectly healthy: may be taken to a distant part, and on the full s wing Monday show symptoms of the disease; on the Wednesday it may be dead and buried, and in the course of the next three weeks the animals with whom it has been placed, be they few or many, may all have become victims to the same disease. This hypothetioal ease is the patteru of thousands of natural ocourrences, and with all the facts before us there would be no difficulty in acoounting for the rapid extension of the plague through the country. Take for example some few places within 10 minutes' walk of each other-not selected, but taken in the course of two hours' inspeotion. Names are withbeld, as they would not strengthen the fuots, which are copied from the note-book. (1.) Mr. X. had 70 cows; the
disease appeared among them; one animal was very ill and died, the rest, as they gave evidence of illness by the premonitory symptoms-partial loss of milk and appetite, were sent to market and sold. (2.) Mr. W. had 29 oows; when the disease became apparent, all were sent to mariket and sold, (3.) Mr. R. had 12 cows; when the disease broke out, all were sent away and sold. (4.) Mr. S. had 140 cows. The disease broke out and destroyed several ; but 104 were sent away and sold to propagate the disease elsewhere. In these four instances, in one small neighbourrood, over 200 infected anitcals were sent away and distributed throughout the country; the question naturally arises, what is the exact amount of injury done, if the calculation be extended to the wnole of the metropolitan districts, and still further to the country generally. The fact really is, that the first attempt on the part of the Government to obtain information of the existence of the disease under a penalty for non-onmpliance with their Order, led to a result directly the opposite to the one intended. Cattle owners at once perceived that their interests were about to be compromised, and as no hint was given of oompensation, it was clearly to their advantage to keep the matter in the dark as far as possible, and get rid of the infeoted stook to the beat advantage; accordingly, the notices sent in were units, and the animals sent away were hundreds and thousands. If the animals so \(r \in m o v e d\) be estimated exaotly in the same way as so many sheep infected with small-pox, and sent among bealthy flocks in all parts, a good idea will be gained of the magnitude of the evils inflicted upon the enuntry by these means, and the necessity for explaining the extension of the cattle plague by atmospheric influence, or by the assumption of its spontaneous origin is entirely done away.
Another impurtant inquiry is-what has been done to prevent the spread of the malady, and with what results? This question we propose to disouss in our next.
that Mr. Our advertisement culumns inform us that Mr. Robert Smith's anuual sale of Exmoor Cobs, Galloways, and large-sized Ponies from
Pony Mares, will take place at Bristol, on Wedriesday, October 4. They are ohiells bays with blaok points, and combine good furm and aotion with great hardihood. Mr. Syitir's stud farm being Irom 1000 to 1200 feet above the sea, is a sufficient guarautee of their hardihood.

\section*{THE HARVEST AND CROPS.}

Havira during the last five weeks minutely inspected, probably. a larger area urder crop throughout the before your readers my opinion, based on many years experience of testing the field eotimato by the barn floor results of the farm crops of 1865.
In my interim report, written in the end of May, I alluded to the late and barren spring, the rapid growing of the crops caused by the singularly forcing weather in May, and to the extraordinary prospects which the luxuriant state of the crops then warranted, and indicated that a third erop in euccession would equal the great crops of 1863 and 1864. These prospecte were soon blighted, and a sudden check given to the
luxuriance of ail cereal crops, and never was the luxuriance of ail cereal crops, and never was the
brilliant promise of early sumamer followed by such indifferent resulcs. On the morning of the 12 th of June a severe frost greatly injured the erops, especially on solt, peaty, and moorish soils - thair luzurinat hue being suddenly ehanged into a blanched appearance, while the vigarous and broadly developed plant aasumed a stunted and spiral form. It was chiefly, lowever, the absence of rain and the prevalence June which lessened the yield of straw, of which the cropes, at an earlier date, indicated such great abuedance. Forturnately, all enrly sown crops had passed the ear forming stace before they suffered from the would have been reproduced in 1865 . This circunustance accounts for the long eara of all the cercala compared with the length of straw. In the firse week of July copious rains improved in bull the later-eown lenefited; hence in many caseos, especially on light soils, the ears of the corn scarcely got clear out of the hoe.
Cutting commenced in East Kent, South Esser, Hertfordshire, in the earlier districts of Norfoll and Nuffolk, and in' Berkshire on the 24th of Jaly, and
fortunate have been those farmers who in the last week of that month securell the grain then crit, as it Whas from the overpowering sun that prevailet, in the bust cundition. With Ausust came very unsatisfuctory and, being accompanied with a humaid temperature, harvest operations were not only almost daily interconsted, buty grain from discoloration and sprouting
conjured. The coreal crops being all ripe,
farmers were at a loss whether to cut them in a we atate or to allow them to get over-ripe. The latter
evil was doubtless the least; but where crups were evil was doubtiess the least; but where cryps were
laid and twisted from heavy storms, or becomaing choked with sown Grasses, their only resource was to cut them.
Alchough a few fielis are still to be secn uncist in the south and south-eastern counties of Englaud, yet chese are exceptional, aud the great bulk of the crops in these counties has been carried. In the Midland counties, ton, cutting is all but finished, and three fourths of the crop are in the barn-yard. Iu Yorkshire Lancashire, and Cheshire three fourths of the crops are ut, and fully oue-third secured. In the most northern counties of Eugland the greater proportion of the crops are in sheaf; but up to the end of last week the farmers, anticipating more favourable weather, delayed cutting, nearly one-half of the crops previous o the present week were uncut, and, with the
exception of a very small area in the early counties, exception of a very small area in the early counties,
little grain had been carried. As the operations of cutting and carrying have been uninterrupted this week, from the extraordinary favourable change in the weather, a very large area of corn has been carried in excellent condition, and with another such week there will be few fields outstanding.
It is worthy of notice that in the upland distriets harvest has not been so early since 1826, nor have crops ripened so equally since that year. Indeed, cutting commenced nearly as soon in the Vale of Tweed as on the banks of the Thames; while, from the hot sunshine that prevailed throughout June and July, crops in the uplaud districts have been as early as those in the lowest. This simultaneous ripening of the crops in the different districts causef, where hands, which, added to the frequent interruption from weather, has made the present a lingering barvest.
All cereal crops have been so variable this season that those in a county or parish can scarcely with to witness two adjoining fields on the same farm, the one yielding a good, the other an aluast worthless crop ; or two contiguous farms where the crops of the The Wheat crop first clains attention. In Eas Kent, South Essex, on the deep soils in Wiltshire, and the strong red soils in Worcestershire and Warwick shire, in Leicestershire, Lancashire, Cheshire, Roxburgh, Berwick, the Lothians, and in the Carse of Stirling, this cereal in point of bulk reaches close upon an average. Indeed, ;on all deep, strong, and alluvial soils the Wheat crop has neariy the usual length of straw, and large and closely set ears, and plump well-
filled grain. Even on the best soils, howevar, there filled grain. even on the bast soils, however, there is
a slight deficiency of plants. On the best soils in Surrey, Sussex, and Hants the Wheat crop reaches th lod average yield of these counties Barring the rich loams in the north-east of Norfoll, the marl soils, which form a comparatively sroall area, in Lincoln, the strong and well-farmed clays in Northumberland and Yorkehire, this cereal is in these connties decidedly under average. Spring-sown Whont fs most deficient,
being short in straw and thinly planted. Rust attacked the Wheat plant in the second weel of August; but with the exception of Wheate on fen land and those late sown in spring, the ravages of this disease have been comparatively limited. Like the quantity breadth early secured is yielding a good bright sample, but the greater proportion carried previous to the present weel, being in a soft condition, will be some
time before it is fit for market. and even then the grain will be coarse and rough; with the exception of some of the earlier variecies, such as Talavera and Australien, little injury has been eaused by sprouting. Barley-happily termed hy Mr. Caird the wine crop of this country-in many indaces is now substituted for Wheat; therefore, the area under the crop is
rapidly increasing. This may partly be aseribed to the comparatively higler price now realised for Barley, but chiefly io the fact that the stock husbandry is becoming more appreciatod, and as Barley is the best intervening crop hetween roots and Grasies, it is the crop in the usual rotation that conduces most to the extension of stock farming. Early sown Barley ou deep soils has eut up well, being thick on the ground, and having a long, full, and clogely-set ear. In Norfolk the great Buley-producing county, with its varied thils of clay, loam, sand, and gravel-the erop varies as the soils vary. On an the hight solls which skirt drought, in several iustances being burnt totally up. On the loamy noils, which form a considerable area of the county, Burley, though far short of last year's
crop, is nearly average. Every where late sowa Byriegs crop, is nearly average. Everywhere late sown Birioys hwing prevented the plants froma tillering. This cereal has suffered most from weather, all of it heing discoloured; while a considerable portion of the earliest cut in "very county has sustained considerable damage from spronting. so that raaltsters will look in viiu for the silvery-tinged samples of last year. Where of allowing the carried out, as is the soutueru counties. of allowing the Barley to lie in swathe, and not put in stook when cut, the loss from sprouting aud discolora-
tion has been great. Indeed, this mode of aliowing
grain to lie on the ground lin wet, mught xeatseo
the most effectual way to cause spriut. the most effectual way to cause spriut.
The Oat crop is by far the
The Oat crop is by far the most deficient of : 3
cereals. Indeed, a bulky crop I liave This season the best cuops I have lave rarely sor the deep soils in Oxfordshire, in Suuth Ded mere ? the westeru counties of Scotland. In Averlen, and one of the largeat Oat-growing comaties, the cent soils, where the sample is shrivelled aud hari quality is good, the grain being full and phuikr, t: quality is good, the graia being full and roun weather. AB the ears of the grain little lejity the yiold will be great, compared with the lengta of From
From the general failure of seeds last jear a large are shire and on the light soil around Kortherminster. general this crop is nearly an average, aud the qualiy uperior.
The Bean crop is unequal. On all deep lonma ant indeed, on all deep clays, including those of the anthe and chalk furmations, Bears are a full average crop but on lighter soils deficient. In general thry are fil and closely podded, and are an average crop.
variety of soil a most luxuriant sistre, and should th variety of soil a most luxuriant arop, and should tho
disease, of which there aro already uannistakzile disease, of which there are already uminstakabil
symptoms, not extend, the yield of this root will be very great.
The Turnip crop-which supplies the chief winter food for cattle and sheep, is the best soil-restoring croy in a rotation and the best preparation for artificia Grasses, and is withal the most profitable firrm crop although the most costly to raise-has throughour the season held out various prospecis. Oa a large brendith of stifir soils the infart plants Wro completely de
stroged by the Turnip fly (staltica nemornua), sy than on all such soils resowing was essential. If su the advanced stane the plant was in mary ingtancss temuled of its leaves by the ravages of the earwig, happily unfrequent enemy to root crops, and throughinut Juse a deficiency of moisture greatly retarded its growth a
every description of soil. Fortuuately, towards the every description of soil. Fortunately, towards the
ond of the first weok in July there was suffien amount of rainfall to recover the injureal phat, and receut rains, which proved so injurious to cerenle, haro
proved most beneficial to Turnins. The lattor generally, indeed, are singularly luxuriant: and although there are some failures on the bunnug soilh in the south, and also patchy fields to be seen on the tenacious elays in Yorkshire, Northumberland, Barwickshire, and East Lothian, yet these are exceptional aud in general the Turnip crop promises to be a full average. Wherever deep autumn ploughing, and
meroly surface scarifying in spring had been carried out, there the Turaip crop is most luxuriauk. A sufficient degree of moisture and a fine frost puivertan soil is thus preserven to tusure vigorows braied.
Mangels are a full average crop. Hay cat well m was well secured, and is of good quailty. The mis math, or second eutting, is unusualy good, beit
Pastures are singularly abuadant, and are carrying on unusual quantity of stock.
Unlike those of last pear, Grass-eods are luxuminat being closely planted and vigurous.
Taking the crops as a whole, and without referenos to the great crops of 1863 and 1864, and taking inlo account the high average reached in reeent years by an improved system of hushandry, I estimate the rieid d
the Wheat crop to be 26 bushels per acre, or 4 bubhels below average; Darley 32 bithels per arre, 8 bushels below average; and 0 toz 34 bushels por acro, or 14 bushels bilow averige. Peas and Beans average, Turnips average, Mangels an extraordiuary crop, Potatos unusnally good, hay average, pastures singularly abundant.
As I anticipated in my report of last year, the prios of butcher's meat has ruled extraordinarily high, and prices for store stock, especially sheep, are even higer than those for fat; so meat, especially

considered that strong lambs, if taken here generally improve by being used as rams. Lambs are greatly preferred for begetting lambs for fattening
Before closing this notice of the Attleborough Hall ale, we canuot do less than remark that the syatam of apreading straw on the fields for sheep to tread in answers as perfectly as wo said last spring it promisent to do. All the roots are here sown with une ploushing better uan they nomothing can be the quantity of corn fed per acre was about I ton, as the roots were last year so few. Bayond this, no other manure has been used, and on these 11 -inch furrows, or rather depth of moald, there are some wonterful Alangel, capital Swedes, and White Turnips, quad, for the season, those crops are unusually clean. This may in some measure be nccounted for, after the showery urface after the 11-inch seed of amazan nen the time to vegetate, and were therefore harrowed up at the time of sowing the crop. These described. About twoothirds will be taken to adjoining fallows, and one-third be fed in some cases on the field for the Barley or spring Oats. The cartage anved by this prastice is of immense importance. The improved condition of the land is, however, nf greater import-
ance. The present stubbles will be as usual forted ance. The present stubbles will be as usual forked over, to raise out the few roots of twitch that will gather by the end of a course. This is done ant cheapest as well as surest method of keeping land free of this troublesome plant.
Last year the Messr. Salter were so hard tup for feed for sheep that they fed off a piece of lightly
poudded Beana. This makeshift, as it was looked upon at the beginning, proved so advantageous that this year several acres of part Beans and part Rape or
Turnips bave been sown, and are being fed the ewes haviug a few rods nightiy. By this feed the ewes are clenn and healthy, although they are on a piece of sappy after-grass. They eat the stalk and all down olose, and the cheapness of this praotice must be
also greatly in its farour. Abridged from Mark Lawe Express
Owersby: Mr. Davy.-The average of the 118 shoep was 13\%. 1s. \(6 d\), while the shearlings brought on an average 14.. 13 s. \(6 d_{0}\) The higheat price was 762. whioh was given by a Cotswold breeder, Mr. Gapne, af Gloucestershire. The next figure to this was fetched by a three-ghear rant. which was let to Mr. T. Brown for \(40 L_{\text {; }}\); and Mr. Byron gave \(36 \%\). for the hire of i shearling. Other shcarlinge were let to Mr. T. Cartwright, Mr. Mayfield, Mr. Dickinsen, and Mr. Cadliwn, or sume of 30 . and 816 . There were 70 shearlings let, 86 two-shearr, and a dozen three-shears aid
upwards, and the total produce of the letting waal 15426 pwards, and the total produce of the letting was 15426 Caswell, of Itoughton, were sold by Messre. Lumley \& Son, and averaged 14l. 15 s. The highest priee was Cos. The 48 Pointon rames, the property of Mr. T Caswell, averaged 146. 2s. 6d. The highent price was R
Biscathorpe.-Tlis flock of raus, which year after rear drawa such a large gathering of the principal sheep breeders of the midland counties to Biscathorpe, was let by auction by Mr. Briggs on Thuneday lasto A 150 rams which Mr. Kirkham had selected for his friends. The success of the letting was most complete, the prices realised being quite in charaeter with the ame of the flock. The 50 shearlinge averaged 161. 18s. 6d.. the 52 two-shears 17l. 3s., and the 48 aged sheen, \(151.4 s\) s ; the average of the 150 rams let being 16l. 18 s . 6 cl . The best shearling was let to Mr Caleb Guing, Ireland, for 70 guiveas; the best two shears to Mr. C. Clark, Scop wick, for 137T.; and the best aged shcep to Mr. W. Chaplin for 100 guineas. shearling rapes wore sold hy auction in Duuse Fair Aug. 29; 42 shearlings, from \(14 l\). 10 s. to 3 . 1 (1s Average price, 7l. 10s. \(6 d\). \section*{3. From Mr Huyton, V.S. : Park at Long Melford, Suffolle.-} At the commencement of last month there were 150 beasta
grazing in this park; on the 2 Rst and 22 d several owners of
cattle, fearing that their animals might fall uuder the dis Which had made tits appearance in the ne neighbourhood (one of
a number of Irish beasts purchased at Bury market having been attacked on the 12 th\()\), removed their beasts, nearly 20 in are apparently sound and healthy. On the 25 th ult. several
other beasta were removed early in the day, but though apparently healliny at the time, they had the germas of the murraing sittings at Melford on the 25th ult., and made an in ingection the the animals at once, since which I have attender daily at \(t\) ?
park, and panent a arreat part of my timee there. The first cat
pccurred in the part on the 2 th, occurred in the park on the 2 2th, apd since that date animals
have sickened every day, and upwards of ho have died. I
have carefully examined evary animal daily and as soon as there appeared the least symy notomas of the mourrain the beast ones, in a herd by themselves, in a different part of the
park, and in most cases subjected to vetorinary treatment. An extempore hospital has been used in the park, where the
diseased animals are constantly attended by mean night and
day. The appareutly sound ones are herded in another part day. The appareutly sound ones are herded in another part I have daily examined the heactuy beaste, and, at the request market, most of the beasts having been exsmined on several beasts have nii been slaugitered, dressed, and parked in the
Park, and not one animal since the disease first made its
appearance there has been allowed to leave the Park alive appearalle there has been atlowed to leave the park alive.
There are 50 beasts there at the prosent time. some sound and
nthers down in different stages of the disease, all the lattor being under veterinary treatment. Should they recover they
will be separated froin the others and herded by themselves, but no nuimal which has been attackeri in the Park has yet
recovered. The beasts that have died have been buried in the
 of the trunks of the trees are also strewed with lime and
saturated with tar, tar fires are constantly kept burning and the utmost vigiliance is exercisod to ward off. if possible, the slaughtered animals is immediately removed or buried. The
basis of the treatment of the disease is ammonia and tonics, drinking is medicated with mineral acids, and the beasts themselves frequently washed with water impregnated with
anmononia. I may add that the Park atself is well wooded and anmoonia. I may add that the Park inse subsoil consists of gravel and stone. All the cases in Melford are distiuctly traceable, and there is no doubt
in my mind that the murrain was introduced there by a number of Irish beasts which came from Bury market, one of Thus the disease is at present confined to Melford and the adjacent district in the north and north-west. At Sudbury,
Suffolk, where I amap apponted inspeetor, 1 am happy to state that araong the so cows dopastured on the comnopon lands no which were generally in a proper state, and gave orders to aro inspected on the Croft before they tore allowed to enter the
exposed for sale on the market hill.
till the or the date when the first symptoms were discoverst till the death of the animal, has been (the shortest period)

surgeon and the Government inspector, and the suspected surgeon and the Government inspector, and the suspected
antmal be at once separated from the others, placed in a very clean and well-ventilated shed, put under trestment with medicated water, sc., that the sheds be not only kept in the
utmost cloanliness, but anl dung and refuse removed to a
隹 distance, and the shed well lime-washed. Let no one attempt, seceret thiluking he can cure the beast hinaself, or seelk to get
rid of it; for by so doing he not only renders hinuself amenable to the law, but is also endiangering others and spreading the
plague,
4. From Mrssrs. Morris \& OArms: Leadenhall Mdurcet.-We slaughter of cattle which has boen carrind on for the last fow Weiks. Yt may be expedient, no doubt, to kill animala sufer-
ling the worst stage of the disease but such wholesale
butchery unchery as has taken place we believe to be perfectly
unnecessury. Possibly a great quantity of meat killed in this way into the market, but as dead meant, depreciated in ralus and only to be disposed of at a loss. Tuis Bystem of blindly
tilling all cattle infected, or supposed to be infected, is based do not believe to bo the case. We have the autherch we Mr. Wilde, one of the sanitary inspectors of of the City,
thornughly practical an 1 efflcient officer, for this statement and he has giren us two instances in which he"has successfully Names and other particulars can be furnished if necessary. We need scarcely add that we contemplate the proposed
sanatorium in the metropolis with the greate9t satisfaction, destroy \(n\) be characterised by an attempt to cur duestey. Again, we would question the ad visability of placing surgeons and medical men, a great number of whom must necessanily have very little experience in thy peculiar disease
which has so suddenly arisen and assumed such formidable
5. The Metropolitan Cattle Market. - As regards the

cattle plague. To be in a position to judge for ourselves,
vesterdy made an inspection of the Metropolitan Cattle Market and slaughter-houses at Islington. We will state wha merely premising that the accounts of immense slaughter-
houses emitting an awful stench are not founded ou fact There are 75 acres of ground comprised within what is known
as the Islington Cattle Market. The actual market-place occupies 14 acres; the rest is nccupied oy lairs and paddocks.
The whole is washed and purified with chloride of tione once a week. It struck us that this ought to be done every day, and
that burnt clay in this case would be a cheap disintectant. There is accommodation in the market for tying up 8000 head of cattle, and pen accommodation for 25,000 or 30,000 sheep.
There are often larger numbers of both than these.
likere is for cattle. sheep, and pigs are Mondays and Thursdays; there
is a miserllaneous market for horses. asses, and goats on Fridays. The slaughter-louses are rented from the corporation
by private individuals. Thery are six of them, in which
betwer lureaking out of the cattle plague the Markets committee of hands, 11 wlich hall diseased a beasts, and no others are killed.
In this place every In this place every rope, poleaxe, or other implement
animal life destruction is exclusively used wwith diseased
animals, and has not been retnoved to any other buildin walls are limewashed, and the purvading smell of the place is overed with creosote and chloride of lio animals to be maten by cats and dogs The hides are disinfected, and
the manure is kept apart, each layer being covered with a dis the manure is kept apart, each layer being corered with a dis-
infectant. The six slaughter-houses reuted from the corporation are used respectively Mr. Cross, GUimaldi, Mr Packman, Mr. Markham, and Mr. Wiiding.
Having had notice three weeks ago to limewash and disinfeor these places, the occupiers have done so within the last fow
days, and the houses are pretty nearly as decent as places of slaughter could be. The main point is to
Among the recent arrangements Mir. Tegg, V.S., who is both additional help. He has a man at each gate of the masrkot who come in or go out, and also the number of the drover's badge He has also two assistant vetorinary surgeons constantly on duty with him inside the place on market days. An experi-
enced butcher, who has the night management, ingpects enced butcher, who has the night management, inspects each
carcase, and allows none that is diseased to pass the gates. carcase, and anows nine that is diseased to pass the gates.
This man reports daily to Mre there is a large wooden shed, with an entrance from the public houses, where beasts are itaproperty intermixed, sud where
there looked after. Mr. Baldwin, the clerk of the market, has the
responsibility of the whole general rugulation of the place.
6. The Human Analogy: From a Hospital Physician,-
Taking for granted that this plague is typhus, why should experiment not be made of treating it as we do typhus in the numan subject? There is now pretty fair statistical evidence
to show that the most effective treatment of human typhus the plan of administering continuons animal food and freyuent dases of muriatic acid. Under this régime we hospital phy.
sicians hardly ever lose a patient at the present day. Now looking at cattle with the eyo of a physician, and not as
farmer (I mean putting aside the question of expense) not see any pubting aside the question or expense), I canSmall quatitities every half hour ot weak beef tea and millk \({ }_{30}\) may be giveu, and every two hours a draught containing 20 or 30 dropa of the pharmacoposal muriatic acid. The animal
should be well covered up and kept perfectly still, should be checked by opiate injections, if necessary, but it is that \({ }^{\text {usuall }}\) arreated by the acid after a few hours I am awar should expect a suflicient number to be saved by the above plan to
beast.

Holly Lodge, near Watpord. - On the 27th of June an Alderney bull was purchased at Bushey, near Watford, and five sucking calves, three yearling heifera, and one bull. The
bull had been imported from Alderney for About a monta aler, namely, on the \(y\) for several months calf was attacked with unusual symptoms. She was separated having calved, she died 48 hours after the finstered; but, were observed. This led to the belief that she died of the pastured with the othera in a field occasionally cow had been if not sold were taken to the Metropolitan Cattie Market, and the sheep were sevarated from the cows by iron murdles, Th; Holly Lodge Estate is partly b bunded on the east by the route
takeu by drovers with foreign and other cattle to and from the market, some of which are also occasionally brought back to ueighbouring fields. The bigh road forms the western These facts are stated to show the cattle-sheds and pastures boen easily com municated to the animals. A fow daya later three musoles. The previous nights having become suddenly and to that canse. Although these calves had been passtured quite apart from the cow which first died, the cow had been driven died, the calves having been placed in the next shed whit two of them died on the bith of August, un miatake ibly of the
cattle plague. The third calf was sent to the Royal Vatte plague. The third calf was sent to the Royal virulently that it was thou the necessary to kill them diferers so days illoess. On the 12th a cow and a heifer wers also deetroyed, and on the 14 th one of the sucking calves died.
Thus, out of a herd of 19 animals, 12 had died with a fortnight. The rualady had taken so strong and sulden a
hold upon them that no systematio moans of remedy
could be applied except separation, warmtho atimulants, aud the medicines ordnaarily given in cases of cold and fover incurable by two of the veterinary surge pronounce advice, to tod in; but it was determined, upon further adopted. One drachm of calomel was administered hitherto later hours afterwards one nint of castor oil, and three hour added to a gruel of yeast and oatmeal, and given porter wer These remerlies acted most efficiently, and in one coervala much oncouragement. The next day the cow began to eat
hay, to chew her cud, and to vield a pood quant These rewedis, tngether with bi-sulphate of nodis, which
invariably produced a return of the mailk, and quinine, were
then tried upon furs other patienta, with yaried then tried upon fuur other patients, with varied success, But
in the ood all these cows died, not, it is believed, of the
catele the drugs administered to them. This buhlef was atrengthened tirst cow thui axperarance presented by the visoera of the diseceted after demth. The recosining cow thus treatod is atil

\section*{EPIDEMICS AND EPIZOOTICS}

\section*{[The following are extracts from a cl}

THe accounts which have been made public of disastrous effect of the cattle disease in the case of th dairy of Miss Coutts and that of Lord Granville, an the report made by the two foreign veterinary pio fessors on the post-mortem examination of carsia intereating.

In the case of the herd of Miss Coutts the treate of the infected animals was, to say the least of it, rem vigorous. Lord Granville's cows had not only advantage of all the skill and energy of his herdsm but, with great wisdom, were submitted to the (ram ment of any veterinary surgeons who wished to their own, theories in the way of remedial measure. both cases the epidemic defied all curative treatme No sick cows could have had a fairer field to strug with disease. All that care and cleanliness could do prevent their infection was done. When infected that money could command was called but in vain. We have now positive evidence has whe an epidemic prevails, the most apparently healid and low subjects are not safe. Wo and deprem vitality, invite disease; we now know that when dise is set ufloat, no matter from what quarter, in yo quart is there perfect safety. There is a moral to be iram from these swo dxiries and their scene of cows of Lord Grauville and Miss B. Couns 1 reain highly privileged class. They abode ion that luxury and comfort. There is out; on the con believe that it did not, lim frst appery reason ill beated cows.

The report of the two foreign veterinary protesion on the post-mortem appearances of the cattle the examined reads to me as just such a report as ayl good phyiologists would make upon the of cour patients who have died of malignant typuasce allowing in some details for the a cow
The manage or Luman Granville's dairy gives the ea oí one cow, which was aaved:-" Slue lay," he si! in a kind of stupor for 12 hours, when daily of gin in four days she was sufficiently reco eat a lictle hay and do without further tro never read atage aicple, phal she bed stage of typhoid disease. Hur suite fancy

in accordance with free-trade priuciples; but in the same breath we are obliged to ada, " spare the money?" it is an old adage "where there's spare the money ?" It is an old adage "where there's a will there's a way," and I hope you will be able to
solve the problem and satisfy yourself. Some parties solve the problem and satisfy yourself. Some parties
will be sure to grumble. The malt.tax I presume realises, in round figures, \(5,000,0001\). net. I trust you will shortly be able to announce you have \(2.000,000 \mathrm{l}\). to spare towards its repeal, leaving \(3,000,000\) l. to be made up. Select \(40,000,00 \mathrm{l}\). of taxes, to which add 5 per cent. so long as required. That will raise
\(\mathbf{2}, 000,000\)., which, if the taxes are equal now, no one 2,000,000., which, if the taxes are equal now, no can complain of. Draw \(1,000,000 \%\). under Mr. Gurdon's plan, or some modified adjustment, and the difficulty is solved in the opinion of one who begs to subscribe himself with grea respecto Thos. Fisher Salter.
(No. 2, To Mr. Salter.)
Iniand Rovenue, Somerset House, London, W.C. 2ad August, 1865
Sir,-On the 21st of April last, the Chancellor of the Exchequer referred to this Boart for their consideration a letter you addressed to hitn on the subject of malt for cattle-feeding purposes. 'This Board regret the delay that has taken place in their reply to your suggestions, but much time has been occupied in the experiments that were necessarily required. I am now to inform you that there will be no objection to your using unground malted Beans and Peas, or Barley malt cake be first mixed and crushed at the same time with it, and that sarnples pass the examination at this office; unground Burley malt cannot, however, in the interests unground Birley malt cannot, however, in the interests
of the Revenue, be allowed to be used for cattle feeding of the Revenue, be allowed to
purposes. W \(m\). Corbett, Sec.

\section*{(No. 3. To Mr. (Corbett.)}

The Hall, Attleborough, August 4, 1865.
Sir,-I beg to acknowledge the receipt of your letter of the 2d August, relating to malted corn for cattie, Peas, if I understand your letter correctly, there are no restrictions; therefore I can have them malted at any malt office nearest to my occupation free of duty. The restrictions on Barley remain the same, with the exception that it may be cruched under rollers with Salter.
(No. 4. To Mr. Salter.)
Inland Revenue, Somerset House, London. Sir,-Your letter of the 4 th instant, addressed to the Secretary, having been laid before the Board, I am directed to acquaint you that Peas and Beans may be malted, duty free, for cattle feeding, without any restriction, except that the process must be conducted give the local officer 24 hours' notice before he steeps the Peas or Beans, and keep them at all times separate from grain or malt in the malt-honse. Barley or other
grain, malted duty free for cattle feeding, remains grain, malted duty free for cattle feeding, remains
subject to all the established restrictions, except that the malt may be crushed under rollers with the Lin
seed or Linseed-cake, instead of being ground ; but sample of the mixture must be submitted for approval. Adam Young.

\section*{Home Correspondence.}

The Champion Wheat Crop of the Season.-Will you do me the favour to insert this letter in your next publication, as several of my friends are desirous of to the United Kingdom to produce a piece of Wheat equal to his, and which I accepted. Mr. Hallett with drew from the trial in consequence of not being able to secure judges. Chas. Bates, Dagenham, Essex, Sept. 11.
rience has tancht me that diseased Potatos may be preserved and rendered profitable and serviceable, not process of preserving them for hoth purposes being the same. The plan I have in several years adopted has been to boil them tolerably well, but not into a slushy consibtence, and then to drain and jam them into tabs a few at a time, with a rammet, without any water, a bushel), a double-handful of coarse salt (value 1 . air-tight as possible by pouring over the top of all a thin coating of puddled loamy earth mixed with a little oil, daubed over as fresh as occasion required, with a little salted grease when the crust become cracked, Thas they will keep fresh for a loigg time, should there not be sufficient pige obtainable the same year to eat may be used as a valuable manure should they become too stale for food. Their being washed for any or both purposes is not necessary, were it not for the danger of the dirt burning out the bottom of the boiler or copper, as grit is rather essential than not for the wellbeing of the pig. The same hot water, too, may be the Potatos are washed. Care, therefore, is necessary in this particular. Old flour barrels, to be bought at from 6d. to 1 s . each, answer admirably for the purpose, as they can conveniently be storedt ripon each nthre in any small outhouse, which should be on a northern aspect or cool sunless side; whether it is indoors or
abroad it matters not, as frosts do not despoil their good abroad it matters not, as frosts do not despoil their good
qualities. Thus they proved very serviceable mixed with
pollard or meal. In 1845 I had 900 bushels diseased ou f 1000 , which were hurried on to a large heap promiscuously, and used as dung the ensuing spring, and what is remarkable, very successfully and profit ably, on half an acre of land, and planted the next year, 1846 , with Potatos, the common Pink-eyed
variety, which yielded a full crop, and the soundest variety, which yielded a full crop, and the soundest I
have grown since of that kind (they being now nearly extinct). This rubbish of course was not ealted, no heing then thought of, consequently had become putrid. Former experience has taught me also that after summers of extreme heat and drought, since blight has appearell, all sound early Potatos at the end of this month (September), whether it was the entire crop, or hose which were left in the ground at the time of early raising, became prematurely sprouted; as if making special effort to reproduce a second crop, and came up perfectly green and healthy-looking as Potatos look in continued so till frost overtook them, rendering them unfit for planting. In a former year when they did so, acarcely a single self-sown one could be found in the spring, though that winter had been a very mild one. Careful watchfulness therefore should be observed as soon as they first appear, as I am sanguine to believe they will do so this autumn, when, if they are taken up, they will keep well, and prove most serviceable for seeding those being such as Nature has proved to be freest from disease. Envperimenter, Maldon, Efsex.

\section*{Farmers' Clubs.}

Kingscotr.-At the recent annual ploughing match of this vigorous and flourishing Society, there were bo had, and 48 teams started at nine o'clock.
At the anniual meeting of members, held at Hunter's Hall Inn, Mr. Daniel Holbrow was elected president in the place of Mr. J. T. Harrison, resigned oin account of his leaving this neighbourhood, and Mr. George Barber, of Babdown, was appointed chairman of the committee of management.
At the dinner the chair wats flled by Colonel Ktives. COTE, M.P. He proposed the toast of the eveningSuccess to the Kingseote Agricaltural Association. Societies like these were of inmensevalue to the farmers they diffused intelligence and a high tone of feeling
among all in the neighbourhood, and united all classes upon inany oceasions. There was great good in the monthly discussions which the members carried on during the winter. There was a strong feeling throughout the country that something more ought to be done for the Elucation Committee of the Royal Agricultural Society's Council, which was appointed this year. The majority of the committee were for only taking up the
existing machinery of middle-class examinations and adapting it in the best way to agriculturists, and had decided to aid the exannation of the agricultural class in botany, chemistry, geology, and kindred subjects. Royal Agricultural Society oucht to begin practical examination in agriculture. The majority were against that, but Mr. Holland, Mr. Randall, and himself, put forth a protest. The argument of the majority was that a practical examination conld not be carried out, for that you could not get examiners of the same mind, and that the pupils would come from different parts of the country, where entirely different systems of farming were pursued. Well, all he could say was, it ought to be tried. This little Society had taken a step very much in the right direction. It had established a class for instruction in chemistry, and he was sure any man must be a dolt who could not under-
stand the extremely clear and valuable instruction given by Mr. Church. It was a useful subject for farmers to take up, and be hoped other classes equally useful would be formed. He did his best in committee to get the Royal Agricultural Society to give prizes in aid of agricultural knowledge like this. The farmer was under difficulties as regarded the education of his sons. There were few places saited to farmers' sons as
regarded their means and requirements. They needed a good general and practical education. There were colleges in Devon and Suffolk for carrying out this ohject, and there ought to be such in every county. It was necessary that there should be a practical and a physical education. He had no doubt that the masters of those ploughmen who took prizes to-day could handle the plough skilfully, and show their men how to do it It might be said that this county had the Royal Agricultural College at Cirencester; but that, he thought, had overshot the mark altogether. It was too expensive, and as to their management they had been obliged to give up their farm to a tenant farmer. If they could not make it answer, all he could say was they ought to. He concluded by proposing the toast, and regretting the absence of Mr. Harrison, the President, conpled with it the name of Mr. Burnett, the Hon. Secretary.
Mr. Bernatt said he had occupied this position as vice chairman six or seven years ago, and was delighted at the growth of the Society. He contrasted its present position with its begimming. At the first meeting the plonghing was wretchedly bad; the ploughs could not
keep on their own land, and were cunning keep on their own land, and were running on to their neighbours' ; but to-day the ploughing was excellent, and he did not believe that superior could be neen in
England or elsewhere. As a proof one of their local
men had taken the champion prize. During ite par season they had some very instructive lectures, tat bo many most useful aud interesting disclussions, in whem ideas. He felt that it was needful that should be done for a purely agricultural ementis? Chat education ought to be practical, and he 20 young men who were fit to stand befme examiner in practical agriculture. But when the the Oxford examination that thing, and the difficulty was to combive the : branches of education at a rate within the farmer means.
Wigton: Commercial Principles allied to Panain -At a late meeting of this Club Mr. Layport mas After preliniary
broad terms to define farming, and to describe when in consider to be the essentials of a "practical farmer?

farmer's business is to prodice corn and meat, and he is the best man of business who concentrates his eff rts, and applios al to till his ground and feed Lis stock.
6. Let me summarise what has already been advanced, Farming is a busmess, similar in its broad features to all other trades or mannfactures, and should be managed on the same general principles.

The present condition of agriculture shows, however that the true commercial spirit is wanting in thic branch of our national industry.
This is proved by the average small size of the farms in Great Britain-by the consequent primitive character of the appliances for culture-by a wasteful and expensive general management-by in,ufficient capital, and minimuen production-by an almost entire absence of systematic book-keeping. The natural consequence of this state of things is a want of confidence amongst capitalists in farming as a profitable investment
That " farming does not pay is a generally receive opinion: and from the absence of systematic book keeping, tion to the rule. Hence it is that capital is so deficient - that high farming is the exception-and that agricul ture is stationary in the face of a universal progression

It now follows to determine bow the capital for im provements may be obtained? fur President says:by reducing the size of your farms. This a clea and intelligible indication how a man may increase the and practical his capital per acw a man may make the amount of capital he now possesses more profitable But I subnsit with all deference that no inkling is thereby afforded as to how a man may increase the amnunt of his capital available for culavation, nor doe it show from what quarter, or by what proces., agricul ture is to attract the capital neceasary form a state of imperfect action to one of prontable activity

In this pamphlet these plansare elaborately described
and illustrated; and now that a dry September is again and illustrated; and now that a dry September is again beginning to press the importance of a water supply on
our attention, we doubt not that the pamphlet will be widely circulated and read. How easily the needed work may be accomplished is plain from the following extract:-
"In the published records of the discharge of drains
clay lands (see Royal Agricultural Society's Jcurnal, in clay lands (see Royal Agricultural Society's Jcurnal, vol. \(x x_{n}, p_{0}\). 273), it has been shown that the proportion of the rainfall discharged annually varies from about 1-10th to \(1-5\) th, according to the density of the soil.

Taking the mean of these proportions and the rainfall on the surface at 24 inches, the depth of water discharged would be 3 in .6 dec., or upwards of 80,000 gallons per acre. If we allow to each inhabitant of a village 10 gallons per diem, and assume that for
four months, or 120 days in the year, recourse would four months, or 120 days in the year, recourse would
be had to the conserved supply, it would appear that 67 people may obtain a summer supply from each acre of land, if the whole discharge could te collected and used.
"Now, if the average population of villages may be taken at 400 inhabitants, it would require only the drainage water of 6 acres to be collected to secure a reserve against drought for an entire village.
"If the service reservoir be an open pond, a considerable allowance mast be made for waste by evaporation, \&c., and 50 per cent. on the quantity, \(i\). e., 15 gallons per head per diem, or the drainage water of 9 acres, should be provided, for a village. If a covered reservoir be adopted instead of an open one, the quantity may be reduced; but the expense of constructing a covered tank of sufficient size will preclude its adoption, except in special instances.
Then follows detailed plans and estimates, and the work concludes thus:-
"Assuming these figures to fairly represent the cost of supplying a village of 400 inhabitants with water, and the number of houses or cottages in the village to be 100, it follows that the cost per person would be
20s.9d., and the cost per house 47 . 3s. If the cost 20s. 9 ., and the cost per house 47 . \(3 s\). If the cost
were charged upon the houses, and the money were borrowed to do the work, it could be repaid by instalments, with interest, in 30 years, at 64 per cent., and the annual charge would amount to \(26 \%\)., or a charge upon each house of not quite \(5 s, 3 d\). per amnum.
"The capability of thus supplying villages with water is not conjectural;-every day's experience in
drainage only confirms the conclusion that there are few villages in which something of the sort might not be devised. In fact, the figures giren represent the worst aspect of the suggestion, for Nature frequently affirds opportunities of collecting the water
drainage, without recourse to artificial ponds, drainage, without recourse to artificial ponds, in
hoilows ןand ready-made receptacles which may be appropriated with advantage. The only thing necessary required, and that it is an act of justice to charge it upon the properties that will derive benefit from the supply.
"Turning again to farms-as clay lands will derive the greatest amount of benefit from the application of steam cultivation, it is a desideratum of the highest importance that water should be at command during the summer, when the stirring of the soil secares the greatest benefit. And as all clay lands will be drained acquires its proper position in agriculture, it is only necessary to provide a sufficient supply for the engine when draining the land.
Wells at certain intervals will do this in perhaps as cheap a form as any other mode of preservation, or ponds will serve the like purpose. A steam engine of of land from 100 to 125 gallons, say 125 gallons of water, and a well 12 feet deep and 6 feet in dismeter will hold, if rendered water-tight and properly covered over, 2115 gallons, or a supply sufficient for the cultivation of 17 acres. It will only be necessary when carrying out any system of drainage, to multiply proportion to the number of acres of arable land on the farm.
"It may be fairly asked, - If these objects can be so simply attained, why bave they not been carried out during the great progress of drainage? The answer is soon given. The necessity has not been acknowledged, and until that is the case, nothing willjbe done on any extensive scale.'

\section*{Farm Memoranda.}

TWe take advantage of the immense body of sgricultural evidence lately taken berore ehe Hypothec Commission at the oxisting style of Scottish agriculture, and the enterpriso and energy of Scottísh agriculturists. ]

\section*{(Continued from p. 85\%.)}
20. SNawdix, East Lothiax: Mr. Joseph Harper. I farm about 1300 acres of moor, and above 700 arable. 1 pay \(900 \%\). a year of rent. My term of entry is payable at Candlemas following entry, the reason being, that part of my farm is pastoral. I think the term of entry is fair enough, but in gelleral it would he better to make it a Martinmas entry for arable farcep, with the frrat rent payable at Whiteunday before the crop is
reaped; that would be, in fact, fore-rented. I liave known gunno merchante, smithe, joinere, and general
merchants in town and country suffer from the landlord' preference under the law of hypothec operating prejudi cially to them. When the question was discussed two o
three years ago, I was so startled with the great injur three years ago, I was so startled with the great injury
that the commercial classes and others suffered, that came to the conclusion that the law should be abolished altogether; but subsequent discussions, and subsequent reflection, have caused me to modify that opinion to a certain extent. I now think that, if the landlord had one year's rent secured to him, that would be a very fair arrangement. I would give him a preference over
stock and crop for the rent of that year. If the landlord stock and crop for the rent of that year. If the landlord
let the tenant remain three half-years without paying rent, I would still just allow him hypothec for one year As the law now stands, the landlord rarely loses his rent. I think he should take a certain amount of risk, though there is a distinction betweeu a proprietor letting his land on lease for 19 years and a merchant whose transactious are from day to day. The merchant can stop his supply of goods, but the landiord cannot
turn the tenant out on so short a notice. I do not myself know of any case in which a party has been called upon to pay twice for agricaltural produce under the law of hypothec; but at last Melrose fair I was asked by a person who had bought lambs
from the farm of another from the farm of another farmer, whether it pay for them, as he had since heard that the tenant was about to be sequestrated. I said that, in the event of sequestration, I had no doubt he would have to pay the Lord President's advice in a receut case, and ask to see the tenant's receipt for his rent. He was quite indignant at the idea of putting such a question to the farmer. I would consider such a question put to myself as a personal insult. It is a good advice from a
lawyer, but not practicable in business. I then advised him to write to the factor as to his condition. I sometimes put my sheep to other farms to eat the Tursips. Two years ago 1 had sheep in the low conary 1 curnips. The price of the Turnips wa tenant was sequestrated, and I was told that, if his sequestration had happened before my sheep had left, they could have been seized
21. Netherton, Dumblane : Mr. James Stirling.The rent of that farm is from 250l. to 300l., partly a grain and partly a money rent. My father was a farmer in Craighead. His farm was about 90 acres, and the rent was 100 guineas. I succeeded my father in that farm. He left me a few hundred pounds besides ueceededing of tho farm. It is 40 years since succeeded my father. i have still my father's farm. took another farm 10 y ears ago, on the estate o
Kippendavie, of 200 imperial acres. I took a thir farm last year. It is nearly 400 acres, and the rent is 500l. I commenced with a farm of \(100 l\). rent, and am now paying in all nearly 900 l. rent. I have five of a family. The last farm that I took was for my 500 l I . I ced that farm for 1 toldest som the 500l. I stocked that farm for my eldest son, as well as
having a stock of my own. I have found no inconvenience arising to me from the law of hypothec. I have rather found it to be beneficial. It prevents me laying out so much of my capital, by paying a forehanded ent, as I would have to do were it not for the law of ypothec; and of course I have the money to ay out on improvements on the farm. If there had been no law of hypothec, a could have fore-rented
my own farm, and stocked and fore-rented my son's farm, but it would have reduced my capital for the improvements on the farm. It would not have been so convenient for me to do as I have cone umier the law of hypothec. Commencing with a sinall capital, under the law of hypothec, I an now in the position I have tated. If the law of hypothec were abolished, I should hink the landlord would require security or forehanded ent. I think it would not be convenient to the majority of the tenants in my neighbourhood to pay
forehanded rent. My opinion is, that, were the Jaw of hypothec abolished, withont some conntervailing security to the landlord, it would have a tendency to remove from moderately-sized farms a most respectable and industrious class of tenants. I first commenced with arm of 90 acres, and then took a second, and then thrd farm. On the second of these farms, I expended a good deal of money in permanent improvements, but not on the last farm. I only entered it at Martinmas. I think the sizes of the farms whel were taken by the people with very small capital, to whom I referred as having done well, have generally been from 70 to perhaps 200 acres. I would not like to say that the present tenants could not fore-rent their land, if the law were abolished. I think that, generally apeaking, those who have been for some time in their farms could fore-rent them; but I certainly think that altimately it would come to their being removed. would account for that in this way, that unless people are able to pat their sons into farms, it would come to be that they would be put out. \(Q\). What do you think would come of the farms, or who would occupy them, if these tenants would not do so?-A. Well,
perbaps tenants of more capital. I could not say where they would come from. I do not see that the present tenants wonld get hetter hareaine of their farims f they were fore-renting them. As far as my experience , have not given a shiling more for the farms
not think the farmers would get their farms chome if they paid their rent beforehand. I see farm not say that they are taken by practical fat took both farms on the Kippendavi arm was never valued. I just tox offering for farms, when they are advertised. The certainly offering more than the farms are see very often tenants coming into the quarter in reside do not stop long in the farms. I think strangers offer more than those in the district. known some of those strangers, being men of capit who took farms, and did not do well with the or not, but they left their farms in a shors Ithink these farms were none the worse enants. I know no case where tenants have be out of their farins. I could not say whether account of the law of hypothee that these think the cost of the they should has generally put on the land, is about one-fourth the rent on the average. I have not known failures of farmers in my district. The general size he farms in my neighbourhood is from 70 to 210 acm I know a great many tenants of the smallest tarm my neighbourhood who have risen from the
ordinary labourers. I know four or five ordinary labourers. I knotv four or five, or perbyy
six, who have risen from being servants. The land gen bourhood. I am not aware of the landlords hate given any assistance to those labourers who took sin arms. Perbaps they gave them a little assistance iving drains and such permanent improvement there had been no law of hypothec, these men a certainly not have taken these farms. Those who b
taken them have generally thriven well in them. If law of hypothec were repealed, and the leas! these small farms were out, perhans some of tenants might be able to pay a fore-rent, bec money. They have thriven under the law thec. There have been very few clanges district. I know of no changes for a great n of years except two, and both of them wer number of changes show that the lauilorid exercised a wise discretion in the choice of tenants. Of course there is a difference in landlo ome do take a higher rent if it is offered for arm, and others do not. I should certainly say the landlords look well to the circumstances tenauts. I think they generally cousider the a
and skill of offerers, and make inquiries about \(t\) before they let their farms. I think it is the \(g\) opinion of the tenants in my district, 80 far 881 made inquiry, that the law of hypothec has wo well. If I were a landlord, I think I would select men kill for my tenants, even in preference to men of ha capital. I think I would do that, even if the tren hypothec were abolished. I would have more trast a man of skill, without any more capital than wn tnelk the farm, than in a man of large cupital a
kill. It would take a few hundred pounds to st farm of 70 Scotch acres. It depends putirely on class of stock put on the farm. I hoould thini 002. would do it very well. I do not miw irm whether 300\%. would do it. The rent of a farm acres is 100 guineas. The man that has sola, farm, just require to have 600 . to take a simila arm cheaper than others. My own opinion is an thing like 7l. an acre.

Miscellaneous
Stack Burning in North Lincolnshire. -The fertit cenes of last wister, which produced so much contron nation throughont North Lincolnshire and East shire, seem about to be re-enacted. No soving, ales harvest been gathered than two fires-Laved many of the marks of the unmistakable inceadialsi ast winter-are reported from North The first of these occurred at West Band eight fir Retford. The fire made its appearance son Widnight on Saturday, upon the house...ald ng all sare. Betw Mr. Foster, of High House, residing abour a mile west of Mr. Toder's, was awoze by the stackyard, which fronts his bedroom. At ab: 6 oclock, in spite of the arrival of two fire engines, the efforts of the farmer and his men, aided oy stab: Wheat, Barley, and Oate, besides four ws were left near the stacks, and of wh the iron frames remained. Four large peacock which flew into the flames, al entire produce of the farm had heeng and of the whole a few loads

\section*{Calendar of Operations.}

SEPTBMBER.-The following notes are abridged from Yorton's Parmer's Calendar:-
1 Autumn Cultivation.-There is no part of the Irbich the clayland farmer needs more useful to bum in his business than that which times the opera:Is of tillage to the fit condition of the soil. Tillage :2rsations which will benefit at one time will do a.ctief at another, and many a man has lamented too rat actiwhich had been better left undone till the 5. ther had improved. It is the same sort of wisdom of tolly, only intenser of its kind, which is displayed Ithe distribution of tillage operations through the peosa as is shown in their arrangement from day to wr. There is a great need of fitting what is done in efield to the actual weather of the day; but there is n eren greater need, especially on clay soils, of fitting the great tillage operations of the year to the average rether of the seasons.
There seems to be an advantage on clay soils in the dep and thorough tillage of the stubbles when dry in asumn, which is so remarkably greater than the Jrantage of the same process at any other season a Imost to require some special explanation. I believe jomerer, that the explanation is no other than that bich ordiuary tillage and its influence on fertility rexive; the greater effect arising from its being done in the dry and followed by the frost. But whateve the explanation be, the fact on amost co cheapening and rendering more effective a thorough autumn tilhge, and of increasing our power of carrying it out, rill be welcome to all clay-land farmers
Among such means none is so valuable when turned proper use as a long period of dry weather after mrest. Let the ordinary means of cultivation be put wargetically to work immediately after harvest during mech a season as we are having (1861), and they will be better in their influence and cheaper in their cost than all that ingenuity and capital can devise or furnish for the mistance of the farmer in ordinary or in difficult Liem.
Inminformed by a gentleman who farms largely in Holand that there the first operation on the stubbles an deep a furrow given with the p!ough as can be done with horses. Ten to 12 inches of the alluvial soil tey thas turned over; and if the weather permits, 2 crows-ploughing of less depth is given before winter In the neighbourbood of Edinburgh nothing strikes the pectator more during a walk over the fallows in winter tan the great depth of the ploughing which has been firen to the land since harvest. And in instances arer home, where the practice has been transplanted radopted tarther south, the same advantage seems to follow a deep autumnal ploughing. In the fen districts a rge deep-working plough has been lately introduced by 1r. Howard, which seems to be most influential on the latuity of the land. The bringing up a portion of the cay subsoil to be weathered during winter, when it momes mixed with the vegetable mould of the surface found to be most beneficial.
And where there are no especial reasons why advanaypes may be expected from a similar practice, as on a Surrer, yatively light soil over chalk in the county of di, yet che same advantage has followed the 12 inches a a similar practice. And a furrow, 10 or 2. inches deep, given by means of steam power, has - a capital preparation for the succe mand a capital preparation, indeed, for the whole an: be given in the case of a very foul stubble; such hid biven in the case of a very foul stubble; such
deen be cleaned before it is safe to turn it over mapt nsefol it is then that modern implements are Core asefal.
otber man's caltivator and Bentall's broadshare, and for the purchines of that class, should be put to work 5 he in parpose of cutting off that thin surface of the Tie comparative roots of creeping weeds luxuriate int place, distury sunall quantity of material, in the Lond, if necessary, is, is thus the more easily weathered, mifiers dras a cece burned. The harrows following the ehter carrig all the rubbish together; and when it is itmed orer off or get fire to, the whole soil may be Certainly deeply with the plough. 201 caltivator is areliminary use of the paring plough meroms alone are used in tillagy. Where ploughs and proces is cumbre used in tillage operations, the whole . Fetches,-Winter The extreme.
Wier the corn harvest is Wines cannot be sown too early Remeraily sown harvest is finished, though they are Aterat, the what any time during the latter half of thaf of October, mond month of September, or the first iog even a fortnight a mild season they will bear sowamon elevaght later. If the soil be poor, or the apon every farm and exposed, sow in August ; and shen food thers late, in order to have a succession of gree food the ensuing summer.

Spring Vetches produce rather a lighter crop than the winter sort, and are subject to more risk from a dry summer. There !s no difference in their use or value per ton; but the spriug sort coming to maturity two or three weeks later, makes it convenient and advisable to grow some of each, in order to have a succession of
them for green food all the summer. They may be sown all the spring and summer trom February till the middle of July, bat the success of late sowing will depend on a showery season.
Immediately after corn is carried from a field, or even part of a field, in August, or early in September, scarity and cleanse whatever of them, having no Clover Vetcher seeds among them, may be intended for Vetches. Cart on it such manure as can be spared, up
to 10 or 15 tons of well-rotted aung per ares, to 10 or 15 tons of well-rotted dung per acre, and
spread it, sowing the Vetches upon it; these (the secd and manure) should then be immediately covered by the thin and narrow slices of a very small plough. Or what is generally better, plough in the dung, give the land slight harrowing, and then drill the Vetches in row: 6 or 8 inches apart. If ploughed and pressed, and then sown broadeast, a very light harrow, or if the soil be friable, even a bush harrow, may close the seams. These operations will cost about \(10 s\). per acre. I3ut where no manure is used, the seeds may be harrowed or scumed in without ploughing, at so small a charge as 18. per acre.

A proper quantity of seed is three bushels of winter Tares alone, or two bushels and a-half of T'ures mixed with half as much winter Barley or liye per acre.
After the seed is covered, cleanse the water-furrown in order to render the land dry during the winter.

Wheat.-Sowing and reaping used perhaps more commonly formerly than now to be carried on together;
and the young Wheat had often indeed appeared before Whent harvest was completed. This was the case especially with Wheat sown after fallow, and with Wheat sown after Clover and Grass. Such fields are in the southern counties, either after a second cutting has been removed, or after a hard pasturing of the field, manured with dung from the yards which has been lying in heaps since spring, ans is now carted on and spread broadcast at such a rate as the quantity allows and ploughed under with a shallow furrow. If ploughed with a skim-coulter so as thoroughly to bury the green surface and whatever lay upou it, aud afterwards pressed with the drill presser, and then suffered to lie for : month before sowing, every condition likely to secure a rop is observed. There is plenty of manure and of "heart" in the land, and it receives and acquires a good irm texture which the Wheat plant likes. The land lies in ribs sufficiently abrupt to insure that seed sown broadcast and harrowed in shall fall into the lines opened for it and come up in row as perfectly as if drilled.
Whent after a bare fallow is sown by the Suffolk drill in rows from 8 to 12 inches apart on land which received its last ploughing some weeks before. And it is then harrowed in aud the ground left-the rougher the better. Six pecks of Wheat, or less, is ample seedng in the month of September. And that quantity isalso sufficient when sown broadcast either skiltully by hand or by machine, over a ribbed ploughing, and harrowed in so as to come up in lines,
The following memoranda on Wheat-sowing in September are given from the original edition of this work:

Seed-time.-Upon all cold, wet, and backward soils, September is the best season for putting in Wheat, provided the land be not too dry; for Wheat should never be sown in a very dry season, nor till rain falls in tolerable plenty. Upon drier and warmer soils it is far better to postpone it till October. But in this case every agriculturist should remember that the soil intended for Wheat should be cleansed and prepared or it in September, by scufling and destroying ali root weeds, as well as ploughing the soil once into ridges, the most suitable for keeping it dry through the follow ing winter. Another general observation is, that in proportion to the earliness of the sowing a amall deduc tion may be made from the accustomed quantity of seed, as two bushels sown any time in this month are equal to three in November.
Steeping Seed.-There are many methoda of ateeping, brining, and liming seed Wheat, and they are all intended to prevent the smut.

Notices to Correspondents
lovghrva: Inquirer. The niceties of this subject are no longer of the importance "which they once porseessed. We
drained land should be "smashed up"-that is the prope way to treat it. If you want to know all the mystories of th subject as it used to be practically carried out-perhays sti,
is in some districts-consult Stephens's "Book of the Farm." The whole vocabulary of this once tedious subject has become obsolete: and in place of "gathering up, crown and furrow ploughing, casting or yoking or coupling ridges, casting ridges with gore furrows, cleaving down ridges,
cleaving down ridges with or withnut gre furrows, ploughing two-out-and-two-in, ploughing in breaks, cross.furrow-
 Mrainage, as permitting a deep, rough tilliage before winter, and to steam ploughs and steanc cultivators, as enabling it, that the most striking lesson of recent agricultural experience In land cultivation is due.

\title{
HALLETT'S WHITE PEDIGREE WHEAT, MARK.
}
(ROUGH CHAFFED),

\author{
NOW OFFERED FOR THE FIRST TIME,
}

Grown upon the Summit of the Chalk Downs, and yielded over several Acres nearly Seven Quarters per Acre, the Crop on similar Light Soils being this year extremely bad.

This is a fine Millers' Wheat, in addition to possessing the extraordinary productiveness of the original Red Pedigree Wheat. Straw of medium length and very str, nuc being laid by bad weather. A Winter Wheat only.

SEED REQUIRED.

\section*{If Drilled in September, 4 Bushels on 10 Acres.}

Note-The ORIGTNAL "RED" PEDIGREE WHEAT will be supplied if specially named, otherwise the above new white variety will this year, in all caces, be fim
Price, including Bags :-ONE GUINEA a BUSHEL, or SEVEN GUINEAS the QUARTER by the (quarter or Half Quarter, delivered in Bags, sewed up and the Brighton Railway Station, upon receipt of Cheque or Post Office Order, without which it will not in any case be sent to wilnown Correspondents. Less than at Bushin an be supplied.

\section*{TRADE \\ CHEVALIER PEDIGREE BARLEY. MARK.}

This has been " bred" in the same manner as the PEDIGREE WHEAT, viz.: by repeated annual selection, re-starting in each year from a single grain.
Althouch grown upon a poor thin soil (resting immediately unon the chalk), which upon neighbouring farms produces Barley rarely weighing so much disll lbs, purt and fit only for grinding, the PEDIGREE BARLEY last year [this year's crop not yet threshed] weighed 57 lhs . per bushel, and produced \(89 \frac{1}{3}\) bushels per artiv.

Besides it astomi-hing productiveness, characteristic of all the PEDIGREE CEREALS, it possesses remarkable value for the maltster, not a single grain firitiny fy ynne and all growing cyually.

Although only a very limited area of it has this year been grown, it will, in deference to a gencrally expressed wish, be at once offered to the public inst all of wititis: next year, and a subscription List has been formed, to which gentlemen desirous of securing any of it for drilling next Spring, would do well at once to add their i... which, however, will not involve payment until it be ready for delivery, of which due notice will be given by printed circular.

SEED REQUIRED.
If Drilled in March, 1 Bushel on 3 Acres. If Drilled in April, 1 Bushel on 2 Acres.
Price :-TWO GUINEAS a BUSHEL (including Bag), delivered in Bags sewed up and sealed, at the Brighton Railway Station, upon receipt of Cheque or Pa-t is Order, without which it will not in any case be sent to unknown correspondents. Less than a Bushel will not be supplied.

Note.-As the quantity is so limited, it will, until exhausted, be sent out to Gentlemen in the order in which they have joined the Subscription List.

\author{

}

FEW things are more mortifying to authors and public men than the strange mistakes and misrepresentations to which they are subject from the carelessuess or want of skill of office readers and reporters. A striking instance has lately come under our notice in an account of an inquest which took plave at Rickinghall, near Bury St. Edmunds, and which, indeed, was copied in the newspaper portion of this Journal of Sept. 9 .
A child had died confessedly from the effects of arsenio, and as one of the same family had prevously died after a short illness, the body was exhumed, and portions submitted to an eminent practitioner at Bury St. Edmunds, who detected so arsenio, but who suggested in his evidence that
death might have arisen from the effect of pisonous Fungi.
The greater partion of the evidence as reported Fivenirestly contrary to that which was aotually goisoning by Fungi. Whatly regards the symptoms of poisoning by Fungi. What was actually stated, as we know from correspondence with the gentleby arsenic and Fungi "in some respects resembled each other," and therefore required careful discrimination; "that arsenio was au irritant poison, and Fungi a narcotic irritant; that gastru-intestinal irritation." The symptoms, ruoreover, as described by one of the witnesses nere those which would be produced by Fungi.
should quite right that an erroneous impression which not be left on the minds of our readers, by thich they might on some future occasion be led distinet.
Some evidence, moreover, was given about the presence of Fungi in the body, a circumstance The boy does not seem to us at all surprising, since quite certain that no poisonous Fungi which he could have eaten, even if they had been taken it is is could vegetate under such oircumstances, as in the least likely to the habit of any he was spores of some Fungi, as we lately remarked, vegetate more certainly if they pass through the never heard some graminivorous animal, but we produceard a mould of an abnormal character. For the most a mould of an abnormal character. For
with any wenave a sketoh, which does not aveord

The myoelium is distinotly jointed, and the spores, of which we regret that we have no measurement, consisted of three distinotly defined cells, resemEling more those of one of the leaf-Fungi (as, for example, Polycystis) than of any mould with which we are acquainted. Other Fungi sometimes appear upou putrifying flesh; we have, for example, seen a kind of Solerotium, a spuriuus genus, which consists either of an altered state o certain moulds, whioh must have been the condition in the instance just mentioned, or a winter, or, as it is termed, a hybernating form of some of the higher Fungi.
It is a curious fact that the same Fungi may act differently on different persons, the symptoms in the one case being more those of irritation, in another those of narcotism. As this is the oase, and as arsenic has sometimes been administered with Fungi, it is obvious that no certain opinion oan bo given without a post mortem analysis.
It may not be useless in conclusion to state that where it is suspected that deleterious Fungi have been taken, emetics and castor oil should at once be used freely, and that recourse should be had as sooa as possible to a regular practitioner. \({ }^{*}\) M.J.B.
Previous to the removal of the Marble Arch from Buckingham Palace to the Cumberland Gate, which took place in the spring of 1851 , the east side carriage drive, running parallel with Park Lane, presented few attractions either to the masses, or the habitual lounger in Hyde Park. The first improvement was the formation of a new road, which was carried further into the Park, inside the few tine old trees through which it formerly wound. Some years before, a row of Plane trees had been planted next to Park Lane; and although these shut out the view from the neighbouring houses, they were already adding a certain amount of seclusion to the new drive. It does not appear, however, that any further alterations were contemplated in the intermediate space now left between the drive and the publio road. The usual London belt of Lilacs and other shrubs existed by the side of the railing, and on one occasion was made the subject of a petition to the present Premier, that it might neither be neglected nor in any way interfered with. Its days were nevertheless numbered, but only to reappear in more perfect luxuriance; for on Commissioner, Mr. Mann, the Superintendent of the Parks, proceeded to thoroughly trench and enrich the ground; plans were submitted to the elder Nespield, and the first result of Mr. CowPER's new gardening polioy was a pleasant and interesting promenade, stratohing from Hyde Park Corner to the Marble Arch, and affording the equestrian a magnificent panorama either on leaving or entering Rotten Row. Indeed, when the flowers are at their best, the view is singularly glorious, the mixture of park scenery picturesque trees and garden producing a variety that may be set in friendly competition with the more stately splendour of the Champs Elysees. From the noise and bustle of Oxford Street, it is a sudden transition to the shade and comparative quiet of the garden.

In arrangemeut nothing can be more simple, one central waik dividing its whole length from the Marble Arch to Stamhope Gate. At its commencement irregular groups of Lilm and Plane are interspersed with beds of Ivy and Periwinkle, or where there is sufficient light, brilliant patches of colour. Then a more open plot intervenes, formally laid out with standard Acacia and flower beds, and enclosed on either side by a low baoking of shrubs. In front of these a permanent border of mixed Pinks has been introduced, having a good eftect either as a grey edging or a line of variegated bloom. Next we find another cluster of overhanging trees, and beyond these a pretty assemblage of Coleus beds and Centanreas Cannas, and Pelargoniums, Castor Oil plauts, the Giant Rhubarb, and the light green of the Indian Maize contrasting to advautage against the gorgeous colour of the flowers. The garden here begins to widen, and in the intervals between the foreground trees, peeps are obtained o distant glade, and trees feathering to the horizon. And were it not for the peouliar gloom that hangs

over the metropolis, and the incessant though gentle rumbling from the vehicles in Park Lane, one might almost fanoy oneself miles away from the great City. Of couree, during the "seasou," such an illusion is impossible, and it seems almost a wonder how Mr. MANAT contrives to grow such beautiful flowers amidst the clouds of dust that are sometimes showered upon them.
Just bi yond here is Stanhope Gate, from whence the garden entirely changes its character. In one of his essays on the imagination, Mr. Addrson has remarked that works of Art, as compared with those of Nature, "have nothing in them of that Vastness and immensity which afford 50 great an entertainment to the mind of the beholder." We think that, judged by this standard, the boldness of oonception that initiated the endless ribbon of red, purple, and yellow, commenoing at this point, and following a cuurse parallel with t? e drive further than the cye can distiugaish it, deservedly merita our approbation. The effeot is undoubtedly tine and strikiug, especially when whirled rapidly past it; aud the pedestrian, moreover, has the inner walk, where the bedding is much varied. Here are the ordinary Pelargoniums, Ageratums, Feverfews, Dahlias, and other tall flowers; and a short way down, two beds of Hybrid Rhododendrons, that are flourishing as well as either Aucubas or Iluily. Thell cumes a stately Elm, as Hood would say, "like some ramous Laoo00n," but throwing out its arms in solitary grandeur, and breaking right through the monster ribbon. At the extreme end the strip narrow again, and is ocoupied by a single ohain of flowerbeds, alternated with Lucombe Oaks, which promiso some day to monopolise the whule of the Grass compartment. On the opposite side of the drive an Italian garden has been construoted in the old reservoir, with bands of Irish Ivy, and a marble group in its centre, which serves as a drinking fountain.

Passing round the Ackilles Statue to the entrance of Rotten Row, we come across another novelty in park gardeniug. It will be recollected that there is a triangular piece of ground between the avenued portion of the ring drive known as the "Ladies" Mile," and Rotten Row. At Hyce Park Corner it is a narrow wedge, gradually widening until it presents a fine bread frontare gently sloping towards the Row. The whole area is as nearly as possible 12 acres. A portivu that is completed near Hyde Park Corner, with its graceful diversity of outlying beds of Yuccas, Humea elegans, foliage plants, and informal groupings of Holly, lihododendron, and other varieties of trees, has already excited much cornment and adniratims. Specituen plants of Thuja aurea, Lumbardy Puplars, Thorns, and others are charmingly disposed in recesses among the planting. The remainder is beiug oarried out under the advice of Mr. Markiaim Nespicid, and we can therefore rest assured that the result will be satisfactory.
Before quitting the subject we must allude to the new road through the Park. When the preparations were making for the Exhibition of \(186 \%\), some difliculty wis apprebenued with respeet th the approaches. The Brumpton Roac' was widened, and a new gate placed in Hyde Park, opposite the end of Exhibition limad ; still the ouly acecess from the north was by Park Lane, or the narrow and circuitous thoroughlare of Church Lane, Kensington. A more direct communication whe considered necessary, aud various suggestious were made, such as for a pontoon bridge, hanging walks by the side of the present bridge, or for widening the whole structure. In disearding these Mr. Cowper showed his ususl jud,rment, and we think his simple solution of the difticulty is in every way successful. The entrance at the Victoria Gate from the Bayswater R ad, is oue of the prettiest in the Park-the drive sweeping betweeu noble trees past Kiensington Gardens, and over the Serpentiue. Bridge, which is so aivided that pedestrians have one-half of the bridge and equestrians and carriages the other. One-half of the western part of Rotten Ruw is also fenced off for it, and frum here it leaves the Park by the Queen's Gate, close to the Horticultural Gardens.
The First Commissioner had another scheme for connecting the broad gravel walk in Kensington Garden between Lancaster Gate and the Coalbrook Dale Iron Gates, with a small ruad which would have passed through a tumel under Rotten Row into the Kensiagton Gure !had; but the expense proved fatal to it, and it is very probable that it would not have boun ready in timo for the Extubition. But even if it had been, the present line
answers every purpose, as is best proved by the fact that the temporary expedient has resolved itself into a permanent public roadway.
-We are happy to be able to announce that Dr ; J. D. Hoorer, than whom no more fitting person could be found, has been appointed to succeed his father, the late Sir W. J. Hooker, as Director of the Royal Gardens, at Kew. There can be no doubt that under his able supervision Kew Gardeus will maintain the high repatation they have acquired amongst the scientitic establishments of Europe, as well as continue the centre of botanical science at home.
- Dr. Thwarres, the distinguished superintendent of the Botanic Garden at Peradenia, Ceylon, writes to us " on the PACEING for transport of various kinds of SEEDS which do not retain their power of germinating after they have become dry"-and to this category belong many of the seeds of moist tropical countries. "I am continually receiving," says our valued correspondent, "such seeds packed in paper parcels, and of
course find them of no value for sowing. If packed in a close tin box, with finely powdered charcoal between them, such seeds will remain good for some weeks, and if the seed vessels themselves are carefully gathered just as they are ripe, and packed in the way above described, taking care not to bruise them, the seeds they contain will be preserved in a good state for a still tices of the close box, seems to cleek the growth of fungal mycelia, which would otherwise speedily destroy the vitality of the seeds."

From Erpurt we learn that the Exhibition of Flowers and Fruit held in that town from the 9th to the 17 th instant was ou a large scale, but presented little novelty. The objects were for the mast part displayed in the open air, the remainder ander tents. The principal exhibitors were Messrs. Jühlke, Benary, Heinemann, Haage, Schmidt, \&c. But few save Germans were present at the show, and the Congress was not attended by that large assemblage of savans and horticulturists which foriced so important and delightful a feature of the exhibitions at Brussels and at \(\Delta\) msterdam, and which we hope to see repeated next year in London. Erfurt itself wore a holiday appearance on the occasion, the houses being caily decorated with flage and boughs. A banquet and an excursion to the Thuringer Wald were pleasant additions to the flora fête.
gardener, at the Chatteans the intelligent English Oise), has sent us samples of a very handsome Hybrid amaranthus, which, so far as can be judged from the specimens before us, will prove a most valuable plant
for the summer flower garden. It is described for the summer flower garden. It is described as cross between the Amaranthus unelancholicus ruber, so much used within the last year or two
for bedding purposes, and the very gaily tinted Amaranthus purposes, and the very gaily tinted occasionally seen as a pot plant at our great exhisanguineous red which marks A. melancholicus ruber, while the lower end next the stalk is of a bright crimson red, and the young leaves of the lateral shoots are almost whoily of this brighter hue. Being so much more brilliantly coloured than its parent, it may be gardening.

\section*{New Plants.}

\section*{313. Dendrobium Tattuntanum, Bateman MS.}

 heinias laterales in disco laciniæ antice in lamellas rhombeas antherà̀ velutiuâ. Rcchb, fil. (couly. D. Cumuluinc R. Br.).
This is an excoedingly pretty and distinct Dendro. binm, which I was glad to bave the opportunity of dedicating to Lord Egerton of Tatton, from whose rich collection of Orchids I received specimens in July fresh for an indefinite length of time, and are very gaily coloured in a style quite unusual in the genus, the sepals and petals being yellow and white, while the lio is a deep mauve. It was discovered on the coast of North Australia by Mr. J. G. Veitch, from whom living plants were sent to his father's vast establishment in the King's Road, Chelsea. J. B.
314. Demidrobivil Johameis, Rchb. Ml.
D. caultbus incrassatis foliosis racomis erectis nuultiforis
brevioribus, bracteis minutissimis triangulis, seralo supremo

Lilre the preceding this
in North Australia by Mr. John G . Veiteh, from whom
plants were received last spring in such excellent conditiou that sonee of them have already flowered in the King's Road. The flowers are borne in erect racemes, and have singular twisted brown sepals and petals with a yellow lip.
Prof. Reichenbach being anxious to connect in some way the name of Mr. John G. Veitch with that of a plant which forms one of his more remarkable discoveries, and being unable to call it Dendrohium Veitchianum, because that name had long since been given by Dr. Lindley to another species of the genns discovered by Lobb, hit upon the iugenious device of making his Christian name the passport to immortality in the present instance. Certainly no one ever laboured harder better than the adventurous young traveller, who has already added so many new things to our collections, and who, we sincerely hope, may be spared to enrich them still more. This and D. Tattonianum will be figured in the forthcoming number of the a Botanical Magazine." J. B.

\section*{BEARD'S PATENT HOTHOUSE ROOFING.}

For some years past the most thoughtful builders and horticulturists have been rather dissatisfied with the usual modes of attaching glass to wood or iron for roofing purposes. The general system has been to place the glass between rebated rafters or sash bars, to overlap the squares, and to separate them from the ron or wood, and keep them in position by means of putty.
The whole of these processes have been objected to on various grounds-rebatea, because they increase the expense of manufacture, and the risk of breakage of glass, and weaken the bars; putty from its first harduess ; and dirt, obscuration of light, production of drip, and retention of water, which, when it freezes, leads to a wholesale destruction of glass. The sash bars are often increased by tight glazing.

course if a square of glass is tightly fitted between two bars of wood, or worse still, two of iron, it must be broken by the slightest change in bulk of the substances against which it presses, or by sudden concussion It is also well known that most roofs and all horticultural structures are subject to both these influences, and hence the cause of most of the glass broken. Where rebates are used, one eighth of an inch should always be left clear between the side of the glass and the upright centre of the rafter. But even when this is done, the hardness of the putty will neatralise the benefit of it to a great extent. The evils of this hardness are most apparent on metallic roofs, because metals contract and expand more with the addition or subtraction of heat than wood or other substances. This power of change in obedience to alterations of temperature is also much more active in metal than in either putty or glass, which are irremovably come bined with it to form one building or roof. All these substances are changed by caloric, but they are changed in a different ratio-at a distinct rate of speed, and that the metal in its hurried obedience to this natural law will double up the glass. Every one is familiar with the capacity of laps for water-how they draw it in and retain it by capillary attraction in that dangerous position until the cold grasp of the frost expands it into ice, and breaks the glass by one and the same

Looking at the threefold deatructive force of rebates, putty, and laps, it was only to be expected that improvers would strive to abolish one or the other, or all three together; and as a matter of fact, this is mainly the direction that improved methods of glazing have taken. Mr. Russell many years ago ing horticultural and other roofs with glass tiles. One end of these was made wider than the other, so that the uniler end slipped into the upper, and each two rows of tiles were grasped and held firmly together by a metal flange full of putty being pressed firmly down upon them. Mr. Snow and others adopted the plan of glazing and to end without laps. Read protested his putty from the weather by inserting the

Harrison, Saul, Cranston, Barrett, and others han metals and other substances as substitutes aid a Copper, lead, iron, zinc, brass, and glass for purty been used as the binding materials, and isseif han glue, india-rubber, gutta percha, etc., as the chaie breaks to the friction of glass against meta
hese reeders that recontly patented by \(\mathbf{M r}\). Chace ts gow of Bury St. Eaconunds, in Suffolk. He Marles Bean abolished rebates, putty, laps, and paint has not abolished rebates, putty, laps, and paint, but ent metallic roofs.

He forms his frame work
iron, and his improvements may be said to abolish working expenses by superseding the necessity repairs. The least durable substance he emplogs \(m\) : last probably 30 or more years, and it can be reneme in a few hours at a trifling cost. His first great otijec
is to render the iron anti-corrosive. With this viem began to ereot his houses with galvanised iren an they may still be built with that metal. Mr. Beardi, however, does not strongly recommend it now. Pmo tical difficulties connected with the galvanising proem has found in aek another antidote to rust, and shis has found in a ppecies of enamel paint. By a sories a
dressings and balkings the iron is turned out finishod hard and smooth as the internal surfaee of an enamollo saucepan. The entire frame-work of the houses com sists of this enamelled iron, and this onamel needs paint and defies rust. It is impossible to eraggent the value of this boon.

Mr. Beard's next object was so to attech the glem the iron, that the latter might continue to obey
natural and necessary law of contraction and erpen sion without breaking the former. This is accom plished by kooping the glass entirely at all points fro of the metal. It is completely insulated from its and yet firmly enough bound to it to prevent the glom being moved or blown out by stress of weather. All this is accomplished by the simplest and cheapes bars (or rather ribs, for there are no lights), are used.
For ordinary-sized houses this bar is made of thru. quarter iron, 1 inch wide, and \(1, \frac{2}{2}\) inch deep. Of coum
the size of the bar would be determined by the width of the house The ahore sire is merely named to giv definiteness to the facts. The mode of glazing mould be identically the same whether the roof bars werr large or small. Along the screw-holes are drilled, \(\frac{3}{4}\) inch deep, at intervals o 30 inches. The roof bars are placed 20 inches apprt. Small studs or tiny bolts, \(1 \frac{1}{2}\) inch long, with thread at each end, are then turned three quarters of an inch into the holes in the bars. A strip of asphate felt, the same width as the rafter, is run along the san bar, and holes pierced through for the studs, so tha at on the iron. On the top of this glass, next a three-quarter inch coverivg bar is placed glass, next a three-quarter incla coverivg bar bo small
on the felt, and the whole is finished by a so the hexagon capped nut being screwed firmly on to the other end of the stud that projects through bay overing bar. This completes the glazing, and reepo rafter or roof-bar beneath.
The squares of glass are 30 inches by 20 , and as tho studs are placed so that each grasps the corners of four squares, this gives an average of one slad weigh 26 to 28 oz. to the foot to support this size, care must be taken not to allow the two squar lass to meet as they lie side by side on the top of th oof-bar. A space of from \(\frac{1}{8}\) to \(\frac{1}{4}\) of an inch monle always be left, and at no point should the glass touch the glass, or impinge upon the metal bar orecaution is binds all together. The reason of this precaucange this-when the metal moves in obedience to its chand of temperature it is needful that the glass should the power of rooving with it, and at all points it mas be shielded. from friction against itself or the of tho either by a vacant space, or the intervention old elastic felto Thus breakage by
or concurssion, becomes impossible.

Although this mode of glazing is quite comphtab with the use of laps, it is easior managed an without them. It has been demonsaraved acime again, and these houses convincingly cod to ke previous experience, that laps are not needed the onl out the water. And yet, singularly enough, the Inte
objection made to this mode of glazing at the objection made to this mode of glazing a sp it was exhibited, emong the hundreds of garden who visited that grand display, was "that generally maust come in." The fact does not seem to be genera known, that where two straight edges of gars a straight line, the water is suress the over the point of union, uuless une brilding flatter than is ever the case in horticultral bingularl It is however, certain that these hous now boen erectel free from drip, some of them have now, heary rains, for two years, and neither during safter severe froet do they exhibit the evils of drip.
this comparative exemption are obvious enough good roofs of any kind the external water may be kept out. It is the water extracted froinat the

\section*{NOTES ON BEDDING PLANTS}

In, bedding-out, as in other things, we keep moving ner plants worthy of popular adoption, yet so many are the resources of our nurserymen, and so wide ithe run of botanicail travellers, that there are usually Haring had pretty good opportunities of observing these, I will endeavour to indicatejtheir merits as far my judgment goes.
pacta would appear to be a "decided acquisition" memuch as it does not grow more than half the size of the common form, and is therefore suited for edgligg and smaller compositions thau those for which thases thas is fitted. It must be planted more closely than the original,
reould Herbstii, or Achyranthes Verschaffeltii, namorthy of the large sale it has had. At Battersea L looks a miserable object, and, indeed, that is its redeemed to some though with Mr. Eyles its character is time, that thad so extent. It is, indeed, so good with might think it a useful plant; but at its best it is in aspect to warrant these, and not sufficiently distinct London it has inuproved much with the late fine end of August. If. August.
Mr. Gibsson is certainly justified in considering m it displays an ersii the best plant in its way, as with and it is in the sub-tropical, weary of colour, but and well looked after. In other gardens, though a thant bright indispensable subject, it does not attain Anarnatht and vivid tint which it does at Battersea. cold or light melanehclieus ruber seems at home on eren on the London displays great beauty of colour cond gonerally useful of the lot, as in some to be the pollow and starved Coleus remains in sickly green and It dow woll at Charved condition throughout the season
Sentolina incana is chath, where Coleus is useless.
cultivation, but it promises aoon to be an indispeusable
thont of gardens. I have seen many plants of it, and
pheas rate are being propagated from now at a high-
useful. With all the neatness of leaf.ge of the
Lavender Cotton it is much more tomentose, and has a dwarf recumbent habit, which will eause it to bo a useful edging plant.
Would not youngand clean-grown plants of Santolina Chamrecyparissus furnish the sort of tall eilvery edginge for which Antenuaria margaritacea was recommended a few years ago ! The Lavender Cotuon, ton, has the adrantage of hardiness and is evergreen-or rather ever silvery. I am confident it might be used with great success as a " winter gardeniug
The Tropaolums are certainly establishing their claims as first-rate plants for summer decoration. Among the best are Tropæolum coccineum compactum which, without stopping or pegging of any kind, forms tlowers. It has the advantage, too, of not setting knocked out of bloom or beauty by such heavy raius as we sometines have. T. compactum luteum is also low and neat in labit, with orauge yellow spotted flowers, and is probably the best of its class. Tro paolum Eclipse appears to be the best of the climbiug vases, \&ec. This breed of Tropavolums possesses decided advantage over such as tre raised from seed, fite as some of these are, inasmuch as you are always sure of perpetuating the right thing from cuttings The first-named kind seems to be as good as any other plant used to produce a mass of scarlet.
Among the novelties and striking combinations at
 seterophylia variegata. I have grown the plaut for several years, and know that it may be depended ou as a beautiful variegated subject. It has winained in bed is now covered with its slender shoots, which form an "airy" but not straygling mass, every leat
being thickly dappled over with pink and white spots, furnishing an indescribably pretty effect. Many variegated plants "got green" as they get old in loaf age; with this Vitis it is the reverse, as the later formed leaves are the most prettily marked, and the effect of a mass of it is more attractive at the end than the beginning of the summer.
The neat dwarf and hoary Veronica incana is capable of doing a good deal as a dwarf edgiug plant. It has also some advantage in being hardy.
Those who have to pay moat attention to eutumnal decoration-whose employers only frequent their gardens in autumn-would do well to use the new white Anemone Honorine Jobert, and to mix with it the old Anemone japonica. Among low or trailing shrubs they look and do well, and on rockwork charmingly, as about the houses at Chatsworth,
Enonymus radicans variegata, well pegged down, forms a dwarf, distinet, and pretty silvery edging. of a glisteuing tint too, which is sometimes desirable, By this glistening sharacter, and by having a brightioh jet low margin, Arabis alpina variegata differs from A. albida variegata, than which it is a more effective and useful edging plant.
Bouvardia angustifolia (Van Houtte's variety) is a free-blooming kind, yielding fine heads of scarlet Howers. It, as well as other Bouvardias, should be put do not flower satisfactorily
Of silvery-margined Pelargoniums SilverChain would seem to be the best for the bodder, from its round and swelling but neat habit, and bright markings. Old specimens of it for high lines or centres look parti cularly pleasing.

Of the "Cloth of Gold section," Mrs. Maxwell Hutton has a free yet neat habit, and is perhaps the best. There are some charming things coming out in the Mrs. Pollock way, but as yet they are too rare to be alked of. By the way the most beautiful masses of Mrs. Pollock about London are not grown as recom-
mended at page 69, by having "gravel or briekmended at page 699, by having gravish at the bottom to bring the variegation well out," but by the contmary process of making the bed the richest in the garden. Mrs. Benyon is alwost as fine and brilliant in flower as some of the standard green-leaved kinds.
Of Bouquet or Lilliputian Dahlias one called German Daisy is a great acquisition. It is very dwarf, growing only about 18 inches high, and the flowers are also exceediugly compact and pretty. lo is rainer changeable in colour, shading off from lilac to violet crimson most useful for cutting from.
The finely variegated Arundo Donar grows very dwarf indeed compared to the green form, and for this reason a good plant of it, with its waving and beautifully marked leave, would I think form a pretty and gracefin centre for a 6 -foot bed. It would be necessary to select plants with half a dozen young abooks or thereabouts. They would not get higher than 20 ins or 2 feet during the season, about London at all events; and should be protected in winter with an old mat or something of the sort.
The variegated variety of Vinca major, called elegantissima, retains its markings regularly, and pegged down neatly it makes a good yellowish edging, shining, and of course hardy.
Achillea ægyptiaca is worthy of a trial as a bedding phat like those of a whitened Nothochlmene, furnishes a
continu nu liom of clear jellow flowens, and usually
grows abuat is maches high. The faded corymbs of Howers tuust be cut off. A. aurea is also worth trying in this way, but it is Lardy, and if allowed to remain in the ground during the winter the second year' in the ground during the winter the second year
bloom is of much ahorter duration than the first lo succeed with it as a beduing suliject, it should be Salvia argentea is Pelargoniums, dic
Salvia argentea is unquestion. his the fuest largeleaved silvery plant we have, aud nuw mere than ever usefu! for associativa with the greets and handsome habited plauts whichare Legimuing is tastefinly vary the massers of gay tluwers. It may lie sech at battersea by auybody, not much mure thau half the size it beually grows, porisaps frumb beiug on a ra.net? brick beil. It grows freely in ordinary garden sui?, but of
course like most other thago likes it relh and deep, out the heaviest ram, coldest boil, or fullest exposure to not affect it in the least, though nomo at first sight say-judging by its woolly repect-that it must be poilod by rain. If planted round large-loaved thing6, ar 'yparissias, au herbaceous plant which forms a very neat green bush; round it, for mstance, au edgiug of his Salvia would tell well.
The fine Sempervivum califormieum, with its handsomely tipped leaves, is perlapus entitled to take and clean in growth, and moreover quite harily, and as presentable at Christmas as at midsumuer. No pogging down, no gotting green, no annual propagation regurred with it. But as it has been a neglected pant of coure it cannot immediately be had in sufficient quantity to make clgings of, and those who
have the plant at present would do well to divide and

These notes chielly refer to bediliug plauts as soen in the neighbourhood of London-the centre of gardeniug as of thought. However, I am going to have a un towards the circumference of the circle, and if see "anything good" and ue
will report on it. W. Robinson.

\section*{THE CORSICAN PINE-PINLS COHRSICA.}

CThe annexed paper, which wo have Fomewhat condensed,
bas been sent us by the author, su a sample of the now
THIS most valuable timber tree is indireunus to Greece and Spain-nay, it is fumd more or leas plentiful all over Eastern and S.uthern Europe. If introfuced inte, it was but little known in this country until the beginning of the present ceatury, and even then uly as a rare or new Pine: for it is only during the ast 20 years that its intrinsic merits as a first-clase imber tree, in every respreet well adhated for profitable planting in this counlry, have been appreciated; and even at the present time it is sadly neglectnd by pracical planters. For quality, quantity, freneral utility, nd early maturity
It is perfectly hardy, and what is equally necessary constitutionally hardy; of very rapid growth, sur passing its congeners, and a rival to our constiutionally tender and now diseased Larch Fir; of arge dimensions, attaining heights of from 80 to
130 feet, arriving at maturity in 60 to 80 years, but will produce timber fit for any purpose, even neval architecture, in about 30 to 40 years. It is not fastidious as to soil or situation, and exceptng in spongy-marsh or soft peat, I know of no escription of soils in and out surcharged hith sugu wo ( would not grow, and produce wood (rilative and comparative), of as good quality aud (yund quantity, and xtant Its apecial and most valuable quality in my estimation is, that there are few it any other kinds of trees, either indigenous or exotic, which would so well remunerate for planting the many thousand acres of waste and unprofitable poor barren lands, which are so common in this country-lands which, when we consider the genius, the skill in rural economy, and the wealth of Great Britain, and our enormous progress in trade and commerce, are disgraceful to us as a nation. I fearlessly assert thst (with the exceptions of the two descriptions of soils already mentioned) of the many, yea, too many, thousands of acres of waste lands, there are not more than five per cent. which might not through the medium of practical knowledge and the necessary capital be turued to profitable account by being planted with this and such like trees.
Its wood when young or newly cut is creamy-white when matured and seasoned brownish-yellow; very resinous, elastic, and tough; very durable, long-grained, and thongh a hittle coarse in texture, yet easily worked and capable of receiving a tolerably good polisb. As far as I lave seen I am inclined to thiuk it will not be very subject to the ravages of wood vermin. I know of no Fir nor Pine less subject to the ravages of insects, fungi, game, or vermin, which may be accounted for by the bitter aromatic flavour with which its juices are impregnated. It seems pre disposed to inconstancy in its distinguishing characteristics, which may have been iuduced by its occupying so wide und dissimilar a range of native babite and which has led to much contusion in its introdaction, cultivation, and nomenclature ; for it is
to be found in catalogues and collections under many specific names, as well as in many varieties. Some of
the forms indeed seem externally very distinct, but when grown under the same conditions, most of them more or less closely resemble the true species. Moreover, there are several quasi-species, e. \(g\)., austriaca, calabrica, caramanica, contorta, Pallasiana, pygmea, \&c., which geuerally reproduce themselves from seed but each and all of which are vastly inferior to the prototype "corsica" as a timber tree. There are also some seminal varieties which are more or less beautiful as ornamental trees, particularly the variegated-foliaged and the pendulous-branched forms. Most of these require to be increased or perpetuated by the (at least to Firs and Pines) reprehensible modes of propagation-grafting, inarching, layering or cuttings but in such cases, when ornamental branches, not trees, are wanted, these arts are pardonable.

Whenever it is intended to plant this Pine for profit or good timber, great care is necessary in selecting the from the most elevated and exposed situations, and from the coldest climate of whiche the tree is a native, until we have it in sufficient quantities and of such an age as to enable us to obtain our supplies of seed from home-grown trees; for I hazard the opinion that when this Pine has become thoroughly acclimatised, and we can obtain cur supplies of seed from such counties as Aberdeen, Argyll, or Perth in Scotland, if it does not surpass it will at least divide the honours with the
native Scotch Pine, as the most economically valuable, native Scotch Pine, as the most economically valuable,
and in every respect best adapted Pine for the profitable planting of the waste lands of Great Britain and Ireland. It is said that great care is necessary in its cultivation, inasmuch as it is what in common partransplanter. That it is a sparse or tap-rooting Pine When in a young state I frankly admit, but that it is a bad transplanter I most emplatically deny. I have of late years been cultivating many thousands of it for
planting exposed forest land, and I have invariably made it a rule to transplant the seedling plants the first autumn or winter after their first summer's growth, and again every succeeding autumn or winter until removed from the nurseries to their forest quarters; and by such a course of procedure in the cultivation of every alternate season the more fibrous-rooted ones, the failures are nil ; and mending-over or replanting a single plant in any enclosure or plantation after the first planting is an operation which we bave consigned to the limbo of the past.
It may be concisely described in a few sentences, viz: Leaves generally two in a sheath; seed-leaves generally six to eight iu number, on young growths
4 to 6 inches long, on old trees 2 to 4 ; dark green, rather slender, more or less curved or twisted, particularly on the tips of the shoots, having comparatively short sheaths. Cones one two or more in a cluster, horizontally disposed; irregular in form-egg-slaped, conical, straight or curved, of a brownish yellow
colour, 3 to 4 inches long, and 1 to 2 inches broad at on the back, and of a mereamy-brown colour. Buda ovate in form, resinous, hoary-like, rather long, and
comparatively sharp-pointed. Bark darkish-gray more or less furrowed and predisposed to peeling, distant whorls, forming a lofty handsome free-andeasy looking ornamental pyramid.
and a hard worker for its supplies is a gross feeder, and a hard worker for its supplies of food. In thin hard soils its large serpent-like roots will be found
thoroughly exposed, and creeping in every direction, thoroughly exposed, and creeping in every direction, declivities they will be found ascending or descending in search of the crevices wherein are deposited alluvium, or natural humus, their choicest food. Senilis.

\section*{Home Correspondence.}

The International Exhibition of 1866.-I regret that I have never been rich enough to be able to give
a donation in aid of the fund for carrying out this a donation in aid of the fund for carrying out this
International Exhibition. Still I can give expression to my hearty good wishes for the success of so laudable come to London. For all thisle I may look in when I the sorry figure that some of our smart gardeners will cut in the face of the foreigner. I recollect very well that when conducting the Prince Doria Pamphili's gardener to the noted English gardens to show him "our superior skill in horticulture," we were excelled in Orchids, and had some fine specimens of Abies and Picea growing among Potatos. The Prince's gardener remarked as we were returning,
"Non beautiful Jurdin,", "Son beautiful Uxor," "Ubique Pomme de terre." The gardener's wife, not the general aspect of a garden where the Potato was supreme did not raise his ideas of our horticulture. any arrangenents which are made for showing off in gardening we must not show small outlying places noted only for one article, where out of every ten departments niue are done badly, and an extravagant sum spent on
consistent places, where each department has a Yair
share of attention, are few and far between. It is the same with our nurseries; for example, the Camellia House at Messrs. - is quite a show, having no equal anywhere; but when you have seen this, and a slow house of plants in flower, the gems are
exhausted, and the neglected state of other parts only gives rise to grief at the inconsistency of the whole. -s nursery is consistent, and is quite a Rose growers, too, err grievously in this way. Blinded with the gorgeous gaiety of their Roses, they neglect the commonest characteristic of neatness, and either stick fashion to a crooked stake, out of all nature, and out of all art. A. F. M.
Humming Bird Moth. - We have yesterday and to day had visiting our Geraniums, two at least (seen at same instant), I believe four, of these rare visitors, rare them previously. What is its scientific name? C. W.D., Surrey. [This very interesting moth is called Macro-it-"The vigilance and animation of this creature are surprising, and seem to equal those of its namesalse that splendid meteoric bird of the tropics, that ' winged thought' as some one has called it, though our plain and dusky insect can boast none of its glorious hues. Our little sphinx appears chiefly in the mornings and evenings of the day, avoiding the heat of the sun,
possibly roused from its rest by the scent, that 'aromatic soul of flowers' which is principally exhaled at these periods."]

Planting Peat Land (see p. 869).-Will your correspondent, Mr. Carroll, be so good as to add \({ }^{\text {to }}\) the information he has given by stating if he has had any experience of the growth of Berberis aquifolium in bog,
drained, and undrained, as a cover and food for game? All who know anything of the bogs of Ireland know that the real difficalty in dealing with them is to ascertain the point where outiay in improvement ceased point. Planting to treat them so as not to pass that of profit, natmely, the gradually increasing value of growing wood, the shelter afforded by plantations, and the cover they form and the food they give to winged
game. If in addition to these objects the dreary plains are changed into picturesque scenes, which many of the bogs are capable of becoming from their undulating character, it is hardly possible to overrate the advantages of planting. The question therefore is, what trees and what shrubs will grow best in bog partially drained or not drained at all, for it seems to be pretty well understood and generally admitted, that to thoroughly drain the mountain bogs of Ireland is a losing game. It is this experience and prevailing opirion that stops Wales and the western parts of England, but a new view of the matter would spring up if we could be assured that with partial drainage we could plant them with profit. There cannot be a doubt but that there are many places in Ireland where the Rhododendron would flourish, and the Fuchsia live through the winter without protection, and these plants woald give good effect to the borders of lakes, where flowers and foliage are in the proper place. Every day is advancing the value of ornament in landed property; but it must be in the proper place, and who shall say planting is not in "the proper place" wheu carried out in the bogs of Ireland, seeing that when Nature had ber own way, many of those bogs, which now present the bleakest aspect,
were covered with trees which for size and character would ennoble many a modern parl ? \(A\) Fen-man.
Fruiting of Standard Peaches and Nectarine Trees. -Some of your readers may remember that last year I gave an account of a Standard Nectarine that had produced fruit out in the open air, perfectly free from walls or trellis of any kind. This same tree has this year exceeded itself, for it has been literally laden with
fruit. It has ripened more than twelve dozen of Nectarines, and some of a flavour beyond what the ame kind usually attaing, either in pots or on a wall. I have Peaches also; but that is to me no novelty, for have frequently had them under similar circumstances during the last five years, but Nectarines never
till the last two seasons. The variety of the Nectarine is the well-known Newington, and those that begau to shrivel before they were eaten were perfection in point of lavour. We often plant Almonde as ornamental rees. The character of this Nectarine as an ornamental or the habit of the brane Almond in all bat blossom, the arrangement and colour of the leaves far exceed those of the Almond. Why should we not introduce occasionaily on our lawus Peaches and Nectarines, as
we do Mulberries? William Masters, Exotic Nursery, Canterbury.
Morus nigra.-Will any of your correspondents cavour me with some advice under the following cir cumstances? On the lawn stands a fine healthy
Mulberry tree, a standard 4 feet 6 inches in circum ference and 18 feet in height, yet it is still uufraitful. It is situated be adopted to induce this tree to bear? sheltered by large trees and shrubs. J. Goode, The Gardens, Glenarm Casile, North Ireland.
thesinut fowering. - Ahere is now within a few yards

Park, a Chestnut tree in flower and young leaf. Than
tree is in the habit of appearing in fall leaf a meek two before any of the other trees, and the ald on are now (Sept. 15) clean gone off before the othereara half stripped. It is but partially in flower and leat
but buds are opening; and if the present remate warm and fine weather continues for a weark more, it will doubtless soon have somemhat of ita \(1 /\) pect. \(R\)
Lilium aurratum.-Since the pablication of my not three weeks ago, I have had many inguiries respecting treatment; and as they are far too numerous for mety answer separately, you will oblige me by publishing the following :-I believe the secret of my success to Lay been the paying great attention to the plant as regare flowering, thereby securiug a very gradual decay of to leaves and stem, which is of much natural advanta the bulbs. As soon as all signs of life had departed fone the stem I kept the bulb in the coolest part of the green. house, being careful at the same time not to allow the soil to become too dry, which may be guarded agains the roots slightly in action damp . mistakes possible to allow these bulbs to be entirel dried off during the winter. As regards soil, I we good fibry loam and peat in equal parts, with a goo proportion of sand and leaf mould, atter which I did
cow or sheep dung dried and beaten up small in cow or sheep dung dried and beaten up suall, in
portion of 1 ounce to every 2 lbs, of the whole of other soil. I never give manure water until the pot filled with roots and the buds formed, aud this gradually withheld as the flowers expand. Rober Bullen, Gardener, Bow Bridge, Leicester.
Owvirandra fenestralis.-Your correspondent II Brown, of Tooting, has given us an interesting artich
(see p. 293) on the cultivation of this plant, in which be lays it down as an absolute rule that the water in whichi? is grown should possess an average heat of \(84^{\circ}\), not lower than \(80^{\circ}\), he says, but the uearer \(84^{\circ}\) the better, in orde to insure success. He would also seem to direct, oce at least leave us to infer, that no season of rest is necessury for its wellbeing. It would be interesting to know how long the plant mentioned by Mr. Brown as having
been grown in accordance with the directions refered been grown in accordance with the directions referred whether or not ils constitution did not give my under such an exciting metho It is probable that all who may be dei this most interesting plant may not be able to command the heat recommended by Mr. Brown, and inded 80 high a temperature is by no means essential ; in fuct it is questionable whether such treatment, if persisted in found to have on numbers of cool Orchide, introdiced and kept in a warm close atmosphere quite at varince with the conditions under which they grow naturally The Lattice plant has been cultivated at this place for a number of years with a fair amount of success; and it has been found invariably to succeed best with the water from \(66^{\circ}\) to \(70^{\circ}\). During the greater pars
of the year trom \(67^{\circ}\) to \(68^{\circ}\) would be the avenge Of course in the hot summer months the heat would rise considerably higher, though not perms nently so. When a greater heat has been maintained the plants have always extibited unmis takeable signs of dislike to it. The tanks in wiich 10 it grown have an average depth of water of abou 10 inches; the surface of the soil being covered tiles which gravel, or cate form of the leaves than any gravel. The soil consists of one-third turfy loam, one-third turfy pant and one-third rough gravel, with a sprinkling of sand. The gravel is very essential, as the plants are always found to root more freely when a good quantity of it is incorporated with the compost. The water is the purest rain-water we can get, as fre likely to contain as possible. Water from stagnant poosinal plant Ouvirva is to be avoided, having been freque Ouvirandra (all the others havion)
divided for purposes of propagation to the method just mentioned, had last summer 230 sound leaves. Sing
several times measured 24 inches long After the winter's rest most of the older leaves but ths rest appears to give increased \(J\) gang Petersfield.

Holnan rech feverual groups of variegated-leaved plants, Budson hid excellent, cut flowers, of the Show. Mr Leigh Park; Mr. T. Larkin, gr. to Viscount mond.
the badquat were exhibited in the drawing room nex Theregre to Mrs. Smith, Epsom, were exceedingly. Chear tho itomed Camernu, gr. to the Duke of Richmond, Tere very fome luvely specimens of Orchids. Ericas Mir. Yinnert, of Hastinge, Mr. Rhodes, Sydenham, and Mzo hoth attrantive. Mr. Keyues carried off the 1st dity semas, Verbenas were good, but owing to the protty varietios trusses were generally small. Some arietios of Pansies were shown by Mr. T. J.

Jenner, for which an extra prize was awarded Asters were highly attractive, both French and quilled German varieties. Buth spikes and cut flowers
Hollyhocks were exceedingly fine and mucu adnired
Achimenes exhibited by Mr. Lambert, gr. to the Rev H. Smith, were well grown specimens, and Gloxinias were likewise generally good. Bridal bonquets were exquisite specinens of art, and all of them received First-class Certificates.
Among variegated plantes to which allasion has already been mate, those shown by Mr. Hudson, gr. to - Barch ırd, Esq., Horsted, deserve especial notice His Crotons were particularly well coloured, and Caladium Belleymei was also exceedingly beautiful, ae was hikewise a variegated Pine Apple (Anauassa sativa variegata). In the collection shown by Mr. Younk, gr , Stone, Esq., some variettes were equall Victoria regia.
Amongst the collections of eight dishes of fruit, all which were excellent, particularly that shown by Mr. Cameron, Goodwood, was a new feature, viz. collection of eight dishes exhibited by fruiterers only. Messrs. Balchin \& Nell exhibited in this class a beautirut Grapes, Duchess d'Angoulême Pears, Golden Drop Plums Golden Perfection Melon, Ribston Pippin Apples, and the Chancellor Peach

Of Fruit in the first division Open to all Eugland here was a large exhibition. Grapes, both Black and White, were particularly good. The Black Grapes exhibited by Messrs. H. Baker \& Son, Worthing, were universally admired; those shown by Mro, Buahby, Worthing, were also excellent.
Fruit grown in the county of Sussex was on the centre table in the banqueting room, and extraordinary it was both in regard to quautity and quality. The black Hamburgh Grapes were exceedingly fine, both those shown in three bunches and in boxes of 12 Jbs ; the berries were large and well coloured. White Grapes ere also good. Peaches were excellent, as were also Plums, Pears, Apples (both culinary and dessert) Morello Cherries, Figs, and Red Currants. White Currunts were likewise very large.
In a large booth, opposite the Pavilion, were placed tove and greenhouse plants of large growth. Mr. G. Parsons, Western Road, exhibited beautiful plants of tephanotis floribunda, and an Allamauda.
Behind the stove and greenhouse plants, were the Roses. In 48 varieties in bunches of three trusses, Messrs. Paul \& Son and Mr. James Mitchell were the contending parties. In both collections there were exquisite and lovely varieties of most of the leading and best Roses. In Messrs. Paul's collection, which obtained the 1st prize, was Maréchal Niel, which is a perfect yellow gem.
Gladioli, shown by Mr. Sladden, Ash, Sandwich, and Messra. Downie Laird \& Laing were exceedingly beautiful and much admired.

Among Miscellaneous subjects were pot Vines beautifully fruited from Messrs Laue \& Son, Great Berkhamstead; also a dovice for a flower-garden by Mr. G. Godley, 15 Park Street, Brighton. Messrs. Ivery \& Son, Dorking, exhibited a large collection of British Ferns. Lantanas were furnished by Mr. Wm. Penfold. Mr. A. Smith, Dalwich, showed zonal Pelar goniums, to three of which, named Glow, Rosy Circle, and Premier, first-class certificates were awarded.
Mr. Spary, Queen's Graperies, Brighton, exhibited, not for competition, some very large heads of the Mammoth Sunflower, several of which measured quite 38 inches in circumference.
Several seedling Dablias, some of good properties, were shown. Among them Lotty Atkins, John Downing, Chung, President Lincoln, Helen Potter, Golden Empire, Freemason, and Fair Imogen received Firstclass Certificates, and similar distinctions of a second class were awarded to Lady of the Lake and Lilac Perfection.

The weather on both days was exceedingly fine, and the show was both large and good. On the 13th 2976 isitors were admitted, exclusive of exhibitors and officials, and on the second, or shilling day, 3508 shillings were taken for admittance.

\section*{Notites of 2800K5.}

Report of the Colonial Botanist for the year 1.864. Cape Town, 1865. Pp. 150.
Dr. Brown, the Colonial Botanist at the Cape of Good Hope; has in his annual report for 1864, printed a series of letters written by himself to various persons on watters relating to the welfare of the colony. As many of the subjects treated are of the highest importance, we hope that Dr. Brown will circulate an abstract
of his researches, for we fancy few of the class for whom this report is specially iutended, will wade though this rather formidable-looking blue book, teemiug though it does with practical suggestions and interesting iutormation.
Want of moisture in the atmospliere and the ack of an available supply of water for purposes of irrigation, seem to constitute the grent detects
of South Atrica in a cultural point of view. And these requirements our author proposes to supply by putting a stop \(t\) that wholesale destruction of busbis aud herbage, whach the cslonats term "burning
the veldt;" by the extensive planting of trees, and by the formation of large reservoirs of water, in order to tacilitate irrivation, or at least pronuce an evaporati in of moist vapour. These things being done, drainuge effected, and manure applied, the diffeuity will be, not to raise crops, bat to get the crops couveyed to a profitable market for conssmption and expor ation. It io evident, from what has been sadd, that Dr. Broun lnoks forward to the time when it will be more remmerative to adopt the mastericultural thats to continue the pastora: life which is now chietly followed
The burning of the veldt is condemme.?, not ouly on the gromd of its increasing the ardity of the climate, but from the possible and not unfrequent destruction of whatever crops, plantations, or houses there may be in the vicinity, the losses an entailed being tar fr in compensated by any of the advantares alleged to follow the practice. For instance, it has bren frequently observed that rain follows immediately after extensive conflagrations of this kind, but on the othe hant, within a very short period it may also be found that the streamlets flowing from the place have been wholly or partially dried up.
Again, the defenders of the practice assert that the fire destroys the coarse herbage, and so allows the sweet Grass a chance of growing up, and even rendere the coarse herbage itself eatable by animale, as while ymung, sheep will feed on it.
To this, Dr. Brown replies by stating that after Rhenister lush (Elytropappus rhenocerotis), a noxious plant that spreads to such an extent and is so difficult to exterminate, that it leaves the land practically useleas. While not disposed to deny that some advantaces may accrue from burning the veldt, the Colonial Botanist considers that the same results might be obtained in a more economical way; on the principle that it is not necessary to burn a house down, in order to enjoy the luxury of roast pig. He shows that hundreds of thousands of young trees, belonging to one proprietor, have been destroyed by a neighbouring, but hardly neighbourly, farmer burning his veldt.
The more general cultivation of trees is urged, not only on the score of increased dampuess of the atmosphere so caused, but also from the great want of timber in certain districts of the colony, where, we are told, that farmers have been occasionally forced to burn their waggone and wooden implements to keep body and soul together
Sir John Herschel's example might advantageously be followed in such a case. It appears that Sir John was in the habit, wheu taking his walks, of providing himself with a walking-stick and a pocket full of seeds, and of dropping a seed here and there as he rambled aboat. Some plantations in the neighbourhood of Swellendam are said to have originated in thie way.

As to water, there does not appear to be any real deficiency of that important element, so much as a difficalty of turning it to good account. Dr. Brown relates that he on one occasion crossed the Tariza river in a box suspended from a rope stretching from the trees on the opposite banks, while the river torrent was tearing along below, 22 feet deep, as ascertained by measurement, where, 48 hours before, the depth wa only 16 inches; and on another occasion he was witneas of the devastation caused by the sudden rise o a river to a height of 70 feet above its usual level Though in such cases as those just mentioned no ordinary daus would be of any use, in other situations water might be retained to a very large extent, and
" even the river's spoed might be bridled by arreating its waters ere they reach its bed.
Other portions of this report are devoted to the expediency of increasing the number of vegetable products in South Africa, or of rendering those already obtained more valuable. In the case of Aloes the great defect seems to be in the mode of preparation, and this applies with even more force, as we shall hereafter see, to the Cape wines.
It has been suggested, that the milk sap of the Eaptorbia, so abundant in some parts of the Cape, might be turned to good account in the manufacture of vulcanite and of other substances into the composition of which caontchouc enters in mome form or other With this view, some of the milk sap from the plants was sent to London for trial, but it was unfor tunately found to be of little value, comparei with
India-rubber or gutta-percha. Different methods of preparation may possibly remedy the delects of Euphor bia sap, or render it useful iu other ways than thoue just mentioned.
Referring to the improvement of Cape wines, the reporter reuarks that there are upwards of one huudred varieties of the Vine in caltivation in the colony, those best suited for making wine being the Hannepot and the rough-skinned Steen Grape, which are tae most productive with regard to frait and wine; next to These are reckoned the Pontac, the Musendel, and the
Frontignan, which litter two are employed in the manufacture on the Constantia wines. A wine grower is reported to have suid that "the Cape Grapes were thie very best in the worls. Iu seeking for the nusis of the inferiority of the wine made fron such Gapes, the autbor lays considerabie stress on
the necessity of keeping the must cosh during the period of lermentation, a somewhat diffisult thing to do in such a climate, but one wheir may be effected by placing the must in underground vaults, or
in double-walled houses with a stratum of nir between the walls, or even by placing baskets of ice in the rooms Where the wine is stored.

Drainage is another means suggested by Dr. Brown to avert the unpleasant goutt of Cape wines, by insuring offensive flavours are traced to the use of unfermented dung as a manure, in preference to which the German method of making use of the branches pruned from the Vines themselves, is recommended.
Pressure of the Grape by machinery must, to say the least, be preferable to the mode so generally adopted of "treading the Grapes by lualf-naked pouring from them in consequence of the excitement and exercise.
Many valuable guggestions are thrown ont in this report as to the establishment of an experimental farm, the accounts of which should be lept with the same degree of accuracy that a merchant demands in carrying out his transactions, and without which no trustworthy evidence of the profit or 1.88
apon agricultural operations can be obtained.
In a letter to Professor Harvey, of Dublin, it is mentioned that Mr. James Chapman has brought frow the interior a living specimen of the Welwitschia, together with photographs of the plant in situ, and similar repesentations of other interesting plants, sucb as the Baobab, the Elephant's Trunk, Adenium namaquanum, and many others. A pluotograph has alled Naraf, known in Europe by name from the mention made of it by Sir J.. Alexander. Seeds of
this have been sent to the Cape on different occasions, but they have not germinsted, and so little is known with certainty of the plant that the description given by Mr. Chapman is a valuable addition to our scanty information. "The plant is generally found destitute of leaves, but present-
ing the appearance of one mass of prickies. He says that when the seed germinates the tap root descends, but drift sand accumulates among the sprouts of the young plant; these seem tor rise above the sand, for the mastery is renewed ar the plant is found coyering a largish mound of sand, penetrated in all directions by rootlets at a level far growing deeperand deeper. The floweris infundibuliform and short-lived; the fruit is all prer the plant. generally spherical, about the size of a child's head, with a hardish skin, in thickness and firmness like that of a Gourd, and breaking into segments The seeds icidal. The mesocarp is not adherent oleaginous matter, are stored for food, as is also the pulp, which is preserved thus: it is boiled in a pipkin or pan; a piece or matting is spread upon the clean sand; a sieve ; after a tume this is raised, whets there is found underneath a thin cake of hardened jelly, which has somewhat the flavonr of jelly prepared from Apricots;
this is freed from adbering sand, which is easily done, and if not required for food at the time it is rolled together and stowed away for future use."
Some pseful suggestions to missionary and other travellers for the collection and transport of ohjects of notice of are given in this report, which terminates by a rimm of the late Dr. Pappe, and a suggestion for the formation of an economic museum of South African vegetable products.
Die Uhina rinden der Pharmaloognostiahen Sammlung zu Berlin, mit zehn taftln, abbildungen von Dr. Otto Berg, Professor an dor Universität zu Berlin. \(4 * 0\), Berlin, 1865, tab. X. (The Cimchono Barks of the
Pharmacologiegal Collectio of Berlin, goo By Dr. Otto Berg.)
This treatise forms a valuable addition to the already copious literature of the Cinchons harks. It contains some preliminary remark on the Materis Medica collections of the Berlin Univennity in geberal, and on the Civchoma barks in partioular. Some alight notice is given of the botanical history of the speoies of Cinchona,
in connection with which we may observe that Dr. Berg in connection with which we may observe that Dr. Berg genus. He moreover rdopts Lambert's name, C. Condaminea, for the species which Linuæus, appropriately enough, called C. adicinalis, and the re-establishment of by Dr. Houker iu is receut volune think, suggested Magazine. Tise greater portion, however, of the present work cousists in an elaborate description of the microscupical claracters of the barks of the various species and varieties of the thue getus Cinchona, os well as of the barks of several plants belonging to nearly allied genera. The author has availed himself of the various collections within his reach, and of the microscopical preparatious made by l'hcebus of the barks of Delondre and Bouchardat. The various barks are arranged in subdivisions aceordin \(;\) to the urrangement and dispo-
sition of the bast cells in radiating lipes or in seattered sition of the bast cells in radiating lines or in scattered groups, the presence or absence of s.tp vessels, the thickness ot the middle bark, dc. Bauman's Catalogue Général, contains fruit trees, hardy trees and shrubs, and inloor plants-good collections of each.F. Gloede's List of strawberries has been already noticed at p.868.-W. H. Davis's Desoriptive Catalogue of Roses.

\section*{florists' drloberg}

Many of your readers have doubtless sailed from quiet hute harbour of Folkestone on their voyage to Burlogne, and after getting put a fow hundred yards hey have seen nimbly funning one after the other lowed a peculiar nervous rising sengation of the stomach, so hard to bear with patience. Such is the seusation felt by a true lover of Roses when he reads the liats of New Roses so liberally furnished by good-natured and enthusfartic correspondents of the gardening papers, who seem to me to require a heavy ballast of old Moss and Cabbage Roses to keep them from toppling over. No new crimson Rose issued in the springs of 1864 and 5 is worthy of a place by the side of such grand and distinct sorta as Charles Lefobvre, Senateur Vaisse, Alphonse Damaisin, Duc de Rohan, François Lacharme, Gloire de Santensy, Madame Boutin, Madanae Julio Daran, Maurice Bernardia, Professor Koch, Suluvenir de Comte Cavour, Souvenir de Lady Eardley, Turenne and some few others of the same range of colour.
Why, then, are we pestered with these hundreds of sorta, seedlings from General. Jacquominot, and but fow of them so good as that glorious old Rose, and many of them dignified with the names of princes, princesses, and peers? I can өxplain the question; it is merely to take the money from our pockets and transfer it to those of the raisers. I repeat, that out of more than 200 quasi new sorts of crimson Roses introducel these last two years, not one is fit to be placed alongside of the firsit may list, or even the second.
Then as to rose-coloured Reses, not a single variety can approach to Jules Margottin or John Hopper, which latter in the past season has been if possible more henutiful than our old friend Jules. Again, in pale flesb-coloured varieties, what "new Rose" has been worthy of being shown with Madame Vidot or Madame Rivers? As to white Roses, so little progress has been made, that not one can be compared to that old beautiful hybrid Bourbon, Acidalie. It is true that those clustered white Roses-hybrid varietiessuch as Louise Darzens and others, are pretty enough but they have nathing of the general size and form of Acidalie.
To give your readers some idea of the number of new Roses annually issued by French rose-growers, I annex a list of those "mis en vente" last autumn, by the following raisers of seedlings; and besides these, there were 40 or 60 others from the small Rose

\section*{Damaisis}

The grower lant named is most particularly libera with his new Roses, and withal mont remarkably ahrewd, for he has practised quite a new mancouvre. He offered a bribe to those who would take all his seedlings, in the shape of a plant of that very good
yollow Teerscented Rose, Marcolal Niel, of which he
of those who were tempted to take M. Eogendo opind Roses.

There is, I trust, comfort in store for the tren creations of grand names and descrintions then charlatanism of our neighbours will cease. The pm state of Rose culture reminds one of a time lanem when Rose lovers were told to go to Hessmes. Lom Roses.". I went, and most undoubterly : 20 , there-in name. How well I renember the zo sounding names of hundreds of varietien af anderstand why differeat not in nature ! which seemed not to differ. I was so givel to to perceive that every sort had cost a cerain intelligent neighboura. Po ir John Buil His an and liberal he has always been ! Well, it is au aut failing, and so let it pass. It is the liosecorving
John that is to be pitied. He reads a grond Jow Roses, and longs for them, and reads a grond hat stock of prydence he suffers himself to bo ho into purchasing new Roses, and-repentanco arge masses of Hybrid Perpetual Roses nop on Gallioa. Princes, princesses, dukes, and lands pelled to have a knoxing guide and one is a what respect they differ, and even then
I have been led into this tirade, a readers may perhaps call it, by a severe fenlin? if appointment, which I have experienced all the season. Whenever I have been attracted by a Ihw some of my large groups, and have rushel ing it would prove oue of my new ones, found it onp true old hohd. Whenever ! i been tempted to view nore closely some liose at English Rose shows which seemed to look -of of those odious parallelograms-called sho known established filvourites. Whenever I have \(\mathrm{r}_{\mathrm{a}}\). the large Rose growers, and have been louk: their large masses of Roses, and have been ca one or as usual those kinds I have named, not well-tried friends
wes wat I for its brilliancy. 1 que or my ne no found it to single bloom of Charles Lefebvre, so brilliant, solarge, perfect in its shope ass to defy all compotition ; an it I made a determination that, insteal of haring at of 50 or 100 sot
special favourites.
There is something inexpressibly ridiculons in the nomenclature of new Roses. Our French Catholic have gone into our Protegtant church, and have en Roses. We may expect soon to have a Rono amy The Right Rev, the Archbishop of York;" bis will theu recerve a douceur of some new roien tim lift." I confess that I feel some difficulty in aint pronounciug the prefix "The Reverend," and so lim invented a method of elision: instead of calu. friend's attention to a Rose, under the nsme or Reverend Stephen Stumps, I say "hen if we realiflamen
Reverend; good, isn't he?' And then one day to have a rose namad after our excelien! : learned prelate, I am fearful I should sars, whena inue bun opaned, "York is brilliant to-day," or, if I happem. be gathering a very fine bloom, I ghould "ork you're wanted.
matters to show how the unsublime; and so I trust it will be a cautios B the French Rose growers, and prevent their funis intrusion into our church.

With respect to English secular namel, nor plentifully given to new French Roses, they aro as they once were, an hopour. Any giving an order to a French Rose raiser th of 500 france may have a Rose dedicater named after him ; it is thus we have in one comfort, they are rarely seen a third year of their introduction. ghould-be English names are ollu "James Weitch." When we come to "
"Deuils," the combination with Jingl I fear I thought mischief when I advised Rose grower to name one kose souveair as Andiual and another Deuil de Richard Roe. Rosa Inglu-

mond would it be neoessary to destroy all but of the queens?
"What quantity of food would each stock regsing to to writes "A Beaine winter?
tho fenibility of the plan." There is no doubt as to But it is by no from hives taken up for their eey. But it is by no means to be recommended on required with these bees, for the purpose of filling their the with combe, and laying up a sufficient atore for ith a rery expensive one in comparison with or this Heordinary ways of obtaining good stockith If "A a sive partially filled with combs, he can try the Wru a few workercombs of suceese. Or if he can of a framohive, it may answer tolerably well.
Amorageous to dispe found by the cottager mor given for of their by purchasers, than to and appropriate the houey and wax. atilom indeed that a hive will afford as qual the price per stock usually asked and can procure a hive more or less filled with xceed that of experiment; whetber the don the andount of emptry combs you can
Haring provided yourelf with auikblo comb-
knives, you will do well to make it a point to have the cutting out of the combs entrusted to your own real or imagined superior skill. You can then look out for -ny combs which contaiu brood, which beine of no use it the cottage bee-keeper, you can probably obtain inare th cut away and appropriate to your own use. Wrap most practicable fateu it iu the hive intended for the reception of the bees.
Drive ont into separate hives the bees from two or more stocks; knock them all ont together ma a cloth epread on the ground. Sprinkle, but without drenching, the bees with sugared water slightly flavoured with peppermint. The hive must then be gently placed over the apparently seething mass of insecte, its edges resting will westicks previonsly plared on the cluth. The beem will usuaily unite peaceably, and may be removed to
their permanent stand the next morning. The hive should be accurately weighed, Feeding, at the rate of a pound or two of food per day, must be immediately resorted to. It will take Irom 40 lb . to 60 lb , of boiled augar food to bring up the weight of the hive to the proper atate. The probable cost of establishing a colony in this wise would be about 1l. and upwards. This would greatly depend on the quantity of comb previously placed or contained in the hive, it being calculated that it requires 20 lbs . of honey to form one pound of waxen combs. You may unite the bees of two or more beaten-out hives. We have crowded as many as five into one hive, leaving the bees to settle the question of sovereignty. We suppliad the hive with pleaty of tood, some of whiels was pure run honoy. Ot this last, 10 lbw were given and taken down in oue night and a day. If economy is your chief object, we should recommend your waiting until
the spring. In March or April, when the perile and triais of the winter have passed, you can choosa atrong healthy stock; you will probably be able to purchase it at a lens cost than would be demanded for it now, and will not run so much rialk of lons ; and then by a small amount of judicious feediag you wil promote early and extensive breeding and the issue of early and lurge cwarms.
Bres and Fruit.-1 aloo have to complain of the unusual attack on the fruit which my bees are carrying drew attention to the fact of my bered by some that drew attention to the fact of my bees feasting on the
Raspberries, early in August, and as to its having then continued for some little time. It is seldom that waspe are nnmerons at that date; we must, I think, look for some other camse than the rcarcity of wapps. I do not think this can have much to do with it. The real lact is, that there has been little or no secretion of honey since the latter part of June, and the bees lave been compelled to resort to unusual sources for the supply of food for their own wants and that of the brood. Owing to the remarkably fine and warm weather which has prevailed so long, breeding has been continued on a rather extensive scale; the bees have naturally a reluctance to break in on their sealed stores; and finding but little honey in the flowers, the souree of their usual supply, they have resorted to other fountains; first Raspberries, then wallfrut, and now fallen Pears, have been with me the cbjects of their attraction. These signs seem to me to turetel a some What disastrous winter for bees. I would advise all during this month, and it found to be at all deficient in weight, mupply them liberally fwith artificial food, giving as many pounde as each hive seems to require in as short a time as possible. If I may judge from the experience of former years, this is the only way to - Bees have made sad havoc with my Pearhes and Nectarines in this neighbourhood, and several gardens within a radius of four or five miles Hall Place, Tunbridge.

Garden Memoranda.
Ropal Gardens, Frogmore (Concluded from p. 871). -Let us now examine the Pear garden, about an acre in extent, on the east side, corresponuing wid different out-door compartuents are letter covered with fruitful trees than any I have seen for years, and, by the way, nothing indicates good gardeuing leetter than this fact, particularly whon it applies to such a vast extent of 12 -foot wall as that surrounding the greater part of the 32 acres of vegetable and fruit garden at Frogwore. In a great number of gardens it is painful to see more bare red lrick surface than herdure. fruit departuent), "does your treatment of these fine wall Pear trees differ essentially from that do not cut lack the leadiag shouts t.ll the wall is covered-not aven of joung plants olitained from numeries. The young shoots are thmueu hy plucking them out towards and sir to help the free forma ion of fruit buds on the remaining shoots, which are shortened back to three or four inches with the knife in July. In the winter they are pruned on the clowe spur system.". The walls are furnished with
trees are grown on the Quince stock, as the wails cannot bo quickly or satisfactorily corered with them. There are five of these minor gardens surrounding throe sides of the contral or
inain garden. The walls of the next we chter sare deroted to Apricent culture. Here unformately, elsewhere, disease has flaye 1 fome havae wath the walls, the Moor Park bemig the worat atfected? After the walls had got perfect ! covered. aii of a suiden heulthy shoots began to perish on every tree. Again hey began to recover, and improved for two or three rears, sufficiently to encourage the hope that thing will look as they did before, but again a collapse come and so they go on. But now an experiment is in oour of being tried, which it is hepeit may present this dentructinn. It is growing seedling plants on their
own roots, and as yet theso preseut no mall of fuilure, hough it sometimes appears in romuger ahit fimaller rees than some of the seedlimgo. Strange to sar, these seedling Apricots are placed against the walle and trained awny unproved. "Not one of them bes yielded a bad fruit." "Thero is apopular beliof amony gardeners that in raising seodingis it is very rare to get a good or even a midding truit amning them, but
at Frogmore, so fimous for now fruit mining, the reverse is the case.
The Apricent and Peach walln are coverod "with canvas (Dorsetmhire oheene cloth, 14 years in use now without a break) during the critical period in apring but it is rolled up daily, and it is considered better not cover at all than to have a covering that is no aken off daily, except in very Bevere nud umusual weather. Currants are grown on the walls, and, like the Paars and some other subjecte, they are not
stopped till they reach the top. The favourite kind or wall-work, in which way they may best be kept late, is Warner's Grape.
Of Grapes grown on walls, Napoleon is considered the best; it is different in leaf from the common Muscadine, but is near that kind.
Although the climate of this part of the worid sould appear more suitable to the Peach than that of Trelant, the contrary seems the case, as usmatly in thi conutry l'each walls look miserabie modeed comprared with those I have seen in Ireland, ant in gartens the where other walldfruit wore not at all egrin to what they are in this country. For instaciec, at lard Charlemontis, near the reaswiore at Dukilin, there is or was a fow years ago a Peach wall, perfectly covered with green healthy fruiting wood and foliage from the bottom brick to the top, and studded over with fruit as good as could be raised indoors ; whereas the finest places about London frequently present nothing but a few ghostly tall funtails on the walls. It may be
owing to the moister climate of the Emerald Fole, which may keep down red spider and other ailment to which Peaches are liable. The sialway is a grent favourite at Frogmore. It may be had in use as late as the end of November, and weighs often 11 ouncen. There is \(刀 0\) trouble in growing the Salway or the "mooth-leaved kinds," Which; all do well on oper walls.
There is more wall space devoted to seedling Plums at Frogmore than that for fruit altogether in some great gardens; and here again, strange to nay, they do not get a bad Plum in a whole batch of seedlingsa Victoria and Washington ; a strain of Early Golden Drops, with one small and distinct, as rich as a Greargage, but with a plensant vinous flevour; and in frot several dozen fruiting specimens of seedlings promising distinction and variety of fiavour.
On the Cherry welle mapy theen had been diafigured much in the mauner of the Apricot-the dicay diting
from \& very severe spring frosto The bordery of the main range of glass houses right and left of \(M r_{\text {r }}\) Ingram's residenoe are planted on the ribbon ayitern; while on the other side of the great walk occurn a mired border, running also the whole length. The latter is supported by a low terrace wall, bolow which there is \& long row of oblong bedd for nnuuals, \& © co, The way in whick these are edred, so to speak, aud the way in which the mutations that are continually going on with the crops kept from disagreatbly showing themselves to the terrace, must strike every viaitor. It the first place there is an arched trellis of Pears running along the terrace end of the compartmente to the right and left of Mr. Ingram's house, 900 foet long The Pears have completely coverod this, and seen from the main walk ( 2 foet or so higher than the garden it so well commands) the green.cuvered arched trellis ans like a round broad heinge, white \(j\) 1st in frodt of lind of arrangenent is continued away down each side of the central wnlk, past the ceut.al fountain, with Aprles, and aiso across the other main walke, divergiug right and left.
The trees are phanted in the centre of the arch. leading shoot being taken elong the top of the trellis, from which the shcots are brought down to the ground. About a foot or so higher, and with the treen planted at the sides, this trellis would have formed an unrivalled green and fruit-arched walk, but with the trees at the sides it probably would not bo so easy to cover the trellis as it in now. Apart from its neat ness, permanence, and excellence as a boundary screen,
and Pears, as irrespective of other merits the trees could not be so severely swept by the blast as espaliers, though the Pear blossoms sometimes get cut up in spring.

Thereare strong-looking rising trees on the walls of the handsome and ercellent new Pear, British Queen, which as everybody knows was raised here, and a splendid collection of the best-known varieties for each season Mr. Powell, who has had charge of these walls for many years, wasgood enough to indicate to me some of the most approved in each section. They are as follows, an asterisk distinguishing the kinds suited for pyramidal, trellis, or bush traiuing:-Eurly Pears : Tyson, "Williams's and *Summer Buu Chrériens. Jargonelle, and Louise Bonne of Jersey. Middlegensou varieties: Seckle, *Bergamot, *Beurré d'Amanlis, *Beurré d'Aremberg, *Beurıé Bose, Beurré Diel, Co onte de Lamy, *Althorpe Crassane, Eyewood, "Marie Louise, Napoleon, *British Queen. Late varieties: Enster Beurré, Beurré Rance, Chaumontel, "Sabine Enster Beirre, Beurre Rance, Chaumontel, Mabine
d'Hiver, *Paboe Colmar, *Winter Nelis, Glou Morceau, d'Hiver, *Pasee Colmar, Winter Nelis, Glou Morceau,
Vicar of Winkfield, *Kaight's Monarch, *Ne plus Meuris.

The folloring Peaches and Nectarines are considered the best for out doar culture: Early Victoria, Grosse Mignonne, Bellegarde, Buckingham Miguonne, Barrington, Walburton Admirable, Late Admirable, and Sulway, ripening in the order of nawing. Nectarines: Vermaah, Murray, Downton, Violette Hative, Elruge, and Victoria.
Not a word yet about the Strawberry! Why, one might write for a day upon Frogunore and its Strawoerries! The kinds grown in the gardens have for the most part been raised in them. The following are some of the chief kinds used: Prince of Wales, good middle season var.; Prince
Arthur, heavy bearer, mustly grown for preserving and Arthur, heavy bearer, mustly grown for preserving and
forcing; John Powell, distinet, well flavoured, and prolific; Fairy Queen, resembles Britich Queeu in flavour, spoken of as excellent by the best judges ; Improved Elton. Iarge aud late; Frogıore Late Pine (Bradley), large, early, and handsome, travels well; President, an early variety of great merit, good for pot culture ; Rilleman and Cockscomb. A few other kinds, culture; Riteman and Cockscomb. A few other kinds,
including red and white Alpines and Hautbois, completes the collection.
Mr. Marr has the care of the Vegetable department, in which half an acre of London Flay Leek suggested seed-farming immediately-not thinking at the time what great demands are made on that savoury stalk. M•Lean's Little Gem Pea was considered the best for house-work, and very decided opinions were expressed respectin
names." No, no!

While thankinggood culture and able superintendence for all one sees in these 32 acres of kitchen and fruit garden, let us, however, not forget that Dame Nature has been good enough to deposit "not less than 5 feet of fine loam within the walls," on a clean gravelly bottom. This of ilself is almost enough to
carry lasting despair to all gardeners who have to contend with poor shallow and wet soils, which are common enough even in these green isles. Thus must I wind up for want of space this very iucomplete sketch of the walled-in gardens alone, of this right Royal establishment, over which Mr. Ingrau has presided for a long series of years, with so much credit to himself, and so much advantage to those employed under him. W. \(\boldsymbol{R}\).

\section*{Miscellaneous}

The Trees of Cyprus are chiefly Conifers, for the Oaks are either under-surubs, or are confined to the higher hills. The Plane hides itself in the shady valleys. The commonest Pine on the low levels is the Aleppo Pine (Pinus maritima or halepensis), which, no doubt, once on a time clothed with forest a large part of the island, but which now grows scattered, or forms small woods on the less accessible slopes. Next iu abuudance, in the eastern part of the island, is Cupressus horizontalis, which forme small woods on the northern chain of bills, and at one time, probably, covered with forest their southern slope, as Pinus maritima did the and perfume, and the tree is therefore much sought after. Juniperus pheenicea is also abundant on the desert plains of the eastern part of the island. All these trees extend from the sea level up to 3000 feet, and the Pinus maritima up to 4000 feet, where it overlape the lowest level of another Pine, P. Laricio. This Pine extends from that elevation to the top of the higher hills, aud forma extensive, though open forests, which give a dark green colour to the western mountains of the island, as seen from the sea. Trees of 200 and 300 years are common; younger ones are scattered and seedlings a rarity. Few of the trees are uninjured, and great numbers are destroyed for the purpose of obtaining the pitch and tar by an exceedingly rude process. The islanders have no saws, and lop off the branches of the trees for their purposes, leaving the truak standing, which it is too laburious to cut down Near the summit of Troodos, and ubove P. Laricio, another Conifer, Juniperus foetidiseima, Willd., occurs. The summit itself is bare and dry, and produces only Natural Bistory Revints along the water channela

\section*{Calendar of Operations. (For the ensuing week.)}

Ir not already done, lose no time in getting tender plants under protection, a kind of work the omission of which may peril the welfare of valuable stock that cannot be readily replaced. In addition to making the indoor department as gay as possible at this season, attention to cleanliness and order should be rigorously enforced, as the time is drawing near when this will be ooked to as a principal means of affording gratifica tion and enjoyment, in lieu of that which must soon be lost in the open flower garden; and when attention is concentrated more exclusively upon the plant houses, anything which is untidy or out of order, wil the sooner attract notice. Some nice good-shaped plants of hardy Rhododendrons, Azaless, and Kalmias, which are well supplied with blossom-buds, should now be takeu up, potted, and plunged in a bed o ashes, from whence they can be brought forward in succession as they are required.

\section*{flower garden and plant houses.}

Alterations of grounds and planting of Evergreens should now be carried on with dispatch, while the soil is in good condition for operations of this kind; the drier mould is when placed round the roots of newly planted shrubs (provided they are judiciously watered in) the sooter they will emit fresh roots. Mulching is, however, requisite to keep out frost, and earlier in the season to prevent evaporation
Astrers.-These are still in good bloom, and should receive careful attention in the way of watering, in order that their beauty may be maintained for as long a period as possible.
Azaleas, - Keep these in an even condition with regard to water at the root. Stake or tie out it necessary, and do all that can be done to keep the plants clean, and to maintain them in good health.

Camellias.-Thin the blossom-buds if too thick, and give the plants plenty of air while the weather is favourable.
Cinerarias, - Cuttings of these may still be put in, or young plants may be raised from seeds. The last will prove useful late in the season. Plants struck early may now require a shift.
Chrysanthemums.-These dislike aclose atmosphere, and if under glass and the house contains plants requiring treatment, the Chrysanthemums should as far as practicable be placed in the coolest part, where air can be given freely on every favourable opportunity; except they can be pretty fully exposed to air their foliage soon gets attacked and disfigured by mildew, especially if the plants are bushy and well grown. See also that they are kept well watered at the root.
Climbers.-These, at least some of the most rambling of them, will now want a smart dressing where they obstruct light in any material degree. Such as flower on the young wood, and which are now in a ripening condition, or approaching a state of rest, may be
pruved in close. Others, such as the late-blooming pruved in close. Others, such as the late-blooming Passifloras, Combretums, Echites, Ipomoeas, Stephanotis, Thunbergias and Mandevillas, which are still cutting away merely barren shoots, and drawing the remainder into somewhat closer festoons, in order to remainder into somewhat closer festoons, 1

Heathi. - These should be kept as much as possible apart from other plants, especially such as are of a herbaceous character; indeed, where circumstances admit of it, they should wholly occupy a house or pit by themselves. They seldom succeed well if associated with soft-wooded plants.

\section*{FORCING GARDEN}

Cucumbers. - Plants in bearing will now or soon require fire heat, at least at night. They will also enjoy a moist growing atmosphere
Ptrys.-Do not subject plants in a fruiting state to a very low temperature, which should be kept at from \(60^{\circ}\) to \(65^{\circ}\) by means of fire-heat, for although they will bear a considerable amount of cold without apparent injury, those not subjected to any unnecessary extremes will produce the finest fruit; and a short period of comparatively dry treatment will ripen the growth and just as effectually induce a tendency to show fruit as checking the energies of the plant by an unnaturally low temperature, and without any of the ill effects of the latter method. Little dependence can be placed on the weather after this season, therefore see that plants in pits with insufficient means of heating are well protected by means of covering at night; and maintain the command of a rather high temperature by frequently renewing the linings, so as to be prepared for any sudden decrease of heat. Avoid anything approaching excess of atmospheric moisture among young stock, whether in pits heated by linings, or in better arranged structures; it only tends to promote a too free growth for the amount of light.
Vinns.-Admit a free circulation of air through Vineries in which there are no crops, and attend vigorously to the destruction of insects, if any. Keep the atmosphere as cool as possible, where the wood is ripe, or nearly so; aud in all cases stop the growth of aterals, even where a warm temperature is of necessity kept up, for the purpose of ripening late crops; as leaves produced duriug this month cannot possibly attain a perfect development sufficiently early to repay the amount of stored up sap, which they have con

SATURDAY, SEPTEMBER 23, 1865.
Efery newspaper one sees is now more or less earnest in considering the cattle plague; and thus there is no class of society under whose nutice this acourge of the herds is not brought. Consumers of beef to a far greater extent than any other people, it behoves us seriously to look about us to tind substitutes for the many tons weight of meat which must thus be deducted from the ordinary supply. The mouse in the fable gnawed the net
and helped the lion out; so may the Dorking fonl, Aylesbury or Rouen duck, Toulouse goose, and other varieties of poultry each in its degree help the farmer as producer, and help to satisfy the appotite of the consumer. There never was a thae when our best breeds of domestic poultry were better worthy the attention of farmers and of bountry residents generally. This is a subject that pasition in relation to the food supply of the Continent than with us. It is usual, when we at intervals see in the public journals a little toot note stating the number of millions of eggs imported in a few months, to feel a sort of regret, not unmixed with wonder, that we do not take steps to supply ourselves with articles of such daily use frum our own farm-yards. Again, the numbers of rabbits imported from Belgium amount to many thousands per week; these sell at an
arerage of from \(3 s\). \(6 d\), to \(4 s\), and sometimes 48. \(4 d\). ., per stone, without skin or offd; all of Which is turned to good account in Belgium. In how many homesteads in England can there not be found an old pigstye or cart-shed that at a trifling ofst could be converted intoa rabbit house? The cost of keeping these useful little animals wouid be but Tery suall on a farm where there is always more or less waste corn and fodder. Their dung is valuable at mine ; they are, it well cared for, tit for market at nine or ten weeks old ; and they will breed nearly ull the year round. They have, however, Who are enemies; but none so dangerous as those given them a prejudiced against them without having Fuwlo a trial.
Fuwls are at last getting rather more attention among us, and a marked improvement is apparent Mariket from Lincolnshire and Cambridgeshire. When it is considered at and Cambridgeshire. gradual poultry on a farm can be improved by the
be regretted that it is not more generally carried out.
The farmer or dealer who takes to market a dozen fowls weighing one pound eaoh more than the average, is sure to have the call of the mirket, and will naturally obtain the best price. Where on a farm there is an ordinary stuck of poultry of no particular breed and of little value, it would answer as an experiment to kill off all the cocks and turn down in their place some strons young Dorkings, Brahma-Poutras, or Crève-ceurs, and to note the result of the first year's breediur. We believe the difference in amount and inprovement in quality of the produce would be su tuarked that those who made the attempt wouid be induced to persevere until they had a stuck that would rank highly in their estimation from the results obtained from it.

Continuing the course of argument pursued in our last paper, we have to inquire what has been done to arrest the spread of infection, and with what results? At the commencement of the outbreak, the first thing to do was to find out where the disease existed, and with this object Government took action. Notices were sent to cowkeepers requiring them to state directly on the appearance of the disease among their animals how many were affected, in order that steps might be taken to arrest the spread of the malady; no response was given to the demand, and consequently no step, were taken to prevent the removal of diseased animals, whose existence in fact was not known; accordingly the markets were crowded with infected stuck. Unsuspicious purehasers bought and transferred them to their own premises, and among their own stock. In a short time the evil became suddenly apparent, and news began to arrive from all quarters of the appearance of the "New Cattle Disease."

Veterinary Inspectors were meanwhile appointed by the Government in metropolitan districts, and outside those limits by the mayor or hy magistrates in petty sessions. The duties of Inspectors Were defined by varivus Orders in Conncil, and up to the present they comprise power to enter and inspect any premises where there is reason to
believe disease exists; power to order the isolatiun of diseased animals, and to prevent the removal of those animals, or any nthers that have been with them on the same premises, or in any way in contact with them ; powor to cause to be destroyed and buried any diseased animals which may be considered dangerous as sources of infection; power also to cause the sheds in which cattle have been or are kept, and al so the manure to be properly disinfected or destroyed; power, lastly, to sanction by certiticate the removal of any healthy animals from infected premises to a slaughter-house for the purpose of being killed and dressed as early as conrenient, but no power, be it observed, to sanation the removal of such animals, even when free from any symptoms of disease, to a market, whence they might be taken to healthy localities, and diaseminate the disease. On the one hand, these provisions, however effective in theory, are constantly evaded and on the other, appointments of incompetent veterinary inspectors have occasionally been made And we need not say that this is as great a mischief as the other; for power in incompetent hands will only raise opposition toits exercise. Moreover, veterinary inspectors are not ubiquitous; all of them have their own professional interests, as well as their speoial duties to consider; and even assuming that each man in his district were to devote himself exclusively to the duties of his appointment, it would be impossible for him to wateh all the cowsheds day and night in order to ascertain when animals were surreptitiously removed. Such an idea of the capabilities of an inspector could only be entertained by those who estimate him as a wiece of patent machinery of 500 police power. The actual working of the system amouits to this -some persons are reckless of consequences, aud simply take their own course in defiance of pusitive orders, and in oppsition to all good advice. They prefer to incur the risk, and dispose of their infected stock in what they consider the most advantageous way. They may be summoned and fined, or they may by some legal quibble escape punishment. It either case the mischef they have done is notrepaired by means of penalties intlieted upon them, the perpetrators. Another large class of persons are actuated by purely selfish considerations; they have no desire to break the law, but they must save themselves, and consequently, under the prosent ciroumstances, injure others. A further division may be considered to be represented hy those who apparently are quite incapable
of understanding that there can be any real ohjiction to sending to market eattle which, although coming from infected premises, are stil in perfect health; who, in answer to every explanation, urge their inalienable right to do what they like with their own, an idea which clings to the uneducated mind with singular tuacity. Another class includes those whose deeds are ennphatically deeds of darkness, who, under the cover of night, traffic in diseased animais, buying at a small price anything that can be couverted by any iogenious process into human food.

With all these adverse ciroumstances a: work it cannot be a matter of surprise that the measures that have been instituted have up to the present proved inadequate to provent the spread of the disease. Had owners of stooks seen til to co-opersrate with the Government, the evil misht by this have been eradicated; but as, on the contrary, they practioally offered every form of opposition, the means which were caloulated to etfeot guod have been reudered abortive, or at best their effioiency has beon marred.

It is very difficult to suggest a remedy for tho existing state of things, because our English notions about liberty are offeuded at the mer talk of restrictious. Any interference with the iuterest of trade is sure to be depreated; and in a country so extensively devoted to commerce as ours, it becomes impossible to legislate in favour of one part of the community without at the same time intlicting injury upon another part.

Closing certain ports and stopping all fairs and markets would undoubtedly be, or rather woald have been, calculated to urrest the spread of the disease, but at the same time so much injury would have resulted in a variety of ways that this obvious course of procedure could not be eatertained. At the present fume the discase is extendiar, although in many places it has assumed, as was predicted, a milder form. Some of the charactersstic symptoms, such as emphysema aloag the back, and the peculiar state of the palite, so frequent iu the parly cases, are now seea very rarely, the discharge from the eyes and nostrils is no longer one of the first indications, and sumetimes is not present at all until the disease is
 extent. These variations are more particularly noticeable in neighbourhoods where the disease has previously been very virulent. Cases of the malignant form of the malady are still met with, as might be expected ; but even its occasional occurrence under a moditied form must be accepted as a favourable indication.
In propurtion to the obscurity of the signs by which the disease can be disoovered, will be the difficulty of detecting infected animals. Too much caution cannot be exercised therefore at this time in regard to the inspeation of stook. The slightest symptom of ill health is to be estimated as of serious importance. Dulness and dimination of milk are not now in all cases to be looked for as the primary signs. Some cases have recently occurred, in which the first symptom was slight diarrheos, the animals meanwhile milking well, giving no indications of disease; yet in two days trom the first observation of the diarthoa, the malady prosented itself unmistakeably, and ran its oourse rapidly to a fatal termination.

After a careful consideration of the whole question, we are compelled to admit that the measures which have bean in operation since the outbreak of the plague have not resulted in anything satisfactory; the malady has extended in spite of all that has been dome to arrest it; and judging from daily observation, it is steadily advanolog yet. People seem to have made up their miods that no care will avail ; the disease is conveyed by the air, or in sume other mysterious mauner, aud if their cows are to have it they will, no matter what is done to prevent it; these reckless notions are too prevaleut, and, added to the fact that stock owners stuli persist in viewzoy all animals as perfectly healthy so long as they show no symptoms of disease, notwithstanding that they have been in contact with infecterd stock, there is reason to fear that there is no chance of our getting rid of the plague at present.
Consumers of beef and milk are the victims of a not unreasonable apprebension, either that they will have to do without these commodities altogether, or be conteut with them as very occasloual luxuries. With regard to the mest question, there is little doubt but that the supply from abroad will, while the foreign stock remains to a great extent healthy, Bullice to prevent famine prices being decoanded. The milk question is
more serious, not only because the supply is even now very much below the demand, but for the further and more important reason that a great deal of milk from diseased animals is sold and consumed. We have no desire to excite unnecessary alarm, but it is our duty in the interests of the public to protest against the popular fallacy, that diseared milk cannot be obtained, because of the secretion being arrested as soon as the animal is attacked. Many animals continue to give milk for some days after the disease has commenced, some never lose the secretion entirely up to the moment of death; and all cases of recovery are marked by its gradual return from the time that amendment is perceptible. Microscopic examination has resulted in the discovery of morbid elements in milk given by convalescent animals, when those animals have been yielding 4 quarts per diens. The milk from diseased subjects without exception contains these products, sometimes in abundance, and convalescent animals that are yielding their full quantity, nevartheless give a poor quality of fluid of low specifio gravity ( 1012 to 1026), the average being a bout 1018, which is the speoifio gravity of skim milk adulterated with 50 per cent. of water. The specific
gravity of gond new milk may for the sake gravity of gond new milk may for the sake
of comparison be fixed at an average of 1032. A great many specimens have been examined, and the results have been uniformly the same. How far this diseased milk may be injurious when taken as food there is no direct evidence to prove, but there can be but little doubt of its unwholesomeness, particularly as an article of diet for children.

In sume instances the cream taken from milk containing diseased products did not appear to
hnve retained any of those morbid matters. have retained any of those morbid matters.
The suljeert is still under observation, and should it prove to be the case that oream in the act of rising to the surface does not earry up with it anv of these elements, it will be an argument in favour of using cream, properly difuted, for children's food, where there is any
doubt ahout the purity of the milk; and there is doubt ahout the purity of the milk; and there is
no question that both the milk and the meat of diseased animals have been, and are being, Iargely consumed by the public.

That the pastures of very poor soils may be immencely improved by feeding on them cattle or shepp, and supplementing the Grass with some of the aids to fattening-corn, oil-cakes, \&ce,- is a point about which there is now very little
difference of opinion; though it is still scarcely admitted hy some that the result of such measures for improvement will compensate for the outlay and loss of time which are inevitable in this course. We have, however, lately met with an instance
which bears on this question. Some pasture on a which bears on this question. Some pasture on a
very thin water-soaked soil was composed of the coarsest of the Grasses; Rushes, Sedges, and other semi-aquatic plants, were everywhere apparent; it barely served to keen alive the few animals that were unfortunate enough to be placed upon it. It was occasionally mown, and the hay wbich it yielded was deflicient in quantity, and-as might be expeoted-very coarse in quality.
The first steps for its improvement were the laying of drains ; but these were not judiciously planned, and very imperfectly served the purpose for which they were made, A quantity of soil and heaps of rubbish, excavations of subsoil, \&c., lay adjacent to the pasture. These were mixed with quicklime to the extent for the land to be dressed of 60 cwt . per acre. A mixture of White Clover, Trefoll, Perennial Rye-grass, Crestod Dog's-tail, and some of the Fesones was sown at the rate of 25 lb . per acre; the top-dressing was applied, and the ground well bush-harrowed afterwards. The seeds were sown in the spring, and previously to sowirg the field had a good harrowing with a sharp tined harrow. It was necessary that the field should be mown the first yoar. The produce was of course very light, but it is probable that the shelter afforded to the
the herbage was \(3 \in r v i c e a b l e . ~\)

During the auturan a large number of sheep and cattle were put on, and the fotlowing food given. For the cows, cut Wheat straw, grains, and about 4 lh. of Rape-cake per animal; the sheep had 1 lb , of Rape-cake per day each. Winter onming on, the oattle were removeri, and the sheep stook incrensed, and these were nowv folded equaliy over the paature. They were allowed to ramain in the fold until the Grass Wa: completely eaten and trampled down, their droppings being thick on She soil. Their food at this time was chopped oatstraw, graias, pulped Tumipe, and Rape-oake,

With ocoasionally a feed of acorns, which were
plentiful, and selling at about \(1 s .4 d\). a bushel.

In the spring the sheep were removed to allow the pasture to freshen, and after a rest of a fortnight the improvement was so great that the field was scarcely recognisable.
But the reality of the improvements was equal to the appearance. Land that formerly halfstarved a few animals now carried six sheep and a beast per acre. Sheep were sold fat from land which was considered almost a waste.
And in the work of improvement there was no loss felt. The greater part of the sheep stock were hoggets, purchased in Ootober at 20s. each., and these were sold the following Maroh at \(46 s\). each, a few goiner off after shearing at \(50 s\).

The system here described might be applied with advantage to a large extent of land in this country, including much that it would be unadvisable to break up, either because of the expense of tillage or expectation of a deficient yield.

Now that stook-farming is yielding such profits, and artificial food can he had at reasonable prices, there need not be much apprehension about the trial not being remunerative. We have shown that in two years an inferior pasture was raised to a very good standard. It has been made evident that the system was not a losing speculation, and there can be very little doubt that with care in the after management the pasture will not only not revert to its former state, but will continue to improve. \(C\).

\section*{ON DISINEECTION.}

Tar document from which the following are extracts has been prepared by direction of the loords of the Council. It is headed "Memoramsum on the Principles
and Practice of Disinfection, as applicable to the present and Practice of Disinfection, as apphcable to the present
Epidemis of Cattle disense. By J. L.W. Thudichum, M.D.":
. Principliss of Disinfraction. - The cattie plague, although uffecting every part of the animal,
slows its visible effects most extensively in the intestinal canal. It is believed, and apparently upon good grounds, that the intestinal discharges are the principal agents, upon the distribution of which mainly lepends the spread of the disorder.

It follows from the above that all artieles which have been in contact with a diseased animal, or any of its discharges, particularly its feses, are capable of carrying the infection for an indefinite time, and maqst be looked upon as being actually infectious to othor healthy animals. Such are racks of wood or iron, cribs or mangers of wood, iron, or stone; articles used for fastening animals, leather collars and straps, ropes and chains; all barness of any animals uscil for drawing, and all carts, waggons, and curriages which they have
actually been drawing; the stalls or sheds in which animals have been standing; the whole lengths of the gutters and drains through which their urine has been
flowing; the entire surface over which their manure has been drawn, and all implements with which the removal has been effected; the entire dungoheap upom which infected manure has been put, and the fluid contents of the manure pit or of the special receptacle for the urine; yards or sheds in which cattle have been bept to tread down long straw, and the whole of such straw and manure, as also the ground beneath them; pathe and roads upon which diseased cattle have walked or been carried; fields and meadows upon which they have been grazing; all carts, carriages, trucks, and railway trucks in which diseased cattle have been conveyed, and all the platforms, railings, bridges, and boards upon whioh they have been moved thoretos at aleo all apparatus which has been used to pen, tie, lift, haal lower, and fix them; the olothen, and perticularly shoes and boots, and iropapointed stioks of drivern, and their dogs; the apparel of all cattle-herds or attendants, particularly their sloes and bonts; the shocs and boots of all persons visiting places where diseased cattle are or have been standing; and in general the clothes of all persons visiting inf"cted pluces, ships, and all parts of the for embarking and handing the aniinals; markets, and ali sheds and pens and implements used in contact with rattle; slaughter-houses, and all peraons and imple. raents in them which have been employed upon siek sick animals killed in slanghter-houses s knackern' yards, trucks, or carts, horsen, men, and implements which have been employed ia the disposal of sick or dead animals; wells and ponds from which diseasod cattle have been drinking, or into which any protion of their excreta has hail any opportmity; all fodder, Grass, hay, straw, Clover, \&c. and particularly remnants of fodder upon which diseased cattle have been feeding; and, in generaf, all persons,
animals, places, buildings and movablo things which have been in contact with matters proceeding from dinoased cittle, or wi"i such diseased entele themselves, To the above-mentioued places and thinge any of the procurses and agents enuparated and desoribed in the
following may have to be applied:-

\section*{THE CATTLE PLAGUE}

To coatigus to publinh the letters of Correspondents on this subject.]
-We have now had the cattle plague in this country momonths or more, and it is only checked in individual cases by killing. Probably there will never be much animal in a a cure of the disease by the dissection of a nothing from those that are buried 10 feet deep. Sup pose 20 healthy beasts were placed with some that are a matter where iufection would be expected to follow as klled and cuurse. Let one or two of these beasts be fetent pretesected every day in the presence of com bary surceuns, should a few medical men wish to trace and proceuding. A record of appearances could be ke, \(t\), Which the disease gnters woud be made of the way iz day by day, which might give some slearer motions th tisease, wheatment. I should call this dissecting the If such, which seems too much to deal with as a whole
If such a plan was adopted I would willingly contribute wownd the purchase of the 20 bemets. W. D.

What farmer to to call your attention and that of thagintater. It appears that a farmer in Suffolk hed meparate fomong some of his cattle, but had also quite With the doos them and shat up in a separato shed

S. Mr. Henley, M. P., At Bigester.- [ cannot part with you without saying a word on what, in commou with me, you will
all have read in the papers this morning about the cattle
plague. We have been favoured with a list of directions and plague. We bave been favoured with a list of directions and Council, and drawn up by a gentleman whose name I hardly I have been at a loss to discover; but, at any rate, the directions emannate from a learned doctor of medicine with a very outlandish name. Now, these iustructions contain some attention of those agriculturists who go about the country and attend fairs to the nature of some of the recommeuditions. Among other things, the Doctor recommends the use of what attention of our chairman to this. His is so good a judge of learned Doctor recommends in the first instanco-beginning, not at the head, but the feet-that good boote should be worn,
well greased, and reaching np above the knees. The next thing be recommends is a waterproof coat, closely buttoned all down the front and tied very tight at the neck, and, in of the hair of the head to escape. Now that is suggested as a safety dress, and our agriculturists are recomisended the country fairs. Another direction is that when any beast is affected, or suspected, o
the tail should be tied up to one of the horns. Tisead, which io, that if the tail be tied up the animal will dirty it and will not bo apt to distribute the foejes with the peculiar action which that region is subject t
Now, these are all things so simple and so quite witbin th
power of all of us to do that I canot thiak we shall any of avoid following the learned doctor's advice published tnrough
the Privy Counchl. A further measure is suggested as a mode efficacious I have no doubr, and that it must be somewhat to be carefully burnt, and the soil turned wroug side upwards, and if that is not sufficient then you are to proceed to now all the Grass and burn it. Then, that there may be something for the beasts to eat afterwards, you are to take care not to turn any cattle in for a month. That is the remedy given under Although these things make one laugh, yet in talking the Although these things make one laugh, yet in talking the mendations of this kind-whether they may be the wisest or sanction of her Majesty's Governmeut unless they felt the pravins to issue instructions filling two never bave taken the papera, and containing some things good and useful with some that are not likely to be much followed, unless they knew that the occasion was very grave, and that it behoves us all to do what we can to put a step to tbis serious malady.

\section*{ROOT GROWING AT BRACKLEX}

There is everywhereabundant promise of cattle food during the coming winter. The hay crop has, indeed, been generally deticient ; but there never was such an aftermath, and never a better second cut. The store of hay will thus not be attacked till much latter than usual in the season, and then there will be an unusually abundant crop of Swedes and Mangels to consume along with it. It is not such a good year as the last was to test the merit of any particular mode of cultivating the root crops; for, however cultivated, the crop is this year generally good. We were, however, last week over a small farm near Brackley, where the root crop has been almost always good-even last year-and first-rate now. Mr. Malins, who occupies about 200 acres on the brown oolite soil near Brackley, most of it his own property, has for about eight years followed a particular system of root cultivation, of the advantages of which he is every year more perfectly convinced-and already, on nearly 30 acres, he has a full and bulky crop, which, with several months of growth still before it, will certainly be much heavier before the end of the year.
The merit of his plan lies not only in its productiveness but in its cheapness. The fields are old arable land, chiefly a brashy stony soil-some of it much heavier and deeper-but receivig little or no uanure for the Turnip crop. Sometiroes there is a portion of the farmyard dung allotted to the Wheat stubbles for the Swede crop, but oftener there is none. The abundant crop we saw last week was grown with none,
and no artificial manure whatever is employed. The experience of Mr. Malins in root cultivation, like that of the Rev. S. Sinith, of Lois Weedon, in Wheat cultivation, is a capital lesson in the fertilising influence of tillage

The Wheat stubbles, slightly manured or not manured at all, are ploughed deeply before winter, and never moved again. That and early sowing are the keystones of the system. Let us here describe the management in detail. There are 110 acres of arable land, some 20 acres of meadow, the rest being grazing ground. The arable land is cultivated halved four-field system, with the Clover quarter halved between Beans and Clover. Clover thus comes round once in eight years-Swedish Turnips in yards in four. The straw of the corn crops is cousumed
ing 3 or 4 lb . of cake apiece each day. And the dung carted out to heap is used first on the Clovers either in spring, or after the second cut in the autumn, before being ploughed for Wheat. Then it is used every year at the rate of 10 tons or thereabouts per acre to the pasture land, which is mown each year. The remainder becornes available for the Beau crop over the halfbreadth of Barley stubble not sown down with Clover. Occasionally a tieid of the grazing ground is dressed. And, if there is any over, it is applied to the Wheat stubbles, which are ploughed deeply up for Swedes as soon as Wheat sowing has been accomplished. The autumal ploughing is done with a four or five-horse team, and done thoroughly and deeply. The land has all been thoroughly drained, and so it lies rough, and deep, and dry all : winter. In spring, if any surface weeds appear, they are lightly harrowed down; and in the first week of April, about 2 lb . of Skirving's Swede seed are drilled in rows 2 feet apart. The seed comes generally at once. It is almost too early for the fly, and the land is full of moisture, and so the young plant grows. Under ordinary management the crop would certainly bo mildewed. We hear of sowing Turnips as early in the spring as possible in the north, but here an early-sown crop is almost certain to be mildewed. Mr. Malins, however, has never suffered from mildew-not that there is none in the field-the lower leaves of almost every root are already disco loured, and many of them withered, and many of them meally enough - but there is always a heart of fresh green leaf still feeding the balb-and those we examined were as firm and good as possible. The plants are singled out 2 feet apart. The surface of the intervals is simply pared with a horse hoe. The men who single the plants go over the ground with the hoe a second time. The 6s. 6d. paid for this, the horse labour of the light horse-hoeing, harrowing, and drilling, and of the single heavy ploughing are all the cost and labour of the crop. All-for the crop is never pulled or carried home. It is wholly fed on the ground with sheep-and there will be food enough for about 400 heavy Cotswold tege, receiving also the Clover hay off about 13 acres, for four months this winter, but no corn or cake.

We do not mean to say, nor does Mr. Malins suppose, that the experience of this management at Brackley will be realised anywhere. Nevertheless it is certain that everywhere the lesson may be learnt of the fertilising influence of tillage operations for roots as well as corn. The land here, too, is not unusually good. It is in many places thin and brashy-elsewhere, and thore the crop is obviously heavier, it is deeper and better. The farm is only half arable, but the Grass land is not robbed for the plough land. There is one meadow of 20 acres mown every yearfurnishing, therefore, hay every year towards the general dung heap of the farm, and there are some 3 lb . of cake purchased for each of about two dozen beasts daily during the winter. This also improves the dung heap. But this dung heap is drawn upon for the meadow land and pasture land, as well as for the arable. So that only a portion is put on the Clovers for Wheat and on the Barley stubble for Beans, leaving a very small quantity for the Swedes; nevertheless on this, and on the very heavy folding with sheep-the consumption of the whole crop upon the land where it grew-depends the maintenauce of the general fertility of the land-on this, and on deep, and clean, and thorough tillage. Care is taken that whatever food for plants the land contains shall not be wasted on the farmer's enemies. It all goes to the Swedes, the Wheat, and Beans, and the other cultivated plants-none, or hardly any, to Thistles, Couch, and other enemies. All these are thoroughly extirpated; and the hedges being kept forked, and every rootweed also being forked before the ploughing is done, there is no seed-bed by which it is reproduced

It is, however, especially to the cultivation of the Swede crop that the attention is directed. And it seems, from the experience of Mr. Malins, that on soils of a certain class-by no means of the very highest natural fertility -an early seed-time, with the consequent long time afforded to plant growth upon land which has been decply ploughed all winter, is enough to produce an excellent crop of roots. There are no deep or frequent horse-hoeings allowed during the growth of the crop-no breakage of either root, fibre, or leaf. The young plant, uncrowded even as a seedling, and left whely separated from its neighbours from the beginuing, is left to fiud its foud from air and soil under the condition not of an artificially supplied fertility, but of a great depth and area of natural soil. It thus grows conaparatively slowly, but healthily, and the fields are now full of roots measuring 2 feet round, aud many of them more than 30 inches.

It is by no means meant by this account of root cultivation near Brackley either to disparage artificial manuring or to intimate that mere tillage will everywhere do all that it accomplishes here, but we do mean by it that everywhere deep and thorough tillage is a most efficient fertilising agent, and that anywhere a better crop may be obtained by depending more on this than is generally done.

We may add that, notwithstanding the early sowing, not a single plant has run to seed; nor is the mildew such as to hinder the continued growth of the plant which, moreover, has already ittained the dimention
of an excellent crop. Oxford Jowrnal.

\section*{ON STEEPING WHEAT FOR SEED.}

Lyor the careful preparation of Wheat for seed iepends, to a considerable degree, the value of the futare crop. Several diseases to which the plant is mbject are; believed or known to have their germs Fident it the seed or on its surface, and to remove thee should always be the object of a careful opera-

\section*{bur at seed time.}

Thetwo distases, to avert which is the main object of tuping and otherwise preparing seed Wheat, are the taut and bunt or pepper-brand; in the latter, which is He more dreaded of the two-bccause the grain
?ains its form and appearance in the sanple\(\therefore\) in prasietic Fungus which produces it has a pcculiarly Fid odour; in the former this smell is wanting, and the sed-vessels burst, dispersing their sooty contents beiore the general ripening of the crop. Sinut is more momon in Oats than in any other grain crop.
It has been known long before those who adopted the practice possessed any definite idea of the cause of trese diseases, that the best method of avoiding them ras thoroughly to cleanse the seed. Botanists have
rince informed us that the cince informed us that the success of this operation is germs of those -germs of inconceivably small size-not above \(\frac{\mathrm{T}}{16 \sigma \sigma}\) o aborted by the root of the young plant.
The following passages are extracted from Professor Hension's report. Referring to the bunt or pepper.
trand, he says. "Crand, he says:-
isfected seedply immereing the grain in water, the zethiog but theat, and on the water being poured off bimple process, however, is never perfectly effective, mins (smut-balls) are crushed, and the spores are mithersed in the form of a fine powder, which adheres mains, by means of an oily or greass matter found in been Fungi. In order to detach them thoroughly, it has Tater in whed useful to add some alkaline ley to the arite and form a Whill no longer adhere to the surface of thie grains of long employme, possessing alkaline qualities, has been motatances containing ammonia, as the liquid portion of emplos brine, sulohate been used. But as some persons is it is surials which do not possess alkaline properTdestroying the vegetative properties of the Fungi, ita grains. It may theruving them from the surface of der of experiments to determine which supposition is be owing toct. Perhaps some portion of the effect may op werhaps so the increased specific gravity of the liquid; of the steeped corn, sufficient to prevent the sporules an the plant ; just as corrosive sublimate, essential (cils, I May also leather, prevent the formation of mouldiness. Wlations are applied may be of some importance." ARanst bunt and ")n the precautions to be taken Fethink well worthy the a suggestion is offered which fe eror Henolow warthy the atteation of farmers. Pro
"From a variety of considerations, it has alway appeared to me strange that practical agriculturists are accustomed to pay so little attention to the raising of pure seed-crops. There may be reasons which I do not properly appreciate that would render it mexpedient to cultivate a seed-crop apart from the rest of the produce raised on a farm; but I should have thought that it was always worth while for every farmer to set aside some purtion of ground to be more carefully tended thim the rest, for the purpose of securing coe and perfectily clean seed such a practice, he would then be able to weed h:s crop from every plant infected with bunt or amat, before the Fungi ripenea. \({ }^{\text {N }}\)
It is certainly the interest of the farmer either to do this or to purchase his seed from those who pay parLicular attention to its cultivation.
We shall make only one more extract, in which a series of experiments are recommended with the view of ascertaining what substauces in solution are the most effectual preventives of these diseases. These are published here, as being likely both to lead the practical reader to a useful conclusiou as regards his own practice, and also to encourage the habit of investigation generally.

A parcel of thoroughly bunted or smutted seed should be divided into a number of small nackets, each of the same weight; or, if very small, each containing the same number of graius. When any of these packets are steeped or washed, the floated grains and the Fungi which rise to the surface may be kept apart for separate experiments, being carefully labelled 'F. 1, 'F. 2,' \&ece, to show that they were obtained frum the packets of seeds ' \(N o .1\), ' \(N o .2\),' \&co, by this \(\stackrel{\text { process. }}{\text { No. }}\)

No. 10. " sulphate of copper and do.
"These last may be repeated by washing the seeds clean after they have been steeped, to remove a
thie mixture that may here adhere to the surface."
In addition to briue, blue vitriol, \&c., Glauber salts, the sulphate of soda, has been recommended to be used just as the sulphate of copper, and then dried with lime, which decomposes it and leaves caustic soda on the surface of the grain, to deal with and destroy the life of the fungal germs which may cling to it.
We may add the following report of experience on this subject, which is taken from a statement made sone years ago by Mr. David to the Cardiff Farmers' Club.

In November, 1822, I selected three bushels of Wheat, which I had grown that summer, and which was exceedingly smutty, but to render it still more so, I had a quantity of smut-ball rubbed into it, until the whole was much blackeved. The lot was then divided in to iv bif busbels, and having dissolved hatf a pouvil of blue vitriol in boiling water, the Wheat was pickled as follows:-

No. 1. Immersed in the vitriol water for three hours
No. 2. Washed and skimmed until it was clean, then immersed in the vitriol water as above.

\section*{No. 3. No preparation.}

No. 4. Washed and skimmed well until clean
No. 5. Washed and skimmed as above, then sifted quicklime over it, and mixed a quarter of a pound of salt with it.
No. 6. Pickled in the mode usually adopted, with a mixture of lime, salt, and water.
"The seed was sown the following day on a Clover lea, in six separate ridges, each 112 yards long by 4 yards wide, half a bushel to neare. (!)

Nos. 1, 2, and 5 came up thin, seemed to be at the rate of only two bushels per acre.
No. 6 appeared to be at the rate of about 21 bushels
No. 4 appeared to be at the rate of about 3 bushels per acre.
No. 3 appeared at the rate of about 4 bushels
per
"Sere.
Sept. 5, 1823.-The whole was reaped, each 10
being carefally kept separate, and the result proved as follows:-
No. 2. Found only two smutty ears in the whole ridge, which, notwithatauding the care taken, might bave come from an adjoining ridge.
No. 1. Had several smutty earn in it.
No. 5. From 30 to 40 black ears in the ridge.
No. 6. About a 20 th part amutty eark.
No. 4. About a 5 th part smutty ears.
No. 3. About one-half smutty ears.
"From which it appeared that the blue vitriol, coupled with washing and skimming, proved to be an effectual cure, even to a sample of the description sown. Ever since, I have invariably used vitriol, and have fornd from 20 gears' experience on apwarde of 100 acres of Wheat annually, that one pound to a sack of Wheat will prevent the dibease, as I have never had smutiy Wheat since. I believe the cure was effected in the above by deatroying the vegetative powers of the damaged seed, for it will be observed that the produce was clean in proportion to the thicknome of the plant."

We have only to add that we have found the use of blue vitriol (sulphate of copper) to be perfectly efficient, though at the rate of only half a pound per busbel. But to add quicklime to the Wheat after having steeped it in this solution, as was done in one of the above trials, is entirely erroneous. Lime will decompose sulphate of copper, and to add it to the Wheat after steeping it, as above, would, therefore, be an attempt to neutralise the benefits which are expected from the ase of that subatance for this purpose. The recipe it at follows:-Dissolve half a pound of blue vitriol in a gallon of warm water in an earthenware vessel, aud pous it over a sack of Wheat on the burn floor, and turn it over and over, so that every grain shall be thoroughly wetted. It will be dry and ready for sowing in two or three hours time. Do a sack at a time, and do not have too much done beforehand, as it is better that it should not lie long iu lieaps befure sowing. Morton's Farmer's Calendar.

\section*{THE CONTINENTAL FEEDING OF DAIRY Cows.}

The great feature of the continental management of dairy cows is the very goneral adoption of the summer as well as the winter soiling of the animals, or what is called the "stabulation permanente." It is to the Continent, therefore, that we must look for the best exposition of the advantages and disadvantages of the system, ouly noting here that, in the opinion of hy far the greater majority of authorities there, the advantages outweigh considerably the disadvantages. It will be worth while, therefore, to glaace briefly at what are the modes adopted on the Continent in the management of dairy cattle; and in doing this we cannot do better than fullow the celebrated treatise by Barou E. Peers, entitled "De la Stabulation de l'Espèce Bovine," premising that, although the remarks of this celebrated authority have special reference to the district of West Flanders, they give a fair idea of the modes adopted geuerally throughout the Con tinent. There are three systems essentially marked and distinct-(1), the system of the (otabulation) housing, absolute or permanent; (2), that of housiug mixed or temporary; and (3), the pasturage syatem. These three systems under which the milk cows are placed have each their uncompromising advocates, and tis almost unnecessary to say that each can present its useful side, and one may have benefits which another does not possess.
In districts where the arable lands are good and well cultivated, and which bring in a good rental, and where the pasturages and the meadows for the supply of hay are not common, the farmers are in a measure compelled to adopt the first of the above named systems, that of the permanent housiag (stabulation), this constituting the basis of their feeding system. The green crops or hoed plants (les plantes sarclées), such as Cabbages, Turnips, Mangel Wurzel, Carrots, are therefore in a measure forced to form part of the rotation of the farm. The market gardeuer in the neighbourhood of large towns finds great benefit in the adoption of this system for his milch cows, for he feeds them with the residue of numbers of vegetables which he daily exposes in the market for sale. He has a ready sale, moreover, fo his milk, and the system provides him with a good supply of manure for his crops. In the condition in which he is placed the pasturage is not practicable, and the raising of Grass crops would land him in large deficiencies.
In the third system-that of pasturage-the cows are piaced to Grass either during a part-and that the greater part-of the year, or duriug the whole year. This system undoubtedly seems the most \(n\) tural in its general aspects; but it is ouly in highly favoured districts where the pasturage can be carried out during the whole year. The farmers of a grea part of Holland, of some localities which stretch in vast extent along the sea margiu of the North Sea from Dunkirk in France and along the coast of Belgium to l'Ecluse on the frontiers of Holland, and of the valleys is which flow streams and rivers, in order to obtain a supply of cut Crass, find themselves under the necessity to adopt the syatem of permanent pasturage during several continuous months. The

Grass being the principal product of these farms, it is necessary for the cultivator to consume it as much as possible on the land; and converting a portion of the Grass of these natural maeadows into hay, in order to find food for winter, he has the after Grass for the cows, which is thus a supplementary food, and at a cows, which is thus a supplementary food, and at a
period when the Grass does not grow with the vigour of early spring. But those localities where large flocks can find in natural pastures and meadows a proper supply of food during a lengthened period of the year are not common; and those districts are certainly privileged where the pasturage can be carried out during the months of winter. Permanent pasturage can only, therefore, be understood in a limited sense, comprising some seven months, during which the Grass is fairly abundant, the housing of the animals being carried out all the winter till the return of spring. It is in West Flanders that we find all the systems which we have noted adopted with a certain degree of success, although it may be said that their adoption depends upon motives of which theory does not approve, but of which it may be said that practically they are successful. The permanent housing out in a large part of the district of Courtrai in Belgium, long celebrated as a Flax-growing district. Several causes have determined the farmers of that district to adopt the system which they have found so beneficial to their interests; and it may be said, without fear o contradiction, that they understand thoroughly this department of their practice. Amongst those causes above alluded to is the extent of the alluvial lands bordering the river Lys, and which, possessed of a remarkable fertility, have long been devoted to the culture of the industrial plants, as Flax, oleaginous plants, and to the cereals. It is easily to be comprehended, thereground is culfivated with such painstaking care, that more value is set apon, and, in fact, obtained from them, than could be from the same extent of land placed under Grass. Fertile soil, highly manured and rich in nitrogen, farms of small extent cultivated by
hand, with labour abundant, sueh are the motives which plead strongly in favour of the adoption of the system of permanent housing, and in the rejection of the pastoral system, which cannot be embraced without compromising the very existence of the workmen who are required in numbers to carry out the various operations involved in the cultivation of numerous crops.

\section*{We proceed to notice other points treated of by} Baron Peers, connected with the soiling or housing system as practised on the Continent, and which have thequal value in the practice of this country. Amongs the questions which are still disputed, and seem as yet far from being definitely settled, is that which has
reference to the relative cost of the two systems- the pasturage of the cows during eight months of the year, and the permanent housing of them during the whole of it. Superficially examined, the pasturage system economical advantages; but a closer investigation will lead to the opposite conclusion. This holds, of course, are, on the contrary, abundant and productive, it is incontestable that the permanent housing system will not be so economical as the pasturage. Let us minimum 50 ares of pasture land during 200 days Let us suppose that these 50 ares occasion an outlay of 100 francs annually for all expenses, including rent, making the cost of daily nourishment during the period above named 50 centimes per day. Taking the abundant crop of food, and which is the most most cultivated in a wide variety of soils, and as constituting, therefore, a fair means of comparison, we find that two cuttings will produce regularly 10,000 kilogrammes of green food per 50 ares. This will give for
200 days a daily quantity of 50 kilogrammes. The expenses attendant upon this extent of land, and the cultivation of the crop which it bears, may be put down as the same as those attendant upon the same extent of pasture land; but while there is thus a similarity in the cost, we find a higher value attached to the
products of the 50 ares under Clover than the 50 ares products of the
As regards the produce of milk, let it be at once admitted that it will be equal in both cases, the cow fed in the pasture field and that fed in the house; but in the latter case we have a produce which at once gives it a higher economical value. In the pasture, irregular, and, in many cases, most prejudicial effects upon the land on which they fall. The vegetation is doubtless often very luxuriant where the manure is voided, but frequently the animal has a distaste for the Grass grown upon such spots; moreover, lying there exposed to the atmospheric influences, a great loss of its manurial value is sustained. On the contrary, in the housing or soiling systera, the best and most
ready means are afforded for saving the manure. The value of this, as produced by one cow during 200 days, is set down at 40 francs, thus at once reducing the cost of the Clover feed from 50 ares to 60 frances. In the most calpable negligence is pept in a is utiled
none of it is or need be lost; in the pastures a larg per centage- 10 per cent,-is calculated as utterly
lost from a variety of causes, most of which we have already named. Again, the green-cut food used in the honsing system may be further coonomised by mixing it with.
rookt.
There is yet another advantage connected with the housing system, and that is the great facility which it affords in the maintenance of the health of the animals; but as to this we have already alluded. Nothing further on it, then, need here be said, except to point out that the thorough oleaning of the amimals is very easily carried out, the ordure is easily removed, and the currycombing also-not often done in England-which is found wherever it is adopted to exercise the most beneficial influence upon the health of the cow. In carrying out the system of pasturage, it is right to note here what Baron Peers says respecting the two plans of having-during the continuance of the season -(1) the animals brought home night aud morning to be milked; and (2) the animals milked in the fields. The Baron advocates the latter as the best; for, as he remarks, nothing favours so much the abundant secretion of milk as tranquillity, and the liberty which
they enjoy in the field, the exercise they take there bey enjoy in the field, the exercise they take there
being sufficient for the maintenance of good health. In Holland, where the pasturages are of very fine quality, the cows are kept out night and day; and the women go to the fields and milk them at a regular hour in the morning and at night. The quiet of the animal is thus secured. But where the practice is carried out of leading the cows home night and morning to be milked considerable loss is sustained, for not only is the distance from the field to the farm-house so considerable as to induce fatigue, but many things happen to frighten them, the result of all which is that the milk is rendered either less in quantity or xeduced in quality. It may bo taken as an axiom that all agitation bad for the cows
The continental authority, of whose opinions we have thus given a free translation, is a great advocate with the bulky and aqueous root food generally given by the addition of the oil-cake the secretion of milk is not only greatly favoured, but also the healthy develop. ment of the animal; on this point Baron Peers and Mr. Horsfall are at one. The oil-cake facilitates the secretions and the dejections, and gives to the milk an exquisite flavour, and a great richness in butter making principles. Making the oil-cake as the basis of the food of the milk cow, the Baron admits all the other alimentary substances into the category of daily food. He is, indeed, like the majority of scientific griculturists, a great advocate for the use of a wide variety of foods, so that a change of diet as well as mixture of food may be within easy reach of the dairyman; and on the value of a mixture of food, does not, lhowever, conceal the danger that may arise from rapid changes of diet, as from dry to succulent food, and vice versa; but he believes that, by the axercise of a little care, this may be avoided, as by mixing succulent food with dry, as green-cut forage
with straw, gradually increasing the quantity of the food which is alternately to form the staple of the animal's meals, eight days will suffice, he says, to habituate the animals to a change of food.
In considering the number of feeding materials at the command of the dairyman, it may be asied, why does he confine himself to ore only? The system of mixing a variety of feeding substances together will infallibly provoke-says our authority-the appetite of the animals, facilitate their digestion, and maintain them in good health. Thus, during the period in which the housing is enforced, as in the wiater months, the dairyman may have at his command the varieties o traw, as Oats, Wheat, and Barley-of hay, of Turnips, Beet-root and Carrots-so that he may easily concoc an excellent mixture. Cut hay and straw with sliced roots, we look upon as the basis of a feeding material economical for the farmer, and healthy for the animal Economical, because the smallest particles of these ubstances are converted without loss into valuable liment; healthy, because these mixtures have a good influence upon the digestive organs in equalising the diverse qualities of the feeding substances. Thus the straw and the hay have a constipating, while the root therefore-continues our authority-an essential t have a mixture of food, to maintain the animals in a ust equilibrium, so that their excrements may not have either a too great solidity or liquidity. Baron
Peers is no advocate of cooked and fermented food. Cooked food, he admits, forms an agreeable mode of administering it, but he believes that it withdraws rom the roots a good portion of their valuable qualities, leaving only the watery and fibrous portions Of all the roots the Potato should, he thinks, be alone cooked; but then this root is rarely given to milk yield of milk, while, on the other hand, it makes the butter difficult to be extracted. We have already noticed that Baron Peers is a great advocate for the use of oilcake, and of this as a food which can be cooked. It is perhaps the best, because cooking it contains. Of fermented food, he snys, that it has
the advantage of containing much velmblo easily digested. Fermentation requires to to
ducted with considerable ducted with considerable care, for if it in not cums ap to a certain point, the good qualities of the fry are not brought out; while if it is carried berve. of these difficulties and disadvant In presen in in cooked and fermented food, Baron Pannetri in the use of a mixture of cut straw, hay, and a certain quantity of water and oilcake. This give a greater abundance of milk than dry or min first consists are two ways of making this food is over the surface of the solid food, mixing liquid oilcake preparation. A species of so quid olcake preparation. A species of soup The second which the animals will eat with arim The second method consists in giving the amon mixed solid food dry, previously giving them a d composed of meal and water in which oilcake is and Of these two modes, Baron Peers prefers the first cold weather it will be advisable to give the \(m\) slightly warmed- The Cow and the Dairy, Fullarton

\section*{FACTS FOR FLAX GROWERS}

A STranger to Ireland, or even a young Irist gnorant of his country's agricultural bistory and he industrial traditions, on reading much of what has
pubse
pushed of late relative to Flax culture and mauagement would be led to suppose our ancesten were little acquainted with, if not groosily ignoran i Flax culture.
This would be a great mistake, as I can assure m as an old Flax grower, and having a perfect recollecean the practices in its regard, common not o mongst the old men but the old women of Irole fully nalf a century ago, that the old men and wom
of that day understood then the culture of Phar fill af well as it is understood at the present dy "the Flax instructors," whether native or employed now to teach the natives how to grow it almost said id of disgust, to me, to hear and ran only practically but scientifically acquainted mith th culture of this crop, when assuming that it in
exhaustive of the natural fertility of the land grome to forbid its extended culture, even in due counn land cropping rotation. The cause of my seekivg on notice this crop through your pages is my har by Englishmen who unlike some of my own countrymen, not asis dissuaded from a matter of so much importance stands its primary culture, und as every intellige stockfeeder knows the great value of rlax seedia manufacture, if I may so express itry from 1001 for over the sea's level to within 10 to 20 feet under ordinarils mark, there will be frowing good Fs except the following - (1), very deep or uarechin boge ; (2), light, open, shallow, gravelly solls, ock sula sons, whether ligh imestone especially. Nor is there any culmiferous crop in ta the fibre be but a matter". of secondary considertary Neither is there auy crop better calculown such land bx with, whether the object in laying down sod for temis to produce Grass and Clovers for soiling
Fury or permanent meadow or paseed when well and judiciously selected will be found as wall dity or resowing*, and the production of oid.
These facts admitted, and no well-informed proctas man will attempt to gainsay them, it is to be herato that whatever failures have true causes-want of judgment in a variety the time to discuss them

to men of common sense to discuss the sensel the seed to be lost, under the im. the crop can be injured by taking it that when allowed to rot in the steep pond
uefit the fibre when there in any degree ling, and that to a very trifing degree, the
fermentative power of the water. But as this is more a scientific than a practical question I will leave its diecussion to speoulative theorista, first maying that pulled, should be taken off by one or other of the various means adopted for such purposes.
Manner of Disposing of the Fibre.-This must depend upon the demand in each respective locality which I regret to say that in many parts of Ireland at least is not very tempting.
My belief is, and I speak from dearly bought experience, that in localities far from the manufactory it wonld be better to sell the orop, either befone it is steeped or retted, or asm moon as possible after, to the owner of some local owner of breaking and scutching mills, and leave him to find a market for the dresse fibre and tow; and if he, an some othors do, erush the seed to extract the oil and prepare the cake for feeding, the purchaser of such cake will find it more profitable to purchase from him than (with very fow axceptions) go to the expense of preparing such food on the premises where the Flax isgrown. Observe, my emarks in these latter respects have reference chiefly o Ireland, where furm machinery is too hittle known o the extensive farmer and not known at all to the small farmer, too poor in mind and means to cultivate closer acquaintance with things to the large furmer so indispensable to secure success in his operations

\section*{Home Correspondence.}

The Ohampion Wheat Crop of the Season. - Under the above heading you published last week a letter from Mr. Bates, in which that gentleman says, "Mr. Fallett withdrew from the trial in consequence of not being able to secure judges." The facts were that on the lat July I wrote to Mr. Bates that although my crop was much injured I should not withdraw. He and I at once named our respective members of the jury, all of whom deelined to act. At length Mr. Bates whobe Hewitt had recured Mr. Charles Eoward arbiters At Mr. Bates's request, I wrote to Mr. Howard, thus "secured," iaviting him to Brighton, at which he expressed his surprise, saying that he uad not comsented act, and I was obliged to write an explanation of my roubling him, and to Mrr. Bates, regretting that upon insufficient grounds he had caused me to do so. Thus the matter ended, through the failure of Mr. Batom to The Manor House, Brighton, Sept. 18.
Cotlages of the Poor.-How are we in the United Kingdom prepared to meet the probable visitation of
the cholera? By the introduction of large quantities of diseased meat into the markets and butchers' shops -by the want of a sufficient supply of pure water in all large towns and villages-and by crowding the workiag classes into small, badly ventilated, dirty dwellings, in which it is not possible for the inmates to separate the sick from the healthy, or to provide accommodation for the sexes apart frois each other. The terrible eastern scourge carries all before it on its first appearance in a localicy; and though no means of prevention are known, yet the frigbtful effects of the cholera may be mitigated by attention to cleanliness,
ventilation, and diet. The free use of hot lime wash on the walls of houses is a valuable remedy in cases of infection. If neither humanity nor common decency will call the attention of the upper and middle clasegs to the points in question, the fear of contagion may have some influence, and induce them typhus, searlet fever, and small-pox, Some little agitation has lately prevailed on the culpable neglect of the cottages and infected districts, in which the working classes reside; however, it is but a drop in the ocean compared with what ought to be done. A man and his wife may have ready inclination to check the bad conduct of their grown-up children, and scold the younger, but with minerable reaultar as might be anti-
cipaied, when they have but two rooms to live in by day and sleep in by hight. The nataral results which follow a system of compelling men, women, boys, and girls to congregate topether like animais, is not conducive either to morality or religion; and has an undoubted tendency to demoralise the class, who, more particularly suffer under the degrading circum stances alluded to. To judge of the true state of society, a knowledge of the various classes composing this great faunily must be obtained, not from outward appearances only ; in the usual intercourse of man with man individuals are obliged to observe certain civilities, Whether they indicate real feeling, or are pat on for the occasion. To arrive at a better understanding of things in general, the houses of both ligg and low the land, and exhibit a very different aspect from the polite and smooth exteriors of pornons meating either a pmblic assemblies or private gathoriogs. A peep whind the scenes will show on how unsafe il foundation society erists, and the wide tield for reform there is people realise to themselves the ruin the fast young nen and women of the present day, and the carelese old ones, are bringing upon themselves, and the nischiof they are entailing upon the riting gemeration. Palcon.

\section*{Eocietics.}

Roval Agrioutrugaz-The Veterinary Committeo Roval AgRTOUTVMalu-The Veterinary Committee to its menbere, describiug the diseene and the proceedings proper to be taken on an attack of it. The following is an extract:- The several Orders in Counci! Which have beeu pat forth, well calculated as they are w arreat the pragress of the malady, will; neverthelom, prove non-effective to n considerable extent nulen they are backed ly individual exertion. (Sne of the chief, and in many instancen the only carere of the exteusion of the disease into several fresh dietriots has been the recklens manner that many persons have dealt with infected cattle. Not only have these been driven from place to place, and turued into fields soparated only from large herdo of healthy nuimals by an ordinary fence, but many bave been sent to fairs and markets and thus, by comoungling with uthere, have spread the disense far and wide. All preventive mensures are thas rendered of little svail, and unless practices of this kind are 'prevented by tine vighlance of agriculturists and thers, thousander of oattlo will be lonk to the country in addition to thowe whieh have alrendy perided,
Every one should be impressed with the faot that the disense is the most infections as well as the most fatal Which is known to affect eattle, skin in its deadly effect to the mall-pox of sheep, but not giving warning to persoss by an eruption upon the body. Like small-pox of sheep also, the poinons lien latoat in the ayatem for several days after being iuhuled, and daring this time the animal glves no indications of being affected, en that the most cautious persons may be deceived in the making of purchanas. Another fact of equal importanee, but not generally known, is that the special poisonous
material, or infections matter, on whels the diecase material, or infections matber, ons whels the dicease
depends for its existence, is multipied to an ertent scarcely to be estimatod in the systom of every fresh victim; so that it is quite possible for one diseased animal to be nitimately the casse of the cleath of thousands.
After deacribing the precautions to be obeerved, which have been already published, the Committee remind the members of the necessity of recoguising the early symptoms of the dimene, and not confurnding them with those belowing to other maladiss common to cattle. For this purpose they here insert the leading symptoms of the cattie pligus, sad of the two other epidemic affections to which cattle are subject:-

 reldened. The prostration of strongth is great, the antmal
staggerins when made to
of of mulk is rapudly diminiohed, and suon ceases altogethor.
Plow

 ing the side of the chost aver the disensed ling. Firm prossure
applied to this part will also cusse the animal to shrink.
 \(-5-2=2\) The Mouth end Fort Disease.-Attack sudlen. No premonitnry symptome, excepting in very rire instances. The
snimal frequently smaks its lips, and skuws by the move-
nonts of its tongue that the mouth is the seat of muffering. The saliva flows freely from the mouth, and accuunulatering.
is a frothy fluid aronvo the muzzie. An examination of the as a frothy fluid aronud the muzzie. An examination of the
mouth shows the existence of large blisters on the tongue, and
often on the inner part of the duper lip. They are few in refuses food, but rulls it about in its mouth, and often drops
insteal of swalluwing it. There is little or no disturbance of
either the breathing or pulse; nor is the temperature of the cither the breathing or pulse; nor is the temperature of the
body altere. The evacluatious are alsu natural. In many
nstances the foet are afectel as woll as the month, and
blisters will form betwecu thu tues, causiag the annmal to wall
lenderly, aud frequentiy to catch up oue fout after the other and shake it, as it to disloise sumethiag which was producing pain. In mileh cows the teasts are occationally affectoil with a this situation to
sores and crusts, and prevent the ready ow of the milk. The disease is of short duration, rarely pro-
uces death, and frequently extots simultaneously amorig the
heep, pigs, and poultry of tiue farm, as woll as among the cattlo.

The Catlle Plague : with suggestions for its Treatmont by Homaopathy. By Jumes Moore, M.R.C.V.S. This pamphlet is for the most part a discussion of the history, circumstauces, and symptoms of the prevailing epizootic. Towards the close of it, however, there is a hester, wich the author bolieres to hase been the
same disense as the Steppe Murrain, and which was successfully treated by him.
The following account of it was published some years ago in his "Veterinary Homœopathy": 一

\section*{"On June 9, 1857, I visited a cow belonging to Mr. Shenton,} Peot Hall, Cheshire. This was an aged corw and a henvy
milker. she had only recently come into her present owner's
possession. On June S, 1857, she was observed to shake
 nothing further was observed until the following morniug
when, soon after eating a ehovel-full of grains, she became very
ill, was violently purged, and vomited her meal. There is when, sooniolently purged, and
int was reason to suspeet poisoning.
no reat
"Symptoms:- Pulee 96 , and weak: respiration 32 , and
attended by a peculiar groan at every expiration: frequent attended by a peuliar groan at every expiration; frequeut
single cough recurring at intervals of a few minutes; loud
rattles in the trachea; mucons membrane of the mex rattles in the trachea; mucous membrane of the mnuth and
gums inflamed. copious and constant flow of clear muucous
from mouth and onostrils, tongue lance-shaped, and protruded
3 or 4 inches from the mouth: urgent thirst; preat difficulty in swallowing fluids; deglutition accomplished by a sort o
©bolt: cannot drink from a bucketon the floor, but nly when
it is raised to the mouth; eyes watery, dull, half-closed, and it is raised to the mouth; eyes watery, dull, half-closed, and
sunken; legs, ears, and whole surface cold ; secretion of mill
sust suspended from the first; appaling purgation of fluid whitish
frothy, horribly foetid matter, mixed with flakes of lymph, and occasionally with a hard lump of feces. (The cowwan called
the discharge 'corruption,' and he cannot stay in the shed beyond a minute or two.) Extreme and rapid prostration, difficulty she was got into a box in another part of the pre-
mises-she could scareely stand up, and walked against every obstacle, as if sho were blind.
" Treatment.
curn 2, 10 drons every hour alternately: 10 drops, and Arsenironger; ;enpiration 20 visit.) Much improved ; pulse 80 and stronger; reepiration 20 ; groan gone; occasional coug,
lively ican stand un; slight dribbling of saliva; purgig con-
siderably abated; the matter roided is natural in colour and not offensive; appetite fair. The cow began to rally about " 11 th. Pulse 70 ; respiration natural ;
To have Arsenicum every three hours.
"I did no see this vowy again, but the owner told me, a "o Remarks:-Dysenteric Murrain is mentioned by Dr. Green-
how, in his Renort to the Cuecral Board of Health, on Murrain
in Horned Cattle in Ifrned Cattle: and he gives in the Appendix an account by Which occurred at Sinope in the summer and autumn of 1855 This disease, as it prevailed in the East, was characterised by
spmptome closely resembling those of Asiatic cholera in man while the post-mortem appearances were thnse of dysentery. within a few hours.
"During a lengthened practice I have seen only five cases
ft the ahive disease. Two cases were cows belonging to Of the ahive disease. Two cases were cows belonging to
Mr. Syddall, who takes great interest in such maters, and
never saw such a disease before. One case died shortly never saw such a disease before. One case died shortly after
\(I\) saw her, the other died before I could reach her, botb after
a few hours' illness. The a few hours' illness. The phst mortina apearances coincided
with Mr. Radelife's account. Mr. Whititle, IV.S. Wortley. told
me that he had seen seven or cight cases at one farm, and that Me that he had seen seven or eight cases at one farm, and that
they all died. I have heard of other deaths if the neighbur-
hoord of Manchester. The owner, who las been born, brod, and brought up as a farmer, and who bas been amongst cows The The alarming nature of the symptoms must be admitted. speedy reniedial action to be derived from a few doses of
homeenphthic medicine, even iu desperate cases. Arsenicum was, no doubt. the curative agent, and proved as efficacions in
the choleric murrain of the cow, as in the cholera

In accordunce with the process recorded here, the author recommends Arsenicum and Aconitum, with two or three other "remedies," according to the symptoms
observed. He also recommends Arsenicum-third dilu. tion, 10 drops every day as a preventive. The following is the concluding paragraph :-
nose. Furchasers of cattle sbould particularly examine the nose. A con apparently in good health, eating well, chewing
the cud well, aud mill ing as usizal, mav cet have the plague upo her in course of develo, meant. This may be discuvered
by ohserving that the upper part of the alee (wings) of the openings of the nostrils are swollen and shining, and the dewy part of white noses, marked with numerous small, slate-
coloured spots, flat, and not raised above the surface. 'This is
cher I believe, an original observation of considerable value, and a the appearance of any others.
a 2. I may also mention that in white cows I have observed or an essential symptom further observation maay decide.
" 3 . It is well known that many cows, slavering the mol have been condemned by the appointed inspectors, under the idea that the disease w,
We are bound to add that we would rather trust the judgment of Prof. Simonds and of Prof. G. T. Brown, to whom our readers are indebted for the full discus aion which the whole subject has received in our columns during the past few weeks.

evidence lately taken before the Hypothee Commision at evidence lately taken before the Hypothec Commission at
Edinurgh to publish such extracts from it as will indicate the existing style of Scottinh agriculture, and the enterprise and energy of Scottish agriculturiets.] ]
Bluetojv, Dumblane, Perthehire: Mr. Andrewo Sharp.-My farm is 200 Scotch acres, or about 250 imperial acres. I entered with \(120 l\). of rent, and I now pay 260l. My entry was 15 years ago. The length of my lease is 19 years. My rent rose gradually laid out the money for drainage. I have been engaged in the practice of agriculture about 45 years, always in
Perthshire, and mostly in the eastern district of Perthshire. I have experienced no inconvenience from the law of bypothec. I think I have experienced some advantage from the law. I commenced business with my staff in my hand. I was a long time a servant, and
farm ; and I think that, on entering the farm, I had an advantage by the law of hypothec, ou account of
the postponed term of payment of the rent. I entered at Martinnas, and the first half-year's rent was payable in the jear following the putting in of the crop, on the 1st of February. Had it not been
for the law of hypothec, I would not have expected the landlord to give me such a postponed period of rent, especially to a stranger, as I was to him
at that time. I have reciaimed most of my land out of that time. I have reciaimed most of my land out guano and on permanent improvements. I get lime by the railway, and I pay credit price generally for it. I get cradit for my lime for a month or six weeks-
never more than six weeks. I sometimes get six months' credit for guano. There are a good many tenants in the same position as myself in my neimhbourhood. They occupy small farms like myselfsome less and some larger; and they have raised themselves to their present position. I think that the law of hypothec is an an advantage to that class of teuants, by enabling the landlords to give them an
indulgence. I do not think it would be possible for indulgence. I do not think it would be possible
such tenants to pay rent before they reaped a crop.
The Seed Trade: Mr. David Cross.-I have been in business for 25 years on my own account. My business for 50 years before that. My father came to Glasgow about 20 years before I joined the business, but he was always in Glaggow or neighbourhood. We have numerous transactions with farmers in buying and selling. We sell about \(100,000 l\). worth of manure
and feeding-stuffs in the year, and we sell seeds and and feeding-stuffe in the year, and we sell seeds and
seed.grain to an additional extent of \(30,000 l\). or 40,000 . We purchase Rye grass seed by sample, to the extont of 20,000 . or 30,0002 . annually, from farmers and others. This year the quantity is less, owing to the bad crop; but, on an average of five years, our pur-
chases of Rye-grass seed have ranged from \(20,000 l\). to chases of Rye-grass seed have ranged from \(20,000 l\). to
\(30,000 l\). annually. We also purchase grain, chiefly for seed. The seed-grain is purchased principally in the Lothians stock markets. I ought to mention, that we purchase grain by sample in the districts where we do business, in places where there are no stock markets. In the districts where we do business, I am brought very much in contact with the agricultural class-with tenants who pay all sorts of rents. have experienced loss from the law of hypothec. When tenant-farmers become bankrupt, we find that the sum to divide, after satisfying the landlord, is very small as a rule. During the last three or four years, our raukings on the estates of tenant-farmers amounted about 2600l., which was spread over about 7 debtors. From 67 of these we have received as yet no dividend ; five have paid from \(6 d\). to 3 s. per pound five from \(3 s\) s. to \(5 s\) s. ; four from \(5 s\). to 7 s .; five from \(7 s\). to 10 s s ; and one has paid 11 s ., which is the highest
dividend we have received. Our loss has been 2600 l dividend we have received. Our loss has been 2600 l ., the dividends. That has been upon traasaction the seed-trade the rule is to give credit. Our accounts are generally rendered from Martinmas to Christmas, and a good many of them are paid about that time, though a great many are deferred till spring, when new transactions are gone into. Many of them pay cash for their manures, taking the benefit of the discount which we give for cash. Our rule is to deduct \(5 s\). per ton from the price of manure for cash. As a rule they don't pay ready money for seed ; but some do and we allow them 5 per cent. Our losses have been
partly on seed transactions and partly on manures. There is a class of our customers who get manure and seeds together, from whom we don't ask cash payment. The two go into one account, and are paid together. It is not from that class that we sustain the loss, it is more from the class whose credit we try to limit. We stipulate for ready money from them, but are frequently disappointed in getting
it. Q. Would the tenants, who are unable to pay ready money for manures, be able to pay forehand rents to their landlords?-A. In some cases they might. Tenant-farmers labour under this disadvantage with the present law, that their credit is doubted. They don't get those conveniences from bankers and other that merchants do. I have been told by bankers, again and again, that they disliked farmers' bills. One
banker told me he would rather have a shoemaker than a farmer. He said that was in consequence of the law of hypothec. If there was no such law, I think a farmer would be a more eligible person for a subjer to deal with than most merchants, because his subject is not so easily made away with. I think it
is of no advantage to any person. I dou't think it is any advantage to the landlord. I don't see why the landlord should ask security. Of all classes he has the least need of security. He parts with the produce of his land for the current year; he does not part with nothing. Even under a 19 years lease he parts with nothing; he merely becomee a creditor of the tenant
for the rent. In point of fact, he is the only instance of a person having a transection wherein he parts with nothing. If I sell goods to a merchant on a six monthe bill, my debtor can convert these goods at once into money; but, if a landlurd lets a farm, the any of which is payable six months after entry, or at he is a tenant such us ought to be selected, aud such
as every wise landlord will select, he must
very threshold of his entry manent and effectual security, and canno: drawn by himse \(f\) or his creditors for un
do not see why the law should internow advautage to the strong party, because the strong party here. He can let his land he pleases, aud he can make his terios for rent what he pleases. If there was
law, I thiak landlords would best for their interests in regard change in the terms for payment of rent who required a take a good aud industriv who required a little credit, or to take paying
if the landlord desired it should interpose to zoake it unnecessary for from their landlords are not benefiting thenise the landiord, or the community geuerally. Item industrious, economical, and Lard-working tense. If anything were done to injure their I don't think they would suffer. Landioris paid would be glad to have such tenauts, paid a backhanded rent. I differ from infer fore rents. I think a laadlord is perfen with that class of tenants, if they are of the have described. I can see no reasou for the cont: of the law. - It is a relic of a state of thiugs long? away, when payments were made in kind, and was the practice for the landlord to go rourd so much of the crop before it was removed
(To be continued.)

\section*{Miscellaneous}

The Butcher's Bill.-In all upper aud middle bouseholds the butcher's bill is the heavist weekly accounts. No people consumsume fully. And as, in consequence of our wasteful wo have a wide margin for retrenchment, every head of a family at the present ma prepare to meet the difficulties of the crisis, a
of butcher's meat will inevitably raise the price other articles of food, to say nothing of the rain as we write, is ruiving the harvest
those whose fortunes are so large a amount of their daily household expenditure of paratively small importance are in duty bound the example of a well-timed and judicious econm order that more food may remain for other
less fortunate than themselves. The waste conar with our daily consumption of butcher's meat e mences in the butcher's shop. The percentage s. is calculated to make the coo
servant we pay to watch over our interests to be. knows Nobody, save the coak actually comes house; indeed, in very few households supply of meat reweigked when it is sent merchant; we see our silks and our linen when we buy them; but for some unace sut eason we take our butcher's accuracy pointed on upon trust. And, as we her's is the heaviest of our weekly first step towards kitchen reform, therefore, tur should advise, would be that ever house from the butcher's should be reweige that n: it received. The next step whant and no bullocks and sheep' are scarce and dear, be dear also; and we have no desiry apon the question of pri
n. conapetition. We are simpily of weighing in with the prime
highest price is paid, quantities class families, are either thrown
the perquisites of the cook. In France, price of meat has usually England, and where fortunes are not as they are with us, the method meat has been much more thit flet-gets exactly what she wants, ir order to obtain the filet, she has sirloin, accompanied by
meat for which she
fiet than she would here pay for the practically, pay less ; for in one would is with all other prime joints. The usa England weighs in with them fla aside before they can appear upon the or buying our cutlets aud casserole, we buy loins and at least half of which are hisow

be readily sold to them by the butcher, for parts of good meat are far more wholesome per the best parts of inferior meat whorer classes chiefly eat. The second stey, fwards kitchen reform ought to be an nt with the butcher that every joint sent in closely trinmed for the table betore it leaves and that if we want chops and cutlets, we ints from which they are cut. Then comes the actual consumption-whether meat is to be evarybody three times a-day, whether the to have five meals a-day and loot joints for This must be left to the firmness and their employers. It is painful to think who work faithfully and hard for one' insufficiently fed; but still there is indulgence, beyond which it is absurd transgress. Our correspondent wrote in our columns some montlis of letters in domestic economy, placed series of lant daily consumption of butelers which a first-class famly conld tairly attain d and a half a-head. There is no difficulty in hat this estimate is excessive. In every firsty is considerable, and all those iten, butter, sh the consumption of butcher's meat ousht best specimens of athletic well-fed Englishseen are among the gentlemen of her Household Brigade. They are all 6ft. high andition all young and healthy, they are all a H. way be supposed to be above the average, and toun none of them, save their non-commissioned zerf, are positively corpulent, they certainly bear no rarance of being atinted. Now, if we reflect that a ate famly of, say, 16 persons, of whom one-hal romen and children, dieted according to the besides butter, fish, poultry, bacon, and eggs liitum, consume exactly the weight which is and ample to maintain 32 Life Guardsmen in high - ith and wigour without the accessories of butter, is puiltry, bacon, and eggs, we thiak we have esta. *ted the fact to which we earnestly desire to call :-wic attention, that the usual expenditure of an azhs kitchen is so extraordinarily wasteful as to Ard a wide margin for retrenchment during the +raxing meat famine. An English soldier's rations aro
f bread and \(\frac{3}{4} \mathrm{lb}\). of meat a day. Pall Mall Gustite.
anies for Agricultural Direction.-The possi-
acting on unvarying rule is in direct proportion :ue unvarying character of the subject on which you m to operate. If soil were of uniform depth, conwefcer, und dryness, if meteorology were one of the wate sciences, and vitality were everywhere alike, the art of agriculture itself might be expressed in a few an of unversal application, and the result of every peration might be certainly predicted. But into every * of theere agricultural conditions irregularity and artainty enter, and just in proportion as they rmail do rules become impossible, and even principles - zeceral laws become veiled under the influence of wreimmediate circumstances. A man may become a wis magetable life, and even weather, in any one vilty, ave tolerably uniform and known; he cannot beas become a good stock farmer, or at least be cannot te a pood herdsman in this way, for no one rule will apply -ite rarying animal temperaments and characters merch he has to deal. We should be inclined to aber than success of a market-gardening company Lise grounds. The success of cow-keeping depends on conpaniest in the animals individually, which neither Graus Onltugents can be expected to exhibit.
9. J. Onlture.-Towards the end of last year Mr. I. Bates, Long Ditton, Surbiton, Surrey, with 1: Le wanted previously not acquainted, informed me 7 arstem, and that he would put the preparatory retion. Theng, tillage, and seeding, under my The field was therefore prepared, the seeds a. jet afterward although the braird was not vigorade of June there was abundant pasturage. It Fise pot into the first week of July before 60 sheep * port into the field, but as that number was quite shary to the food the field furnished, it was found ath presented the Grasses from getting too luxuriant,
or 15 she obviated the necessity of mowing, 150 \(\therefore\) the field sheep per acre, would have been required, at number for kave yielded valuable fattening food be momber for four months, which would bave most profitable mode. As it is, taking into he field has yielded excellent hay of the and will afford for two months hence the beginning the 60 sheep it has main the valuinning of July, and also taking I estimate the corn crop the field would an i estimate the profits derived this year per acre. Apart seeds without a corn crop oen at once obtained, thich otherwise sever coald not have made so good, and, besides, by
this mode the land has been enriched, while by the aceu mode it would have been inpoverished. It is weessary to state that the fiehl, which umdulain's (o) the west, is of a light sandy nature, is naturally extrumels poor, is situate in one of the hottest districts, and need scarcely add that the past summer throughout has been one of the most senreling on record. Mr. Bates kindly offers the inspection of the field to any one who wishes to avail himself of it, and so satisfied is he with the results that I have just laid down a seeond field for him, and he intends to ald a third in spring. James Sanderson (in the Times), 15, Manchester Buildings, Westminster, Sept. 18 th.

\section*{Calendar of Operations.}

West Sussex: Sept. 12.-We are now in one of the bost extraordinary seasons that any remember. The heat is intense aud oppressive, and there is every sign that it will continue so for some time longer, as the barometer is higher to-lay than it has been fur months. Harvest has been done here for more than a week, but bas not been what we would call a favourable one. Theat may be not much under an average in quantity, but the quality is far from good, there has been littlo carrical in really good order, and it will be long before any of will be fit to grind by itself, so that old will be in request all through the winter, and there is a amount of tailing, and if it is possible much will be used again for feeding purposes.
Barley is not good on the whole, much of it was down long before it was cut, and consequently thin and some sprouted, and some was cut when we lad heavy mild rains, and is a good deal gromm, and there is very little that is not more or less stained, and Oats are altogether bad. Peas are perhaps the only sound erop we have got. Roots havo done well, but we think there are moro patches failed than usual, and there are sigus of the earlier sown Swedes incliniug to rot. But the young Clovers are extra good, and will havn to be fed extensively through the autumn to prevent their rotting during the winter; but the diftculty is to get stock to do it. Sheep have gone up to a very high price, and jet are all wanted; but cattle are not sent to market, because few would care to buy them at any price, and our market has got very much deranged since the cattle disease has appeared in the neighbourhood. The disease has not spread much since its first appearance, but has been ery deadly in'those places. In this locality, on the ast and south of Chichester, it has shown itself on our or five firms, and now and then we hear of it. spreading, but fortunately the report has nearly always turned out premature ; and though it be the case, that those who lose do not let it be known, yet others seem too eager to spread the report, and every animal that dies is said to have had it. And the cry of wolf may make us feel too secure and neglect to take those precautions that we ought And such appears to be the case round Chichester which is perhaps the only place where united action has not been taken to prevent the spread of the disease. It is true that meetings have taken place, and inspectors have been appointed and several suggestions made, but nothing agreed upon, and there is at preseut dauger that no steps will be taken to prevent the further spreading of it, till perhaps it has got much further, and then there will be another attempt to shut the stable-door. Whatever may be the cause it is a fact that the landlords and tenants of West Sussex cannot form a strong working association for any purpose connected with their calling. We see accounts of meetings held in all parts of the kingdom, and useful hints given, but here little is done in that way. Should some spirited farmers try to get up a meeting landlords do not attend, anc it is often difficult to get a cbairman. The late Uuk of Richmond bore the chief burden of all this, and now there appears to be none to take his place, \(G\). S.

\title{
HALLETT'S \\ trade \\ WHITE PEDIGREE WHEAT, \\ MARK. \\ (ROUGH CHAFFED),
}

NOW OFFERED FOR THE FIRS'T TIME,
Grown upon the Summit of the Chalk Downs, and yielded over several Acres nearly Seven Quarters per Acre, the Crop on similar Light Soils being this year extremely bad.

This is a fine Millers' Wheat, in addition to possessing the extraordinary productiveness of the original Red Pedigree Wheat. Straw of medium length and yery stit being laid by bad weather. A Winter Wheat only.

\section*{If Drilled in September, 4 Bushels on 10 Acres.}

SEED REQUIRED.
If Drilled in November, 4 Bushels on 4 Acres.
Note,-The ORIGINAL "RED" PEDIGREE WHEAT will be supplied if specially named, otherwise the above new White variety will this year, in all cases, bellims
PRICR, including Bacs:-ONE GUINEA a BUSHEL, or SEVEN GUINEAS the QUARTER by the Quarter or Half Quarter, delivered in Bags, sewed up and mil the Brighton Railway Station, upon receipt of Cheque or Post Office Order, without wohich it will not in any case be sent to minlnozcn Correspondents. Less than a Bubhel is be supplied.

\section*{TRADE \\ CHEVALIER PEDIGREE BARLEY. \\ MARK.}

This has been "bred" in the same manner as the PEDIGREE WHEAT, viz. :-by repeated annual selection, re-starting in each year from a single grain.
Although grown upon a poor thin soil (resting immediately upon the chalk), which upon neighbouring farms produces Barley rarely weighing so much as and fit only for grinding, the PEDIGREE BARLEY last year [this year's crop not yet threshed] weighed 57 lbs. per bushel, and produced sid buate single grain failing to s

Besides its astonishing productiveness, characteristic of all the PEDIGREE CEREALS, it possesses remarkable value for the maltster, hot a singo ghe and all growing equally.

Although only a very limited area of it has this year been grown, it will, in deferenee to a generally expressed wish, be at once offered to the public instan? of whimes next year, and a Subseription List has been formed, to which gentlemen desirous of sccuring any of it for drilling next Spring, would do well at once to ad which, however, will not involve payment until it be ready for delivery, of which due notice will be given by printed circular.

SEED REQUIRED.

\section*{If Drilled in March, 1 Bushel on 3 Acres,}

Price :-TWO GUINEAS a BUSHEL (including Bag), delivered in Bags sewed up and scaled, at the Brichton Railway Station, upon receipt of Cheque or her Order, without which it will not in any case be sent to unlonown correspondents. Less than a Bushel will not be supplied.

Note.-As the quantity is so limited, it will, until exhausted, be sent out to Gentlemen in the order in which they have joined the Subseription List.
FREDERIC F. HALLETY, F.L.S., THE MANOR HOUSE, BRIGH'ION, SUSSEX.

\section*{}

Duntre the course of our series of papers on Pegntable Pathology, several instances were given thetabnormal development of Cellular Tissue Where not confined by the cutiole, muoh after the manner of the granulations which take place in a mound in the course of healing. This was emarkably the case in the cores of Apples, where the external cells were curiously echinulate, and of the the stems of a Broccoii. A singular instance Gourd of nature has just occurred to us in a Which of that yellow-fleshed variety seeds of society under the name of Cucurbita ovifera (a Yame sometimes applied to the white Vegetable by saring that which Dr. Linduey used to eulogise a gaving that it was the only variety fit to make gentleman's puree.
on cutting up one of the Gourds in question, the sere surprised to find it quite hollow, without divided trangrace of fructification, and the whole White bands.ersely into brown and yellowishwithered frag. The brown bands consisted of disepiments, of decoroposition; the latter consisted of numerous ing like cushion-shaped granulated masses, lookexample, some form of carbonate of lime, as, for a thin sle, what is called botryoidal. On subjecting were found the microsoope, the interior cells were found to be like ordinary cellular tissue,
with very large intercellular spaces, and abundant starch granules; the outer cells, on the contrary, were variously shaped, but more or less rounded on the free edges, and filled with granular matter, which became yellow with the solntion of chloride of zino, indide of potassium, and iodine.* Some of the cells contained threads of funcussparn, and others elliptic or globose bodies with a distinct nuclens, and granulated externally, which, like the matter just mentioned, turned yellow under the same treatment, and which might be the fruit of some internal Fungus ; though of this we are by no means cortain.
While on the subject of Gourds, there are two noints on which we shall venture one or two remarks. First, as regards heat being favourable to the development of male rather than female flowers in Cucurbits, we have never been able to verify Mr Kntant's doctrine. Under precisels similar cir cumstances, as far as we cotild observe, the first flowers of Cucumbers and Melons are either mile or female, and we have observed the same in Gourds. In the more tender ones, as C. melanosperma and C. moschata, we have generally seen the male flowers come first. The nature of the flowers is, however, predetermined long before the shoot is fully extended; so that if the doctrine is true, all the flowers on a shoot should be of one kind, which is certainly not the case.
The other remark we have to make is about what are called Cattle Melons, the seeds of which have of late been extensively advertised. What we have seen growing from purchased seed are all varieties of C. maxiroa, showing a greater or less admixture of the common Turkseap. Now this is not what is largely cultivated under the name of Cattle Melon in the United States, and for the same purpose in the warmer parts of Europe. The species cultivated in Amerios is uniformly C. Pepo, and sometimes produces as much as 15 tons an aore. A Gourd, probably of this kind, was recorded in this Journal, Feb. 1862, which attained the extraordinary weight of 280 lb ., and we have ourselves an enormous example of the Citronille de Touraine, the kind oultivated for cattle in Franoe, on a plant growing on a heap of cinder ashes, the major axis of which at this time, while it is still growing, measures 27 inches, and the minor 14. Should this ripen properly, of which we will give due notice, we shall be very happy to send a seed or two to any one who will forward a stamped euvelope with the proper address. We have moreover a Gourd from another variety, with whose name we are not acquainted, but which came accidentally with some other seed from France, which is nearly globose, and 15 inches in diameter. This resembles in form and colour the well-known Potiron Jaune, but does not belong to the same species of Cucurbita, but is a true Courgeron. There is however no chance of Cattle Melons being grown to profit in this country; in ordinary summers, and even in our hotter seasons, the produce would probably be confined to one or two fruits on a plant. If numerous they cannot be expected to be so large.

There is another species, \(C\). melanosperma, which bears black seeds, which affords exoellent food for cattle, though it is a very inferior Gourd for culinary purposes. But there is even less obance of this aucoeeding than the hardier C. Pepo and C. maxima, as it requires a considerable degree of warmth to bring it to perfection. Not a single fruit set with us, till the late extraordinary weather. In the East it is grown extensively for cattle, and is much estepmed because of its keeping well. When some Yaks were shipped from Shanghai to France, great quantities were packed in casks for their use, and many of them arrived in perfectly good condition after a long and tedious voyage. If cattle Melons are to succeed at all in this country, we must look to some variety of C. Pepo, which is the only species of the four which does not sacceed in a very hot country; and if we tried it we should certainly prefer what are called lazy-beds for its oultivation, pinches off occasionally the tip

Whatever tends to the improved Education of Gardeners at once commands our warmest sympathies. Hence we are glad to see, that moved theretn, we believe, by an impalse from Kensiogton, the Society of Arts has arranged to include the examination of gardeners in it well-tried and thoroughly practical soheme o

\section*{"It may be useful to some of our readers to give the}

Pot. Iod. gr. ijj.
Chior. Zinc. gr. viju.
examinations. Whatever the cause, we can entertain no doubt of the fact, that as a body-there are many honourable excentions of course-the young gardeners of the present generation are not the studious sulf-denring race ther were when most of those who are now the leading gardeners of the day were underguing professional training. Hence we can have no doubt that anr stimulus which can be brought to bear, in respect to their studies, upon the roung men sho are preparing themselves to take in due course these leading positions in the gardening world, will not only i, beneficial to them personally, but will also tend mest surele to raise Horticulture itself amongst the practical sciences: and leaving out of view the general advantages likely to flow from such a state of things, no one can doubt that even the vered question of wages must eventually be influenced by such an elevation. In fact, we hold this to be the true line of attaok upon the evil of low wages, wih which it is true enough, as otten urged, that gardeners have too generally to contend.
Most of our readers are doubtless aware that the Society of Arts has for some time pant held examinations in Botany. These are continued, with the usual prizes; but in addition, as an incitement to young gardeners to ground themselves in this useful and delorhtful semen, we wherve that the Council of the Royal Bortioultural Society offers three additional Prizes of \(5 l ., 3 l\)., and \(1 l\). respectively to the three candidates being bona fide professional Gardeners, who, taking any grade of certificate in Botany, ohtain the highest number of marks in that subject.

The new examinations, however, to which we desire espeoially to invite the attention of young gardeners, are to be conduoted under the heads of Florioulture, whioh is intended to comprise what in hortioultural language is called plant-culture generally or the flower-garden department; and rruit and Vegetable culture, which comprises the management of the kitohen-garden and orchard. Under the head of Florioulture candidates will be expeoted to answer questions relating to any of the undermentioned subjects :-
'The leading Flowers of the different nemsone, indicating those to be obtained antarally, and those by artificial means. Leaf Buds and Flower Buds. the conditions favonmable to their development reepectively. Food of Plants, how and wherice derived, and in whut frrm received. Manuring substances best adapted for Flower Culture.

Improvement of Races in Plante, how has it been effected, and by what means can it be carried forward? Hybridisation, objects and guiding principles of. Conditions necessary to ensure fertility in Flowers.

Construction of Houses for Plant Culture. Warming and Ventilation. Influence of Ventilation on Plants confined in forcing houses. Limits of Temperature endurable by Plants, and how to turn this to advantage in Practical Floriculture. Bottom-heat, value of in Plant Culture. Watering, the rationale of what to avoid. Liquid Manures.

Propagation, the various modes of, and their special adaptations. Germination of seeds, conditions favourable and unfavourable to. Vitality of seeds, duration of, and how best preserved. Treatment of Seedling Plants Budding, Grafting, and Inarching, how perPlants Budding, Graing, and and to what subjects best adapt. Increase by cuttings and by layers. Leaf-cuttinge, how is it that they can organise buda? Potting. Composts.
"Acclimatisation. Is it possible to increase the hardiness of any race of plants, and by what means?

The examination on Floricultural subjects is to take plaoe on the 24th of April next; that on Fruit and Vegetable Culture, embraced under the followa ing heads, is to take place on the 26th of April:-

Kinds of Fruits adapted for various soils and expures. The Propacation, Pruning, and Trand of cultivation under glass, both in and out of pots. The Theory of Ripening, and the principles that ought to regulate the preservation of fruits after they are ripe or their subsequent maturation. The Packing of Fruit for transmission to great distances.
"The kinds and quantities of vegetable seed! and roots required for cropping gardens of given dimen sions. The culture of the different kinds of vegetables and salads. The preparation of fermenting materials for artificial heating. The forcing of vegetables and salads.

Soils, Water, Atmospheric Air, Light and Heat in their relation to the succeseful cultivation of Fruit and Vegetablen. Manures and their application. The Disenses and Insects to which Fruit Trees and Vege tablesare subject, and their remedies. The Structure and
Functions of the Organa of Planta, considered in their relation to growth and reproduction. The erection heating, and ventilation of garden structuren."

The Society of Arts, in addition to its Certificates, offers prizes of 5l. and 3l. in each of these sections to candidates taking First-class Certificates. In addition thereto, the Proprietors of this

Journal offer prizes of \(3 l ., 2 l\), and \(1 l\). respectively to the three candidates, being boná fide professional gardeners, who, obtaining a Second-class Certificate, at least, in either Floriculture or Fruit and Vegetable culture, shall obtain the highest number of marks in one of these subjects, and also a Second-olass Certificate, at least, in Book-keeping or Mensuration.
The Examiners appointed are for Florioulture Mr. Thomas Moore, and for Fruit and Vegetable oulture Dr. Hogg. Those who are desirous of availing themselves of the examinations may learn the full particulars by application to "The Secretary of the Society of Arts, Adelphi, London, W.C."

While we aocept this proposed examination at its actual worth, as a direot gain to Horticulture, we trust yet to see the Royal Horticultural Society itself vindicating its position, by taking a more prominent and aotive part in reference to this important subject; and we believe we are correct in stating that some arrangements with this object in view are under consideration at the present moment.
- M. Tréoul has recently read a memoir before the French Academy of Sciences on the Production of Amyliferous Plantules in Vegetable Celis during Putrefaction. The facts, observes the Reader, given in this paper show that the organic matter contained in certain cells can be transformed, during putrefaction, to living bodies of a very different nature to the generating species M. Thuecul believes that he has discovered in the cells of a plant under examination minute crystals of chlorophyll, of various sizes, and of a bright green colour.

We are glad to learn that our countryman Mr. Mrrediti, of the Vineyard, Garston, has carried off the Medal of Honour, the highest prize awarded for Grapre, at the recent Fruit Flower and Agricultural Show at Brussels, with an exhibition that especially attracted the notice of the King and Royal Family. There were some four or five collections of Hothouse Grapes shown, but with the exception of those from Mr. Meredith, which attracted universal admiration, and a collection from M. Gobs, which were tolerably fine, the bulk of them were inferior, being nall both in bunch and berry. The season nevertheless has been very propitions for Vines, on the Continent, so that much of the produce shown was finer than usual. The most abundant objects of exhibition were the Apples and Pears, but the season has been so hot that they were dry and comparatively flavourless. Peaches were very good, and there were a few Pineapples shown. The plants were numerous, but comprised nothing remarkably fine. Wheat and Barley were good; Potatos very poor ; and Maggels large, but
very much deformed. The Show seems to have been a satiafuctory one.
M. Pastrur's views on the Ripening of Winfis were alluded to at p. 679. A memoir has since been presented to the French Academy of Sciences by M. Béchamp, in which he affirms, contrary to the resulta of M. P'ASTEUR, that the sole cause of the improvement of wines by age, is a fermentation, promoted by the presence of organic bodirs. Not a single exception to this was found in the different wines examined by him. He adds, that the whole secret of maturing wine lies in preventing acidity, and in encouraging the production of these organisms.

Those who know Glasnevin will be glad to learn that Government intends granting even a much larger sum than was anticipated towards the improvement and extension of that fine botanic garcen, Amongst other alterations it is proposed to improve the handsome curvilinear range of lean-to houses by doubling its width and converting it into a roomy spanroofed range; to modify and improve the ugly aspect of the new Palm house; and to add to the gardens an adjoining piece of valuable undulating land on the banks of the Tolka. It will be a capital plece for an extension of the arboretum.

A few monthy since M, Joarph Bormy commu nicated to the Imperial Academy of Sciences at Vienna, a paper on the Parasitic Nature of the MI8TLETO, in but that it actanserely as a vigorous, though useless, branch of the tree on which it grown.
- According to the French news in the leading journal, this is to be a prodigious year for Trupfles. A few have already been brought to market much sooner than is usually the case; but the harvest has not yet begun, and the precions subterranean mush-
room is still acquiring size and fragrance in the ground. Not ouly, it is stated, will the crop be unusually large, but the quality will be something very remarkable, the hot sun which came after some rains in August having been highly favourable to the perfume of these black diamonds of gastronomy. A century ago the whole of the Truffies annually gathered in France did not amount to a value of a million franes; they are said now to produce more than 30 millions. Truffes are found in almost every part of Fravie, and in many
departments their collection and sale is a great resource
to the poor in winter. Hitherto it has not been gene rally allowed to collect Trufles in the forests of the State, but that prolibition is expected to be shortly removed. A bundant Truffles and a wonderful vintage, it is remarked, will make of 1865 a red-letter year in the gourmet's calendar.

\section*{New Plants.}
315. Cepisiprdivi levigatuk, Bafomain in Bot. May., t. 5508.
This fine rew Cypripedium was discovered by Mr. J. G. Veitch in the Philippine Islands, and by him sent to his father's establishment at Cheleea, where it bloomed for the first time in March last. It is most nearly related to C. Stonei, the only other species known to have glossy leaves, but differs from it in the form and colour of its \(\mathrm{lip}^{\mathrm{c}}\), which is mmall and of a dirty
yellow, while that of Stonei is large, with a pink front on a white ground. The petals too of C. Stomei are not twisted, and only twice the length of the sepals while in C. lævigatum they are much twisted, and at least four times the length of the sepals. Again, in C. Stonei the dorsal sepal is striped on the outside with crimson, but is white within, whereas in C. lævigatum the crimson stripes are all on the inside.
Mr. Veitch found C. lworigatum established on the
roots of the well-known Vanda Batermanni, to obtain

a. Cypripedium lævigatum, b. Magdevaliia tovarensis, which was one main object of his voyage, though he ourght for it long in vain, and had alnowt begun to despair of ever meeting with \(\mathrm{it}^{2}\), when running his boat one day ashore in the bay of a seall ibland, he was delighted and astoniehed to find the rocks by the enest covered with large masses of the plant of which he was in quest. As the Vanda affects a warm situation, the Cypripedium should be treated in thie same way. Bot, Mag. l. c.

\section*{BLIGHTED APRICOT TRER}

I have been interested in reading an accound of is A pricot culture in the Royal Gavdens, Frogmore of and am reminded of the numerous theories formen advanced to account for that most diatiessin? disastrous blight by which perhaps one-thirl? half of a fine tree full of fruit would in oue dar beem totally dead. This was, I think, qecounted for br m theorists by suow lodging on the large horime branches trained againet a wall; this, thaming by and becoming ice at night, it was thought, hid foundation of this terrible disease. Othors impus it to the sun in summer scorching the bare parto of 1 ) old branches, and thus bringing on ouddon daut have strong reason for thinking it to be, like our Pow and other vegetable diseases, a mystery ; and allthen to be modified, yet perfectly incurable.
I say this, because I have had some conilm experience in Apricot cullure, and I hatio ino e trees under many different circumstsons in
south, west, and south-west of France the standre trees, which are sometimes planted among the \(T\) and in orchards appropriated to them by thoners and hundreds of thousands, are often afticted mith n dying off of large limbs, without any appareat cass and generally in the midule theory was knocked ofe for I had thought and said that the disease masora tor 1 had treought and said that the disease mas oria brought on a plethoric growth, subjecting the tree: a sort of apoplexy or paralysis. My favourite renes was therefore the budding Apricots on Apricot tremThis, by bringing on the growh of day of biet and I still believe it does so to a certain extent 1 icleas have, however, received this season a nem tan for among my numerous seedlings are many re from the "Abricot Pêche"-the Yeach Aprieot; a of these, a fine young tree, four or five years oli, morning in July last showed sigus of paralygis br leaves withering; by the afternoon, owing to the hot:the tree. There was no mark in the stem, E no signs of canker, for it looked perfectily sume and healthy, yet without the least the leaving only one branch, which has since tho d made a vigorous growth; on bending the stem it bith suddenly, and showed itself to be dry and dowin to any extra exposure to the sun, for it had beom in orchard house summer and winter, standiag awe is ther, and of cored a mysterious malady to the Apricot trees, particularly of the Moor Parl' shd varieties, are more liable than some other mire still it is not confined to them, for Ph discovered a large bearing tree in a pot of another \(=\) that has within the last fortnight suddenly didy iil was ten years
With respoet to seedling Apricots not varying wint in quality, I fully believe that if 100 socmus raised from the Moor Park or Peach Apricol coid? one would be found of inferior quality; some wound large, some small, some a trite earier, sond good. .h. small extent, but all would be juicy and gariety fic most difficult to procure any very distinecthat offer it seed, as there are but advantage by crossing.

The only really marked varieties which I bare ? produced are a seedling from that very oid sorn Red Muscadine, which has given me an carly like its parent, but larger and much mor The Museh Musch has also givent, and most sort double the size of robably the richest and larly rich and juicy, present known; and to fin in tavour of ail at presed, I may mention St. Ambroise, a sort rather early in ripening, duced a seedling large and very late, ripening after the Moor Park. This odd variation my not so surprising as what tyon a seedling fro house-a late Pavie, not yet ripe, a seed a
Early Victoria Peach, one of the earliest of sll. In the interesting notice by your corresich the Royal Gardens at Frogmore, at the place given to the Victoria Plu, Plum. This sort, as a culinary useful and good. I have seen it, and
in orchard and forcing houses, often very large and beautiful; and I' never could namage to eat one If her sweetness, the Transparent Gage Plum, I am the Transparen Gas of Four.

THE LONDON PARKS.-No. IV.

\section*{The Righent's Park.}

Lut ns neart carefally go through and examine the \({ }^{2} 505\)
with reqard to general design, it will be well to
mind that each is made in a narrow strip, T feent wide, and nearly 400 yards long, between two athe for a classical garden. Each side is divided into a monnal and two ante-gardene, and we are in the W. ante-garden looking to the soutb, where stands The interesting gardener's cottage, designed in the old
Fonlish stvle hy Mr. Eden Nesfield. In the ante-ardi-ns a walk runs exactly between the two lines of theas rards, thell it meets the central garden (which axpies nearly the whole width between the trees and the remainder of the length), when it branches and anden. Near the edge of the walk in each antearden tapering young Poplars are planted at intervals, thind which are the flower-beds and shrubs, gradually Theetnots on the other, with which the slim young Ppolers make an agreeable contrast, while they also give one an impression of wakiny through a sort of central garden and leave the last Poplar behind, the effect by contrast with the artistically narrowed ante garden if cue of breadth and expansion, so much so that je never think of it in connection with 75 feet. By otherwise have been a sort of veretable Gower Street. Pquilly satisfactory is the part played by these Poplars at ench end. By forming a minor vista to the big trees they carry the eye onwards, aid the perspective, and narmwness, and consequently of increased space.
Here and there among the shruby on either side the antumgarden walk are yonag standard Almond and
Prach trees; by-and-by these may be sufficiently leveloped to produce this perspective aiding effect, and then the Poplars could be dispensed with if they should
beome to.) large or othervise objectionable. There are tastefully pheed vases on either side the ante-garden malks, and large raised tazzas and vases in the centre of the main gardens. The Puplars are used in the eas zarlen with the same object and the same effect.
Now let us discuss the matter from a purely gradenth N.W. antegarden are composed of a centre of green findenved plants such as Dracemenas, Solanum robustum, and Aralias, surrounded by a belt of the extremely 73eful Amaranthus melancholicus, edged with Centaurea.
This, though not so floe an example in the same divaction as we shall see on the N.E. side, is yet quite an antidote to all grumbling on my part, for it is the
wry thing I have been all along advocating. The central beds in this ante-garden are two bold masses of being of Yellow Honeysuckle, which looked very washy indeel against the white stone, as did some of the
Gorden Chain breed of Geraniums in like positions. Oberve th:at thers is as mueh variety of arrangemen in these grardens-I think more-as is ever noticed in zandiness. For instance, there are two circles on each side, north and south of this oblong bed of Stella, planted respectlvely with purple Vorbona and Calceo the Stella is a narrow band of yellow Pansy running along in front of the little Privet hedge which borders
the the towering slifrnbs and Aucubss. In the 8.W. antezarden this little strip is of Variegated Mint and blue
Iobelia; in the S.E. ante-garden it is a most pleasing combination made by planting a line of Scarlet Verbena behind one of variegated Cuckufoot Grase - an excellent -dging plant; and in the N.E. garden a mixture of Vartiegated Mint and Amaranthus melancholicus proves ; beiding senson around London. When the gur is ont nothing equals the translucent beauty of the celour of pardeners ; and this ought to teach a lesson to those is Andeners who, when the planting of important points other, with the commony border a fac-simile of every
It may be observed that some things do not here look on well as in more open gardens, and this is in consebungry man will not more gurely eat a gaveury dish suck his reach, than will these gormandising trees Dale for every bit of nourishment in these beds, not anpedient will completely ent the roots off from the being emboth, which will thon have the advantage of being eaten up by trees.
these parhan to the mont pleasing componitions, and in the wide oblong beds with tazza in centre and botho is a line of Holls Running along the middle of the ing green behind the brilliant flowers-a capital idea. Trenthen eide of the Holly its one row of stella, one of 15 inchece Rose, one of Chriatine, two of Manglesii,
as to heights and forming a pieoe of brilliantly harmonious colearing, which cannot fail to plense overy garden is the way in whioh tapering, sraceful, and formal shrubs are used on the Grass band surrounding these panels. Yucea recurva is freely planted, alter-
nating with pyramidal Box, Yews, beds of dwarf Rhodonating with prramidal Bos, Yews, beds of dwarf Rhodo eventually prove one of the most useful plants in these gardens, and slould be planted freely in every geomerical garder. Just observe how chaste and pretty this line of young white Fuohsias looks in the raised bed round the Griffin tazza; they bloom continususiy, and re so satis'actory as to warrant the general use in lower gardens of this popular favourite, particularly in eds raised 18 inches, or higher.
Space does not permit me to go through every eature, but I must point out a bed of crimson and green Dracenas with fine India-rubber plants in the is pretty, and aloo teaches how careful we ought to be about putting such things in the open air. In the oouthast ante-garden the chief compositions are centred by handsome but simple vases with Ivy creeping round the base, around which is a circle of Frogmore Searlet which is quite surpassed by Attraction and Stella. On each side of this is a bed of Coleus edged by Centanrea,
very effective when the sun is out. But on the whole, ranting that the two plants do equally well, Mr. Nes field thinks Coleus andor no circumstances equal to Amaranthus, being of too deep a tone. I think so too, and aleo that nothing sarpasses a mixture of this Ama ranthas, and some milvery-looking subjeot like the Variegeted Mint.
The eastern central marden does not seom thoroughly in unison with the situation and surround ings as the westom, but hem ariben from the necosaity of having to facilitate the disperaion of the large crowds that pass up and down heroabouts occasion of colouring seen for a long time occurs in this. It is called the cable frieze, and viewed from oither ond is well worth a study, although Purple King and some of the Polargoniums have been put out of humour by the ponring rains of Angust. It is composed of six gradnally enlarging circles, the smaller one having only roon for speck of Centauren, with band of Pueple King an edge of Cerastinm, while at the other end a large circle of Stella surroundo the green belt at the base of the vase, Looking from this vaw see the Centanres normin a white spot: in the centre of its bed, and next to it in the series Alma variegated, then Flower of the Day, the circles and bands of Purple King getting arger and becoming warm; then in the fourth bed Golden Circle; while the fifth, next the glowing Stella, is filled by a splendid mass of Golden Fieece which would seem to be a valuable plant compareg to
some of its allies. The fillings in, or little trimgular some of its allies. The fillings in, or little triangular beds, are well planted by Christine, which las a beautiful effect outside the novel series of variegated bed. the frieze is Blightiy puak and marg. tone curb, a narrow gravel waik running ins, instead of being left in its nakednese, is for 15 inches next the tone curb densely covered with darls-green trailing Ivy, kept clear of the white curb, and of a few incheo of gravel near the box; the effect of the whole of tais
frieze, which I take to be quite original in its planting is that of exquivitely quiet harmony of colour, as distino from the brilliant harmony of the N.W. central garden. It could only be bettered by substitating Silver Chain Pelargonium for the
We have no time to spend apon anything loes beatio
fal than this, and so will step into the.N.E. antegarden, which I take to be the feature of this year's planting ; and as particularly illastrative of the true theory of garden embellishment (I bate the wor bedding-it is only fit for the kitehen garden), I would recommend all gardeners who have the chance to study t for themselves. From this garden you maymediately may be seeu from any of the ante. garden. . the contral barden the frrst rase at the enge intended by the aruina baid fom the ante-garden the color designer to bide out from the antagar the ante-garden complete in itself. In some of these beds are Cannas, in others Dali. bit in all the intent is the same. The first striking thing in this ante-garden is the laxurious growth of the sub-tropical plants employed in it, and not planted on raised mounds, but ont the level ground as ordinary bedding plants. They have, it is true, a lajer of brick rubbish below clay bottom, and would be quite unnecess iry in nine cases out of ten. Of course these bricks are quite ineffective from a geothermal point of view, and yet the Castor (Dils have leaves two feet across, and are 9 feet high already, while the Ferdinandas top them by a foot, and the Caladiams make leaven heathy ard dustinct emongh to be nobly useful. This, depend apon it, is the best phase of sub-tropieal gardeming, bocause the plant an may be raised nearly at cheaply and sreon plants, becanse they grow as fresa wildest native plants, and afrord a mark the S.W. antegarden and
a still greater contrast to the ragged Hollyhocks filling similar beds in the S.E. gardeo. However desirable these latter may be from an artistic point of view, their number might with adrantage be reduced, and come distinct beds such as those in the N.F. ante-garden ubstituted for them
Here it is that the band of Amaranthus mixed with Variegated Mint is so conspicunus for its beatut. It is
not an unbroken or monotonous band, as at every 20 yards or so out juts a circle of Ferdinatidas with a band of Castor Dils arouml, edged by the nithe leaven of the esculent Arum, and the line of colour rams into this as it were; while looking in the other direction, a circle of equal size projects with basket vass in centre, surrounded by a row of Arum esculentum, which 8sochates beautifully with the vase, and aromad it a uass of Pelargonium Rose Queen eiged by Gumhnlium lanatun. This I take to be an artuatic and excellent attempt to associate graceful plants with showy onet, and sich combinations must eventually bear away the palun from vast pilea
Now look to the north end of this ante-garden, and you will see the walk bramches off instemal of koing straight to the end as in the opposite site, and this formed by the branching of the walks is planted with formed by the branching of she wadkis plamtentlective and pleasing inargin, composed of Centaurea near tho dark foliage of the nhrubs then a good bolt of Frog. At the northern and wider end of this triangular space runs the ohort cross walk as in the other antegardens, but in this case beyond it there is a bank of Ferdinandue, 9 and 10 feet high, on a rich raised bed to "finish off" the garden, and this rich green wall seen "finish off" brise garden, and this rich gargined Bhodoriendron bed comen well.
This garion, which impartial abservers will prononnee eminently suited to the situation, and as well arrange as it could be to secure variety without "frittering away," has, as regards its summer decoration, as well designal planting and westid. As a whole they would be highly creditable to any landecape zarifener, but thoy are remarkable as the work of a young artinc
he paric is well superintended of Mr. Edwarde the new Mr. Murply; and lar. IVon looko atter fully dieplay the present aystem of flower gardening consequently there chould be no further extention of fine gardening. There is however a speos beliveen these gardens and the Colosseum cut off from the park proper, and this it is proposed to convert into winding shrubberies, de.-indeed, the contractor is arready accumulating his materials for he wrk Ater this every incb of generation of children-big and little. Why, even now generation of children-big anats of this park are alive with little vivacions Londoners. To see them so with little vivacions londoners. one of the best things a thinking man can see in it. There little London, fall of raptare, is gathering ap that health and strength in youth for which oppor carnest. W. Robinson

\section*{GRNMBAL FLOWER BEDDLNG.-No. V.}

Ir providing a mitable display for the different seasone of the year, habit of plant as well as floral beauty, together with the proper position the different plants should oceupy in a flower garcien arrangement, mut all be kept in view. Great numbors, of platiey theless wholly unit for purposes of meneral decoration, and can only be used with advantage in misel borders, or in other situntions in whioh other plants can aid them in maintaining the display after they get como paratively inaffective. In this class we must include Phloxes, than which few plants are more beautiful while in bloom, but unfortunately their gaiety is aon over, leaving a blank to be made up. Thus in a bed of Phlox verna I plant Duke of York Tulip, and edge with double white Daisy. The beautiful Phlix procnmbens is best as ant edging, or as a covering for the side of a raised bed, intermixed with a feer plants of Scilla sibirica. Plants of similar habit may the treated in ame manner, and in the case of these, and many other spring flowers, such as Daisies, Arahis, Aubrietia, \&c., the bed or edging should be planted thickly at first, as they seldom grow much atturwards and amount
the effect in spring is apt to produce a certain amoner of disappointment.

Among aunuale there in great choice of colour ; the pretty old-fashioned Virzinian Stock makes a beaatifal adging, but if grown in bods it should be intermised Deisy, the rich onloar of the Tulip setting off the light lilac of the Stoek to excellent adrantage. Collinsia bich which Queen Victoria
 Tulip may be adrantageously asociated. Any person
trying this Collingia for the firat time must nut be discouraged if the veeds do not come up at the time thay are expeoted, for from some cause or other I have
knows tham to lay in the soil for at leant three meath

 califirmiea, whiech is a beantifill yellow, and tatands the winter in most placeas Nemopopilia inimigisis has of late been much negelected for for summer bedding in the sonth; ; it is of thoort daration, but in spring

 an early or late spring makes all the difference in regard to their blooming; where there is convenience therefore
a faw should be sown in a pot, and afterwards pricked off into 60 -sized pots. These will always prove sufficiently early for all purposes, if planted out on the firta appearance of ano weather, and the pots may
 do not require any protection, but, on the eontrary, are bettere out of doorsi Of thees the Silene, the My Molotime and Saponaria are the bett; Limmanthes Donglami i nod grandiflora are also good in their way, but they flower later than most people consider a proper season to commence summer planting.

With materials such as these and others at command, I have no hesitation in saying that our beds and gardens should be a continuous mass of bloom daring the greater part of the year; as soon as one varioty of
plant gets out of beauty another should be introduced, just as we do with various other crops in spring and summer. For summer ribbons it is found that certain kinds of plants are used almost everywhere, owin doubtless to their possessing properties to recommend them for that kind of ornamentation, a fact which is also equally the case with regard to spring the coming season as an example. The plants I employ are Ivy, Cerastium Biebersteini, and Queen Victoria Crocus, Red Daisy, Pink Daisy, White Daisy, Blue Pansy, Yellow Pansy, Dark Pany, Creamy Silene, Yellow Wallfower and Anemone mixed, and Red Honesty at the back. These form a ribbon against a wall, but in many places there is no wall, and in that case the
advantage of the arrangements mentioned at p. 819 will be apparent. Where no wall exists greater variety may be created, inasmuch as the lines may be wavy or
serpentine, which is more pleasing than straight lines, and serves to show the varions colours off to better advantage. To prove this we have only to take \(p\) circular bed and a square one, and compare them. The circular one is always the most effective; let us suppose to be apras and form of bed softens down their stiff, stately habit, 80 as curves. J. \(F\)

\section*{Home Correspondence.}

New Hardy Blue Bedding Plant.-Many a garden is affected with emut and gas, and particularly botanic but by far the worst off in this respect is the Liverpoo garden, where even the much-enduring Hawthorn seems devotes most attention to bedding, the only gardening doors in the Liserpol a decent example of out-ofdoors in the Liverpool Botanic. And his display of
bedding plants is most extensive, novel, and beautiful -a leading feature in one design being a string of small circular beds running through a scroll pattern. They are filled with a blue flower, fresh and effective; it \(i\) here now, but Viola "montana," a plant likely to be of great use in the bedding department, and a grea acquisition for those who sigh for a hardy bedding col-
lection. It is grown in good soil and in a slightly hollowed lection. It is grown ituat these are not peculiar to the Liverpod "arden, and the plant, is considered by Mr. Tyerman his bedding. It was in blue is surely a great want in (6th Sept.), and had been so since the dawn of summer Though it is known in the garden as Viola montana, it is apparently not that species. Doubtless it might be planted with advantage a few weeks earlier than the ordinary bedding plants. I would recommend gardeners to try it next year, particularly those in the district counties wha proved so useful, and in the northern presence of Coleus, and one or two other thinge that do well about and sonth of London. Viola latea is also used with success as a bedding plant by Mr. Tyerman and here and there it forms a pretty edging to the blue the question as to the name of this blue Viola.]
Califormian Cucumber.-A very fine specimen of this Cucumher or Gourd has this year been grown by Mr.
Grabam, wond agent to the Duke of Newcastle at Clumber Park, Notts. The plant which produced it was raised by Mr. Graham, from seed forwarded to him from the township of Etobicoke, County of York, Canada West. In Upper Canada tbis species, the fruit of which sometimes attaing the length of \(6 \frac{1}{2}\) feet, is Cucumby" known under the name of "The Californian region on the Pacific side of the continent, from which is probably the same plant as that jears ago. It country by the name of "The Snake Goourd ?" that
title being derived from the great propensity the fruit exhibits to curl and twist like a snake; by careful training, however, it may be grown quite straight week it had attained the length of 5 feet 2 inches, and, owing to great care having been paid to training it, is as straight as any ordinary common gardeu Cucumber The able garden-superintendent at Clumber considers he fruit in question to be a curiosity. W. S., Sparken, Worksop. [The true Snake Gourd is tender, and of doubtfal utility, and is evidently different from the foregoing. ] The Weather Prophets.-I was tempted last spriog enn one shilling in what ought to have been one penny, to gain possession of a sam thin pamphet to the "Forecast of the Summer of 1865." I now quote the few lines:-"It is considered to be significant of a ummer remarkable for its extreme coldness, thereby hrowing back the crops for their full time of maturiug and housing into the usual period of the autumnal rains the whole period of their growth will be probably rendered unkindly for them by the presence o unwonted cold." Again, I read from a letter of a "Mr Shepherd, C.E.," to the editor of the Mining Journal The general charater of the autumn will be, as I have over and over again asserted very bad indeed." (The italics are Mr. Shepherd's.) year or two since a Dr. Plant, of Birmingham, one of the mildest winters on record. When will these over-weatherwise gentlemen leave off their idle surmises ? One would think after what the venerable and experienced meteorologist Arago asserted, hat we should not see any more of these Murphy-like presumptuous weather prophecies. If I remember correctly, be candidly stated that he had most carefully studied meteorology for 20 years, and had come to the conclusion that he knew nothing and never should know anything sufficient to enable him to give a fore cast of the seasons. Let us therefore hope that afte this most glorious, sunny, agreeable, abundant season, we shall see no more shilling presumptuous pamphlets Tictoria Regia, -Th
is Queen Havant, Hants, the country seat of W. H. Stone, Esq M.P. The plant now in flower is a seedling from that of last year. It was planted out on May 12th, 1865 vhen it was very small, in a 48 -sized pot, with only two small leaves on it. It has made excellent progress, and it, eight of which average 6 feet in diameter, exclusive of the rim, which ic
2 inches deep. These gigantic leaves, which are light green above and vivid crimson below, are covered with numerous elastic prickles, about \(\frac{3}{4}\) inch in length. The stalk of some of these is 1 inch thick, extends to 10 and 12 feet in length, and if our tank had been larger, they would doubtless have reached to even a greater ength than that. The plant has produced six or seven flowers, and several others are showing their heads above
the water. When this magnificent flower first unfolds itself the water. When this magnificent flower first unfolds itself
it is pure white, with a pink centre, which increases it is pure white, with a pink centre, which increase
in size as the bloom becomes older. When about a day old the whole is a pinky rose colour, and it throws off a sweet scent. The upper side of the calyz, which consists of four leaves, is pure white, the under side pale green, closely studded with short prickles. O petals there are 100 when the flower is perfect; but in eneral they average from 80 to 100. When expanded the calyx measures from 12 to 14 inches in diameter; but it is concealed by the petals. The full-blown flower measures from 15 to 20 inches across. This Queen of Lilies is stated by Sir Robert Schomburgk to have been ound growing in a currentless basin formed by nature n the river Berbice in British Guiana, South America 1837. A. Young

Large Peaches.-I see (p. 868) that Mr. Umney's Peaches are larger than those which I gathered nere rom turfed borders, a circumstance at which I am not urprised, as I have practised in his immediate neigh bourhood and therefore know its capabilities. In the neighbouring county (Sussex) I have seen Figs ripen on standards by the bushel, Peaches on an east aspect, and Grapes on any outhouse with a south aspect, all of which in the county of Darham must be grown under lass. We cannot, therefore, compare Durham with Surrey ; but if Mr. Umney will sow down part of his
Peach border and publish the result, he will confer a Pavoar not only on myself bat also on otherns. \(L\). Steven som, Lambton Castle, Durham.
Croous nudiflorus.-How is it we do not grow this charwing autumn-flowering plant in plenty? It is far leaner and prettier than the Colchicum, and I think the best little plant that flowers at this season. A good show of it about the 18t of October would be very
desirable in many gardens, and it is much to be desired that the Datch wonld take it in hand for us and make cheap like the spring kinds. W. Robinson.
Owvirandra fenestralis.-In answer to my friend J., Dangatein, Petersfield," in reference to the article written by me at p. 299, I may state, that a few years
since, when Ouvirandra was comparatively new, I had several plants, some in glass and some in earthen vessels, and I invariably found that atmospheric changes were injurious to the plants-soinetimes they were too hot, and at times too cold. Being anxions to overcome thi dimealty, 1 thred a plant in a large tub by planging it
find how fast arowing, and I felt quite delightat: nearly touched the sides of the tub ( 4 feet, in dinem all round, and quite as fine as those deteribed The first cold night we had, the temperation house became low, and all those in pans on the of ise urned black, the leaves rotting in a few days, learim only a few young ones in the centre, while the plan: fy the tank remained as fresh as ever. I continued reatment, and I found the plant as go d at Chrisime Ouvirad been at Midsummer. At this time f the no s it winter months was of consuerable importa the plant rested, or nearly so, but retained sea eaves as good as ever. As the spring advance began to grow as rapidly as it had done in the p
summer. Therefore I attributed my success to ap a uniform temperature, or nearly so. I may might have been a few deorees lower in min summer, but not many. This plant was slways d but the other plants were often subject to Confern, bough the same water was used. Had I to gro plant again I ahould still adhere to my former ment, and should not hav with similar success. Thos. Brown, Erotic Nums

The Humming Bird Havk Moth, Macroglom stellatarum, or, as some of our country folks cal "Nimble Dick" has been very abundant this y this neighbourhood the larvæ may be found in h解 seashore, feeding on Galium verum, while moth is constantly to be seen on the wing. Thenv in however, one point in its proceedings which pazzes and which perhaps Mr. Westwood or some of entomological correspordents can explain. Ther ong brick wall fully exposed to the sun near my howe, and daring the past summer I have frequently hese moths flying from brick to brick and tonc he mortar with their long proboscis, as they hover rers of the Verbena or any of those mave lowers from which they extract the sweets. can be the object of this? On the other side wall they had flowers in abundance, but they p what seemed to be a complete waste of time to the more pleasant occupation of "sipping nectar." Doabtlew hey had an object. What was it? D., Deal.- 1 umming bird moth has been very abuudant in eighbourhood during econd brood has appeared. Unlike the majority phingidæ it flies during the hottest sunshine also the beautiful moths of the genus Plasia, of which
the burnished brass (Plusin chrysitis) and the gamas the burnished brass (Plusia chrysitis) and tholes noth i(Pl
Offensive Smell of Water in Tanks.-The melt hich your correspondent complains, is undoubtedy caused the decomposition of vegetable matter in water, and it may be prevented by putting a suak quantity of charcoal into the cistern or tan ; in p into small pieces the charcoal will foat on the T. \(C\)

White Nice and Syrian Grapes.-Having seen the large bunch of Grapes shown under the name of vice by Mr, Fowler at the "Intermational Exab Edinbargh, I am of opinion that She Svrian of Speechly's Catalogue. I have see syrian grown both at Welbeck and at Clumber, ines which I have no doubt were rased fla original Vine of Speechly's at Welbeck, and was of the bunch as well as that of the berries was lifferame as that of Mr. Fowler's Crian保 ipe is of a beautiful pearly colour, and whe
tion it is far from being a bad Grape Speechly grew one bunch of the Syrian to
of \(19 \frac{1}{9}\) lb., a fact of which there can be no the late Duke of Portland told me that he wighed, and that it was carried on a pole Rockingh Speechly conld never again grow a bunch 80 the same Vine; the large bunch in quest tself on the top of a strong rod that had form congeries of eyes" producing six great are duced for some particular purpose, and can on grown by leaving few bunches the required weight. long distances. Exhibitions.-The managers of horticultaral exhibitions often make great mistakes in appointing juages porin all, and accordingly they elect botanists or florists to be censors of fruits and vegetables, or good fruit growers to judge Orchids and Ferns. A notable *o ooted florists were appointed to judge the Plums Pears, and Apples, and a very pretty mess they made Pears, Surely, when fruit-growers incur the expense and trouble of sending their productions to a Show, and by so doing make the exhibition attractive to the general poblic, they are entitled to so much consideration as, to so pouesess some knowledge of such things. A Country Gendemer.
Aoparagus. - About London young shoots of this are rringing up in such profusion that a great many dibles have been gathered and sent to table, and I am fold that cgards flavour they are excellent-in towerer, that the result of this unseasonable supply will be a weakening of the roots; at all events, the that no frost gets to the roots, otherwise they will be likely to suffer. Has cutting thus late been general autiumn throughout the country?
Milky White Potato. - We beg to direct your attention to this new Potato, which we introduced last sealon. There is an old saying, that "the proof of the podding is is the eating, and for your acceptance a boiling of it, in order to enable you to judge of its taste, colour, and appeartuce when cooked. It is early, having been ripe these fire or six weeks. It is a capital cropper, free from after Christmas. J. C. Wheeler \& Son, Gloucester. Milky White is a medium-sized, sballow-eyed, thinskinned Potato, which, when cooked, is particularly Plane Trees.-At p. 847 it is in favour.]
Plane Trees.-At p. 847 it is stated that a Plane tree now exists on the shores of the Bosphorus, 90 feet high and 150 feet in circumference. Did any of your readers ever see a tree 30 feet in circumference; if so, let him imagine if he can a bole of five times the size
Even the Wellingtonia must hide his diminished trunk after this. A Country Gardener. [The statement copied from Dr. Daubeny's book is perhaps a misprint for 50 feet, or the trunk may be a composite one, or it mas refer to the head, not the trunk.]

\section*{Foreign Correspondence.}

Niw Zifatand Gardiming. - Probably in no one instance has the progress of Canterbury been more marked than in the science of horticulture. In spots but a havery few years ago, nothing was to be seen reigned supreme, and where the most coupd was covered with the wildest and most rank native vegetation, ardens may now be seen on almost every side, rivaling geauty and fertility those of old England. The great drawback to the natural beauty of the Canterbury plaing was at first the total absence of those essential have the rivere scenery-trees and water. True, we banks were planted, as is now the case they rathe disfigured than embellished the scenery, by adding to the general appearance of wildness and desolation those familiar to us in the home country to the productions of Australia and Tasmania, are flourishing luxuriantly, forming a strange combination between the two hemispheres. Willowe and Poplars flourish purprisingly, and the next generation may see our lome vieng with those of Lombardy, to which, in reeeublance, and are fuptures, they bear a strong natural origin
of Mr. Purdie is one priees altogether ituated in the Papanui Road, and compriees altogether about 8 acres. A more unpromising labour a gas been could hardly be imagined, and great The land actually under cultivation contains an sheltered fross variety of plants, trees, and shrubs, over the from the bleak winds which so often sweep the young growing plants and to the ripening fruits, Adjoining this kept, composed of the Cape Broom. now being this is a considerable area of ground, plaing difficulty, for it presents the aspect of a barren scanty, the monotony of which is only broken by a and Neough vegetation, composed of Cabbage trees peaty soil, and when the ground, however,
it in prgetic owner. The Flax plants, which grow on
it in profusion, add to the fertility of the soil, as the
decayed matter is found very useful for gardeniug purposes. The ground has to be first ploughed up
and then the large clods have to be broken, in and then the large clods have to be broken,
order to produce a tolerable evenness of surface. person who had seen the land a few years ago coula hardly recognise the change which has taken place or believe the rapid growth of the trees and shrubs. The garden contains an immense variety of plants the Apple, Pear, and Peach trees being loaded with fruit. The early age at which fruit trees produce their crops, is one of the strangest incidents in the Canterbury gardens. Some of the Apple trees, barely 12 feet in height, and of a very small circumference, may be seen so loaded with fruit that the branches are actually weighed down with it. The blight has played sad havoc with some of them, and the young trees in many instances are as much disfigured and distorted as trees of old growth sometimes are at home.
Mr. Purdie possesses a fine collection of ornamentai sbrubs. One remarkable feature in his garden is the success which has attended his budding and grafting operations. This is especially noticeable in his specimens of the Holly. On standards of quite a recent growth he has budded some of the choicer sorts, which have taken surprisingly; some of these are of great beauty, especially the variegated sorts. The Conifera thrive most luxuriantly: indeed, these plants Zealand than they do in England, and in a fow years owing to their rapid growth, they attain a considerowning to their rapid growth, they attain a considergreatly prized, on account both of its pretty foliage and its handsome fruit. The Virginian Cedar, and an endless variety of the same class of shrubs, are also to be seen, as well as some fine specimens of Pinus excelsa, P. maritima, \&c. There is a beautiful Viburnum japonicum, a most valuable and ornamenta shrub, distinguished by a dark evergreen foliage, and forming a most desirable addition to a shrubbery, as there is no great difficulty in rearing it. The Ilex cornuta thrives well, and is a very pretty sample the Holly. Another plant of great elegance deserves mention, the Wistaria sinensis better known in England as the Glycine. It has been common enough at home of late years, but on its first intro duction was much valued. It is particularly suitable for this place, as it is easily propagated, and where we have so many verandahs it forms a very pretty creeper for them. The one in Mr. Purdie's possession is one of the few, if not the only sample in Canterbury. He possesses some elegant and valuable hrubs and plants from Tasmania; amongst them specimens of the Peppermint-tree, as yet but small In their own home they attain a considerable beight the leaves possessing a pungent flavour. We must no omit to notice an old acquaintance, in the shape of the common Snowberry-tree, so familiar to us all. This shrub seems to thrive very freely in its new home, and promises to be an acquisition well worth fostering. The Chinese Privet grows well ; it is a pretty plant and easily propagated.

\section*{Soritties.}

Botantcal or Edinburgi: July 13.-Dr. Dickson, President, in the chair. The following communi. cations were read:-1. Supplementary Notes kpon解 Giri, and proceeded in April and May, 1862, to inspect the wooded tracts of Bassahir. The official report has been printed by the Punjab Government. The peculiarities of the Simla Flora were enumerated, and the table of mean temperature at Kotgur was given. The means of communication from Hindostan to Tibet, and the different kinds of rope bridge used in medical sid in Himalaya were explained. The the remarkable fith of the people in the skill of European physicians, was alluded to. The frequency of goitre and the large amount of ophthalmic disease were mentioned. Agriculture is capable of little extension from the precipitous character of the hills and the small proportion of arable land. All the available ground is laid out in terraces, and the cultivation is carried on with great care; the soil is often good, and the small fields are onclosed with loose stone dykes. As soon as the snow melts ploughing commences, and the women are sent out with baskels of manure. Every cultivator heaps up before his door or ander the them the the sheep and cattie, and mizes the animals Grass and leaves used for littoring the animais, purpose. To this are added the dried capsules of Poppies, Walnut shells, and Apricot stones, with refuse chaff when not required for fodder. Indeed, this branch of mural economy is well attended to by the hill tribes and those substances having lain during the wintermon the foll rotted in apring, when they and when the Poppy and Tobacco plants appear above ground. In Kunawar, the lands of few villages pro duce more grain than the inhabitants require, and is annually imported into the districto In times of scarcity the people eat Himalayan Chestnuts (Pavia indica) and Apricot kernels. These are soaked in indica) and Apricot kernels. the bittarness, and an
afterwards ground into flour and mixed with the uferior millets, forming large cakes. A great demand for food has arisen from the influx of spurtsmen and other summer visitors who annually increase in number. The Agri-Horticultural Siciety of the Puujab grants a rearly suppir of vegetabie seeds fo distribution among the inhabitants, and encourage the growth of esculents in the Himalayan valleys. Many European and American vegetables bave been intro duced, and grow well. The Potato, in particular thrives remarkably, though the inhabitants in the upper valley do not ret cultivate it to any exteut. For several stages from Simla the increased cultivation of this esculent is very surprising, and it is largely exported to the plains of the Eastern Pubjab for the commissariat stores of our liuropean truops. Stise
system of culture pursued was described. Steep slopes are preferred on account of drainage. The soil is generally loose and stony. The underDeodar trees are cemored-the sipruce Fir (Abien Smithiana) not being valued as timber is killed by barking, and the trunks fall in one or two years. The Oaks alone remain for shade, and are gradually felled for charcoal. After manure bas been supplied to the moil, the Potatos are planted in the middle of April or May upon narrow terraces. At the close of the rains, five months after planting, the tubers are dug up fully ripe. They are packed tightly in woollen bags, and despatched, generally on musee, to the plana, These are relieved of their burden twice a day, when the sacks are thrown down carelessly at halting places, which bruises the Potatos. The plan of packing them in boses might secure more careful transport. Turnips re sown after the cereals have been reaped; they are eaten fresh or stored for winter use. The anther mentioned that, in crossing to the Asrang laller, Turnips not much larger than a billiard ball. . Notes on the Porests of India. By Dr. Brandia, Inspector-Gteneral of Foresta in India. The autho described the characteristic vegetation of the different lasses of forests in Burmah, which the has superin ended for 10 years, and contrasted their general ppearance with those of the Sal Forests at the foot o he Himalaya and the less luxuriant forests of the Central Proviaces hich has heen intreduced into Brition India, as the only safe basis of conservancy.-
3. On the Influence of Forests on Climate. By. Becquerel ; Trauslated from the French and com municated by Mr. G. M. Lowe. Mr. Lowe gave n condensed account of M. Hecquerel's paper on forests, and their effects on climate, read before the french Academy in May last (see p. 722). The first portion of the paper gives an account of the extent of fores land in France from the time of Julius ('esar. The second is on the action of forests on climate. This, he says, depends, firstly, on their extent; secondly, on the height of the trees, and their nature, whether having caducous or persistent leaves; thirdly, fourthly, on their capability of absorbing and radiating heat; and, fifthly, on the nature and physical condition of the soil and subsoil. This influonce is also exerted on running streams and springe. 4. On the History and Structure of \(L_{\text {'rocoreus. By }}\) C. Jenner, Fisq. This little-knowu and rare plant was first noticed by Mr. Hassall in 1545, and was by him named Ourococcue, from the peduncular process, as he called it, aepencmon with Agardh's Hematococcus and others. Mr. Jenner exbibited a set of microscopic preparations, and a series of beautiful drawings, executed by Mr. Nell Sterrart, showing that the process called a peduncle by Hascall, and subsequently.by Berkeley, Henfrey, and Brann, is lit a mer the nucled cell. Mr. Jenner showed the close affinity between Glooocapsa and Urococcus, and illustrated the more compliated structure of the latter by a reference to the simple structure of the former. Mr. Jenner gathered his plants in some caves on the West Const of Arran.
Brimish Assoctation: Soptember 7.-In the first dey's sitting of the rarious Sections few subjecte adapted for our columns were discussed.

In Section C. (Geology), the President, Sir R. I Murchison, in the course of his address, observed, in reference to the first traces of life in geologic hecora, that the lowest sedimentary rocks, wife, had been gonnd to conaid a This discorery of araminifer in the very lowest known heposit ingtend of interfering with, suatains, he said, deposit, he truth of the docts of life, and this beciunin ras followed through long perinds by creations of higher and higher animals successively. Thus, through the whole of the vastly long Lower silurian period, so rich in all the lower classes of marine animals, whether Molluaks, Crustaceans, or Z wophytea, no one has yet detected a vertebrated creature. Fishes first begin tn ppear in the lateat Silurian deposit, from which time o the preat day they have never ceased to preval有 to
ing period, have followed each other. In the over ying Secondary and Tertiary formations, higher and higher grades of animals successively appear, and
the relics of man or his works have been detected in the youngest only of the Tertiary deposits, though certainly at a period long anterior to all history now well know that human beings co-oxisted with the physical configuration of ; and we also know tha gone considerable changes since such primeval men creation, and those writera, however eminent, who have announced that fishes, mollusks, aud other inverte brata appeared together, have asserted that which is positively at variance with the results of the researches pinion as to the great intensity of power employed in the production of dislocations of the crust of the earth, though I cannot subscribe to the doctrine that the ordinary action of deep eeas remote from coasts can adequately explain the denudation of the old surface Admiring the Huttonian theory, as derived from reasoning upon my native mountainous country Scot land, and fully adinitting that on adequate inclines ice and water must, during long periods, have produced great denudation of the rocks, I maintain that suoh maning is quite inadequate to explain the manifes proofs of convulsive agency whioh abound all over th

\section*{In Section D.}

In Section D. (Zoology and Botany) a very interesting paper was read by Dr. Moffat on Phosphorescence in
connexion with storms and diseases means of tables, that the readings of the baromete were higher when phosphorus was non-luminous, than during its luminous periods; that the degrees of former than the latter condition, were lower during the luminous during the prevalence of the north wind. By imisar tables he showed also that periods of phospho inga of the larumeter, increasing temperature read humidity and the setting in of the south wind; and that they as invariably terminated with increasing readings of the karometer, decreasing temperature and humidity and tho setting in of the north wind. The re phosphorescence and ozone periods, and periods o pon-phissuhore:ccnce and no ozone, the atmosuheric ondions of hruinous and ozone periods being those of the Equatoinal or sea wind, and those of nonuminous periods and wo ozone the conditions of the Polar or land wind, was next pointed out, the author proceeding to indicate the connexion which he believes to exist hetween the luminosity of phosphorus it was observed, is accompanied by diseases of the ervous and vascular systerns, aud diarrhoea, often attended with vomiting and cramps in the limbs and, as a rule, it was observed that if any of these deases place, the barometer readings woul pould appear, and the wind increase, ozones, if ahsen fall back upon south pointa, and would increase in he ; and that if the barometer readinge were helow season, a storm would follow. From a series of experiments the author had satisfied himself that decreasing pressure and increasing temperature were favourable o phosphorescence of phosphorus, and consequently the development of ozons; and that increasing readings of the barometer and decreasing temperature were unfavourable to both. With regard to the cause of the diseases above named, the author was of opinion that thes were the result of the retention of urea and other urinary molids in the blood, and diminished atmospleric pressure. The fact that the cutaneous transpiration and the evaporation from the surface of oid hags had important influence upon health, he oncluded admitted by all physicians. Dr. Moffat accompanied by some forms of disease, they are nevertheless, highly beneficial in a sanitary sense; for they carry with them a store of Nature's reodoriser phosphorescence had much to do with the belief that and that if phospone, if it was not reaily it source; of rendering iron magnetic, as hossenses the property phosphorescence of the ocean, the development of ozone, and the disturbance of magnets during storms, colld he accounted for
In Section E. (Geography and Ethnology) Lieut. Colonel I'elly read a paper on the Comoro Islands, a group of four islands lying between the northern extremity of Madagascar and the East African coant, The most northerly is Comoro proper, an islant about 30 miles in length, with au average breadth of about south, is Mohillarest the smallest of the four. Johanna, 30 ming south-e ast of Mohilla, aud distant from it some Mayotte, 31 miles south-east of foluanna, is third and staple prorluct of Mityotte is sugar; if well cultivated, the island might exycrt from 15,5 1001 to 20,000 tons per aunum ; but there isa great scarcicy yot abour; the popu-
lation is stated to number about rool sond of Johanna is a sultauat, without any direct relation with the other islands, and contains a population of

12,000 . The olimate is salubrious, sea breeze and frequent' ahoweru temparing the heat. The soil is Coffee thrives excellently, and will probably form altimately the staple product of the island. The trade of Johanna is at present not large, the total value of the past year's (1860) imports being about 4500l., and is carried on chiefly with Zanzibar and the Freno settlements at Mayotte and Madagascar. Mohilla governed by a Queen related to the royal family of Madagascar: The island has a population of about 4000 souls, Of all the Comoro group Comoro proper ness of its scanery from its surface rises an volcano, 8000 feet in height, which frequently vomit forth streams of lava, which flood its flanks and form new promontories and, islands in the surroundin

\section*{Contributions to Natural History, ohiefly in relation to} the Food of the People. By a Rural D.D. Small 8vo., pp. 364. London: 1865
In spite of a certain amount of flippanoy, this little book, appearing at the present time when the food of we people is a matter for very serious considenation, oollected in a series of articles, originally published in reviews, a variety of information on a large number o subjects. To Hippophagy, Myoophagy, Salmon rear ing, Fish hatching, \&c., chapters are devoted in his volume, and the vexed question, should we eat ou horses? is revived and answered in the affirmative
Those interested in the salmon rearing and batching experiments will find here a resumé of all tha has been accomplished up to the present time. The hints relative to the extension of the fish trade are worthy of attention. It is quite certain that many more varieties of fish might be sent to market than are received now, and with great advanta to the faring population as well as to the people at large, on the principle of the old motto that there are "more
fish in the sea than ever came out of ita" Now-a-day when the beef of Old Eagland seems likely to fail, and housekeeners are puzzled about their daily provisioning, they will read the account of the doings of the Acclimatisation Sosiety with interest, and rejoice in the probability of having, before very long, the eland or antelope to help out at times as an article of food nd, says the rural D.D., "wo are confident that the men of the next century will have at their tables the lesh of beasta, birds, and fish, and also fruits and vegetables, of which we know nothing save by eports In the good timas coming, through the sue Sritui Jabours of the Acclimatisation Society of Grea Britain, Ireland, and the Colonieg, we hope to din upon Chiness lamb and Chiness Yams, and to find them agreeable substitutea for Britieh lamb and Lettuce and as auch things have appeared at the fingt annua tinner of this society, it does not anem tno sanguine to hope that we too mayy partake of such delicacies as sangaroo ham, Syriay pig, Canadion goose, guan and leporines.
Catalogurs Reorivbd.-E. G. Henderson \& Son? Catalogue of Bulbs in one of the more complete lists o bulbs, and contains besides the most extensive list of Herbaceous and Alpipe plants we have met with for a ong time past.-Paul \&\& Son's Rose Catalogue is com rehensive and useful.-G. Jackman \& Son's Trade Catalogue of Plants comprises Frutt trees, Roses, American plarits, Conifers, and Ornamental trees,
aud shrubs, with wholesale prices.-W. Mfasters Catalogue of Ornamental Plants combines in som measure the characters of a garden guide and a nersery catalogue. Many useful hints may be gleaned from its perusal.-A. Henderson's. Bulbous
and other Roots is a brief list of the most useful. - B. S. Williams' Catalogue is in two parts, Bulb list, and a Pelargoniunn list, both of which may be consulted with advantage.-A. Verschaffelt's Plantes
Nouvelles is chiefly occnpied by new plants and J. Verschaffelt's Catalogue des Plantes, and Aug. Van Geert's Prix Courant, are general lists of very extensive and varied collections of plants. In both the list of Camellias is very full, and descriptive

\section*{Che \(\mathfrak{x p i a r y}\)}

Yore article on the supply of Food for Bees, which poerred on Sept. 16, page 870 , caused me to inspect the state of my hives more closely than I should otherTse hare done. Iam sorry thave stated as regards the very smail amount
the hees have been able to collect during the ths of July and August; the importance of timely osnation ; and the necessity of supplying the requisite pouibie.
my retarn home after a short absence in London is consequence of your remarks I inspected the condi tina of my apairy. arbt, that there is the winter without abundant feeding. Among these are some stocks that a few weeks since I had firmly bulieved were amply provisioned, without being likely to require any help from me .
helieve much of this unfortunate state of affair nuat be attributed to the very long period of fine and dry meather we have had, the bees haviug been inducen stored for winter consumption. There has been since the end of June but very little secretion of honey in the fowera, yet the bees have continued their apparent estensively carried on. It would appear as if a fine dry aatumn may occasionally be anything but a blessing to the bees
. fear that the mortality among bees during direaly have many hives in this reighbourhood died of starration. One person near me has lost five swarms ard stocks, and believes tinat all the rest of his hive The bee-keepers
ses to the mers in this locality, who have sent their me that the resnlts have not been satisfactory rim mas owing, in a great measure to the wet and cold reather which prevailed in this district duxing the month of August.

Iam much interested in the Apiarian department of your periodical, and hope that others will belp you in making it attractive.
A fers weeks ago I forwarded to your Apiarian Fditor a small Ligurian sswarm, which came off from Ne of my best Italian stocks. I heard from him o its safe arrival, but I an anxions to know whether the loong queen proves to be a breeder of pure Ligurians Ind every renson to hope that this would be the case t:me have turned out to be impure, and breeders of anmistrkeable black bues, I fear that the one sent to fo glad to hear that in this supposition I am mistaken, and that she has proved to bo in all respects worth his acceptance.
Mesile in town I took the opportunity of calling at of honey-comb, mentioned by you as having been Hoth the supers were very fine, particularly the rlass netaron, contributed by Mr. S. B. Fox, of Exeter, Which tor richness of colour and pureness of combs, I have never seen surpassed. Apis, Durham.

\section*{Minute House Ants.-I am dreadfully pestered b} myriads of diminutive red ants, about the eighth of an material. I have a romarm over almost every eatable aad it may be imagined low these little pests do congregate in that locality. It is necessary that all Auver pots and dishes of honey be raised on large an a'so obliged to have carried out with respect to all Sherwise they rrould be other eatables, in the pantry thonsandis of these ants. I have seen a sponge cake so aive with them, and perforated through and through,

\section*{Thrse quirelicomo}

Wose about 20 yeere visitors were first noticed in our heen free from them. They since which we have never autumar and carly spring, but swarm prodigiously in It it is believed feales or males, winged or otherwise.
It is believed that these minute ants were imported iosengers I I shoulu like to know to what species they long, ant if they have been known in Eingland for a of earred with them. Can any owe suggest a niethod dincover the thing these ants? It seems impossible to appear to return home at night, nor can they ever be Anserved as going in one directiou inore than another.

Cottage Nive."- When bees are managed, lik
ve should, as a rule, break up the swarms of the only a swarm when required for filling any vacaucy in the apiary or increasing the number of hives, 13 y dopting this plan a larger quautity of saleable honey comb is uenally obtaiued, and the old stocks, having
swarmed, will have young and prolific queens, whereat requently very old queens are at the head of the warms. These have the bad hahit of dying off or becoming unprolific, and the tine swarms dwindle away and perish, to the great surprise of the owner, who caunot understand why swarms should die
The best time to take these hives for their honer arly in August in all distriets which are not abundan in heather. The brood slival t be carefully cut out an placed in a sinall box or bell-glase, orer some othe stock. The communication being opened, the bres wal will tend greatly to strengthen the stock the following spring. The bees may be expelled from the hives b funigating or driving, and should be united to other stocks or weak swarms. We should never think of destroying them, nor, if for that purpose sulphur wer ner if thuch of the brood to be aubs quently hatched out.

\section*{Garden Memoranda.}

Bothivell Castle.-Readers of the history of Scotland must be familiar with this name, which has played so important a part in ancient feudal times. The former old castle, with its battlemented round owers, is remarkable oven at the present day for ite may be seen compact fragmentary masses of stone and lime, apparently as indestruetible as if they had been the remuant of some voleanic eruption-a capital sample of the workmanship of the eleventh century. A glance into the interior shows that there has been a in breadthen coue ab which is what we take to he the banqueting hall, 60 by 30 feet, with numerous elliptic windows overlooking the court. Adjoining this is evidently the chapel, for here is a very good remnant of the fout; and there, in the recess, is a tolerable indication that the altar must at one time have stood there. The strongest part of the building for defence is where the great and massive round tower still stands. It certainly is a very imposing structure, situated on a rocky ledge of the River Clyde, overiooking the more humble and less stately rain of Blantyre Priory on the opposite side. Both ruins are very much lad and quite overtopped with Ivy, the roots of which have penetrated into the chinks of rock and stone ad in some cases assume large dimeusions, being quite s thick as one's arm. The surroundings of woo water, and lawn all contribute to enhance an effect which is quite as agreeable as it is imposing.
According to tradition, Bruce bestowed this castl upou Addrew Murray, who married his sister. It after wards came into possession of Archibald the Grim and third Earl of Douglas, who had married a grand daughter of Murray's. The 4th, 5th, 6th, and 7th Earls inherited the title, after which it was forfeited to the Crown, and was successively possessed by the Crichtons, John Ramsay, and the pourns Earls of Bothwell. After the Earlaom of Bhe was forfeited in the 16th century, it passed through several hands, until uitimately it reverted to the Douglas family, the heirs male of which became extinct in 1857. It then fell to the late Lady Montague, who died shortly after inheriting the estate; and it is now possessed by her daughter, the Counters of Home, who married the present 11th Earl in 1832, by whom she has a numerous issue. The family, although not sojourning much at Bothwell, evinces a very lively interest in the preservation of the castle, and in maintaining the "policies" or pleasure grounds in a high order of keeping. The new lamily edifice is not castellated, on the contrary it is a plain equare building of considorable size, situated within a few minutes' walk of the old castle. The ground does not present great diversity of contour, except the undulting lope receding from the river; but there are one or two pretty landscapes with the trough of the Clyde forme bounded by rich wooded slones, and fine rural scenery in the distance.

There are some capital samples of timber of ancient growth distributed over the park. All and Oak and Larch predomivate to a much larges extent than is usually the case, a circunstance which gives a more interesting have, carpeted as they are in the early season with Auemone nemoroza, and in succession with the wild Hyaciath (Agrapinis nutans), the Cowelip (Primula vera), aud the highiy decorativo Daffudil (Narissus Pseuln- Narcisous). Awong the rarer and wore Neotia Nidus avis, Listem
plants to be found here, are Ne ovata, and Epipactis latifulia, three very miteres ing ground Orchnds; Doronicum Pardalianches, Evi tago Virgaurea, I auta Helenium, Sedum Telephium, Geranum phreum, Betomica offinualis, gare, aud Uriganum vulgare, all interesting plants to botanints. Not lems interesting are the Ferns, which comprise such kinds
ophioglossum rulgatum, Polystichum aculeatum, Lastrea dilatata and Oreopterie, Blechnum boreale Asplenium Trichomaues and Adiantum-nigrum and Athyrium Fillx-foemina. Scolopendrium vulgare and Cystopteris fragilis. What with historica nosuciations, extensive pleasure grounds iuter
fected with well laidout roads and walbf, and the ontiguity of the Castle to Giaserow, which is distan only seven miles, it is not to be wonderel at that the citizens of thit importint town avail themselves of the privilege of promenaling and inapecting the Teek-a concensiun which ba heen grazted for some considerable time. On Saturday arternoon excursions take phace for the thenct: more
expecially of the "sons ef tw.l, who comont aval home eveces of any other stated das, am alvantare which is mure and mure embraced an thown xamples of this k.nd, alchough chefly of local interest, cannot be too widely circulated, as their influewee for good both directly and indirectly is of incalculatele value, and tends to draw closer the bouds of amity between the poor and the rich.
As a gardoning cstahlishment, Buthwell Caxtle ha figured anoug the foremont in Scotland; and Mr. Turniull's name, who will shortly, if he is spared, count 40 years in the service of the fand known and renpected by all the leading gardeners in the country. His requtation as a II eath grower has the well establishod (sce p. 743) and his kitehell and mowo gurden, by the reeults they prewent, amply testify to garden is formal in outline, flopings, and hermaet to low wall ou the one side, and the bitchem garden wal on the other. It is subdivided into numerous figures with gravel walks, presenting, during spring and sumumer, a combinat.on of rese, differmg in some resiucts from moit of the formal flower gardens which have come under mey observation. Mr. Turnbull has never been a violent partisan of the bedding system, although its beauties and adaptation in some respeets lave wedded him to a pr per use of the "searlet, the yell we, and the blue, along with some of the choicer herlacenns plants and Horists' Howers which receive "diatingaishent consideration." Very few hure such a fine amorunent of vation as Mr. T., but he is not so deaperately lingoted as to refuse to go along with the times, and got up offective combinations. Prolably the lest mixed border that has come under the cognisance of the writer is here; but observe, it is not one of that Eort of names, mourning " bels that are more remarisable for names, pecies, and varieties, tha eeping the artistic entirely :rom view. Na, inds illis thoroughly effective. A display of colerated in any well-managed garilen. Well, this borler runs any well-managen garien. spoken of, which is covered wi:h Jropmentun of sorta, a flower largely grown, including Eelipse,
 prolifice in flower aud better in form. Then come Dahlias of sorts, intermixed with a variety of Delphiniums, Phloxes, and some other things; and then Geraniums, and the dull crimson Vaierian, which is a ost effective plant; then doukle white Rockets, Jellow looking from one end all in luns sloming from the wall to Various plants are introduced be-ides these named, but the interest and the beanty kept up from May by this arrangement is unabing. A border such as this, instead of heing made up of say half a dozen varieties of plaritg, may contaia ant one possosses and with presenting an ailmirable contour, keeps the eye fired from one cnd to the other, which is all that the malcontents of the modern systen "hold a brief" for, with right on their side. The Dahliz clumps are clliptic in outline, and are charning because they are not only densely flowered, but because they are unforme and set into so rich an ellging of a broad band of Purpte King- the softest of all of the Verbenas, and the outer edge a sheet of searlet Miss Trotter. Old Mrs. Wheeler was a most effective centre patch, surroundell by Aibn florilanda. In the large cencre one was Ruly (iacen. Nancher heur, and Famy Dodds in doubie lies; the old purple Lord Mayor, whech inas a miee solt tone of Verbena. Une of the most effective of the beds was a large oue, something aiter the figure 8 form, centred with Zisinda Ihalifa, surrounded with white Feverfow, then Perilla, and next Plurnie King Verbana, the suit tous of the jurple enhancms the eflect af the Perilla, and broadly edgen with araczuel an in fine路 be ng lares and stocky when planted out. as Mr. T. sown 112 ald pricking uut when the majonty of growers are only soring the seed. R-elkery ther is a chocicher Saxifragen, Ferns, of which there is a choice collection and other rock plants crop up in the dengu in evilent epots ; so do Roses, libulodeluiron, and somee othe American plante, reduemg the aquatty formality which mavy flower gardens are cilurgcable with. Phloxe and P'entatemous ib und, aud aice of irit-a
many of the seedlings of the former being of a high
standard of excellence. But it is impossible in the standard of excellence. But it is impossible in the
compass of a single article to go into details, it is better therefore to proceed with the general outlines, leaving the reader to draw his own inference.
The kitchen garden is not only large and commodious, but the quarters of ground are in splendid condition, yielding a large and uniform crop of vege-
tables-the Peas, the Cauliflower, Celery, and Broccoli tables-the Peas, the Cauliflower, Celery, and Broccol
being of the most unexceptionable character at all times. Three rows of Pcas grown for seed apart from the others were very remarkable as crops and croppers. The names of the sorts were Veitch's Perfection, Payne's Conqueror, and Lynn's Wrinkled Marrow, the two former carrying the palm for flavour and the latter for prolificacy. It is impossible to over-estimate the merits of these three sorts, which should be in everybody's hands. The orchard, which forms a valuable auxiliary to the kitchen garden proper, contains about four acres, and is situated on the outside of the west wall, screened from the view of the promenader by a high-growing hedge of Quicks. The herbaceous border is between the wall and this hedge, and contains such a variety as one does not stumble upon overy day.
The houses, with the exception of one or two spanroofed structures for plant growing, are all of ancient date. The " old greenhouse," which faces the flower garden, must be one of the oldest in Scotland at present in two, and built against the old brick wall. In winter and spring it is very gay with Camellias, of which there is a very finely
grown collection, but, !ike some others, containing grown collection, but, !like some others, containing
plants, both as regards number and size, far too large for the accommodation. Acacias, Epacris, and other
New Holland plants help to furnish it a while in summer Geraniums, Fuchsias, and such like take their places. The other two plant-houses already spoken of are low, and well adapted for the cultivation of Ga practice which had to be resorted to in daya of yore. The Vineries, three in number, are also very old houses, rather sunk than otherwise, and not particularly well adapted for Vine growing; still Mr.
Turnbull always manages to have good useful crops of Grapes. The Pine-houses, of which there are two, and one succession pit-the former having front shelves, which are filled with Orchids and ornamental plantsare very successfully managed, fruit being produced in quantities almost without intermission, and very fair sized fruit, too, considering the quantity grown in
limited space, In a comparative point of view, two plants occupy the a comparative point of view, two two plants to be Queens, which, speaking safely, yield an average with Mr. Turnbull of 3 lb . weight, they would be equivalent to one which with the extra growing space should produce a " 6 lb . fruit," - Which is more the exception than the rule, to say nothing of the usefulness of the small-sized fruit. tion, and a common sense view of putting the question One of the finest Pitcher plants (Nepenthes di stillatoria) in the country is grown here, running up the rafters to the top of the house, clothed with an immense number of pitchers, and there is no knowing how much larger it might have been if it had not been reduced periodically to keep it within bounds. O Oncidium Lanceanum very good samples, especially of Oncidium Lanceanum, which is quite free of spot;
Cattleya labiata, a fine plant; Lælia Perrinii; an immense Miltonia spectabilis; several excellentlymanaged Zygopetalurns, and Calanthe veratrifolia. Dionæa muscipula is particularly weli managed, growing in pots, standing in the stone kerb, with the Spbagnum around it as healthy and vigorous as you (Drosera rotundifolia) in its midst. There has been a capital crop of Royal George Peaches and Elruge Nectarines in a comparatively new lean-to house adjoining the Pine stove; trees clean and healthy, wood not too thick, and size of fruit good. The Peaches out of doors that have been planted since, or those that survived, the severity of the winter of 1861.2 has been put in particularly a young plantation that has been put in lately. J. \(A\)

\section*{Miscellaneous.}

Waterproofing by Paraffin. - The rendering of textile fabrics, leather, \&c., waterproof, has long and justly been looked upon as a matter of considerable importance. Many means have, at various times, been employed for the purpose, but all, or most of them, have been found open to objection. Wax and drying oils were the substances first used, then caoutchouc, and afterwards gutta percha, both by itself and along with drying oils; recently, paraffin has been adopted, but,
if used by itself, it crystallises and separates from the if used by itself, it cryatallises and separates from the
fibres of the cloth, an inconvenience which is prevented fibres of the cloth, an inconvenience which is prevented mixture possesses the great advantage of rendering a fabric repellant of moisture, while at the same time it does not prevent the passage of air through it ; and it affects but little, or not at all, the most delicate colours, It is particularly advantageous to leather, which it not only renders waterproof, hut more durable and susceptible of a higher polish. Intellectual Observer.

\section*{Calendar of Operations.} (For the ensuing veek.)
Thoss who contemplate making new orchards, removing large fruit trees, or replacing unhealthy young ones this year, should commence operations of a preparatory character immediately. In the first place secure if possible abundance of good loam; and if this
can be obtained with some rough turf in it so much the better. The loam being provided and stacked in a high and sharp ridge, in order to throw off rain, the next thing is to thoroughly drain, if not already done, the site intended to be planted ; without this all subsequent operations will end in disappointment. Perfect drainage being secured, stations may be formed for the trees, about the best kinds of which some observations will be made when the period of planting has arrived; in the meantime, we would advise a trench to be thrown out without delay around any large trees that are intended for removal. This will check late growth, and induce small rootiets.

\section*{flower garden and plant houses.}

Dutch Bulbs should be largely cultivated where a fine display is required ; and where hardy shrubs are forced for the decoration of the conservatory, they should now be put in order for this purpose.
aUriculas. - See that frames in which these are to be wintered have a proper pitch, and that all the glass is sound, so that the plants may not be subjected to drip, which would infallibly ruin them. Free circulation of air should at all times be promoted. Wheu Auricula.
Carnatlong and Piooterg.-In obtaining new varieties the best plan is to have them immediately; better plants can generally be got now than in spring, and they will have time to establish themselves before

\section*{winter.}

Hyacinths.-These should now be procured, potted, and placed in a cool dark place free from frost to make covered of doors will do, provided they are well When well rooted they may be started into growth in heat as required.
Tulips.-The time has nearly arrived when all Tulip beds of the best description ought to be properly arranged for planting, so that the bulbs may be got into the ground in good time. Some means also should be adopted to shelter the bed or beds from heavy rain, as it is extremely prejudicial to the bulbs before they have begun to appear above ground; and in fact excess of moisture ought at all times to be avoided.

\section*{FORCING GARDEN.}

CUCUMBERS.-Do not permit young plants to over bear themselves. It is much better to insure a constant
moderate supply by judicious management, than to moderate supply by judicious management, than to at another. Maintain a temperature of about \(70^{\circ}\), and keep the atmosphere moist and agreeable for the growth of the plants.
Fras.-Where any are ripening keep the atmosphere as dry as can conveniently be done. Keep the shoots thin and neatly tied in, so as to expose them fairly to Where the air, but avoid stopping at this season. Where the fruit is swelling keep the atmosphere moist, giving the foliage a good washing with the syringe.
Peaches.- The house which it is proposed to force early may now or soon be got ready for work. The surface of the borders, if exhausted by repeated waterings, should be carefully taken off with a fork, and replaced with fresh soil. Worn-out trees, if any, may
also be replaced by bearing trees from the open walls.
Pinks.-If circumstances should reuder it necessary to subject a portion of the stock intended for fraiting to a brisk temperature at once to induce it to start, the most promising plants should be very carefully selected for the purpose, and placed in a small house or pit by themselves. It is not, however, by any means desirable to start more plants into fruit at this season than may be absolutely necessary, for they will produce finer produce later in the season; where a separate house cannot be commanded for those which must be subjected to a high temperature, we would recommend the plants selected
for fruiting to be placed in the warmest part of the house at command, filling the rest of the compartment with young stock.
Vings.-Those in pots for forcing for early work may now receive what pruning is necessary, provided they are in a state of rest. Let late Grapes have every
attention as to thinning out decaying berries, and thorough ventilation, with occasionally a little fireheat if the weather should become damp.
hardy fruit and kitchian garden.

\section*{Continue to look over froit and other stores frequently} order to see that all is sound.
Broccoli.-Forward plants should be earthed up as ey advance in growth.
Cadliplowrrs. - Prepare stations for plants which it is intended to protect with hand-glasses ; the soil for them should be rich, and the position, if possible, should be under a south wall ; some put nine plants under a good-sized hand-glass, and in spring take five or six of them away, and plant them elsewhere.
Parsiky.-Endeavour, as far as circumstances will
permit, to have a good supply of this under safe pro
tection; for there is generally a large demend for is and in the event of a severe winter it is difficalis 10 m
it by the ordinary protection of hoops and mets Pотатоs.-No opportunity should now mote getting Potatos that are ripe out of the bo lats stored in a dry condition. Potatos may eitherer be be in narrow pits, with a little dry earth sprinklod and them, or in airy dark sheds. Before storing, howence take care to separate the bad ones from thowe then
sound.

\section*{the well-drained oaloareons loam which Mr} Macins farms is drilled upon the flat after spring harrowing, with and each plant, singled out 2 feet from its neighbours, thus finds a well filled, accessibll and abundant atore-house, which its roots graduaily traverse, and which aupplien the plant with nourishment enough without extraneous aid for a healthy, slowly growing, and ultimately heavy and productive orop. Having been over Mr. Malins' Turnip fields, we can bear testimony to the accuracy of the report given last week (page 900). The 20 or 30 -acre field we walked across had received nothing but a deep and effioient autumn tillage after Wheat, whioh sueoeeded a heavily manured Clover stubble. The depth and thoroughness of an autumn ploughing on well-drained calcareous loamy soil, oscasionally adhesive, sometimes brashy, had already produced a very heavy orop of roota. Though sown so early, not a plant had run to seed; and though the lower leaves were withered and meally with mildew, there was still a heart of fresh green leaf from which the roots, as sound as posmible, were boing fed. And this is no mere novelty; it is the eighth year of the practice, which has been uniformly sucoessful. And we oannot doubt that not only here but everywhere the deepest tillage is now showing its superiority over ordinary cultivation (even where the latter has been supplemented with heavy dremings of artificial manure) in enabling the root crop to meet the withering effeots of so prolonged a drought as we are at present suffering.

There cannot be a doubt of the superiority of steam tillage on heary lands, whether in a steady drought, such as that of the present seasou, when the best work is done in fallowing wherever the furce is sufficient to tear up the land-or in eatching times when the best use is thus seoured of such intervals of suitsble weather as are granted to us.

THE CHAMPION PLOUGHING MATCHES.
We trust you will permit us to notice an apparent misconception pervading your Leader on autumnal ploughing matohes in a recent impression. Our object in attending these matches is not to ombark in a other single firm, but to make our ploughs and their capabilities more widely known, for we fud daily ovidence that there are hundreds and thousands of farmers throughnut the kingdom who continue to use ploughs of antiquated and fluulty construotion, requiring greater power to draw them, costing more to heop in repair, and possessing other disadvantages which the modern ploughs do not.
Nothing is more common than the remark from farmers or their men, that "the new ploughs may be very well, but they will not work on my farm. you who are posted up in all that is of the best and most modern construction, and are generously willing to give every one the credit for the same knowledge, it may seem a strange thing that we and other makers
should fncur so muck trouble, but if you were more fully acquainted with the difficulty that there is to introduce improved ploughs into a distriot, and with the eoonomy that arises to farmers from their use, we think you would not dismiss us or the farmers with the severe condemnation that closes your article.

It has heen our practice for a great many years to attend more or fewer of theae ploughing meetings, and from the kind reception wo have invariably met with, and the interest taken by both farmers and the men in the work done, we are satisfied they are glad of the useful and interesting addition to their meetings.

In conclusion, allow us to say that in the circulars we issue announcing our success, we invariably print if of late Messrs. Howard's name has occurved more if of late Messrs. Hownrd's name has occurred more
frequently than formerly, we trust that it will not thence be inferred that our competition is more directed against them than against any one elve who chooses to eater the lista hamsomes \& Sims, Ormell Worken Ipavich, Sept. 21

THE CATTLE PLAGUE
1The following report oy professor imonds to the Clerk of the to sheop, is by far the mos
\({ }^{6}\) Veterinary Department, 23, New Street Spring Gardons Sept. 25.
"Sir,-I beg to report that, acting on the inatructime the staternent received at your office relative to an outbreak of the cattle plague in a remote part of the comnty of Norfoll, supposed to have arisen from
cattle having been in contact with some diseased sheep, cattle having been in contact with some diseased sheep,
recently brought to the premises, I have viaited the distriet in question, and lnquired into all the circum-
stances of the case. It appears that as far back
as the 17 th of August Mr. C. Temple, farmer 120 lambs which he had instructed on his farm procure for him for feeding purposes. The lambs were bought at Thetford Fair on the preceding day, and were immediately sent by rail to Fakenham, from which place they were driven to Blakeney, a distance of about ten mileg. On their arrival they appeared to be fatigued to a greater extent than ordinary, whioh was, however, attributed to the heat of the weather and the exertion the animals had undergone. In addition to this the shepherd observed that several of them they did not appear to be 'a very healthy lot,' and that he thought it would be better to return them to the dealer. Within a doy or two of this time the symptoms of illness were more marked in all the original cases, and many more of the animals had been attanked. On the 24th two of the worst cases were
removed from the field to the farm premises, and were placed in a shed for treatment, in which atterwards cow was put. On the 25 th two of the lambs died, and in consequence of this, and of the large number which were now affected, the whole were brought, on the morning of the 27 th, into the same yard where the shed previously alluded to was situated. There is also another shed, separated from this yard only by mome old furze faggots into which the cows were driven night
and morning for being milked. The lambs remained in the yard till the morning of the 28th, when having had some medicine administered to them, they were returned to the fold and never came again near the cows. While in the yard three died, two on the 27 th and one on the 28th, and on the following day two others died in the field. From this time the disease went on, so that by Friday last, the 22d of September, the day of my vieit, 46 had either died or been killed, and 27 were in a very precarious condition. On the the of Sepcow gave evidence of being affected with the cattle plague, this animal being the one which had been put into the shed occupied by-the diseased sheep on the 24th of August. A second cow was attacked on the 11th of September, and a third shortly afterwards, which was followed by others; so that by the 16 th all the nows, six in number, a helfer, and a calf were all dead. My examination of the lambs showed that they were unmistakably the subjecta of the plague. The symptoms agreed in almost every particular with those observed is cattle afecto wise also identical. With view to ascertain the true nature of the changes produced in the myatem prior to death, I had four of the lambs killed, and from these I took some diseased parts and forwarded them to the Royal Veterinary College without note or comment. These parts were examine by my colleague, Mr. Varnell, who at once recoguised the special changes of structure which are caused by the cattie plague. The whole racts of the case leave not the least doubt of the disease termed the cattle plague, and that when affected they can easily communicate the malady to the ox tribe; and moreover, that when so conveyed, it proves equally as destructive as when propagated from ox to ox in the ordinary manner. The case is also more important from having occurred in a place no less than 14 miles distant from any other where the cattle plague exists, thus placiug beyond a doubt the faet of the malady being introduced among the eattle by the sheap alone. I regret to add that this is not a solitary case of sheep being affected by the eattle plague. I learned that some sheep were supposed to be aimilarly affected belonging to Mr . R. F. H. Harvey, [M.P., on his estate at Crown Point, flock of upwards of 2000 lambs, among which the malady was prevailing. A large number had been separated from the diseased, and gave no evidence of the malady. Very many, however, had died, and the disoase was making rapid progress. I also examined many of the dead, and found the post: mortem appearances to be identical with those seen in the other cases spoken of in this report. In this iustance the malady was brought into the estate by the purchase of some cattle, which afterwards died from the disease, and which were unfortunately
the time the disease manifested itself. The whole matter is one of the greatest importance, and which I lose no time in rubmitting to you for the information of the Lords of the Councll.- have the honour to be Sir, your most obedient servant, "Jas, B. Simonds."
2. From Dr. Letribiy on Mr. Harvey's Flock.As I have just returned from an inspection of the infected flock on the Crown Point estato of Mr. R. F. H. Harver, M.P., I have thought it probable that some of your readers might like to know a little of the history of the dispase, and of the symptomas and prospects of curre. Mr. Hurvey's estate is a shon
distance from Norwich. It is situated on high land and the soil is a mixture of gravel and loam to the depth of 11 or 12 feet upon chalk; it is therefore well drained. About 1000 acres of it are Grass land, and most of it has been newly laid out. Upon this there are pastured nearly 2 noo sheep, or rather lambs, which werc purchased in April last, and which did well until the begiuning of the present month, when two
of them died with excessive diarrhoea From that time
the flock until a large portion of it spreading thro the flock until a large portion of it has bean thrictich The symptoms which I observed during my ri appears to ibe somewhat foeble in it looks heavy and stands with drooning bail, it of Its appetite taile, and it shows algas of sorera ans. action by the heat of the head aigge of serere fur ing the shade and running to the water to drink this time a discharge begins to fow from the eres nose-the discharge being very limpid and colos and ine water, not purulent, although there are occai patches of ulcerationabout the nose from the ind of tlies, There is some difficulty of breathing respiration is panting, and the animal mone and pain. Diarrheea also occura, but the discharme ts nor tinged with blood, as in the case of cattie, but in thin gruel-like consistence, and of a pale greenish colour. Froma this time the animal either ranill succumbs and dies, as if from exhaustion, or else quickly recovers, 24 hours baing the period whic

\section*{generally settles the issue of the case.}

The experience which has been gained from observations of the disease at Mr. Harvey's farm that if diarrhoea does not oour the animal inparies dies; and that there is no relapse of the diseem nor any case where a sheap has been attackod d time
The treatment whioh has bean adopted ha bo very simple and apparently very successul. In th first place the animals have been supplied with trough containing a moderately strong solution water. This they have drunk as soon as the febi symptoms have appeared, and their resorting to water is often the earliest sign of infeotion, beginning to feed is the sign of recovery, discharges from the oyem and nose and bowelsath a legion of flies, which freely deposit ova therein. has, therefore, been found necessary to cleanve animal from the discharges by frequently sponging Under this treatment about two-thirds of the anina have recovered, thus showing how barbarous a destructive is the proposition to "stamp o disease by killing every infected animal Harvey had pursued such a course of tratment
would assuredly in the end have lost every one his 2000 sheop, whoreas he will now mre at lean 1300 of them.

The post-mortem appearances were exhibited to ma by Mr. Wells, the skilful veterinary surgeon Norwioh, who has watched the progress of the diseas in the flook from the beginning, and who made dissection of one of the dead animals in my presenc I observed that the intestinal canal was red ap inflamed, the peritoneal vessels were gorged mith stomach, as well as of the cœecum and beginning of : large intestine, was patched and spotted with blow congestion, and all tho aggregated giands of Pe wer9 so gorged with blood as to be astins, In the respects, therefore, the appearances are very sumi to those which have been observed disease. The lunge, however, were much congestel and the right side of the heart was full of blood, whin the left was empty, evidently showing that cir had failed in the capillarles of the lungs. in this ppor ticular thore is a difference in the porb and pending th ances of the cattle and sheep diseases, and to the commurabillt Simonds is undertakins the disease by inoculation from to the other, it would be well to sus
as to the identity of the two diseasers.
In conclusion I ought to say, that the public a indebted to Mr. Harvey for the paias wis and taken to unravel the myatery of these diseases, the pportunities which he has afforded tho study like myself, have taken an intereal them. Above all, he has shown that it mas parte that there are more succesaful ways of dealing with than by "stamping it Dut. Ronk, Nopt. 27.

6. Iyportation from Russia.-The eattle Eplague 4y at the present juncture a subject of general inteTh, wot only as regards its devastations and remedy, but teo in relation to its origin, the Committee of Foreign to Revel cargo, think that a statement of the facts docidsted put plainly before the public may assist to theo the matter in a more satisfactory light. I have, enefore, been requested to send you a résumé of the ansaction, which I shall do without comment, losving those who read to draw their own conclusions. ast winter contracts were entered into with landuttlo for the English market by a person who, not wing the meaus of carrying out hil arrangements, _porters in this city. On the 23d of May last the stater Tonning, of Loudon, left Revel with a eargo \(3: 1\) oxen, 331 sheep, and three horses, and arrived 3rins suftered any casualty. The cargo was originally 35.no suftered any casualty. The cargo was originally
22 osen, but one was slaughtered in Revel on account S: icie iental injury; another animal suffered upon the royge, but was landed at Hull in good health. In
Hall the cattle underwent the usual veterinary inspection and the inspector declared that he had never passed a cientrer lot of cattle, or in better condition. A portion a: tie cargo was disposed of in Hull, and another lot u.sease followed in either of those towns. The remainder of the cattle, 175 in number, were forwarded If of Juha in a perfectly healthy condition. Twenty of these last were subsequently sent to the victualling depot st Gosport, inspected on the part of the Governmant and declared healthy on the 5th of June, after a is particularly, as 10 days are assumed to be the inabetory period of the disease. The speculation was, oinever, not profitable ; the cattle were not of the teen led to expect, and they therefore declined to The imunthtation of cartle from Russia carme thertaking Thid, ainh neither directly nor through intermediate forts h.us any stock since arrived in Eugland
from Revel or any other Russian port. Between thre and four weeks later the cattle disease first maniment melf in Loudon. In tracing its origin much aitention was given to the importation from Revel, and it mes the persou through whose instrumentality these soheoguene introduced in this country, and who had proceedings, who made the supporters whit hostile wreatigatur deputed by the Government to conclude "rinderpest" cargo was the veritable cause of the If had never apearing in England. Jimase in London was in the remotest degree traceable contact witil any part of this cargo; still, the wserti sh that the "rinderpest" was prevalent in that iar: of the Russian Epupire whence these cattle were that, for a cast a oertain doubt upon the transaction More lately, however, documents-of which I I send mitteo, and a perrual of the pose certificates will, I cimple, menable the public to judge the case upou its cenchre is to be given. Charles Hicks, 60, Weat [lilenfulluw the certificates, which seem conclusive

\section*{6. Fruy Lord Stpnety to Mr Helps.}
"Dear Mr. Helpognal, Foot's Cray, Kent, Sept. 20. Wheports on the cattle disease, consequ overwhelmed ajpect in giving you the history of what occurred to had 11 beaste show the eccentricity of the malady. I Ona dairy cows, in the upon the eatate from my They wery cowar th the parli here, of various ages. tery roal or any possibility of cuntagion, and the parl Eem atock of a wall and wide plantation. Moreover, no

Shortly any kiud had been brought into it this
nily after we niet at Usborne (7th of August a pet-rinant was seized and died under the hands In time all tirgeon, to whose place it was removed -indect, andpano have died, and two are now recovering iwo souncest of say have recovered. They were the elves are here, half herd. My dairy cows and their Hou the crowe, half a mile from the farm-perhaps
of mine whose meadow and frme lio betrean the twant herds. And, as far as I an acortain, when the flrat beinok was Beined, no cattle were then affected in the therefourhood nearer than \(3!\) miles. The result, no doubs on my mind is, that although the malady is spherie causes over which no one has any control. You will perceive that nothing can be more cocentrio than the course of this malady in this dintrice. The day previous to my going abroad I happened to be looking aver these animals. They were then healthy in every respect, and in good and healthy pasture, where they had been all the summer, and no butcher or any persou who night bring contagion had been near Holland they think the disease was brought there by unsold animals returned from this country. The estates in Silesia, and he told me that they had this malady for two years and were unable to find any remedy. The veterinary surgeons in Holland seem na ignorant as our own, and had no idea beyond an indincriminate slaughter. As far as I can judge, all the symptoms were of a typhold nature, and they yiolded to stimulants, suoh as whilky and iron-wnter. Some of the cattle whioh died sank very suddenly, when they were apparentiy recovering. However, I am not going into the question of treatment, and only wished to show that the malady may come independent of all "A. Helps, Believe me to be, yours faithfully,
7. Surrouk: Wattiafield.-My attention has just been drawn to a letter in your paper with regard to an Wattis againat the Orders in Council committed at been somewhat found fault with my jurgment has inaccuracy in your report, to which I heg to draw attention. Twenty-six beasts out of the herd alluded to either died or were destroyed at Wattiafield ; tho remaining four of that herd I maw Rickinghall Inferior, in my district, and condemned two of them. Mr. Rubinson refused to have the two killed, removed the four out of the district, and then destroyed the anything Iondemned. The other two may now, for saw them, in good health. Whhoin Piroy, Impeofor, Trworth, Suyfill, Sept. 22.

The marious Orders in Council which at different times have been published have been consolidater and eringued in the following form: in which it vill be seen that the word animal is at length made to apply not exalusively to ox, cow, and oalf, but to include sheop, lambs, goats, and awine :
1. This Ordor shall extend to all parts of Great Britain.
 appolit inglectors within the limits of the metropolitan police
district, provided that such revocation shall not affect any ulder any order her reby revoked.
3 In this Order that " whard and mean any cow. heifer, bull, bullocis, ox, calf, sieep, lamb, goat, or swiue; and
the word "inspector" shall include any inspector appointed under this orde:", or under any of the said revoked orders.
4. Whenever the local authority, as hereinafter defined. ahall be aatisfied of the existence of the said disorder in, have reason to apprehend its approach to the district ove
which bis or thelr jurisdiction extencis, it shall be lawul

\section*{the times on the cattle plague.}

\section*{The Cattle Plague, by ita extension to the sheep,} and its continued ravages among our herds, has attention ach nationall mportanco as chaim the can command This attention, we cannos bit wberye with regret, it has not yot received. Farmers and cattle-owners have been terrified at the suddan destruction of their stock, and have: apuealel, wit! almost the he!plessness of an Oriental people, to the ioverument; and the Government, taken unawares, and compelled to aet suddenly, could do no otherwise than adopt the ndvice of "eminent veterinary surgeons," and enforce the measures which these anthoritlen have propounded with all the dogmatism of inadequate snowledge. Those mensnres, it mint be admitted, are the clumsiest possibie. A set of cattle plague in their lives have been inveated all over the country with absolute power to condemn cattle as auffering from the plague, and to slaughter, if it pleases them, whole herds of valuable animals. We have proclained that our so-called science provides of
with no resources whatever, and that we have no other means of getting rid of the cattle plague than to deatroy, if need be, all our cattle. To make a desert and call it peace is a policy which we think only worthy of imperial barbarism; but to destroy our cattle, and then prowsuree ourselves frow from the catto dicense, is the precisely similar practice which veteriuary barbarism would impose upon us. Are there no men phosel of the Government, zand who could trent the jubject in a mare scientific manner ?
We see hitherto no trece of that carefol and petient observation of aymptoms, that minnte diagnosis, and that effors to meet the dinense in its early stages, which characterice the trentinent of haman diseases by our modern surgeona. It is to this hant point that we think it worth while to draw particular attention. It appenes to us that the rough and carelens maner in Which the symptomes are at present observed affordm no
ohnce of the diseake boing treated li time either to ohnce of the disease boing ereated in time either to
ecovery. The veterinary surgeons inform the Council and the Council, as they are obliged to do, inform the world upon their authority, that the symptoms of the disease are "great depression of the vital powers, fre quent shivering, staggering gait, cold extremities, quick and short breathing, drooping head, readened eyes, with discharge from them and also from the nostrils of a macous nature, raw-looking places on the inner side of the lips and roof of the moutb, diarrhcea, or dysenteric purging." We notice, in the first place, that the disease is here only described as it appears in ts full development. Must the inspectors and veterinary surgeons whom we have referred to wait for such advanced symptoms as these before they pronounce that the cattle are suffering from the plague? Cattle o not suddenly break out into all these symptoms without some premonitory warning. Is it not possible to recognise the disease before it has reached such fatal development? What chance is there, we should like to know, of preventing contagion if cattle ar allowed to herd with others until such symptoms a hese develope themselves? The mischief by that time is done, and their poisoned breath und noxious excrements have provided sufficient material of infection to inoculate the whole herd. The case of the sheep which we described the other day affords an instructive instance in point. These animals were received on the 17th of August, and immediately on their arrival the shepherd emarked that they appeared unhealthy. What was unhealthy ones carefully isolated from the others? On the contrary, they were all allowed to herd together and not until the 24th were two of the worst case removed from the field into a cowshed. The disease had obviously been affecting these sheep the whole week, and what wonder if the whole flock were infected? This may be an extreme instance, but it is still, we fear, an example of the reckless disregard which prevails of the carly stages of the disease. When igno indiscriminately all the hodge-porge of symptoms which we have quoted, is it likely that they will detect the disease and treat it vigorously in its earlier and milder forms? Even when Lord Granville's cowa were attacked by the disease, the first instance was treated only as a cold, and the "distinguished" veterinary surgeons who were called in at the last could not decide whether it was the cattle plague or not. Our description of symptoms furnished by the Council reminded him of human beings prostrated by typhus fever, with their hands clutching at the bed-clothes In other words they reminded him of human beings in an advanced stage of typhus. What would be thought of a doctor who reglected to treat a patient until such advanced symptoms as these were developed? It is obvious that all measures of precaution against con tagion must absolately collapse unless the disease can be detected at an earlier stage
We find it very hard to suppose that more skilful and scientific treatment would not disclose some earlie symptoms of the disease, and would thus enable us the better both to prevent contagion and have some chance of effecting a cure. The disease is said to inculate for 10 days. Could it not be detected before the end of the 10 days? Suppose, for example, as seems highly probable, that the disease commences by affecting the lungs. Could not a skilful handler of the stethoscope detect some internal signs of the disease before it displayed itself in symptoms of external distress? The stethoscope, applied to human beings, frequently detects incipient disease of the lungs before the sufferer has anv idea of his danger. But it is evident that such examinations 'as this, and such a careful observation of symptoms as we have suggested can only be made by thoroughly well-instructed pathologists. An ordinary veterinary surgeon might as well endeavour to observe the state of the stomach by looking down the throat through a telescope. The practical conclusion, therefore, which such considerations guggest is that some thoroughly well-educated medical men should take the question in hand, and conduct a series of really scientific observations and experiments. Considering the importance of the disease, and the extraordinary light which might be thrown by it upon haman epidemics, we should have thought that even our first physicians might have been induced to throw their energics into the subject. But, if they cannot do so, these are handreds of able young physicians and surgeons anxiously awaiting an opportunity of distinction, and with their hands as yet unfettered by any extensive practice. Let it be remembered that no such opportunity for experiments can possibly be afforded in the case of the human subject. Fiat experimentum in corpore vili is the old rule, and here is the exact opportunity for practising it. Suppose the case of another herd like that of Lord Granville becoming afflicted with the
disease. Let such a herd be immediately placed under the care of some acientific pathologist. Let him examine every animal by the atethoscope and by all the other resources of science; let them be carefully Watched from day to day and from hour to hour, and the effect of every remedy carefully observed, and it is impossible that some results should not be attained. For this purpose the Government might Wieely offer sufficient reward to induce not only
energies to the subject, and by this means they migh obtain information which would emancipate them from the slavery of their present veterinary autocrats Disease is a delicate, a mysterious, and an abstruse subject, and is not to be managed by every rough cow doctor who calls himself a veterinary surgeon. Th Government have no doubt done their best in thei emergency, but now that it is evident the disease is more than an emergency, let them appeal for mor sientific assistance. If they hesitate, there is surel sufficient independent energy among our doctors and armers to induce them to prosecute vigorous researches n their own responsibility. Let a young man discove effectual method of treating this disease, and he will btain for himself a far more satisfactory reward tha any the Government Patent Office can offer. Sept. 28.

\section*{THE WINTER KEEPING OF SHEEP.}

OwING to the drought of 1864, the root crop was deficient everywhere, and especially on the dry soils of the southern chalk district, where the scarcity of the roots so alarmed breeders that at the great autumna fairs the prices of store lambs, compared with recen years, showed a reduction amounting to 30 per cent and there was almost an equal fall in the price of breed ing ewes-and this, with mutton at 5 s. to 6 s. per stone and wool at 2 s . to 2 s . 6 d . per 1 lb .
Lambs therefore paid unusually well for wintering althongh the market for them in the spring of 1865 was seriously affected by the unfavourable weather and by a panic in the wool trade. The following shows that "well bought is half sold."
200 lambs, which cost 22 s .6 d . on September 12th, were kept on leas and stubble until November 3rd, then on Turnips until December 19th, when 50 of them wer drafted to another flock getting a little cotton-cake. On the 3rd Fehruary fatting commenced with Linseed cake in addition and cut Swedes. On the 7th April the 50 tegs were put on Rye with Mangels, and they were sold on the 4.th of May at 61s. each.
The remaining 150 lambs were wintered as stores at ittle cost, on inferior Turnips uncut; they were put on Rye from March 8th till May 4th, when they were valued at 48s. each.
The district just referred to became so exhausted of its stock that at some of the later fairs the number of ambs and of ewes exhibited was less than one-fourth of the average. But in Essex, on six adjoining farms, including that from which I write, the number of sheep wintered has been greater than these beavy land ever carried before. This has been effected by the extension of a system of management often practised on heavy land, that of eking out a scanty supply of green food by a liberal allowance of straw, chaff, and grain which happily were good in quality, as well as plentifu and low in price in 1864 .
By these means we were enabled last winter to kee 1500 sheep on about 650 acres of arable, and 350 acres of dry upland pasture-chiefly park surrounding a mansion. The arable land does not very well bear folding in winter, as a preparation for spring corn. Neither climate nor soil are favourable to Turnips, and notwithstanding our efforts in assisting . Nature, our crops of Turnips, Rape, or Swedes, are never first-rate, and sometimes very bad. Strong stubbles, good Beans, Clover-seed, aud Mangel are the specialities of the locality, and they indicate heavy land, corn-growing, and yard-feeding. Sheep have been generally "conspicuous by their absence," though even the heavy-land farmer is glad to winter a yard of them, instead of cattle, tha e may keep some at least of the stock that paye best.
In the autumn of 1864 our root crops consisted of ome white Turnips and Rape, eaten by the ewes in September, and of a very bad crop of Mangel, the whole of which was reserved for the ewes at lambingtime. In this predicament we wintered about 1000 half-bred !ambs, more than 400 ewes, and some fatting sheep. All, except the fatting sheep, were folded on the stubbles, and allowed a daily run on the park of about an hour for each flock. The freshest Grass was reserved for the ewes, and a very meagre bite remained for the lambs; in fact, except for a few weeks in autumn, the parks afforded them little or nothing except exercise and water

The flocks were divided between three separate farms, and their food was prepared at the respective home steads. The treatment was in every respect similar we shall therefore only notice in detail the management at one farm.

The following details are taken from our "Live Stock Book:"

September 29th . \(\mathbf{3 5 2}\) lambs in the parks, on a little Cotton-cake and some Oats, until Noversber 4th, when they were folded on a Wheat stubble. Gave them 5 bushels of meal daily, mixed with 468 lb . of straw. chaff. Cost \(3 \frac{1}{2} d\). each per week for meal
December 20th. -Increased the food to \(6 \frac{1}{2}\) bushela of meal and 1 bushel of oil-cake.
December 18th.-

was the case in the present inst plentifnl we give sabout 6 lb , a-head

In the case a teg, weighing
comend cake with chaff, than on \(1 \frac{1}{2} \mathrm{lb}\). of the latter vithat the roots.
The of dry food alone is costly and trying to the लositution of young or weakly animals. A teg, out covaltion, would not bear it, while a sheep in good Secth and appe ite would thrive. A yard of culled bes fed on dry food only, without succulent vegetables, :Meved rapidly and paid for their food.
I do not recrid this example of sheep-farming for its emeral economy, but as an instance of reliance on dry fem in a cuse of emergency; proving that a sheep irsuer is mot without resource under a tuilure of roots, hie be bas stacks of good straw on his farm.
To complete this picture of exceptional management, i: obonld be stated that some of the stubbles folded Lat ninter had been badly farmed, and were very much out of condition. The crops that followed, much aing Yeas, Beans, Oats, Rape, and roots, were all striningly benefited by the fold. Those who have experienced the slow and expensive routine of bringing an exhansted farm into good cultivation and condition, " \(\%\) understand the advantage of saving time in the :racrs. Artificial manure is not the right remedy for this land. The manure-cart travels slowly, and conunt easily be set in motion at all without pats The sheep-fold in such a case can luardly cos tho much.
This narrative may be supplemented by a few remarks on the general cconomy of shepp-farming.
For the maintenance of an ewe flock during the Whole year, some modification of the usual fourmorse rotation is required in order to proville summer morse

Thronghout the southern chalk district of England, wiich is essentially a breeding district, the summer f2n for ewes is either found on the native Downs or is pravided artificially by Sainfoin layers, by Tares and clover, and in some instarces by water-meadows. On the lightest soil the produce of artificial Grasses is not c्रTent in hot summers, but the run even of inferior pasturage, if water is provided, enablea you to keep an par flock through the summer. By laying up less of titp "seeds" to a bay-crop, and on suitable soils by laying down Grasses for two or three years \({ }^{3}\) layer, a casiderahle addition might be made to the number of breeding flocks

Where the rain-fall exceeds an average, an increase in the extent of pasture-land is desirable; but on nther snils and climates arable farming is much more productive, and probably yields a larger bulance " mpoft:.
Nogreater bencfit could be conferred on the light. lind farmer than the introduction of some forage-plant, Which would be to the sands what Sainfoin is to the cbalk. We have seen Lucerne hanging on the side of a Nleep sand-hill in Surrey, green and luxuriant when Whr veretation was scorched into hay, its deep roots tin ing their way into a subsoil moist from the drainage othigher land. This plant affects a warm tree soil, and is in y productive under liberal feeding.
Other crops which help to bridge over the awkward commer months are, on heavy land, early Turnips and fupe, sown at intervals in May; and the Cabbage, reriods of the oar. planting will produce food at al Cimates, because though a great water-drinker, it io obtained at apply from the subsoil. The crop may may be required. On farms period of the year that it dily, August, and On farms where food is acarce in Ining, August, and September, I recommend the folling rystem : - Sow the first week of August, re-set Early var October, plant out in March.
\(N_{a r c h}\) varieties, as the early York, may be sown in wilch in seed-beds, or even drilled in the field, and will be fit for use in autumn and winter. If Cabbages ate ramoved, instead of being eaten on the land, the and lam produce sprouts in spring, useful for ewes rprout well. The large Drumhead, however, does not At the

Nothing can be more evident than the keeping the land in hive advantages derived from large capital; not only do we secure increased pro duction, but greater economv in the means of proluction Mr. Eivershed, in the English Agricultural Society' Journal.

\section*{THE WHEAT CROP OF 1865.}

The abundant Wheat crops of 1863 and 1864 have been followed by a crop varying much more according to soil and other local circumstances than either of its mmediate predecessors. The amounts of produce Fielded in any partienlar field, or on any particular farm, are, therefore, the less reliable as indications of the character of the harvest generaiiy. I think, how ever, that from the results obtained in iny experimental Wheat field, which has just yielded its \(22 d\) cron in succession, taken together with those obtained in fields on the same farm which have been treated more in accordance with ordinary practice, wo may gather that on the heavier soils of the country, if moder itely well farmed, the Wheat crop of 1865 , will turn out to be above an average, at any rato in quantity, if not in quality also
The following Table gives the produce per acre and the weight per bushel of the dressed corn, ohtained on several of the differently manured plots of the experimental field, in 1863, 1864, and 1865, and also the average produce on the same plot; for the 13 years 1852-1864 inclusive, during which time (and in Bome cases for a longer period) the same description of manure has been applied year after year to the same plot. It may also be further explained, as in forme coports, that the different "artificial manures" each contained the same mineral mauure, but in combination either with different quantities of ammonia-salts, or with nitrate of soda:-

How Manured each

\section*{Weight per bushel of Dressed Corn.}

\section*{Unmanured \\ Farm-yard manure \\ Ditto
Ditto}

It is seen that the land which had received no manure of any kind for more than 22 years gave considerably less produce in 1865 than in either 1864 or 1863 , and less also by more than two bushels thau the average of the last 13 years. The quality of the graiu, as indicated by the weight per bushel, although inferior to that from the same plot in either 1864 or 1863, was nevertheless much aoove the average of the 13 years, the weight being nearly 4 lb . more. Where 14 tons of farmyard manure were applied every year, little more than 37 bushels of Wheat were obtained per acre in 1865, against 40 bushels in 1864 , and 44 bushels in 1863. Stili, the produce with the farmyard manure was higher in 1865 than the average of the previous 13 years, which amounted to less than 36 bushela. The produce by the different artificial manures was in 1865 from 5 to 7 bushels less than in 1864, and from 11 to 13 bushels less than in 1863; but, on the other hand, it was from 3 to 8 bushels ruore than the average of the preceding 13 years. Thus, though with each of the very different conditions of manuring, the produce of 1865 was materially less than that of 1864 , and in a still greater degree less than that of 1863 , it was at the same tince in every case (excepting where entirely unnianured) notably higher than the average of the preceding 13 years. The weight per bushel of the dressed corn was also in every 13 years, though lower than in 1864 or in 1863.

Turning from these results to those obtained under the ordinary management of the farm, it will be sufficient to state that the produce in four separate fields was, respectively, \(38,48,48\), and 51 bushels of Wheat per acre, umounts which represent a considerably higher yield than the average of the farm over a series of years.
There can, indeed, be no doubt, that on many light soils the Wheat crop of the season just past suffered both from the frosts of the winter and from the heat and drought of the summer, and that the better crops of the heavier lands have in many cases suffered. at, any rate in quality and condition, from the unsettled harvest weather. At the same time I am disposed to think that the Wheat crop of 1865 will turn out to be, in the aggregate, little if any helow an average one. And if we would find a period of successive seasons comparable in abundance with that of 1863,1864 , and 1865, we must go back for about 30 years, whon the fairly abundant harvests of 1832 and 1833 , the splendid crop of 1834 , and the again abundant one of 1835 , brought down the price of Wheat by the end of the
last-mentioned year to 3 fs. per qr., notwithstunding the high protective duty then ruling. J. B. Lavees, Roth amsted, Herts, Sept. 25.

It is very antiafactory to observe the contimmed care bestowed on the rearing of young stock throtighout the country, as appears by the Returns of this year, which exhibit an increase in the number of cattle, sheep, and pigs, under 1 year old, in each of the provinces, and almost in every county-the total increase of cattle under that age being 56,147 ; of sheep, 175,441 ; and of pige, 220,285 ;-and we may confidently hope, that present, the value of live stock will soon reach the large amount \((35,368,259 l\). ) it had attained prior to the "Hay Famine" in 1859, by which, and the excessive rains of the three following years, the number of stock and the agricultural prospe
were so injuriously affeoted.

Rmigratios. - In the first seven months of 1865 the Returns of emigrants obtained at the several ports of Ireland by the Enumerators, show that 62,262 persons left this comntry, stating it to be their intention not to return. In 1864 the number for the same period was 84,586, being in this year a decrease of 22324 . The by provinces for 1864 and 1865, at page 20. The total number of emigrants from the commencement of the enumeration at the Irish purts, in May, 1851, to the 31 st of \(J\) uly, 1865, is \(1,591,487\).
I beg to observe that on no former occasion during the 15 years in which I have had the charge of these statistics, has a more friendly interest been exlubited towards them, or a greater desire shown to learn the results of the enumeration. William Donnelly, Registrar-General.

\section*{Home Correspondence.}

The Potato Disease.-I hear and read much respecting the dernatation of the Potato rot; and at this juncture, when the cattle disease has diminished the quantity and increased the price of butcher's meat, it is more than ever necessary that such a valuable and nutritious emeulont should bo preserved. It can do no I can make known more estensively the means which 1 adopted for about 10 or 12 years in sucesssfully preserving the bulk of my Potato which wepo Mifected with disease. Many years ago I went to reside at Mossley Hill, about three miles from Liverpool, and there I cultivated, for my own use, about 30 acres of land. I found it advantageous for my horses, cows,
pige, and poultry, to plant 10 or 12 acres with Potatos each year. The first year I lost about half my crop by the disease. A neighbouring farmer told me that my land was too rich, and that I should have better Potatos if it was poorer. So I got off a 9-acre field a crop of with the soil. But it was in vain. Nearly half the erop was again diseased. My neighbour then ad-
vised me to cut off the tops just as they began to turn brown, and accordingly the scythe was plied the following year, when the tops began to mp the tubers, there, with dreadful use, for, on digging deadly enemy of the escnlent. Utterly disheartened,
was about giving up the cultivation altogether, when read a letter in The Times, which inspired me wit possible after the Potatos were dug up, those not possible atter the Potatos were dug ap, absolutely decayed should and salted in layers-in other words, piekled I determined to try it, and the next year I planted in the same field of nine acres fresh sets of Flukes and Kemps. As soon as the tops began to show blight we commenced getting up, and carefully separated all which exhibited even the slightest tendency to disease Each day at noon these were taken to the farmy y with a birch-broom, and then received a second scrubbing in a second vessel. They were then boiled, for I had no steaming apparatus, and laid in one corner of a shed which I had partitioned off, and were then crushed by a wooden beater till they formed a layer three or four inches thick. A sprinkling of salt was then made over the layer, and in the evening the intermediate getting ap was similarly treated. So we proceeded till all were oot np, and I found that we had a heap of Potatos the size of the partitioned space, 9 ft . long, 5 ft . wide, and 6 ft . high, and the whole became one mass of Potato pulp with just as much salt as kept it from putrefaction During the winter and spring we fed with it the carriage horses, cows, pigs, and poultry. They all wited spade just gs if we were cutting through butter. Our milk and butter were unsurpassed, and our hams and bacon could not, I think, be exceeded. Every year the same course was adopted with perfect succees, and wo cared little for the disease; for although there were a few Potatos in each crop too far gone to be saved, my farm servant was of opinion that we always made four fifths of the "touched" Potatos useful. Having removed to a marine residence for health, I hav discontinued farming; but 1 am convinced that if all would adopt the course whith 1 did, a very large portion of what are called diseased Potatos would be saved and made useful for dattle, leaving a larger portion for the wants of man. If the writer of the ago be still living, and should see this, I beg to tende thim my hearty thanks for his suggestion; and, being desirous that it should be better known and made useful at this period of dear food, I ask the aid of your exten sive circulation, that some, at least, may benefit by it I am not an agriculturist, but merely farmed for my own gratification and for the use of my household Samuel Holme, Birklands, Southport, Nept. 2
Grass Land Culture.-Mr. Sanderson has done good service to the cause of bucolic progress by bring ing before the public striking instances of successful, intelligent, and extensive application of capital to agricultural improvement. He is perfectly correat in stating that a Grass pasture may be more quickly and completely formed when the seeds are sown and grown without the competition of a corn crop. The sacrifice of the latter atrd of its straw is a heavy set-off or cliarg against the gain in time, or rather the growth and development of the Grasses. I fancy we are running a little mad on the subject of Grass land, because meat happens to be at a very high price. By all means have Grass where there is naturally a Grass climate-1 mean a moist, pluvial, hilly, or elevated district unsuited for cereals; but to propose to lay down in pasture the fields of our dry, sunny, cereal and seed-producing districtes, would be nationally a great mistake. As a rule, our south and east cotntry pastures are drab-coloured during summer, while in Devonshire and along the western coast, and in Westmorland, cumbetland Ever-green Ireland strains from the Atlantic clouds their moisture, and is naturally pastoral and Potato-growing - the very soil and climate for Turnips. But have we not ample means for producing meat independent of natural Grass-winter Tares and Mangel, well manured; and has it not occurred to corn-growers that it pays better at present low prices (all things considered) to sell their corn crops and straw to their animals rather than to the factor or miller? An acre of either Wheat, Barley, Osts or Beans, if a good crop, will, if properly prepared with its straw, produce a large quantity of meat, especially if aided by a moderate quantity of cale and roots. If wo treat our corn corps as we do our Grass-that is, consume them on the farm, the means for future production are left with us; not so when we sell them off. The history of our Grase parks and pastures (which occupy one-half of the kingdom) it generally a melancholy record of employing the purse and omitting to replerish it. The consequence is poverty, and a dying
out of the best Grasses, replaced by Moss and worthless weeds. Cover these lands with sheep consuming cake and corn, add guano, an'l the rich fattening Grasses would soon reappear. If the seythe were supplanted by sheep's teeth, John Bull would no longer have to complain of shart supplies and dear met ordinary calculation is that 7 lb . of grain will produce 1 lb . of meat, net butcher's weight. As Whent is under 1d. per 1 h ., and ment is at \(8 d\). to 9 ad., it requires n n
conjuror to show that feeding will pay. I. J. Mechi Tiptree Hall, near Kelvedon, Essex, Sept. 22
Sheep Disease.-My exprrience as a farmer does not diarrhoes from developing itself into way I prevented
mong my stock may not be out of place at the prerent
anxious moment, viz.:-About 10 yeare seo 1 men very excessive crop of acorns, and, thinking that 1 inter occurred to me that I would gather parpme. accordingly I proclaimed to the village bome that I would give \(2 d\). a gallon for all the some could bring me to a certain date. The responee averpowering that I was glad when the time appent and I had several bushels delivered after that
half the price. Well, my neighbours, the could not imagine what I was going to do wit However I sent them to the mill to be graned meal, and in a short time after I had occasion to an a calf for diarrhoea, in which case I had abont oner the acorn meal and about the same quantits of 0iter or hran-I am not sure which in some milk and water so as to one dose provad quite sufficient to stop the diene had several cases after this both in cows and treated in a similar way with similar succese course, a cow or a horse requires a larger feed, succall, than a calf or a oheep. The nem be very prevalent that season) spread far and and my neighbours came to bog or bar of my acorn meal, which I wa glad to give them as freely as I give this informum through your valuable columns. Patriot, Park, Pre wich, Sept. 20.—The recent sheep disease ntw seems to have been so fatal, I believe to be merely consequence of the heavy dews that have follond exbremely hot September days, Oar shoep ber coughing most boisterously-in fact, distnrbing My bailiff at once had them all folded at niegut did not let them out until the dew was well of Grass, and the sun was high ; they also got half a prea trice a day, of Cotton-cake to stay their Alomes have not had any deaths amone nearly 900 sheen. heay poisonous to vegetable and animal life. They all the Turnips, rust the Grass, and kill the aboop en lambs. By shutting up animals at night anditit early morning all this mischief is preventel can be no doubt that these dews are one of the agm employed to decounpose and destroy the mas vegetable tissue that must somenow rid of in the coarse of the autumn. sideration whether yarding at night might not go far towarda preventing monit. 21.

The Smithfield Club and the Cattle Plagur- sure that whether a man is a breeder or fecje horned cattle, or whether he is one of the puhm can, in any suggestion which he make, general welfare of the publu the pag destruction of horned catlie by Peofesear Simonds has pro said on that point. Profeswor simonds has that all oure io impossible. This being 80,1 sam that as far as horned catile are concernel, advisable to hold the usual Caristmas coter Islington trís year. salesmen, inopect herdsmen, and others are likely toconvey to tho there shown this infectious dieense ; and as count cattle thate shown will most likey butchers from many towns in different part for Christmas purposes, this dire disease may bid minated widely over this country. My remarti a apply to sheep and pigs, which are not sum Batr Blandford, Dorset.

\section*{Farmers' Clubs.}

Croydon: Improvement of Permanent Pasture.-At recent meeting of this Club, Mr. E. Stables (of Ficklestole) said:-When I first came into Surrey I was somewhat puzzled with the Grass-land; as far as 1 could understand the general character of the soil I thought it well sdapted for (Trass, and yet the generality of the Grass to be seen was very inferior rality of the Grasght up in a grazing district, and Having been broug to seeing the Grass-land farmed cultivated, and well manured, and proftable crops and uutritious Grass grown, I was some time before I could realise the fact that the inferior Grass to be seen in thi neighbourhood was chiefly attributable to the suicidal manner in which it is treated. Is it not as proper, and decidedly more proftable, to treat Grass land as it is deable liketh Ithink it is for ration renson. rable la, blich is becoming more and more decideld every year, is the growing disparity existing between the price of live stock and comn; and as for as we can understand the csuses now in operation, we may expect it to continue and butchers' meat a the present time if our manufacturing district hall been in prosperity we can only conjecture; but we pre quite sure it would have been considerabl hizher than it is at present. That our Grass land i mpable of areat improvement there is un douht -on capable of great inprovement
first duty is to ascertain the cause of the defiviency Perhaps it is wet: if so, it must bo drained, or a other expense will be comparatively wasted. Wonder ful effecte are produced by even draining wet Graws land The coarse worthless herbage suited to wot land wil
dinappoar, mo well as many noxious weode, and apeedily beeome replaced by herbage of a valuable nutritive kind. In some cases the laud may bave baen sowa with inferior hin is of Grass, and woull be much inproved by the applifition of some cand metes. If so manure, and miwing ome vear instiad of prsturing, and not eut the (frass to mena, bat to allow it to get well ripe before betng cut, by which mians thie ronts of the old Grass will be very much thinned, and remm male for new seed, which, if previnusly harrowed, then rollel im nediately the old crop is remorel, would be likely matariaty to improve the character of the herhage. This is a inst efficetnal inile of aperation you will gat ril of 95 per cent, and if you aperation yon will gat ril of as per cent, anit you complete cure; but anccess in this inatance depende character of the herhare moy be much moiltiv! and controlled by the judicm mathoice amb apphertion of artifital manures. "If yor wish to improse the quatity apply a dressing of suparphoophate or palverised bones for several years consecutively, and if you sive it a dreasing of gypsum in the bargsin 10 mach the better
but if you wish for ganatity fresmactive of quality, would recommend a mixture of soda and guant, or, at my practice has generally been, to apply a light drewsing soila another year, and no on. I have formet this plan lo an the wat anal of with the constant removal of stock from ordinary pasture land it mutat require a corrasponting return in the shape of manure of aone kinl, notwithstanding the droppinge of the mimals. They cunnot manufacture all the lind grows into mannre; thes: musi draw on the
land for the manufacture of flesh sud bonee. Our object should be to return to the land in the shape of manure what we talke from it in the crop, whether the crup be corn, beef, muiton, has the benefit of cattle droppings, it crilently dine mot has the benefit of cattle droppings, it erimontly
require the the entire crop is remyed; yet we must alloir that pasture land does require necaston, mmoring th preserre it it, astate of efficiency. Thre elmaratere of the kind of stock kept upon the land If youn growing cattle or mitch cows have beon grasoch they will have extracted the phosplate containel in the koin It is eatimatel that a milch cow carriwa nff at the raten 30 lb . of phosphate per annmm, henere the propriety of
 manure, but unfortunately oa moat arahle farms it io too scarce ant article, and as our sunceess in farming depends much on the stndy and practice of ceonomy, appears more proper, as a general rule, to apply told do not thinks as soine people arrue, that there is any great waste in the top-Iressinz with fold-yard manure. I think an occasional tod-dressing with dung on meadow land, where the entire erop is mown and meadown may be allowed; but in the case of pasture land which gets the dung of the cattie pastured on it, and only requires a mote more help, the propriety of using auitable artificial manures is evident. it is of importance that the droppings of the cattle should be frequently spread, and not aliowed to remain just where they happen to fall. Thisis a very mommon nrg.ect, by which mech valuable manure is wasted or worse than wasted, as an over-dose is positively infurions. Where horas cart to another, and, even when this is done, it will sometimes happen that one part of a field will be over-manured, and the Grass become coarse and refased by the cattle, in which case it is a good practice to mow that particnmost of the Sarrey hill farms chalk is easy of access, and a good dressing of chalk would in miny cases be of great servlce in increasing and sweetening the herbage. Chalk is said to be a mother of Grames and Clovern, and f you apply it freely, eny 50 cartlonds to the acre, you may safely depend upna seeing your Graes become fal rubbish. I would atrongly recommend the use of the bush-harrow, and also of the heavy land-roller, abont the month of April. I am of opinion that most of the trong clay lands on the Surrey bills would be much better and more profitable as permanent pasture land. My own limited experience and observations tench me that the strong land to which I refer is capecially adapted not only to grow Grasz, but tn grow gnod Grame on which beasts will thrive and do well, and, eapecially if yon allow them a little oilcake, make the:naelves fit inf the shambles. When von intend to lay a field down to Grass, by all means have it free frmm weuls ; amil sow gond seed, not the sweepings of the hay loft, which are requently fall of weeds. I ntrongly recommend yon to apply to messrh sabvon, or La won, or hiblos, or somie charaeter would be a sufficiont gnarantee for a senuine anadulterated article, and aloo for a proper mixture of the different kinds of seods suitable for the land; and do not pasture the youg Grase the first year, but mow,
and mow early, not allowing the plants to run into occupy the ground.

\section*{Rebitcos.}

The Journal of the Royal Agricultural Society of Fingland. Second Series. Vol. I., Part 2. J.\&Murray. The contents of this Number of the Agricultural Journal relate almost wholly to the live stock of the farm; and are thus in keeping with the present anxieties and plans and wants of the English farmer. Any attempt to take the book out of the rank of a mere work for consultation, and adapt it to the carrent interests of the members whom it reaches, but who have hitherto rarely read it, is to be commended; snd though we look in vain througls the pages of the present volume for any reference to the great calamity that has just overtaken our cattle, and multiplied the risks of stock farming, yet the many Essays on Sheep and Cattle, Dairy Farming. \&c., show that the Editor is desirous of making the Journal more immediately useful than it has hitherto been.

The reports of the discussions before the Society are a very satisfactory portion of the volume. Dr. Budd's capital lecture on the pig disease is well illustrated with good woodents.
By the way, may we ask what has become of the 50l. prize offered by the Society for the best essay on agricultural education. Were any essays sent in compete for it? and why do none of them appear?
We bope from time to time during the next few weeks to give such extracts from the several essays here published as will enable our readers to judge of the contents of the volume for themselves. They will
find in it a very excellent report of the Plymouth find in it a very excellent report of the Plymouth
Meeting, drawn up by Mr. Dent, M.P., as regards the Meeting, drawn up by Mr. Dent, M.P., as regards the regards the implement department.
Agriculture, Ancient and Modern. Parts 14, 15, \& 16.

> J. S. Virtue, Ivy Lane.

The numbers received since our last notice of this work continue the discussion of arboriculture-then proceed to the description of farm buildings and cottages, and treat of the apiary-the veterinary department-the diseases of horses, cattle, and sheep. There is thus still the characteristic lack of systematic arrangement to which we have referred as belonging to the book throughout. But notwithstanding this the "Old Norfolk Farmer" is generally an interesting and pithy narrator of things botin new and old upon the several subjects which, whether in due order or
disorder, he brings under the attention of his readers, disorder, he brings under the attention of his readers,
and we doubt not that his book will be serviceable to and we doubt not that his book will be
agricultural intelligence and progress.

\section*{The Cotteswold Sheep. By James Marsh Read. C. H. Savory, Cirencester.}

The articles descriptive of the Cotteswold sheep, and exhanstive, we may say, of its history, which were
published some months ago in our columns are here collected. The pamphlet well deserves a place on the table of every one interested in our grandest breed of sheep. How large and wide-spread an interest is taken in the breed will be learnt from a single extract:-
"Perhaps, however, no other circumstance will show the estimation in which the Cotteswold sheep are held for use in other districts so much as the returns of those who sell them, and therefore we give a return of those sold, from information obtained from Mr. Villar,
the extensive auctioneer, of Cheltenham, last season. From this return we gather that for the season of 1864, for 31 breeders, Mr. Villar sold 1014 Cotteswold rams, and these averaged \(10 l .13 \mathrm{~s} .6 \mathrm{~d}\). each, and these 1014 sheep went for use into 26 counties and countries. This return represents the business done by ouly one anctioneer, and, had we been so fortunate as to get returns from other salesmen, doubtless the wide-spread
use of these sheep would lave been yet more ase of the
We hope this pamphlet, which so well describes this breed, will obtain as general a circulation.

\section*{Farm Memoranda.}

We take advantage of the immense body of agricultural

Edinburgh to publish such extracts from it as will indicate the existing style of Soottish agriculture, and the enterprise and energy of Scottish agriculturisto.]

\section*{(Continued from p. 904.)}

Burbo: Alexander Bethume.-I am a landed proprietor in the county of Fife. I have several small tenants, and half a dozen decent-sized farms. My gross rental is about 2500 l . a year. I have farmed for 16 years, and have paid attention to farming since 1850 .
I have generally farmed about 200 acres of my own I have generally farmed about 200 acres of my own have directed my attention to the working of the law of hypothec. I think that, looking back to the state of Scotland, when tenants had little or no capital, the efficet of the law, together with leases, upon landlords, tenants, and the whole community, was remarkably good When it came into force; but now, I think it is just as injurious to the landlord, because it has a tendener to give him an inferior class of tenantry. It induces
tenants to become occupiers of land, when it is not for their advantage, or the advantage of any body else, that they should have it. It brings a great deal of odium upon the landowners, without giving them any real benefit-its apparent advantages being quite illusory. On well-managed estates, where only the real value of farms is taken from the tenants, I don't believe that the law is of importance; but I am sorry to say, from my observation of parts of Scotland, that I think there is a number of estates on which a weak class of tenantry have been admitted, and that, under the
peculiar circumstances of agriculture at present, rents peculiar circumstances of agriculture at present, reats
are promised which are not paid, the land is underfarmed, and it is affecting landlords that way. So much does it affect them, that, if some alteration in the law is not made, I think the tendency will be to bring about a further change in the proprietary of Scotland, and to throw a large amount of the land into the hands of the monied and mercantile intereste. As to the tenants, I think they are tempted, by the credit which is given them by the
landlord, to take farms which they are not competent for. These tenants start in difficulties, and remain in difficulties during their whole lease. The law also affects tenants in the way of damaging their credit, and it prevents them from obtaining money to carry on their trade. A number of tenants at present underfarm their land, and I think the want of capital on the part of tenants is very important in considering this question. I think the first person we have to look to
is the proprietor, next the tenant, and lastly the public is the proprietor, next the tenant, and lastly the public;
for it is impossible to exaggerate the importance of agriculture to a country. With reference to merchants and others connected with supplying the land, I have no great sympathy with them. I think that they and our agriculturists have the remedy in their own hands; but I think it is a grievous hardship for smiths, wrights, and other small tradesmen, when the law is put in force. I have a great feeling in favour of the old proprietary of Scotland; but if they are not in a flourishing condition, and managing their land properly, let them be as old as Methuselah, they ought to get out of it. I should be sorry to see mere money nower
in this country getting land without paying smartly for it. With reference to my opinion that the present law damages the credit of tenant farmers, I think it is apparent, that the risk under the law of hypothec is so great that capital is very shy of confiding itself to that class. I entirely disapprove of a tenant entering on a farm with insufficient capital to stock and work it. I
don't think any man should go into a farm which requires 10002. to stock it, if he has less than that sum. He should not commence farming operations on credit; but I consider that he would be benefited by the abolition of the law, in respect that, if an unforeseen emergency should arise, he would be able to turn his credit to better account.
A French Prize Farm: Masny.-We have given on previous occasions copious details with reference to
the Masny prize farm-a noted French model working; but perhaps it will be well to add the general results attained during the eleven years ending 1863. The profit and loss account of those years were as fillow

Ten out of the eleven years thus resulted in profite, although a loss of \(1353 l\). was sustained in 1861. The definitive profits of the eleven years were thus \(12,176 l\)., being an average of 110 il . per annum. The figures given are not without interest, as they show how grave are
the vicissitudes to which agriculture is sutject. since the vicissitudes to which agriculture is suh,ject, since
in 1861 there was a loss which exceeded the average profit, taking an average of the 11 years; while in another year (1858), the profit was reduced to about the thath of the average. It will be readily understood how it is that the cultivator who has no personal fortune, or who enjoys no credit, or who
spends too much in prosperous years, finds himself reduced to the rudest extremities when disastrons meteorological circumstances reduce the profits almost to nothing, and, nevertheless, require an ezaggerated expenditure to save the little which Nature grants him. The year 1861, which yielded such deplozable resulte, Was distinguished by a bad crop of cereals at the same time that prices were reduced by exaggerated foreign
importations; while, still further, the price of Beetroot was lower than it was during the whole 11 years. These depreciations of profits were coincident, at Masny, with increaved expenditure involved by preparations for the competition for the prize of honour. These remarks made, it remains a wellestablished fact, even \(b_{z}\) the table which the reader has under his eyes, that arricuiture, like all other industries, largely remunerates the efforts of all those
who devote themselves to it on favourable conditions. who devote themselves to it on favourable conditions, of 1107 . per annum indicated above as having been
obtained during the 11 years was calculated after Agriculture thus furnishes an evidently remupers perio on the a and prudent. For the period with which we occupying ourselves, and which comprised years, the working capital at Many was \(60002 . ; 1859,80067 . ; 1860,95762 . ; 1851,11\) 1862, 10,4991. ; and 1863, 12.3891.- giving an for the 11 years of 797 Tl . Including the alloman average capital was thus 18.42 per cent. per annon It will be seen that the amount of capital per an acre worked was more than doubled in 1863,
pared with 1853. Truly M. Trévet, this model French working is atet, the dire tician; we wonder how many Engligh farmers calculy the profits they acquire with as much nicety. M Lane Express.

\section*{Calendar of Operations}

As during the ensuing month we euter the prowe seed-time for Wheat, when a less than common quanti
of seed' sown per acre will produce a better of seed sown per acre will produce a better
common result at harvest-time in the case properly tilled soils, we quote here the remarto Arthur Young and his latest Editor on the subjed Wheat culture, after the various crops whid succeeds :-

Beans, if well cultivated, form a tolerable prepar tion for Wheat; I have seen in Kent a field of Whem which, as an experiment, was made to follow four pre
parations, viz., Beans, Clover, Tares, and fallow, an the first was superior to all the rest; next the Clore then the Tares, and the worst was after the fallow. the Bean stubble be clean, a paring implement broadshare will cut through everything and loosen th surface sufficiently to enable the harrows to leave it clean and fine as a garden, women attending to pich and burn. In other cases the scuffler or coltivater will do it better than the other implement. When the
sarface is clean and pulverised, either drill or son the Wheat broadcast; in the latter case it may be covere either by a harrow, the scuffler, or a very small plogegh Wleeat becoming root-fallen from a loose bottom, bota new surface will be brought up that may be dififealt drill. If the soil be more loose and friable, and the fine surface which the operations had obtained ploughed down, it will give the Wheat too loom bottom, and there will be a chance of a rond-ner this circumstance, do not plough at all, but either directly or sow broadcast after the soil has heen verised and cleansed by the scuffler
covered by the came implement, which will save tillia and obtain the probability of a larger produce. This a new practice on strong land, but I have seen sut success in it as leaves no reason for donbting the sonn ness of its principle. It should be rememberes, whatever other circumstances may influence the gron of tis grain, it loves a firm bottom to rolv, nor wil dey forrshes where 10 uless the under stratumi which it will attempt to fix its roots, be firm fertile The best bsais is well-cultivated earth, from not having been lately disturbed.

Wheat after Clover. - Clover forms so good a prot paration for Wheat, as to yield ample crops at rem little expense: so much so 2, Barley; 3, Clorert Wheat, is practicable on land dry enough for Turam and rich enough for Wheat, the agriculung repatition be satisfied with his profit. But arver radually appe it has been found that two first introduction of Thichip wore unime manuring where they wam one pow require amplo little and the Cin has broduced of larger size wilures, that it is no loo ensy to have it every fourth year. need of varistions, but still retaining Cloverever. mi paration for Wheat. The husbandry, which was merely by the harrow after ploug which method (tor the akim-coulter was unkno seed was too apt to fall into the seams of the The practice of dibbling was an improsith method the seed was deposited in the
slice, the regular treading which pressed down the forrow, and gave a dees not otherwise attainable. continued the they began in dibbling, the practice w lessened; but they bave done it of lave here We may mention here that various and ing eight or 10 sets at once, an la \(n\) nir, Powell, near Tonbridge Wells, in England.

Where the practica of dibbling remaius, ihe arving been ploughed a lortriler, and then
y iben to be bash-harrowed. Six pecks of seed are eooskh observation it is necessary to make, that if the Land s known to be predisposed to mildew, an increase if ceed on that accurnt is right, whatever the soil or acon; by reason of the well-known fact, that all thin crops sum.
A very singular experiment of Mr. Dacket's, on mnaring a Clover lea for Wheat, should here be menprond. He had a field in which Wheat rarely escaped being gre itly root-fallen; not to lose sowing it with that grain, and at the satne time to guard agaiust the mendy, he scaffled it repeatedy, till he bad torn ap the Coover, and also gained tilth enough for the drill; then be collected the Clover fragments, and carted them into trilled the field. The Wheat in this case having oblined a firm bottom in an unstirred soil, escaped the Limese, and yielded an ample produce. The Clover root which would have produced the dreaded looseness ind it been tarned down, made a large quantity of jong, and therefort was not lost to the farm, though the particular field was deprived of it. No saving of aspense was here made, but an extra one incurred ; but it secured a crop where otherwise there would have tean none. This treatment is especially needed where there is mucin Rye-grass among the Clover. Indeed, ouless a liye-- rass stubblo be thus thoroughly disintegrated and tallowed, it is one of the worst preparations in the Wheat crop that we have.
"Wheat after Tares.-A good crop of winter Tares Lemes the ground in such loose, rotten, and friable onder, that on clayey soils it is in excellent condition for either green crops or Wheat. But sasidy land may be too loose after Tares for Wheat, and in that case it in mech better husbandry to sow Turnips, or plant Pontos on it, than prepare it for Wheat. However, if the furmer should determine to sow Wheat after Tares, the soil should be cleunsed and pulverised by , the scufter, the Couch and rubbish should be burned, and the astes spread, in which state, if the surlace hes m solh ridges as will keep the soil dry the following -inter, the Wheat may be either sown or drilled with out any ploughing. This has been practised with good moces, and it fis peculiarly suitable for either light or strong land.

With such cautions on the part of the agriculturist a aro before mentioned, Wheat succeeds very well stier either Clover, Tares, Beans, Cabbages, Potatos, or Turnips."
To this we add that a single bushel of Wheat per are is ample seeding in the early part of October \&l mell-cultivated land.
"Beans.-The growth of winter Beans has increased di hete years in this country. They ripen early, and thos not only afford opportunity of a fallow before the aed time of the Wheat crop which follows them, but they are thus also less liable to the attacks of mildew and aphis, which often make their appearance on spring. somn crops later in the season. They seem alsi) appecially adapted to a lighter class of soils than has 2itherto been considered fit for the Bean crop, and may thus be taken instead of Peas or other crops less riloable than themselves, and suitable for light land calture.
"The comnon culture is to scarify a Wheat or corn ather rub any kind, and harrow whatever Couch or ather rubbish there may be in it, and burn it. Then cart on whatever manure you may be able to spare for , and it is the experience of Mr. Lawes that the poorer tinds of farm-yard dung-such as are made from the itter of store cattle-will do as well for Beans as dung ef richer quality. After 12 to 15 tons of dung have been than spread broadcast, it is ploughed uoder and the and is harrowed. Two bushels of the small winter Ben are then sown by the Suffolk drill, with the evers of the seed coulters well weighted, so as to make 2 deep furrow. And they are thus sown in rows from 5 beches to 2 feet apart. A harrowing after the drill wites the operation.
We may add that winter Beans are proper for the Practice of what is called 'double culture.' Bean soils ee very suitable for growing Parsnips on, and they may Beave. Su February, in intervals between the rows ol taured- Suppese the land to be already ploughed and alturately of the the plough through it at intervals panately of 18 inches and 6 feet-in the furrows sow head drill rour Par them by harrowing the land down; anowidy your Parsnip seed in early spring on the thus SHilid drill (fis suallow as possible, by means of the Tio drill (frrst mixing about 5 lb . of the seed mactine number of bushels of sand which the excione of the to sow), in rows 18 inches apart, two in Ger by busthe intervals between the Beans, and कut, tor the sake of a ung. Let the rows be north and Us the Beans may a uniform distribution of daylight. manner, and the may be sown by themselves in this in Aprii. The interval of left for Carrots to be sown thecraal cultivaterval of 6 feet is wide enough for the ation of the laud.'

\section*{* Belgrave, near Leleoster, May 20, 1863}
"Sir, The Lean-to House which you supplied to me in \(\mathbf{1 8 0 0}\) has fully answered my expectations. The Huuse is planted with Vines, and Figs on the back wall ; there is no artificial heat, and, though last year was a most unfavourable one, some of the bunches of Black Hamburgh Grapen welghed more than a pound, and ripened well for the season
"The material and construction of the house have proved highly satisfactory.
" Mit. Ifereman."
"Xours \&c., Alfred Elzis."

\section*{"Johnson Hall, near Eccleshall, Staffordshire, May 11, 1863}

Sir, -1 have had in operation for several years, Lean-to Vineries made with your 14 feet sashes at an augle of about 60 degrees, the lower or front wall belng 3 fect high. Nothing can be more simplo than their construction; the mode of ventilation is excellent, and entirely obviates the annoyance and breakage caused by movable sashes, and I feel much pleasure in recommending these structures.

\section*{Mr. S. Hereman."}
"Yours. \&c., Edward Lyox."

\section*{" Wath-upon•Dearne, near Rotherham, May 12, 1863.}
"Dear Sir,--The three small Glass Houses you sent me answer admirably. The Lean-to with 10 feet sashes covers now about 25 healthy and strong Vines; last jear the produce and quality of the fruit were surprising. * * * I recommend every one who is so fortunate as to take pleasure in his garden, and who can afford the expense, to erect one or more of your cheap 'Hothouses for the Million ' -3 never-falling source of proftable amusement.
«I have other more costly and extensive glass otructuren, but, having regard to thair cost and efficiency, they bear no comparison with those I had of you.
" I am surprised that market gardeners do not adopt them more generally.
"s Mr. Sayuel Hereyan."
"I remain, \&e., G. P. NıHolsus."
"Without any pretence to high finish or elaborate workmanship, which in such structures represent a mere waste of moner, they are perfectly whll mion rangement is as simple as ingenuity can render them. No rafters obscure the light and make them cumbrous. No sashes have to be pushed up or let down it lines and weights, or by expensive mechanical contrivances; and yet all the ventilation requisite in such buildinys is as perfectly secured. * * portability that must give them a peculiar value in the eyes of the public. If we hire a house for :two or three years, and are enthusiastic enough it ap and reme remains the absolute property of the landlord at the end of the term. But, if instead of fixing up we drop down one of these Here with the watering-cans, wheel-barows, and other implements."-Dr. Lindle"f in "The Gardeners' Chronicle," July 25 th, 1860.

\section*{S. HEREMAN and J. MORTON, aGENTS, 7, PaLL MaLL EAST, LONDON, S.W.}

The SECOND EDITION of A HANDBOOK of VINE and FRUIT TREE CULTIVATION, as adapted to the above Patent Hothouses, containing Illustritions Hints for Heating Houses, and General Directions for Cultivation, \&cc, may be had of Mr. Hrrmanr, price 18.; post free, 1s. 1 d .
The perations before he attempted to instruct others."-Cottage Gardener, October 6, 1863.

\section*{}

Whencter we shall have mastered the nature of epidemics we may hope to be in a fair way of has all the characteristios of a trues, for fashion springs an characteristios of a true epidemic. It
a few isolated cases, then spreading in spite of Hpposition, right and left, crossing mountains, utmorst violenceans, suddenly appearing with the and marolence in some great centre of civilisation, the marching onwards till the uttermost ends of become acquainted with it. Then, and only then,
it disappears, almost as suddenly and mystoriously as it sprong up. We have seen maps showing the course certain great epidemios have taken, and we should like to have similar ones illustrating the road those new fashions have travelled in which we are speeially interested.
The fashion which is now spreading, epidemiolike, in our gardens is that of growing what are called fine-foliage plants. We have struggled hard against it, keeping it out as lon r as we could, but there is no denying the fact, that we have now fairly eaught this new Phyllomania, this mania for fine foliage ; and, whether we like it or not, we cannot shut our eyes to its existence. It has orept upon us so quietly and noiselessly that it is difficult to trace the country of its origin. Was it perchance of native growth? At first sight it would appear so. Our British Ferns, it might be argued, have given us a taste for foliage plants. The graceful tracery of their leaves was so bewitohing that we could not help admiring, colleoting, cultivating them; and attention once turned in that direction, soon enrendered a rage for exotio Ferns and other foliage plants till the whole oulminated in the present Phyllomania. But, however plausible such an argument might be, we fear it does not hold good. If our native Ferns ever were bewitching, it is astonishing that their power has only been felt by the present generation, and that they excreised no kind of spell over our grandsires, who evidently regarded Ferus with no special sympathy. It is humiliating to admit that their beauty was not appreciated until, together with the other leal plants, they became fashionable.
But in what country did the fashion, the rage for fine-foliage plants originate? We think we can trace it baok to the Pacifio Ocean Throughout the whole of that great sea, north and south, the islanders, ever since we have known them, have cultivated plants with tue foliage. The rudest tribes, such as the Samouns, T'ahitians, and even the canuibal Vitians, never fail to plat around their houses Dracanas, Crotons, 'Terminalias, Araliacere, and others having handsume foliage, and that in preference to flowers. In the Nort'1 Pacific islauds, such as Japan and its dependencies, where a regular system of gardening had for ages been established, the taste for foliage plants had a better chance of developing itself; and when the Dutch, who for a long time were the only people that kept up an intercourse with the Japanese, tried to obtain living types of the Japanese flora, they hardly ever urooured any other than garden plants-irom access they interior being denied cormen, and amonest they purchased from the nurserymen, and anes the so-called "foliage plants" were largely represented. It was thus that the Netherlands caught the Phyllomania fever, which was soon to spread like an epidemic over Germany and France, assuming larger and larger dimensions, and ultimately establishing itself in Britain turning us, amongst other things, into such publishing house in London which has not brought out one or more books on Ferns, and hardly a botanical author of note in this country who has not tried to instruct us either how to colleot, cultivate, or study Ferns.

The success which the Ferns achieved amongst us was the greatest triumph of flowerless plants over flowers ever recorded. The rage for finefoliage plants had now fairly commenced; the Hoodgates were opened. All plants with variegated leaves became much sought after. A species which would not be looked at if preserving the natural green of its foliage, beoame at once an object of interest if labouring under a kind of albinism so as to make it appear mottled. But white and green, or yellow and green, were not enough to
cause variety. The eye wanted more; and during the last few years the whole globe, inhabited and uninhabited, has been searohed for plants with leaves having more than two colours-if possible all those of the rainbow. The searoh has been productive beyond expectation, and we have now in our Caladiums, Arums, Orchids, Begonias, Marantas, Cannas, and others, an endless series of these favourites, daily augmented by new additions, which enterprising nurserymen are dragging from the depths of tronical and semitropical forests.

The latest development of Phyllomania seems to be decidedly towards large and hard-leaved plants; all that are soft and weedy, such as Begonias, are to be cast aside. Here horticulture has lighted upon inexhaustible stores, and amongst them the most majestic and beautiful of
all known plants, the great Pack tribs, about whioh we shall have a few words to say ou a future ncoasion.

We have been asked so frequently as to the Federation of the Hortioultural Societies of Belgium, and their connection with the International Exhibition and Congress held last year in Brussels, that we avail ourselves of the opportunitr afforded us hy a pern-al of the statutes of the Fuleration, \(t\).) answer s-mpe of the questions put to us. We du so the more readily, as some hints mar possibir be gained from anr continent al aeighturs as to the manacem int of our ow: Shaw and Congress next year.
The Federation is established under the anspices of the Bulgian Government, and comprises all the Sooieties of the country, who conform to the regulations and pay a certain small annual coatribution to the general fund. The amount of this subsoription depends upon the status and numerisal importance of the several Societies. The objeot of the association is the furtherance of all branohes of horticulture by priolical meetings of dalegates from the various Societies, when matters relating to gard-ning in all its branches are disoussed, and congresses organised. Two such general mectings are held amuually, in conucction, if possible, with the more important hortioultural exhibitions of the season. A working committee is chosen from among the delegates, and one of the members of this committee is appomed by the Belgian (Bubernment to uet as its representative at the meeting. lu this way the claims of horticniture are made known in high quarters, and an mercourse maintained which cannot fail to be of utility to the soience and practice of horticulture, as well as to the general public.

The relation between the Ferderation and the various local Socicties thus seems to be of a similar kurd to that existing hetween our Socity of Arts and the Suctities in union with it: or still more like in its wreanisation the Mritish Medical Asmociation, with its branuh societies in tach county.
The Federation offers prizes for the best ensays on subjects connected with the varione denartmenta of gardening and the collateral scienoes. These essays, if judged worthy, are printed in the annual Bulletin, in which publication are also inoluded the reports of the varims aflilinted Sicieties, minutes of their preceeding, ascoumho of the various flower shows, \&c.
It is olear that a central body like this, representing all or nearly all the local Societies of the kingdom, must have great weight and much greater opportunitios of advancing horticulture than any one of the institutiuns semarately; ret it does not il the least in'erfre with the independent action of each Society. By the effor:s of a similar association of the Dut.lh Sucieties was carried out the brilliant horticultural exhibition at Amsterdam in April last, and the no less successful congress of botanists and practical gardeners

Whether a similar combination of the numerous horticultural Societies senttered over these islande, for the purposes of joint action be desirable or not, is a question we should much like to see fairly discussed. Joun Bulr has a hatred of centralisation, and the societies are, we fear, nut free from jealousies, so that it might not be easy to establish such an association. In the meantime our provincial and metronolitan societies have now the opportunity of forwarding the interests of the International Show in London next spring, and we earnestly hone that coliectively as weil as individually they will arail themselves of it to the utmost. Such a Show as we hope to see, must be the result of 'a long pull, and a strong pull, and a pull all together.
Frow a correspondence in the Times of India wo glean that the prospects of the successful culture of the Peruvian Cotton in Scinde are not at present very satisfactory.
The causes to which the want of success are atiributed are various. Among them the cold night temperature, which stops the germination of the seeds, or cheoks the growth of the plant at later period of its existence. The "boll worms" are also great enemies to the ('otton plant, destroysigned " D .," and attributed to a highly competent signed "Mr. N. A. Dalizler. Frum this letter we extract the following remarks, merely ading our hearty wishes for the realisation of Mr. Daczeli's golden dreams:-
"My object in writing, however, is to state that I think I have discovered the casse of this universal
want of success. Last October I visited a house on
the outskirts of Poona, situated on the almost bare rock. This rock is a kind of earthy amygdaloid, which produces one of the poorest kinds of soil. In the compound of this house I saw three Peruvian Cotton plants growing in this poor soil ; they were
covered with pods, and the cotton in all of them was perfectly clean and of the finest quality. It must be noted, too, that these plants were entirely neglected, and were never watered. It may be concluded from this that the soils in which Peruvian seed has been sown wood and leaves, and that a poor stony soil, jire that around [many of the Deccan hills, diminishes the luxuriance of the Cotton plants, and favours the
formation of flowers and healthy pods. This observation is entirely in accordance with the fact well known to experienced gardeners, that whatever circumstances tend to diminish luxuriance and check rapid vegetation are more favourable to the production of flowers than leaves; and that a plant in a sterile soil and exposed situation flowers sooner and more abundantly
than when in a rich and shady place. The Peruvian Cotton-plants which have hitherto turned out failure, should be transplanted into a poorer soil. I send you a sample of the cotton picked off the you feel disposed, to the Secretary of the Chamber of Commerce. All the worthless snil of the Deccan
might be clothed with Peruvian Cotton shrubs, yielding each from 5 oz . to 1 lb . of pure cotton, and may be thus converted into gold-fields.
"Poona, June 21, 1865."
To Mr. G. W. RiGDEN, of Canterbury, we are indebted for a piece of OAK from the ruins of the Chequers' Imm, the resort of the "Canterbary Pilgrims" in days of yore, and recently destroyed by fire. The wood is perfectly sound, and evidently is that of the sessile fruited Oak, which was formerly confounded with in our columns in past years that we need only point out the improbability of the mediæval builders seriding forests yielded an abundant supply of Oak.
- A correspondent calls attention to the well. that is so intimately associated with the memory of Dr. Isamc Watts. "It is a splendid specimen, and is now growth, the contrast between the colour of which, especially the younger ones, and the very dark foliage of the tree, is very charming, and, as far as I kno
very unusual in the immediate vicinity of London."
- The Rev. S. Hadden Parkes, whose name will be remembered in connection with the Bloomsbury the Times, that the Chief Commissioner has placed at his disposal for the working classes of London, the the Parks during the preceding summer. "I know" he obeerves, "from actual experience that it is possible with care and attention to keep such plants during the winter months. And if only we can induce the poor flower shows of window plants, and before long we shall see their results-increased beauty to the streets of London, a more cultivated taste among the working lasses, and more cleanliness and comfort in the socia life of the poor." The hint might be taken by the
owners of private gardens at this season, when so large owners of private gardens at this season, when so largs be destroyed.
Gardon, Mr. N. Winson, of the Jamasica Botanic exported from the island to New York, for the manufacture of paper. As much as 70 per cent. of clean gigantea) attains its full beight of 80 to 100 feet in three or four months time, and the average growth during that period has been ascertained by measurement to be 8 inches in the 24 hours.
for the We fape of Good Hoport of the Colonial Botanist courtesy and gratitude of European botanists, that we feel assured might be satisfactorily explained by defective postal arrangements, or by some other among the many mishaps that may arise in carrying on a distant correspondence. Mr. Chirman, to whom
we owe many acknowledgments for services rendered to science, suggests that "as it may be inconvenient for European botanists to acknowledge by letter the receipt of every parcel of specimens which they may receive, they should take steps to forward systematically to their correspondents abroad an occasional pamphlet cating the latest information.
i have," says Mr. C'Hapisin, "for several years been forwarding specimons, which, excent in nue soli-
tary instance (Dr. Harvey), I have never heard of again. There is always some inducement for a person to continue his services when he can find out what has some interest; while, on the contrary, people become disheartened and discouraged when they hear nothing
they have gone astray
Now that complaints are made in this country that our old stock of Proteacer, Stapeliz, Mesembryanthema and succulents in general have died off, persons willing and able to help in renewing our collections and adding novelties to them are greatly to be
encouraged, and we would gladly become the medium through which such labours might be acknowledged.
during the correspondent of the Athenceum states, that held in Hanover, the weather Gracas Naturalisms the excursions made in the neighbourhood thus became a source of great enjoyment. One of them was fo the newly-established Zoological Garden,
charming spot on the borders of a wood by which two thirds of Hanover is surrounded, and through which excellent roads have been made. Another was to the Burg, a grove of fine Oaks, some of them nearly 1000 years old, where coffee and other refreshments were taken; and whence the whole company, including the ladies, proceeded to Herrenhausen, where the Royal Gardens had been thrown open and all the fountain played. The garden adjoining the Royal Château i still as it was at the time of GEorge I., in the formal Freuch style of Louis XIV., with straight walks, high bedges, fountains, and cascades. The theatre, cut ou of trees, to which Thackeray alludes in his "Four Georges," has of late been used; but such a theatre to be in on a summer evening, when the trees and hedges, which serve as scenery, are lit up by thousand of lamps, is of course quite unfit for anything but scenic display. The Orangery and botanic gardens attached to this French garden are amongst the most famous in Elurope. You nowhere see finer Orange trees, some of them more than two centuries old, and in mach finer condition than either at Berlin or Versailles. In the Botanic Gardens you find a great number of rare old plants, such as were to be seen in Collection" was adonted in our national establish ments and recommended for imitation. The collectiou of Palms is the richest in Europe, though the dimensions attained by most of them are smaller than at

At the first general meeting two papers were read, dealing with DARwin's theory, the one defending, the other attacking it. The enthusiasm with which a few years ago Darwinism was greeted is beginning to defend it, did not earn a quarter as much applause as Prof. Schultz-Schultzenstein, of Berlin, who, in a very lucid manner, it is said, laid bare the weak points of the whole Darwinian structure, and boldly claimed all that was sound in Darwin's theory as German property, treated long ago by German savants in a more satisfactory scientific manner.

\section*{STRAWBERRY FORCING.}

Havira been invited to make a few remarks on the forcing of Strawberries, in answer to the inquiries of a correspondent, I willingly do so in the hope that they may be found of more than individual interest.
It will be necessary to treat of the subject under different heads, and as the most suitable Soil for the purposes of pot culture is the first thing to be considered, I will commence with that. The importance
of selecting a suitable compost is very great, and is in of selecting a suitable compost is very great, and is in
fact the real base on which future success must rest In the neighbourhood of large gardens we often find wild Strawberries of various kinds, growing up in secluded places from seeds carried thither by the birds: and if we examine the soil in which these plants
have, as it were, located themselves, and in which they are found to be most luxuriant and healthy, we shall find in the majority of cases that the soil is more or less composed of clay. The Alpine is a notable exception to this rule, as it will grow on the tops of garden walls and sand rocks, but that too flourishes and ruits most abundantly on clay, so that altogether the selecting the stiffest and strongest loam we can procure At the same time it is also necessary to crowd as much nourishment into the pots as is possible, consistent with the presence of a proper medinm through which the roots may take it up. Now, a good stiff loam congenial to the natural habitg of the plant, wil furnish that medium, and thoroughly decomposed night-soil, which has undergone at least three or four years of preparation, or well-rotted cow-dung, or table-dung the strongest and very best docomposed nourishment required-the merits of the manurial substances being about in the order in which I have mentioned them. These materials, then, when well incorporated, together with a little sand and leaf-
mould, for inducing a more equable passage of through the ruass, will form a suitable composto. The proportions should be three barrows of loam to one barrow of night-soil; but if cow-dung or stable dung is used, the proportion of these should be rather larger than in the case of night-soil, say one barrow and a haif to the three of loam. To this quantity add nearly another barrow load of leaf-mould and sand.
be occasionally turned over, mixed together and ready for use early in

\section*{of thich time it whil be necessary to commen} of proparing the plants, which is the next stage is The first week in June p.

\section*{Home Correspondence.}

Douglas Fir.-Those who have seen the magnificent Alagetaff in the Royal Gardens, Kew ( 149 feet high), will have some idea what this fine Fir is capable of becoming in its native forests. Thinking, therefore, that it might be interesting to know how well it thrives in the far North, I be er to furnish an account of a beautifal specimen of it which I lately saw growing amongst
other Conifers in the grounds of Sir James H . other Conifers in the grounds of Sir James H.
Burnett, Bart., Cralhes Castle, Deeside, Aberdeen. It was planted, when very simall, in the spring of 1849 ( 17 years, ago), and it is now upwards of 46 fe et
high, thus showiug that it has increased on average, upwards of \(2 \frac{1}{2}\) feet each year. It is one of the most handsome specimens I have ever geen,
clotied as it it with fine healthy vigorous branches clotied as to bottom. There may be larger specimens in
from top to the country, but I consider the tree in question exceed-
ingly interesting, showing, as it does, how well suited ingly interesting, showing, as it does, how well suited
it is to our climate. Why is Donglas Fir not more extensively planted, seeing that in the very "home" of our native Scotch Firs, where they attain their largest size, it can equal them in point of hardiness, tiknous woods I measured some examples of SentchFir, remnants of the great forests which once existed there, and I found them to be above 9 feet in circum-
ference at 4 feet from the pround, and to he between ference at 4 feet from the ground, and to be between
80 and 90 feet in height. They have clear trunks destitute of a single branch for 50 or 60 feet. Welling tonias seem also to do exceedingly well; they are per
fectly hardy and grow vigorously. A. F. B., Chiswick. White Nice and Syrian Grapes.- The Grape called
ere the "Nice" has a larger leaf and bunch, and a here the "Nice" has a larger Leaf and bunch, and a
smaller aud rounder berry than the "Syrian." I Should
be glad to know if we are correct in the names. David be glad to know if we are correet in
Finnay, The Gardens, Rokeby Park.
Macroglossar stellatarum, or Humming-bird Moth. As many of your readers seem to he interested in this
beautifal moth, owing to its abundance this season, may perhaps be allowed to put on record a contradictis led to flowers by smell. Some years ago I had drawing-room walls scovered with an extremely well. made French paper, on which bunches of flowers occurred at regular intervals, and on several occasions
I have seen this sphynx hovering vainly attempting to insert his proboscis. I think this is conclusive that it is guided to its food
by sight and not by smell. Isis. I Mave
observed the observed the humming-bird moth flying towards
the walls here, the walls here, as if anxious to emit something sipped which was not agreeable to ito Nimble Dick is a very good name for it, for it is really very quick on the wing. I have caught seven this season, and I bave one now living which I caught this morning. There has
been a great abundance of them in this neighbourhood this season. J. Joon, Welton, near Daventry. As the appearance of the humming-bird moth seems a novelty in Eugland, it may be interesting to know that we have observed it also in this neighbourhood early scarcely scarcely a day passes without my seeing one hovering thing, which makes it difficult to catch. I have, how ever, twice caught one in the house. It has also been seen in Leitrim as early as the beginning of June, and caused much surprise there, being mistaken for the real humming bird! Its loud hum is very peculiar, and I always know when one is near. C. L., Co. Wicklow, Ireland.-"C. W. D." mentions (p. 892) having seen
four of these at one time. Here they may be seen by the four of these at one time. Here they may be scen by the but with the exseption of wasps I am of opinion that
most insects have this year been more than usually plentiful. Our little enemy the Codlin Moth (Carpo. capsa Pomonellii) must also have been present in great numbers, for the Apple crop in this part has suffered
severely from the grub. (Quite one-third has fallen from being what is generally termed worm-eaten,
D. Uphill, Morefun Gardens, Dorchester. You
have already mentioned the appearance of this
insect in various places, I subjoin anothe
from the Times, the letter being signed
from the Times, the letter being signed "J. Y Akermana, Abingdon:"-"The long-coutinued fine
weather has beon very favourable to the developweather has beon very favourable to the develop-
ment of insect life. To this cause may be attributed the appearance of that curious insect commonly known as the 'humming.bird moth.' I have had one or two in my garden at intervals every day for the last it in like manner. I learn also that it has been frequently seen in several of the neighbouring villages, where hitherto it has been so great a stranger as to be by its rapid flight and by its constantly feeding on the wing. I have not seen one of them perch. They seem to be very partial to the Larkspur ; in fact, I have not seen them operate on any other flower this year. Can any of your readers account for the appearance of this moth \({ }^{3 \prime}{ }^{3}, \boldsymbol{H} . R\).
Basket Plants (see p. 920).-Campanula fragilis is a flowers, trailing plant, which, as regards colour or flower with which I am! acquainted. It produces blossoms in profusion, and is in full bloom now. A more suitable plant for a bracket or hanging basket it would be difficult to find. J. M. W.
Chrysanthemums on one Stem.-What constitutes Chrysanthemum "grown on one stem" for exhibition? The schedule states that they are to be grown on one Will it meet this, if after striking the cutting, the head is pegged down to make roots, and suckers allowed to ome up? Or, after striking the cutting, must the plant be formed by frequent stoppings without pegging, cutting away all suckers that may come up, so as to
show from \(1 \frac{1}{t}\) to 2 inches of clear stem? N. B. Undoubtedly the plants must be formed from ramifications issuing from the one stem, entirely above ground -and it can very well be done.]

Iresine Herbstii alias Achyranthes Verschaffeltiiition of the flower garden, after reading Mr. Robinson's remarks respecting it, I was particularly anxious to
ascertain the reason why it should be condemned for ascertain the reason why it should be condemned for
that purpose. At Battersea I found it to be truly miserable, as your correspondent states, and at first I could scarcely believe that the plant I saw was the Achyranthes, it was so very different from my where it was used for edgings and mixed beds, it was equally miserable, and, placed beside that gem of all bedding plants, Culeus Verschaffeltii, with its rosty white edging, it was miserable indeed. At the to be quham Nursery, Chelsea, I found the Achyranthes at Battersea, being of a rusty brown; while at the Park in question it was of a faded pink hue. It looked better at the Crystal Palace, Sydenham, than at any other place which I visited; even there, however, it was not
good. I have over 700 plants of it in use at Osberton, where its colour is really beautiful ; it is now thriving most excellently, While the Amaranthus is fast tity of it which he saw at Messrs. Dickson's of Chester, he had not seen anything approaching the beauty of my plants at Osberton. I, therefore, still maintain the opinion which I first formed of it, viz., gardener when better known and properly managed. The past summer has been too hot for it; to have it in per. fection it should be planted in a moist, sbady situation. It will then amply repay the cultivator, and will soon redeem its lost character. Indeed, as I before stated, it will stand at least 10 degrees of spring frost, and thrive in places in which the Amaranthus will not live. If next summer should prove a wet one, instead of one like most effective plant in the flower garden. That it has been wrongly treated there can be no question, for instead of being planted in the shade, it has been fully exposed to a burning sun. Its colour is so good here that the Viscountess Milton, the lady whom I have the honour to serve, has so arranged the bedding for next season that the Amaranthus melancholicus will be quite superseded by the Achyranthes, two beds of which edged with Mra. Pollock, have been greatly admired during the past summer. I have sent a boz full of it for your inspection, in order that you may see how fine its colour is with me. Edward Bennett, Osberton Hall, Worksop, Notts. [The colour was a fine rosy crimson, very beautiful ; but if it must have moist shade, it can rdly keep a place in the parterre.]
Unseasonable Pear Blossoming. - In Sanford Lane Stoke Newington, within three miles from Shoreditch Church, there is at the present time (September 25), fairly expanded on it. However common such a sight may be in the western or southern counties, I fancy that it is almost unique so near London, and demerves passing notice in your columns. G. T. S.
Planting in Peat.-The following remarks have reference to a narrow but deep tract of pure and very deep peat on my property, between brownstone hills on one side and limestone on the other. It is in a hollow, to be found wherever a hole is dug at about two or three feet in depth. It was planted with Scotch and

Spruce Fir about 35 or 40 years ago; thene ano
rapidly, and are now large healtay trees when rapidly, and are now large healthy trees wherere peat above water level. The Larch trees in tit at this peat are remarkably large and healthy clean trunks and spreading branches. Birci and 4 but the timber is not close in the grows ver attain a huge size in a comparatively short Weeping Ash grows well and laxuriantly, as do, green Oak, Bay, and Red Cedar (Juniverus rives Ere one of the latter, about 25 feet high, is a me dark green. Fuchsias grow most freely, even neglected and allowed to contend We bad an Erica arborea fully 12 on Brian Evergreens was killed by the winter of 1854. Evergreens grow perfectly wild. The branches
Rhododendrons take root in all directions form a jungle if left to themselves, while on every b and shaded bank their seedlings spring up in my The following are the dimensions of a few plants a years of age. One Rhododendron measures 13 feet and 13 broad, and I mireadtr; another 11 feet b measures 10 feet high and 13 feet broad an an Azalea 11 feet in height and 13 feet in width specimen of Rhododendron arboreum, covered from top to bottom with the richest blom March, measures \(14 \frac{1}{2}\) feet in height and 16 breadth. Your correspondent, "A Fen Man," (p. 892) how Berberis Aquifolium will grow in only knew of one specimen of it so planted, a.d young plants of it are doing well. Different kinde Hollies do very well indeed, and Laurels, Aucmban an Arbutus flourisl. Royle Hobticultural: Oct. 3 (Floral Committee). - Cbarming collections of Roses, considering the season, Yeass Paul \& Son. Among the varieties were the Ene new yellow Rose named Maréchal Niel, Madame Charle Crapelet, M. Vuillant, M. Victor Verdier, Charles Lefebvre, King's Acre, Duc de Rohan, Gloire
de Dijon, Celine Forestier, Yellow Austrian Briar, de Dijon, Celine Forestier, Yellow Austrian Briar,
Bourenir de Malmaison, and many others, for Which special Certificates were awarded. Several Bragg, to the former of whom a Second-class Certificate kind, boldly tipped with white. From Mr. Turner likewise came a collection of Lilliputian or Bouquet Dablias, the names of some of the best of which were Little Virginie, Burning Coal, Little Mistress, Little
Pbilip, Northlight, Progress, Little Wonder, and King of Purples. For these a special Certificate was to Mr, Rawlings for a medium-sized bedding Dahlia Nerine Fothergilli came from Messrs. Paul \& Son and a charming maes of Solanum Capsicastrum hybridum, lasded with orange-red berries, about the size of
marbles, was contributed by Mr. Macintosh of Hammermith, This handsome new Solanum, which received as if it would form an admirable plant for indoor jardiniers. The same exhibitor also showed a well.
flowered Veronica, in the way of V. decussata, named Madame Jacotot. This promises to form a good companion to the well-known V. Andersoni, which this marm autumn has induced to flower inh unusual profubave a highly ornamental appearance, and well deserve to be largely cultivated for the decoration of cool conservatories and greenhouses late in the season. From Mr. Mr. Melville sent one or two Tropzolumes, not in good Condition; one or two Pelargoniums came from Mr. Geo of Quamoclit from Mr. Earley; and a panful of a little Mescres, Downie Lealled Alternanthera amcena, from Oescra, Downie Laird \& Laing.
Oct. 3 (Pruit Committee).-Mr. Earley, gro to
dishes of, Esqu., Digswell, received a 1st prize for three Orange Pippin, Ribston Pippin, and Sam Young. Mr
Cor, Reding Cox, Redleaf, had a \(2 d\) prize for very good fruit of Cox Pippin. Pippin, Pitmaston Nonpareil, and Rro. Whiting came Ribston Pippin,
Sudbory Beauty, and a kind without a McLaren, Caurdingtond a kind without a name. Min Melon Apple, Ribston
Pippin, and Margil. In other collections we notice Penn's Pippin, King of the Pippins, and Sam Young. Consiating of vernished a collection of Pearmain Applea, Purry's, Traveller's, Lamb Abbey, Winter, Micklebam,
and I

Whiting was lat with of three dishes of Pears Mr. Louise, and Comte de Lamy. Mr. Earley, who was 2nd, had Brown Beurré, Gansel's Bergamot, and Marie Lonise. Mr. Ivery, of Dorking, eont the anme varieties as Mr. Whiting. Mr. McLaren had Glou Morcenc, Marie Louise, and Beurre Boec. Mr. Buffett, gr. to Lord Palmeraton, had a beantifully grown \({ }^{0}\) Providence Pineapple, weighing 9 lb .6 oz ., for which a special Certificate was awarded. A dish of Murcat Hamburgh Grapes was contributed by Mr. Osborne, of Finchley, Which, although somewhat deficient in colour and flavour, were awarded a 2 d prize. Au amber-coloured Grape, called Baxter'a Seedting, was not considered to be any iomprove
ment on existing varieties. Mr. Grahan's Cranford Mus cat Grape, upon trial fully confirmed all that the Committee had previously said in ite favour. A Grape called Napoleon, shown by Mr. Ingram, of Frogmore, was considered, as has been indeed previously stated is our columns, to be a very useful sort for open walle ; and good specimens of Black Prınce from out of doors came from the Society's Garden at Chiswick. Mr. Alexander Stewart contributel a most excellent Peuch, provisionally named Slindon Park, for which a First class Certificate was awarded. It is a free
stone, as large as the Late Admirable, and in all respects a desirable melting lute variety A First-clans Certificate was awarded to Messra. Puul \& Son for very good examples of Belle de Fontenay and red and yellow Four Seasons Raepberries. From the Society's Garden came a collection of Plums, in which were good examples of Ickworth Imperatrice Coe's Golden Drop, Dunmore a kind in the way of the last mentioned, and Coe's Late Red. The same collection also contained the Royal Bullace, a better bort than the ordinary white kind; and German Prince,
an oval black Plum ; Cushing, a yeilow-fruited monthly Raspberry, and Briukley Black Autumn Ras;berry uls came from the Society's Garden. Mr. Wm. Hani, Neweastle, contribated large handsome apecimens of a new white Potato called Freedom, of which highly satisfactory accounts had been furnished from well known authoritien

British Association.-We add a fow more pmagem from the reports of the Sections:-
In Section B. (Chemical Science), Dr. 8. Mac adam read a paper on Esparto Fibre, or Epmaith Grass, and its employment in the manufacture of paper. During the last three years, large quantities of a Grass obtained from spain have been employed in this country in the manufacture o paper. Delivered in Great Britain, has caused a demand for Esparto fibre; and should it continue, other countries, as Barbary, which yield the aame Grass, will no doubt contribute largely to the supply. The chemical composition of an average sample is : moisture, 9.62 ; oil, 1.23 ; albuminous compounds, 5.46 ; ligneous fibre, 56.28 ; ntarch, gum, and paper the material, first carefully cleaned, is sub papers the the action of canstic sode. The fibre, how ever, is rather short in nature, and hence paper entirely made of it is extremely liable to tear. It is customary, therefore, to give strength by mixing the pulp from Lisparto fibre with the pulp from rags,
commonly in the proportion of equal parts. The paper so manufactured im largely employed as a printing paper, and the majority of the Scotch noww papers are now printed on it. The spent sodionquor, destructive to fish, when it is rua directly into a fishing stream ; even if diluted to the extent of many times its own volume, the liquid possesses the power of killing them within a few hours. Two plans have been suggested and put in operation for the arrest ment, more or leas completely, of the moda liquor. residue with carbonaceous matter, Buch as fine coal o sawdust, and the recovery of the soda from the calcined mass ; the second, the reception of the liquor in large pen cesspools, where it may persol
Dr Macadam also read a paper on the Recults of
Agricultural Experiments made in 1864.. The experiments referred to were undertaken at the author's suggestion by agriculturista in Roxburghshire, and form one of the first series of field experiments carried different manemial mistures were used in the triales, and formed a set of experiments, whilst 10 farmers made arrangements for carrying out the experiments. These mixtures consisted of Peruvian guano, phosphatic guano, phosphoguano, boneash, superphosphate, guano-superphosphate, taken singly mingled together in definite proportions. In each mingled together in defuitio proportions were cun ducted on the same day with the plots of ground allotted to each manure. The soils on which the experimenta were made were in part of a hesvy nature, and in other part of a light character-the proportion of each being equal. Each experiment was condeted sequently required 3 acres on each farm. The crop was Turnips, and the yield or produce was weighed on the
differeat farmen, as the manuree which gave the largest neturn on one farm did not jield the langent crop on field experiments and are due to the eppecinl cireal tances or conditions of ench field wiore the triale ene ande. Where onis one tel erparimente trials are ducted on a single farm, the loonl infuences may matorially affect the result; but where, as in the present case, the field operations are conducted on 10 arms, aud the mean protuce of the 10 trials is obtained, then the disturbing influences of one farm he otber furme or practically neutralise by those of ine other farms. Taking the masam produluted to the same navisey value for each of the ma..ures, the greatest return of crop was yielded by the disoolved phosphatic guano, followed closely by the Peruvinn guano. Indeed, the differonce in the produce obtained from the plots treated with these manures was 50 slight-only 19 lb . to the nere-that hey may bo regarded al laviog yieldod tho mame emils. Fa referring to these experimeinla, it must be dry, though the drought was not sio mas excepi-mally as it was in England. The realita olitaned, however, are valuable as representing the yroduce obsintintio in dry season ; and as a similar series of Geld oxperi ments are hoing made thin year in the same district, an opportunity will bo obtained for contranting the remula for both yeare.
In Section D. (Zoology' and Botary) Dr. Cleghom read a paper on the Dooder Foreste of the Weatera Himalaya, and exhibitod a akotch map, tmoed from the Grent Triponometric Survey, Ahaming approximately the position and extent of the Deodar tracts
 wood of the Codrus Deodara for ralway burpmes, for which it is found very valuatle. A Governenent rivers of the Punjab for working the forest upon mound principles of conservancy. The quantity of Deodar
timber brouglt down the Cheuab alone in one year was not less than 12,000 tons. Allusion wes made to an interesting and increasing trado in timber upon the Indus and Kabul rivera-an important subject in its commercial and political bearing. The Deodar grows at an elovation and changeable climate. The mativen of the Himalay
invariably prefer the Deodar for buildiug purposes; it invariably prefer the Deodar for building purpioses; bridges in damp and exposed situations, with sternate layers of stone, and soine of these buldings have stood for centuries. The underground behaviour of this wood in the permanent way has been so far A series of photographs by Col. C. W.: Hutchiuson, R.E., illustrating the characteristic vegetation of the Deodar tracts and other Himalagan trees, was exhibited by Dr. Cleghorn, who pointed out the good qualities and uses of the various species. He also gave a number of their dimensions and the rate of growth as indicated by concentric circles of the logs floated down the different rivers. The importance of conserving our Indian forests was first diecussed at the British Association meetings in 1850 and 1851, and since then the subject hat attracted great attention in India and England
Mr. Tristrem followed upon the name mubject, remarking upon the peculiar isolation of cortain troce of Cedars is and mentioned the attemptemenc.
Col. Munro thought the Deodar would uever be of any use if grown too quickly-the quality of the woor A much dependa upon the soil indentity of the Dooder with the Codar of Lebanon, in which Dr. Thomsou, Col Munro, and Dr. Cleghorn took part

The Orchard House, or the Onltivation of Fruit Trees wnder Glass. By Thomas Rivens. Twalfth Edition, enlarged and improved. London: Longmans. 12 ma . Pp. 205.
Whatever may be maid to the contrarg, orchardhouse culture is progressing. The very fact that this little mauual has reached a twelth edition is sufficient evidence of this, even were it not true, as Mr. Rivers however assures us it is, that within the last jear more structures under the name of orchard houses have been built than during any former similar period. There aro of counse as our author observes in hia Preface-there are of fruit trees under gloss after this method. Lat them, he continues, doubt on in peace; but nevertheless he does the very best thing to disturb and to dispel such doubts by recounting the successful reaults of his own exper ience-ever accumulating, and by the aid of experiencesh ideas are suggested for each successive which fres a very pleasant reading and instructive book We are not going through the details of orehardhouse culture, so thoroughly explained in these pages. Those who seek such intormation must go for it to the book itself. We mather prefer to linger annonget the
Peach and Orange groves of which Mr. Rivers writes, and which must form the rery elyoium of the modern
fruit-grower. Oh the delights to be gathered anaongst groves of standard Peach trees bearing "bushels of fruits !" and if these do not prove satiating enough, our imaginative readers may roam in posse amid "Orange trees under glass, giving fruit and flowers and a perfumed promenade \({ }^{3}\) of the most luxurious character, where delicious Taugierines and Maltese and Sto
Michaels yield their "rich and sugary fruits" in prodigal abundance.
But though thus exoiting pleasant dreams of Pomona's bounty, Mr. Rivers does not forget to be practical. The bushels of Peaches and the lusciout Oranges are not to be had by merely dreaming of them, or even officiously cultivating them, but the
trees must have the right sort of treatment "There is one thing most uecessary to be adhered to in the culture of standard and half-standard Peaches under glass-the ground must not be stirred after they are planted. This idea will of course be combatted by some gardeners. I can only repeat, let the surface of your house be as solid as a path, and do not listen to those who advise the contrary

A few words about the preparation of the border of an orchard house before planting. Stir the borders be poor, some rotten manure mayibe mixed with it to that depth. It should rest a fortnight to settle before the trees are planted, and as soon as that operation is finished, tread all the surface firmly, and do not allow it to be shaded by placing too many trees in pots
among the standards. If, after a few yeara, from bearing very heavy crops, the trees become a little exhausted, spread on the surface in March some of the rich compost recommended for surface-dressing, to about three-fourths of an inch in thickness, and allo the roots to feed upon it, but do not disturb them.

Those who have not read "The Orchard House" should do so forthwith, and think well over the modes of treatment they are directed to practise. That it
affords matter for thought will be evident from this aphoristic sentence:-"A Peach tree would from this bear better in the centre of a solid path, than in the richost, deepest, and most fertile soil of a kitchengarden, if light and dry."

The Elements of Botany for Pamilies and Schools Published under the Direction of the Committee of General Literature and Education appointed by the
Society for Promoting Christian Knowledge. Tenth
Edition, revised by Thomas Moore, F.L.S., \&o. Loudon: Longmans \(12 \mathrm{mo}, \mathrm{pp} .204\).
This little book, which has been in great part rewritten, now forms a compendious guide to the elementary study of botany, and may be used with advantage in families and rchools, as the title-page suggests. The replaced by others selected from well-known standard works belonging to the publishers; about 150 of theae beiug scattered through its pages. A very ample glossarial index is given. Not the least of its recommendations are the clear and legible type, and the
careful manner in which it is printed.

\section*{JFloxists dflowex.}

I Wisir to offer a few remarks on the DaHicis at the late Crystal Palace Flower Show. Although a large number of blooms were staged at this exhibition,
which was by far the best which has been held in the vicinity of the metropolis, and these on the whole were of fair quality, there was, nevertheless, to the critical observer a falling off both in quantity and quality stands of Mr. C. Turner, Messrs. Saltmarsh, and many others, was inexplicable, unless the hot dry summer and prevalence of thrips preverted them from exhibiting. The alteration of the date of the exhibition, making it one week earlier than first announced, was not, in my opinion, beneficial, but rather the reverse, as the best blooms are always obtained in September, the colours being then more persistent, the flowers, moreover holding on better in the long cool nights of September Amongst the new Dablias sent out last springs. stands pre-eminent in quality, although Bird Pasauge, Edward Spary, George Wheeler, Stella Colus Lady Gladys Herbert, Champion, Purple King, and Annie Weeks, must not be lightly passed over, as they stands for some years to come. Bird of Passage is very attractive, from its exquisite Picotee-like edge; and Lady Gladys Herbert is very novel and distinct; they are ovidently first-class kinds.
Amongst older kinds I particularly noticed Peri, Drop, Baron Taunton, Miss Herbert, Foxhunter Golden scarlet, Brunette, British Triumph, Miss Henshaw, Karl Pembroke, Edward Purchase, Miss Herbert, Mrs. Trotter, Jenny Austin, and Loril Derby, as being very fine, especially those in Mr. Keynes stand; nothing could be more beautiful than these varieties.
In the Fancy class, the best flowers were Magpie, Bung, Queen Mab, Pauline, Marvellous, Lord Warden Yearling Duck, lilac striped with black, and Garibaldi.
exhibited was that called Marquis of Winchester, a dark

Savory addition to the class of laced flowers, but somewhat flat and low in the eye, evidently a very certain kind, but nots equal to a fine bloom of Umpire. Yellow Triumph (Whesler); Lady of the Lake, blush, edged with
purple; James Backhouse, deep purple; George White, deep purple; Bullion, yellow: Master of Arts, fawn, a finely shaped flower, are all likely to be useful additions These in fact are all that I noted as being equal to or improvements on existing kinds, although others would probably, if seen again, be found worthy of notice, Pope's Fanny Sturt, a deep red edged with creamy White; and John Bunn, orange striped with crimson,
will be two good additions to the so-called fancy class. Messrs. Rawlings, Legge, Hopkins, Turner, and Kayne had many seedlings which, if grown in a season more suitable for the Dihlia than the present has been, would probably attract more attention. Amber Witch, amber and I have seen nothing like it since Andromeda was cultivated.
A Second-class Certificate was awarded to a large coarse flower, with orange-yellow ground colour, striped Chinese giant; compared with this, old Lee's Bloomsbury was a model, and what the Judges could see in it to merit a second-class award, when many really fine seedlings were passed unnoticed, puzzled me as well as many other old exhibitors. It will, no doubt, if not a tall grower, be a showy border flower, and that is all.
Such decisions as this give room for anything but enlogistic remarks on the judgment displayed.
I also noted an innovation which, if not stoppod at once, will injure exhibitions not only of florists' floweri but of plants also. This was the giving an exhibitor "two prizes" in the same class, a proceeding directly at variauce with all rules and regulations in
florists societies. It is unfair to exhibitors as a body, as it places the small grower entirely at the mercy of the large one, the latter being always able to select, from a large quantity, stands almost ad libitum; whereas the smaller grower with difficulty makes up good stand, probably slightly inferior to the larger grower, and consequently loses what he justly considers his prize. This was evidently a sore point with many see that the wholesome regulation above alluded to is uot again infringed.
Another reprehensible practice has sprung up of late years, and that is exhibiting seodlings along with aamed flowers. This is quite as unfair as taking two prizes in one class, as the raiser or purchaser of a seeding grows a goodly number, so as to be able to produce ix first-class blooms on any given day, and is generally able, therefore, to place some in his stands, and these being generally improvements on existing kinds, those Who so use seedlings gain an undue advantage thereby
The two annexed rules ased to be printed in every scherdule of note in my younger days:-"No exhibitor o take more that one prize in each class." "Seedling not allowed to be exhibited with named flowers in the stands." It would be well if they were again to be permanently adopted. In those days usiag seedlings in a stand would disqualify it Now, however, both and the consequence is dissatisfaction. The true florist only requires a fair exbibition and no finvour, and \(e\) is then well satisfied.
would also add as a hint to the managers of exbibitions, that it is a great improvement in the arrangements if a green baize partition is run the whole length of the table. A dark background adde greatly to the appearance of the flowers, and prevents visitors entre backs of the stands. The want of suow they may be otherwise furnisied. It would also be great boon to exhibitors if the managers of show vould have stands of their own, for the autumn exhibitions especially, so that they might be all uuiform in columr and size. At present it generally happens that scarcely two are alike, which is anything but pleasing to the eye. The cost would not be a material question, and any of the leading exhibitors would urnish the correct dimensions. Exhibitions would nost undoubtedly be rendered much more attractive if he stands were uniform in size and colour. William Heale.
Is the Rose a Florists" Flower :-Uuder "Floristo" Flowers" I fiud, at p. 891, a well-timed letter about the new Roses with which the French Rose growers gill our innocent Eaglish florists, who believe that a I berch name must mean something goo
Flowers" being classed protest against onr " Queen of the old-fashioned English florist seems to be on the wane. The latter, as far as I remember him, was rotund, ruddy, and remarkably good-natured; had a great turn for a pipe, which he smoked over his Tulips or Auriculas in a most enviable happy mood, particularly if he was looking over a Tulip with a "clean bottom," an Auricula with a perfect "thrum" (I think), and colours well defined, or a Carnation well arranged on its card. How well I remember some four or five of such men with their pipes gloating over their
flowers, and the good-natured smile of utter contempt - fowers, and the althoughatured smind-they of would give when I,
a bizarre Tulip, but "pin-eyed," or to a Polyantlius 0 and Aur coat of velvet and gold, labouring under

\section*{Garden Memoranda.}

Johit Russkl's, Esq, Maypield, Fateiex.- That undulating portion of groud \(d\) receding from the Frith of Forth as far inland as Falkirk, and rumning in : wavy line to the conflines of Stirling, is, if not the most
fertile, at least from a clinatal point of view, among rertile, at least from a climatal point of view, among
the favoured spots in Scotlind. When the rude blasts of winter are telling a tale of devastation and death upon out-door vegetation, not only in the highland portions of the country but in some of the more exposed and uncongenial parts of the county (Stirlingshire), this lower division is mildly dealt with those charming exotic novelties which it has been ont object and ambition to naturalise, more especially in modern times, seem to take kindly to the climate and the treatment they recelve. It has been averred, and that too with singular pointedness, that "the eye never gets weary of looking upon trees" that bave grown in years ; but it must be conceded that the introduction of suitable and varied forms creates an additional zest to the fancy and ambition of the landacape gardener and the lover of Nature
Mayfield is one of thome phece which have sprung up, Mushroom-like, within the hast few years, adorned with all those rare infroductions that have beens sent lome
from China and Japan, and all the most motable Conifere that have heen introluced from various part of the world, not existing on sufferance, or dminative in propertions, but of such bulk and in such healtu as excite the admiration of all and smulry that come within their influence, and stimulate the zeal and ambition of a very worthy commercial gentleman to
employ a portion of his means in extending to the employ a portion of his means in extelldig to the situation for the Pinetum and ornamental grounds has been well chosen, being one of those fertile slopes where the upper stratum consists of that fine mellow loam,
rich in vegetable fibre, which is peculiar to the locality, and is sheltered from three points of the compass with limber of some age
Many of the sorts introduced in the Pinetum are planted in groups of three or more, which very much enhances the general effect, especially where, as in this instance, the distance between the planta is considerable.
The sooner that the formal style of planting these fine subjects in lines and squares is done away with the better, and \(\mathrm{Mr}_{\text {r }}\) Russel and his gardener, Mro. Sorley, are striking at the root of that style or mode of planting. True, there is no necessity for plangh crater con tiguous to a manaion, but where there is extent and shelter this grouping mode is accapital one. To par. ticularise, or even to enumerate all the choice thing grown here, would be simply to reproduce a catalogue but as some things thrive better than others, and are more generally adaptable, the reader's attention may be directed to such as the universal favourite Picea and making from 12 to 18 inches ansually. This is certainly one of the fuest of the tribe. Probibly the most wonderful in point of growth is that famous one with which Douclas's name will everbeconnected-Pice nobilis, which has these last two or three seasons made 3 feet every year, and which mast eventually along with the former drive the common Silver Fir out of court. Pinsapo, too, the most rigimy asiocarp and amabilis, all much larger than one is in the babit of seeing, and not in the least degree affected by the climate; while the more common sorts, such as Abies Douglasii, excelsa, Morinda, and others, are doing well. Wellingtonias are maintaining the high character of being free in growth and abundantly hardy, not in the least affected with the disease which threatens in some localities to destroy their ornamental appear. ance for years. Cupressus Lawsoniana, Tbujopsis Thuja gigantea, Lobbii, Craigiana, and eures, all of which are very general favourites, present nothing to cast a slur upon their character. The famous Deodar and the form, along with all those mentioned, eapital "individuals," either for the mixed multituse occu pying the Grass lawn, or for groups in the Piuetum.
Among plants of more recent introtuction, Thujopais dolabrata, and the variegated form of tuis type, which, in move, has stood out uniujured; and so have some of the varieties of Euonymus, which add much to the lastre of our gold and white variegations, as welr as Iecorative Olenceous berries Retinosporas too, in variety give promise of being safely reclioned in favourable spots as hardy. The haudsome and unique Uinbrella Pine has stont the test seo far, buected to the have never had the chance of being gubjected to the rigours of a winter like that one time betore we have a parallel. The variegated Lonieera, trained in the form flowored at Mayfield during the spring, standing out all

 lime. What a grand atcquantion thas will prive mo a a fruize and planted out as we d. cur bedding planto there can be no guesti. n but it will bloom out of doort before from overtakes it.
Modern flower gardening has a diligeat and a mont ancosenful atudent in the perton of Mr. Sorley, who the bent bas tho thorouga conatauce of bis entplay or, deppatching him to Lomdom varion we have a capital illustration of iu ouse of the mont succesfful deaigue that over came within my cugnizance, which in partly due, acoording to bis own
showing, to the shecess:ul comlinations of coivur and style adopted by Mr. Giboon at Battersen. No cooner had he seen the magnifoent oontrust be-
tween Coleus Verpchatielti and Cent.anci sapusina, tween Coleus Verschaffidti naid Cent.unce sapusina, raut, than he conceived a plan of massme nithout flowers. The border is a portion of a serice of teriaces in fromt of the villa, and forms part of the baloony, from which you beve a view of the country right in fronk. It is about 200 feet long and 12 foet wide. As a background Thujopeis boreali, Caprenves Lawoonianm,
and Irish Yew ilternate. Golden Yow grafted aud Variggated liollies are arrangal in fo ont of three ; then a row of Pelargunimas, whach were che of howr, owng to the henvy ruins that oeemsed in Ansumt: hat what the grenter whef wilhout flowerp. Then in fout of thene was a broad biud of Golden Chain and Cloth of Gold, broken at intervale with a large round patch of Coleus, alteruating wilh closely patches of Mrs. Pollocts Pelaryonium, Culeus, and Cen taurea, alternatiog
 of Cerastium Lomentosum, nest to spacious terrace of Grase. The combination was lite a beautitul pieme, suitable for ass evening dreas of the wont exquisite sichgrey, and is undoubtedly worthy of imitation. The effect of it is grand under any circomatanees, but in the plavial West, where raintall is much atrive the average, and on that account hostile to flowern and the cornon style of beilding, this, depend upon it, is a very batisfretery way of getting out of a dificulty
Thave booked Arabia lucida variegntia in one of the moat handsome fellows, of quit. a different atyle from Cerastium tomentinum, poesensing all the characturiatica variegnta, bring of a much denser habit, snd the the gold, the green, and the white, personfifed in every leaf, being wheh more delicately and charmingly lovely. Other contrasta and blending were numerous in various portions of the ground, bat
unless one diverges a little from the beaten track, to record them becones merely from the betten track, designs in otber places. It munt be remarked, how ever, that thewe grafted Golden Yewe, and other ever green plants of similar character, tone down that heaviness of green that octars in mised plantations, as was pointedly alla ied to by jour excrllcut correspondent "F.," soine time ago, and agr
contour of artistic fin ler gardening.

I must not dwell longer on this pint, but at once revert to the in-door gardening of this establishment. The "Experimental" gardens at Elinburgh having now become a portion of Government property, being tacked to the present Botanical (ardens, it became necenary to dispose of the housens, and the principal buildings fell into Mr. Russel's hands. The large conservatory is converted into a "Winter Garden " at Mayfeld, and measures about 80 by 20 feet, with a wide centre table, and a table all round the apan or hip-roofed erection, The arraogement of the central table was rather novel; instend of having the tall phants in the centre and smaller plants sloping down amphitheatre-like, there were rows of Alsophil anstralis, 1)racemas of sorts, Yuccas of eorts, toward the edge, and low fine-foliage and other inte resting plants, with Ferns in the centre, forming a long uninterrupted rista from one ent of the house to the other, the umbrapeous frounds of the Ferns, and handsome recurved foliage of the Dracienas hang ing gracefully down over the heads of the smaller "rry." Several of Fortune's and Veitch's more receut Japanese introductions were here, including the male Aucuba in flower, and the female in fruit, the large crimson berries being quite a fonat to the eye of those who have known and grown Aucubur so long without seeing them in the perfection of beauty. verticillata - the Umbrella Pine \(;\) the variegated Camellis in flower, a facsimile of the old single red, Sedum Sieboldij, several Retinosporas, and the hand some green, crimson, and white saxifrage, which Mr Fortune had sn much diffeculty in getting home alive of Dichorizandra vittata rosea, an iuteresting marbled
stemmad plant; several Cycads, of which C. Riuminiana was the most rare; Cordyline Veitchii, Peperomia arifolia, Antharium leuconearum, a fine plant of Musa vittata, and the handsome Pavetta borbonica, while in Ferns there were samples of thy frizzled, created, and multiform Athyrium Filix-foemina; the handsome Lepidopteris ('Coilea) superba; Lomaria L'Herminieri, with fronds dark-brown when young, changing as they get aged to a dullish green; Neottopteris australasica, with its handsome fronds, each with a very prominent black midrib; and several being made to make the house an orchard house, a least to run up Vines on the one side and Peaches on the least to run up vines on the one side and Peald be extremely undesirable to attempt too much and rue the risk of spoiling both, as all such experiments, whether large or small, are sure to do. In another house, the large Camellias that were planted out in one of the experimental garden houses have been re.transplanted here, and that too with every symptoun of success, albeit one of the plants, an old white, is about 17 feet high and 10 feet across. Imbricata and tricolor are also doing well, which says much for the care both in "lifting" and transit of auch huge plants, which had to be conveyed fully 30 miles; and further convincingly shows that Camellias of great age and size, although growing rampant on a border, may be so dealt with successfully
Mr. Russel has began to grow Orchids, and has two houses specially built for their culture, containing a very nice collection for a beginner. Judging by the ont-door decoration of this place, the character and kind of the articles employed, and the apparent determination of the proprietor to excel in all that he engages in, we may look forward to this as one of the rising Orchid collections of the day. In conclusion, it is but a graceful recognition of Mr. Russel's worth to plare upon record the handsome manner in which he supports gardeners and gardening, by throwing open his beautiful grounds for the local horticultural

Doposition of Dew-So rapid has been the radiation of moisture from the eartli's surface during the last few days, and so great the condensation which ensued in the mitigated temperature of the night, that the deposit in the rain gauge yesterday (Oct. 1) amounted to upwards of 0.01 inch. Allowing for evaporation from the heated gauge, which is exposed to the unmitigated rays of the sun, and from the more exposed funnel during the winds which prevailed, the aggregate quantity may be fairly estimated at an additional half inch, thus making from dew alone in four nights \(1 \frac{1}{2}\) ton per acre. During this period the hygrometer at
midnight has almost invariably indicated complete midnight has almost invariably indicated con
The Apple of Sodom. - Solanum sodomeum, found by Sibthorp in Sicily, of which a splendid figure is given in the Flora Greca, is a native of Africa and Syria, It obtained its name from being regarded as the plant Fhich Hasselquist had identified with that bearing the
famous Apples of Sodom, described by Josephus and by Tacitus as fair to the eye, but when plucked dissolving into dust and ashes. But for this identification Sib. thorp must be regarded as an insufficient authority, as he never visited the Holy Land, and the species commonly met with at the Dead Ser is the Solanuun coagulans of Linnæus, the S. sanctum of Forskahl, and the S. Hierochunticum of Dunal, described by the latter in De Candolle"s Prodromus. Robinson, therefore, in naming it the S. Melongena, a name given by modern botanists to a whole section of the Solaneæ, and not to the particular species which represents the true Apple of Sodom; nor does he seem warranted in adopting the suggestion originally thrown out by Seetzen, that the latter plant was an Asclepias. It is true that the Asclepias gigantea or procera, the Osher of the Arabs, is found in a few places on the borders of the Dead Sea, and its fruit when opened contains nothing but a dusty powder. According to Robinson, too, it resembles a large smooth Apple or Orange, hanging in clusters of three or four together, and when ripe of a yellow colour; if so, differing greatly from other members of the Asclepias tribe, whose seed-vessel certainly bears no sort of resemblance to either of these fraits. But I am assured on good authority, that the Asclepias alluded to is an extremely rare plant in that interior of the Apple of the Solanum just mentioned is likewise, it is said, frequently converted into a powderlike dusb, through the puncture of an insect. Upon the whole then, I am inclined to adhere to the older notion, that the latter was the plant intended.

\section*{Calendar of Operations.}
(For the enswing week.)
OwING to the wonderfully fine weather with which We are favoured, flower gardens are still comparatively
gay. Keep all in connection with outdoor floral decorations therefore neat and clean, so as to set them off to as runch advantage as possible. Let weeds, if any, be removed both from borders and walks, and leep the
latter well rolled. All preparations for bulb planting should now be forwarded as much as possible, in order that active operations in reference to these matters may be commenced as soon as frost has put an end to the beauty of the bedding plants.

\section*{FLOWER GARDEN'AND PLANT HOUSES.}

In cool conservatories and greenhouses damp or insects soon do irreparable injury to soft-wooded plants, and these must soon receive careful attention
Calorolarias. - Narrowly watch these and fumigate lightly two or three evenings successively if thrips make their appearance, keeping the atmosphere moist and giving air on every favourable opportunity to prevent the foliage from flagging
amellias and azatias.-When these are housed pee that all decaying leaves are removed, keeping the plants rather dry at the root. Allow them to have plenty of air while the weather continues favourable.
Cinerarias.- Plants for late blooming must now b kept cool and airy, and should not be allowed to suffer from want of pot-room. These must not be trusted in cold pits after this season, for they cannot endure frost without injury
Crocuses.-These may be planted, provided beds are ready for their reception ; they like a deep, light, rich sandy soil, bat will thrive in an ordinary soil or situation. In planting, the bulbs should be covered from 2 to 3 inches with fine mould; and if an effective display during the first 'season is desired, plant thickly-not more than 2 inches apart. For edging borders and beds the Crocus is exceedingly useful; and, where planted in lines along the margin of walks, or in clumps of \(3,6,12\), or more bulbs each, and allowed to remain in the ground for several years, the effect of the masses of flower which they produce is all that can be desired. Care must be exer cised, however, to protect them from mice, which are exceediugly partial to them, especially in winter.

\section*{inds.}

Hollyhocks.-Stools of choice sorts may be lifted and potted, to supply cuttings, which strike readily on bottom heat; when struck pct off in nice light rich soil.

Hyacintes.- For blooming in-doors, either in pots or in any of the various contrivances that are used instead of pots, strong bulbs should be selected and planted in succession; place them in any dark coo making roots, before exciting them into growth. If pots are used-and these are donbtless the best, if not the most ornamental-use good rich sandy soil, and secure perfect drainage; for a liberal supply of water is required during the blooming period, and if the drainage is defective, the soil is very apt to become soddened.
Pelargonitms.- These should be kept rather coo and dry, giving whatever water may be necessary on
the mornings of fine days, so that all superfluous moisture may be dried up before the evening, avoiding the use of fire-heat except when necessary to prevent the temperature falling below \(40^{\circ}\), or to dispel damp when this cannot safely be done by giving air.
Pinks.-Finish planting these out into their bloom ing beds, in order that they may get well established Rosse
Roses.--Examine those on pillars and trellises, and if the weather continues favourable see if the soil wants renewing or the kinds changing. For choice sorts roomy holes should be made, capable of containing three or four barrow-loads of well-prepared soil. Turfy loam of good quality is the chief thing; to this add a portion of rich rotten manure, and, if at hand, a little sandy peat or leaf-moula
TUxips.-Prepare beds for these, and plant early next month. Examine the bulbs, and arrange them as determined on at blooming time.

\section*{FORCING GARDEN.}

Cucumbers.-Look sharply after woodlice, which sometimes do much mischief. A cooked Potato put into a llower pot and covered with dry hay or Moss is a good trap. The best of all remedies, however, is Mr. Cuthills plan of pouring boiling water round the insides of the pit or house close to the walls, care being taken not to injure the roots. Bearing plants in pots or boxes will now be benefited by being top-dressed with rich soil.
Mushrooms.- The surface of beds coming into bearing should be sprinkled with water a week or so before the Mushrooms make their appearance; this is better than watering after the Mushrooms are through. not already undergone these operations. Pings.- Watergone these operations.
Pinses.-Water plants in pots as little as possible at manner it is a good plan to cover the pots over 2 or 3 inches with the plunging material; where the bottom-heat will permit that to be done, it obviates the necessity of watering so frequently.
pruned and the rods dresed pruned and the rods dressed. The border outside may also be covered with Fern leaves or straw.
hardy fruit and kitchen garden.
Trench, dig, and ridge every spare inch of ground while the weather will permit these operations to be

\section*{dvantageously pertormed} observed in gardens the soil of which pectary character.
Celerg.-Earth up as required while the
dry. Leaves affected with fly, which this year, should be picked off and burned Root Crops.-Let Carrots be taken away; a few Pursnips for present use may also \(b_{s}\). . up; they will, however, keep well in the goo thus circumstanced they may have a coa as wanted. All root crops, including betren be taken up and stored in as dry a state as posises,

\section*{The agricultural batette.}

SATURDAY, OCTOBER 7, 1865.
A VERY natural pressure is being brought to bear upon the veterinary profession because no specific has yet been disoovered for the disease, and the Government, its advisers, and those also charged with the exeoution of its arders, are involved in a general attack. The pertinent question is asked, Are there no scientific men at the service of the Government to suggest some remedy for the existing state of things ? - Up to the present time the answer is wantiag.
There is no lack of suggestions from those whose inventive faculties are evidently in advance of their practical knowledge. Treatment at one time the most complicated and expensive, and at another the most simple, is advocated by enthusiastic theorists with the expression of a thorough conviction of success. One gentleman had found an enema of warm water effective in curing a favourite puppy of some distressing malady, and he accordingly, with an anxious desire to benefit his fellows, at once ran off to the owners of some diseased cattle and placed them in possession of his discovery; they naturally but ungeneronely laughed at him for his pains, and his consolation now is to bemoan the profound stupidity and obstinacy of those who rejected a plan so effective and so easy of application.
The public are disposed to be credulous in reference to this matter. Accounts of successful cases are received and adopted with remarkable eagerness. Empiricism is in the ascendant, and science for the nonce must retire and wait the time, which will assuredly come, for utterance.
While perusing the perpetually reourring statements as to the perfect facility with which the disease may be oured, it can hardly have failed to ocour to the readers of those reports that the authors of them are ignorant of the subjeot on which they write. Medical men may in some sort olaim a right to speals generally
on any subject relating to animal structure or animal disease ; but they have no right to forget the great difference in the practice of human medicine as compared with the treatment of the lower animals, and no knowledre, however profousd, of human anatomy, cau qualify them to discuss the peculiarities of the internal structure of an ox or cow. In the absence of a complete acquaintance with the anatomy of the animal, and a practical knowledge of the symptoms and morbid appearances which characterise this plague, they have no right to assume a diotatorial tone. Some few of the medical protession have paid the neoessary attention to the subject, and mastered its details, but strangely enough those are the men who are silent.

Another remarkable sircumstance belenging to most of the reported methods of treatment is their universal suocess; save in our columns no ono reads of failure-the most simple domestic remedies seem to arrest the disease, and in a day or two the patient is convalescent. Meanwhite, it never acems to occur to the public mind that these sucoessful practitioners, who find their medicines so sure, may possibly have been treating and curing a cattle plague of the imagination, instead of the solid reality which the unsuooessful praetitioners have to deal with.
It may be to some extent reassuring to state as a faot, without enteriny into details that would be promature, that the disease is being made the subject of minute investigation; that every symptom, however trivial, is recurded, and every morbid phenomenon carefully remarked; and further, that every rational plan of treatment is being, and has been for some time pari, tried under the most favourable circumstances. Hydropathy, homœopathy, and allopathy, havo all had their merits tested; chlorio ether, Condy's tluid, carbolic acid, and even seoret nostrums sanctioned by high authority and vaunted as certain cures have all failed. Those agents which ia non scientific hands are infallible, seem to lone their potency when given under the direction of men who should be most oompetent to judge of their effects. Not for us is it to attempt to harmonise these discordant results; we have dealt with facts as we have found them, and in the spirit that has guided us throughout this inquiry, we are compelled to assert that the treatment of the cattle plague has not advanced one degree-the remedy for the evil has yet to be discovered.

Reports whioh are constantly sent from various parts of the country prove the disease to be still on the increase. Nor is this remarkable:-all the measures direeted to be enforoed in order to prevent its extension have been from the first met by a steady and determined opposition, and the law of contagion has had unlimited freelom of operation.
At the risk of boing wearisome, we must repeat the statement made again and again, that the public does not realise the true nature of the malady, and it suits its humour just now to support the daily press in its opposition to "the unscientific and barbarous system of slaughtering instead of curing ;" and as a result, the disease that might have been easily arrested at its commenoement, has now burst the bounds and may not again be subject to control.
The power conferred upon inspeotors to "seize and slaughter" seems to be the great grievance of the times, and yet in how really few instances has this power been exercised against the owner consent, or while there appeared a reasonable hope of saving the animal. The great "slaughter" has been by the butcher, to whom the animals not yet in a state palpably unfit for human food have been consigned.
In our experienco, the majority of siok animale have been subjected to treatment by the owner, or by some medical man anxious to try experiments ; rarely by veterinary surgeons, whose advioe is seldom sought for diseases of cattle. In fact, the object of the order to "seize and slaughter" has been entirely defeated, in consequence of the order not being carried into effect until it became a matter of iittle moment whether the animals were killed or left an hour or two longer to die from the disease. In atriking contrast to our system of procedure is the following aocount of the way they manage these thinge in the neighbourhood of Tilsit and Courland:-
"The moment the plugure shows itself in a cattle shed it is
walled up, and no cumounication is allowed Walled up, and no cumonunication is allowed. All that were its it, bealthy as well as diseased cows or cattle, evon the men or
women in attendance-fur the attendante carry the complaint in their hands and clothes-are shut up. Such attendants are alone purmitted to bury the dead cattie in a piece of ground onclosed for the purpose. All food is passed through a hole in the wall or enclonuie; and if, perchane 3, the person giving

\section*{recoiving it, he is also forced to
When the cattle are all dead,}
men tae cattie are all dead, or the disense has otherwise aud woodwork, and nore eapecialy the clothes of the atten-

Our notions of the liberty of the subject would be slightly shocked if suoh a system as this were suddrnly established and carried out in England. We cannot, however, expect to enjoy our freedom and not pay the price of enjoyment.

What is the best course to adopt no one seems to bave an idea. The disease is advancing among our herds, and seems likely to devastate our flocks unless some very decided steps are taken by those who are most interested; but if every effort on the part of the Government to meet the diffioulty is systematically opposed, we can ouly proguosticate coufusion and disaster.

The Farmer's Poultry Yard generally means the range of the homestead, with the rafters of the cart sheds for roosting places, and disused mangers and lockers for lajing boxes. It is practicable at a nominal expense to adapt almost any old out-building or shed to the simple requirement of the hen house. Let us start with four walls, a roof, and a door, or if that be considered extravagant, a lean-to attached to the barn-end or stable Having the roof, the floor must be seen to. This should slope from the back of the building to the door, so that all the dung and dirt may easily be swept out. The floor should be formed of gravel, chalk, and clay rammed down hard enough to
allow a birch or heath-troora ts be drawn over it without disturbing the surface. Where a large number of fowls are kept, the dung is a valuable manure, and should be sayed for mixing with other substances of less strength. In Sussex, market, an old tub or hogshead is often kept outside the fowl-house door, into which all the droppings are placed, and sold from time to time to men who make it their business to collect it,
The perches may be of the rudest description, as a pole or young tree sawn in half, and placed with the round sides uppermost in the most convenient position in the house, at a height of from 30 to 36 isches from the ground. The layiug places may be made singly or in rows along one end or side, and consist simply of divisions about 24 inches apart, with a bead in front to prevent the eqge from rolling ont. The ventila-
tion may be left in a great measure to convenience it is necessary only that there be a good current of air pass through the upper part of the house at least 3 fect above the perches. A good lock on the hen-house door is always advisable. The
oceupants of many a poultry-yard are accused of being non-productive, when their eggs constantly find their way into puddings and egg-cups they
If a large number of birds be kept, there will always be sume of them that will lay away, or as it is called "steal" their nests. These should be Watched as they separate themselves from the rest
when let out in the morning; ther may often be seen to make at once for a spot in hedge, ditch, cow-stall, or straw stack. A model row of nest boxes will not make hens lay just where you want them to, nor will old birds that have spent the earlier seasons of their life at perfect liberty be easily aftached to a poultry house; but it may be accomplished by degrees, and when the young pullets are growing up they may casily be made to roost always in the house by being driven to it every evening with the hen when they first leave the coop.
It is commonly said that fowls eat so much that the chickens you rear cost more than those Jou
buy. This may often be the case, but the same thing applies to every desoription of stock. Where fowlo have the range of farmyard, stackyard, pigstyes, \&c., the adults want but very little feeding; in threshing time, or when there are
many pigs fatting, they hardly want feeding many pigs fatting, they hardly want feeding down a little relish for them when they come regularly at night. The eareful poultry keeper will then ran his or her eye over them to see if any prominent bird be missing; with ruffed feathers, raised wings, and a generally unusual or owl-like appearance, she must he Watched when the others go up to roost, an most likely she has a nest-full of eggs, on which she Oroposes to sit without nny one's permismion. One thing should never be lost sight of-if the fowls be what up at night thoy must be let out at daybreak. This may easily be managed by a
ittle trapdoot being made to slide up and down, just large enough to let a fowl in and out; this may be lifted by whoever is first stirring fin the yard. The egg collection from the nests and the floor sweeping may then be left for a leisure quarter of an hour in the course of the morning.

The feeding is a very important particular, and where lavishly and carelessly done, as is too often the case, failure is sure to bo the result as regards the produce, and disgust at the expense and waste, on the part of the proprietor. How often is it not the oase that the farmer, returning home to breakfast from his early survey, is horrified; to find the front court strewed with corn which the sparrows and small birds are making short work of. His first idea is that a saek has burst in moving, but he knows the men would have swept up any that was so dropped. On inquiry he tinds that "it was only a little thrown down for the ohickens," when all the time there is more on the ground than his fowls would eat in three days. Fowls 80 fed cannot thrive; iastead of ranging away in a healthy and natural pursuit of food, they fill their crops at once with a mass not easy of digestion they are unoomfortable from repletion, squat about in corners, and drink immoderately from any dirty puddle. In such yards the birds are hardly ever healthy, they do not lay well, the chickens die, and the master, knowing how much food is consumed or rather wasted for so trifling and unsatisfastory a result, votes poultry keeping a snare and a delusion. On the other hand, where there is proper management, the birds when first let out get just a haudful of meal (Oat or Barley), mixed into a stiff paste, thrown down among them. At first they run for it, fight for a bigger lump than common; but soon the keen edge of appetite is blunted, and they begin to disperse. Oue seems all at once to remember some heap or patch where he or she had a good repast yesterday, and takes half a dozen friends to tinish exploring it. The feeder should then immediately cease the distribution, so that not a bit may be left on the ground; the whole flock will then disperse, some to the stack-yard, the pig-styes, and the barn-doors. Their owner coming home to breakfast passes a bevy of thene looking out for insects and worms at the plough tail a field from home, and sits down to his eggs and bason, or the grilled thighs of yesterdaj's roast fowl, with a keen appreciation of the usefulness of his birds, whioh is often enhanced by the knowledge that many of the little elegances and utilities he sees around the room were prooured through the feathered part of his farm stock.

\section*{A Royal Commission has at length been} appointed to investigate the origin and nature of the Cattle Plague, and to ascortain, as far as possible, the mode of treatment best adapted for the cure of the affected animals, and the regulations which may, with the greatest advantage, be made with a riew to prevent the spreading of the said disorder, and to avert any fature outbreak of it.

The following suggestion from Mr.
Hallett, of the Manor Farm, Brighton, appears to deserve attention. He prefaces it with a statement of his own experience: :-
"In Auguit last I had the misfortune to suffer extensively from the cattle plague. Ten days after its first outbreak three calves in a walled building oome 14 feet square were found to be attaoked. One died he other two, exhibiting the lant symptoms of the diseane, raw spots in the morth, omphysema, putrid evacuations, mucons diecharge from nose and eyen, hivering, panting, do., were forthwith destroyed There was in the same building a fourth calf which had been with the others three days, all sucking their daily supply of milk from the attendant's fingers out of the same pail. Here contact was close and complete, and at the enr of the 'period of incubation' this fourth calf would be certain to develope the disease, an 1 was accordingly shot ; yet neither externally nor internally conid a M.R.C.V.S., well acquainted with the plague discover the slightest symptoms of it. How, then, can our system of inspection at fairs and ports afford any but a false security when during the period of incuba tion, that of real danger to the public, even a post mortem yields no sign ?

I will now suggest what may appear at first sight somewhat startling, but which is, nevertheless, I believe, the only common-sense way of grappling at once and effectually wish this pest, whinh in the
century raged throughout the country for 12 years.
*Let the Hon. Privy Council issue un order, to be renewed if necessary, that all cattle and sheep be for one month from its date kept strictly mpon the promise where they now are (entablishing a quarantine of 14 days for all "animals" imported), and upon

The of Soding of the produce appears good, the lalian Ryegran eepecially, which coutains much sugar. Aud we see bornu sore in excelle con nd cows, we kept, and 50 or 60 horses takeu into Grass. \(\therefore\) cattle are kept, and 50 or 60 horses taken into Grass. Whe lules for the Londou market or sold to the surrounding dairmmen, who fetch it away, paying at the rate of trea \(4 l\). 10 Sl. an acre, according to crop. Haymaking is avoided the soason, the Grass has grotw so fast that \(\therefore\) cusiderable portion must be thus treated. The a sture of the ground, and lose occasioned by haviug the crop, together wiff the land whilst the hay making is :2 progrest, are serious drawbacks. An artificial ;ricess of drying would be a great boon. The hay is callutly, of which there is little fear, makes useful fodder. Now as to the value of the sewage. Our expefieace is yet too limited to enable us to speak poaitively on this point. All who have seen the economical and practical, and exhibits a true picture of what may be expected under ordinary conditions, and therefore, whatever the result, we may safely rely upon th The Commissioners, who had been experimenting dwase the water. They were in difficulties; the application was mismanaged; and they were glad to lease it to Mr. Marriage at about the same sum they paid; consequently the town of Croydon gets nothing for the sewage. The actual value of the land is, howculculete that the sewage costs the tenant one-eighth of a penny per ton. Considerable outlay has been incurred in laying out the land, grubbing up woods, sce, a portion of which has been paid for by the tenant, and bis restrictions as to cleansing the water, and his heavy outlay, he could not afford to pay a farthing a ton. The serage of Croydon is, owing to the grevelly nature of the soil, more diluted than would be the case generally,
and we think it is fair to assume that if land is properly laid out to receive the sewage, it may be worth about id. a ton. We believe that evidence has lately been
given before the Committee on this aubject to show a much higher value, but such evidence will ouly anislead. The sooner the inhabitants of our large towns understand that the sewage is not of the high value some estimate it, tho better. There is not a single instance either in this colutry or abroad of a town cvery case the balauce is considerably on the wrong no longer be polluted. With proper managewent vast quantities of produce may be obtained from that which too often is now an unmitigated nuisnace, and corpora.
tions must be content to make the best terins they tions must be content to make the best terins they
can . The vital importance of good drainage is illus. trated in this case-Croydon, in the days of cesspools, raked amongst the most unhealthy towns in Eugland, and is now amongst the healthiest.

\section*{THE CATTLE PLAGUK}

\section*{TWe enntinue to publish the letter}
1. From near Harwich.-Last ovening I drove down to Harwieh, cight viles from my residence, ant as I entered the town never hefore were my felings more pained. On the morning before, that is, Rotterdam containing about 1200 head of cattle, and the Government Inspector having iuspected momain, and the one was found to have had the condemned and killed and buried, and the whole cargo, consisting of bullooks, calvee, theep, and pigs, Wis detained and not allowed to be moved awey from the pent in which they were placed when taken out of thole of them that remeined alive. As I entered the enchor, the pior rather, where the ceasel lay at the rarious beasts as I passed the pens, and packing their being moved carrying them to thucks roady for probably moved away on the rail to Loncton and moumbly, other places. It was painful to lear the the in the pens; indeed, I cannot depcribe the efteot and grunt moanings, bellowing, bleatings, squeakings, is a wretched place for upon my feolinge Harwich time that the poor cattle had not had any from the not would there put, on board the vessel at Rottordam, Others omployed put an end to their sufferings; the poor calves from their piercing crics, having had no dhensed hed to suffer the most. In iddition to the larned heifer on board the vessel, several sheep, I were thed been muffocated from over-orowding, and
You may place implicit confidence in all
here write, for in addition to what I wywelf saw and heard, I sought out the inspeotor of polico, I before had learned, and in addition he informed me that a milkuan of louvercourt, thich adj jins Harmich, and buried, aud that a caif had drowned were killthe and further, and which I thisk wurthy of ispecial notice, that an ass, which the inepector of pulice attacked with the disease, and at 5 o'clock of the sithe day died, decidedly of the same disease, that is, of the cattle murrain, the ass having strayed up to the riace blood, and died in five hours after it was attacked. But I observe particularly that the two cows of the milk man, the calf, and the uss had died or been killed before the arrival from Rotterdam of the oargo of cattle, sheep, and hogs, aud hence the disease was not Imported to them.
information make what use you please of thi true. I believe there is no doubt whatever but the ass caught the discase as I have stated nor is there any but that it was the real murrain known as the cattle pest.
2. Fron Mr. C. A. Elpoti, Pulmay.- 1 purchased 12 bullocks at a small fair at Fiulon, four miles from Worthing, Sussez, on the 14th of Sopte:nber. They were kept in my field near there umtil Inesday September 20, when they were sent by tail in tro trucks, which were said to have been clean and lined with Lay and watered, and driven through Wands worth, over Kew Bridge, to my farm in Bostou Lane Hanwell. I saw them every day. Late on Friduy unwell, but as it was dark, and the symptoms sligh ho was not treated until early the next morning, when the appeared much worse-running from cyes aud nose; purged, discharge being like soap-mudn, and the wtench from it intolerable. He was separated from the rest Linseed oil ware given early Liuseed oil ware given early. I eaw him at 11 A.N. in
the following state:- Fars and feet coli, breathing haborious, hair staring, \&c.; repeated the thrpentin and Linseed oil, after which he seemed worso ; soon however, ho was purged freely, and then eppeared betto Two wineglassfuls of the solution of permanganate of potash, or Condy's fluid, is a bottle of cold water, were given every hour. After taking the mecond dowe he geomed warmer, and improved in 0.ery way. A 6 P.M. had little or no diacharge; eyes looked better breathing natural; urine passed freoly, and ho began to eat; he was no lively he could not be lept in the pen of hurdles. I considered lim out of danger. On viewing the other bullocks I waw in five decided eyes, a little from the nose, hanging down of the head, and an unmistakable dejected cappearance. They were all ( 11 in uumber) driven into a pen, and half a pint of turpentine with one pint of Linseed oil given to each they were then watoct upou the bowels and kidneys; they then eeemed
better; lad two wineglassfuls of Condy's fluid is a bottle of water given to them, and were fed with Linseed tea and hay. 'These bullocks have all improved, and were pronounced yesterday (26th) D. the \(n s p\) ece to be 11 . he appered to be sinting from erhaustion, and died about 3 p.an., when he was buriod exhaustion, and die

After I left Hanwell on Satunday, the 28d insto, I went to Worthing, and found my cow sufiering from the disease. They had given the turpentine and oil twice during the day. This animal did not couse in contact with the bullocks, though she was on the promises. When first taken she wous smell Symptoms at 11 'P.M.-Suppression of milk, udder cold, ears cold, loss of appetite, and diecharge from the oyes. In the morning boemed morse, the coat staring and fect cold; gave two wineglasafuls of C mily is flu:n
in water, every hour until she had taken a quart in water, every hour until she had taken a quart. gradually improved, and the next morning was con two or three times from Sunday night to Monday night. On September 26 I called at 23, Spring Gardens, and saw Mr. Simonds, in order to ascentain the above treatment could be testod anywhere in the learined Professor that I conld apily to the L m Mayor, who had a horine sanitarium. I was surprised to find that the Government had, as I understood no such place. Mr. Simonds concluded by telling me found at the fiir some Whelsh beaste also stood which had beeu bought by a person in Sussex, and most of which died in a fow days. My treatment was dotermined upon some time before the apperrance of the discaase.

7. The Bushey Pari Herd of Cattle,-Bushe Park, or rather, we should say, the Busbey Paddocks comprises about 87 acres of pasturage, upon which the Royal stud of racehorses are reared and fed. The stud at the present time numbers about 58 animals-stallions mares, and colts. Colouel Maude, Equerry to he Majesty, is at the head of the establishment, and Mr.
John Ransome, the well-known whip, is what is termed John Ransome, the well-known whip, is what is termed affairs. It is the custom at Bushey to purchase certain number of cattle-a small herd, in fact-to eat off the rough Grass on paddocks after the horses have passed over it; and, accordingly, 12 Scotch polled added to the Bushey herd. In about 12 days after they were purchased one of them exhibited the usual signs of the cattle disease, was immediately separated from the rest, and was left in a shed by itself. Mr. Moon, of Kingston, the inspector of cattle, and, we believe, a veterinary surgeon, was called in, and pre scribed for the diseased beast, but to no useful effec \({ }^{+}\) for in three days it died. Brandy-and-water, we things, but nothing given to it appeared to have the slightest salutary effect. The disease quickly spread through the herd, and in a fortnight the 12 beasts fell victims to its virulent attack. Everything was done that could be done, considering the ignorance that prevails generally as regards the nature of the disease, to \(n 0\) purpose the infected animals, but it was al to no purpose, though a medical practitioner, we
believe, was called in. But, though the Bushey autho rities could not, even with medical aid, save their herd of cattle, they effectually and promptly buried them when dead, so that no disease should possibly emanate from them. The remains of the beasts lie in a grave, 6 feet deep and proportionately long, well covered over with lime; and the Griss-upon which they fed has been cut down and burnt, and a good dressing of lime spread over it. The fences, also, in the paddocks are
being tarred, the hovels and sheds cleaned out and being tarred, the hovels and sheds cleaned out and
limewashed, and the whole establishment is being put into a good sanitary state. None of the horses are affected by the disease, although it must have been, as it were, " under their very noses." These cattle, as we have said, were bought at Barnet fair, and had been inspected by practised veterinary surgeons, who were sent down to the fair, we believe, to prevent any
infected animals from entering the market. This is not the only circamstance of diseased cattle being sold at Barnet fair. A farmer living in Hampshire bought at the fair nine head of cattle, and before he got home every one of them had either died of the disease or had been slaughtered by order of an inspector. Our only surprise is that any one should buy cattle at any fair While the disease among the animais is raging to th extent it unquestionably does at the present time.
8. Celoring as a Disinfrectant. - I called yester day on a gentleman who had long owned a large estate on the Polish frontier. To my inquiry how he had managed to protect his herds from the plague when prevailing in Russia and Poland, he answered by said he and his neighbours were mainly indebted for the immunity they had so long enjoyed. To the disinfecting power of that noble gas they had owed an all but complete exemption from the murrain in the two dreadful years of 1854 and 1855, when the Polish herds were decimated by it ; and a year ago, his son wrote influence again, although the danger being less imminent, its use bad been restricted to a fow monthe only. On both occasions the great thing had been to reduce to a minimum the intercourse between the
animal worlds of Poland and Pruseia, and, when animal worlds of Poland and Prussia, and, when
impossible to prevent it, to render communica tion innocuous by smoking, washing, and saturating with cllorine both man and beast passing over from the infected country. To ore this en
it was ordered that no Polish ox, horse, dog, duck, goose, in fact no domestic animal whatever should be allowed to trespass on Prussian gronnd. Wild beasts, too, were shut out as much as possible The frontier had been lined by a continuous cordon o soldiers, who watched it with the atmost vigilance, and would not even allow swans, hens, or hares, to visit the Prussian territory. Many were the ducks shot down in mid-air, or while swimming on the little river that separates the two countries near my friend's estate. interlopera, and punished accordingly, while as regarded
borme, which by Pruesian postilions had been driven
over to Poland and back aguin, they had their hoofs
washed with some chloric liquid, washed with some chloric liquid, and their bodies
regularly smoked with chlorine. Men were allowed, though certainly not encouraged, to pass to and fro; but each time they made their appearance at the fumigation, which lasted from 10 to 20 minutes, and was charged 3d. per head. The Prussian stables was charged \(3 d\). per head. The Prussian washed, and painted with chloric substances. When a case of murrain occurred on the Prussian
side of the border, a rare but not entirely avoidable contingency, the animal was killed without loss of time, and the place where the malady had shown itself hedged in by soldiers, and treated, in point of intercourse and communication with the rest of the world, as though it belonged to Russia. Then you had to smoke when leaving, and dared not take away any animals, even though you might lave had them with you in going there. This, together with the ordinary animal and vegetable matter that may have come in contact with diseased beasts, will, my informant assures me, effectually protect one country against another, or even one village against the neighbouring one. protect a village against itself, if the plague has once Simple as his advice seems to be, it is supported by the notable fact that in the cases it is based upon the rigorous application of these rules has resulted in rendering a political a sanitary barrier, which the
malady, with all its venom, found impracticable. Chlorine, soldiers, and the utmost stringency in using both, is the long and short of his recipe. Times Berlin Correspondent.

Ditnoses Witnesses having been examined for the pursuer and at 2000l. Witnesses having been examined for the pursuer and
defender respectively, the Jury visited the farm. The following Consider in the first place the way in which the pursuer's claim was arrived at. It was quite obvious that his favourite mode of valuing the possession of the land in 1859 was on the supposition that he took a Fotato crop from the whole. He said he would have made from that Potato crop a gross produce of 20002. at least, and on this the profit wonld be somewhere about two-thirds of that amount. Mr. Hope, who was the leading witness upon this point, stated the case in this way. He said that he thought 81 acres of that land would have yielded 35 bolls an acre of Potatos, 27 have given 25 bolls. Mr. Hope thought that the total amount in that way for the 81 acres would be 2008l. 16s. ; and for the 16, 275l. 4s.-in all, 2284 l. He (the Lord Justice-Clerk) was stating that in the outset, as what might be called the largest view of the pursuer's case that had been attempted to be presented.
But it must be apparent to them that throughout the whole of the evidence led for the pursuer the estimates that were made by the witnesses were all made on certain assumptions. There could not be the least doubt that land in East-Lothian would yield 35 bolls an acre of Potatos-nay, that some very special Potato land down about Dunbar would yield a great deal more some years. But 35 bolls an acre of Potatos was a very
large yield on anything like ordinary land. Everybody must admit that, and everybody examined did adinit it; and he thought it was impossible to doubt that these estimates were made on the assumption, in the first place, that the soil and climate of the land were suitable for growing PotaEos; in the second place, that the season was favourable; in the third place, that the land had sufficient manure; in the fourth place, that there is in consequence of these things a plentiful crop; and in the fifth place, that in bringing out the total produce in money, there were good prices going the market. Now if any of these elements failed, went a long way to disturb the calculation and to destroy the value. Therefore he thought these were important things to consider in dealing with the
pursuer's case:-Was this suitable soil and climate for pursuer's case:- Was this suitable soil and chmate for season-a good season for the growth of Potatos generally, and a good season for this land? Was there sufficieut manure to produce a full crop of Potatos on that land that season-and were the prices
that year of such an amount us would justify Mr . Hope and the others in stating the Potatos as worth 16s. a boll? These seemed to be the really important points for their consideration.
great discrepancy in the evidence as was not an! yon character of the farm, and also as to what mus we have to deal. Thus, for example filds an account of the farm which was very well poan their consideration. He was asked, in the f abork) would read to them all Mr. (the Lord Clerk) would read to them all Mr. Hope said boor I never knew of such an experiment as changing froe si
five to the six-shift in the last year of the leang ando
proposed in this case. Without that change the
 cannot say which
not been over it."
Now, it was a material observation certainly Mr. Hopes evidence that he never, down to the prea what was the character of the farm generally, he said:-

result of that seemed to be that this was not what in ordinary circumstances might be Potato land, and therefore it was not ver anring that in point of fact Potatos were never 5y. upon it as an ordinary crop-that there never a beell any grown upon every arable farm for the use of the tenant's family sud of the farm servants. They vail \(n n^{2}\). therefore, take it as part of the basis of tue calculations ore mitable for the profitable growth - mate and

I and 3. The next question came to be whether the这 1459 was a good year in the first place for Potatos, \(\therefore\) in the second place for the growing of Potatos in as land. Now, that to soemed to be admitted-not a wonderfù moon by any means; but they bad been told by all tho ritnesses who remert of the season, which wrs 2 andourable to gravelly light soil. Those of the jury tho were farmers would generally appreciate that, ant thoo who were not would easily understand that sach mi. But then they came in the next place to shat appeared, next to the character of the soil of the whether in framing their estimate the pursuer's itomes proceeded by allowing a sufficient amount for manere; and that brought them to the question thether a Potato crop could be grown with artificial manire alone-not anywhere, but on this land in 1859. Tueru was a good deal of evidence upon this, which had represented by both sides of the bar to be very Enclusive. The pursuer's counsel told them it was in Thut to enatend that artificial manure would not «roov articicial manure had grown Potatos, and that with profit. The defender's counsel said, on the other hand, That it mas altogether out of the question, and that the small arceptional cases showing profit made on those itatos proved nothing, and that the general evidence \(\therefore\) men of the most experience was that the thing was inposible. Now that was one question which they rast sulve for themselves. It lay at the very foumdiHon of the case , therefore he made no apology ing their attention to the principal part of the evidence bearing on that point, and it was the only other point Xr. Whope said in regard read any part of to
Mr. Hope said in regard to this matter :-
"glixty-nine acres of the ninety-seven of this farm in 1859

 frepyard manure au

Xin, that was all he said upon the subject, he thought, ercept with reference to the particular fields. Backhill, angid, hal been in white crop in 1858, Grass in 1857, and white crop in 1856 :-

 manure alone was with 5 acres. It was clay land-Oats the
Now that was an example of the thing having been one-done no doubt upon a very small scale; and so he so he could see, nobody had ever tried it except \(M_{\text {r }}\) Howdnn's case scale. But it was successful in of giving 181. a Scotch acre; not a very large price particularly as Mr. Howden's is pretty highly rented :t:s, and he eaid :-
"I bave grown Potatos often with artificial manure alone-
 Bot they worl
on: the would keep in view that Mr. Purves's land was on the red land of Dunbar; therefore, although it was tecessiful there, it did by no means follow that it would soccessful elsewhere; and they have heard enough hout the peculiarity of the red land of Dunbar. Then arbe \(\mathrm{Mr}_{\mathrm{r}}\). Herriot whose experce certninly was the most startling of all, for he said:-

ind certumy, if artificial maure with thin monrish tand osmld yield 60 bolls an acre of Potatos, that was apricultor most important facts in the recent history of habt Mr. Hey ever saw or heard of. He said no he accomplisherrint was sincere in his belief that rens Bafe to rely upon the was afraid it would nont be bodg under siluilar upon that as a guide to any other

Mr. Herriot was at the time placed; they wouli
give what weight they thought proper to this. He sive what
"I had gacres of Potatns, instutine the servints', in \(3 \times 59\); it

That was his experience on his present farm at Easter Fliston, near Jed'jurgh, to which be entered in 18.59. Now the next witness upon this subject was Gearge Hall, a farmer at Lindru'u. He said
 ywaund out of lea nnd broken it down to plant Potutos, an
was thus sued with grano alone. On 9 acres of ground \(I\) used

Now the peculiarity of that experiment of course wasand it was a distinet peculiarity-that that was atter two years Grass. Then the witnesa Keppy, who wad grieve upon this farm along with Mr. Mitier, spoke to what he saw done at Townhead, in Berwickshire. He said-

I raised a cran of Potatos with artificial mannure aftor white

This, however, was all that he said of the Potatus on Townleat, grown with artificial mauure. There were 9 acres of them after a failure of young Grass, ant 9 acres after old Grass. Now he thought that was all the evidence of the pursuer's witnesses bearing upon that question; and they have brought forward, so far he could see, five different witnesses, who said that they had cultivated Potatos with artificial manure in
circumstances more or less successfully. On the other haud, the defender had brought two witnesses in par ficular; and he would contine tine passages that he intended to bring before them from the defender's wit nesses to these two-Mr. Dicksoa and Mr. Curror. Now Mr. Dickson said that-

With 5 cwt . of artificial manure, I could not expect much Potatos at all. They would have beon watory and uneless.
Potatos nuzy be grown with artificinl manne alnne after old (iriss, but ar or white cerof on such land it is imp ssivlo. The
effect upon that land would have boen to scourge it, and it wou'd have been contrar.
Further Qn , he says-
"I have experimonted on growing Potatos with artificial manure, not aiter Grass in and fousul it would nut dus thoush

That being the evidence on the manure question, it was only necessary to call attention to another of the points he had suggested for their consideration at tite outset that was, the foundation of the estimate of the pursuer's witnesses as regarded the matter of price.
[This, however, we do not extract, as it is not of public interest. We add further that the jury returned damages at 656l. 4s. 3d., including interest.]

\section*{Cattle plague insurance.}
[The following letter from Sir J. Kay-Shuttleworth has been published.)
The introluction and spread of the cattle plague presents a new problem to that system of personal iberty and self-government to which we are attached. Arbitrary (iovernments, possibly with the advice of men of great experience and scientific knowledge, have aeted on their conceptions of the origin and mode in which the disorder is propagated, have prohibited importation, prevented all markets and fairs, isolated infected farms from all intercuurse of man or beast, laughtered all cattle that sickened, and paid an indemnity to the owner.
In this country the interference of the Government is much more cautious. Here we discuss in the public journals all the scientific questions as to the origin of the disease; its character, whather it is or also epidemic; by what means the contan agious or also eplare the conditious which promote its preads, ana wais are suscentible to its attacks dffusion; what anmals aleroes any, and if so, wher whether the disorder or swine; the utility of inoculaon; the establishment of cittle hospitals for its treat ment, and the best remedial measures.
We ought to be on our guard lest, in the unreotricted free.lom of our discussion, we either allow the time for flentund action in the suppression of the playue to cifflusion.
Those who are faniliar with the modes of thonyht and habits of small fromers in remote districts wust be ware of the necessity of simplicity in matructions as to all sanitary and preventive measures. As, in a free
country, the (Government mainly relics on the intelligence, activity, and energy of the people voluntarnly to adopt and carry into extcution whaterer measures are becessary for their protection in such emergencies, it seems indispensable that the landlords should intervene on estatea divided into amall firms: should take care that every tenant is well iuformed as to all the orders n an which no instructuns have been issueni shomlat tend the knowledige of an educated clats may be made useful o one which derives little information from reading.
The Privy Council have hithertsissue, no sugrestions 28 to the principles on which socieries tor mutual protection against losses from the cattle phayue should be founded. These principles do not appear to be melfevident; for such asseciations are in course of forma. tion, on plans so differant that it is clear that many will issue only in disappointment and confurion, while With the jope of contributing sometheng tomards the removal of the mists with which the questions eomected with the organisation of such ansecitions may not be presumptions to strive to point out what are some of the principles nud the arraurements flowing from them which have to be defined.
The cattle plague societies are commonly called nsurance associations. This is a dangerous name. It is more or less founded on the presumption that even with respect to the ordinary diseases of cattle the amount of risk has been ascertained against which an insurancer has to he efferted. The limit of the rate of payment in most cattle socinties as an insurance for ordinary risks has heen settled on the presumption that these risks do not exceed 2 ) per cent. on the imdminnity allowed. Thus, taking the average indemuity at 100., I am informed that most of these sociecties lunit the contributions of their members to \(5 s\). on ench head of stock insured. But, owiug to this limit and to imperfect management, many wuch asbociations have beoome bankrupt.
If the amount of risk arising from the ordinary diseases of cattle has not been ascertained, much less has it hitherto been possible to define the risk of the cattle plague. Whatever shatl urove to be the mortality from the plague in the whole comntry, the losses in different counties or unions will be very founded the mortality of Great Britsin, if foreseen woul foresecn, would not be applieable to regunte to an insurance fund only extending to any smaller area. Such an average would be as much binhw the losses of some counties or unions as it woult be above those of others. Yet an approximation to the mortality likely to occur in the whole country might be arrived at by a careful eomparison, made by experts, of the rate of mortality which has occurred oser cometries, and especially in those most resembling Eugland. A cattle insurance society for the whole country could probally only be
founded unon some such data, affirding preaumptivo founded upon some such data, aft rising presump ive probability that any private society would inspire sulficient contidence, or that anything short of the foundation of a national insurance society by the Governinent would succeed? Thus, if the whole mortality during the continuance of the eattle plague were likely to be one-fourth of the stock of Great Britain, and Mr. Henley's estimate that we have \(8,000,000\) of neat stock he correct, the death of
\(2,000,000\) of neat stock would involve a loss to farmers \(2,000,000\) of neat stock would involve a loss to farmers
of at least 20 millions of money. The premiums of of at least 20 millions of money. The premiums of be calculated for the whole duration of the plague, and if the iudemnity to be paid were estimated at twothirds of the value, more than 13 millions of money would have to be subscribed to meet it. Insurers would have to make an average payment of nearly 11. 13s on every head of neat stock insured. For the sake of simplicity, I exclude the consideration of the iasurance of sheep aud swine.
But we may couceive that in some counties or unions the mortality might be greatly in excess of one-fourth, and that a proportionate payment would in that case be required from insurers.
Hence in the formation of local societies arise difficulties iu settling the terms of association. Sometimes it is not perceived that the amount of riak has not been ascertained, and a definite annual payment is required, often at a lnw rate, on the presumption that it will be sufficient. In other associations the maximum of the cumulative payments which each meinver engages to make is fixed on the presumption that 5 or 10 per cent. on the average value of the stock will suffice. In one assocation I observe that 15 per cent. on this value has been adopted as the limit. It is clear that these several limits of liability are founded on no ascertained facta, even as to a general average of mortality likely to affect (ireat Britain, much less would they cover any instance of excentronally great mortalitv in a more limited area. Wherever the stipulated payinents do not cover the losses of the insurer last stricken, the nssociation has failed to do juntice, and it is obvious that mayy of these asseciations are founded on illusory hopes of such justice, alld that, on the contrary, many persuns who have paid every instalment of the calls,
will have to bear their own losses, unaided by th ssociation, because its funds wili have been exhausted.
Then, the extension of the system of mutual protection against losses from the cattle plague is hindered by che vatural hesitation of the farmers to agree to an unlimited liability to meet the indemnities promised by the association to all its members who sustain losses, or, on the other hand, when the liability is afford no effectual protection to those who last sustain loss. These difficulties would obviously be diminished in proportion as an approximation could be made to an estimate of an average loss, likely to occur in Great to calls on that average. But though the obstacles to the formation of societies might thus be reduced, they would still fail to meet claims in counties or unions where an exceptionally great mortality occurred. In the absence of a national association, the society for matual protection in one county or union would be the insured stock of its members, whila in another county or union the assigned limits of the calls migh be far from being reached

Another obstacle to the progress of mutual protection societies is the reluctance of small farmers to sign any contract deed, or even any document binding them to
fulfil the conditions of the association. In lieu of this, some societies, composed association. In ineu elligent farmers, with extensive arable culture, have agreed that 50 per cent. of the indemnity of two-thirds of the value of the stock which have perished by the plague shall be retained to mect the future calls of the associa-
tion. Where the farms are small and the farmers poor, this 50 per cent. of the indemnity of two thirds of the value is indispensable to the farmer thas purchased fresh stock. Consequently, societies composed mainly of small dairy farmers decline the suggestion of any such security for the payment of future instalments, or limit it to 10 per cent. on th indemnity. Moreover, these societies are often founded on the misconception that they are identical with
insurance associations, with an ascertained risk, and that one rate of payment can, equitably to other members, insure a farmer against cumulative casualties. Thus, if a farmer have 20 head of stock, and pay the successive calls on this 20, he may lose them all ; and it is conceived, in some societies, to be equitable to the indemnity of the association that he should receive the indemnity, not only on this 20 , but as often as he
siall lose his whole stock, or encounter any additional casualty, without any increase of the rate of instalments to be required from him at any stage of those successive losses.

The extension of the cattle plague to sheep also raises questions as to the facility of its communication to them, and the rate of its diffusion and mortality, on Yet without sound data, sheep cannot be admitted as subjects of indemnity in existing societies, nor can separate associs
unknown risks.

I might almost indefinitely extend the onumeration of the difficulties attending the foundation and management of these societies. It will be clear to your
readers that however ably the principles of such associations will be discussed and settled by the opulent and intelligent farmers of such counties as Norfolk and Bedfordshire, there is little hope of making some of these principles even intelligible to the small farmers of remote districts.
Moreover, the most intelligent farmers would obviously prefer a national association, founded on an approxiBritain, and managed by mome responsible pablic authority, such as a Government Commission, to a society which would have to encounter the risk of a The Government has, with great advantage to the public, founded the Post Office Savings Banks, and more recently a system of annuities and other deferred payments, based on the general principles of life
assurance. If the agricultural community is to be organised to meet the imminent national calamity of the cattle plague by a system of independent mutual protection, I conceive this can only be effectually done similar to its interference in the two instances which I have cited. James Kay-Shuttleworth

 one on your bahal at onoe, as there is plenty of time yet-they
to abandon it at the eleventh hour, more particularly as you
publicly challenged the United Kingdom. Chat Bates, Dagenham, July 19, 1865.
Poultry.-Emboldened by the position of a paragraph on poultry in a recent impression, I venture to ask room for a few lines on the same subject. The majority of your readers will doubtless, ere now, have received
their copy of the Journal of the Royal Agricultural Society of England, Second Series, Vol. I., Part 2, and they cannot fail to note from the table of contents, the deep attention the food supply of this country is he influence of the first Agricultural Society of the day be brought to bear on poultry? The Council once be brought to bear on poultry? The council once
regarded it favourably, and for a few jears added it to heir annual Shows. The good example was speedily followed by nearly all other Societies, whether county or foreign, and the result has been a marvellous improvement in and development of our different breods of poultry ; but at present we have done little nore than learn how much room there was for it. I do not think I advance too much when I say that in all probability, had the Royal Agricultural Society continued its exhibition of poultry at its annual meetings our farmers would by this time have taken steps for the introduction generally of the different birds as direct branches of live stock, and that we should have been more independent of our neighbours for our sup plies. At the meetings of the Bath and West of England, the Birmingham, and numerous othe mportant Societies, the poultry bay is alway thronged. The money paid for admission at the door and for purchase of birds tells well up, and the list o subscribers is constantly on the increase. It would be a graceful act to the wives and daughters of many of our agriculturists who take as much pleasure in their poultry yards as their husbands and brothers do in their cattle, if, when the great meeting of England's agricultural produce were held, they could contribute to its success. If, as an experiment, one o more classes were added to the prize list, say for fowls, turkeys, ducks, and geese, the entries would I am sure be sufficiently numerous to justify it, and the classes could be divided as experience should suggest. The prize list would be a guide to the intending purchase of stock, the different districts of England would b fairly tested as to their poultry capabilities, and as is now the case with cattle, the breeds best suited to the different localities would be sought after and improved The nucleus of a poultry stock is to be found on almost every farm in the country, and on the princhple that a rood bird costs no more to keep than a bad one, I think the subject, insignificant as it may appear, is worthy the ttention of agriculturists generally. Hants.
Thistle Seeds.-Now is the season for Thistle seeding and the winds will distribute them far and wide. Some say they are carried five miles annually. What should we say to any man who dare sow seed weeds broadcast over our lands? And yet, practically, those who permit Thistles to flourish and bloom unheeded either on thei own or their neighbours' property, are guilty of suicidal neglect. A visitor to my farm assured me that bis relative brought an action acainst a neighbour down, and recovered damages and costs Unfortunat holders of little fields and great hedge-rows had need watch attentively on this matter of seed weeds. Hence the great value of scarifying immediately after the corn is removed, for weeds then flourish and ripen their seeds very quickly and abundantly. I have known very practical farmers who did not believe that Thistle ever seeded, or at least produced seeds that would grow. J. J. Mechi, Oct. 5.
Crops in Gloucestershire.-The long continuance o dry weather threatens to stop the grow th of roots, and a general opinion exists that this will lower the price of store sheep. Siwedes and Rape have suffered much from mildew, and the young Clover and Sainfoin are also affected in the same way. There is (most likely as a consequence of the above) a considerable mortality among lambs. Whest sowing is retarded for want of rain. Young Clover is remarkably good, and has been of much service to the sheep stock. Store cattle ar somewhat easier to buy than for some months past Sheep still maintain their price, and we saw one pen o ewe lambs sold yesterday for 62 s . a head, and 50 s . to \(52 s\). is not uncommon for top lambs. R. A. C. C.

Wheat Steep.-I have for many years dressed my seed Wheat with a preparation of vitriol," with great success. No smut ever attacks the grain. Falcon.

\section*{Sorítics.}

Atbrit Vhembtrart Couliegs: Oct. 8.-A now Veterinary College in London, having the above title and springing out of one formed in Edinburgh a few years since, was this day formally opened at a branch head college will, when completed, be situated in Chelsea, but, as no further advance has yet been made towards the erection of the structure there than the purchase of the grount apmon which it is to stand from the Commissioners of Chelsea Hospital, the company who are the promoters of the new college under the Limited Liability Act, deemed it wise, acting probably on the principle of "striking while the iron is hot," a a forciby drawn by the
knowledge, to inaugurate their new
branch establishment at Bayswater.
Professor Gamgere delivered the
which was listened to throughout with markal ale tion by a number of gentlemen marith ben interested in the subject of the adverting to what he conceived to have heen the causes of failure in teaching veternary observed that one of the first po attention to in Scotland was the prevale
disorders among horses, and inaving statistic among horses, and having collectel turists nearly 60 diat of the animals used died of disease, he wrote and spoke onerg boiled meat system, feeding horses as we vorous pigs, and pointed out the ki
draughts of turpentine, oil, and draughts of turpentine, oil, and opium, inflom attention to the evils attendant on an He hadint live stock without adopting proper precoult the spread of disease, and had adrocated tho aza ment of foreign stock markets and a ricis markets and fairs. After many years steady investigation he thought it rather the profession to which he belonged denounced as ignorant and inadequate for
sion. There was in his opinion great sion. There was in his opinion great rem disease early in June, and the Government \({ }^{\text {b }}\) be an Order in Council on the 24th of July, did mon quately warn the farmers of the appearance the Governeing under the advice of Professor Sim broke out in London, "that a \({ }^{\text {w }}\) contagious or infer disorder, of which the niature is at present uncers bas lately appeared and now prevails among a Ont 2ath of July he arrived in Loudon, and on the adersed a meeting at the Marylebone Institntion the subject of the strange disease. Thanks to the pe" and breadth of the land that the cottle ple the country, and farmers were put on their guard the purchases they might make. This alone savel mav a man, he believed, from serious loss, and it was mose soo regretted that the alarin was not given one men the in. With regard to many associations frrmed ing most unsatisfactorily, and he thought that it bi Government could be guided so as to benefi opportunity, a syatem could be formed would add to the public revence, materin plague. An indemnity fund from the nation was not required, but there might be a national insurauce system, in which every farmer woold confidence, and which in time would realise en defray the expenses necessary for the supervi national diseage-a preventive system, aland helping at the same time to melt down the Nation Debt [!] Many people were impresser with the ideat the malady could be cured, but the ca more deadly and infectious than any otwer han disease affecting men or animals, Keeping

road locomotives, in some cases amount01
021.

\section*{The eridence before the House of Lords on railway} clearly shows that the whole nation was afraid of th procress of steam power on both road and rail; anc is probible that road locomotives would have remained fresome years longer in the shade but for the rapidly mding ase of heavy steam-driven machinery for callural purposes; the displacement of horses by
abrienltural steam engines should be able
them-elves and the threshing and ploughing machimery

In the joar 1861 Parliament pamed an Aet "for Regu8 the Use of Locomotives on Turnpike and othe ds, and the Tolls to be levied on suck Locomotives and

By this Act the prohibitory tolls were removed just scale of tolls substituted. A clause, however ivberted giving one of her Majesty's principal acretaries of State power to restrict or prohibit the on of locomotives in certain districts. This power was in mony cases unduly exercised-in some instances pro tie request of a few individuals without consulting the mastrates or inhabitants, thereby neutralising benefits unferred in the Act referred to. This obnoxious clause and the undue use made of it by Sir George Grey, prosmicultural locomotive engines, and is some instance III ploughing companies were obliged to discharge Weir men and stop working.
pplication was to Parliament, and the Mocomntive Act of 1865 was passed, which removes the :he use of locomotives, and places the power of making reulations for their use in the hands of the local解Grities of towns whose population shall exceed This Act also removes the restrictions as to the zmplored ines within 25 yards of anin september, 1867

The question of steam on common roads is now ylaced on a fair footing; and not only for agricultural rumposes, but for the removal of heavy loads will the ase of the road locomotive engine become more and
"By some it has been feared that traction engines mill exert a destructive influence on the roads. It is, therer, well known to experienced road surveyor than injure roads. The relative damage done by the hocis of horses in drawing carriages, compared with the driving by the wheels, is three to one in favour of and driving wheels. The steam horse consumes coal thify wen at work, while animal muscle must be conthe pondened with hay and corn. The increase of meppopulation of this country is now telling on the aiply of meat, and the food of each horse tre aheap.
"It annot be denied that there still exists in the on sccount of the supposed tendency to frighten ware, and this can only be removed by the unremitting attendantent and civility of the drivers and The follor

Tiree persons at least are to dirive or conduc romolives, and if more than two waggons are attached ngrone an additional person to take charge

\section*{Farm Memorande.}

We take advantare of the immense body of agricultural eridence lately takien bofore the Hypothoo Oomminutin at
Edinburgh to publish suob extracts for it me will indidioste the existing st
and energy of

SCortise Agricultury: George Aulajo Jamieson Esq.-We have the charge, more or lews directly, of everal estates in various parts of Scotland, viz, in Lanark, Mid-Lothinn, Weat Lothian, Perth, Forfar, Aberdeen, and Ross. The aggregate rental of the estates of which we have the management is about
\(100,000 l\) a a year. I think the effect of the abolition of the law of hypnthee would be exceodinely unfarnurablo to almo-t all chases of ayriculturists-certainly to a very large proportion both of landlords and tenants. In the south of Scotland, very usual terms of payment are Candlemas and Lammas after reaping. If the liw Whitsanday and Martinmas preceding-possibly ait months sooner. This would be equivalent to cutting while in the north of Scotland, the period of entr and of credit being different, the result would be to curtail the credit from 15 to 18 months. This would tell very much on the smaller tenantry, They would practically to a large extent be excluded from offering altogether. They would not have the neans to stock their farms in many cases. The result over the whole country would be to withdraw from the
tenantry of Scotland about \(7,500,000\) l., that bcing in my opinion a moderate estimate of the amount of on year's rental, of which at present the landlords allow the teuants the use. The extent of farms, and the class of tenantry, varies very much in the different parts of the country; and I do not think the interests or opinions of farmers in the Lothians or Fife can be at Ill representative of those in the north, where arable farms are very much smaller. I have made up a note of tenants on estates under our charge in various part of the country, and I find that, leaving crofts under 102. out of view, in Lavarkshire the average rental o farms on one estate was 1502 . 18 ; in West Lothian, on two estates, the average rental was respectively 4027. 18s. \(2 d\). and 319\%. 16s, or combining them, 356l. 8s. ; in Pertbshire, on one estate, the average is two estates was respectively \(130 l .10 \mathrm{~d}\). and 141 l .138 .6 d .; in Aberdeenshire, on six estates, the property of three separate proprietors, the average is \(54 l\). . 15 s . 10 d ,
 in Ross-shire, on one estate, the average is 79l. 4 s .2 d I find from a return I have got, that the average rent of farms in West Lothian above 50l., is 1692.98. ; but his ranges from an average of 3361, in the parish of Dalmeny, to 90l. in that of Whitburn. Including crofts, the contrast becomes even greater: in Aberdeen 151 a \(15 l_{0} ;\) in Perth, \(160 l_{0}\); in West Lothian, 300l. ; and in Lanarl, 76l. I have no doubt the average rent payable by each tenant in East Lothian, Mid-Lothian, and Weral parts of Roxbrg ane no experience in thes counties. The advantages derivable from the present hw of hypothec are, I think-l lst, the security it afford th those wo invest in land or on the security of land those who invest affords to landlords of providing d, the means it anford the capital neceseary for the tenants with a part of the capital necesaary for the working of their farms; \(3 d^{\prime}\), the opportuaity it tha affords to smailer farmers entering on the empioyment and thus recruiting the ranks of agriculturists by persons of skill and practice ; and 4th, the inducemen and opportunity it affords for the granting of leases of the long duration of 19 and 21 years. I don't think hat the security which it gives to the landlord is given bargain entered into in the ordinary affairs of life makes the pariy to it secure at the expense of others put the letting of land on the same footing as th leuding of money. No person will lend money withou taking such security as he considers necessary for the safety of his capital, and the regular payment of his interest; and if he takes such secarity as will render that a preferable creditor, the person wars his othe creditors, that a tenast is in towards hir landlord. There is a very large number of persons who advance money on the security of land, and they are in the same position as the landlord-the position of being preferable creditore
We very rarely advertive farms In most of the estates nnder nur charge, the farms are valued by some neutral person like Mr. Dickson, and if the factor and he coincide, the farm is offered at their valuation to th
it desirable to remove him. In very sare canot has there been any change. Sequestrations are alinost unkuown on mont of the estates under our management. I have made some inquiries on the subject, and to take one esme, Mr.C. Chalmers, who has had considerable experience in managing landed properties in Abirdeenshire and Fincardineshire for upwands of 40 yours, always
 the course of his experiwice tha: the has hut to resort to it." I have obtainet a re-urn of the number of sequestrations used on a large estate in Alwedeen for the last five years. The rontal is about \(38,000 \%\). a jear, and there are abont 1800 tenants. During thene five yeare there were in 1860, one for 90 L ; in 1861, none: in 1882, one for 111. 128., and one for 981; in 1885, none; in 18p1, fire for 78\%. 108.; in all, eight for hud 5\%1. 4s. 5d. in annual anount. In not one of these cases were the proce-dinza follownt out to sate. These
 tenanta who bad beee for many year, in arrear, juut to get rid of them. Thioy were for \(402.082,9 \%\), and 14 respoctively. I am sare that other parties dealing with chese teman:s could ant have been great losers, becuuse they were quite notorfoully bankrupt, and the sequeatrations were not renorted to till law of hypothec cmables a landhord to grant forbearance th temants withont risking his moner. I bave also obtained a return of the whol:s sequentrations used during the same period in the county of 1 in lithgow, and I find the following renults:-In 1880, mont 8981, Be 11d in 1861, 2, 148l. 98.; 1862, 8, 1320l. 12. 10d.; 1863 15, 31392. '6s. 1d.; and in 1864, 5, 4922. 108. Total
 this list I find the same names recurring year after jear, 80 that in realits, although there were 81 seques trations, there were only ninetern parties sequestrated. The average amount sequestrated for in cach year was 1187l, the valuation of the county being \(16 \%\), (inm). In two of the 19 cases, the mequestration were taken at my own instance; and the rental we have charge of in that county is about 10,000 l. a year. Q. In arnog at seven and a half millions as the sum which yous think temants have of the landiord's capital throughout scotland, did you make allowance for the furms that are fore-rented? \(-A\). I tmok it roughlr. I got trom the almanark the valuatinn in the diferent evuntien, exclusive of burghs and railways; but I find that in Kinross, the valuation of wheh is 58,0007 , and in Lanark, where the raituation is 1.1 (fothonl., ratways and canals seem to have been incluted. The gross amount of the rental of Scotland is \(9,481,3281\). of
whieh I took for railways and canals in these two counties, and to meet the forchand payment of rents, \(2,000,000\)., leaviner \(7,500,01 \mathrm{~m}\) ). It was a very rough calculation, but I know that foreband rents are exceedingly rare. Sheep farms are mostly fore-rented, but they do not form a very considerable part of the rental. I do not know the practice as to farms in Roxburghshire and Dumfriesshire. If the law were abolished, tenants would lose on an averge interest by fore-renting. Q. Don't you think they pay 4. Indirectly the influence of the laty is to enhance rents, and thereby no doubt they will. If it reduced rente, tenants would benefit to the extent to which they were reduced. Both lan tlords and tenants have a direct pecuniary interest in maintaining the lav. Q. A. Because he gets the use of the landlord's money. Q. But those tenants that have money? - \(A\). You are speaking of clasess of tenants as distinguished from the general bulk; my remarks apply to tenants as a clase, and with reference to them I amere to what I have said. The landlord derives this benefit, that it secures his rent. It also enables him to select deserving tewants with confidence, and it creates confidence in the mutual dealinga between landlord and tenant, Which 1 think exceedingly desirable. I don't think landlords are entitled to any security beyond what other capitalists possess, but no other capitalist waul inde-tructible?-A. So is gold, practically. Q But a tenant can run away with the gold, but scarcely with the land ? - A. I don't see why a man with a farm worth 10006 , should not make himself erpmily secure as the man who has 1000 sovereigns. The latter woat lend them to anybody else unless he is sure of getting them back again. A tenant may destroy the lana, and he may be unable to pay his rent. The value of land has certainly riean very much winan will onl years, and a man bis money. \(Q\). You think the only get 3 per cent. for his money. A. It is difficult to speenlate on what the effect may be, because there might te remedial measures which we cannot anticipate, but the direct influence of the abrogation of the law woull iquestionably he to affect the value of land. the estates under your charge, and in Linlithgow they have only amounted to 10 s . or 1 s s. per 100l. ?-A. About thato Q. Do jou think that landlet their farms to men at a greatly reduced rent, simply
because they were able to fore-rent them? - A. But I look on sequestration as the exceedingly rare consequence of the law, as by no means marking the number of sequestrations as the measure of the benefit derived from the law. I think sequestration is a thing derived from the law. manage sequestration is a the mangement of land resorts only in the very last extremity. Rents are got without putting the law in force, but it is known chat it could be put in force. I am against granting ameliorating leases to tenants, but my remarks on that subject applied to a system well known in the north of Scotland, where houses on the farms are really the property of the tenant. In a great part of Aberdeenshire till recently the houses on the farm were the property of the tenant. He built them, and at the end of the lease he had a claim on the landlord for repetition of the value. That is a system we have done away with wherever we could. I think the effect of the abolition of the law would be to prevent landlords from granting leases for 19 or 21 years. \(Q\). If they could obtain more rent for their land under leases than they could get from yearly tenants, do you think they would not grant leases?A. There is no ssying to what that might tempt them, but it would make land no longer a certain investment, but a speculative one; because you would be trusting no longer to the security which the law gives, but speculating upon the substantiality and credit of the individual tenant. Q. You stated that persons succeeding to entailed estates had considerable difficulty in raising money when they succeed to their property, they not receiving their rents for 18 months; would that not be an argument for having the rents sooner paid ? \(-A\). I made the observation as showing that the advantage derived from the postponement of rents was not all on the side of the tenant, and that the landlord was put to some inconvenience to find the money to advance to the tenant.

\section*{Calendar of Operations.}

October.-Wheat sowing was referred to last week. The furrows should be cleaned ont by plough and spade, so as to leave a free passage for water, which might otherwise stagnate during winter.

Winter Beans should be sown this month on any Wheat or other stubble that has been prepared for their reception. The stubble should be worked, in the first place, with the grubber or cultivator, then manured broadcast with sach a quantity of farm manure, up to 12 or 16 tons per acre, as the yards may be able to supply; then well harrowed, and ribbed over by the plough with shallow furrows, at intervals of 18 to 24 inches. The object of this is that the seed-sown by the drill in these furrows, and covered by two double turus of the harrows-may be deposited at a depth at which the drill, if not thus assisted, could not place them. Or the seed and manure may be ploughed under together; the former being sown by the barrow in every second or third furrow of the plough. Another mode of sowing Beans, whether of the spring or winter Fariety, which is adopted in Scotland, is to plough in the seed and manure every second furrow. The land, if light, is first ribbed across as soon as possible after the corn crop has been removed; then, just before sowing the Beans, harrow down the furrows, lay on the manure, cover in with two ploughs following each other, and drill the seed in the bottom of the furrow behind the last one. The dung can either be drawn into each furrow with forks, or all placed above the seed, as may be considered desirable. The seed should not exceed 2 bushels per acre. Where it is desired to cultivate Carrots or Turnips between the rows of Beans, as may often be done with advantage, sufficient space should be left between adjacent couples of Bean rorrs for the purpose. The two rows of Beans need not be more than 15 inches apart, and the spaces between the couples may be 7 feet-room enough for the two rows of spring-sown Carrots.

Winter Vetches may be sown now-some having been sown in September also-for successions next May and June. Three bushels per acre should be drilled in rows, 6 inches apart, on land that has borne corn the past season, and that has been manured, ploughed, and harrowed, as for Beans. It is well to sow half a bushel per acre of Winter Rye among the Tarea.
Potatos should have been harvested before this month. They may be taken up either by the cominon or by the double mouldboard plough, which is made to undermine and throw open every other row, the tubers being gathered by women and children; and the alternate rows are to be similarly treated after these are completed: or by spade husbandry, in which case the whole operation is let to a party of men, who dig or fork up the tubers, and employ children to sort and gather them. This costs from \(20 s\). to \(25 s\). per acre. When the plough is used, the field is afterwards to be harrowed, to expose avy tubers that may remain. In either case, the produce is to be carted home and secured in pits, or otherwise against the frost. To secure them in a sonnd condition, no fermenting matter should be near them. Perfectly dry "houses," thickly thatched to the ground, with chamuels to carry off the water, will secure the store for sale or consumption. Tbat portion intended for seed should be "green'd," or air-hardened before storing, and, if Mangel Wurrel and dry as to prevent sprouting.
towards November-such of them as it is not intended to consume on the land where they have grown.
Rape or Coleseed will be ready for receiving the stock o be fed upon it.
It is well, if the farmer find himself possessed of sufficient manure in his yards at this season, to apply it on all the land which requires it, that is to be cropped
early in spring. All laud for spring Beans, early-sown Peas, Carrots, and Parsnips, should thus, if possible, be manured in October.
Fences.-Finish clippiag, slashing, and cropping hedges; cleanse all ditches and water-courses; plant Grass Lands which weging for planting fresh hedges, month should now be stocked with the breeding ewes, with their ram; the ordinary grazing sheep remaining on Turnips, Rape, or other keep. The bullock pastures will require a sufficient quantity of store cattle o sheep to eat up all the rough Grass which remains, as it is essential to good grazing that once in every year all pastures should be well and cleanly eaten off. Th
Water Meadows. "The working-up" and repair of anything connected with the operation of irrigation should be commenced; and it would be desirable to complete twem as early as possible, that advantage may be taken of the November raine, the floods from which will be impregnated with enriching qualities from yards, roads, and newly manured fields that drain into the watercourses.
Live Stock: Health,-Horses are particularly susceptible, from the circumstance of their casting their coats -becoming at first almost bare, and then acquiring a coat of much greater length. They are thus, from their semi-naked state, more exposed to the vicissitudes of the weather, besides which, from sympathy with so large a surface as the skin, there is greater weakness
throughout the system generally. They accordingly sweat readily with little exertion, and appear faint. Some horses are much more affected by these changes than others, and as a general rule, horses with coarse hair, gnomy legs, and deficient breeding, are more influenced by the antumual changes than well-bred
animals, possessing naturally fine sleek coats. Coughs and catarrhs, with the more serious cases of inflammation of the windpipe and the air tubes generally, are common diseases at this season of the year, sometimes appearing as simple affections, and at others assuming an epizootic character, or existing as concomitants of influenza. Diseases of the skin, or rather of the sub teguments, such as cedema or swelled legs, cracked heels, grease, \&c., are now common.
In oxen and sheep we find catarrhy, coughs, and other kindred disorders, as in horses. Young cattle are liable to a very fatal disease, commonly termed Quarter-illwhich is produced by lying on the wet ground, or when it is covered with hoar frost. By housing early in the season this disease may be prevented. Epizootic disperiod of the year; the disease of the mouth and feet, called the epidemic, becomes prevalent towards its too, rages most in the autumn.
In sheep, too, the epidemic, which is more serious than with oxen, generally makes its appearance now, often remaining an unbidden guest throughout the winter. The fuot-rot also prevails towards the latter end of the season on soft rich pastures, and that dreadfully fatal disease, the rot, which some yeurs since used to decinate our flocks, though latterly not much heard montends its ravages most during the autumnal where breeding stocks are not kept, to purchase sheep and cattle for the winter's manufacture of meat and manure.
Horses continue to receive their full allowance of corn ; the Clover and Vetches, however, on which they have been feeding, having now failed, must be replaced by hay or Oat-straw chaff, with a small allowance daily of Carrots or Swedish Turnips. Bean straw may bs used later.
Sheep must be folded during this month on the earlier Turnips and Rape, where they may receive oilcake, or Beans, or Barley, in addition, according to the object of the iarmer, or they may be folded on Clover lee, Turnips being brought to them, and cither cut into troughs or spread over the land, which is thus manured for the succeeding crop of Oats or Wheat. They should have access to a covered trough containing salt. Grazing or yearling sheep will do well on Grass pastures. The best mode of consuming the winter fond is to begin with the Rape, then go on with the common Turnips; next, the hybrids or Scotch yellows; and lastly, the Swedes, which should all have been taken up and pitter in open weather. Ewes ought, the first part of this
month, to be put to the ram; and the ewes should be marked according to the week they are tupped.

\section*{NOW OFFERED FOR THE FIRST TIME,}

Grown upon the Summit of the Chalk Downs, and yielded over several Acres nearly Seven Quarters per Acre the Crop on similar Light Soils being this year extremely bad.

This is a fine Millers' Wheat, in addition to possessing the extraordinary productiveness of the original Red Pedigree Wheat. Straw of medium length and very stifi, trel being laid by bad weather. A Winter Wheat only.

\section*{If Drilled in September, 4 Bushels on 10 Acres. Oetober, 4}

SEED REQUIRED.
If Driiled in November, 4 Bushels on 4 Acres.
Note-The ORTGINAL "RED" PEDIGRE"E WHEAT" will be supplied if specintly
Note-The ORIGINAL "RED" PEDIGREE WHEAT will be supplied if specially named, otherwise the above new White variety will this year, in all cases, be format
Price, including Bags:-ONE GUINEA a BUSHEL, or SEVEN GUINEAS the QUARTER by the Quarter or Half Quarter, delivered in Bags, sewed up and selid. the Brighton Railway Station, upon receipt of Cheque or Post Office Order, without which it will not in any case be sent to quinown Correspondents. Less than a Bushel wil: be supplied.

\section*{CHEVALTER PADTGREE BARLTE. \\ MARK.}

This has been "bred" in the same manner as the PEDIGREE WHEAT, riz.:-by repeated annual selection, re-starting in cach year from a single grain.
Although grown upon a poor thin soil (resting immediately upon the chalk), which upon neighbouring farms produces Barley rarely weighing so much as 51 lbs , pir bat and fit only for grinding, the PEDIGREE BARLEY last year [this year's crop not yet threshed] weirhed 5 f horms per hushel, and produced weit bushels per aure.

Besides its astonishing productiveness, characteristic of all the PEDIGREE CEREALS, it possesses remarkdble value for the maltster, not a single grain futing to and all growing equally.

Although only a very limited area of it has this year been grown, it will, in defirence to a generally expressed wish, be at once offered to the public instead of waitin: next year, and a Subscription List has been formed, to which gentlemen desirons of securine any wf it forsed wish, be at once offered to the public insteadd their a which, however, will not involve payment until it be ready for delivery, of which due notice will be given by printed circular.

\section*{SEED REQUIRED.}

PrICr:-TWO GUINEAS a BUSHEL (including Bag), delivered in Bars sewed up) and seatent Drilhed in April, I Bushel on 2 Acres. Order, weithout wehich it will not in any case be sent to unkinown correspondents. Less than at Bushel will not be supplied Railway Station, upon receipt of Cheque Note, As the quantity is so limited, it will, until exhausted, be sent out to Gentlemen in the order in which they have joined the Subscription Iisth

SATURDAY, OCTOBER 14, 1865.

\section*{meeting for the ensting wfek}

The efficacy of Root Pruning in the case of Fruit trees is, thanks to the labours of Mr. Rivers, pretty generally recognised in this country, and the circumstances which render such au operation desirable are equally well understood; but with reference to Forest trees the case is different, and many circumstane-s are overlooked to which attention ought to be directed.
A gardener would ordinarily see in the process merely a means for facilitating the removal or transplantation of the tree, and he would sar that the removal of a number of branches, in proportion to the number of roots cut away, would compensate for any disadvantage that might ariso from the supplies of food. As the supply is impaired, so should the demand be lessened.
Of couree there is a certain amount of truti in this, but the result sought may be gained, unless great care be taken, at the expense of a deformed and enfeebled tree, and years must elapse before the ill-nourishoid tree can regain its vigour.
There are other thiogs besides the facility for transplantation whioh ought to be considered when root pruning is to be carried out. What is the destination of the tree? Is it to be planted separately or in a group? Is it intended for an arenue or for shelter? A moment's reflection will illustration let are not idle questions. By way of illustration let us take a tap-rooted tree: if such a tree be root-pruned, the result will be the prodaction of a large number of small rootlets, that sre useful, indeed, for obtaining food for the tree, true, may be remedied by efficient staking. It may, however, turn out to be positively injurious to have a dense mass of fibrous roots at the border of a field, for such roots will absorb muoh of the nourishment intended for the crop, while a tapmoted tree, seeking its food at a greater depth, does comparatively little harm to the fibrous-rooted plants at its base. We make these remarks obriously not for the experienced planter, but in olashing which we have too often seen carried on at this season by ignorant labourers to cave themsulres trouble. In these cases "conservative surgery" should furnish the rule of practice.
Trerre is a certain class of people who seem to
derive a melancholy satisfaction from making the Werive a melaucholy satisfaction from making the
Worst of things. We can afford to smile at such self-tormentors, or to compassionate their infirmity When their apprehensions are ill founded or out of
when the danger is really
oppeat or imminent, no opportunity should be lost in trying to convince
such persons that their method of procedur is sure such persons that their method of procedure is sure
to make the bad worse, white every endeavour should be made to induce them to do their hest ti repel, or if that be impossible, to palliate the evil. Just now the supplr of animal food is a matter for most serious consideration, and as it is quite certain that an increased use of Vegetible Fon in some form or other must be made, it becomes necessary, strange though it appeare, to tell some people that vegetables and fruit furn under proper precautions a wholesome diet.

We have been led to make these remaris because there is a very foolish and far too provalent an idea that vegetables and fruit produce cholera. I may serve to dispel this pppular fallaer to puint out that there has been a less anount of diarrhers this autumn than usual in spite of the hot weather, in spite of the armudance of fruit-nar, even in spith of a profusion of Plums! Moreover, we douht if a single authenticatel case of cholera can be attributed to a prudent use of fruit in due season.

That our remarks are not uncalled for, is evileneed by a fact that cano within our own knowledge recently, where an elderly
lady becane the subiect of true surv, and lady became the subjeet of true ssursy, and
ultimately died, simply becauso from fear of taking the cholera, she had abstained frum eating vegetable food in any shape! Now, few things are better established in medical science than the intimate connexion between sourvy and a want of a due supply of regotable ford. Suoh em rgencies as the present ought to stimulate oar gardeners and the members of our acclimatisation societies to increase the supply of vegetable food by the more extended culture of what we have aiready, and by the introduotioas of fresh articles fit for human oonsumption.

In the October number of the Popular Science Review we find an interesting article hy Professor Gullifer on the nature and diagnostic value of Raphides and other plant eryatals. The article in question is a summary of several memoirs on the same suhject, published from time to time in variuus journals. The author considers that the existence or abseuce of these crystals is sufficiently constant to serve as a means of distinguishing one group of plants from another, and moreover has made use of the characters so afforded in some of his garden difficulties. "Thus," ho says, "it proved at ones casy and convenient as well as novel and interesting to pick out, simply by the raphidian charaoter, seedlings of the exotic
Onarracero from seedlings of other orders Onagraceæ from seedlings of other orders
and seadlings of Diesembryaceæ, which had also been sown in pots, and got confused with other pots of young Crassulacex, were as surely and quickly distinguished in like manner. planted, and intended for removal when required, Willow herb, various evening Primroses, Phloxes, Campions, and Rockets, had got into troublesome confusion, when nothing was easier than to discern all the Onagracea by the profusion of raphides in the roots and subterranean buds, before growth had revived in the winter and early spring.
Mr. Gulliver goes on to describe the principal forms of plant crystals, and notes their presence in certain natural orders and their absence in others. In Gymnogens he has seen no raphides at all, and yet the raphides, if we may so term them, of Welwitschia, are not the least curious feature of that extraordinary plant. We have not space to follow this expert microscopist through the several natural orders, but we have said enough to show that his researches are by no means unimportant. The only fear in a case like this is that the impor crystals may be exagrerated. Taken by itself the absence or presence of raphides is comparatively of little importance for diagnosis, but in conjunction with other points of distinction it may be valuable.
There are many circumstances in reference to hese little crystals that require further investigation; such as the conditions under which they are formed; do age, soil, or other external conditions modify their form or their numbers? Are
they alwars present in some plants, and as they always present in some plants, and as
invariably deficient in others? The different furms under which these crystals appear-are they significant of corresponding diversities of origin? All these are subjects requiring fuller investiga tion, and, as we have seen, they hold out promise of practical utility. The observation of these raphides is an easy matter, and requires ouly
moderate magnifying power; henoe wo hope tha
some among our ilmuiting gardening frien to miy amuse themotives ia thio le inare, lir endenvourlog

Tun few remarks we offered at p. 913 on the sutiject of the Eaccithus of Gimmankiks, has hrought us a lutter from our correspondent
Mr. 1). T. Fialr, which as trenting of rasti. rs deserviug the serinus consideration of the gardening frat-ruits, we venture tol hing thus prominently under their notice. Mr. Fisit observes, in respect to the status of gardeners :-
"Perinis there is mo diss from whom so mu th scxpectes, and to whom solftle in grest in return. hat certainly is u:ast sfatery ghe fhe that will nitimately reandy itsolf. It is sore than probilite how: ever, that the falli:iz oll in imt lliee ual cip ici! y of modern Donfy gardeners may chigizate in thas valgar chume. promptitule in the governow of men mal things muwearied diligence, studi ma forecight. refi welt thate,
 something in the basine senarts of the wowl. And they do. The fact is, our extended trable and flurishing commerce is creating a groning dem mid for mperor young men; and unlews the comdition of gerduners is tuethread. their quality must deteriorate. Almost an of every 190 girleners whather puathent themsilvers to the front rank of their theminess, enf.uss that were they
atarting afresh they would choose some other profes. sion. The romance of gardening as a prusant is su'ssiling before hoore utilitatian views; and it is generally felt that the wear and tear of a gardener's the pecuniary ourrifie: of all his enly inm-
 5 5\%. to 1001 . per amman.

But garieners have a more serions grievance than even this. With all our acquirements, including ofen a knowledge of half a duzar trales and nlinont an
many or more pofessions, our intellectual nad socinal many or more pofessions, our intenlectual nad socind
status is comparatively mowhere. 'O.aly a grdmar' in too often the contemptume frectity remirk we are compelled to hear, if by sheer forea of tatent or gomius we attempt to push our way to literary emisence or clain a standing anony the larnel professions, More galling still ar, the patromisith airs ansu nel hy the (otal maguates of procincial sucity, whase only clum Sh distiuction too often entrists in that they had She wisdom to chonse, a husines whinen himed thair falities. Such as these have meither the will nor the pwer to measure any man's worth by an intelleetual atandari. Money alone makes their men. Those that have this are gind and great, an! al are mean and despic rhle besideE. Such views as chere mould aud farhion the worlds opinions. Their tendency is to put down and keep down gardeners with large fa'vilies in the lowest ranks of gantel starvation.

It is toily to rail arginst and uzeless to iznore the existence of such tendencies as these in society. They mainly rule the world. If gardeners are \(t\), eed and keep that position which their general intelligence entitles them to hold, it must be by blidy coufronting and nobly living dowa these prejudicos. The by the tyranuy of the ivorld's fishinet, can on'y be over borue and deatroyed by the stering worth of our characters, and the emintue? of our talents. obvinus merit and real montal piwer will compel ine homage
even of grovelling Mannon-worelippers. Individual even of grovelling Mannon-woralippers. Individua
gardeners are constantly uting these as the levers by which to raise themselves to their proper place in the sxinl and intrliectual secle; but two sets of influences bave preventel more from thore above them; the other is an nostacle which gardeners themselves have createl. Our ranks are crowded with men who neither respect themselves nor are worthy of the respeet of other.s. Destitute alike of the power of controlling their appetites or their passious, they transform many a lovely scene of quiet rural beauty into a very Pandennoinm, digerace and degrade the name of gardener, and prove a pest to their employers, and a curse to their Heighbnarhond. Such mon in our ranke injure our social and intellectual vears sonctimes to secure the respect of either men, masters, or the neighbourhood under such circumstances. We camot, inleed, himder such men trom becoming gardeners ; but masters my generaliy avoid employing Hhem. The man who is ready to offer himself at the lowest wages is likely to be as ignorant of gardening as he is destitute of intellect, and a cheap gardener is always terribly dear at any price.
"But I gladly turn fiom this gloomy picture to a brighter one. (iardeners are receiving moricencouragecintion of cur services by grom emplyens, the public are beginning to appraise our attaiuments more highly. This will prove a powertul stimulus to further exertion. Cerliaps nothing to clevate gardeners and improve the ecience of gardening as the extension of the Society of Arts examinations
to Floriculture and Horticulture. Since reading your excellent remarks I have received the complete schedule of these examinations. In scanning over the list of prizes and certificates for 1865 , I was astounded to find that not a single gardeuer had competed, except in the special subject of botany. Are arithmetic, mensuration, light, heat, chemistry, animal physiology, trigonometry, drawing, history, \&cc., of no use to gardeners? Or are drawing, history, de., of no use to gardeners? our young men so destitute of intellect as ant to care
for the honour of a certificate or the value of a \(5 l\). prize? Or are they profoundly ignorant of the whole sclieme? Presuming that the latter must be the case, I beg as a favour that yon will publish in full the whole list of Examinations for next year, with an abstract of the rules and conditions, \&cc. Until this is done, of will is the intellectual arena with clerks, shopkeepers, is the intellectual
"I know that had this system been in existence 20 years ago, I would have struygled hard for many of the prizes. As it is, I intend, if my many duties will allow me, to be examined in the two new branches that have just been added by the Society of Arts. Prizes or certificates of this kind should possess something of the value of a degree, and I know of no more likely mode by which gardeners may raise their social and intellectual status than by earnestly striving to win such honours. I trust, therefore, to meet a strong competition next April, so that the Society of Arts may be encouraged to continue and extend these prizes by witnessing the anxiety of gardeners to use every means placed at their disposal for their every means placed atemation."

Thr following note from Mr. Consal SWINHOz may be suggestive to growers of OrChids:- "I procured a few days since from a Chinese junk captain several species of Orchids
which be had brought from the little-known island of Sama-sana, off the cast coast of Formosa, Orchids are gathered and brought to this port for shipment to the northern ports of Chius as medicine. The chief business in this article is done by junkmen from this port of Takow with
Sama-sana, whither they are orought by boat Sama-sana, whither they are orought by boat
from Plack Rock llay. The Orehids are consequently from the high and steep mountain ravge on the east cosst of this island." We are glad to learn that some of these Orchids are on their way to this country, as it is not unlisely that some of them will be new to science.

Galignani states that the northern departments or to them as disastrous as an invasion of locusts in southern latituiles-that of vast and innumerable ewarms of Noctua segetum, one of the night moths. Fire, acids, and oner
powerful agents have been tried against them in vain; for, notwithstanding the most unremitting toil and care, the insects multiply to an alarm" ing degree, so as to threaten the total destruc-
tion of Beet, Endive, and Cabbages, fortunately the only vegetables they attack. They do not issue from their hiding-places until nightfall, when they repair to the Beet-plant, and with round the neck witiout touching the leaves at first sight one would not suspect the feld the other than in the most flourishing state. It effecte puling up the plant by the roots that the done, the remain at a depth of a couple of inches and change to chrysalids. Amongst the various remedies tried, one which promised success consisted in driving a number of fowls into the fields. The caterpillars were indeed devoured, but it seems they possess poisoncus qualities, for all the poultry died of the effects of this food. There appears, says our authority, to be no other remedy but picking up the chrysalids one by one as they are bronght to light by the plough.
- We have lately had brought under our notice Vartability of Fersne A crop of plants had been raised from the spores of Nephrodium molle cristatum, a very indifferently crested form of a very common Fern, a form intleed but slightly removed from the normal condition of the species, from the very slight degree of development manifested in the crests. In this batch of young plants occurred a considerable of most remarkable deviations from the parent plant. Many of them have the stipes and fronds repeatedly brauched, and the parts everywhere densely crested, yet not assuming the character of N . molle corymbiferum; this form might be called ramosissmum, and is analogous to the magnificent form of Filis-mas bearing that name. Others, with more of the plane character of the normal state of the species, bad well crested apices both to the pinnæ and frond, and a forking of the stipes, though less developed than in the former: such a development as might be called ramosum, A third set, with very little of the plane portion in some crested head of crispy segments, and this form we propose to distinguish by the name of orandicels, because it is fashioned after the manuer of the varieties of our native Fems to which this name has been given.

Some other curious deviations occur, but they require curther development. Of the history of the parent cristatum we are not informed; but we believe that in
the hands of Mr. SIM, by whom it was introduced, the very beautiful and densely crested form called corymbiferum produced retrograde varieties, with a very emall amount of the cresting so conspicuous in the parent, and it is nossible that cristatum may owe itm origin to this source. As bearing on the sportive character manifested amongst Ferns, the curious facts above adverted to are worth recording-corymbiferum, a finely crested form, yields retrograde forms, with an almost if not quite complete obliteration of the crests; While cristatum, itself scarcely crested, gives a profusion of the most densely branched and crested forms buted and very common Fern.

DOUBLE-GLAZING AND ITS ADVANTAGE: OwING to the total absence of single-glaz.d if houses in this place (Berlin) and its Mr. Warner rightly conjectured (see n. eibl anable, at least for the present, to give any information respecting double-glazing, with that of single or plain glazing, up, as the Aup of Orchids, to which Mr. Warner's question reter: I am confident, however, that if there reails \(\mathrm{l}_{\mathrm{I}}\) any difference of the kind it will certainly pr favour of double-glazing, for it is an irrefurat that Orchids will succeed better in double houses than in the ordinary structures which present in use in England, and it is beyond aii that the most vigorous plants must necessarils of flowers, phow of bloom, both in quantity and the growth is well ripen
or proper season of rest allowed or even enforced over it is obvious that the atmosphere of a glazed house is far less exposed at all seaso external influences, and consequently the resyec degrees of heat and moisture which the plat during their seasons of growth and rest, are ke with a facility and regularity which those who never had the opportunity, or to use the expression, "the pleasure" of cultinatiOrchids in such a house, can hardly form 2? idea of.

In spite of all that has been said and writh about intensity of light being absolutely nean sary for a vigorous growth and copious blooning in Orchids, a considerable number of mor successful and intelligent Orchid-growers and the opinion that, during their season of gromi. the greater majority of Orchids prefer a gen subdued light, or accompanied by a protionate degree of moisture, and a ino of the "fresh air" thau what is oin too ofter recommended and "administered" in such 1 quantity as totally to anuul the effects of it invigorating qualities, by the amount of gpor and other distigurations which are so frequentif "frought on by its being admitted
fresh " and generally too dry
As for inteusity of light during winter, the senson of rest for most Orchids, and the lene ficial influence of which, during that peris,
certainly denied by nobody, I think a greak: aunount of it will on an average be secured : a double glazed roof than by a coummon sest surfaces of glass made perfectly airtigh surfaces of glass made perfecty point of great importance, the sheet of a point of great importance, filing the intermediate spaco will be compt ratively frec from moisture, and consequet. on account of its dryness, will to a great extad prevent the formation of iee upon the upon the iuner ones: whilst in single-glian

\section*{houses, where moisture is coutinually an}
houses, where moisture is coutinually condensing on the glass, the paues are, as soou as emperature out of doors sinks below freezing p
or superbiens. And yet to get Odontoglossum Malli was most desirable. Dr. Lindley himself had called it "a most beautiful thing." It has the labit of
Odontoulossum Lindleyanum, Rchb. fil., and bears a rich spike, or even, though seldom, a panicle. The flowers are nearly as large as those of Odontoglossum Insleayi itself. The sepals and petals are acuminate, tapering into very long points, in the way of a Brassia. The sepals are almost wholly of a chocolde.brown, with yellow margins, tips, and patches The petals are lemou coloured, with deep chocolate part being larger, transversely ovate, acuminate, with numerous fringes and teeth on the margin; the centre of the basilar part covered with a crowd of acuminate lamello, the superior thinner, the anterior broader, and often bearing two teeth. It would appear to be white, with chocolate-brown blotches. The species is a special ornament of Ecuador, where it was discovered by Colonel Hall, and observed later both by Hartweg and Jamieson.

We only know the plant in a dried state. Our representation is perhaps incorrect, in being too small. We took it from the single flower glued on the base of the sheet in the Kew Herbarium. It is derived from Hall's specimen, being the type of Dr. Lindley's species. But long experience has taught us that such flowers sometimes get at least 1 -4th, often 1.3 d smaller, when dried, though, indeed, they may naturally vary a good deal in being smaller or larger. But among all the specimens we have seen, there were none smaller, and the spike represented in "Xenia" shows a variety with larger flowers.
This plant has ceased to be found only in Ecuador. The long-sustained wishes of collectors are crowned at length with success. It is in our reach-it grows in Belgium. We saw but a few days since remarkably healthy specimens which had arrived in an adunirable state at Mr. Linden's splendid establioliment. Our friend bad sent over one of his travellers in search of the plant. We hope it will grow well wheu taken under cool treatment.
Among the realta of the actual endemio Odonto-
unavoidably, and often to a very cunsiderable ness, covered with hoar-frost and even solid ice, obviously offers far more obstruction to light additional surface of glass, which in respects offers invaluable advantages. will certainly not obstruct light to such a degr the case with "rough plate," which neverthele: made use of so extensively throughout all Eng'ans. To strengthen my assertions, and to vindicate t. partiality for this mode of construction, I suail well it few examples illustrating the exuberan able to atm growth as in bloom, which Orchids are able nder its beneficial and inappreciable in Reichen From among the collectis Schilleriana, received fs 3 Esq., a plant of Phalronopsis Schillerian, aring at the time of its arrival here three sum leaves, the largest of which was 3 wide, was exhibited about largeat o no less than \(12 \frac{1}{3}\) inches in length and \(5 \frac{1}{3}\) in wid bearing a spike of bloom with ninetyexpancled and fine-sized flo rfaches; several buds the plart reached the This is certainly a degree of perfection which his is certainly a deable of attaining when introduced
On another occasion this same collection furpia Vanda coerulea, a splendid plant 3 feet high, botsm top to bin with the most faultless leaves from flow and bearing three glorious plant, which at the time it was exhibited wis icture of health, and was awarded an eance was however Royal Highness the which, in regard to icably ruined through is unfortunately to such delicate and connected with exhibiting; yet the

Ooronen 14. 1865.]
a bloom which it had produced may also have conlod largely to its ruin, by bringing on exhaustion. after its return from the exhibition it began to aner. lost its top, and never regained its vigour; it for: instely has measure compensate for the loss of their pane A similar accident happened two years ago , thich, in the same colleotion, had attained a size and shich, in lom met with, and the impression which it pelo at the time it was exhibited will certainly be reil romembered by many who saw it then in the full plant at that time was literally covered with bloom, pad formed a dense mass of three feet in diameter, of which there is not an atom left.
Of other exceptional plants which I have on different Augracum sesquipedale, two feet and a-half high, the Enest plant of its name which has ever come under my motive, and upon which 1 counted 11 fuily expanded Larpentes, with eight splendid spikes. This plant multiplise here with a rapidity quite uncommon among thken off one shoot every year. There are also shoots of Fandas, erpecially of suavis Veitchii, which can evidently bo excelled nowhere; some of them baing from 7 to 8 uniform leaves down to the very rim of the pot; and I have often seen four spikes, each with 12 to 14 flowers, as one growth. Of Saccolabiums, especially gutrigntic speaimens here, not unfrequently producing three splendid spikes from one growth.
Among the collection of L. Reichenheim, Espr., I have lately seen a plant of Phalænopsia Schilleriana loug by \(5 \frac{1}{2}\) wide-has that size ever been surpassed in Baghad?-as well as that of a Phalænopsis amabilis in the collection of A. Borsig, Esg., the largest of its bJ 5 inches in width ?
Another oxceptional case worth mentioning is that
of a Selenipedium caudatum which has flowered in the last-named collection, producing two scapes, one bearag two fiowers, the largest of which measured from \(w\) the ends of the petals fully 35 inches. Moreover, some of the rest of the Cypripediums, for instance the
parieties of barbatum, evou barb, majus superbum escopted, as well as Cyp. superbiens (Veitchii) produce tro flowers upon almost every scape.
The houses alluded to at \(p .650\), as being regularly months, are those of the Messres Allardt, sons and successors of the late well-known and passionate Orchidpphilist and nurseryman of that name, often men"Fiower Garden." One of these gentlemen, who permonlly attends to the cultivation of his Orchids, told me upon my inquiry as to the results obtained by this practice, that it was not on account of the Orchids that the extra lights were taken off, but on account of being fastened upon blocks of wood, or planted in baskets, and all suspended along the iron sash-bars of Ho further remarked, that if Orchid growing was a better paying business here in Berlin, and consequently proper space could be afforded for their caltivation, he should have them, with but very few double-glazed roof all the year round. The plants, although in general enjoying good health, are looking "desperately hungry."
this system of en of the usefulness and excellence receive a fair trial by some of your intelligent and enterprising cultivators ; and although I must confess that on account of the mildness of the English climate, with jou which it has for a climate like that of Berlin, jot I am perfeotly confident that its merits once being properiy tested, and the advantages which Messrs. appreciated, it will find a most universal application. thatly, I beg leave once more to remark or all houses wherein plants are to be cultivated during winter, require a temperature been cultivated for years in double-glazed houses not, lese on an average far healthier and certainly collivated with comparatively far greater trouble under conatries \(A, R\). . R. . as well in England as in other d. R. 2.

\section*{THE CANADIAN RICE.}

Tras plant, the Zizania aquatica of Linnæus, the Wild Rice of Amentum of Link, and the Lake Rice or interest from the attempts which have made by the to introduce it to our northern lakes as a food for
wild
geseraty, if we may judge from the inquirien made
respecting it, that we gladly reproduce the following passages from a pamphlet br Mr. Gocric, printed at the private press of Messis. Peter Lawson \& Son, of Edinburgh.

Although noticed by London, Lawson, and other agricultural writers, in their descriptive enumeration of Cereal Grasses, the Zizania aquatica has never haid which it seems to deserve. The former author, in hi Encyclopmadia of Agriculture, states 'that it grows in great luxuriance, and produces abundance of blani farinaceons seeds, in all the shallow streams of the Canadian lakes and the hilly range which divides Canada from the country on the northern Pacife Oosan Its seeds contribate essentially to the support of the wandering tribes of Indians, and feed immense flocks of wild swans, geese, and other water-fowl, which resort
there for the purpowe of breeding: And the same author, quoting from Pinkerton (Geog. iii. 33u) adds that 'productive as is this excellent plant, and habituated to an ungenial climate, and to situations which refuse all cultivation, it is surprising that the European settlers in the more northeru parts of America have as yet taken no pains to cultivate and improve a vegetable production which seems intended
by nature to become at some futare period the bread corn of the north.' Purvh, in his 'Flora Americaus Septentrionalis,' published in 1814, describes the Z. aquatica as being frequent in Canadian lakes. Whilo modern authors mention it as being more common to the north than to the south of Lakes Ontario and Erie, they atilim that it is found in the greatest profusiou and luxuriance on both sides of the British and United States boundary liue of \(49^{\circ} \mathrm{N}\). lat., in the innumerable lakes of tha vast central plain, in which are all the head waters of the great river system, which finds an outlet into the
Gulf of Mexico through the Missouri and the Misaissippi ; into the Atlantic, through the great lakes, an the St. Lawrence; into Hudson's Bay, through Lake Winnipeg, the Saskatchewan and the Neilson Rivers and into the Arctic Ocean by the Mackenzie' River In this central region Schollerafo estimates the number of lakes at about 10,000 , which, accordunder two classes, those with ciear sandy sloores, and considerable depth, and those with marshy margins, and abounding in Wild Rice. The former yields various species of fish; the latter serve not only as a storehouse of grain for the natives, who gather it in August and September, but they invite myriads of water-fowl into resource to them."

The Wild Rico seems never to have formed an article of regular commerce in the American citics; ye it is invariably deemed an acceptable fiends returnin in the 'fall' barvested by the Indian squaws, who collect it into their canoes by bending over the stems and threshing ont the seeds with their paddles; the seed is then husked or prepared for use by a further process of drying in the sun, beating, and winnowing. Accorni and agreeabl food of a missionary visiting party in 1855, in their journey from that city to the thinly iuhabited and scattered stations on the North Red River, and other parts north-west of Lake Superior, where they reate o about 4s aterling per bushel. The Wild Rice bears about 4s. sterng the common Rice, or any of its no resenblance than in name and aquatic growth. Like the cultivated Wheat, Res it is of annual duration, and is surpassed by none of these in rapidity of growth, attaining \({ }^{10}\) the summe months to heights of from 6 to 10 feet above the surface of the water, and thus converting immense districts of river and lake shores into thick fields of waving verdure, not unlike the reed grounds in some of our British rivers. Such places being well adapted for concealment, and easily penetrated by the light bark canoes of the Indians, are often referred to by American novelists in their descriptious of the strategic warfare of the Aborigines
"That the Z. aquatica will be found suited for the climate of Britain may be fairly presumed, seeing that climate of Britaing to Jolnstone's Physical Atlas) the Isothere (ar of summer mean temperature corres. fsounding with Central Britain passes considerably ponding with Contral Bre yet it does not exceed the or northern hmit of its native gine culture, corresponding with Paris, passes at least \(7^{\circ}\) south of Lake Itacea, the source of the Misaissippi and of the Great Sismanah on the St. Loais, which is described in Oliphant's Minnesota (p. 182) as a boundless swamp, covered, when he and his party visited it about the 12th of August, 1854 , with Wild Rice, the stalls of which were 10 or 12 feet high, and the seed being quite ripe and very sweet, they anused themselve in plucking the ears and eating their contenks as they paucls, in which the sico as ang through the smaddling was imposible. "In Scotland the culture of the Canadian Rice wat essayed by those eminent promoters of horticulture, the late Dr. Neill and the late Sir G. Mackenzie, of Coul,

Row-shire, but without sucooss, the moods having appa reatly luat their vitality in their tramsmissiou from America. Hence it was supposed that their growth could only be iusured by having them brought home in - ater or mud. A later experiment has proved this opiniou to be fallacious Dr . Neill obtnined a nesomd tample in 1887, which was sown in a 6-inch flowerpot in his greenhonse aquarian with another aquatic plant reemingly with no better aucoom than had attended the former attempt ; but the otbor plant having grown, the pot remained undisturbed. In the nocond yerr, the Wild kice came up otrong and vigorous, and produce Howers and seeds in the course of the summer and autumn. The seods were not very abundant, which In'y be accounted for by the contracted root-room forded by the pot, the plants having acaroely attained a height of 18 inches. This fact proven that the dry. ness aequired by the seend in their transil from Canade inderreal from the sunits of the first ixperiment, but had simply retarded its development.

Alter many fruitess endenvours, having at last ucceeded, through the hudness of Mr. Roburt Mait. land, of Toronto, in procuring a busheel of monhesked reed of the Z. aquatica from Rioe Lanke in the Newcatle district of Canada Weat, I have diatributed it in various arrts of the country among perions likely to take an ntereat in its culture. In un of opinion that the neede or sluguish streame, nad in order to enaner their sinkin in water, they may lee rolled in pellets of cisy. I woula atso recommend thut tacy be sillpgeted to is varied treatment as possible, even nowing some in lluwer pots and hothouse tauks where practicable. When tho eeds are ripe let them bo pides of lakes, ponds. or rhers, brairdinus."
The Zizania was formerly cultivated in Bagland by Sir J seph Banks, and subsequently by others; but it is certainly the fuct that the seeds do not readily germinate, in fact, do not uoually germinato at ali, unless dropped into mud under water as moon as they ripen; and being an annual it is probable that inuttention to this circumstance, and the drying of the meads in the ordinary way, has led to ite being nearly lont. sufficient quantity to be of any use forr the olyject which has latterly bronght it into promineent nutice.

\section*{PLANTS AND THE SOILS IN WHICH THEY}

ANy one interested in the relation botweon plants and the conditions under which they grow naturally, should pay a visit to an out-of-tho-way corner of well known to the geologist for tho variety and interest of its strata, to a solect fow for the beauty of its scenery, and to a still more select number for its botanical trcasures doserves fuller study than it has an yet had in reference to the distribution of its native plants. Such au iuvestigation would not only be of interest to the lutanist, but it would doubtless he suggestive and iustructive to tho horticulturist, from north to south are the sandy liue-cappled hills, bounding the nuble estuary of Poole harbour.
Along the shores of this haven, and of the adjacent ones of Christchurch and Studland Bay, is a Lroad belt of sea-sand and dunes. Landwards of these is a vast tract of heath, moor, and bog, stretching up to the foot of the chalk rauge. Crossing ths hater, anu dy followed by low cliffs of brightly-coloured Hastiags sauds. These gralually lose thenasclves in the vallcy, in which the town of Swanage is placel. To the south of this rise the bleak barren hills of the purbeck anm bere mentioned. Here then, if any chalk downs before mentioned. the student may trace out the reliti mship; where, the student may trace out the on it and the plants growing on it. Let me proceed to notice few of the more prominent facts relating to this sulject, which a short scijuurn in with in similar situations in mst parts of our island, and which need not be enumerated. But why is it that in the Hastings sand of Swanage Bay, south of the in Studland Bay, ou the other side of the downs, where tine sand belongs to the tertiary series, the plant is scarcely to be seeu? The nature look to other causes in order to account for its presence in the one place rather than in the other; as. the other.
a instance of what wonderfully diverse soils certain plants will flourish in, is afforded by Aster Tripolium. Many must be familiar with this plant growing by the acre in the salt marshes and mud por it grows in the chinks of the oolite rocks, with scancely
an atom of mould aronnd its ruots, and at such a height that it must ouly be wetted by the spray on rane cocasions. Ammophila erundinecos ynay be rake os a reprementative mand plant; it occure
abuudantly in the dunes, while hardly a vestige of the many bog plants I need say little; in this Of the many bog plants I need say little; in this moist conditions; and so, not without a pang, I leave these little gems for their near neighbours the Heath plants. Parts of the heathy district, especially on the hill tops, have been planted with Pinus sylvestris and Pinus Pinaster. It is curious to see how, under the shade of the former, the vegetation is scanty, while under the Pinasters the Heath plauts flourish in comparative abundance. This may be because, in the latter case, the shade is less in amount, owing to the looser disposition of the branches, and the more scanty foliage. The Gorse in this district is almost entirely of the dwarf kind, Ulex nanus; and all three of the commoner Heaths grow in profusion, mingling gloriously with the bright yellow of the Furze Traversing the heath to the foot of the chalk range the abrupt transition of the vegetation is as remark able as is the sudden change of soll; nevertheless on the northern slope of the chalk, a few stunted Heaths and a little dwarf Bracken may be found mized with the Gorse ; the Gorse is however no longer U. nanus, but U. europæus, dwarled indeed by exposure, but stil very different from the true dwarf Furze, the latte of which was at the time of my visit in ful bloom, while not a blossom was to be seen on the common Furze. The Heaths and Furze which try creep up the chaik range fai Heath ine summit, so that on the south side no a Feath is to we seen. A fow yards make all the abundance. Then complete absence and tolerable as it is in similar situations in South Kent, by the abundance of Iris foetidissima, hardly found off this soil in either place. The oolite range is very barren nevertheless in the hollows and sheltered places profusion of Carduus nutans may be seen, recallin the abundance of the plants on the dry oolite Oxford shire hills. This plant may be found on the chalk and elsewhere, but its head-quarters, so far as this distric is concerned, are the oolite hills. Here, as in Oxfordshire, it may be found with Marrubium vulgare. forbear to enter into further details, having, I trust, said enough to show that something is to be learnt by piorticuiturist as to the dietribution of our wid plante, according to the kind of soil on which they grow. M. T. M.

\section*{THE CELERY FLY}

Ters following account of this troublesome little insect, condensed from our Volume for 1841,
may, we hope prove usefal to many who are suffering severely this year from the attacks o the larva upon their Celery plants. Indeed it is scarcely possible to look at any beds of that usefnl vegetable, without noticing the blisters formed by the maggots upon the leaves, which are more or less green On examining these blisters, they are found to be considerably inflated, and, on holding them up to the light, a maggot may be seen moving between the thin and somewhat trasparent cuticles, where it has been con عuming the parenchyma; those parts of the blisters where it commenced its operations being withered, they become ochreous or brown, and the other portions but recently deprived of the pulpy substance partake of pale green tint; in this way one maggot will form a patch more than an inch in diameter before it is fullgrown. Several frequently live together, or appear to do so; but this may happen from their cells uniting, as neigbbouring larve increase their habitations during their prozress to maturity. They have been found at work at Midsummer, but in July most of the blisters are empty. It is, however, in September and
October that the plants are most disfigured and injured, when the maggots are often revelling in every leaf, and have not disappeared in some seasons even in November. These larve are of a glossy pale green, with the alimentary canal shining through the back; the head is attenuated and the tail obtuse, with a few trbercles (fig. 1). The maggots leave their habitations, and probably enter the eartl to undergo their transformation to the pupa; this, however, is not absolutely bat up in a more than the indurated skins of the maggots, which are contracted, and become shining, ochreons, and horny, enclosing and protecting a delicate nympla of charming green colour, which has been found perfectly formed in February, on opening the cases of some which had transformed late in the autumn.
The beautiful and elegant flies comprised in the genus Tephritis (the Celery fly is T. Onopordinis) which inhabit England amount to 40 species; they are very fond of sunning themselves upon the glazed leaves of plants exposeel to the sun, when they skip and sidle along in a very peculiar marner; their wings being slightly elevated like those of a batterfly. They seem to be greatly attached to Thistles and allied plants, whither they resort to obtain fond from the flowers. The emales of many of the species have the apex of the abdomen furni,hed with a horny, attenuated process protecting the ovipositor; \({ }^{*}\) as it it were for depositing
the eggs betweeu the calyces of such flowers; but it is
ays its eggs upon or in the leaf. It is evident that there are two or more broods in a year, for the flies have been observed from the middle of May to the end of July on plants under paling, upon Laurel leaves, as well as various flowers in gardens. The larve are not
confined to the Celery, for the fly has been bred fiom confined to the Celery, for the fly has been bred from Alexanders), and they frequently infest the Parsuip lenves also.
The male flies of Tephritis Onopordinis of Fabricius (fig. 3) are shining ochreous, with a few black bristles on the head and thorax, which are dark ochreous; the lower part of the face and horns is jellowish; the atter droop and are furnished with a fine brittle or seta, which is black, except at the base. The eyes ar deep green; a crescent space behind the scutel is pitchy; the body, which is five-jointed, is rusty brown and downy; the wings are much longer than the body, iridescent, prettily variegated with brown,
leaving two transparent spots on the costal edge,
tricolor, but they had in between arvens flowers than ordinary examples of trimel they were paler in colour
Lery variable. Latea, with the
blue, and the lower ones yellow,
almost identical with those of trw, produced more hirsute, and had larger flowers, flowers entirely yellow, yielded about one-hat thers wholly yell heing very dwarf, with light green shining bibly, large bright yellow flowers. The variety \(\boldsymbol{p}\) le for bedding purposes, under the nanne of belongs to the batch just alluded to, and is most useful plants, being very dwarf, viz, than from 3 to 4 incles high, a continunas \(A\). and the blossoms are a beautiful bright yello tana proved very variable in colour, not being like tricolor, but varying from bright blue others resembled the parent plant, except the: leaves were much more hanceolate, and the stipule we
more fully developed and deeply pinmule being very long. The yariety mentiont Mr. Robinson is one of these. One other varietr we grow has leaves quite linear-lauceolate in form leaf, and of the same shape; the flowers of thisare brighter und of a deeper blue than thowe of the rate. just named, but they are not produced so freels sorts may be readily propagated from catting, are qoo nowered most frecly all of blossom. \(\mathbf{V}\) mor (October 7) thay 12 is. high, lout it can bo perged close to the groon John Tyerman, Curator, Botanic Gardens, Liver
London-grown Mistleto.-As any facts relatire the "Flora of London," and its rapid absorption is bricks and mortar, must be worth recording, it a not be uninteresting to know that within less tano mile and a-half of Whitechapel Church, at a distance ot more than 20 feet from the road, within 6 fee: the ground, and in sight of the many thousando
passengers passing daily, there is growing, aod : passengers passing daily, there is growing, ad
been during the last 22 years, a very fiue plant Mistleto possible health, and shows an abundance or bloom the ensuing season, but I regret to observe tha small tree (an Apple) upon which shows unmistakeable symptoms threatening the destruction, within a very shor of its interesting parasite. I much deplore this for sake of the rising goneration of Londoners, few of wh I suspect, have ever had an opportunity of seeillg Mreto ongh in a gre is much to be regretted the
lane no recently published Plant Catalogne, Sree. tho only one arranged according to the natural ssstem was published in 1830; Don's in 1845 ; Loudon's, " Supplement, in 1850; and Pritzel's only, but a book which I have found very usef The immense number of new plants introduced sian the latest of these works was published imperatir calls for a nem and complete catalogne, and a edition of or a supplement to either of the works; named would be a valuable acquisition. All of dra have considerable merits, and there are many tages peculiar to each, bat the naturai systen arran ment seems to be the preferable one, an allied plant to be more readily fourd an aware of the great labour and expense wid must attend the publication of a new catalogue. one who will take the trouble to write out the de tion of any one plant contained in a single line of eilf of the publications mentioned may satisfy this; he will be surprised at the vass ams are garden. tion it contains; in fact, soes, I know also of this kind has, as a matter of course, circulation, and it cannot be expected that a pub incur the expense of a new edicion or a doubt, honer ont the prospect of repayment. trees of hoyal George and Noblesse this autumn no fewer than 145 dont beautifully coloured and
trees in question go and havo no doubt borne sequence of the very fine bright character of our atmosphere, or from some other untnown case, it bas aever tive, ind is new gardens. Arvensis came partially true; there were

Noths.-The humming-bird hawk moth has been ler Duwerous this summer in this neighbourhood. I reer puwerous lare captured 26 , and would be happy to exchange a Lare captar they are good specimens, evenly set, and
Sir pairs tre trunk extended. The peacock butterfy has
bire the ven very scarce; I have only seen one. The small artive-shell has, on the contrary, been very common; Painted lady and comma have been very hile the cabbage white has been quite a is not considered to be very rich in somology, but the humming-bird meth has been very fire and six might be seen at once hovering over Yerbena beds, to which they seemed very partial
They also seemed very fond of the Tritoma Uvaria, the powers of which contain a great quantity of nectar. The silver Y, which much resembles the humming bird it its habita, and which is generally very common a ten. The larve of the death's-head moth have also beon rather plentifal, five of the chrysalids having been I. \& A. Dickson \& Sons' Nurseries, Chester.

E3winration.-Can any of your correspondents oblige Queensland as a field for gardeners? Many doubtless, who poseess good ability, a tolerable education (ooten self-acquired), and are not frightened at hard with an impartial account of the climate of that part of Australia, the availability of the land grants, \&cc. rerative advautages of New Zealand, would, I feel sured, greatly interest and perbaps benefit many batides myself. A Gardener.
Uvedale's St. Germain Pear.-There is now being exhibiterl at Ambleside, in the shop of Mr. Grier, 14 incles in length, \(8 \frac{1}{4}\) inches in girth, and weighs \(2 \mathrm{lb} .2 \frac{1}{2}\) oz. It was grown at Grasmere in the open ide Is not this very large? T. S. P
Caylon Timber Trees.-Can any of your correColombo, and comprising a descriptive list of Ceylon imber trees, can be procured ? C. P.
The Salway Peach.-The merits of this fine late Peach are scarcely, I think, so well known as they deacre to be; the tree is hardy, and a most abundant bearer, producing fruit which frequently weighs from good, and the colour is so beautiful as to render the fruit quite ornamental on the dessert table. The period of ripening is at a time of year when there is a
great dearth of wall fruit; this season it has been earlier than usual, owing to the great amount of sunheat which we have experienced, but in ordinary ceasons the fruit is in perfection about the end of the present month and the beginning of next. Henry Bailey, Jun., Shardeloes Gardens, Amersham, Bucke. fraish me with a remedy for this evil? I have a young Charlesworth Tokay Vine in beautiful condition as far 4 growth is concerned. It has been planted three years, and is now fruiting for the second time. It has made wonderful growth, and seems to enjoy the
following compost in which it is planted; viz. loam, rotted dung, and bones. The border, which is outside, well drained. The fruit is about to change colour to maber. What can be done? F. F.
have read with much Achyranthes Verschaffeltii, respecting this beautiful bedding plant (see p. 940), merits. At Heckfield this endorse his opinion as to its merits. At Heckfield this season it has more than
fulifled my moat sanguine anticipations. My object in wisting this is to save a really valuable plant from the especially coupled your own note must cast upon it, that ehade and moisture are essential to ensure success with Mrs. Pollock Pelargoninm bave it in combination beds upon the terrace, which is not only not cool and sade, the aspelevated and fully exposed to the morning beng situated in the south-eastern angle is of course and this sun's influence at least two-thirds of the day, colour than mass is possible more brilliant in comstances and upon the same ground we have Coleus Lord Evertii and Amaranthus melancholicus; but to the Iresine, although friends all give the preference dimend either of the others. From personal observaappen know that Mr. Bennett's remarks about its truep; bute in metropolitan collections are just and Gibson's (of Battersea who has the advantage of Mr. Chysal Palace) acquaintance, must be perfectly sure either of the want of skill or energy on the part of Which Mr. Bennetivators that has led to the results of
ninences and the complains. May not atmospheric
be to blame in the matter? I mend for your inspection, with Lord Rversley's permision, specimens of the
Iresine from our mott expoosd bed. I may perhaps remark, for the gridance of younger cultivatorn and amateurs, that I find a light rich earth, abounding in decayed vegetable matter, to suit the plant in question admirably. J. C. Dworritomee, Heckitild, Hante [Your apecimens are not quite so highly colcured an theless good.? by Mr. Beanett; but they are never theless good.]
Cutting off Tree Roots from Flowor Beds.-This has been done in Regent's Part, as follows:-A deep concrete foen cat, and illed will 15 inches thick through which the roots of trees can never penetrate \(\boldsymbol{W} . \boldsymbol{R}\).

\section*{Foreign Corrempondence.}

Cinchona Cultivation in Dabsmuing.-Dr. Anderson's report for the month of May indicaten an increase in the moisture of the atmosphere more avourable to vegetation than the weather that pre vailed in April, and which had raised the mean minimum temperature of May by nine-tenthe of a degree. Thewe changes had favoured the rowth during the month (10t inches) greates the measured plante hed occurred in a fine plant of Cinchona micrantha at the lowest plantation, where his epecies is in the most perfect igorous growth in Cinchona succirubra ( 6 inches) wat also at this plantation. Cinchona officinalis, bowever, grew faster ( 8 inches), and was healthier in the coole air of the fourth plantation. The number of cutling made during the month was 6071. The number of plants, cuttinge, and seedlings on the 1st June, 1865 was as follows:-C.succirubra, 14,350; C. Calisaya, 61; C. micrantha, 2004: C. officinalis, iucluding varieties, 34,050 ; C. Yahudiana, 5092 ; making a total of 55,557 .

\section*{Socteties.}

Thirst Natural Hestory.-The following are xtracts from the report of the Carators on the scarce plants distributed this year by the Botanical Exchange
Club, and which are notable on the score of critical Club, and
Ranunculus psendo-fluitans, Newbould.-In the new edition of English Botany, Mr. Syme (who places it under R. peltatus along with \(\mathbf{R}\). filoribundus, Bab.) mays of his, it is a "very remarkable plant, and may be a inclines to think. Professor Babington unites it with R. heterophyllus, with which it agrees in the weak collapsing leaves; but in other respects it approaches R. peltatus, or rather R. floribundus, and is very possibly only a state of that plant induced by growing in running water. Iu habit it closely resembles \(R\). fluitans, but has the segments of the leaves shorter, much less rigid, and less parallel, the stamens longer than the head of pistile, and the receptacle hispid." Mr. A. G. More sends us a supply of specimens from the neighbourhood of Dablin, and writes: "The plant seems as well marked by distinctive characters as any
other of the British Batrachian Ranunculi except fuitans, circinatus, tripartitus, hederaceus, and cenosus. To the general habit and appearance of \(R\). fluitans it joins the floating leaves of R. peltatus. Its submerged leaves are long and very flaccid, whip-like, and much coarser than in any of the others, except fluitans. In the streams of Ireland it appears to be not
unfrequent, and to take the place which \(\boldsymbol{R}_{0}\) fluitans occupies in England.
Viola intermediate between Birta and odorata.-Mr. . R. A. Briggs sends from Limestone, in the neigt living and dried examples of a Violet, with the following charactern:-Habit of growth resembling that of V. odorata, the root-stock widecreeping (in one of the specimens a foot long), and when luxuriant sending ont stelons which bear tufts of leaves and flowers; petioles covered throughont with short stiff deflexed hairs, at which is longer than the poduncles; leaves dull green and hairy all over above, paler and similarly hairy all over bereath, the largest so much cordate that there is only a narrow sinus left between the basal lobes, the point blunt, the crenations more than twice as broad as deep and densely ciliated; stipalian cilions few and very short; peduncles weak their ciliations few and very short; peduncles weak slowder, the upper part with only a fow scattered hairs, the lower part more densoly hairy, the bracts linear and slightly gland-ciliated, placed generally below the midale of the peduncle; sepals oblong, blunts cituated blue (lesg purper third of their edge, petals purplian base of the and white, the upper and central pair about equal, a quarter of an inch across, the lateral pair each furnished above the base with a tuft of white hairs the lowest one three-eighths of an inch across, obovate narrowing gradually downwarde, distinctly emarginate, marked within with eight or ton branched purple line the spur mave-purple, alightly hooked conspicuously exceeding the densels ciliated calycine appendages anther spur curved, blunt, four to sir times as long a broad; ovary rather pointed, furnished with a few
spreading hairs. Somotimes Mr. Briggs has found tbe dowers scentlem, or very mearly so, and at other times rather strongly scented. At Thirsk, even when the living specimens were first apened out in the backet in whic hey had then sent from Plymonth we could not detect ny seent at all. Mr. Briggs eays that "The calcureous and hirta plentifally." We have not been able to identify it precisely with any of the wumerous intermediate French forms described by Jordan and Borenu. Jiols Curtisii, Forster ; \(V_{0}\) asbulosa, Bonenm-Specimens ranging here have come before as this jear from Malahide, Co. Dublin (A. G. More), the Kerry coant (Dr. D. Moore), Neweastle, Co. Down and the athore of Lough Neagh, near Shanes Castle, Co. Antrim (Rev. W. M. Hind). Mr. More considers the Malhhide plant, Which has cometimes all purple and sometimes all
yeliow fowers, a mere form of V . trioolor. It scemas quite clearly shown now that both thie purple and yellow flowered plant bave the terminal lobe of the atipules sometimes tnothed, as is a'so the mane with the montane V. lutea. Such being the case wo do not see that there is any important character to rely upron to separate these perennial-rooted const onaly from one another, and would concider them to form nn intermediate link connecting tho typical tricolor and typical lutea
Stellaria ulipinosa.-Mr. J. T. Boswell Syme senda a eeries of this plant to show the change which taker place in the leaves as tho year advances. The specimens hive are in sets of three, gathered in July, September, and October reapectively. Whitat in the July examplea the leaves are asssile and barely narrowed below, in the October ones the upper leaves are distinctly spatbulate October ones the upper leaves are distinctly spathanate
and in some of the lower ones the laft becomes a distinct petiole.
Spergularia, -With regard to this genus Mr. More writes: "The uavally recerved names will again have to be chauged. In a recent monograph Dr. Kindherg has identified his Lepigonum neglectum with the Spergularia aalina of Presl's Flora Cechica. As this is the oldent called, whilst the L. salinum of Fries and Kindberg is to receive the new name of L. leioppermum, Kindberg. Again the name of L. rupentre will have to he amigned to its oldest claimant, Brazilian plant, and thus we are led to adopt Lebel's manuecript name of rupicola
for ours. The two species have been recently dencribed for English Botany Supplement in accordance with thete views.

Sanguisorbe officimatis, hat been found by Mr. More in some plenty on the banks of Lakes Cullin and Conn, in Mayo. It is new to the West of Iroland, having been known previously only in one Irish Station, viz. :by the Bann, in Antrim.
Circaa intermedia.-Mr. Whittaker sends upecimens from the neighbourliond of Matlock, in Derbyshire, all of which have thin cordate leaves and conspicuously winged petioles, but only some of them the setacsout bracteoles which are regarded at characteristic of \(\mathrm{C}_{\text {. }}\) alpina. Itjis not recorded as a plant of the Trent

Polycarpon tetraphyllum.-This, though now considered as confined to the Channel Islands and the south-west of England, is recorded on old authority from the neighbourhood of Hull. In the collection o the late Mr. Hailstone, of Bradford, a portion of which specimen of the true plant labelled as being from this locality, with a ticket in the handwriting of Mr. Brunton.
Sison Amomem.-This is admitted by Mr. Babington as a Scotch plant, but rejected by Mesarr. Wahoon and Syme. A specimen in Mr. Winch's collection at Now castle, from a field pear the Hiruel Loch, Berwickshire, is the true plant.
Viburnum Lantana.-Noted by Mr. J. G. Baker, last May, in a station where it is not unlikely to be truly wild, a hedgebank near Leven 13ridge, Cleveland, North Yorkshire. Tuis is the only scation in the county with which we are acquainted where it seems more likely to be indigenous than introduced. It bas been found by the Rev. A. M. Norman, in Durham, in a hedge near Sedgefield, but he considers that it has most likely been planted there.
Verbascum nigro-pulvernlentum, Smith.-Mr. Whittaker sends from smith'e original station, of Hellesdon, Norfolk, examples of this plant, gathered by the Rev. Kirby Trimmer. The following description is made partly from thene, and one or two pointa are taken from
the English Flora. Stem about 2 feet high, panicled above with erecto-patent brauches, bluntly angular, thinly cottony throughoat, the groandwork shining
porplishobrown. Leaves noft in texture, blunt at the point, bluntiy and irregularly crenate the upper surface dull grey with a thin covering with down and the veins conspicunus, the lowar leaves large, stalked, not more than broarly ovate, the apper ones cordate sessile, or even a little clasping. Spike interruptedly panicled below, long, loose, both pedicel and calyx densely cottony. Corolla bright jellow, measuring nearly half an inch acroes when fully
expanded; stamens densely hairy with violet-coloured hairs, shorter than the slightly hairy club-shaped stigms. Pedicel at least trice an long as the calys

Much like V. floccosum, from which it differs by its less woolly stems pedicels and calyces, less woolly and
crenate leaves, longer pedicels, and by the colour of the hairs of the stamens, which are white in V. floccosum. There seems to be no question that our plant is identical with one that is well known and widely diffused upon the Continent, the V. Schottianum of Schrader, the V. nigro-floccosum of Koch, the V. mixtum of Ramond in De Candolle"s "Flore Française." The Norfolk specimens agree well with the plant of Wirtgen's Fasciculus, No. 43. It is probable also that the \(\overline{\mathbf{V}}\). thapsonigrum of Withering is V. collinum Schrader, V. seminigrum Fries in part ; and the V. nigro-lychnitis, of Babington, the V. Sehiedianum, of Koch: all three being hybrids between V. nigrum and the other species,

Gentiana germanica.-Sent by Mr. A. G. More from the neighbourhood of Tring, both Bucks and Herts. The result of the examination of a considerable series of specimens from different parts of the Contipent, is a conviction that the presence of a stalk to the capsule, which has been regarded as a mark by which this may be distinguished from G, Amarella, is valueless as a diannostic character. It is sometimes present in the small-flowered G. Amarella, and in the large-flowered G. germanica every variation may be traced from a barely perceptible stalk to one half an inch in length. Plantago Timbali, Jordan.-Sent by Mr. H. C. sown Clover. Probably not uncommon, but very easily passed over as ordinary P. lanceolata.
Neotinea intacta, Reich. fil.一This is an Orchidaceous plant which was added to the British Flora by Miss F. M. More, who gathered it in May last at Castle Taylor, County of Galway. There is an account of it
by Professor Reichenbach in the January Number of by Professor Reichenbach in the January Number of figure. Only some half-dozen specimens have yet been gathered. It is not very closely allied to any previously pecies, but was formerly referred by Lindley to Aceras. It is a plant of Asia Minor, the Canaries, Northern Africa, Greece, Italy, Spain, Portugal, and the South of France, so that it
Ireland is of great geographical interest.
Potamogeton nitens, Weber. - This is a species new to Britain which has been fonnd by Dr. Moore in Ireland, and Mr. G. E. Hunt in Loch Ascog, in Bute. It has been fully described and figured in the Journal of Botany, plate No.33. Of the previously known British species it resembles P. heterophyilhm most, but may be readily known by its clasping and broader-based low eaves and peduncles scarcely thickened at the apex.
Polystichum Lonchitis.-Both Mr. Embleton and Mr. Richardson bave sent specimens which unquestionably belong to this species, from a station in Northum berland, the exact locality of which it is not thought desirable to print, which is within 100 yards of the sea level. We are not aware of any other English locality
which brings the species clearly within Mr. Watson's which brings the species clearly within Mr. Watson'3
Mid-agrarian Zone. That in the county of Durlaam is at least 300 yards higher.
p. angulare.-Mr. Richardson sends also a characteristic example of this, which was not previously known clearly as a plant of the Tyne province, fro
Cauledge woods, near Wooller, Northumberland.
Ophioglossum vulgatum.-Gathered by Mr. J. G. Baker last summer, on the Hambleton Plateau, N.E.
Yorkshire, at an elevation of fully 350 yards above the ceallevel and in the Super-agrarian Zone.
Equisetum trachyodon var.-Mr. A. G. More sends from the banks of Lough Cullen, Mayo, a specimen of an Equisetum, which differs from the typical trachyodon by its looser sheaths with weak green teeth.
Chara alopecuroides, Delile.-Mr. More sends a sup. ply of this very distinet species. He finds it only in brackish water, in the saltworks of Newtown, Isle of Wight. This 18 also new to Britain, and was described and figured at plate 9 of the Journal of Botany, but the plate hardly does justice to the habit of growth of
the plant, the spikes being much more bushy than they are represented.
Introductions.-The principal plants which come under this head which we have to notice are Camelina sativa vera, fields at Fozford, Mayo (A. G. More); Trifolium elegans, roadside at Harton, Durham. Centaurea solstitialis, in a Lucerne field at Cleadon, Durham (J. G. B.), and Setaria viridis, feld at Kenilworth, Warwickshire (H. Bromwich).
Entomological: Sept. 4-F. Smith, Esq.e, V.P., in the chair. Mr. F. Bond exhibited some luteresting varieties of Fidonia atomaria (a moth remarkable for of the opposite sexes), namely, a male and female, both exhibiting the ordinary colour of the male, and another pair with the ordinary colours of the female; also some specimens of the common butterfly, Gonepteryx Rhamni, namely, a male having portion of one forewing coloured as in the female, and a female with portion of one fore-wing coloured as in the male; also some specimens of the rare Ennychia anguinalis. Mr. McLachlan exhibited some rare Neuroptera from Loch Rannoch, namely, Fshna borealis, Sialis fuliginosa, and two new species of Phryganeidæo. Professor Westwond mentioned some peculiarities he had observed connected with the development of the Ailantus silisworm. Mr. Dorville exhibited a specimen of Caradrina cubicularis cally on the pader aurhee of the
remarked on the great abundance of Chelifers which he had observed this summer fixed on the limbs of the common house-fly. Mr. Baly mentioned that in the neighbourhood of Aberdeen the common wasps were
extremely abundant this summer. A letter was read from Mr. Stone, giving an account of the epidemic which has attacked the nests of wasps in the centre of England, whereby vast numbers have been entirely destroyed, so that scarcely any of the perfect wasps have been seen during the summer. He had also noticed that the earwigs, which on the other hand had been exceedingly numerous, hed attacked many of the wasps'-nests and devoured the larvæ. Professor Westwood read a letter from a correspondents in which it was stated that vast numbers of ear wigs had congregated in the cover of a bee-hive and destroyed the larvo. Mr. F. Smith stated that he had not observed a single wasp or wasp's nest
whilst collecting Hymenoptera at Bournemouth. Mr. Stainton exhibited some pods of Epilobiam montanum, attacked by the larvæ of Laverna subbistrigella. Professor Westwood gave an account of the Exhibition of Economic Entomology and of Insect Products, opened on the 15th Angust in the Palais de l'Industrie, at Paris. Mr. Kirby exhibited a dwarf variety of Polyommatus Alexis, measuring only \(8 \frac{1}{2}\) lines in the expanse of the fore wings. Mr. Stevens exhibited portions of a collection of insects just arrived from Damara Land, South Africa, including several rare species of Goliath beetles. Mr. Bond communicated a notice of the occurrence of vast clouds of winged ants around the steeple of St. Morris' Church, Coburg, which had been mistaken for smoke, and had occasioned great alarm among the inhabitants ; and Mr. Wormald stated that he had recently observed the same occurrence about the spire of St. Alban's Abbey. A notice was also communicated of the poisonous effects of a species of black gant on horses and mules in South America, as well as Sir Gardener Wilkinson's account of the poisonous fly named Zebub in Upper Egypt.

\section*{Notices of Books.}

Manual of Geology. : By the Rev. S. Haughton, M.D.
F.R.S., Professor of Geology in the University of Dublin. London, 1865. Pp. 360.
This little volume comprises the substance of 15 lectures delivered at Trinity College, Dublin, and "is intended as an introduction to the more systematic chemical history of the globe we inhabit, the constitution, so far as is known, of the superficial aad of the deeper portions, as well as "of the surrounding atmosphere, are made the subjects of discussion with reference to the capabilities for existence afforded to the inhabitants of this planet. When oxygen was absent, for instance, we cannot conceive the existence of living creatures; and there is reason for believing that, below the granites, the earth's composition comprises sulphur, but no ozygen.
The composition
mechanical origin by deposition from the formation of the various slates, sandstones, and limestones, with their associated minerals, are the subjects next treated of. In the third lecture the formation of nodules is considered, and allusion made to their value to the agriculturist, as for instance in Herefordshire, where a barren red sandstone is rendered fruitful by the nodular "corn "stones, which
yield, by atmospherie disintegration or by the skill of yield, by atmospherie disintegration or by the skill of
the agriculturist, carbonates of lime, magnesia, and iron, to aid the otherwise poor soil.

Geological time and the length of period required to deposit the 20 miles thickness of strata that constitute the crust of the globe, form the subject of the next lecture. We need scarcely say that no very satisfacsory conclusions are arrived at concerning this difficult subject.
The relative abundance of the various groups epochs is next considered, in connection with which an outline of zoological classification is given. Tocks
re the systematic account of the various latter the author propnses to classify according to the prevailing fossils, thus: Malacozoic, Ichthyozoic, Saurozoic, Mastozoic and Anthropozoic, according to the and lastly the existence of Mankind. The consideration of the geometrical laws that influence the forms of plants, animals, and minerals, forms the subject of the seventh lecture, wherein are also treated of the geometrical laws to which some of the instiucts of
animals are subject, e. \(g\). the formation of the cells of the honev-comb. The following chapters are devoted to the history of the creatures that have lived at Farious times upon the earth's surface, from the Foraminifera up to the Mammalia. Space will not
allow us to follow our author through these intereating chapters, which, however, we recommend specially to the notice of such of our readers as are desirous of obtaining some knowledge\} of fossils and of their relations to existing creatures; more arlvanced students illustrated to see the subject so well epitomised and original woodcuts. The reader who expects to find
peats and the gravels, with their remen is said upon the subject in the for litule or \(2 \times 1\) nor are some of the more recent discoveries, such of the Eozoon or the Archæopteryx, even "The upper palæozoic period," says Mr. "might as well be denominated the age. the age of fishes," and yet the determination
plants is, from the imperfection of difficult a matter, that it is with reluctancem the subject. In be induced to give an exists, or we are eren tertiary period less facility which often leads palæo-botanists astra principal forms of fossil vegetation are notic boniferous period is attributed to the larg of carbonic acid in the atmosphere in thu: at present. There is an Appendix to the fossil plants, which should receive those proficient in the geometry author asserts that the leaves plants or their scars are in whorls, and are leaves of the whorls above and belosy this is what happens in most
and whorled-leaved plants at the
we canot agree with Mr. Haughton that arrangement is indicative of a lower positio scale of organization than is the alternate arrangem of leaves, Such questions, to quote our mithr
sneering remark, "must be left for the considentin of those acquainted with the secrets of Creation

In the concluding lecture the reader will ind a , summing up of the evidence derived from the fossils of the various epochs, and an account of the theories of Lamarck, Darwin, and others, which mon for their object the explanation, so far as is posib the life history of the globe. In connexion
subject we cannot forbear expressing our reg Mr. Haughton, for whose ability we have so h respect, should, because he differs in opinion some other naturalists as to the mode in whic Creator has fashioned his regulated their successive appearian, Crentor, or at least lead others to iufer that t His constant and presiding presence mouldil history of the globe."

\section*{fforists' \(\sqrt{ }\) Flowers.}

Wril jou kindly give me a little space in your Heale, in reference to his criticisms (see p. 942) upou the Corstal Pazace Dahlia Show. First, he comphins of a falling of with respect to Dahlias, flower in former years. With regard to quantity, I may mention that we have not the number of exhibitors which we had some 10 or 15 years ago. Nearly all our best amateur cultivators live close to London, and the perations of the builder, have in almost every case driven them out of the field. With regard to quality of bloom, however, I maintain that the late show was a
good average one. As to the absence of the stands of Mr. Turner and Messrs. Saltmarsh, I may state that Mr. Turner has ceased to show Dahlias, and that Mesars. Siltmarsh but very rarely exhibit at our metropolitan chows.
Your correspondent considers the alteration of the date on!which the Show was to have taken place to have been a mistake. I, on the contrary, think that it was a wise Show would have interfered with that held in Scotland and both exhibitions would have been thereby injurionsly affected.
I quite agree with your correspondent in his wonld be first-rate. A reference to your Paper of some months ago will show that such was the fact.
With regard to the seedlings of the present year, your correspondent describes Marquis of Winchester as
ine of the best. The judges appear to have thought 80 too, for they awarded it a First-class Certificate. Your correspondent adds, "nest comes Mrs. Savory; ""
well, the judges awarded this a First-class Certificate abo, but in doing so I am of opinion that they strained a point, although I willingly admit that it is clean and attractive. How, however, is it possible to compare this flower with Umpire, which your correspondent has done? I believe that there are no two Dahlias more Fotally distinct than these.
From what has been stated it will be seen that the jolgen and your correspondent are on this occasion the second class flowers, however, he says, "the decision of the judges gave room for anything save eulogistic possible that the judgment displayed." Now it is just may be correct. It is however at variance with the combined judgment of all the principal growers
that were present, in addition to that of nary judges engaged upon the occasion.
Chang, which took aspecially to a flower named -while many really fine flowers were passed by Yellow Triumph as one of the latter. Chang, according to moy notes, is an immense back-row flower, very showy, flat, and somewhat coarse as shown-hence the award of a Second-class Certificate. It is added, comerespondent that will be useful in its class; and your correspondent may take my word for it, that upon every occasion on which he shows 24. Fancies equal to
Clang, he will invariably, see 1st prize awarded to his exhibition.
Mr. Heale neat alludes to the innovation of allowing forgets, however, that the Crystal Palace Exhibition is not that of a florists' society. The Palace people cater for the public, not for the florist; and offering prizes to me that they have a right to dictate their own terms, Another reprehensible practice, it is argued, is that of allowing seedlings to be exhibited along
with named flowers. Why not? If the grower has, the saving purchase, good fortune, or close attention to means let him have the advantage of it; for if it Le an advantage, most certaiuly he has deserved it I quite recollect that the old Metropolitan; Society of followed, allowed this the paren or nearey and that note in bis mistaken, when he says that every scledule of lings along younger days forbade the showing of seed The green wamed flowers.
improre green baize background mentioned decidedly of cut llowers I do not regards plants, but in the case wing it.
hat is reference to uniformity of atands, I admitt that they shall be so, both most socioties stipulate that that where they are not, the judges should be inotsucted to disqualify not, the judges should be

\section*{Tbe sptaty.}
"A FEW days ago we copied (sars the Qlobe) from the Glasgow Morning Journal a piragraph reporting the The proprietor of the ebop, writing to the same journal some days later, Bays :- 'Since the notice of the invision of my shop by bees the annoy ance has coutinued, though I have smoked the premises every day. Yesterday, the young woman who keeps the shop had to shut ap and prone to use their sting Indeed I was myelf afrid during the afternoon to enter the passage leading to the back shop, and the public ontaide had difficulty in noving along, owing to the swarms of beee, which,
ound the door and windows, were literally in clouds round the door and windows, were literally in clouds. In spite of the free use of brimstone they tricd to force After I hemser through the keyliole and shutter-bolt holes. was opened, but in two bours the enemy had full possession of the premises. I closed and smoked again, which finished the work for that day. This morning at balf-past 7 I opened as usual, but before \(90^{\prime}\) clock I had to run with all the skeps, mugs, and plates of honey out of the shop into a back store, and to plug up every hole through which air could penetrate. While so engarged I was attacked by the bees, who stung me through my
cap and veil. To-day I again smoked the sloop, which cap and veil. To-day I again smoked the sloop, which sunce the ren
We have not met with the paragraph alluded to shaving already appeared in the Glasgow Morning Jown il, but thabstance of it is apparent from what follows in the extract from the second letter written to the same journal, which we bave just quoted. There is nothing very remarkable in the attack of bees on honey or sweets, wherever, or whenever, access to such strikes प8 as being most noticeable is that of the attack on persons in and about the place and neighbourhond. We have had most determined invasions of our honey room, which is situated in the basement of the house, although the bees have to come round and descend a considerable distance to reach it. If inadvertently left open for only a very short time, the pioneers of the foraging party are quickly about the epot, and but little further time will elapse before the onslaught is made in qood carnest. The thousands of bees flying in
and out of the passages, and the roar kept up by them are frequently causes of intense alarm to passers by, but we have never known a single weapon used by the marauders on such occasions. They are usually too intent on their immediate object to resent even tolerably rough treatment. In the case which occurred at Oban, the insects must have been infuristed by the fumes of the smoke, and we strongly suspect that they were beaten and knocked down by the perspt to pitch about individuals at such times for temporary rest; probably the fears of the latter construed so harmless a proceeding into one of assault, and by their violent action rendered these peaceably-disposed robbers positively
The eagerness with which bees will pursue their attempt at spoliation, when once fairly incited to the work, is marvellous, as is also the rapidity with which they appropriate the spoils if means are not taken to prevent them. After the attack has been cosed, every crevice is diligently tried and explored. It is also extraordinary how long afterwards they remember the occurrence, and tenaciously cling to the spot, ready to take advantage of any oversight.
This brings us to the chief object of these remarks At this trying period of the year it is very importan that the bee-master should be extremely careful to avoid leaving about any hives, combs, or diahes used in the deprivation of the honey harveat. bees may educated to rob, and in an apiary where tay any honey which may be present, an incessant attempt at plundering other hives will prevail. With Atrong colonie there is little damage done, except a considerable but the weaker stocks stand but a poor chance, and are very frequently destroyed altogether.

After such a remarkable season as the one just passed away, when for the last 12 weeks little or no honey has been stored, and many hives are reduced to starvation point, there is more reason for being doubly careful to avoid anything which may tend do excter daring the working hours of the day. Even feedin becomes now, if necessary, an evil, onis to be carried on at night. Having many hives to attend to, we bave tried giving foo the bees become excited in the extreme, and all the stncks in the apiary, whether fei or unfed, partake in the excitement. By feeding at night this in to areat extent avcided. It is also our night this is to a great extent avectis made of much belief that food supplied at night is made of much greater real service lo for fature use
It is well now to contract the entrencen, particularly of the weaker stocks, which gives the wees greater power to rcsat these attemets cesse, the entrancea may bu somewhat enlarged, as we believe a tolerably free admission of air, provided it is without draught, to be
conducive to bealth generully and to freedom from
dysentery in particular. We would aloo again strongly dysentery in particula. We would aloo again atrongly inspect their hives. Within the last few days we bave inspect thoir hour toch wo we well provisioned with soeled food, to be almont completely destitute. Hives that were not previously inspected from a conviction that they were perfectly safe for the winter, are fuund to be almost at the point of starvation. Therefore it is that we advise immediate inspection, and a liberal supply of many pounds to each hive that may require
Foeding Bees.-I am marprised at the quantity of rood whioh a strong hive can convey down from a bottle efeeder in a single night. Having a large glase similar to that reemmended ly you at page 870, and it held \(4 \frac{1}{2} 1 \mathrm{~b}\). It was placed over the hive at fi P.M. and was perficety empty when looked at the following morning, at 8 welock. This I have repeated three or four times with similar renults, and I believe I may have to thank you for being the means of aaving my only two hives from death hy starvation. Wm. Short?

\section*{Garden Memoranda.}

Woonstock Pari.-Travellers in Ireland should not lose the opportunity of suring this jutcresting place. the rail the proper atation to get out at is Thomantown. Hill and vale, wood and water, form the chief features of the landscape from Thomastown to Inniatiogue village which atretches mont romantically frum the banks of the river Nore, up a very ateep accent, to thic lodge gate at Woodetock. A well-made carriage drive
of moderate length leads in a very direct way through the park to the manion.
Variou important works have recently been going on here, and in carrying them out Mr. MeDonald, the gardener, has very judiciously kept tho natura character of the plare carefully
garden,
Given
iven an elegant Grecian style of house curton en a magnificent landscape, strit hing tar armanh for the landscape to be most appropriately connected? or, in other words, what foreground is to be given to the picture? Obviously a mere flower garden would not be sufficient; a mere mass of flauntinge culour wiahd mot do atreaks of brickduat and Kilkenny coal do in winter, True, a lawn of green Grase and a few treee and shrubs judiciously placed would certainly not be out of character. Pat then there is abundance of material of that description too. The problem has been solvel by placing in close proximity to the house a winter garden, so planned as just to admit of the introluction of
sufficient flower to enliven the seene withont marring the general effect. This garden is connected with the house by a how parapet wall of granite, the stone of which are remarkahly well cut ly native workmen. The garden consists of four sunk panels, with piece. The designs in the panels are etrictly or the introduction of ines ana and harulinus are hrubs. Dwarf Portygal Laurelr and Liurustinus ar extensively used, and what may be called the frnmework of the picture consists of horm and edping to the latter The horizontal line is here and there broken by handsome upright-growing shrubs, which serve to enlighten 30 strictly formal a design,
It is not, however, this new winter garden, beautiful 4s it is, which will most attract the attention of isitor to Woodstock, the netural lawn with ite noble arboretum is the grand feature. The general contour of the ground is eminently fitted for displaying to advantage the beauties of the numerous and costly Conifers which adorn it. Looking from the bouse across the winter garden, to the left of the parape wall is a beautifully-made croquet ground, are below. To the right of the winter garden the ground ascends with an easier slope, till the view is interrupted by a number of full-grown specimens of Pirns Hartwegii as large and as hardy as the common Sentcu Fir. On growing singly splendid specimens of l'ines, Cypresses, Cratægus, Liquidambar, and other things all of which contribnte to make up an interesting arboretum. Conspicuous annong theee, and forturately standing in worth going to Woodstock to see. The outline of this tree is perfect. It is conical in shape, the branches lengthening by the pasiest gradatio downwards; the trunk is tapering, and shme height of the tree is 42 feet. Diuus insignis, when of the size which it has acquired here, is alco a very fine tres, to which in habit and colour it is diffiruit to find a rival. Preea cephalonica, Thnjopais borenlis, Cryptomeria juponica, Cupressus funebris, and a host of other Conifers, are also all large and handsomes a "queer doctorini"" it may be mentioned that a called of Pinus Gordoniana, nome 15 foet high;'showed symptomes of approaching death. So far gone was it that itm
consignment to utter oblivion was determined on, when
Mr. McDonald, like a wise husbandman, obtained leave to "dip about it and dung it"-the result is that if it should ulcimately die it will not be before it has shown unmistakable signs of reviving life. All around what appeared to be a sapless and lifeless trunk, are numbers of green and healthy-looking shoots bursting forth, some of them being already 6 and 8 inches long. The appearance which this tree presents is highly curious,
and, in a physiological point of view, highly interesting. and, in a physiological point of view, highly interesting.
Let us, however, leave this part of the grounds, and let us take a view of the rockery and Araucaria avenue. These two are mentioned together because they are near each other. The rockery is placed where it ought to be, in front of a precipice, and consists of large blocks of stones thrown up into brokeacliffs and low scattered masses. Here, growing plentifully, are Osmunda regalis, and many other of our more admired native Ferns, together with Stonecrops, Saxifrages, \&c. Over one of the mimic cliffs Linaris Cymbalaria hangs in Spirea filipendula adorns the crevices with its delicate pinnately cut leaves, while on the summit of another mimic cliff are several plants of Pampas Grass. Some of the miniature valleys are even made to assume a subtropical character by the introduction of few tropical plants.
The Araucaria avenue will byoand-by be a grand affair. It consists of a long straight vista as seen trom the windows of the house in an oblique direction; a very it is planted on both sides, at regular distances apart, with what are already fine examples of Araucaria imbricata. How grand will be its appearance when the plants have attained the size of the giant already described!

Leaving the dressed ground, we plunge into a ravine and thread our way through what would almost seem to be a primeval forest-not, however, without rugged
walks, revealing here and there vistas of picturesque beauty. Here we get a glimpse of the noble riverthere of a cascade tumbling down the rugged rocks on the opposite shore-and now we reach "the cottage on the cliff," embowered as it is in most umbrageous seclusion, and overlooking a tangled ravine, a hundred feet or more in depth, a perfect labyrinth of rock, tree,
bosh, Fern, and Moss. How often the interior of this cottage is scoured in the course of a year would perhaps puzzle the lady who acts as major-domo to tell, but it is certain that everything shines as white as the lawn of Autolycus.
There are yet many interesting features about Woodstock which must be passed over lightly, such as a very neat terrace flower-garden on one side of the house, the grounds near the gardener's residence, \&c. Enough,
however, has been said to furnish some idea of the however, has been said to furnish some idea of the
general character of the place. One view, obtained general character drive as one approaches Innistiogue, returning from the house, however, deserves notice The river is seen winding down the valley, with many picturesque hills both right and left. The village, with its ancient-looking bridge spanning the
river, is partially revealed, reminding one of the river, is partially revealed, reminding one of the
rumbling brig on the Scottish Devon, the old bridge of Kelso, or the far-famed Dunkeld. J. D.

\section*{Miscellaneous.}

Profits on Mushrooms. - Recently, at the Sheriffss Court, Red Lion Square, before Mr. Humphreys, coroner, as assessor, and a special jury, a compensation case, "Inglish \(v\). the Metropolitan Railway Company," occupied the Court nearly the whole day. The claim was for \(716 l\)., in respect of premises and business as a nurseryman at Kensington. It appeared that the claimant, Mrs. Inglish, widow of Mr. Inghah, who had
carried on the business for years, was a Mushroom grower, and had a number of beds. The railway had taken possession of the ground, and a loss had been sustained. It was stated in evidence that the profits on Musbrooms amounted to from 100 to 150 per cert. One witness said if \(50 l\). were expended in twelve months, or perhaps in six months, the sum realised would be 200l. Several witnesses were called on both
sides, and the assessor, in placing the case before the sides, and the assessor, in placing the case before the
jury, remarked that the profits on Mushrooms had no jury, remarked that the profits on Mushrooms had no for the place, the jury could compensate the claimant for the loss of the business, and also in reference to the profits on Mushrooms. The jury eventually assessed
The Diet of Worms -
the fact, that the earthworm persons are not aware of the fact, that the earthworm really does live upon
earth. It is sometimes stated in popular works on zoology that the worm picks out portions of leaves, Grass, \&c., and devours them ; but this is quite a mistake-the earthworm lives upon earth. It must not be supposed that it assimilates the mineral constituents of the soil; its gastric and biliary secretions dissolve the decomposing animal and vegetable matters which are invariably contained in rich soil, and it is these which are assimilated. The earthworm could not live upon earth that had been burnt and deprived of its organic constituents. In a similar way the arenicola, action of the tide, gorges itself with that substance, and extracts the matters which it contains fit for nutriment. More frequently, nowever, the "lug "lives in the rich
clays of creeks and saltings which abound in animal and vegetable matters. It is worthy of observation that a very large quantity of earth or sand, as the case may be, has to be gorged before any appreciable amount of nutriment is extracted; at the same time the swallowing of earth is an assistance to the worm as it burrows in the ground, inasmuch as large quantities of material are thereby removed from its path and ejected behind. The appearance of those curious little masses of digested earth on the surface is thus caused, by means of which the earthworm effects such wonderful changes on the surface of the ground, tarning up the earth, burying the stones, and producing a fresh and fertile soil where formerly was a barren waste. The mode in which the earthworm swallows the earth is somewhat carions: its pharynx is extremely muscular, and provided with an internal muscular tunic, which acts within like the piston of an air-pump ; anything to which the mouth is applied is thus sucked in and passed on by the action of the muscular walls of the pharynx and cesophagus. There is no doubt that worms do an immense deal of good by their feeding on the earth; and as to their biting the roots of plants and shrubs, as is sometimes said of them-why, it is all nonsense. They could not do it, if they wished, as they have no teeth; they are quite satisfied with the earth, and if it is freshly manured, they like it all the better. It is this last fact which brings them round the roots of trees, and has made some people suppose that they come to bite them; whereas they really come after the accompanying manure. E. R. Lankester, in Science Gossip.

\section*{Calendar of Operations.}
(For the ensuing week.)
Now that we have had rain enough, all'sorts of evergreens, if not already done, should be planted. Any sbrubs or trees considered too tender for our climate should be planted in as warm situations as possible, in order that their young wood may get well ripened.
The stronger-growing Roses may be at least partially prused in order to prevent winds from swaying them so as to affect the roots. Tender Tea.scented varieties in beds in cold places may be taken up and put in thickly by the heels in a sheltered place, or receive some kind of protection where they stand. Laying turf and other ground operations may still be proceeded with.

\section*{flower garden and plant houses}

All walks and drives should now, if not already done, have a thorough cleaning; this will carry them through till next May, or nearly so. Let lawns be well rolled, and receive a good mowing close on the heels of it, which will keep them in repair for a long time to come. Camrlisis.-Plants started early last spring will soon be again in flower; therefore these and others should be well attended to with water
Cinbrarias.-If mildew is troublesome, dust with sulphur the moment the pest is perceived. Forward plants may require a shift, and if so, use a rich compost for the purpose, consisting of good fibrous loam and welldecay ed leaf-mould, with a proper admixture of silver sand. Let the plants be placed thinly on the shelves on which they stand, and as near the glass as possible. Fumigate occasionally to kill green fly
Japan Licirss.-As soon as the bulbs are sufficiently matured, which will be known by the decay of the leaves and stems, they had better be repotted; not that this is of importance at present, but it will economise space, and prevent the operation being neglected until after they have made fresh roots. The soil in which they have been growing ought to be entirely emoved from the bulbs, and the latter divided as may be thonght proper, for there will always be found about, the crown of the parent some small bulbs, which may be placed in 4 -inch pots. If the ripening has been complete, the roots will not be troublesome : but if not, there will be found a quantity of fresh roots remaining. Whan such is the case, leave them to themelves for some time longer; never pot while it is necessary to cut or break the stronger roots, bat strip your fingers through them, in order to remove those that are decayed. The pots should be just sufficiently large to receive the bulb and strong roots adhering to \(t\); give a moderate watering to settle the soil, and place them in a greenhouse or cool pit. They will equire no further attention until the season begins to excite vegetation, when they must be regularly attended to. Water as soon as you see signs of growth, but
sparingly until they bave made leaves, \&c., to draw up and give off moisture.

\section*{FORCING GARDEN.}

Cuctmbers. - Stop laterals, and remove even main shoots where ton much crowded. Keep up a bottom heat of about \(85^{\circ}\), and a moist atmosphere. Let the top heat range from \(65^{\circ}\) to \(70^{\circ}\) by night, and from \(70^{\circ}\) to \(75^{\circ}\) by day.
Pines.-We may now look forward to every day dawning duller and later than its predecessor, and as the power of the sun declines, so also must our artificial temperatures be somewhat decreased, and in exact accordance with the latter must the amount of moisture be regulated. Take care that the latter is not so excessive as to condense in quantity upon the glass, \&c., close up the laps, or run down into the hearts of the plants. To prevent this, evaporating troughs should be more sparingly filled. In clear
ravorable weather, when a greater quantity of air
can be admitted, the amount of moisture man
slightly increased. Watering should be done great care, and syringing
mornings of very fine days.
Vinss.-In the anxiety to keep haneen fruit sufficiently dry, be careful to avoid the even in that direction. If the houses are the ertes by fire-heat, the berries will shrivel, an bad, with regard to some kinds, as decay, the pari, opposite management. It is easy to comprebead is wanted; but to regulate the atmosphere to
requires more care and judement that be found. If not already done, let all is geeeral be devoted to cleaning the sasbes of the differen tures, pits and framea included, from the dorent accumalated upon them during the summer. conduces more to the health and well-being of to occupants than the free admission of light.

\section*{HARDY FRUIT AND KITCBEN GARDE}

Storing fruit and root crops, whoeling man chief work to be done here. Alterations, if any also be proceeded with while the weather is Cauliflowers.-Let those under handlight all the air possible, protecting them only fros rain, and very cold winds. The lights should be closed during severe weather only, and the tops shen be tilted in wet; but during fine mild wenthee should be lifted off and set on bricks, to keep clean. Watch closely for slugs, and check their rmm by timely applications of soot. A little finely clean coal-ashes is an excellent thing for covering
surface of the soil between young plants of any tin

\author{
SATURDAY, OCTOBER 14, 1865
}

IT is only in Norfolk, under the leadership of a public-spirited landed proprietor and of an energetic tenant farmer, that the landowners of the country have seemed to realise the position in which they stand to the cattle plague. Even a subscription of 500 l , however, towards a county insurance societs, most imperfectly represents the degree in which a great landed proprietor is interested in the subject; and the offer of a noble lora to add a certain per-centage to all that his tenantry may recover from their own mutual insurance associations on account of losses, shows a mach truer appreciation of the state of the case.
We often hear of the proprietor and his tenant ailing in the same boat, and it is perfectly true that both are dependent on the judgment, pluck, and money of the latter. If the farmer's capital be destroyed, it is plain that the rent-producing fund is lost; and moreover, if he loses either head or heart under the disaster which has befallen him, it will be the worse for his landlord as well as for himself.

We learn that the diseasc has attacked the dairy herds around Guildtord. Many a small cowkeeper has lost his whole stocir, and in one instance a herd of 108 cows, the property of a tenant farmer, has been wholly destroyed. He had, however, like most of his neighbonrs, insured his stock on the first approach of the plague. A London cowkeeper, who holds land in that district, found a month or two apo that there was something wrong with his cattle in his town cowhouse, and so he brought the whole herd bodily down by train to his farm ; and in this way it is believed that the plague was introduced.

As soon as it appenred, the tenant farmers at a public meeting, attended also by many landowners, resolved to distribute the burden hy a mutual insurance association. We understand that the energetic man who led the movement was wise enough-foolish enough as the event would make some think him-to say:-"It is aseless, gentlemen, to make our case one for charity, or beg round the countr for assistance. We must buckle-to and bear the brunt ourselves." And though the thing is hardly credible, we are told that this independence so offended county gentlemen that men who had brought their notes for 203 . and \(50 l\). towards the establishment of a County Association kept their pockets buttoned. Was not this, however, just the spirit that should have been encouraged \(P\) This speech, and still more the response to it, for 20,0001 . Worth of oow stock was that very day insured, and the yuantity has since been doubled in the petty sessiunal division of Guildford alone-this spreech showod that as to both their judgment and their pluck the tenantry were sound. It is for the landlords, however, to remember that neither of these without farm oapital will pay the rent. And we think that it would have been in every way a wiser thing if, instead of leaving the tenantry around Guldford unaided in their diffioulty, the landowners of the district had undertaken, in the very outset, a share in that burden whioh must inevitably fall upon them in the long run

This calamity has shown us that there was a risk hanging over the farmer and his capital which neither party to the bargain at all contempluted when the agreement to pay so much rent for so much land was made. It is in equity, therefore not in charity, now that this risk has borne such disastrous fruit-that the proprietor of the land should feel moved to share the burden which has fallen upon his tenant.

And even upon the grounds suggested by the lower motives, it may be wise to undertake at once the share which properly belongs to him-for the burden will ultimately fall the heavier for the want of timely effort. And the plan of adding a percentage to whatever sums are reoovered by a tenant from an insurance company seems the best way of maintaining undiminished in efficiency that whole agency of head and heart and capital on which the owner, the tenant, and the labourer alike depend.

Diseased Mile.-The investigations upon the mioroscopic charaoters of milk taken from animal suffering from plague, or recovering from it, have developed results which are anything but consolatory to the consumers of that article of diet. In our last observations upon this subject we took occasion to suggest the importance of avoiding the use of milk, containing morbid elements, as food for children. And where any doubt exists, some substitute should at onoe be employed: a mixture of eggs, well beaten and diluted with thin barleywater and sweetened, would be palatable, nutritious, and harmless. Microscopic examination at onoe sets the question of purity at rest, but such a test is not at all times at hand. In its absenoe the more simple domestic operation of boiling may be employed, not as an absolute test of perfect purity, but as a guarantee of wholesomeness. No very bad specimen of milk can be boiled without underguing coagulation, or curdling but at the same time, milk containing morbid elements in moderate amount will rot show any indication of impurity under this treatment. Boiling is at any rate the only chemical operation that can be adopted generally, and it should invariably be had recourse to as some slight protection.

It will be in a certain sense interesting, if not reassuring, to our readers to be enlightened upon the subjeot, and for this purpose we quote from the notes of recent microscopic examinations.

For the information of unscientific readers we may premise that the eloments that will be alluded to are the milk corpuscles or cream globules, pus cells, which are the principal constituents of the matter of abscesses ; and granular cells such as are found in fluids exuded during inflammation According to the preponderauce of the two latter products will be the murbid condition of the milk.
No. 1. Milk from a cow dying of the plagae.
The fluid is thick, yellow in colour, and when poured into a vessel does not show any froth upon the surface; the occurrence of froth upon the surface of milk is said to be an indication of its goodness-not a trustworthy test, however, as many experiments have proved.

Under the mioroscope this specimen presented
the following oharaoters. Milk globules small and clustered together; numerous pus cells are intermingled with the milk globules, and give to the flaid its viseidity and colour. Specific gravity, 1020.

No. 2. Milk from a cow after a few days' illness; two quarts are obtained at each milking.
The milk is thin, but shows froth upon the surfaoe when poured into a vessel.
Under the microscope the milk globules are few in number, small in size, and scattered. Pus cells are present, and also a few granular cells. Specific gravity, 1024.
No. 3. Milk from the case No. 1 a few days later ; the cow now gives 4 quarts per day.
Under the mieroscope pus cells and granular eells are present in addition to the milk globules. Specific gravity 1024.
No. 4. Milk from a cow suffering from plague in a severe form. Only a small quantity can be obtained, which is thick and yellow in colour, and has a peculiar animal smell.
Under the microscope this specimen proved to be oharged with pus cells and large granular cells.
Some further examinations of cream from diseased milk have been made, and in most instances prove that some morbid elements still remain in it. Sometimes the quantity is less than in the milk and sometimes greater, so that the hope expressed in recent observations on this point cannot be longer entertained. All that
can be said is, that cream from diseased milk is sometimes free from morbid elements, but at others it contains them in abundance. This circumstance shows the absolute necessity of a large number of examinations being made before any conolusions of a general nature are drawn.
It may probably be objected that when animals are badly affected or dying of the disease, the quantity of milk obtained would be too small to make it worth while to use it; this is doubtless true in certain instances where the secretion is almost arrested, but many animals suffering from the malady very severely continue to give a considerable quantity of milk, from two to four quarts per day, and as they improve in health the seoretion is gradually increased, without a oorresponding improvement in its quality. The next examples are seleoted from cases that were improving when the milk was examined, or otherwise were considered to have perfectly reoovered.
No. 1. A Datch cow recovering eight days after the attack, gives 2 quarts of milk per day. In this speoimen the pus cells are very abundant, the granular cells are fewer in number. Specific gravity 1023.
No. 2. A cow that has recovered from the disease and gives 4 quarts per day.
A portion of the milk aiter standing for some time separated into two parts; a quantity of floccuient deposit falling to the bottom of the vessel, and leaving a serous looking fluid at the top. The deposit under the mirroscope consisted of pus cells and oil globules, and the fluid altogether is more allied to pus than to milk.

No. 3. A cow that has been well since August 20. This was a very severe case, and the only one that recovered out of 20 attacked. For some time past this cow has been giving 9 or 10 quarts of milk a day.
The fluid looks and tastes well. Specific gravity 1028. Under the microscope a few pus cellis and granular cells are to be observed. These morbid elements are not sufficiently abundant to render the milk unwholesome, but their presence in the milk of an animal so long after recovery is very significant.
At the very commencement of the ontbreak we called publio attention to this point, but the general adherence to a notion that somehow became prevalent, that the milk ceased to be seoreted as soon as a cow was attacked, establishod a feeling of security, which these investigations prove to be false and dangerous.
Oar readers must decide for themselves as to the proper course to be adopted under these oircumstances. There is no disputing the facts that milk highly charged with diseased products is ohtained in considerable quantities from cows at different periods of the attack and after recovery. It is also true that in many sheds there are no cows left excepting those that have had the disease ; some of these animals are giving mevon or eight quarts per day.
There is no positive evidence of injury having resulted from the conaumption of the milk given by these siok and convalesoent animals, but still inflammatory produets are not preeisely, what one
would select for part of the daily dietary. There
are only two ways out of the difficalty, either to have all the milk sold examined by competent persons, or what is more simple, to do without it for the present altogether.

The very interesting announcement of a discovery of rich phosphatic deposits in North Wales was made by Dr. Voelcker at the recent meeting of the British Association at Birmingham. A phosphatio limestone, and a bed of black shale largely impregnated with phosphate of lime, has been discovered by Mr. Hope Jones, of Hooton, Cheshire, whilst he was searching for other minerals in the neighbourhood of a place called Cwmgynen, about 20 miles west of Oswestry. The phosphate deposits occur not far from the clay-slate and lead-bearing districts of Llangynog. The rocks are Silurian, of the Llandeilo series.
Mr. Hope Jones has traced the phosphatic beds a long distance ; they are continuous for about two miles.
The blaok phosphatio slate or band is fally 18 inches thick, and the limestone bed from 8 feet 6 inches to 9 feet. The vein which separates the two deposits from each other is 14 to 16 inches wide, and filled partially with white pipe-clay, caloareous spar, and copper and iron pyrites.
The following is Dr. Voelcker's account of these two beds after 10 or 12 complete and a large number of partial anelyses of the various minerals :-
"First, we have the non-phosphatic clay slate, forming the strata of the locality. In most specimens, I found the amount of phosphoric acid too small for quantitative determination; in one specimen, however, I obtained .28 of phosphoric acid.
"In the next place, we find a bed of black shale, 18 inches in thickness. This shale contains variable quantities of phosphoric acid. Towards the summit of the hill it is not nearly so rich in phosphate of lime as at a lower depth. Thus, in specimen No. 3, taken
from a higher level, I find only 24.07 of phosphoric from a higher level. I find only 24.07 of phosphoric
acid, equivalent to \(48 \frac{1}{3}\) per cent. of tribasic phosphate acid, equivalent to \(48 \frac{1}{\text { pan }}\) per cent. of tribasic phosphate
of lime; while in another sample, taken at a lower level, I find as much as 29.67 of phosphoric acid, which is equivalent to 64.16 per cent. of phosphate of lime.
"The mine at Cwmgynen, as worked at present producess speciinens containing from 54 to 66 per cent. of phosphate of lime. Blocks weighing above 1 cwt ., I am informed, are now worked out, which resemble intimately the specimen in which I find 64 per cent. of phosphate of lime.
"Lastly, we have to take a glance at the composition of the black limestone beds. The darker-coloured varieties contain graphite, and are richer in phosphate of lime than the lighter-coloured specimens. In the latter I find only from 10 to 20 per cent. of phosphate
of lime ; in the darker varieties from 30 to 35 per cent.
lime; in the darker varieties from 30 to 35 per cent.
"The limestone beds contain a good deal of carbonate of magnesia ( 5 to 8 per cent.) On burning, they furnish a lime which is very valuable for agricultural purposes ; for the farmer who applies this lime to his
land not only supplies it with lime, a constituent required by every description of agricultural produce, but also with the still more important mineral constituent of plants-phosphoric acid. It is scarcely necessary to observe that it is chiefily the phosphoric acid in bones which renders the latter so valuable as a fertiliser; nor need I specially dwell on the fact that the application of this newly-discovered phosphate of lime is, in point of fact, almost equivalent to 'liming' and 'boning' in one operation.'

\section*{on what does the value of a ton of ROOTS DEPEND?}

I Reppur, on the mode of their administration, We should never. forget that every ton of roots contains about 9-10ths of a ton of water, consequently, that we give to the animal which consumes only roots nearly a gallon of water,( 10 lb. ) with 1 lb . of dry matter. What would our groom aay to this in our nag stable? "Gripes and pargation" would be his repls, especially if this water had a teinperature nearly to the freezing point. What a tax upon the urinary organs! These are the very means used in the hylropathic esta-
blishments at Malvern to reduce the bulk of some overcorpulent Alderman or bon-vivant, whereas the object of every farmer who wishes to see a profit, should be to increase bulk and prevent purging or diabetes. One can hardly wonder at the immense losees suffered in stock by "blowing" (windy flatulence) and scouring caused by cold watery masses abstracting heat from the
stomach and chilling and cramping its powers. Well may they rejoiee in Thorley and other producers of stimulating and warming cattle food to counteract such mismanagement
In wet and frosty weather, alternating, and a wet bed to lie upon, we cannot wonder that a thousand tons of Turnips have hardly produced a cwt . of ment. Roots are food or physic, according to circumstancen, therefore, as physic, we know they cannot conduce to the farmer's profit. The best estimators say that with nimals ansheltered it requires 150 lb . of Turmips to
 it takes 150 lb . of Turnips to mak
substance in the pound of meat.
150 lb . of Turnips contain 135 lb . of wateo gallons), and as our Scotch friends often water is the bullocks 150 lb . as a daily allowance, we can weli the: stand how wisely they act in adding to this dry mix it all in due lves of our pulpers and chaffeciver. \&c. A certain amount of moisture is indisen seeing that our own bodies contain 76 per cent. of \(r\) : although our forefathers once believed that we were solid, and that Harvey's theory of the circulation
lood was a great error.
But to return to our Turnips and their profise conversion : it is quite clear to me, from long prace. our observation, that we must by steam powe: m. straw or hay mixed into fine shat eighth of an inch), pulp our roots, and so intermir mass that it may suit the digestive organs, and: be converted more profitably and with leas tikto animal's health.
If 1 d. per lb. in the price of meat makes to farmers a difference of 1000 l . per annum, surely. same rule will hold good in regard to the cos. producing this meat, and the cost of a few tons of co or the steam engiue can be of little comparatin mportance.

I know that many considered I was wrong a extravagant in advocating the use of a fixed ongin a farm of 170 acres, but if that farm is to it ought to do, and as mine of 170 acres does, 37 f meat, and over 600 quarters of corn anuually, much of that corn and cake, with abandance of rectin are to be properly prepared for the animal's stomen pulpers, pumps, cake-breakers, threshing machine, fo The farmer who makes 3 lb . of meat where his ne bour only makes 1 lb . produces, of necessity, times as much manure as his neighbour, and moon course grow more of corn and everything else. Goim the barn door only for money is a poor affair, es at present prices; we must look to corn and combined, and, if the latter is to retarn to us a good p for our root and green crops, the present generaily and crade system must be changed. We must han covered yards, straw cut up for litter, no dang hep but rich unwashed manure carted at once to the lanoa sort of fold in the dung cart. When we consider the of the daily excrement of our animals 13 parts out \(0: 11\) are urine, and in that urine is all the soluble portion. the manure; that there is more dry matter in the han in the solid manure; and that this dry mato the urine is worth 17L. 4s. per ton, while the dry when tables in my book, page 412)-well may the firm preter the oshoep fold to the open farm-yard manet so much being wasted and washed awsy from th latter.

The success of the farmer is essentially a Jandlort? question, for he is sure to participate in a tenan: of land-consider before you buy, whether it wr not be more profitable to you and your terit: to lay out some 20l. an acre in drainage, ings, machinery, \&ce, with a suitable resue mer
a former of capital, rather than to purchase a mun extended estate, the purchase money of which mion leave nothing for landlord's improvements.

Tenants possessing capital a dated farms with inferior residences, once sricis to a primitive condition, which is fast before a more advanced, intellige race of agriculturists. If landlords d class teuants, they must also take and requirements. I know so many wealt Who buy farms as a mere matter of investin only at the present rentals-and that their tenants are backward,
capitalled. The acres of this c \(\rightarrow 0 n\) the contrary, the extension railways and factories, is cultural area. The on ancrease the produce

Cumlt, Companies, aided by talented advisers, of whom velave plonty of thus derive a safe and permanent : incerest
According to our talented friend Denton, we want 100 millions or so to drain our 20 millions of undrained sruses, and I could res, covered jards, machinery, and a number of other necessary and profitable improvenents dut would require and absorb some 200 to 300 milions But where is the money to come from? not the eame quest it not come from somewhere to the extent of 400 millions !-daily increasing
The fact is, farming is in its, mere infancy, but the time is coning when, owing to that great man Liebig profesion, unclouded by those dark mists of doubt, Fint of knowledge, and prejudice, which prevent its proftab of existed, showing a good percentage, several of by millionnaire acquaintances would, I am convinced, Lave invested largely in them. There is nothing more ertainly profitable than agricultural improvement.
ubled, and the farmer's profit increased to 208 . or 23 s . per acre, where now it is only half that amount, or even less, and in too many instances a loss of capital.
Money to any amount may be got on mortgage at per cent.; but how can people invest in Agricultural Improvement Companies which purchase lands with their own apital, and invest their own capital in improving such lauds. Under such companies, tenants with capital would be too happy to hold land having long leases, with the is the way to bring into the agricultural arena a flood of tenant capital and intelligence.
have gradually diverged from my ton of Turnips, bot after all, the profitable consumption of them depends upon the questions I have mooted. It is of no
uise to talk to men about more stock, more machinery, and the other requisites for a more profitable meat and corn makiug. They say, look at these buldings; my landlord cannot or will not help me and do his slare. I would readily pay him 6 per cent. for covered yards, c., but he won't hear or it, so that after all" may "on what does the value of a ton of roots depend."
The importance of producing our own food abundantly and cheaply is, to my mind, a paramount question. everybody is anxious about cotton, bat if the question were put to the British public whether they would rather go without their clothes or their food for a montb, I fancy corn would carry the day against cotton, The ever-recurring appetite demands our best from foreigners as to buy our clothing. That we have the means of producing the former with a profit practically convinced. To lend our money to foreigners se enable them to compete with us in corn growing insteal of employing our people at home is a grea finatcial blunder. I am surprised that our sharp "getters up" of public companies in the City have not they lave tried, but found bucolic stolidity the that even for their powers of persuasiou. It is not a slight rebuff that can repel their advances. J. J. Mechi, Dct. 5.

\section*{THE CATTLE PLAGUE.}

\section*{We continuc to publish the letters of Correspondents on this}
1. About 32 years ago I became Curate of Mapowder in Dorset, in the following way. The living thens
belonged to Mr. Shipley, who desired Dr. Gray, Bishop of Bristol, who ordained me, to nominate a curate for him. I received a kind letter from the Bishop, asking me to take the curacy, adding, "Mr. Shipley is very give to the eed he was, for he gave and land added to this amounted to 200 l . per annum. It was the best preferment the Bishop ever bad to give away. Being great many cattle died of it. The seeing this piague. A precisely the cattle died of it. The symptoms were periodicals; the pest is known in the vale of Black an exceedingly hot one. It was not imported, but locally generated by cold dewy nights succeeding and cous hot days. I had about from 32 to 34 haifers around mea, I kept both eyes open, and watched my Fine. Several of them were taken ill, and some Fere very bad. I did not, however, lose one of my cattle. The tongues and cyelids were much animal ; the vas about to was swollen also, as if was evidently a through and through inflammation. It was plain that immething must be done, and done quickly too. I allouse, bled them sharply, gave them 8 oz . of Epsom with nitre, bran mashon, a little hay, and chilled water days nitre, I stopped the inflammation, and in a few dops the animals were able to go to Grasi. I continued
to watch the herd, and as soon as I naw the ejes heavy and tearful, I bled the animal and stopped the painful
suppuration. I remember that some of the anımals had a short hosky cough
I may mention that while I wa at Mapowder, my Kind friend the late Mr. James, steward to Lord Beau-
champ, and father of Mr. James and Charles James, the champ, and father of Mr. James and Charles James, the
distinguished graziers, introduced hir fint Hereford sire, which he bought of Mr. Tarner, of Nolse, Hereford. It is some years since I sam their beautiful herd. I sball soon have an opportunity of seeing them, Lave been summoned by one of the young ladies to in made to her when a little child I will then report apon the herd.
Though some of the above is what the doctors would call "a foreign sulstance," yet I trust the Eiditor will allow me to express my gratitude for the kindness of the late Bishop Gray, and also of my much esteemed riend, the late Mr. James.
In conclusion, I believe that this plagne is contagious, but I also believe it may be locally generated. The weather suited to it is excessive heat followed by dewy and cold nights. Lowlands are more likely to produce it than hill tops, because the dews, which sre equal to the solar heat, are heavier in valleys than on high grounds. Perspiration is eatopped, the kidneys are chilled, and in due time suppuration finde its way There is, however, one caution I must give an regarde bleeding. You must feel the pulse. To bleed when the pulee is feeble is death! If you should not discover the illness till it hus assumed a typhoid form, pou must use stimulants. Iron and camphor in equal exhaustion. It is the best remedy for dogs in dis temper (which is a typhus fever, and inflammation of the whole mucous membraue of the animal), when suppuration takes place. This cattle plague is said wo typhus. I may mention fover (both are alive now), James and Jane Gosnay, of Gussage St. Michuel's, Dorset, about 35 years ago, by giving them drop after drop for hours (for swallowing was agony) of port wine They were given over by the doctor, and were nearly black in the tace. I should think that port wine would be a good stimulant as well as styptic for animals suffer ing from this typhoid plague. W. F. Radclyffe, Tarrani Rushton.
 Which were at tirst supposed to be a heaithy lot.
Profesisor \(\operatorname{CimonNBS}\) said, when he was at Crown Point a fow days ago, Captamn Lambart had told him that he could take
 bad not had the disease at all; others were in the eurly stage
of the disease, aud others there were which had had the Mr. Harver said all he knerr about the disease was that when they had a cold day, and there had been onlignle sumingive
the animals were attacked, instead of 25 animals dyivg, only were found dead on the follow ofng morning. They were
originally herded together. Unfortunately the cattle bad died,
go they could no longer herd with the sheep, and the only so they could no longer herd with the sheep, and the on
thing ho had observed was, that after a cold day a minc smaller number bad died. He had tried various changes of
diet, as
different thiting 12 on Linsed, 12 on ootmeal, and had tried different things, but they found that it did yot make any
difference, for his shepherd said all those had died. The diseas
wne was going through the whole, and there were a certain number
which recovered, and which were not attacked with the disease agau. When he went smong the flock, the shepherd was
able to point out to him the sheep which would propably recover. The antmals had been on coe estate for three
months, and were worth from the best was to test whether the disease affecting the sheep, was the eattie plague or not, was to
try whether cutcle could be inuculated from shivep, and rice versd.

\section*{SOCLAL SCIENCE CONGRESS.}
[The following is a condensed report of Professor J.
paper at Sheffield on the Cattle Plague.]
This most malignant of all fevers is one of the indigenous maladies of the East. From time to time, during centuries past, it has lurked in the Asiatic and European steppes, killing slowly the rude grey oxen of the Russians, and exterminating the cattle of districts and countries to which it is usually foreign, and into which it has been accidentally introduced. Not unfrequently the active agents in the propagation of the plague have been droves of sick oxen dying on the dition. The periodic extensions of the malady in the lines of communication estabished by trade led to our attention being forcibly directed to the subject as the importation of foreign stock increased in this country. tion was established by cattle-dealers betwenn Russia and England, the murrain of the steppes could not fail to be imported. This opinion we expressed repeatedly, and even indicated that the malady would reach us through the Baltic. All we wanted was that any cargo of cattle direct from Russia should be subjected here to regulations such as those which aro in force in Austria and Prussia; but we were freely told that, until the cattle plague came, no one would be convinced of the importance of, or necessity for, reached us through the Baltic. As we are compelled to trace plagues in men and animals to devise means for their prevention, it is we wish to devise means for their prevention, it is necessary to ascertain all we could as to its cause. is certain that to the west of the Czar's dominions the plague never originates spontaneously. That is truth as much established in the minds of scientific small-pox in man, or the purely contagious character When the pox.
When I first saw the steppe murrain amongst the cows of the London sheds, on the 29th of July,
I knew that the disease must have been imported. On making inquiries we found that a cargo of Russian cattle and sheep had been brought from Revel to Hull. It was the first cargo that had yet come to us direct from a Russian port, and 14 days after a portion of that cargo was first exposed in the
Metropolitan Cattle Market the strange disense was Metropolitan Cattle Market the strange disease was
seen in Copenhagen Fields. An agricultural society in Esthonia had agreed to supply a certain number of cattle and sheep free on board a steamer at Revel last May. That society had insuperable difficulties in fulfilling its contract from the scarcity of oxen fit for the London market. The termas of agreement with the supplied free on board, fit for the London trade, buy many of the cattle did not come up to the proper standard of weight and fatness. The number supplied was short, and 46 animals were obtained from St. Petersburg to make up the cargo; but their condition was so bad that only 13 of. them were chosen by the person representing the London importers. Of all the had to be slaughtered diseased by a butcher, a fourth died in the yard before being delivered on board, and an action was brought against the English agent for the price of this animal, which he would not, and did not, pay. A fifth animal showed signs of illness on the passage, and when the cargo arrived off a Danish port a letter was sent from the London salesman intimating that "the things," meaning the cattle, should be taken to Lowestoft, instead of London, so as to avoid the doctors. For some reason or other they were afterwards landed still further from London, at the port of Hull, and there subdivided for sale at different markets. One half left Hull for London at once, and that half propagated the disease. Why the other half did not do so is of no importance to us, as we constantly find, in tracing contagious diseases; amongst cattle, that, two farmers having
bought a herd between them, the one half purchased by one man remains in health, and the other half dies. The cattle sent to London stood in the London market on the 1st of June, and some of them were exposed again afterwards for sale. They must have communicated the disease to foreign cows near them, for it was
these cows which conveyed the malady into the these cows which conveyed the malady into the
London sheds. On the 24th and 27th of June the plague was already raging in different dairies, and since then it has been widely disseminated.
Some may still think we are too positive in our assertions on this point, and there are those who charge us with want of modesty for openly asserting what we believe to be the truth in relation to the origin, pro-
gress, and prevention of the cattle plague. Unfortugress, and prevention of the cattle plague. Unfortu. this. country has been most imperfectly taught and studied. But we are asked to confess ignorance on
"that there is no existing disease respecting which
medical men would dogmatise so unhesitatingly as the mederal men would dogmatise so unhesitatingly as the plague;" and we are told "that the doctors are looked up to because they have done good work, becanse they have diminished the fatality of our human diseases, and are daily at least endeavouring to acquire new victories over nature." Now, there is scarcely a medical subject on which you would engage to find a hundred of the best men unanimous in their opinion; but we have had congresses with nearly 200 of the most
learned veterinarians in Europe, when, on the subject of the steppe murrain, no difference of opinion could be said to exist. It might be positive assertion, it might be dogmatism, that the disease was incurable, that it was also propagated by contagion, and that to diminish its ravages we must slaughter the sick and infected ; but the verdict of the best men in the world, medical and veterinary, is unanimous on these points. That verdict is as unanimous as any conclusion would be at a meeting of doctors if the subject of human small-pox was broached, and the invariable origin of this disease in contagion, and its pre vention by vaccination, were discussed. As Professor
Seifmann justly observes in his report, just published, Seifmann justly observes in his report, just published, whether we should venture to do so, considering the danger of thereby keeping up many sources of contagion. As to the curability of the disease we have had some experience during the present outbreak.
smeatment have recovered. We have treated many, and left many to take their chance. The result proves that those left to themselves have done as well as those that have been treated with all the remedies suggested from the commencement. The chance of cure depends altogether on the severity of the attack, and whenever attempts have been made to follow up a considerable number of cases, and treat the
fully, the result has beeu a mortality from 85 to 95 per cent. It is not astonishing that cures have been advertised, and wonderful
resulcs announced. In the last century hundreds and thousands of cures were advertised; and the imaginary remedies were pointed out. I do not believe in anything of the kind. I am one of those members of my profession who decline to advertise and proclaim "wonderful cures." The recovery of one or two
apparently desperate cases encourages experiments as to treatment, but, so far as our experience has gone, the prosecution of trials has resulted in loss and disappointment. From the commencement of the outbreak one of my principal objects has been to discover how we might determine before ordinary observers that an animal had the disease. If remedies can be found to prove of service, they must be applied before the changes of structure are so far advanced as to
render it impossible to restore health. Susceptible animals might, from the moment of attack, be declared, to all intents and purposes, dead. If the existence of the disease is discovered three or four days after, and even before it is detected by ordinary processes, I do not believe, even then, that its progress can be arrested. So far as my observations now extend, I believe that
from 24 to 48 hours before any very obvious signs fom 24 to 48 hours before any very obvious signs
of ill-health, such as dulness, loss of appetite,
are observed, it is possible to indicate that animals are under the influence of the malady. I have no great hopes of success from treatment even at this early stage; but all will admit that it is something to have ascertained how at the earliest possible moment sick cattle may be distinguished from diseased cattle. I cannot pledge myself that our observations are judging the symptoms. Their eyes are dried and their noses moist, yet the animals may ruminate and not display symptoma of attack. By testing the temperature of the whole of the animals, we find it rises gradually as the disease extends; at first rapidly, then more slowly, until the heat reaches \(105^{\circ}, 106^{\circ}\), or \(107^{\circ}\) -fever heat. This heat of the system could be deter it. Out of a large dairy three or four animals may be picked out that are affected.
Before entering on the proposals made for the pre vention of the cattle plague, I may be permitted to allude to the contrast offered between veterinarians and
doctors, by which it is implied that we have done doctors, by which it is implied that we have done
nothing to acquire new victories over Nature. On former occasions reference has justly been made to the manuer in which, under a proper organisation, no less deadly \& disease than glanders in horses has been well nigh banished from our cavalry stables. This has been victory over Nature, but it has been due to the early
slaughter of sick and infected animals. When small. pox ravaged our flocks in 1862, treatment, inoculation, and vaccination were resorted to, until I called the farmers together and told them how to kill out the disease. In three weeks the malady was stopped. This year, too, small-pox broke out in Sussex, and as the disease was no less imported than the steppe
murrain, the early slaughter of diseased animals at once extinguished every trace of the pest. Having ascertained that it was the true Russian plague which had reached these islands, we hesitated not to advocate the means found most efficient abroad of preventing contagion by killing the sick. We were at once met
of the atmosphere. Government said it on wose to control the progress of the malady, and I sverter tion of cattle disease. At once steps for the prem diffuse useful information on the disease, and civic authorities, railway and steamboat a
\&c., to aid. Local insurance societies favour. I how the fallacied various country maxie: justice of my remarks has been ampl? dicated by th fortnight back fortnight back, at Northampton, I spoke importance of a Government cattle ins indemnity from the public purse, and endeavour to slow that, if Government guided in this matter, it could meet
the case, and secure control over stoc
suppression of so virulent a malad raging. It is true that there are other measure adopted, and gross abuses to be correct measure not to be advocated is directing the enem of veterinarians to the cure of the disease. Al this course, and there is an end to any Briteby the plague may be banished from is pher of typhere ellow fever, of human small-poz and cholera, an doctors who have gained victories over Nature gained no victories over these maladies but adoption of preventive measures. Animals
dealt witl differently to men, and a hundred of cattle plague might be quoted to prove that to \(k\) is to save the lives of thousands and tens of thowam To spare the knife implies propagating and the malady.

\section*{A LONDON COW-HOUSE}

Meeting in a crowded London street the other 2 a friend who had been lately travelling through mem
English counties, we asked if he had been nominstadi serve, as he was well qualified to do, on her Majempt Commission of Inquiry into the Cattle Plague, of whid we had just heard? His reply was, that he had boer in and out amnng stock farmers within the past mont all over the Midland Counties, and he had neither me nor heard of "Rinderpeste;" that he belier
rinary surgeons and agricultural journalists had, for their own purposes, manufactured this rumour of disaster among herds; that they had th done much greater injury to the meat trade, influence on the markets, than tenfold the actur immediate mischief of the disease itself, if that had be borne in silence; that a medical man of his acquain ance who had had ten cows attacked by the diseneso bi actually cured six of them; and that in short the en calamitons enough for many London cow-keepers, min mere local fever, the product of close accommodtain bad air, and lack of drainage in the

\section*{cow-houses.}

A few hours afterwards we walked through s Lond cow-house, situated in the lower part of a Belgranil Mews. It was 25 feet wide, 12 feet high, with opeais windows on one side, and large openings in drained domn affording perter into a trapped sem The cows \({ }^{3}\) stalls were seven feet wide for couples; 2 the arrangement of troughs for water and for food all that could be desired.
accommodation at a glance, for the honse masempe the It had been swept clean by the plague! Here dent example alogetber of our friend. accommodation was perfect-the drainage, air, au and treatment inad been sweet, and clean, and gout and yet the "Rinderpeste" had cleared out the and most intelligent in the trade-taking the excitement, carefulness, and anxiety whic rumours of its attacks had produced, and effort to keep it at a distance from himsel.
And nothing is more curious in the attacks. The cow.houses pent up in the ver of the metropolis are said to be entirely free fro while animals in roomy suburban byres, and at pasture, have been struck down ies are not virulent attacks. The worst examples ard where, a livelinood area rented and the food but in the model and even fancy cow-housla aristocracy. The pet herd of Miss Burdend Lord Granville's large estabishmard to cl and wholesome treatment, furnish the instances of extreme
Srosnarday se'nuight Lord Sydney, rience as bad as any of them. Ho park 11 beasts, born and bred ou the eatho 0 homestead possibility ? vall and made plantations. Moreorar, any kind lad been brought into
here on the 7 th of August one amimal wa here on thed under the liands of a veterinary , to whose place it was remuved. In time all hers became affected; nine have died and two
first bullock was seized, no
eovered. When the are recovered. Whected in the neighbourhool nearer \(1 n\) three miles. The conclusion to which Lord Sydney , that thagh the malady is no doubt contagions, must nevertheless often arise from atmospheric
me which there is no control. Be this, howcuses over whichs we cannot in tho least assent to our Tre, ad's ilea that the prevalent fear is unreasonable, or :.nt tive datality of the disease has been exaggerated, Le:ravilled through the Midland Counties.
savel to and \(\mathrm{frO}_{\text {, wherer }}\) watters of agricuitural (:xample of another kind for an illustration, althonzh 1. Iaswids of mowing machines exist and are employed ance in 50 miles of a railway journey in July that we see Ay wher mower than the scythe at work. There are nithistanding that not one in a thousand of them have then yet attacked with the disease, or that an agricm:rral tourist with the "Rinderpeste" is most properly a frishthul thing to every stock-owner in the country.
It has nearly decimated the dairy herds of London; It has nearly dithont reason that County Associations, insuring solely against the risk of this disease, are crerynliere being established. And more injury will done to the meatess policy advocated by our friend be foilowed, than though every stock-nwner in the country this new risk under which he loolds his herds as to resolve at once to insure in the nearest oflice for the purpose, and to determine, as far as possible, to keep nut of the store cattle market during the autumn. This is an injunction which is now rendered ten-fold
more imperative than it was, by the liability which sheep at length have shown to take aud carry thic infection. Near Norwich, Professor Simonds reports that at least two large \(f\) ocks have been attucked by a fatai disorder, resembling "Rinderpeste" in all its distinctive features. And within the past week even horses,
armoding to Mr. Tattersall, lhave proved to be not a a menptid.

Thisis no mere rumour manufactured by the journalist -it is a inost disastrous calamity, and too much fear of it cannot be excited. Better have trade stagnate as
tise consequence of this fear, and cousumers, dealers. ant the public generally thus be made to share the common burden, then let mere recklessness convert orer shelming plague, which shall ultimately sweep our pastures and our feeding stalls as bare as many a ondon cow-house already is,
Wherever, therefore, store stock must be bought, let the greatest precautions be observed to keep them long eunugh in careful quarantine. Every head of pur-
cuased stock ought to be kept at least a fortnight in absolute seclusion. The fields they graze should not be catered; or if the cattle must be kept in yards or thedr, the man having care of them must be considered frill of danger to all the other stock upon the farm, and not be suffered to come near any other cattle, or near any one in charge of them.
Vothing is more clearly made out than the extreme virulence and activity of the poisonous contagiou which
reems to be couveyed with wonderful facility from one phace to another. Oxford Journal.

\section*{THE ORKNEYS.}

Tur climate of Orkney is moist and mild; there are meiller such warm summers nor such cold winters as in the south and west of Scotland. In June 1861, how-
eerer, a cliild died at Kirkwall froun sunstroke. 13ut in Orleat is very unusual. A gentleman who has lived in Orkney the greater part of his life told me that he weight. The Gulf Streaun is, no doubt, the cause of

The length of daylight makes these islands desirable summer residence. I have myself read of June; and 1 have been told by a friend who lives in Orknee; and I have been told by a friend who lives in
Oriat on the shortest day he has read the Times at 4 oclock p.s. by daylight, or rather by the beantiful wilight of that region, for in winter the sun is only The four hours above the horizon.
The soil is in many parts mossy, but there is almost ererywhere a stiff clay underneath, and this, when good loam. In many places the the Moss, makes a very th be "tickled with the plough that it may smile with and harvest," ns somebody has said. With such a soil and such mildness of elimate, Orkney is likely to moistness and the withering sea breeze will, however, always make the farmer's returns from grain crops more There is tain.
mach is being pertaps no district in Scotland where so In 1814 very considerable progress had been made on wome of the larger estates in Orkney, more especially in
the Nortbl Islef, where Turnips were pretty extensively grown, and at lenst one thock of fine Cheviot menus sheep was profitably kept; but it was not untih ab me
25 years ago that thio agricultural movement began in 25 years
carnest.
l'revious to that time the sea had been the sole support of the working man. He reuted land, and paid his rent out of fish and seaweed. Leases of land were not given to small tenants, and of course no improvement was possibie. Small crofte were held oa the run-rig system, and a croft was supposed, to do its
work if it raisel some stunted Oate, Bere, and a few Potatos. The women were zenerally the farmers, whle the men fished.
It is not many years since Orkney made out of her sea-weed alone an aunual iucome of \(15,0001 ., 20,0001\), , and even 25,0001. There is a kind of sea-weed, the Fucus palmatus, commonly calleal Tancle, t.r.man up in great abundance on the eliores of the (hikneys and also of the Western Isles. From this a substance called kelp is made, valuable from the large amount of iodine it contains, and once extensively use 1 in the mann facture of saap and glass. Its value at one time ranged from 8l. to 16l. per ton, and during the war, when the
importation of Darilla from Spain was prohntited, it reached the price of 20 o per ton. Orkuey kelp alway brought donble the price of that of the Westenn leles or of lrelanci.
The process of kelp-making is as follows:-The seaweed is collected and dried, and put into a hole in the ground about 3 fect wide. A live coal is then put in, and the heap is allowed t? Emoulder. During the smouldering it is atirred with an iron hook, until in
course of time it gets into a state somewhat like molten course When it cools and dries, it is kelp. hesides iodine it contains Glauber salts, common salt, an. carbonate of вoda.
Owing to the reduction of duty on Barilla, which is both cheaper and better for glass-making, the manufac ture of kelp is no longer remunerative, and as a genera rule, kelp-making in Orkney has given place to farming
It was not until after the failure in the kelp trade ii 1832, and the establishment of cation with Edinburgh in 1833, that it occurred to some of the larger proprietors on and near the mainland, that something might be made of the sail, to balance the loss of income from kelp. Even the most sanguine could not have anticipated, that, in a few years, improved farming, and comnunication with and eggs alone to a larger sum than had ever come into the islunds from the kelp trade.
In saying a few words on the present stale of agri culture in the Orkneys, I shall take the island with which I am best acquainted as a type of the whole. It is perlaps below some, and above others, but it is a fair renresentative.
In the island of Shapinshay, which contains about 7000 actes, ouly 730 were under cultivation 15 years thriftlessness of the fariniug of these days is well illustrated by an anecdote I had from Mr. Balfour, the proprietor. His father, observing that one of his tenants was always in difficulties, though he did not pay a farthing of rent, said to him one day, that he wa surprised at his being so much in want, seeing that he had a good croft, and pail nothing for it. "Oh, Captain Balfour," he replied, "I dae pay a rent."- "Why, what rent do yon pay? He thus took shelter under the fact, that a hen wa exizible, but he did not venture to say it was puid.

Annther tenant, whose rent of 10 s. had beca reduced in successive years to 7 . length, for his innortunity's sake, allowed to sit free. This kept him quiet a year or two. but at the end of laird, who, at a loss to know what more he exid wan said, "Well, Robert, do you wish for a further reduc tion of rent?" - "Oh, Captain," he replie \({ }^{\text {, }}\) " ge 're jokine me noo ; but I just cam to say that if ye dinna big me a barn I maun flit."
The island is now in a very satisfactory state of caltivation, about 5000 acres being under the plough, although the rental is as yet only about 1500 .
The rise in the price of land is surprisin. Thirty years ago it was thought valueless, and coald be brught for an old song. One half of Shapinshay was purclaased by the grandfather of the present proprietor in 1796 for 12000.; in 1816 the oller dozen years an Slapinshay imported meal for the support of its inhabitants ; it now exports largely grain, Potatos, inhabitants; it now exprt
cattle, sheep, pigs, eags,
Any one who takes a to Orkney will see, as he sails into Kirlswall Roads, a noble mansion, which for elegance and size would attract attention anywhere and he will be at a loss to think what could mace man to build so fine a louse so far out with Mr. Ba!But if the traveller were to a walk with him over his fartate, and see how much has been done, and is still doing throngh his ene uragement and resilence among his people; it he e uld see the cheerial, indepentent, yet thoroughly respectful bearing of The world is goving well with me; I have enongh to eat, drink, and put on, and I expect to he better off still, and I
saw all this, as I have, he would be at no liss to understa d why Mr. Balfour has cast in his lot with his poople and mate has bame with them.
One plan ahopted to ebe urare the improvement of the land is to charge for the fist seven yeare a merely nominal rent-fat. or 1 s . Fer acre. For the second third seven a rcusonable rent is chargal, according to the ntate of the land. Another phan is:-A large gieoe of comparatively waste or half.cuitivate.! hand is squared off and made into tarims. Tue previous rent is a little raised, and a lease is granted lor 21 peare, on the inderstamant liat if at the end of siven years the improvements stipulated for have been carried out, onethird of the reat shall bo remitted townids piyment of the expense of them. After the first or ven yons no further temission is made, and the reat is raised 15 per
eent. each successive seven years, till an average rent be charged.
The rental of the whole of ()rkney is above \(50,000 \mathrm{t}\), and is constantly moreasing, perhaps at the rate of 2hoot, a yenr ; and the condition of the people is improving every year in consequance. In the throe hamkat kiskwall there are undematood to be deposita, in dee chiefly by the mindle and working" clanses, to the
anount of 300, (inol? Thene arc larke figures, but they cerase to be surprising when you are tollt that, at a moderute computation, \(111,(\mathrm{KH})\) head of cittle, a large proportion of them Short-horne, are exported annually. b.sitles a great number of pigs and sheep. Compare this with the traffic, not a great many years apy, when a sloup of 70 tons hurdin, mahing ten trips a-year, was found th be almost sufficient. Fifteen yeara ago bee was sold at \(2 d\). per 13 ., butter at Gd., egges at \(3 d\). a doz.2n, cows from 30s. \(152 \%\). The avernage price of two enrollds rassed in Orkney is now from 121. to \(15 \%\) "Good W'ords" for September.

\section*{Home Correspondence.}

Education.-One of the most important quastions of the present day is Education, bearing, as it docs, 50 prominently on the welfare of the rising generation The subject is surrounded with difficultion. In all chouls thero apnears to be a want of some systematic method to act upon, in order to adapt the instruction given to the calibre of the varicty of youthful intellect existing anongst a number of boys; and at the same time to fill thacir minds with matter best suited to the occupations the students will have to follow in after ife. It is a mistake to expect the same sinount of knowledge from youths of a similar age who may differ in alrilty. One may have memory-another udgment-a third application-a fourth steadiness of urpose. Now, each of these lads ponsenaing a persu iarity of character, to treat them all slike, becauce Lhey liave arrived at a certain age, would be as absar as to pace an equal weight upon several beams of equal dimensions, without considering the nature of the rees from which they were cut. In schoole, to clam the quick and slow together requires great judgment, otherwise the former may be unduly elevated, and the latter painfully depressed, to the prejudice of both. The master frequently attributes to stupidity what is merely a want of power in a pupil to catch the meaning of an explanation so quickly as his more precocious companion, though when he fairly comprelends the question he is nure likely to retain a knowlenge of the subject than the volatile youth. Cufortunately the sharp boy is ton often attended to, and the duller no glected. Many persons who undertake the tuition of youths are wanting in a most essential qualification -the study of human nature, so necessary to enable masters to form a correct opinion on individual character by which the treatment of his pupits may bo regulated. A modest and diffident lad is ften ruined by the intemperate conduct of his teacher, who forgets the trouble his own instructor experienced in making him understand what he has wot the patience to impart to the bnys under his charge. Much more might be said on the fitness and unfitness of meu who undertake the office of schoolmaster; however, the main point discussed it the Agricultural Gazette is not general elucation so mueh as the preparation of youths who are destined to cultivate the land and produce animal and vegetable food for man and bely practical part ou deducation, such as may be received at any good school, is indispensable. A thorough grounding in writing, reading, and arithmetic, with a love of knowledge impressed upon the individual, and \(3 y\) making study a pleasure rather than a task, will bo oufficient guarantees-under the blessing of God-for and more useful than of hoys with stuff that will never be of any ser vice to them, and which they really do not appreciate, having them, a it ap the occesion, and exhausted a fair only got in up firence in the exercise of memory only, to enable exanining masters to report farourably of the the progreas of the expenge of the youth's brains. It is drubtful how far an establishment exclusively for the education of furmers' sons would be advantageous to them. It is generally considered preferable to mix lads at a public school with those who
shoulders together, and interchange ideas with those minds better stored with valuable knowledre to carey them through the world than if they were kept amongst their own class and trade. A youth who wisbes to become a practical agriculturis cannot spare more time at school than is necessary to fit lim for self-instruction as he advances in years young to a class of literature, to be studied when the boy leaves school, which will provide a store of infor mation. School education is the pioneer, opening out the road, clearing away the rubbish, and showing the path to knowledge-but whether the man deliberately follows the track pointed out, avoiding the dangers and temptations he will meet with, or madly rushes on to his destruction, must depend upon himself. There is more learnt after than at school. Falcon.
Cholera and Cattle Disease. -The following paper was drawn up by the Rev. H. Moule, the inventor o the "Dry Earth System," at the request of the Secre tary of the Hereford Society for Aiding the Industrious; and the Committee of this Society-feeling the great importance of the subject, especially at the presen time, and hearing that the system has now been trie for some years past with most encouraging successhave resolved to circulate it throughout the city and the whole county. Copies may be had, gratuitously, at
the Society's Office, No. 50 , Commercial Street, Hereford; and the Committee will be thankful to any clergyman or other frieud who will undertake to have a copy sent to every house in his parish, and to cal attention to, and where uecessary, explain it. Any communication, by letter or otherwise, will at
attended to. J. Venn, Sec., Hereford, Sept.9.

Disease among Dairy Cows in Ireland.-Permit ine disease which has broken out amongst the cattle in this neighbourhood and in many other parts of the island

\footnotetext{
- Some of the most rapid and malignant cases of choler

}

It appears to be epidemical, and is chiefly confined to the dairy cows. The symptoms are : the forelegs from swollen"; the animal becomes lame, and is attended by a good deal of fever; at the end of three or four days the egs present the appearance of having been blistered and discharge a watery kind of flut, have not had the opportunity of tracing the complaint further. The whole of our dairy cows were attacked simultaneously, and the means adopted were to give each beast a drink composed of \(1_{2} \mathrm{lb}\). of Epsom salts, 1 ounce nitre and ounce sulphur, a:3d 1 lb . treacle, aud the affected part diluted with 40 times its bulk of water. Practically speaking they"were all well next day, with the exceptio of one. In this case the disease appeared to be deepl seated, the swelling was considerable, and fomentation with hot water was had recourse to, and when it broke the discharge was much thicker; in fact, matter had formed. At the time I am writing I cannot report her any better, and she certainly does not appear any worse. Her appetite is good, and we are feeding he on bran mashes, Liriseed, and sliced Turnips. Should any of your correspondents have met with the disease, Channel would be greatly obliged if they would give us their experience. Joseph Earps, Home Farm, Newotownbarr

The Potato Disease. - In a valuable paper, contributed to the Royal Agricultural Society's Journal for 1858 by Jeffery Lang, M.D., great stress is laid upon what the author considers to be an established fact, namely, that the "disease" never attacks Potatos that are buried more than four inches beneath the surface or colluded to, not only by numerous examples but by experiments upon healthy tubers buried at different depths, and fterwards watered with water which had been previously in contact with diseased Potato tops. In all cases we are assured that, after continuing the experiment for some time, the disease was induced in Potatos buried at a greater depth than four inches invariably escaped uninjured. Upon this is based some valuable hints on Potato cultivation. If this notice will induce ayy of your readers to examine cheir Putato fields, with a view to disever whether a deep layer of soil is a
suffieient protection against the dreaded "blight", ny ohject in writing to you will be attained, X. I. Z.

Albert Vetrbinary College: Oct. 10.-Theory and Practice of Agriculture. -Professor Colminan thas at this institution. The following are extracts from his lecture:-
In introducing myself and the course of lectures which 1 shall have the honour of delivering in this institution on the
"Theory and Practico of Agricuilura," it is desirable that I
explain to you what I believe can be conveyed in such a enurse, and what is beyond our rach. Agricuiture is an art,
differing from most arts in this, that the vaikiations of prectice

 fings, he will bo fit to undertake profitably the manuzement of
land. It is true, undoubtedly, that nuuch valuable information
 endowed with boolk-learning may become a great talker-may
discourse learneolly, and the adiniration of the ignorami,
ind on soils, manures, rotations, de. ; but put such an ne on a
farm, teli him to arrange his labour, plan rutationt, and
adapt his live stock to the food he has gruwn, aul above all to produce at the year's end a percentago on the capital, and
where is he? Well, ho may bo there, but the balance will be practical, and som much depends upon field work, the question may be asked, what is the Rood of lectures? Why not this practical teaching? If farming were a toere practical
art, if we had reached perfection in that art. if oue
practice prevailed, and variations wore not innumerable practice prevailed, and variations were not innumerable, ture in ascence as scientific tritha, and true sclence poin Science is as it were the key by which we unloek the
machinery that lias hitherto teen hid from our gaze a and are enabled to trace the movements of the various forces
by which the figures on the diai are put in motion. It follows, hen, that an inight the law by which plants and animals ive and move and have their beligg, must lead to an intelligent
and improving practice. Endowed with this knowledge wo
shall no longer be content to follow blindly in the footateps of others, atumbling every now and then, in the semi-obscurity, upon some improverent as it were haphazard. We shall be confidence than befire, because we shall be enabled to under-
stand the reasons for particular ssstems, and at the same time be in a position to suggest improveneent. For a long period the union of science and practice was not a happy one, and
lacked that mutual respect no necessary for the entente
\(\qquad\) d t d
menting in his laboratory obtained cortain resalit upon which he generalised, and, never thinking that he might have on

[The Professor thell proceeded to develop the pilatis of the course of lcetures which he propos this institution.

\section*{Dockina: Prospects of the Farmer.-At the Rard} annual meeting of this Farmers chent pro LeICESTER spoke as follows that I cannot you upon meeting under propitious circumsta have harvested the very worst Wheat crop recollect in this district, the nampronitio and carly and severe frosts in the sprin our prospects for the future Wheat cro bright. It is very desirable that in thi county we should get our
the 6 th of October, and there is very little pared for the Wheat crop. Our Barless on lands were burnt up, and on all lands they got up. Yet as the Barley general throughont the country durg Barle hold their own, aud those who bed as were contemptuously our Bar'eys were being drenched in the hopes of an abuudad stroyed that prospect. Our Nantic I am more and mure sitisfied pertaining to deep cultivation

\section*{ploulyuing}

Oar lightand arible land farmas in Wat Norfollk are sherefore we do not derive that advantage from price of mest which we otherwise should do. gentlemen, we are threatened with a disease So and our sheep; but I think that from the through the exertions of Mr. Read-to whom doeply indebted for the prompt and vigorous sures which were taken to prevent diseased cattle II infecting the healthy-with proper caution on piar eecape severe losses from this calamity. 'This a long list of grievauces, but that will be of service anus cren in years of abundance. Continued prosperity :suls an! difficultios we have had lately to contend nilh we linve learnt some things. We have learnt that ary-the most costly crop we can grow-is not a
necoseary item in our produce. We have learnt the seveseary item in our produce. We triw as a feeding article. We have learnt bow to ecunomise our root crop. And if we have to the roots of our plants to enable them to seek moisture in the earth, the trials that have been wive wis have not been, I trust, talking over our own affairs, but to consider what promees we have made in improving the condition froeperous at the present time, I think that I may and threal is cheap, and I think we may high apon the moral and physical improvement of our in this district. It was no uncommon thing to see a man intoxiented. But I think I ean say that for some rears I have not seen one of my iabourers the worse mork done without an allowance of beer; to get any mirke, beer there, and beer cverywhere. Now I never make any allowance of beer to any of my labourers ; I give a full equivalent in money. They prefer its, and I am quite sure that they, their wives, and thair gentiemen, that thero is no work but what can be doae better without the beor that the men are in the tototallers. I do not think that it is desirable that aquors in excess should bind themselves by a pledge, bat those who find they cannot control themselves and abotain from excess have done a wise thing in
doing so. They cannot obtain the beer that we driact they cannot obtain the light wines of Germany and France, which will quench our thirst without the drugged beer of the publican, which tends to excite their thirst and to cause excess, or they must drink the wrotched stuff which is made at home, which is
quite sufficient in itself to make any man a teetotaller.

\section*{Newcastise-At a late monthly meeting of this
Remers' Club, Mr. Weers, of Ryton, read a paper on} the storing and consumption of root crops. He said: Too ohject of this introduction is to induce members aluitted that discuss freely the points raised. It is string, and not in a house; and that fermentation, Froot, and permanent germination should be avoiled. Prot, then, for cattle-Should the whole crop be
puiled and stored, or a portion left and taken as required? For sheep-Should the whole or a portion only be atored? Second-In pulling, should the top with it, the instrument used being stuck into the Turnip to pull it up! or should a portion-say an iach - of the stem be left? Should the tails or
ronts be cut off or only cleared of soil? Storingtre they best in triangular heaps, say a base of 4 or 6 feet sloping regularly to the top? Or in
obiong ones, any width you please, 3 or 4 feet theng, covered with straw ; the object in the latter case
being to ing to provide against frost only? Or in emall heaps bide ! pened, packed close in, and covered on eacly on, either in the field as they can stand with their tops a more convenient place? I have read of the tops of sender being malted down for future use. Has any rot triangular heaps, covered and ventilated, the beat Cattle seeping them? Now to the coneumption. long troughs, a ourt-load given in cold open folde, in puilper, mired with to be sliced and given alone; or being to ferment spontaneonsly, or steamed before adided to the mass to mako the other ingredients be maker is nus? I observe that a celebrated cattle?food Tou (ean so soffering to sell cattle spice, with which Aanot the farmer prepare his owu cattle food and crop, braks? Sheep-Should they be netted on the should they have them out, and other things given
field or ous Gress? Would not sheop the thetter wit some "cover while on Turnipe in winter! L.wity, whl nut be advisable to keep the Turmip euter an pulper, the straw cutter, mill, and steamer going These, then, are some of the maliont points that infor mation upon would be most valunble at the present ime, and I believe it will be both interesting aud before you, the disoussion of which I now leave is our hande.
Mr. E. I. J. Browell said: Last year he placed his Swede Turnips against a long wall facing the north, and covered them up;with straw, and they kopt very well. He thought the food given to cattle should be reduced to a smaller bulk. In the cano of Turnips, they found that, spreaking roundly, 90 per cent. of them consisted of water. Oilcake was a very rich strong
food both for fesh and fat-forming qualicies ; Btraw was rich in the respiratory part of food, and the for mation of fat; and so far was Burloy, which perhaps some of them might be giving to their cattle this vinter. Beans approached more nearly to oilcako. It apeat experience, that they should cut or pulp the Turnips, and mix hay or straw. With them, and give
long with it a little oilcake, Beans, Barley, or brea.
Mr. Jacob Wirson did not think thatia very large quantity of Turnips was good for cattle. A. 60-stouc bullock ought not to have more than nine stones of some as a day. A while agy, ho trich the did rery well on its Some younger bullocks runving in the the large bullocks went out, the jounger ones wem placed in the boses, and in the course of a week or two they voluntarily reduced themselves to nine stones per day. That would show the siperionity of hox eeding to open places. Pulping, he believe, would be very much rehorted to this winter, and he would recommend the uso of Palm Nut menl, which had been used with considerable advantage in some parto of the south of Eugland, sud it only cost about 76.2 ton. but peraaps this weut againat pulping think other wise, as they would be driven to ito The success of all feeding consistod in a propor mixture of food. He on the south side of some dry hedge.
The Chatrman said that, as thoir Turuip crop had failed, he would suggest that they consume their own produce ; because, if they weat into other markets to buy seed and cake, they would find
it very expensive. He was one of the old echool it very expensive. He was one of the ohd chan, experience, and he never saw them in bettercondition II was certain of this -they were eating only one-half the quantity of Turmips they formerly did, and ho had no doubt that with giving them about 6 stones each a day, with about 7 or 8 lb . of meal, they would bo about 50 stones at Christmas. The expense per week was about 7s., and if they obtained 98 . per atone for beef, there would be a profit or 2 s . Hed an advance in the price of beef, he slrould bo in a worse position than the crop of Turnips had been excellent.
Mr. J. Wilsor moved a pote of thanks to Mr. Weeks. There was a point which deserved their careful consideration, especially those who farmed strong landWhether or not they could have a substitute in the way of ai crop for Turnips? He thonght they could grow Cabbages, A friend of his in Worcestershite farmed some very strong land, on which he grew a large quantity of Cabbages, producing 161. an acre. they co thought, was as good as a land in wintar, there was no reesen why they could not do so in summer. With regard to the feeding of skeep, he had for many years followed the aystem of cutting the hay for them. There was very little waste, and the sheep did very well on it.
Derbysurbe: Autumnal Cultivation.-Mr. Baker, of Kedleston, read a paper on this subject (Dr. Hitchman in the chair). He said : I propose to consider the merit of the system, first upon the advantage it afforas of making an attack upou our natural enemies (weeds) in their weakest state-and I don't think it will require any very strong argument on my part to make this apparent, as you are all aware of the fact; but we may as wel place, examine these pests immediately after the corn is cut; we then find them in a general way in a comparatively sickly state, with roota penetrating about 2 inches into the ground; but if they are left unmoleste for a week or two we shall find theon double tha depth, and it will, of course, be necessary to culti vate the deeper to eradicate them, which canuot be done without considerable addicional labour and cost, and then not so successfully as if the work had been commenced at an earlier period, as the difficultien of working out the twitch and the like increase in proportion to the depth of the cunced immediately Therefore, if the operation is mere stimming of from 2 to 3 inchos deep will be sufficient to insure being under the roots, and with the usual harrowings ec., the earth will be shak on out sufficiently to enable the
rubtiris to bo collected, and carted ofs as a foundation meading to the yaris, or to we taken to the general rubbisth heaf, of the farm to bo used with hume for Guture crops, or at an ab-orient of Binuid samure. But
 use the simim W.t' g. eat care is rearila dejeth, as if it is not worked ieep erocugh to get under the tiritch
much misehief will be dase by cittir off the points of the roots. I minst aloo state that I have hat i comni ler able experience in tho use of the fork and tianket upon very stronaly and confldently recommend this practico to your notice as the cheapeest, cleaucst, and wost satisfactory eystem chat can be adupted.
This forking eystem was ahways strongly recomHuded by tho late Mr. Pusej, as well as by Mr. Hudson, of Custenore, and others. ; and when the
fork is used mase, aarly in the sencon, the land fork is used na above, carly in the soncon, whe hac the purpose of setting the anaual woode arowing provious to the winter ploughing, and if the furg enn then be spared, I think it should be carted on previous to the ploughing, as the lamd is then in a good state to carry the carts, and consequently the dung will be pat on with comparatively litito exertion to tho team, and withont injury hy poaching the land. This will be found an immerise advantage as regardo tho preparetion for any crop that may be required to bo sown in lan fapriug, particularly on what is callod "strong land," as a simplo moufting will propare it for tho reception of eitlier 1).lis, O.ata and bills, Dills and Rape, and the like, and any of thom can profitably be eaten off with sheep in the summer, as oubstitute for a deall fallow. Shouid the lan 1 be requined for Cabbaye or roots of auy kiud, it will ouly be necessary to apply the artificial manure by hand upon the surface, and then ridge up tho land for the recoption of the seed. Here, aguin, 1 must strongly izapreci upon you the necessity and importance of carrying
on all operations conmeoted with root cultivation simullaneously. I say, ther, let us got every thing in the best powsible and most forward retate so that when our root orops are to bo put iu, with alacrity. To ensure the power of dolng his, cultivate, and, I any, duug ia the enturan ic holhor autumn cultive rilly a leioure thene of the year. Then why gollow rally a leisure thene of the year. Then why allow he fingers with indufference, ospecially in a counis where, in a general way, we have rather long wiuters, which retard early alpring of erations? D.eqend upon it, the time has come when wo must bentir mirselve and shako off what is called the hare fatuw sybtem. Why, as you know to your cost, it has becone a house old word that "Wheat don't pay." Then how cat we afford to co on paying two years' rent and tasen for one crop, and with one-fourth or a fifth of the nrable and (as is the case in some districts) in fallow? There a very strong inducement for ur \(l\) give lim matle our best and mont serious consinderaion at the presen moment, for what do wo hear outside but an outery about the probability of a scarcity of meat, which should, I think, lead us to consider how wo can beot provide for the growing meat demand in future. Lo as all put our "shouders to the wheel in this matter, and, by taking auvautige of this leisure season of the year, with the fork aud ba-ket, or
rith a comparatively superficial kkimuing, clear away the twiteh, de., inmedately after the annual weeds have well started, well and thoroughly plough the laud deeply befure the vet season of the year commences, by which the land will be put into the most favourable position oo receive a free circulation of the air, as which the full benefit of the frosts and winter weather, re so desirable

1 believe it is paselver land grow green crops sucocalaghing previous to the ridge with only one good ploughing provious ploughed in plough, and if the dung can be got eotter. And now for one moment let us consider the advantages to be derived from this autumn cinltivation, with respect to call enabing very important feature in successful root cultivation. lan atternting to clean the land intended for roots until after the epring corn was all sosu. Then with ploughs, the drag, harrow, \&c., we got off the first crup, and the same thing was repeated until the land was thought clean enough to sow. By this time we had worked away a very important week or two (or even month or two), as well as a good portion the soil becam so senson happened to be a pegetate, and of bours it dinained in a dormant state till As a natural consequence the crop was generally a defective one, and principally in conseque. I may nalso having the land ready cultivation was frequently sowed a few acres at a time, as the land was prepared, which afforded a very goo experiment upon the merits of carly, wettum, and lato cowing; and from that experienco I blrongly gele not leter than about the 20th of Apsil, and for

Swedes the last week in May. Well then, from what then saw of the advantages of early and medium root sowings I was induced to do all in my power to put myself into such a position by autumn cleaning and dunging as would enable me to sow a larger could satisfy myself I was obliged to be busy with the fork, \&c., as soon as the corn was oft the land. By that I could generally sow 16 acres with roots ridge ploughs, and one each with two double drills, and thus get over a large breadth of land almost at any time with a prospect of the seed vegetating immediately after it was sown, as I had all the natural moisture retained in the soil.

What would be a better substitute or adjunct than roots to grains? Bare fallows might be tolerated when Wheat was selling at 60 s. per quarter, and meat was not so much
in demand as at the present time, and with the defective in demand as at the present time, and with the defective
implements that we possessed formerly ; but there nan be no inducement for the practice now, as the tables have completely turned round, and we have the very behoves us to do all we possibly can to take such advantages of these things as are likely to be most beneficial to ourselves, and, at the same time, useful to
the public at large. Then let us have no more "dead the public at large. Then let us have no more "dead us be up and at our enemies in the autumn, and then by early deep ploughing put the Iand iuto such a position as to secure a winter fallowing, and thus enable us to take advantage of the best season for sowing anything that may be thought desirable as a fallow crop.

Dr. Hitchman said :I am glad to iear Mr. Baker advocate manuring in autumn. All cartage on heavy soils manure on in dry weather is a great boon, and fortunately science has discovered that the manure can be safely deposited on clay lands long before it is required by the crop. In fact, it is best there. Its ammonia, its phosphates, and all its valuable constituents are
thus preserved--imprisoned in the molecules of the thus preserved-imprisoned in the molecules of the
soil-until taken therefrom by the rootlets of the growing crop. Mr. Thompson discovered this law, and it has been confirmed by Way, Liebig, and others. I have myself experimented much in a small way, testing the absorbing powers of clay, and am satisfied that all the valuable salts are safely preserved in the soil and wili not be washed away by rains. Mr. Baker referred to ploughing deep to husband the moisture. It is a relief to me to hear so practical a man advo cate deep ploughing and a thorough pulverising of the soil for such a purpose; because I was startled to read in the Derby Mercury some observations made at the Uttoreter Show, by a gentleman whom 1. have regarded as an authority in agriculture, which, were they correct, would overturn all my ing the proper management of soil for retaining due moisture and ministering to the support of plauts in times of drought. This gentleman is reported to have said, "On his own farm he had strictly observed the land for fallows for Turnips, but to ekim over the surface so as not to disturb the subsoil, and thus to keep in the moisture." So long ago as 1701 Jethro deep ploughing, and let another be rough by insufficient tillage-then plough the field in the driest weather, you will find every fine land turned up moist but every rough land will be dry as powder." In capillary drought moisture ascends from below by wapilhary attraction, just as a piece of thread placed the moisture below, so do molecules of earth carry moisture from below upwards, provided the subsoil be porous; agaiv, a very great source of moisture in dry seasons is the night dew, which permeates the of nitrogen for the supply of the plant, but which dews could not penetrate to the rootlete of the growing Turnip on lands which are simply skinned upon the
surface.

\section*{Farm Memoranda.}
[We take advantage of the immense body of agricultural
ovidence lataly takren beforo the Hypothec Commistion at Edingurgh to

and energy
particulars are given about the agriculture of Lincolnstract
y of contract.
Lnscolisgerme Agbiculituria: (No, 1). Mr. John
Higgins, jun.-I am a land-agentand farmer in Lincoln shire. My father is the general agent and superintendent of estates with a rental of 77,000l. a year. He is also factor on Mr. Nisbet Hamiltou's Lincolnshire estates I have been in business with him for the lnst 20 years, besides farming on \(m y\) own account. The size of my own farm is about 800 acres, and I pay about 30 s. per acre rent. The periods of entry to farms in Lincoln The commence ins the autumn for sowing Wheat. compensated for the seed and labour, or he allows the incoming tenant to enter and sow the Wheat. The entry to the fallow land is on the 1st of December under the agreement; on the let of March the tenant
enters for sowing spring corn, except where a little time is given when the Turnips are not eaten off; and on the 14 th of May he enters to the home-steading
and house, which completes the entry. Leases are an exception to the rule, and I may say a rare exception. The general rule is that under strict law the possession is yearly, and terminable by six calendar months' notice in writing from either party. On well managed estates a written agreement is considered necessary; and where there is a written agreement it is usually adapted to the custom of Lincolnshire. improvements, and that constitutes the tenant' security against any arbitrary dismissal from his farm. By that schedule he is paid for his improvements according to a scale which is generally specified in the agreement. By unexhausted improvements profit has not been derived by the tenant. The rents are payable in October, six months after the entry is completed. The crop has not only been reaped, but is the property of the incoming tenant ; he has either sowed it himself, or paid the outgoing tenant for seed and labour. He does not actually pay the rent till he
has reaped the crop. The second half-year's rent is payable at the following Ladyday, which is 25th
March. Q. What are the securities which the land. lord possesses for the punctual payment of his rent -4 . The landlord is generally satisfied with the account which is given of the candidate for the farm. If ho is a very young man, or there are any circumstances which lead the landlord or his agent to feel any doubt on the subject, he frequently requires the candidate to give him the name of another person as joint-tenant. That is an extreme case; but generally from knowing his character or reputation, or by a few inquiries on the subject, the landlord or his agent becomes satisfied that he is a trustworthy person, and lets him the farm. If he falls in arrear, the landlord has his remedy under the English law of distraint. authority, put an officer of the law in possession of such effects upon the farm as he thinks will cover the amount of the arrears. The officer takes an inventory, and gives the person in arrear notice at the foot of the inventory, that, if the rent is not paid within five days, he himself will sell the effects. The landlord
may do this as soon as the rent is due, but not before the day of payment arrives. I am not aware that he has any security before the day of payment, demand the rent shall be paid quarterly; so that he has that additional security. An ordinary creditor cannot make his debt available against the tenant, till he has satisfied the landlord-that is, if the rent is due.
Having levied his execution, he is obliged to pay the landlord if the rent is due. The distress can only be put in force against goods actually on the farm, except where a clandestine removal, prompted by fraudulent conduct, shall take place ; but this must be for the purpose of eluding payment. I believe the landlord cannot follow goods and possess himself of them after a boná fide sale, even if the bona fides was only on the he can do so. The landiord's power to take the goods so fraudulently removed is limited to 30 days after their removal. The landlord, however, runs a very great risk in following property, because the onus rests on him of showing that there has been clandestine or fraudulent conduct; and, if he cannot prove the fraud or collusion, he wili be liable in an action of damages,
If goods are removed after the officer of the law has been put in possession, the landlord could follow them. The distress applies to everything found on the premises, whoever it belongs to ; and it even goes the applies to cattle which have strayed, provided they have escaped through the owner's negligence, and have been a night and a day without recovery being made. When I say that the distress applies to all goodis on the farm, I mean that it applies to corn growing as may aleo distrain the goods of a sub-lessee, whether such sub-lessee has paid his rent to the lessee or not. The Act 14 and 15 Vict. c. 25 , :provides that growing crops seized and sold under an execution are liable, so
long as they remain on the farm, for accruing or subsequent rent, but they cannot be taken possession of till the rent is due. The right of distress extends to rent in arrear for one year provided there has been a bankruptcy, but for six years provided there are no other claims urged against the tenant. The landlord does not lose his right of distress by taking security
for the rents in the shape of a bond or bill. Suppose the tenant has a counter claim against the landlord, that does not affect the landlord's right of distress. In our district our experience may extend over 40 years, as my father's has done, without bringing the factor to the cognisance of more than five or six cases where the law of distraint has required to be used. I have been in
business for nearly 20 years, and I have only had one case where I had to recover rent through the arbitrary process of distraint ; and I have a statement in my rents for the Crown and other landlords in England atnounts in the aggregate to \(77,000 \%\) per annum, and or a period of 47 years we have only had occasion to resort to the law of distress six or seven times. For
he rents due up to last October the rent was under \(10 l\) " these estates yieldito int the landlord can distrain if hen as a fresh rent as in his inventory. The landlord's rights inded es of distraint are preferable to those of all to the landlord, including the may \(p\) My father has the management of expense on which there are leases for 21 years, an the same with reference to distraint as in 5 of the rent, the lease becomes void, 21 days after each half-year-if paym-general a a crown lease which I looked at the I find that the tenant getting into arrear for the recovery of his rentity which the landlj right; because, if a tenant under the allowances makes a large bill, that is a se landiord, the tenant cannot claim it from the first intended as a seout. Waygoing are now doing away with these, feeling the lavid longe require a security in that form, bow de, Lave a good security in the power they have to ree payment of the tenant's account for uneshase mprovements. The tenant's bill
mprovements is subject to the scruting
appointed on the part of the landlord and the the Mr. James Martin.-I am a land-agent armer at Wainfleet, near Boston, in Lent and telum concur generally with Mr. Higging' eridence terms of entry in our county differ; some are of March, some at 6th of April, or new Lady D old Lady Day. Where the agreements conta may be used when the quarterly the right of dsine are the exception in Lincolnshire. In Usfordshare now there are some cases in which there are leasa! 14 , and 21 years, and these leases contain a prorim chat non-payment of rent shall, at the option andord, terminate the lease-within 14 or 91 generally. We don't collect the rents due on 5 ith from November to January.
25 th September, and I don't pay it till February, right of distress exists for the whole of that in an agreement on one of the estates for which It agent:-"To be allowed on quitting, where a cora cr has not been taken, for all the bones or other artife cake consed in the last year; also half the Lin cake consumed by cattle or slieep on the side
providing there be no more used thau the avera the three preceding years, and half of the same be paid for unless sanctioned by the landlord agents, and done at least 3 feet deep, and wita les of not less than 2 inches bore; when so done, wim the tenants finding tiles and labour, to be allored a a seven years' principle; no cartage to be pui exceptiug done in the last year of the tenancy. and marling to be allowed on a five years' prisip? The bills for underdraining, liming, and marlug to axamined and approved by lie abour on day after the work is completed. Labour on but not otherwise, to be paid
has been properly ploughed four times, and the not to exceed 2l. per acre.

\section*{added t}
ag out the agrecment
ciple deducts one-serent. the eighth year the tenan There is no reference made to bones or oilcake, only we don't admit cotton-ake. farmer would get the same for boiled bones as tor bones that had not been boiled, supposing used them for three years: but all the man reat produced to us, and we pay according to are allore All accounts must be paid before 10la an acre of the landlord. I should consider 10 . 600 ncress necessary for taking a farm of average, about a third is pasture. 2400 acres. As to the rotatio have half corn, quarter seeds, an others three-fifths corn, one-fiftl seeds, and Turnips. We leave it in the take the corn as they like.
Turnips, Barley, seeds, Oats, Turnips, Barley, seeds, Oats, and Wheat; the sis on deep soil is hall white corn, one-sish or Vetches). The rotation there is not to hase white crops together-Turuips, Bar
Pulse crop, and then any white crop
 than usual. Our harvest was berun up in the luse Auguet, the cutting was comple was finistued on an act September. In \(12 \frac{1}{6}\) days six seythemen
September. In 128 days six per day;
herefter the whole was in the stackyard in first-rate Berdition. In wet seasons, when straw was abundant thave had upwards of 100 stacks; this year, off the ee extent of land, I have only 52. As the erop was anusualis light, I had two scythes fewer at work than thare bad for years, and consequently the expense is considerably less. The whole cost of cutting, gathering binding, leading, stacking, and threshing is 222., of \&\%. 9t. per acre. It is to be remembered, however tiat all the half-year servants were engaged in the rork, and that the cutting, which is the more costly part of harvest operations, was mainly performed by the ploughmen. The wages of scythemen per day are 3 s., binders \(2 s .6 d\)., women for gatiering \(1 s .9 d\)., and anrls for raking \(1 s .2 d\). It is not supposed that there gill be as great a shortcoming in grain as there is in milraw. The stacks already threshed have yielded pretty atiffictorily, although the yield per acre is not large The whole crop was brought to the stackyard in the best condition, without one sprouted sheaf; and athough the Oats are not heavy per bushel, the Wheat and Barley are expected to weigh well. The farmer when now met together have facts to talk of. Une tells that he put the crop of upwards of 70 acres into 19 st ucks; nuother says that one of his stacks contains the crop of 9 acres, and a third says that he put the prodace of 15 acres into his mill-barn, threshed it, and the yield was 11 qrs. of Oats ! The heat and drought of sommer still continue, and the Turnips have become gaite discoloured with mildew. The growth of the earlier sowings has been stopped for some time, and they have entirely lost their natural colour. The later sonings have kept their colour better, but are now fading also. Turnips cannot now be a full crop, nor will they be of grod quality. Potatos are particulanly fine, and as yet the tubers are free from disease. Thi woil is so dry and hard that it is with difficulty it can be turned with the plough. Our stork are in a thriving, bealthy condition, and there is no word of the approach of the plague. Steps are being taken, however, to prevent its coming, and prepare for its approach.

\section*{Miscellaneous.}

An Unexpected Prize.-At an agricultural dinner held in Lincolnshire a few days since, Mr. W. North, whilst proposing "The Town and Trade of Boaton," begged permission of the Chairman to exercise a privilege conceded to him by the stewards-that of warding a iudge's prize, which the official judges had werlooked. (Laughter.) It would be fresh in the recollection of many present (said Mr. North) that at the last annal metting he had the distinguished Lonour to receive a white hat- (roars of laughter)-as a prize for the worst stacking and the most slovenly stack-yard. He had carefully preserved the prize-(laughter)and baving made an inspection of a great many fatmsteads, he had met with one that he considered fairly entiled its owner to be the holder of the hat for the ensuing 12 months ; and having brought the hat with him to the meeting, he had very great pleasure in awarding it to the geatieman he had just alluded to and that was the Vice-Chairman, Mr. W. Welah (Rnars of laughter.) Mr. North said the hat had never fitted him-(laughter)-and therefore he could very cheerfully part with it. Then, amid the convulsive bughter of the company, be handed the hat and box over to Mr . Welsh, and resumed his seat.

\title{
HALLETT'S TRADE \\ WHITE PEDIGREE WHEAT, \\ MARK. \\ (ROUGH CHAFFED), \\ \\ NOW OFFERED FOR THE FIRST TIME,
} \\ \\ NOW OFFERED FOR THE FIRST TIME,
}

Grown upon the Summit of the Chalk Downs, and yielded over several Acres nearly Seven Quarters per Acre, the Crop on similar Light Soils being this year extremely bad.

This is a fine Millers' Wheat, in addition to possessing the extraordinary productiveness of the original Red Pedigree Wheat. Strav of medium leugth and yry athe being laid by bad weather. A Winter Wheat only.

If Drilled in September, 4 Bushels on 10 Acres. SEED REQUIRED.
\[
\text { If Drilled in November, } 4 \text { Bushels on } 4 \text { Acres. }
\]
" December, 4 " 3 "
Note--The ORIGINAL "RED" PEDIGREE WHEAT will be supplied if specially named, otherwise the above new White variety will this year, in all eases, be fort
PRICE, including Bags:-ONE GUINEA a BUSHEL, or SEVEN GUINEAS the QUARTER by the Quarter or Half Quarter, delivered in Bags, setwed up and s the Brighton Railway Station, upon receipt of Cheque or Post Office Order, without which it will not in any case be sent to unknown Correspondents. Less than a Bushit wat be supplied.

\section*{TRADE \\ CHEVALIER PEDIGREE BARLEY. \\ MARK.}

This has been "bred" in the same manner as the PEDIGREE WIIEIT, riz.:-by repeated annual selection, re-starting in each fear from a single grain,
Although grown upon a poor thin soil (resting immediately upon the chalk), which upon neighbouring farms produces Barley rarely weighing so much as 51 lbs , per bs and fit only for grinding, the PEDIGREE BARLEY last fear [this year's crop not yet threshed] weighed 57 lbs . per bushel, and produced \(89 \frac{1}{2}\) bushels per acre

Besides its astonishing productiveness, characteristic of all the PEDIGREE CEREALS, it possesses remarkable value for the maltster, not a single grain failing to geraur and all groving equally.

Although only a very limited area of it has this year been grown, it will, in deference to a generally expressed wish, be at once offered to the public instead of maitiog next year, and a Subscription List has been formed, to which gentlemen desirous of securing any of it for drilling next Spring, would do well at once to add their mas which, however, will not involve payment until it be ready for delivery, of which due notice will be given by printed circular.

merting for the ensuing wfik.

Thenix and practice unfortunately do not always agree, and of course a similar diversity exists between the professors and the practical med. Some there are who, when troublesome facts come in the way of their pet notions, make short Fork with the offenders, leeep to their theory, and like the Frenchman, shrug their shoulders and suy, "so much the worse for the faots." Others, The practioal men, keep to their facts, forgetful, it may be, that after all they only see through a glass darkly, and that the facts they observe ma be susceptible of more than one interpretation.

We allude to this subject because there ar mane points in which it is positively discreditable th theorists and practical men that such discrepancies should so long exist. Take the case of timber, for instance. The physiologists tell us for the most part that FAST-GROWN TTMBER is the srangest; the reader will find in the "Theory o Iforliculture," p. 413, ed. 2, a summary of the arguments on this eubject, and those arguments seem as satisfactory to the physiolozist, as they are Hear rere to the practioal forester.
Hear what one of our correspondents, Mr Jiyes Grigor, says on this point in our present volume, p. 867 . IIe attributes the great durability ts the inclement Scotch Pine grown in the North circulation of climate and consequent slow circulation of the sap. But these statements are to a physiologist satisfactorily disposed of in the work of JI, CHast as well as by the counter statements more than one to whose paper we have referred on aran one occasion.
Mr. Grigor is supported in his views by Mr. Hrtchisons, of Carlowrie, who in an able paper on the culture of Conifera in the Transactions of the Sonttish Arboricultural Society, to which we shali liave other opportunities of alluding, lays it down as an "undeniable axiom that the slower the arnmth, the closer the grain and the firmer the textare of the wood.
On the other hand, the physiologists tell us that the more rapid and energetic the growth, the quicker is the transformation of the soft sap-wood age, the one grown in a poor soil, the other in a rich one, there will be a!predominance of sap-wood in the former, of heart-wood in the latter, and the thicker the several layers of wood the smaller Bence the of sap-wood will there be found. nence the most valuable qualities of timber-hardpatible with the and elasticity-are quite compatible with the greatest thickness of the annual
areps. Mieroscopis investigation shows us that the inner portion of each annual lajer, that formed ail caring, has very nearly the same thickness in and is made whether grown in rich or in poor soil, strength; while the thin slender tuhes of little period, is thick in proportion to the rapidity of its
growth, and is made up of thick, strong wood cells tilled with hard wrody deposit.
Nuw there is doubtless some truth on toth -ides; and we hap. it will mot the ling te fore we. get

One of the most striking objects in the nuble collection of woods at hew is an extraordinary cauldron-shaped body ut enniderable diameter piereed with hundreds of small oval holes about the size of a thimble, with Lollow tiates correspending on the outside, tlirourh which the roots penetrate to the ground, and of such an intensely hard eonsistence and indestrnctible character, that when the hotmo (feen-xtt true (Lentuices sechellarum), of which it conistitutes the Tase, perishes, it is left behind, and preecrves its form for many years. Our attention was eapecially called to it by the late Sir W. J. Huoker, at whose surgestion the subjoined figure was made by Mr. Fitca expressly for this Journal.
When the Nut first germinates the cotyledon is extremely obtuse and sac-shaped below, where it gives out a number of roots, as in the figure; each succecding leaf partakes somewhat of the same character below, where, according to Mr. Sfinburn Ward's descriptiou, they cluster

and support each other, no stem appearing above the ground. The tree continues in this state from 15 to \(2 \bar{y}\) years, when the stem is first formed. Mennwhile, as the roots are sent out in every direction, the tissues harden round their hase and in the interstices till they become as solid as the skell, and form a distinct socket round the softer bulbous base of the plant within. If the report be true, which, however, requires confirmation, that the base of the trunk plays freely within this socket when struggling against the wind, either the central portion of the root must ultimatels become free, or else a portinn of the basal tissue musi be protruded with each naseent rout. It is scarcely, indeed, conceivable that with such a multitude of roots radiating in every direction any motion should be possible. The socket has been found quite perfect and entire in every respeot 60 years after the tree has been cut down.
If we mistake not, something of the same kind takes place in other Palms, though not to the same extent. A joung plant of Borassus flabelliformis in the Museum seems to illustrate the matter. It is of little consequence whether the ronts penetrate the base of the leaves, as in many Eadogens, or not, as the leaves would ultimately decay, though not till after several years, and leave the base of the stem free.* M.J.B.

Among the numerous topiss of interest mooted at the Congress of Botarists at Ainsterdam last spring, few were more important than one relating to the Names of Puavis. The suhject has also bern taken up hy mure than one of the foreign
* For firther infurnation we refer our readers to two
hosticultural jurnals, and it may praitly form ane of the mathers for consideratios at cur own me the nex! lear

 liszusting anat urs in the way we have meenChad, but als, of giviag nia is a practice rom which thes ahd ath homonn! ! man whimk. A plant is receised as mew it beoines a mame anon it is discorered that the phant has heen
 of the-way publication having lut a hambed circulation : hence arines a symong my, offen increased, as every butauist kouws to hats cost, by the imperfect description of the sprefos in the dirst mstance. "Well, what of that?" says the pure botunist; "that is cur allair, and a mighty troublesame one it is, and it does mat coneern you horticulturists." But, nevertheless, it does cana.rn the horticulturint, and it is of serious importance to the plant buver. An upright tradesman has no desire to paim cff an old triend ander a new name, and yet from irshloetmace hat may often dosa; white a broitur tha hamnn, with less senoitive morality, may for a time find it advantageous to make use of both namen. Assuredly a plant huser dass not eare to give the same price for an old plant with a new name as he does fur a bema fill n. w plant, and yet this sort of thing hapirm= duly, rardy we hope from design, hut very fropenty from ignorance.

Professor Kncir, of Berlin, has pointed out one way of meeture the evil, at nuy rate in part. Certain botanists are especially noted for their aequaintance with rpeeial familiss: some devoto their attention particularly to Urehids, some to Ferns, sume to Palms, and so forth. Such a division of labour is extremely beneficial. The botanist who, with a rullicient grounding in tho general principles of his rcienoe, ocenpies himeelf with efrtain groups chifle, is mape likely to advaner serienen hian be who flits from order to order, as the hee from \(f 1\) wer to il wer
A botanist such as we have meotioned, should, as Professur Kon ir suggens, act as refurce to the forticulturist. A surppeed new Wrohile should be sent for identification to him who has the bust knowledge of Orehids, and so in other cases.

The man of scicrice would harr no interest in attaching a name, except on ecientitic grounds; if he were to do so 0.1 any other pretence, disomery would soon ensup, and his reputation for honesty would be quickls imperilled. "n the cther hand the honest man of commerce would know that he had taken the best means open to \%im of securing a correot name for his plant, and of preventing any fulsification, accidental or of design.

In connexion with the names of plants another point was mooted at the simu (')ngress by lur Ascuerson, viz. the impoliey of attaching a known species; such a practice, of cuurse, ofth leads to disappointment on the part of purchasers, and this might be ohviated by giving simply a vernacular name, English, lirench, or Cerman as the case might require, and by reserving the Latin name for the original snecies.

Of course neither of these proposals would do away with synonymy and its attendant evil results, but they would at least be steps in the right direction, and they would als, tend to draw into closer alliance the student and the practical man. How greatly such an alliance would raise Horticulture and strengthen Botany we shall have other opportunities of showing.
- In our impression of July 14, 1860, we gave a figure of a remarkable variety of PAPAVER RRACTBATUN, in which some, amd at times all the petals were united together by their marging, so as to form in the latter case a perfect cup. Thas siogular variety has been in culivation for some tive in France, though it does no appear to be well known even there, according to \(M\) Cabriere, from whore notice of the cullivation of the plant in a recent nuniber of the "Fiore des Serres" we coupile the following remarks:-Apart from its morphological interest, few plants are so effective for fine colour, and hence it has hecoune desirable to propagate it by a process which has been prove to answer well and speedily, not only for this partienary phant, wher rarely
 when the growth of the year is almost completed, the plant is taken up, and its long fleshy roots are cut into pieces 2 to 3 inches in length. These are potted in peat earth, and placed in the propagating pit, either under
a bell-glass or frame or even without such protection. The earth is kept moderately moist, and in the course cellular tissue are observed springing from the central portion of the cut surface, and also just within the circumference. These grow into true buds, provided with leaves and roots. It is probable that this mode of securing cuttings from roots is applicable to a great
number of plants in which this mode of propagation has not been tried.
Horticole that an attempt has already been made in certain districts of France to introduce into the primary schools iustruction in the rudiments of Agriculture and Horticulture, in a manner suited to the temer cupacitie of the youthrul mind. MT. De cid Rox statis that the attemut has been followed by good results, and that it is effected by means of a series of copybooks, which serve for writing from a copy or from dictation and which comprise the principal pounts of importance in those sciences of which the young scholars daily see application made by their parents in the garden or the field. This is worth bearing in mind, now that the Education of Gardeners is exciting attention.
- We are happy to be able to announce the publication of the second part of BENTHAM and Hooker's Genera Plantarum, and hope that it may be speedily followed by a third.-Another long-expected
book is also on the eve of publication, viz., LINDIEY book is also on the eve of publi
and Moore's Treasury of Botany.
A correspondent of the Builder suggests the following plan to Drstroy Ants in houses, which he had practised with much success:-The parts of his house which were infested were syringed with fluoric
acid. In about one hour after there was not one insect to be seen alivo-it entirely destroyel them. Spirits of tar, commonly called oil of tar, were used in a similar case about three years ago, and the place has been quite free from the annoying insects ever since. It is suggested in case of any difficulty in procuring fluoric same purpose. If fluoric acid be used, it must be done with a leaden syringe, while if sulphuric acid be chosen a glass one must be employed; both, moreover, require careful management, as they are painfully destructive to the skin.
Curator of the Royal Botanic Garden, Kewr, is desirous Curator of the Royal Botanic Garden, Kew, is desirous separate collections.
It consists of a very complete collection of Ferns, and also a general one of Flowering Plants:-
I.- The Fern collection represents more or less fully the Fern Flora of the islands of the West Indies, North America, Mexico, Central America, Peru, New Cranada, Venezuela, Guiana, Brazil, Tropical Western Africa, South Africa, Mauritius, Ceylon, India, the Malayan Peninsula and Islands, the Philippine Islands, Hong Kong, Formosa, China and Japan, Australia,
Tasmania, New Hebrides, Sandwich and other islands of the Pacific.

Lach species, with tew exceptions, is on a separate sheet of stout white paper, 21 inches by 13 inches, with name, synonymes, and references written on the sheet to which are also added the name of the country and more specimens of a species; the various peculiarities and geographical range of indivitual species are thus well illustrated, and have been particularly attended to
in the formation of this collection. The number of species is about 2000 , including many that are rare and interesting. The total number of sheets amounts to 6,460 . The whole collection is scientifically arrauged, and contained in a cabinet \(6 \frac{1}{6}\) by feet, divided into 55 compartments. This collection was considered by Sir Wrintak Hookeze to bo socond only

\section*{0 his 0 wn.}
11.--The collection of Wlowering Plants consists of about 5,000 species, representing nearly the whole of and 3,300 garden plants, chiefly collected between the years 1824 and 1841, the older specimens being on paper of less than the usual herbarium size; the lorger number, including Proteaceæ, Myrtacees, New Holland Acacim and other Leguminosm, Epacrider, \&c., \&c., are all on full-sized herbarium paper, and are arranged in their respective ordern. The garden specimens are plants introduced by our early collectore, as M.asson, Conntngeam, Bowir, and others, many of which are singular and remarkable, and are not now in the gurdens of this country. The 1,600 native specimens are chiefly selections from the Indian collections of Wallice, the herbaria of Lambert, Gardner, Cuninct Hav, and Bowre. Besides the above there is a collection of Graminers, Cyperacer, Junceæ, \&-., amonuting to about 480 species; it consists chienty of garden speci-
mens, collected between the years 1826 and 1830 , and they are believed to be all correctiy named. The general collection contains a stanll set of curious Australian terreatrial Orchils, introunced by ('cinvingHas during the years 18224.5 and \(b\), and which flowered
at Kew. There is alan a special coll ction of frarden Ferns, cousisting of 4 an special coll setion of frarden the usual herbarium size; likewise several smalt special
collections. collections.
his son, the late Mr. Alexander Smitir, which he had intended for publication, under the title of "Economic and statistics of all plants known to be made use of by man in all countries, for food, clothing, medicine, manufactures, mechanical arts, \&c. It is contrined in 30 octavo and one folio volume, and is believed to be
the most complete work on the subject yet compiled.

THEORY AND PRACTICE OF VENTILATION.
T're sulject of Ventilation is wide as the world, deep as the ocean, sulutile as heat, and high as those lieavens that constitute or provile the elevated machinery for the ateration of the globe. It affects, or is affected by,
nost forms and all conditious of matter, making solids liquids and gases subservient to its great purposes. Perpetual motion and incessant change are the processes by which ventilation is accomplished, and heat is the active agent that sustains the ceaseless activity of these ventilate, as it eulightens aud warms the earth. But in the performance of this function, as in the execation of the other two, the sun is most powerfully helped by the earth and water, while the air leaps down to minister to each, and kindly mediates between them all. But for the presence of the atmosphere as the grand connecting link between solids and fluids, the sun could neither warm, vivify, nor enlighten the world; and it may seem a useless truism to assert, that without an atmosphere there could be no ventilation. Yet it is quite possible to conceive of an air that would have supported life, and yet have been immoveable. But happily for our welfare our atmosphere is so constituted in its relation to the economy of the universe, that motion is a necessary condition of its existence. It is tremblingly sensitive to the influence of heat. The surface of the world is so formed, clothed, and furnished, and so placed in relation to the sun, the chief source of heat, that tis physically impossible that either earth or ocean or the superincumbent air that rests alike upon both, and maintains each in their respective places, can ever This fact, the variety of temperature througbout the atmosphere, is the foundation of the science of ventilation. Air can only be moved from one place to another
in two ways. It must either be driven by mechanical in two ways. It must either be driven by mechanical that the latter is Nature's method. Let us inquire how she does it, that it may also become ours; for Nature is not only our oldest but our wisest teacher.
By the addition of heat to air its particles are sepa-
arated further from each other than they were before. The heat exerts an expansive and diffusive power, the air occupies a greater space, and consequently becomes lighter. Now light air will of course rise through and sail along the surface of heavy air, just as a cork or piece of wood will upon water. But a volume of air, arge or small, cannot pass from one place to another without creating a vacuum. Air being an extremely
subtile and elastic fluid, of course other portions of subtile and elastic fluid, of course other portions of air rush in to supply the place of the heated air, and thus out the atmosphere by the slightest disturbance of its temperature. It thus appears that it is impossible to discuss the question of ventilation apart from that of heating. The former is but an episodir or necessary
otishoot of the latter, and both must be looked at ogether if either is to be properly understood.
The sun is nevertheless the primary source of all our warmth. A wide belt of the earth's surface is heated to a permanent temperature of
\(80^{\circ}\) by his direct rays. This belt is about \(80^{\circ}\) by his direct rays. This belt is about three
thousand miles broad, and from the fact of day and night being of nearly equal length there throughout the whole year, it is called the equatorial or equal zone. A part of this space most immediately the other parts. Consequently the air there rapidly ascends into space, and creates a vacuum on the earth's surface, which originates and sustains a move ment throughout the entire atmosphere. The object of this movement is to moderate the excessive heat of the centre of the earth between the tropics, and to temper the cold of the frigid zones.

To effect this distribution of solar heat, two great agents are used. The one is hot air ; the other hot water. I will notice hot air first, aud the first thing that demands attention here is the mode by which the air becomes warm. It is not heated mediately by the sun. This is a marvellous and infinitely important fact. If the air were heated from above by the direct action of the sun's rays upon it, as the crust of the earth is heated in part, it would at once become an immovable fluid. I wonld also absorb all the heat before any of it reached
the surface of the earth. It would disarrange the whole system of the nniverse, dissipato the air itsel into space, and by removing tice only barrier that can keep diwn our heat, chill the surface of the earth into perprtual barrenness. But the Almighty has ordered it so that the air shall be heated from below and not from above. It is the great carrier of solar heat to our its burden it refuses to absorb or be warmed by heat in the process of convereance, the amount down upon the surface of the earth amoch mon than it receives from the sun, After performing this
beneficent service the air rests
from its labours on the warm
But it only rests to brace itself for surface of the caloric, and starts afresh on its grent with nem nim watering, feeding, or ventilating

for it is of the lio
or it is of the highest imp
plauting and watering, as
sodar. Two missionaries following each other, like Paul in thoee early days trees and shrubs were managed just is we see the delving and drenching done now; but the -pe ing of the wood and the maturing of blossom-buds of funchine and drying wind on the one part, and of sin or other water supply on the other, that the time whercly a large portion of the water is kept out of the sist-m does the tree or shrub essential service. There are I celual experiment, bat, as in the case of root prunine tho good done is laid to other causes. In ringing fruit :rees the same thing is done, for the supply is partially cat of, and the checking of the descending sap gets the credit of the fruithnness induced ; but let any one been nieely ripened, if wet weather should set in, the fruit will soon slow that the plant is thoroughly
saiurated with wet; the berries taste of the sater inbibed, oud many of them burst open and forthwith rot; whereas, had the earth kept dry and the tolinge been protected from wet, the fruit would have kept sound for a very long time.* In September and frequently in August, long before we should think of placking up and planting trees and slorubs, they will
bear it with impunity and even be benefited by lack of moisture, but this relates only to plants before they are gone into winter quarters, and presupposes that there is a little margin of summer still left to elaborate the juices already stored in the system.
I am aware that this doctrine wiil be cavilled at, but its practice forms one section of the art of transplanting well, and it is put in practice for other reasons than thoere which hold good later on iu the season-to which I
will direct atteation hereafter, and try if possiblegto beal the wounds of winter planting by coating the rootlets with mud, further protecting them from their semly planted trees in puddie, for although paddle onder ordinary culture is the worst form that good soil enn assume, yet in winter and spring-planting puddling is the most important part of the process
trees is very necessary in planting or transplanting olject one has in view, in order that the means may be regulated accordingly. That a plant lives after being iranlsplanted is no mark that the work has been well been torn up by the roots and dibbled in as if their roots mere iron, and clods bruised with the dibble could not harm them. Surely Satan himself must have set the Int clodhopper a Cabbage planting. A. Forsyth.)

\section*{DOUBLEGLAZING AND ITS ADVANTAGES.}

Thir question of double-glazing and its so-called "adranteges" has now assunned an aspect of so decidedly are in a position to question its efficacy to stand out and the more urgions. The necessity of such a step is all 4Towing horgent and obvious when we consinder that a iaining to an efficient along with an economical mode plansts of all kinds, and that to the collumns of the borticultural press we should look for a thoroughly practical this matter involves a question quite revolationary in because it goes to the very bottom of the pockets of all itho are charmed with its novelty and enamoured with it "beneficial influences," all at first seeming couleur it seems a fair question to put-have the results met been triumphantly in the affirmative and "A R \% " (p. 962), convinced of the "usefulness and excelitrngly recommends its general adoption in this Womntry, making use of the names of "c Bewley and
monders in pioneers of a system which is to worl tirowing in the cultivation of Orchids, distinctly illactrationg his argument, too, by the most forcible of all boarbood of Berlina under double glass in the neigh. This is certainly
alapt in viradication of his partiality for double-glazing coald not, who have been adhering to the old system, grounde, apart from the scientific discossion of the beselficial in the exing that double-glazing would be thioner, the first question that occurs to me to ask is growth of Orehids or any other plants, that do theleconlial to gocome a necessity? Are the conditions To be lorked for in a bouse all bud hermetically sealod
 Men ways of to any one who watches the simple but truly
Meture shifts the scene for a fresh act.

Mr. Warner was mentionod as an anthority and apostle of the double-glazing system, but I fiod when I go to Broomfield that all the Orchid houses are of the enmain order, and I see exampless of Vanda and
Phaiauopsis that might well be rivalled but could Phai buopsis that might well be rivalled but could mr. Rucker's, Mr. Basset's, itc., sind see platite,
many of them remarkable as exatuphes a firstoltas same remark heuses of similar conalruction. The mumerous housef, Mr. Williams', athd some Ar. Veitch's. It is imposaible then to arrive at any other conclusion than that they answor the purpuse And what next ? True, Mr. Bewley has had doubleot seen; and so has Mr. Veitch and several of the other gentlemen named; but the phants so far do mot aypen to tre more remarkable under the one comdition than
Turee different coliections are named as containine plants of a very praiseworthy character; but, I would ask, is the reasoning of "A. R. E." sound-is the deduction logical as to all this being brought about hy the effects of double-glazing? I do not require to
hold a brief for the Orchid-growing fraternity of this country-"their works bear witness;" but I could point out hundreds of plants quite as remarkable, some of them far more so, that have never been under a double glass roof. If the highest derree of Orchic fundamental rule, and ignoring, or at least treating all the others as subsidiares, then I would frankly ack all Orehide the force of "A. R. E.'s" argument; but
grow that soil, air, circulation, moisture, and some other minor things, form important agents in the routine of successful cullure, I hold they are entitled to be considered in forming an estimate o the success of any oue's practice.
In order that we may appreciate the merits of both systeme, let me take up the standard recognised and propounded by "A. K. E.," and claim results which amply measuring success by that gentleman's own wand; and what do If find ? In order to be accurate I have taken the sizes, and the plants are open to inspection. Pbalæunpsis Schilleriwa, a plant with eight leaves, the largest of which measures 14 inches long by \(5 \frac{7}{5}\) inches wile, which produced last spring exactly 110 flowera, 105 of which were fully expanded "surpassed in England." Vanda suavis Veitchii as grown here is 7 feet high from the bottom of the lower leaves to the top of the plant, has 18 breake, tome of
which are 4 feet high, and has produced spikes each 16 -flowered. Vanda insignis, that fine yellow-ground variety, has more than 50 breaks, is over 8 feet hirch, and is, I presume, quite as remarkable as theplants we are triumphantly asked to watch. Both these plants are clothed from top to bottom, and are scarcel ever out of bloom. [They are magnificent examples of three flowers on a scape, and the petals according to my note book are 23 inches long, which, if taken aloug with the length of the dorsal sepal, would make them not much less than the one in the Berlin collection. Oncidium Lanceanum has also grown here wonderfully well, with leaves 21 inches long by 5 inches wide; but in one instance where I had grown a plant quite 3 fect across, with a score of tower spikes, it it was only by reducing it into piecese and tying them upon blocks, that its life was saved. I have them in lesser sizes, with leaves of the above
dimensions without a blemish. The Vanda cerulea referred to must have been a unique plant in every espect, eclipsing by far anything I have ever seenit is a plant in fact that I cannot succeed in growing atisfactorily.
But now that we are tilted, the one country against the other, the one mode of glazing against the other, let us examine a few more plants, keeping still
to the game collection. Cattleya labiata Pescatorei has produced 12 spikes on one plant, with 10 flowersprobably the most gorgeous example of superb colvuring ever witnessed in any plant. Lycaste Skinueri has pseudobulbs measuring 8 inches in circumference by 5 inches long; and in one instance has produced 12 flowers from a single bulb. One plant, 3 feet across the bulbs, has had 65 flowers open at one time, Anguloa Clowesii, in
one instance, has over 50 pseudobulbs, the largest of which measures 91 inches in circumfereace by \(8_{4}^{2}\),inches long, and has produced 60 flowers at one time. Dendrobium albe-s.nguineum, a plant at one time lost to the country, has pseudobulbs here 18 inches long by are tro may be illnstratest. generally good, bat one or two sors may be inmstrated O. grande has produced 15 thowers on a branche spike;
O. Pescatorei has bulbs which measure \(6 \frac{1}{2}\) inches roumd by \(3 \frac{1}{2}\) inches long \(; 0\). Uro-Skinneri, \(S\) inches in circtumference by 6 inches long; and lastly \(O\). Reichenheimi, 10 inches round and \(6 \frac{1}{d}\) inches long. Such instances an these, at all events, and numerous others both here and elsewhere that could be quoted, ought to make gentlcmen and their gardeners payse before coroing to the conclusion that
a thing of the past.
In touching brielly upon the second question promulgated by me I apeal with a little more diffidence, not
because I doubt the force of the conclusions, but imply because they have not been tested by my own practical exp-rienos. I hold, however, on privciple, that a house chut requires to be made "perfectly air-tight," an it onjoined by the supportens of the double-glazing aystem, is, [in direct proportion to its air-tightuens, the constitation of the plank. A very good case in point I observed some months ago at the Chelsen Botanic Garden, where two cases were similarly placed out-ofdoare, the one with danble glane and the nther with single, filled "ith Fonns and smae cther cuntie fiath:s, samilar in character and kind. So far as the experiment went
it wasclenrly in farour of the aingle glanes but donhtless the Curator can luther calighiten us up is thas puint. To a want of a proper circulation of air, must be added the subthed light, especinlly in our northern climite, where wintry days are dull and short-all tending to incease the evil. James Anderson, Meadow Bank.

\section*{TRUFFLES AND TRUFFLE ClLTLIRA.*}

THE numerous varietics of limgi that are exp. wed for sale in the markets of liance and ltaly mut ind..ee a to their culture by the horticulturists both of Great Britnin and the Comtisent. The Mushomn is the only species at all commonly made use of in this country; he Blewitt may sometimes, indeed, he seen in Covent Garden, but it is a species far inferior in flavaur to many others of our Fungi, and it is certainly nut tho produce of our gardens, Truthes, which ntre imquently seen, and so hirfly asteemed in ('ontineental warkrts as
to command a high price, are comparatively rarely to be met with in our own, and even Covent Garden oan boast but of one native kind, and that an inferior one -Viz, 'Tuber mivivm. There are, however, various reasons for this neglect of Natmee's hencfits that operate with us, that do not apply with equal force to our poisoning from the indiseriminate nee of Fonci rashered by persons ignorant of tho qualities of the various pecier, a danger in great measure guarded against abroad by the appointment of an official persum capable of determining thie noxious or intiocent nature of the species brought for sale. What tenta, hawever, still uatural inaptitude of our country men to acquire the art of cookery, which is a very important element in suiting these plants to human dizestion ; added to whelh, there is the difficulty of adopting new customs, or changes of iet. Were a tiable for eatablished, we should soou find numerous species
brought forward as valuable additions to our menns of sustenance.
Notwithstanding that Truffles have been considered articles of luxury, and have commanded a high price from the time of the Romans down to the present, and that it has ever been the aim of horticnlturiats to bring them into the number of regular garden crops, they seem hitherto to have defied all efforts to reclaim them, and to resemble, in their! intractable disposition, the wild ass, "whose house has been made the wilderness, and the barren land his dwellings, who scorneth the multitude of the city, and the range of the mountains is his pasture." If thie, then, be a correct representation of their character, it is a question whether it would not be easier to cultivate them by assisting Nature in her own way, than to restrict her within our limita by forcing these denizens of the forest to occupy a place in our kitchen gardens. It would seem indeed, that the amount of shade they demand is such as to be inus see what has been done hitherto in the various endeavours to grow trofles by the asmantance of art And here we cannot do better than give the informa bion with which the Meserr. Tulame present us in their beautiful work on Hypogeous Fangi. They mention
four species of Truffles exclusively in viz., :T. melanosporum, T. brumale, T. æstivum, and T. mesentericum, of which two, or perhaps three, nccur in Great Britain. Tuber eestivum is apparently the oniy species to be met with in a recent stato in our
chops; T. mesentericum may at times orcur, bret it has
"From the Jowmal of the Royal Heorticultural Society of ror.
not yet been noticed there. T. brumale, if our plant England of too small a size to be worth sending to market. In Italy there are other kinds, one of which, T. magnatum, commands a kigher price than any other, and in the southern parts of Italy, Sicily, Syria, and Africa, another species, Terfezia leonis, is of common use as an article of food.
The true Truffles have rough seeds, which, seen under the older and imperfect microscopes, resembled somewhat a Truffle in miniature, and early writers concluded that the mature plant was merely one of these seeds largely developed in all directions. The Tulasnes have proved, however, by careful observations, that they germinate in the same way as do those of most other
Fingi, viz, by giving origin to delicate threads, which spread in the surrounding soil, and that from such threads the young Truftles arise, probably after some kind of impregnation, which is as yet, notwithstanding the researches of recent observers, involved in obscurity. resembling that of Mushrooms, must be taken into conaideration in any attempt that may be made to cultivate them.
The soils in which edible Truffes are found in France are always calcareous or calcareous clays, which accords
generally with my own experience. Tuber mesentericum occurs, however, in ferruginous sands, as is also the case with another species, Hydnotrya Tulasnei, which, or a closely allied kind, is largely eaten in
Bohemia, under the name of Czerwena Tartoffle. Messrs. Tulasne describe the soil of a Truffe district near Loudun, Vienne, as composed of rolled fragments of calcareous matter, mixed with fine quartzose sands, lying on a thick bed of compact marly clay, which
easily splits up into thin layers. It contains, in 1000 parts, 500 of calcareous matter, 325 of clay and iron, 150 of quartzose sand, and 35 parts, more or less, of
vegetable mould. But they attribute a still greater influence in the production of these plants to the presence of trees-a condition necessary perhaps to sun-rays. Our authors testify, indeed, that this is not always indispensable; and I Lave seen Truffes dug up on the bare sloping sides of the Italian mountains,

Some persons bave supposed that these Fungi are parasitic on the ronts of trees. This the Tulasnes expressly deny, on the strength of observations and
inguiries institutcl to that end ; and I can confirm the in this matter, and would remark that the frequent presence of certain galls attached to the suall roots of the Oaks, resembling young Truffes so strongly as often to deceive me for a time, may have given origin to this
error. error.
Some trees appear to be more favourable to the production of Truffes than others. Oak and Hornbeam are especially mentioned; but besides these, Chestnut, Birch, Box, and Hazel are alluded to. I have generally found Tuber æstivum under Beech trees, but also under Hazel; Tuber macrosporum under Oaks, and T. brumale
under Oaks and Abele. The men who collect Truffes for Covent Garden obtain them chielly under Beech, and in mixed plantations of Fir and Beech. The Truffe theonds of France are remarkable for the sterility of conjectures-viz, that Truffles exercise a prejudiciai influence on all plants in contict with or proximity to
themselves, by appropriating their nutriment in a manuer similar to the Rhizoctonix; but a more probable reason of this sterility is the frequent digging
to which the 'Trafle grounds are subjected by the collectors; for, as Tiumes are not truly parasitic it would at tribute an inconceivable amount of influence to their mycelium to suppose them capable by its means of destroying all the surrounding vegetation. And we may renark that some species occur in grassy places,
as in the forest of Vincennes, according to Tulasne; and so with T. macrosporum and T. brumale, as I find them. It seems to be a better explamation of this sterility, so sacceed well where they find a comparative freedom from other vegatablegrown, arising from causes inde-
pendent of themselves, and that they are the result, and not the cause, of this sterility.
In common with many other Fungi, Truffles do not bear to be disturbed in their early stages; so that the summer species, as T. æstivum and T. mesentericum, not to stir the ground more deeply than is absolutely crop of the more valuable kinds, T. melanosporam and T. brumale. Any disturbance of the soil in the winter, aids in theirer are mature, does no harm, but rather suitable for the germination of their spores and the observations it would seem that three or four months suffice for the developinent of these plants ; they state That they hare met with Tuber mesentericum about as which must acruive their full size before the end of its mature condition alone. And it is supposed that the warm rains of Ansust are highly conducive to the
fertility of the Trutfle. ground, and that the aboudance or scantiness of the croy depmins very much on the
nature of that peliod. These phants grow without any
special care or tendance; but as special care or tondauce; but as they are not un-
frequently found, both in France and Italy, on, the the cultivation of the land, it would seem that they succeed as well in ground that bas been stirred and manured, as in that which has been left in its natural condition.
Some notion may be obtained of the extent to which the trade in Truffles is carried on in France, when we read that in the market of Apt about 1600 kilogrammes (about 3500 lb .) are exposed for sale every week in the
height of the season, and that the lowest estimate of the quantity sold during the winter amounts to 15,000 kilogrammes (nearly \(33,000 \mathrm{lb}\). Weight). According to another account, the Department of Vaucluse yields from 25,900 to 30,000 kilogramenes annually. The vast quantity that must, therefore, be procured and sold in all the French provinces where they grow, and the
large revenue arising therefrom should be a great large revenue arising therefrom should be a great attempt their cultivation in England.
Many trials have been made to subject these vegetables to a regular system of culture, but hitherto M. Bornholtz the chief accounts of these attempts. They inform us that a compost was prepared of pure mould and vegetable soil, mixed with dry leaves and
sawdust, in which, when properly moistened, mature Truffles were placed in winter, either whole or in frag ments, and that, after a lapse of some time, small Truffles were found in the compost. But the result was discouraging rather than otherwise. The most successful plan cousisted in sowing acorns over a considerable extent of land of a calcareous nature; and when the young Oaks had attained the age of 10 or 12 trees. This process was carried on in the neighbourhood of Loudun, where Truftle-beds had formerly existed, but where they had long ceased to be productivefact indicating the aptitude of the soil for the purpose. In this case no attempt was made to produce Truffles by placing ripe specimens in the earth; but they sprung up of chemselves from spores probably contained m were cut for the first time about the 12th year from the sowing, and afterwards at intervals of from seven to nine years. Truffles were thus obtained for a period of from 25 to 30 years, after which the plantations ceased to be productive, owing, it was said, to the
ground being too much shaded by the branches of the young trees, a remedy for which might have been found by thinning out the trees; but this would not be adopted till all the barren tracts called "galluches" had been planted. The brushwood, by being thus thinned ont, would be converted into timber trees; and Poiton, which are commonly situated under the shad of lofty trees. It is the opinion of the Messrs. Tulasne that the regular cultivation of Truffles in gardens can never be so successful as this so-called indirect culture at Loudun, \&ce.; but they think that a satisfactery result might be obtained in suitable soils by planting fragments of mature Truffles in wooded localities, selected should be analogous to those of the regular Truffle grounds; and they recommend a judicious thinning of the trees, and clearing the surface of brushwood, \&c., which prevents at once the beneficial effects of rain and of the rirect sum rays. It is added that
this species of industry has added much to the value of certain districts of Londun and Civray, which were previously comparatively worthless, and has enriched many of its proprietora, who now make periodical sowings of acorns, thus bringing in a certain portion of wood as Trufle-grounds each year. At Bonardeline,
for instance, the annual return from Truffes in a plantation of less than half an acre was from 4l. to \(5 l\) Another case is adduced in the arrondissement of Apt , trees are left about 5 or 6 yards apart; and so soon as their branches meet and shade the ground too much they are thinned out.
The districts of England especially suited to produce Truffles would thus appear to be situated on the great island from the south-eastern corner of Devonshire to the mouth of the Wash in Norfolk, occupying all the country that lies to the south-east of such a line including the counties of Somerset, Dorset, Wilts,
Gloucester, Mampshire, Berkshire, Kent, Hertfordshire and parts of Northampton, Norfolk, and Lincoln; and it is to the proprietors of lands in those districts tha these Fungi.
A great proportion of the Truffes exposed for sale in Covent Garden come from Wiltshire and llampshire, collect them coincide completely with those of Messrs Tulasne cited above. I have been informed by otre of these men, that whenever a plantation of Beech, on
Beech and Fir, is made on the clath districts of Salis. produced ; and that theac plantations continue produc they cease to be so. It has been observed that the sperine mont available for culinary purpoers with us is Tuver sostivum, a species considered in France ns of far

White}

Wifference

Eribition at Edinburgh, under the name of White
Sice Permit me, therefore, to direct their attention to the "Fruit Manual," "p. 118, where that variety is deacribed as follows: "White Nice-Bunches very lange and loose, with several shoulders. Berries medium ange, round, and hanging loosely on the bunches. Skit thin, bat tough and membranaceous ; greenish white, becoming pale amber-coloured as it ripens. Flesh firm di sweet." Also to "The Book of the Garden," p. 633 which says: " Nice-Bunches of the largest size, loose, with extending shoulders; berries medium-sized; form giobular; skin rather tough; colour greenish white, changing, when fully ripened in the sun, to a yellowish green; leaves of large size, very downy noderneath; whole plant robust and strong, sets freely and is a very great bearer." These descriptions are esactly applicable to the variety grown here as the White Nice, and generally known in Scotland under that darue. The Syrian is described in the "Fruit Yanual," page 115, as follows :- "B Bunches immensely large, hroadz-loouldered and conical ; berries large, oval shen quite ripe; flesh firm and cracklin pale yellow well ripened, of yood flavour." These two varieties of Gmpes, when ripe, are easily distinguished from each other. The White Nice has downy leaves, prodnces nther loose bunches, with numerous long shoulders, and medinm-sized round berries, in colour resembling forms more compact bunches, with transparent berries, above medium size, of a light yellowish white colour. To have them in perfection both these varieties should hang two or three montha after they change colour. The three bunches which I showed in Edinburgh were grown on a Vine planted seven years aso, and tramed under a rafter 22 feet in length.
Thry weinhed respectively 12 lb . \(9 \frac{1}{2}\) oz., 11 lb ., and 9 lb . \(0 \frac{1}{\mathrm{c}} \mathrm{cz}\); in all 33 lb . Had they been less soverely thinurel, and the shoulders been unpinchel, they would have been considerably heavier. The Vine, notwith Archibald Fowler, Castle Kennedy, Stranraer.

Cucumber Disease.-I have this year
anonget iny Cucumbers different from anything with Which I am acquainted. The evil appeare in the shape of spots on the leaven, which in some instances look as if barned by the sun, but mostly as if they had been
eaten by some insect. The fruit has the appearance of being pierced \(8 n\) as to cause the sas the appearance of tine, after which it stops and the wound beals over, the covering being brown, with a hard surface like rust. froit is affected when nothing more. Sometimes the matter with the plant, and on the other hand I have sometimes bad sound fruit from diseased plants. The malady attacks them at all stages of growth; after plant bas been affected, it however sometimes oul grows the mischief, and one may sometimes be diseased while another plant in the same bed is free from it. Can you afford me any information on the subiect? \(A\) Cucumber Grower. [We do not see anything different Dexed Cucumber disease from that which has perplexed cultivators so many years, and of which the crase has never been discovered. The disease assumes \({ }^{\text {Parious forms. M. M. B. B.] }}\)

The September number of the Botanical Maqazine contains portraits of the following plants:-Liparis atropurpurea, a purple flowered unattructive terres-
trial Orchid found in Cey'on. - Phalanopsis Schiller large-liowered lorm from the collection of Mr. Veitch.-Alströmeria (Bomarea) densiftara, ou of the climbing species of this now too-muct ne, lected genus; the leaves are ovate acuminate, and the lowers terminal umbels are of a reddish criusor, introduced by Mr. Veiteb. - Hemanthus incarnatus, s South African bulbjus plant, with large recumbent obovate-obtuse leaves, and heads of small Alesl-coluured
dowers, flowered by Mr. Wilson Suunders.-Lankesteria Barteri from West Africa, flowered at Gla-nevin; it is a shrubby stove plant, with ovate oblong acuminate enves, and terminal spikes crowied with stowy prim-rose-coloured flowers.-Euphorbia Montieri, a curious Spurge from South-west Atrica, whence it was sent to Kew by J. Montero, Esq. It is a very remarkable ooking plant, with thick fleahy atems, producing leafy branchlets, the leaves spathulate, and the inflorescence at first a single involucre terminating the brauchlet, rays. It has no beauty to recommend it.
The October number, to which Dr. Hooker's name is attached as Editor, opens with a beautiful figare of the charming Calathea Veitchiana, better known in gardens Maranta Veitchiano. It is a very haudsome plant, introduced by Mr. Veitch from Western Tropical Sonth America, through his collector, Mr. l'earce. The leavss are broadly ovate elliptical, elegantly marked with greygreen on a dark green ground, and rich purple behind, while the flowers are in a dense head on a sceptre-like
scape, whitish, the large upper bracts empty as in Eucomis, - Dianthus chinensis laciniatus, the D. cinciJapanese Pinks recently introduced. The favourite Indian Pink, it is remarked, appears like the Zinnia, after long cultivation in Europe and Japan, to have broken out into several very striking varieties well worthy the attention of our florists. - Dendrobium Tattonianum, named in compliment to Lord Egerton of Tatton (p. 890); the plant is a native of North Australia, and has recently been sent to England by Mr.J.G. Veitch; the flower-scape rises erect from near the top of the pear-shaped or fusitorm stems, the flowers being small and scattered, pleasantly scented, white tipped with yellow, the lip deep mauve on its disk. - Stachytarpheta bicolor, a suffruticose stove herb, with ovate toothed leaves, and spikes of pale blue white-throated long it comes from Bahia.-Mesembryanthemum acinaciforme, the large purple flowers of which should do something towards bringing these now neglected plants sgain into notice- - Dendrobium Johannis, a N.
Australian species, descriked at p. 890 . It has terete stems, bearing near the top numerous erect spikes of flowers, in which the sepals and petals are dark brown and twisted, and the lip yellow; the flowers exhale a pleasant odour of honey

The Florist and Pomologist figures Anemone angulosa, already described at p. 698; and Anthurium scherzerianum, one of the most ornamental of stove plants introduced of late years, and which has gone on improving so rapidly in appearance, as it has acquired vigour by judicious culture, that, as well remarked, the only only four years ago, shows the plant "ludicrously spathes being in the earlier figure represented as scarcely more than an inch in length, while they are now shown to have attained nearly three times that size. This plant has been freqnently shown by Mr. Veitch in excellent condition during the past season.

The Gigures in the Floral Magazine comprise-Pelar goniums, William Hoyle and Charles Turner; Rose the brick-red Bougainvilleag lateritia; Epidendrum vitellinum majus; Cyclamen europœum Peakeanum, continucus blooming sweet-scented variety obtained and Picotees, Milton and Mrs. Fisher.

In La Belgique Horticole (Nos, 8 and 9), Professor Morren figurea Bertolonia guttata, one of Mr. Veitch's handsome new spotted-leaved Mielastomads; Francisced Lindeniania, one of the large-flowered species, apparently a good deal like F. eximia; and Cypripedium Crossii, represented as having chequered leaves, and very handsome flowers, in which the dorsal sepal is pale lined with green towards the base, transversely barred with crimson about the middle, from whence red veins extend into the pure white apex, the petals being also tipped with crimson, lined with green, and bearing a few purple spots along the upper edge; the
lip is represented to be of a reddish colour. It would seem to be a very ornamental plant.
L'Horticulteur Français (No. 9) figures two striped Verbenas: Anna Gerard and Belle Alliance, the first very much like Mr. Cooling's Annie, the other more copiously flaked with deep crimson; and Rose Mar guerite Dombrain, a large cupped-flowered Hybrid
Perpetual variety, flesh-colour shaded with deeper rose, raised by M. Eugène Verdier fils.
Booss Recsived. - Purts IX, and X. of the new edition of Webster's Dietionary bring that valuable work from "Scantling" to "Utilitarian."-Part VI. of Brande's Dictionary contains as usual many articles which show that recent acquisitions to our knowledge are not overlooked in this re-issue of a standard work. Under the head of landscape gardening is this piece of advice, as good now as ever:-" Let selected and beautiful nature be constatitly taken as the model, and suceess must follow."- The Technologist for October contains among other matter, an article on the supply of resin, with numerous reports from our foreign consuls on the resin-producing capabilities of their several districts; also on the manufacture of paper from wood-pulp, as well as from numerous other fibrous materials-The October number of the Pharmaceutical Journal continues its report on Pharmacy at the Dublin Exhibition; and, among other subjects discussed at the reeent pharmaceutical conference at Birmingham, has a paper on the effects of soil and cultivation on the development of plants. Report of the United States Patent Office for the year 1862, 2 vois. Of these one, containing 446 pages con-ists wholly of illustrations.-Coloured prints of Aubrietia Campbelliz and of Clianthus Dampieri mar ginata elegans, from Messrs. E. G. Henderson. The
first of these has been fully descuibed by us at p. 506 of our last year's volume ; its history has also heen given by Mr. Campbell, who raised it, at p. 1133 of the sume volume. The Clianthus, as represented, is a white variety of the charming C. Dampieri, with the blossoms neatly and regularly edged with rearlet, the black boss being present as in the type. If at all equal to the representation it must be very handsome, and cannot fail to be an acquisition to our gardens.
Capalogus Recervzo, -Johe Sootts Descriptive Catalogue of Fruit Trees gives full descriptions of a
large collection of fruits, as well as a good deal of -Descriptive Catalogue of Nursery Stock by the same.- T'. Warner's Catalogue of Fruit Trees, \&c., is also descriptive, but briefer than the foregoing. - Van Houtte's Catalogues des Plantes de Plein Air is devoted - herbaceous plants, and hardy trees and shrubs There is a very full descriptive list of Hardy Rhodo dendrons.

\section*{}

Dubing these few years past I have been is the habit of seeing a collection of Ixras, and I have often felt surprised that these beautiful half-hardy summer flowering Cape bulbs are not much more generally grown than they are. They are so varied in colourranging as they do from glowing magenta and bright crimson to the most delicate pink-they are also so easily managed, that the limited attention which they have hitherto received must in a great measure be and merits of the flowere, rather than to any incapacity as to cultivation. I well remember seeing some eigh years ago at Dropmore beds of Ixins on a Grass plot, and so singularly gay were the flowers seen there on one of the brightest and sunniest days of the month of June, that since that time I have always been an enthusiastic advocate for their more extended cultivation. Just at this time of year, when orders are being given to seedsmen for the spring supply of bulbs, it may not be undesirable to offer "a word in season" as to some of the best and most striking varieties of this flower, the following selection of which cannot fail to afford the cultivator the most lively satisfaction :-
Anais, pale buff or fawn, tinged with deep lilac, and having rosy purple centre.
Aurantiuca major
Aurantiuca major, a very fine variety; bright golden yellow, Aurora, golden buff groubd, striped and suffused with rosy purple; an early flowering variety.
Bucephalus, deep magenta, very
Bucephalus, deep magenta, very. fine and showy, a "flower
Bat shculd be in every collection."
Beauty of Norfolk, cream, tioged with magenta, and having
 Cyrus, pala, golden buff, witit donse marking of ro:y purple
a the back of each segment of the flower.

Cupid, blush, tinged with deep pink; very pleasing in
Dolphin, golden fawn, tinged and pencilled with rose; eye
Dos
Dian3, pale lilao and rose, with amaranth eye.
Hemisphere, yellow and deep rose, with dark contre
Hybrida longiflora, pale rose! with dark eye; flowers very striking when fully expanded,
Lady of the Laike, glowing magenta, with dark contre; Macutiful and strikiog fower.
for
Magnifica, rich golden yellow, tinged with red, and salmon
ye, exceadingly fine. Thisi variety is considered by nome to Nelanni, sulphur, with marking of deep rose, and dark eye;
very fine.
Owhir d'or, bright crimson, tinged with orange.
Plautua, rich golden yelnw with dark centre, haviug broad stripus of deep rose on each serment of the flower.
l'hebe, palc guden buff, exquisitely marked with rase Pallas, pals orange, with rosy purple stripes, and darts
centre; very fine. Risea muitifora, delicate pink tinged with brigit rose, cutre deep pivk; novel and fine.
Silas, very like Auais, but ruch
ine variety.
Sulphirrea spicata, sulphur, with rosy flame on each seg
ment ; eye dark. with rosy purple eye, tipped and striped
with the same colour.
Titus, bright yellow, with dark eye; very showy.
Wonder, \& semi-double flower; colour reh
Wonder, \& semi-double flower; colour rich glowing rose
Viridıflora, pale green, with dark centre; very novel indeed.
Though some of these varieties may appear ton clowely to resemble others, yet they are in fact very different.
Ixias succeed best when cultivated in the open ground. They should be planted in rough peat with which some good leaf soil has been mixed. The strong bulbs scarcoly require tha addition of any silver sand to this, but the smaller and invariably weaker bulb should be planted in a compost which should comprise ully one-third of silver sand. The border in which they are to be planted should occupy as warm situation as possible; it should be sheitered from the effects of hard frosts, and on no account must the soil of the beds be allowed to get dry when the plants are in a growing state. The beds should be raised abont six inches above the ground level, and the hulbs should he planted by the end of Novembir, and buried from three to tour inches deep. The beds should also be sheltered from the effects of heavy rains as soon as possible after the bultis are plauted : too much moisture at this pernol will induce rot; and when the plants are in bionm some sifulter from he ivy rains shouid also be extemporised, as the moisture lolging on the thick apikes of ilussoms will often calle the stalk to saap by reason of the superincumbent weight.
If cultivated in pots, a soil compounded of good fibrous peat, leaf-mould, and saud, in about equal proportions, should be used. Pat from three to four bulbs in a 32 -sized pot, and place them in a cold frame for the
made growth, say to the height of 6 inches, they sos The Sparaxis, Babiana, and to flower.
family as the Ixia, but the last is known Sparaxis by not having, like it, a jaguel sheant berry; and from the T'ritonia by having then inserted at the bottom of the petals instea tube of the flower. Two or three varieties of :0, are worthy of cultivaticn, viz, graudiflora variety, superb rich crimson maroon, หith ve, Angelique, pure white, with yellow ege; and Emmanuel, red, surfused with yellow, very siowry The culture of the Babiana is almost eatirel It seeds freely, and if sown in the autumn will imes produce plants to flower the following summe generously grown.
Two varieties of Tritonia, T. crocata and reven, lowers of a fine pinky maraxis. .. crocita very showy blossoms of bright orange rose; T. A. liant, with flowers of an intensely brilliant range, is said to be an extremely fine nein I have not yet seen it. Like the Sparaxis they ifter gorgeous and showy, and flower about the satre . The culture of the Sparaxis, Babiana, anil the Trith. should be the same as that recommended for the thi The two varieties of the Tritonia, crocata and \(m\). differ materially from and must not be confounded nit Tritonia (Crocosma) aurea。Quo.

The hives are also have uew floor boards to sai: house. I intend to raise each hive now on three wedges, hall an inch ing; aud when the bees have all transfer the hives to the foor boarces behind. Then close the entrancem
with perforated zinc, and put them it has been moved to its proper place. This in the bl plan I cau think of
"I have fed up the tivo swarms from the fine of year I told you of, after having streupthened han and swarm-a mere baudful giveu the two nearly half 17 lb in the other.
7 lb . in the other."
We use and should recommend the Stewarton hives. One slide only ner ber
? the bottle. There is no necessity for the bottle to e placed in the centre. If a block of wood with a cestral hole, through which the neek of the bottle can certirnst, is used, the slide can be drawn out further fiace s piece of perforated zinc over the narrow open an which invert the botcle, having previously Thow a cloth over the bottle, and put on any kind of iemporary covering. The bees will not take down the od to rapidy as if they had access to the entire lismeter of the
As regards condensing the moisture in hives during Le winter, we have long ago discarded any appliances a iapted for that purpose. It is, in our opinion, not air unnecessary, but absolutely injurious, and beea. Uur apiary for many years has passed through anch succeeding winter with as little loss of hives as ayly other with which we have been acquainted, and Do moisture catching apparatus has been used. On Lie contrary, we endeavour to have our tops as closely amented as possible. In our earlier bee-keeping whether as a consequence or not, the average mortality was very large. By the very means taken to prevert accumulation of moisture within the hives the evil is increased, owing to the cold surfaces erposed, and to the cold air which finds its way through any crevice. The only precaution we take for preventing any iojarions effects from internal moisture, is that cilcing our hives formard, by placing a wedge or two of nool of about 1 t inch thick under the back of the loor-boards. This allows condensed moisure to run
to the front and out of the entrance. In addition to thin, we usually remove from our larger-sized frame bores the two side combs, to be replaced in spring.
The feeding in spring may be carried on in the ame manuer as before stated, ouly a much smaller पnautity must be given at a tiune, and a smaller
lottle fitted in a wooden block is desirable. Care wiust be take:1 in this, as well as in the other case, Lat the neck of the bottle goes sufficiently through to

Iu trausferring the hives of the hive no canse to fear any ill effects from the future position of their entrances being a foot or so more with respect to the floor-boardy, it is a pity that it is necessary to change them at this seazon, and break up
the at present securely fastened lives. But if the at present securely fastened hives. But if it
must be doue, we should alter the plan proposed slightit!. Separate the hive from its board, lay three melges on the new board, and quickly lift off the hive, resting the edges on the slips of wood. If any bees remain on the board, bring them on it closs to the atock, and they will quickly run in. Now let dorn the hive gradually by removing one wedge at a
time, and not a bee need be crushed
We are not surprised at the result of the feeding of tho two weak hives. It is just what we stated in a previous communication that it would be. But at
any rate the hives are most probably safe untit the apring. No doubt but that some comb has been made, and breeding promoted, so that these two hives are in a favourable condition for commencing their Iaxt campaign.

\section*{\section*{Garden Memoranda} \\ Moncribffe House. - This, the delightful residence} of Sir Thomas Moncrieffe, Bart., is situated about platform at the base of a range of hills, which extend madmard from the junction of the rivers Tay and Earn, loat in diminishing in height until they become finally of comiderable extent, inclines gradually from the level in southern boundary. To the river Earn, which the great Northern road, Trom which end is separted by \({ }^{2}\) stone wall. The beautiful mountain-the Hill Moncrieftly behis its northern boundary; it rises up of more than two extends onwards a distance e river as the extreme end of the parks. timber, amongst which a considerable admixture of These trees ee, and Scotch Firs has been planted. up perpendicularly at intervals along the face of the in questione, and produce a fine effect. Below the hill in thestion the park of is also magnificently wooded, bot li wise many remarkable single specimens of treesseattered ingnt, of which we noticed the following.
teir stupenduus forms of Horse Chestnut growin feet in mansion, one of which in 1525 measured 15 the ground; in 1859 it the helght of 3 feet from sime distance from the measure. 185 feet at the The ground the trunk heirht of 7 feet 6 mehes from limbs, and again at 16 feet ins into three inmense Which reach the covering with its ponderons branches, cime of thee-a glorious object, and probably not only ose of the largest, but also one of the oldest trees in

Scotland. A hand ome Aob, 90 foet in height, with from the ground. Several mood girth 11 feet at 3 feet Turkey Oaks may also be found amidens of Scarlot and Planes, Elms, and Oaks: of theee latter gigatic Limes, 3 inches round at 3 feet from the ground, and it is 90 feet in height-a noble specimen. Here and there thriving well-protected examples of Coniferre occur, among Wellinge remarked Picea nobilis and Nordmanniana, Wellingtonia gigantea, the brond-leaved Doughes Pir and others equally interesting. A fine old Waluut is
60 feet high, and measures at 3 feet frno the ground 60 feet high, and measures at 3 feet tr un the ground
13 feet 6 inches in circumference. Another remarkable Ash deserves notice; it is 100 feet hizh, and has a girth at 3 feet from the ground of 14 feet 6 inches, covering with its spreading branches the area of 270 feet in circumference. Towards house portion of the park, immediately facing the Firs, which produce a fine effect on cliefly of dark contrast which they make with the round-headed, hardwooded trees with which they are associnted. In the midst of this plantation is a "curling" pond, which is usually covered with ice on the first setting in of frost, and contiguous to it is a remorka'le White Willow. An old tree had been blown down and deenpitated, and from the ancient trumk, which is some 10 feet in length, and nearly perfeetly dicayed, save some live bark on one side, a moble lead has been formed, which on account of its comparaturely frai support is regarded by may with interest. Several
good specimens of Purple Beeh and roumblowaded Thorns ate also very effective ohjects 10 a landseape really rich iu natural beautics.
The house, as has been already stated, is situated on level ground, overlooked by hills; it is a large fourstoried commodious building of simple architecture, and is about a mile distanit from the Bridge of Eara station beatiful buildings of the Bridge of Farn, the road crosses the river of that name, and entering the pirk sweeps on ward until it reaches the eastern front of the
mansion, where the main entrance is situated. From mansion, where the main entrance is situated. From separated from the road by a light iron fence. As this road ip, however, also that by which access is gainel to the stables and offices, the privacy of the gardens is in consequeuce much interfered with. The propriety of removing the entrance to the opposite sile has ther, fone been suggested, an alteration which would int involve much expense or canse the removal of more than a very few trees, which mirht come in the way of the proposed line of new drive. From this point a better line of junction would be effected with the magnificent western approach, by which we departed, through an avenue of ancient Beech a mile or so in length, to where it joins the great Northern road, one of 'Telford's noblest works-and which is led gracefully onwards round the shoulder of the hill, From the elevated ground here a charming view presents iteelf. In the fore-ground is situated the beautiful city of Perth, with its towers and apires, its handsome
bridges spanning the broad, clear, placid waters of the Tay, one of the largest of British rivere, which rolls majestically onwards to the German Ocean. On the right the finely wooded hill of Kinnoul rises up abruptly from the river's edge to a considerable altilude, the numerous villas and gardens with which it is adorned appearing to much advantage thus elevated in position. Beyond are the woods of same, amiars its towers, the whole being encirclad by the lofty and rugged range of the Grampian Mountains-altogethir a glorious scene. Retracing a little, and leaving the public road, we gradually ascend by a broad carriage drive to "Moredun top," the hicghest peak of Monerieffe within a ring of considerable size. The secnery from this spot, as Peunant says in his History, is the "glory Scotland." It includes the broad valley of Strathearn, one of the richest and best cultivated districts in the North. When we saw it a few weeks ago the whole was of a golden hue, ready for the sickie, ab far as the eye could penetrate; not a single fallow field could be seen-all was under crop. In the midst of the valley the river winds fautastically with an almost imperceptible current, forming a conspicuous feature of the lovely landscape. On its banks and prominent points, embosomed in trees amidst wide-spread lawns, may be seen castles and mansious, the residences of the nobility and landed gentry, while comfortable villages and detached cottages occur at intervals, and substan ial farm steadings, with their tall chimneys and fixed machinery, rear their heads in all directions. The broad crystal stream, too, is spanued by several handsome bridges, and the whole is well backed up br the nountains of the Ochill ratuge, sonae of which are beautifully and artistically civerpll
woods, producing an admirable effect.
Descending from the hill top, nne looks down upon the nlain below as cn a map. Proceeding onwards, we pase the front of rocks (where pebbles and agates of good quality are founi) by well-directed walka. As we get spaces many well-protected thriving specimens of choice Coniferæ, rising up over a loxuriant and very effective carpoting of Bracken. Among them were the broad-

Wellingtomia cigantea, Cryptomerin japonica. Capresatus Lissoniana, all in beautiful condition. There were also two goul plants of Arancaria im? ratis of con romored ir apparently doing well. *here they had enferel ir in ite cin it the park
 effective contract. Pinus Combra, tho, seen much at home in this elerated situation. Ou the right amidat the partial shade of lofty trees, there is an admirably constructed marble-fitted dairy, with a thatehed projecting rost, forming a culonnatic an! round fierce rays of the summer sun. \(D\).

Srazcaria Rulei.-The newest of all the Araucarias, and perhaps one of the most remarkable, Whether as to This was first known in England in 1861 or 1862, when small specimens of the foliage were rec we of the trees as yet discovered occupying a radius of only half a mile, and this on the sieason proluce the greatest extremes of drought and heat, or cain aud cold winda, and where no other vegetation exists for hundreds of foet below. It at double the eleration of the habitat of that taee. It was diccovered and introduced from Port Mollo by hr. II. Duman, collector of Jinn Parim, Esy, it is specific name. It is a tru romis cane \(\overline{5}\) ) or 00 feet high, bram hing in like mammer to A. .a :i atm, stemn, and thene of a more rigid and tubular form, forking in all directions, at equi-listancen, symmetrical manner. The leaves are very closely aftirity is with A. imbricata, which it resembles in
remarkable degree in many points, but in others it is
wholly distinct. Its beauty js said far to surpass the wholly distiact. Its beauty is said far to surpass the known. 'The cones are nearly spherical, the scales about an inch brond, terminating with a long projecting narrow point, or scale, abjut an inch long. Of the economic uses of this species nothing is yet known, though it is probable the seeds are eaten, like some of the other species. Mr. W. Bull, the well-known nurseryman of the King's Road, Chelsea, introduced this rare plant into this couutry. J. R. Jackson, in Intellectual Observer. [A figure will be found in our volume for 1861, p. 868.
Study of Natural History.-The following letter on this subject from Mr. Carlyle is given in the Edinburgh Courant:-"For many years it has been one of my constant regrets that no schoolmaster of mine had a knowledge of natural history, so far at least as to have taught me the Grasses that grow by the wayside, and the little winged and wingless neighbours that are continually meeting me with a salutation which I cannot answer, as things are. Why didn't somebody teach we the constellations too, and make me at home in the starry heavens which are always overhead, and which I don't half know to this day? I love to prophesy that there will come a time when, not 'in Edinburgh only, but in all Scottish and European towns and villages, the schoolmaster will be strictly required to possess these two capabilities (neither Greek nor Latin more strict), and that no ingenuous little denizen of this universe be thenceforward debarred from his right of liberty in those two departments, and doomed to look on them as if across grated fences all hins life!" Carlyle's longing to know the Grasses by the wayside will no doubt recall to many the questions put by Balzac to his gardener before writing "Le Liys dans la Vallée." Book-learned men have constantly this sort of desire to get at the heart of auother kud of lite than that they have studied to satiety. Berries from the Tree of Knowledge.-"By all means let classics be retained: as the handmaids of more useful branches of study. Valueless themselves, they Thoroughly satisfied of the truth of this principle, an Oxford M.A. of ominence-he took (he mentions) high botanical honours, though "comparatively weak" in Latin and Greek-determined to test it at a recent middle-class examination. The result was a paper in Latin prose translation, of which, he admits, the candidates "could make nothing," but which he still cannot but consider a move in the right direction." We subjoin it; adding also the interpretation, as sent -which, we may add, the words seem to us to bear "vix aut ne vix quidem" in some places-for the benefit of the mere classic.

The style of the Latin is more or less that of Cicero's letters; though we think be would certainly have expressed some of his ideas-towards the end especially -in different language. We are not altogether satisfied of the rectitude of the "move." Surely it is pushing the Oxford theory a little too far. We commend the English version (fragments of which seem, unaccountably, familiar to us) as a useful memoria technica, to the notice of mothers and governesses. Pall Mall Gazette.
Ailantus Silkworm.-The long continuance of warm weather has greatly favoured the experiments made in the rearing of the Bombyx cynthia. In the enclosure within the Jardin d'Acclimatation, in the Bois de Boulogne, may be seeu at the present moment a large number of these worms, of the third generation of this season, feeding in the open air on the Ailantus, or spinning their cocoons. The creatures are of great size, and seem to be in perfectly healthy condition. The cocoons are generally formed at the extreme end of the branches, or rather of the leaves, for the Ailant us has long compound leaves, with many leaflets, like the Ash, where no bird, however light, could rest and make a meal of the occupant, ard the worms take the curious precaution, before commencing the cocoonl, to attach several threads of their web to the leaf-stalk as high as the third or fourth leaflet, so that if that on which the cocoon is fixed were to be broken from its stalk, it would still be held pendent by these stay-threads. Journal of the Society of Arts.

\section*{Calendar of Operations. (For the ensuing voeek.)}

Atthoigh the weather is still comparatively favour able, all half-hardy plants intended to bo wintered out of donrs should now or very soon rective some kind of
protection. Various protection. Various materials are used for this purpose, but the principal point to be aimed at is to
cold; for it is well known that they will endure a much
lower degree of temperature without injury if the ground is dry below them, and if the stems are kep dry, than when in a wet soil, and exposed to rain. Deciduous plants may be tied together as soon as the leaves have fallen; the ground about their roots may be covered with ashes or Cocoa-nut fibre, and the stems thatehed over with Fern or straw. Evergreens may be protected with a covering of mats, or some other material of that description, put on so as to open towards the north in favourable weather. Leaves, ashes, old tan, and many other articles are all useful, and can be got together now for the protection of tender herbaceou plants. Branches of Evergreens are also extremely
valuable for tying against plants on walls. Mats should valuable for tying against plants on walls. Mats shoul
now be got iu readiness for covering frames and pits.
flower garden and plant houses.
At this season every effort should be enployed to keep up a good display of bloom in Conservatories and Greenhouses, They will now be used much more than when the weather is favourable for out-door exercise ; their inmates, if attractive, will therefore be much more valued now than they would be at any other period.
Chrysanthemums.-Care must be taken to keep these in good condition. A little weak liquid manure given occasionally will assist them in making a better display than they otherwise might do

Crocoses. - While bulbs of these in pots are kept in dark place, very little water need be given, merely sufficient to keep the soil, Moss, or sand from becoming too dry. When the roots have made some progress,
the crowns will soon make their appearance; and as the crowns will soon make their appearance; and as soon as these are observed
greenhouse or conservatory
Pelargonioms should be kept rather conl and dry, of fine days, so that the superfluous moisture may be dried of fine days, so that the superfluous moisture may be dried
up before the evening, and avoiding the use of fire-heat up before the evening, and avoiding the use of fire-heat falling below \(40^{\circ}\), or to dispel damp when this canuot safely be done by giving air.

FORCING GARDEN.
Cucumbers. - These must be well attended to in order to eusure success. A temperature of about 70 should be maintained, which will allow a little air to be given on comparatively cool and dull days. Stop proyressing shoots at every second joint, and pincla off all tendrils and young fruit that are not wanted to swell as soon as they appear.
Peacers and Nectarines.-Prune and otherwise prepare the trees in the earlier houses for forcing, and cover the outside border with leaves or litter, for the purpose of excluding frost and heavy rains.

Pings.-Stock expected to furnish frnit next summer and autumn should not be too much checked, indeed it may be kept growing slowly all the winter, which is perhaps the most gertain method of preventing its starting too early in spring. Where the plants likely to fruit without inaking further growth are considered insufficient to meet the demand until next autumn, the stronger plants of those for late fruitiug should be encouraged to make growth as early as can be done without weakening the foliage, with the view of preparing them for starting in April.

Vines.-Houses which it is intended to commence forcing early should have some fermenting materials placed on the borders so as to encourage the roots a little before the Vines are excited; this will be of great service towards getting the buds to push strongly and without loss of time.

\section*{hardy fruit and kitchen garden.}

Apple stores sloould be often examined, picking out all that show symptoms of decay. Any of the more choice varieties of Pears that do not ripen properly should be removed to a warm dry room for a few days, which will be found to greatly improve them. Keep all fruit as cool and dry as possible. If frost is excluded from the house it can scarcely be too cool where the object is to preserve fruit plump and sound as long as possible.
Asparagus. - Young plantations of this will probably still retain their freshness; in which case the tops ought not to be cut off yet. It is a common custom after the beds are cleaned to spread manure on the surface, and then to dig the alleys and cover the dung with purt of the soil. This top-dressing can on!y benefit the plants by rain washing its nutritive particle down to the roots. It might, therefore, lie exposed all winter, and be forked in when the beds are dresser in to be dug out; a dressing of manure should be lightly turned in instead.
Beer.- This may now be taken up and housed. In lifting great care should be exercised not to break off the end of the root or to wound the skin, for when this happens the cylouring matter escapes in the process of boiling. Trim off the larger leaves and atore the roote in dry mould or sand, like Carrots.

Cabbagrs. - Where the late dry weather has hitherto prevented these from being planted, now that wet has c)me, no time should be lost in getting them in. Where
they have beell well looked atter they will be coodsized plants, and if carefully transplanted they will be as forward next spring as if they had beeu put in eirlier. Earth up Coleworts.

Crlery. - Take advantage of dry Feather, is xse
to give a general earthing-lip. Endrye - Let this bg-up

The Garicultural Gazette

We have often described in these columns establishments-markets they may be called for their great extent-where enormous quantities of agricultural produce are manufactured-many thousand quarters of Wheat, for example, weekly into tlour and meal-or many tons weight of bacon daily from many hundreds of fat hoge weekly. We have now another instance of the kind before us-the establishment of a private firm, whose goods are now known all over the world-where, from a comparatively small beginning, the growth of a quarter of a ceatury has at length covered nearly two acres with buildings in which many thousand sacks of tlour, many hundred tons of butter, many million eggs, and many hundred thousand galions of milk are annualiy converted. We do not refer to the tons of sugar, currants, treacle, \&c., which are every week brought into consumption here, for they are not the agricultural produce of this country, and we aim at interesting English agricultural readers only.

And if any one imagines that a manufactory of this extent is not properly an agricultural subject, let him just consider what area of land thus tiads a market for its produce. The milk consumed must need nearly 1000 cows to yield it, and these, as ordinarily spread on dairy farms, would oceupy tour or tive square miles of pasture land; the butter used corresponds to the production of many times as many cows as yield the quantity of milk. So here are 30 square miles of Grass, whose dairy produce all comes here. To supply the eggs required, the produce of nearly 20,000 hens must be collected. The Wheat flour manufactured here,
if we suppose the average produce of the conntry over a diatriot wholly arable, oultivated on the four-field course, needs nearly 30,000 acres of plough land. Here then, in all, is the Wheat and dairy produce of probably 80 to 100 square miles of territory, and we should add the eugs of a thousand British homesteads were it not that those employed are chiefly foreign, constituting about 100th part of the whole egg-import of the country. We imagine, then, if only on the soore of their influenoe as great buyers in the market of agricultural produce, that occasional reforence to such establishments as this is quite within the soops of an agricultural journal.
We are referring now to the Bisouit manufeotory of Messis. Hextley \& Palmeas at Reading. There are here a 50 -horse power engice and 800 men and buys emploved in converting all the raw materials we have named intu many thousand tons a year of manufactured goods. About 40 tons of coal (inclusive of the quantity needed for the engine boilers) are here ueed weekly in driving off ia ovens both the water naturally present in these raw materials (for a sack of th ur weighs 28 lb . more then the ship's bisouit into which it is menufactured) and the water mised directly or as milk is dough. A sack of flour weighing \(2 \frac{1}{5}\) owt. noed \(\frac{4}{4}\) of owt. of milk or |water to 'make it dough, and thus 1 owt. of water is driven off fur every sack of flour consumed. Of course the heat is also used in baking-its operation is prolonged byyond the period needed for mere denicoation, in order to the partial roasting which we imagine to be ohemically equivalent to the partial combustion of the goods. The quantity of coal required t., drive off a known weight of water in the conversion of dough into biscuit, which we had supposed might teach us something as to the possibility of artificial haymaking, cannot therefore, we fear, throw much light on that subject. It is, nevertheless, ove of the items illustrative of the extent to which enterprise and intelligence have led to success in a great commercial undertaking, and examples of this kind are usefully brought under the occasional notioe of agricultural readers. The process of manufaoture here may be desoribed as follows:-
The various raw materials are brought to one end of a serien of buildinga; and in the mixing room, where they are firnt brought together, apecifed quantities of fiour, sugar, butter, white or yolk or whole egg, treacle sce, according to the nature of the axticle required, are weighed and measured out into the receiving pans of a pair of scales, which stand over the bopper of a mixer. There are six such hoppers in the room, and when the quantities proper for biscuit, gingerbread, or cake, of whatever the article required may be, are thus allotted, the pan is emptied, and the whole masa of 1 or 2 cw . or more finds its way down a wooden tube through the
floor. In the lower room there are a number of mixert continually at work, four of which are horizontal circular iron pans, which revolve rapidly under a heavy corrugated roller whose axis hinges radially on the centre of the revolving pan. This revolves more slowly, with its whole weight reating on whatever may be lying in the trough. The attendant is contian vice turning the mass from the rim to the centre, and vice versa, and thus the mixture, whatever it may be, In the so-called vertical mixer, a sort of horiznntal In the so-called vertical mixer, a sort of horiznntal cylindrical pog mill with radial arms is about one lifted, torm, and aropped, and thoroughly commingled.
In a quarter of an hour or more a cwt. or two of dough becomes thus tolerably prepared for use. This is then taken to successive pairs of heavy iron cylinders, between which it is repeatedly passed and repassed doubled up in mass on one side, and issuing in a thin leathery sheet upon the other, until it has become absolutely homogeneous and posseased of just the requisite temper and tenacity
These cylinders are in some cases detached machinea, and then the dough, when thus properly attempered, is taken from them to the biscuit machines. In other cases they form fixed attachments to the biscuit-making machines, and then the dough being taken from the mixer and passed once or twice through these cylinders, is at length received in a thin continuous layer, about 3 feet wide, upon a travelling canvas, and thus passed under the stamping apparatus, by which oval, round, or angular pieces almost contiguous are punched upon the sueet; and the waste intervening or interstitial portion, still forming a continuous sheet, being lifted at one end, is carried over a roller and delivered ou one side to be rolled over again, while the biscuits pieces left upon the travelling canvas are received on wirework trays and passed through the ovens.
This stamping or punching of the biscuits is done in different forms of wachine. In one, vertical stampa are used. They are pressed on perhaps a foot length of the sheet of dough at mace, and work up and down, thus ataraping the whole surface as the dough passes under it and proceeds, in its stamped condition, al alrendy described, to have the waste portion of the
surface left between the biscrit pieces lifted from it and removed. -Then there is an automaton stamper, in which a frame of punches of the proper form is pushed againat the sheet of dough as it passes over a cylinder, from which it lifts the biscuits by an intermittentemotion, depositing them upon a travelling canvas. does just in time to return to the charge as a sufficient length of dongh has again appeared to receive it and refill it. In this case the quantity of the remaining interstitial portion of the sheet of dough is reduced to a minimum ; for whether it hangs together or not is unimportant; it drops into a receptacle where it is taken for re-use.-Llastly, there is the revolving the extent which the thickness of the biscnit needs the catting edges between the biscuit-dies and the separating interstices alone remaining fized. The movable surface of the biscuit punches is moved in and out at one part of the revolution; and the movable surface of the insterstitial pieces is moved in and out at another part of the revolution. The consequence is that as the cylinder revolves upon the sheet of dough, its whole surface becomes filled and clogged to the depth of a biscuit thick, and the biscuit pieces are pushed out at one place on to a travelling canvas, and the interstitial waste pieces are pushed out at another place into a receptacle, whence they are carried back for use again.
In every case the biscuits are received on wirework trays, as well as iron plates, and these are carried to the entrance of the socalled revolving oven floor. These are irou webs, 4 feet wide, and 30 or 40 feet long, revolving on rollers at either end of a long oveu, and thus constituting the moving floor of a bot-air chamber. The trays any particular cake or biscuit laid upon them remains for 8 minutes up to 30 minutes exposed to the lieat. And thus the dough, which is continually going in as stamped fragments at one end, is coming out as biscuit, hot and crisp and made, at the other.
There are about 10 stamping machines and automaton cutting machines continually at work; and there are so many both of revolving ovens and common ovens, as represent a baking surface altogether of above the machines is in direct commonication with the oven, by which of course the labour of carrying between the two is saved. In this case the dougb received from the mixer and from its own waste receptacle, is passed through in a continuous sheet on to the stamping cylinder, which is continually delivering its circular or lozenge-shaped pieces on to a constantly revolving iron web, which carries the whole right through the oven beside which it works, and at the
other end of which accordingly these trays of finished biscuit are continually issuing.
It must not be understood that the manufacture here is confined to machine-made biscuit. Every variety of article of the kind, made partly by hand, and partly by machine, is supplied to the trade. Machines like our owu drain-tile tools are continually pushing out long lines of fretted sweetened dough, which, cut up into fragments, make one kind of fancy ware. Cracknele, another kind, are made by subjecting the stamped their moisture into stean, when they rise to the surface, and are skimmed off and thrown into cold water, to be aguin somewhat hardened in their expanded form before baking. Many hands are employed in rolling out paste so thin (for a particularly thin wafer biscuit) that machinery has not yet been found able to deal with it, Many other fancy kinds of calse and biscuit are rore or less made by hand. And it is found that the general interests of the concern are served by a portion of the goods or of the processes being thus manipulated, a portion only of the whole being dependent on machinery. There is a higher standard of quality continually before the manufacturer to be maintained in the machine-made goods when the ideal standard which is in this case more than nearly reached by a clever working man is thus continually presented. And it is well to have a school for individual skill thus constantly attached to a inmafac turing eatablishment; so that there is thus an advantage in having one or more departments or sections of the manufacture in the hands of skilled artificers.
As regards the machine-made goode, the tools, though in the main unaltered from year to year, yet have to be adapted from time to time to the varying demand for particular forms of biscuit, and nothing is more necessary to commercial success than prompt attention to the earliest signs of varying demand. As an illustration of this we were informed that it was but th other lay that a particular form of little biscuit, about the size of a pigeon's egg, but flatter, was first introduced; but so rapidly has the demand arisen for this little "pearl" biscuit, as it is called, that the consumption of flour for these alone is
of some thousands of sucks per annum.
The trays full of baked articles of all kinds are carried as they leave the ovens to the lift, which takes them all to an upper story, and there they are distributed in trucks on shunting rallways all over the upper floor of the buildings-some of them to drying rooms, and others at once to the packers, by whom they are weighed into cases, or, in variously apportioned mixtures, placed in tins and boxes for trassminsion to all parts of the world, The manufacture of tine and boxes for this
parpose, part of which is carried on upon the premises, thorough organisation by which•so large a manufacture is carried on with the utmost economy of labour and material within a limited area.

And thus the flour, milk, water, sugar, ginger, spice, treacle, butter, egge, currants, almonds, raisins, \&c., delivered from railway trucks and vans at one end of the series, after traversing warehouse, mixing-roome, machines and ovens, liits and drying rooms, and packers, is ready for delivery into
warehouses or directly into railway tracks and vans again. There need be no accumulation any where, and it requires not more than a few hours for the whole process to have been accomplished; and the various substances which entered in the morning as the raw material of the manufacture may be ready packed for delivery to customers before night. In point of fact the stay of the material on the premises during the process of manufacture is not necessarily more than an hour or two.
We feel certain that our readers have not considered this short account of a great market and manufacture of agricultural produce to be out of piace in these pages. There only remains to be added, in reference to the relation of master and servant here, which is a subject interesting to all employers, whether agricultural or otherwise, that the wages paid vary from \(30 s\). a week for skilled labourers to 15 s , a week for common labour, and from 48. to 88. a week for boys. And these wages have a special agricultural interest ; for it is impossible to doubt that much of the great rise in the price of butchers' meat during the past fow years is owing to the nuch larger sum paid to labourers throughout the country. And thus the prosperity of the various manufacturing incustries has a mighty influence over that of our agricultural districts. We have only to add, that in the manage ment of the large body of labourers here it has been the endeavour of the employers to study both the independence and the welfare of the people. The only piece of cuercion that is exercised is to insist on every one subscribing to a sick fund from \(1 d\). to \(6 d\). a week, according to his wages. * Opportunities, such as reading room and occasional social gatherings afford, are offered to those among them who choose to share in the attendant expenses. The whole establishment appeurs to present a capital example of success as the result of well-organised labour and machinery, inventive and administrative power, and good business management.

The game laws and the relation of landlord and tenant on the subjeot of the wild animals maintained upon the land occupy attention on the Continent as well as here. Not cnly are they discussed by the Midland Farmers' Club, the Sooial Science Congress, Mr. Bright and Mr. Hopr, but French Bishops comment upon the subjeot, and seem to have as bad an opinion of a chasseur as the Pope has of a Freemason. In Austria, acoording to the Gazette des Courses, the number of animals that corne under the head of game must be considerable, while those that are simply considered noxious and destroyed whenever there is a ohance are countless. The number of animals and birds killed daring the chasse of 1864 and 1865 in Bohemia alone is thus quoted in the Journal des Débats of Ootober 10. It should be remembered that the season is described as below the average :Bucks, 1342; deer, 1855; wild boars, 587 ; roebueks, 9764 ; hares, 488,824 ; rabbits, 6271 : foxes, 6461 ; otters, 249 ; badgers, 238 ; martius, 2262 ; polecats, 23,109 ; squirrels, 14,494 ; hed rehogs, 208 ; black game, 510 ; ditto large, 1688 ; gélinottes, 1867; pheasants, 62,174; partridges, 586,195 ; quails, 14,415 ; woodcocks, 4811 ; ducks, 17,452 ; herons, 1240 ; snipes, 1811 ; wond pigeous, 3262 ; great bustards, 941 . In birds of prey:great eagles, 87; horned owls, 217 ; kites and buzzards, 9372 ; vultures, 8839 ; falcons, 6741 small owls, 8168 ; the list oloses with 168,118

The disease has now been two months in Holland, and tre panic created by it in a country whose chief wealth is been far !ess than was believed. Up to the last ascia! statement 3319 animals had been attacked, of aich 1169 did, 674 were slaughtered, 717 recovered, ad the remainder number of cattle in the country, less an the thee in every 1000 have yet been attacked by the rease, and not two in 1000 have perished. Jame iuceard, The Hague, Oct. 13.
2. From Mr. Grabam, of Caprllie.-I own a end of 120 Ayrshires and a flock of from 300 to 400 heep, and, notwithsting my cattle and sheep or of its eing curable if it visited them. I believe that the but contarious, and therefore I take care not to intryfuce among my stock any cattle or sheep from market, ruck, or boat where diseased animals have been. I purchase from farmers on their own farms, and only afitected by any contagious disense, or which have not me recently from any public market. I take care, wo. that any one who has been lately in a cattle-
market shali not come within my cow-houses. I thus itn lot apprehensive about my stock being attacked by the eattle plague ; but more, I feel quite confident that if they were I should be able to cure them, and that rithout much difficulty. It is now a good many yeara autle diseasea. It was authoritatively pronounced, it is atill generally believed to be, incurable, just 3 rinderpest is now declared, ex cathedra, to be that mont easily. I believe the same of rinderpest, and by means of the very same treatment. In what do pienro-pneumonia and rinderpest differ? Only in the
iart of the bndy affected. In what are they the same? art the immediate cause, which is inflammation. What removes inflammation in the one disease, or rather in L.e phase of the same disease, and restores the affected animal, ought to remove it in the other, and save the sufferer. How, then, is inflammation subdued in a case of pleura-pneuminia? Simply thus:-Take three
toblespoonfuls of sulphur, three table-snoonfuls of sitre, and half a table-spoonful of ground ginger; mix these in a pound or so of treacle, diluted with warm water. Administer the dose at once. Take three soft wring them thoroughly; first put one on from horn to tail, wrapping it carefully round neck, chest, and Dody, acesuring it with a hay rope, and do the same successively with the otber two sheets. Then put three
dry rags or blankets on carefully, and secure them all pound with a common rope. When the dry cloths ave become wet, and the wet ones dry, pull all off, aud put over and round the animal a well-toasted rug or blanket. If the legs are cold, twist a hay rope round then. Give as much warm drink as will be taken tre at full to time. Within two hours perspiration should te at full work, causing water to drop from the skiu,
assisting the action of the bowels and kidneys, and pulling the sulphur all through the system. In mine hours the animal should be chewing its cud. If not, and if it aud application. If, after other nine hours, you are not untintied, do not deapair, but repeat the dose and application again. I feel uhlesitatingly confident that they als afflicted with rinderpest were thus isey would be saved, just as I have thereby unfailingly
saved the subjects of pleuro-pneumonia when seemingly in the goint of death. I have this very day (Monday, the justness of my expectation. On Saturday last (hee 7th) I put in the Glasgow Herald a notice of this suceessful in teating pleuro-pueumonia as likely to be of IJerny, towards the ground of Falkirk Tryst, cattle fiscourite dying of the disease since last Tryst. The with rinderpest on Sacurday morning. Between 2 and aod die afternoon it seemed to be expiring. The dose t3. application prescribed in the Herald were resorted biack as conple of hours there was a copious evacuation, The lonked somewhat better, but not quite satisfactory. which should have been given. Yesterday the milk foid, chewinurn, and this mortinn she is greedy for giving lier ricer cud and giving milk. They were liave pot ay not do her harm, but she should rather some Linseed jelly, bit now and then of fine bay and
itain greatly puzzled at what is done at present iu reason a hich distinguishes for it only by the want of
 \({ }^{2}\) culused of rinderpest of discomfort what it may, it is mat to be transformed into what is called artificial coantry, which manure must by aud by be sent to the atry; which manure, when at the farm, may be
exposed to the dairy stock to sniff over, perhaps to walk manure must, at all events, be spread on the and which assist in producing a crop. What then? Wround to arise against artıficial manure made from rinderpest carcnes? But this is not what most bewilders me The animals among which the condemued one has been re permitted to be sold and taken all over the country They may bave the disease, though not so aivanced is do, carry the infection with them, to spread it wherever they go. In regard to pleuro-pneumonia, I know that it is as safe to intruduce, among a clean stock, an animul visibly affected with that disemese it is to introduce one apparently well, but out of a herd where the disase is; and in regard to rinderpest I belineve the same If public markets are to be iuterfered with, the ouly policy which can be adopted with a probability of uccess is to sto; all public markets for a stated time. At the same time the fact ought not to be ignored that in this part of the country at least, more cattle have fallen before milk tever and pleuro-pueumonia, atic more sheep have died of rot, than have jet perished naturally from rinderpest. Herds of dairy cows, to my own knowledge, have been swept away without a recor against pleuro-pneumonia, but now there is not a soli ary vietim, real or supposed, of rinderpest which is mot rumpeted forll; as if the results were a judgment o the land instend of a bloodred condemnation of on want of science and skill. Alexandor Graham, Capollia, near Glasgow, Oct. 9.
3. On thes Abovs.-I have read with much interest the letter of Mr. Alexander Graham. The following information may prove useful in the present emergency, as suggesting a preventive aganst the caticle phavue,
and it confirms the beneficial effects of the medocine which Mr. Graham recommends as a cure. I have for many years reared from 30 to 40 calves amnually, and was subject to considerable losses in the antumn and spring from the young animals being attacked with quarter-evil, which carried then off 111 a few houre selecting generally the most healthy and thriving.

\section*{On the recommendation of Mr. Hayward,} Folkington, Sussex, I have tor the last 10 or 12 year administered to the young stock, in the early nutumi and spring, before turning thum out to (irasa, a dose composed of two ounces of sulphbur and one ounce of nitr mixed in a pint of warm water. I have not lost a single animal after, although I have ou more than one occasion before, giving this medicine. Some weeks ago this dose was given to all my horued stock, some 160 in number, and it shall be repeated. I lave found about one-half of the above quantity of sulphur and avout one-hal of the above quantity of sin phar and mitre given to each sheep in the spring decidedly bene-
ficial. John Thornhill Harrison, Stonehouse, Gloucestershire, Oct. 13.
4. Metropolitan Cattle Plagie Cumattee. - at a recent meeting of a sub commmittee of the Me Mrropolitin Cattle Plague

\section*{AGRICULTURAL MUSEUMS.}

Scientific naturalists are not the only special class who feel that they have a grievance in the management of our museums. The body in whom we are most intereated-the agricuiturists-more than any other has been neglected. If the present collections are hidden, unarranged, and imperfectly utilised, at least both the men of science and the general public must acknowledge that some efforts have been made to meet their wishes-specimens have been procured aud with the agriculturist-no effort at all has been made to provide materials from which bis speciality may be studied; and yet, speak to any one on the subject of agriculture, and its importance and high position as a science will be at once admittod, and the justice of its claims for encouragement and assintance from the country readily ackuowled ged.
If that be so, it is singular how little its progress has been cared for. As to the formation of museums, it is almost literally true that everything that has been exception, we believe that every existing museum has Peen more or less due to the exertions of Messrs.

Peter Liwson \& Son, the nurserymen, of Edinburgh.
The finst agricultural museum which was:formed
been closed for many years.
The second was formed by Messrs. Lawson in in Edinburgh This was afterwards presented by them to the High-
land and Agricultural Society, and wholly kept up at the Lawsons' expense until very recently.

The third was also made by Messrs. Lawsou. It was a work of great toil and labour, and was specially prepared for the Great Exhibition in 1851. After the
close of that Exhibition it was presented to the Museum close of that Exhibition it was presented to the Museum
at Kew (then in its infancy), where it remains a at Kew (then in its

These gentlemen were also in 1855 , on the occasion of the International Exhibition at Paris, intrusted by the British Government to illustrate the present position of Agriculture in the United Kingulom for the by them for this purpose, including a collection of heads of the principal breeds of oxen and sheep. the close of the Exhibition the whole was translerred to the Conservatoire des Arts et Metiers at Paris, shere it now remains.

The next was the Agricultural Museum of the Royal Society. Dublin. This also was, to a considerable extent, indebted to Messrs. Lawson \& Son.
The Agricultural Museum at the Crystal Palace was also formed by the Messrs. Lawson.

The South Kensiugton Museum contains a tolerable but iusufficient and unequal agricultural collection. The nucleus of this also was formed by the Lawsons.

There is an Agricultural Museum in the Royal Agricultural College at Cirencester. This was wholly formed by Messrs. Liwson \& Son, and presented to the College, in token of the interest they felt in this useful institution.
The only existing museum in the formation of which these gentlemen seem not to have had a share is that of the late Professor Low, and which is now attached to the agricultural chair in the Uuiversity of Edin-
burgh; but even here the whole of the vecetable burgh; but even here the whole of the vegetable
products were prepared by the ubiquitous Lawsons for products were prepared by the ubiquitous Lawsons for the learned professor.

It thus appears that the only national or university museum which has not ignored agriculture is the South Kensington Museum. That attached to the Ediuburgh chair cannot be called a part of the University Museum it is a class museum, which, it is unnecessary to say, is wholly different thing.
Perhaps it may be pleaded by the British Museum that such a collection is not within its scope, being of a technical nature, and that the different objects of which it should be composed may be found in it under different heads, as botany, zoology, \&c. The first excuse miy be sound, but the second certainly is not. The breeds of cattle are not to be found in the
British Museum, and the varieties of farm-produce are British Museum, and the varieties of farm-produce are not to be seen either in the botanical department there Lawson. But admitting that it is a technical subject Lawson. But admitting that it is a technical subject, Kensington, let us see what is done for it there.

It may be taken for granted that Messrs. Lawson's part of the work, which more especially relates to agricultural vegetable products, is good; their past success is a sufficient guarantee of that: and a good foundation is usually the precursor of a good super structure. The models and patents, of course, contain matter of much agricultural interest, but it has neve been worked. It has been left to grow of itself, and of course great blanks and inequalities exist ; but here the collection nearly terminates. Examples of the different breeds of domestic animals-one of the most attractive and interesting subjects of which an agricultural museum can take cognisance-are wholly awanting; for a heal or two of a sheep or an ox cannot be called illustrations of breeds. These small nibblings at the subject show that it has been thought of, and that is all; they equally show that neither the it has bee of the subject nor the proper way to trea fairer to say, has not been recognised. The idea of palming off a stuffed head stuck against the wall as a representation of the entire animal or an illustration of a breed, could never have been seriously entertained as the "bo all and end all" of the subject. It is obviously a compromise, by which an attempt is made putting the call for illustration of breeds without putting the hand very deep into the breeches' pocket. It is a mere temporary sop in the pan, to tide the is satisfactory to no one. It cannot be very satisfactory to the administrators of the funds to have expended a good deal of money uselessly, for the mere purpose of stopping exclamation for the moment; and it is les satisfactory to the agriculturist to be fobbed off with parcel of useless heads when he wanted real illustra tions. A head is utterly useless-it is worse than materially in other points, may be very much alike in the head. Perhaps our neighbours may think that, as Cuvier could reconstruct a whole animal from a single bone, the agricultural Civiers of the present day should be able to divine the rest of the proportions of the animal from a sight of the head. Something, no doubt, mity be learned from physiognomy; but we distrust it ever since our salad
visage called upon us, who strength of that dese music from another, to make a fot know one \(2-2\) entertainment of the make a fool of ourselres ! is any one who told us that the head of an an ong legs, or its broad cheeks a round barrel.
y a collection of this tind any good is pensable that good representations of animal, showing all its essential points, exhibited. It is the combination of characte constitutes a breed, not any one special chanch taking them together, and seeing thly be loum relation to each other, and not judging from portions.

The best mode of representing the differen: able difficulty. One and one attended w.th cune able difficulty. One negative point we hare But will stuffed bodies do any better? 'l'here an couple of stuffed sheep (merinos, if tee ate rightly) preserved in the Crystal Palace, but thece been preserved and stuffed with hay in the orjay fashion, so that it depends upon the stuffer whether

> the points were preserved or not.

Those who have seen Mr. Waterton's collecio published as a frontispiece to bondescript whicn which he challenged naturalists to mako out: which was merely a distorted skin of the head of animal-it matters not of what animsl, for alua one would do equally well-fashioned while in
dried perhaps on a mould, so as to assuse resemblance to the human countenance. The a specimen at all times greatly depends un the natural those who excel are mostly men what been educated, and had opportunities been affurd them, might have made themselves a name as scur
painters. But to show an auimal's points necessary to know them. To throw the loose Southdown will be of small avail unless what a Southdown is; and even although he we supplied with a living model of a Suuthdowa fr which to work, he would still be at sea unless knew wherein the points lay-where and what \(\pi\) the differences between a Southdown and all ott and even then the eye of an outsider might fa and distinguishable enough. It is plain, therefuse, the stuffug will not do.

A better plan would be to make models of a pers animal-perfect at least according to our pa lights, as the points of perfection may
knowledge increases and the breed improve Kensington should furnish this, and casts should 1 supplied at cost price to all the local agriculturn I'hey might be skilfuliy coloured, or supplied wits tight-fitting true skin stretched over the coloured a this might be dispensed with.
for the sake of increasing the interest and attract... we should like to see the cast bearing a skin.

The best test of the fitupss of anything for purpose is for one to put himself in the position of person who is to use it, and, after trying it in appije tion, to ask himself how it answers. Let as Agriculten Let us the South Kensington be intending emigran: Australia, visiting the museum in the expec learning something about sheep and wool, on mi our future success in

A liberal art, that needs no pain

\section*{Home Correspondence.}

Irrigation and Drainage. - I was interested in reading an article on the application of seware at Crovdon in the Agricultural tiuzetle of the Thinst. Is there uny iustance of success where the sewaze hae been applied to a flat surface without natural or arti ficial sub-drainaze? My own impression is that, as in the case of ordnary water meadows, subbilrainage is absolutely necessary. If any one of your numerous correspondents can answer the question, it will very likely prevent \(s\) me grand mistikes being madr, in many eases where it is intended to utilise the sewnge of towns. J. C. C'lutterthuck.
The Champion Wheat Crop of the Season.-In my letter in your Number of Sept. 23, page 903, 1 हail:"The facta were that on the 1at July 1 wrote to Mr. Bates that al:honus my crop was much injured I sliould not witlulraw. He and I at ones named our respective men:bers of the jury, all of whom deelined to aet. At length Mr. Betev wr the that he had surured Mr. Charles Howard and Mr. Hewitt Davic, whom! at neee pecented as solle abliters. At Mr. Wates's request I wrote to Mr. Mowari', thas 'se-ured,' invitimg him to Brighton, at which he "xpressed his surpisise, saying that he had not consentel to act." This is the ex iet truth. A' the very nutset Mr. Bates wrote that he lad nominated Mr. Hidlay, of the City Flour Mills, and I at onee replied, maning Mr. J. A. Charse, of Loms Sutton. Then, immediately preceding the letters ho published last week, Mr. Bates wrote as follows:-
" near Sir. - I enclose "Mry. J. ML Aley's refinat. Wh.at is to

Had he not most unfortunately omitted to send you this letter, he would not have even appeared to impugn my statement. I have just threshed my crop and beg to send yon samples of it, which I think will bear comprison with any othur in every respect. The weight is 63 m . per linglie!. I inclose my letter of the 2Sth June, and sahigin a otatemen' of the crop, with the rematk that thik rear num amilar hight land you miont have some miies without findine a sinzle acre with 40 buralocla unon it. London Cow-houses. - There is much talk aud writing about "Rinderpest," but there are quite pests enough at home without going to a foreign land for two additional syllables of which few know the meaning. I was in conversation this morning with a person who told me that he had seen in the neighbourhcod of Bishopsgate Street a cow.honse, with a number of cows in it, in which no daylight ever entered, or not sufficient, as gas was always burning; the only inlet outlet for foul air also. I suppose there must have outlet for foul air also. I suppose there must have
been considerable contention between the two airs as to ontrance or exit. The cows remained in the house some 12 months or more, and I suppose were then sold out to be eaten. Can such a place be otherwise than the source of disease-is it not a centre or starting point to taint the whole neighbourhood? Can the cows be other wise than disease !, tied up by the neek, in a vitiated atmosphere, with no daylisht, and with unnatural food? Can the milk be otherwise than dise ised, the people otherwise than disensed who consume diseased and putrid milk? And then, when the unfurtunate cow can no longer give putrid milk, the diseased carcase is sold and consumed to breed futher dissase in man-and then comes in the medical man with his potions and pills, and nostruas, and wise saws. Twenty years back, when living in breakfast table; the putrid filthy sm-11 emitted from it was most diegusting. It was the last time that I ever drank milk in my tea in the city. Fresh air隹 post for months together, produce disease. When will people awake and leave off wallowing in the mire of guorance and stupidity, producing disease and death, and work for the apothecary, undertaker, and grave digger. One who thinks that a crust of wholesome bread is better than a pound of putrid flesh from a London Cow-house.
Thistle Seeds.-Mr. J. J. Mechi mentions at p. 950, Oct. 7, that some say that they are carried five miles annuailly. One autumn I was with the members of a Natural History Society dredging some 14 miles out at sea off the east coast. The wind was east, and during the afternoon many seeds of Thistles passed by the siip. It was thought they had come from the continent. I was told by a sea captain that he bad at this season of the year frequently met them at 50 to

\section*{Farmers' Clubs.}

NewCASTLE : Oct. 14.-The following resolution, moved by Mr. Wilson, of Woodhorn Manor, Morpeth, Was this day unanimously adopted at a meeting of this Clul:-" That this Cummittee petition the Home Secretary (Sir George Grey) to take measures to stop
the importation of forcigu (live) cattle and sheep for the next six months; this being in their opinion the only means of eradicating the rinderpest from this country; and they recommeud also that every facility should be given for the importation of dead meat, so as not to interfere with the supply of the food of the .

\section*{WITIIAM: Oct. 5.-At the annual meeting of this} Society, which has been originated by the tenants of the Braxted Purk Estate (but which, there is reason to hope, will shortly beenme a district Society, and necupy the same grouni as the former Withan Society), the Mr. Alderman Mrion touk place :-
Mr. Alderman Mechr said the people of this country
it was quite clear that to feed them some differen \(10,000,000\) with the same area of land; and this called for great improvements and judicious investment of capital both on the part of the landlord and the teriant, because permanent agricultural inprovement could only be carried out by the joint action of both. It was a very large suhject, and he was not going into details,
but of this he was sure, after 20 years experience, that there was nothing more profitable than judicious agricultural improvement. Where a man could affurd,
as he could, to pay himself a double rental, and make as he could, to pay himself a double rental, and make
1l. per acre tenants' profit as well (and probably some did much better), it was unmistakable evidence that agricultural improvement was highly profitable. But, improvenent? (A Voice, "I should say not," and improvenent (a A Ahter.) He remembered being told 20 years ago by
practical men of those days that water would never pass practical men of those days that water would never pass
through stiff clay; but those 20 years had passed by, through stiff clay; but those 20 years had passed by having found the proft and advantage of draining stiff clays. Again, he was told that straw was of no use or feeding purposes, but he had lived to see the time when straw cut up fine and pulped with roots (he was not going to tell them all that could be done with a ton of roots) was used as food, and animals would grow fat Upon covered yards, slso he bad definite conclusion; and he hoped the Chairman rould make covered yards instead of those which had just been burnt upon Mr. Gooday's farm. They did not cost more, and if the straw was cut fine and and, and would produce more profitable results than it put upon a dung heap, twice turned and twice carted. They had convincing evidence of this in the sheep-foldthe simple application of the excrement to the soil, and its well-known beneficial results. These were points apon which he had made up his mind as sources of profit in farming. As to thin sowing, he thought he might congratulate the country, "and this county in particular, upon the great change which had come over abundant evidence that the quantity of crop did not in any way depend upon the quantity of seed. They might put as much corn as they liked upon badly. farmed land and it would not produce a good crop; but where land was well drained and well filled with manure they would increase the produce. As an illustration he might mention that last year from one peck of Wheat per acre he grew 7 qrs. 3 bushels, and \(2 \frac{3}{3}\) tons of straw; 2 bushels, but the straw they had not time to weiph. (Loughter.) Gentlemen laughed - (A Voice, "Well we may")-but he could tell them it was not for difficull one dast harvest, they wond reconect, was not easy to do it satisfacturily; but he believed they vould agree that the largest quantity of curn almost dways produced the greatest weight of straw. It was laid down by men of experience in the
Royal Agricultural Society's Juurnal that where the corn was 80 per cent. the straw was 70 per cent., and he believed it to be a rule that the greater the crop the greater the straw. He didn't ask them to put in half peck per acre-what he asked them was to make experiments for themselves, and adopt that from which
they found the best result. When people told him they had not tried this or that, but they kuew it would not do on their soil, he could not give them credit for being good farmers. Yet them go on, throwing aside their strong old prejudices : if any gentleman would say he
had tried a certain experiment fairly and found it sot to answer, he (Mr. Mechi) was ready to take off his hat to him; but when he referred back to his father or his grandfather be could not value such a man's independence or his judgment. Of course they could not make improvements in agriculture without putting increased capital into the soil; but that capital would be found as it had been found in other cases. If any one 30 years aco had said that they conld find \(300,000,0001\). of money to make railways and change the whole carrying system of the comintry, he would \(n\) thave been believed but that sum had been found, and he believed there was ronm to invest \(400,000,000\). in the improvement of much to the iuterest of the country. Ho would now touch upon another subject. (Laughter). Were gentlemen amused at his having a rood crop? He was happy to say that his 40 acres of Wheat averaged 7 quarters
Mr. Wakeling: I never kuew a great man grow great crops but he soon failed.
Mr. Mecur would not enter upon that sul.ject : but certainly no man ever grew rich by growing smaller crops than his neighbours. He would now enter upon a suhject as to which there would be no difference of Park had He was glad to see that the owner or Brant he didn't profess to know much about it; but he had made progress; and in draining the field in which the ploughing took place to-day, the land bad been greatly improved.
Mr. Qoirampton : That was always a good field.
Mr. Mechi : I deny it.
Mr. Quimampton: It used to grow nearly 5 . quarters
per acre.

Mr. MrCHI had passed the field near!
ing for the last 20 years, and lad watche land was wet and the crops insignificant; bant in ing it 4 ft . deep the water after a fall ur rain 5 . profits must naturally be increased, \(11: .\). he hoped Mr. Du Canie would of their \(C\) he hoped money would be cost morey, abundantly, because he knew it the fee simple of the that from covered yards, draining, and resi outhay was judiciously made it wo rental, better for the labourer, increase of produce, very much beil ing reacisin at large, He legged to propose the gout te make himself useful in the canse of agricaltorn other ways.

Mr: Jofn Hutley said they might look romelt 50 miles, and they would find that those farmen in stood their ground the best of any men in As steward to the Jate Lord Western he used little to do with these fine improvements, for if an scarifier came out his Lordship would bave is would repeat that the man who had heen regular system and did it well would best et ground.
 congralso congratulate them (and of course it was as they had boen almost entirely free from the inruls.

Tas Mrmand: The Game Question.-At the last Tase Mritaid: The Game Question.-At the last nood by Mr. RobotiaM, who said that to his own
snowledge the produce of Mr. Benion's farm of 72 scree, at Buckley Grange, was sold in 1859 for less Wou itl, wr at,wit a thirtecuth of what it would have Wheat, the produce of 5 acres and a half, went for lange quantity of meadow land, which was boned a :t eacnit rablits from the 22d September, \(155^{4}\), and is proluce up to the 29 Fobruary, 1860, was s,ld for is. He He could point to many instances in which is gane. It would be said that firmers sufficing much from game might leave and tako other farms. But that was, in most instances, impossible, because thoy were so impoverished by game eating their crops that they had no capital ; while landlords who did not freserve ganue, heing invariably improvers, required preserving, landlords' arfents would not amy mach in favour of any tenant who had been troublesome soout game. Excessive game preserving had a
most discouraging and depre-sing effect upon tenanta for who could work so energetically and lopefully to raise crops which were sure to be eaten
uif le cime, as he would if he had only the seasons to cuntend sainst? It was not wonderful that men thasing so much to discourago them should go ou in the oll jug-trot as loug as they could, exhausting all their energies in effuris to mect current engagements; and when at length they failed to do that, the game preserver who had paraly sed them swept away all they had for rent, leaving nothing for other creditors; and Le could foresee that if the question were properly
discussed, and it could be proved to the pcople of this country, that they were paying \(2 d\). per 1 lb . more for pruservel, all classes would insist on a repeal or modificstion of the gane laws. He had made a calculation the which he had arrived at the following conclusionare 16 the 32 million acres of land in England there aremge, a hare or a rabbit. He considered that oue bre to every 4 acres was a fair allowance for sporting of lares or rablits--- ay 6 millions of each - which for foud would be worth, say-hares, at 3 s . each, \(900,000 \mathrm{l}\). rabbits, at \(1 s\). cach, 300,0001 ; ; total, \(1,200,0001\),
Taking it that two hares and one rabbit cat as much as a sheep, it followed that if only the excessive cuantity of game were destroyed, 3 milliou wore sheep might tis. each, which, at 12 mouths old, woull, be worth 1,20nentol.; or equal to an indirect tax of \(4,800,000{ }^{2}\). pay for all the cite people-as largerted a sum as would be only reckoned what food the game would consume than was well kuown that chey destroyed muth more Corthin they ate. Besides, they were not kiiled off at a as the rage like sheep. Therefore the sum set down mort, whi'e of hares and rabbits was much over the har, was much unke it ; su that, taking it that two dentrisel as mablits ate as much as a sheep and greaton seen to be at least ten millions sterling-a year in sum, he believed, than was ever praid in one In conciusion, Mr. hall received from Mr. Johm Bright, M.P in whech he sulfject. It to attend a public mooting on the Wich good would be the effect that he did not think the game lams, tut towns were knowa to be against seat game lars, but so loug as the county constituencies towns game preservers to Parliament, the members for in the game laws," Nis for farmors. "As to changes of ail lave whin them: What you want is the repcal tie preservation of game. The fundamental principle
if the tevent bare absolute farmers should be this-that they should CTer, all avimald which live unon the of and control \(\therefore\) a. thay occupy land and pay rent for it; they risk hes hupes, their money, their time, their labour, calivation of their farms. The horses, cows, sheep, harcs, and are theits, and crope are also theirs, and the Saere farun ehould also be theirs. Till this is the
neti,ed ias, and temant farmions also the practice of the country, the sathe prese just claim, and the evils of game laws and M. Frastry
lodge warmaly the efforts of some landlonds to make the-wolare of their tanants their chief concern, there
wo wisdom in dimguisiug the fict that there were estates where the teuant-farmer in has strusele for outwistence met with roy luthe consiluration; where game acumma:el and cr:- decayed. As to the destruction of crapis iy gaine, be might state that inwing the prescnt ainumer he met two persona from
different parts oi the country, and asked how were their Manzels? The answers of both were pretty nearly, the sau.- - I shall have none; the hares ate them up when they were about the sizo of my finger.'
He would a-k those getlemen who the prosplect of so tuas of Muwais pur aure how they wouldjlike that? He might also nalk how many tons aritton cach of \(\mathrm{H}_{2}\) (owe hares consumed whilat induiging is those finger luxurien! High farming and gane weserving wero uttexly ineompaitine. The difered with Mr. Robothain in speaking of the "N.elit I'oweh-
ing Act," as to a poacher being a thief. He thought it spolse volumes in condomanation of the game-prenerving system that it made the tenand-farmer lowk mion the midnight deyredator as his bent friend, and the thefeateher as his most inveterate enemy. That the game aws required alseration he thonght was unguestionable, but ho had not studied the sulject enough to emable him to state precisely what that olteration roula be.
Mr. Osboris was of opinion the ezcosaive preservetion of game was fast assurning the dimemsione of a national celarnity, and faet loosening the tios which had ormerly existed between the cultivators and owners acrease soil. It Waz, moreover, one caure of the then proposed:-
"IThat this Club dosires in the most emphatio manner to
 oneral and earuest apposl to be mado to landod proprioture,
in ordor to induoe them to tako immoditate stope for atating the ovill.
Mr. Bigar stated that the discussion last sutumn on farm agreements had induced him to take an oppor tuxity which was afforded him of making some experi ments on an estate of 8000 acres in Shropshire under
his management. He discharged all the koepers, intimating to the tenauts that the land'ord was foud of shooting, and wished to reaide on his property in amity with them all. They had liberty to course hares and to destroy rabbits at all seasons of the year by ferrets, but not to shoot on the farms. The result was that in a weeks shooting this year 550 brace of birds were killed, instead of 250 , as formerly. This wat a prectical proof that if farmers were treated in a liberal and
straight forwad mamer by their landlords they would re:pond to it.
Mr. MASFRe thought they were all running their heads against the supposition that the landlord was the owner of the haree, rabbits, and pheasants; but when they took a farm the game belonged to them, until they entered into a covenant with the landlord allowing him to reserve them; so that really and truly the giving of them up was the farmer's own act. The preservation of gamo debarred an enterprising man from investing capital in the land, as he had no security that he would be remunerated for his outlay reaping maching or steam plough allowe l, and the tenants had been compelied tu leave 5 feet of sprace on each side of the hedge-rows for game preservation. Ife had no wish to separato the interests of laudlords and tenants, but they must try to shun men who imposed such restrictions. The underletting of wame to a person who had no iuterest except in killing as much as he could was a great grievance. The winged game were not so prejudicial as the hare and rabbit oport for their laudlords, but not for battue-mongers aud professional poulterers.

The rosolution was carried unanimously.
Mr. Osibors then moved-
 rinus to the tenant farmer, but at the mone timo is a fruitful which are increaning from jear to year; while the garne laws at present in forco are most ohjectionable, as leading to the law 8 are the result of class legisia
wolfare of the counuunity at large.
He remarked that during the last year there had been more than 10,000 prosecutions for infractions of the game laws, and he considered those persons who preserved game to an excessive extent, more particularly rabbits, were responsible for these prosecutions,
Mr. T. B. Wrirht, in seconding. the repolution, referrel to an art:cle contributed to Morton's "Csclopassage which had been quoted from the evilence of the late Lord Ifatherton before a committee of the House of Commons would be fonmed. That article hat generally been consilered to supply a fair and temperate view of the question under discustion; and he (Mr W.) was of opinion that since it was writion, years ago, some change for the better had taken place. As every one who took an interest in agriculture
must know, there were frequent ca-cs of great hard inflicted uhon teuant farmers by the undue preserration of came, but at the same time he thought thare
conolude the circumatnoneen that might lead them to discumbions by that Club on the thing. During the R ndell had informed them that on come catete in Word asteralure the winged geme wore now alone preserved. O. heer mat meen of more juot and ihberal arrangement lad heom acemt. inod, and on themo grounde they might

 been a farmer for 44 yeark, and 2.0 father and grandatber were farmers. Howden 18 abunt itu acres mpenial. It is nearly all arable. I Lu' Weaniy 400 acres in rotation, and the rest im pasture.
is above 500 . I have another farm in the norner of Rosburghonire of 120 acres, rent \(150 /\). I left an adjoiuing one at Whit sunday last of 2.50 aclec , I was farmer in Laud rdale for many years. I have several times experienced inconvenience from the law of hypothec. On oue oceas.ons I bought, at a moishbouring farmer's door, a brood sow just auom pósme, and uuft to be removed to the nearest market. axious for that breed, and a few daye after brought her home, a distance of at,out half a vile. She three days afterwards pigged a litter of 16 pins; bat tho euant was sequestrated a week after, and the landor a ground that she could not be taken to any other warket iu the state she was: but the matter was referred to a highly respectable solicitor in helso, who gare it against me, and the sow had to be returned hreo.weeks afterward, with her lupme. That was a
 sold some seen corn and nover gut paymont. Ho was
 would bo arahle. In the courre of fome jears he laid out 110ul. in lime, and he had repuire a cash-account from a banker in talashiels to the extent of \(1000 \mathrm{I}_{0}\) His cmutioner died, and he tried to get another, but live of hypotbec ; and he came to mo with tears in his eyes, and said ho would be obliged to cive up his farmo.
He lost about 20 owl. in the farm-11001. in lime, and

600 l . in fencing and improvements; and though he had to pay for the straw of 200 acres when he entered,
the landlord would not allow the creditors to take it, stating that the tenant was only entitled to it at the end of the 19 years' lease. The straw would come to more than \(200 \%\); and he had put up a threshing-mill, for which he got nothing but the removal value let at a rise of \(1111 \%\). on a lease of 19 years. I think the dividend was sco per pound to his creditors: the laudlord whs paid in full. The creditors allowed him 2(1). to assi-t him to remove, and alat two cows aud
all his household fumitnre; the landlord when applied to wnuld not allow him ansthing. I believe he would have done well if he hat got a cautioner, and that he would have bevefited by his liberal outlay. llis successor, I believe, made several thousand a larger farm elsewhere. Had the money beon his own, he would have carried on suceessfully: and would, I believe, have mot a cantioncl: If the lawe of hypothec were done away with, I see nothing to prevent a farmer wetting money on loan as well as a lending monery by the law of hypothiec. Azone of the trustees I tried what we could to carry on the farm,
hut the landlord wouhl give us no facilities. The creditors, without a dissenting voice, would havo hin out of their money if the landlord had let us carry on the farm. The farmer was thought a first-rate farmer Although he got a first cautiener, he could not get a second. He cime to me and said that several of
thoce to whom he applied would have lent him money but for the law of hypothec. I think the law of hypothec has a tendency to make the landlord depend farm. Q. Your friend was ruined by farming on borrowed money, and you think the abolition of the law of hypothec wont enable farmers mone readily \(t\)
 have (1) (1):t a farm in which he lins sunk sin much tenant virtully finirniss money from the landlord for a yeur and a hall ni two jeara; is not that the A. I am of a duferent opinion. I think the lemant fives an mach credit to the landlord as the Emin aters of amalin land, f.rmed unter a five ahift course-that would make 200 acres of grain, 200 of Grass, and 100 of Turnips : and suppose the reat to be by giving the, tinant 18 months to pay, the landlord giwes a crenlit of 1200 . Now turn to the other side fallow latill for Turnips; but at first he limes only tenant has the straw of the waygoing crop, which the incorning tenaat requites to purchase, 200 acres at 30 s. fallow. 'The second suramer he limes the whole of his lus inloo probably about zuvlo; buit I think the tenant gets the beneft of that to a cervain extent, and I will coun only the half sunk into the land. By putting in foreign him half the value the first year, buk the other half is sunk into the land. All these are outlays which the tenaut, if he fails at the beginning of the lense, canunt carry away. Ho has gencrally to pay a considerable the mark when I say il. l. for that. Ho commat put up a tire ing fan hatior low: and it thrown to the dump, that is t!e hest !nt of the pree lont, or aink +1105 l. to the landlord against 1200l. lent by the lamiliord, making a balance of \(95 l\). for which the tonant only gets eredit. All these sums so lent or crealito's, amd wom! 1 permationtly hene fit the Land. 4. Is lime a permaments benefit to the lonll-A. I
 tename has snmk 17, y\%, the landlord still crediting the tonant with 12 uol, for the tenaut is aiwaye a jear and a half behind. The tevant, in fech, is sinking more money evory year for five or six years, and the whole It is thim la s five rears of the leane that shomlid reaice the prost. It macht be far emongh to ark the termat to prevs of fore rent the lant tive years of his lease the first 14 years of the lease, for the tenant is always pretivg in quite as murh as the landlord is giving him ize the ho An that ir taken in Lauderdale for granted the iaw were changed, I think the landlord whuli is more particular in inquiring into the chmacter am sisili of riment. In i.a.ininie it newl to bo then farms, I think when entry io at Whitsundey the firnt payment Lammas, but on arable farms they ourist to be back-rented. I know of offered but refuecd, in consequence of the law of hypo-
thec. The landlord, laying the. lam of hypothoc on
his side, knew he would have a better compe-
tition without fore-rents. The landlord in question tition without fore-rents. The landlord in question case in which the highest offer was refused; an! farms were sometimes lot to people who were not practical farmors. Oue was a baker, who two
farm of 400 acres and failed, paying \(2 d\). per pound in his creditors. I know of other two cases in landerdale where the landlord was paid, but the cee liters got nothing. In that district there have been six or seven sequestrations in 10 years out of 20 or 30 farmers. The estate to which I refer has been much
improved of late renrs by the tenants. I oould meution a improved of late rears by the tenants. I oould meution a
case there where a farmer lail out a great deal of moner for improvements, but at tho end of the lecen mather's offer was taken, and he got nothing for his improvements. Gsod tenants do not like not to be improving their farms. When I left my farm in Lambenale, I expected to get it again. My rent was \(310 l\). for
340 acrea, and 1 hail improved it so that it was worth a great deal more; hut a man who had not heen a farmer, and was reported to have a small capital, was preferred at fonll.-the landiord truating to the necurity of the hyputhec. It is commonly reporte
that the tenaut has been sequestrated every yenr for three years. It is six years since I left Lamberidale. 1 am at prescut on the borders of the stock-farmers of the Duke of Buccleuch. They seem all to be safo. I nun glad to say sempestrations are not irequent there. I o not hear the selkirksiire tovantly comioriable circumstances, being in the near neighbourhool of the Duke of Bucclouch. I am in favour of tho total arovition of the law of hypothec. I think it would be would ke a great improvement both to landlord, tomaut, and merchant.

\section*{Miscellaneous.}

Testimonial to Mr. R. O. Pringle.-A well-merited testimonial was recently presentent in Mr. Pringte, whon
 duties of the Scotlish Parmer. The presentation consisted of a well-filled purse of sovereigns and a very han lsome picee of plite, wit'l the foll-wing inserip. tion:- "Presentel, with a purte of sovereigns, to
Robert Oliplant Pringle, by a number of friends in reland, in apprecistan of has sorvices in promoting
 tho: with the Iris' Fotimes' Giactle. - Il hite 28th Seprember, 1sin.". Mr. Richar, ("hnomer, Kiz.
fort, Moymalty, who occupied the clanir, ral in adtress, ti) which Mr. Pringle mado a suitable renponse A new Means of Increasing the Pertility of Lamd has been invented, and, it is said, succesefully tried ac Aunaberg near Bunn. It in well innown that humus, or upper mould, the most valuable constituent of suile, is formed by the action of the atmonphere on the animal and vegetable matter contained in the emrth. The air however, coming into contact ouly with the eurface of our planet, this fertile sulistime is generateil th but an imaignificant depth, and after so many centuriws at sowing and reaping covers ther separate from tiu. twThe offic of the wew inver.tion is to wem the gem. aling of humus to the lower stratia by introducing nir into the bowcle of the emth. To this end pipes, very similar to the ordinary draing, but riduled with anrrow
apertures, are laid down at a depth of from 8 feet to apertures, are laid down at a depth of from 8 feet to hearth, where a fire rarefying the nir causes a constint draught to pervado the pipes. The atmosphere thins freely entering and issuing frons the pipmes preserver its normal condtatom undergomed, and threnkit the numerous apertures nppramehes the strata which con-
tains the roots. Thas the soil is loosened, and pene. trated hy oxygen so effectuaily, thit thengh the mir from above may be obut out from the hearth, the fire will continue to burn all the same. The invention, or ather the experiment, whiel, may be destined to marl a uaful premeas in agrieniture, was first designed by
 once nf br. Hardatein, both attached to the Axriens. Witherigh quite a new hing it is state. I to have already added to the enpacition of the soit. Times Berlin Correspondont.

 Change it as linseed and leans fur oil-cake, of
It is tho moit recent experience that roots os he pulpe! and mixed with chaff a day or so beien being used.

Whethor or not the advantage of pulping is derive? Fom its inducing a larger consumption of stram fry cut and mixed with the pulp than when offarei ti
cattle uncut, it is decidedly an advantage to the antio farmer, for a large quantity of straw is on ploughlent generally used wastefully in litter, aud a portion of it will be saven for use as food with economy and pmat

The following memorauda on this sulject, extrached fom contributions to the twantieth volume of the English Agricultural Journal, appear to bo conelminn the subject.
Mr. Liwrouce, of Cirencester, says
"We tin I that, taking a scure of bullocks together huwhis, of chall mixed with jiat laiff a huudredmeigut of pulped roote, exclusive of cake or corn; that is 19 may. rather more thau two buehels of chatt are mined with the roots, aud given at two feeds, morning and at the mid-day feed, thus :- We use the steaming appe ratus of Stanley, of Peterbornugh, conisisting of a boiler in the centre, in which the steam is generated, and ririch is counectod by a pipe on the leth haud lange galvanisod iron receptacle for steaming food fur with copper-in which the cake, mixed with mater, : mals into a thick monp. Allj ining this is a elate m: of susticont sion to entan one feel for the entire: frot dees, יypan which a fes lumes of soup as! thr. down firm ; and this process is repeate 1 until the shto tank is full, when it is covered down for an lirtict two before feeding time. The soup is than ferent ap 'teneal, and prapared for ready digestion

"2 The use of ordinary hay or straw. After being nuixed with and this soou renders the most mouldy cummences, and and animals eat with avidity that which hay palatable, and asimalect. This fermentation softens they would otherwise more palatable, and puts it in the straw, make more readily with the other food in this respect I think the pulper of great value, par ticularly upon conn-farms where large crops of straw are grown, aud where there is a limited acreage of masture, as by its use the pastures may be grazed, the paspensive process of haymaking reduced, and consetuently au increased number of cattle kopt. I keep quentliyd more, giving the young stock a small quantity oilcake, which 1
© 3 . Cheking is utterly impossible, and I have only had one case of hove in thrce years, and that occurred wlien the mixture had not fermented.
"4. There is au advantage in mixing the meal ith the chaff and pulped roots for fatting animals, as thereby they cannot separate it, and the moisture from fermentation softens the meal and ensures its horough digestion; whereas, when given in a dry state without any misture, frequently a great portion passes way in the manure.
On the value of the process for a grazing farm with but a small quantity of plonghland, Mr. Coruer, of Woodlands, Holford, Bridgewater, thus spenks:-

My plan is, first commenciug with the grazing bensts, to cut about an equal quantity of hay and straw and mix with a sufficient quantity of roots (mostly Mangel) to well moisten the chaff; and as the beasts France in condition I lessen the straw 'and increase he hay, and in their further progress I mix-i adaition to all hay, chaff, and roots-from six to ten lb. per day to each Lullock of Barley and Bean-meal according to its size-and I have them large sometimes sold last week for the London market a lot of Devon ozen, of very prime quality, averaging in weight upwards of 100 stoue imperial each.

For my horses, cows, yearlings, and oxen -the Inter to be kept in a thriving condition and turned to Grase, and kept through the summer for Christmas, 1860-I cut nearly all straw with a very small quantity of hay, and this the offal of the rick. These alsubave as many pulped roots as will moisten the chaff, except the horses, and to them I give along with bruised Oats just enough roots to keep their bowels in a proper condition. To the two or three-year-old beaf (if any some long straw and a part chan and
"My farm is but a small one, under 200 acres. My predecessor always mowed nearly all the pastures for hay, which is about half the farm, and with this scarcely ever grozed any beasts, and kept but very few sheep. Since my occupation 1 searcely ever exceed ten acres of meadow with one field of seeds for hay I keep from 250 to 300 largi-size Leicester sheep, and graze from 20 to 25 large-size beasts a-year, with other breeding atock in proportion.
consiler the pulping of roots is better for fatting pigs than anything else. My plan is to have a large two-hogshead vat as near the pulping machine as possible, so as to fill it with a malt-shovel as it come. from the machine; at the same time I kecp a lad sprinkling meal (either Barley or Indian Corn) with the roots, and this is all done in 15 or 20 minutes: it s then ready for use to be carried to the pigs in the stalls aloneside the fatting beasts. I never could fat pig with profit until I used pulped roots.'
On feeding horees with pulped roots, Mr. Slater, of Weston Colville, Cambridgeshire, says:-
I give all my cart-horses a bushel per day of pulped Mangel, mixed with straw and corn-chati. I begin in September, and continue using them all winter and uatil late in the summer-nearly if no quito all the rear round ; beginning, however, with smaller quantities, about a peck, and then half a bushel, the first week or two as too many of the young growing Maugel would not suit the stock - Ibeiev pulped Nangels with chaff are the best, cheapest, and oost healthy food horses can eat. I always find my hories miss them when I have none, late in the slomer. I give them fresh ground every day. Young store benste, cults, \&cc., do well with them ; but I do aot think they could bo used with any advantage with a llock of sheep; they are, however, useful for fattening bullocks, inducing them to eat any food you may wisb to give them."
These remarks illustrate the influence of the mode which food is given upon the economy of the meat ranufacture. Whenever the root crop is inferior, o the hay croy badly harvested, the pulper, for econo mising the former, and for enabling the easy consuuption of the latter, is a great economy Dteaming food is another great assistance to the feeding Mr: Liwrence's account of the advantage of steaming lood has been already given.

SATURDAY, OCTOBER 28, 1865.

> MEETINO FOR THE PNSTING WERK.

We are informed that the date fized for the apening of the Intersitinnat. Montictitpraf. Exmintion and Congrises is May 29d. The Show will enntinue till Mas 2ith.

Admost every autumn, and especially after hot summers, auch as we have enjored this year, there appear in our columns, and in those of our contemporaries, notices of trees which blossom a second time. This Unseasonable Fiowering occurs chicfly in trees that blossom early in the spring; thus it will be noticed that the trees usually mentioned as exhibiting this phenomenon are the Horse Chestnut, the Laburnum, certain sorts of Apples and Pears, the Persian Lileo, \&o. Again, it will be found, as a general rule, that thene trees are isolated, or fat any rate fully exposed to ann and air, that they frow on a dry sterile soil, snd that they lose their leaves farls; in other cases the trees have heen transplanted and their rootsinjured.
In attempting to get at the rationale of the procesa, from the facts we have abje stated, we must first of all eliminate those cases, such as the Glastonbury Thorn, in which the production of flowers out of due season is the result of some special endowment, some idiosyncrasy as a medical man would say, handed dowa it may be from generation to generation, and originally due to some cause, the nature of which we are not at present able to explain. What we have now to consider are cases in which the untimely blossoming does not happen constantly, but only so long as certain conditions, such as those before mentioned, are complied with, and which peculiarity is not reproduced in the offepring.
M. DE SCHCENEFELD, who has paid some attention to this subject, considers the phenomemon due to a premature and unduly protracted arrest of vegetation in summer. A lengthened summer drought checks the flow of eap, thickens it, and so predisposes to the formation of flower ard fruit-buds; after this comes a moist autumn, frhaps; new action is taken on, the buds expand again, a second tpring cocurs. In transplanted irees, or in those which have been cut back in spring, the process of flowering is retarded from similar causes. Such plants es the latter, it is true, do not
flower twioe, but having been prevented from blooming at the usual time, in consequence of their growth having been arrested for a while, they produce their flowers when oircumstances at the unseasonable blossoming is the result of some check, some period of rest, which past, the plant bursts into life arain. It is easy to see the bearing this has on practical horticulture; fur iustance, it it be required to have Lilice blossoms in autumn, it is quite possible to have them by pinching off the Hower buds in early spring. We have uurselves accomplished the feat in Rhododendrons, which often produce a second crop of flowers in auturn, poor indeed in colour and form, hut it is for the herticulturist to improve upon that. Nature shows him how; he has but to follow her guidance in that matter as in all others.
The same principles are involved in the operation of foroing. It is merely a question of altering the time at which a rlant shall rest and that in which it shall grow.
There are certain other curious points oonnected with this subject, which we merely maention now, as we may perhaps revert to them on another occasion. Such among others is the fact that in some of the trees that blossom twice in the year, the seoond flowers are produced from buds which occupy a different position on the plant from the ordinary flower-buds-which would, in fact, if the order of things were not changed, be developed into leaf-buds and not into flower-buds.

If it be true that we have fairly caught the taste for fine-foliage plants-have become veritable Phyllomaniacs, it is singular that the nohlest and most elegaut of all plants, the P. Lars, are as yet so sparingly represented in our hot and wreenhouses There is without exception no class of plants whieh has exercisel so mighty a spell over mankind as this royal race, and no one can serionsly occupy himself with Palms and their history without speaking of them in somewhat enthusiastic terms, The most unimpressive minds feel a thrill delight when first beholding a grove of Palms is a sight never to be forgotten by people brought up as we are amongst Oak and Pine forests. The painter transfers it to canvas, the poet writes about it, the architect imaitates it in his art, outdo all the others by availing himself of the great resources of. his art, conjures up in our dull northern climes the most striking features of the sunny South by cultivating Palmas in the open air, in greenhouses, or in stoves, as his means will allow. At least this he ought to do ; but this, we are sorry to add, as a rule he does not.
It must not te imagined that the spell which Palms exercise upon mankind is a matter of recent growth, due to the rifinement of taste which modern civilisation has wruurhts amonyot us. On the contrary, it hegan to operate in intiquity. It
is the true origin of that species of true-worship is the true origin of that species if tre-worship the Eastern homisphere, which still exits in full force in parts of Asia, Africa, and Pulynesia, and which survives crin here in the decoration of ur huses at Cliri-tmas time with Mistleto and Holly, or wa-sailing our Apple trees on Twelfth Aisht Ere. If tree-worship had passed away without leaving any nther traces we should have little reason to be thankful for it, but we are indebted to it fur two of the most noble styles of arelitecture which the human mind ever conceived-the Grecian and the Gothic.
Let us explain. The Date Palm at an early period of history must have engaged man's attention in an eminent derree. It grows, to legin with, in a tract of country where atmospheric moisture of any kind is so scanty that its leaflets, unlike those of other Palms, are receptacles, and thus catch every drop of moisture. It has mir, hranches like other trees, or as the Gingerbread Palm (IIrphene ti.ebaica), with which it is occasionally ansociated. It has several features in common with man which mo explanation could remove from the minds of primitive people. Its body is covered with hair, like the body of man; its head, once cut off, would no more grow again than that of any human \(b\)-ing; the male and female are representeil by ditterent trees, and it is well known that the female would die an old maid unless some bachelor should take compasssinn on her. All to this that. the wionle prpu-
 staple food, as is still ther e:sr. in those conntries. Moreover, tak \(\rightarrow\) into consileration the imprewion produced upos an nimaginative people, when
after travelling for days in dry, dusty, waterless deserts, with nothing in sight but grey drifting road, they suddenly entered a grove of Date Palms, affording water, shade, fuel, food, and repose. They must have been made of stern material if all this had made no lasting impression upon them. As they lay under the trees and saw the evening breeze gracefully playing with the feathery leaves which formed bold arches over them, gilt by the last rays of the setting sun, and soon to besilvered by the rising moon-a torcible appeal must have been made to the religions element of their composition, and these Palm groves must have appeared to them places peculiarly suited for the purposes of worship. And such indeed was the case. Palm groves, and those of the Date in particular, were deemed piculiarly sacred. As civilisation advanced, and regular temples were built, the arehitect naturally took for his type, what must ever have been associated with his religious feelings-the Palm grove. Hence we find that the oldest Egyptian temples are simply copies of Palm groves. As will be seen in our woodout, this is evident amongst others in the grent Temple at Elfoo, where the leaf of the Date tree has been almost slavishly imitated.

The Greeks stole this, as many other ideas, from the Egyptians, without acknowledging the obligation ; and after improving upon it by their unrivallerl taste, they handed it down to us as Crecian architecture. Nor do our obligations to the Inate Palm end here. We muvt remember that the oldest puin'ed arches are to be found in Egypt, and that the Date Palm his been the prototype in the Gothic style of architecture, a pointed arch being simply the meeting of two Palm leaves. In same of the oldest (rothic nathedrals the Palm leaf and its pinnæ are distinctls trageable and the notion that our Beech wonds led to the ennception of the Gothic strle cannot be entertained by any one familiar with the genius, if we may say 80 , of the two kinds of plants.

The spell which Palms exereise over men's minds lasts long after their more intimate connection with these plants has terminated. At the time of our Saviour, ages had elapsed sinoe the Jewish people were taught to have any peorliar veneration for a tree worshipped by so many other nations. Yet at Chrisi's triumphant entry into. Terusalem one of themeans used to demonstrate their joy was to cut down Palm leaves and strew them on the ground. To obtain a branch of the sacred Palm was one of the highest honours amongst the heathen nations of antiquitr, and " to carry off the palm" is still an intelligible Phrase of nur language, and in daily use by many people, who, thanks to the present state of things, have never seen a Palm in their lives. Is it not high time that gardeners should free themselves from the reproach that they, of all people, are the onlv ones indifferent to the beanties of the noblest of all plants?

Apropos to the season we may invite espeoial aftention to some forcible remaks on TransPaviriva which will he fouml in our present issue, and others which were printer at p, geth The pouts principally insisted on by our corre spondent as most conduoive to a anccessful reault
in the carrying out of this important operatios these :-Plant early, and puddle the roots.
Now, the advantages of which, the advantages of early trang, fold basis. There is first of all the fon \(8: x\) well stated by Mr. Forsyti in these mbin The time oomes ** When any process wht a large portion of the water [which might n essential service," by faoilitating that process which is necessary to health sary to the consolidation of wood tion ciner trees, necessary to the in trees, and necessary to the building up of constitution in trees and shrubs of all whether ornamental or useful. Then there in seoond advantage, and that no slight one, to 1 derived from the increased earth temper which exists at an early as compared rith period of the autumn-a temperature which :the vegetable machine in motion, so far as : aotion is concerned, and places it in the tix fitting condition for progress when spring c It has been ascertained, from observations by lib THOMPSON, that in the neighbourhood of Lonern the earth is in the month of August from \(8^{\circ}\) warmer than in Ootober, and in September in \(6^{\circ}\) higher than in October, \(10^{\circ}\) to \(12^{\circ}\) higher the in November, and \(16^{\circ}\) or \(17^{\circ}\) higher ther it Decomber, The gentle stimulus whieh the increased earth temperature of the early antua provides, is and must be of immense importanse in the
shrubs.

The practioe of puddling the roots at the lin of transplanting is one on which differonom opinion appear to exist. Practical men life correspundent resort to it with eminent su but then it is argued on the othor side hat west gorged with water to the further detrines! their heulth, and even the destruction of the tr portions of their roots. The inference stein, cimat always seleoted for planting, and that this, iust. of suffering from the process, will be so far bet. fited that the loss to the tree will be reduceli, minimum, and with just that amount of chas only which, as already meutioned, is favourabla the development of a sound constitution

Wr had lately occasion to call attention ts faot that the MYCELIEM of FOMGI may bederin? to a considerable extent in total or partial decay of their tisolopmen is very of disease in Vines which has been sent Worcester.
affected in two houses and also in a cold pin thongh the disease has occurred before, it 4 liarly prevalent this year. When anidit, into a house it spreads with something more thas It is quite nerw to us as looal uffection is concerned,
as this country is disease as that describ . observations by M. Esprit Fabre, a Burtam: who has made several valuable communicaiva. soience.

The disease before us, whether on houses or otherwise, occurs the tissue is in some cases falls out, leaving unsightly Where, however, it attaoks a principal indues more permanent, and sometheirhbouring rose-coloured tint in the noguffased which calls to mind exaotly the dreater p 1) onal's Rougean, in which the in many substance dries up, 80 that in maturity leaves fall long before the maither the ruit. In the true Rouge a the rods, the whole of the surface ond in as the leaves, is diseased, Similarly in cases the plants perish. before us, the disease is bescends to the to the leaves and petioles, buts the substanc where it frms dark spo, and the bor is depressed in the eurrounding The colour in the centre, varies from ges brown, and the whole resembles vith the is figured in the sa. propanties id 1. * Observations sur lam Maladies regnantas do . F M. EAsprt FABre,
Montpellier, 1853.
under the name of "Anthracnose maculée," a asmes. Dusal was nut able to find any distinot fangons tissue in his spots, but we observe not anly vory abuadant myoelium, but a mass of minute cells exactly resembling those whioh se atten oculur in the genus Orthititude of minute bodies endowed with mocalar motion, resembling those bodies which pe called stylospores rather than true fructification.
It is not possible to make any positive asscrtion about the identity of this disease with one or both of those whioh occurred at Montpelier, but it is at lesst probable that it is very closely allied. The Hougeat is very contagious, and it is therefore much to bo hoped that this disease, which resembies a again in this respect, will not spread. The only way of ohecking the Rougeau is to out the plants off close to the ground, in which oase the plan vigorous shoots are frequently healthy. If however, the practice is delayed too long, it is found that the roots are so much affected that either no shoots are sent out, or only very weak ones. If two-thirds or even three-fourths of the rods are affected there is still some hope of recovery, but there is nove if the disease has procoeded further. It would be interesting to know whether the disease recurs, and whether the main stem also is affected; and in due course we hope thatour correspondent "J. F. R." will give us this requisite information. M. J. \(B\).

\section*{- Some time ago an inquiry was made in our} hat had withetood the rigours of lurge bay laurble This is an important matter, no less in a cultural point of view than in a physiological aspect. The ubject resolves itself into this broad question: What are the circumstauces that favour the production o
rale or female flowers respectively? To get atisfactory reply a large body of evidence must be collected, and it may be the means of stimulating arther inquiry into this interesting subject to point out that among Conifers particularly, the young plante, Then they begin to flower, produce blossoms of oneser only, either male or female, as the case may be, and is only after the lapse of two or three years that lowers of both sorts are produced. It is possible hat a species which in the southern parts of this island begins by producing female flowers only, might in the north show male blossoms first. We do not say that this is the case, but we should be glad to recoive iuformation from our correspon tents on this observations on the sex of the flowers of Cucurbits, as modified by heat or other external conditions, has, and Fe think with justice, been called into question.

\section*{alluding Journal of Agreculture for Nova Sootia} \(G\) foowers \({ }^{5}\) Assoctation of that colony, to be held at Nelfvile in October, says :-" There is in the possession cultural Society of Lilver medal of the Ropal Hortition for the collection of fruits sent from the exhibition held at Kentviile in October, 1863, which will be open only, for the best the members of the Association pples, 12 of each sort:-Gravenstein, Yellow Belle Henr or Bishop's Pippin, Ribston Pippin, Baldwin, Nonpareil, and Rhode Island Greening. The silver inedal must be taken three years in succession before it will hecome the property of the successful competitor.
-Mr. H. J. Church gives, in The Chemical News, Thilowing method for making Skeleton Leaves:ferred to a are boiled for two minutes, then trans and gently heated solution of permanganate of potash timues may be easily removed by means of a brush. buphurous acid or a solution of chloride of lime may eved for bleaching them. The stains of perman saate of potash upon the fingers are easily washed of dilute sulphuric acid.
II It is stated that a new method of Destroxing ployed witl success by M. ROBERT, who it appears has hus saved the old Elms of the Boulevard d'Enfer from "Cosmation. The operation is thus described in cosmos:"-A little of the old bark is shaved off in order to facilitate the operation; then the whole of rated sof the tree is impregnated with a conoen said, not otion of camphor in alcohol. This, it but prevents others from attompting to penetrate the
nounced for publicok of Physiologicil Botany is an the assistance of Messis. A. De Baby, The Irmisch, R ections. That J. Sachs. The work will appear i plant cell, and a general sketeh of the organography flants, by Professor Hormeister. The subject of
he formation of shoots will be undertaken by Th. Irmisch, and the anatomy of the organs of vegetation vascular plants by M. A. Ie Bairs. The second par will iuclude the morpholosy and physiology of Fing
and Liver Worts by A. IE Bars, the Elitor contrn buting a similar article ou the Mosees and vascula ryptogams. The third part, aloo by Professor Hor IEISTER, will be devutod to the reprojuction of the Phanerogatuia. The fourth part will, it is aunounced comprise the sulject of experimeutal physiology, by . Sachs. The importance of this work is attested b the names of the contributors.

We understand that the Commeil of the Caleonian Horticultural Society have awarded the Nenis Phize for the triennial period, 18ヶ2-65, to Mr. William Thomson, gardener, Dalkeith Park, for his eminence 8 a Scottish horticulturist.

\section*{STRAWBERRY FORCING}

> (Concurted from page 939.)

Tue proper method to be adonted for the presersa Gion of the plants through the winter will very mush depend upon the stock and convenienco at command the stock be a moderate one, and ; it room phentiful should recommend the pits to be planged in cold pits early in October, and the lishts to be hift
entirely off until the advent of frosts: and as theme ncrease in severity, and are likely to be hurtfnl to the crowns, the pits should be efficiently protected. If, on the coutrary, the stock is reckoned by thousands, ew only of the earliest potted and strongest plants should bo so treated for early purposef, and tho
remainder laid on their sides in coal ashes, and pilet up in the form of ridges, which will afford au equal facility for the applicatiou of covering material, and is ndeed a method by many preferred to any other. In practice, however, I have found that the method is not material, if only care is taken to preserve the plants
from severe frosts, and to let them have plenty of light and ventilation.
Much of the success to be attained in the forcing of this delicious fruit will depend upon the stractures which are available for carrying the plants throngh the different stages of growth. These consist for the mos part of pits, Peaca-houses, n all of which proper provisious may, be made for tho purpose. I need here allude only in passing to the mproved structures of the present day, which hav been designed especially for the purposes Strawberry forcing, for which they are exceed ingly well calculated, masmuch as they combin ertain conditions which are knowu to bo indispensable, with a greater corrmand over thern, fundamental points of cultivation, however, remain analtered by the structures employed; and as good fruit may be produced in rery inferior structures, constructed houses, only they entail more trouble and the operations are conducterl very olten at the expense of extreme neatnes , We my therefore structure is employed for the purpose of Strawberry forcing, provided that the weces-ary conditions are present in an available form, aud those conditions ma be shortly defined to be the power of applying a temperature, increasing gralually according to the
different stages of growth, together with au absolute command over the ventilation
Now, with regard to a gradually increasing tempera ture, this is to be attaiued in a variety of ways. It may be fecured in one structure, one crop at a time With two available structures a better supply may be depended upon; but where there are plenty of honses and pits, it becomes very easy to keep up a regula supply by transferring the plants from one to the
other as they require it. This affords au opportunity of starting a certain number every week or fortnight according to the quantity required, so as to keep up a constant succession. In a general way, a pit, having the command of heat to a for the second stage, and Vinery in full work, or a Pine stove, to ripen the fruit off, will be amply sufficient for a very good supply. When there is only one house at command there roay be a good supply at ope time, but no regular succession can be kept up. Thesupply may however be very much increased by the aid or a pit in additio, an flues it nay be a Mac Phail pit heated with dung linings, or deep cold pit filled with a mixture of stable litter depe cos previonsly turned about of ten in order to get rid of the rank fermentation. This latter plan is an excellent one for starting plants late in February, and on through March and April; but cannot be trusted or earlier purposes, because it is mest probable that the heat would decline just when ris, the temperature therefore the fruit be requircl eany, the that purpose must be wholly under control; and withe requisite chere is nothing better than a pid of such a pit, and with the additional convenience of a Vinery to finish the fruit off, a good
The will be the same in every
case: a certain number of pots, regulated according to
the demand or convenience for forcing, should be should should not be much athare that of the exterial atino-
sphere, but may then te gra-luails ma-ed until the sphere, but may then te gramails rawed until the
night temperature, which requires the mont careful attention, talus a range from wio us to (un) umtil the fruit is set, affer which an incretise of \(\pi^{-}\)thay bo allowed. The day temperature bern: so much infuenced by external conditions is not so th.uroughty under coutrol, but as a gencral rule the range to be amed at by fire-heat is from in in the ear ser stages, wito .5 during the ripening process. Of curse a bright siderably, but as that aflordsan opportunity of g.ving abundance of air, it is beneficial rather than otherwise. From the first diy that the phants are intraluced into heat until the fruit in gatherest, the greatest attention must be paid to watering. Auy neglect on this point is irretrievable after the platso are in fill person, and should never be indiecriminsely porformed, but regulated aceording to the eomblithon of the phants. It is for this reswom that ine precise firections ean be given, beenu-e the guntity regured arics wh the state of erowth. In the enery tatane the amomet, regnired will be consider thy leas that when the phants are in vigorous sactinn, fint at no time must thicy be atlowed to heeome so dry an to callem
the leaves to flag. The mont cepions nuplly will be becessary from the time the frumt is ret :and nwelling, ap to the colonring point. Symptoms of defective drainage munt always be lonked for and corrected. Syringing must be resurted to evening and mornang with the excention of a few days when the jlants aro in bloom), up to the time when the fruit legin4 in colvur ; aud both for ssringing aud watcring it is her of the same temperature as that of the internal atmo phere of the structure. This is highly importaut, for if the plants are chilled through any sudden application of eold water, a check is sure to be given to the principle of vitality, and this often results in himinees, curious malformations of the fruit, and other myaterisas appear The use of lignial mamie is important during tho welling proceso, and thmald alwisk 10 rewote it an
 or its application to plants should a whys be quite clear when used, and method of preparing a quantity is to put the excrements of nimals, either biped or qualruper, or lusth themethery into a large tuo or butt, to which may be a dited mill porsioa of soot, and then fill up with water, the required, and to be frequently stirred abnut until thio strength is extracted, and then left to settle. It it better to use it rather weak than overstrong, and its use must be discontinued when the fruit begins to colour

Another most important consideration is that of Venti'ation. The want of a careful attention to this will often render all other efforts nugatory, so that from the very commencement the plauts should be nured to a free chrrent of air, whenerer it is possibic to anmit it withont danger. and that can only ariee from cutting draughts. Fron the amomit of moisture required about the plants the atmosilere wonld soon become too stagnant and damp, if ventilatiou did not step in to correet it, for which if vilt rest of air should always be left on at might, and lu. be iucreased early in the morning, more or less, according to the state of the external atmosphere. By thus nuring the plants at all times to the play of fresh air, they become so far hardened as to be much less liable to fuffer from sudden exposure to cold nide cutting draughts. To carry this system ont well there must he a rood command of heat, so that the operat.r should be able to regulate the temperature by ventilation, rather than be obliged to keep the house close to It is important
lso, that tho plants ihould bo kept passing through glass lose their power of acting beneGcially upon plants in proportion to the distance at Which they are placed from its Thus, when close to but as the distance is increased so do they becoune ttemuted and Jivm out so as to be rcilly ematle in all their parts, aud thereby leas able to bring good fruit to perfection.
Amoug the minor causes by which the euperior quality of the fruit is influenced, is that of thinaing. Healthy plants will alway throw up and set many more fruits than they are able to bring to perfection. As a general rule, the earliest buld therefore be nipperi
fruit. All the small ones should out as soon as possible after the fruit is sot, leaving from 12
strength.
The time required to produce ripe fruit, from the period of starting, varies with the season. Thus plante started the first week in December fhonld yield ripe fruit by the first week in March : but as the fearon advances and the sun becomes more powelm, the produced on an average, in 11 weekg. Whilst on this
point, however, it may be as well to remind cultivators that very early forcing, say any titue before the
third week in January, should never be eutered upon where a full crop is de-ired, and is ouly eligible in large places where both the stock and the conveuiencers for forcing are so abundant that a half crop may be made to meet the requiremente, by putting a double number of pots to work. Plants etarted after the time above mentioned may be reasonably expeoted to produce a full crop.
the plants sheubl a meronced into the forcing housen soil in the pot removed, aud its place supplied with frosh compost; the pots also should be scrubbed clean. The questiou as to whether saucera should be used to the pots, is rather a vexel one. In my opinion they are not necessary, but there may be some particular cases in which they may be found useful. Thus, for example, where every attention can be paid to the watering and syriuging, I would never use them; but there are cases in which a man's hands are so tied for
want of labour-he knowing full well that the want of water will be fatal to success, and that he canno almays apply it at the right time-that he will naturally and gladly resort to their use, in order that the plants may not suffer.
I think I have touched upon all the salient points connected with the foreing of this delicious fruit. I will conclude by observing that if the forced plants are healthy and free from red spider, they may be planted in well-prepared soil, with gutumn crop, and the certainty of a splendid crop the next summer. To ensure this, however, great attention must be paid to the watering, for some time after planting. John Cox

\section*{ON TRANSPLANTING TREES AND SHRUBS.}

When the leaves have dropped, and trees and shrubs assume the clommant state, the natural season for trausbeing male it becomes necessars to plant evers day when the work can be dune, that is to say, the planter must the cin as early in the season as he can, and curry on \(n\) late as he can. Under these circumntances the principal danger is dryness. The old adlage has it, "Put a tree in the ground before Christmas and tell it manat ank it to grow." It is therefore clear that the times aud the ensons have everything to do with this business, as all experience, ancient and modern, goes Land tille dried; hence depth of tillage or trenching is essential to success in arboriculture. Land trenched two feet eupply of moisture in the winter months as will keep the roots of the trees moist till nearly midsummer under ordinary circumstances; and an there is no royal pick helve, and the pinted shovel must face the diffimilty it a heavy expenditure of wages
The earth being finely pulverised, and the plants honestly planted before the old year goes out, nothing need be said bere of the trees put in before January but after that we come to the time when the nature of the work to be done before the treen can be got in, demands that they be planted as lato as they can be o live. I have planted the Rock Rose tribe (IIellanthemoms and Cistuses) in the soorching sun and and every plant has succeeded, and has not only lived, but als. thoweres. I nee I not may that protting the planta in earth antl watering them in the usual way woukt not have snececten. I believe three dags wonld have killed them all, for it muat be borne in mind that every phant was put upon a small hilluck of stones, so
that when it di. that when it did grow and flower it might fall
gratefully to the gronim and display ite marvelloun beauty to the beet advantage. These were all plantod iu preparel mod, and just an atone-maton would lay a bed of mortar on the stones of his building, and then place another block, so did wo with the Cistinese in a billoek of named Rock Roeen, for they delight in a billock of ntone-brank, and a fine large pebble routlet and the sir. Fow persons have any iden of the power that a heavy stone has in rofistaisiog oisture over a ront
Finely powdered parat winl, finely powdered clay se peat an l why reduced to a raortar-like state, and plenty of sand or stonebrash added, will with Witer make an excellent puddle for the more delicate
kinds of shrubs and costly trees an above siated. For ordinary trees, when the rit is made, aul the plant put in, amil a part of the fine soil added, it will suffice to let the water flow, and work the earth with the foot into a puddle there and then, aud afterWurds cover in. It will be many a day before that puddle as in the samestate as earth not puddled. It is in quite together than any amount of lry ramming or treading without water could secure. Earth thy is pudilled does not take water froely; hence it is not deasrahle be renilered less servicentlo if the puddle ming
surface. You might as well pour water on a duck back as pour it on high dried peat earth or moist clay puldle ; neither of these would tade it in.
('ow dung added to clay makes an excellent puddle for trees, such as mursery stock when first sent out. It i made of the consistency of paint or cream with water in a pit or tub, and kept atirred, just as the paper maker contrives to stir the pulp he uses to an even con sistency, by which he can give paper an exact weight
or thickness. He knows how to stir a tub of gruel for his own interest, and woe to the gardener that will no do as much for the beautiful objects entrusted to his care.
Now, whother the plants come from one's own bursery, or whether they are purchased, the pudlle ought to be part of the business of transplanting Every rootlet as soon as dug up should get this salv applied to its wounds; and afterwards those tha plant and those that water may go their round rejoicing, for half their work has been done when the feeders have had this surcoat laid on. Alex. Porsyth.

\section*{GENEALOGICAL TREE OF THE PEACH TRIBE}

Uvder this title M. Carrière is nublishing a serics of articles in the "Revue Horticole." The subject is interesting, and is treated in so lucid a manner, that we eed offer no noologies for laying before our readers in condensed form the substance of M. Carridre papers. The first artiole is accompanied by a figure representing an imaginary Peach tree-a genealogical Peach tree-by means of which he explains the forma tion of the different races of Peaches and Nectarines that we have now in cultivation. The main trunk, \(A\), base two brancheo-one to the left, one to the right above these, after an interval, two similar branches sprout out. Each of these primary branches gives off numerous branchlets after the mane fushion; these branchlets give origin to tertisry ramifications, and so

This can be understood without reproducing I. Carrière's plate. Of the two lowernost primary branches, that on the left, which henceforth we will call B, is supposed to represent the Clingatone Penches; that on the right, C, the Freestone Peaches. The two upper branches, \(D\) aud E , ididieate reaprectively The Clingstone and the Freestone Nectarmes. Fer illustratiou's sake, M. Carriere takes the usain truuk to represent the group l'each, of which B, C' form two -pecis of one gemus, and D, E two specties of aunther senve.
Euch of these species ramifies and produces mese, varieties, and the like, and M. Carriarens object is to show how thees varieties originate, and how, having originater, they may be referred by their characters to their proper place on the "tree.

Having thus introduced the subject, M. Carri-re leaves the Peaches for a time and onters into som generalities connected with the lifo history of plants which we need not reproduce here, but which never theless will repay perusal, from the clearness and elegance with which they are treated. Wo cannot rofrain from extracting the following - "The law the brings about the extension of the tspe by the modifiea two opposing forces; the one tends constantly modification and change, the other to flxity amb permanenco. Eech is constartly in operation, but with unequal force. Indeed, had they equal power as they a t in opposite directions, progrcas would be
imposible, and thinge would remain forever at atandimposaible, and thinge would remain for over at a stand-
still, which is cortainly not the case. From this it resulta that the modifying principie is more powerful than the connervative one

In illustration of whe he lias before said, and hy way of introducing the subjeet of the leach, of Carridre takes the cases of the China Anter and of the Stock. In reference to the former he writes as follow

When first introduced from China into Frunce Aater had single finwers of ath century the Chin colour, but the stems were slender, \(s 0\) that the fower were apt to droop. At the present time, from the numerous needlings which have beell raised from the Astere plants bave been obtuined of great diversity in habi and eppearance. Some are tall, with rigid orec stems, nethers are almost stemlem, and ail interme. liate forms bet ween these extremes may he met with. The flowern of theme varietice prosent too greatent differance one from another in colour, in form, and in sive, and what is most remarkahle is that they all reproduce themsolves (hoep true), and no form distinet racen, even
though grown side by aide. though grown side by side.
some of the races ane an entirely different from the others that if their origin were not known, they would be taken for different species. It will readily be a.lmitterl that all theae forms of Anter are the result of matural solection and not of hybridiention, thlised, since it is the only species of its kini, and there is no other species in cultivation amnng allieri genera sufficiently near it to allow of croes fertilisa in=ecte Again, these plant are hare difficult hy reaching the otigme, asthis much mhortar tben the tuhe which contains it.

The Stock furniahen us with atill more remarkable
plant usually considered as the representative sype, we shall see that its leaves are densely clothe short white hairs so as to appear hoary, and, as it obtuined with towers of a varieties hare violet, or yellow colour. We see mer, lilac, of these varicties, after having becorer that pina onough to form 'races,' has given origin to ' varicties,' differing in babit, but producing 'mons very like in colour those of the parent plant sul-varieties becono permanent in their turn, obtained several from the original Stock we her uumber of iudividuals.

But this is not nll, for from this first tyne leaved varieties have originated, and this type moow of leaf has become hereditary, so that me smoothane principal groups of Stocks, one with hoary learea, other with smooth leaver, each of which may berer

M. Carridre proceeds then to point out the arai gies between tho Stocks and the Peach group. says he, "there is first a downy leaved group
produces a great number of varietion produces a great number of varieties which formman a hair ppearo, differing from tho frbt in a dina a great number of, and which, in the Pench we geed a type with downy fruit, which in course of time pry duces varieties which become permanent; after a it another type with smooth fruit appears (Nectaine which also proluces varieties and races, and beome mutatis mulandis, the exact counterpart of the Pere group.

Anslogons factes to thowe which occur in the Atter and Stocke, and which prove that without anyijint crossing any 'type can, by virtue vitality, that is to say, by modified descent, givarin Cabbagen, the Onions, \&c. Among these plants ne9 varieties apring up constantly, fix themselves, perchance form races as stahle as those which a eommonly termed species. There are some mit Which are 80 constant that they cannot be made degenerato or to return to their origiual types; are the monjority of Cabbages, Lettuces," etc

\section*{Home Correspondence}

Unseaconable Blossoming. - The great heat ap as it has been by an excessive amount of rain, forced into blossom now many shrubs that onga, matumilly in have flowered next spring. The Labors
nums luwe felt this influence, and in many cases an almost as floriferons as thry would be at their naturn season. I might enumerate many more in this categ. but will only take a few as examples.
that linere not produced fruit are now show ang a get of thowern. Apples anid some sorts of Pears at doing the same-in the case of some of the Appla even though they lave already produced fruit. Magnolins usually produce a second Mraguolis yis. Thonsoni has not shown any difp aituin for this late flowering; its relative sempervirens has bloomed most singular occurrence is amongat the varietien a Rbododendroms, some sorto of which are litenil ponticurn, viz, roseum, undulaiam, de., while ai single inetance has occurred with me of the uthimi bloseoming of the very early kinds, the kinds i.fmm has appeared on any of Incian blad from arboreum, or any of the indich ar after hy those wishing early blo forcing housca No korth American blood, such as masimur catawbiense, bas been at all affected liarities of the season. Arcberfield
apon it as a bedding plant. We grow it here in quantity, and it is not excelled by anything for beauty and tity,
grace. The non-gardening public take it to be a variegated Forn. to 'send out' by-and-by, after we have it by the thousand, as was the case with Centaurea ragu sina." Hitherto it has onled blant about London. I must look very pretty as an edging, \&c., when well and cleanly grown. W. Robinson.
Silver ostriped Hawk Moth.- Your entomological readers may be in of this moth (Chærocampa celecrio) which occurred here a few days ago; it is supposed that the larva fed on a Vine growing on the premises of the aptor, and if so, hopes may bo entertwiund of a moderate supply in the spring. I have in my possession vers good specimen of the Death's-head Moth caught The long drought be commoner than usual thi the development of Sphingidæ, and many fine specimens of the rarer kinds have been seen in this district. . Dale, Coleshill, Warwickshire.
Mistleto on the Oak.-There is now growing on an Oak tree by the side of the drive leading to Eastnor
Castle, the seat of Earl Somers, situated between this town and Ledbury, no fewer than five large bunches of Mistleto, apparently in the greatest luxuriance. discovered them a few days ago, on the right-hand side sbout a quarter of a mile from the Deer-park gates, Nention has been made in your pages of Mistleto having been found on Oak trees in different parts of the country, amongst which is named Ledbury in Herefordshire, but the information has been received with doubt If those, however, who may still be unbelievers in the matter will pay me a visit, I will direct them to the pot where it is growing. G. Butcher, Great Malvern.
Peach Housss.-We hear and read a good deal about early forcing Peach houses, and also about the proper
methods of erecting orchard houses for Peach culture on the forcing system, but no onel appears to think it correct in practice that houses should be constructed to
retard fruit beyond the time of their ripening on the open walls. Nevertheless this is quite as easy as ss the first month in which Peaches can be aot for table by forcing, they can, by retarding, be had up to November, thus yielding a supply, where there is a demand, for somewhere about seven months. I have
been watching this for several years, and have proved this season, that in a house I could gather fine Barrington Peaches two weeks after
the last of the same sort were gathered from a wall with a south by east aspect, where it was planted to come in later. We are gathering at present from a seedling of Mr. Rivers's, got several years ago, but of which unfortunately the name is lost. A Salway inside the house is still green and hard. This result is obtained merely night and day in the spring and summer; and where ate Peaches are a desideratum, the plan could be easily carried out upon a large scale. There is this advantage also, that under glass they can be shat up at any season, and kept from wet and cold now. \(F\).
The Humming-bird Moth. - This seems to be a notice that in the many intimations of its occurrence which have appeared in the papers, Scarlet Pelargonium, Jasmine, Scarlet Verbena, and Larkspur, have been mpecially mentioned as subject to its visits; but if we
may judge from the frequency of the notices, the carlet Pelargonium is the favourite. M. C. W.Thave kept one of these alive for the last five days in a Hyacinth-glass, occasionally putting into the glass a few Geranium flowers. I may add, that at times the humming, in conjunction with echo from the glass, in some hide one imagine that there was a musical box borough, County Weaford, Ireland. RThe specimen was a genuine example of this moth.]
Maréchal Niel Rose.-I wish that I could endorse the verition expressed in your pages (see p. 989) that the veritabla Miréchal Niel has not been personated by Hardy and well-known American ladies, to wit-Jane from mand Isabella Gray. It was not from hearsay but my new Rose Catalogue; and I am ready to min affidavit that I have seen Jane Hardy in place, both in England and on the Continent jost also in a French catalogue, which has nificent Rose which were sold last plants of this mag.
Round fhat some are not the true variety." In one instance badge on her coat. in full bloom with the Maréchal's hard with you, but this is a little too bad. You given me the first that the Marechal having politely cannot allow his fame to be even temporarily clouded mach impersonation unworthy of him. You are apart than yours, and although a soldier he is less rongh than yours, are. He is also less inclined to embonyour conduct, is searance, as might be inferred from and atraightforward is sombtuous; his, manly, erect,
"Isabella Gray," he is more like to "Chromatella." You are ambitious of being bad taste in this adventure. not the pitious of being great, but the path of glory are pretty path for you. Withdraw, withdraw. You Walter Savage Landor has told us, that "women, like the plants in the woods, derive their softness and tenderness from the shade." William Paul, Waltham Cross.
Stoneless Berberries.-Some time ago I was in
Dorsetahire, where I found splendid trees of Berberry Dorsetahire, where I found splendid trees of Berberry,
with bushels of fruit on them, entirely without stones. with bushels of fruit on them, entirely without stones;
Upon asking a gardener about them, he told me that all the Berberry bushes there, whether wild or in gardens, were stoneless. Upon this I wrote to a west country nurseryman to get me some plants of thi variety. He tells me that he can send them to me but that they will have stones until they become old rees. Some 20 years ago I purchased six plants of stoneless Berberry of a celebrated nurseryman, and after watching them for years, when they fruited, they had rather larger seeds than usual, and continue to bear them. Can any light be thrown upon this matter ? g, and I am obliged to make it of the common kin because I cannot get the other. Possibly this notice may make some kind person tell me how to get plants the stoneless variety. W. D. F.
copper-coloured Beech.-T have seen a copper-leaved Beech produce an abundance of beautifully-coloured copper-leaved seedlings. They were as dark as I ever
save the parent tree, and in rather more proportion saw the parent tree, and in rather more proportion
than half. The trees in nurseries are, I think, grafted or budded. W. D. F.

Double-glazing.-A Phalænopsis Schilleriana in the collectiou of L. Reichenheim, Esq., with six leaves, the largest of which is 14 inches long and 5 wide, has been named (see p. 963) as an illustration of the advantages of double-glazing. We have one here that has never been in a donble-glazed house, which has six ine healthy leaves upon it, the longest of which is 15 inches, the widest 5 inches. About the middle of June last it threw up a flower-spike, which, when it reached the height of 18 inches, produced a young plant at its point. The latter has now three leaves upon it, the largest of which is 9 iuches in length. In July it sent up another spike about 2 feet high , which has likewise formed a plant at its point, and it has a smal leaf at the next two joints, where I think plants may Ainsworth, Esq., Manchester. - In reference to Mr. Anderson's remarks (see p. 987), as to my name being put forward as an authority on this subject, allow me to state that all I have ever done or written in the matter has been merely to elicit facts. At the same time believe that a well-constructed double-glazed house will one wh to Orchid growers. I do not at pr cultivation, and I am so far in love with the plan of double-glazing that I intend to have a house like Mr. Bewley's in order to try experiments on certain species of Orchids. We are much indebted to "A. R. E." (see p. 962), for giving us so much information about houses and Orchids at Berlin. It must be evident that plants are grown satisfactorily and flowered well under double glass, and equally evident that splendid plants are grown under single glass by Mr. Anderson. I have no notion, however, that the question as to wed by isolated instavie of excellence either on one system or the other. My idea is that when a house shall be devised, easily convertible from a double to a single roof, then Orchid growers will have a better opportunity than now of growing some species which at present are
difficult to manage. The question of expense is not of much moment, if the health of valuable plants is improved. On the other hand it is quite certain from my own experience that single-glazed Grape houses, costing only 11 . per foot run, 12 feet wide, are sufficient to grow many (and those some of the most beautiful and cheapest) Orch
Warner, Broomfield.
Tagetes.-I grow a variety of this, but I am unacquainted with its proper name. Mr. Bennett (see p. 989) speaks of three varieties, appointa, he names to its being too tall for beds, which is the only thing of which 1 have to complain in reference to my plant. I have been blaming the richness of the soil, when perhaps the natural habit of the variety is alone at fault. I am also told that the tall variety is oby.blooming plant, which is not the tall variety a case with me, for my besse last three months. I consider the Tagetes to be a very excellent and durable bedding plant, which is more than can be said Calceolarias, especially of late years. I grow the Tagetes by tens of thousands, and I thinis that it must Your plat a T. tenuifolia.]

Double-flowering Peach. - I have read several accounts in your late Numbers of standard Peaches producing a crop this year. I know little about Peach or other trees, and shall be glad if you will inform me if it is usual for a double-blossomed Peach to bear fruit. This inquiry arises out of the following facts. In my
up and wheeled thither, I found a small (as I thought) shrub, with five or six double blossoms of a bright rose colour on it. I was very pleased with it, but did not know how it came there. I showed it to the gardene and others, but got no information about it, except that either Peach or Almond Homever, some time afterwards I found five blossoms had set, and pro duced an Almond-shaped fruil. I concluded that it was an Almond tree. After an absence at the sea-
side of three montbs, I found four remaining, still etaining the Almond shape, but much larger in size; on plucking them they proved to be deliciously favoured Peaches. They had no colour, and two of them were united near the base by a fleshy joint. The plant has made remarkably thick wellripened new wood, notwithstanding the peculiar soil in which it is planted, and has a most bealthy foliage. C H. W., Loughton. [It is not an uncommon thing for double-blossomed Peaches to set fruit, and even to ripen them, especially in such a warm summer as that which we have just experienced.]
Worms.-You state from "Science Gossip" (sec p. 968), that earth-worms eat nothing but earth. No doubt this is true in the main, but do they not greedily suck in all decayed vegetable substances ? For instance, a worm will in one night pull in yards of string, and give it a sort of masticated look, though of course, having no teetb, it cannot chew it. W. \(D . F\).

\section*{Foreign Correspondence}

Adstralian Vegetation.-In the last number of my Fragmenta I have briefly reviewed the Palms of Australia, 13 in number. The most interestiug is the Alexandra Palm (Ptychosperma Alexandræ, F. M.), recently brought to light from the viciuity of the
Fitzroy River of East Australia. It is one of the most graceful forms of the princely tribe of plants to which it belongs, being even more beautiful than the noble Seaforthia elegans. It attains the height of 80 feet. Having through Mr. Edward Bowman obtained fine Pulm into many European collections. In the same number of the Fragmenta I have given an accuunt of several new Fern trees, of which oue especially is remarkable for its gracefuluess, having, although 8 fee in beight, a caudex only 1 inch thick. This Fern tree of the Fragmenta I have referred to the Australia Pandanere. Robert Brown was ouly acquainted with two; now we know seven, if the three Freycinetia shall finally prove distinct.

Pittosporum tenuifolium and eugenioides are found so far south in New Zealand, that I should think these fine trees will prove perfectly hardy in the milder parts of Britain. Where they grow in ther sbarp frosts are not unusual in the winter, as weth
heavy snowfalls. If they can be naturalised without much trouble, nothing could surpass the ease with which these noble trees might be generally distributed, as the seeds keep well and germinate readily. There are other New Zealand plauts from the southern parts fine Middle Island, which merit the attention of European horticulturists. In the Mediterranean of course New Zealand plants would be in their element, wherever humidity and shelter prevail.

I have had the gratification of introducing the best variety of Mocha Coffee into the Feejee 1slauds. The plants sent from the botanic Grolific than the ordinary variety previously introduced. One of the young trees, about three years old, bore at the first harvest also found its way into the islands from my establishment, and seems to prosper there. At Ipswich, in Queensland, the Connecticut Tobacco has gained the palm over all the other varieties which I was instru mental in distributing in that part of Australia. The Shiraz Tobacco ought to grovv well in some of the
mountain districts of South Europe, where the autumal dew-fall is regular. Ferd. Mueller.

\section*{Eactetits.}

Quemeland Hortictltural: August 8.-The following report of this exhibition of garden produce is condensed from the Brisbane Courier
The tables appear to have shown an excellent display flowers, fruits, vegetables, cerenls, nat other miscellaneous articles. The Botanic Gardens furnished Camellias, a good specimen of Maltese Clover, which thrives abundantly in Queensland, especially on light sandy soils, and a variety of miscellancous shrubs and flowers. There were also two excellent samples of New Orleans and Sea Island Cotton from the same collection, from which likewise came some fine large Pine-apples Chinese Yams, two specimens of Indian Yams, Native Bananas, Liquorice plant, and Passion fruits.
Among vegetables, the honest old-fashioned Potato the Cauliflower, Cabbage, Lettuce, Celery, Carrots, Turnips, Beet, Rhubarb, Peas, Spinach, complaint that nothing in the shape of vegetables can be grown in the colony. True, there are long seasons of drought; but contingencies of weather, it must be remembered, are incident to most climates. Nothing has been shown yet to prove that the agriculturist o horticulturist in Queensland has any difficulties to
contend with, whicb, with patience, perseverance, and
a knowledge of the soil, he may not be quite equal to a knowledge of the soil, he may no
cope with and surmount in the end.

There were some good specimen of Rye-grasses from the Acclimatisation Society; three consecutive cuttings were shown, and one could hardly credit the rapidity of their growth withoat referring to the labels affixed to them. A specimen of New South Wales Prairie Grass, more for its rarity than its use, we presume, was nlso exlibited. Lovers of Tobacco fumes were doubtless gratified to witness the progress not only of the growth of the leaf, but also of its manufacture. "The native article" can now be supplied to a considerable extent, and, judging from its colour, and the clean firm manner in which it was presented, there can be littie doubt as to its excellence. There were also specimens of Virginia and Kentucky leaf in the raw state. There was a large collection of preserves
(bottled), and a jar of honey (English), tastefully arranged bouquets, and a specimen of wax flowera Colonial wines were also exhibited, Of fruite, in addition to the sorts named, there were Oranges, Limes, Lemons, Citrons, Cape Gooseberries, Granadillas, and Brazilian Cherries.

\section*{Notices of 300ks.}

Les Bomnes Fraises, manierre de les Cultiver pour les avoir au maximum de beaute (with a Calendar, and Instructions based on the experience of fifteen years) By Ferdinand Gloede. Paris, 1865. Pp. 151. The author of this little book has evidently given much attention to the varieties of Strawberries, and their cativation. He gives instructions for their manage\& calendar of operations having reference house, with the different months of the year ; and a descriptive list of what he considerg good sorts. This list is very extensive, and contains most if not all the kinds
recently sent out. It is followed by select lis's of early recently sent out. It is followed by select lis's of early and most exquisitely flvoured kinds, as well as of those rejected as wo longer worthy of cultivation
In treating of the choice of Soil, the author maintains, Strawberry will succeed in all soils, with a little carevery little in comparison with the numerous enjoyable results. I have seen, he adds, Strawberries succeed perfectly well in the almost pure sands of Fontainebleau, in the npenings of the foreat in the neighbourhood of Thomery. I have seen them yield a remarksble produce, caltivated in the paved courts of a large city, wel was no soil. There the proprietor, an enthusiastic amateur, inade holes a foot in diameter, and as inuch in depth, filled them with a compost prepared beforehand for the parpose, and in it he planted his Strawberries. Sirawberries, and replaned them by fresh compost and by other Strawberries, and thus he was enabled to continue their cultivation for many years, having the
satiafuction of seeing his table abundantly furnished with superb and excellent frnit.
For strong moist clay soils the preferable kind of manure is horse-dung, or that of fowls, rabbits, or sheep. For a light warm soil, cow or piras' dung is to be preare much the same as thane practienting recommended
The author atrongly insists on cutting off the runners. The difference of produce between that of a plant with the runners regularly cut off, and one left to between the rows is to be avoided; and the old leaves should be left for the protection of the pants till February or March. Suails frequently make great laving down little heaps of bran, of which they are very fond, and to which they crowd, they may be easily collecterl at night or early in the morning.
All Strawberries, it is remarked, are not indiscriminately good for the purpose of preserving. In this author states that the flo generall porm and buttery guch as that of the British Queen, La Chalonnaise, and Carolina Superba, mixed with some Alpines, and with some Strawherries having red flenh to give colour.
Very good deacriptinns are siven of upwards of which still fexist, but are for the mot purt disappearing little by little, being surpaseed by better varietiea more recently obtained. This again is followed by aunther list of 68 sorts finally rejectel as altogether unworthy of cultivation. The varieties comprised in these two liste are very properly condemned; but still the sorts
thought worthy of descrintion are too numperona for cultivation, and it would have been very desirable if the anthor had given a much reduced selectinn, consisting of not more than 20 or 30 sorts. This his long experience would have enabled him to have done with just digrrimination; and it would have left fewer to be tried by cultivators-for this has generally
before any sort casa be planted extenaively.

Boora Reonsved.-Tea: acem, by Cherlea Barwell Colen (Longmans). If all tea were like this poem, there Sckool, Cantorbury, by the Rer. J. 8. Sidebothein, contains a history of the school from ite foundation to
the present time, a list of the masters and of the more dintinguished among the pupils. In this latter category Boyle, the "great Earl of Cork," William Harvey the discoverer of the circulation of the blood, Iord Thurlow, Rnv. W. Frend, Jamer six of thermometer notoriety, Lord Tenterden, Bishop Broughton, Sir George Gipps,
and many otbers, -Goraldine, Gustave Vasa, Riohard Whittington, \(L_{0}\) Chemin do Fer (Relfe). These are representation by the pupils in schools or in private families, and are well adapted for the parpose for which they are intended.

Catalogurs Recerved. - Thomas Rivers' Descriptive Catalogue of Roses, the 32d Edition, is very select, and therefore all the more useful to the purchaser.
Respecting the Climbing Devoniensis Mr. Rivers remarks:-"Some persons, ignornnt of the nature of cultivated Roses, have disputed the claims of this Rose to be a climbing pillar Rose. It evidently originated in some strong shoot of Devoniensis, and has retained 15 feet long withoat putting forth any blossoms; these generally break forth in autumn. These climbing
deviations are no rarity. Géant des Patailles has sported into a climber."-Charles Turner's Catalogue of Roses, fruit Trest, \&c.; nlso Select List of Pelar
goniwns. Among Pears, British Qaeen is highy spoken of -as it well deserves; and in Strawberrie Ingram's Fairy Queen is pronounced excellent, and highly to be recommended. There is a good selection of Hoyle's and Foster's new varieties, -Johm Jeffories \& Son's Catalogue of Nursery Stook.

\section*{florists dflomers.}

Ir is not many years since Tom Thumb was intro duced as a novelty. At that time it was a great advance upon the Bedding Priargosivas then in existence, and it is aill one of the bent we have for
bedding purposes. The immense demand for this variety gave an impetas to the efforts of the hybridiser, and we soon had Attraction, Perfection, Eclipse, Punch, and Crystal Palace Scarlet alias Trentham Searlet, with a hout of othere whose names are forgotten. The five varieties just named, however, still stand their ground for decorative purposes, and althongh every year novelties are introduced which are maid to be superior, the greater portion are consigned to oblivion as being inferior keep their position as the best in their respective colours, although Roi d'Italie is a fine addition to the rosy-scarlet class. Our old favourite Madane Vancher is, I think, eclipsed by White Tom Thamb; Stella, however, must not be overlooked, as no one who has ceen the magnificent beds of this variety at the Crystal Palace would bo without it, and it is in my opinion by far the best of the Nosegays for bedding purpones; Cybister is beautiful in colour, but grows too strongly out of doors, and is bent adapted for pot culture. The last two years has given us some really good scquisitions, especially as regards form, and no doubt we have: and next to this come Mons. C. Nachet and The Clipper, all different shades of searlet. M. Nachet is a splendid variety for pot culture, at is aleo The Clipper, both throwing up fine trusese of flower in a white eye, is a beantifal variety, and for pot culture will be highly esteomed, the truses being thrown well ap above the foliage, which is a great advantage.
My principal object, however, in writing these few remarks is to notice the new varieties sent out last apring, as many of ynur readers may not have facilities for taking notes or for seeing them in bloom. I bave ha 1 opporis 1 iplion collection consist ng of upwaris of 60 varieties of the preseat year, and I find that amongst, those from the Continent the various shades of salmon-colour prodominate, or with white. Amongat these Madame Gueffier, Coguette de Rueil, Madame Rougier, Charles Ronillard, M. Barre, Madame Hery. Madame Lierval, Dame Blanche, Carneum periectum, and Madame Lousael appear to be the bust, The most novel are Coquette de Rneil, curiously striped; Madme Rougier, almon flashed with rome, a fine variety; Charlem Ronillard, edged with crimson ; M. Madere Hun wery witu crimson, very free blooning Dame Blanche and Cinrnenn purfectum are somewhat alike, and both have broal margins of white to the salmon ground colour.
In Whites we have Marie Mezard, very pure, with a alight whade of pink in the centre; Madame Bumllet, phre white, with a light purple shade in the centre; both there are dwarf varioties, hikely to be ueefol for bedding. Whitn Parfection (Hendervon) it of vary fine shape, and evidently an adivance in thio coloar.
The double varieties romprise Triomphe do Gergoviat, Auguste Ferrier, and Maréchal de Chantourd. These appear to he all alike, and, as I am informed, are the produce of the mame plant, distributed by different persors-hence the varions names. Theoe varieties are very curions, and will form a nucleus for the hybridiser
to improve npon. They ponsess one exceedingly good
quality, which is, that the petals do not drop as in ordinary varieties, but aulhere to the calyx and in this alone will , make them and decay with the Ranunculiflorum fiore-pleno I have not
described to me as being the best doable feen, byt year I um told is to bring us something grand in
way of double varieties. Amon of double varieties.
Amongst the Scarlet varieties, the beat are I A'Italie, but brighter, and with fine howhat. like Constant Hualtt, very free, trusses well thrown the folinge; Queen Mab (Hally), free and fin shoe follage; Red Riding Hood, dwarf aud free; Henin rosy yed, with shade of purple, a fine well-formed diona
Rose of Lee, orange scarlet, a little Rose of Lee, orange scarlet, a little starry, foligg
the etyle of Commanderoin. Chief. Vegit Queen Mab; Pygmie, dwarf and free, fine hone toliage, very showy; Boule de Feu, bright verailin scarlet, good shape, very effective; Gilory (smin orange scarlet, tolerably good shape; Prime Nirien (Smith), vermilion-scarlet, very show dwarf dwarf, and very useful for bedding; Prince Hubert large dull scarlet, fine truss, and good for pot colltorn de Surcoloured kinds, with the exception of Be ane, before noticed, are no improveman Helen goadame Barre, which mach briguter tor Gloire de Roses and Serena are protty, and that ine that can be said about them.
Of Rose-colours, Enamel, of fine form, but bearim small truss, is still useful for pot-calture. Victorie d Puebla, deep rose, almost red, is an attractive rarity but a little starry

Madame Werle, ivory white, flushed and edged 9 it crimson, is a very beautiful variety, especially form culture.
Dr. Lindley, but most of those named will befoum useful for pot culture. They will require anolben season's trial before their real merits for bedding goniums are much more extensively grown in the antumn decoration of conservatories,
is more effective in the autumn than we.l-grown p of them, and fime specimens are amually staged a A prember Exhition rich comnost should be avoild reh compost tends to promote rank vigorous git and prucity of flowers. Stout sturdy plants, fell m be found most aseful.

An amateur raiser in this neighbourhood has serent seedlings with three top and three bottom petals i each flower, making a complete circle; if these conti
true to their eharacter it will be a step in the e direction. Mr. Salter told me the other day that fineat zonale he had seen this year was Jules César, yet sert out. I believe this is in the sijy or , brighter in colour than that varietyo. He also name Chriatian Dregen and M. Thiens as being partictar? fine scarlets.

ime, fatal to them-a less exciting compost, thoroughly sweetened and well exposed them. Floral Magazine.
Irias.- Your correspondent "Quo" is not quite correct (see p. 990) as to the right time for planting Ixias. October is the proper mostponed beyond the early part o Dovember. It is only too in the most favoured part of England that these floral gems can be grown out of doors with success. A south border should always be "Quo" recommends, but it should also be rounded order to prevent any lodgment of water on it. It sbould, moreover, be hooped, and during severe frost and met weatter pro of a cold frame, however, no one in any part of England need be without a bed of Ixias, Sparaxis, sebure success is to plant the bulbs in large 60 -sized pots, three in each, and to plunge the pots in asbe in the frame, leaving the lights off, except during wet weather and severe frost. Early in May, when the lants are wefl up, the pots should be plunged in the lone blooming, the pots may be lifted to make room for autuinn flowers, and put into a spare border until the roots have hecome ripe. Barr \& Sugden, 12, King Street, Covent Garden.

\section*{Tye Spary}

Tas following account of the Loss by Suffocation of fine stock of bees, may possibly be both interesting and instructive. I may premise that my experience in
bee-keeping has been but limited, or perhaps this misfortune would not have occurred, or at any rate would not have proved so disastrous. In June I became possessed of an mproved hive, with the appearance hal not to wait long for a swarm, which was first hived in an ordinary butt, prior to being successfully lodged in the new hive the same evening. The bees worked so vigorously that they soon outsiripped Stewarton box, and everything promised well for my being in possession of a first-rate stock for next year A short time since an apiarian friend, who kindly assists me with his advice in the management of my bees, called to see how they were progressing, and was immediately vith this the appearance of something being wrong sliding door which was affixed to the entrance had accidentally or otherwise become closed. Whether some person had incautiously meddled with this door, or by lifting off and replacing the outer case of the hive, had unintentionally closed it, or whether the lieat of the weather had caused it to become lonseried, and consequently to drop, could not be ascertained. On lifting the door with caution in cese of a rush of exasperated bees, all wars still as death; not a bee came out; and on looking in at the window it was evident aised by the imprisoned
"Black Hole of Calcutta" for these unfortunates. A large mass of bees, dead and blackened with honey, was pilad on the door-board; a few only were alive in the top part of the hive. The combs had all collapsed, made of them. On being informed of the disaster I repaired to the apiary, and was horror-struck at the ight, and with the thought of what the poor creatures It was evidered.
save any portion of the that nothing could be done to save any portion of the bees or their works. I was truly astonished at the progress this swarm had made, and consequently the more grieved that the simple shipping down of a zinc shutter over the entrance-way hould be the cause of so dire a calamity.
It was evident that the stoppage must have occurred some time between the cessation of labour for the day the bees had previously and the early morning, as all were working, or pretending to work, vigorously, but only a few robbers, attracted by the scent, were to be seen hovering about this particular stock. It could reuove all traces helped, and nothing remained but to ing stocks would become or the bees of the anjoinI firmly
firmly resolved to remove all door or entrance account to allony has then in my possession, and on no Exeter. Earwigs V . Bees.- In your report of the Meeting of adverted to the unusual number of earwigs, and of Waspa' nests in many instances destroyed the larvæ of Wrompa a nests. Protessor Westrwood also read a letter numbers of earwigs, inad which it was stated that vast bee-hive of earwigs destroyed the larve.
with Seral of my stocks have been infested externally with earwigs, but oue in particular, during the entire extent, has been favoured with them to an enormous extent. On lifting off the outer case and coveringe, for
the purpose of examining from time to time the progress
disturbed and bill handred of earrige a day or two, quite as large a number would again be found. But I bave not in a single instance had canse to believe that these pests were in any way a source of serious annoyance to the bees. Many of these ntock gave me swarms or supers of honey, and the hive which beyond any others, was infoeted with the earwige, in
addition to filling a beautiful super with 55 ib net addition to filling a beautiful super with 55 lb . net weight
swarm.

I think, therefore, that there must have been an inherent weakness in the stock alluded to by Mr. Weath wood's correspondent, otherwise the earwigs would not have been suffered to enter the bive in sufficient force
to effect any serious injury to the larva. I am convinced to effect any serious injury to the larva. I am convinced
that the searcity of wasps during the lant season is not that the searcity of wapps during the inat mason is not in any material degree to be attribated to the attack
of earwige. It is far more reasonable to moribe thi of earwige. It is far more remsonable to ascribe thit mortality of the queen wasps to the cold weather which their nests and first deposit of egg. Apiator.

\section*{Garden Memoranda.}

Monceierpe House (Concluded from p.991).-The ple isure grom is situated on the same level piece of land as that on which the mansion is baik, and kitchen garden, on which it abute on the western and southern sides; a sunken wall divides it from the park on the south, and a well-secured fence from a road which passes along the bottom of the hill on the
northern side; it contains an area of some 13 acres in northern side ; it contains an area of some 13 acres in displaying to advantage the rich treasures of thene charming grounds. Amongst a multitude of fine trees Rhome remarkable Associated with these we noticed good specimens of Tulip Tree, Purple Beech, Thorn Acacia, Turkey Oaks, and Weeping Ash. A white Willow is 65 feet high, and is 16 feet in circumference at 3 feet from the ground, covering with its pensile silvery-leaved brancles an area of 32 yards in diameter; altogether forming a magnificent object, whica contras a noble-looking Silver Fir some 90 feet in height, the stem of which is 10 feet 4 inches in girth. The beautifu? branches, which weep to the turf, cover an area of 42 yards in circumference. Taxodium sempervirens is a fine specimen, green and beautiful. There are also nice examples of the recurved cut-leaved Beech, variegated Oake, and Irish Yews. A Weeping Birch forms remarkable ohject, and contrasts admirably in 1859, is around it. Wellingtonia gigantea, planted in 1859, is
11 feet 3 inches in height; PiceaNordmannana, although not particulariy large, is remarkable for its glaucons and beautitul appearance. Deodars are present in noble Wild Clierry are als) very effective, especially when clad in their deep rel autumn livery-they are useful, too, in the autuma months in diverting the birds from
fruit in the garden. Cratæzus tanacetifolia, Siberian Cruit in the garden. common Berberis, and other-, are judiciou*ly ocattered about. A magnificent suruce er mearure 8 feet in girth; it is a perfect cone from top to bottom, where it covera.
circuus

The south aspect wall of the garden is covered with flowering plants, amongst which we observed Magnolias, Jammines, Roses, Wietariag, Cotoneaster, Almonds, Ceanothas, Deutzias, and others of border filled with At the base of the wall is a narrow aroad wall in front On the south side is a Rosary, which is planted with good selection of choice kinds; there are also clumps of Dahlias and odher fows and other pleasing shrubs,
masses of Rhododendrons

Rhagt whioh, rcattered about, are nice specimens of hus Cotinus, Rose Acacia, Arbakus, Cedar of Lebanon, Thujopsis borealis, Cupressus Lawboisian, and Blac Suruce. There is also a noble specimen of Golden Holly, and a very remarkable treo of Weeping Biveh, well as some enormons Lime troe, a few of which ought to be removed, as they do comsiderable damage to the ornawental wall, and with their abude destruy great portion of the interior of the garden. On the south side is a mausoleum-an anciout Ivy-eovered and Ash; the latter are corered for a cousidarable distance up the bole with Ivy.
The zitchen garden coomits of two divitions: one portion, a parallologram, contains \&ई acres 3 the other it irregular in form, comprieing \(1 \frac{1}{4}\) sere, and the whol
 is grown very successfully. The ground slopes a hetle to the south, and the soil is of a deep lommy charnoter, woll saited for the cultivation of both fruit and vegetablic, Some old atandard, or rather "rider" Peachas, cover a
wall, from which heavy crops are annuilly obtained. Figs, Apricots, and Plum trees are aleo very productivo. Half-standard Apple trees too produce apleadid apecimens of spotion frait. In the centre of the norther wall of the largeat division of the garden, an excellen range of glass was erected a fow years agos it and is divided into fire ments. The first is a apan-roofed greeubouse, running north and south, with one end resting on the garde Wall; it is 28 foet 4 inches long and 20 foot wide;
it has a otage in the centre, and a bench on either hand, commencing at the door, which it in the southern end. It was filled with flowering plants in the shape of nioe apecimenss in the centre of the stage was a good plant of Cycas revoluta. The next 13 house is vinery, 35 feest long, 15 feet wide, and bunches of finely swolled well-colonred Grapes, con sisting of Lady Downe日' and Back Prince; the back wall was coverod with Brown Irchia Figs, and on the floor were some admimbly trained pot specimens of Azaleas. The centre house of the range is also a span-
roofed greenhouse ; it is 30 feet long and 21 feet wide, and is staged and shelved precisely as the end housp. It was filled with gay specimen plants, amonget which some fine masses of Liliums oceupied the centre of the stage, keeping company with a huge kyrtio, which had been struck from a sprig taken from the wedding bonquet of the present amaznets
mother some 41 years ago. Encharis amazonica, Witsenia corymbosa, Celosias, Pelargoniumas, Fuchsias, Achimenes, Statices, \&c., flled in the remaining portions of the stage and benches. The third house is a lean-to Grapery, of the same dimensions as the other Vinery; the young Vines in this house had been nearly destroyed by wireworm, when rape-dast was furked into the border, which apparently atopped their ravages. This honse also contained some excelleut Grapee, and he Passifiora edulis was fruiting freely. Tue oller house is a span-roufed stove of the same dimensions as the end greenhouse; it contains a nice selection
of well-grown plants, numbers of which had receutly takeu honours at the exlibition of the Ruyal Horticultural Society of Perthshire. Conspicuous amonggt them were Coleus, Draceena, Euphorbia, Dieffenbachis, and many others, had a fine appeurance amidst beautifully powdered Fern fronds. Passion-linwers, Cissus, and from creepers were siightly taining tolerable specimens of Oncids, Cattleyas, sco, the whole producing an excellent effect. The whol range is admirably aẻrated by ventilators, which allift up simultaneonsly by means of machinery of a very gimpl description. The heating, twa, is circulating in iron pipen from Meiklejohn's boiler.
The ground in front of the range of glass just mentioned hedges; the upper partion, which forms a terrace, consists of symmetrical beds having broad Bux edwings with gravel patas between them. The lower portion is in the panel style on turf, with equidistant rows o circular beds on either side of the broad gravel walk to the extremity of the garden. The whole of thit garden has been very gay this seasnn with choice edged Arubis aud Cerantium baing chiefly used for edging plants where such were required. Saponaria Crystal Palace Nastartinin were most effectively dilo played, and we were particul inly the Gludiolos, whic was splendidy in bloom. The main walk fron the entrance on the western side has niso been gay this year with flowers in the rubon style, the back of Hullyhucks of superior kinds. This walk erosses the garden terrace immediately in fromt of the range of houses. The other borders were 1 ro-
digally covered with antumn flowering Phloxes and digally covered plants.
The walk here, like mont of those in Scotland, are kept hoed aud raked, consequently they are loose and much less agreeable to walk on than a smooth well-rolled
surface, a practice which has doubtless arisen from the
want of binding gravel. Here it is of a bluish tint, want of binding gravel. Here it is of a bluish tint,
obtained from the river, and is possibly of a more nuitable character than that in general use. The broad walks of the new park at Dundee are apparently surfaced by a similar material, in the same style as shells are employed on the magnificent walks in the Royal Horticultural Society's Garden at South KenRoyal Horticulturaite spar on the broad walks of the grand terrace at Chatsworth.

There are other glass erections on an elevated situation immediately behind the main range. These were erected some 40 years ago for the cultivation of discontinued. The central portion is 55 feet long and 14 feet wide, in two divisions, in which are excellent crops of Grapes; the other portion is 100 feet long and 8 feet in width, and is chiefly employed in producing Cucumbers and Melons, and preparing plants for the decoration of the main range of houses. These pits are now in a somewhat dilapidated condition, and erections.
Behind the main range of houses is an excellent well fitted-up fruit room. The Mushroom house, in the same range of building, is also well constructed; it is heated and has aslate ceiling. There are also a good potting shed and seed room. On the opposite side is an Auricula stage In this portion of the grounds were some well.grown specimens of Chrysanthemums, together with stores Primulas, Cinerarias, and similar plants used for winter decoration. Here, too, were very nice examples of Heath, Epacris, Camellias, Azaleas, Cytisus, and many others ready to be moved into their winter quarters.
Moncrieffe has long been remarkable, both for the beauty of its situation and for its successful gardening For nearly 40 years of the early part of this century the late Mr. Mitchell was famous as a cultivator of stove and greenhouse plants, his Heaths being only grown in the New Botanic Garden at Edinburgh. Auriculas and Carnations, too, were especial objects o his care. Nor has the place retrograded under the active management of Mr. Bissett, the present superintendent, who has for a series of years managed the repairs and improvements on this large estate, and directed most successfully the whole of its gardening operations. We left delighted with all we had seen. \(D\).

\section*{Miscellaneous}

Hops in France.-It appears from official returns that the cultivation of Hops in France has increased considerably of late years. The Hops planted in the department of the Bas Rhin in 1857 covered saperficies of 574 hectares ( \(2 \frac{1}{2}\) acres each), and there have been 120 additional hectares planted within the last eight years. M. Heuzé, in a conmunication to the Imperial Agricultural Society, attributes this increase in the culture of Hops to the improvement in agricul ture. It must be observed, at the same time, that the quantity of Hops imported is increasing every year while in 1855 there were \(1,556,000\) kilogrammes. The landowners in the Bas Rhin are at present making every exertion to supply a sufficient quantity for home consumption, and to enable the country to be independent of foreigners for a supply. It is said that French brewers, for a great number of years, were accustomed to make beer without Hops. They substitated for the Hop plant Coriander seed, Wormwood, and the bark of Box-wood, but the bad quality of the beer thus produced disgusted their customers, and they compelled brewers to use Hops, as the only substance which can
produce a wholesome beverage. It is stated that every produce a wholesome beverage. It is stated that every
inhabitant in France consumed, on an average, in the year 1825, nine quarts of beer. The consumption increased in the year 1837 to nearly 20 litres, and since then it has progressively increased. Journal of the Society of Arts.

Ants and Cocci.-Not long ago, whilst in an Orchid house, I noticed a great quantity of ants running here and there upon the leaves of Calanthe vestita and Limatodes rosea. My curiosity made me eramine their movements, when to my surprise I saw them milking, as it were, a species of coccus which infested the leaves of the plants. Now I had heard of this before, but, like many more persons, thought it was but a tale; but now I had found out the whole miethod, and here it was in full operation before my eyes. The ant gently stroked the coccas with the two antenner, and some
times with the legs; after this the coccus excladed a mall ronnd white substance, which the ant ate, and then commenced apon another coccus. Perhaps some persons may doubt, but to all those I say get a plan infested with coccus, place a colony of ants upon it, and arround the whole with water, so as to prevent escape, and then they will be convinced. A few weeks after this incident my attention was drawn to a still stranger sight, viz., in a hothouge I had cleaned several smal shelf. One day, while watering these plants, I noticed three large domes of earth surrounding the stems of three P. princeps I had cleaned. At the time I thought it was perhaps the work of worms, so I turned the plant out of the pot, and found to my astonishment, not worme, but a colony of ants, snugly enjoying their
new home ; and when I looked at the stem of the plant I found a quantity of cocci attached, the earth forming quite a chamber for them; so I came to the conclusion that the ants had formed this chamber, and brought when wanted. J. F., Clapton, in Science Gossip.

\section*{Calendar of Operations.}
(For the ensuing week.)
Tre time is at hand when ungenial weather may frequently drive labourers in-doors, where a stock o work should now be provided. The tying of new mats cutting and picking of shreds for the walls, cleaning old nails, drawing bast for the coming season, arrangemen of herbs, examining stores, making flower-sticks, labels \&c., washing and putting away all spare striking or other glasses, making straw or reed mats, protectors for baskets or the ensuing year are matters of as grea consideration as out-door business, and should be go forward betimes. All superfluous or dead things in pots should be emptied out, and the dirty pots from every part placed in a corner of the shed, ready for washing Plenty of broken pots should also be housed in a she corner to be crushed and sorted ; they may be fairly reckoned amongst the most important things connected with the potting shed. Any one having old half-worn sashes without glass, may readily make a most useful straw cover of them, well adapted for covering Endive and other salads, Parsley, \&c. ; as also for placing over early crops of Potatos, Radishes, Carrots, \&cc. When covered equally, three or four long sticks or laths should be placed on them in a line with the sash bars, and bound down to the latter in a few places by ta twine. If housed when out of use, they will last a couple of years.

\section*{FLOWNR GARDEN AND PLANT HOUSES}

The flower garden is now so far robbed of its beauties, that if not already done, steps should be taken immediately to secure a desirable arrangement for the decayed. Let all observations as to improper heights \(r\) misarrangement of any kind therefore be made.
Bulbs.-Attention should now be paid to bulbs grown in the open air, as they ought to form a conspicuous part of every garden. This is the time for laying in stock and planting; the latter operation, indeed, should be no longer delayed, for it is desirable that every bulb should be well rooted before winter. Bulbs are in general planted too far apart, and there are too few of them to make a good display. Yet what can better repay the labour and money expended on them How dull would the garden be for many months f this interesting class of flowers were neglected! Buy Crocuses by thousands, and Tulips and Hyacinths by hundreds. Remember they all increase very readily, and with care the outlay will be repaid with interest. Crocuses and Tulips multiply without much trouble. If borders are preferred to separate beds, the following plan will be found advantageous. Let the outer row be Crocuses, the next Hyacinths, and the third, or inner row, Tulips. Do not be afraid of planting too thickly, but let there be 2 or 3 inches space between each kind of bulb. The Crocuses will be out of bloom by the time the Hyacinths are in their prime, and the foliage of the former will make a pretty
fringed border for the latter. Oval or round beds have a fine effect when planted in this way; the beauty is prolonged, and the whole may be cleared away in time or the spring bedding. In planting, dig a treach about 4 inches deep around the bed, and as wide as required. Let the bottom be well loosened, and then place the bulbs in order upon it, Cover with about winter be careful to grard against the ravages o mice, for they often devour thousands of Crocuses and Tulips before they are observed. The Crocuses may be mized, or planted in alternate rows of various coloura. The same plan may be pursued with Hyacinths. For planting in the open air, purchase mized sorts, single and double white, red, and blue. These mixtures generally contain many fine sorts. Snowdrops, Crown Imperials, Narcissus, \&cc., may also now be placed in clumps.
Chrysanthemums. - These will soon be coming into bloom, and care must be taken to see that they do not suffer from want of water. A. little weak liquid manure given foccasionally will assist them in making a better display than they otherwise might do.

\section*{FORCING GARDEN}

CUCUMBERS.-A temperature of about \(70^{\circ}\) should still be maintained. This will allow of a little air being given on comparatively cool and dull days. Stop progressing shoots, and pinch off tendrils.

Peachrs and Nectarines, - Cover the outgide border of the early house with leaves or litter, for the purpose of excluding frost and heavy rains. Tie in the trees, and get all ready for starting when required. Pines.-Where the plants likely to fruit without making further growth are considered insufficient to meet the demand until next autumn, the stronger plants of those for late fruiting should be encouraged to make growth as early as can be done without weakening the foliage, with the view of preparing them for atarting in April.

Orcing the beginning of next month, is inded done, now have some fermenting materiais the borders so as to encourage the roots a getting the buds to push strongly and with time.
hardy frut and kitceren gardey Storing fruit and root crops, and clearin winter, will now be the chief, work to be done
All alterations required should also be pronae without dolay while the weather is farour CeLery and Endrve.-Earth up the form up the latter on dry days.
Peas.-It is a cominon custom to sow P this time on a warm south border; but
subject to so many casualties subject to so many casualties during wister, th boxes under glass, and transplant when cold is over. Those, however, who have means to follow this method, may sown now soon in the open ground. Spring same circumstances will, however, come in ater if any than those sown at this season
Wall Trers.-Where new borders aro these, they should now be pusheid forward dition. Where the subsoll is cold and wet it be thoroughly drained, and some means sho used to prevent the roots from going too deep
WINTER Grewiss.-Destroy weed, if any these, and stir the ground or earth up as ant deemed necessary.

\section*{The agricultural Gatette.}

\author{
SATURDAY, OCTOBER 28, 1865.
}

Nothing is more fitful or capricious than the attacks of Cattle Plague which are reported from time to time. Lord Gran wiliés herd was declared to have become infected by his herdsmen having habitually passed through the field in which the cows belonging to a neighbour had died. They might have troi in the cow-dung there, and thus brought the poison with them. But it is a curious fact, which makes this theory untenable, that the neighbour to whose field reference is thus made, stocked it again with cows within a few weeks after his loss; these have remained healthy ever sinee, and it was not till a fortnight after he had done so that the first cow in Lord Granvilie's cow-house suffered. Take another example :-
Mr. Collinson Hall, at Navestock near Brentwood, is in the midst of the disease: neighbours have suffered all around him: bis own farm is intersected in every direction with public roads. His principal cow-house is in the angle of a crossing of this kind, and men are in and out or it all day long, walking to it along the public roads, which are in direct communication with infected farms. His cow stock, upwards of \(10 n\), have been healthy hitherto. He has them in several separate Ints, turning them daily into the Grass fitlda, and keeping each lot always and absolutely apart from its neighbours. The only precaution used is to employ a herd boy with them, who never suffers any of them to approach the boundaries of the fields, whether they abut upon the public road or only on a neighbour's land. Here is an instance where the risk of infection is a maximum, and jet
no harm has ret happened. Oa the other hand, the simgle cow of a clergyman in a netghbouring parish, living in a necluded paddock, and never appruachead except br the "gardener," sabjected thus to a mininum of riek, "has takin the diseaso and died.
There is in this very unocrtainty, which, hawever, is seen in cridemacs just as it is in epmestions, a strong and we believe a wholesome addition to the frightfulness of the calamity wheth will, we hople, drive men wharualy to the wark of mutual insurance. There is a strung otyection, often expressed, to an:ythog which tends of equalise prutits in a communnty; we caunot, howeler, suppose any objection to a prooess which should help we equalise losses. The puthien: of of full inturma tion abmut produee and consumption-timely and trustworthy information on agricultural statistica -is not generally prpular wits men of basineas as tenant farmers-and we have beard the argoment that it would put men more fairly on a par in the choic of times fir sales and purclianew met hy the objection, "We would rather not be on a par; let those who have been at pains to gather wnfe information for their guidance have the advantago of it. It is not ouly persomally. but generally, better that there should be thas premium ufon enargy, activity, nad intellipncte." We ean however hardly beluve that the argument, how ever it may apply to profits, will neeur to any one in the case of longes, exprecially lates by a dianatur which seems to set all carefulamen at nayght. Men aro willing emotsh to namme agnathet fire: thare in no reasoning on the ground of keephg all tha advantage of extra carefulnexs to lumwlf, wer ariving to condemn the insurer whop fay a wmall premium to cover his own risk, and thas hity to cover that of his neighbour alas. Aud no doubt the terror of this new calamity will drive men into mutual insurane. Seltishonese will urge it, not forbid it, and puline spirit, also, will no douth help it forward.
We are glad to find that nome of our county societies for this purgose have thus alrea iy griown, one may almost say, into great banking inkltutions. We referred the ither day to the local insurance company for the Petty Sunsions diverict of Guildford, where \(40,(\mathrm{mon})\). worth of ntarck were in two days insured at a premium of half-a-crown in the pound, with liabulity to sucocosive wapouny calls ap to that amount. We learn that the Count Association at Gloucester has already f(C), ()(N)/2) worth of dairy stock upon itn books and there too the lisbility is at present limited to \(12 \frac{1}{2}\) per cent., or half-a-crown in the pound. The tenant farmers in the Vale of Gloucester have thus bound themselves in the amount of \(5(5\), ,(M0) . to bear one another's burdens. And there has, we believe, been no better illustration in our day of the increased capacity for combination and mutual action which the hitherto isolated agrioulturiat now displaya.
In tnwn cow-houses the system of management is so entirely different from that of oountry dairies that the prompt stock owner, while he runs a greater risk of the disease, does not run so heavy risk of immediate loss. His cows are continually shifted as their milk fails, and are thus kept in a fatting condition during the milking process. The universal system therel re is, as soon as a cow refuses her food or suldenly shrinks in her milts, to slaughter her at once, The carcase is always fair beef; and whatever the disease may be, it the firat loss of appetite is acted on at onoe, the beef is undistinguishable in appearance, and probably is not different in reality, from the flesh of a perfectly healthy animal.
Be this as it may, there cannot be a doubt that London is now supplied every week with carcases which are killed lest the lack of appetite which has been noticed should be the firat symptom of the cattle plague. It is not a very plessant commentary on this fact that larger quantities of meat are now weekly condemned by the market inapeetors is the City than have ever hitherto been the case. If so many more cwt. are every week oondemned as bad in a supply of various quality, there must be so many more tons per week on the verge of absolute unfitness which escape detention.
It is satisfactory that we hear nothing more of the liability of sheep to take the disease from cattle. The sheep which Messrs, Swas, of Elinburgh, placed in the Sanaturium there have been in the same place now fur many weeks, with sucoessive series of plague-stricken cattle which have been fruitlessly subjected to treatment beside them and died, but they have as yet shown no signs of the disease.
We observe that the whole subject is to be dis-
oussed on Monday, November 6, before the London Farmers' Club, to whom it is to be introduced by Mr. Charles Howard, of Biddenham, near Bedford.

\section*{THE GUESS OF AN AMATEUR.}

Doctons are at their wits' end. They are at best estate "guessers;" and it is possible that one of the unscientific may "guess" as near the mark as the "scientific."
In my last contribution I referred to the necessity of early depletion. In inflammatory cases the absorbent vessels are turgid, and the quickest relief
is by depletion. Depletion is at the very head of is by depletion. Depletion is at the very head of
stimuli acting on the absorbent vessels; medicine is a long time in relieving those vesselg-too long for such a rapid and deadly complaint as the cattle plague. The absorbent vessels being gorged, they cannot take up the medicines destined to act through them; the issue is, the fever becomes typhus, typhus becomes plague, and the animal dies putrid. Let us review some of the inflammatory complaints to which cattle,
no less than human beings, are subject. I believe that in most cases cold is the exciting cause of most of, if not all, the internal inflammations.- By vege tarians it is called "radiation," so destructive to vegetable life, especially in the spring of the year, when after a hot day dews fall plentifully, and the wind,
N.E., freezes it to hoar frost. Extreme cold, by a N.E., freezes it to hoar frost. Extreme cold, by a
quick transition succeeding a broiling day, chills the whole surface of the animal, and produces fever. Let us, however, specify some of the diseases which are best arrested by early depletion. I ama a bold man even to talk of depletion. Formerly doctors and or any cause. Man dies of tubercles, and beast dies of inflammation of the lunge, or goes broken-winded. 1. Carditis, or inflammation of the heart; 2,
Peritonitis, inflammation of the membrane lining the abdomen; 3, Gastritis, or inflammation of the stomach ; 4, Enteritis, or inflammation of the bowels; 5. Splenitis, or inflammation of the spleen 6, Nephritis, or iuflammation of the kidneys. I believe that in severe cases of the above, depletion is the first and quickest remedy, and that it enables other auxiliaries to take effect. Let us, however, take fine Greek name, which is used to describe the lining and substance of the lungs. Pleuro means the lining-pneumonia means the substance of the lungs. Pleuro-pneumonia combined, means the inflam mation of both these important parts of man or beast. I contend that early bleeding is the quickest, surest, and best estoppel of the disease, and of bad conse quences should the subject survive. Let us take the case of influenza in horses, which proceeds from checked perspiration-the grand cause of maladies in our fine but variable climate.
of pleuro-pneumonia, beginning with influenza. My mare was taken with it. Her eyes were swollen, as if ahe had been beaten with a stick, and the tears rolled down her oheeks. I sent to the house for the cheapest dootor in inflammatory cases in the world, the heam." I bled her severely-about 6 quarts-put a sheep-sinin over her loins to sweat her loins and kidneys,
and gave her nitre and gruel. I kept her warm, but gave her plenty of air ; I bandaged all four legs. I saved her from death, and did not leave behind broken wind A fortnight to Grass (Dr. Green !) and she was all right! With regard to bleeding, it should be in the very first stage; to bleed late might be death. Moreorer, in bleeding, the age, the sthenic or asthenic state of the animal must be considered; and further observe, you can take more blood from a lean than from a fist nimal, and also more blood from an animal with a small heart than from an animal with a large heart. In health an animal with a large heart has not so quick and full a pulse, as an animal with a small heart. In bleeding you must have reference to these hings; it is a matter of judgment
Let us relieve the article by a couple of anecdotes. My father was a racing and hunting man. He lived
till he was 81 years of age. He had seldom less than 30 horses about, of one kind or another. He told meas the result of his long experience, "that he lost eeveral valuable horses by not bleeding, but he never lost one that he bled early." He added, "for Do not bleed by driblets day after day. You will weaken the horse without stopping the inflammation. If you don't at ouce stop the inflammation, the inflammation will stop the horse.'
Anecdote the 2 d , or case in point. Some years ago a lady sent for me to see her mare that was ill. I went, and found her labouring under a violent inflammation of the lungs. She blew at the mouth and nostrils, and
heaved violently at the flank. I told her servant "John" to get the fleam. "Lor, sir," said John, "Missus would not hear of it. You had better see her." I knew the was a homooopath, and the fissue of my intervow. I told her what it was, and the last hope. She size of a thimble, told me to hold up my "infidel" hand and doled into it 4 little white specks, scarcely visible, called Arnica [?Aconite], adding-"this has entirely
supereded the lancet!" In vain was remontrance

I closed up my hand, and went with the "supersedeas." I rolled them np in paper, and greased the paper to
insure delivery. The globules were delivered faithfully, and I went home. Not the next day but the day after "John" came to me, sayiog, "Missus has sent me to say the 'Hos' is dead."
Let us turn now from aneedotes to a joke truly black-I mean the plague, called pestis. The plague is
typhus gravior. The yellow fever, another form of marsh miasma, is typhus icteroides. These are deadly complaints, but both, especially the former, bear great analogy to the cattle plague. In Turkey, I believe that their first act in typhus gravior is to bleed, with viem of causing the absorbent vessels, which are curgid, to take up the medicines administered. The fail. The following things as regards the human plague are remarkable :-
Firstly, it is well known in the Levant that the plague advances from south to north. It usually begins at Grand Cairo, spreads to Alexandria, and
thence passes through Syria to Smyrna and Conthence pass
stantivople.
Secondly, a dead body will not communicate the plague so readily as a living boing; from which I infer that the chief communication is not by contact, but by inspiration. I believe that to be the case with the present cattle plague. It is not communicated by the "contact" or touch of the body of the diseased, but by the contact of the breath, alias by inspiration, and hence one diseased animal will infect a herd in a little time. Instead of contagion use the word infection by inspiration. I fancy there must be abrasion of the skin for the disease to spread by simple contact. I may be wrong. Finally, I believe that the first things to be done are to bleed-to act upon the kidneys, to open the pores of the skin, and relieve the bowels. After that is done, support is the next important thing. Port wine, barm, bark and ammonia, iron and camphor are all good things in typhus, and they are all innocent in their natures. I hope false delicacy will not hinder any one from criticising my article. The great object is to arrive at truth, and discover the "Catholicon and remedium efficax."
Remember the words "obsta principiis-venienti occurrite morbo." Bleed and physic your herd before they catch the disease in your neighbourhood, if the weather is sultry. Keep your eye on the herd. If an animal separates itself from the herd, looks dull about the eyes, does not ruminate, and stares in its coat, you may be sure it is breeding the complaint. Then is the time to physic and bleed. I am going to visit a farm in my neighbourhood, where, I hear, kine, sheep, and pigs are affected. I will report. W. F. Radclyffe, Tarrant Rushton.

\section*{ADVANTAGES OF FARMERS' CLUBS.}

The following inaugural addrass was given by the Rev. Prebendary Broroton on the
Farmers Cub tbe other day.
THE advantages of a farmers' club are not necessarily limited to its members, but may extend to the district in which it is formed, and oven to the agricultural profession generally, and through the influence of that profession to the common welfare. I propose accordugly to make a few brief remarks: first, on the benefits which any individual farmer might reasonably expect to derive from joining a farmers' club; next, to consider the advantages which a flourishing society of this kind would probably confer on the neighbourhood; and lastly, to indicate a few of the questions of agricultural and public interest which might suitably occupy attention and elicit discussion at the collective meetings of the members. In suggesting the advantages which might induce individual farmers to join a club, and in appealing at once to considerations of self-interest, I fear that I shall seem to some to be pitching the inauguration address of our new Club to a somewhat sordid key. Only let me remind you that in such associations each member gives as well as receives. I shall, however, attempt to ahow that the advantages which each individual at once confers and derives through his membership are, or ought to be, quite beyond the measure of the sum of money he subscribes, whether he considers that subscription chiefly as a payment for value to be received, or as a contribution to the benefits of others.
1. Among the advantages which farmers' clubs offer to their members I will notice first those of con-venience:-
The rooras of \({ }^{\text {a }}\) well. conducted club ought to combine
some of the publis conveniences of an inn with some of the some of the publis conveniences of an inn with some of the
private comforts of a home. I trust, however, that the ladies
and the landlords will not take alarm at this statement fear lest the attractiveness of the club should lead to their
desertion. For the present, at least, the committee of the Barnstaple Farmeers' Club hold cut no inducements to its
members to forsake their habitual resorts for bed and board.
But, sbort of eating and eleeping, there are few conveniences of But, sbort of eating and eleepling, there are few conveniences of
a private or pulic house which may not be enjoyed by the
members of a club at a very modelate cost. It Is no elight

his consideration; and if on felonging to a club must deserve his conaideration; and if any farmer in thim room is disposed
to inquirg at what coot thens adventigen may be proured, I
am havpy to be able to inform him that they are alread

smile may have some effect
the marsupisl membrane.
2. I pass on to apeak of the advantages wiza farmers
flourishes.
Such an institution is calculated to give diguty the
cipal occupation of the inhabitanta It aserte to
cipal occupation of the inhabitant
importanoe of that occupation, and th
members of the club, but to all who are worthily hend
the same pursuit. And I may be permitted to sai tha

think, confer upon the distriet in which remove mo

2. Is Rindrapest Spontaneous in the Country? It is now universally allowed that this malady, which destroys more horned cattle than all the other complaints to which they are subject, is always introduced into this country by foreign cattle. Wollstein, Metzler, Keck, Laubender, and some other physicians, thought that the malady might be spontaneonsly generated, and even Adami was for a time of the same opinion. Adami once tried the following experiment:-Having gradually leated the blood of an ox until it got putrid, he placed it close to a healthy one-year old calf which was shat up alone in a stable. On the fourth day the calf began to shiver, to move its head to and fro, and to breathe heavily. On the sixth day it ate seventh day-the third from the outbreak of the fever -all the symptoms were aggravated. On the eighth day the animal neither ate nor drank, its eyes were pulse and projecting, its month hot and foaming, and its pulse quick and hard. On the 15 th day the calf died, and a post mortem examination of the carcase was at once made. The lungs, which were much inflated, and loaded with coagulated blood, had dark brown spots on them ; the löser (probably the third stomach)
and the labmagen (rennet-bag) were highly inflamed, and the löser was crammed with dry food; the galland the löser was crammed with dry food; the gallafter the outbreak of the fever a perfectly health day months' old calf was placed close to the above-mentioned animal. On the ninth day the second calf sickened, and showed the same symptoms as the first had done. Vinegar and camphor were exhibited, and pleased that his experiments had turned out so wighly but he soon, to his great annoyance, learned that the Rinderpest had for some time been raging in the district from which the blood used had been obtained. At a later period Adami, Lanzisi, Ramazzini, Camper, De Haen, Vink, Opitz, and Hanold made other experithe Rinderpest is they came to the conclusion that west of Europe is never spontaneously generated in the West of Europe. It is a mistake to suppose that the malady is indigenous in Hungary and Galicia, for it never appears in those countries nnless it has been prevalent in Wallachia and the Bukovina, In the Fracastori, Gazola, Geedike, Le Cletc, Bourgelat, Berg, Halber, Vieq-d'Azyr, and Abilgaard, the Rinderpest was east of Europe. Times Viennal Asia and in the southeast of Europe. Times Vienna Correspondent.
8. From the Eari of Winchilsea.-Does it not strike you Majesty's Council to issine an order (upon its vewn and hole responsibility, without the concurrence (upon of Parl own and sole
conificacting an enormous pirtually
without the pretencerty of a certain description without the pretence of an indempity to the denfortunate
owners? In other countries which have been attacked by the cattle
disease, the Governments have adopted most peremptory misease, the Governments have adopted most peremptory
measures, slaughtering whole herds, drawwing a cordon sanitaive
rouul large areas, and preventing ,ont but that of doges, men, and animals got onerally. the egress of cattle,
arbitrary enough to this sounds arbitrary enough to an Englishman, and at first he may,
perhaps, congratuate himself upou not being a Prussian,
Austrian or Austrian, or Dutchman. But is his position preferable to
theeirs? Nay, it it not, if you come to examine it far worse?
The Government of each of these nations buys up the cattle before it orderst them to be destroyed. With us it destroys (by
the fate often enough of inspectors whose judg ent be relled upon) without spectors whose judgment can hardly
market value per head of a market value per head of a diseased beast.
Now, I do
deatruetion of a meant to assert that in case the the the proction of a herd may not be the raadiest ways of arresting
of the prontagion, bnt I think it can hardly be asked sacrifice. The worst has happoned willingly concur in the
 would almost appear that the manners and customs of some parental Governments are more calculated for the beneit on
the community than this unlimited free trade, conducted upon own interests) to make sure of an indivi. inal pursuance gain, regardless
of the damage he may entail on his nelghbours, and titwould
moreorer appear that free trade bas its duties an it moreover appear that free trade has its duties as well as its
advantages, among the former of which may well be reckoned dev liability
The disease once introduced, the London market system provinces, pretty much after the fakhion that Britania is to
be seen-if one of them still survives-sowing letters, in Mulready's oricinal postage envelopes.
with railed off, at a loss, to be sold at the market being forthwhatever they will fetch, nuake concentration of a malady thterly impossible.
was distributed my the desire of shifting loss, byd negligence, I belicated by all the ramificutions of untraceable contagion. he murrain of a century ago (for an account of years and need only turn to the "(Gentleman's Magazine)" this peat die out, become subdued in its character, or a remedy will b ound for it; still this state of things will demand time, is at best problematical, and can neither pay for present losses nor
Illay the panic which is at present as irrepressible as the negro.
Were some large cotton or fother manufactory employing an Order in Council to be issued thereupon, commanding the without indemnity to the ground and the machinery burn the nature and extent of the outcry that would follow: the "Black Country" would ro into permanent rebellion ; and yet rich a proceeding would neither be more unjust nor more
ridiculous than the issuing of an order commanding the ridictulus than the issuing of an order commanding the
destruction of infected cattie, on public grounds, without an indemnity to the owner.
Let the authorities carry out free trade in its entirety; by which I underatand the full and indefeasible right of any one posessing a diseased cow to take it to market and sell it for
anything it will fetch; or else, if prudence and precaution oblige them to act otherwise, let them compound with the titled to buy the beast and slaughter it in the common interest Upon stch terms, and upon none other, is the public entitle hey brealc the Commandmets, they steal, and if they steal, and lare good against one or a thousand, a pickpocket Greas
Ocl. 18.
4. From Mr Graham, of Capellie.-In the cattle plague report from Kirkliston, near Edinburgh, which appeared in there had 25 cows, one of which died, four were sold to unaffected, and 20 were in good condition and seemingly ear:, Were afterwards attacked, and the report goes on to
gay - One of the 10 attacted, and which semed very ill o Sunday evening, was wrapped up in wet blankets, overlapped
with dry ones, and dosed with the prescription recommended by Mr. Graham, of Capellie. Yesterday morning she was abl in at, good state of of healterable. portion of milk, and was apparently
It is unfortunate that ull the 10 Whenever one animal is attacked, all the others in the same byre should at once be treated, making this alteration in th sbould be a spoonfuls instead of turee spoonfuls of nitre tities of sulphur and ginger. A. Gralum, Capellie.
5. A Century Ago.-I don't know whether you will think it of sufficient interest just now to give publicity to the accompanying extracts from the cashbook of an eminent grazier at Moulton, near this town, in and about the year 1747, when the cattle plague, it appears, raged in England, but you are at liberty to make any use you think proper of such extracts. The circum stances related therein seem so singularly to coincide with the present state of affairs that you may, perhaps, then that the while to publish the same. I may say, then, that the book in question containg the accounts
formerly of Moulton of beasts by a \(y_{0}\). May, 1727 , to September his own Lhei seud you are interspersed at their seveni of Moulton, a descendassion of \(\mathrm{Mr}_{\mathrm{r}}\). Heter Spalding, Oct. 23.

And another thus:

 the gave in all 9 fin Eallate, name is. in danuary, 131 , Frbriars 122; March, 12); and from April 1 to Sivemier 26,569 . The highent miliong in one day ก 3 . 49 gallone.
cosered thickly with atraw, and moely tied down with ntraw rope.
With the view of economisng the Turaipe, and making es much of atrongly recommendel to pulp them, mixing them
with cut straw. We all know that when cattie low in
condition are first put upou Turnips they suffer condition are first put upol Turuips they suffor
greatly from scouriug, and it is allowed that they do better when stinted to a small quantity. We can ever, as the large roomy stomach of the ox must be filled before the lies durnn to ruminato, and there is a difficulty in getting him to eat straw in sufficient quantity. We get over this, however, when we have them. The litter straw counteracts the watery intluence of the Turnip, which comtains between 75 overy facility for the readv admixture of other kiuds of artificial food, such as the dittorent kinds of cake, broken suall, ground, or diluted, also the difforent kinds of ment, \&e. I last rear snw an experment which was conducted over several months-eattle fed on pulped Turnips alongside of others fed upon Turnips cut in the usual way into slices. The two lots of cattle were much on a par as to comlition, but the lot fed upon pulp had been kept on a much smaller quatity of roots, therehy effecting siderable saving. Even in good Turnip seasons it is found more profitable to supplement them with artificinl foot than to follow the old methow of using only Turnips and stram.
The principal artificial food that farmers are in the there is nothing better for feeding purposes than this cake, but we are of opinion that it is ofreu bought at too high a price. It is often alulteratel with bran and other ingredients; the only safeguard is in dealing
with a person (if the highest respeetability, or what is better, having samples of our purchases analysed by a good chemist. The number of cakes and prepared cattle condiments is legion; some are equal the the best of Linseed cake, while others are second to it, and in keeping down the price of cakes in general. Good Cotton seed-cake has been proved to be a grod feeding article; but some are prejudiced against it from
having used it injudiciously. Cotton cake made from the whole Cottnn seeds contains a go nd leal of wo lly fibre or indigestible matter; and when given to stock effect; but the fault there lay more in its abuse than from the kernel of (cutton se in, has been provend hiv analysis to heretpual to the bent of Linserd cake, and used in the fendmy of sheep, nund with gond effecty. Cotton cake shouht be of a bright yellow colnur, w. th but ferw of the black purtieles of hrak, britte, and easily broken. It casa he bollght from in 10s, to til per ton, wher as linscell cako énsty from 1 le? to \(1 t\) ralued ; it ensts only abont half the: price of I Inder cake, whereas its elements have been shown i,y Piof Way's analysis to have all the value of nileake. The has something raucid abont it. It is Rape cake -it advantage hy being broken very small, anl lised with a little oileake or Barley meal, se. IBy being lissolved in warn water, or mixel with conkel fonl, it luses al its rancidity, aud stock eat it with a relioh. There is a groat economy in using cooked food, especially for young stook; besides, it is healthy, being a preven-
tive against parter-ill: it is also very beueficial for milk cows. But I would not adrocate its adoption in feeding for the butcher, as it makes the beof soft and Habby. I have spoken of the above different kinds of
cake, but I have mo douht it will be a some whether they are to buy cako or 11-e the grain grown upon ther nown farms. I wanlil be inclime ! to alvocate the use of both; but as gram is so low. I would une it more largely than purchazed foori, for Burley meal, but to get the fuil benefit of that meal, would use it with a little of oue of the above rentioned cakes.

As regards wheep, their Turnips can be mnat persitably supplemented with the some artificial fond ans is given to cattle. The three cahe+ I have namel ahove that hay and usmae in the fealing of sheep. Theneve sheep; and to get the frl! beuetit of it, I would have 12 inches af the bottom, dividing them with a proptition running up the twilllle, and covered over with a satille roof, so that they may form a domble hox. The divi-ion un the midille will, revent the wind from blowning mat tho forder, and by this menne there is no waste. intended to pull their meat from atinve and tread it working in the low I must confess I lik. to g.e then working in the low hoxes anonget their cut chatf.

or with water that has been in wooden tubs or ressels the day, but the same principle should be carried out with them as was laid down in previous paper-- cease feding. The fatting coops should be in warm building. Where beasts are stall-fed, if corper can be found for the chicken coop under th same roof, the birds wist the quiet of the place. A very , mportant thing with regard to fatting fowls is that thry should be fed at day-break. We commonly hear suc:1 a complaint as the following:- "We had a coop made on the best plaw, gave our chickems up the thinne they became." Nine times out of ten the cause of suct they became. Nings is, that when fed in the morning boat \(70^{\circ}\) clock the poor birds have been pining and fretting a long time for food; they peck each other' feathers, get restless, and lose more llesh dafterwarde Very often when they are fed, enough food is thrown to them to last them nearly all day, so that from seeing always before them they get to dislike it. Instead that, a trough should be fixed along the front of the coop, which should be kept filled with clean brigh gravel or grit, the stones in it not being too large for boards the length of the coop, and about 4 inches wide, should always be kept clean an in readiness for feeding time. The food, which should
consist of Barleymeal or Oatmeal, should be mixed in only a sufficient quantity at a time to serve for on meal. It is made with water, milk, or pot liquor from the fowls are first put up to fat it should be mixed to constituency not greiter than treacle, spread out 0 one of the above-mentinued boards, and placed in fron board should be withdrawn, washed, and laid by in readiness for the next meal. In looking through the young birds intended for breeding stock, those that do not seem favourable specimens should be drafted into the fatting pens at once. It must always be rememWilled, or they will fall away, and become what poulterers call clung. When, in winter, the ground is covered feed the fowls, as they suffer terribly if the snow gets with their food-it acts on them as the strongest purga tive; consequently in snowy weather the birds riquir rather better and more generous diet than usual. Hants.

\section*{anebittos.}
1. The Cattle Plague ; its History and Treatment and Prevention. By A. J. Murray, M.R.C.V.S Professor of Veterinary Surgery at the Royal Agri
cultural College, Cirencester. (Taylor \& Francia mentural College, Cirencester.
The Nature and Treatment of the Cattle Plague By R. H. Allnatt, M.D., A.M. (J. Churchill \&E Suns. Rinderpeste; its Prevention and Cure; and Gypsum as a Sanitary Agent. By J. J. Lundy. (Simpkin, Marshall \& Co.

So much for No. 3 upon our list.

Dr. Parkin's pampblet combats the doctrine of con-
agion as ordinarily understood, and argues for the conveyance of the poison through the air. As to prevention, it recommends the shelter of animals in dmitted ricts from the night air. Air should cor-houses. As to treatment, it recommends the use of rarious forms of carbon, and especially the use of it in yeast, \&ce. ; naphtha and various oils, liquid carbons, ar aleo recommended. Stimulants are forbidden, excep
Pamplilet No. 5, by E. H., is a homœopathic dis course on Belladonua, Bryonia, Ammonia, Arsenicum Phosphoras, in the drop doses indicated by the suc

Lastly, we have a pamphlet on the right use of iron Dr. Druitt says- " which shall not be poisonons in iteele which shall have tonic or nutritive virtues ; which shall
 alimentar we grow on the farm, mixing Oats, Wheat, or Barleyground or bruised along with oil-cake-in short manufacturing food in every way we can. We are believe but for that we could do no good or sav ourselves. On the Duke of Richmond's estates there are not many farms above 30nl, and only two above 5001 The tenants do a rool ded on these eitates. We have to lay out a considerable sum upou buildinge Irecently renewed the lease of both my farms from the Duke of Richmond, and had to lay out between 400l. and 5002 . on building houses; aud if I weut dowis during the currency of my leare, they would full to the lanillord. But the tenants are told that they don't pay so high a rent as they would have to do, but for that, expendicure on Duke's estate is moderately rented. Taking into account what the tenants have to do with reference to these buildings, I should say it is only fairly rented. I know one tenant near me who has had to lay out five or six rents in building houses and improving the farm for himself, the Duk only giving wood and slates. That is a great outlay for a tenaut, but there is a very gool feeling hetween the Duke and his tenantry. in some cases the tenant must support the houses to a valuation of say 1000 a and if he likes to build to the extent of 5nn. marthe by agreement, that is allowed for at the end of the lease; but iu some cases the houses are hauded ove to the tenant on inventory, and that inventory must be supported. If they are not worth the sum at the eud of the lease, the tenaut bas to pay the difference but, if they are worth more, he reeeives nothing.
Chatreris, Isle or Ely.-Summer hasibeen reluctant to leave us. Early in this month we still had the temperature and brilliancy of a June or July day, April and September have been two of the finest and warmest months we remember to have had in any one year. We can only regret that this heautiful weather should in anywise have interfered with agriculcura operations, as it was so thoroughly enjoyable. However. it was on the whole beneficill rather than otherwise, enabling us by steam cultivation to aerate our strong soils, and to clean them from every noxinns weed; it has also enabled us to take up the Potato crops most satisfactorily and economically; it has further penetrated our corn stacks, and made the grain, which was sor and unfit for use few weeks ago, now dry and harc and fit for the millor. But the time arrived when we were anxious to sow Wheat, and but very few fields retained sufficient moisture to make sowing a safe operatim; and on our rentsos over late hatuce the great desire for rain, that this work may not he retarded beyond its proper time. [Recent rains have no doubt fully satisfied this desire.]

The threshing-machine fully confirms our previously xpressed opinion as to the value of the Wheat crop. Complaints are universal. From iuquiry and observacion we conclude that the avorage of this neighbou hood cannot exceed a quarters por acre, wh more \(1 \frac{1}{4}\) quartor per acre below an average crop, ast yeâ. thau 2 quarters bolow our own average inferior to either of the two provious yeare, and will yield more than one-third less flour per acre. On a few forward gravelly lands the crop is of fen farms ; but we see no prospect for the feu former this gear but to lose money, and that in rather farmer this year is agreeable.

We have not threshed any spring corn at present; we herefore defer untilwe have more defiuite information our report of these crops.
We have seized the fine weather of the last month pushing on with steam cultivation, and have smashed up" 120 acres, Which are now expeted to element they may contain. When the rain descends, thed corched clods will fail like lime, and give us as fine a secd-bed on cur Bean stubbles, where cultias fine a secd-ded be desired.

We hore fer fields where the soil is well pulverised that have retained sufficient moisture to enable us to sow Wheat, and we have commenced to-day, aud shall be able to continue with two drills through the week, and then, unless rain falls, we must stop.

On cool lands, Kohl Rabi and Mangels are doing well, and will afford an abundance of winter keeping but on hot dry soils the sunshine of the last month has proved injurious, and the crop will be less than was at one time expected. Coleseeds, too, are generaly poor; occasionally we see a good crop, but tais is the exception. Our pastares are burnt up agai.
vigorous verdure of August loss amongst lambs through-
There has been a heavy loss amongst iambs have kept out the catcle plague has appeared at Mepul, four miles distant, and for a time was confined to one farm, but has since appeared in an adjoining one. It was supposed to have been brought ty some calves from the Metropolitan market. We think very stringent rules should be adopted to prevent the stringen of such a fearful malady. To day a fair has spread of such a fearful malady. been held at Peterborough, and to-morrow we soan
have droves of cattle passing along our roads, probably
spreading disease all around us, We cannot resist the conviction that it would be wise to prohibit cattle passed away. A. S. \(\bar{R}\).

\section*{Miscellaneous.}

Comparative Merits of Various Breeds as Cream Producers.-Within the last few years, owing to the high prices obtained for butter, \&c., in the neighbour. hood of our large towns, it has become a matter of importauce that strict and careful attention should be given to the dairy produce of the farm; and I was therefore induced to undertake a series of experiments upon the various breeds of milch cattle gencrally kept in this country, with the view of ascertaining their comparative value as cream producers upon different descriptions of food; and after three years of careful investigation, I beg to lay the result of my labours before the public, for the benefit of my brother farmers and others interested in the subject. The results were obtained by the aid of the ordinary cream test glasses, three in number, and checked by one made specially for me by Messrs. Negretti \& Zambra, and carefully graduated to 00 ths. In the first experiment the cows were grazed during the day, having hay and chaff only morning and evening.

Experiment 1
\begin{tabular}{lccc|c|c}
\hline \multicolumn{5}{c}{ Breed. } & \\
\hline
\end{tabular}

In the next experiment (where the breeds are placed in their order of merit), each cow had in addition 1 lb . of Linseed cake per diem.

Experiment 2.

In Experiment 3, each cow had, in addition to Grass, a fair allowance of chaff, with one quart of brewers' grains and one measure of Thorley's condimental food daily.

Experiment 3.

For the fifth experiment 1 lb . of Palm nut meal (rom Messrs. Suith, of Liverpool) was substituted for the cake, in other respects the food was the same as in No. 3.

Experiment 5.

From the two last experiments it will be seen that the cows lowest in the scale as cream producers show a greater improvement when fed upon a material containing much fatty matter (Palm meal containing upwards of 25 per cent. of fat) than upon food consisting of little fat, but nuch albuminous and mucilaginous matter, while the reverse is observed in the breeds higher up the scale. In the foregoing experiments thiree trials were made at each time, and each experiment repeated three times, over a space of three years (the trials being made shortly after each calving), and the same animals employed in all the experiments except the last year, when two of the cows proved not in calf. The figures, therefore, are a fair average of the animals I had under trial, and are the result of nearly 270 examinations, 7. T. Gape, Esq., Elm House, Winkfleld, Windsor, in Ncottish Farmor.
Whellard's Cheese-maker. - Among the machine Which did not compete for prizes may be mentioned
Hellard's (Uttoxeter) chetse-maker, one of the most Hellard's (Uttoxeter) cheese-maker, one of the most Cockey's and Keevil's machines with a creat many
silver medal. It consists of a circular pan, made of tin,
copper, or brass, having taps at its side for running off the whey at intervals as required. This pan, which is mounted upon an iron frame, turns on an axis, and may be tilted at pleasure to cause the whey to flow off quickly. Above the pan, and supported by two castiron weights and a cross-beam, a very effective system
of leverage is provided, giving pressure to a vertical rod or rack, to which is attached the perforated pressing plate or sinker. This sinker is lowered into, or raised out of, the pan by means of a chain and ball of equal weight with it, as in the action of the weights to a sash window. To enable the dairy servant to get at the curd more easily, the pressing plate, when raised, may be placed in a perpendicular, horizontal, or inclined position by means of a very simple self-acting movement. It is also made to revolve, that it may be more readily cleaned. The machine is mounted upon rollers and by detaching the pan, which is done in a few seconds, it will pass through a doorway 30 inches wide. The knives for cutting up the curd are of ingenious construction, somewhat resembling, in the arrangement of their curved surfaces, the screw of a steam-ship; they revolve upon a centre in the pan, and are so arranged that while one-half of the knives are cutting the curd down the other half are cutting it ap, and, by reversing the motion, a contrary action upon the curd is obtained; many of the objections to revolving knives are in this way obviated. The entire machine is welladapted to the capabilities of any dairy servant. All wheels, cogs, and complicated marhinery are avoided; it occupies less space, is more portable, and requires less labour and skill than any other. The pressure upon the curd increases as the sinker descends, is self-acting, and is easily regulated from 1 cwt . upwards, thus enabling the dairy servant to go about her other duties while the curd is being gathered. And after the whey has been expelled from the curd, it is pressed into the vat By the use of this machine, all the operations are performed in the simplest maner, and with the utmost cleanliness, as the curd is untouched by the hands till removed in the form of cheese. The machines are made in many sizes, and at prices within the reach of any dairy farmer. We are glad to have this opportunity of publishing a full accounc of what we believe to be a very efficient and ingenious addition to the list of dairy tools. Oxford Journa?
Inoculation for Pleuro-pneumonia in Australia.1. Destroy all Cattle undoubtedly Diseased.-On the appearance of the disease do not hesitate to destroy any cattle showing symptoms of ill-health. To inoculate cattle which have contracted disease in a positive form will not often act as a cure, and it is also unlikely that any large proportion of such will reccver; therefore it is better to destroy them, especially as by so doing a plentiful supply of the lymph or virus for inoculation will be procured. 2. How to Procure the Inoculating Substance called the Virus or LymplıOn opening the animal the lung will be found swollen and a portion of it hepatised, or become like liversolid, hard, and heavy-the weight so much increased as to sink in water. On cutting into the part of the
lung between the sound and hepatised part you will find veins of the lymph or virus in the form of jelly. This is what is required for inoculation. You must get it in a perfectly pure form to inoculate with success. In a proper state for use it should resemble in colour calf's-foot jelly; if lighter in colour it is so much better in quality, being purer. To get it sufficiently pure, cut away all parts that are in any way tinged with blood,-then take out the part of the lung containing the veins of lymph, cut this portion into strips, and let it drain into a vessel-afterwards strain the fuid thus procured through muslin or calico, and any corruption will be removed, leaving the lympl in a proper state for use. This will generally turn into jelly on getting cool. It is preferable to nse the lywoph from an animal fresh killed, although, if you cannot get one to kill, that from a dead animal may be used. If pure and kept in a cool place, it will remain fresh for four or five days. 3. How to Perform the Operation.For the operation the cattle should be put in a crush pen. Then take hold of the tail by the end and make an incision with a laucet-shaped knife-the incision to be into the skin (not into the muscle or near the bone), about an inch from the end, up the tail, and about a quarter of an inch in length. If cut too deep the cattle will be apt to lose their tails, therefore do not cù quite through the skin, and avoid if possible to draw blood. in order to make the inoculation more certain, make another incision of the same kind an inch or so above the first. In applying the virus, put it into those incisions with a sinall piece of bone or other
material shaped like a spoon, and the operation is complete. Inoculating knives can be got, but the method above described is more certain. The whole process should be completed as quickly as possible, and the cattle turned ont at once, therefore the more labour you can procure for the occasion the better. With a crush pen that will hold 16 to 20 head, and ahout eight hands at work, 1000 head can be easily done in a day. The labour would be thus distributed-two operators, one working on each side of the pen, two men carrying the virus in saucers following, two squaring tails, and alling up with the assistance of two other hands with sumfient labour, done 1200 in a day, and with
tumbler hand he says he can do \(3: 0: 3\), head with the dhe virus will be got from 10 to 20 animals thoroup disease is frequently contracted from upon the Grass, and there is no doubt intectious." Australian Paper.

\section*{Calendar of Operations.}

Ootobre: Mangel Rarrest.- The: end o? the proper thme in which to harvest this :r frost. This was, in fact, the fate of a the crop in 1859, owing to its hariug beon field during two or three days of servere we the first night's frost; and as the weather lasted over several days, the bulb
frozen through, and they rotted soon ator had a lesson then on the need of early bar crop, and protecting it for use in spring
In illustration of the method of har other root crops, I will describe the phan Whitfield Farm, year Berkeley, Gloucest annually of Swedes and Mangel Wur/el one-half of this has been Swedes, 20 Mangel Wurzels, and 10 acres, or ther Belgian Carrots. The whole of these pulled and carted home for cousumption fards, and cattle boxes during wister, is custom to let tee whole work to five walook to pull and top and fill the bulbs or about 7s. per acre for Swedes, 8s, or \(\mathfrak{H e}\) forv Wurzels, and 20s. for Carrots. The last needed to be half dug when being
reference to the others, which were reference to the others, which were
about 26 inches apart, five ment would pulling, each man taking two rows, a roots pulled, so that the whole eight rows eight or ten boys and women tonpel roots as they lay upon the ground, cutt: ach or so from the crown of the root, \(s, ~\) at eaves fall separate; and cight or nine bors and \(n=\) with a man, filled the carts as they came up. carts were sufficient to keep a continul
ready to be filled, when the distauce to the not exceed 800 or 1000 yards; and the \(\begin{aligned} & \text { maris }\end{aligned}\) accomplished at the rate of about 5 acres \(\frac{8}{3}\) Turnips daily.
The pulling is easily done in the case of a mon The larger the roots the easier it is to pul of the ground. It is in the case of stunted, roots, with fangs and forked growth, arises. To meet a case of this kind, it ma cases be advisable to undercut plauts as they the rows, by a horse-drawn tool fashioned purpose; but this is more frequently nee
The following is an actual record of one ye rience on Whitfield Farm, when some 40 acres work had to be done. It includes an hands employed by the contractors in lifteng \(t\) of Mangels and Swedes, and the time they toris the work, and the tons of roots placed in the bine

The contract was for 29 acres of Mangol at

Mr. J. FLEMING, F.R.H.G.

\section*{The following Resolution form the basis of the Scheme:-}
1. That there shall take plare in London, in 1866 (in the Garden of the Royal Horticultural Society, at South Kensington), a Grand International Horticultural Exhibition and Congress, to be open four days, from May 22 to May 25, and to which the leading Botanists and Horticulturists throughout Europe shall be invited.
2. That Tivo Morning Meetings (of the nature of a Congress) shall be held, at which Papers prepared by leading Botanists or IIorticulturists shall be read, the Papers to be previously printed in English and French, or German, and circulated, and discussion thereom invited.
3. That there shall be Two Conversazioni, at which Foreigners invited to assist at the Exhibition and Congress shall have the opportunity of mecting with our own leading Horticulturists, Botanists, Exhibitors, dec.
1. That there shall be a Banquet, to which leading Foreign Visitors shall be invited as guests, and to which also Ladies subscribing will be admitted. Ticketa 3 Guinens each.
j. That the Comnitee will endearour to arrange that the most easilyaccesaible Enclish Giurlens, in which some feature of British Gardening-such as "Forsing," "Decrative Gardening," \&c.-is well illuatrated, shall be open to Foreign Visitors.
6. That a Subscription List be opened for the purpose of obtaining the inecessary to the formation of a liberal Prize List (the Prizes offered amonnt is £2500), the erection or part erection of the necessary Exhibition Builime: entertainment of Foreign Visitors, and for the working expenses of the Elthit and Congress ; and that a Guarantee Fund be also entered on.
7. That Gentlemen subscribing Ten Gutrfas shall be entitled to one D. Ticket of the value of \(£ 33 \mathrm{~s}\). ; to one Card of invitation to each of the 8. available for one Gentleman and two Ladies; and to Eight Tiekets of aimens an the opening of the Hortirultural Show, when the admission by paran of One Guinea each person. Subscribers of Fimz Gurnbas, or Guanam Genterity receive one Card of invitation for each Soirée, available for one Grow suixch two Ladies, and Four Tickets for the opening of the Horticultural Show. and Charantors of smaller ant sunts will receive in proportion.
8. Subscribers' Tickets may, if desired, be commuted, so as to be arailsbe. f! ! Banquet, three of tho before-mentioned Tickets for the opening of the wish being exchangcable for unc Dinner Ticket, provided that notice of exchange them is given before the 31st of March, 1860. Sub the man used on the opening day will admit on any subsequent day, in the menor atated thereun.

Gentlemen willing to lend their support to this undertaking will perhaps be kind enough to communicate at ance with the Secretaries.

\section*{A SECOND LIST of SUPPORTERS will be published shortly.}

S.ATURDAY, NOVEMBER 4, IN6:

Mbistaves foe the emsuno wexe

Ir is but a ahort time since it wan our mad
duty to announce the deathe of two of the
great shiefs of Botany and iforticuliure
Sir Whadiy Honkes and painful newn
to communicate, and this time the blow fall
ret more nearly home than hefore. The trin
in complated-j)r. Ifribis is nn more. From
a life of incessant sedwit he passed into the
sleep of death on Weelnesday murnung lant.
We need sas no moro now, ия mar realite
will feel that it is to them, an on ourselres: a
persor al gerrew.

Whine all that we now eall Sperits ereated an such, or are some of thrm mority the rellepting of antecedent aneciss? Thas is ene of the quastions that have atiracted of lato geara much altur!iun. If the latter hyppotheais be acoapters, if aycrices to assumed in he derivative, then apothacr question arises that has heen equalle warmle disensent, viz. as to how the new aprecies havestrung irm the nid, and what are the circumataners that have trenzht about this change? In a supplementare el aptor in M. Naters's now memeir an Ilighislism in Vegetables, reproduced in the detulur rommber of the Nitural Miatury Jinewn, we learm that this diatingrishod phyontogiat in a firm teliaver in the derivatiere origin of epeeter, and lh:at he has arrived at that opinion from the etudy oif the variations to wheh rultivated plants are. lishto. and which variability he eanadera io nut limated to ruitivated plante, hit pertains alen t" "preciea in a wild state. There are, asya M. Narion, seme m 0 n or 800 kinds of Solanum diseeminated nver an immense extent of country in the oid ard New

World. All are speoifically distinct; but all resemble each other in a certain sum of common oharacters, which are of much greater consequence to the systematic botanist, who has to classify them, than are the comparatively superficial poinfs whick distinguish one species from another. Now, do these common oharaoters, these analogies whioh all the speoies have, exist fortuitously, or simply because it has pleased God that they should exist? If each speoies had an independent origin, then the analogies just alluded to must depend either on chanee, which is an absurdity, or on a supernatural fact, that is to say a miracle, two elements which do not pass current in soience. Allow on the other hand, a common ancestor to all these species, endow its offspring with an inherent power of variation, and gradually you will arrive by the sole aot of evolution at species, races, and varieties.
The superficial traits will vary from one form to the other, but the common essential foundation will always subsist. M. NaUDIN oonsiders that the forms that have originally a oommon origin, and which in the course of ages have beoome multiplied, have al ways followed divergent paths, and that, in consequence, it is contrary to Nature to suppose that species can be ohanged one into the other, or that two species can be melted into one by hybridization. These views do not prevent M. Naudin from recognising the unceasing presence of Divine intervention in the phenomena of the present world.
"The formation of an embryo in a feoundated ovale, the development of this embryo into a feeble plant which bursts its integuments, and finally its transformation into a great tree, which in its tarn is adorned with flowers, and reproduces its rave-all these things are neither less marvellous, nor less incomprehensible, nor less divine, than the oreation of the world; they are, to speak truly, real creations, since they give place to beings which had no previous existence. Never'theless, since we see this phenomeua suceeeding each other, and following in a logical order, it does not come into our minds that they are supernatural matters."
M. Natdin does not offer any opinion as to the oircumstanees that have brought about the existence and perpetuation of some forms, and the deeadence and disappearance of others. We do not therefore see how M. Naddin has forestalled "English savants of the highest distinction," as he fancies he has, still less his own illustrious compatriot Lamarci.
Is a recent Part of the Transaations of the Scottish Arboricultural Society is contnined an elaborate paper on the "Introduction and
Cultivation of the newer Contrera and ather Forest Trees, with special reference to the olimate of Great Britain and Ireland," by Robert Hutchison, Esq., of Carlowrie. The writer various parts of the country, whioh he prints in extenso, without, however, giving, as he might have done, the names of his informants. Referring our readers to the paper itself for the details, we proeeed to mention some of the results of Mr . HUTCHIsoN's researohes.

One most important consideration as regarde a successful result is the natural habit or
idiosyncrasy of the tree. Thus our summers and idiosyncrasy of the tree. Thus our summers and
autumns are too short it is found for those species which push forth their young shoots early in spring, or continue to grow on late in autumn. Such among others are Abies Morinda, !Picea oephalonica, P. Pichta, Pinus Pinsajo, \(P\). maorooarpa, \(P\) torulosa, Even in Devonshire Cedrus Deodara, Abies Morinda, and A. Menziesii sometimes suffer from spring frost.
The next important question is the selection of a suitable coil. An average loam with a dry subsoil is the best as a general rule, while soils of a olose adhesive nature-chalk, undrained clay lands, and deep spongy Moss, are onndemned as being for the most part ansuitable. These results are, we believe, in accordance with general experience; though we have known oases in which the Wellingtoniz, for instance, has succeeded adnirably in soil of a boggy nature. The injurions effeots of exposare are insisted on, and in reference to this point the author aays, "All the Himalayan and many of the Soath Californian varieties will thrive on a north, when they will positively die if exposed to a south aspeot.'
Young plants on their own roots, reared from aeeds derived from a healthy vigorous tree, are recommended in preference to others raised from cuttings or grafta, or taken from a weakly bource.

The injurious effect of the proximity of large towns and factories is then alluded to, in support and illustration of which we may instance the common Arbor-vity as we see it near London.
A mile or two from the great thoroughfares we find A mile or two from the great thoroughfares we find
this plant struggling to exist, with a few green shoots at the top of the plant, and below a blackened mass of half-dead twigs; half a mile further a difference is recognisable, the green increases, and the smoke-begrimed twigs are less visible. And so when we get a few miles out we find the shrub bedecked with green, and with scaroely a leafless spray.
Mr. Hutchison recommends the pruning of the side shoots with the view of favouring the development of the leader, and of rendering the plants less liable to injury from rabbits. Pruners are advised to leave their thinnings on the ground, as the rabbits prefer them to the standing trees. Frequent transplantation is recommended for the sake of procuring a denser habit and a more graeeful form.
Few trees withstand the effeets of wind so badly as Conifers. There is one notable exoeption to this rule in the ease of Pinus austriaea, whioh we have seen by the seashore, and also on its native mountain sides, scaroely at all affeoted by the force of the winds.

Taken altogether this is a valuable contribution to our knowledge on these points, and might have been made more so by a more extended research. Our own columns would have furnished numerous reoords whioh would have made the report more somplete.
Ir has been observed in several parts of England, that the remains of the stigma, which usually vanish almost entirely, are retained in many instanoes at the apex of Graprs, in the form of a little short cyliudrical brown corpusele. On a mieroscopic examination this is found to consist of dried stigmatio tissue, mixed more or less copiously with old pollen grains, and in many instances where the air is suffioiently moist, minute moulds are developed on the tissues. In some instances we have seen this extending to the berry itself, and ultimately eausing a slight degree of decomposition. The mere contact of the threads of moulds with healthy tissue is often suffloient to induoe deoomposition, and when once a mould is established, it often extonds with frightful rapidity. In its incipient stage it might easily
escape gotice, except very closely ezamined, but this could not be the oase with some speeimens whioh have just been communieated, where the patch of mould has caused a strange depression at the apex of the berries, spreading on every side for a quarter of an inoh or more, and resembling in form an advanced vaceination pustule, though not in colour, the centre being white with a bluish tinge, while the circumference, from the oozing out of the juiep, is of a bright red. The mould is undoubtedly the common Penicillium, and we do not think that any skill of the cultivator oould check its progress when once established, while it would require a very aoute eye to ascertain the presence of any disease in its embryo condition ; the only chance in that case being the most complete ventilation, with a very dry air. We confess that we had not ourselves observed the fact of the permanence of the stigma till it was pointed out to us by a correspondent, with an indieation that mould sometimes appeared at its base, and it was in consequence of this communieation that we became aware that the mould sometimes spreads and causes deoay, an exaggerated form of which is now before us.
While on the subjeot of disease, it may be well to notioe more pattioularly than we were able to do in our answers to correspondents, a curious affeotion to which some Pears have this year been subject. Most cultivators must have
observed a sort of canker which oceurs in Apples, especially in Ribstone Pippins, in consequence of which the flesh is mottled with brown decayed dry spots, calling to mind the well-known features of the Potato marrain. The Pears in
question were covered with large unsightly warts, which we believed to wo identieal in nature with those which so commonly oocur on the leaves. On dividing the fruit, however, though there were no external indications of deeay, we found brown spots resembling very closely those above mentioned. We have never seen these before in the Pear, and as we are unable to explain the oause of this occurrence in Apples, where they are very frequent, it can scarcely be exprected that we should have any better fortune in a comparatively
rare example of the malady. It is cettain that
rruit keeps very badly this year, a cireacest
which we are inelined to attribute to difference which has existed between noet \(z_{2}\) To diurnal temperature. We feel quite sure als. that this has been the case with stone fre
we believe it to be the of the fruit garden. \(\mathcal{M}_{0} \mathrm{~J}_{0} B_{\text {. }}\)
take place at the New Cemetery anin is minned, next at noon.
he Pitmastan Duchissiz do Angoounary farcurah, by us at p. 1108 of our last jear's rean is Stevens, the gardener at Malvern Hall, mient grown, has sent us a remarkably fine sample, mean exactly 12 inches round the thickest part, and 8\(\}\) rom the insertion of the stalk to the eye, and mie 21 oz . The quality proved to be excellent being meiting, juicy, and high-flavoured Mr. Steyers that the tree has thise. We learn :-: Mr. Steverss that the tree has this season borne one
fruit of nearly equal size with that we have all - Beware of Nrw Potatos! Thin faroes: esculent contains a vegetable base of deleteriour qual called solanine, which is especially developed in plant when it is shooting. Dr. HAAF has ascert tion in the shoots, but in the tuber itself, and at: : extreme periods of its existence, viz., when seare of it than the pulp. Hence people that clief? upon Potatos should beware of new ones, generally so bighly prized as delicacies; they ougut : least to be peeled, and rather boiled than fried, berss water carries off a good deal of the solanine.
- We hear that the Serdinsa Perabcovite exhibited during the past summer by Mr. Fieyira,
Cliveden, before the Floral Committee, and to wha Cliveden, before the Floral Committee, and to wat passed into the hands of Mr. Turver, of Slone: Several of them are in the style of Dovaid Brat best strain, to which we have often made a"lee Others, such as Cliveden Rose, are, as lar as ve \(2:\) aware, peculiar in colour; and being albo remarks for their clear and brilliant tints, they will, lise:
series we have just alluded to, pruve fine acquatis for flower-garden decoration. new tints amongst bedding Pelargoniunn \(\pi\).ll learned with satisfation by many a llower-gardener -We learn that it is proposed to preserst 1 testimonial to the Rev. S. Reynoups Hore, wio wo ural word a maris of recogntion fom the Rose ith The abundance of flowers which have this attore been produced upon the Jerusalem artichoien made us regret that no one (so far as we buon! ? adopted the means of securing seed by growing; plant under glase, so as to put us in the way of ootian an new and more hardy varieties of this useful and prois esculent.
=-Dr. Ferd. Murliner, of the Botanic Gurie Melbourne, writes to the effect that he "wrould bee oo receive fresh, well-ripened, caretully dnd Australian seeds, from any Euıopean gansel, quantity.
loben species of Firs from various parts in the Australian forests.
In a recent number of the Botanical section published a note on the genera ungia, to which, as it unluckiig, involves a clange of nomenclature, we der it sary to direct the attention species among others,
with heads of flowers cuclosed coloured petal-like bracts, have beel Butanical Magazine under tulipifera, G. macrostegia, and the year 854 under the name the second was published by as \(G\). macrostegia. All these three are Darwinia; thus Hedaroma turipila learned President of the to bear the name of Darwinia Hookelzs Genetylis macrostegian only the change of its generic nam other name would smell as sweet, and ful plants will lose none of their aturacion of cultivators appellation. distinguished by, we shall bo oon in our
how possess.
Professor Andrasson of Stookholm is, after eight years
courplishod author, and forwarded for publ Pr fortheoming volume of Dz Curbolze's fortheoming volume of Dion that so vel
genus should have fallen into the hands of a Soandisarian who has spared noither time, travel, nor labour to parfect his work.
perfect gienus in queetion is quite the most variable in the world. Upwards of a thousand species have been the world. to distinguished by various botanists, rorking in various parts of Europe and North sumerica. These have, we are told, been reduced by Dr. AYDRRSSon to about 200 species.
When it is remembered that the Willows have their male and female flowers on different trees-that for the most part they flower before the development of the leares-that they present great facilities for inter. the leatiog and are otherwise extremely variable, the difloulties that Prof. ANDersson has had to encounter sill bo appreciated, and the value of his consecientious Whowr proportionately estimated. We would fain hope that our friend's fame may have the long-eaduxing ritility of the Willow

ORCHIDS AND THEIR CULTIVATION.-No. IX Having discussed at some length the mode of constructing Orchid houses calculated to diffuse light and
heat, and to secure ventilation among the plants in may to promote robust health and abundant bloom, it now becomes necessary to enter more fully into may be appreciated and understood, it will be better to adhere to some plan of arrangement, whereby a sabject so extensive in its character and bearings,
and which requires an unusual amount of intelligent observation as well as consistent conformity with the lans of Nature, may be correctly interpreted so as to command success.
after the be pardoned for choosing to treat the subjeet, heads; for as the plants I have to do with cover a certain area of the temperate, semi-tropical, and tropioal regions of the earth, they must, of necessity, be
provided with a corresponding climate; and for that, if for yo other reason, it will be most convenient so to to ado and comment upon them. It is needless here houses the argumentative strain in favour of two for so much would have to be said to illustrate shall incidentally if ifen from the geveral plan, and I tally, if not formally, truat upon it in
These three divisions I shall distinguish and the Cool, the Intermediate, and the Thopical and as cool Orchids have engaged so much attention mith that division.
is The first question that suggests itself to the grower to induind of soil will these cool plants require so as It might thence, fine healthy propagation, and as a necesaseal mode prefe be expected that I should, after the tation on moil, fropound my practice in a general disserand varieties that are most at home under conl treathave in Had I found all the genera and varieties that Blpine regions of New Grenada, Guatemala, Mexico, in ond particular comptries, luxuriating satiefactorily to difter cohstitutionally, although subjected for other
respeota, at least in point of atmospherio treatmont, to by itself.
Were the flower-loving community to be polled, over the longth and breadth of the country, the numbers would point with sidgular unanimity to the Odontoglossum as the chief among the geuera bearing cool treatment, posseasing, an it does, outline, and yieiding, when well mangged, a profusin of bloom that wuuld vie in richness of colouring with the most decorative of common flowers. Odontogloesum cultivation, it may be remarked, is merely in its infaney; for now that importations have arrived successfully from several ports, including Bogota, and that wavy ridge of mountains that stretches acrose the province of New Grenada, wo are likely to have such an augmentation of rarietios as will ploase and astonish all who come within their inflaence. Loven of flowers that are in an affluent position are becoming affected to such a degree with the beauty of bnown varieties, and the certain absence of everything that any but a botanist would look upon as worthless, that it will require a very powerful disinfeotant to oounteract the progrene of sach very harmlem direase ficed beoanse, as people were told, plants coming from a purely tropical country, almost suithin liail of the equator, so to speak, must of course get tropical treatment; but now that thinge ere better underatood there will be fow losses, and one may predict in a fow years a glorious representation of the family of Odontoglots.
Speaking of composts for Epiphytes, I would say, from information gleaned from several sources, including the testimony of collectors on the apot, that I do not think it is absolutely all respects by natural conditions in furuinhing a
medium for root action. Nay, more-1 go a step medium for root action. Nay, more-1 go a step
further, and say it would bo a positive loss, as is evidenced by a great many samples that have come under my personal observation, and with which I have had to do. Surely it is about as opposite treatment as can well be imagined when Odontoglossum grande, Which grows naturally on the stumps of compost largely charged with both ammonia and phosphates 3 and there can be no doubt that the latter is by far the most sensible and satisfactory way of treating it, in order to ensure high heulth and an abuudant bloom,
Both Dean Herbert and Dr. Lindley were rught when they said that "plants do not grow naturally in the soil best suited for them;" probably it would have been more literally correct if they had said, plants do not ahoays so grow, because in certain chosen spots in heir native home they are found to attain the acme of perfection. From the airy character of Orchid seeds
they must be dispersed over a varied surface, in the same way as our own Groundsels or Dandelions, and some of course fall upon "stony ground," eking out a
miserable existence, and affording a capital illustration miserable existence, and affording a capital while others revel in the height of luxury in an element more suitable for root development. More really depends upon the cultivator than people imagine, for if he were to tie himself hand and foot to any special routine suggested by the soil or the conditions under which plants are found. he would doing his duty. Excellence in any department is only attained by repeatod and woll-considered efforts, and the plodding, experienced prectitioner is alch to
ondeavouring to strike out in a direction calculated to produce the most salutary effects.
The compost I have found most suited for the growth of established Odontoglots of ans through certain ordeal before it is fit for use. The main ingredient is that elastic fibrous material] which has grown on the top of the peat for ages, and which although almost constantly immersed in water, retains all the toughness of living Grasses. This is greatly superior, in my opinion, for general Orchid growigo to the best Wimbledon or other peat, which certainly is ull of fibre, but contains too large a proporevent earthy particles, and these go a certain case of almost any compost. This compressed vegetable matter that I refer to, is incorporated with a little humus, and when dug out is heavily charged with water. In some places I have found it fit for use 12 inches in depth while in other parts of the bog not more than 6 ioches can be obtained. However it is dug out in squares, atter the fashion of peats which a allowed to stand until dry, then carted home, and piled up in an open ents, and of being preserved from rain for a few months, it gets into the desirable condition of being almost as tough as flax, B(1) that the tearing of it is, I presume. scarcely less difficult than the picking of oakum: There is not a particie of sand in this bog stratum, which is, moreover, not found in fibre of which is good enough in its war, hut by no only after using such "stuf" as the Wimbledon peat and other fibrous materialis obtained from what might be
called dry barren slopes, that I found out then thigre. dient ; and hare prond that it in heyound grention the uncint valunblo material that I have experimented upon
The next important article is the sphagum, which Is found in great abundance in the same boge; and I may state that it was in a Luuting ea; cuitions a fiter this that I began to examine and found out the compremeed vegetable matter which I look upon as invaluable There coems to be no want of Sphagnum of the finent quality in and around London, and doubtlese the other material way also be got for the diggag. To proceed, 1 take two thinds of the bleck fibrous matter together aird of Sphagnum, incorporate them well cheop or horne droppinge, which muat hat is dry on rublied Mushrooun spanu, so then it can he lise bea and to furnish a greator proportion of ammonis to the roots than they would otherwise get from the aimple compost. This heap of compunt, (ven wheld dimis com pressed, is as clastic as un old monny firass lann ; and were it not so, 1 could weither preicet nur lowh for very superior ozamples of cultimation. Propars ingredients of this kind, grow the plants in houmen auch an I have described, do not kpare the water durins
 monthe, and see that the temperature doer not full helow \(40^{\circ}\) if ponolblo in eevere weather. If the culti vator attend to thewe directiona. ho ought to suocoed. It it a grand thing to have in bloom, an I have had, a plant of the old \(\mathrm{U}_{\text {. grande }}\) with 1201 ilawern an about 20 apiken. It was grown from a tarand-rixpenny plant in the wey juet meationed. There is not the slightest diffioulty in growing these plants if a littio sensible attention be paid to them.
To gentiomen and gardenern who are beginning the cultivation of Orohiden I would may, buy a fow established plants of a common mort; for there is a certain rkk in beginners buying rare things and getting
hold of plants that have been so uuch faugued in their journey homewarde, that it is difftcult to induce resu-citation in many of them; grow them in a warm greeuhouse, aud strengthen your collections as you gain confidence in yourselvers; and then, inntead of having to go a day's journey to ree there exotic beanties, we shall have them ncarcely leme common than Camellies and Azalons. James Andersom, Meadoso Rank.

\section*{PARIS UNIVERSAL EXHIBITION OF \(186 \%\)}

THE Secretary of the Soience and Art Dopartment
the Committee of Council on Elucetion bas insued serles of papers referring to the Pario Univernal Exhibition, to be held in 1867. Intending exhibitors are requested to apply for space as early as possible, and at all events to do so before the 2eth February, 1880. The gencral regulations fill 17 pages of a small folio pemphlet, those capecially applicable to British and Colonial cxlibititors being printed in red iuk.

We must refer our readera to the regulations themselves (which may be had on application to the Secre-
tary of the Department, at South Kensington) for full details. Meanwhile we extraot a fow particulars relating to matters coming more especially within the scope of this Journat.

The articles to he exhibited are arranged in 10 groups, osch of which is subdivided into vumerous glasses ( 95 in all \()\). The groupe are as follows:
Group 1. - Worke of Art.
Group 2.-Apparatus and application of thy liberal Arta
Group 3.- Yumture and other objects for the uno of dwellinge.
Group 4.-Clothing (including fabrica) and other bjects worn on the person.
Group 5.-Products (raw and manufnctured) of mining induatry, forestry, dc. Under this head Class 41 includes "procucts of the cultivation of forests, and of the trades appertaining thereto. Specimens of difforent kinds or crees. Wooxl for cabidetwhrk, for building purposef. Fire-whod. (couber hark for textile purposel. Tanning, colouring, odoriferous, resinous substancos. Product obtained from forestos: charcoul and dried wood; raw potash; turnery; basket-work ; straw work; wooden shoee, \&ce."
Class 42 comprisen " products of shooting, fisting, and of the gathering of fruits obtained without cultuvation. Among the latter are included regetablo products of the earth at tained without culture Mushrooms, Truftes, wild fruit, Lichens uned as dyes,
food, and fodder ; fermented sap; Peruvian bart; useful barks and filaments; wax, resinouts gume ; Indiarubber, gutta-percha, \&c.
Class 43 is devoted to " agricultural products (not used as food) easily preserved, wach as textile materials; raw cotton, flax and hemp sentehed and unscutched, textile vegetable fibres of all kinds: wool in its grease; cocoons of the silkwnm. Tarimus agniend for household purposes; fleaginous plants; olls, wax, resin. Tobicco. German tinder. Tanning antetancef. Dyaing substancen. Preserved fodder.'
Groap 6 is intended to illustrate "apparatus and procemtion ined in common arts, including, among procestes used in the cultivation of fields and forests.

Plans of culture, distribution of crops and management. Apparatus for agricultural works; drainage, irrigation. Plans and models of farm buildings. Tools, irroplements, machines and apparatus used in hus bandry, sowing and planting, harvesting, preparation and preservation of crops. Carts and other rural
means of transport. Locomotives and horse gins. Manures, organic or mineral. Apparatus for the physical and chemical study of soils. Plans of different systems of re-planting, managing, and cultivating forests. Apparatus used in the cultivation of forests, and in the trades appertaining thereto."
The 7th Group comprises food (fresh or preserved) n various states of preparation, thus:-
Class 67 .-Cereals and other eatable
Class 67. - Cereals and other eatable farinaseous products; and the products derived from them.
Class 71.-Vegetables and fruit.
Class 72.-Condiments and stimulants.
Class 73.-Fermented drinks, wines, beers, \&c.
- The 8th Group is intended for the exhibition of live stock and specimens of agricultural buildings under the following classes :-Class 74, farm buildings and agricultural works; 75, horses, 9sses, mules; 76 , Bulls,
huffaloes, \&c. \(; 77\), sheep, goats; 78 , piga, rabbits; 79, poultry; 80, sporting dogs and watch dogs; 81, useful insects; 82, fish, Crustacea, and Mollusca.
We reproduce the 9 th Group verbatim :

\section*{-9te Group.-Live Produce and Specimens of} Horticultural Works.
"Class 83. Hothouses and Horticultural Apparatus. - Gardeness', nurserymen's, and horticulturists' tools. Apparatus for watering, for keeping turf in order, \&c. Large conservatories and apparatus appertaining aquatic plants. Fountains and other means employed aquatic plants. Fountain.
for ornamenting gardens.
"Class 84. Flowers and Ornamental Plants. Species of plants, and examples of culture exhibiting the characteristic types of the garden and dwellings of each countrry.
"Class 85. Vegetables.-Species of vegetables and examples of culture exhihiting the characteristic types of the kitchen gardens of each country.
Clasz 86. Fruit trees.-Species of trees and examples of culture exhibiting the characteristic types
of the orchards of each country.
"Class 87. Seeds and Saplings of Forest trees.-Species of trees and examples of culture illustrating the pro"Class 88. Hothouse Plants.-Illustrations of the mode of culture adopted in various countries, with a View either to pleasure or utility,"
In the 10 th and last Group
In the 10 th and last Group, the articles are to be exhibited with the special object of improving the Ihrsical and moral condition of the people.
Further particulars will no doubt be forthcoming as with these we shall endeavour to make our readers duly acquainted.

\section*{ON THE CULTIVATION OF PALMS.}

The great obstacle to the general cultivation of these princes of vegetation (as Linneves well calls the Palms), in any indifference to their elegance and stately beanty, so much as in a general opinion that only plant-houses of colossal magnitude are suited for their reception. A stature of 50 to 80 feet is common
among them, and even those species, few in number, which do not develop a stem, for the most part throw out their foliage over a circle some 20 feet in diameter. The great majority of horticulturists cannot afford to devote so much space to a single plant, and the result is that the princes of vegetation are practically abandoned to the princes of horticulture, or to great aational establishments such as Kew.
But if plant growers, and especially plant purveyors, were aware that a considerable number of species exceed a height of from 6 to 20 feet, or a thickness of stem not surpassing that of a walking stick, exist in regions readily accessible, and already searched to some extent by botanic explorers, Dossibly we might
fee these lovely forms moore familiarly in our stoves. fee these lovely forms more familiarly in our stozes, Amazon," a work which, though not the production of a professed botanist, may doubtless be relied upon for such details as come within the scope of our present inquiry. In this pretty little volume he has described and figured several species which might be grown to adult size withont any inconvenience in a thousand
hothouses in England. There is that interesting Palm, Iriartea setigera, from whose stem the Indian makes his fatal gravatana, or tube, through which he projects his unerring arrow by the force of his breath. The stem of this species never exceeds the thickness of one's wrist, and is more commonly that of the finger; While its height varies from 15 to 20 feet. The leaves
are few, pinnate, with the pinnæ abruptly cut off and notched at their ends; and the fruit forms an ornamental bunch of bright orange berries of the size of
our hips. The elegant Leopoldina pulchra is of about the snme thickness, but less lofty in stature, ranging from 10 to 15 feet. But there are others much less than these. Mauritia pumila, a curious little species
spines, "is only 8 to 10 feet high, while Lepidocaryum tenue, the smallest of fan leaved Palms, and one of great grace, is no thicker in the stem than one's finger, and scarcely taller than one's head.
It is, however, to two genera of American Palms that I would chiefly point attention, since they yield none but minute species. They are named Geonoma and Bactris. Of the former, G. multiflora, a kind with
leaves like those of ordinary pinnate Palms, attains a leaves like those of ordinary pinnate Palms, attains a
beight of 8 to 15 feet, and has as slender reed.like stem, prettily divided into joint-like ringe. G. paniculigera is 6 to 9 feet high, with a similar stem, but its leaves are divided into a few broad pinnæ. G. rectifolia is still smaller, with similar leaves less expanding, a more loosely-jointed stem, and a bunch of shining black berries of the size of Currante. But the genus Bactris is our cheval de bataille. Wallace assigns 46 species
of this one genus to South America, of which he describes and figures eight. These appear all to be of minute dimensions, of most elegant form and habit, none with crowded or expansive foliage, but with sufficient variety to make them all worth growing. One (unnamed) attains 20 to 25 feet in stature, but is of 10 feet. Bence pectinata while most of them range belon 10 feet. B. pectinata is about 8 feet high, with ample leaves of the ordinary pinnate or pectinate form, a
slender smooth stem, and a bunch of scarlet globular fruit, not so big as Red Currants. This has the foliage, the leaf bases,'and the spathes, clothed with prickly bristles while another (also unnamed) has rings of reversed spines set at short intervals around the stem. B. integrifolia has a stem not so thick as the little finger, and 9 feet high, with broad entire leaves cleft at the tip. But what shall we say to B. simplicifrons and B. tenuis, Falms in which the stem is never thicker than a goose quill, and 6 feet in height? Here are two charming little Palms, which may be cuitivated in a stove of the most unpretending dimensions, removed to the drawing-room, or set upon the dining table! There is quite sufficient diversity between them; the latter has three or four sparsely pinnate leaves; in the former these organs are broad and simply cleft; in both the bases are prickly; the fruit is like a compact bunch of tiny Red Currants. These would make a pretty pair.
Where are these little Palms to be procured? They are scattered, in more or less abundance, through the forests which border the Rio Negro and other tributaries of the Upper Amazon. At least all those mentioned by Mr. Wallace have this habitat, but then these rivers were the field of his exploration, and we may reasonably suppose that all along the slope of the Andes, other but similar kinds may be found. Now these regions are being diligently searched for Orchids; magnificent Odontoglossa grow in these Andean
valleps; and several experienced collectors are valleys; and several experienced collectors are even now, if I am not misinformed, busy in that teeming seek for the minuter Pentlemen were but instructed to Geonoma and Bactris, and to send home the ripe seed I think there can be no doubt that the result would be equilly satisfactory to them as collectors, and to ua as growers.
Nothing is simpler or easier than the succersful transmission of Palm seed. I have myself sent quantities of different kinds from Jamaica to Evgland without any difficulty, and without any failure, by observing the following precautions. The fruit, perfectly ripe, is packed in a box or barrel, or any similar vessel, with about an equal quantity of earth, in that state of dampuess in which it is dug up in average weather; it must not be watered by any means. The seeds and the earth should be thoroughly mixed together, or may be put in alternate layers. In this condition they will endure a long voyage, and are found, on being unpacked, already sprouting, and ready for immediate potting off. I believe it is almost useless to attempt transmission of Palm seed except in earth. These details in practice, however, I willingly leave to the superior experience of others; it is ratum. P. H. Gosse, F.R.S.

CYCLAMENS.
As the season bas arrived when our stock of these charming spring flowers should be examined, and if necessary, shifted, a few notes on their culture may not be unwelcome to many. Though few plants will endure barsher treatment than some of the varieties of Cyclamen, yet few, if any, will more thoroughly repay the cultivator for a proper study of their habits, or attention to their more immediate requirements. There are many excellent practitioners in other matters who never could treat Cyclamens with anything like success. The cause of failure was always attributed to a constitutional weakness in the bulbs, but I may be able to show that the fault lays in another direction. It is a fact that the demand for flowering bulbs of Cyclamens has from the time of the first introduction f some of the varieties of C. persion, been greater than the supply; the consequence has therefore been
that seed of some of the better varieties has been imported in quantity, and some bas also been aved rather promiscuously from varieties in this country. From the time of sowing this seed saleable bulbs have been produced, having been pushed on in a high temperature, in often less than from 18 to 24
months. This treatment, so inconsinteal
general habits of Cyclamens which base of their native bills embedrare fomed greatly weakens the young bulbs, causing of two causes which operate ind in in in Cyclamens. The whole of the seedlings in demand. They are therefore
withont its ever having occurred
as might have been imagined,
among the varieties had taken place; species have been broken into, and though an 20 per has sometimes been met with, not painstaking cultivator. And yet, who thiuk ing away a Cyclamen? I say, therefore, the amount is given for them, choose good ones and good form, and there peoloured Hon ers, suber and good form, and there need be no fear of a except when, by a little gentle forcine usal fower earlier than it is customary to is is mat however, at all times have finer Howers if gently heated airy atmosphere just when \(t\) are beginning to expand. In order to keep Crch as long in bloom as possible, it is requisite th res them to a cooler temperature than that in which : have beell when the flowers have attained their fo After flowering they should be removed to ati airy situation, where they will have the beneft morning and forenoon sun, but they like a litton later in the day. They do well either plangod in or turned out under an east wall, taking them mon

arvolberkind. It is very dwarf and compact, yielding
and it does not run so freely to seed and her varieties. A very fine selected stock of this, nown as the Early Divarf Mammoth, unquestionably noe of the finest iocks of a awari Eariy Caulifower andesule houses some four or gonever, unfortunately disappeared, or nearly so gerfection, it was found necessary to save the seed in this country.
The Stadtbolier, or Standhonder, as it is sometimes callel, is a fine selected stock of the Wilcheren; it is wher earher under some circumstances in turming bardier. The leaves fold themselves over towards the cratre of the Gower, and spread mut over it ; while and imegularly, and so leave the delicate flowers nore espmel to the action of frost and wet.
Tuo rich a soil can searcely be devoted to the growth and dressed with the best rotten manure, and care in seeping the phants well watered in dry weather, will produee Chuliflowers in the greatent perfection. Liquid manure can alwhys be ndministered with advantage, bu hard, undeveloped heads will be the result. If seed is sown in heat about the middle of March or the first of A pril, and the young plants are planted out as soon as the to "turn in" before the summer closes, while the remainder will come in during the early part of winter onless cut dowa by very severe weather. If sown in the open ground early in May the produce will be fit for winter use. In planting it is a good plan to take out width, filling half its depth with good short manue Which should be well mixed with the soil. The young Culliflowers may then be planted in the middle of the trencl, 2 feet apart. If more than one row is wanted the trenches should be at least 2 feet distant from each other. In very dry weather a soaking of witer once a tion is performed a portion of the soil may be worked Canlifower trench, which will prevent evaporation. and Germany. Enormous breadths of ground are emploged in the cultivation of Cauliflowers on th Continent, and so koen is the competition annong the
growers that there is little fear of a very bad stock of any variety being supplied during the sunmer months. Specimen heads are sent over from Holland to the different seed establishments in London, and some of ibese have weighed as much as 8 or 9 lb . each. liland may therefore be regarded as a country highly uitable for the growth of this vegetable. Quo.

\section*{Home Correspondence.}

Fourcroya cubensis.-A plant of this is now flower ing with us. Its stem is about 23 feet in height, or
rather length, as it is trainel horizontally under the foof of a house which is only 16 feet in height. It is, I think, more elegant than F. longæva. Like it, our Botanic Garden, Oxford. [The flowers enclosed are somewhat Yucea-like, of a green colour, and have a delicate lemon-like perfume. The adventitious buds occor in the form of small bulbs springing from the axils of the bracts, by the side of the flowers; so that in this case, at any rate, the bulbs are not the repre sentatives of flowers, but merely of ordinary leaf buds.
Humining-bird Moth. -We are never any summer without this moth feeding on the flowers of the Pelargoniams, which grow to the height of 15 feet or more cause that I attribute if cone lews numbers according to the warmth of the summer. lo le sean at appeared in hundreds, a dozen or more Llosomf, and dartang their long and flexible tongue, more than an inch long, into every flower. So late as feeding on a flower iu her room. On taking it into the garden and removing the glass. it was so fearless that it iutantly commenced feeding on a Pelargonium flower chme to her, and kept within a few inches of her hand. have also caught them, as well as the Convolvulus fear also we zome Marvel of Peru I bad in my hand. (soon. p. 1013) will find some notiespondent "W. D. F." your last lear 's volume, pp . \(1064,1133,1158\), and also in Loudon's Arboretum, vol. i., p. 301. Loudon aye, "Miller and also Duhamel, both state that froit with trom this variety commonly produce teeds become fewer, and that it is the age of the plant that at last causes the froit to be seedleas ; in that case variety." "Wust be considered more a variation than a Dorsetghire he found this variety us in what part of extends from Portland Bill northward more than 40, anc from Lyme Regis eastward more than 50 miles, 4. more precise description of the locality would
suckers from trees which, in therr ewn native thara shire, are undoubtedly stonelese I have generally found this a better plan when variation came witi aye than resolting to a nurseryman. It may ents, who may have in due measin cathered their stoneless fruit, to tell us how long we may confidently expect the result, and when cur heart may begin to be able to tell us whether the result dore not depunt in some degree upon the coil or on the sitmation and may lnow instances in which two suckers taken from the same atoneless tree have produced, in two different soils or situations, the ove less fruit. I shall be glad to sece some information on thas put in your on the lookns, as the inquiry of "W. W. I). F?" Bézique.-Can any of your readera supply rules fur playing this Freneh game of earda? It appeenrs to b quite a new game, and is sold withont directions, which is not a likely mode of ensuring a very estennive ale. The wives of many of your submernere will fecl grateful to any lady or gentleman who coun will enable them to find amusement in what is mis be such a "fubhionable and favourite game in Paria ; and they desire to seek information thromgh the mediun of your Papor, boping, and very much dinponed to Ladies that they shall not seek in vain. Many Country Ladies. [Gallautry compels us to insert thin letter, lime we must remind our fuir corrcapondents that our columas are hardly a fit place for such inmpirien
Root Fungi--I was employed professionally the W el day to report on the cause of death of a fine Wellingtonia giganten, measuring 12 fret in loeight 24 feet in circumference of branchen, and 2 feet round the stem. It will therefore at once be apparent that manding spot in the grounds of Portnall Park, the seat of Colonel Challoner, you may imagine the sorrow of the owner to lose en fine an ornament. The cause
of death was soon discovered. The noble plant, in luxuriant health, apparently deatined to overtop its neighbours (some fiue old Oiks), bad been atruck down by an unseen and unsuspected enemy. A rickly hate skill and intelligence could d alas ! its doom was fixed, and in a short time this muchcherished favourite whs a dried stick. Some of your readers will doubtless, ere this, have whispered to themselves "Fungi." True, the cause of death wan Fungi. Fungous spawn had penetrated every part of its system; a white kind of network was found of which I send for your inspection. Ihet us now hope for anspicious weather to enable me to replace this tree by planting another, \(50 \mathrm{me} 6,8\), or 10 but I confer do not fear the operation of transphanting, hand "just alluded to, althougls I shall plant some distance from where the other tree stands. The following questions, however, arise in my mind: Grst, Can the Fungi be detected in the soil? secondly, Ilow
far will it run from the tree, and can it travel in any other way than by train, i. e., can it trave through the earth without the sid of roots of trees to carry it? Charles Noble, Sunningdale Nursery, Bagshol [It is very difficult to eay how far fungous spawn may not extend, especially when the species is unknown. As the enemy is probably some Polyporus or Thelephora, but propagate the mischief, even if the new tree so planted at some distance. It would therefore be prudent to trench the ground deeply, and get out if possible every fibre. We had a noble Cupressus macrocarpa allected in the same way, but whether death was due to previous dronght, or to fungous spawn more immediately, we could not say positively. In any case the dead roo should be removed. M. J. B

Lobelia cardinalis.-This tine old plant surely ought to have a place in more flower gardens than it has at the present day. When grown in good rich soil and In wintering the roots, however, I always find that I lose a great proportion of them. If any of your correspondents therefore will give their experience on this point, they will much oblige me. My method is to place them closely togetber in a cool frame, and intervening spaces with litter daring severe weather. H. T. H

Qubresland. - The following report of the Selector of Agricultural Reserves upon Mennga Creek Rocking. ham Bay, River Mackay, River Macaliser,
the Herbert, and Sea-View Range, juat made public, may pomibly be of une to such of our rendert as contemplate emigrating to Qucenaland:
"I examined," says Mr. Waiter Hill, the Selector, the country on the banks of the Mennga Creek for a distance of 10 miles, by a width varying from 1 to 2 miles, and found about 7 wo acrem a vailkbie for 3000 acres of forest, and 500 acres of scrub land; and on the left bank, about 4500 acres forest, and 500 acrem serub. The whole area is pretty well watered, and the gupality of the soil, qenerally, is adapted to tropical and semi-tropical agriculture; but a large proportion of it, being henvily timbered, would, I am afraid, offer great obstaclea to the small farmer.

In the hope of discovering country more eligible
the purpotes of an Agricultural Reserve, I extended

 found them for the most part extremely low, and almost uninterruptedly fringed with Mangroves. The lands immediately adjoining were, in many places still lower, andudutiou with brack ish Tater, rere chiefly remarkablo for the esuberance of their marine vegetation.
"From the Mackay I proceeded in a boat
"From the Mackay I proceeded in a boat to an south-west. Upwards from the mouth I found the land all sandy for about a mile; thence for two miles the banks ure frimgel with M.mgrover, and this again is replaced for the nuxt 12 mines by tropical vergeataon, Sciadophy Hum, Mi musnps, Wormis, Moriada, Livistonia, Susa, Amomm, Dracontimm, with numerous other trees nom shrubs peculiar to these districts.
"One teature I nuticed, in examining this river, was the peculiar density of the sorub on each bunk, the belt of which in stme places could not have been less than a mile in breadth. In fact, I nover witneaced in any of the colonies so dense or 20 lusuriant a growth of scrub trees and plants as was presented on the bants the iuherent richness of the soil; and the additional fact of there being in the very centre a river containing
at all times an abundint flow of the pureat frenh water down to ite very embouchure, ought to be an adequate grarautce that ibe soil is well adapted to the cultivation of tropical or semi-tropical produce.
"I next proceeded overland to examine the soil adjoining the scrab, and nearer the bead of the river. On reaching the necessary elevation, I was struck with the magnificent and romantic scene which suddenly the north, south, and west, with scarcely a tree upon them, covered with lusuriant Grem, watered with aeveral large lagoons filled with paro water, and agricultaral land that I have ween in the Australian colonies. It is, moreover, worthy of remark, that beyond thase phans the land in wid gently umdnliting varied in qualits as to be eapable of yielding in perfection all the proilucts pecuiar to a impieal elimate.

In am of rpinion that the whole of this country, incluting the land along the banks of this excellont tural purposes.
"There in ne particular feature in the country here referred to, to which I would beg to draw specint attention; that is, the facilities atforded on these extensive piains for irrigation, both by the extent of the laznous, the namber of the creaks, and the convenient sites for the erection of machinery to raise and
diatribute the water. Nevertheless, the day is probably very diatint when artitical means will need to the resorted to -the rather, beensae this district is more faroural in reappet of natural water reantures than any acquainteri.
"In diaposing of this matter, I have thought it right to give a natan to the river alluded to, more partienlarly
as nwing to the richness of the soil upoll in lanke, it in lik. Iv to thecome the erntre of a lorse and fluriahin: popmlation, I thive, theretores, empatern I it thes for Lamis and Works.

still damp, and the combs still became green, brittle,
and mouldy. Then we tried covering the central and and substituting an empty wex inclined to believe to condensing glass. improvement. But as the central portion of a hive is that in which the first batch of
brod in the spring is almost invariably reared, we were led to the conclusion that a current of cold air rushing up througla the centre of the breeding combs must be lighly injurious; we know that it was occusionally the
cause of a portion of the brood becoming chilled and abortive.

\section*{Our next experiment consisted in placing an empty} hive below the stock, compelling the bees to pass through it in order to reach the combs. This we found had little reason to complain of the prosperity of the
bives so treated. The empty box was removed in the spring, usually in March. Since then we have learned that this plan is largely adopted by the Ayrshire bee-
keepers, and those who adopt the Stewarton system. This is a different style of ventilation, and the same objections cannot be urged against it. Air is freely admitted below, but there is no pernicious current through the hive. Therefore, on the whole, if any means of ventilating hives be resorted to, we should be disposed to recommend the adoption of the foregoing mode as bein
the contrary
When the system of bar-and-frame hives became largely carried out in our apiary, we found that the side combs in the large-sized boxes with ten frames usually became very mouldy. By be replaced in the spring, much of the evine was obviated. But we have been compelled to come to the conclusion that, as a rule, hives unmeddled with in this way have usually made a more forward start i spring, and consequently have been in a better position have of late been the fashion in the sonth of England. In no season has this been more apparent than during the last, when hives which bad remained entirely undisturbed, were in so much more forward a state
than others which had been taken more care of, that we have almost been induced to alter our whole system of practice. Many of our stocks which had not been disturbed since the previous autumn, either tor the temporary removal of side combs, cleaning, or renewal of lloor-baards, \&c., were sufficiently populous to com mence operations in their supers, long before thos differently treated were in a position to do so.
Bees will, if left to their own instincts,
Bees will, if left to their own instincts, sednlousiy the holes in perforated zine, placed over the apertures in their crowns, are generally completely filled up. This is more particularly noticeable just after the close o the honey season in autumn, as if they were aware o the necessity for making everything as snug and airhow easily bees become chilled, and can suppose how diffcult it inust be for them to beep up the requisite amount of internal heat to p.
With hives possessing a very abundant population artificial ventilation does not seem to be productive o 80 much injury as where the population is scanty, or instance of this in the apiary of a friend, early last spring. Having become possessed of a Woodbury frame hive, he set his carpenter to work to manufacture some clever country iddition to several other mistakes, thi at all nenntry worker in wood did not seem to think i stocked consequenci was, that in one of the hives thocked with a fine swarm the previous summer only rested for about half an inch in the centre being raised about three inches at each side so that the \(\$\) Whole upper sirflace of the combs was virtually exposed. covered woollen case, wiils ample means of ventilation numerous that no injurious effect had resulted. On
removing the resented the ease to inspect the hive, the bees warmly decided signe exposure, and poured up, exhibiting very
the beat irritation. In auother instance the bees had evidently suffered from the effects of the warping of the cover and free admission of air, being Wrak and listless. It was evident that the streng th o ponsibly may have conduced to keeping it in a healthy colony; that could not recover itself in time to be of any use to the owner, in the way either of supers or swarms.

\footnotetext{
Garden Memoranda.
DAXCSTEIN. - The plant-treasures of Dangstein are it is one of thosown to the readers of this Jourual ; but visit to it mariety and life. The immere.iate cause of my clrious suly be traced to some diminutive but very Surracenias eight "live" grown there. I went, in short, to see plant probably not elsewhere in caltivation in the
British Isles. Possibly many of your readers do no
}
know what this Darlingtonia is like; possibly they may have raised a weedy leguminous plant of that gardeners familiar with did ; certain it is that many are quite unacquainted with and fond of Cephaiotu may be described as a Sarracenia with a split lip, mor singular than that very singular genus, and more difficult to cultivate, as we may infer from the fact of its not being in cultivation, except here, though it has been imported and tried by by 1 rutivators *. These are seedling plants raise by Mr. Vair; they are little more than an inch high
and the longest pitchers perhaps two, but each perfectly developed in its own small way, and quite healthy The youngest pitchers come with an undivided acuminate lid, but they are few; the rest look like the heads of young unfledged birds, with the beak pointed agaiust he ground, split up the middle, and widely divergent The plants are grown in a house with north aspect\(70^{\circ}\) in well 'drained like Orchid pots ; soil: sphagnum, sand, a little peat, and minute potsherds.
But what a ponderous bench of Sarracenias! and what a treat it must be to the gardener continually among what Carlyle would probably call "the Formalities to get a peep at these. I had no idea o meeting such a capitally grown and full collection here, and had almost began to think it hopeless to grow Sarracenias, \&c, in places not directed bs a Bain or a Baines, and was agreeably surprised. Mr. vair grows S. flava nearly, or quite as large, as Mr. Baines, of Bowden, does ; Drummondii large than I have seen it elsewhere; purpurea and the others very fine. They are grown exactly as are the Darlingtonias-the same house, soil, and temperature. cast with is a hollow rim oltside the edge of the pot, outer edge is a little lower than that of the pot, of course to prevent fluids going in the wrong direction. It is useful to keep abundant moisture round the plants, and seems on the whole a very sane improvement. Suppose one wanted to keep a way snails from
a plant they were fond of supping off, what mode of a plant they were fond of supping off, what mode of
so doing so good as this little canal? For Fern growing, \&c., Mr. Vair has had some cast with a rim deeper and an inch or two lower down the side of the pot, big enough to hold a little soil on which to grow elaginellar, and therewith hide the pots.
I do not propose to give the reader what is known to gardeners as "a good look round,"-only a peep in here and there. From daylight, then, with the Sarra night," with that grand old plant Ipomacea Bona-nox, which is expanding its transcendently beautiful pure white flowers, 6 inches and more in diameter, with delicious fragrance-not exactly wasted upon the desert air, for several persons have come out to look at it that would not think of hothouses after supper for anything else except the night blooming Cactus, and that is a poor thing compared to this creeper, which keeps ex panding its flowers after dark for nearly the whole year one of the party. It would boten times a greater pity
it should flower during the day! (except in public gardens locked up at dusk or \(60^{\circ}\) clock), for tuen could not be cut in its opening beauty to grace the drawing-room just when the ladies enter it, and to delight and astonish-not the natives, but the visitors. It makes the room too almost as sweet as the stove in which it grows.
From this we will emerge again into daylight and hasten to the Ouvirandra, as this is one of the few places n which that curiosity is well and reqularly grown Here as elsewhere there are evidences of its capricious ness, as fine plants that sent leaves to the edges of lined tubs, 4 feet in diameter, all chose to lose the greater portion of their large leaves a few weeks ago, but now they are starting afresh, no doubt to make fine plants by next year. Their culture as pursued here was described a few weeks ago (see p. 892). In one little respect air. Vair gains a fem points as regards the cleanness and look of the plante xcept immediately round the neck of each plant the ravel and suall spar is not which it would get hat which it would sink, and by which it woud at every watering but on slates which rest on brickbats place on the soil, and thus the mud is not disturbed by watering, and the pebbles look clean. Mr. Vair believes shade to be essential to the plant. Mr. Bain, of Dublin, has certainly no doubt upou this point, for have al ways found his pans containg cosered with a old copy of a newspaper. Mr. Vair, toa, has proved that it does not require very warm water to grow in which is true enough; two of the best pans I have seen were in Messrs. Jackson's nursery, Kingston, in large inverted bell-glasses in the Orchid-house Berneriana was one of them, and in full and beautiful flower; but that it can be grown well in ho water there cannot be a doubt, as Mr. Berry, ardener at Dalvay, in Morayshire, used to grow \(80^{\circ}\) to \(100^{\circ}\). With Mr. Bain it does not grow so larg
- It has been raised, we believe, in other cases. Some few years since it was shown at one of the summer motropolita
Oxhibitions by Messrs. Jackson \& Son of Kingston.
as in other places, but he never loses it, or has it go
back or lose its leaves as is the case with otber people ; the leaves, on the contrart, siways remain clean and wiry This 1 am quite sure arises from the fact of the roots of his plants never touching a particle of putrid stinking soil, and consequently never rotting away. He grows it on sods of firm fibrous peat, placed on potsherds, and has a little hole with a cork in it at the bottom of each pan, by which he can draw off all the water once a week, or as often as he likes-just the sort of "wrinkle" one would expect to piek up in the College Botanic Gardens. Mr. Vair tried a little stream of water directed through the tank, but as that did no good, it was stopped. Plants have been grown here with nearly 300 leaves on them. Under the leaves they place white dairy tiles-a capital plau to show the lattice work.
hese tiles are also 'placed behind the beautifully cut Trichomanes, of which there is a fine lot, including good plants of the exquisite trichoideum, and many other rare, and probably some new things in this way. The collection of Ferns is good, and contains many rarities and novelties. These delicate Ferus occupy one side of a warm low stove, and opposite them on the otber, forming an aunirable conast, are half a dozen cases of Anæctochilus and dwarf ornamentalleaved plants, including the rare A. Bulleni, and otheri Anæcocili though the same conditions repeated now fail to produce a good result.
Against the back wall of the Orchid house was a creeper very appropriate to such a position-Vavilla lutescens, with stems and general growth very much fatter and larger than the common Vanilla, and producing large flowers occasionally. It is not often that a private garden possesses medicinal plants, as they are very rare even in the best public ones, but they have very full collection of such plants, wanting few but the Clove-and who does uot want that? and the true Strychnos, a difficult thing to lay hands on. The curator of some botanio garden in a hot rogion would confer a great boon on nis Britislı contemporaries by sending over a lot of fresh seeds of such things as the Clove, Nutmeg, Strychnos nux vomica, Bread Fruit, Jack Fruit, Mahogany, Cinchonas, \&c., or in fact of any valuable tropical fruit or medicinal plant. Perhaps it would be better to plant fiesli seeds in a 1 a ardian case, when they would probably vegetate on the vnyage.
I have lately had a case of plants from Mauritius, with joung Clove plants among others. These plants not sub-curator of the Mauritius Botanic Garden, when sending the case, sprinkled a few seeds of the Clove here and there in the soil, and in the Banaboo pots in which the other plants came,
and these grew, nearly every one of them, well, and I have got a dozen nice young plants, which it is hoped will live over the winter in a warm pit.
Apropos of the carriage of plants, there is here a little Dendrobium beginning to sprout out, which was sent from Moulmein, Iudia, to Dangstein, England, Over the medicinal and other interesting plants hangs the Granadina, attain this end, Mr. Vair finds it necessary to fertilise the blossoms-not, strange to say, with the poliet or
the Granadila flowers, but with that of Passiflora the Granadilla flowers, but with that of Passifora Wа. Rábimpon.

\section*{Miscellaneous.}

The Laurels of the Ancients.-The term Laurus was employed by the ancients with the same degree of laxity as that in which they indulged in the case of the Acanthus, the Acer, aud the like, just as that, with regard to the same term, which 18 admitted into the popular phraseology of the present day. We speak of andrian, the Laurustinus, \&ce, shruls no farther related than in the one character of being evergreen shrubs, applicable to the same uses in ornamental gardeningo In like manner Piny enumerates the Tinus, a plant which must have been the Viburnum Tinus, the Laurnstinus of the moderns, belonging to the family Caprifoliacea (although some, even in his time, considered this as a tree of a separate class). Then
follows the Royal Laurel, sacred to Apollo, and known as the Augustan, being used in trimmphs to encircle the brow of the conqueror, which is the Bay, or Laurus nobilis of Linnæus, belonging to the family of Laurines, and possessing something of the aroma so remarkable in certain tropical species of plants noticed by Theophrastus and Pliny, but not an plants noticed Europe. The Bay Laurel itself has been regarded by some as a questionable antive of Europa, and even Pliny seems to speak of it as though it were of foreign extraction, when he alludes to the care with which it was preserved, as was the case in the Villa of the Cæsars. But this was an exceptional case, arising from the veneration felt for that particular branch of Laurel, whicin, as the story goes, was held in the beak of the hen that an eagle had let fall from a loft unhurt into the lap of the Empress Livia; and at any rate the
di covery of this plant amongst the Tuffs of Castelnau, in
Piovence, as stated by M. Planchon in a late work on the subject, proves that it existed antecedently to man in the south of France. The crackling which takes place when the leaves are put into the fire, arising from its oil becoming volatilised, and bursting the walls of the cells within which
it had been imprisoned, was regarded by the Romans with superstitious fear, and deterred them from applying the shrub to profane purposes, or even from using it for fires at the altars. See Pliny, lib. xv., male end female flowers are on separate trees. Sibthorp male end female flowers are on separate trees. Sibthorp plant now known as Daphne is the D. Laureola, or Spurge Laurel, which is probably the species called by Pliny Daphnoides. * * Other varieties are also mentioned, which it is not easy to identify, but amongst them does not occur that which is the commonest of any at the present day, using the term Laurel in its popular sense, viz., the Cerasus Laurocerasus, or Laurel ancients, having been introduced into Europe from Trebizond in 1576, by Clusius, under difficulties nearly as great as those stated with respect to the Cedar of
 eumption of coffee, usually attributed to the increased consumption of tea, appears to be a most serious matter for the coffee-growers, whose whole prosperity depends upon this particular branch of commerce. The Planters Chancellor of the Exchequer, that of late years the consumption of coffee has been steadily declining, the deliveries for 1864 showing a falling off of more than \(12,000 \mathrm{cwt}\). as compared with 1863 , and of nearly 28,000 cwt. as compared with 1862; while the conly
sumption of ten, on the other hand, has been rapidly ou the rise, the deliveries for 1864 showing an increase of about \(3,500,000 \mathrm{lb}\). over 1863, aud nearly \(10,000,000 \mathrm{lb}\). over 1862 . The petitioners urge that
this contrast is owing in great measure to the reduction of \(5 d\). per 16 . in the duty on tea effected in 1863 . They fear that the late further reduction of \(6 d\). per 16 . will render the cuntrast even more striking, and are justified by the fuct that, in the first five months of
this year, 1865 , the deliveries of coffee for home consumption were upwards of \(20,000 \mathrm{cwt}\). less than in the corre sponding five months of last year. They point out that, whereas the presont duty on tea of \(6 d\). per lb . may be taken as 17 per cent. of the value of the produce, the duty on coffee at 3 d . per lb . is above 35 per cent. of ita value, and finally, to prevent a further aggravation of compete on even terms in the home market with tea, the petitioners "pray that in the coming year a reduction may be proposed in the daty on coffee proportionate to that already carried with regard to tea," all that the loss of trade in the home market may be more than made up by an increased demand on the Continent. - At Hamburg, the greatest coffee market Germany and the countries to the north are derived the demand is constantly increasing, and the prices have been rising for some years past." This, we believe is the case all over the Continent. To meet this ing, and especially in cur Ceylon. In some minor places, however, as, for instance in Borneo and Réunion, the cultivation of the plant has boen much neglected, whilst in other parts its
introduction is looked forward to with sanguine expectation as the source of a great export trade. This is so more especially in Feejee, where there are at present 20,000 coffee trees in a most flourishing conJournal of the Society of Arts.

Sicilian Vegetation.-Owing to its physical conditions, a decided undercliff or Riviera commences at the south suburbs of Messina, protected from the north and northwest by the coast chain, and gradually"less and less
exposed to the north-east as it descends southwards. Under these influences of protection and of exposure to the south-east sun, a wonderful change takes place. Nature burats into extreme southern luxuriance; not wo much on the advanced or more exposed headlands, Which still catch the north-east wind, as in the inter-
vening bays or sheltered ravines, Vegetation at once assumes a very advanced southern claracter. Stately Orange trees, sometimes as large as moderate-sized Oaks, and Lemonftrees overtopping two-storied housee, high; the White Mulberry and the Almond trees were in full leaf, and the latter had fruit full size, evidently stoning; Fig trees were in leaf, and the fruit large the Vines had made shoots four or five feet long.
What is called the Black Mulberry tree was still all but leafless, as at Palermo, only a few buds and ter minal leaves appearing. Few if any cultivated flowers were to be seen, with the exception of Carnations in full bloom in pots or vases on the balconies which most houses of any pretensions possess. Wild flowers were numerous in the orchards and in the fields, prominent
among them the Gladiolus, which was growing in great Wrofasion. Barley and Onts were in the ear, and tion was certainly more adranced than I Ining vegeta-
in any other part of Sicily. - The name given to a village in the more southern portion of this region-Giardini well as now, of exceptional fertility. Bennet's Mentone, 3d Edition.

\section*{Calendar of Operations.}
(For the ensuing week.)
The heavy rains which we are now experiencing will have the effect of softening the ground, left dry by the late hot summer and comparatively showerless autumn, and will enable all operations in the way of planting to be pushed forward under advantageous circumstances. Root pruning may also now be proceeded with. The principle upon which it rests, diminishing the supplies, is unquestionably correct, but the manner of applying it is in some instances as unscientific as pruning Gooseberry trees with hedgeshears. A trench is commonly dug out within a short distance of the stem, and the whole of the roots, good, bad, and indifferent, are cut off without distinction; the effects of this rude mutilation are often very unsatisfactory. The same principle, however, carried out in a more efficient way is productive of the very best results. In the case of wall trees, taking up and replanting generally gives them sufficient coots can then be removed in proportion to the vigour of the trees, while those retained can be spread out in a proper position, that is, nearly horizontal. By this method (which also affords greater facilities for trenching, raising, or draining the border) a tree suffers less, and yet is sufficiently checked to alter its habit; the roots being likewise brought to the surface
and properly spread out, are less liable to penetrate too deeply in the ground, which always tends to promote lusuriant growth and consequent barrenness. Old wall trees which, from their size, it is impracticable to transplant, we would root-prune ; not, however, in the way alluded to above, but by undermining the roots and cutting off the lower and stronger ones only.

\section*{flower garden and plant houses.}

While the weather is favourable look carefully over half-hardy stock, and if any has not already received sufficient protection, let no time be lost in rendering it as secure as possible for the winter.
Climbers.-Particular attention should be paid to securing as much light as possible in all structures containing plants ; and where the rafters or roofs are used as trellises for climbers, the latter should be reduced within convenient bounds, as the growth of nearly all is or ought now to be completed. Late autumn-flowering sorts as yet unpruned, such as
Mandevillas and Ipomoos, will now be sufficiently ripened for the purpose, but little more should be done after removing the changed leaves than to prune the weakest shoots ; their final pruning should be deferred till March or April. If larger and stronger shoots are cut now, they are apt to commence growing, in spite of the moderate temperature, and thus expend ! the strength which ought to be reserved till spring. The shoots of Maurandyas should bo considerably reduced in bulk, as they are affected by the slightest damp during winter. If any of the late-growing Passionflowers or other creepers impede the ingress of light, they should be reduced; deferring, however, their final pruning until they are about to commence their new growth in spring.
Pelargonivas.-Give air whenever the weather will admit of it; but avoid cold draughts, and keep out rost. On the other hand, be careful not to use too much fire-heat. Training and shifting must also receive attention.

FORCING GARDEN
Cucumbers.- Give those growing in pits all the light possible by taking off the covering early in the morning, and keeping the glass clenn. Be careful that red spider does not establish itself upon plants which may be the case in Pine stoves, where the drier atmosphere favours its increase
Prnes.-Do not allow cold weather to seal up the ventilators; the admission of air must, of courae, be gradually reduced in accordance with the advancing season, but this is a very different matter to almost discontinuing it. Let water be very sparingly used during dull weather, but have an eye to those plants Which stand near flues or hot-water pipe
Vinks.-In some instances houses from which the fruit is cut will by this time be converted into greenhouses; the Vines require to be kept cool and dry, and the plants want very nearly the same treatment; frost, however, must be carefully excluded. While the plants are in these temporary dormitories, particular care should be taken to keep them perfectly clean and free from insects of all descriptions, or these latter will leave broods behind them, which will be very troublesome another season. If possible, avoid putting plants into those houses in which the fruit is still hanging; but if it is necessary to do so, let them be of such kinds as require the smallest quantity of water during winter.
hardy fruit and kitceen garden
Examine fruit and root stores to see if all is in a state of good preservation ; any fruit still out of doors should now be gathered.
three or four dayb, and those whic erami maturity, if not required for immediat lifted when dry, aud after tying theire lespe should be laid in by the heels in a sheltered
or hung up in an airy shed, where ther tected from wet and frost.

Peas and Beans.-Those who reside able localities may now make a sowing of thers
early crop. The seeds should be so early crop. The seeds should be sown of th
side of low ridges, the crown the young plants from cold between will aid in keeping the chopped Furze, or other similar materia sown along with the seed, to prevent the dep
of mice. There is a chance, in that these early sowings will produce dood in medium or late situations the chance very small. In the latter case there and wore certainty, as has been previously sowing in boxes or turves early in spring, an them out with a slight shelter to wards the a

\section*{The Ggritultural batett.}

SATURDAY, NOVEMBER 4, 1865.
menting por the enslina werk.

On Wednesday last the Royal Agricultural Society began its monthly Council Meetings again ; and its Educational and nther committees recommenoed their labours. On Tueeday last a Gloucestershire Farmers' Club also recommenced its monthly mettinga. The subject under discussion was Agricultural Education, whioh was cunsidered, as before a company of farmers it was nure to be, from the strictly professional point of view; and we hope that hereafter we may have to report a useful and satisfactory negotiation between the local and the national Societies as the result of the week's proceedings.
It so happens that the minority of the Eduoation Committee in Hanover Square, who failed to carry their views on the education question before the Council, are nearly all Gloucestershire men; and it is thus fitting enough that the next attempt to urge the subject on the central Sooiety from that professional point of view which it has hitherto resolutely ignored, should be made from that county. It is now proposed that a soheme be organised and published for an annual examination in agriculture, by which the agricultural knowledge, proficiency, and skill of young men resident in or belonging to the county may be determined; and at which they may be induced to present themselves by the offer of prizes for superiority. Both the Principal of the Royal Agrieultural Cullege and Colonel Kingscote, M.P., a member of the Agricultural Society's Education Committee, who were present at the meeting of the Kingscote Farmers' Club last Tuesday, cordially accepted the suggestions on the subjeet in the Paper which was read, and which is given at length in the following pages.

The alleged impossibility of direoting an efficient examination into the practical knowledge and attainments of an agricultural stadent or apprentice was ridiculed by men who have had ample experience in agricultural education. And the possibility of collecting in the county, or in the possivince on society's map to which the that province on ample funds to provide for all the expenses of the proposed annaal together with sufficient prizes to induce the competition in question, was generally believed. Inquiries are at onee to be instituted on this subject, and at the next monthly meeting it is to be hoped that an encouraging report will be received. If it shall appear that the project will command the support of the leading landowneri of the countr, the whole scheme will then require discussion and elaboration in detail, and it will be time to open a negotiation with the Agricultural Soclety of England. The awards of merit must be by the National Society's examiners, in order to
it is hardly likely that tho suciety will alogether refuse ite assiotnnce to a well-considered locel effurt of this kind; even though it he excluaively profersional attainmente that it is dovirod to promote.

If, through the Gloucesternaire Club, the Cuatral Society shall be induoed, however indireotly, and in only one of i's prownees, thus to lend its earetion to an agency professedly for the promotion of a strielly ayricicilural cducation, we mas then hope to see it sectug in the other provines uphen its map in like manner; and the sulpeet of a professional education for firtm airirmlies and otudents mary thus after all eome to reenice that favourable conaideration from tho Rogal Agrioultural Bociety which has hitherto bees deaied to it.

On Wedneedey Lett Mr. Macourv, of Bonhard, was eleoted Soeretary to the Ifighland and A grioultural Society, in the plece of Mr. Hall Maxwilfo C.B., who has lately restged. He tators a chour that has been filled fir en yeara i.y a mal on unusual enersy and problan spinic The llighland Society may be seid to have leag in:", thew lite during the term of Mr. Misurnit'sollice, wheh has now extended over a pertod of 20 yeare. Froma oumparatively languid and ineffioiont plight, it has aprung into the living eotivity and strength, at well as mere position, of a really Natianal Serinty. Its membership nuw embraces all the beading tenantry and landowners of N.arth Britans. Its anuual shows are no longer mere provinetal holidays, but acericultural gutheringe of the whole country; and, berides itu annual central fllirt, the connection between it and the looal moviction has been cultivated to the great advantage of aunual ploughing matches and local cum ehtines everiwhere. Its roll of membery has riaca from 2tion to 4200 since 1815 . The amount of its invested oapital, during a period when no one conl.! nceusn it of listlessuess or inactivity, han risenfrom 34, (1).117. to upwards of 47 , (M) mereaved lown). Nome of the enurroman krowith which these figiores indicate, has in diuth broun the fruit of that gemeral aceass of ene ray and life in Aritish agriculture, of which we seep printeverywhere. But neither can we douht thit the prosperity of this great suchety has bee fo manly ownig to the active conrse of usefulness by which ies pwinlarity has been ensured, and in whioh it has bsen often led and slways kept by sts inviueible and indefatigable Seorelary. From the midat of the continual movement that has heen ohservable during his career, two points in partioular may bo selected as especially deserving of notice, and the mont noteworthy of all was, we may kay, excluively his own. The oollection of the agricultural statistics of Soothend during four sears was accomplished almost entirely by lis own personal iuftuenco with Soottish agnculturiata; 30 that about 1000 of the flower of Seatish tenantry were induced by him aotively to co-operate ; and thus a task which Guvernment appars to despair of accomplishing in lingland, was carried through by Mr. Hali, Maxweld, originally single handed. In this and many other achievementa his sucoess has been attributable to a characteri .tic mixture of genial tact and the imperative moodboth warm and hot vitality; and the difficulties which a public-spirited and independent man will always meet, and which an active and atrongwilled nature sometimes creales for itself, have thus either been disarmed or overcome. Mr. Maxwell received the Companionship of the Bath as the well-earned reward of his sucoessful labours here.
Tue other great step which the Society has taken during the term of Mr. Maxwnith's uffice has been an attempted expression of its interest in the subject of agricultural education. This has ret to bear its fruit-but planted as the germ has been, we cannot doubt that a vigorous growth is to ensue: and that in the long run this will be looked back upon as one of the moat important of the rany useful steps wirich the Siciety has taken during the carcer of its energetio offico:
No wonder that a good deal of iatwrest is felt in Scotlaud in the apporutment of a successor to so able and earnest-minded a man. And no wonder that the projoct for an effioient expression of gratitade to the officer who is leaving themmooted originally by tho leading men in both he rant and file of soottich agrioulture, has been heartily takea up by all claseses in and out of the National Society.

We have recoived the Prize Lists and Programmes of the 17 th Annual Show of the Bimmingilar and Midland Courties' ExifibiTrom, and obwerve that considerable addition
 amount reaching the sum of 2 asiol.

should try both their knowledge and their skill-their acquaintance their knowledge of the theory which underand animals, practice, and their indivilual skill in
lies farm prech farm practice consiets. parious operations in as I shall state at length directly I Ton't know whether it appears wild and imprac. ticable to you or not; but and ultimately attract the convincing yout of young inen who are to be farmers general attention of many of them to employ in useful - professional study much spare time now wasted, and prat it would have a wholesome influence on the next
there generation of agriculturists. Perhaps in place of "county on the Society's map to which Gloucestershire province ond that includes I believe Herefordshire and belonge, and the as well as Gloucesturshire.
Worcestershire as wing to state the plan more in detail, I will ask what probability there is of its being accepted not merely by this county to ensure its success. The first difficulty in the way of the produce of our corn-fields and the great risk hanging over the cattle in our pastures make the present time extremely unfavourable for its makrodrction. That of course is true enough; but the
intron is just now before the Royal Agricultural society, and it seems to me that if any plan of the kind is to be brought forward at all, it must
The great difficulty, however, no doubt is that it is good schooling for their boys, much more than scientific or practical instruction after they have left school, that tenant farmers are nost anx ious about.
If any scheme were proposed which would bring good schooling within reach of their sons and of their means, very warmly welcomed. Mr. Acland's plan sympat hises of a contribution tos ards supplying the want thus felt; and no doubt a first consideration of it therefore leads one rather to favour it as a project which olfers help,
howerer slight, towards the great want of the day. I venture, however, to submit to you that the existence and the prevalence of a real anxiety on this sulject
is a hundredlold better sccurity for the demand being altimately wrill met and supplied by those whose proper business it is, than any smath effort towards the supply on the part of auy agricuitural society can be. Acland's scheme for using the moneye subscribed for agricultural improvement towards the preliminary elucation of sons of farmers, whether they are themselves to be farmers or not, is itself to my mind the
complete nad sufficient proof that no such scheme is wanted. This felt want is already resulting in more and better education being procured for the rising generation in counlry districts than ever any previous generation large schools-olten of cannty scho ilis-a work in wheh county gentlemen and men of all grades in any county may nroperly take gieat interest, whether they belong to agricultural socie ies or not. But the supply of such schooling, or even the encouragement of it, is not pro-
perly the work of ngi icultural societies as such. What they have to do so is to promote the improvement of agricilture; and thus agricultural educition, but not the work in whicl they of country boys in general, is a To me it seems that the sure popularity of any scheme for promoting the general education of boys, and the comparative coldness with which any scheme for promoting the professional agricultural education of young menis rec: ived, are all the proof one neds that the latter
of these schemes requires all the aid that agricultural societies can give it, and that the former needs none.
Of conrse we all know perfectly well that this better eduration from boyhood upwards is what more than anything else will benefit the next generation of tenant farmers-even as farmers, and still more as men; but that is a matter which is being gradually worked out already, and we need not; because it is all important, put other important aims and purposes altugether out of sight, or divert to it that share of eflort and attenI have is properly chaimed from us by them.
May before the Royal Agricultural Society in which my olject was Royal Agricultural Society, in which should direct their attention, which as an agricultural
society society they mi,htht properly do, to the professional
education of education of ngricultural students. The pducation of another step) chat of lnys irous amongat whom one and not my sunject, and a cuntended it was not theis. That wan of conrse a muth ligitior sul ject than any that could come before me as a member of the Agricultural Society; but there "as un reasun on that account why an attimpt shond not he made to deal
with the much loumbler, but though far inferior, yet important suliject that did belong to the Aaricultural Society, namely, how a well-educated boy should be made A gond farmer. A clover writer in the North British Agriculturist, with whom I ertirely symprathise is the
estinate he firs education which a lad should have for mere manhood's sake, whatever be the profession he may adopt, and the
theless imagines that the purpose of my paper was to
magnify the professional training as compared with magnity the professional training as compared with the essential education on which it ought to be founded; and le exclaims to the editor

\section*{"The object of Mr. Morton seems to be that the lad shnuld} plough like a plo ghman, stack like a stacker, shear sheep
like a shepherd, and other wise assist He will do nothingof
the kind. He will at first enjoy the liberty he bas so early acquired; hie will think himself a man; and after some year
of a lazy life, , , may bo able to manage the practical work o
farme as woll, but certainly not one whit better than if, as o study farming at a farm, carrying with him a disciplined
ind, and the cultivated brain of a man.
I quote these passages, notwithstanding their personal njustice, because they express, as strongly as 1 believe we all wish to express it, the feeling that after all it is an enlarged and liberal, and to the extent which time allows a thorough general education during boshood and youth, which more than anything else is needed any profession whatever-aner and raise the position But though we all hold this no doubt as strongly gs this writer does, that is no reason for puttiny things to improper uses. An agricultural society is a body in Thice men associate for a certain deanings which thus propery come under their consideration and patronage. But there are other good things and even other better things which do not belong to us ; and the conviction that there are more important things outside of our proper otjects must not hinder us from giving due attention to those purposes or which in particular we have banded ourselves together. We shall certainly be all the more likely to serve our generation usefully if we keep ourselves or ven confine ourselves to the work which properly belongs to ng. And thus it is that white we may mulvidually believe the general education of our sons to be
by far the most inportant purpose of our lives, yet, associated as we are in a society for agricultural mprovement, we may feel bound to confine our attention here to that professional training by which after this preliminary education they are to be fitted for their career as farmers.
The three points which I quoted as the grounds of
Mr. Holland's advice to the Royal Agricultural Society on this subject were-1st, that the general education of boyhond is already receiving more anxious and earnest attention in country districts than it has ever don before, so that it does not need any exterial spur or help; 2d, that the scope of the professional education
of the farmer has been of late years wonderfully extended, so that there is a field not yet properly worked nor even in general properly appreciated, over which agricultural students and apprentices ought to be urged and 3 d , that it is possible to guide and stimulate their useful studies in this field by prizes and examinationsjust as possible in this way to urge to effurt in the field, the laboratory, and lecture-ronm, as it is in this way to arge to effort in the grammar-school or college
Of the first point I shall say no more than has been enough to convince myself that although agricultural societies should resolve that this preliminary echooling, as I call it, is no part of their business, yet there is no fear of its being neglected. Those who have the guidance of societies and public agencies are rather apt done, country for himself. Agricultural education, whether in the sense of Mr. Acland or of Mr. Holland, is proceeding and will proceed pretty much as it has done hitherto. It is the relationship of father and suo throughout the country that is the real security for that-the renl incentive to it-the real guide of it. to act, farmers, more alive than ever to the value of education, will do their best for the general education of their children; and more alive also lan ever, as they must be, to the difficulties of mak "Drofessional" edncunt, hey will do their best fonded to succeed them on the farm. It is in the latter point, however, where so great a novelty (compring the knowledge of one so great a novelty (comparing he ma the application of science to ngriculture is at length making itself felt, that exterual stimulus and guidance are especinlly needed. For, notwithstanding the rhow, it is the undoubted fuct that the tenant farmers of this country have risen and are rising imore rapidly than any other in that ge Agriculturional stank England have thought proner to cultural society of especal putronnge; but which, as I believe, needs that patronage so much less than the strictly agricultural education which they might have taken up. Small as the educational influence of any rorieties, whether national or local, over the great body of farmers in their district may be, it will be more efficient if brought to bear on their own proper work,
in the field which properly belongs to them, and on
ground where guidance and incentive are really needed, than it is likely to be when directed to work which is not that of an agricultural society, but of the Universities, the College of Perceptors, and other educational bodies-which moreover is not in a field belonging in any proper sense to an agricultaral society, nor on ground where any help is wanted.
I hope therefore that if the Kingscote Farmers' Club should thiuk proper to offer its co-operation to the English Agricultural Snciety, in any scheme for promoting agricultural education in this part of the country, it will confine itself exclusively to the professional part of agricultural training, which the National Society has hitherto neglected.
I could quote to you many letters from farmers and others in all parts of the country unanimous in the tion that in virtue of that inproved general educabut which her bocien a generation past-the existing generation of English agriculturists stand much higher in point of intelligence than the preceding one; and in that we have thie best security or the care which the future generation of them are now receiving. I will, however, quote only one, the letter of Mr. Anthony Fewster, whom we all kuow :-

\section*{spect of two generations, thie ad vance of the agricailurist in}

proventions of the subject of general education-believing too, rightly or surongly, that the members of this Club in their anxiety on this subject would gladly, if it were possible, rather have any influence which this Club may possess directed in promotion of thas on whicheral education is
strongly-but knowing that this general already satisfactorily progressing, and believing that a agricultural society should confine itself to strictl eveningal sunjects, 1 not possible to lend the National Agricultural Societ a hand in the promotion, not of general education, but of the technical and professional training which a well educated biy requires before he can become a farmer. Let us then refer now to the remaining two parts of Wr. Holland's case, viz, the fact that there is a great and imperfectly culrivated fued for the promenal may be directed and induced to work in ibis field by prizes and examinations.
On the first of these pointr, what is it, let me ask, that a young man needs besides land of another and He needs Kown, in order to wh we all the "scientific" knowledge, "technical" skill, and "busi ness \({ }^{2}\) tact, and thas more accurately define our meaning, we do not thereby limit it, but rather the skilful scope of it. All the knowledge one or other the sciences; and thie more and better that he knows of such natural truth as his own practice illustrates and teaches by example, the more likely are full skill and tact to avoid mistakes and to reap their pr reward. I submit to you that the agricatara generation has wonderfully increased the field and increased the need of all these several branches of a perfect agricultural training.
As to the need or land now to bear the or wher which has with amateurs and enthusiasts, what is its natural price for agricultural purposes. We have to con tend with an extraordinary developunent of industry the pre trades and manufactures, which has rase be. We have to meet the world-wide competition of other food producers in the English market, thus beating down the value of much of our field produce far below those market standards which we used to try by artificial means to maintain. There are extraordinary of produce which mist gradually lead to altered arrangenents; there is with mannre and food mana the local markets, but with manare ath imo man fretnrers in distant towns, and even with importers of plain that there is unasual need and unusua oppor tunity in farming now-a-days for the exercise of shrewdness, tact, and enterprise?
Then as to the need of technical and practical skill the farm, and I am told of younore than ever on farms thiat they generally possess it less than they used to do. Our labourers work less than formerly am not lamenting this, bnt ouly stating what I beliere will be generally admitted to be the fact. The cons seek better-paid employment, and there is not so much of
the chif-fashioned almost inherited skill handed down from father to son ou which masters could depend for the execution of their orders. The relationship between master and servant is not (at least in many districts makes the need of special skill on the part of the master greater than it ased to be. He must be able not only to give orders, but to direct their execution, on
the score of a diminished skill in agricultural labour an the intensity, as I may call it, now-a-days, of farming.
It is because agriculture has to do with living things that there is such especial need in it of careful, skilful superintendence. Animal life needs it more than vegetable life, and either of them need it more than is required in dealing with the dead stuff of a merely material manufacture; but the progress of agriculture has been shown in the diminution of bare fallows, in the adoption of altered rotations, in the immense purchases now made of imported manures and imported foods; and all this has goue to increase the quantity of living thingsupon a farm. We grow more plants upon our acres than we used to do, and we feed more animals. Aud on this ground, as well as because of the altered relation of master and servant on our farms, there is now especial need of practical skill on the part of the yourg farmer. But what is the fact? I do not know anything about it here, but elsewhere I am told that land is generally being taken by young men with much less of this practical skill than used to be thought necessary.
Thus Mr. Dadding, of Wragby, Lincolnshire, who believes in the saperior intelligence of the present generation, says-
"That the practical part of the buiness of a farmer is in advance I do not believe. The young men of my father's time,
40 or 50 years ago, were accustomed to ploughing, grooming their own horse, and attending to a cortain quantity, of stocizin fact, taking part in any of the practical work on the farm,
Now this is oryy different, not one in ten of the higher class
of farmers would be capable upon commencing business of directing from his own practical experience the
And Mr. Clare Sewell Read, of Norfolk, comparing the younger of the present generation with the past, Bays:-

As sound practical farners, I don't think they are much science of agriculture must be greater.
Aud in Sussex, Mr. Ellinan says :-
"I believe that the present race of farmers are not so well
informed upon the geueral working of the land as the last Informed upon the general working of the land as the last
generation, but we possess roany appliances which formerly
Wure unknown. I may eay that Wure unknown. I may may that I kuow of no young man in
this neighbourhood, of the age of 22, who is capable of con-
dincting a large farm to advantage unless entirely trusting to dincting a large farm to

And it appears to be the general opinion that the present generation of young men among the tenantry to whom, on the score of general iutelligence, there is generally couceded a higher social position than their fathers had, possess no such superiority as regards that professional ability or skill which now more than ever appears to be required.

Lastly, there is the professional intelligence on which this skill ought to be founded. What an immense field is open to us here, compared with what there used to be. Formerly a man's professional career as farmer was limited to the area represented weekly at the local market town. The practice which long experience had established in the district was the sum and substance of all the discussions in which he could take part. If a theorist intruded, it was generally with some lop-sided or imperfect truth which distorted his own judgment
and was soon laughed to scorn by that of his and was soon laughed to scorn by that of his practical late John Smith, of Bowldon, formed one of the cont puratively small circle, his extension of the field of thought and of discussion was confined to the urgent recommendation of mere points of farm practice-the
expedient of stifle-burning, for example; "or the substitution of a six-field for a five-field rotation of crops. How is it now?
John Smith had an occasional agricultural correspondence, which remains to us , with a friend in labour and expense, to travel beyond the county, and thereafter bring plenty of fresh material for hearty conversation with his friends at home. How is it with us? We have the penny post that gives us correspon
dents everywhere, the rail dents everywhere, the railway system which promptly takes us anywhere, and the penny daily paper that longer the mere farm, or parish, or market town which limits our agricultural intelligence and insight; we have the farm practice of the whole kingdom continually before us, and periodically the National Society steps from one county to another, and brings the farmers of the whole kingdom into actual converse with ourselves,
Nor is this all. It is not nearly all. We have adrantage which the enthnoiatic laboure of now the science for at least a quarter of a century have given ns, of a full knowledge being accessible of the natural properties and relations to one another of the
substances with which the farmer deals. Here we come into the region which those practical men wh have succeeded without this knowledge call " theory." It is no theory at all. It is as truly real and absolute and substantial truth as anything that can be dealt with by the horse and cart or butcher's scales. The relations to one another of the several kinds of material atoms of which the world is built, are the sabject of
immutable laws which govern, whether we know it or not, the results which we gather in the harvest field and market place, as much as they do the multitude of examples where (carefully secluded from disturbing circumstances) they have been studied in the laboratory.

A large and comprehensive knowledge of these laws,
was not possible to those who took their farms 20 and 30 takes a farm at present. And is it not desirable that knowledge that such and such results will follow such and such a practice in the field, a man should know all about it, with that completer understanding which sees the process apart from its circumstances, and diseloen the essential history of the case and wrapped. The practical value of this scientific knowledge has been already proved by the light which it has thrown on the action of manures and on the processes of the meat manafacture, \(i, e\), on the growth
of both plants and animals. It would be easy to illustrate the advantage which such knowledge must confer upon the farmer at any length, but it is not necessary to do so here, for you have already acknowledged this advantage hy the chemistry class which has been formed Chere, and taught during the past seasou by Professor Church, of Cirencester; so that this county has the honour of having led the way in the acknowledgment
of the value of scientific knowledge, both by the establishment of the Royal Agricultural College, and by the formation of local classes for the study of the siences of agriculture.
Well, then, gentlemen, I think I have stated at sufficient length the largeness of the field over which a strictly agricultural education extends. The student or apprentice must acquire in it knowledge, skill, and tact
befure he is properly qualified as a farmer, and the befure he is properly qualified as a farmer, and the
severity of competition everywhere has made them all more necessary than ever for his success. And while I have admitted in all humility the comparatively greater importance of the preliminary general education of boyhood and youth, 1 may appeal to you
whether, after however slight a survey of the extent of whether, after however slight a survey of the extent of knowledge which a thorough good agriculturist requires, there is not even here, in the strictly pro-
fessional training which be ought to undergo after leaving school, ample scope for that enlargement of the whole aim and mind of the man which is the best fruit f what call liberal eduction, and on whith must depend for the ultimate influence and position of agriculturists as a body.
My opponent, as lie thinks himself, in the North British Agriculturist, takes the case of a lad leaving school early and half educated for that agricultural training which he requires, and he says:-
" Before he gets the length of starting with his capital, what of some kind he muat gethis I thinkm I can toll you oducation learned to brown pipes and
And then follows his passage, already quoted, about the advantage of coming well educated to the work of the farm.
The better educated a lad comes to learn his business as a farmer the better is it for himself and for his subsequent professional career, but when once he does tart work in the agricultural groove, whether his education be defective or not, let us not leave him to the pipes and liberty and lazincss which my friend farms, he cannot be induced to take an interest in the studies and the operations by whick the knowledge and the skill of the thoroughly well-educated agriculturist are to be acquired.

It is here then that I believe the Agricultural Society of Eugland ought to have taken him iu hand. Their periodical examinations, whenever and wherever such services were requested, would bave tested the prothree essential conditions of professional success
The great objection to this course was the alleged impossibility of determining agricultural proficiency by examinations. Doubtless you cannot ascertain the tact
or basiness ability of a young man in this way, but you can ascartain his knowledge and his skill, and that is at lesst as much as can be tested by the board of naval examiners who pass cadets and lieutenants on board ship, and who are believed in as a guarantee of their professional intelligence and skill.
would not have these examinations and competitions to be mere verbal catechism. There is already almost everywhere, or there need to be in the classen for zons of farmers at our ploughing matches, precedent for the much more elaborate trial of akill by which I should like to see the agricultural students and apprentices of a county make good their claim to the Society's honours and rewards The Vorth Britisk Agrioulturist is quite right in like a ploughman, shear like a shepherd, thatch like a thatcher, and pleach a fence like a hedger, and there is no reason why his ability in all these capacitien should not be well tested by a board of agricultural examiners. Of course there is no doubt that his scientific knowledge could and should be properly ascertained both by a series of written questions and by a conversational examination. So also could most of his ordinary rules of farm practice, the processes of tillage and of manaring, the details of crop caltivation froin beginning to end, the history of the horee, ox, and sheep, from colt and calf and lambhood upwards, like described by any one acquainted with them, and an describod by any one acquainted with them, and an
question and unswer sense in which the temper, said nt a. but depends. There is no which much
deason the contending for the prize of superior merit lave their ability teated by bei that might be made the subject of tering examitend, therefore, that taking bet excount, it is possible to dal trial ont agricultural proficible to
I think it cannot be dispandidates local, or county, or provincial examination supported by adequate premiume, mustions late many a young man of the must tend to province in question to the better district, selves as farmers. It would, in equipmeat agricultural education, and thas tend word work of agricultural improvement

My or agricultural societies
after a before a committee of its members, issue letter to landowners and others in this county or agricultural province, declaring the and importance of the object, and asking contributions towards the prize fund, whi
of course the mainspring of the affio obtain 150l. or 200l. a-year promised within the limits of the district then or 10 go to the National Scciety and claim fomigh, assistance both of money and of men, If them club undertook the arrangements for the ifid skill and of practical kuowledge, and the Diatim Society undertook the examinations into sciene on practical knowledge-if the local clab broughtan ame contribution from the district of \(150 l\)., and the ? Society offered nnother 100l.-we should he thorough test and determination of agriculta ficlency, and we should have
many a young man to give much more time improvement than be would otherwise have done of both Society and Clab would be working mittin limits of their proper fields of operation.

I know examinations in agriculture for mere difis tions and diplomas liave hitherto been alnost a faira The Society of Arts tried it for several years, br have had to give it up for want of candidate Highland and Agricultural Socigty have had hare candidates for their diplomas
which localising of the affair, and the low Which will thereby be created in its favour, may as ress here notwithstandiug. as regards the particular pro, there are at loast reasons why we might especially expect succeas in The first is that this county has
example in the same directiou. fitting thing that the Kingscote Farmers its county or provincial scheme for agriculura Farmers' Club, through whose agency, stirred op late Robert Jeffries Brown, the Royal Agric College wns founded. The second reason for explat saccess in Gloucestershire is that we have alresdp .orin this county at Cirencester a body of professen tural stadents, to whom a stimulas of this bind viceable, and from whom wo and nationl her see many a candidate for the certainly merit in the scheme if any usefulness thereby accrue to an Institution wicaltu

THE CATTLE PLAGUE
1. My father in carving used occasionally
a glass off the table and scosesh it, but it mit own fault but the fault of those who his why. Much the same is it with the -When disease attacks whem nought" it, not become developed within thembel reg, gy and conditions which they
own control. Unqueationably is developed in any one indiridast athach it The world is supposed to has or so, was the cattie disens or has it been subsequently sent-1 Pand
nusb have had a beginning, and if not directly sent to ous carth, it must have been spontaneously, or, more correculy, to its development; and if originally doveloped under the said favourable circumstances, doreloped the development not take place any number \(d\) times under similar circumstancer, the same sith other contagious diseases, as may be, it is sacis. hetory so fud that a fer persous are taking a commonnome view of the disesse and treating it in a ce.mum cupace manner; in witness thereof kee the letter iu yubs indammation, or fever ariong the excretory or from the lechmg uptior of the blood, the treatment is the same, and that is hy acting on the excretory organs, to set rid of the ruatter improperly locked up in the
bods, the only outlets being the skin, the kidneys, and intestinal canal. There is no way of charming disease amay by fl ccifics. You must open the door and let has doune. After cleaning out the viscera nud acting on the kidness, there is wothing to cqual sweativg, by whatever meaus it may be produced; but if the direase
is active the treatment must be so also, and it is no use giving in until reaction takes place. As an instance, this time last year I was attacked with nuuscular rbeumatism or lumbago, but of so violent kneel, nor lie down; the slightest movement, bringing into action the muscles of the back, was most exeruciating, the sensation being as in torn in pieces, and I could not help balloaing cut on the slightest motion. I was puzzled what to do, but was sensible that active treatment
must be adopted, as I was getting worne. My wife suggested a sweating bath, and with her assistance and mastered the attack in seven hours from taking the frrst bath. I took four baths between 8 o'clock in the evening and 3 in the morning, lying down between feelings of exhaustion came on; at 3 o'clock I Was so far better that I dropped asleep until one about 10 o'clock in the day, and one con each of the two following days. One word more, Mr. Editor, upon how contagious diseases enter the body. If or when
they do enter by infection, it is through the stomach, not through the lungs-nothing but pure atmospheric air ever enters the air-cells of the lungs; all impurities are taken up by the mucons membraue, and are either expectorated or pass into the stomach, and thence into some, but it is nevertheless a fact; the blood is never rendered impure by air taken into the lungs, but the lungs way nut take in sufficient oxygen to oxidise the
blcod, leaving it over-charged with carbon; that is a condition entirely dependent upon exercise, or a diseased
state of the lungs. Having written until I am tired, I will now wish you good day, Mr. Editor. Philosopher
2. The following Cattle Plague Returns have been iseued by the Veterinary Department of the Privy number of cases which have occurred in Great Britain, but only those which have been ascertained from the
official information received at the office from official information received at the office from
inspectors, whether appointed by the Clerk of the Council or by the local authorities. The divisions of England are those of the Census:

The Times has the following remarks on the previous Week' returns: At length we have got bome statistics of of 14,000 animals are hnown to lave heen attucked by
thie Plaeuesince its first appearance, and of these nearly 12, (c) 0 have died. To be sure more than 5000 of these vietims were killed to save curing, but they swell the iotal loss of stock. As to the recoveries, there are the whole at!acks; hut then the proportion can, of course, only be measured by the nurober of cases in Which cure was attempted. The metropolitan district
appears to have eufficed most, as might naturally be appesrs to bave eufficred most, as might naturally be
expected, though perhaps the tale is swelled in this
case by the greater comploteness of the reporta Thea
come the South-eastern Counties, and then the Enstern -which, however, according to the classficeatiom n'eptui include only Resex, Norfolk, and Suffolls,-and then
Scotland. These four districts ncconnt for upward of 12,000 cancs four districts secoun len ing onty some 2000 casnalties for all the rest of England and Wales. In fact, there are whole groups of countien where bat a score or two cattle bave been lont. This returns trem which we quote only profers to seprerent the cases reported to the authorities, and are not sup-
posed to express the actual extent of the visitation. They are correct enough, no doubt, as showing the dibtribution of the disorder, but not as measuring itm ravages. More satisfactory sssurance may be derived rom a discussion in the Common Council last week, when questions were aksed about the progress ur
decline of the disease in the metropolis. Jo this, the Chairman of the Markets Conmittee replicd that, as he had no information from the London cow. positively. What be could say, however, was that there were very few dirensed mimals brought to market. On the last two market days two sick animals had been discovered, and no more. But this was not able to add that, though the markets comld show anch clean bills of health, it was not owing to any rentriction or diminution of sapplies. Un the contrary, the had ever been known, while mitch cows were for he found as nure and as productive as uenal. This is certainly welcome intelligence. the general whaleomeness of the meat brought to market during thim season of infection has been remarkable. I'robably the
increased care and vigilance of the auth ritien, now naturally on the alert, have more than compensated fir the greater prevalence of disease. At all events the prices have risen.

\section*{SOCIAL SCIENCE CONGRESS.}

The following is the paper on the Garee Lavm Moed by Mr . Hope, of Fenton B
CLamber of Commerce.]
AFTER giving the history of legislation on the anhject, he discussing the effect of proposed alterations in scocland is discussing the effect of proposed alterations or modia
cations for the amendment of these laws, and at least some advocate their total abolition. Even a cursory examination of them will show how vindictive, if not ferocious, the penalties are for any infringement of their enactments. Their (ffect is also most disastrous on the morals of the labouring class in the ruma under them have increased from 5000 to upwards of 10,000 in England alone. The losses sustained by tenant-farmers from the destruction of their crops by game has long been a cause of just complaint, and it is admitted by every competent judge that high or serving. I have a strong belief myself that all game laws uight be utterly abolished with great advantage to the whole community ; and if a more stringent law of trespass was thought wecessary, that no speeia damage was instructed, a penalty not exceeding 40s might be recoverable like other debts, besides com peusation for any damage, even the carrying off of hares or pheasants by wilful trespassers; but I appear here as representiug the Scattish Cbamber of Agriculture, and by that body, and to show that these laws onght to be by that body, and to show that these laws onght to be modified and amendit, justice and right feeling.
There can be no reason for a qualifeation Act being in
furce in Scotland, when note is requred in lingland. In the furce in Scothand, when not e is regured in England. In the
latter country a tenant tad full rignt the the gane on his land

the sport of the landord. a ard shauld a farm-labourer
accidentally or even systenaztically destroy them, I do not
 (unless the sannction of the proprieror is granted tor destruying
them), nothing will be gained by auy change that can be prozosed.
4. I know it is said, why do not farmers make such stipulations in their agreoments with their laudlords as to ensure their freedom from game ravages
Doubtless it fs in the power of a tenant to refuse to oocupy,
land unless the gazse is let along with the right of cropping; land unless the garme is let along with the right of cropping;
but this is not and has never teen the custom. Tue gine bas
over been universally reserved by the proprietor. it 18 impos. ever been universally reserved by the proprietor; it is in ipos-
sibe to obtain land on any other conditinn, and those who
insist on having the gime may make np their mind to retire
from the profession of a tenant-farmer. It is the law, and the iusist on having the gime way make up their minds to retire
from the profession of a tenant-farmer. It is the larw, and the
law only, that enables the proprietor to conry out his terms in
regard to game. The tenant is the weaker party, and surely it regard to game. The tenant is the weaker party, and surely it
is not asking ton much to have so far abolished this law which
enables the stronger party to carry out measures so detrlmental ensbes the stronger party th carry out measures so detrimental
to the rural population. But there are ways in which seme
farmers protect themselves from nares, and one is by having
an active man on the farm whn kDows how to set a wire farmers protect themselves from hares, and one is by having
an atetive man on the farm who kows how to set a wire
Thbs is much more common than is generally supposed, but it frequently leads to great evils. II have known some old men
Who have snared hares from their youth, and who never went
further: but as a rule it is enerely, maing further; but as a rule it is enerely a training for thore who
molke miduight incursions into pheasant preserves. By single night's work in these preserves as much moneys is realised as
 reformatian in there finds it imp, s, sible to effect the slightest indignantly deny they are thieves
They confess to having briken a law, but then it is a man 8 making, not of Gnd's creating- for no one can say these
laws carry on their frout the broud impress of truth and
justice, which all laws ought to have.
5. One great improvement in the administration of these laws would be to have the trial of offences under them conducted before the paid magistrates in England and the Sheriffs of Counties in Scotland, in place of the Justices of the Peace as at present.
In the Night Poaching Aet sheriffs are mentioned, and have
jurisdiction; and all transportable offences must be tried by jurisdietion; and all transportable offences must be tried by
the Conrt of Justiciary. Now. Justices of Peace are almost
the only individuals interested in this matter; while their
 jodgmen where they or their friends have the remotest
interest, but theso game laws have been enacted and are
maintained for the sole benetit and pleasure of the very men
selected to try offenders against them. One of the worst

 Hame. He is taken in the act; and a Justice of the Peace fines
him for such trevsans. But he has killed a hare or phetasint;
a second fine is inflicted for being in unlawful pulsseession of grme, not being a duly qualified person. If he pays these two
fines, he is next brought up for want of a certificate and
instances are by no means rare of persons being thus punished
[Mr. Hope then proceeded to state what the game laws are in Scotland, concluding as follows:-
The resolutions adopted by the Scottish Chamber of Agriculture were

1st, That hares and rabbits be dropped from the game list.
" 2 , That all prosecutions for offences against the game laws be transferred from the Justices to the
Sheriffs of the respective couuties. "3d, That cumu
offence be abolished.

4th, That damages be made eligible by statute in all cases of injury caused by increase of game during mined under the autherity of the Sheriff."
If effect were given to these resolutions by leginia. tive enactment, it would satisfy by far the greater proportion of agricultural tenants, and would tend the complexities of these laws were simplified, and their cumulative severity diminished, the object at which they aim would be better attained, as they
would more genera'ly enlist in their favour the feelings of the community.
The Chatrysay (Mr. Holland, M.P.) thought that in connection with this surject the association ought that in con-
much obliged to Mr. Hone for favouring them with his very much obliged to Mr. Hone for favouring them with his very
interesting proper, and he congratulated Mr. Hope on
the fact that the subject of the gane lawe was the first
that was brought under the consideration of the

 management of game and in the prevention of its being a check
upon the occupiers of the soil. He felt convineed that
-before many years wore over-the feeling of the public and

 his cropis, and biap landlord, not liking to hear so much about

\section*{Home Correspondence.}

The Cattle Plague and Quarter-evil.-As I have received notes from gentle nen in Bedfordshire and Somerset inquiring about the recipe against quarterevil, it may be well if you could give a notice that the recipe is one ounce of saltpetre (nitre), and two ounces of flour of brimstone (brimstone); the animals being kept in the yards on a little bay until the followine
morning. John Thornhill Harrison, Frocester Court, Stonehouse, Gloucestershire.
Fowler v. Smith.-Having been a constant reader of the Agricultural Gazette for the last 10 years, I have been often amused at the pungent remarks of Mr. Smith, of Woolston, on the subject of steam cultivation, and like many others have admired the pluck and if not the implement itself; and though bolding very different opinions on the satre subject, having been smitten with the prevailing idea that Mr. Snith has
sold many more sets of tackle through the ingenuity of his argumeut than that of his implement, I have hitherto bardly dared to contradıct him in public print; still, from readmg his article on Steam Cultivation in your last week's Paper, I am almost compelled to add a little of my experience on the other side of the question. 1 may observe, that as I am not an implement manufac-
turer, or agent for the sale of any implements whatever, I have no personal interest in the dispute as to which is the " best application ;" but being about the largest proprietor of steam cultivating machinery expgland, I think I may fairly lay claim to some Smith that the co purative statement of the cost, \& \(\mathrm{Cc}_{\text {. }}\), of the two sets of tackle that he publishes, is a very one-sided affair, as nothing whatever is said about the
depth and quality of the work done, and it is attempted to pat in competition as to matter of cost, two widely different articles:-the one, a large powerful set of tackle, suitable for hiring out, and that has to work a a heavy country, and move from place to place sometines probably 10 or 15 miles), and that is called to go into the worst farms and the worst fields on those farms, and expected to tear up the ground 10 or 15 inches deep; and the other is a small set, kept at home on one farm, probably set out to suit them, and same fields three or four times over, and only working about 6 inches deep. Hence the difference between 6s. 10 d. and 14 s. 7 d. per acre, which no doubt would occur under such different circumstances; but the
value and quality of the work done in most of the public and private trials that I have witnessed as between Smith and Fowler, is as a garden rake to a
spade; and to prove to Mr. Smith that that is the real relative estination that they are held in in heavy clay countries, I may inform hin that I bave for the lat two years and a half let out two sets of Fowler's large double engine tackle in this county, and they
have never lost a day's work except from bad weather or breakages, and that there are also in my neighbourheod six or seven sets of Mr. Smith's own small tackle nearly all of which are to be let out, but are scarcely ever employed except when miue can't \(g\), though they charge only 6s. per acre and I charge 20 s., and consicie worth all the money, and of course so do my customers or they would not pay for it. And now, passing over the
matter of cost, I may take the next head, "quantity of work done," and the same remarks apply to that. It is a very easy matter no doubt for Mr. Sinith to do, as he tells us, nearly 8 acres a day (for six days in September) on his own farm, where he has been over and over the same ground with the same implement a dozen times and nut very deep now. But when I tell Mr. Smith Suptember, I cu!tivated with one of iny sets of tackle exactly 225 acres, or 9 acres a day, and that on seven different farms of stiff heavy clay land that had never been steam-ploug laed before, and tore it up from 12 to
18 inches deep, I think you will all agree that notwith
quite as much and more praise his little pet, there is great tackle and the great inventor who due to the great tackle and the great inventor who devited his
whole life to its perfection. Joseph Camel, Somerset, Oct. 24 . The Champion Wheat refer to my statement, page 878 , Sept, Hallett will these words': -"Mr. Hatlett withdrew from the trial in consequence of not being able to secure judges, whom he did secure? threshed his crop, and that it will bear he has just with any other in every respect. go on with the trial? I am quite ready. Ioes be not Mr. Editor, you did not publish our currespondence
that Mr. Hallett sent your it that Mr. Hallett sent you; it would have placed matters in their right light. Charles Bates, Dagenham

\section*{Che Boultry Yand.}
rham only a Cottager, living in a two roomed house thero; and my garden is a plot in a fiell without lirision from those of my neighborr. The lane cluse is a constant thoroughfare, and I have no run for cart; and the donkey livg by means of a donkey and occasional mouthful of any hay I can buy. But, taking altogether, I don't suppose any one has less conmience than I have for keeping birds. There was accommodation, no run, and all the food that 1 should give them must be bought; and add to this, knew nothing about it. I don't suppose any ranley where could be more ignorant, and though the I an a hundred miles from London. When I saw cup, or "Cicking and eating the leaves of the Buttercup, or "Craizey," as we calls it, I thought that " must be as it would be if I should catch myself at Fonnd that thecause it must be starving. I have since Soolng that they eats a lot of green living stuff; ; and anders I has time to stand by and watch lest they get dha neighbours' bits and takes to scratching If I I fand there is nothing pleases them better than Gmas that the into their hovel a basket-full of the man's lawn close by. Cabbage-leaves and Turnipquarters for is a good thing to give them. It is close 14 birds for them with me, to be sure. I have got the bits now altogether, i.e., 13 hens and a rooster, aud the bit of a covering.'I knocked up for them in my garden it with straling stuff and pieces of slab, and thatching if cost me 30 s. . is 6 it open to the south (I estimate bardly high enough for me to stand upriglat. I began 2? . four years ago. I find that it cost me about another, about for food, and I can sell, one year with rar no chickeng, worth of egzs from them. I don't ien I put it that it is so much, whatever it is, ou to a is in the teryment. It's woudurful what differences there sucth to do to aper and quality of hens. There is just an thom, do there quarrelling and comiorting too amony, be bound, there I Is among a lut of chililren, ''l

The most that I buy them is Wheat or Barley and graves - the bacou-factory graves is a deal better the fat to tallow-chndiler's graves ; there isn't gute the fat to it, and hens don't care about the fat. It is the hard and stringy parts cut up and b-iled for them for they want it about; not that the hardness is good, for they want it boiled to make it of a more pulpy mature, but the hari fibre corresponds more to Heeliy watter than the fat, and that last they don't care no much about. It's wonderful the differences there is in the food for them ; and those that take delight in watching of them can see in a very short time what suits best. I never fuund nore good from anything in my life than I did from a Jot of old aud spoilt or rotten cheese, as you might call it, that I got for 2 d . a pound. A little of that instead of their graves did a great deal better for them, and graves will cost 1 lad. or \(2 d\). a pound, too, so that the saving was all in the gooduess of the food. I haven't got anything like the room that I should like for them of course-no yard, nor Grass plot that they can be fed on-and so I have to put the grain that I give them into vessels for them. The old cast-off packing casemade of a hoop or two and a bottom to them, in which the American cheeses comes over, is what I usen A two-quart measure of the Barley or Wheat-with a bit of graves, according to diseretion, or something of that, is what I put into their boxes for them in the day, i.e., I put it into the boxes as often as it is empty, which is just about once every day. It is about the 2 bushels of graia by the month that they need, or not quite so much, and then if I can't give them a bit of green stuff out of my own garden, or a bit of Grass from the hedge, or from the garden handy to me, perhaps I can let them out in the by a watching them for au hour or two mornings and eveninge, to see either then or in the aunny part of the day in winter, that they don't do mischief. They do very well at that. I find that they are better in than out in the heat of the day; they get languid, and it hurts them so that they don't recover Grass is a deal better rin for them thau arable or garden. There is more worms in Grass, and there is Girass food for them, too, that they need. I am very particular about their water; they have as good water as I have myself, and in as cleau a vessel. It is pure spring water which comes out at different places all aiong our valley in great plenty, and I take care to wash the vessels they has it in. They have their roosting sticks across the hovel, and about a haif a dozen
boxes and nesties along the bottom on one side, and they are quarrelling oftentimes, seven or eight of them, like a procel of children, to get out of doors, to get the first into the six nesties.
I find that they begia about Valentine's Day. John Sherwood-he says he has noticed it is pretty handy the saue time as the rooks begin their neet building, but have notic id it is geverally about Valentine's Daythe middle of the February month, and that is a little earlier, and then they go ou perhaps four eges a week apiece up till moulting time, in September and
O.tuler. We never get many egge after the middle of October, but in September I have had 176 eggs laid from 13 hens (three or four of them moulting, however), when they were haring the decayed cheese, and then they were selling for about I find that a bird at four or even five years old, if healthy, is as good a layer as if younger. In my four years' experience I lost oue this year, and not above two during the four years by illness, so that I have not had occasion to buy many since I began, and I have the same birds that I had four years ago. I never have any difficulty in selling my egge, because people know they have them fresh and fresh. When they take to wanting to set, I cover them down in a basket or sieve, lettiug them stay there, just giving them food once a day, till the tendency of setting has gone past, and that will be in three days at most. nevor found that dipping them in water is good. This is my account that I kept for the gears 1863 and 64, from October to September-that was ouly 11 months. I have not kept a particular account since, because

One cow and three calves died, the f the existence of pleuro paenmonia on one farm only hear arge dairy stock is kept. The farmer says very little about it but it is supposed he has not lost less than 20 cows.'

\section*{Farm Memoranda.}
[We continue to give extracts from the evidence taken before the Royal Commission on the Law of Hypothec, illustrating
The Manure Trade.-Mr. William Hope (re examined). -When you were examined on a former occasion, you stated that you sold \(190,000 \mathrm{l}\). worth of manures per annum; was all that sold to farmers, or was part of it sold to wholesale dealers?-A. I underatood the question then put to me was as to the amount of manures that we sold annually, and answered it accordingly; but I have since divided the amount as correctly as possible, and find that we sell nearly three times the quartity wholesale that we do retanl. The because the goods sold wholesale are chiefly boues, ash and manufactured manures, which, as compared with Peruvian guano and nitrate of soda, \&ce, are of much less money value; and hence I calculate that the money turned with farmers slone will be, say, \(100, \mathrm{COOL}\). annually, Of that sum, as near as I can estimate, onehilf, or 50,0007 , is sold tupon credit terms. \(Q\). Assuming that to be correct, what would the per-centage of loss upon farmers' bankrupt estates amount to ?A. Taking the per-centage of losses male with farmers, whether they have become publicly b:usk rupt or have mude private settlements, and estimat ing the amount at present put down as doubtiu debts, I woulit say that, if I add to the sum formerly stated as lost by my firm in two years, namely, 2400 l ., the amount considered doubtful, and the realisation of which is dependent upon many contingencies, it amounts to upwards of \(3500 l\). within two years, or say \(3 \frac{1}{2}\) per cent. upon our sales to farmers. There are casts wher tenants under sequestration to their landlords have good reason to expect that, with the indulgence of the creditors, they will ultimately reclaim their position, and, having every desire to give them such an opportu-
stand over; in ethers, their estates are in the hands of trustees to work out their leases. In one case, where we have a considerable sum owing, the matter stands thus:-Previous to Whitsunday, 1863, the tenant agreed to leave his farm, having lost a deal of money in it. He idvertised a sale of his stocking, \&co, and considered that when it was over he could pay all his creditors, having the growing crop to pay the landiord; but, a few days belore the sale, the law-agent for the landlord intimated to the tenant, that, unless he was allowed to uplift the entire proceeds of the sale, he could not allow it to go on. The tenan ment, whereby this agent not only collected the proceeds of the sale, but got full control over the crop and the result is that until this day, the temant, not withstanding his utmost efforts, has been unable to get any settlement with this agent, and is at presentnearly two years after the date of his sale-unable to inform his creditors whether or not he can pay them anything. He states that the agent informs him that he is still due the landlord money, which, he says, is mpossible, unless the landlord brings against him reductions in rent got years ago, which were given permanently, and not with the intention of being recovered at a future time. The tenant considered, previous to this, that he was in a position to pay his creditors 20s. in the pound. He left the farm, and it is relet. We don't sell much manure through agents If any one is to blame for making bad debte, it is principally ourselves. \(Q\). You told us that you would sell cheaper if the law were abolished ? \(-\dot{A}\). We sell cheaper for cash than for credit. I said that if we had no risks to run, such as we have under the law of hypothec, we should be able to sell at comparatively ess cost. Q. Do you sell cheaper to landlords?A. We sell cheapest to all who pay ready money but it is seldom we are honoured with visits from landlords, and hence we bave no special terms for this class of customers. \(Q\). But supposing they don't pay cash - A. If they don't pay cah, they get it at the credi prices. \(Q\). Then it is not the law of hypothec that makes you sell dearer to tenants? \(-A\). Undoubtedly Q. Then why dou't you sell cheaper to landlords?A. At the moment I could not say we make a dif ference; but we sell so little to landlords, that I don't know that I could give a case where we make any difference. If the law of hypothec were abolished, so that our risks were lessened, we would certainly be enabled to reduce our scale of charges. Q. Suppose the law were abolished, would you alter the scale of prices? \(-A\). I think the tendeney would be to alter it to a certain extent. As a class, small tenants pay very regularly indeed ; one reason being, that they come to as expecting no credit, and they generally bring the noney in their hand. If we had the law of hypothec to protect us, I would not olject to lying out of our
money till the farmer's crop was reaped. We wonld sell universally upon credit terms, if we had the hypothec to protect us.

\section*{Miscellaneous.}

The Cattle Plague.-It is said, on good authority, that the Commission ou the Cattle Plague will report very strongly on the prospect of wide and serious loss the agricultural capital of the country from the plague, and advise the summoning of Parliament in December. Spectator.
The Third Annual Meeting of the Gloucestershire Root and Grain Society is to be held at Gloucester on the 9th of November, when, in addition to the prizes offered by the Society, there will be a number of special premiums for competition. Amongst these we may notice that Mr. Wadley contributes a silver cup, value five guineas, for 12 Swedea, certified to have been drawn from a patch of not less than four acres, manured with the London Manure Company's manure, and a similar prize for 12 Mangels, the conditions being the same; Messrs. Foster Brothers, ten guineas for 12 Swedes, from not less than five acres, manured with phospho guano; and Mr. John Chadwick, five guineas or 12 Swedes, from not less than four acres, manured with Messrs. Norrington's superphosphate. Prizes are offered by the Soclety for Swedes, White Round or Pomeranian, Lincolrshire Red Globe, Green Globe, Yellow Scotch, Grey Stone, and Tankard Turnips Long Red, Long Yellow, Yellow or Orange, and Red Globe Mangels; Red and White Carrots, Parsnips Cow Cabbage, Kidney and Round Putatos, Red and White Wheat, and Barley, as well as fin Fruit and Chrysanthemums. Mr. A. C. Wheeler, of Gloucester, is the honorary secretary.

\section*{Notices to Correspondents.}

Comoxist : B M.-The Swere seed which you user has been mixed with Rape.
Gas-Lime: Subscriber. It is a mixture of caustic lime and carbonate of lime, with lime contaning coombined with it
sulphuretter hydrocen, \&e, which has bcen sulphuretted hydrngen, \&c., which has been taken by it out
of the coal gas which is passed over it for furifiction. In s
far as it is combincl with this sulphuroted hydregen, ar as it is combincd with this sulphurotted hydrcgen, it
will, by explsure to air, become gypsum. A waggon load,
or as much sometimes as two wnggon lands per acre, is need.
They generally tnake it into a cumpost with eartl, and turn
it over several times before putting ic over the land. It is
more commonly applied nore commonly applied to clay land than light soil. Coal s no Clover. We wil endeavour to obtain analyses for you.

\section*{NEW GARDEN PLANTS}

FOR EXTENSIVE DECORATION IN EARLY SPRING AND SUMMER MONTHS

Aubrietia Campbelli (syn. A. Hendersoni). This beautiful varlety is one of the most desirable hardy springHowerng pereminial her baceous plants for the decoration of the Flioa
Gardion ret introduced haniug rececived several First-class Certiflea

 thinche in height; ite ovately-deltoid-formed leavee are arranged like
its kindred species in close erect terminal leaf-tufts, of a sub-rosulate

 and, withant the and of secondary colours, it forms charmingly
effective frouls at a period when continuous-flowering plants are not ientiful.
It is strikingly adapted for forming select riband rows, parterres, in pots, is valuable as portable specimens for placmg in vase groups or baskets on terraces, or in cool culservatory promeliades, and of select rockwork, or fringing the boiders of terrace slopes raised grounds or in the open borders, in miniature flower groups, or in extensive riband lines, heing unequated inn int growth and season of bloom.
Those Cultivators who whe to poesoes a Coloured Plate previously may recelve one post free by forwarding seven stamps.

A CATALOGUE of the most extensive Collection of General HERBACEOUS and ALPINE PLANTS, with valuable Columns of Reference, forwarded free on application.

Scilla sibirica.
A beautiful little hardy bulbous plant, two to four inches in height blooming in the early spring months, thriving in ordinary soil, and quite uncequalled for ninarginal effect in flower gardens, or fur front
efficet in baskets, vases, or belts. 16s. per 100; \%s. \(6 d\). per dozen.

The Golden Blotched Daisy.
Crimson-flowered, Gl. each; White-flowered (new), 1s. ench.
Veronica fruticosa glauca.
A very neat and distinct new species introduced from New Zealand,
the entire stock being purchased by Messrs. E. G. Ifendrkeo \& Son. the entire stock being purchased by Mesirs. E. G. Mrypyrion \& son. with small glancous ovately oblong leaves, squarrosely decussate in and efrly summer months. lts very glaucuus white foliage constitutes a striking feature in
itself, and would produce a marked contrast if grouped or planted out itself, and would produce a marked contrast if \(g\)
in flower beds or on rockwork.
3s. 6d. and 58 .

Fuchsia Beauty (Banks). A heautiful exhibition variety, with broad bryght carmine scarle sepals, gracefully recurved; the corolia pure lavender colour, cup
ehaped, of a model outline; growth free and vigorous, adapted for pyramid or bush gpecimons. This hooutiful variety Mr. Bariks he
selected selected out as one of the best Will be gent out in October, 1866, selected out
10s. Gid. each.
E. G. HENDERSON AND SON, WELLINGTON NURSERY, ST. JOHN'S WOOD, N.W.

SATURDAY, NOVEMBER 11, 1865.
}

\section*{}

The history of Dr. Lindley's Career, as bretched on another page, adds one more testimony to the exceeding value of conscientious work. From first to last, one of the main characteristics of our departed friend seems to have been his power of work. A sound constitution and robust health enabled him to undertake and carry on haours such as no ordinary man could do. Conscious of strength, and fired with zeal which no amount of opposition could quench, he laboured still leaving nothing undone, while there was nately anything to be done, till he unfortunately forgot that there might be limits of endurance beyond which even his iron will must bend, his energies succumb; and so we have to haurn the loss of one who might still, perchance, longer, could hervice to his fellows for some years efiort, could he have been persuaded to relax his brain, and allow some rest to that over-tasked his memory, to learn the l lessons his life sets before us, and to apply them as best we can according to our several qualifications. Work alone would not have raised Dr. Lindiey to the high position he to joyed in the estimation of those best qualified of working was his conscientious, systematic mode independg, his undeviating purpose, his fearless It is no of spirit.
lemaperament matter for surprise that such a that of others should have sometimes clashed with the rectiturs of easier mould. Once convinced of What rectitude of his purpose it mattered not who or hapin opposed him, and there are many who, will now in times past differed in opinion from him and earnest in that he was ever straightforward Tacillation in his convictions.
\(s 0\) opposite to those he himself -possessed qualities him. Cir that they received but scant pity from beld in circumlocution was another thing which he beld in utter abhorrence. Tell him straight-
forwardly what you wanted, and he would serve voll to the best of his ability. Beat ahout the bush, and you provoked his impatience. He had no time to waste. He expected others to bo, as he himaelf was, clear, concise, and to the point in his statements. His elementary books show this ; many of them are quite axiomatic, almost too much so for speoulative students. But these and other points are well known to the readers of this Paper, many of whom have been thrown into contact with him.
Speak we now of his powers as a lecturer. With some experience of lecturers and lectures, we are enabled to say that Dr. Linsples had few rivale in the art of laying before the student, in the clearest way, the main facts of the case. His language waw correct, fluent, and luoid; not adorned with ornate phrases and elegant expressions meaning nothing, but so replete with information, and that information so well digested, so perfect! arranged, that not a sentence could be lust with impunity. Those who remember his demonatrations in Regent Street will endorne these statements, still more those whose happy furtune it was to have atteuded his butanical lectures at Chelsea. In the ordinary olass rooms where Botany was systematically taught, the profusion of details of which the student had litlle or nu means of seeing the practical bearing, disgusted many (and this is still the case as a rulc), who looked upon the botanical lectures as a nuisance and a waste of time. But at Chelsea the dry bones were made to live. By his eminently practical way of making use of the illustrations which the Garden afforded him, the Protessor although destitute of the aid of drawinge suoh as he had in his class-room at University College, and trusting solely to a piece of chalk and a black board for his diagrams, managed to make his auditory, or the more earnest among them, not only familiar with the structure and medicinal properties of the plants before them, but enabled them to understand and appreciate the practical bearings of many points in physiulogy, in morpho\(\log y\), and in what may be termed speculative botany, and thus succeeded in demonstrating the value of the study of this science for its own sake, for its practical utilitf, and for its special importance as a means of training for the 1 rufussion they were about to enter.
An objection has been raised to some of hi earlier works on systematio botany and olassification, on the ground that in each successive book he advocated a different arrangement of plants from that which he had previously done. Those who make this objection should recollect the state of Botanical Science in Englaud at the time these books were published. The influence of the Linnean system was still predominant. The natural system was a novelty in this country By its very nature it required, and still requires, constant revision and change. It is essentially a science of progress, and in those early days of its existence in this country, the ohanges were necessarily more frequent and more extellive than they because he moves with the ace is absurd. To say that errors do nut exist in Dr. I.indley's warks would be equally absurd. Nut let us not withhold our tribute of gratitude to the man who has given us the "Vegetable Kingaom;" and in reference to his services to Horticulture let us not forget, among a host of other things for which we have to thank him, the keen interest and watchful anxiety over the affairs of the Ifurticultural Society, his constant endeavour to maintain its position and increase its influence as a scientific oody, and his active assistance to new and interesting travellers sent out to collect new and interesting plants for oul conferred on the Society alone, but throngh it on the pablic in general. We ought not soon to become forgetful of the impulse he gave to the cultivation of Orchids by his numerous publications on these singular and beautiful plants, or of the benefits he rendered to our cratt by his constant association of Practice with Science, and especially by the publication of the "Theory and Practice of Hortioulture."
It may be asked, what do people seek, or rather what do they ordinarily find, in Flowre Gardens? It is perhaps not too late to put this question ; for though the answer may readis, seeing it is attended by important corollaries. In the flower garden we seek fresh air and exercise, enjoyed amid pleasant surroundings; we desire to gratify a pleano f natural beautr as exhibited in form and colour. and ve indulge our interest in rare or
degant speetes and vanctles of prants. Mintor well summartees these dilightfal ehjects, whet in one of his minor poems, be epraks of

\section*{ctive illaura,}

What we seek, then, in flower gardens is Pleabure, and it is proper to formularise thio truth, for it itumediutely surgeste the principle that Buere must necenarily le diverstins of tashes in flawergardening. Tils u.de \(d\) is merely saylup that people differ in their tastos and pleanunen-a very comroon-place remark, no doubh but one very frequently forgotten.
Take, for example, the autumnal hower garden -the bedded-out partirres-a ayle so papular at
 rance, or from want of thought as to the true objeots of thie form of tloriculture. Some partioular case of it is under the ultimate command of a far lady, we dall sumpe. Tolicr is is a art of ugen-air drawing-ram, carjuted with qurt, walled in by verdarous treas, and haver fur eriling the blne shy. And it is ghomansy furniahed for her. i!e may bo veryimizhty acquainted with planta ; Ahe may hardly howw a Lobelia from an Ageratum, or a Verluma fram a Caloolaria; and yet she may heve an exquivito peroeption of form and culcur in their general efforts. Indepomdently of har melit to gratafy h.er tasten, her plearure derive! frimn lie dhwir garkets may he a very consuderatble a liftom th the athra". tions of her autumnal soj jarn in the conntry. other people may view the farlen with difterent eyes. The gardener who denigoed it has an artistic pleasure in his nuocess. fome friendly oritio from a distance may compare if with wher places, and may cuter into curious questiona as to the adaptations of its parts, and the elaborate perfeotion of the whole. Again, the propagator of plants tinds a pleasant sulyeet of cunservation in the deoorative capacities of particular variction. He takes deep interest in considirmg haw the Fir fly Verbena maintains its content with Lady Viuturia Soott, how the Gulden Chain Pilaramum holds out against Mrs. Pollock, and whesther tho doughty Tom Thumb has mot been otring to sucounb to the Orange Nuncray, or Bhtan's Indian Yellow. Even the admario of hight fimath may have positive enjoyment in uncomamanly realising Mismon's idea of a pimwise garden, to the eflect, namely, that it shosil he from.

But there is another sanree of phanure in il wwer gardens, and that is, the inturest maty akis in paricular species or varieties of plants. Butanises and florists-in this respect they may be roharded as one-do not much affect the hed ling-out ryptem. It is true that io certain botanic gard.na, fuch as Niew, Liverpoci, and uther pians, three are fine specimens of autumnal partirres, bat these oovar rather because the managers thank it their duty to cater, so far, to the public taste, than from any predilection they have for that propular atyle. Their tastes rather tead to in hiridual planto ; and they for the most part fiad intimtels more eajoyment in a single shrub er tran, thin is the mast
 the honours of his play, will pune a! times, ant direct attention to the play of colowrs ; to the contrast of the brilliant whte or searl-t blassoms with deep green foliare, or will point out the tranklueent tints produced by the light falling on the blooms raised above the level of the cye; but his whole heart expands, while he stands enraptured, and half worships a splendid Jady Eleanor Catheart, or a Gazelle, a fiem, a Proushtoni, or whatever other variets he may have incluted aroong his favourites. And then he has histori"s of many of them. "I mrself graited that Albam elegans on a (i-feet strek now 3 inches in diameter,
with a top 10 or 12 feet high. That dohn Waterer was a present from the excellent old man whose name it bears. That Minuie was supplied by Mr. Standisir himself, and was among the first let cut." (Ir surpmse we visit a grower of Orohids. His colleotions are arranged in s.me subtle order of his own, bat he hardly ever thinks of general effects. He leads at once to his cherished treasnres. "Liok at that Oncidium," he sars, "or this Ihalaynopsis;" or again, "that Van!la, or this Angrasum fowers, the length and breacth of leaves, and the Inxuriance of the whole plant. Obsorve the effects of cool culture on that Odontoglossum from New irenada, and the henefits of warm treatment as shown on this Dendrohium from linrmai." We should find instapers of simi ar entinsicm in the Rose fancier, or in the erowir of ry=m mams, or of what used to lee ealled theris'silliwer. His (ye
gleams with a light, and his voice rings with a musie, which only lovers of flowers for their own
sakes, can ever know. And who shall aneer, or censure the speciality of such tastes as these? Assuredly no one who has the true spirit of horticulture, or who deserves ever to set his foot withia a flower garden.

The sources of pleasure in floriculture are manifold and various, and he is the greatest gainer who can enjuy the most of them to the full. Certainly a man should suspect himself of some pursuits from which he perceives others deriving pure and simple enjoyments. Perhaps there is too much impatience on both sides. La RocheFOUCAULD, in one of his famous maxims, remarks that our self-love is more hurt by the condemnation of our tastes than by dissent from our opinions. This was true, it seems, of Frenoh human nature in his time, and it is partly agree to differ on matters of politics and religion. It is even respectable to have a definite opinion of one's own. It is allowable to ride a hobby pretty vigorously, if we do not ride down other people. Why then should there not be full toleration of our neighbours' tastes in flower gardening? And why should we not cherish more tastes than one? The owner of a picture gallery may regard a Titian or a Murilio as the glory
of his collection; but he may attach a high value to a Claude Lorraine or a Turner, and he may be glad to possess a fine Rembrandt, a Cuyp, or a Wilkie. Such a catholicity of taste betokens
high culture, and a mind above the cant and pedantry of criticism. The late illustrious Prince Consort pronounced gardening one of the fine arts; and so far as it rises above the mere supply of the kitchen and the table, it deserves to be terminates in pleasure-pleasure pure and simple -it is uncoubledly one of the line arts, as much so indeed as music, painting, or poetry. Recent writers have shown that all that men do-quicquid
ayunt homines-may be classified either as work or play, and that play-in othtr words, whatever ministers exclusively to amusement or pleasure, is the ground principle in the fine arts. Prolittle guarded, for there are some arts, followed for amusement, which are far from being fine arts. No deduction, however, need to be made from gardening, for, in its essential nature, it was pure enough to be the employment of
Paradise. It is still fitted to be the medium of the purest and most exquisite pleasures. Let its
votaries recognise its dignity, and act in aocordance with its character. But whether regarded as a fine art, or a source of pleasure, or simply the means of amusing play, let it not be made the arena of bitter strife or sectarian exclusiveness. They are very
silly ohildren, if such indeed there be, who restrict themselves to one kind of play.

A Wiltshire correspondent has pointed out to us a fact in relation to Vine Culture, whioh seems to be worth the consideration of practical men who have to deal with Grape growing in a level country. Me has established a cold Vinery in what he describes as a very successful way, the
sorts grown being the Black Hamburgh and the Muscadine. The result and its explanation are thus set furth in his own words:-"I think a good part of my success in growing the Black Hamburgh so well, is in a great measure owing to the circumstance of a well being placed in the middle of the hed. When the bed of the Vinery Was made, the drainage was made to slope towards this well. The result is so good, that I a well for this purpose alone.'

Such is our correspondent's view, and there is something feasible about it. A shallow well, or even more than one, sunk in a Vine border below the level at which the drainage is put in, must draw off superfluons water which at any time might collect amongst the materials of which the latter is composed, and that more speedsly and effectually than would be done by a mere drain, unless the latter had a very sharp outfall; becanse in such a case the slope or fall towards the well could be regulated to any pitch. Of course, on a hill side, all this wonld be of less importance than in a flat country, but then there is this additional advantage resulting from the adluption of what we may call the well-system of drainage, that while the water would be tffectually removed, the soil would be aërated without further trouble. In shor!, it seems to us that the simple expedient of
the well, with its conducting drains, would acrate the border as efficiently as a distinct series of air drains, such as are sometimes introduced to supplement the water drains, at a considerable cost o labour. At any rate, the hint our correspondent gives is worth remembering wherever it may prove applicable, and may be especially aseful in the case of the gardens of amateurs.
- Wr have lately received another addition to the crested forms of Filix-MAS, and, this time from
Scotland. It has been found by Mr. Walter McKay in the woods of Camperdown, and may be distinguished amonget Fern growers by the name of MoKayI. The peculiar features "of this variety, which is a wellmarked one, are the pyramidate general outline of the pinnæ, especially the lower ones, which are nearly half as broad again as those towards the upper end; the remarkably (for this species) acute form of the pinnules which are serrated, and in the lowest pinnæ rather deeply cut, something in the way of remota; and in the incurved apices of the pinno, which terminate in small but well-defined crests. These features give it a distinct character, so that it will be a welcome addition to the already numerous varieties which have been brought to light by the keen eyes of modern Fern-hunters.
- Mr. D. Hanbury has been good enough to forward us some thoroughly dried SeEDS of Xanthoxylum alatum. On examination the embryo
may be discovered lying in the albumen. Some of our may be discovered lying in the albumen. Sonee of our from certain of which young plants have been raised, although no trace of stamens or of pollen has hitherto been detected! It is a pity that some other plants are not equally prolific.

We are glad to be able to announce, since there is this year no Chrisanthemom Show at the West end of London, that the United Horticultural Society will hold a Flower and Fruis Show in the City, on Tuesday and Wednesday next, at which we have no doubt these fine autumnal flowers will
be well represented. Chrysanthemums, Foliage Plants, Fruits, Fern-cases, and Cut-Howers are inviled. The show is to take place in the Guildhall, under the patronage of the Lord Mayor.

The French correspondent of the leading iournal states, on the authority of the "Journal de Saone-at-Loire,' that the Academy of Maçon has this year adjudged the prize for Viticulture to a landed proprietor named DCBOIS, who, among other acts of eneficence to improve the condition of the peasantry, has organised the young women of his parish under the care of a skilful Vine-dresser, by whom they have been taught the art of pruning the Vine, and such other operations as do not require the muscular force of a male Vine dresser. These young women are known as the Vigneronnes du Maçonnais.

The Funeral of the late Dru Lindiey took place at Acton on Monday last, in the presence of Horticulture, among whom we noticed Mr. Bentham, Dr. Hooker, Dr. Thomson, Professor Reichenbach, Mr. Vetton, Mr. Eyles, \&c., \&c. We hope shortly to be able to present our readers with an Engraving from the portrait of one who for so many years occupied so high a position in the world of Horticultnre.

\section*{THE LATE DR. LINDLEY.}

Joins Lindeley was born at Catton, near Norwich, on the 5 th of February, 1799, being a descendant of a good Yorkshire family. His father was a nurseryman of considerable ability, and is known to gardeners as the author of "A Guide to the Orchard and Kitchen Garden." Dr. Lindley was educated at the Grammar School at Norwich, of which Dr. Valpy was then headmaster, Sir Wm. Hooker having been a pupil at the same school is few years before. As a boy, Lindley distinguished himself by his industry and quickness, although he had some difficulty in learning lessons by rote. At this time his inclinations led him to the study of plants and antiquities, and he is hiring books on the latter subject, which he read with such avidity that his schoolfellows bestowed on him the nickname of "Old Antiquity." He left school when he was about 16, and shortly afterwards went to Belgium on business for the late Mr. Wrench, of Camberwell, the well-known seed merchant. After his return from Belgiam he remained at home with his father for a few years, and devoted himself indefatigably to botanical, horticultural, and entomological pursuits. His first scientific acquaintance was with Sir William, then Mr., Hooker, who was 14 years older than himself. At the time of which we speak, Mir. Hooker lived at Norwich, and was in the habit of visiting Lindley at Catton to procure plants and insects. The acquaintance was continued after Mr. Hooker's removal to Halesworth. It was at this latter place that Lindley made a translation of "Richar.d's Aualyse du Fruit," setting himself to his tavk with so much devotion that he ampleted it at a single sitting, having worked at it or three days and two nights without intermisaion This translotion of the Malayan Archipelago, and in and the himself to yan Archipelago, and in order to inu and forwards tropical climate, he walked backmand once during the heat of a summerwich more then occasion, when on a visit to Mr. Hooker he On on covered by his hospitable entertainer sleeping on floor of his bedroom, as a preparation for the \({ }^{5}\) an of his intended voyage. For some reason or othe this project was abandoned, and owing to bit father's reverses in business, Lindley was left to troduced by Mr. Hooker to Sir Jonorl Bankand in 1818 or 1819 proceeded to Londofi, where b was employed by Sir Joseph am his assistant librorio Dr. Lindley always spoke in the warmest terms of liberality and kindness of his patron, whose asse stances was the more acceptable, as Lindley, to his honour it said, had made himself responsible for his fatherts debts. Sir Joseph also recommended him to Cattley, who was desirous of finding an editor for the "Collectanea Botanica," in which many of the f plants he cultivated were figured and described by Lindley. This work was published in 1821, and remarkable for the faithfulness and beauty of its ill trations. It was dedicated to Mr. Sabine by its edito who was even at that time able to sign himself member of the Imperial Academy of Naturalists of Bon In 1820 Lindley published his "'Rosarum Mono graphia, which was dedicated to Mr. Charles Lyyell, kinuordy, the father of the present Sir Charles Lye Mr. Lyell was so pleased with the work that he sen the author a cleque for 100\%. With this mone Linaley bought a dissecting microscope, and a sma herbarium which formed an important auldition to his own collection. In 1820 he was again at Hales worth, aud it was whilst searching the ditches in th neighbourhood with Mr. Hooker that they found some Duckweed in flower; a description of this by Liadle appeared in his friend"s "Flora Scotica," in 1S2l. the same year the Monograph on the gemus Digitai was published, illustrated partly by himself, but chielly folio erdiand Bauer. In this fear way publisted collected by Van Braam, and from Chiuese drasing collected ly Van Braam, and preserved in Mr. Cittley library. No editor's name is appended t.s this book,
but it seems probable from tho Iatin preface that Lindley arranged these plates fur publication. Neither descriptions nor (with few exceptions) analyses accom pany these figures, which were issued more as curiosi ties and specimens of Chinese art than as botanion drawings. Nevertheless, stress is laid in the preface just alluded to on the figures of no pentandrous

In 1822 Lindley became Garden-Assistand Secreta to the Horticultural Society, of which Mr. Sabine ma then Honorary Secretary. At this time the garden a Chiswick was in process of formation, partiy under with his usual ardour, rising early and summoning to their work those less aobive than himself, order that the orchard might be planted before Secretary to the Horticultural Society, havin duties to perform both in London and at Caisme From this time be may be said to have becomot mainspring of the Society, upou which devended it efficient working as it advanced in prosperity, requiring his daily attendance during office hours in frou Street, or once a week at the Garden, besid83, at the extra work in the early morning. In 18ers anguin time of Mr. Sabine's resignation, owing to over-sa which oxpoctations and untowar ben etirely unconnectid the Society had got into difficulties, which taxed energies and attention to the utmost to overcome conjunction with Mr. Bentham, who had suacuat Mr. Sabine as Honorary Secretary, he worked as plan for holding at the Garden general exibive fote flowers and fruit in lieu of the old expensin mot which, although tried again in 1831 under mavourable circumstances, failed completel moting the objects or the resources of the
These exhibitions proved to be the means of the Society to its former prosperity, and bec model on which simiar or about the metropolis of the country. On these days by those who have had the management by those who bave aad in the Garden
displays. He was always in in the morning, and he never left six in the evening. Nor were the Regent Street less the object of Linley's care there must be many persous graterul ing subjects connected with horticultur Bentham's resignation in 1811, arrang made by which almost addition to his own duties, fall upon Dr. took the designation of fice Dr. Henderso Honorary secretarien, Dr. Royle, active part in the manageneento fa thiv tinued until 1858, when he reeigned
sornters to the society and Member of Council, a pastion whing business of the Exhibition of 1862 orewh him to give up any farther participation in the digsomont of the Horticultural Society.
If may here be mentioned that the Doctor worked 25 tand in arranging the Chiswick fêtes during the last jer jears of their continuance as he did at their comat that time, well knowing the state of the finances of the Society. Had Dr. Lindley done nothing more then attend to"the affairs of the Society he would have cocomplished as much as most men could have done, bot bis energy was inexhaustible, and until he had pased: 50 years of age he never knew what midition to the Horticultural Society he had his odidion to the Horticultural Sociel both at University College and at the Botanic Gurden of the Society of Apothecaries at Chelsea, in which hattor establishment he held the office of Prefectus Iorti, well. as his own personal researches to onea in the year 1829, and he continued to lecture in that Institution until 1861, when he resigned. Upon tis revignation he was made Emeritus Professor, at the instance of Professor De Morgan, and was of Botany In the University of London from 1861 lectures, making large rough drawings for their illustra tion. For many years his class was very large, but as the number of botanical lecturers (many of whom had been his pupils) increased, his class fell off in numbers. Dr. Lindey never read a lecture, but he invariably
prepared notes, and paid great attention to the arrangemont of his matter. His lectures were remarkable for their clearness, their conciseness, and the profuseness with which they were illustrated. Among his early pupils was Mr. Griffith, the well-known Indian botanist, .ur whom Dr. Lindley always expressed the hishes lormal character, but eminently practical. Their nuo has been attested by large numbers of dikoontinued in 1853. Dr. Lindley also occasionall lecured at the Royal aud other scientific institulis classes that he published several of his best hnown botanical works, but his two great general works, the " Vegetable Kingdom" and the "Theory of Horticuiture," were the results of long-continued abour bestoved ou the collecting and digesting a vast of the Natural System, he zeal for promoting the atudy of the Natural System, he had very early formed a plan improvements on the Jussieuan arrangement intro duced by Brown, DeCandolle, and others, as well as the views which his own numerous observations had induced him to entertain, aud for many years his of plants for this purpose. Seeing, however, as he alranced, that the completion of a Genera, would be a work of far greater duration than he had originally ment in the "In gave a sketch of his ideas of arrangeEtany" (1830), in the "Nixus Plantarum" (1833), Ind in the "Key to Structural and Systematic nient of a "Cenera Plantarum" by the celebrated diea of preparing one himself, and embodied the System of Bis preparatory labours in his "Natural Hon published in," or 2 ad edition of the Introduc arefuly elaborated of all Lindley's works, and ongested to Endlicher the issue of his "Euchiridion he ideas carried ; this in its turn supplied several o Stuural System into by Lindley in expanding his pertapes be beet knom" (1846), by which his name will The " \(O\) betlin known to posterity. is princinal ngether with a rentents, modified and re-arranged, rmed the above-mentioned "Key to Structural and Sstematic Botany," which was translated into several ab equently lages, including Hungarian, and was " "Elements onlarged in a new edition under the title "Elements of Botany " (1841). He had also in bro, entitled "Ino editionduction to Botany," which went tro igh two editions, and was the foundation of his In 1823 appeared the "Synops.
Cessors, in which, following the example of the British Tree armooker and Gray, the British flowering plants "Fiora Med according to the Natural System. The
"imilar A appenrance, "Medical and Economic Botany," made Which in its improverd form 11 later. The "School Botany," mithe editions, was first published in 1839. A worls rolumes, under the title of "Ladies" Botany." In 1837 of which oniy 25 condid Monograph on the Victoria regia, These were by no means circulated. greater part of means Lindley's only worke.
conducted the whole of the "Bitanical him. He oxcopt during the first fow years: andi, with very little assistance, "Lindley and Paxton's Flower (iarden, besides contributing to eovaral of Paxton's works in horticultural botany. The botanical articles iu the "Penay Cyclopedia" down to the letter R the excel " Treatise on has boen generally acknowledged), and the Diffusion of Thany," nubhished by the sisuety for pen: besides the serater of the eighth and the whole of the ninth rolume fibthorp's a PIomad the published from 1835 to 1837. The elegance of the Latin preface to the ninth volume has bees mnch admired, but though Dr. Lindley was a good Latin scholar, this preface was, we believe, revied br hin
friend Professor Key, of University friend Professor Key, of University College. From
1831 to 1837 he was engaged with Mr. Willian Hutton in the "Fossil Flora of (ireat Irritaiu," a work three volumes, containing figures and doscriptions of fossil vegetables found in this country. As in elementary botany, so in horticulture the commeneer with a small work, entitled "Ontlines of Horticulture. This waa followed by the "Theory of Horticulture," first published in 1840, which, after having been
reproduced in America and translated int.o nearly every European language, not exceptiog 1h:sssinn at length reached a second edition in Eugland in 1855. Dr. Lindley was very proud of this work, ami has often been heard to say that in lis opinion it was, upon the whole, the best of all his productions the "Vegetable Kingdom," perhape, excopted. Unti from "Theory of Horticulture" to "Theory nad Practice of Horticulture," this work had but a very Slow sale in England, although its reputation on the Continent and in America was very great.
Then there were his works on Orchidaceous plants, to which he had more particularly devoted hie attention for many years. The "Sertum Orchidaceum,
magnificent work in folio, with beautifull coloured plater, mostly drawn by Miss Drake. appeared
in numbers, and was completed in 1838. The "Genera and Species of Orchidaceons Plants" also came out in parts, between 1830 and \(184(\) ) and a
second edition of the latter, under the title of " F "olia second edition of the latter, under the title of "Folis
Orchidacea," was commenced in \(18: i 2\), but unhappily this has never been completed, the last part having been issued in May, 1859. Many of the books we have mentioned, and these are not all that were produced by his busy pen, were illustrated either by
skilful pencil, or by that of his two daughters.
In addition to the works we have just mentioned, Lindley was a frequent contributor to the Transactions o the Horticultural Society from 1822 to 1843. He drew up reports on the new plants in the Society's Garden, on various ornamental plants, and aleo added remarks on several points of morphological or physiological interest, such as the mode of formation of double lowers, the action of frost on plants, the rate of rowth by plants at different times during the day cic. We have already alluded to the Svo Jomrnal of the Horticultural Society, 1846-1855; though Lindley did not himself write wuch in these volumes, it is to his careful editing and research that thes owe their principal value. In the "Transactions of the Linnean Society we find in the year 1820 a paper beautifully illustrated by Dr. Lindley on the Pomacees, and a shorter notice a subsequent year on the Anatomy of the Roots of Ophrydce. In the volumes of the Journal of the
same Society are also several important paperv same Society are also several important papers
of Lindley's, chiefly referring to Orchidaceous plants.
The records of the British Association also tentify to his diligence and to the variety and extent of hir labours.

\section*{(To be continued.)}

\section*{ORIGIN OF THE PEACH}

Mr. Rivers, in his excellent "Catalogue of Frait Trees"" just published, says:- "In describing this fruit (Early Silver) the first of a new type of Peachea, 1 am fruit catalogue and give my theory as to the origin of some of our old kiuds of Peaches. I believe that the Id White Nectarine was one of the earliest introductions from the East to Earope, and to it, in my opinion, we we those pale Peaches, the Noblesse, Malta, and White Magdalen, so remarkable for the piquancy of their favour. I have been led to think so from my having formed a nelv race of reaches the only variety that bas for many years been caltivated in England. The first generation gave me the Early Silver Peach, one or two ther pale colour Peaches, and several White Neetarives. The second and third generations have given me one or two very early Peacher, as large as the Noblewe, yet ripening a fortnight ear ier than the Red Nutmeg, also wo or three large lato Pearour, and likely to be of value "It is quite impossible to convey to the pomological world the remarkable things that the orchard-honse has in the short range of ten years brokgowledge of thr give a greater and more complete Nectarinee than has rieen abtained in a century by the Continental writera The French pomologists of the prenent day are almost
ridiculons is their knowioder, or ment of knowiddre, Carriere eould reside far fire jeare near a good Unchard home they woald mot write at they do about Peaches 1 am temptod or proroked to write thus, beowuse a Vrouch pomologint will not believe that anything peouliar or good in frout ons ever take 1 hav

 destroyed. To my great prement matamation thus nat trees tive are l'eaclics-one a bright orage, the cher: pale-Geshed, shd of delicious flavour; Ave are SNement hers three of which now give bright orangecoloured fruit of the size of the Violotte HAtivo Nectarine, mad Imo with white fieeh. The gavour of the Peachen is aprightly and Nectarine-like. This is indeed the case with nearly all the Penobers raised from Nectarin atones; beoce I have formed an opinion that I chat found new saces of Powehes from the Nectarine."

\section*{TROPICAL BOTANY.-NO. 1}

Premups no nection of the ecience of botany has boot less discussed than the influence of tropical menamy upm vegetation, ariang most probnbly from tho foct that few Luropean authors on this ecience know anything more exact knowled ge than the fullowing pabage from Darwin shows:-"In consequence," writes this cele. brated naturalist and traveller, "of the leaven of treet mut being shod periodically, the inhabilants of the inter-tropical regions lose perlaps one of the wont
glorious sighte in the world-the fint buruting inlo full folinge of the lenfoess tree." Nius thin is a apec one who travels throngh an Indian jumgle fown Jamary to April may witners. We may mat esprentres the delight which the inhatitants of tempurate cimaton fet on the approach of Spring, when all wegelation
 impression pervades the mish of thr ewnhany an Neture to her appointed periods of revini. year in which we may not acc yanng learen and famer shonts springing from lemfiess branches, , blifhouch at an . one perind there is no general hurat of fand
 to bring with it unages of heper fear, or malnes with the hicher liestinies af man. In Gardner, in bis "Travels in Brazil," ptatenthat the low ame apmerrance wich the moods of cald climutos io in winter, heat efiecting in the one inftance meme with us in India, only that we should escribe the fall of the eaf to drought rather than to heat.
The appearances of Spring in temperafe clinatra re accounted for by an increave of temperature. Heat is the all-pervading agent whirh there call Heat is the an-pervading agn wery drgree of heat vegetable life into exiatence, and crery drgree on
above the freczing point finds its corresponding plant, whose functions are then called into play.
It has been laid down by botahiste, as Sir J. Herache informs us, that a plant flowers when the sum of the mean diurnal temperatures (or ratlier, as inamitnined by M. Quetelet on apparently better grounds. that of the quares of those mean temperatures), foro the first movement of the sap in spring, attut but definite amount, differing for each specius of phat, Now
invariable for the same under all urcumst neen. Now, invariable may be all very will in temperate climates, where heat is the sole agent, lint it is yuite inappic, ie to the ather influences. Thus we find the Mancabinoming at Shikarpoor at a temperature of 4 ., and at no \(7^{\circ}\) at Bombay. Thus in the to trees at least, is sit phyeicalinduence, wists which confonmed urs. Ther eent forth tender leqves and hlosenom in the colleat month, and although this phenomennn is nhser wath!e in almost all moathe of the year, it is in that monnly which is both the
hotteot and the driest taken tolysther (March). that the greatest number of trees birgin to apront. M. Planchen,
 in March, consilers the phemomenon as atiry r-mark ahle one; and it is truly \(m\) re than romarhable that profuctione at, a time whon the heat and drought nould eom gront enough to wither up all vegetation.
Thone savans who have no experience of the tropics
and who have written on this subject, have often fallen into great errors. Thus Professor Daniell, of meteorological celebrity, states that in tropical climates the sap never ceases to flow. Professor Sacci states that the neat indispensable to vegetable life is never suspended in the tropics, which enjoy an eternal summer. It is scarcely necessary to say that these statements are incorrect, and that every species of tree has its winter, or in other words, its natural period of rest, in which all functions are suspended. If, as another philosopher has said, the ardour of the sun, without the tribute of rain, causes trees to suspend their functions, yet it is equally true that these very same circumstances do not prevent many others from resuming all their vegetative activity.

The European horticulturist tells us that the production of flowers and the bearing of fruit are exhausting functions, and that plants after that have need of rest. This cannot, however, be universally true. We have many trees, such as the Mango and the Jambool, which ripen their fruit just before the annual rains, and no sooner do they feel the influence of these, than they start off with undiminished vigour, throwing out leaves and young branches, which are to bear fruit the following season. Trees of this kind have a prolonged period of activity from Jannary to September.

It is evident that tropical trees do not obey one general law, and that what acts as a stimulus to one kind has no effect on another. It may be that each species is regulated by a kind of special vitality, which atmospheric changes of temperature, moisture, and light cannot explain.

There may be some general law, but if there is, it seems to have little connexion with, or dependence upon, external circumstances. If we were asked, what are the immediate canses of the appearance of Spring, we should say that they were water ascending in the stems of trees under the influence of physical forces; but this would never account for the tropical Spring taking place at the very period when there is a minimum amount of moisture in the ground as well as in the air. However closely we may investigate the subject of seasons, to sccount for the various appearances in tropical vegetation, we are brought to the conviction that the causes lie too deep for us, and that wherever the vital principle is active, the investigation is beset with insurmountable difficulties; and that we shall probably never discover why the Cotton-tree flowers in January and the Tamarind in June; or why the same order always prevails in the leafing of plants; why the Birch should invariably precede the Oak, and the Oak the Ash. The Book of Nature presents ns with mysteries as great as the Book of Revelation, and of both we nust be content to be ignorant. N. A. Dalzell.

\section*{NEPENTHES RAFFLESIANA.}

Those who were at the Edinburgh International Exhibition could not fail to have noticed the splendid example of Rafflea' Pitcher-plant which was shown by Mr. Mitchell of Hamilton Palace-a plant quite 7 feet high, and clothed from top to bottom with leaves of the most exuberant growth, the majority of them adorned with huge pitchers. As I have had an opportunity of seeing the plant since, and noting its strange physiological character, I wish to inquire whether the variability it exhibits in pitcher formation is of common occurrence in that variety. The lower pitcher-like appendages are much inflated from the base to the centre, after which they become gradually contracted to the mouth, and hang very elegantly; they have two prominent wings planted on the ridges which rum nearly parallel from the base to the mouth of the pitcher. This appears to me to be the normal form of these tendrilified leaves, but the younger leaf appendages present a totally different appearance, and but for their being the produce of the same plant, might be considered as belonging to quite another species. Those referred to are widest at the mouth, measuring there \(2 \frac{1}{2}\) inches across, and tapering towards the base or foot-stalk; and what is most singular, while the mouth is much more substantially adorned with the overlapping lid peculiar to the race, there is an almost total absence of wings, and the ridges, instead of being parallel, converge from the mouth to the base. This is no isolated example, for these peculiarities apparently become more fixed as the plant advarices in growth.
So far as my experience goes, this appears to be quite a physiological phenomenon, as I have both seen and possess plants of quite an opposite tendency. In fact, in the case of what might be called suffruticose Nepenthes, practical men have so far had nearly all their examples with tendrilified leaves without pitchers, the plants rather inclining to flower and produce young shoots, which, when rooted and set growing on their own account, produce pitchers up to a certain stage and then again show the reproductive tendency, without yielding those curious and ornamental developments so attractive to the eye. I have a plant fullj as tall as Mr. Mitchell's, which has not produced a pitcher for the last two years, but it has flowered, and turns out to be a female. Whether the fact of its bearing flowers, or its sex, has anything to do with its not producing pitchers, I am not physiologist enough to know ; albeit \({ }^{2 t}\) had given up bearing pitchers twelve months previons to its flowering, so that it is my belief, if there be any hitch, that it is attributable to sex. I would therefore like to know whether male plants are more freely
pitcher-bearing than females? Treatment may have something to do with it. Mr. Mitchell grows his Nepenthes in a moist shady stove in what might be called a "north house," but Mr. Veitch grows his equally shady, moist, and tropical, and in his case the tendencies so far are retrogressive in pitcher-bearing, and reproductive, therefore progressive, as regards the multiplication of the species or variety. J. A.

\section*{NEW PEARS}

No. 1. Marie Louise d'Uccle.-A variety of Marie Louise, so named from Uccle, a village near Brussels. This very excellent Pear differs from its type in having

general some seasons the with large blotches of ruset. I some seasons the russet largely predominates, Is usual time of ripening is October and early in Noverober, varying, as is common with Pears, according to site,
soil, and season. It is decidedy soil, and season. It is decidedly a very fine rasiee?
and worthy of extensive cultivation and worthy of extensive cultivation.
No. 2. Conseiller de la Cour, aiias Maréchal de one of heod cultivation attained the weints of 10 Punce, having tais seame near Nat Caunton Mano near Newark, Notts. It seems to succeed well in our northern counties, its habit being remarkably robe and vigorous, and the tree not incliued to canken There are but few varieties of the Peark succeed so well on the Quince stock, union of the bud or graft with the stect being perfect, and its growth in one seacin often 6 feet from the bud. When ripe skin is of a yellowish green, its flesk melk. ing and good,-in some seasons very good but much depends upon soil and site, whid influence the flavour and textare of Pan to an extent almost incredible. On the whole, this fine large Pear deserves a ploy in all gardens where a collection of an extent is cultivated.

\section*{Fome Correspondence.}

The Golden Hamburgh Grape.-I am mat obliged to Mr. Busby for calliug my atten tion to places where this variety is said be seen in perfection; but having grom bunches of it 4 lb . in weight, with the berries \(3 \frac{1}{2} \mathrm{in}\). in circumference, I have no particular wish to see it better grown else where, With respect to its carrying an lities, I have had some experience in sending it long distances for the last three ycar, and it invariably did not travel so well as Bled it invariably did not travel so well as Beat was not aware that it had ever been sen from Scotland to any of the London frith shows,-in fact, although so showy a Grape, its appearance on the exhibition tables has been very infrequent. As I have said before it is a noble Grape, both in look and in flavour, when well grown, but it will take all Mr. Busby's time to write it up 982 favourite variety, for some of the best cultivalors of Grapes have failed in growing it successfully. William Tillery.
Salvia splendens. - This fine old plant is not half so much cultivated as it ought to be; some cuttings struck early last spring were planted out in a border not by \(20 y\) means favoured in situation, yet they grell a peculiar and fine aroma-that of the Gansel's Bergamot \(\mid\) very fast, and by the end of September were bursting
-and also in growing freely when grafted on the
into bloom all over, when they were taken up carefuly all over, when they were taken up carefuily
with balls, potted on the spot, and they nol are the most conspicuous plants we bave in the conservatory, - far exceeding in tha respect Salvia fulgens treated in the same way. It is needless to say that care is required in handling a plant so casily broteen, but it richly deserves all the attention that is necessary for success in its callivation J. W. C.

Bézique. - Your correspondents "Yany Country Ladies" (see p. 1037), will find the rules for Bézique in Vol. 5 of McMillan Magazine, Nov. 1861, to April 138. A. C. P., Clifton, Bedalo. rejoice to see Mr. Fish's articles on this mot interesting subject, which, strange to say, still so little understood even by too may. good and practical gardeners. I trustion to will forgive me if I call his attention tote not a misstatement, but an imperfech all, in ment on the most important point of all, which he says, "Heat exerts an expais: and diffusive power ; the air occupios greater space, and consequently we but be goes on to say, "Now, light air course rise through and sail along the course tor just as a cork wil surface of "Would it not be more correct upon water." Would it not be rise because it
to say that light air does not to say that light air does not rise bess is light, but because it offers
ance to the cold air, which, being heas ance to the cold air, which, being to rise? always sinks below it, and so forch we shall eee Let this once be understood, asales opened t) fewer of those sliding top throwing "give air," but in reality throw shoots, and avalanche of cold on the the soft and preciors in turn forcing out all the sor naturalls deo moisture in which vegetation aitted at the lights. If the cold arr is admilation bottom of the house, free verls of fresh air be insured, and a constant supply injury to provided night and day without injurg Fsite the plants, and without the enormolls wope, of heat caused by the old, but now, 1 bope, nearly exploded plan of ventilating frown Mr. Fish is quite right with regard do good Quince stock, on which it soon forms a robust and above. th-Oil of amber and ox-gall mixed in equa parth added to thin oatmeal and flour sufficient to form 8 paste, rense thirst, so much so that if vessels of water be fised clowe by, the rats will drink until they die on based spot. South Durham. Lobelia cardinalis.-Your correspondent "H. T. H." joald divide his planest suckera, and plant them from a 103 inches apart, in a frame on a mild bottom-heat. Give them air on all favourabto occasions, but they fine strong stocky plants. I formerly used to pack this Lobelia away closely together when I lifted it from the beds, but losing numbers of it, I adopted the man add that this variety is very impatient of confine pent in pots; it succeeds best planted out. H. J. F. bundreds of Conifers, which I noticed were rapidly losing bealth and assuming a sickly hue, that steadily inceased. I saw that they were attacked by Fungi, and that some means must at once be takeu to 12 feet in height. The greater part of them consisted Deodars, Pinus excelsa, Abies Douglasii, A. Mengiesii, and Cupressus Lawsoniana. The remainder were Vellingtonias, Abies Webbiana, A. Morinda, Arbor rite, da, All were planted in a nursery, the soil of דhich was for the most part about one-halt shingle, and the subsoil entirely of that description. I had all the plants taken up, and every particle of soil slaken from their roote I found that every plant was attacked by Fangi, and that most of them had lost at least two liinds of their roots, which were entirely covered with and penetrated by minute thread-like processes, forming \& thick network all over them-sometimes, indeed, After the plants were taken up, I had the roots well mashed in pure water until not a particle of spawn culd be seen on them; what were left were then cut back to 3 or 4 inches beyond the decayed parts. On rumining the soil in which the trees had been planted found partially decayed leaves and small pieces of decayed wood, which were doubtless the cause of the mischief. Leaf-mould had been applied to give the the wrong direction. Every leaf and every bit of wood mis sucleus of disease; nevertheless I was compelled oplant again, and that on the same ground, having no other. I however partly removed the soil and put maiden loam in its place. "No more leaf-soil for me." Trmenes were opened, and the plants were well poddled in and staked in cases where they required
that kind of support. Some 1000 plants were treated in this manner, to which was added syringing morning and evening in very hot weather. The loss has been bers than one per cent. A Wellingtonia has grown peares in height since it has been subjected to the porations just described, and it is pushing innalength. I should state that the plants were lifted and replanted in the latter end of March. If I should find desilate larger trees attacked by Fungi, I should not Lesiate to treat them as I have just mentioned.
Herbert W. Cordle, Coollattin Park, Carnew, Wicklow. Double Grafting Tines. - I have found that oubleografting of the Golden Hamburgh Vine has strengthened the footstalks of its berries. On its own rodaced a late Vinery and in an unheated border it Deniring to have it in an early Vinery, I worked it on the Bhek Hamburgh, on which it grew vigorously, bat still it moduced loose bunches with tender footstalks. Th same spring and in the same house, I had it worked on been g ghoot of the Muscat of Alexandria, which had been grafted on the Black Hamburgh the previons the Black. Cuting back the Muscat to within 6 inches of burgh was warked longue system of grafting. It fruited at the same time being compact but the result was different, the bunche atrong foompact and well filled with berries, baving well fith fataks, apparently fit to atand carriage equall rell-finished bunch Grape, and in every respect Mike Manor Gardens, Worksop, Notts
Medicinal Plants.-Mr. W. Robinson, in speaking of the mediciual collection of plants at Dangstein, says in lay hands and Strychnos nux-vomica "are difficult M. Linden, of Brussels, in which I find the Catalogue quoted at 10 fr . each or 75 fr . (3l.) for a dozen, and Aora, Very same price, and Swictenia Mahagoni, 15 fr . their collectiong sure, will grudge these prices to thonas, Chérimoyer, Ebony wood, and a host of other

will come forward and join the ranks freely. For \&o will come forward and join the ranks freely. Forl indicating hopes of great anceeste, notwithatanding that many huudreds of people have not yet Leard of the cheme. When they do, sabscriptions will doubtion that can render help will do their best towards carrying out this truly national undertaking, in order to make it an honour to the country, especially as many foreigners are to be invited. Let us not only subseribe liberally surselves, but let us try to induce our friends also to help. A great deal may be done by introducing the subject, and explaining the good that is likely to
emjanate from such an affair as this is sare to prove. B. S. W.

\section*{Foreign Correspondence.}

New ZㅍuLaND GaEDEing.- The new botanic arden at Christchurch, now under the procen of ormation, is favonrably situated at Avonside, and bout 3 acres in extent, possessing a good, rich loam soil, well suited to the purpose for which it is intender and occupying one of the pleasantest parts of Chris church. In this garden quantity will not be taken into consideration at all; but rarity and newly-introducen trees, shrubs, evergreens, and Conifers will always mee with a fair trial. An accumulation of plants in Canter bury which have enriched the plains, induces the owner to commence arrancing them into shape; so that their value may be truly and faithfully appreciated, having regard to the sdvance of knowledge in the meiesce of regard to the savand horticalture. Among the objects of interent already planted out, and looking healtby, may be mentioned the following:-
Of Ornamental trees there are some very healthy ramples of Asculus rubicunda, worked on the common ort: and we were told that Pavia fiava wa on its way out from England, and would be very soon in our gardens. Of Thorns there is a good pariety -Cratagus pJrifa, C. macrantha, C. Crns-gall C. prunifolia, C. tanacetifolia, and C. Douglasin, the last beautifully in fruit, the haws being twice the size of those of the common fhorn. No doubt that Thorns will be extensively planted hefore longnothing more ornamental for plantations can welleration of all planters. There are also a good many trees of the double red, and single red Thorns. Amongst other trees may be seen Grmnocladus Thorns. Amongst other American Ash Morns alber canadengis, Aleppo Ash, Ameblosomed Cherry, double white-flowering Chinese Pench, and many other novelties.

Of Conifern, the collection is quite in its infancy; atill there are a few worth notice. For instance, crowin, Pinea, P. Pumilio, P.montana, P.sylvestrie, P.Sabiniana, Pinea, P. Pumilio, P. montana, Ponderosa ; also a beatiful specimen plant of the lied Spruce Fir ; Prom thabita of P. Pumilio and P' montana, they planting in sandy placem, both of them growing very dwarf and bouhy, and being very ornamental and rady

In this garden it is intended to cultivate as many native evergreens as possible, many of them being equal native evergreens as possible, many of them being equa
as soon as they can be obtainod. Nothing can well be handeomer for our gardens than the native Veronios
already in cultivation, mumbering a dosen diutimet species. Of evergreens and sarubs the variety is almost endless ; mase of the chaveent are: - Mngitulia granditura nud M. anomofolin, both doing well. and very ornamental evargreens. The two varictics of Japan Spindlo-tree ave aleo very ormamental. Of Hollies doing well, therv are llez cornuth, I. Aquifution recarva, ferox-aurea, asmo-marginata, and albo-marginuta; alao Viburnum Tinus lucudum, eminingé 'enved and very distiuct from the common Laurentime; with Viburnum suspensum, japonioum and ragosem. The Latver in cosrac of time will make a zrand addition to olis flore-pleno. Ioviese may be gudud spirwa preal. Liguatrum japonicum, beautifully in flaner; Daphane Mezereum in fruit, whels in inrely ever sewn bure; and last nomonest many which muth be pamend over, Bym. plzoricarjus racemona, a dener matas of while bertion and fowern. No garden should bo without this orns. ental shrub.
Tender annuals fiomer bere in profraion, woch at Lio doable \%innia, Lobelia rumona, warlet eonual Jiax, Portalaces of difforent colourn, and many othor choice fowera.

Royal llogtscoltugal: Noember 7.-W. Wilmon Snuaders, Kisq., in the Chair. Sinveral now Followa were lected. The chafrmen of the Wloral and Proit Com mittees having reapectively reported the awards made by thoos bodies, the Rev. M. J. Berkeley made some observations on the suhjects hefore the mecting, in the course of which he explained the differencres betweon the eeveral races of Gourdes sll of which hed, he suid, been referred by M. Naudin to four typen matrely, Cucurbita Pepo, maxima, moschath, and melanomperma. The first was always dietinguishable by its furrowed foot-stalks: in the second the foot-ntalta were not furrowed, and the skin was unally tonder; the third was a delicate plant which rarely perfected fruit in our linate, and the fourth might be knowa by it black secds. He also mentioned that ulile mo many of the true Gourds were wholecome, and largely ased for fiod, the Lagenarias, or Bottle-Gourda weres he believod,
in all cases deleterions. Major Clarke mado a few eomin all cases deleterions. Major Clarke mado a dew emom plants exbibited by Mr. Bnll, to which the Floral Committee had awarded a Special Certificate. The Chairman then drew attention t) the receent lome which had been sustained by the Sxciety, an well an by the sister sciences of Botany and Hnrticulture, in the decease of Dr. Lindley, o:se of the ablent botanint. at the present age, and a prince among horliculturinte whose laborious life had been devoted with cminent success to the advancement of Morticalture and liotany and, intimating that the Council had just paned a vole to adopt a similar recolution, which was ananimoasly agreed to.
greed to.
Nor.
(Floral Committee).-Among the subject produced on this occasion were several varieties of Chrysanthemum from Mr. Salter of Hammersmith One of these, called Gloria Mundi, a deep rich golden yellow, finely incurvel, and of excellent form, was very beautiful, and received, as it deserved, a firmt-cian Certificate ; a similar award being aloo mad. in the case of (rolden Ball, a stiff petaled flower of a goldinn auber colour. Golden Leverly, a soft clear yellow, charming in tint, and of great depth, though an showa not saevenly incurved as the fisst-named, reccived a second-clas Centificate; it seemed to be a free-blomer, and for ornamental purposes will be a mont valuatic acquistion. Another variety, with short stiff petain, rowy yurple inside and pater on the exposed end-clase Certificate Hereward, obtained also a Second-clasn Certificate. white variety for pot culture; and Prince of awomono large Anemone-liowered morth of good form bus rather dull (pinkish rone) in colour. Mfr. Bull reocived First-len Certificate for apecies of Cusert (probably C. refexa) growing on IVy. The little whits bells on the filiform leaflees stems, resemble Lily bell trung on threads, and are deliciously fracrant; it was rewarded as a curiosity. To the same exhibitor Sucond-clase Certificate was given for Selaginelle Martensii albo-variegata, tho brakches of which-wero freely blotched with white Mr. Bull also had common Aucuba in berry, to which, 3 woll conainting collection of medicimal planti noticad whong. From Messrs. Osborn sons came Parochetas comaunis, truiling blue-flowered papilionaceous plant, said to be hardy, and likely to be useful as an antumn-blooming basket plant for greenhomes; to this a Samond-rlam Certificate wat given. If. Fleming showed som Pariegated Primulas and Pelargonium, which the Committee deaired tomed likely to be an improvement on the variety called Golden Chain
Nor, 7 (Fruit Committer).-A Special Certificate was awarded on this occanion to Mr. Downing, gr., Marbury Park, for very fine apecimens of Pomegranaten, ripened in on ordinary gieenhouse. Mr. Challin, of schild Piry

Was awarded A similar mark of distinction was also conferred on fine-looking ronts of Dewar's short-topped garden of the Society came a collection of Apples, and Diamant Traube Grape, a fine variety of the Sweetwater class, by no means new, but well worthy of more general cultivation thay it has hitherto peceived. Mr. Vair, gro to Lady Dorothy Neville,
furuished a fruit of Monstera deliciosa, apparently not quite ripe. A collection of Gourds was shown from the garden of the Sooiety, and gome rare kinds of the Mame clase of fruits were oxhibited by the Rev. M. J. Berkeley.

Genera Plantarum, fren aret. G. Bentham et J. D.
Hooker. [The Geners of Plants, defined according to speoimens principally preserved in the Herbaria of Kew. By George Bentham and Joseph Dalton Hooker. Vol. I., Paxt 2. Containing the Polypetalous orders of Dicotyledons, from Leguminosze to Myrkacero.] Large 8ro., pp
\(\& \mathrm{Co}_{4}\); Williama \& Norgate.
More than three years have elapsed since we recorded in our columans the publication of the First Part of this important work, upon the commencement of which we then congratulated the botanical world. We have now
Fart. Long as the interval between the iesue of the two appears when measured by the value of the work, and by our impatience to get possession of it, it needs but a glance at its pages to convince us that no time has been lost. The First Part, consisting of 432 'pages, completed the series of Thalamifloral orders, divided by our authors into two great series-Thalamiflore and Disciflore-and included a single order (Connaracem) of Calyciflore, the third and last division of Polypetalous Erogens. The Second Part, now before us, contains about 300 pages, and gives 11 orders of Calyciflore, beginning with the vast group of Leguminose, which alone occupies 166 pages. Rosaceæ, Saxifragex, and Crassulacep follow, then come five small 110 species ; and Combretaceæ and Myrtacer complete the Part. We learn from a notice on a fly-leaf that Melastomaceæ, Lythrarieæ, and seven other orders, including Cucurbitacece, are nearly rearly for publicaPart but for the severe illness of Dr. Hooker, which prevented the necessary final revisiou, without which they could not be sent to prows. As we rejnice to know that this illness is now a thing of the past, we may look forward to a speedy completion of the first volume of the work, Umbellifere and Araliacee being now alone wanting to complete the tale of Polypetalous orders, with which we are told, it is to be brought to a concluaion.
The orders included in the prement Part occupy verg nearly the same relative position as in the "Prodromus" of DeCandolle, to the arrangement of which our authors seen inclined to adhere, not sticking to it servilely, but not deviating from it without good cnuse. We find in the present Part closely associated with Saxifrages, which our authors consider to be their nearest athinity. Indeed, they include Parnassia in that order, which alone of all the reputed Droseracee is markedly porigynous. Our authors not only follow DeCandille in considering Haloragex distinct from Onagrarieæ, but regarding them as much less closely related than is commonly supposed, they place them at some distance apart. Gyrocarpus and Illigera, two genera
of somewhat doubtiul relationship, are included anong Combretacez.
The favourable opinion which wo were able to express of the Firat Part of the "Genera Plantarum,"
has been confirmed by experience. Io far as we have been able to learn, there is but one opinion as to the
practical utility of the work. The facility with which genera can be determined with its help, is, no doubt, mainly due to the almirable diagnostic tables, the preparation of which must have given our authors on the correctness of the generic characters, which have ovidently been carefully tested by oomparison with the herbarium. It is most satisfactory to all working
botaniste to have at last a good manual, which when botaniste to have at last a good manual, which when complete will, to the extent of the material available,
form a standard work based upon an examination many or a!l the apecies of each genus. The orders now gone over, with a few roore soon to follow, are those which (short of Endogens) most of all required revision, so that more rapid progrese may by aud by beyond the bounds of possibility.
f. It if well known to all botanists that the great order of Leguminosse, here estimated to contain 6500
study to one of the authors of the work betore us.
Mr. Bentham has in a variety of forms published his views of the classification of this vast order, sometimes describing the species of a particular tribe, at another all the forms which inhabit some particular country. He bas in fact boen long regarded as the greatest authority with regard to it, and it is most whpartant to have his matured views of the order, which he divides as usual into three sub-orders, the
mits of which are considered as wall defined. Suc is not the case unfortunately with the 23 tribes, for the distinotion of whioh ho has in vain sought to find
satisfactory characters. So far as we can judge, the other orders, great and small, are all worked out with equal care. Errors of detail will no doubt be discovered, but their discovery will be a matter of time and labour. It is probable too that the publication of this work will lead anew to great disoussions on the principles of classifiontion, the rastly increased number of correct data now available in its pages affording a fresh starting point for apeculative botanistso
We are disposed to regard as one of the mont satisfactory features of the work that it sets itself steadfastly in opposition to the prevailing tendency to the undue multiplication both of orders and of kuowledge, to speak with guthority on the question of the proper limitation of both. Throughout the work the authors go as far as possible in the direction of
synthesis, uniting with the larger orders an number of less extensive types which are generally regarded as independent, Thus Rosacem include Chrysobalanem, Amygdalem, Sanguisorbem, and Pomacem, and under the Saxifrage order wo find not only Escallonies and Cunonier, but also Philadelphus, Ribes, Hydrangea, Francoa, Roussea, and Brexia, all of whioh have at one families. Chamelauciea, Lecythiders, and Napoleana are in like manner included in Myrtacem. The same principle is carried out with regard to genera. sound, are at firstrather startling. Thus, under Prunus we find not only Cerasus, but also Amygdalus and Armeniaca, and the tribal name Amygdaleer gives place in consequence to Pruneæ. Cydonia is joined with Pyrus, from which it only differs by the number of ovules; and Sanguisorba with Poterium, neither the unisexuality of the flowers, nor the number of stamens, affording a oonstant character. Astragalus includes Phaca, but not Oxytropis. Ervam is brought under Vicia, Orobus under Lathyrus, and many other lons familiar instances might be adduped,
The careful estimates of the number of speoios in each genus" is quother very important feature of the work. In the case of large genera, they can of course be regarded as approximations only, as no exact reckoning can be made without a detailed study of all the apeoies. The present Part contains the characters of 700 genera, which are estimated to contain 11,000 species. In the former Part there were a few less than 1300 genera, and about 13,000 species. Taken together, the proportion of genera to species is as 1 to 12 ; but whereas in the First Part the ratio was as 1 to 10 , in the Second Part it is roughly as 1 to 15 . The cause of the greater proportion no doubt is, that the Myrta Part contains the orders Leguminose and First Part one order only (Crucifere) exceeds 1000 species, and that only by a very few. The proportion of gonora to species is, as a rule, groater in small orders. Thus in Hamazaeliders there are 15 genema, all well marked types, to 30 species. In the present Part 24 genera contain upwards of 100 species. Of these seven contain more than 200 species, but only two of the seven, namely, the genera Aeacis and Eugenia, have more than 500.
In a few cases we observe that a familiar name gives place to a less known one, in obedience to the laws of priority. Thus, Jonesia gives place to saraca, Genetyllis to Darwinia, Adamia to Dichroa. We suppose that these changes are necessary, but we confess that we look on them with regret, from an unwillingness to part with old familiar frieuds. Happily they are not numerous, and it may be looped that the present work will, for all future time, be regarded as of sufffeient weight to induce botanints to socept it as a standord, and to refuse to
adopt any future alterations adopt any future alteratione.

aeel is chje ctionable, and will, we hope, in time be amended. Sinmewhat more core is taken to suit the taste of the Ilum, which is worked partly na a stock
called the Brussels, and partly manother variety raised
from German seed. The wild Cherry is used as a stock for the Bigareaul and White-heart Cherries, the Mahaleb for the May Duke and Morello. The Peach is badded on the Musel and Black Damask. In France the Almond is used as as asock, and purchasers of Peach
trees in that country should remember that trees will trees in that country should remember that
not live on to teder a sockek in this country
In the various quarters of this parto of the nursery are trained Apricots, Peaches, Peerrs, and Cherries, ail exhibiting remarkable vigour and health; we also find numbers of dwarf pyramidal Apple trees or Apple gtocks for small gardens, evidencing a growing taste for fruit culture amongst amateurs. Owing to judicicous grafting an amateur may now cultivate succeesfilly
large numbers of dwarf Pears and Apples in a small large numbers of dwarf Pears and Apples in a 2 small
space of ground. Crossing the road, which here again divides the nurseries, we enter into a division 8 acres in extent, occupied as a nursery only four years since, and now filled with nursery stock.
Mr. Wrarner enjogs the sing galar advantage of working a farm and nursery conjointly. The farm, which 15 270 acres in extent, ajojiins the nursery, and whenever additional land is wanted for nursery purposes, it can withont difificulty be appropriated. This new division is shiefly fillud with Roses and fruit trees; of the former there are here above 10,000 , and summing up the number of fruit trees found here and in other parts of tho nursery, we find that the whole amounts to the extraordinary quantity of 200,000 trees. In prothe extraordinary quantity of 200,000 trees. In pro-
ceeding through the different quarters we notice great plantations of standard Apples, and others growing into standards. It will be interesting perhaps to follow the history of an Apple tree while in the nurseryman's hands. Raised from seed, the stock at two years old is fit for budding; after that operation has been performed, the first year a tolerably long shoot is formed, the second the shoot is allowed still further to extend itself, and forms a head; the side branches, left by some to give strength to the tree, are pruned off the following spring, and the tree is then ready for sale. We noticed one quarter of Apple trees pruned as pyramids, four and five years old, offering many temptations to a fruit grower, the trees being full of bearing wood.
The Plum occupies no inconsiderable space in this nursery, we saw about 6000 of one variety alone ready for sale ; it; is the kind called Denyer's Victoria, and is one
of the most prolific we possess. Amongst other nursery of the most prolific we possess. Amongst other nursery
stock we remarked a large quantity of budded Elms growing most luxuriantly; all the varieties are worked on the Wych Elm; there are some 20,000 prepared for sale in this way.

North of the Abbey walls is another portion of the nursery about 6 acres in extent, chiefly filled with fruit trees in various stages of growth. Our survey of these extensive and interesting nurseries finished here; the extent of ground occupied by them is 57 acres, and we have seldom seen that extent of ground better or more profitably or more judiciously occupied. 'The whole nursery reflects great credit on the management of Mr. Warner, who acts under his relative, and brings energy, enthusiasm, and knowledge, to bear on the working out of the many problems in vegetable physiology involved in the cultivation of the diverse at Leicester.

\section*{Miscellaneous.}

Sticklebacks' Nests. - Let me ask the reader to accompany me, in thought, any day in the months of May and June, to a pond or shallow stream. We will take with us a hand-net, and a tin or zinc can, for the capture of specimens, and a separate vessel for the nests and eggs. Let us auppose that we are on the bank of a clear pond; now for a stickleback's nest. I lie flat down upon the Grass, and geritly move away with my
hand the floating leaves of the pond-weed (Potamohand the floating leaves of the pond-weed (Potamo-
geton natans) and the green Conferva, and look about me. Ab! do you see that little fish with crimson breast, and eyes like emeralds sparkling; see how wide awake he looks; depend upon it he has a nest not far away. And here it is, very plainly to be seen, partly covered with the sand and mud at the bottom of the water. Do you notice these roundish holes in the nest? Bravo, little stickles! he is at you like a bull-dog. How angry he is; if his power were equal to his will, he would swallow us all up. Now we can easily catch him. So I put my net near his nest, and over the net he swims, and out of the water he comes, and I put him in my collecting tin. Now, let us watch the nest, and see what will happen. Here they come, a hungry group of sticklebacks of all ages, and
alas! for the depravity of piscine nature, they are alas! for the depravity of piscine nature, they are
attacking the nest and devouring the precious morsels inside. Let us restore the father fish to his native elements and his familiar haunts. Quick, or the work of deatruction will be complete. In he goes, and for a moment seems to have lost all recollection of past events. But no! he is "coming to himself," and boldly to the rescue of his house and family, first tilting at one and then at another of the enemy, nutil, mirabile dictu, he has driven every vanquished foe far

But he has other work to do, he must repair the home
hastens hither and thither, carrying in his mouth little bits of weed and stick, and dubs them into his nest till the work of repair is completed. Rev. W. Houghton, in Intellectual Observer.
The Tobacco Trade at New Orleans.-In 1863.4 the supplies of tobacco here were too trifling to establish a regular market, and there has been but little
improvement since. The stock has varied from 594 hogsheads in September 1864 , to 1031 in December last, and 873 receutly. In comparing the year's business with 1863.4 , it appears that the total supply has consisted of 3004 hogsheads, embracing 594 hogsheads on hand at the commencement of the year and 2410 received since, against a supply of 1638 hogs heads last year. The exports have comprised 1831 hogsheads against 797. The reported sales have been confined to 300 logsheads against 514. Prices have exhibited a wide range. Journal of the Society of Arts.

\section*{Calendar of Operations. \\ \section*{(For the ensuing woek.)}}

Promecion from frost will doubtless soon. Jemand attention in every department, and particularly in regard to pits and frames. These usually contain some
of the most msefil plants for both in-door and out-door decoration, as well as the choicer and more tender kinds of vegetables. In protecting these useful importance to keep them, and everything about them, as dry as possible. This points out the superiority of wooden shutters over mats or any other textile manufacture which is not impervious to moisture. Another advantage is in their not lying too close to the glass, as a cavity is thus secured, which, in conjunction with the non-conductiug properties of the wood, tends to prevent the escape of heat. To this we may add that they are more easily put on or removed, and prevent the breakage of glass, which is scarcely avoidable in handling frozen mats. They are a little expensive in the first outlay, but their durability, combined with the advantages just enumerated, is sufficient to
silence any objection upon that head. Where mats are silence any objection upon that head. Where mats are
used, they should be hung or spread in the most convenient place for drying them during the day, as they are by this attention rendered nuch more serviceable in excluding frost. During very severe weather it is a common practice to place a layer of hay or straw between the mats and the glass.

\section*{FLOWER GARDEN AND PLANT HOUSES.}

As soon as any of the flowering plants in the conservatory become shabby, they should be removed to make room for Chrysanthemums and others which are coming into flower. In arranging these, let the situation of each be suited as much as possible to the nature of the plant. With regard to temperature, also, some require to be placed in the warmest parts of the conservatory, while others will be satisfied with a simple protection from frost.

AOHIMENES.-A batch of these may now be started in heat for stove and warm conservatory decoration. They may either be grown in pans or pots, according to the taste and requirements of the cultivator.

AURICUlag. - Give these air on all favourable occasions; remove dead leaves, and keep the surface of the soil free from Moss. Water sparingly.

Bedding Plants.-Cover securely at night, especially wheu frosty, bat during favourable weather give air pretty freely during the day.
Calcrolarias.-Herbacenas sorts in pots will now be well established, and will require little attention beyond that of frequently fumigating them to keep down green-fly. Such as are required to bloom a little earlier than the others may soon be shifted. In doing this it is a good practice always to sink the ball a little, in order to admit of a top-dressing of fresh mould being put over the riper parts of the young wood, increase of the strength of the plants. Thorough drainage, too, is a point to which particular attention must be paid if healthy well-bloomed specimens are desired.
Cameleras.-Any now coming into blossom should be liberally supplied with water. Air must also be given whenever the weather is favourable.
Cifinese Primulas.-Forward plants must be well attended to with water, and carefully lept out of the way of cold currents of air. As soon as those now in beauty have faded, replace them with others coming into flower.

Prlargoniums. - Plants of these intended for flowering early should be placed as near the glass as possible. Let the night temperature range between \(40^{\circ}\) and \(50^{\circ}\), and see that none of the plants suffer from want of water.
Violets.-These will soon be in flower. Their beauty and fragrance will be increased by letting them have plenty of air whenever the weather is sufficiently mild for that purpose.

\section*{FORCING GARDEN}

CUCUMBERS, - Do not push these too much at this dull season; but keep down thrips and red spider in houses heated with hot water by maintaining a moist healthy atmosphere.
Pings.-Plants intended for fruiting during the
have a steady bottomolneat, and attention. Let thew at night, allowing the thermometer to rise \(10^{\circ}\) as 50 higher during the day time.
VINES. - Let any fermenting material upon bondan of the early house be examined, to see that it does not
get either too hot or too cold; the former will necessary to open it out or remove a portion reader it in the latter case it should be turned over of it; bet portion be mixed up along with it. Avoid a high perature at night, and admit air freely in fine weatote using the side ventilators only when it is showers.

HARDY FRUIT AND KITCBEN GARDEN. All kinds of pruning should be pushed forward m: as much expedition as possible, while the weather
favourable for that kind of work. Also lat of vacant ground be done with all convenient deaci
Cauliflowers.-These, together with Endive Lettuces in frames, must be frequently examined, divested of decaying foliage. A little lime and sprinkled upon the ground will also be beneficial keeping them free from the ravages of slugs.
