\section*{Che Ggricultural (bajette}

SATURDAY, NOVEMBER \(11,1865\).
OUr readers will find in another page a full report of Mr. Howard's excellent and elaborate paper on the Cattle Plague, read on Monday last betore the London Farmers' Club. In the oourse of the discussion which ensued, we had the history of the visitation again described by Professor Simonds, who vindicated the conduct of the Privy Council in oonnection with the subject. Sir G. Jenininsons of Gloucestershire, on the other hand, condemned the Orders in Council which had been issued. Other speakers detailed the ciroumstances under which partioular farms and districts had suffered. But upon the whole the disoussion, though unusually prolonged, added little to the well-digested statement of the whole case in Mr. Howard's leoture.

We are requested to announce that an International Show of Cheese will take place at Paris on the 20th and 21st December, when gold, silver, and bronze medals will be awarded to exhibitors of the finest cheeses. The entries close on the 1st December, and forms of entry, with all information, will be supplied on application to his Excellency the Minister of Agriculture, Paris.

A Special Meeting of the Counoil of the Birmingham Cattle and Poultry Show was held on Thursday at the Queen's Hotel in that town, Mr. R. C. Chawner in the chair, when the following resolation, of which notice had been given, was proposed by Mr. T. B. Whiarit, and seconded by Mr. T. Horlex, jun. :-
"The attention of this meeting having been called to the the cattle plague in many parts of the country-Reselved That it would be injuliciopss and improper to hold a stow of cattle this year in Bingley Hali, as previously contemplited, and that an intimation to the effoct that no catte whil be Gilled up cattle certificates of entry ; but that the arrangements rates of charge for exhibiting agricultural and horticultural
implemente bs occupied."
The resolation was opposed by Mr. WM, Woodward, Mr. Henry Osborn, Mr. Johis Lowe, Mr. Wh. Fowler, jun., the Chairman, and other gentlemen, and ultimately negatived. Mr. Councillor Lowe afterwards proposed a motion, of which he had given notice, for the postponement of the Show for one week, from the 2 uth November to the \(2 d\) December, which was adopted.

Imagine a long and narrow building, mainly of wood, whose side elevation presents to you two tiers of flooring open through wirework gratiog to the air; with, above these, a felt roofing, and beyond them a further elevation containing louvre board for ventilation, surmounted by glass roofing for light. Its section is about 8 yards wide and 4 yards high, including a central passage of 5 feet width under the glass roof; and apartments in two tiers on either side, both of which present a perfectly sheltered room to the inner passage, as well as the open divisions (seen outside) to the air. You onter at one end and lontilated ; and
(by means of an air culvert underneath it), if necessary, well warmed.

This is Mr. Gerelin's idea of a poultry bouse, as desoribed in his exhaustive treatieo on poultry breeding, "lately published. And it is no longer now a mere idea. We have lately visited the fome for Poclits, near Bromley, in Kent, where the idea has been carried out by the National Paultry Cumpany with every prospect of a suecessful issue. Only one of a series of niz nuoh breeding hounes which are proposed has been as yet ereoted. The whole, however, when completed, with accompanying yards for the rougher and more wholesale management of common birds for food, and an establishment both for setting and for fattening fowl, will ultimately, it is beliered, turn out many thousand head of fattened poultry anmually, and many thousands, too, of the purest blood for breeding purposes in the rear. Fon miter tho building at one end, and look down a clean bright avenue, 350 feet in length. As you traverse this passage you see through the doublefloored and open grating on either side families of the best l'rench breeds-Crêrecuur, la Fliehe, and Houdan (each containing six hens and a cook)-also of Dorkings, Cochin Chinar, Hamburghs, Brahma loutras, Spaniwh, \&e., the best breeds known in England. Fich family has a space of 4 yards in length, with a correaponding length without, in the one care epen to the inner passage, in the other open to the air; in the former a deep sands Hloor, in the latter a init of farm yard as it were, well bedded with straw. In the former are their roosts and their feeding boxes and drinking troughs, and from it, encronch = ing on to the central passage, they enter the laying nests-basins filled with earth or hay-anugly sooluded from the observation of the others. All this is on the ground floor; above them, about 7 feet from the ground, is another floor, on which ohickens, also provided, as we have said, with an inner and an outer chamber, are reared. They have the caro and comfort of an artificial mother:-a low curboard, as it were, with its ceiling thiokly fringed with hanging wool, under whioh they run for warmth and shelter-and they looked healthy, prosperous and well.
Many of the families and broods here, looking in oondition fit for the Bingley Hall exhibition, where some of them no doubt will show themselves, have been already for six month in this confinement, and there seems no reason to doubt the assertion that good and healthy breeding condition can be maintained under such circumstances without that prolonged and extensive daily run which country birds generally recoive. of course great care is taken to provide them with proper food. It is one part of the scheme that these long buildings are to be separated by land for market gardening, by which the manure from them may be utilised, and on which also green food may be grown for the maintenance of the birds. The daily food for the breeding fowl is mixed bran and Barley, with Cabbage and other green stuff chopped up, Animal matter, too, is added in small quantity. The contrivances used as feeding-boxes and drinking fonntaina are exceedingly ingenious.

There are altogether 100 of these separato and double-floored establishmenta, each 4 yards long, placed end-to-end on both sides of the central avenue in the one long series which alone has been as yet ereoted; and between them, on both nides, young Vines are oreeping upward, whioh next jear will help to beautify the interior, and perhaps provide a canopy of fruit as well as leaf. At the end is the accommodation for sitting hens and fatting fowl. Small coops, very olosely packed in darkness, are provided for both parposes, both the processes being bent carried out in perfect quiet, broken only by the visit of the feeder or the crammer twice or thrioe a day during the period of three weeks which both the hatching and the fattening seom to need. Here, too, is a room where artificial incubators are soon to be st work; and as the artificial mothers, where care is taken to provide well broken food and sufficient shelter, seem to be successful, we shall no doubt soon have well-grown birds produced in quantity-almost manufactured by machinery.
Here, too, is an establishment-also rather closoly paoked, as it seemed to us-for breeding, rearing, and feeding rabbits of special sorts for which there is a demand. Beyond, again, in detached wooden buildinge, provided with exteneive yards, large quantities of more common sorts of fowls are being fed. Turkeys alno are being crammed in quantity; and provision is made for - Poultry Breeding in a Commercial Point of Viow, wo. By
the breeding and rearing of duoiss. It is impossible
to doubt that good organisation, wholesale production, division of labour, and careful superintendence, will be followed by the same eoonomical and profitable results in poultry management as in other "manufactures." And it is very proper that the immense field whigh our imports show is open in this country for the growth of poultry and of eggs should be made the subject of a partnership enterprise of the kind on which the National Poultry Company have entered. The Company are still only gathering their stock. Some hundreds of first-class birds, for the supply of what may still be oalled the demand for fancy breeds, have been procured from France and from the beat breeders here. And only a few hundreds of common birds are feading, But when once the place is fully stocked, and the large contracts which pur great hotels and clnbs would gladly make are in full operation, the Company will no doubt have real power and place among the great commissariat agenoies of the metropolis.
We shall hereafter call the particular attention of our readers to the plans of Mr. Gerelin, as described in his very instruotive treatise.

\section*{CHEMICAL NOTES}

By Profensor A. H. Church, M.A., F.C.S.
Spent Galls as a Manure.-Vast quantities of nutgalls are imported into this country for the sake of the tamnic acid which they contain. This acid (with several other substances allied to it or derived from it) is largely employed in tanning, dyeing, photography, the manufacture of ink, and in medieine. Having heard that the spent galls are eagerly sought after as a manure for market garden crops, and that the favourable effects of their anplication to the soil are very marked, I thought that an aualysis of thern might prove of interest. The sample of spent galls
analysed was placed at my disposal l.y Messrs. Hopkin analysed was placed at my disposal l.y Messrs. Hopkin Wandsworth. The nut galls retain something of their original form; they are morever hard and tough though porous. The subjoined analytical details seem to show that much of their stimulative action on vegetable growth should be assigned to the mechanical improvement of the soil which they effect, and their decay, of the chiof manurial elements they do, however, contain a distinat though small proportion. The calculated monay value of the spent galls would indeed not exceed 29 s. per ton, if we premature to say usual data, but at presero tosing premature and if soy woder what agricultural conditiong thelr use is likely to prove advantageous.

Use of Oarbolic Acid as a Precaution against the
Cattle Plague.-Chloride of lime and permanganate of potash, though excellent disinfectante, have their diso advantages. Chloride of lime produces irritating vapours, and from its powerful chemical action does pther work besides destroying the virus of infection. Permanganate of potasli can act only when in solution, the ozone which it yields does not seem to make its escape from the hquild, and thus it can scarcely bo considered as an effective purifier of tha air. A third substance, the vapour of which readily diffuses itself, The offensive smell of sulphuretted hydrogen or of an untrapped drain is destroyed in a few miputes by the introduction of a piece of cloth moistened with carbolic acid; and there is geod reason to believe really destroyed. This is not the place to dilate generally upousthe used of carholic acid, but we may stute that the value of this agent in medicine, surgery Ind dentistry, is becouning day by day better known. acid as a precautionary meazure against contagiun of infection.
To keep the air of a buildiug used for cattio clean board, and then soaked with many be lough carbolic acid (costing 1s. per pound-one pound will last for montha). The board is then lhung up within the
building. building.

With homed eattlo another mode may be sdoppod. A piece of thick flannel, an inole on two broad, is made of the animal; this flanuel riug is then painted over with earbolic acid

Tho object of both these plans is to diffuse the purifying vapour of carbolic acid in the air surrounding several localitios, and tise general have been tried in theported as particularly excellent. So far no case o the cattie plague has occurred in any animal so treated
though some of the trials are being carried on in the the efficacy of my precautionary measure, but I consider that there are fair grounds for anticipating its success A writer in the Times lately recommended "dead oil" as a disinfectant; carbolio acid has the concentrated College.
ail 4. A. O., Royal Agricultural

\section*{gTEAM CULTIVATION. Fowler v. Smitiz.}

Mr. Josrep Nioholis, of Queen-Camel, Somerset, has kindly come forward to assist us upon the subject of steam cultivation. I shall pass over that part of his letter where he "admires my pluck" and go at once to business. He tells us that he is "not an implement maker or an agent for the sale of any implements whatever, and that he has no personal interest in the dispute as to which is the 'best applicatiou.'" Upon the first point I can balance off with him, for I am "not an implement maker or agent for the sale of any implements whatever," but I am personally interested in the dispute as to which "if the best application," not because I have ever received any pecuniary advantege from the sale of the "Little Implement," for I have spent every farthing that I have earned by suchisale (yes, more farthings than I have ever earned by such sale) in the promotion of steam cultivation generally, aud I never principal patents date March, 1855 , and January, 1856 therefore the 14 years them will soon be over, and as the Royal A aricultural Society of England has done its best to choke the spread of steam cultivation, it has pretty well choked the sale of the "Little Implement" (without being able to shove the big one qhead, and we will see presently what Mr. Nicholls' help to them is worth), for I have gole goes on for the next four years, there is no chance whatever of my ever netting a farthing by such sale therefore upon that point I ain talking as disinterestedly as Mr. Nicholls, for he tells us that he is "abou's the England-that he has for the last two years and a hal Eagland--that he has for the last two years and a half
let out two sets of Fowler's large double engine tackle in his county." Then how can he bo disinterested when he has got over 2000l. at stake upon it tice upon the subject, and I will pay due respecto what Mr. iNicholls is telling us now, but he must not imply that he is less interested in a pecuniary point of view in the matter than I am myself.
The battle has been and is now between the Royal Agricultural Society of England and William Smith, of Woolston. The Royal Society. would have its old plough, and then it would have its locomative engine. William smith started with the cultivator and common portable engine, and stands by them now. The Royals
have been obliged to succumb to the cultivator, and the great battle now going on is as ta which is the engine, the common portable or the locomotive. Mr.
Hutchinson's comparative statement is strong evidence on the side of the common portable. I have remarked upon it, and I beg that you will allow me to yemark
Where did Mr. Nicholl
get "two sets of Fowler's large double engine tackle" from? Two years and a quarter ago at Worcester, Fowler brought out his first set, of double engine tackle. That sat was broken in my own sight in the trial field, and singe that period I have never heard much about tackle made upon that principle. A year out another double engine set, the set upon which we are now talking. Large double engine sets upon that principle have been sent ont siace that period. How Mr. Nicholls could have got a large double engine set by Fowler two and a half years ago I cannot for the life of me understand. Is it true that he did get it then? and is it true that he has had that length of practice with it? Let him explain.
Mr. Nicholls tells us that the com
of Mr. Nicholls tells us that the comparative statement support that he tells us that "nothias whatever is said about depth and quality of the work dune." Let me refer him to the letter that you kindly published for me in your Paper of October 28 last; he will there
find that the worl to be done was of the roughest and herviest character, and that the work when done was of good quality to a depth of 10 inches, and that it ented in a good result, By it he may also see that the tackle was three years old when it went to Dunton Loilge. I can tell him that it did upwards of 2000 acres on Mr. Pike's farm 偱 Stovington, before it went to Dunton Lodge.

We are then told that the content is unequal hy "two widely differeut articles; the one a large powerheavy country and move from place to place (soractimes probably 10 or 15 miles), and that is calleal to go into the worst farms and the worst fields on thonse 15 inches deep; and tho other is a mmall set, kept at home on one farm, probably set out to suit them, and only moviny from field to field, and perhaps many of the same fields three or fouc times over, and only working about 6 inches deep."
* Now there is no evidence here, it is a mare opinion. Yot it is true that they are swo very difter of
articles, but how the comparionn of
 underotand the etatement, the tiane tukio. rat the tackle from farm to fawn is not cuis \({ }^{\text {el }}\) is
125 davs, and we have nothing whatever the work dono in Shropshire was done deener, then would be quite impossible to do it to a better tesu: I must have a word at " rrobably set out to se to suit the Woolston tackle, for the Woolston cacic can do any farm, be its fields what shape or form, for 2 may, no matter how irregular in shape or form they the Fowler tackle thregular in shape or form. It the Fowler tackle that needs furms "set out" "to sul done with horses is very considerable. Mr. Mosereo in his prize essay published in the Ropal Auricult: : Society's Journal, No. LI., Part 2, p. 331 , writes to form that point: form, with a road running along one it, on which the engine travelled while engrue
in the cultivation. The eastern boun in the cultivation. The e日stern' boundary foice lay good nearting perpendicular to the road, and formod good starting point for the steam cultivator. Whan 1 spot indicated by the do thed line was reached, we had the alternative of either wasting time by working the steam plough in short and decreasing len thy, or, as in horses. The corner, about two atres, was cult.rum entirely with horses." Here, then, is p sitive evid ... that Fowler's tackle needs fields set out to mi : 12 ,
the following will show that it was Fow 1 er's tavkle : Mr. Moserop was writing about, for he writes in the cssay above referred to, at p. 322-"Oul exnemince 12 horse-power engine: \({ }^{3 /}\) yet, strange to nay, that although they left these large corners, they, during the frst year of their working ( 1860 ), did not avany: three acres per day in doing 309 acres. On the eann
far:n the second season they dida littlo over fur ace. far:n the second season they dida littlo over fur ace. per day on an average over cor four acres jer dys The depth the last year was, ou f.11 aceat 9 inches; and on 102 acres, 7 inches. This t).... extent supports the quantity of work per dey
done in Shyopshire, but more apoit dept4 premantly. It is now quite clear that it is Fumler's biatlo tiat needs fields made to suit it.
Now let us have a word at the "jarse Is it sa? Let me refer him to a report in the North British Agrioulturist of Oct. 25,1865 , on 3 .f. Wright's farm at Beal worked by a Fowler's \(114 m\) ongine set bought af Newcastle in 1864. There he my read thus:-"Mr. Wright considers the obstaces h . chasing one, with the necessary implements anl tackle ; the expense of zepairs; the damage dore stiff headlands duving wet weather by the ongine nod vater cart ; and the impossibility on a clay farm moving the engine along the headlands whep a suall. fall of rain"occurs - or even a heavy shoryer may rellutr
it neeessary to stop oporations, and thus a less of time of the persons engaged in working the engine an saine paper of November 1, 1865, in a reporb
 tackle, including plough and cultivator, was gat short? are harvest of 186 have been ploughed
three or four times.
with, partly on account of the land boing natural retentive of moisture, imperfect drainage aget the evil. The stean tackle not being the autumn, before the wot weather set in. will continued the whole wiater, tie engiue
several times, and some breaiages touk pace. good deal of time was lost, particularly in the sprib when it was of great consequenall
work." Mr. Nicholls supports all work. "Ir. Nicholls supports all miz. from bad weather os breaka
 is positive avidenee that it cand if min wot lik stopped it while it was falling, for man do not
working in the wet; butt this tackle wil. : .
after it has done penining until tice land lecener after it has done rainme int mas, mast cha tine of the persons enghge in workn on and ne essarily be increave l. This unay to stim in : mere at a los cost. We lanst not

The breakages from all heary. Then I caunot see that
tivas for tackle to go out by hire.
such tackle that is
wet when with do
breakage, without chaying an extra pinge to

snenk for itself. Buty as recommend
Nicholls teils us "that there are and
hoot hool six or seven gets of Mr. Smith's own nearly all of which are to be let out, but ever employed, except when mine can't chey charge ouly \(6 s\). per acre and I charge 5 I bive in that quarter of this littlo isle a that ilerable number of sets. They have gone lut 1 know not as to whether they are used \(\therefore\) ritels or for hire. I never inquire about them, for know frow my own practice that they can do good sisk if they are properly managed. Let Mr. Nicholls reits the names and addresses of the gentlemen to re the hefers; we may then be able to get evidence shom the question.
Mr. Nicholls says: "the value and quality of the ark done in most of the public and private trials :an I have witnessed as between Smith and Fowler, is is a garden make to a spade." Where he has A: Chelmesford, in \(1856, \mathrm{my}\) little implement made ame very good work ou the heavy land that Fowler's finush could not be made to enter. Fowler had not a finvetor there. At Chester, the next place where we wet, and where Fuwler received the great 500b, upon trals worked out upon a false entry, and where also 1.e siciety awarded to a mere agent of mine a large
aid medal of honour for the practical work done by wis implemente, Mr. Fowler had not a cultivator at that meating. The next time we met was at Teddesley, There Mr. Fowler 'made but a very poor cut with in first introluction of a cultivator. The next mieet was at another; a 12-horse evgine of Smith's of conve being chauged secretly for the 10 -horse agiae he entered. The cultivating work done dono by my implements. The next and last time glan wo mat was at Worsester. Hers is what the jadges aaid about my tackle when contending for the prise for which it was entered :-" Mr. Smith with ts 10 horse double cylinder engine, driving his windLis and 3-tined grubber with 4 inch spud points in :se usual way. Throughout the whole of this trial he proerred a uniform and steady pace, making by far tie best work over ridge and furrow, and stirring the ai. most effectually." Then, with such evidence as \(t\) is before me, I ask Mr. Nicholls to tell us where thase public and private trials have been witnessed by
lim, for it is evident that it was none of those noticed sbove. Let us have no hole in the corner work. Let shove. Let us have no hole in the corner work. Let
than out with it. Mr. Nicholls, before finishing his cther, gives a little about "quantity of work done," and says that although I may do on an average, in Set tember, on my own farm, nearly 8 aeres a day, yet "Lot very deep now," he has done in the 25 working dirs of last September 9 acres a day on seven vouli his arms, from 12 to 18 inches deep. What and what is the value of work done from 12 to 18 inches deep It is quite evident that wet weather would and does interfere with him, and it is quite clear to me that he is making a plaything with his tackle by going
from 12 to 18 inches deep the first time over. I have gone as much as 24 inches deep at once by way of experiment ; but I know from practice, that on my tary clay land, that had not under horse culture been worked more than 5 inches deep, 10 inches will bo enough for many years to come. The hard, horsethodden under crust is thoroughly broken through, the iif and water passes freely through the under soil, and enowtra 5 inches in depth brings quite new clay no In for the present ; and if I were to do more than at I should bring up more clay at once than is Turpose,
Mr, Nicholls bas brought but little evidence to prove ihat his large powerful tackle is suited for him, or that it ctivijedted as such, for he himself proves that he is areage of 34 acres on each farm. In June last in I. I. Clarke, of Long Sutton, showed forth in the \(\because\) Nheng steam tillage upon small and mediumEn 1860 It addremsed a letter to the farmers of Crealatei it was published in your Paper an well as
" Pether ways: from is I quote thus:
Pefore showing the best practical application, I hara been famis acres on heavy and 7 ou light land spteen found to he an arerage day's work; that the applying stean-power to the cultivation of the soil; threabing and stong Sundays, and a few days tor Peptember and Octopeage by rain, the working days for 225 antied by 5 for heavy and 7 for light land, gives enitivated and 315 as the quantity of land that can be monthtel once over with a set of tackle within those a to be generally applied to the cultivation of the soil oive large farmer must possess a set of tackle of his between them or three simall farmers may have a set amangement, for Septemb of another, according to and it the work is to So be der and October will not wait, Ha monork is to be done well it must be done in

I ann furn the practice I have had since thet prime mun fully colvinced that nut onis the lage farmens smaller posene tackio of their own, but so mus the possession of a set, whose farms join may mon sn the to arrangement. To that extent the courract pyathe may do, but no further, for the mostha of ceptember and October will not wait, and I ant the wore frims convinced that if the work is to be dowe will it mite be done in those months; fur the days of Nureniber, December, January, and Febrnary are so short, insty, and dark, that it will never bo done well in thone montaso A little work may be done in Mamah, and that is all, for the land, if farmed well, must during the rest of the year be in orop. Besides those short, dirty, and dark days before reforred to, there is another point of vast importance-that of smashing up all the land in Soptember and October as roughly as possible, the
larger the lumps the better for the land that is to larger the lumps the better for the land that is to lie freely admit the percolation of the hat it may action of the atmosphere during the whole of the four winter month
Who are the mon, or company of men, who an find tackle to hire it out only in September and Oct ber, about 45 days in a year, and mako it pay ?
Mr, Nioholls has brought bis prectice to bear upon this question by letting us know that he did 225 neres
of heavy laud in 25 of the working das of of heavy laud in 25 of the working days of lawt September-a dry September. What would he have lone if it had been a wet one: and what would he du in 45 days, the avemge workable day for portable engine tackie in an average of semons hocording to his own showing it would not exceed 400 acrea. What
must his charge per acre be to pay lim for his time iu superiatendence, intereat of money, and wear anil tear on this great out'ay ! Such an outhy of caphital cught to keep him a gentleman. Those are points that he must
 little help in the me remind him that he can have but to be cultivater by steam power, engines must be too thick upon the ground for him to have much olance. In a moderately dry season his can do 400 acres and that's all. The less powerful portablo ones will do less of course-then their number must be great. He has but very little to support him. Mr. Hutohinson has shown that the Shropshire Company's chare per acre a a very high one-14s. 9d. per acre. The Gloucenter and Durham Companies are things of the past. The Wakefield Company is upon its last lege, with only le. for its shareholders, who drop all interest for their money, and their Secretary (Mr. Clay) workn for nothing and boards himself. Suph support will not help him much on the locomotive engine. ITe and the Rogals naust show hard if they show it by William mith and the little portable engive.
Mr. Nicholls showe that there are in his district some little portable engine sets of tackle. There are in that district a very considerable number. And as soon as I can get the Reyal's "choker" out of the way, that it is found "impossible" to move even after a heavy shower, they will go a-head again, for they can find other employment besides cuitivating-for they will have the threshing, grinding, \&c., on the famn where they are employed during the winter montha, and the eost of such tackle is but a mere trifie, eapecially if the ale of horves is taken into acoount, and it ought to be. About 380l. is all that is needed, and there are plenty of farmers in this country who an pull out such a sum.
Now, sir, taking it all in all, I cannot nee that Mr. Nicholls has made it clear that Mr. Hutchinson's in " \(a\) one-wided gffair," or that there is anything unfair in his comparisons. On the other band, I think I have plenty of evilence to bear probing, that a locomotive engime is a very slippery concern, especially to company shareholders. Money vested upon such slippery tackle is very slippery stuff itself. The Gloncester and Durham Companies have found it eo, the Wakefinh. Company is now getting into the same boat, and wait but a little we shall see the Shropshire men all rowing with them torether. I hope Mr. Nicholls will take care of his half-pence. The contract sysvem applied to Forsler's tacklo has done the contracting duals, although \(I\) am rivaly to have a fling at any steam Wultivating company whene Smith, Woolston, Bletchley Station, Buchs, Nov. 6 .

\section*{THE OBJECTS OF FARMING.}

THe papers with the above heading which appeared in June and July last, were irtermitel by tho mame absorbing topios of the peneral ciectim. ti.e harvast, he mostly, of the cuttle distant. Aasced arar, with their anxiutins amit the most part passed away, them but their mears for their losses, lenving hehnd for our thition, we may perlaps find leieure again to recur to thase primeiples of farming which I was aivocating, and gather up the improvements which would follosv frour their inction. We saw reason to believe that by greatly increasing our stock, and growing corn crops two years ont of three, we might sell off double the quantity of corn, and more than double the quantity of meat now usually produced, at the same time incrensing the con-
dition of the land and realising a much higher profit-
an an emple remumertion for the increasod capital and lebour bill.
The following Tuble will isto mides of the dirimbor on a \(400-\) nore thrm, manged, itt, on the old t-ourme, and \(2 d 1 \mathrm{l}\), on the new 8 -ocume aytiom :-

So that the drast man with 1000 L invested will make under 200l. a year; whereny the necond, with 2000l,
will realiee nearer 12002 . yepr. Nor aro the contingent advantages lems than the abovo. 4 man frming so bighly is nearly indopendent of romona While him neightour is suffel ing frem lifighe tranghts, or rains, his corn will be as near as may to fo yuartern to the acre every year; his Cabbacis anil M inveln will be double the weight of his neightemin's ruts. A rain, Instead of ranuing over the countiy at hariost time to get casual hande, he will contrive, ty t1e 15e of maclinery and the command of a largent theff, to cut famities of han 1 u -ual hands contented and work amoothly together of hay and larvest time be out over and the worl shinos-whieh I fear has not been the hencal experience of this summer. His lahourers ulso will he more handy and more trmetworthy. Inktead of an idle and stupid lot who can do only one things, say hocing, and that whinle you are Jouking at them, the bigh farmer will have secured an intellignt act who are used to engines and maclinery, are quicker at understanding orders, and far less careloss in ezecuting them. They have a greater interest in the farm, and consequently he snffers lese from their neglect, hath in his stock and in annual repairs. Stould he bo laid up or called away from home, thinga will suffer lesa from his absence. I am aware that mall farming experience the actual are far inferior to ti.e calculated profits annl
that the results of a rear seldom accord with omr expectations, but with the exception of one important item, disease of stock, the high farmer is, as I have just eaill, liss exposed to diappointment through an unpropitions seasnn than the man whose land is in low coudition. THE LON(i-HORNS.
As interesting article in the "Farmer, Magazine" for Alugust last has drawn our attention to this hardy and very uscfol breed of cattle. The fashionable breed of the present day no dould are the Shorthome, esjeccially in the midland counties; but it must be

At page 034 this figure was orroueonsisy net down at 6000 .
admitted that all "breeds not only have their admirers, but are by good judges considered most suitable for
different parts of the kingdom. In Herefordshire, the different parts of the kingdom. In Herefordshire, the
"white faces" or "middle horn" have the decided preference, and no doubt are first-class grazing animals, but are of little use as milkers. In North Devon, those
models of perfect symmetry, which appear indigenous to that part of England, are considered to possess firstrate quality, but never make heavy weights. In Scot-
land the "polled Angus" are considered unrivalled, whilst the "Sussex" and the "Suffolk polled" are equally prized in those respective counties. In some parts of the counties of Leicester, Warwick, and Derby, breed, and have been kept with great care as a pure race of animals for more than a hurdred years. Lately,
at our local slows, they lave come up to the Shortat our local shows, they have come ap to the Short-
horn standard, and won prizes from them. At the Sparkenhoe Show at Astiby, the splendid ox of Sir J. H. Crewe, Bart, of Calke Abbey, took the 1st prize from the Short-horne, and other similar victories have
been agained by the Long-horns. At the Royal Agricultural Show held at Plymouth this year, the sum of 302. was awarded to Mr. K. H. Chapman, of Upton, near
Nuneaton, for his Long-horns ; and in the report of the Nunenton, for his Long-horns; and in the report of the
Royal Journal, just published, on the animals exlibited there by J. D. Dent, Esq., M.P., senior steward, it is the greatest curiosities of the show," the 1st prize in lis class being awarded to him. A portrait of Mr Clapman's steer appears in the "Farmers' Magazine" with the following article:-
This steer was bred and fed by Mr. R. H. Chapman, and was considered by competent. judges to be
one of the best of the breed ever exhibited. In 1863 he took in prizes 25 l, , and two Silver Medals, viz., 1st prize of 102 ., and Medal, at the Smithfield Club 1st prize of 52 ., and Medal, at the Birmingham Show and 10l. at Leicester as the best ox or ateer of any breed, under four years old, bred and fed in the county.
He was also sold to the butcher at three yeare and He was also sold to the butche
eight months old for 50 gaineas.

The Long-horns have been bred at Upton for more than 100 years. The founder of this herd, Mr. selecting Long-horns in 1756, when he hired a noted bull called Twopenny, from Mr. Robert Bakewell, of Dishley, and acquired the reputation of being a careful
and judicious Ureeder of this sort up to his death in nnd judicious breeder of thisis sort up to his death in
1802 . Baicewell once said that 'George Chapman had
one of the best herds of one of the best herds of Long.horns that he knew any.
where.' For the next half century purity of breed and Where, \({ }^{\text {F }}\) For the nest half century purity of freed and
usefulness for dairy purposes were cultivated in the herd by his son, Mr. Samuel Chapman, and this stock at the present time is in the hands of his grandson. almost obsolete kind of stock, at least in the showyard, where they are regarded, chitefly as curiositioe-- Previous to the year 1791 history does not afford such n case of estraordinary prices for stock as were realised assembled at Rollright from almost every England. Two two-year-old heifers were resold at an and Young more than 40 grineas, and Garrick, Suitan, average of 2151 . 5s., might have been resold at an advance of nearly 50 guineas each. Fight years produce of Nell, danghter of Old Nell and Twopenny, sold for more than 1000 guineas. At the Croxall sale in 1811, Disbley Daisy and her calf were
sold for 2390. 8s. Shakespeare was knocked dorn to the bid of \(420 l\), and it is said that the enormous sum of 700 guineas was offered and refused for a 'thang horn bull named Tiger.' An old writer says, - that the superiority of Long-horns of this period was a natural or constitutional property of furuishing meat upon those parts of them which sell for most by the has been the cause of their going oution of What, then, extract from a letter of a Short-11orn breeder, who has been weil known as a first-rate judge of cattle for the last half-century, will best answer this question. He
says: ' I have no doubt, if the breeding of stock 50 years ago bad been as well understood as at the present day, and right principles had been carried out, but that the Longhorn breed of cattle would have occupied a very different position to what they do at the present neriod committed the same error as the breeders of Leicester sheep in breeding in-and-in, looking too much to fine and beautifinl looks, and neglecting the strength of constitution and depth of Alesh, which always must
be at the foundation of all good animals I I do think a good Long-horn cow will produce as great a return for the food she consumes as the beat animals of other breeds.' Another gentleman who is a warm admirer of Short-horns, writes rather amusingly as follows :'Certainly the best and liandsomest Loig. borns I have
ever seen I have seen recently, and for Lonq-horng, ever seen I have seen recently, and, for Long-horns,
they are indeed fine animals. I admire the enthusiasm with which a few cling to this expiring race; it reminds me of the zeal with which the Stuarts' cause was upheld through family feelings long after the had been reeognised and doomed by the general mans of mankind; and I fancy some of the breeders of Long. horns stick to them because their ancestors were breodery of the name kind for generationg. I have
ancient fame ; but I am strong in the belief that they have been dispersed for better breeds, and will never be resuscitated again; a few good Tories may stick to chem, bs some fine old English gentlemen cling to
knee-breeches and top-boots; but these fine old worthies will all soon follow the shade of the noble Sir Tatton Sykes. All honour to their memories ! they,
belonged to the best sort of the best Englisbmen The vastly improved standard to which the Long-horns have the last few years been brought at our national shows, proves there is no fear of the above predictions being verified, and the more so as the Long-horns are in the hands of such men as Sir J. H. Crewe, Bart.,
W. T. Cox, Esq., M. P., and Colonel Inge, of Leicester sheep celebrity. The showyard is considered the arena to decide the merits of various breeds; but if it is exceed other breeds in dairy and cheese-making produce, with less food, it should be remembered that not mere appearance, but that which pays the most after expenses are defrayed, is the test of real value; for it has been well said that 'a well-filled cheesc-room is the
best furnished room for best furnished room for a tenant-farmer.'
on one of our national shows a few years since found fault with a Long-horn cow for not being fat before she was seven years old. He entirely overlooked the fact that she had produced four calves, and made cheese and butter for four years, a feat which perhaps no other cow in the exhibition lad done, and was then sent to
the show with a the show with a year's feeding and not forced from birth, as a great many animals are for the sole purpose which can be profitably kept until a great age. Bake. well had a cow called Old Comely, whicich bred well, and lived to the age of 26 years, and when killed the fat on her sirloin was 4 inches thick; and we met with a butcher a short time ago, who stated that he kulled one of this breed at 22 years of age, quite fat also. There
is no doubt that the Short-horn "Herd Book" is no doubt that the Short-horn" "Herd Book" has been of great value to that breed; more recently the Hereford men have established one, and we recommend the facta as may be most useful to guide them in the laudable endeavour to raise the breed to its rightful position. What breed can boast of a longer pedigree than the Long-horns? Holme Pierrepoint, Babraham, and Warlaby will ever have a mystic charm; these worldd-renowned places, with many others, have a thousand pleasant reminiscences of bygone associations. So to Long-horn breeders will Rollright, Dishley, and Brsilsford ever be considered as classic ground. There are spots in most lands to which historical records give a national and lasting interest, some for heroic deeds of Valour in the battle-field, and some for the victories of the manufacturers of food for our ever-increasing population; and it must be ackrowledged that in the fimprovement of our domestic animals there is a wide observed that 'fox-hounds and race-horses are very fine animals indeed in their way, but it is a mistake to neglect the humble race of quadrupeds; for it is not denied that the ass, for instance, does more service in return for the cost of his keep and grooming than any distinctive marks of character, perhaps more than any other breed. A white back, coloured sides, with some spots on the shoulder or thigh, and graceful curving horns; in some cases in Loug-horns brindled sides are preferred, of a dark, cast, as it is generally supposed the darker colours indicate more strength of constitution. Some Long-horn herds are wonderfully alike in character, the progeny bardly ever deviating from the Gresley, of Drakelow, who bred Long-horus some 80 years ago, that he took much delight in keeping a dairy of cows aimilar in colour and shape."-Leicester Journal.

\section*{THE CATTLE PLAGUE.}

Br a letter from a friend jast received, I learn that the "Rinderpest" now prevailing here has attacked his beasts suddenly, with great malignity, some 300 miles north-east of Sydney, and reports have reached us from the Neilgherries of the cattle dying there of the same disease, and instances are not wanting
in England where the murrain has appeared in localities in England where the murrain has appeared in localities
far removed from all sources of contagion or infection.
Further proof is not needed of this visitation being universally epidemical and originating in some altered condition of the atmosphere, and hence all our precautionary measures, even with exclusion of all foreign animals from the kingdom (wise and necessary as such measures may be in the opinion of many), may not save us from invasion ; and I liold to my oft-expressed belief, that this disease might fall upon us at any moment.
We know literally nothing respecting the laws governing epidemics, and many may reinember how cholera in theor aghast on the first appearance of in all our attempts to account for the many novel circumstances attendant on its progress. We saw one side of rivers depopulated, while the othor side was safe frou the scourge-one side of a street suffering in continued comparatively healthy-a village without a single case, between two other villages sorely smitten.

STEAM CULTIVATION
Fowler v. Sumer.
Mb. Simon Hutohinson, professing to give 1 impartial and disintereated account of the cheat effectual mode of cultivating land by stat power, ventures to draw a comparison betweas and set double 14 horse-power engines as wo Shropshire Steam Cultivating Company. Hu ments, emanating from a genterng, might seriously affect steam generally, and influence the decision their land; and unless strong experience can be advanced to co
nents, the public might naturall working of two engines was altogethe and almost
contradict such statements, and
the two systems to a race betwee
horse. The former may, by chance
race, but would any sensible man prefer
horse? We know the fable, where the

Smith's stand with respect to Mr. Fowler's 4 horse-power engine set, for when properly they can easily curne that Mr. Smith's tackle is preparing to start, they can almost finish
work. But still, the praise Mr. Hutchinson work. But still, the praise Mr. Hutchinson
upon the working of his small upon the working of his small tackle wer is a correct principle, whether conducted wer is a correct principle, whether conducted rigu countries for steam ploughs, together iucreasing progress in their manufacture at and more especially at Leeds, must convince
prejudiced that its advantages are being known reciated.
appreciated. mn the farmer obtain a greater advantage from an the from hiring? Are the majority of farmeers sition to buy steam cultivating machinery? Have ovar qualified to undertake the management of
crpensive machinery? Have they facilities for expensive machinery? Have they facilities for demands of the steam plough ?-for unless eagines can be fully employed, their advantages are fully obtained. Iu the system of hiring and letting strict, und certain districts can be provided with the istrict, and certain districts can be provile; any shaped field can be worked by we two engines set, and no horses are required to nore them from field to field. We know the great live many proofs now of the still greater advantages d stam ploughing tackle when let out on hire. The dry or wet; he can keep a less number of in the stable 16 hours and only working eight; he can Fow his horses into money by working young ones hary work-in fact he can almost insure his crops, when otherwise there would be great risk incurred; frif for instance, compelled to work his fallow land in thapring, he might in a dry summer throw his chance
of Turnip crop away. Such are some few of the dinntages of steam cultivation generally, but I am atified that the system of working two engines is the gratat boon ever introduced for agricultural purposes; mannch as the farmer requires no additional capital, Tass no riok of missing his season, and can reduce his ruting expenses considerably. I have worked as
egineer with Fowler's small tackle for upwards of three yeare. I have also worked upwards of 100 double podine sots in Egypt, where we averaged above 15 acres menge quantity for the small tackle. I have done for meess together upwards of 12 acres per day with it an working for others, and I am now engaged to to the demand for their services is so great; and I en confident that they can almost do double the suall s of work in the week in comparison with the But do not let idle words alone satisfy the pepared with the North Lincolnshire Steam Cultiva. Company's engines to work one week upon any
in any county, and give Mr. Hutchinson's set of tackle two days start in the week for any sum he
con raise, in order that" we may repudiate his falacy. That will prove practically the advantage and as for cor better than any imaginary accounts, wother, one worked in the year 1862, and another in coil, the one light and sandy, the other dissimilarity of Cing-why, positively no fair or proper comparison could be drawn, Lestivel Mr. fair or proper comparison
cone name his county, fix his coil, light or heary, and if we do not sleep, as did the Hutchinson meets with an accident, his time for repairs thall be allowed, and vice versa, and no advantage Whaterer shall be taken in proving the superiority of int instence or the other. I admit that the outlay in the considerable, but if purchase of the large tackle is very Tantagty of work done is equal to the outlay, then the adlage is apparent. Supposing one set of tackle, costing it a charge of 10 , carn \(8 l\). per day by working tarn 31. per day by working 6 acres-at the end of the lays one set earns 481., while the other is earning and at the end of the month one set is earning , While the other is earning only 72l. Why,
72 indung a much largor percentage; and if I am to ond harge set would be still greater, as fewer men Inow leare required to work ith

Lindsey, Lincolnshire.

Clay Soils.-The owners and occupiers of nur stio clay soils bave hitherto laboured under great dis. advantages, for whilst engaged in the cultivation of a soil containing the elements of great fertility, it is yet at certain times of so obdurate and intractable a mature as almost to defy any attempt that may be made to deal with the ordinary horse-plough. The soil, saturated with moisture at one time, and dried to brick-like texture at auother, presents a most uninviting material to deal with; and indeed, when the land is in such a state, the worl with horses is geverally deferred. The purchase of this favourable opportunity is, lowever, at the expense and loss of time, and the precious interval between harvest and seed-time is lost, not be regained. The present autumn Wheat seed time will probably show the truth of this, for the dry and brilliant summer weather having lasted so long into the seation, the ploughing has been deferred by waiting for rain to soften the bound and hardened surface, and the seedtime will certainly be late, and very posibly a troublesome time for wet lands. In order to obviate the ill consequences resulting from delay, the clay land farmer is compelled to keep an excesive amount of horme strength; he knows perfectly well that the work muat be kept well forward in advance of the seasons, no mutter what the expense may be, for in this lies the meoret of the successtul tillage of heavy land. To effect this, however, with horse-power becomes a most expentive
work, for whilst an abundant and excessive amount of horse strength is not too much at one time, yet a another, from adverse weather, the whole staff of men and horses are alike useless and idle, constituting very great and almost unavoidable expense. How this difficulty to be met? It is very cortain that changes in the season will occur, and to oe successful you must work with the weather aud not against it
and with all the toil, energy, and perseverance, the capital, the drainage that is necessary for the cultiva tion of stiff clay land, clay is still clay, and whoever depends upon horse labour is sure to be brought to grief; the work will not be completed in proper time, and consequently done in a bad manner. Morcover the frosty weather will arrive, patting a stop to seed operations-the irresistible forces of Nature apparently dead against the farmer; and all this arising not so much from a want of will, energy, and determination, a
from a want of power to do the proper work at the proper time.
Enough has been written in these colamps to point the way to a very much better and much less dependent position, and to a power, viz. that of steam, as beivg of clay; and although "Fowler's Steam Plough," we are informed, may be seen at work iu every county in England, there are still large tracts into which it has not penetrated, and probably will not till a new class of tenantry take possession of the farms. One great obstacle is the expense connected with the purchase of such a costly set of machinery, incurren chiefiy afforded by the travelling or passage of a heavy locomotive on the coil, and the draught consequent upon the yoking of three or four ploughs together as an implement of cultivation. Many people care not to go or to inquire beyond their impression that the adoption of stean power would be much too costly for them, and so dismiss the subject from their minds altogether; and it is a question that will be decided England, in giving prizes and confiniug their attention england, too much to the ecepiny appendage in the progress of steam nower as applied to the working of the soilwhether in so doing they have entered upon a wron principle, and thrown obstacles in the way of a proper and successful application. Your readers will have see an elaborate and well-detailed account and working of the two systems, "Smith's" and "Fowler s. pleasure in adding testimony to the erdinary portable of the former in connection engine. A simple working double cylinder farm engine. A simple wor conimplement is "Smitb"e Cultivator," yet withal con structed upon an excellent principle-that of the ship anchor-and prevented only from palling up or stopping a powerful engine by the wheels which regulate it depth; it forms a ail, and apon a farm of 400 or 500 acres it is equal to an annual saving or the keeping of from 8 to 10 horses. It is well, as Mr . Smith observes that the farmers should reflect on this, and there is a question for the landlords to consider-whether they will be contert to take an almose of the land mas their cold clay, when the produce of tre hand may very much increased under a proper style of cult
and sufficient power to work the soil. W. G G.

I have examined the statement recenty in your columns of the rel I defer for the present exporing the steam cultivation. I calculation, and confine myself to my nairnes ance this autumn with Fowler's tackle, which I wish to be compared with Mr. Smith's experi-
letter. We began on Snturday, 2nd Neptember, and continued at work steadily till Mouday the 18 th September, 14 daye, shifts included; 114 scres being accomplished in that time. The conl cont 1 Os.a ton; 6 tons \(f \mathrm{cwt}\). were consumed, which, with the labour, makes up a cost per acre of 1 s . \(8 \frac{1}{2} \mathrm{~d}\), or less than half Mr. Sinith's expense-so far at least as I un lerotand hin calculation. As I reckon it, his coal cost him 1s. 2 d . per acre, while Fowler's engine only cost me fild. per acre for coal. Asain, in laterur, the "Worlston" seeme to have cost Mr. Simith 2s. Gid per acre, while Fowlor's only cost me 1s. 2d. per acre. In neither cane is wear and tear taken into account. I had ateo a "drug" or beavy harrow attached to the cultivator, but for Thich the consumption of conl mould have been lose still. As to shining tackle, every home I have whe hard at work that fine dry: wenther, and it was sut immense adrantage that the engive was able to roll off to a distant field, dragging anchor, caltivator, coal is iucluded in the Gidd. per acre. I hape that others of jour stcam-cultivatiag readess will give their experience, but it would be an advantage if you would give us a tabulated form, no that wo may all compare uncertanty in our comparioons. Henry J. Wilson, Novolemds, Mangfeld, Oot. 30.

In giving the following atatement of steam cultivation on this farm and neighbourhood, I wish it to be underatood that Thave no intereat inn,ny way in recommending one manufucture in preference to another, believing all to have some good points; even the worst application in better than horses for tilling the woil. Having read with great pleasure Mr. Hutchinson's doings with Mr. Smith's tackle, I think all who have laboured to perfect ateam culcination will agree that it is unfair to eelect a set from any steam ploughing company, and compare their expenses \({ }^{*}\) agninst work done on private farmes. Mr. Hutchinson, no doubt, workel at the proper season, including harveet time, extra long day and extra wages, whereas the stam ploughing com pany lad perhaps to travel long dintances for work, and those who have let out their tackle for hire know to their lose that the roughest pieces generally fall to their ot. I therefore feel it a daty to the late Mr. Fowler and his representatives to give a ahort account of our doings. My experience with steam cultivation commenced at the Chester Show, where the late Mr. Langston ordered from Mr. Fowler our Girst set of tackle, although I cannot boast of so well-kept an accond of our work from that date up to the present as Mr. Hutchinous blows for one year. It is no recret to atate that the Chester tacklo paseed through several degrees of costly improvements, yet after all, and considering it wad to face the stubborn subsoil for the first time, ous cost per acre did not exceed horse ploughing in this district. However, the old engine is now fitted with elip drum, and doing excellent work with a 7 -tined grubber, on 700 ucres of hill land for a tenant (Mr. Hewer), who purchased it for 400 L . Mr. Langston next ordered a 12 -horne set at the Leeds meeting ; this tackle arrived early in August and has worked the 4 furrowed plough but little; however, it and the 7 -tined grubber ordered at the Battersem meeting, which I purcinsed, the ful set for \(600 \%\) two years agn when taking this farm, have done, on the average, 500 acres each year, averaging 8 acres per day, costing for labour, oil, coals, and watercart, \(1 \mathrm{ll} .3 \mathrm{~s} .8 d\). I may here state that our tepairs have not exceeded 10l. per year. The leeds rope 18 still in work although about 300 yards is much worn; the rest will stand two years longer, so that cost of rope per acre will not amount to mueh. And why have we been able o ace mplish this good work? Mr. Langston baw years ago the necessity of well draining his land and removing useless fences as well as timber, and it is also a great pleasure to see Lord Ducie, his succeasor, fully carrying out further improvements to forward steam cultivation. The third set ( 14 horses) was ordered near three years ago for the use of the tenantry on this estate: it has done much work, particularly this season; their breakages few, considering their work has principally been the first time over; yet their expenses will axceed mine per acre, they having, like the shropshire Company, to travel for worls. The fourth set ( 10 -horse) was ordered at the Worceaster meeting by a tenant Mr. Craddock, who requeats me to say he has done deal of grubbing with his marrow 7 -tined implement, besides threshing, grinding, dec; hiv only breakage hat been the crank shaft. I amsure his farm, like the rento is much improved by steam tillage, and he also states he has reduced his horses to siz on over 500 acres of land. I believe anch lot of tackle is in good order: and those who wish to beneflit by steam mut not depend upon steam ploughing companies. Oar crops increase, and the grubber is used mach Rarm, Sarsdem, plougb. Matthew Savidge,
Chipping Norton, Nor. 3.

Having accidentally seen one of your Papers of the 23 d ult., I beg a small space in your columns to say a few words respecting the tables of sleam cultivation shown in it. First, it is my opinion that the work ohown for Fowler's powerful set of steam apparatus is very much given thalf that which can be easily done Having the management of one of Fowler's double sets of tackle (not 50 powerful as the Whitchurch Steam Plough

Company), I beg to enclose the following statement from Oct. 1, 1864, to Sept. 30, 1865 :- 51 days \(527 \frac{3}{3}\) acres. The above has beeu generally on strong clay land, at depthe varying from 7 to 15 inches. The horse and manual labour on the above has been 1 horse, 4 men, and 1 boy, 153 days each; the 4 men and 1 boy includes the man to cart water. During last autumn I dug 193 acres in 19 successive days, in strong clay land, including removals, with implement 40 inches wide. I trust this will find a space in your valuable Paper, and be of service to some - persons thinking of investing capital in steam cultivation. I may add that we work entirely for hire, and have had many removals while doing this work. Charles Hill, Dogsthorpe, Peterborough.

\section*{Home Correspondence.}

The Irrigation Works at Buscot Park.-Buscot Park Estate, the property of Robert Campbell, Esq., comprises an area of 4550 acres, and is sitaated entirely on the Oxford clay. As this geological formation is well known to be unfavourable to the production of springs, as a natural consequence there is not a spring of water on the whole estate. The river Thames runs by the estate for \(3 \frac{1}{3}\) milef, and the river Cole, a tributary of the Thames, \(4 \frac{1}{2}\) miles. Mr. Campbell is the owner of a weir on the Thames, at which he has the right to dam the water up to a certain fixed datum; he is also part owner of the tolls, and therefore has a direct interest in the navigation of the river. The are intos been thoroughly underdrained; the nutfall by the drainage to these streams is supplied intermittently, as, in times of rainfall, the water is run off more rapidly than would otherwise be the case in the absence of drainage. It is this underdraining of the country (which on the one band has tended materially to improve the quality of 8 ar crops, but on the other hand acts prejudicially upon our rivers, and Mh 80 in dry seasons on the lands themselves) that led
Mr. Campbell to carry out the works of irrigation now in progress, which works have for their object the restoration of the balance that has been disturbed by the drainage, and are nearly as follows:- Three thousand acres of the estate are intended to be circumscribed by two lines of catch-water drains. The upper line of catch-water drain is intended to lead off all the rain water falling on the higher parts of the estate into two or three impounding reservoirs having an area of upwards of 50 acres. The other line of catch-water will lead the rain water falling on the lower parts of the estate into two reservoirs having an area of about 15 acres. There is also a large summit or distributing reservoir of nearly 30 acres in the highest lauds on the entate. The water collected in the first series of reservoirs is intended to be pumped by steam power land; and the water collected on the lower part of the estate will be led from the reservoirs constructed to receive it to a water-tight pumping well at the Thames, from whence it will be raised by a Puacelet water-wheel and pump into the distributing reservoir.
The only use that is intended to be made of the Thames Water is to supply the power necessary to raise the water collected on the lower parts of the estate to the sumisit reservoir; and the water-whee! for accomplishing this object will be fixed at the weir at which Mr. Campbell has the right to dam the water up under certain restrictions. Having given you an outline of the construction of the intended works, I need now only say that the water collected in upwards of 90 acres of reservoirs will be distributed, priscipaily in the summer months, over the surface of from four to seven hundred acres of land, and, after passing off the land, a considerable portion of this water will find its way into the Thames at the very period of the year when it is mont required. As the success of the scheme depends to some extent on the care with which the water of the upper Thames is stored, so that the greatest amount of power sball be got from it, the interests of Mr. Campbell are identical with those who require the water either for their mills, the supply of water for towns, or for navigation. trust you will be enabled to see from the foregoing deacription that not a drop of water is intended to be taken from the Thames, but that, on the other hand, the works now in progress of construction will collect the rainfall of 3000 acres of land at periods of the year when it is not required, bat is rather prejudicial to the tribute it in periods of drought, when most aneful. Baldzoin Latham, Croydon, Oct. 17. [The above report to the Oxford Journal, by the engineer to the works, was written in reply to the rumour that Mr. Campbell was taking water from the river.]

\section*{A Bovine Cry.}

What meaneth the lowing of these oxen?"
Ye farmers, listen to our tale,
We tell youl what the facts is, We're ill with typhus, feadly pale:
The "1ostrum is poleaxes!
They knock us in the head by benres,
Wbich will not pas your taxes Wbich will not phay your taxes.
Inspectors are at mighty bores, Twere well ind popleaxes;
Twere well iudeed in time of need They give us whops, whop after whope,-
Fine scientifick bealing

To quiet limbs and aching jaws
The poleaxs is most certain,
But over skill, alas ! it drawa
But over skill, alas it it drawa,
An everlasting curtain
Avaunt, ye doctors, and ye "vets,
Avaunt, ye doctors, and ye "vets,'
Learn what a solemn fact is,
Poleaxe won' pay the farmer's debts,
May "plague "seize sour poleaxes!

\section*{Farmers' Clubs.}

London: Nov. 6.-The Cattle Plague.-At this, the first meeting for the winter season of the Central
Farmers' Club, Mr. C. Howard read a most instructive paper on the Cattle Plague, from which we make the following extracts:-
It is my intention to sketch briefly the history and nature of the disease, to notice its appearance in this country, and to remark upon the curative and remedial or preventive measures.
1. Na/ure and History of the Disease.-It will be remembered
that when the alarm note was sounded by the veterinary professorss upon the apparance of the cattle plague in England, the opinion in some quarters being that it was an endervour on the part of one or more of these veterinary gentlemen to
write thememelves into notice and place. Those however, who
winted with the frightful ravages the disease had felt that the herricoltural interest was about to be axposed to one of the greatest calanities that oould overtake it. First,
then, as to its nature and history. It appears that cattle plague, which differs not only in intensity but in kind, is no
new disease; it was known, acording to some authorities, as
long ago as the third contury. We read, also, of a grievous long ago as the third century. We read, also, of a grievous
murrain in the time of Moses: whether akin to the present murrain or not we have no evidence. It has at various periods
committed fearful bavoc among the cattle of several countries
on the continent and in more distant territories. It is stated, on the continent and in more distant territories. It is stated,
that from the year 1793 to 1795 it destroyed in Italy between that from the year 1793 to 1795 it destroyed in Italy between
three and four million aniuals, and in France, from 1713 to Eurnpe it is computed that some 200 millions of cattle perished
Erom cotlle plague during the from cattle plague during the last contury, and tn more recent Egypt it was introduced in 1841, by the importation of forrign
catte, and in three years some 350,000 were destrnyed. Flearn
also from iny brother, who has lately visited that country,
that in the year also from my brother, who has lately visited that country,
that in the year 1894 above one million head of catle died
there. So great was the mortality, tbat the Egyptian farmers, left without dranght animals, were driven to mechanical anpli,
ances for the tillage of their sill , hence the large orders that
were recoived in this country , yene were recoived in this country a year or two since for stean
engives and steam ploughs. From the best veternary autbori-
thes in our own country and on the continent we learn that Hes in our own contry and on the cont vent we leart that
the spontanenus developnuent of rinderpest takes placo onl
in the East: as, With cholera morbus, this appears to b
its nown in the East: ase, With cholera morbus, this appears to be
its natural homoe. Farious cruses are assigned, such as the
soil, climate, its peuliar and manazement of the cattlo. I learn from some writers
on the subject. that true rinderpest is simply malignant
typhus fever; but that another kind or form of the murrain is typhus fever, but that another kind or form oi the marrain is
typhoid fever, accompanied by inflammation of the lunge, typhoid fever, accompanied by inflammation of the lungs,
aggravated pleuropneumonia. Other varioties of the murrail have to do with is the type or form of the murrain now pre not to be typhoid fever. It is undoubtedly much more cou-
tagious than any known disease, either of man or animal much is this thy case, that thesese either of man or animal, so anthrities consider it
can be and has been caried from sime can be and has been carried from diseased to healthy cattle by
dogs, sheep, goats, and oven marching armies, while the
soldiers and soldiers and other animals oven mare heening armientern, while the bed by it. Some
go so far as to maintain that flies even are carriers of the
poison. As to the go so far as th maintain that flies even are carriers of the
poison. As to the question whether sheep being brought into
contact with diseased animals take the disease or not it sce
 the bullocks had breathed, and a portion of their waiciva the sheep. It is therefore open to queetion whether, in
the much-discuussed Norfolk case, the sheep were! the victims of this dreadful sourge; case, upo this, however, we may
hear more this evening. The disease does not devalop itael hear more this evening. The disease does not devalop itsel
after coming into contact with diseased animals. As to the
time, however, great difference of opinion exists: some say time, however, great difference of opinion exists : some sayy
for from four to 14 days, others to 21 days. It may be known from the following symptoms: Great dulness, frequent head, with a mucouls disocharge from the nose, reddened eres, with a watery discharge, quick and short breathing, ulecrated
lips and roof of mouth, cessation of rumiuation, with diarrhcoa or dysenteric purging; the animals rapidly, sink, and die in
rom 12 thours to eight or 10 days, in most instances the second day, after falling. The cattle plague first made its appearance in England in 1144, and remarkably ennugh, as in the present outbreak, the cows near London were its first victims. Varinus was an importarion. It raged with more or legs vimulence

\section*{Farm Memoranda.}

Bonsington Fabu, hell by Mr. James Melvin, is siturted about three miles son:h from the Rutho station on the Filinburyh and (ilagnw Rulway, and close to the boundary fintween the eavale e 19 il. Iothian and Weat-Iothian, ar limlitis, watre. The hatiosteadng aun a consinter fore above the level of the sea. Some of the farm lies in leed sam what liwer, but other purts of it are even higher than the elevation we have stated. Owng to its position is earmonis a whe view, extending from the rieh amt hishly casitivated valley of the Almond in the foregromnt, to File and the still more diotant Grampian.
It was in 1939 that Mr. Melvin conmenced Parming of Boministon, and very enmi ath, r t'at? pevit he began to lay the formdution of a latacater firk in Burkley blond-the most fashionsative bl cif of hie duWhich lie afterwards crogaed with ramiv fonn P'mlett
 sers ing, being at that lime a
sheep, although extremely neat, had not suffi-
cient size or outcome to pull down the scales as cient size or outcome to pull down the scales as
they required to do, Mr. Melvin turned to what are now well known as the Border Leicesters, and having resorted to Lord Polwarth's and Mr. Stark's far-famed flocks, he has effected an entire chauge in the character of the Bonnington sheep, the best, proof of which being the increasing demand he experiences every year for his rams, and the regularly improving prices he has been obtaining for them. At the last sales of the Lothian Ram Society, held last month, which, being but a young association, has not as yet the prestige of the Kelso sales to run up prica, nearly 10l. Customers for the Bonnington rams came neary y 10. Customers for the Bonnington rams came from all quarters-from John o'Groat's, and beyond it, At the last Kelso ram sales, Mr. Melvin made a decided stand at the first for "No. 5," the best of Lord Polwarth's lot, and though followed hard in the contest, it ended in Mr. Penny declaring in Mr. Melvin's favour on a bid of 952 ., being the highest price yet attained for a Border Leicester shearling. "After doing service this
season in Mr. Melvin's flock, "No. 5" will proceed nes season in Mr. Melvin's flock, "No. 5" will proceed next month to New Zealand, being the fitting chief of a flock of about 100 Border Leicester and Lincoln rams, at present at Bonnington, which Messrs. James Morton \& Zealand.
In the Bonnington flock we found that the owes, of which there are 200 , are long-sided, full-quartered, roomy sheep; and throughout the flock, young and old, there is that strong family likeness which indicates good breeding; the clean cut jaw, nice wool, quality, and size, telling very decidedly of the Polwarth blood which runs in them. The family likeness will, we expect, be well brought out in the lot of shearling rams
which Mr. Melvin will have next one capital ram (one of Lord Polwarth's.sheep) having one capital ram (one of Lord Polwarth's.sheep) having
tupped over 100 ewes last year at Bonnington, and of the produce about 70 are tup lambs.
Mr. Melvin does not give his ewe lambs anything beyond a half supply of Turnips, cake being excluded from their dietary, as he goes on the eafe principle than his land would carry properly. The land is for the most part a tilly clay, and when in pasture does not fatten a sheep like land elsewhere, requiring an extra
half-pound of cake daily to bring them up to the mark, as compared, for instance, with land about Kelso. For many years he carried out the same principle in feeding his tup lambs, namely, half Turnips and no cake; but latterly the views of his customers have changed, and on his tup lambs. These are all kept until after they are shorn, and a selection is then made of those which are to be retained for sale, while the rejected are finished for the butcher. This is a better plan than selecting those which are to be kept while they are young, as it
often happens that some which woald furnish into capital sheep as they got older, are rejected when the selection is made early.
1 ISeveral years have passed since we became convinced from experience of the benefits of autumn cleaning
stubbles preparatory to a root crop, and as we occasionally meet with some who are not prepared to think so highly of the system as we do, we confess it was with considerable pleasure we found that Mr. Melvin has been carrying it out for some time past, whenever it could be done properly. He uses the ordinary grubber chisel-toothed tines are superseded by others of a triangular or V -shape, which are about \(7 \frac{1}{2}\) inches broad at the broadest part. These are mado of malleable iron, cast-irun being useless at Bonnington, owisg to the
underlying rock being near the surface in several places,
The farm was all drained many years ago on the about 36 feet apart; but when a deeper system of draining becaue common, most of it was drained a second time, with two-inch pipes sunk 4 feet. The old shallow drains, however, are still working well.
The rotation followed includes two manured green crops in its course, one year's hay, and two or three years' Grass : say (1) Oats; (2) Potatos; (3) Wheat; (4) Turnips; (5) Barley; (6) hay, and then pasture. stances require : for example, we saw a capital crop of Potatos growing close to the steading in a field which had produced a crop of hay last year. The tups got their Turnips last winter on it, and the land was then ploughed and prepared for Potatos, which were put in with plenty of dung, a heavy clean crop being the result. In common with all the farmers in that part of
the country, Mr. Melvin has until now been in the habit of taking out large quantities of dung from Ediuburgh, the canal which passes the lower part of his farm being very convenient for that purpose. But since it has been proved that there is great danger, and indeed a certainty of spreading the cattle plague by manure brought from infected places, he has wisely given up getting Edinburgh dang in the meantime, although the want of it will doubtless be a serious
inconvenience. Mr. Melvin has experimented largely with all kinds of artificial manures, and for sorve time he used a good deal of nitrate of soda as a
top-dressing for Grass, but he has abandoned it in favour
ferring doing so to top-dressing Oats after Grass, finding that the plan he follows produces better returns than when the artificial manure is applied direct to the

The Turnip crop is partly eaten on the ground, th lighter portion of the land being selected when this is
done, and partly on the Grass fields. Upwards of 100 head of cattle arê fattened during winter; and this year Mr. Melvin has been particularly fortunate, having procured a capital lot from Ireland before "cattle plague" had made its appearance in this country Those beasts have since been going on an out-farm, and for this year, Mr. Melvin is independent of the store cattle fairs.
Labourers are not easily got in the neighbourhood of Bonnington, partly owing to a large quarry which keeps a number of able hands constantly employed but chiefly owing to the numerous paraffin works which have been opened at no great distance, the constant smoke from which sends a haze all over the country obscuring the prospect, and even discolouring the
fleeces of sheep; but it tells of a largely increased and fleeces of sheep; but it tells of a largely increased and
well-employed population, and, consequently, a greater circulation of money, which, of course, compensates for a multitude of minor annoyances. From The Farmer.

\section*{Miscellaneous.}

Landlord and Tenant.-Now, I so far agree with this position that I think the basis of the connection between landlord and tenant is undoubtedly the aimple basis of contract. That I quite concur in, and I wish that some of those gentlemen who speak on the subject would always remember their own doctrine, because we frequently see principles laid down as applicable to the property and obligations of those two classes which are not founded on contract, but upon some abstract
notions of right. It appears to me that the contract is undoubtedly the basis of that relation. A landlord when he lets his land gives up everything which he does not specially bargain to retain. A tenant, when he takes land, takes everything which he has bargained to take, and nothing more. But, after all, this is mere bare, hard, stony logic, and we cannot live upon logic; we must have something better than that to live upon, and there is something in the connection between landlord and tenant which puts it out of the question that the relation should be one of pure and simple commerce. In the first place, the mere duration, the mere length of the relation, removes it at once from that footing. I need not refer to those tenants who have held their land tor generations-who themselves and their fopsfathers have occupied the same farm under successive generations of the same family of prorrietors. I will not refer to these cases; they are cases, no doubt, which the progress of time is 'gradually tending to fina, though there are sin a very large number ordinary case of a man taking a farm for 19 years from another. I say that of itself constitutes a connection which renders it impossible that the relation between them should be one of pure commerce. Why, just think what a 19 years lease involves! Nineteen years, counting from early life, carries a man to middle age. If a lease is given in middle age, it carries him on very far towards the decline of life. If it is given in the decline of life, no man can expect to see the end of it Isay, therefore, that the mere duration of the connec tion between those two persons - the man who lets his constitutes a relationshipes for 19 years intimate and personal than a mere commerein relation between a manufacturer and those whom he employs, or between a shopkeeper and those with whom he deals, There must be give and take in the relations between landlord and tenant. It is very well to lave a written agreement-quite right to have a written agreementand in Scotland, in nine cases out of ten, we have it cannot be exactly measured by what is written in the four pages of that lease. There are generally some things in which the landlord wishes to b obliged by his tenant; there are almost always
many other things in which the tenant wiehes to be obliged by his landlord. There are advances to be made for draining, or for building, or for other purposes; there are various offices, in short, of good neighbourhood and goodwill, if there were nothing else, which render the connection much more intimate shan that of mere commerce. And that is the basis upon which the influence of landed property must continue to rest-upou the good feeling and mutual
interchange of good offices between the landlord and the tenant. If there are any who think that this is an illegitimate influence, and who wish to see it diminisbed, I am afraid they must bear with it, because, after all it is not an artifinial result, not the result of artificial connection, and is bat arises from the nature of the connection, and is to be found in the nature of thing.

\section*{Duke of Argyll at Inverary}

Scotland V. England.-I think there can be no doabt whatever that, although we are certainly on a level, and I should say ahead of England in many respects, yet, as regards the cleanliness of our houses, and the general outward aspect of our cottages, I think England is decidedly ahead of Scotland. Among the smaller
neatly-kept gardens. and houses, and, abo Scotland, coming from no stranger pass the contrast which, in many districts of
least, prevails in that respect. Even tenan
of considerable capital, are accustumed
tented to live in Scotland in houses and with ant in England. I had a curious allowed by long ago with a farmer who paidle of the not less than between 600 l . and 700 l thin of very great intelligence. Wheu I weat to viat a considerable distance from garden as which was in immediate proximity to his that on knocking at his door the odoan ne's nose was anything but agreeable, and very inferior to that of a bed of Mignonette. making some observations to this farmer, as for many years, he took whoximity, very Scotch view of the question-ust say was m useful, but not at all sentimental. "Weel, I ha'e keepit my health extra
thank ye." Duke of Argyll at Inverary.

\section*{Calendar of Operations}

NOVEMBER,-Wheat Sowing should proceed 4 e slightly increased as the season advances.
Twrnips.-Such Turnips as it is intences. consumption in the yards should be pulled in the ne part of the month; and where the practiee prere. pitting the whole crop on the fields where and throw into heaps 9 crop ot th or Swedish Turnip will cost from 5 , to when they are to be carried from the field the way is to throw them into rows, four or dir th way is
Mangel Wurzel should be all harvested. The ats pulling, topping, and throwing into carts will be fur s. to \(9 s\). per acre.

Carrots and Parsnips should all be dug and necurd November. They are lifted by a spade or fork, a woman cuts the tops as fast as two men can lian roots. The whole process, including filling the Will cost from 188. to 25 s, per acre. Some give fres
\(8 d\). to 10 d per load of 40 bushels for harreatin \(8 d\). to \(10 d\). per load of 40 bnshels for harremi. Swedish Turnip, should be. housed or pitted m the are dug.
Stubbles.-The horses will be kept at worl apon corn stubbles this month. Those fields intended Beans and Peas next spring should be plongted in then those for Carrots and
those for Swedes and Turnips.

Claying or Marling Land.-Some of the habert this month, on light land farme, may be proite directed to this process, wherever clay accessible. It is spread over the surface
from 50 to 100 cubic yards per acre manner, may be raised aud spread during t The threshing of all kinds of grain, as straw required for home use, or as the stats
appears to advise, continues a Thorr, Beech, Hombur Box, Yew, Maple, Privet, or anyching with mian may be desirable to ror hase. rem Docks, and, in fact, all perennial, weeds. I thought necessary. Repair posts and rails liquor

Grass Lands must now be thinned to their pow tomed winter
Water acre. Irrication is commeneed; Wtention should be paid to carry the water ores en attention should be paidy cerry tarn of the met on a mild morning, keen w,

They must be allowed as much space of in
should all be cut for them) or
ass iserense, their quantity of artificial food; give scoess to coir feet, and, if necessary, dress them - astir to ustic mixture; those which are inclined is \(1 . .4\). Weed at both nostrils. Grazing or yearling anyn, heed astures, ought to have one half pint anser, or similar food, daily. Sheep requiring a maral for ticks, mast be avoided after a recent \(y\) yarisl leeping.
Fhe store pigs are now fed on steamed Turnips da 8 diy Parm-The cows, when the Grass fails, either sint, hay in the day, or are tied up in cow-houses or anded in well-littered yards, as is the practice tricer morth. Water should be served to them; and qucer my receive Mangel Wurzel tops or Cabbage, or ar tope along with their hay. As winter advances cunip toposadually diminishes; and in small dairies ming ceases.
Yorland Farm.- Have the bathing or smearing Homend the middle of this month at latest. When arded is done, put fannel jackets on the hogs; they may \(\therefore\) be nowed to the wool, or fastened with tape. hidet josts about 3id., and will last three or © jears if well taken care of. Tups are now put to twes In low and sheltered situations, where be mare crossed with a Leicester tup, this shouldige an an the latter end of it is soon enough, that the lambs Ir not come before there is food to support them Fin 50 to 60 ewes to a tup are quite enough, when tha aro allowed to range over an extensive grazing. Ire bogs, if to receive Turnips, should be put on now, ad ench day allowed a run off to Grass or Heather. HChriot hogs are not already on Turuips, put them a \(\mathbf{0 N m}\). Old aheep, which are not sold, should be moved from their grazing, and put on Turnips. Over thing now is very prejudicial.
Proted Mangels.-As a good many casualties of \(t\) bind always happen during a sudden change to sinter weather, we quote the following passages on to mbject :-
Meperbaps well to bear in mind that the experience Los9 proved Mangel Wurzel capable of preservation water being frozen, and capable of wholesome use yhood even though partly rotted by the frost. It is all to aroid all risk by timely harvest work ; but it is :t wio, if frost should have attacked the crop before Poof of this was adduced, along with many others, in a per recently contributed to the Bath and West of mand Agricaltural Society's Journal. Mr. Chadwin, TOllard Royal, Salisbury, speaking of a heavy crop of Yugole caught by the severe frosts of October, 1859, mos: I tried several of the roots, and they were malect masses of ice. I knew it would be useless try as to store them then, and therefore allowed them to main a fortnight or three weeks after the frost had Tre before taking them up. On finding that the frost is thoroughly left them, I put on all the strength I "old, and stored them in the field, in long heaps, 7 feet Tide at the base, tapering to the top, covering them rat short straw or litter, and throwing over this 7 to diches of moil, leaving it quite rough, without patting down, and leaving the top of the heap without soil Matuation. The heaps were never opened all the numta. When they were opened in May, the roots Tene found to be in a most perfect state of soundness, I I boliove they might have been kept so till the Oning year."
On the value of frosted Mangels as food, the followinc arimony seems conclusive. Mr. E. Bowly, of Sidding , near Cirencester, says of the same year:-"The langels of 1859 were seriously injured by the very wrere frost in October, when few had even commenced acting them up. This I think they very much a the ordind those who had the courage to store them athe ordinary way reaped the advantage they always mat for spring feed; but many, like myself, were bor permanently securing them. We got them . hether and covered them with straw, intending to shem over again and throw out any that appeared ased by the frost; but straw will not effectually keep froit, and the very severe weather which followed \(\because\) injared them most severely; we were therefore Bed to consume them immediately, instead of, as arty reserving them for spring feed. I gave them to
Try indption of stock, and witbout any apparent Ewough maeed, the sheep and cattle did well on them Ifin well, unless the land be wet ant areat deal nel cling to the roots, to do nothing to cleaning them to throw them into the carts as they are pulled, depetirig only that the leaves are first cut off. This die by a single chop of the knife, and at such tin beat, to the head that the leaves shall fall separate the root, tont, not to cut the tap-root off, bat to leave
entirely untouched by the knife.

GRAY'S OVAL TUBULAR BOILER. international exhibition, Class IX., No. 2119.

Mr. Gray begs to call the attention of the Nobility, Gentry, Nurserymen, Gardeners, \&c., to his NEW OVAL TUBULAR BOILER,
acknowledged by practieal judges to be a great improvement on every form of Tubular Boiler yet introduced. proved itself superior to all other Boilers for quickness of action and economy of Fuel, doing its work with one: less the amount required by any other.

Extract from Report in Gardencts' Chronicle of International Exhibilion, May 24, page 4,6,
The ine upright form of Boiler is usually made on a circular phan, but the opal form given to Mr. Grar's variety of it is sad t:

They are made of all sizes, which, with prices, may be had on application.

\section*{mbetings for the ensuing weet \\ 
}

\section*{is Hobticuluure a Science? This queation} boften been asked, and our attention has been mere than once oalled to it of late, in connection sith the life and labours of Dr. Lindley. He, use the words of the late President of the
Wral Society, "raised Hortioulture from the conation of an empirical art, to that of a developed mierce." We have then the authority of the Pogel Society for stating that Horticulture is a fience. We do not propose at this time to msider the argaments that might be advanced in
rt or in denial of this opinion, but we assert Int in spite of much pure empiriciem, and much hast is doubtful, yet the defects and shorteomings AHortioulture do not iavalidate its claim to be moked among the sciences.
ds it was Dr. Lindery's aim, in conduoting the areners Chronicle, to raise Horticulture, and to Ifre it its proper position both in the eyes of men is sience and in those of the general public, so it wast be the work of us, his succossors, to continue riat he began : to avail ourselves of every opporinity to promote the best interests of Horticulture, alrance it, to raise its tone, and to give it yet uving we shall the experimental sciences. "In mans of assistil not only be adopting the best as the material inter progress, but also of furtherimeans of livelihood or on æesthetic considerations, conscientious devotees of this most useful meace. For our own part we look upon Horticultare as a branch of the soience of Botany-applied Dony, that is to say, bearing the same relation to res to the science that the practice of medicine Pportion as the horticulturist, professional or : Tnteur, departs from the teachings of Botany,
degrade course vegetable physiology, so does Gding mis calling or his amusement-a proaincee, for perilous to himself than to the

Such either here or elsewhere, must Such persons should remember that das thests are bound up with Horticulture,

Cotroy look, then, to the closer intimaoy between oove and the ticulture, between the students of the most powerful means of advancing both. Atermination baption, and if necessary the deseription oaptism of his newly imported plants; he ficg and to for advice in matters relating to Physiologist upon many points relating to aning in as the principles to be followed in terations in forcing, and in a number of other they will which we need not specially allude, Widers. On the other hand, the benefits which botanist may derive from the horticulturist qually marked. Who can know so well the of plants, who see so much of their
variability, as the horticulturist? Who can furnish such important evidence as to the constancy and value of the points by which a botanist is led t distinguish one species from another? Who could supply such an armoury of facts to the phrsio logist, relating to hybridisation, dimornhism, and acclimatisation, as the horticulturist?" Who ha such opportunities as the horticulturist of proviag the value, for general or special culture, of rlant and shrubs made known br the butanist as likely to be valuable for ornament, for use, for food, o for other economic purposes? The botanist in his stady or his herbarium, knows only half the plant- the dead part, the mummy, but the horticulturist has the advantage of seeing it in a living state, of watching its development from the sprouting of the seed to the production of the fruit, 'and has in", this way immense advantages over the mere botanist. Clearly then an alliance of the two classen of workers is a thing emineutly desirable for both parties. The slonder ties whioh at present connectithem are to us a matter of greatest regret. We hope those who read these lines will help us to strengthen the bonds of onion, and render service alike to Butany and Horticulture.

A sohool of Horticulture, such as we hear whispered is in contemplation at Chiswiok, would do much to bring about the results wo have mentioned. It is somewhat strange that we in this country, where Hortioulture is supposed to be practised in its highest perfection, should be without such institutions. Our continental friends have forestalled us in this, but it is never too late to follow good example. W look upon the improved eduoation of gardeners as one of the means for ameliorating their
condition. Continually complaints are reaching ul as to the inadequacy of their wages, the imperfections of their houses, the degrading and arbitrary restrictions to which they are frequently subjected. The laboureris always worthy of his hire, and as Horticulture advances and its ministers contribute to its progress, and show themselves worthy by their knowledge and conduct, so will the grievances of which they now complain (and too often justly) be diminisbed, and "gardeners" in the highest sense of the word, will, like the art they practise, increase in estimation.

We have great expectations too from the International display and the Botanical Congress of nex year. Horticulturists and botanists will then be brought into contact in a way which has never before been accomplished in this country, though here again we lag behind both Holland and Belgium. It would be unreasonable to expect that many immediate practical benefits will accrue from this association, but indirectly, and in the course of a short time, we look for the greatest advantages to both branches of the soience from these and similar meetings, and we earnestly hope that all the horticulturists and all the botanists, all the lovers of plants of whatever degree, will join their forces, and presentus, not only with a splendid floral display, but also with the best gaarantees for the future advancement of Horticulture and Botany.
For our qwa part we beg our readers to favon as, as they favoured Dr. Lindlex, with communications and; facts on all and every branch of Horticulture, as well as on collateral subjects. Without their co-operation this Journal could not have attained its present position ; without their aid it cannot maintain it now. In the preface to the second edition of the "Theory of Horticulture" Dr. Linduey has acknowledged the obligations he was under to the contributors to this Journal for facts and suggestions supplied by them. And a we hope to receive assistance from others, so we hope to be able to aid them in return. will be our endeavour to lay before them the most recent facta relating to hortioultural science and to horticultural practice; to give early notice of new plants as they appear, and to present a caroniols districts of orr own country, as well as on the Continent and in our distant colonies. Foreiga Correspondence we look on as hardly less important than Home Correspon dence. In the letters of our friends berond the seas we get important information as to the olimate and vegetation of their several districts, from which the cultivator may derive valuable hints for the treatment of his plants.
Landscape gardening, the production of florists flowers, and the massing themin ornamental gardens -all these we look upon when properly carried out as branohes of the fine arts, and, as suoh, deserving fullest recognition in our columas. Iu fine, though fully consoions of the diffioulties under
which we, in common with Horticulture in general must labour, now that cur Chief has fallen, we hope, with the ail of nur friends, to retain that favourable opinion which has for to tone a time been nassed upon the Gardeners Chronicle.
The mission before us, then, we interpet to be this:-to bear our part in elevating and expanding the science of Horticulture, and to bring in: unison the scientific and practical elements of which it is constituted; in devoting our best energies to the fulfilment of these wie shall at the same time he taking the Lest possible means of carrying out anuther branch of that mission, namely, the improvement and clevation of the position of the professional gardener. Tir this end we ask for the help of all who have at heart the well-being and the advancement of Horticulture.

We are delighted to find that the prospeots of the Inthinational. Homtiochitubar. Pibibimon and Conciless aresn hright. Nearly 3untul. have already been sulncribed, and upwards of 3 siono. guaranteed. The arrangementazerently ooncluded with the Ruyal Horticultural Eaciety provide thut the Exhibition shall be held cither in the western portion of the Society's Garden, or on the site al the Great Exhibition of 1862 . The une of the Conservatory and of the Westers and Upper Areades is alsn granted to the Committee, with : right of way through the Suthern Areaden if the Show, or any portion of it, should be hald on the vacait space to the sonth of the Gardens. The Morticultural Kuciety aiso undertake to lend to the Committee of the International Exhibition their staging and other appurtenances, and to place at their disposal the services of the staff of the Society for the week. The Committee are to reoeive all moneys taken for admission to the Garden duriag the oontinuance of the Show, which will be open to the public from Tuesday, May \(\because\), till the following Friday eveniug.
The Fellows of the Horticultural Society are th waive their right of admitting friends duriog the week, but will have personal admission to tho Gavden throughout that period, with this rexepption, that they will not be admitted into the Conservatory or Aroades on Monday and Tuenday during the staging and judging of the plants ani thes are to have free access to the Exhibition in the Western Annexe (or in the southera epot of ground already alluded to, should it be found more convenient to erect the tent in that situation) only on the Wednenday
In seturn for these privileges, the Committee of the International Show and Congress engage to admit Fellows and Debenture Holders as above mentioned, to pay \(300 l\). to tho Society on taking possession of the Garden, to provide on each of the Show days three bands of music, and to restore the Western Annexe to the state in which they found it.

So far well ; it rests now with the plant lovers, the hortioulturists, and the botanists to come forward and support this Exhibition to the utmost of their power. Sufficient has already been done to show that there is every prospect of successthat success must now be made a triumph. Wo Englishmen must not forget that we are in arrears in this matter. Dielpium and Molland have forestalled us. In both enuntrics we received the most cordial weicome and the profusest hospitality, and we saw displays some depariments of which were decidedly superior to anything of the kind we could have shown at the time. But we hope our exhibitors have learnt a lesson, and that many of those noble specimens which we know exist in the country, but which are rarely seen at our flower shows, will be forthcoming for the delight of hortionlturists of all grades, and the promotion of the "Science and Practioe" of Horticulture throughout Europe.

We have received a letter from M. Naudir, in Which he complains that his meaning has been misanderstood in the leading artiole of November 4 nn the subjeat of the Oricin of Spectes. Ho writes "that he never had any idea of having forestalled any one whatsoever with respect to the subject in question, and that he is very sure that be has never said or written anything which could make one believe that he attributed to himself the priority of an hypothesis whioh many others had made before him. His intention was merely to express his satisfaction that he was not singular in believing in the common origin of species, and thnt his opinion was that also of distinguished savans, a circumstanoe whioh was strongly corroborative of that which he had himself formed.
When translating the passage sent to us by
M. NaUDNN in manusoript, for the Natural History Review, our own impression was just what he himself alleges in his letter. The distinctive marks between the views of DARWIN and others are admirably stated in a note heading the translation in question, and we have great pleasure in transcribing them
"What Mr. Darwin has done is
'1. To show that the operation of natural selection must eventually result in the co-ordination of the derivative individuals into more or less definable groups, whioh we call species, genera, orders, \&c.
"2. To demonstrate that such a process actually takes place in minor groups, both of the animal and vegetable kingdoms.
' 3. To show how the main facts of elassification, development, and geographical distribution are all consonant with and explicable upon the hypothesis that organised beings are all derivative, and have been ruled by natural selection in everything relating to their development, whether as to grade of perfection, numbers, magnitude, or diffusion over the earth's surface. It is the application of this demonstrably proved law of natural selection, together with the fact that the struggle for existence must lead to the extinction of the weaker races, to the speculation of the derivative origin of species, that is the novel point which Mr. DARwin has brought out, and whioh raises the said speculation to the rank of a legitimate hypothesis; and it is the fact of the derivative origin of speoies being no longer a speculation, but an hypothesis (or as some say a theory), that has necessitated its careful consideration by every scientific biologist, and its acceptance by many at once and by more as time advances." M. J. B.

A fruit of Monstera drliciosa (of which a fieure was given in this Journal, 1864, p. 962) was exhibited at the Horticultural Society on the 7 th of November, and was pronounced excellent by every ne who tasted it, having very much the flavour of a good Banana, with an addition of briskness which was a decided improvement. Every one, however, complained that little prickles were left on the tongue or fauces which were far from agreeable. On remoring the green lid which covers the upper part of each berry, little transparent sharp points were visible, to which the annoyance was clearly due. On examination, multitudes of bundles of raphides, like microscopic needles, were at once apparent, but it was clear that these, if capable of penetration, were not the only prickles. On examining the projecting points, which were even more abundant in the green cover or dise when divided vertically, they were found to consist of a peculiar tissue, resembling very closely the hairs which occur on Peziza stercorea, but without any articulations. They vary much in diameter, some of them being \(\frac{50}{60}\) dth of an inch across, with very thick walls and a narrow tube. They are pointed behind as well as above, and have a tendency to become branched. In some cases, indeed, where the diameter was much smaller, we found them forked three or four times, but still pointed behind and slightly waved, looking very much like the spicules in some sponge. As our specimens became withered before we could examine thom, we were unable to ascertain their connection with or origin from the accompanying tissue, but we hops some day to reexamine the matter with better materials. M.J. B.
M. Boussingaule atates, in a paper on the Furcisoss of Lisaves recently read before the Fiench Academy of Sciences, that leaves exposed to the action of hydrcgen or nitrogen lose, as in carbonic acid, their decomposing power. This he attributes to the circumstance that they are deprived for a long time of the popply of oxygen, which is necessary for the removal of carbonic acid, by slow combustion.
- A delicate compliment was paid to the learned President of the Linnean Society at its first meeting for this session, in the shape of a basket-full of the Frutts of Benthamia fragtfera. They were sent up from the West of England by Dr. Prior; and being well ripened, they had a very handsome appearance.
- A correspondent has kindly forwarded us an account of the Pianting of Trees in the parish of Little Gonerby by Grantham. It is proposed to plant a large number of ornamental and useful trees by the sides of the principal thoroughfares, so that the parish will ultimately assume very mach the appearance of a park studded with buildingg. Great interest seems to be taken hy the inhabitants in promoting this desirable step, and the Duke of Iretlasd has slown his sym. pathy with the movement by presenting a fine specimen other handsome trees of different sorts. There can be
no valid reason why this excellent example should not be followed in bundreds of our towns and villages. Once make it a common thing, and the silly mischief of thoughtless boys would cease. The matter bas practical bearings as well as mere æsthetic ones. We might have avenues of Ailantus for the silkworms, or even lines of Walnut and other fruit trees as are so commonly met with abroad, where the depredation must be trifling, or the practice would not en entitled to great credit for this praiseworthy act.

Mr. Boul has forwarded us flowers of the Cuscota exhibited by him at the meeting of the Horticultural Society on November 7, and mentioned in our 'columns (p. 1061). The calyx is beautifully sposted with purple warts, the corolla is comparatively large and bell-shaped, and the scales within form beautiful objects under a magnifying glass, from the elegance of their fringe. Professor OLIFre har, we beliave, determined, that this curious and interesting plant is the Cuscata reflexa of Roxburgh.

\section*{THE LATE DR. LINDLEY.}

\section*{(Concluded from p. 1059.) -}

Nor content with the labours to which already referred, Dr. Lindley and other gentlemen cluding thelate Sir Joseph Paston, determined in ist supply a long.felt want in the shape of a first.clast cultural journal, and the Gardeners' Chyonicleaccord. made its appearance. Of its success it is not for speak; but it is not too much to say, that the of the articles contributed by the Editor, and with which he conducted the horticultural depa of the jourval in question for nearly 25 rear been acknowledged both by the friends and ri the publication. In these columus he did his raise the position of Horticulture by laying betore public in the clearest manuer the physiological involved in the various operations of gardening, a best methods of cultivation; while his vast kno and of their requirements gave to his writings. Nor were what may be terne! personal interests of his readers uncared for, indefatigable perseverance and untiring patienco bons
himself to work to detect fraud and to expon th practices of the unprincipled. He was a steady cate of the improved education of gardeners, see
that a powerful remedy for the grie under which many of them labour. did his interest in them cease bere
Lindley was a staunch supporter
Gardeners' Royal Benevolent Instits: and rendered great assistance to that De : association both with per and purse.
It is not unnatural that aman pnis ing Lindley's peculiar mental quit tions, his energy, his straightformarim his method, should be often consalter br members of the Government or other bodies on matters with which ine familiar. A mong what may be term. is lic services, may be mentioned made in 1838 by Dr. Lindles, assistance of the late Sir Joseph Pari and of the late Mr. Jobn Wilson gardener to the Earl of Surres), on state of the Royal Gariens, a reporn revealed an amoant of the the majn the then Royal gardeners, which is happily forgotten. As has been stated in notice of the life of the late Sir Nila
Hooker, Dr. Lindley reconmended tiati Royal Gardens at Kew "should be in ste ois to tie nation, and should ultimately the head-quarters of botanichl sc England, its colonies and depende The nomination to the directorate of that estabishmur and the placing of the garden on
at \(\mathbf{M r}\). Stevens' auction rooms, where the nomenclature was not quite au nivear of science, notwithstanding that some rongh brightlv-coloured sketches of the true species were exhibited beside the bulbs of what afterwards proved to be widely different plants. Thus the pseudobulbs of this species were arranged under the representation of Odontoglossum Warscewiczi Rchb. filo, a plant yet unintroduced, but which will one day prove, we dare say, a most dangerous ival of such splendid plants as Odontoglossum crispum Lindlo, O. Bluntii, Rchb. fil., and last, bat not least the lovely O. Alexandra, Batem. itself. When the plants flowered, there was naturally much dissatisfaction and the plant itself seemed to have disappeared. More recently we have obtained flowers grown by Mr. Linden and subsequently by Mr. Moritz Keichenheim of Berlin by Consul Schiller of Hamburgh, and by Adolph. Schlieper, Esq., of Elberfeld, a zealous collector of Orchide, to whom it is inscribed.
The plant has also been well observed in England, botb by Messrs. Bateman and Day. We hesitated to publish our views, since we did not know whether there were three species or one, or whether this was not a dimorphism of Odontoglossum Insleayi, for it beara such an extraordinary likeness to this species, that it might be its twin. Yet we have ascertained that our plant always flowers in late summer, while Odonto glossum Insleayi would appear to be a winter flowerer We may add that the colours of U. Insleayi (with the sharp horns on the lip, so well represented in Mr Bateman's Orchid. Mex. \&f Guatemala, and the projecting table of the base of the lip) are much brighter, the sepals, petals, and lip being marbled to the tips with rich and deep cinnamon, while ours is of a light yellow, and only the inferior parts of the flower are marbled. Odontoglossum Insleayi, ton, always shows a very prominent table under the stigma.
We have been anxious to obtain some information
respecting the habitat of these plants. It would seem
sent footing, were matters in mind
Lindley felt the highest possible interest, and it always a subject of gratification to him that he been instrumental
just mentioned
During the Potato famine, Dr. Lindley and at: were commissioned by Sir Robert Peel to procis Ireland and report on the actual state of to there, and the Minister is well known been much influenced by the report of the reye sion in his determination the Corn Laws. Many of our reavers remember the long and ultimately success of Lindley fought in this Paper for the came to glase. It may he said, indeed, that to him extent belongs the credit of luaving plate \(m\) within the reach of persons of also often m Lindley's peculiar powers were ald Excise dep able by the authorities of of adulterations and the fraud. Perhaps, however, the greatest, althnugh i the least known of his public services, For mant nection with the Island of Ascension. Formirit he was consulted on this subject bin the present state of this mainly due to the following of his judicious a to the skill of those offictals who wation time to time upon his recom name should also instructions. Dr. Hooker's Lindley in ciated with that of Dr. the island, and subject, he having visited of improving it its condition and the meall known, erbarium, which, although inferio extent, is surpassed hy he devoted the whole hours, receiving great and conservation of Orchidaceous end or lately been mado

Tiod Profecoor was an enthusiastic volunteer, and
The intad constantly as a full private of the South fous prinful affection of the thumb.
Dro Lindtey was in bad health for some years Dro the died. In 1851 he was one of the

jarorso. of for displayed in the Great Exhi sion of that year. The duties of this office, in contudion with his other labours, were so onerons, that be became in consequence seriously ill. A period of maced his work with his usual ardour. At the time of the Exhibition in 1862 he was induced, much against ot the edrice of his family, to take charge of the whole lonial department, and although constantly complainng of headache, from which he had never before auffered, be refused to abandon his post, and after the
Sxibibition was closed, it was seen that Lindley's rentul and bodily powers had received an injury from the elluts of which they were never to recover. He wa wa compelled to resign the Secretaryship of the Hortiallomal Society, with which he had them been connected 540 years. It was at this time that some of his Neds sabseribed for a portrait of him by Mr. Eddir, wid the excellent likeness now in the Society's Meeting Sona attorwards a chaste and elegant epergne in silver suabo presented to Dr. Lindley. The value of the tit was eubanced by the appropriateness of the mong Orehids, Roses, and other plants.
Dr. Lindley was a member of about 60 scientific mietier, including every botanical and hortioultura nciety of note in Europe and America. He became a Pellow of the Linnean as early as 1820, and of the Roval in 1828 . He received the degree of Doctor of
hiloophy from the University of Munich in 1832. In mo was elected an honorary member of the Royal A taleny of Science of Berlin, and in 1853 siresponding member of the Fronch Institate. In at the Reyal Society, the Royal Medal, awarded to him theognation of the value of his labours in various beaches of scientific botany, and more especially for bislearned and comprehensive works on the natural xders of plants, on the Orchidacem, and on theoretical pructical borticulture.
In his address on this occasion the President, when making of Lindley's acquirements, made allusion to bis original and vigorous intellect, his quick appreciation TMinities, the clearness of his method, and the lacidity This style. He showed that Lindley regarded syste mic botany as the sister science of the comparative
mon animals, and like it depended for the rlae of its results upon the namber and variety as well as completeness and accuracy of the naturalist's medship also alluded to the patience and skill that Dr Lindley manifested in the dissection of the singularly raplicated structure of the Orchids. In reference t antiealture the following expressions were used :-
" Sor is it too much to say, that it is masing due to his efrts that this branch of knowledge has risen from the Allusion was also made to the consistent \(t\) Dr. Lindley had made to establish and owledge of the natural system of botany in To these remarks, from the recognised of the feelings and judgment of scie

\section*{TYEORY AND PRACTICE OF VENTILATION.}

\section*{No. IL}

Or searcely less importance to as than the frot that the air is coldest at its highest elevation, is the truth that the surface of the earth is warmer than the air Were it otherwise, the cold deuse sir of the pola regions, instend of, as it does now, finding its way baek to be heated along the lower regions of the atmospbere,
would rush along the surface of the earth, and tread out a path of blighted desolation with its icy feet righ ap to the tropics.
Having thus glanced at the origin of atmospheric heat, and the principles that govern its general circulation, I will try to explain the actual process of it heating. This process, called convection, may be The princia system of reciprocal exchangen The principle upon which it works is one of barterage, giving away so many partioles of hot air for
an equivalent of cold nir. It does basiness on liberal an equivalent of cold nir. It does business on liberal
principles, and gives away rather more than it taken back so that there is ever room for the raw material, cold air, in its manufactory. It differs from both radiation and conduction. These are distribators of heat-convection is a dealer in the article. It is just as careful to receive cold air as to distribute warm. The best illustration of convection is to be seeu in boiling water Scattering into it a small portion of cochineal, which is of about the same density, its colour reveals the move ments of the fluid. An impetuous stream will arise in the centre, and other currents will descend at the sidem,
If, however, the fire is pretty equally applied round If, however, the fire is pretty equally applied round ncreased almost to infinity. They are all governed, however, by this great general law-that llaids strive to find rest in an equilibrium of temperature. This state of repose they endeavour to reach by a displacement of particles. Even the boiling water varies in temperavare. A difference of from one to three degrees may b found in it; hence the violent ebullition and apparen confasion. Neither does the motion cease with the cessation of boiling ; for hours aferwards che lighter op of the heavier and colder portion. Nor does conrection cease until the whole is cooled down to on uniform temperature, if, indeed, that can ever happen in our climate.
A similar process is constantly going on throughou the air. Could they be rendered visible, we should b astonished at the swiftness, number, and diversity of its currents. In fact, we do occasionally catch glimpses of them, for the air is not perfectly transparent. That heated uracery the upper openings of hothouses, is simply air and vapon of water in rapid transit. The same thing is seen when bright sunbeam darts through a semi-darkened room The dust atoms in this case reveal the eddying currente. Seen, or unseen, and they are generally unseen, these currents flow on and on for ever. For so sensitive is the air to the influence of heat, that the maintain its entire atmosphere in violent agitation. This agitation is cansed by the efforts of the air to maintain tself in a state of reat. An unequal system of heating renders repose impossible. Convection works on bravely on secure aniformity of density tbroughoat the entir mass of the air; the sun puts out his whole power to destroy it; and so the two great processes are carrie on in apparent antagonism, and yet in profound harmony, for the heating and ventilation of the world. It is only by a perfect comprehension of the action perfect theory of artificial ventilation can be formed Fortunately, in relation to this subject there is or ought to be a pertect analogy between Nature's method nd our own. In each caso aike there is a heating power, a distributing medium, and anserving force. and at the poles are to Nature's plan, the heating apparatus, the glass, the outside shade, the external cold and the air of the honse are to ours; therefore in our limited spheres we ought to be able achiero similarly ame measful results.
I will now proceed to notice the great hot-water ystem, Nature's third mothod of heating and renti iating the world. Watertakes partin its forms of water, ice, and vapour. The sun does not simply heat and ventilate, but also waters the earth. He is the great water wiverse. Bending down over the surface of the inoist earth. lakes, rivers, and sear, he drinke up an enormons draught of "ater,
drinking powers are determined and controllod by the amount of heat he beatow on any particular spot. Where drinks most. A round the leme where it is greatest deccribed the sun takes a dranght thet conld aink the level of the sen there 15 foct lomer in the courne of 4 year, were it not replenisked. The average annua conmumption or rather distribution of water by the sun masy be roughls estimated by such facts as these:that the lifte up enough to supply all the wants of the vegetable and animal kingdow, and leaves plenty to spare in the coarse of ome jear to cover a bevel ypace
the size of the earth's surfuce to a depth of a feet supposing that it could all be collected toggether williont any of it being relifted!
I shall have oconion to reture to this eabject, and will ouly advort to a fow genocal prinoiples bere. The frst is, that a large expenditure of heat io awolved in ifting and carrying this large yuantity of water. The monnt of beet mocmary to convert meter into rapour or in other words, to cerry it up into the air, depend upos the temperature of tho wator. Ios requires moet, cold mator next, and hotwater of course lonet of all. As thom condition originato in the varying quantities of heat alroady existing in the water, follows that where moat water is reined the ereateot amount of beat will be expended; also that the expenditure of heat is eynonymous with the production of cold. Hemce the extroordinary activily of the ent in raidng water within the tropice \(k\) cop emperature of these regions to an average of about

The large amount of water diffinsedi tisroughout the atmosphere, aloo moditios and amuliwrates its wbolo glare of the sun, colours the air with the mont brilliant hues, and becomes a powerful agent in securing its complate ventilation.
The heat made use of in expanding water to the atate of vapour is not lost. It ascends or aails through apace with itm watery burden. Presently it comes inte contact with cold, whose busincess it in to guncd the portals of the world, and to see that nothing, how ever uubtile, can pass through. The water hears and obev the nuthoritative order to stop. A rearrangement of it particles beging. How this in acoomplished no one can tell with certainty. It is probable that electricity conver and shivers the water-carriage at a stroke, liberating the caloric and compressing the watery vapour with the instantancounnets of thought. It is known that in thander cloads, if not in sll others, elec tricity abounds, and some such office it may perform But common and old as is the phenomenon of rain philosophers canonot ponitively explais its onume. This much is known, that as cold air is unable to hold in suspension so much water as bot nir, the passage of warm air through cold must condense part of its moisture, and that water, being so much heavier than the mir, cannot remain man anch in the atmosphere, and therefore falle as rain or anow. It important for our purpose to note here, that whenever vapour is thus condensed into water, heat is libe rated and set free. Thus the beat used in converting water into vapour on the hot surfaces of sea or land is discharged in the cold regions of the atmo sphere. In the act of conversion from vapour into water, large vacuums are created in the atmonphere which this liberated heat does not seem able to fill up. The dispersion of this heat in the midat of cold atrata and the creation of there empty spacer, that were previously occupied with water distended to more than 2000 times the apace it requiren in its normal condition, creates endless eddics and currents in the air. Hence wind, that is ventilatior is expected with rain; and in fact water in tie firmo vapour in the air is one of the most powerful mems of keeping it in perpetanl motion. Combastion, reapirution, and decompcsition are conatantly assisting the sum in the elevation and distribution of aquenus vapours through. out the air, and it is impossible to exagerate the influence of water as a disturbing, that is a rentilating force thronghout the atmoophere. D. T. Nisk.
P.S.-I am much obliged for asT. P.'s courteous correction. I adbere, nevertheless, to my original tatement Light air does rise through and sail along the top of cold sir, for the reason that I stated. Heat, not cold, is the canse of the motion. The present communication and forthooming remarks on the two antagoaistie forces of elanticity and denulty will rende this still more clear. D. T. F.

\section*{DOUBLE.GLAZING.}

Alrinoug this subject has been several times commented upon, it has not yet recaived that attention which I anticipeted it would have done from practica gardeners, the perfons par eacciltione Mr. Anderscn has given us (see p.987) a comprehensive resumé of the system of "double-glaziog, and at the rame time has adduced mome logical arguments in favour of views is, however, still wanted.
It is, indeed, time that definite information in th: matter should be laid before the public, as I find that many gentlemen and sheir gardeners entortain the idea that singleglasing will shortly be numbered among the relics of antiquity, atd
is already the ne plus meftra of all good hothoure
building, irrespective of the uses to which such houses
are to be appropriated-the plan being considered are to be appropriated-the plan being considered
equally well adapted for general plant or fruit houses, as for Orchids.
Now, although I endorse most of Mr. Anderson's statements, it is not my intention to contradict all that has been advanced in reference to double-glazing. I do feel bound, however, to state that the benefits ascribed to it have been so extravagantly extolled as to lead amateurs and others into the belief that it is absolutely essential in all classes of horticultural Hitherto double-glazing has been advocated mainly for Orchid-houses, and among its advantages are named saving of fuel, uniformity of temperature, increased natural condensation of moisture, and a greater command of that perfect ventilation
But on the other hand it may be asked, is doubleglazing so efficient as to have no disadvantages? I think not, and in confirmation of my opinion let us eramine it during the four seasons of the year, com-
mencing with spring. For ordinary purposes I believe mencing with spring. For ordinary purposes I believe
it will be found that the objections to double-glazing are very numerous.

If, as I have read, the "blanket of air" obtained by a hermetically sealed space between two
roofs, has proved to be so non-conductive as to render a period of several days necessary to reduce the temperature inside the house to that of the surrounding atmosphere, is it not a rational inference to conclude that the rays of the few hours' bright light allotted to us during spring would thus be made almost entirely By thus diminishing solar warmth, and I may add light also at a season when ventilators are but seldom and cautiously opened, is not the interior atmosphere rendered more stagnant than if the house were singleglazed? Moreover, is it advisable never to vary the temperature of Orchid houses, but on the contraxy to keep the plants almost simmering in steam? Aud lastly, if this mode of? treating Orchids be conducive to success, what is to be understood by the remarks made by many of our leading horticulturists, who suggest that the excessive heat and nursing hitherto bestowed upon Orchids is productive of sickliness and stagnation rather than of vigour and exuberance of growth? That Orchids will flourish under single-glazed roofs has been fully proved, not only by Mr. Anderson, but by others ; it. has been
said, moreover, that they even eclipse in size and beauty those cultivated under double glass, which has, however, produced in one or two instances fine plants; but this by no means constitutes doublebelieve it to be.

These remarks, although associated with the season of spring, apply with equal force to that of autumn;
and as regards summer, I believe the unanimous opinion to be, that the outer roof is not only superfluous at that season, but if allo
would prove to be a positive evil.

Double-glazing has doubtless advantages during the cold nights of winter, but the removal of the outer roof by day appears to me to be a desideratum, and in support of this opinion I beg to state that the plan of
using a thick woollen or flannel roller covering for the roof has been adopted with a success fully equal to tbat ascribed to double-glazing, with the following additional advantages, viz, -that it can be removed daily and at pleasure, and that it costs only a tithe of the expense of a double roof. The material usually
employed for horsecloths when laid close to the roof about watering or shutting -up time will of course become damp, and thus effectually prevent air from entering between the laps of the roof, diminish the condensing power of the glass, retain a uniformity of temperature during the night at a great saving dew which has been so exultingly described ns the peculiar result of doubleglazing. If all the good effects therefore of double-glazing, without its cost, I think that the sooner the practice I have named is made known the better. That succese has attended the adoption of this plan for two years I can bear testimony, and I entirely coincide with the opinion of many who are enabled by a comparison of
the two systems to form a decision, that this simple method is even superior to doubleglaxing. G. Deal, Chelsea.

\section*{Home Correspondence.}

The late Dr. Lindley.-We have this year met with three severe losses in the death of Sir W. Hooker, Sir Gardeners' Chronicle; and it is well that there should be a fitting memorial of each of these eminent men, if noly as an encouragement to those now entering into their genius to follow in the same footsteps. I attended the course on Botany delivered by Dr. Lindley to the 1832; and although my previous acquaintan in the year 1832; and although my previous acquaintance with the admirable lectures of Prof. DeCandolle at Geneva was calculated to render me rather fastidious on such
matters, I came away with a most favourable imprea
sion of the accuracy, grasp of mind, clearness of conception, command of the subject, and power of imparting information, which were displayed by one who of the Jussieuan system now so universally adopted. For, at a period not long anterior, when Dr. Lindley, then a young man, delivered his inaugural lecture at the same institution, he startled many of the old disciples of Sir James Smith by his frank and thorough system of classifying plants, which their master had, by his influence amongst British botanists, been the principal means of leaving up to that day almost unLindley"s.character was the indomitable activity of mind and body which he displayed at the period alluded to, and in which he persevered up to a late period of his life. I found it some effort at that time to leave my lodgings in London in time to make my appearance in the lecture room at 8 o'clock in the morning, but I was sure to find there at his post Dr. Lindley, ready prepared with his matter and illustrations, although compelled, in order to do so, to take advantage of one of the earliest stages which plied between his country residence near Tarnham Green and the metropolis, previously to the Horticultural Gardens at Chiswick, which he superin tended. But this would have been less remarkable had not the subsequent hours of the day been occupied in Loudon by the rontine of duties connected with the
Secretaryship of the Horticultural Society, with the Lectureship of the Chelsea Garden, \&sc, and his nights engrossed in those profound and intricate researches on philosophic and structural Botany, which have conferred upon his name so higb an European reputation. When to all this was added the great labour imposed upon him by the share he took in the International Exhibition, we cannot wonder, however much we may deplore, that the energies of his mind should have been exhausted and broken down under such a pressure of work and of anxiety. Charles Daubemy, Botanic Gardens, Oxford.

\section*{Magnolia Soulangeana.-I do not know whether} for thi is an uncommon thing in this country for this Magnolia to ripen its seed; but as no case of the kind has over before come under my observa-
tion, I venture to mention it. The Magnolia in question grows against a south wall, and was covered with blossoms in April last. Generally I break off the seed-vessels, and had done so this year a few, however, escaped, and in one of them a large red seed is found near the base, the remainder of the seedvessel being sterile. I may add that in my garden this year the Jerusalem Artichoke has blossomed freely, and that the common Scotch Briars have borne several autumn flowers. G. P. de Teissier, Rector of Brampton, near Northampton.
Mildness of the Seasom.-In the neighbourhood of Bridgewater, Somerset, on the 5th insta, Raspberries ripened out of doors, and Green Peas were to be had in many places. The Cornel, or Dogwood, was in full bloom for the second time, no fruit baving been the
result of the first blossoming. The common Male Fern was also noticed to be sending up new fronds as in spring. The berries on the Spindle Tree are more abundant than they have been for years. Alfred Haviland, Bridgevater.

Osiers. - Will one of your correspondents inform me where I can get Osier cuttings, and information as to planting a now Osier bed in a damp locality, which Hoare, Godstone.
Chrysobactron Hookeri.-In noticitg Dreghorn \& Aitken's Catalogue at po 1038, you speak of Chryso. bactron Hookeri. Can any of your correspondents say
whether they have ever bloomed it, and by what treatwhether they have ever bloomed it, and by what treat-
ment? A. \(\boldsymbol{R}\). [It flowered at Kew in 1851; and comes from subalpine pnstures in New Zealand. The address is King Street, Kilmarnock.]
Arundo conspicua.-Seeing this plant noticed last year as being a rival to Pampas Grass, I obtained a plant early in the spring; it has grown pretty freely, but has not shown any symptoms of flowering, although the Pampas Grass near to it has done so profusely.
Will some reader be good enough to inform me what wort of a bloom it has, and whether the plant requires a wet situation or not? Mine is planted on good ground, rather dry than otterwise. Perhaps it is not old enough yet to bloom, yet it is a full yard in diameter. If it in a smaller degree resembles the Pampas Grass it will be a great acquisition, but if it blooms sparingly and requires special treatment, not easy to be given everywhere, it will not become popular. J. W.C. [It is a native of New Zealand in moist places, grows 8 feet high, and has large white panicles of
Seedlings from Japamese Plants.-Seedlings have been raised liere this year from each of the following kinds of the lately imported Japanese plants, viz, Aucuba japonica vera, Rhaphiolepis (Photinia) ovata, and Lilium auratum. The seedlings of Aucuba were raised from the A. japonica vera or greeu Aucuba, females which had been fertilised by variegated males. The berries were gathered about Christmas, and the young plants have been coming up for the last two
months. I think there will be several new varieties among them. The seedlings of Rhaphiolepis ovata were raised from imported plants. I think this will turn out
to be a valuable addition to evergreen shrabo. lt proved hardy, and it is described by \(\mathrm{Mr}_{\mathrm{r}}\). Forthme Japan. It bears a purple berry twice the with common Haw, and ripens in October. The plants of up in spring. The seedlinge of Lilium auratum ay
raised from a remarkably fine plant raised from a remarkably fine plant which mas mot in your Paper on the 20th of August last. John Bamon
Elvaston Nurseries, Derby. Elvaston Nurseries, Derby.
Potato Disease, -It may be worthy of notice is order Solanaces, which have been lately introd into this country, and grown in gardens as orname foliaged plan 1, have been subject to a spottin decaying of the leaves, in many respects similar now toowell known Potato dieease, a fact strik contradictory of the hypothesis of 87 me who at
Can this malady, \(a b\) imitio, to a worn-out consti fresh subjects, be the veritable Fungus which plays ap havoc with the Potato, or is it a variable form of same? William Earley, Digswell.
Stoneless Berberries.-I have to apologise for
efore answering the question " before answering the question of "Diss" (seep Dorsetshir Piddle Hinton, about five miles from Dorchester. trees I saw loaded with stoneless fruit ben Diss's" view, as they were very old ones, b sharp gardener there affirmed that all Berberties I have written to him for furthens, were stone observed an old Berberry of this variety at Strond year. On the other hand, I have old trees, I suppom least 40 years old, the fruit of which is nearly all stom and I never saw a stoneless Berberry in the midher counties or in the north. W. D. F.
Black Barbarossa Grape.-I I see that in a contem rary, exception is taken to the advice given in th Gardeners' Chronicle of Oct. 7, as to the position whid this Grape should occupy in our Vineries. The tals ment there made is that the Barbarossa is mom valuable as a late than an early Grape, and the adru based thereon is that it should therefore be planted in a late house with Hamburghs, St. Peter's,
requiring the heat necessary for Muscats. that up to the present period this is the way in mbid the Rarbarossa has been treated; and the m bunches of this Grape that have appeared exhibition tables from year to year testify to the rim of this mode of treatment. A most perfeet banch d Grapes of this variely was exhibited by the Rang
Horticultural Society at their Autumn Exbilition d Fruits in 1864, the size and colour of the berries beire the admiration of all who saw them-so muci so the it obtained a separate editorial notice in the Garcener Chronicle of Oct. 22 (p. 1010). This bunch was take from a Vine grafted on the Black Hamburgh, al growing in the large conservatory at Chiswick, , little fire-leat is used, and where the Muscats do ripen perfectly, but where the Black
St. Peter's do well. Therefore, with all deferene the opinion of Mr. Pearson, who draws his from one solitary case, I must venture to as sidered just the reverse of what he pleses to 1 it. S.

A great many varieties of Pine-apples and Fiod
re planted six years ago, with th
their comparative merits; but the ground selected for
the purpose beirg of too easy access to the public, no
aportunity was affurded of comparing the different opportunity was affurded of comparing the different couvenient place, and I hope to give a more satisfactory scoonnt of theu in my next report
Some tropical and semi-tropical trees and shrubs which have previously borne fruit in these gardens, produce a more abundant crop as they increase in size and age. Of these the Sweet Sop (Anona squamosa) me micata are, perliaps, the most desirable for cultiva. The useful Jaco tree (Artocarpus integrifolia) of The Indes has also produced a large quantity
The Casava (Jatropha Manihot), the tubers which furnish a food much valued in the Weat Indies, bc., has succeeded well. The variety in the garden is that known as the Sweet or Blue Cassava, and is connidered the best.
Amonget recent introductions of useful plants, I hare to mention the receipt of a large number of planta of the Corls tree (Quercus Suber), through the kindoese
of Mr. George Macleay; the whole of these of Mr. George Macleay; the whole of these have parts of the colony, and from whom the plants will no doubt receive the care and attention which they so well deserve. Also the Java Almond (Canarium commune), and the beautiful Indian Mesua ferrea, which will be well adapted for ornamental purposes. The Maltere Clorer, or French Honeysuckle (Hedysarum coronarium)
has not renlised the expectations I had formed of its wine as a fodder plant. It does not flourish well in nmmer, and many persons whom I have supplied with weeds have attempted its caltivation, but without In my collect many useful and interesting indigenous plants, Which will prove valuable for cultivation in the gardens, bat especially so for purposes of exchange. Of those, a Scitamineous plant may be regarded as particularly ioteresting, its fruit supplying the aborigines of the
north with a food as highly prized by them as the Bubya Bunya by the natives of the southern districts. This plant was seen by Carron, in Kennedy's unfortunste expedition, and described by him as a singular science, and the great value of its fruit as an article of food has been hitherto unknown. I had also an opportunity of collecting seeds of a species of
Eugenia, known to the settlers as the "Cherry tree," Waich produces a delicious fruit; of a new and very bandsome Cycadaceous plant, as well as of Cycas media, the native Banana (Musa Jaciii), and also
the Nelumbium Leichhardtii, all of which furnish the natives with edible fruit. I also collected many Aue Fern plants, some of which are new to the
Anstralian Flora. Many other valuable plants have been procured, had the due discharge of my other important duties allowed sufficient time and opportunity orecome acquainted with the rich and extremely The incor Rockingham Bay
Botanic Gardens will be a valuable cark. with the latere, and will afford an opportunity of and also of improving their place of healtirful recreation. To carry out this onject,
perso very extersive alterations will be necessary-making
walks, draining, planting, \&c. These will be proceaded with as expeditiously as the means at my command will allow. Improvements are now in
progress in the Governmert Domain, which will be continued as opportunities may occur. I shall also Rardens, for croquet playing. I may also mention that forther addition of six cast-iron garden seats has bee Whilat are now placed in suitable situations.
additional labour granted me, I would abserve for the will be readily absorbed in the contemplated alterations, guence of the extremely short notice given me, I regret the Dublin Exhibition unable to send any contributions to Por the ExLibition,
Proits at Korthcoming International Exhibition of Septens of fruits, which will be forwarded by the September mail. In accordance with a desire expressed \({ }^{4}\) extersivernment, I shall endeavour to make Opportunities afforded me will allow, as by means of I have, very advantageous exchanges may be effected. of Messrain to Harris \& Cowledge the continued kindness Dons Ball line of packet ships, who still gratuitously the amme wardian cases of plants to England, and use The Botanic in their conveyance.

William Hooker and Dr. Hooker, of the Royal Gardens, forwarded to sir for the sum of 1000 ., which had been for this purpose, for 1864, has ber. The amount voted purchase of books in the Australian colonies. Many reading than formerly. Walter Hill, Colonial Botanist and Director of the Botanic Gardeme, Brisbame.

\section*{Sorictics.}

Umited Hobtioultural: Nov. 14 and 15.-Au exhibition of Chryennthemumes micoellaneous Yiowers and Fruits, took plase under the auspices of this Saciety in Guildhall on Tuesday and Wednesday last, and was n all respects highly succoseful, a result with which all must be pleased, inasmuch as the surplus proceede of this and of other shows held by the anrae Suciety,
are, we understand, to be devoted to the establishment are, we understand, to be devoted to the establishment
of a Benefit Fund for Gardeners. With this charitable end in view the Hall, with its ancient trappings and decorations, as on Lord Mayor's Day, was kindly placed for the occasion in the hands of the promoters of the Fund, who received no remuneration for their time and services, while the different exhibitors obtained only Certificates, to which no money value is attached, for the fine display of froits and flowers which they produced, all being anxious that funds should be raised as speedily
scheme referred to.
Cut blooms of Chrybanthemums were tolerably numerous, and occupied portions of the oentral Messer Anemone-fiowered sorts were shown by Messrs.James, Georke. Forajth, Rowe, Howe, and Cuz.
Among them were Queen Merguerite, Empress, (iluck, Fieorge Sands, Fleur de Marie, Louis Bonamy, Mrs Pethers, Princess Marguerito I Madame Godereau, St. Margaret, Prince of Anemones, Marguerite de Wildemar, and Antonius, the last a very handsome yellow variety.
Large-flowered varieties came from Mesm. Forsyth, Jamees, Morgan, Wheldal, Delvalle, Rowe, Howe, Drain, Parker, Slade, Ward, Mozham, and Heale Among the different kinds were beautiful blooms of Jardin des Plantes, which still stands at the head o bright yellows; White Globe, large and fine; Beverley,
Empress of India, Prince and Princess of Wales, Venue, Sain Weller, Mr. Brunlees, Rev. Joshua Dix, General Slade, Prince Alfred, Pio Nono, Beauty, Novelty, Nil Desperandum, Antovelli, General Bainbrigge, Lady Harding, Doctor Brock Robert James, Nonpareil, Orange Perfection, St. Patrick, Maréchal Duroc, Golden Ball, Lady St. Clair, Queen of England, Pearl, King of Denmark, Themis, Plutue, Mrs. Holborn, Go!den Eagle, Abbé Passaglia, Cherub, Oliver Cromwell, Duke of Wellington, Anayo Hercules, Madame Lebois, Imogene, Eve, Priucess Louis Little Harry, Lord Ranelagh, and Donald Benton.

Plants of Chrysanthemums were contributed by Messra. Forsyth and George, and groups of the same showy flower by Messra. Crute and Delvalle. These were all highly interesting exhibitions, the plants being both well grown and flowered. Among them were some cleverly-managed standards, both of large and small-flowered varieties, the skilful introduction of which into the different collections served to break up that uniformity of appearance in them of which some have been heard to complain.
Groups of fine-foliaged plants were placed here and there round the hal with oullo olfocto These come from Messrs. Williams, E. G. Henderson, Rhodes Wheeler, Prestoe, Wilson (gr. to W. Marshall, Esq.), and Monk (gr. to J. Drewith, Esq.) Among them were Ferns, the graceful Cupania filicifoiia, Spbærogyne latifolia, FicusPorteana, Palms, Anthuriums, Cyperus, Yuccas, \&c
Mr. Bull had the fine collection of omina Rond Horticultural Society, and a valuable group of Aucubas, most of which were covered with berries.
Messrs. Low \& Son furnished some sdmirable Tree Ferns, whose giant stems and noble heads of elegant fronds were the admiration of the crowd of visitors brought together on the occasion. From the same establishment also came an intoresting collection of winterblooming Orchids, consisting of the charming little Cattleya marginata, Sophronitis grandifiona, the
handsome varieties of Culanthe vetita, and one or two handeome
Fruit formed an important feature of the show. \(A\) smooth-leaved Cayenne Pine-apple, weighing 10 lb ., came from Mr. Page, gr. to W. Leaf, Esq., of Streatham. Mr. Sparrow, gr. to Lord Query, was furnished by Mr. Howard, gr. to J. Brande, Esq., Balham. Mr. Young, Leigh Park, also sent two or three well.grown Pines. From Messrs. Lane came some famous bunches of Black Barbaroses, Grapes, together with Foster's Seedling, Raisin de Calabre, Buckland Sweetwater, Chavoush, Black Hamburgh, Frankenthal, Eaperione Alicante, and Black Priuce, all in a state of excellent preservation ; Trebbiano and a Black Grape stated to be related to Barbarossa were shown from Welbeck
by Mr. Tillery; and we also noticed what appeared to be Trebbiano ripened in the open air.
Mr. Wells had one of his patent Ground Vineries (see p. 2f8), in which were exhibited 36 bunches of Black Hamburgh Grapes, averaging \(1 \frac{1}{2} \mathrm{lb}\). each. They were excellent in flavour, but a little deficient in colour. It was stated that
run of these Lilliputian Vineries had produced this season no fewer than 93 bunches of grod Grapes, a result certainly very much in favour of this comparatively new mode of Grape growing.

Apples filled one entire table. They came from the names of Mesars. Nowton, Rhodes, Turner, Purnon,

Williame, McIndoa, Richbill, Watoon, Koller, B iker August, Beasloy, and Mortimore. Among the table Pippu, Goldean Reinette. Warlhuret Pippu. D wnton, Searlet and llath hick's Nompareils, Franklin's Gulden Pippin, Holland Pippis, San Young. Marat, Cornioh Gilliflower, Court of Whek, Cours Pendu Piat. Adause
Pearmain, aud King of Pippins. Pearmain, aud King of Pippion. Kitchen sorts com-
 and Wellington.
Pears, which came from nearly the me exhibitors, comprised among table kinds, highly-coloured fruit of Furelle or Trout Pear, Beurré Diel, Glou Morceau, Easter Beurre, Van Muns Leon le Cierc, Burré Rance, Swan's Eig. Ducherse d'Angoulém... Kuight' and others, many of whioh, as well as of the Appler, were wroagly mamed. Among varieties for culinary purpases, wero Catiliac and Uvedalen 8t Germain, Otber fruit consioted of Quinces, Modiars, and Coz' Late Red and Blue Imperatrice Plums.
Mıscellaneous sulijects consisted of hamdrome-looking Fern casen from Monsra Carter and Barr \& Sugden ; large assortment of Gourde from the lest-named exhibitor and Mr. Young of Highyate a collection of Gourde and Graseen from Mesars, Sutton, fine apeciment of Oniona from Messra, Cuthush; find a mmall group of Vegetables from Mr. Newar, of Newcaatle. Ammpg
the later were good White Celery, Dewar's Short the latter were good White Celery, Dewar's Short
topped Beet. Easton's Glant Leek, and Potatos. From Mr. Shirley libberd camo a large c.llection of Putaton and Ivies. Mr. Hally, of Blackheath, bad a croup of tricolor-leaved Zonal Pelargoniuma. Mr. Howard, gardener to Mr. Brande, Hhowed some thatofully made-up Boaquets, around which, during the whole fternoon, was a crowd of admiring spectaturs. Samples of Collyer and Roberts' tobacco tissue for purpones of fumigation were also shown on this occasion.
Homtioulyula of Romburar: Not. 14 (Anmeal Meeting). - Mr. Thomson iu the chair. The abotract statement of the accounts for the past year showed that there was a total balance on hand of \(31 / 7 \mathrm{l} 7 \mathrm{~s}\). Id. The Society had paid 520l.108. 6d. in prizen during the season. The aubscriptions from mernhers amounted to 4il. 11s., and the receipta at the different mbows to 946 l 16 s .6 d . The donations to the Society for the purposes of shows amounted to 877 l . \&s 6d. The total charge, including a belance from laut year, was 11131. \(10 s .9 d\), and the expenditure amounted to 796l.3s.8d. The Treasurer's very satisfactory report was unanimously agreed to. The Chairman then reviewed with reference to the contemplated union of tho Society with the Caledonian Horticultural Society and stated that a report had been drawn up by a committee of both associations. That report he read to the meoting. It wet forth that the joint-committee were unanimously of opinion thet the union of the two Societien ahould take place; that the name of the united Socioty should be subscriptions for members should be one guinea, and gardeners 108, and 58. The joint committee recom mended that the council of the united Society ahould be composed of four amatours, four nureerymen, and four practical gardeners; that the prenident should be hie Grace the Duke of Buccleuch, and the vice-presidenta hit Grace the Duke of Argyle, Earl of Dalkeith, Farl of Stair and the Earl of Haddington He spoke strongly in favour of the proposed union, and remarked that it would do gnod to both Societier. Mr. Johu Lamont moved the approval of the report, which was seconded The Chairman remarked that the union of the Societies would be consummated if the member of the Caiedonian Society approved of the report, as they had done. A vote of thanks was a warded to Mr. Young, the secretary, for his indefatigable exertions in conwas paid to Mr. Cumming, the treasurer.

\section*{Notites of 3Books.}

La Végétation du Spitzberg, comparée à celle des slpes et des Pyrenós. Par Charles Martine, Profesceur d’Histoire natarelle д̀ la Faculté de Médecine de Montpellier, Directeur du Jardin des Plantes de la même Ville, dec Extracted from the Acaderay of Sciences and Literature of Montpellier.
Professor Martins is one of the most agreeable and popular writers on the vegetation of Europe that we know of; he has travelled extensively, from Spitzbergen, tar within the Arctic circle, to the borders of the Great Sabara, and from the Biscayan Py renees to Asia
Minor, and has given in various papers and publications araphic aketches of the botany, geology, climate, and often of the physical gengraphy too, of some of the Never profund and with no pretensions to orivinality, he nevertheless chooses sufficiently inportant sulijects, colliects materials industriously, marsbals bis facts skilfully, expreses his iden forcibly; and having the tact and knowledge that enable him to seize prominent botanical featurea and subordinate them well to the mental vision, he never fails to leave vivid and very
further the guod sense to avoid obtruding too much of
his own persumal exertions or experience, just introducing so much of himself as keeps the reader alive to the face that the anthor speaks from actual observation. The object of the present essay is to show cause for the theory that the plants which are common to
Spitzbergen, Lapland, and several isolated mountains in Spitzbergen, Lapland, and several isolated mountains in
the Pyrenees and Alps, have not been independently created in their various localities, but have had a common, and this an Aretic origin. The meane of
dispersion has been the glacial epoch, which first chased them from hy perborean to temperate regions, when the returning warmeth drove them up the mountains southern Europe in one direction, and back to the Polar regions in the other; a theory which originated we believe with our own Darwin, and was subsequently more fully developed by the late Edward Furbes in His celebrated essay on the Distribation of British the Geological Survey of Great Britain.

Spitzbergen, whose plants are the most Arctic known, contains, according to Martins, no less than 93 flowering plants, a figure which has gradually been arrived
at bs the exertions of collecturs during a period of nearly 200 years! for it will scarcely be believed that this remote inhospitahle spot was botanised upon so deseribed and figured 11 species of land plants; succeeding him in 1775. Captain Phipps brought 12 species, that were named and deseribed by Solander; Suoresby obtained 15, described by Brown in 1820 . General Sabine, the present President of the Royal
Society, in 1-23 collectell 24, which were described by Society, in 1-23 collectell 24, which were described by
Sir W. Hooker, who also iletermined 40 species gathered by Parry's officers in 1827. In the same year Sommerfeldt enumerated 42, collected by Keilhau in the sout!!ern parts of the group. In 1838 Martins himselt and Vahl visited Spitzbergen, and raised the number to 57 . Since then the number has augmented to 93 , chietly by the labour of M. Malmgren, Botanist to the Swedish Scientific Commission nnder Torell, which form the subject of an excellent memoir by 152 species have been ascertained, but with thene Professor Martins does not concern himself,
Of these plants but one is used for food, the Collearia fenestrata, a species of Scurvy Grass, closely
allied to and probably a variety of C. offinalis; its allied to and probably a variety of C. officinalis; its
more southern form is acrid and bitter, and Professor Martins attributes the absence of these properties in the Arctic plant to the deficiency of light or heat; an analogous inatance is mentioned by Dr. Hooker in Sir James Ross's Antarctic Voyages, in the case of the Celery of Fuegia, a plant most closely allied to, if not identical with the poisonous Wild Celery of Europe, bat which in that cold sunless region affords an excellent salad and pot-herb.
In the enumeration of the 93 flowering plants Prof. strictly Arctic, and what are likewise natives of France. The strictly Arctic are-

Unfortanately he does sot distinguish between the well-marked and badly-marked or (ven had species, for some of the plants are in the opinion of alinost all botanists scarcely even entitled to rank as varieties, and others are considered mere Arctic forms, whose characters are rather due to defficient nouriahment than to morphological change. This is empecially the case with most of the Drabas, with one or buth of the
Stellarias and Potentillas, Ranunculus, Taraxacum, and Festuca, whilat the Polemonium, Poa, and Olyceria, are scarcely more than Arctic forms of plants found in lower latitudes. The saxifraga is found in the Himalaya, Hence there are perbapt was probably not aware of the above list of 23 species which eould universally be allowed to be good.
A few of the other plants which are common to Spitzbergen and Scandinavia are in the mame catogory, which it is important to bear in mind, as nose of them appear in the Florules with which Profensor Martins proceeds to conpare the spitzbergen one
Of these the first is the coue of the Taultiorn, altitude 2653 metres, which io envered with snow for friend Bravais collocted in four yeare 132 mpecien Of these, eight are also natives of 3 pitzhergen, viz.
Ranuncultes ghecialiie

Gaxifraga oppuaicifilia,
Polygomum viviparnm.
Awain, on the Jardin, in the midat of the Mer de bien collected 87 flowering plants, of which five are also natives of Spitzhergen, viz., the above Ranunculus, Cardamine, Arenaria, Erigeron, and Cerastium alpinum, axhibits.
The Grande Maleta, altitude \(\mathbf{1 0 , 0 0 0}\) feat, on Mont Blane, boasts of 24 flowering plants, of which the

One-fifth of the whole.
On Monte Rosa, at an elevation of 3158 metres, the Measra. Schlagintweit collected 47 flowering plants, of which 10 are
of the whole.
The top of the Pass of St. Theorlule, above Zermatt, in the Monte Rosa Alps, is Prof. Martins' nest point of comparison; here he finds 13 plants, of which three are ratives of Spitzbergen, again not fur from one fifth.
Latety, the takes the summit of the Plo du Midi de Begorre, in the Pyrenees, 2877 metres above the sea; ing plantw. Of these, seven are natives of Spitzbergen, no less than one-tenth of the whole. It is a very remarkable fact that of these, three are not natives of
Lapland, viz., Poa cenisia, Draba nivalis, and Arenaria ciliata, the last a most distinct platit the two other are probably forms of widely extended species.
To appreciate fully the force of Professor Martins' argument, it must be borne in mind that the atsemblage of plants in the several localities are very different. Thus of the 72 Pyrenean plants only 35 are natives of the Faulhorn, and 15 of the Jardin: whilst but 13 are common to all these localities, the Pic da Midi being
richer in arctic apecies than any of them. Finally, richer in arctic species than any of then. Finally,
Prof. Martins asks whether this difference is to be attributed to the greater elevation of the Peak, or to other circumstances, a question he considers unanswer able in the present state of science; but the fact proves it his estumation the common geographical origin of the species in question.
Useful and instructive as Prof. Martins' writings are, they betray a want of scientific accuracy in many points that detract much from their value; of this Thus in the fourth line of the first page we are told that the winter of Spirzbergen lasts for 10 months of the year; and in the fith succeeding line that the summer is three months long! In the fifth line of the tirst page, that the last traces of animal life are found at Spitzbergen, and again further on, that the European Fauna has there its extreme polar limits, forgetful of the fart that the Polar ocean teems with genera and species of three classes of the animal singdom, Mollasca, Articulata, and Radiata, besides fish and marine mammals in abundance. So too in the following page, Table Rock is said to be the most northern rock
that rises from the bosom of the glacial sea, whereas a reference to the map would have showed him Ross' Islet, " a spot all the more remarkable as long being the most northerly land known, and havirg been actually botanised upon by the late great navigator and good naturalist, Sir James Ross, whose name it bears.
Such blemishes might easily be guarded against, and would be, were Prof. Martins not too apt to acrifice accuracy to fine writing in his graphic introductory sketched.

\section*{flontsts' flowner.}

The Cebthavthemom is par excellence the flower or saltson, that is to say, the autumnal season ; and Mr. Salter?s collection is inat which any one who obtained reapecting it would naturally resort to without fear of disappointment. Notwithstanding that this Exgrsitior has now become so established an annual treat that moat lovers of this useful autumnal fiower are familiar with it, we may safely assert that we have The arrangement is much the same as that observed in previous neasons, but the blooms, which are most abundant, are individually larger and finer than we ever before remember to have seen them.
Of varieties sent out for the first time in May last the following well deserve notice, viz, Mr. Brunlees, a good show flower, deep orange it colonr, well flled in the centre, and beartifully incurved. Album mali floram, a finely incurved white, slightly tinted with
bluah, but not quite compact onough in the centre to make it a desirable flower for purposes of extibition for conservatory decoratinn, however, it will be fund invaluable. To these may be added Ranuncalus, a ciean looking show flower of medium site, erimson in colour, with paler backs to the petals, and nicely incarved. Golden Ball is also a beautifully incurved round flower, bright orange in colour, tippert with gold, and fiusher with the same hue on the back of the petals. This and Aarenm multill rum, both charming early-finwering sorts, are now in great beanty. Blanche of Castile is another fine white show fluwer, as is also Jigo, which is a large dark proplish violet. Pink Pearl of exhibition liardly gond enough. Prince of \(W\) purposen of exhibition hardly goxd enough. Prince of Wales, darl
violet, is a larg s-sized gool show flower, which is
already in nuariy every winning stand. To white varieties has been adied a valuable kind in the forms a perfect ball of wnowy whiteness Mr. Wyness, violet puce, though a usetul flower, can acarcely ever hope to be more than a good kind for ennservatory decoration, but for that purpose it shonld mot be overlooked. Eve, pale smlphur, is a mediam-sized, well incurved, clean-looking kind, which can scarcely fail to become a general favocrite. Mrs, Kaines, blush, is another excellent show variety, which comee into fiower lator than that oth

Brook, Mr. Salter has succeeded in incoloared Deros yellow sport in all respects as good in the Doctor him selt; this, therefore, is a real acquisition. To the ne sinds now under notice may moreoper the ben Hercules, which is one of the largest Chrysanthemed in cultivation, surpassing in that respect eren Omm England or Alired Sulter
Garibaldi, finely incarved, and will make a neefol o hower. Aureum floribundum, a canary-cologred ration is too small to make a successfal show. Iower ; but foiz purposes of ordinary decoration it will prove invalombe Venus, finely incurved, delicate lilac, in the warp of Ie Slade, but paler in colour, is already acknowledged ty be a good show flower, being in most stands of winhti Chrysanthemums this year
Foremust among new flowers of this season mast be named Gloria Mundi, a seedling from the beautifs Jardin des Plantes, and perhaps the only one eree malitiom that fine variety. It possesser all the god naties of its parent, to which it adds a better shape, being well filled up in the centre. This cannot fril to different shade of colour from the last, Crinsen kini, a difich we did not see fully expanded, promises to be, which we did not see fully expanded, promises to be
one of the richest and highest colouren flowera raised, surpassing in brilliancy even the hand Julie Lagravère. Titania, yellow, laced with worth attention on account of its singularity of colour; but it is scarcely suitable for purposes of exhibition Undine, pearly white, tinted with rose, is in the way o red inside, with a yellow back, is a good ineurved variety, as is also Hereward, which is in the style Prince Alfred, but lighter in colour. Einpress Eug the best sorts to which names have been given, then are, bowever, many Seedlings yet annamed \#bith promise to form excellent additions to the respecire asses to which they belong.
Of well-known older kinds there is a magnificont diaplay. Among whites we noticed Beverley, White Queen of England, Mrs. Halibarton, Antigone, Florene Nightingale, Vesta, and White Christine. Conspicioles among yellows were Jardin des Plantes, Mrs. Miles Yellow Perfection, Salphureum superbam, and Seraph. Cleopatra, Her Majesty, Hermione, Beanty, Princas Cleopatra, Her Majesty, Hermione, Beanty, Priacas
Lonis of Hesse, and Queen of Eagland. Forw most ? among rose-coloured kinds were Belledones, Maréchal Duroc, Lutber, Lady Slade, Princeas Marie, and Christine. Among red varieties ment Jalie Lagravere, sir staiford Rifleman. The rose purple class comprised Prince Alfred, Sam Slick, and Progne. Among orange sorts were Bernard Palisg, Orange Perfection, Little Harry, Dapont de Plime Grange Lodge Rival, and General Slades class of browns may be placed Antouelli and Generid Bainbrigge. These are first-classvarietice, witioukina no collection can be conplete.

Out of doors, as well as under glass, Mr. Saiter bus解 this season ant excellent exhibition. Prince Victor is a new kiad which he hat Pompons Prince Victor i
but is darker in colour, and possessing as it does a hon habit, it will doubtless be found to make a useful and for all cultivable purposes.

\section*{Che \(\mathfrak{A p i x y}\).}
"TWENTTY-TWO years ago I wrote a short treatiss the 'Profitahle Management of Bees,' for the reala of the Gardeners' Chronicle. The treatise 1844. in the first six numbers of this Journal foepers wo never get large results till they kept hives vers larger. Since then I bave been in many Enoland, and in no county have I found I half large enough. Three weeks ago I native village in Lanarkshire, when 1 ascertain the bee-keepers there are of having large hives. years alnce, the best swarms, swarmi
July, gained the weight of 70 lb . and 80 20 nd the seaso ensons
120 lb. in tine seasons. This year one 130 lb . before it was first week of August.
fair day's work for a swarra or hive
2 lb . to 4 lb . per day: advaning bee-keepers in
realise far more than this. culiso far more than this. the queen bee is a wonderfall layiug teu timas more eggs than the \(n\) it hy the bee doctors arject. The number of cells in hive andel cells are fille brood every three weeks for about of the year), tell us that the queen, egge, is very prolific. But to take the uumbers \(t\) queen is hasty imecurate order to make the matte andable, let me take one

80 well known throughout England. Suppose it full
of combs and bees, with a queen in the height the breeding season. Let me take nine more of the same bives, equal to it every way, and remove nine of the queens. Now place all the hives on a large board, or all on the top of one another, with doors or channelof access from one to all of thero. The one queen left bit of comb would be as well filled with brood as if all the ten queens were layivg. Hence, those who keep small hives compel their bees to destroy contutless our English bee-keepers wish to get large swarms, the niked bees as they hang on a branch to weigh 7 lb . rish to have large harvests of honey, they must loep bives very much larger than the sizes used at present. But let me warn them against rumaing from small to large hives ought to be made gradually, sy about one third or one half larger every yoar. Bees properly managed are very vrofitable and most made \(90 l\). in one yeat by his bees; and last year friend of mine in the same parish in Lamarkahire made 400. from nine or tell stock hives." A. Pettigrev, Brishton Grove, Manchester
We are glad to see a cemmunication from so old a Mr. Pettigrew. We quite agree with him in believing that the majority of the hives used throughout the country are much too small, but we think he goes too far when he advocates the use of hives ten times the size of Neighbour's hive, that is to say, hives containing about 11,000 cubic incbes; nor do we believe that a queen-bee evar existed which was capable of filling the cumbs with brood in a hive of such imensions.
We have long been fully alive to the fact that the queen-bee is very ruuch more prolific than most of the writers of bees have asserted her to be. Some years
since we adopted, rather extensively, hives containing bout 1760 cubic inches of comb-building space ; thes we have frequently found nearly full of brood and eggs, but we have, after a considerable triai, been smaller-sized hive is best adapted for affording large mupplies of honey in supers. If it is desirable to use bives of such dimensions, we cannot see the force of the caution against adopting them at once; surely, if reason why they should not be adopted forthwith. But we cannot advise our readers to stock their apiariee with hives nearly approaching to the size of those adrocated by Mr. Pettigrew.

The wonderful doctrine of Parmbeinoghimats is the Horer Bee was first promnlgated about 12 years since os Herr Driertou, a clever German beermaster and saturalist. When he first called attention to this extraordinary dootrine of true Parthonogenesis production by the queen withotet any intereoares with the male or drone bee, he raised such a swarm of opponeuts in nearly all the naturalists in Europe, who theory being trae, that Dzierzon himself began doubt the correctness of what he had seed with his own eyes.
fallacy of Dzierzon's opponente set to work to prove the Was properly conducted distinsor Theodore von Siebold (one of the noost fully \(\begin{aligned} & \text { confirwed this doctrine, and after laborious } \\ & \text { dis }\end{aligned}\) sectinns and mieroscopical investigations, he disc vered a set of voluntary museles for incparting some of the male element which is stored up in the spermatheca, "comengon worker egg during its passage through the

somen of the drovered lively spermatozoids in the impregnated drones, as well as in the contents of an permastozoids in worker egge, whilst they wore entirely

This in those eggs that would produce drones.
ciasively long and acrimorious dispute was at last conciasively settled : all honour be to. Herr Dzierzon, ss Which the great king of bee masters, the illustrious Huber, after discussing the effects of retarded imprey. All other great bee-masters have ween equally loatt." thin abysg, until Dzieraon discovered the doctrive of that the quegenesis, and it is now an entablished fret unfructifueen has the power, at will, to lay drone or It hasuctived eggs or fertilised worker eggs.
that has been stated by a number of writern on bees of time, audeu has to lay wortor eggs for a cortain length queens, in a quantity of drone eggs ; bul 1 have egze, then a few 'drone eyger, and immediately worker and dram, all in a few moutes, and 1 saw these worker fructity the prispes that the queen has the puwer to Ialwive eggo or not at will.

\section*{about bees, to fully confirm or not, all these theories} received soeme by my owa experimenta. So, having the 22 d of September last year, I thought that th would

If I could raise a every drone had disıppeared for several weeks. the 7th October I examined the combs in one of the stocks, to which 1 had jnined one of the imported
Ligurian queens on the \(23 i d\) of September, and found a large quantity of egge laid in three combs. I took from which I remored and put it into another stock, October 18, Examined the con.

\section*{royal cells sealed.}

October 23. Found ore of the queens just ready to leave its cradle; the next day the other young queens October queen.
Novembor 14. Again erarnined tho cotmba, and could not find a single egg laid. I maw the virgin queen, now 23 days nla
1865. I found a drone pupe on the

\section*{alizhting board.}

February 27. Examined the combe and found drones hatched and drone brood in all etages of development young drones emerge from these cells. Removed these combs as specimens, also a few of the drones tha were hatched. I put in the hive, bar-frames containing drone combs.
March 6. I found eqges and brood in two combs.
March 31. A number of drones flying out.
April 7. Examined the combs and found about one quarter of the bees were drones. I supplied the stock frequently from April to June. She continued to lay eggs that only produced drones-not in the regula order that fertile queen lays eggs, but here and there one, so that the combs with the sealed drone brood had a very singular appearance; she also nomecases came to mature egga in one cell, whick ir some to the cell to the size of two cells, and then covering the two larve with one large conical cover.
There could hardly be a clearer confirmation of thi wonderfal doctrine, as I never read or heard of a queen being hatched so late in the season as the \(22 d\) day o October, and afterwards kept until the June following, producing only drones.
The experiment way very successful and most interesting; but I should occupy too great a space of your valuable Paper, if I were to give all the memoranda that I made respecting this etock. William Carr, Clayton Bridge, Newtom Heath, near MamChester, Nov. 11.

\section*{Garden Memoranda}
autumn Gatherinas.-The Liverpool Botanic Garden is very unfortunate as to situation, the amoke affecting it worse than any other. Indeed it could not be so much begrimed in Bloomsbary Square, so the best thing one can do is th There are plerity of places in the neighbourhond of the city in which all sorts of gardening would be possible, and no city can aff rd a botanic gurden better that Liverponi. Beding Yermowever,
deffant of all smoke, and of this Mr. Tyerman takes such allvantage as to produce the moat telling ani novel display of beduing in any botanic garden. There is a greater variety of plants used than is common in
bedding arrangements, and this, in addition to great taste in arrangement and skilial coloaring, adds to the interest greatly. Among the plants used are the Violas, mentioned efsewhere by me; Achillea æayptiach and aurea; Dactylis ghmerata, extensively and "sffectively; ; xapical" was Geraniana anemonmeflium, which is really a very gnod thing, growing 3 feet wigh in a rich bed, and displuying that free Riciaus-like vigour of growth and green, without which it is not so plensant to see a " subtropical" plant in the open air. It might be put in the list of the really free and good things for varying the flower gurden. The purple-ling plant, and is valued, Coleus does no moot in the carden. is having its frist and last trial; it does no good in these parts, and looks parboited; and Amarnntbas hardly grows. London gardeners are not the worst extensively grown, and there is a good deal of inferes in that direction. Indors the plants are making imultaneously a well-directed attempt to lift the ro off the larger houses, bat it is useless proposing any patch work for them. the garden wants removig, They a fine collection of Ferus, and there is a culd house, with rock work, in which hardy Ferns do finely, and annther building-a long house, with north auppet-in which with the lardy Ferns a great number used to hy with the hardy parns a geha wift do welt on of Furus is nparly gs fine hs any in Brituin. From 10,000 to 15,000 people sumen years. There is life and Sundays within the past nt of the garden, and it could
not be in better hands.

Lurerpmol one, enpported liy the Corporation, hot muat support itself or die, like mot Britome. It, two. 1 am glat to say, is in a proaporous and grawing atate, gnily
decorated, but paymg alen some altention to botancal gardening proper. This hins been a most succesoful sencon, the receipts being 15 per cent. grenter than in ordinary venrs ; the subseribers increase ; 40l, ure sometimes taken on onturilay anternoone for adinimion to the promenado. The Orotrids and home phats geverally are inadmirnhle condition. Mr. Pisdicy proporest to mante but much cannot be done in this way till the delt is paid off, as the grester portion of ammual pr.fil goes to nllevinte it. The shows are anccesstul, Oelhids being perhaps better represented at the early omes than cloewhere, excepting london, and linrdly excepting that. It is cheering to know that anf provinetal gardenina getting on thin way, the more particularly ne nome of bhe rich rising towna seem to care aboat eatabliahing gridene, and a fow yearn mince one might buve suppune a deep sleep to have frillen on botario gardens, except The spomed hy Gowerument
The Sheffield garden, too, th in a promiding condition under the management of Mr. Rwing - the debt
having been paid off, and the ground and treet beitig in enpital order. It in fortanately on the right side of the town, and thus escapman noxious vaisours. The mornent ynu enter nu the lawn rua are reminded of the lotunic (Oardeme, Kigent's Park-and not unnaturally of course, m Mr. Marneck laid out both. It fo plemantly diversified - han a ymmetreal and handenme range of glase well flled with plants suited to a botanic aarden, and plenty of almus ones among them. Mr. Ewiag io very furtamite wit Sirracenia porpuren, and has many plants of it in
robnst health. He grows it in the greentrense well up robust health. He grows it in the greenhewse well up
to the glass, the planto in peat and pots standing in pans of water. There has been lately built a very use tul plant honse at a cost of 300 \%. It would be well, indeed, if every town as large as Sheffeld had as good a botanic garden - one better laid out or more charmingly sitnate is rare indeen.
Istrayed into the 13 rmingham Garden daring the pisit of the British Ausociation to thestown, bet there was very little to see there, thnegh the gurden is not the worst at regards situation and mirtagememb.
Perhaps, as asaal, the money is the ditliculty, but I didd not learn, The housen are in a poor otate; mont troable is taken with the betting mante. bur, m the whole, the garden is unworthy of the town.
Duriag the present year the centre apan of Mr. Bewley's large orchard house at Rockville has been divided off and converted into a noble stave, 84 feet long. It makes a capitad introduction to the great Fernery, being continuous with it. There io a winding
walk leading to the Fernery entrance through large walk leading to the Fernery, entrance enrough arge planted out on mownde amd in bedt covered with a ground-work of the better Selaginelles and neat creeping plants. Muna fittata wai in frait, and the contents of the house laxuriantly bealthy, though not more than six months planted.
The great Fernery is an beantifol as ever-any mprovement on its condition daring the past two ears is bardly possitile. Among the Brog ins whet crepp about among the Ferns, sec., splemtida is very
remarkable for the size of its lenves and their effect. They are over 2 feet long and quite elephantine in proportion. The plants are in first.cl.
under the management of Mr . Sayers. \(\boldsymbol{R}_{\text {. }}\)

\section*{Miscellaneous.}

Literary Pedigrees.- I'he curions in these matters have been tracing the parentage of Lard Palmeraton's popular phrase, "the tortuitous concourse of atome",
 with students of old and inodern philos-phies began by crediting the late Premier with their origimation. Them anmebody suid be muet have learnt them from Dagald Stewart. Then South bad the credit given him. Now we learn that Locke uses the plarase; while at the camo ume other writers quote from Cicern to show that before bin. In fact, however, the idea embudied in the phrase is far older than Cieer:, who, like the Ronem philosophers in general, went to the (irueks for the materials of his abstract thonght. Tue theory about thewe "atoms," whove chmiee
were supp wed to have produced the existine orknuic were supp 1ged to have produced the existing or,nnic
aniverse, is to be found discussed in Ariatotio's "Phynies," anil, what is just now most remarkable, in inmedrate connectiou with a thenry idention with that which is propounded by Mr. Dar win in his "Oryin of Species." These atoms were believed to have been perpetanliy varing about from all eteros, out of wich combinations only those survived t. perpetuate themseives " in their kind "whichs cune off victortuat in the muiversal arffict for organic exitence. An deworibel by
 huppens to be the means of propagnimg the existene of grain, therefore grain, "by the force of natural selec. tion," continues to flouriah on the eartis. If the rsin had not happened to be ready to mourinh the cora as
corts, grain would immediately have become extinct ; till, in the never-ending shuffling of the cards, the same atomic combination would once more turn up. The
real theory of Mr. Darwin is, indeed, summed up by

 happened to be produced just as it would have been it they had constructed with a definite design (êvera toû) those combinations were preserved which happened to fall in with the general working of the perished, and still perisb, like the minotaurs and sphinxes that Empedocles speaks about." It is impossible to translate the sentence except periphrastically, but its meaning is abundantly clear; and it shows that the Darwin theory is at least 2000 years old. The only difference between the old and the new speculation is, that while the new school use the word "law" as indicating the relationships of the ultimate atoms, the which they call "necessity." Pall Mall Gazette
Mendacious Puffing.-The art of puffing, says the
Pharmaceutical Journal" for November, has been carried to a magnificen height. Not content with placarding his announcements on walls and hoardings, the aspiring advertiser now displays himself on the roofs of omnibuses, both within and without. Some montbs ago, we were startled to see upon one of these vehicles the word Opoponax, in letters a foot high. What could it mean? Opoponax, an obsolete drug o most repulsive odour-who in his sober senses could prevail on the public to purchase that? But the mystery has been resolved by the advertisement of an after 17 stanzas, worthy of an Aldgate tailor, venture the following assertions:-That Opopanax Chironium, a plant of Sicily, produces flowers of exquisite fragrance ome of which in a dry state were brought from Mexico (!) "after the return of the British and Spanish expedition," by "a well-known amateur botanist, dis tinguished for his services at sea," and that this circumstance has led to their importation as an article of commerce, and use as the basis "from which is distilled the now famous opoponax!" As all this is given a serious scientific information, and rendered plausible by a reference to Professor Balfour, and a quotation from Bescherelle's Freach Dictiouary, besides half-a-dozen words of Greek, it might really be supposed a piece of curious and trustworthy intelligence, instead of most mendacious puffery. It might certainly strike a thoughtful reader as somewhat puzzling how the British and Spanish Expedition" should bring from Mexico the dried flowers of a plant of Greece and Italy how this plant, which is remarkable for its foatid juice should afford a perfume of extraordinary fragrance, and how, if the Opoponax plant exists in Mexico in sufficient abundance to be collected, it has never been obtained by any one of the numerous botanists who have traversed that country in all directions, but that its discovery was reserved for the "well-known amatear" of naval celebrity. But these are little matters into which it is not to be supposed that the public will inquire too nicely, though it is well to throw out a wholesome caution about dangerous imitations, and the necessity of remembering where the only genuine article can be purchased.

Vintage of 1865.-The extreme heat which prevailed during the vintage produced a curious result. The Grapes being in general very ripe fermented in the vats with extraordinary rapidity. A great portion of the saccharine matter had not time to be converted into alcohol, and in countries like Burgundy, where wine growers do not leave the wine very long in vat, fearing it may become hard and rough, the wine, on account of the saccharine matter remainiog in it, will ferment for long time in the cask. These wines will consequently require much care, not only from the danger of exces sive fermentation during their transport while young, but even after they are lodged in the consumer' cellar. The excess of sacchariue natter will render the wine liable to ferment at every change of weather, and if the cellar is not sufficiently cool the fermentation may produce acidity. There is no doubt that the wines of this year's growth are of excellent quality, but they will require great attention before they arrive at maturity. Times.
Acacia Fibre.-At a recent meeting of the Imperial Agricultural Society of the Haute Garonne, M. de Planat presented several samples of thread he had obtained from the bark of the Acacia, and of the Chinese Mulberry-tree. The Acacia which produces this thread grows in every description of soil. It usually attains the height of from 60 to 75 feet. The wood is hard, and takes a fine polist, and is in great demand for furniture and for flooring. It is less dense than oak, but it grows much more rapidly, and it has been used in replanting the Pyrenees, It is likewise planted for ornament. The thread spun from its bark is very useful in the manufacture of ropes and coarse cloth suited to farmers' use
Siciiian Vegetation.-The Soathern character of the regetation recedes under the cooling influence of the vast snow-covered plains of Mount Etna; the Fig trees the oniy terminal leaves, and the fruit is very small the white Malberry trees and Vines have also only
lew leaves; the Black Mulberry trees are mere sticks, scarcely having their buds formed. Lemon and Orange rees still appear but depressions, and are often protected by high walls;
neither are they as large, as vigorous, as tree. like. The neither are they as large, as vigorous, as tree.like. The
Olive-tree, however, holds his own, as also do the Opuntim or Barbary Figs. The latter are exterisivel cultivated throughout Sicily as hedges, and for the sake of their fruit. They grow to the height of some 12 or 15 feet, in a very singular grotesque manner, and assart their claim to being dicotyledonous plants by becoming regular trees, with a large round trunk an bart. This transformation of the flat, fleshy, leaf shaped branches is quite remarkable. Bennet's Mentone, 3d Edition.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

AT this time of the year it is of the utmost importance so to arrange stock in houses as to secure a due proportion of space to each plant. All retarded autumn flowers shouid bave as light a situation as possible. Above all things, if not already done, let every sash receive a thorough washing, both those of the houses and also those of the frames or pits. In order to keep glass clean as long as possible, let mats and covering of all is absolutely necessary, not only for the glass, bat for the sake of proper economy.
flower garden and plant houses.
Conservatories will now require considerable nicety of management. Atmospheric humidity cannot by any means be entirely dispensed with, yet this if unskilfully applied will produce drip. The best plan is to keep as low a temperature as can possibly be allowed, say from \(40^{\circ}\) to \(45^{\circ}\) at night, and to leave a little back and front air on all night if the weather is at all favourable. The front air must be very moderate, or the atmo spheric moisture, instead of passing quietly away by the back apertures, will be condensed as it arises. With a good roof covering in the case of small conservatories, \(40^{\circ}\) would be sufficient, and then there would be atmospheric moisture enough at all times without the special application of water.
Capa Hrathe. - Let these have close aitention as to watering ; if they stand unfortunately near hot-water quiet ventilation day and night if possible; let the air steal in moderately, and dispense with strong fires.

Pelargoniums. - Give air whenever the weather will admit of it; but avoid cold draushts, and keep out frost. On the other hand, be careful not to use too
much fire-heat. Training and shifting must also receive attention.

Roses.-If tender sorts are not already protected, no time should now be lost in regard to this matter. The tops of standards, worked on ordinary stocks, may be guarded by means of straw bands bound amongat and over their branches, or by tight canopies firmly fixed. Beds or masses of certain kinds of Teas, or other tender kinds, should have some porous material strewed amongst them, to afford a little protection, especially during severe weather Cocoannt refuse or even coating of \(h\) ilf-decayed leaves would answer the purpose of protecting their stems a little. Four or five inches of such materials may keep them safe in the event of a severe winter. If it is desirable to protect the tops efficiently, mats thrown lightly on them will suffice, taking care, on the breaking up of frost, to expose cautiously, and not nutil after they have become thawed.
Soils.-Compost yards, if not already filled with the different soils used for potting, must have immediate attention whenever the weather is dry. One of the most important points in this department is to see that the drenching autumn rains bave every facility for escape. The best of soils, be they ever so well harvested, will become soured in a very short period by the lodyment of stagnant water. A good compost yard on this account should be a steadily inclined plane, and the soils or composts should invariably run the way of the descent in parallel ridges. Thcse who are prucuring loam now may let it remain on the ground where dug until hard frozen; it may then be carted away without destroying its texture.

\section*{FORCING GARDEN}

Cucumbrrs.-Attend closely to these; a little neglect now would render all previous pains and labour useless. Give air as often as the weatber will permit, but make it a point to shut up warm. Use additional coverings on cold nights, which will save fuel, and be better tor the plants.
Pines.-Winter watering of Pines in pots is rather \& doubtful proceeding; a better way with general stock is to cover over the pots with Cocoa-nut refuse, or some such material, 2 or 3 inches thick, provided the bottomheat is in proper condition.
Vings.-If any portions of the stems of Vines about to be forced are near the influence of hot-water pipes, they should be bnund with Moss, old mat, or any other material, to ward off the dry heat. Keep the temperature low at present in houses started. Do not give air unless to depress the thermometer, or to avoid a superabundance of rank steam from fermenting matter Let the ayringe be applied two or three times a day
suffering tions.
HARDY FRUIT AND KITCGEN GARDEN.
Trench, dig, and ridge every spare inch of groand when frost permits; this is particularly to be observed let the manure necessary be wheeled out for the fros: of the spring cropping, laying it in heaps, either on the spot where it will be wanted, or as near as possible to That portion not required for immediate digging in should be piled in small mounds and covered ore with soil, to prevent loss by evaporation.
Froit Trers.- Planting
Froir Trees.-Planting ought now to be pushe forward with vigour. With regard to bush fruit,
dressings with hot lime and soot when wet were more attended to we should the trees ar much of the ravages of birds upon the buds, and would recommend their application also to standar Plum trees wherever practicable, as they not only kee them free from Moss and Lichen, but assist is th extirpation of those insects, in the search for whic birds commit such ravages.

\section*{The \(\mathfrak{F}\) gricultural Gatett}

\author{
SATURDAY, NOVEMBER 18, 1865.
}

We have not hesitated to fill more than half the space at our disposal this week with the Report of her Majesty's Commissioners appointed to inquire into the Cattle Plague. A document on which the action of the Government in this matter will, in all probability, be founded, ought to he in the hands of every stockowner in the kingdom in its entirety; and it must therefore receive all the publicity in our power. It will be seen that out of the evidence which has been taken, yet, barring the judgment of only one of their body, the Commissioners are unanimous upon number of important conclusions. The majority, indeed, would confine all living animals of the class to the farms or byres or homesteads where they at present are-they would suffer no living ox, cow, or calf to pass the boundaries of their owner's bolding for a period long enough to ensure the destruction of the poisonous contagion-they would make the supply of meat depend wholly, whether from home or foreign sources, on the carcase trade. This is the idea to which Mr. Hallett, of Brighton, gave expression many weeks ago, and to which most of the soientitic men on the Commission adhere; and no doubt, were the plan possible, it would be successful. A powerful minority, however, including Lords Spencer and Cbanborne, Mr. C. S. Read, M.P., and Dr. Bence Jonrs, do not believe such a measure possible; the prohibition would be evaded, both in those districts where the disease has not yet declared itself, but where it may at any time be in incubation, and all around the centres of the meat trade, where the sudden and inevitable rise in prices would offer the strongest temptation to the evasion of any prohibitive regulation that might be imposed. The Commis sioners however, excepting Mr. M'Cleax, who dissents on the grounds, mainly, that the evil, however great its actual dimensions, is not relatively to other interests and induatries so great as to justify an interference with them for its correction, are unanimous on a number of important measures, for which therefore in all probability we may shortly look. In the first place they recommend the abrogation of the existing
slaughter of infected animals. This, had it been vigorously exercised in the first instance, might have quelled the disorder, but now that that has spread so widely it is of no service, and, moreover, the complement is such a measure, viz., the cumpensation of owners for this forcitle interference with their rights and ownership, cannat be entertained. The provisions, therefore, which are recommended are contined mainly to the direction of an absulute cessation of sales of lean and store stock, the reguiation of slaughter-bouses, the provision that animals suld for meat should be immediately slaughterad, and the maintenanoe of a atrioter oordon between infeoted and untaintod districts.
There are also stringent rogulations proposed is conneotion with the fureign trade; and the herdiug of cattle in uniaclosed lande is to be forbidden.

These are the pracipal points in which the Commission may be anid to be unanimous, and for which, therefure, we may leols for sume action on the part of the Government.
The disease is still apreading. Profemor Smomps announced at the F'armers' Club meeting lant week that that day had brought them notion of ite breaking out in 200 fresh herds, and whatever measures of restriction and frecaution are denirable, ought to be taken it unce.

Pumlic opinion will undoubtedy support Mr. Hordanin in the new Parlimment when he shall aguin introduce measures affecting the Veterinary Profession and the Cattlo trade, more vignrously than it did last jear. We cannot doubt that the importance which recent events have given to the Veterinary profemion, and the diaatrous risks whioh stockowners hare incurred and realised through our unregulated oattle trade, will enable him to carry measures in which last year he was opposed and overcome. Meanwhile we again call attention to a passage from his address read two years ago befure the Sicial Soience Congress at Edinburgh, in the hope that the ideas then enunciated may receive a full discussion before Parliament meets.

The following is a portion of Mr. Hollann's address on that occasion :-
I believe that much good would ensue from the appointment of aus Inapertor-dienpral of Live stack Traffic throughnut the United Kingdom. His duties should be to collect trustworthy intormation an to the health of stock, whether imported from abrond or circulating in the home trade. He would have to keep himself in communication with the different inspector of towns, fairs, and markets flhroughout the cuuntry to visit different locahtien, to give attention to the reports of outbreaks of disease, and more enpecially to the spread of contagious disorders in all countries from which importations are made to this. It would be the daty of such ou inppector to inventigate apecial outo break of divease, with a view to determine the canse producing them, and he would suggest to the Privy Council proper measures to arrest the progress of such disease; and, whilat in communication with local inspectors, and adopting with them special precautionary measures against the propagation of discuse should it appear in any district, he would report to the Privy Council what ateps ought to be taken on the occasion. Besides, he should report annually on the diseasen of animals in the United Kingdom. Such a report would enlighten farmem at to the bent means of protecting their stnck in health, and would directly ead to a great diminution in the truffic of disense animals. But here exists another difficulty. Who are to be the inspectors? Are they to be, as they too
frequently are at preseut, unqualified men for the frequently are at preseut, unqualified men for the
office, chosen frequently throagh corpornto interent rather than on account of their veterinary knowledge; or are they to be well educated, scientific, voterinary practitioners? Indubitably they ought to be the latter; but where are these to be found? My belief is, that from the want of a high grade of education amongst professional men, the farmer has taken up the impression that medical treatment conld do unthing for him; that spending money in attempting to cure his diseased animals was a farce; and bence he has had furtier inducement to send his sick animals to market whilst life was still in them. Had there been in existence a snfficient number of well qualifed veterinery prac. titioners, he would have acted otherwise, and not have incurred such serious losses as he has done through the dinsemination of contagious and infectinus dise ases.
Statistical returns up to the present time show that the number of inembers of the Royal Cillege in practice in the United Kuggdom is only 1018, whilst the number of those who assume the title of veterinary surgeon is 1214 , and those practising as farriers 1109. The number, 124, who unscrupulously assune the titele of veterinary surgeons, which the possession of the diploma alone ought to coufer, affords a atriking proof that the profession requires legialative support. It is expedient that persons requiring veterinary medical aid should be enabled to distinguish the qualified fro:n the unqualified practitioner; and it in a gratification to
juow that a measure is to be broaght next gession
before Patiamuent, having for its othject the punishment of such persons as shall wilfully or faleely take or use tlie name of veterinary surgeon, and practise under that title witbout being duly qualified to assame it. At the same time the framera of this Bill have taken care that it shall not be retrograde in its action, and that
its provivions shall not affeet any person aetually pracits provisions shall not affeet any person aetually prac-
tising as veterinary surgeon previously to October [1364]
Upon a more perfect system of inspection, both at our parts and in our markete, and upon a wider spread of scientific professioual knowledge, do I rely for improvement ili the quality of food supplied to confrom the consumption of diseased meat and milk, and further, to the same sources do I look for a diminution of the inmense losses incurred by farmers and graziers through slaughtering for food, instead of attemptivg to cure, their diseased animals.

\section*{ARE SHEEP LIABLE TO THE CATTLE PIAGUE?}

Berore giving the condensed report which follows of Mr. Woods' able lecture on this subject before the Wayland Agricultural Society last week, we quote Professor Simonds' reference to this sabject at the recent mesting of
fessor Simonds said :
The question has been put to me whether the disease is capable of being communicated from the ox to other anicals,
and whather those animals can in reality cormounucicate the
dise especially susereptible of quis affection, 1 have no hesitation in sying that they are. Thoe who know me best as a wrofes. over many others-I take no srenit to myself on that account
- will, I think, feel that I would not be the first man the danger-aignal, and that if I do hoist it, it is because that is necsary. Thave hnisted the danger-sigual with regard to
 the sheep commonumicted to gether, the former having pre10, or 110 cattle died. Assuming that the Wheep were suscepfavourable circumstacees for its extension - what is the
reeult? Up to the present time, out of 2.000 sheep at Crown
Point of 2,00 have died in the coursent a conyle of months ought to about sheep diseases that this is no
I go further
from the lated sheep in London with the matter, and we have produced
the disease in the sheep so incerte elearly enough that the sheep were labouring under a contaginus risease, and a contagious disoase allied to the rinder-
peat. We have exposed cattle to tho same sheop that were
 of the disease of the sheep 1 a a correct one. The case if Mr. Harrey's sheep is not an isnlated ine ; there is also the case nf of sheep wwere bhenght at Thetord, were sent to Blakenney, and infection previously. The tisease wasing boen oxpmonead to the and Eatex. I will give you two in Invor-one belo the case exem were bought in June in two lors-nineteen in one lot, an not huik up n. T siw them ag in and weann, and they soomed

 the disease spread from the catcle to the sboepp. and at the date Well managed. Two rams were pat with them, and one of spredd to the catt of the risrase berween catcle and stivep, as the result of
exposure and inoculation. We now give a condensed report of the lecture of Mr . Wonds, of Merton, on thin suhjecto It is in a
decidedly contrary sense to the abovo aanrition of Professor Simonds
Mr. Woods said : he had made some inquiry an to the zymptoms shown hy Mr. Harvey's sheep, and was satisfied from what be was able to gather, that there were
great doubts as to whether it was the cattle plague which existell ainnng those sheep. Mr. Harvey, at bis suggestion, decided to ask a deputation of practical men to meet Pr,fessor Simonds and Dr. Lecheby at Crown Point, and to take the noinion of the practic al men on the state in which the sheep might be found. Mr. Harvey had providel for then at Crown Pont a se would nak thie mreting to take a walk with him auroas Mr. Harvey's fields, and take a practical view of the state in which he fornd the lambe, and he what he saw.
He unust confess that he was very muct atmek when be

many of the fitide, which were dilvioud by iroe foveos, whero

poiut with which ho was particularly struck, sund that wat that
ithere was a long rood divided from the fields by wire fence,
and that road appeared and that road appeared as if it was a receptacle fir the lamby,
which were prob bly taken there every day to bo trimmert or Which were probibly taken there every day to be trimmert or
otherwise treased, and if there happened to bba altower of rain,
he felt certain that that road must have been notbing roore

where tbey
be imagined
of Ial

 the effect that slyceulent Grasses from fields that hari previous
been lieavily fed with sheep must have produced on lambs, for many of them had seen it, and they all know that it must b
highly injurious. It should aleo be understood that thos animals had no artifecial food given to them -they had nothing
but what, tiee park prodteced, tund that, as he had sai.i, was ot a very succulent character. There was no change of pasture,
and no change of fiod. Ho thought, consequentiv, that those he was addressing would syy. Lhat even in what he had alrean
stated tbere was quite gufficient to producg a disouse atimil to what many of them had seen in their froks befrre. Bn with the flock at Crown Point whioh bard never jet appeared
before the public, and having heard it incidentally it wav ouly hy considerable care that he was able to arrive at its trush.
They all knew that when lambs had been living on dry and
osce bas produced, the very last thing they would think of dniug
would be to allow them ar tinlinited surpy of water. Their experience told them that their great aith and object when wator was not in let theme run to it indiscriminately, if during the liot monkt of Ausust, and about a week or \(\ddagger\) w bfore the dhesese broke out, Mr. Harvey's 1 a.n bs broke \(a w\) wa
rom the shepherd nore than once or twice, and got down t many of them going orathead and a sreat many over cheir backs; the consequence being that they not only
suffered from the effects of drinkitng the water, bat also from the chill that must mecessarlly have bern produced to the account nf the kind of water they had to drink:-
-The river near Crown Point is, in the summer months, very foul, and the steueh smmetimes is very bad for a mile
lower down the river. The aurface of the water pe sotnotimes
envered with a thin. onvered with a thin conting of the refise thrown into this
river, which have seen skimmerf off topervent the stench."
He had slso received from Mr. Harvey that morning olester,
He had slso received from Mr. Harveg
from Which the following was an extrac
"In reply to your note, it is very poseiblo my lambs drank
隹 froto it, as they were frequently by the river adde enf it is trne the river is sonnetimos so offensivo it fo diffiealte to be there wilhnut b lag sick."
He world ask those whe was addressing whether
 ance ennseqnences of whien they would bo very muil Fraid, if they "ere to allow their flocks to drink such
water as that? But it did not stop there, for he has
nsertainel as a fact that during three months the lanb

 not, his own experience way
that he thought it must hav that he thought it must have been deci tedly wrone to har.
the lambs have that water. He Hinw crome to another point to
which he must call attention. They would have read that a Che meeting of Satinday weer, Mr. Forreaster admitt-d that the

\end{abstract}

\section*{THE CatTLe PLaGUE.}

Tre following is the first Keport of the Commisere appinted to inquire into the origin and nature of the Cattle Plague, dated October 31, 1865 :

\section*{To the Qubrn's Most Exonezint Majesty}

Your Majesty was pleased, by your Commission dated the 29th day of September, 1865, to intrust to us the task of investigating the origin and natare of a disorder which now prevails among the cattle of Great Britain, and Ia generally desiguated the Cattle Plague, and of iscertaining as far as possible the mode of treatment the adapted for the cure of the affected animals, and he regulations which may with the greatest advantage enade with a view to prevent the spreading of the Four dionder, and to avert any fature ontbreak of it. hat mojesty was at the same time pleased to ordain to report to you our proceedings under the Connmis tion from time to time, alrould we judge it expedient to The
The terms of the Commission therefore anthorise us, if we think fit, to report specially to your Mnjesty on parts of of the subject committed to ns, reserving of the culamity under which England and Soothand are at present suffering, and which may at any moment attack seinnctive the extensive growth of the disease, ite desithetive charactor, and theimperfect succeess which has hitherto attended all endeavoury to wrrest its progross, no time in hour duty to take this course, and to lose reoommendationgly presenting to your Minetion, we believe the emergency to require. We shall introdace then with a brief statement on the history of the disease and on its meneral character.

\section*{I. Reorent Attack.}

The dizease which is the subject of this inquiry loward observed and reenguise in Great Britain Two Ehe close of the month of Jnme
 dibenyo ath whoes theits they ware when the symptome of Bergeou in charge. Similar symptomes ware obeerved on thy tho mene which had been purchased in the eame plaoo and or
 dieries, maly broke out immediately afterwards in many Londonat numberr of antmad with extrome napidty, deatroying greal
herd of 93 ; she aftorwards bought more, and loat thens alon
makking 106 n \(111 / 7\) in all. An inupector who had charye of

 Sootland, and was antill ad rancing . Departhent of the Privy Council 0 chee froma suoh official
iuformation on that dopartment has rovelved fron inspectorn throngbout the country, hat airendy appeared in the publio
papers:-

It must be remarked, bowever, that sulch statements as thip do not profees to be-of the real nate and progrese of the disease. They reprosent such cases only as the several inspoctors have been able to detect since they were respectively appointed.
But information reaches tbe inspector indirectly, by
 anything that ho motives hida. Wo were toid bs a london cowkeener that, of 41 cows which died or were slaugbtered on bis promises, the inspector gnt oniy the knacker's receipt for
the 11 that actually died of the disease. It must therefore, we fear, be assuived that the cases rephrted form but as small
proportion of thoes which have actualy oceurred ; and it woold proportion of thowe which have actually vecurred; ;and it would
bs unsafe to draw from them anv inference as to the amount of lues wotpally incarrod by the plaghe.
Meanwhille, from the same general centra, the Metropolitan Market, it appears to have crossed the soa to Holland with
Bome Dutch oxen which had beeni shipped from Rotterdam to London, had boen exposed during three succeasive marke: days, and, not finding a sale at an adequate profik, had been amony them somtanter their retum, when they were pasturing at Kethel, near Schiedam, in a long strip of meadow, on whielis other strips abutted, edch occupied by atoor. ho spread at once in many directions, and soon overran the wholo province
of Bouth Holland, and theonce, wo believe, it has boen frome adopted in the Netherlands seeca to have been at the outhet less atringent than was desirable; too muubl diseretion wad left to the Local autborities; but the proviuces of North their reappective frontiers, protected theraselires in o great measure from the contagion.

Grent Britain
Por the reesons stated above we foel ourselves compelled to
some high roquacer of your Majesty's fovernment with the power of aupenang for a mited time the movementor cattio from one place in Great Britain to another, for extending or
shortening such period, and for renewing the prohibition as onton as circumstances may render necouarry.

\section*{1a. Angeatal Regulations as to Cattle Traffic, should Rcommendb-}

We bolieve that this measure offors, as wo have alroendy said, conceive that the end amply justifies us in proposing to the
nation so great a prosent sacrifice. In submitting this, howver, aa our ifst recommendation to your biajosty, we are well difficultien to difficulies to which thay ade may to some appear plague in so serifous a light as wo do, the remedy may meem rorse than the ovil. This view may poeably be shared by your Majesty's Ministers; we think it right, tbereore, to go further, advantageously adopted, sbould an absolute suspension of the move
bo extend perriod ton or store stock slould be permitted to bo sold at any fair or market, and sales of such stock by auction or advertisement, or in any other mannor whatover, ahould bo prohinited.
or to a slaughterbe moved for immediate alaughter to a market for transit granted by the magistrates in Petty Sessions. The licence for transit should certiry to the healthiness of the dibtrict from which the catto come. With this exception, and except in the case of cattue driven from one part of the same arm to another, the transit of cattle over any pubiic road
(including railwaya), or in any coasting veesel, ahould be absolutely prohibited. e. Preesutiona should be taken that every animal sold for It may bo convenient grt the purpose that a slaughter-house and no to have all cattle which may be sold or consigned to him driven whence they slaughter-house or premises attanhed to it, froun or market should not be allowed to leave the precincts of the borough or other place where the fair or market is held (in
the case of London, the Metropolitan Police District) alive. To insure this object, it might be required that cattle entering a
fair or market should be branded or marked on entrance, and cattle sold else where to a butcher similariy marked at he time of sale, and that it ehould be penal for any one but a butcher
to have a marked animal in his posesesion. If soy reculation of this kind is adopted, it would bo advisable that in every in which unsold animalis could remain from one marlet day d. It would be desirable to draw some more distinct line betweon infeeted and uninfected districts than is, al present traced by the ordors nlisurcered, or is known to have existed within a certain period before the time when these measures as infected in the Gaztte and the county papers. The egrems of live catul from a proclaimed district stoould be atrictly diefrict is, out cattle shaug btered within it and cartinod by the under proper safeguarda for disminfection. Provimion should be publicly sot froe, on proof being furnifhed that all rist from This istter proposal would, if adopted, strengthen the induce ments of the inhabitants of infected districts to rid themselves vigilantls agninst its approach.
We are of opinion that the power to seize and alaughter rested in inspectors by the Consolidated Order may properly
be withdrami, or that, if retained, it Ahould be exercised only in cases where the inspector's directions as to the separation of sound from diseased atock, sco., or any general proventive or samithry regulations issued by the Government, are diseaso has appeared only at heolatod spots and attacked a fow animals ; the prablic benefit is then verg great, and the privato
snacifice emall ; but in proportion as it exteode the hope of
thus atresting its march ditminishioes, the inevitable waste thus arresting ithe march diminishes increases, and the sense of hardship tends to become insupportable. In principle, a system of compulsory slaughtor
should be commplemented by a system of compensition, and of the public creasury on an extensive scalo appear to us insurmountable.

\section*{Forign Cattle.}

No reforence has hitherto been made to cattia imported from in absoluto empar int reoommendation be entortinin and Britain, we think that imported cattlo should be slaughtered mbould be allowed to hand at certain ports only, where proper faciltites can bo arnmed for inspeotion and transport. \section*{gTEAM CULTIVATION.} Fownep's System.
We enclose copy of a lettor and raport received from

Sirs, -Having noticed a statement headed "Steam Cultivation (Smith's v. Fowler's)." in the Gardeners' Chromiele of 21 et of Octobor, 1865, I have prepared a statement of my operations with your apparatus from the date of its purchase to the end of 1864, being two years and four months. My account for the present year will, I think, show a still more favourable result. As the account is for comparison with the accounts published by Mr. Hutchinson, I have prepared it in the sane form and on the same principle as those accounts ; but in my opinion such a form of account is by no means perfect.
It is impossible to judge of the value of work without knowing the nature of the land and the depth of cultivation, \&ce, and it is very possible that the work stated to be done by the apparatus in Sbropshire at 14s. 7 d. per acre may be better worth its cost than that stated to be done by Mr. Smith's system in Bedfordahire, at 6s. 10d. per acre. It is difficult to understand how a cultivafor with three tines, and a width of 3 feet, worked by a 10 -horse power engine, and on a system requiring a much heavier draught of rope, could do as large an area of work as a seven-tipe cultivator 6 feet wide, worked by two 14-horse power engines, unless the former work was of a much lighter and shallower description than the latter. Without going out of my own parish, I could find farmers who get over as much ground per day with two wretched horses as others with four good horses, but the work done by the four is better worth its higher cost than the worl done by the two is worth its low cost,
I see in the Bedfordshire account that seven hands (three men and four boys) are charged 14s. 10d. per day, while in the Shropshire account the same number of hands (four men and three boys) cost 238.10 d . per day. Thís alone would make a difference of \(1 s .6 d\). per acre.
The amount also charged by Mr. Hatehinson for oil ard repairs seems very low, and thongh the account mentions iron shares as included, it is silent as to repe portern, which in rough work form an important item of breakage and wear and tear.
It is necessary to bear in mind that the acreage cost as awn by my recount, iucludes worls (1164 acres) done with the plonghing and digging breasts, with which only abont half as much work can bo done as is done with the cultivators, and which I should not do at all if I did not consider it much more valuable for many purposes than cultivating. As by the cultivating process alone I averaged 9 acres per day, it follow rom We figures in my account that if the whole had been cuitivated, the cost wonld have been 5s. 6d. per acre, or 1. 4d. less than \(4 r\), Hutchinson's cost, and this too for work a great part of which was done with the addition of a drag behind the cultivatnr. Grosvenor Bodgkinson, Winthorpe Ball, near Nowark, Nov. 1865.

deseription of the farm referred to

The Whitchurch Steam-Ploughing Company.-I have had a lengthy correspondence with Mr. S. Hutchinoo respecting a statement he has thought fit to puib it comparing his operations
This statement is thoroughly fallacions, He says be cultivated 773 acres, and coofly puts it down agains our 691 acres. Let us see how he arrives at
773 geres. Taking the quantities from the \({ }_{\text {farm }}\) map, only makes 331 acres; deducting for fences, roads, de the quantity actually operated upon would not be mon than 311 acres. Mr. Hutchinson, however, takes by map quautity, 331 , and siwells it ap four tiees crer working some of his fields three over the mame land and reckoning each time of going ove

\section*{as though it had been a fresh operation. \\ Now, we actually broke up our 691 acres of lend,} n 48 different farme, travelling 248 miles, and doubt our acreage ought to have been a litthe Hutchiners generally understating ting 125 dayb, good portion of this time was spent in travelling. vorked his 127 days on the land, as be lisd worked
removal.
Without going farther into particulane, erery the must see the ahsurdity and injostice of comparing working of a small set of tackie, which ing of 12 fields on one dairy district, always employed upon hoing all over a hardest land, and breaking it up from 12 to 16 inches deep-
disturbed before.
I am thoroughly convinced that we coold mot have done ou
tackle;" besides, the great expens
emovals would have been tatal to
the slightest aid from horses, either in remorala
ing, or difficulty. We certainly have many
vantages owing to the smallueess of the work we ?
only 3 or 4 acres-the small quantity
apon orch farm, and the long removale In fict, ours is not an arable district ase, jet we have done well in chely 8 thee.
CHen '
Whatever Mr. Elatchinvon or Mr. Smith may write rampecting our oparations, is a matter of perfect indiffer. cace to us, but as Meagrs. Fowler have been so rouzinly and so unfairly assailed, in justice to them I feel c.lied upon to show that the so-culied "Comparative statemeat " in wot founded ou fact."R. Thursfucld Simith, Managor of the Whitchurch Sloam Ploughing and Cultinating
Jovember 8 .
Having read with much interest Mr. Hutchinson's recantly publiahed statement of steam cultivation with Smith's tackle, and his comparison to Fowler's, I think erery man who knows anything of Fowler's tackle will condemn the very unfair and unjust comparison Imade.
Ihave no reason to doubt the accuracy of Mr. Hutchinson's figures as to his own work, but I very
puch doubt whether he pas not chosen the wust much duubt whether he has not chosen the must seat Fowler, and think he would have displayed more judgment had he paused before publishing his atatement, so decidedly in favour of one, to the great and moant detriment of the other syatem. It certainly behores every man to think his own syatem the best antil he finds out a better, but to my mind he is far from justified in making auch an odious comparison at jactice.
My simple wish being to show that Fowler's tackle is capable of doing greater things thau represented, 1 beg to say that I have used nue of Fowler's sets for wren years, and now lay before you the aggregate Work done and expenses from Sept. 1,1862 , to sept. 1 ,
1865, on this farm of 600 acres with 10 -horse engime', 4furrow plough, and 7 -tine cultivator.

The above includes shifting from place to place. With regard to rope I may state that I had a new
409 yards in Sept. 1861, which is still in use, and a new 200 and 100 yards in Marck, 1862, which are now in good repair, and look to do as much more as they have done; so that I put down a sum of 50 l . as being sufficient for ropes for the last three years. The interest, depreciation, \&ce., I will allow the public to put on for licmselves.
I have with much reluctance taken up my pen, but neeing as I do an old friend unfairly attacked, I feel it cote, Surrey, Nov. 10 .

\section*{Horae Correspondence.}

Neam Cultivation.-Mr. Richard Toppfer has, according to his own showing, had no practice upon the tackle
in question. He las worked a set of Fowler's small incklestion. He has worked a set of Fowler's small telling us about going to ligypt is not evidence, for we mre not going there to learn to cultivate by steam-power.
His telling us that the is going to work the tackle in question in Lineolnshire is not etidence. In his first paragraph he says, "Practically I can contradict Mr.
Hitehinson." Yee, anybody can contradict, but it is evidence that is wanted, not contradiction. In his recoud paragraph what evidence there is goes
against him. He says, "Can the farmer obtain a areater advantage from purchasing or from hiring Are the majority of farmers in a position to buy steam cnltivating machinery? Have they ever quapensive machinery? Have they facihties for repair-
ing breakages? Have they with the demands of the steam farms commensurate goes not give any evidence upon the questions, but joeaning of these quesiions, is nothing as to whether it in best to purchase or hire. The majority of farmers They wot the means of buying our expeasive mschinery. breakagen would be considerable, and they have no Steans of repairing them ; besides, their farms are not big tackle on. His third paragraph is a mere bit
bounce Mr. Hutchimork one week upon any soil in any connty." Lodge, and hen has done his 127 days' work at Drnton Let kichard Toepffer find 778 acress as tough and rough realto his evaidence will then be worth having. His at charagraph is a mistake, for Mr. Hutchinson did ment of well "topt accounte, field," but to show a state "WF. Bathe asp Wfot of Eivilion Nor. H.-The Saliwbury mootine was fized to oommonco on M..n-lay, June tih, lovit, nund it was direeted linat aill entrien of Stook, Poultry, Imphominntw, and Wiorhs of Art be Baile hir the 9 the of Apmil.

The Sluch Prrie Shed was aceoptel und eov.firmed: the Soerety's prines minounting to stita3l: themen athered by the Saliahury Local Committen to 1sivy, Lotal pivizen for Stock, 1242! In the prize aloer, Thevem. Herefordshore, and Sturthorn catile ure ail phowed an the name footing. In the sheepp clavenes ereverul nlditions have been made: prizen are now offirali for laceenterm, Cotswolds, other Longwonlk, Sonth Dawna, Hampulure Jowne, Shropshiren, Urfori Hawnk, Binnemet and Dorset Horne, and Muniam adieep. In the biorne classen there are prizes of Sith for the heat tharough. bred atallion ; 302 and 15. fars the hatatatalion for agricultural purposes ; and prizes vary ing from 2:5, to 101. and is. tor mares, colts. \&e. total prome for horwos 2\%30. The prizes for prgs remain the sama as lant yeur: the amount being 6ifl. Mr. Minas, of thixfiald, Exeter, agzin renews the offor of prizen for stroeng stniths.

The following in a liat of the Salinhury local Prizes:- C'haunel Imlands rattle a lat and 24 prise of 51. and 31. reaportively for thalis of any aze, bwo.jear old bulle, yearling tmill, dary cows, three your old heifurs. Cittle of any I reed a lat and 21 prise of 5l. and \({ }^{4}\). reppectively for diairy enww; diten for heiferm. Shreap prine of \(\operatorname{si}\) and .i. for fow of Hampshire Down rann lumber, ana da'e for pent of exe tega in thoir wool, part to be momen in the sar. 4 . A pries of 51. for the bent pair of working ent li risu. Priges of 5l. and 3l. for the beat N w l'rest priny; similar prizes for the bect mase an. 1 fuai. and 51. for the bent pair of poniet. I'rizes of 51 . and 1.1 . far Bonketire boar pigs ; ditto for breeding gowe ; whto for the three best breeding anwe above four and not exooeding eight
 cheose; 51. for the hest sack of Whest growid within 20 miles of Salishu
Pomliry Prizes.- Ir. Brent, one uf tie stewarde of poultry, brought up the prize sheet for his department. The total amount of prizes offered is 150 l .
Arte Depertment.-On the motion of Mr. H. Wilinmes seconded by Mr. Hrewe, the sum of 400 L . whe voted for the erection of a new arts buidiug of the Salisbury meeting.

\section*{3 3 evítoss.}

 hy J. Ihorlas. of their publicating, and we are promiced another from
Edinburgh shortly, so that there is ample supply of the demand for such periodicals. The publicetions for this year are all of them in the atylo to which theur
readers have long become accustomed. Mr. Johnson's Almanac contains, besides the usual calendarial matter, a well-digested account of the agricultural topics which have come up for discussion in the history and literature of the previous year, with a good deal of useful and homely and friendly advice on farm and garden and household matters, garnished with fragments of poesy. Mr. Morton's is a closely packed collection of extracts from the agricultural publications of the year, decisions, statistics, and the general history of agriculture during 1865. There is also information on the work to be done from month to month upon the farm and in the garden, and various memoranda and notices of domestic and personal usefulness; instructions on disinfection as against epidemics, \&c.

Mr. Thorley's Almanac is a trade advertisement
We quote two passages from the first of these Almanacs, in one of which Mr. Johnson, we presume, himself gives kindly and weighty advice, and in the other he gives an opportunity to Mr. Evershed to give a pithy and suggestive reminder to the cattle feeder.
The Water we Drink. -The inhabitant of rural districts, when he visits the metropolis, is disgusted with this cockney thoughtlessness; he little suspects that he is doing similar things at home. Let us accompany him there, and ask him a few questions as to the disposal of his house sewage and the drainage of his homestead. He will very commonly inform us that his house is well provided in that respect; that all the sewage (which varies in amount from 30 to 60 gallons every day) is received into a tank; that that cesspool is lined with bricks laid without mortar, and is in "a nice porous soil," so that the sewage soaks
away almost as fast as it enters the tank. away almost as fast as it enters the tank. On further
inquiry he will instruct us that the house-well, and perhaps that which supplies bis live stock, is placed not many yards from the cesspool, and is sunk into, and perhaps through, the very same nice porous stratum as that in which the tank is placed. Now,
as the sewage which permeates this kind of sandy or as the sewage which permeates this kind of sandy or
gravelly stratum does not by the consequent filtration gravelly stratum does not by the consequent filtration
part with anything but what is mechanically suspended, it is evident that all the soluble or saline matters of the sewer (or the drainage from the farmyard) descend into and mingle with the water-bearing stratum from whence the well derives its supply. In some place this is not so much the case in the winter as in the summer months. In the wet seasons of the year, when the land-water is copious, the level of the water in the well is higher than that of the liquid mass in the cesspool, and then there is no drainage from the tank towards the well; but when in the drier months of the year the springs are low, the water-line of the well sinks below that of the sewnge in the tank, and ther the current is directed from the cesspool towards and into the well. It is in such cases that the good house wife gravely informs us that "the heat of the weather has given the water of the well a little turn.
Mr. Evershed on Cattle.feeding.- Putting an animal into good condition is like filling a tub with a hole in it. It is necessary to pour in faster than the contents The first office of food, after building up the body, is

 purpose that the animal begins to fatten. Tho earlier the process of fattening commences, and the sooner it is over, the greater is the economy in the use of food, because the least possible quantity of it has been used for the support of the body.

\section*{Che đoultry Yatr.}

Poultry Breeding in a Commercinl Point of Tiew. This is the subject of a very complete and indeed exhaustive escay lately published by Mr. Geyelin, who
is agent for the National Poultry Company, whose establishment at Bromley we lately described. The contents include a full description of the poultry house devised by its author, with references to the natural history and characters of the various breeds of poultry bred or known in England-observations on food and fowl, feathers, and produce in fattened and breeding on dieeases, marketing, machinery, de. The reports to the Company on poultry breeding in France, and on the prospects of the speculation in England, are also very interesting. The whole is fully illustrated with plans, drawinge, and sections wherever illustrations are necessary. Two sets of estimates are appeudedone on the profits of rearing fowl of approved sorts for oreeding purposes, where the young birds at 12 months old are valued at 10 s . each; the other on the profits of eggs for consumption and of reariny birds for the pou'. terer. We quote a passage on the preservation of eggs, on which a correspondent writes a paragraph below:The shell of the egg being porous, to admit air to the chicken during the process of incubation, allows also part of the liqnid to evaporate, and the air to
permeate when they are not used soon after being permeate when they are not used soon after boing early decomposition and putrefaction, particularly so in a fecundated egg, in which the germ is first decom. posed. Clear eggs, the produce of hens whe have not

\footnotetext{
*. Poultry Breeding in a Comonercial Pnint of View, sc. By
}
been with a cock, keep fresh much longer. This can
easily be exemplified by putting an old fecundated egg easily be exemplified by putting an old fecundated egg it will be found that after the 2 lst day the fecundated egg is putrid, and the clear egg fit for use. To exclude of its liquid, it has been proposed by some writers to pack the eggs in salt, lime, bran, sawdust, \&c.; by others to keep the eggs immersed in lime-water, in salt water, or both combined ; others, again, suggest to var
nish or oil the egge, and some even to parboil them.

There can be no doubt that, were the object to be accomplished solely to preserve the eggs from getting putrid, some of these suggestions might be omployed to advantage; but there is more required than simply to preserve the egg from putrefaction; for instance, for kitchen use, and the breakfast table, eggs ought not only to be preserved fresh, but also free from any foreign flavour, such as lime, salt, bran, sawdust, varnish, and oil must necessarily impart to the egg through its porous shell; and as for breeding from such preserved eggs, it is out of the question. Who has ever seen any chickens hatched from salted or mouldy egge, or from such as have been varnished or
oiled, which latter process stops up the pores through which the air, so indispensable to the formation and development of the chicken, must be admitted?

Now the most effective, simple, and economical plan for truly preserving eggs, and without imparting to them any foreign flavour, or rondering them unfit for hatching purposes, is to use the patent stoppered glass jars with vulcanised india-rubber joints, and proceed thus:-
"Immediately after collecting the eggs, put the jar in hot water, and when thoroughly warm, so as to rarify the air, place the eggs in the jar, the pointed end appermost, and pack and line with paper shavings or cocoa fibres to prevent them from breaking; then will be found that eggs preserved'by this method will be fit for hatching 12 months after, and that those intended for the breakfast table will be as fresh as on the day when laid.

General Rules to be observed in Poultry Brepdinn.-
The hens selected to breed from should be kept part from the cock until they are at least 12 months old, and the cock should not be less than 18 months
old before be is put with hens, as a too early call on aature degenerates the breed. 2. Whatever races are selected they should bo the most perfect specimens that can be obtained, as the first outlay will repay itself. 3. That the distinct races be kept strictly beparate except where it is intended to obtain a cross breed, and for this the finest specimens of hoth races
and sexes should be selected. 4. Not more than six hens should be allotted to a cock. 5. After the third breeding year it is advisable either to sell the stock or to fatten them for the market, as they become less fecund, and their progeny are apt to degenerate. 6. The eggs should be collected at least three times a day, as in a fecundated egr, when set upon for a few
hours, the germ very soon gets developed and the egg hours, the germ very soon gets developed and the egg
is afterwards unfit for hatching. \%. The stock must be fer regularly at sumrise and the afternoon an hour before going to roost. Geyelin's Poultry Breeding.

\section*{Farm Memoranda.}

Wheat Sussex Fars: Nov. 13.-After a long delay Wheat sowing has been commenced, and put in in towards finishing, as the past week was fit for sowing all through, and the land where at all dry worked so easily that a far greater breadth than usual was put in in the time; and though we had so heavy a rain in the
end of last month ond of last month and beginning of this, the land is
all now dry, and ploughs up more lightly then it usually does at this time of the year. Wo are now
four horses, and if the weather continues deeply with shall get it up tolerably healthy for the winter, it, we spring work will be so much lighter. The cattle plague does not apper.
about, and it is hoped that it will soon disworse here. it has very much deranged the farmor's wispter, Blang as we were afraid to buy store beasts, and those that
were nearly fit for the butcor were nearly fit for the butcher have been sold off tand were it not for foreign cattle, meat before manany month would be much' dearer than it is now. There have hee rumours of having Chichester market closed, but such views do not obtain much favour, and we do not think they deserve it, as the market is all but closed for lean cattle and nearly all others, the past three or four markets not averaging above a dozen beasts of every kind. Indeed, it has never been a regular market for but a good deal of the beef came in very large supply farm and taken away as wanted, and so with pork; the the supply of mutton has been large, and perhat more than doubled within the past 12 nd perhaps standing between Brighton and Portsmouth, there is always a good sale-the best going eastward, and the inferior to Portsmouth-and the number of stock sheep has largely increasen. Formerly grazing farmers went to Weyhill and bought their winter stock, but now fewer do so, but buy at home from time to time. And for sheep, fat and lean, the market is increased four-fold within the past 10 years, and being held in the atreets, a controversy has arisen about its removal on sanitary grounds, and the dispute gets hot at times among the citizens; but the farmers have not said much in the matter, and perhaps they would hardly know how to decide. It is sometimes inconvenient if one has cattle, sheep, and pige to sell, as they stand far apart, but then it is so much cleaner and drier to move about; but there is no doubt it will have to be move perhaps before long, on sanitary grounds alone.

There are fewer unemployed hands now than there have been at this time of the year before, and there aro signs that there will not bo sufficient for the work before long, and then the need of homes for the labourer will make itself felt.

The root crop still remains green, but the Swedes are small and woody, and the Turnips where late are yery small. Mangel has turved out a good crop, an is now all stored. Potatos have kept pretty well since
they were taken up, though many of them were they were taken up, though many of them were
previously diseased. The best sorts to resist the disease are the Scotch Rocke, and the York Regente are bad. \(G\). S.
Marpowder. - According to promise, I went to Mappowder on November the 81 h ( my own and also my brother's birthday), to perform my promise
After uniting the happy couple, the wedding breakfast and throwing " the old shoe," accompanied by hearty wishes, I reviewed, in company with Mr. Levi Groves, of Binghams Melcombe, who has a most distinguished Hereford herd, a solected portion of the Mappowder Herefords. The first to which our attention mas called, were six Hereford heifers fattening for the shambles. They were all splendid, but two were espethan these two. The next visit was to "Sir Sampson" ( \(2: 118\) in the Herd Book), bought for 70 guineas. H is by Sir llenjamin. Inever saw an animal so good sumptuous wedling breakfast might have been aprea there! A capital landler, and fine head and forehand wanting only a little more fulness behind th shoulders. Sizty of the herd are in calf to him.
I dare say most graziers know that, if an animal extra good in the hind quarter, he is often a littl wanting hehind the shoulders, and vice versia. In Tach animal that is most level all over is the best. Clifer by the side of the bull was a splendid yearling heifer name presently. It bids well. The next brought or review were the 2 years old 1st prize winners Hereford. They were both splendid. I liked on the
whole the largest best, but the other was of very fine quality.
After these were reviewed, six more were driven uf, They were all splendid animals, but, as before, tho were superior to the others-a cow and heif. the heifer was extra, but the cow was extra extra, and believe best and most perfect animal that 1 ever surling call got it was a Herefon" was out of her, and the Herefor prize heifer, that I have mentioned before as m chize of the twain, was also out of ber.
It is 16 miles from Rushton to Mappowder, and I ould not find time before returning to go and see the whole lierd, but I am satisfied that a He disappointed. The worthy family, I am sure, would ighly spproved of. I had but one sorrow but, alas was gone
I have promised. Mr. Levi Groves in course of time to go and pay him \(\Omega\) visit and review his beart on
herd of Fierefords. I will, in such case, roport them by his permission.

I must not forget to mention my servant's obs ope
on on the fine vale of Blackmoor, as I passed

\begin{abstract}
the high hill of Bull-barrow, which on a clear day \({ }_{p}^{\text {commace is the greatest wonder I ever saw, and that vale }}\) is the next greatest wonder." - "What," said I, "is the third wonder ?"-"Why, sir, those Herefords !
There are these things that I especially admire in the Herefords: their quietness, and their backs, rumps, setting on of the tail, chucks, fleshy thighs, flanks, is now seven years since I saw the whole of the fine herd. I can see by the samples shown to me that herd. Improvement has taken place. W.F. Radclyffo, Tarrant Rushiton.
\end{abstract}

\section*{Calendar of Operations.}

Gorre. - The following memorandum on this sabject is taken from Morton's Farmer's Calendar:-"Gorse wheu cultivated as food for cattle, will yield a first catting in November. It is cat with a small hook, somewhat resembling pa reaping hook, but broader and more circular in the blade. A labourer accustomed to this work will speedily hew down whatever quantity of Gorse may be required. A hundred faggots are considered a good day's work, supposing the Furze to be strong and from \(2 \frac{2}{2}\) to 3 feet highi. The usual price for eutting is about \(5 d\) d to \(6 d\). per score. Each faggot weighs from 15 to 20 lb .; and when braised it take 2 or \(2 t\) faggots to make a bushel. The quantity of this deseription of green food which may be obtained from an acre will vary according tofthe thickuess, height, and quality of the Furze ; 2000 faggots may be reckoned an average crop, and will yield 800 to 1000 busliels of the crushed food. It is crushed either with a machine, half chaff-cutter, half mill, for the purpose, or simply with mallet and block.
"The food is usefully given to all kinds of stock. It is not to be expected, of course, that horses fed on green food can perform the same amount of work as others that are fed on such nutritious substances as hay aud corn; but for the common purposes of husbandry, they can be kept in working order when tpartially fed on Gorse, and have coats as soft and silky as if they had great advantage to be derived from the feeding with Gorse is that it becomes fit for use at the time the Liorses are housed is autumn, and by occasionaily using it during winter, it enables the farmer to dispense withi a larger proportion of hay until the spring, when the borses are harder worked, and, of course, require to be better fed. For milch cows there is not a better description of winter food, or one that is more relished by then, than Gorse after it has been properly bruised.
The average quantity given to working cattle is about \(2 \frac{2}{2}\) bushels a day, with straw. On this meagre fare, it is astonishing bow much labour they will perform, A moderate-sized cow will consume from 3 to \({ }^{31}\) busbels a day; but 2 or \(2 \frac{1}{2}\) busbeld, with a felw fair allowance."

\section*{Miscellaneous.}

The Death of Mr. Hugh Watson, late of Keillor.We regret to announce the death of this distinguished Scottish agriculturist, which took place at the Den, Perth, on the 10th inst. We take the following paragraph from The Farmer:-"At November, 1861, Mr. Watson retired from active life, having given up the Keillor farm, after occupying it for 54 years, under the Wharnclifie family; and the footing on which he stood with the noble proprietor will be best understood by the following anecdote, which was related by Mr . Watson at the farewell dimner given to him on his leaving Keillor:-'Twenty or thirty years ago, when making a survey of Keillor farm, for the purpose of improving it, the landlord and he (Mr. Watson) came to speak of the rent; but two words were no necessary on that subject, for Lord Wharncliffe just said, "I may safely leave it to yourself, Watson; for after what I have seen to day, I think you have a better right to be here than I have."' When Mr. Watson entered upon Kellor farm, it was partly in a waste state, undrained, and unenclosed, but under his management it soon retired a very different appearance, and when be vation. But it was not merely as a skilful cultivator that Mr. Watson won the distinguished reputation Which has been so long atteched to his name. What colling was to the Shorthorn, Mr. Watson was to the polled Angus breed of cattle. He found them a narrow, by the inned, unsymmetrical description of animals, but, by the judicious system of breeding which he followed, substance to fatten and a quality of fleeh which has rendered the 'Angus doddies' one of the west breeds of British cattle. Mr. Watson, in fact, made the character of the Angus breed, and the Keillor herd is that to which all breeders of that description of cattle are anxious to trace back."

\section*{The 5 antucuerge \(\mathbb{C}\) tromicle．}

SATURDAY，NOTFBMBER 2．5， 1865.
mekting for the linuling weik

The genetal Infletexe of Chimate on the growth aud ripening of hardy Facris is known to everybody．The facts are cintinually presenting themselves to the observation of cultivators：ret these facts，and the principlas in which they lead， have not been studied to the extent they deserve， and which，from their importance，might have been expected．On this account we renture to bring the suhject before our readers，not with the design of supplying all that is lacking，for that is heyond our space and leisure，but to suggest fresh inqui－ ries，and in the hope that some of those who have suitable opportunities will be induced to carry forward the necessary investigations．

We would not，indeed，forget what has been done already．For ahout 40 years，very careful registers have been kept in the gardens of the Rojal Horticultural Kueiety at Chiswick，recording regular and continuous observations of tempera－ ture，rainfall，evaperation，\＆c．，and which have been from time to time publish＋d in the Transac－ tions and Iournals of the Sorietr．These registers are in high repule among continental meteorolo－ gists．They form the basis of many of the valuable
remarks on climate in the late Dr. Ln dley's
admirable "Theory and Practiee of Hortioulture." More recently, the British and Scottish Meteorolozical \(\$\) seieties have been instituted; and these bodies have established stations, appointed observers, and have published their observations either in extenso, or in iheir condensed results. We have now before us eight numbers of the new series of the "Journal of the Scottish Meteorological Society," and we find in it much interesting matter bearing either directly or indirectly both on agriculture and gardening. For example, in a map of the Isothermals of the British Isles in January and July, deduced from an average of five years ending in 1861, it appears that the basin of the Thames is in July the warmest region of the United Kingdom, and that it is only approached by the sea coasts of Devonshire and Cornwall, and at length equalled at a line running through the Land s End itself.

It is rather remarkable, however, that plants, and partieularly fruit trees, though they in the main obey, do not very servilely respest any of the isothermal lines we have yet seen. Temperature has a principal influence on vegetation, but it is only one of the elements which rule its development. In his Geographie Botanique, M. plant is a sort of natural thermometer-only a sort of one however; for it is a living organism, and the presence of life in it distinguishes it from a dead instrument, which is acted on merely by external mechanioul causes. A plant is a thermometer which never recedes, and whose progress is ever onward. You may eanse its growth to stagnate, or you may destroy its structure by cold, but you oannot force it to shrink into itself, or withdraw its blossoms when onee they have expanded. Still a plant is in many respects an admirable indez of
climate. Its growth is stimulated by an inorease of temperature, by a given amount of sunshine, by currents of the atmosphere, by aqueous vapour, by electricitr, and possibly other ayencies which our senses, and even nur most delicate instruments, may fail to detect. These elements, in their totality, go to make up what we usually call climate in relation to fruit. And there are besides the pr ne:ple of vitality, and the natural constitution (f the plant, modifying these external in-
fluences. Still, making allowance for all peculiarities, a giver plant, such as a Vine, or a Peaeh, may be assumed as an instrument by which to measure the summer climate of any particular region: as such we propose to employ them, or at least to state some facts which show how they may be thus employed.
Of coarse it is to be kept in mind, that, after all, temperature is one of the principal agencies i vegetation, and that the effective warmth of the air and soll decreases, in proportion as the latitude of places and their tlevatinn above the sea increase. Everyone knows that the further north we go, the colder the weather beoomes; and the higher we ascend a mountain, the more the thermometer falls. Climate, then, may be regarded as in a sort of inverse ratio compounded of the latitude and altitude of the place. Of this general rule, however, there are various moditioations which are intereating to hortioulturists; but as the phenomena are somewhat cowplicated, we shall to-day restrict ourselves to those that relate to latitude.
Take the Vine for an example. It is stated in the Ampélographie Francaise, a work of great statistical preorsion, as well as much artistio
beanty, published some years ago under the auspices of the Imperial Government, that only in Creuze, and if we remember right, Cantal, central and elevated departments of France, Grapes cannot be ripened in the open air. According to
the younger DeCandolle the profitable calture of vineyards is to the south and east of a line running obliquely from S. W. to N.E., from near Vaunes in Brittany, in lat. \(47^{\circ} 45^{\prime}\), to near Dusseldorf on the Rhine, in lat. \(50^{\circ} 43^{\prime}\). On the west and north of this line the vineyards are comparatively few; receded, a fact which led Arago to suppose that there has been a deterioration of climate in Brittany and Normandy. The same inference has been dra:n from the old traditions of vineyards in the south of Englaod, in piaces where ther day. Whatever may be the validity of these inferences, ard we cannot now panse to di-cuss
them, we sup me it knoisn to them, we sup, inse it knoiva to all our readers,
that Gripes ripea on walls and the ruofs of cottages in the vicinity of London. In the latitude of Edinburgh, some \(41^{\circ}\) farther north, the Vine
said that in one fine season the berries were not on'y formed, but were partially coloured on a wall Edinburgh. At Erskine House, Renfrewshire, on the southera shore of the Frith of Clyde, the Black Hamburgh Grape is annually ripened on a bot wall, so as to be suitable for the table. On the same wall the fruit of the common Mulberry is brought to maturity. There are thousands of persons in Scotland interested in horticultural pur-
suite who, having never crossed the Treed, have suit who, having never
Most dessert Apples are grown in Sootland on walls, and some of them are even allowed to ocoupy spaces in south aspeots which, in England, are striotly d:setined to stone fruits. It has been said, perhaps with too much acerbity, that north of the Humber one never meets with an Apple grown on a standard, that is worth eating. Scotland has Pears of her own, suoh as the Muirfowl Egg and the Black Achan, of a hardy character, and fit for the table; but our northern brethren have to grow all their finer French and Flemish Pears on walls, and are not always sucoessful in doing so. The old Chaumontel Pear-once perhaps in higher repute than it is now-grows, or used to grow, on standards in the Hortisultural Society's Garden at Chiswiok; and in a recent visit we saw a fair crop of this Pear on a young espalier tree. We knew an ardent fruit grower near Edinburgb, who laboured for half a lifetime to grow this Pear; and yet, though he trained it against a south wall and treated it with his best skill, did not obtain a couple of dozen of Pears during the whule period. In fine seasons, and in the warmest situations near Edinburgh, such Pears as Beurréd'Aremberg and Marie Louise have been known to ripen on pyramids; but to secure the maturity of the finer and later sorts, noh as Passe Culmar, Winter Nelis, or Beurr' Rance, the trees must be planted against the southern aspects of walls.

All this, some will think, is quite what might have been expented, for \(4 \frac{1}{2}\) degrees of latitude must make a vast difference in climate. Well; but let us look to Peaches. It will not be denied that they yield suffieiently precarious orops, even in the neighbourhood of London. The prevalence of orchard houses is a sufficient proof of that. We need not say that the growth of Peaches is not a whit more certain near Edinburgh, though in average seasons they do ripen there, with the exception of the latest varieties. At Culloden House, near Inverness, which is nearly 2' north of Edinburgh, the middle season Peaches, such as the Noblesse, ripen perfectly almost, evtry year in the open air; and the same suocess is attained at Cromarty House, on the other side of the Moray Frith, and at Tarbat House in Eastern Ross. Figs and Apricots, too, succeed admirably in all of these gardens. The Greengage Plum, which is rarely grown on standards near Edinburyh, ripens abundantly without the aid of walls at Culloden House, and in other favourable localities near Iuverness. These facts show plainly enough that latitude is not the only source of the climatio influences which tell on the maturation of fruits.

The same conclusion is still more strongly hrought out by the results of gardening in Norway. The following facts are derived from an interesting chapter on the vegetable productions of that country, appended by the Rev. Mr. Barnard to his volume on "Sport in Norway," and they are given on the authority of Dr. Sciübelfr, Cunser-
vator of the-Botanical Gardens at Caristiania. "The Apple growe wild is lowlands op to Throndijen, latitude \(63^{\circ} 25^{\prime}\), and in a oultivated state up tolat. \(65^{\circ}\). There are 346 varieties known in Norway. Apples weighing \(25 \frac{1}{4}\) ounces have been known; and an Apple tree at Hardranger has yielded 38 to 39 bushels. Apricots against walls will ripen in average summers as far north as
lat. \(61^{\circ}\). The Cherry is cultivated as a standard as far north as lat. \(66^{\circ}\); there are 22 varieties in eultivation. The Grape: many varieties are grown against walls in the south of Norway. In average summers they will ripen up and Catawba, i.o., varieties of Vitis Labrusea. The Peach will ripen against walls up to lat. \(61^{\circ}\). Of Pears there are 66 varieties of the finer sorts in the country. The Plum (the Greengage), as a standard and against walle, ripens as far north as lat. 64 To this last notice it is signifieantly added,
should be horne in mind that the word ripen is used in a botanical sense, viz., that the fruit is ueffectly developed. In the naually accepted sense, a ripe Plum at this latitude would not perhaps be all that could bo desired." Still it
a fruit ripe whose kernel would not grow and stil less would people continue to cultivate Peadies of the thinnings of Aprioots employed by cooks in this country to make tarts.
then, the produce of the With every deduction cohards, as compared with those gardens an north-west of our island, presents a very intereath problem to the riudents of olimate. For the present we must defer any attempt at its sor the

We have lately called attention to two Parasitr Which have proved extremely destructive in Australis, the one so prevalent as almost to prevent the oultivation of Hollyhooks, and the other very injurious to Plum trees. We havej Maize with the following note:-"This leaf w forwarded by Sir William Macarthur, of Camden Park, in the Colony of New South Wales, where this pest has, in the lower country at least, for tro years running, destroyed all the cereal crops." examination it appears to be a form of the common rust, Uredo Rubigo vera, but with rather larger spores, though, as far as we oan find, with no essential difference. Professor Henslow first, we believe, pointed out the ennnection of this with Puccinia graminis, of whioh itseems to be a secondary form, while Uredo linearis is only the Puccinis in a young state. Desmazières published a Uredo on Maize leaves (No. 1075 of his dried specimens), which differs principally in having rufuus-broma instead of orange-yellow spores, for we see no difference in their size or shape. In Desmaziere' plant, however, we find spores of a Puccinia whic is perhaps different from P. grammis. It is seldom that rust is very injurious in this country to cereals, except it attacks the glumes or seed which is sometimes the case; but it is much dreaded on the Continent, where it is sometimes as destruotive as it is reported to have bees in Australia.
Rust has been peculiarly abundant this year on Grass, giving sometimes a decided tint to whole fields, and covering the clothes and shoes of those who walked through it with a thick coat of orange powder. Speculations have in consequenee been prevalent as to its possible connection with cattle murrain, a notion as unfounded as that whioh was put forward by some one in the Times as to the possibility of cholera arising from Phallus footijus, as if that abominably disfusting Fungus were something new, whereas it may be found any year
in the plantations at Kew in almost any quantity, in the plantations at Kew in almost any quantity, and is abundant in most districts of Geen just as prevalent in Grass in former seasons as in the present, and it is very possible that when eaten in any considerable quantity it may induce disease of some kiud. It is extremely probable that gangrene in sheep and beasts often arises from Grass being infected with ergot, and it would when rust is agaiu abundant in our Grass fields, to see whether it has any deleteriuus propertes. Mr. W. Ingram called attention to this matter tew years ago, though ho had no opportunity putting it to proof.

As regards the prevalenee of rast and milid. Lord Everscey has lately made an observation which is worth recording. It has long remarked that Pea crops are most aub milan after drougat, a
certainly at variance with popular notions
subjeot, according to whian damp is the subjeot, according to which damp is the oanse instead of drought. It is true indeed that denp tavours growth when the Fungus is onee ber blished, bat in the first mentance condition. Hop mildew, for example the offspring of dry not of damp weather. ETERSLET remarks generally that muldaynation
its appearance after there has been a stagna its appearance after from drought. So long as plauts remain in a growing state, they escape the atta great these parasites. There 1s, we believe, a s the deal of truth in the observation, many the diseases to which plants are sal they do not arise frean real par the dry, of when they are in suoh a cuadition as that convey an insuffoient degree of nour when fruit disease often appears; it and the plant, monids are apt to setil surface and produce deony, which would hase had no putwer of doing injury white the \(j\) cirentation.
The following ex

Journal," Nov. 4, 1865, will form a ourions oorol.
lase to the above observations. whioh inoculation with Oidium Tuckeri, or the Fungus whioh causes the Vine disease, has proved fatal to human beings, Wounds acoidentally fatal with the instrument used for cuttiug off the diseased Vine shoots have presented, according to Dr. Collis (Medical Inspector of the Mineral Taters of St. Honoré, Nierre) marked evidence of poisoning. In some cases the persons thus of poisonigh have died in from 20 to 25 days, motrithstatding the most energetic treatment. Yours Desmartes and Bouchet, of Vitrany, hava alsu concluded, from their experience, that deleterious eme rather disposed to establish a coinoidenoe between the epidemic develonment of the Didium and a greater frequency of certain furms of inflammation of the mucous menobranes. The suhjeot has been submitted to the consideration of the Aoademy of Medicine of Paris (Quarterly Journal of Science)." MI.J. B.

Wr have from time to time noticed the exertions of the Rev. S. H. Paress in fostering a love of plantes mont equalid neighbourhoods of London. The following extract from the Pall Mall Caxette expresses our ow feelings on this suhject so well, that we reprodnce it without further comment:- We Rev. N. Harker that is saying a good deal. He has been áistributing the flower plants in the Parks, which the winter would have killed, among the London nour, rith the permission of Mr. Williany Cowprr, If he will, during the winter and when the spring comes plants thus given away, he will gratify a by no means impertinent curiosity. And if he finds that even a small proportion of the whe the transplanting and the dust, smoke, and inevitable
flower-killing accompaniments of a poor man's loilying, Alower-killing accompaniments of a poor man's loiking,
be will gratify not only himself, but, raticnally benevolent people in general throughout the country It may seem a small thing to get up a fondness for Verbenas and Pelargoniums among the hard-working and ignorant poor. Our grandfathers would have effeninacy and perhaps to republicanism. In those days manliness was too often thought inconsistent with a love for music, painting, or poetry; and if an old soldier or sailor took to gardening, it was merely forgiven him as a hobby. We are wiser now, at any rate to some extent. We are learning that the cultivastrengthening the character of men and women of all classes; and that the daily tending a few pots of flowers brightens the hours of the poor and weary with a ray, however dim and feeble, of sonething like that
enjoyment without which we feel that our own labours would be acarcely endurable. In Mr. Parkrs' account of his appropriation of the gifts we are glad to find that about 3000 plants went to London workhouses, and nearly 1000 to the hospitals. People are rapidly coming to understand that amusements are an important

\section*{Alement in the cure of disease}

From a correspondence in the Revue Horticole, the yearn that a similar diversity of opinion exists as to in this country. M. Herince gives it as his opinion that the plant succeeds best in the shade, while M. BHUANT's experience leads him to the conclusion that full exposure to the sun and a plentiful supply of water is best
suited to suited to the plant. Have ary of our correspondents
roticed that the leaves lose their red colour almost entirely when dried for the herbarium? It has been 10 with us.

\section*{muncing the arrival at Kew of ripe SEEDS of Cinchona officinalia (Condaminea) from Ceylon, where they have boen ripened under the fostering care of the able Othertor of the Peradenia Botanic Garden, Dr. Thwaitrs. Queensland, Mauritius, South Africa, Jamaica, and Trinidad, so that we need no longer be under appreliensiong that the supply of quinine wiil be exhausted, Amering to the ignorance and recklessness of sout American bark gatherers. We offer nur hearty con gratniations to Dr. Thwaites on his being the first to send seeds from other than native plants.}

One of the most instructive and interesting diaplaya, held annually in Birmingham during the
Rhaibition weok, is the Grast Frut Show at the Town Hall. This exhibition will open to the public on Taeaday night. Liberal prizes are offered to fruit Srowers in this country, also to those resident in the portion of the Show will be the Class open to the Clanuel is Islands and the Continent. Here an excellent rale is introduced, which cannot fail to make the oflibition highly instructive to those who are in search correctly named viz., "that all the fruits must be as written and placed an each dial of frui
are also offered for Chrysan themums
- Mrs. Pinceis Blace Mubcat Gafe, of whioh a sample has been obligingly forwarded to us by Mr. Prnos, of Exeter, possesena, no far an we oan judge
from an examination of the fruit, qualition from an examination of the frait, qualities whioh
should recommend it strongly to the cultivator. The bunches are long, compaot, and taparing; the berries full medium-size, ova!, parplish-black, with atout footstalks, a thickish skin, frm leab, and fine muaky Gavour. Some two years ago it galued a First-class Certiflcate at Soath Kensington. The favour is exquisite, and in the opinion of good frait growers it will be
iuvaluable as the latust of all Muscat Grapes, doing iuvaluable as the latust of all Muscat Grapes doing
away with the neeessity of forcing early Muscatm, the tenacity of ito green footatalk, and the Armaem of its flesh being favourable to ir keeping. The fruit lants from February up to Anril. We understand it has proved very prolific as a pot Vina, a plant with a singlo rod, in arch pht, having ripened 1 banold a each. kvery berry setg, awing to the vignur of the polleli cate given to it by the Pruit Committeo was well deserved.
- Oan any of our correspondenta throw aby light upon a fibrous material introduced recently and ooming into extensive use as a substitute for Cuba bast, under the namoe of "Japar Flax?" a ammple forwarded of a correspondent has great resemblance to Nerminm tenax (New Zealand Flax). Neither the plant producing the fibre wor the country whence it is introduced is yet known with certainty by the authorities at the Kew Museum.

\section*{New Plants.}

The following denoription of a magnificent pow apecien of Cycadoons plant, from tropioal Eastern Australia, Hill, the Director of the Brisbane Botanic Gardens A living plant bas boen received at the Royal Gardene, Kew, also sent by Mr, Hill, J. D. Hooker, Direotor.

\section*{321. Catahidozumy, Hill.}
C. Horal, Hill: Stew sumetimes attaining a holght of 60 poot and frimn 9 inches to a fuot in dlameter. Rachis \&at. With
promment
ceutral nerve above, rounded beneanth, slighty
 minate, quite enth
an iuch in width.
The cone arisen singly from the centre of the crown f leaves. Female cone from a foot to 18 iuches in length, and about 8 inches in diameter. Scales cordatoreniform, with the points strongly recurved, and a tetragonal stipes equal in length to the fruit. Nut subovate, angular, but variable in shape, covered with a thin shining orange pulp. Mule cone about the saun length as the female, but less than half its thickness.
This species differs from C. Macleayii (Hill) in the much more noble aspect of the plant, its loitier stem larger fronds, and broader pinnm, which are of darker green colour; in the distinct form of not acately
which is rounded beneath and flat above, not and prominently 4 -angled as in that apecies; and fually in the fruit, the nut in the present species being not sure than one-third the size of that of C. Macleayii.
The plant above desoribed in dedicated to the Hon. Louis Hope, of Cleveland, Queenelsad, on account of Agriculture, and Botany in this colony.

\section*{RAINFALL IN OCTOBER.}

Tus quantity of rain which foll in the month of October this year boing unusually large, it habite thought that the following Tuble, which exhibite from depth of rain in evary corrapponding month, from 1826 till 1865 inclusive, may pro

It will thus be seen that last October was the wettest during the 40 years indicated, the amount being no less than 6.25 inches. The October next to this in point of wetness occurred driest October during the periol 208 that of 1834 , when only 0.48 , or less than balf an incl, fell.
The annual quantity which falls at Chiswick on an average of 38 years in 23.723 inches; the proportion for nine months is consequently 17.192 inches. In the nine months previous to October th inch of the average 17.720 inches, or witain \(\mathbf{z}\) made up of an annual average quantity in the three remaining monthe of the year. We have, however, had more tban this in Ootober alone by inch; Bo that this quantity, and all that has fallen or may yet fall

November and Deosmber, will be in excens of the amount for the year.
There being an armar at regands the full of rain at the commencoment of the prebeut yoar, some of our readere will doubtlem be anzious to know how the rainfall now standa :-

The errear in quoction was.
At the end of september it \(\qquad\) 10.2 inchan.
108 inches.
0.02 Inches.

There muat, therefore, be a fall of \(C\) inches extra before the arerage amonnt is mado up; and until this is the came, the springe will not stio to their womed leval.
There is an old well is the ganden of the Royal Horticultural Soclety at Chiswick, which, on socount of some Ferns that took shelter in its sides, was never olosed in, and it serves as a gaugo for mearuring the level of the sirmasis, or the height to W...h h we watery
 now when the wator hes had nomotime to colloct in the gatherisgegro.and uni percolate thangh the moit.保 the rain gaugo indicates that the arrear of ramfult is made up. If

\section*{DOUBLE ROOPS.}

As the discusoion upon this nubjeet fo now taklog a practical form, let us lope that we may have the werite or demerits of this aystom of glaving carefully pointed ont, fir althongh your Barlin oorroapondont miny thoroughly appreve of douthle roifs, thero are nthers crea in the inmailiate neightomentwot of that eity with whom they find hittle favemr, aithomgh they have had lomg experience of them. Moabit, tho rery intelligent gardener of M. Bomigo who when he remide chw, will, have no doubt, furnith his own opinion of thom
There can be no doubt that double ronfo origiasted in Germany, perhaps at Berlin, the the Pulu-kurnee and many of the ganden struotures at that plece have the appearanee of great nge ; and with a tompercture 90 buluw zero for a long perini in winter, one can readily underatand the great admutaces that may bo dorived from a glass house having a double rool, becance the alro filled space between the two roofe would of itnelf be ufficiont to toop out a greet amount of froet-an mportant oonsidenation in the case of any acoldon happening to the heating apparatus. No fair cum parison oan, however. be made botwoed the musemer at Engiand and that of borling many of the Pulum cultivated there would be better. I imegine, uncovered at that emenon than under glase. Indiond, I would treat them like Orange trees or Standard Buys during the summer months. For example. not many yarus from a Palm-honse which I saw at Berlun, partly under the shade of large treen, was a good-aizel srregulur pond, in which all the bett varieties of Nypluea were blooming as finely as I have ever seen such plauts either at ate equally fine durine the summer, and the quantities of seed-por?s on the Nelumbium clearly prored with what success thar plaut had als) been grown there out of doors. This pond had a constant supply of hot water running into it, hut no envering had been placed over it ; in short, its sizo "ould have made any attempt to roof it over difficult. This proves that if the winter there is oxrs. A double roof in winter may therefore then be a great advautage, but the upper roof should be carathe of removal in summer. Even under existing circumatances, howver, the collections of fine tolnged plants which I sam at Berlin appesred to be in ercellent hea'th.
The only exauple of doublmglazing we hine as yet to look to in this e runtis i: that at Rock field, and upon referring to notes tuken lest neeson, I find that the prinoipsi plants in that house were Tree and other Fernis, which although in robust health tright aven be krit so out of doors in such summersan the past. We have, thenofore, at proment un prontiveu-ly to horticultural arections in geseral, even without taking into account the extra expense that they would ineur. over general collections of winter and ahably ing plants would in our climate probence of light tencency to draw roem up, and ant that amount of colour from being infused into the lowerw which we generally get under a single rook.

In Berin most of the plants used for winter decoration are what are termed fuhame piants, surch as Dracruas, \&cc., which, doultless, from the construction of the houses nud the heat reudered necensary there, have been found the most anitable for that clicuate. With us the matter is very different. While therefore double ronfo may be necessuy there, \(\begin{aligned} & \text { ins. } \\ & \text { possess the mame advantages in England. J. F. }\end{aligned}\)

\section*{MESERS. PATERSONS POTATOS}

We have ousereral occasions alluded to the efforts Or the improvement of the F,tato, made by Messrs. Pateran \& Son, of Dundee, and we have now to state that these efforts have heen acknowledyed by the prestatatinouse thors have silyer cluret and epergne at a publie dinner beld at the Royal Hotel, Dundee, on the 10th inst., " in consideration of the great amount of
labour and money they have expended during the past
40 vearn in endeavouring to improve and renew that
most valuable of all roots，the Potato，and in recog－ nition of the success which the firm has attained this season at the Dublin International，the Liverpool and Manchester Agricultural，and the Erfurt International Extibitions－they having been awarded the chief prizes at each competition．＂The epergne is to bear the following inseription：－
At a public dinner，given to Messrs．William \＆George Pater
sonn，this Eperme，aloug with a Claret Jug，was preeented to
Mr．Willian Patersun，（to descend to Mr．George Paterson， shonld he survive his father），ius the tame Mr．George Paterson，the subscribers－
landed proprietors，farmers，potato merchants，and other
friends－as a mark of their respect for bin，and also of their ad miratiou of his suceessful exertions
to improve and reuew the Potato plant．
Dundee，10th Nov．1865．
In presenting the testimonial，the chairman（ex－Bailie Yeaman）observed：
＂This meeting＂has been brought together in the most spon－ taneous manner，and I believe on account of a thurough have rendered to the country．There are none that wrill mostly all phints of view．We recollect the year＇ 46 ，when the
severe blight first attacked the Potato crop，and the great
calamity which befell the country generally at that time，but calamity which befell the country generally at that time，but
particularly the inhabitants of the Sister Isle，where＇the
plant was alnost swept away．＂A Royal Commission was then plant was alnuost swept away．＇A Royal Commission was then
appointed in order to discover the cause of the Potato blight，
and gentlemen of science were engaged in trying to disover and gentlemen of science were engaged in trying to discover
remedy for it，sn that the Potato might be restored to it
former vigour．Now，this investigation created very gra interest，sud I believe no gentlemanation the country（although
many agricultural and scientific men devoted much time
to trying experiments in order to restore that useful to trying experiments in order to restore that useful
root to its former vigour），did more to bring about
that happy result than did Mr．Paterson．He betook
himself to the keeping up and improving of the broed，and set about growing the Potato from the pluin or apple．It is now
nine years since Jr．Paterson experimented in this way，and
two years ago he bad 100 tons of different improved varieties two Jears ago he had 100 tons of different improved varieties of this excellen
himself prepare
time to time，

\section*{and strongest plants，so that he might get the quality brought} to the greatest state of perfection－quality with the greatest
health of constitution；so that it might stand the cimate of
our country；wr in leed of any country；and so that he might
have the ront restored to its furmer state of excellence have the ront restored to its furmer state of excellence．He land；and if we can conceive the great amount of good which
the result of Mr．Paterson＇s labours and enterprise in this matter has been to the community，we must surely agree that
Mr．W．Paterson and Mr．G．Paterson both responded． In the course of his remarks the latter gentleman read the following statement prepared by his father：－
＂From carly life I have taken a deep interest in the Potato plant．My father being a cultivator of fruit and vegetables in
this quarter，it gave mea favourable opportunity of observing
the growth of the Potato，from the most delicato the growth，of the Potato，from the most delicate garden
variecy to the strongest kinds grown in this comntry．My
notice was first attracteri by some of the earlier sorts weaking
in coustitution，and in the course of a few years beconing in coustitution，and in the course of a few years becoming
almont extinct or worthless as a niseful and paying crnp．I
inext turnel my attention to the more robust field varieties
then grown，and with the like result next turned my attention to the
thern grown，and with the like result
（from which，

consists in this，that it goes that show us that many good and
healthy kinds of Potatos may，from the want of observation，
have been lost to us in the past，and that we ought in th
future to observe and select carefully．In the vegetable，a
well as in the animal kingdom，the inforior predominate in
well as in the animal kingdom，the inferior predominate
number over the superior kinds；and therefore the necessit
for rejecting the bad，and choosing and caring for the good．
The Chairman spoke of our Government taking up this matter
of the culture of the Potato．I think that is a suggestion worthy of notice．It really is a matter of national importance．
You all know the value of the Potato as an esculent，
to mankind；you know its great value to the farmer for the
calam
throu was struck with the fatal blight．Suppose that the scourge the fearful effects．Should it would be impossible to estimat matic plan be devised and carried into effect by the Government
for the purpose of adopting means of keeping up strong and healthy kinds of Potato？Even this year disease has existed in several places to no small extent ；and the sooner somethin but possibly they could get skilled parties appointed over the
country－call them Inspectors－whose duty it would be to take due means to secure the careful culture ayd propagation strongest kinds，from whatever source they can be got．Gond
seed is of first importance，hut a judicious and plentiful appli
cation of dung is scarcely of less importance ；and here，as to dung，I may remark，that I think the best manure for Potato say that the disease can be wholly warded，off－in my opinion
We add from the Dundee Advertiser some further remarks on the same subject：－
The npinion heid by Mr．Paterson is that the Potato plague is entirely due to atmospheric causes，and that the disease is
incurable．The only plan，he thinks，by which the Potato plant can be preserved is that which he has pursued so successfully continuy varieties in replace those that hava become，throurh
Mr．Paterson despairs of being able to to elimist the disease． atmosphere the calises of the disease，but he proposes to oppose
to its blighting influence robust and healthy plants capable o aqperitios down to the endurance of the Patato，but he will
train the Potato to habits of endurance，mntil it is able sucess fully to withstand the assaults of the atmonsphere．His effirsts
in this directinn have been remarkably suceessful．To rear Potatos from the plum requires a series of
requires an exercise of great judgment and scientific discrimina－
tion．It is not a difficult matter to rear Potgtos of from the plam－that has oiten been done；hut Mr．Paterson＇s Way as to pronduce a yace of himedy，Potatos capalhe o
resisting discase，remarkably molife，ame of superior quality varinus reports of Mr．Paterson＇s seerlinge we hive published
from time to time，and which many were disposed to regard as brated by the testimony of the most eminent a fricilturist summer shows at Chiswick，which the three greas summer＂assizes＂for fruit and flowers really the judged right there could not be gainsaid and thiran It was this centralisation that be gainsaid afterwards． of seeing plants，flowers，and fruits，to all opportuaities whether amateur gentlemen or humble gardeners；for I recollect well that in the Horticultural Society；
Rooms in Regent Street，Dr．Lindley lecture on the plants there exhibited，a gave a kind of mentary on the list，whereby the quaint peculiarities of plants apparently unimporant were brough superior cultivation．Before the Horticult the score of Exhibitions，and before Dr．Lindley botanical knowledge，the native talent for Englist botany，and the practical knowledge necessary to culti－ low ebb．When Mr．Greons exhibited at Chiswick an Epiphyllum a yard wide，and forming a cone a yard high，literally covered with scarlet blossoms，it＂1as hailed by all as a new order of things；and this， every other new idea that came up，whether in plants or fruits，became by means of the Gardeners＇Magazime that the Cactus tribe got shifted from their hereditary lime－rubbish into rich loam and dung；and the Vine leaf，as another example，got subjected to a heat that the old hands believed would have burnt it to powder，and yet it lived and bore fruit，large and
fine，until a bunch of Hamburgh Grapes brought from Oak－hill to Chiswick， 81 was Mrs．Lawrence＇s splendid specimens of flowering plants set other exhibitors astir；and when the scaly bulb ofs Lily only large enough to till a tea cup was sold for \(30 l\) ．，it behoved the nurseryman to＂consider the Lilies of the field，how they grow，＂so as to increase the costly commodity without delay．I mention these things as datum pegs to show our progress．People not conversant with plants can form no idea of the intense joy that such men as the late Dr．Lindley must have felt when they saw plants in perfection，majestic ragrant as in the Rose，quaint and magnificent as in fragrant as in the Rose，quaint and magnificent as in
the Orchids，pure and lovely as in the Water Lilies－

> Such the stern joy that warriors feel In foemen worthy of their steel."-

To have lived so loug，and to have seen so mach beauty annually brought to．\({ }^{\circ}\) is door，must have bean luxury indeed；and as the Doctor was Editor of the chief medium of communication among plantsmen everywhere，it seemed as if all their joys，ay，and even their grievances，had to be laid at his feet．In his peaceful path he lived honoured and beloved by such a circle as it has seldom been the lot of any one to infuence． His victories were peaceful，with none of the clarion eclat of the warrior；but his wonderful labours legion，who，like myself，have been patroused by Dr． Lindley，and who therefore，as 111 duty bound，speak of his friendship with gratitude，and hold his name ia honour．Alex．Forsyth．

Coniferce on Undrained Clay，togetler with a few （see 1034 ）of perceive in your Notice （see \(\mu .1034\) ）Society，on the introduction of the newer Coniferm，\＆C．，that you state introduction of the newer Conifera，de，that you ithen
it to be laid down as a general rule by Mr ．Henison that undrained clay is an unsuitable soil for Conifers， From my own personal experience of very retentio undrained clay，I can say that Scotch Fir and Silves Fir will grow rapidly，and be bandsome and sound trees for at least 50 years on it ；that Larch and Spruce will grow vigorously and remain sound，the former for 15 20 years，the latter for a few years more－facte frow which I draw the conclusion that if our well－k． Conilers can be planted with profit on retentive clay it is at least probable that some of the newer kinds also succeed on that kind of soll．I aw should choose opinion that in planting a fore resembling its native soil， but I think，from what I have stated，that it is wor trying new kinds of trees on all our soils．Iand the effects of wind so badly as Conifers，with the exception of the Anstrian Pine．Living，as I do，close to the sad shore，I find that the Silver Fir especially holds is head erect against the sea－blast，one tree in particular stand ing high above O．k，Ash，Beech，Horse－Cbestnut，and sycamore and in a sycamore，all apparently of the same age Scotch Fir Larch，Spruce，and Maritime Pine to stand of the exposed situations．With regard to what is sad frosto liability of certain Conifers to be injured by late frost 0 I can say，that at this place，on the south－east Ireland，at an elevation of about 50 feet above the ses， the following kinds of Conifers，name injured，viz． even in Devonshire，have never been ins torulosa，aud Abies Morinda，Pinus Pinsapo，Cupressus tor by harsh Cedrus Deodara．The last has been north－easterly blasts where planted healthy plant of Picea Webbiana has
a mere bush by repeated injury to from late spring frosts following mild a splendin last year，when it succeeded in pusbiag this yeur．I hope that as the head gets up it will get out of the influence of hoar frosts．
bas a healthy P. Webbiann, growing at an elevation of probably not lingly land, and it has no appearance of ever bsving been injured by frost, whilst my tree, planted in gravelly lonm in a sheitered spot scarcely 40 feet above
the sea level, has been, as I have said, repeatedly injured. The effect of the difference of soil on the foliage encomiums passed on the foliage of its race by your p. 1037). I hope I may some day see on my troe purple cones like those of which he speaks. In another part of jour Paper (see p. 103. jutice, to root Fungi. Is not this tree peculiarly fible to death from this cause? or is it only liable to venture to say that if it is as susceptible of being sttacked by root Fungi in its native forests as it appears to with us, it would long ago have disappeared from the face of the earth, for where will you find a native foreat that is not full of dead timber above and below the surface of the ground? Or if all trees were equally
linble to be attarked in this way, it would be dangerous ocut a tree down in a plantation for fear of its decaying roots spreading death to its neighbours, and the ordinary operation of thinning a Fir plantation would cunse the death of the whole within a very short time. Ido not deny that under certain conditions Fungi will pliving one; but \(I\) think that it happens nrely. This is a subject well worthy of the attention of foresters, as a relative of mine, alarmed at ceneral statements on the subject, would not replant and I believe was deterred from planting as much as he had intended on account of the expanse of the operation, which he believed to be indispensable to the health of the young trees. C., Gorey, Ireland.
Stoneless Berberries (see p. 1081). -It may be interesting to know that there is a beantiful clump of
atoneless Berberries at the ancient seat of she Marquis of Northampton, Compton Wynyates, Warwickshise Suckers are being constantly taken from them, and for years past I have known of many that have produced itoneless fruit at once-in short, I have never heard o the reverse tnking place. Geo. Serivea, Agent.
Arundo conspicua does well in the southern counties and is worthy a more extended trial there than it has yet had, but much good is not likely to result from have seen it grow and flower freely in Surrey, and in Mr. Pince's beautiful rock-garden at Exeter. However, thongh well worth growing where it does well, it can never compete with the Pampas Grass in the open air in this country. But there is another use for it, and that a noble one-let it be the Pampas Grass of the tubs or large pots, richly fed, and freely watered, it wal laxariate in such structures, and prove, when its drooping silvery plumes are in perfection (and they last considerable time) the most distinct and beautiful thing one could select to place among conservatory plants of the usual type. I strongly recommend it to ach of your readers as have to furnish conservatories, Robinson.

Conifers in New Zealand.- Your correspondent (see p. 1061), after stating in reference to the new garden al; but rarity, and that newly-introduced trees, shrubs, evergreens, and Conifers will always meet with a fair tria,", goes on to observe:- "For instance, growing in healthy state, are Pinus maritima, P. Pinaster, \(P\) P. ponderosa, and the Red Spruce Fir; Is thi maritima our austriaca \(P\)-if so, give it its proper name and place as a quasi of the Corsican Pine; or, if an from what is stated of Pumilio and montana that they are our two quasi pygmies of sylvestris. I hope your of "thendent will be more explicit in his nomenclature about them, for they Old England. Senilis.
bark of intonia gigantsa. - Those who have seen the height, this tree arranged on a frame 116 feet in height, at the Crystal Palace, will be able to form some if native climate. The tree from which the bark in question was taken, though dead, still measnees upwards of 360 feet in height, 140 feet to the firat limb, 15 feet 90 diameter, at 100 feet in height, and has a trunk which is said to be 18 inches in thickness. Eighty of these trees, we are informed, vary from 18 to so teet 400 feet in California, and measure from 200 t. them have Englisht, names. One is called the Father of the Forest, and though it has been blown down it is supposed once to mave height. The native locality in which these giants are delightis said to be during summer one dittl most that if solal places in the world, and there is little doubt planted with Wellingtonias, in a few years their general appearance would be greatly improved. In order to
show how well the Wellingtonia is adspted to thi which we have growing here on the lawn. In 1855 which we have growing here on the lawn. In 1855
it was in a 60 -sized pot, and was only about 6 inches in it was in a 60 -sized pot, and was only about 6 inches it
height. I planted it in welloprepared aoil, consisting chiefiy of good loam, it which it has attained over 23 feet in height; it ineasures 4 feet 9 inches at the base, and 43 feet in circumfereuce round the brancher. I has produced 18 cones, 2 inches in length and 3 inclies inspecumerence, two of which I have nent for your the prion. These seem amall, considering that they are planted 10 of the giant of the forest. Oar tree has bee planted 10 years, thus showing an increase in he:ght of
2 feet 3 inches each season. It is well furnished with branches from top to bottom, and is also an exceedingly handsome specimen, Wellingtonias I consider ought to be planted in every situation where large Coniters are required in the way of ornament. I may add, that the Araucaria imbricata grows exceedingly well with us, and that we have a fine specimen of it, some 25 feet in height, beautifully brauched from top to bottom. \(H\). Day, Theydon Grove, near Epping, Essex. [The coues sent are somewhat smaller than above mentioned. There is no greater discrepancy between the size of the tree and the size of the cone in Wellingtonia than there is between the acorn and the Oak that bears it.]
Grafting Vines.-I have had under my care a a White Frontignan and a Trebbiana, both of which it is desired to replace with varieties more adapted for early forcing, especinlly in the latter case. I should be glad if Mr. Thomson would give me his opinion as to the probable results of the Duchess of Buccleuch Vine being grafted on the former; and if he, or any other
correspondent, could state how the Buckland sweet water would do on the latter. I may add that the Vines in question are as strong and healthy as possible, having been planted two years last May, and this year they have borne fine crops of fruit, H.J.C. [The White Frontignan is a bad stock for any well as wrould any other Vine. The Trebbisna will grow the Bucklaud Sweptwater very well; but it is yot a good stock or any Vine that is to be forced early. It in thi respect somewhat resembles the Blacis Barbarossa. there are Black Hamburgh Vines in the house it would be better to cut out the two in question altogether, and to inarch on the Hambarghs, as side ehoots, a Vine of the Duchess of Buccleuch and Buckland sweet water. In this way \(h\). sure to do well. I frequently do this when I wish to increase the varieties of Vines in the same house

\section*{W. Thomson.}

Chrysobactron Hookeri (see p. 1081).-This has dowered here every season for these last six years. It it grown in the open border, and is quite up it best, but will th. Rich loam and lewards of 30 spikes of flower will thrive in any of the plants here; they ure of olden yellow colour, and far outrival in beauty any border plant in bloom at the same time. It ripens seeds in abundance, from which young plants are freely prin duced. George Stirling, Comely Bank Garden, border in deep sandy peat, and have been much disappointe with it. I fear it is not worth growing except judge from a solitary specimen. Wm. Robinsom, has flowered freely here for the last five years; this has flowered freely heven fine spilkes of flowers, which produced seeds freely self-sowing themselves around the mother plant. The soil in whice yellow loam, and it likes shade. James Gray, Gardener Newfield, Kilmarnock, N. B.- For the last flowered three seasons Chryaobingry herbaceous border, withou baving any particular attention bestowed apon it. was planted in a moist, shady situation, in a mixture of peat and loam. It is easily propagated from seeds, which in fine seasons are produced in abundance. Seedlings, however will not bloom for four or five years. Dreghorn \& Aitken. Kilmarnock.
Gardeners' Wages in Nurseries.-A rise of wages in every description of trade is now taking place, with the exception of those of the gardeaer When one consider the long liours, the great destruction of clothes in the et or dry, with no reduction of hours of labour on Saturdays; and adds to these the high price of provisions and rent, it ia with a family can exiat on 128 . perweok. The grat profits of the nursery and seed business, and the trade now doing, should surely admit of a litcle better

We are tuld by the nursery unen that we cone to them trab abe the to obtain them, or to assist us. 1 know of men who have been kept in expectation for two or ente Surely the nurseryman's 8 svinge have all been spent. 15 . per week. it would be prohts would allow a rise to his advantage, for more would be got from the men. G.C.

Belle de Fontenay Raspberry. - I can strongly recommend this variety to the notice of any one requiring a first-rate aud bearer. We bave beon
guthering fruit dnily from it for thene laut six weekn, and at the time at which I now write ( \(\mathbf{N}\) ov. 22), its canes are literally covered with fruit. It has also this advantage that owing to this fruit growing pretty clone to the atem and the leaves being of a vendulous character the fruit gets protected from any ilight frost tbat may occur about ths season. It is quite distinct from all Parlo, St. Araph.

\section*{Eotieties.}

Royal Hobticulteral: : Nov. 21.-J. Bateman, Enge in the chair. Oue new Follow, vir., Mr. Norman, Floral and Fruit Comnittecs having respectively reported the awards made by these bodies, the Rev. M. J. Berkeley made some observations on the subject axhibited. He adverted in the firat place to a branch of Black Frontignan Vine, from Mr. Young, gr. to Lord ritzwilliam, in which one eye bad produced the unua black-coloured fruit of that variety, while another eye on the same shout, without any gratting upon trial was found to poasess the same Frontignan fapor trial as that of the black buncts. Such sports, it is Havour as that of the black buncto. Such sports, it is
well known, are not uncommon among ChryantheWell known, are not uncommon among Chrysanthenovelty attaches to them. The remark: on the fruit of Montera deliciosa, given at p. 1082 of our lat Number, next occupied attention; as did also a white Thunbergia from Mr. Earley, of Digswell, which was considered to be a form of T. fragrans of Roxburgh. In this country, however, it seems to be perfeclly in odorous. A seedling Imatoplyllum, from Mr. Bull was thought to belong to the saine class as the old . Aitoni. Mr. Bateman favoured the meeting with few remarks respacting the Orchids present, in the
course of which he observed that it would be seen that they formed by far the largest proportion of the winter-blooming plants exhitited, cunatituting one among other claims to our attention which they pon(Oncidium ornithorhynchum), which although pints, is figured in Huroboldt's great work as yellow, he took the opportunity of alluding to some of the mistnkes into which traveliers not unfrequently fall, when they come to arrange at home the materials often hastily obtained on theeir journeys. Dendrohium TaltoNorth Australia (see p. 890), and named by Mr. Bateman in compliment to Lord Egerton of Tatton, was next mentioned in terms of praise, innomach as though still at first sight somewhat unuttractive, the blossoms were nearly twice as numerous as those on the lunt when first exbibited; and as the specimen prouced on this occasion was still small, the beauty of this Dendrobe, which has the adaciected to be quality of being fragrant, may yet be expected It we even much greater than it is allent drawing-room plant, as confinement of that kind even for week together seemed to exercise no injarions effect upon it In reference to the charming Calanthe Veitchii, which it may be recollected is a hybrid betweos said that he rosea and Calanthe vestitu, Mr. Bollo into had hoped that Orchias consilist would not dare to whose preserves the hybriast world his labout in enter, and that mach as be apprecialed he neverthelea other departments of Flora's dominion, attended bis attempts to raice crowbred Orchids. In the case before him, however, he was forced to admit, though it nearly choked him to do so, that a mag. ficent result bad been obtained, inasmuch as the hybrid in question was certainly one of the fies winter-blooming Orchids in caltivation, all who had the good fortune to see hr. Rackers glass-houses at the present wime the rich rosy flowers of Calanthe Veitchii. Odontoglossum Alexaodix, glorious example of which was Bhown hy Messrs, Low of Clapton, next came under review. This new Santa Hé is Bone of Mr. Weirs eminently benatiful, and sure to be a favourite, Mr. Bateman did not and name it dedicate (see 1083, 1864) Mesers. Low' traveller, Mr psee p. 10s, specimen of this plant sent home by him, on being submitted to Prof. Reichenbach, wa considered by that botanist to be sufficiently distinct from Mr. Bateman's O. Alexandra wow Odontaglot He thertfore called his new onontoglow Tuesday, and although O. Bluntii was much hnudsomer than that to whish the name of Alesandreo was attached, it was the opinion of some persons present and the sane species. Mr. Buteman is therefore of opinion that he must full back on the chivalry of the German, in this case to allow the loyulty of the English to have its way, and that the name Alexandre, instead of Bluttii, muat be given to the best variety of this fiee Odontoglot. He concluded by alluding in terms of praise to a fine collection of Ly caste Skinneri which was contributed by Mr. Veitch, which
he said had been grown all this year without fire heab. decoration, he mentioned that a plant of it had existed in his gardener's kitchen in perfect health for no lese a period than two years.
Nov. 21 (Floral Committee). -The Society's Garden furnished on this occasion a fine collection of Dracænas, mong which were D. Banksii, Veitchii, and australis, all long narrow-leaved kinds; the red-leaved D. terminalis and ferrea; and D. heliconiæfolia and fragrans, nath with ample deep green foliage. Mr. Earley received a Second-class Certificate for the white Indian
Thunbergia alluded to by Mr. Berkeley. In Mr. Vritch's tine group of Lycaste Skinneri, which received a Special Certificate, the best were distinguished by the names of I. superba, pallida, grandiflora, and purpurata. The same eminent nurseryman likewise contributed the canary-coloared greenhonse bulbous plant called Urceolina pendula; Vanda cerrulea, a fine winter blooming Orchid; a charming specimen under a bell glass of Bertolonia guttata, the leaves of which are Dendrobium Tattonianum, Calanthe, and Oncidiun, alluded to byl Mr. Bateman. A large plant of the robust-growing Violet named The Crar, was shown by Mr. F. J. Grabam, who also furnished one or two other sorts of Violets. In addition to the Odontoglots mentioned above, Messrs. Low showed examples of O. gloriosum and O. radiatum, both of which belong to the section of which \(O\). grande stands at the head. To O. radiatum a First-class Certificate was awarded. A beantiful collection of hardy Ferns, for which a Special Certificate was given, was shown by Mr. Ivery, of Dorking; it consisted of different varieties of Polystichum angulare, and of the common Scolopendrium, Lastrea, and Polypodiam. Among them was also a slendergrowing variety of Athyrium Filix-fomina, with fronds Applebyanum has been given \({ }^{\text {; }}\) this received a Firstclass Cerificate

Now. 21 (Fruit Committec). - From Mr. Pince, of Exeter, came a handsome iruit of the Smooth-leaved Cayenne Pine-apple, weighing \(5 \frac{3}{3} \mathrm{lb}\). A very fine
box Mr. Turaer, of Slough, from whom also came Cornish Aromatic and Blenheim Orange Apples. Mr. Wilson, Gishurst Cottage, Weybridge, had wagnificent apec:mens of Chanmontel Pears that had been grown on a tree in a pot in an orchard house, but which had been set out of doors to ripen. Large fruit of Uvedale's St. Germain Pear were furnighed
from the neighbourhood of Bedford by Mr. Swannell. from the neighbourhood of Bedford by Mr. Swannell. Earley, from whom also came remarkably fine Shallots. From Inverness shire were Royal Russet, Nonsuch, Hollandbury, Scarlet Nonpareil, and Manx Codlin Apples, as large and fine as examples of the same kinds grown is the south of Eugland. In the clars of three
dishes of Auples put up for competition, Mr. Earley had the lst prize for fine fruit of Goldin Pippin (?), Cockle Pippit, and Sam Young. Mr. Turner was 2d with Cox's Orange Pippin, C'mrnish Gillitlower, and Rosemary
Russet. Mr. Whiting had Cos's Orange Pippun, Aasm's Pearmain, and Rib-tone Pippin. Frum Mr. Cox came Oid Harvey, Sam Young, and Old Nonpareil. For the best dish of Pears the 1st prize was won by Mr. Turrer, who exhibited beautitul fruit of Huyshe's Victoria. Mr. Ivery had an equally meritorious dish of Winter Nelis. Mr. Ruffett furnished admirable oxamples of Chanmontel, for which a 2 d prize was awarded. From Mr. Cox came very fine large specimens of Winter Nelis, and beautifully coloured exanples of the Forelle or Trout Pear. Mr. Lee, of Cliveden, had Clifton Nonsuch Apple, a lind said to be suitable
alike for table or kitchen use, and Bon Gustave Pear, a alike for table or kitchen use, and Bon Guatave Pear, a
large kind, of which Mr. Lee speaks in favourable large kind, of which Mr. Lee speaks in favourable
terms. A colleotion of Gourds was shown from the garden of the Sociely; and specimens of the Club Gourd came from the Rev. Mr. Berleley.

Linneair: Nov. 2.-G. Bentham, Eaq., President, in the chair. Dr. Prior exhibited specimens of Benthamia fragifera, with ripe fruit, grown at Tatton House,
Kugeton, near Taunton. Arthur, Viscount Walden: Kugston, near Taunton. Arthur, Viscount Walden;
Dr. Bhan Dugee, and J. B. Lavgley, Esi., were elected Fellows. The following resolution, moved by W.W. Saunders, Erq., and seconded by Dr. Thomson, was manimously agreed to:-""That this meeting is desirous of recording at the earlient opportunity the sincere and profornd regret which it has felt at the death of gir William Jackson Hooker, who during so many yeart had been the acknowledged head of botanical science in Britain, the laboure of whose life had been devoted to giving at once a scientific and a practical character to the study of the vegetable kingdorn, not only by his own numerous and valuable worke, bat by the
encourngement and assistance he afforded to every working botanist, at howe and abroad, with whot he
Was browht into enntact. The meeting is empecially desirous of giving expression to its gratetul recognition opened ins most extensive herbarimn and library to felt use of botamsts, and of which this Society has fully felt the benefit in the numerons papers read at its meeting", which could not have been prepared wit out much asiafance. That the meeting also earnestly denires to express to Lady Hooler its sincere and respectial con-
delerice, an
afliction." It was also agreed that this resolution should be entered on the minutes, and communicated to Lady Hooker. The following papers were read:1. On Bilebrandia, a new gemus of Begoniacea, by Prof. Oliver. The only speoies of this new genus,
H. sandwicensis, is, as its name iudicates, a native of the Sandwich Islands, having been collected there by \(\mathrm{Dr}_{2}\) Hillebrand. The genus differs from all Begoniacer hitherto deacribed, in having an ovary with the upper one-third free, and open above in the exserted portion, wing to the non-cohesion and divergence of the consti uent carpels at the apex, as in Datisca and Reseda; and in the presence of amall cucullate petaloid organs, which Professor Oliver regards as true petals. In other respects the plant is olosely allied to Begonia, some of the shrubby speoies of which it resembles. The emarkable ebaracter of an open ovary is an important onfirmation of the view first definitively advanced by Dr. Lindley, that the Begoniaceæ are nearly related to
the Datiscacer.-2. On the Lavo of Leaflet-Genesis, by Harland Coultas, Esq.; communicated by E. Newman, Lisq. The blades of lobed leaves, the author observed, must be regarded as a composition of partially-formed and organically united leaflets. As the lobe represents that portion of the lamina of the lealet which is completed, follows that the terms bilobed, trilubed, quinque obed, and septemlobed, express the number of leatlets of which the whole blade is a composition, and indicate the extent to which their formation has been carried. So alko the words bipartite, tripartite, \&c., are indicaintimate that the entire blade of each leaflet has been nearly completed by Nature. In the digitate leaf each leaf-b!ade is fully formed, its separation having been carried down to the petiole, to which it is articulated This articulation alone distinguishes compound from simple leaves. The passage from the digitate to the pinnate form is simply effected by the genesis of an axis or common support by the Jeaflets, which thus become separated and distributed on either side of that axis. The formation of this axis is considered by the author as the result of the superior vital activity of the leaflets of tie pinnate leaf; whilst m the digitate leaflets are defioient in the vital power necessary to form one- 3. Enumeration of Indian Lemnacere, by M. Sulpiz Knrz; communicated by Dr. Anderson This paper consisted of a description of a new Indian Duckweed, Lemna oligorhiza, and a general enumeration of all Indian Lemnace:m. The new species showed such similarity of structure to Spirodela polyrhiza, that the Lemna To it necessary to reunite he laterge the habi of Wolfia, but appeared to be essentially the same as Lemma, though in the absence of complete information he retained it for the present.-4. Lichenes Novce Zelandices quos ibi legit anno 1861, Dr. W. Lauder Lindsay, by Dr. Ny lander; conminicated by Dr.
Lindeay.-5. List of Fungi collected in Otago. New Zealand; by Dr. W. Lander Lindsay.- Sir 6. Letter from swinburne Ward, Esq., to Sir sechellarum) in the island of Prashin. The letter, dated Angust 8tb, 1805, ammounced the deapateh to Kew of the stem and socket of a full. grown Coed de Mer, from a small tree of the female eex, about 30 feet high. In the younger treep, those of tender years at least, and in which the stems have not appeared above ground, it was stated (on the authority of the owner of the property from which thill tree wis obtained) that the socket is not formed, and the
whole base of the oprooted tree rotm quickly. Une tree, cat down on the same properts not long ago, measured 186 feet, including the leaves; and others till standing are not less than 150 feet high, males, quite straight in the stem, and growing in open marsby ground with nothing bat redgy Grase around the which Ornes island, in which Oranges might be successfully culti-
vated in many parts, as wild Citrons, Limes, Lemons, Bigarades, \&c., are very abundant in all the fertile valleys; while the marshes are capable of producing sumicient Rice to supply all Seychenles, though next \(t\) othing is now grown.
November 1t.-G. Bentham, Eoq., President, in the chair. Sir David Barclay, Bart., Kev. W. A. Leighton, Wilkin, Eaq., were eleoted Fellow. The following papers were read:-1. Notes on Medicago, Crocus, ise, flowers, by the Rev. G. for the intercrossing of distinct a Monograph of the Aphroditacea, part 2, by Dr. Baird.--3. On the Spicula of the Regwlar Echinoidea, by C. Stewart, Esq. ; communicated by Pol. Hoxley the family Gadide, and of the genus Conchis Jonathan Couch, Eeq.--5. Observations on Britioh Salya, by Dr. McIntosh.

Whemants of Phyvics; or, Netural Philosophy written in non-technical Language. By Neil Arnott, M.D., Pp. 322. Longmans. 1865.
Some time ago (seo po s91, 1261) a motico of Dr

Wherein, if we recollect aright, attention was cllas the singularly ingenious and practical turn of bis mind constant desire in his writince as a traveller, by constant desire in his writings to avoid scientif should be intelligiblo to educated people of way thas capacity. It was this characteristic of the ordinary mind, this love of popularisiag science, that Doctori articles in the "Penny Cyclopmodia" so made hy acceptabie, and stamped him as the most proper perne hat oould be found to superintend all that portion ime knowledn ' Natural Philosophy. Butore his paratively few individuals, and writers in general cii not care to make themselves intellioible tolvi In Mr. Knight's "Passages of a Working Life" rees how much writing of this kind was Deeded, ani Dr. Neil Arnott was the very man prepared to do it
To his ingenuity the public is indebted for excellent inventions and improvements in some per stoves, fuel and chimneys, and the then little knom subject of ventilation ; and every body has heard that masterpiece of inventive ingenuity, the singul application of scientific principles to the hydrostatic bed.
The first volume contained 400 pages ; the mocos volume treats of the imponderables - hest, light Part 4 of the general subject. Part 5 is a very brie sketch of popular astronomy, and a very short appendir is added, with merely a few pages on popular geometn to. The treatise on heat begins with the difficuity persone have at first to conceive the fact, that an apparenil) empty room is really full of air, exerting a grear pressure in every direction, and then goes on describing present knowe ateps by which men boat, and ahomby experiment that heat cannot be exhibited apart from matter, nor proved to have inertia or weight. All thi very pleasant reading, and our old friend Cour Rumfurd, the forerunner of the Doctor in some of the
acts and experiments relating to heat, is often inter duced with his experiments, making water boil causing a blunt borer to rub aqainst a mass of mot immersed in water," \&c. Here, as everywhere il Dr. Arnott's writings, oue notices the abundance of acts which always make a subject interesting, and the tendeney of his mind to bring out the practical we e every piece of information. Thus he cannot give description of "the heat transferrer" without showing o cool their hat wort, while in baths and wasbhoma the heat of the waste water may be utilised as it rmm down the ecope pipe. It would not be nature for Dr. Arnott to close the subject of heat withook is page or two upon his famous stoves, and him recommendation that fires should be lighted frem thp and made to burn dowawards, walve and a blower, and the posaibility of admitting "freeh air to a room through a channel fiom the outside, which diecharges under the fender;" and of course he draws attention to the two frota, - 1 nit much of the disease causing premature mortuing among men, is produced by ill-managed tempera dependent often on faults of ventiatiol that the store of coal-fuel in the bowel applicable to human purposes is limited, and way xhausted. To waste this precious fual interes ike prudent parents thinking
descendante.
There is no need for us to enter with the Dr uper his treatise on light, written in the same lucia 9i ective, the telescope, and microscope ; electricit with its application to telegraphic purposes ; milg netism, which is comprehensively pages; and astronomy, which is given rather monestiog length. He contrives to make each subjeot intert and intelligible, which is no inconsiderable ment

the present month, in addition to other matters. has our readers. The first is on a Tree Fern (Caulopteris panctata, Goepp.), Mr. Carruthers, who uper Greensand of Dorsetsinire. investigations into the nature of the regetation of our globe "at former epochs, gives an scount of the stem of the Fern just named, tise leaf sears of which are much like those of a Dicksonia. Too uch stress must, however, not be laid on the leaf scars, \({ }_{35}\) their form and appearance is apt to vary according to age and other circumstances, nor is the shape of these markings always the sare in all parts of the same plant. The specimen alluded to has "five very sligbt constrictions, produced by seasonal interruptions in the stems of Lastrea Filix-mas and Polystichum Lonebitis by Mr. Carruthere, who alludes to the fact that "cold is not the only physical cause of interraption but that a periodic dry wind, as on the coast of China, on extreme heat without moisture as in several tropical regions, and other causes, may produce a season of rest in plants like that resulting from winter in our temperate regions." The other paper to which we have
alluded is one by Mr. Mitcliell, "On some bitherto anrecorded Leaf-forms from the Pipe Clay of Alum Bay, Isle of Wight." The most interesting fact ecorded in this paper is the "discovery of two flower remains, which appear to resemble
Porana ceningensis, Heer." According to the figure, the specimens found have a perianth, or perhaps a corolla( \((P)\) with five separate oblong segments,
base of which, internaliy, is a thickened ring, which may be a disc or the indication of stamens.

Catalogues Riberived,-W. Chater's Catalogue of growers of that llower.-W. \section*{Tbe Apiary.}

We resume our recorks on the Wintrr Manage-
ment of an Aplary (see p. 1062), and purpose saying 1arnt of an ApIary (see p. 1062), and pu
a litule respecting proper hive-protection.
Where straw hives of the ordinary pattern are confarned, the old fashioned straw-hackle, if new, and well cover. In the south of Encland hives so protected naxally swarm early. But tho mischief is that these cllors, or hackles, as they are cailed, are too ofte mice and all sorts of noxious vermin, as harbours fo mitting rain to percolate and saturate the crowns the hives. We, therefore, should recommend the being altogether discarded from the apiary of any one of bee-keeping.
A rather well-known and practical apiarian writer mown by the nom de plume of "Upwards and On mards," some years since adrocated in the columns o dothe: periodical (and was somewhat ridiculed for so usual straw hackles. These require to be secured to the stands or weighted down by a heavy yet their advocate asserted them io be very efficient protecturs, and that lives so covered will be usually in employed coudition and health than when hackles are mployed. There was a warm controversy on this moject, but there is no doubt that large-sized earthenware milk-pans, when the hives are sufficiencly flat in covers to to support them steadily, make admirable mecking must be allowed. No cloths or pieoes of old atervene between the top of the hive and its milk-pan orer. intent we imagine that in seasons of great cold Ware sho heat, it would be advisable that the earthen To therefure not quite touch the crown of the hive; my two or thropose that a narrow hoop of saraw, ald straw hive, be iuserted below, cut uff from thy Would prevent any injurtuus effects trum the abuvein prevent cause, and would prove equally effertive burulugensuang the penetration of heat under a The foreg sum.
being inerpensive, and of being adapted to the means is of little consequence, there is no mode of ensuring thorough protection to hives, whether in winter or summer, equal to that of separate wooden canse, with moveable roofs. As we purpose giving descriptions of the best forms of hives, and of other requirements of "Thr Apiart" as opportunity occurs, wo will not now stay to describe the cases which have ween found the most useful and convenient for all the manipulations necessary in an apiary managed on an improved system.

Whether in winter or in summer, let there be a space for free circulation of air between the hives and the inside of the cases, which should be furnished with apertures for ventilation made under the enves of the roofs. Anything approaching to closeness or stagnation of air is detrimental to the prosperity of bees.
There is one simple precaution with respect to all methods of protecting hives in winter, which is too frequently neglected, and that in, the use of means to prevent the covers being blown off. How trying it is to the bee-master to be disturbed in the night by the noise of a violent gale, when the thought flashes across his mind that his hive-covers are not securely fastencd. He hears the rain descending in torrente, and dreade the mischief that may be doing among his bees. How ansiously he rises in the morning and pays his hurried visit to the scene of probable disaster! Happy indeed is he if he finds his alarms to be groundless. But how much wiser to remove all cause for anxiety, so that i disturbed in the night, however the elements may rage,
the careful bee keeper may rest, comforted with the the careful bee keeper may rest, comforted with the
assurance that no harm from such a cause can accrue to his favourites.
ases whiron pins passing through the parts of the pieces of tarred cord passed across thooks and eyeas, or under the stand, will be found sufficient for the purpose.

\section*{Garden Memoranda.}

Meadow Bank, Glasgow, the Seat of Thozas Dawson, Esq.- Meadow Bunk is situated close to the illage of Uadngtode, in a relired spot in few miles from the busy city of Glasgow, and nuly a shr,rt distance from
the high road leading from Glasgow to Bothwell Bridge, famed in history for its battle. Further on is Hamilton Palace and Bothwell Castle. Meadow Bank is bordered on the one side by the railway leading from Glasgow to London, from which latter place it is well worth a journey to see, owing to the magnificent colleetion of Orchids for which it is celebrated; for, go when ou will, there is always to be found a grand display of bloom. In addition to the Orchids, however, Meadow
Bank has other attractions. It overlooks the river Clyde, which, viewed in connection with gay flowers, beautiful trees, and ranges of glass honses, has a
charming effect-the one blending beautifully with the other. Alter leaving the railway, you enter the ground under an arch, through a pair of large wooden gutes : a splendid avenue of Pinus austriaca, and a broad road several hundred feet long, lead to the dwelling. house. Every one of the Pine trees in question is a perfect specimen of its kind. The broad tur edging, well-proportioned road, and the gay tlowers on euch side produce agood effect; the borders contain Stocks, and annuals of various kinds. The Pine trees are backed up by a goud collection of Horse Chestnuts, which, when covered with white aud searlet flowers in spring, cannut tail to have a tiue appearance. These nuble, hardy trees ought to be planted more extensively than they are, there being nothing to equal then for effect in paris scenery,
especially when shown in the shape of single spectmens. There are also some fine Coniferm here, such as Abies Nordmanniana, which is one of the moet beaatiful of the clase to whioh it belonges. Associated with it are likewise Pinus grandis, Thoja gigantea, several parieties of the graceful Cupressus Lawsoniana, Thujopsis borealis, and many others. On the right-hand side of the entrance is a long walk, the borders of which are Gilled with herbaceous plants; many of these are Phlores, which are extremely useful plants for large borders, and they grow finer here, and indeed throughout Scotland generally, than they do in England. The climate being couler they get more moiscure and less un-light, and they seem to thrive better in stiff than in light soils. Associated with these is a goud collection of Hollyhocks and Dahlias, the whole being supported by a wall, against which are planted the beat kinds of hardy elimbers, intermixed amongst which was the showy Troppolum canariense, the whole having a good effect. Many hards climbers flower in spriug. and by introduciug summer-blosming ones among them a good display is maintainod until frost sets in. Behind the wall just mentroned is the railwuy bank, which is some 40 leat in height, and which, with good judgment, has been \(\cdot\) planted with Pines, which are making satigfactory proyres. Thus, iuscead of the railway spoiling the pluce, as it dues in many instances where the banks are left bare, a fine ettect has been producei, especiully when viewed froun ground lower than the banks themselves. On the leit-hand side of the entrance is another walk, of about the same length as the one before mentioned. On exch side of this are planted Coniferm and Rhododendrons, of the
latter a splendid collection, which promisen to fornish Mr. Dawson caltivates neming.
Mr . Dawson caltivates numbers of hardy an well at tender plants, with the view of making his place intereating at all senconse. In short, valuable plante are met with on all wides, among which many houn might be pleasantly paseed. In the proprietor of Meadow Bunk, plants of all descriptions have steady admirer, who does not ever overlook the most common flowers, which be etill cultivates, although he has areh a boot of bonatiful Pine trees conducts the visitor to a well-kept flowergarden, which is laid out and planted in eunmer with much taste-a real acquivition, as one may have fine flowers and good coloura, but if they are hadly arranged, their effect is lost. In many of the bede the centre consisted of tall plants, such as Gladioli, Stocke, de., Which helped to break up that formality which we of theartan plant with charming folinge, and odged with Lobelia apeciona. Four fine beds conaisted of Pelar. gonium Stella, which is one of the best varieties fo bedding purposes; thil was edged with Variegated
Arabis. There were, moreover, beantiful herds of Purnle Arabis. There were, moreover, beantiful berts of Purple
King Verbena, Calcenlarin, Guzania splendens, (Ilurlinli, Stocko, Pentatemuns, Sarlet and Variegated Pein goniums, \&ec. On the opposite side a long border was planted with Purple King Verben, in which wire ound beds up the centre planted with Scarlet Pelaroniume and Calcolaris amplexicaulif, edged with Cura-tiu'n tomentusum; these heds had a zond effects although the Verbena was not an vigoroue ns it whonl have been, owing to the border being from its si'untion too bank, sloping down to the Clyile; and in the distane are the ruins of Blantyre Castle, which are covered with Ivy.
After leaving Mr. Dawson's dwelling-honse a walled garden is entered, planted with all kinds of bedding plants; a ribbou border in lisisganded of Variegated Peronics in the centre, two rows on each side of Pelargonium Brilliant, then two rows of Pelargouium
Golden Cliain, edged with Lonhelia snceinsa. On a hack Golden Chain, edged with Lobbelia speciossa. On a hack
border was the slowy (L, mothera Lamarckiana, which makes an excellent background platit; the next rum consisted of Scarlet Pelargoniums ; the 31 , Stncks; 4th, Calceolaria Prince of Orange ; 5th, Lolbelia speciosa; 6th, Variegated Arabis. Next the greenhouses was another border, planted with Alyssam variegatum and Verbena Admiral Dundae, which is a fine kind for bedding; the front row of this border consisted of Lobelim speciosa.
There was also here a fine bed of Pentutemons, which when well grown, as these were, are a great ornament o our flower gardens. In the centre of some of the beds were Standard Dallias, the stems of which being long gave the fiowers of other kind below a chance of growing side of which are the Ochi is the Rose garden, on each beds oud are chiefly dwarfs and half standurd beds, and are chiefly dwarfs and half atandards,
The best were John Hopper, Beauty of Walliam, !luchess of Norfolk, Souvenir de Malunison, Glore de Dijon, Lord Kaglan, and Eagene Appert it has been
atated that Roses will not do well in the north Scotland, but here they appear to succeed admirubly, being vigorous in growth and full iu bloom.
The bitchen garden is not large, but compact and well walled in, and the vegetables in it show that they I saw them, bearing abundance of fruit, and the wood seemed well ripened. Ln my next departments of thas lighly iutereating estublishment B. W.

\section*{Miscellaneous.}

Corsican Terotation. -The botanical prodactions of Corsica assimilate, as might be presumed, to those of the countries that surround it. The north, by its vegetation, approximates to the Riviera, the east to the Italian coast, the west to Proverice and Spain, whilst the south shows African affinities. Taking a general iew I should say that the vegetation in the lower rexiuns very mucis resembles that of the Riviera. In the plany on ludian Corn are the plans on the coad oreats and ludial Curn are growa in considerable abundance, in altivated in great perfection, and as the climate is snited both to its growth and to the rearing of the silkworm, there is a yreat opening iu this diftection for the Corsicans. On the lower hills and mountain valleys the Olive tree thrives and flourishes. The Vine is also caltivated with arent mine is made, of a with great allobodied character, erpecially on Cap rather fallobodied character, expecialy the Chestnut Corso and about Sartene. Higher up, the Chestnut trie grows to a magnificent size, and produces on the the very bestquality. Entire districts, erpecialy on the enstern side of the island, are covered with splendid Chestunt torestr. O.ie of the easteru districta, indeed, having the hutle town of Piedicroce for its centre, is called the Castrgniccia, or Chestnut conntry. It has ever been fawouv instory for the unconquerable intrepidity and love of treedon of its inbavitants. !'broughout centuries of tyranny and oppression in Corsice they have never been entirely subilued, and that principally owing to their Chestnut trees Formerly, and oven now, their main food is the

Chestnut, with scant assistance from the oil of the
Olive trees, the wine of the Vines, and the flesh of the wild sheep or moaflon-a native of thie adjacent mountains. The Chestnut tree wants no cultivation mountains. The Chestnat tree wants no cultivation Whatever, no watching. Lite the Breadofruit tree of ing when ripe, and in this climate it never fails to produce a crop. Thus the inhabitants of the Castag niccia could fight all the year round and yet live. Thej might be hemmed in on all sides in their mouatain fastnesses, all ingress might be stopped fo years, and yet they might flourish. These times have passed away; for more than half a century there has
been peace in Corsica, but still the innabitants of the Castagniccia retain their desultory habits. They live, I am told, in sober idleness; play at cards and talk politics all day, and work as little as they can possibly help. Thsir artificin] modern wants, even, are easily supplied by the sale of the surplus crop, now rendered easy by the increased facility of communication tith the Continent. The cultivation of the Olive tree on a large scale would appear to engender the same apathy and disinclination to work on the part of the peasantry. There is one region called the Balagna, extending from St. Fiorenzo to Calvi, comprising a series of smiling hills and of lovely fertile valleys, which is a very garden of Olive
trees. It is renowned throughout the island for its trees. It is renowned throughout the island for its
richess and for its luxuriant fertility. A leading proprietor informed mo that the peasantry, all proprietors, led the same far niente life of easy enjoyment as their countrymen in the Chestnut districts. The Olive tree requires a little more trouble, it is true, than the Chestnut; it has to be pruned and manured every year or two, the fruit has to be crushed, and the oil sold. Still all this, like the labour of the
Irish cottier on his Potato ground time. Every year or two an abundant, easily earned harvest of oil pays off debts and leaves a surplus to live on until the next be readly. Why should he work, says the peasant, when bis future is thas recure? solil to maintain the grower, and owisig to this reason mo donbt, the Balngna has from time immemorial been conquered and held by those who held the adjacent coast. A bove the range of the Chestuat tree we meet with the Pinus maritima, and above that, along with it in some regions, the Pious Larix, or Larch. This tree is a native of Corsicn, and in no part of Europe does it grow to greater luxuriance and perfection. In some of height, are found. Above the Pines come the Beech, then the Birch, and then the eterual suows. Bennet's Mentone, 3d Edition.

Araucaria Ridolfiana and A. Savianas.-Two species rimilar to this [Urasiliensis] have been described: the fi.st by M. Sarin, under the name of A. Ridolfianathis has been proved by Professor Parlatose to be mothing more than a form of A. brasiliensis; the necond by Professor Parlatore, who has given it the name of A. Saviana, and considers it a very distinct
species. This plant is growing in the Botanic Garden of Pisa, where it was planted in the open air in 1846 and ia now a flourishing tree. It may aiso be seen growing in the Botanic Garden of Florence. In both theve it has borne cones. These, in their young state, strongly resemble A. brasiliensis, with the exception that the spines of the scales are much longer, very uniformly recurved, and curled so far back as to com* pletely cover the junction of the two. scales. So dense are the spines on these young cones that the scales ars compietely hidden by them, and the cone much more rtsembles a fine head of Fullers' Teazel than the fruit of 2 Coniferous tree. In the mature cone the scales are much more fully developed, and the spines have the \({ }^{\text {al }}\) pearance of small recurved hooks. J. R. Jackson, in Intellectual Observer.
Durability of White Cedar--Anexample of the great durability of White Cedar (Thuja occidentalis) is afforded which has just been published by traveller Michaux, Which bas just been published by the Abbe Brunet, of Quebec:-"On my way to Hudson's Bay, I reached in the month of August the lake Chicoutimi, near the 48th degree of latitude, and there found the churcis the principal (as indicated by the date placed over natives of the vicinity. This building, made of squared timbers of White Cedar placed upon each other, was in good preservation; and although these beams had never beeu covered either within or without, the wood at the depth of half a line was not the least altered, after a lapse of more than 60 years." This little chapel was stiil standing in 1857. It is not only its durability but also its lightness that causes the Cedar to be so much ased for telegraph and fence posts The Mole.-Dull and sombre as the mole appears to be, it is by far the fiercest and most active mammal within the British Isles. Indeed, so remarkable is it for both these qualities, that I doubt whether the great ferm of tropical climates can equal it either in ferocity. activity, or voracity. We need not pity the mole for ground. There the mole is happy, and there only can it develop its various capabilities. We must not judge other beings by ourselves. We are apt to envy the fiea, and to pity the molle fough the air in chase of
through the parth ir chase of forms darking passage
carrying out the ohject of their existence and that the mole feels no less gratification in the capture of a worm thian the swallow in the capture of a fly. Sach, at all eventr, is the inference which is to be drawn from the manner in which the mole acts when it has seized a worm; for no one can witness the active eagerness with
which it flings itself upon ite prey, and the evident enjoyment with which it consumes its hapless victim, without perceiving that the craature is exultantly happy.-Homes without Hands.

\section*{Calendar of Operations. \\ (For the ensuing week.)}

Wemirin the last 10 or 12 years, the benefit o getting the roots of fruit-bearing trees in some degree under our command, by confining them near the surface, has begun to be appreciated; but even now that system is not by any means so generally followed as it ought to be. For the formation of frait-tree borders, no general rnle can be laid down which would be applicable to all cases : the practice must be regulated by the quality of the soil and by the nature of the sub-soil. That in which almost all kinds of fruit trees are the most productive and the most permanent, is what is called "strong loam;" that is, loam rather inclining to a clayey than to a sandy texture. Perfect drainage is, however, essential in such soil, more especially if the under. stratum fs a stiff clay. To
facilitate this, and to prevent the roots from pentetrating acilitate this, and to prevent the roots from penterating
into bad soil, a layer, 6 or 8 inches thick, of stones, brick-bats, or other hard rubble, should be spread everaly over the bottom as trenching proceeds, observing particularly to make the bottom of the border quite wall to the tile-drain, which mast be laid along the front, a few inches below the bottom of the border, to carry off surplus water. The depth of soil should be governed by its texture and quality. Of such as is now treated of, 2 feet in medium dep:h will be amply more clayey nature, 15 inches at the wall, gradually deepening 6 jnches to the front of the border, is a proper depth. In very light soil, a greater depth should wet, nor in any other way inimical to vegetation, the layer of rubble at the bottom may be dispensed with. As we wonld diminish the depth, so likewise we would increase the width of wall-borders. Some writers have advised them to be as wide as the wall is high ; but this is a very objectionable rule. For a 12 -feet wall (and for permanent trees none ought to be lower) the border should be at least 18 feet wide; if 20 , so much the better; but in that case the necessary walk along the front might be made to pass over the prepared all cases, the surface of the border ought to be somewhat higher than the level of the walk, more or less according to circumstances. Where a garden is so unfortunately situated that thorough drainage is impracticable, the borders for the finer kinds of wall trees may with great advantage be elevated a foot or more above the general surface. It is scarcely necessary so-observe, that no stimulating manure should be mixed with the soil in which fruit trees are planted. If these hints, and those we have from time to time given upon planting, be acted upon, and the branches are allowed ample space to extend, there will be tut little necessity for the now fashionable system of root-pruning.

\section*{FLOWER GARDEN AND PLANT HOUSES}

Continue to remove plants zetting out of flower from the conservatory, in order to make room for Chrysanthemums and others which are coming into beauty While the present mild weather continues, let the temperatare be kept as low as possible.
Achmenrs.-If not already done, a batch of these may now be started. They may either be grown in pans or pote, according to taste.

Aoriculas. I-Give these air on all favourable Brans; remove dead leaves, and water sparingly
Bedding Planks.-During the present favourable veathrer give air pretty freely to these during the day. Calceorartas.- Such as are required to bloom a little earlier than the others may now soon be shifted. In doing this it is a good practice always to sink the ball a little, in order to admit of a top-dressing of fresh mould being put over the riper parts of the young wood. Thorough drainage, too, is a point to which particalar attention must be paid.
Camblelas.-Any now coming into blossom should be carefully attended to. Air must be given them whenever the weather is favourable.
Chinrse Primulas.-Continue to kecp forward plants of these well attended to with water. As soon as any in beauty have faded, replace them with others coming into flower
Pelargonitims. - Plants of these intended for flowering eatly should be placed as near the glass as possible. Let the night temperature range between \(40^{\circ}\) and \(50^{\circ}\), and see that none of tise plants saffer from Vioumar
Vrockrs.-The beauty and fragrance of these will be increased by letting them have plenty of air whenever
the weather is sufficiently milu for that purpose.

FORCING Garden.
Cecombrrs. - Be content with only moderate
orcing at this season; but keep down thrips and red
spider in houses heated with hot water by mein
moist healthy atmosphere
Pines.-Plants intended
summer must now have careful attention daring it have a steady bottom-heat, and a top heat of abowe higher during the day time

Vinks.-Examine ferme.
of the early house, in order to see that it doen lonise either too hot or too cold. Avoid a bigh doer \(\mathrm{d} ; 2 \mathrm{z}\) at night, and admit air freely in fine weatler, usiog :
side ventilators only when it is showery.

HARDY FRUIT AND KITCEEN GARDEN
The prevalence of rain lately will have made hat land much too wet to be worked with advanag
will therefore be best to defer for a time al. whil therefore be best to defer for a tiue al, loone
which involves the stirring of the soil. In the then of other work, deciduous hedges might be trimace the prunings of fruit-trees collected and barn', ro leaves and dung for composts turned, stored examined, \&c. On wet days straw mats might made.

Fruit Trees.-According as the weather is more : less favourable, the various operations of plan
pruning, nalling, or digging, amongst the smatler trees, should be forwarded. With regard to the work, the ground being lightly turned over, chietil: the sake of neatness, and not fur the purpme cropping, it might be done whea digging iil otscases would be injudicious. Preserve cuttings propagation of the beat Gooseberries and Carraba also suckers of Raspberries to make neir plantations.

\author{
SATURDAY, NOVEMMER 25, 1865.
}

A new Order in Counoil is published juet as we are about to go to press: and we are thus unable to do more than very short!y describe the new regulations which it declares. The power of seizure and slaughter possessed by the veterinary inspectors is now limited to cases where their orders for the separation and seclusion of infected animals have been disobered. Increased powern are conferred on local authorities for the prohibition of cattle traffic for purposes of sale or exhibition within their respective diatricts. And as regards the metropolitan district, no animaly
cow, heifer, bull, bullock, ox, and calf") are to be exposed for eale, exoupt for the purpose of immediato slaughter. It is plain that the lucal authorities named in previous Ordern now possese the power of putting in force a large prortion of the recommendations of the Cattle Plague Commissioners in their reapective distrioty-fur the words enable them to forbid the removal of cattle "to any place whatever within their iurisdiction" for the purpose of exhinition or isle. There is a preve-owners from exhibiting or selling on their own land or premises animals belonging to them, which have been on such land or premises not less than 14 days previous to such sale.

The number of cattle attacked by tho plague, as reported to the anthorities, continues to inerease week by week-1765 for the week ending Nov. 4, and 2580 and 2669 for the two succeeding weeks respectively. The whole number of cases reported is now 27,432, of which 8998 were killed, 12,680 died, and 1777 recovered.

The particulars stated above represent all the action that has yet been taken by the Government on the Report of the Cattle Plague Commissioners, and it may therefore be presumed that the whole of their recommendations will not be enforced. As it is well pat by the Eiconomist, prohibitive measures are impracticable: we cannot hinder the movement of oattle which it is proposed to forbid.
" We cannot watch all the roads of England. We have not the police, nor the soldiers, nor the local organisation to do so. On the Continent, where the population is used to a half military Guvernment, defrest
to it, crouches under it, the difficulty, though atill vant, might be surmounted. It might be possible to induce a very deferantial population to obey such a wikase for the most part ; and it might be prasible bis a networ and casual offenders. But in England we have neither the same sentiment of obedience nor the same engines of detection. No one who knows the rural districts of England will imagine that the small farmers, the small drovers (and these are the persons rith whom we must practically deal), will abando all their old babits, will change their usagea of trale, will submit to certain loss and otten instant ruin because a rule of law rays they must. And if they do not submit, if they drive their cattle as before, where is the detective force to discaver them, or the compul. sory force to prevent them? There is in counties an fortunate as to possess a rural police, perhaps one
 look nfter all the buils, all ine beat? All that would it fact happen would be that one offender in 390 would be detected, and be brought ap at petty sesnions.
Moreover it would be necessary to forbid the movement of people also, as well as of cattle, for infeotion is, it appears, oapable of trasmissiun by any moving thing whatever. And even were the movement of contagion hindered for the time required according to the authorities for its destruction, we should nevertheless be always
hatic to freah sllacks. Oar foreizn tredo is oacelo tias njw became en rmans, ind the baroe of rinderpest will remaln aiwara treathitg us. We are lisbie to reprated altacion of thas payize, and, withent negleatimg carefal princhlive raca. sures, wuch as every blochowner wi. Ionititate for tis awn protection, and auch as Guvernment is abid to onrry out for his protection agabsat the s-vi-doer, we inuot ultionately fell back on the ouly true mide of eradications, which to cure. The foitamIng are the remasiks of the Eramomion on thas sulject :-

The true mode of erndicantion is cure. 1t is true that mection! setemee an still tuperlact in its ueatimetht of these discases. But thare haw been we necomily bamaid

 therefore it han not treen stufied. The adjacent
 and, being ruied by despatwe killommeata, and havithg only a apane nuid cobedirnt propalation, they have in

 Cirks, one of the hant nuthertice on the an jeel, meny that in Holland is per cemt. are chras), nat evary presumptrin indicutem blat a hetle espernance will reduce this unknawn, mud therefore ierrifi, mandyly

Treatment hitherto, it muat be cinfeased, hat proved unavailing. In Hollant, indeod, a large proportion of recuveries has been separted 10 eases treated homar pathicalls: bit there in mo much duabe reabug on returnis of this hioll from the uncertainty an to the nature of the dimeane whose cures have been alleged, that we have not thought it worth white to report upon the mubject.
It appeara at lenikli, however, that millymatial men, dissatisfied with the profesation of ult.r halplessticas, whech in all that we reasive ir its our thons veterinary anthorities, have navecmated themwelven for "the trial o! prevantive and carative trea!ment in the cattie phague by the fomerpatho method." The Duke of M Intimenotion in ctiairman, and Mr. Casabl is vio-chairman of the Asosciation, which comprimes many of the mont distinguished men in the agricultural world.
The following is tho addrens whoch thoy have issued :-

Whito in thin country the general impreasan acemed to be that all remolial meanares nguinat the cattle plague ware unavailing, and that in order \(t\) limit the extennion of the dinense, the ouly reaontre was the destruction of the uffiected nmumali, a report arrived from Holland that a certiln amosunt of evecsen and attended preventive and earative crealmeat hy the administration of homocopathic molicimes. On inventigation thin report appeared to bo so woll founded as to make it denimble that this mobluo should receive a fair and full trial bere. With tha object certain noblemen and eentlemen, not all of them homocopathiste, bave formed themalven intail of the cintion together with the wflcers und cuncil of the British Honcespathic Sociut!, with the view be affording ammintance and a lv,ce to thme whe the mode of putting of cobtaining infactice. The great mortality which has characterined the diserne in thin country. and the admitted want of any authoritative guidance as in treatment, apperm to offer a fitting opportunity for anch intervention

The directions now issued are not pot forward at prescriptions which protema io be a certain cure for the disease. They are founded on a knowledge of remedien the action of which has heen obmerved in man and animals both in health and dinense, and which in Holland and in this conntry have already proved beneficial in the treatinent of the Cattle Plague. The disease may alter its tyme and require a change of treatmens, and more exuct information may induce the medical section of the Amociation to moxhfy thein directions from time to time. In arder to judge of there effecta, it is of the ntmont romaequarnce that arcurate returns of tha remalis should be nent to the Assnciation. With thin nojuent hanck forma will be diatributed with these directiona, and all who make trial of this mothod are earricetly regnested to fill up the forms and send them to the Secretary.
The aldreas of the Secretary to this A sonciation is G, Adelphi Terrace, Sirand, W. (\%, and we have elnewhere published the direction fir tratment which ther have issues. Of the memoranda which it ountains, Nos. 8, 9, and 10, are in all prabatulity the most important; neverthulens it has been thought proper to copy the whole in full detail in another page, as a large number of authentio oases will doubtless be thas culiected under the guarantee of so many good names-enough, we hope, to decide ennolusively unon the merits, if of nothing plse, at least of gond nursing as a curative agent. Meanwhile the disease, which appears to
be in some measure losing its virulence where it
has been leng resident, is committing great havoc in the new distriets, both in England and Sootland, to whioh it has extended.

\section*{Tre Root Shows at Gloucester and at Reading-the one mainly organised by Messrs.} Wheeler, and the other, which has now for 19 Years been carried out single-handed by Messrs. SUTTON-seem to have been unusually successful. Although the common Turnips are not so fine as usual, other kinds are as large and well-grown as ever, and the Mangels shown were never hetter. The Elluncester Assuciation is, we presume, for the most part, a mere connty show. The Reading exhibition, though confirsed, we believe, to the eustomers of a single firm, is yet a display which levies its contributions from all parts of the country, and may therefore be considered to be more generally indicative of the maximum growths throughcut the whole country. The Mangels, Cabbages, Swedes, Kohl Rabi, and Carrots shown here were extraordinarily fine; and that is in accordance with general experience. We suppose better crops of Carrots and of Mangel Wurzel were never grown than we have had this year.
-The weather of the past few weeks is stirring up the cwners and occupiers of Iow-lying lands to a re-consideration of their interest in the subject of drainage. We see that both in Cheshire and in Somersetshire meetings are beiog held with a view to the extension and improvement of arterial as well as field drainage. Mr. Grantham, Mr. Batiey Denton, and other authorities on the subject, are being oalled upon for assistance and advice; and a subject which dry seasons bave latterly driven sumewhat into the background, is again asserting an importance whioh becomes urgent and undeniable only when the downfall exceeds evaporation in so marked a degree as to cause an inundation. It is not unly then, however, that the subject is of real arricultural importance, The evils of stagnant water in the land are in the long run quite as great as those of water stagnant on it. They are not so obvious, and thus are borne nuremedied, doing misohief all the while which is capable of profitable correction. We are glad therefore to learn that floods are enforeing attention to an evil which otherwise is liable to be borne in silence and almost unconsciously.

\section*{STEAM CLLTIVATION. EOWLER o. Smitr.}

As I am responsible for the publication of Mr . I will proceed at ouce to the correction of Mr. Hodgkinson's statement iu your Paper of Nov. 18, and as Mr. R. T. Sin th has brought my name in question, I will then proceed at once with his letter:-
 wirk done ly it is questionabie, I will not make a

Now bring ia Mr. Hodgkinson's Or an average of 9 g . \(9 \ddot{d}\). per acre.
The correction of \(2-5\) ths for the engine is made, believing that Mr. Holgkinson did not use it for threshing purposes, it being an engine not well calculated for such work. On Saturday lagt I wrote to lrin, axking him whether he had nsed it for such purpose, nind what the nature of the mil was on to be lightit, well fit Ior Turuip Berterinn, which I believe a year \(r\) gin, well fit for Turaip growimge at all events, a year 'goI I vicited the Ric. Hon. the Speaker's farm, near there, when the right bon. gentluman told me
within a mile or so of Newark, on very light soil; and
as Balderton is about that distance, I jump at the conclusion that it was there where the right hon. gentle man went, and that Mr. Hodgkinson's farm is light land. I am supported in this view by Mr. Hodgkinson' silence upon the point. Had it been good heavy tough stuff, like Duvton Lodge, be would have been safe to have told ns. Should it turn out that he has used his engine for threshing parposes, we shall have to deduct just 1s. per acre. The average will then stund at 8s. 9d., a good round sum too for light land when compared with the rough, tough work done at Dunton Lodge at 6s. 10d. an acre. Mr. Hodgkinson's evidence is of no use to the big one, for according to my dull understanding it is sent out of court to get its case ameaded.
Mr. Hodgkinson introduced his statement with some remarks. I will just notice one-
"It is difficult to understand how a cultivator with three engine, and on a system requiring a much heavier dratur rope, onuld do as large an area of work as a 7 -tined cultivator,
6 feet wide, worked by two 14 -horse power engines, unless the former work was of a much lighter and shalluwer description

\section*{I}

I will explain : come along with me, and let us see them both at work. Let us see Juck first. His 10 -horse engine conveys its power over rollers to the implement.

Now, Mr. Ehtor, you see that Jack's 10 -horse engine has got only 12 or 16 inches of cutting edge to mill 36 hrough the soil to smagh up o width of from 32 to 36 inches. On the other hamil, youse. tbat Jon n's 14.horse engine has got 28 inches of ent ince edze to pull throush the soil to char a wilth of 72 inclies. John tells yout thit he his an a gool ensive, and sure enough it imst be, for it poils camble the width of cutting erige through the snil, an i breaks up double the width of land to what Juek's 10 -trarse ensine does, both iinplements going the same depth. Now, sir, I will tell you a litsle atront this swod engine of John's. that it is worked itp to 45 -horee power. What! you prove to me that this 14 horse engine is wolkeil up to 45 -horse power? Here is my witwese, Mr. David (irric. of the firm of Fowler \& Co., of Leeds. Just ink into this little book, sent out by the Midland Institute, Birmingham, cotled "A Paper on the Applicition ot Steam- power to Machinery," hy the late Mr. John
Fowler and Mr. David fireng, of I, oeds, read hy Mr. rowler and Mr. David (ireng, of I, ments, read hy Mr.
Greig before that, Snciety on May 4 th, 196\%, Frederick J. Bramwel!, Eaf, in the chair. In reply to the Cluairman, here are Mr. Greig's words:-
45 "The indicative power of the engine was ahout 45 harae-power, of which about 75 per cent. would be abont 30 cwt . tontal upon the implement." Now, sir yon can underatand linew it is thent, John'a 14 himers. engine can pall his 6 .feet cultivat or thernigh the soi: dashing it about in all directiona, and yous cin ala, "breakages" are John is ohrized to atop whilo the now understand how it is that Jurk's tac'ile can cet in to the enid of his work, while Johnist is nhlized to stam for the repair of breakages, \&ice Jotm's engine and tackle is overloade 1; the consequence is breakarye and a bad average, with great ersta Johu's ropes are worn nut when they have got 50 home-power lift in them, wtile Jack's engine and taplole is tared at abont its nominal power, keep on steadily th the end, and leave If with a g.od average and light cost, be the aoil or I inth of work what ther may.
letter that. I ho on with Mr. R. T. Smith. Here is a letter that: I hive addregsed to him:-
name in brought in queation. It herefure ask join to Rend ion
mentioned in the letter, as well as oocuptars of the th ond done on each farm, and the timell as giving the quantity of formers
" I ask chis done. "I ask this upon public grounds, to enabie me
 Whitchurch Stoam Ploughinager of the "Wrulux Surize" vatitg gurch Company (Lilmitod), Whitohurch,
Salop."
Healo." \({ }^{\text {" }}\). \({ }^{\text {is the reply }}\) :-

Now, Sir, in due time I have no thorsfield Smith," \#utchinson will square himself upon the question of Mr. Snith, for he says, "You say he cultivaterl \(7 / 3\) and I Now, was Mr. Hutehinson who said hast and I who remarked upon it. Therefore we mut chalk
the first mistake up to Mr. Smith, and I nse the wat the first mistake up to Mr. Smith, and I use the word "etveen it and an autruth. As Mr. Smith has now published the letter referrei to a bonve in your Paper, I now publicly ask for the namea amtadilresses of the nccupiers of the 48 farms in questing with the quantity of work done on each farm, as well as
the time when done, and I ask it up the time when done, and I ask it upon public grounds, matrer. W'illiam Smith, Woolston, Bletchley Station, Bucks, Nor. 21.
unfair to compare the working of a Company againt umork dome by an in ividual." Yet he, like all the rest, thas failed in his evidence brought forth to support that ery; for his evidence is in no form, and is of tio weignt at all, and he woulh make you believe Mr. Hutchinson has chosen the most unfavourable case he knew of to represent Fuwler. In this he is wrong; for 4 ir. Hutchinson wrote to me the other day, informing me that Mr. - told him that he could name atronger casea. W. S

\section*{THE CATTLE PLAGUE.}
1. Pay for What you Kill.-The British farmer an bear the pressure of a grievous culamity that is carrying death throngh his herds of horned cattie with terr:fic viruleuce and a daily accelerated rapidity of destruction, but he is not propared to bend menkly heneath a tyrantic ul injustice. The time is loug past when there existed ans chunce of 'stanuping out the ph igne by summarily dealing with centros of contagion, yet inspuectors coutinue to clecree wholesale slauglite of animals that unay he the compmions of those at tackenl. This is an Mibernian mode of eaving the lid but have lost all in caso the disense hail (most iuprobahis) ymitten each ove of the number. Bit if this butchery is denigned to protect wther herds-chat is, if it is for the sulpposed ardvantage of tho public, - then, sang, tho and bengty doomed by the public ufficur to the bullet or the puleaxe.
I make no appeal to national charity for my kine that may fall beforo the destroying angel, but I claim full repayment for every head of my stock that may bed Wantoniy kille 1 by (lovernment order for the prosur Lolg eool of the nation. John Alger
Sulton, IIncolnshire - in the Times.
2. Animalcules.-I wish to notice shortly the follow ing rentence in the Report of Cattle which uied ima week at Bradford:-" Rxamined by nioroscope, mavierf rom the throat, and ofther macter, hink that by knking inesan' es on the flrst apper rance of characteristio illnges -any irritation of the mucons me.nbrane, ruming a the nuse, \&c. - the surface of the meinhrate condid bone treated by syringe, or by the sponge on wa to clat through the nustrils, throat, and nthernte of animaicula is pricess of development, and leave the membes in the nsefully bracell? It str ikes me, from analogies in tiation treatment of human patients, that a suicable part of the administered in time to every accessibe pe well hurth
mucous membrane by enemas, sc., might be the it well to mucous membrald be very glad if you thought it test this. Anon.
3. Compensation.-M Myy must have read with pleas sire and intereat Mr. C. Howard's capital lectir Payter. Thillatele Piazne, reported in your last wenk the game Will yom
subjeet?
sutject
never satisfactorily ascertain, but I think it mischievous to propag spontaneously in this country, inasmuch as broken oble to render farmers less careful in taking it is liable every possible precaution to averaion may be frustrated by a pontaneous outbreak.
I I would also mention the palpable absurdity, as it appears to me, of having one general inspector fur each so likely to carry the disease with him to hundreds of honesteads as the popular "vet," who after \& post homesteasamination of a beast that has died of rinderpest hurries off either to see another reported case, or probably to examine some ailing animal that happens to be on his way home, Let him, moreover, be as be as virulentiy contagious as represented) that he should be continually going to farmyard after farmyard in an infected district without carrying it along with
But what I want chiefly to have mooted is the manifest injustice of our Goverament, after having, in dil probability, been the means, through want of prope precaution, of importing the disease into this country, prsing an arbitrary law which gives its inspector power to authorise the immediate slaughter of diseased, or supposititiously diseased, cattle, without one word as o compensation to the owner for such slaughter.
I am far from saying that the much-condemned poleare is not the quickest, surest, and best remedy but I hold such a law both impolitic and unjustmpolitic because it frustrates its own object, and has gpread the plague more widely about the country instead of checking it
We know, for example, that men must and will look first to their own interest, and often even though it be evidently to their neighbour's detriment; consequentiy off as many of their animals as they can unknown to the disbe though undeveloped probably having the showing any of the outward symptoms, are bought either by innocent or unprincipled perions, and perbaps go from party to party, spreadiag contagion everyWhere, until they finally find a resting place in some quiet home bitherto untainted, but thus rendered seething focus of maliguant disease
Nuw I cuntend, that had the Privy Council, when tine announced their determination to give a certain compensation (the higher the better, as being more effectual), the disease would ere this have been almos if not quite extirpated, for then the owner of any
diseased beast, finding the Governmentalmost as good purchasers as any private individual, would not have an the risk of incurring the penalty for selling from merciful magistrates could then have found no plea how much suffering would it not have saved, and hirst many thcusands of beasts spared for the use of the comuunity at large, for it is by no means a farmer's question only, but a thoroughly national one. The too patent to require comment
- Mr. Howard has touched upon the possible future ompensation by Government for beasta slunghtered by arder of their inspectors, and also to the memorial
from the Newark Cattle Plague Compensation Associalion, showing the hardship of the present clause in the Order in Council ; but, Mr. Editor, if the Govern ment have any such inteution, delay in announcing it is most terribly expensive, for reasons already stated, and every week adds immensely (since the disease 10 Would Government at once issue such an order for counpeusation, and moreover establigh, as Mr. Howard decommends, a strict cordon around all infected districts, I feel sure we should even powsoon hear the Warvickekire Parmer.
Wate the
4. Prevention.-Obviously, from its very rapid spread the short death among cattle which have taken place in ment measures tukea to oppose the plague are quite inefficient, and although hopes of the Royal Commission aave induced more silence than perhaps has been Wisdoun, the incompleteness of their Report and the submit the mody now make it more commi-sion of public opiuion. It is the public which is interested, question is both unworthy being merely a farmers is comon sense of the people. The special question ruinously upeon fond. That it will fall heavily and ahort experience of the past months has proved. Any part of of sound free-trada priuciples, now an integrai part of the poluey of this country, by the interposition feedeens of natural danger and risk to the buyers and indmpensa le description of the people's food, whilat it of he breuder. The the value of the score ox in the hands efercise of nis accustorned dealings. I do not complaia of these natural resulte, but name them to show that
his national inflition is 80 heary that is is eonnomy so stamp out the disease, than risk the suffering from it for probably years. Austria, in 1863, by setting a police cordon around every farm, \&cc, as soon as it had a beast attacked, and preventing auy of its inmates, even down to a dog or cat, from egress or ingress, stamped the plaque out in eight months, whilst Egypt, which was visited with it about the same time, lest in 1863 upwards of 300,000 head of cattle, and the loss since has swelled the number to upwards of \(1,000,000\), raising the price of beef at Caino to the famine height of \(28.6 d\). to 3 s a pound, which it was about sir weeks ago. Whatever may be our sentimental ideas, and the self-alleged value of our freedom, such childishness must submit to rignrous measurets when a great and unexperienced calamity and emergency comes upon us. In a danger like the one under eonsideration, let as
not fiddle-faddle as our Orders in Council have done, and lose a year by the step-by-step progress adopted.
Let us taboo the farm, parish, or district as the case may be, and draw the boundary line a mile or more distant from the spot where the affected cattle may be, and a proper officer should be set apart to attend to the affected, and prevent any from passing over confined inner line, and prevent any others from approaching, which, should any do, he should be kept in quarantine tili thorough disinfectants are applied, and he receive a pass from the appointed authoritien Obviously, as has been pointed out, all the exuviæ, sc. should be burnt, and after the extinguishing of the plague at that spot, all the buildiags well dimin rected, under and by public authority. It WiM
be said, this would be a public expesse. No be said, this would be a public expense. No
doubt; and as the disease is of short duration i its incubation and after progress, obviously the time for these rigorous measures to fully stamp out this plague would be proportionsily short. T is now inevitable increase of price of animal food, a natural concomitant of the effect it has upon the trade in cattle-and so it is pecuniarily a people's business; and being so, it beceme Goverument that should have intelligence equal to the emergency, to spend the sprat to catch the herring, and no doubt a wise liberality would assist to shorten the stamping-out period. The ordering by the \(G\),vern ment inspectors the slaughtering of cattle affected is not or the intereat of the cattle owner, but to preven the spread of the disease, and thus to preserve the nation's interest and the people's food; therefore the public should pay at least such a proportion of the be killed, as would add a proper inoentive to the owner to oull fn at the earliest possible moment the public officer. If a beast is to be killed like a mad dog, which from past experience the instinctive feeling and judgment of all is to do, the sooner the disastrous material-infectious material.
At least in all tabooed places any fat beast should be prevented from going beyond, and if to be slaughtered let it be done on the spot, and only the meat transported. All authorities, and the most eminent on these matters the strongest, agree that the dung, \&c., is taking it through being exposed to the virus thus in connexion have the plague the severest. Flere, in from Newcastle: now we know that a beast may have the disease, and that it, and particularly its dung, may be highily infectious, yet no outward may slaughter a beast, "and whilst its flesh may be wholesome, yet see the danger of the manure dropped along the street and swept up by the Board of Health and sold to the surrounding farmers, aud the same risk the bue cors, ce., source. The corporation of Middleborough collects the manure of the butchers and sells it to the farmers in railway waggons for many miles around. also told that there is a weekly trade in pigs fonti Newcastle to Darling ton, and when we find our Contihave frequent introductions of this plague, really do believe that a wild bird may convey the infection, and take much trouble to kill any seen comiag frum the single possibility shonld be permitted, so that, at the furthest, six weeks should so stamp it out as to leave very little embers to be strictly surrounded and confined Town manure from the streets and buthers should be burnt, except that all cattlo trane was staje by converting theut into meat on the spot of their fording, and all store cattle allowed to move under grent restrictions and precautions. As to the curative rttempte, these should be confined to large towns, such as E linhurgh, Nanchester, dic, where a large amount of scientific and experimental talent and knowledge. with the sccustomed thirst for discovery, exist ; and good prizes should as incentives be offered for success, to be awarded by a commission or appointed The inspectors and enplagers sho premium should
 poriuon to its duminution ; and as the police are a very efficient body, and omnipresent, they should be actively
employed, and maitable extra rewards given to them for satisfactory results. Again, obviously the seller of cattle has the best chances to know the risks his stock has been subject to, and the innocent buyer may be in perfect ignorance, as so many cases we have seen prove. Surely it would therefore bo wieo policy, and more just, that the seller should lose at least half the bergained price of the eattle, shonid they show symptoms, such as a jury or some body should under infection the time of delivery. Our forefathers, 120 years ago, after sears of experience, adopted some such expedient and it worked by stimulating caution and care upon the seller. I met \& dealer a month ago in Yorkstire driving cattle to the railway to be eent off to \(M \longrightarrow\) and in converes. tion I showed him the risks the cattlo would rua, and which he agreed to, bat added- I sell them; and it is not for me to do anything more than put them upon the rail. suraly, in such plague is, our laws must be made so as to give all parties a self-interest and a lively inoentive in the saviag of the puople's food, such se we seo in a poor country where freeth meat is usually uncommonly chenp. I have seen a heifer of about 34 imperial stones sell in Africs for 25 s., vet this plague in \(2 t\) years hat destroyed \(1.000,000\) heail, and ruised beef to a famine price of \(2 s .6 \mathrm{~d}\). to 3 s . per lb .-more than fully four-fold dearer thara it war six montha ago in this country. If. Wooler, Nadberge Hall, Nov. 15, 1865.

to the Secretary, who will forward the order to a reeognised 6, Ade
6, Adelphi Terrace, Strand, London. W.C., Nov. 20, 1865.
7. The Use of a Bull. - I trust that if ever the recommendation of the Royal Commission has to be carried out in its integrity, some provision will be made for the local traffic necessary from the fact that but a small number of farmers are the possessors of a bull. In my own neighbourhood considerable inconvenience has already been experienced in this matter. The disease has been prevalent in an adjoining parish, but has not yet extended into mine, except that two cises occurred some time back in a butcher's paddock; the only farmer, however, who keeps a bull, and, I should add, a large quantity of stock besides, has since then wholly interdicted the visits of his peighbours. It seems unreasonable to blame an individual for what is proposed to be done by the whole kingdom, yet, as you may suppose, much diasatisfaction has been expressed, and a largely increased price has
been offered, hitherto in vain. If this proceeding be at all general, it is obvicus that the derangement of the aupply of milk will quickly be experienced, and we mast rino look forward to an enbanced price of cows. A few timely suggestions on your part may do much to mitigate the evil, and may show how far individuals can provide for their own safety without wholly ignoring the necessities of their frimndy. Faunus.

ARE SHEEP LIABLE TO THE CATTLE PLAGUE?
Pzrmit me, through the medium of the Agricultural Gazette, most heartily to thank Mr. Woods for his very valuable lecture on the diseeses of sheep. That Mr. Woods is quite correct in the views he has so
clearly expressed in his lecture I unhesitatingly state is capable of very many proofs. I myself, and years ago, have seen several flocks of lambs affected with all the symptoms described by Professor Simonds, and clearly and demonstratively originating from the treatment hey received, namely, from their having been pastured only such improper food, or from baving had no water,
which never fails to produce typhus whenetrer But stran extent by either men or beasts.
part of England that sheep, undere is a notion in the; require water; often and often again have I bad anan ments with my neighbours, and I lament to write arga some of my nearest oues also, on this subject never could make a single proselyte; all with required water," when I have replied that ineren neadnws abutting on rivers, or even where
seep sheep so placed from the river keep sheep so placed from the rivers, the suc with ample sufficiency of liquid alimente animal times with too much. But I refer to different lo and different kinds of food, namely, to high and d pastures, and to times of long droughts and br eather, in all of which cases I have maiota impolitic not by some means or other ae raiboual nimals pure water, or let them have give th of it. I observe here particularly that I do not peit the term clear, because I have known water in tank nd staguant places nearly pellucid to the eye but on examining it I have found it to have bee teeming with deadly poisons, whereas a thick and nearly
some.
But, to return to Mr. Woods; and in doing sol will, among others, give two cases, clearly confromin the views he has so ably advocated in his valuabli lecture.
The first of these cases was a flock of lambs of, think, about 150 , three or four years since. It whu
here generally talked about that the lambs were dring here generally talked about that the lambs were dying
fast, and no one could tell why. This being in adjoining parish, and as I well knew the honest and respectable owner of the lambs, I made dili inquiries about the disease, and how the animals werm treated, and in what kind of field they were weather, I observe, boing hot and dry). If found tha the herbage in the field was as brown and dry hay ; and the poor suffering lambs had no water, goo or bad. I saw the owner, and endeavoured to ind him to remove the flock immediately to where the could have succulent food and pure water, but my arguments were in vain, as all the replies I got were that sheep required no water ; and so they continuel in the field, dying one after another, until about two thirds bad died, when the owner in despair sold the remainder to a dealer, who put them into a mead
The next case was one nearer my home, and in a the circumstances of it it differed but little from the ther. It was of a flock of lambs, bought and put inw a high and dry field of closely eaten down Clover, and the weather was hot and dry, and so continued long season. I passed that field twice or three times a to droop soon after they were put into it, and then one after another they began to die ; but before they gol to this state, I earnestly entrested the our remove them, or give them a regular bupply of pure water, of which he had a copious aupply on hecive any
but I could make no impression, nor rect replies, except the stereotyped one that "sbeep nerer required water." But on several occasions I adoel "Well, my friend, if it be as you say, yet as your iow is clearly suffering dreadfully from waut of memore than I can express, do, I pray you, for my sake, the poor creatures some water. But died, and remaind and so the greater number do, worthle Now on one occasion, with the oxner \(I\) examined the few remainder object of this letterand to publish this is the ere possible the same the symptoms were as nesor Simonds ; and I haver 1 doubt whatever that, were it posible fow those lambs to be anywhere in the same statielly be two flocks (were, they would oncer w demned, and ordered to berve, Mr. Editor and readers, that more per cent. of each of these flas died, than died or were killed out of Mr. Hardees cre
But probably most of my readers will wiod mate could get into the heads of any perfectly sane meen but let us see. At the latter period, nowester, mith since, I was dining at the Cups Hotel, Colcud a Londor a party of very respectable agriculturis agent, when I purposely brought this lan me. "Sheep required no water," and "sheep con do withont water," was the burden of and so Ihave since given Nor is there a the modern treatisent of cattle-nno back, for then, as far as my experienco as ample, no one woul in an upland there was no water for them, as is done But as to cattle, I have seen parts of
fter haring been stifled up in a close
add frosty fogs have env been when approached near
thin they could only
ibem, and where the cold was nearly as intense as it ibera, and where brooks of running water; and yet you masrd nothing but the mournful cry, that the cattle heard noten the consumption, dignified by some by the mave, as it is thought, classic and scientifical name of preumonia. bhich If foar has modern improvement is this, and metropolis, and has perhaps been the cause of the rresent cattle murrain, or if it were imported from eisewhere, among those ladies and gentlemen it found plenty of unlicensed cow lodging-house seepers to give some few years sivce a maggot got into cattle-feeders' hmis persuading them to feed the beasts in graves, just large enoug 6 . 10 and mimin eating, and drinking, and purging, and scouring, mitil the whole had filled up the graver in that way, when they were creaned out, and the beasts buried agmin, and so forth, until a jury would decide that other tenants of the same quadruped race. My reders, pray do not laugh. Some years since a fiend and myself went with permissostem of an establishment whereat this modern system of cattle feeding was in high vogue; but on passing the
sheds we could not see a single oz or cow, and so we went and found a functionary called the "Looker," and of him we inquired where the bullocke mere ? when he replied, "In the stalls." But we ronlied that we had been through the whole, but could not find any; whereupon he led us back to the
selisane buildings, where, a little more light having been let in, we could see the backs of the beasts, each in his deep grave before us, and as com-
fortable, as Sir Walter Scott would have expressed it "as a puddock (a toad) under a harrow." But so much for modern refinement and improvements, and the adrances made in national education!
again thank Mr. Woods for his most valuable lecture, and you, Mr. Editor, for publishing so large a

\section*{THE MEAT MANUFACTURE.}

LaND yielding 12 or 15 tons of green food per acre jearly without any labour but that of repairing the Thistles which invade it, and supplying manure to maintain it, is producing more at less expense than not in such cases as this, then, that our comparison must
be made : there is much poor pasturage in the country, Flich lies, nevertheless, under a climate proper fo arable farming; and it is about this that the question
There
though drained would not pield much of this, which, per acre in four years, an equal quantity might, if it Clover, with y cultivated, be obtained in Turnips and bushels of grain in the same time. Grass is probably more nourishing per ton than Turnips; but when the ore is consumed in all weathers by unsheltered aninals, and the other in well-bedded houses, it may not be about the the resultant produce of meat may balance, of course, of so much grain as food for man in detailed estimate, and this I shall endeavour to merely premising that the above figures are not given warters reason; as on the farm I write from, three 40 uarters of which were formerly Grass, a stock of about betwead of oxen fattening to 60 or 70 stones, and yuarter, with and 300 sheep fattening to 24 lb . a winter, and about half those numbers during summer ine formerly a herd of 25 cows and about 20 yenr hog and two-year-old heifers, with a few pigs, were the ahored in store condition; while, in addition to above, the land now permits an annual sale off it of about 4000 bushels of Wheat.
Gupposeland worth 30s. per acre of annual rent may be annuma ; to yield eight tons of Grass per acre per Sumption, to produce nine imperial stones of beef; or

The same land, broken up, would, under good managestraw i yield during the 1 st year, 25 cwt . of Wheat 2 straw ; 2 d year, 24 tons of Mangel Wurzel ; 3d year, Turnips ; 5th year, 20 cwt. of Barley straw ; 6 th year 10 tons of Clover, or 52 tons of green food, and three of grain. of tons of litter, in six years, besides the produce arrive at any result that easy so to state figures as to above I have gone upon what I believe to be reasonable produce fromat 24 or 25 cwt . of hay is a probable or more from land of such value; that hay is one-fifth rowte of the Grass from which it is made : that the 81 th of aftermath is to the growth up to bay harvest e know from land.
ithout any from experience that Turnips consumed
them, will not generally yield more than 1 lb . of beef or mutton for every \(15 i \mathrm{lb}\) of green food; and giving
Grass credit for a little more nourishment than this we have assumed that 140 lb of it will rield the same meat.* On the side of arable land, again, I have etated amounts of produce which from several years' experience I know to be probable.
used as litter) green food (surposing the straw to be all used as litter) will on the above datum yield 7.6 lb . of beef, and this at \(6 d\) per lb . is worth 192.8 sen , an
amount rather larger than that whiol was the whole return from the frass, while here we have in addition the produce of three crops of grins. Whether the whole extra expense of this mode of managing the land will be more than paid by this extra produce is hardly within the province of this inquiry.

It is hardly worth while considering the case of arable land wholly devoted to meat-producing crops,
and we therefore go on to compare in this reapect the and we therefore go on to compare in this respect the various rotations of crops commonly adopted.
If a cultivation wholly of green cropas or of erops for consumption by cattle on arable land, would pay, it would be a source of immense wealth in many parts of Ireland, where waste land reclamation propeeds so glowly mainly because of the unprofitablenese of corn cultivation under their watery skies. The resuats the above estimate, however, must be the standard
with which to compare the productiveness of Grass, and it has been seen that the former, besides the large crops of grain on the arable land, yields more meat than the latter. The conclusion which therefore seems to be unavoidable is, that in cases when equal akill and care have been brought to hear both on arable and pasture farming, the latter might be converted without diminishing, and probably with an increase to the national supply of animal food.
(a) The Norfolk, or four-course rotation, may be supposed able to yield in the 1st \(\bar{y}\) ear 25 cwt. of Whea straw per acre; 2d year, 3 d year, 20 cmt of Barley straw ; 4 th year, 11 toms o Clover and Grass. This is equal to 30 .tons of green food in four years, or \(7 \frac{1}{3}\) tons per acre per annum, quantity which, at the rate of one for every 150 lb ., i able to produce about 1 cwt. of beef per annum.
(b) In the second, when this rotation is extended one year by keeping the Grass down two years, we may suppose a somewhat larger acreable produce of green crop. Thus-lst year, 25 cwt . of Wheat straw; 2 d ear, 20 tons of Swedes; 30 year, 20 cwt. of harley Clover-giving 38 tons as the produce of five years, or nearly the same acreable produce per annum as in the former case.
(c) We now may take the Dunbar (East Lothian) sir years course of crops as our third rotation, and here we may expect-1st year, 20 tons of Swedes; \(2 d\) year, 20 cwt of Barley straw; 3d year, 12 tons of Clover 3 4th year, 25 cwt . of Wheat straw; 5th year, 25 cwt . of Bean straw; 6th year, 25 cwt of Wheat straw-which will yield 32 tons of green food, or 478 lb . of meat per acre in six years,
(d) Our last instance shall be selected from Professor Low's work, where it is praised for its suitability to rich clays. It may yield-1st year, nothing, summer fallow; 2 d year, \(25 \mathrm{cwt}\). . oar, 25 cwt of Oat straw
12 tons of Clover; Ath year, 25 ent 5th year, 25 cwt of Bean straw ; 6th year, 20 cwt . Barley straw. It thus produces 12 tons of green foo in six years, or 30 lb . of meat per acre per annum.
It is proper to remark that the above estimates are more likely to be relatively than positively true; the datum on which their produce of meat is calculated is of course subject to the vicissitudes which affect all agriculture, and stultify all farm estimates: the her which is to convert this food may be carried off by disease, and its produce of meat will then of course be anything rather than 1.150 th the weight of the food. But all the rotations named are lisble to this riak al
and it may therefore be usefui to lion of meat
Namo.

\section*{Home Correspondence}

Steam Cultivation: Fooler v. Smith.-When Mr. William Smith, of Woolston, published the comparative statement of cost of steam cultivation as between his own set and one of Fowler's, 1 felt bound in justice o Fowler to make some remaris upon the other side of the question, thinking that if such a statement and comparison became public withontany contradiction, it might very serioualy mislead the general body of eaders of the agricaltural papers. I fiad, however,
* The best grazing land in Lincolnahise we are told, ong frat rate
and
former will gain 20 stone, of \(=01 \mathrm{lb}\); and the hater \(101 \mathrm{~b} \mathrm{a}^{2}\)
 remember that the Graw of such haity of its prodece.

that finco I wrote thowe remerka, several othen interested in steam cultivation have taken up the subject, therefore any remarks that I may now make will only be meedod in reply to Mr. .suith'n quentions pat to mo throogh your Paper, as none of the criticisme made in my obiervations do in any way prove that it ant of under the master's eye, to al large sel travelling about the country for, mork in a new district, where their expenses would surs to be beavy. If Mr. Snith or Mr. Hutchinson had wanted to make a fair comprrison, why did they thot Hike a set of Somler's under sinilar circomstancee to their own? There was bio difficulty in doing so, at the detaile of cost and quantity of work done by somo seoren of such sets have lieen already published in the different agricultural papers. Mr. Smoith tells me that I micht have known what "the depth and quantity of the work done" was by reeding his letter of Oct. 28 ; but if be lookod at the date of my tell on the 24th what he was going to say on the 28 th and now we hear about tbat depth, it appears that after several previone workmes of saven inclien it did eventually get down 10 inclies dexy; and he quentions the adrimbility; of going 10 manh is 12 or 18 inches deep with a coltivitor, on mocont, the not aware tisat it "it necessary to bring up any mare cloy with a caltivator working 18 ineben aen than one working 8 inchen. The object and advantage of a cultivator, and eapecially Fowler'o, is that it moves the soil and lets the wnter down without hringing the clay up. It is not fair for any out to take a few extraordinary good days an an average of the years worling -see "Mr. 8mith's 8 ecres a day for juat six days in September; and my only excune for thowing him that I did 205 acres in the whole 25 worhing dxy of September, or 9 acrès a day average, includiug ill moving, was to show the superiority of rowler's nyatem over Smith's in the matter of moving from place to place. He seems surprised that 1 shound have to mov to seven different farms for the 22.0 acres, and perliajo will be more so when I tell hims that I had to go into 23 different felds on those farm to get the 225 merem which 23 moves alone would have taken :mith's tacklo and six or cight hornes nearly 20 deys out of the 25 to have accomplished, judging from the rato" they moved at Worceater, when nuder bis own permonal inspection, and with his best men, and plenty
of them. Mr. Smith aste, where an the of them. Mr. Smith asks, "Where are the mou tackle for lifto conly 45 days a yar? I ask him, where are the men- that can afford to buy a set of tuckle worth \(500 \%\), and work it only eight daya ear, as lie doen? But it doen not appear necesnary that any one should have a set, and let it out only 45 days a jear. I let out mine four or five tumes \(n s\) Mr. Sinith puts me down at, I want to see 1200 or 1400 acrem. Mine commenced in March this year, and the nearly done that already, and the ground it not bit too wet yet for ploughing and digging, at which mine bas been employed ever since the middle of Fotober, when the rain came. Mr. Smith tether. Can Smith's? Or, if they could, would either of them be doing much good? My rerollection of seeing a set of work in wet weather at Exeter, in 1863, in the same field with a set of Howard' and Mowler'n, was that in half on hour after the operation it was impossible to see where Smith's had been and where it had not-and that in a Clover lea in Junc. Mr. Smith aaya, and rightly, that the best montha for cultivating are September and October, especially if dry; but can bis enleivator always work when ition? There was a set of hit tackle bought on purpose for worked in its own neighhourhond during the sutumic of 1863; but in the dry autumn of 1864, three or four of the farmers in that parish applied to me thend down a set of "Fowler s, to cultivate three or fonr hundred acres, sis the ground was too dry and hard for Smith's tackle to work, which I did; no daring those dry months of September and October Mr. Smith's tackle was locked up in a barn, because the ground was too hard, till the winter rains came, and then it was two soft, so that set did noneat all-worse even than the Shropshire people. Now Mr.Smith will ask me again, probably, as he did in last week's Paper, to give the names and addresses of the gentlemen, but at the end of his letter, after complimenting the Gloucester, Durham, Wakefield, and Shropahire Companies on their success, he very fairly says, that though he likes to criticise Stean Cultivating Companies, be will not show up private individuals ; and entirely coincide with him, that though a public Company and their acconnts are fair subjects for nublic criticism, the private affairs and unisfortunes of individusis are not, therefore I must deeline publishing names. There is only one other point in Mr. Sinith's letter that I need notice; I stated that I had had Fowler's double.engive tackle for about two years and a half. Mr. Simith denies it, and asks me to explain. I have therefore refer red back to my old accounts, and
find that I purchased my first set in July 1863, and it is now November \(18 \% 5\), so that is only two years and
four monthe, instend of two years and a half. I am sorry I, made the mistake, but it was quite nm
intentional, and of very little consequence. In further explanation to Mr . Smith, I beg to inform him that
I bave now also the very identical set that he says I have now also the very identical set that he says
"was broken in his sight at Worcester," and which cost 8 s. 6 d . to repair, I gm informed. I have had many such breakages as that, and some a great deal heavier; yet, notwithstanding all that, and \(3000 l\). first cost, as well as the fate of the defunct Steam Cultivating Companies, and Mr. Smith's prophecies of the existing ones, I am very well satisfied with the present result. and confident enough for the future. J. Nicholls, Queen Camel, Ilchester, Somersetshire, Nov. 15.- You did the
public and myself the favour to publish my statement of the working and of the cost of the two systems at Dunton Lodge, and by the Whitchurch Steam Cultivation Company, the expenses in both cases having been published previously; the former in 1863, the latter in 1865. The accuracy of the payments made in either case no one can dispute, and the estimated items, right or wrong, are made, as near as may be, on the same Secretary of the Company, who took several strong objections to inferences portrayed by my statement and I have replied ta every point of importance, with the intention, avowed on his part, to publish the same instead of doing this, he has commeuced a fresh attack through the public press, but I decline to travel over the same ground a second time with him; consequently, I appeal to you to publish our correspondence. I am having slips printed to send for the purpose. Simon Hutchinson, Manthorpe Lodge, Granthams Nov. 18 [We published the Secretary's account of this correspondence, and shall be happy to publish Mr. Hutchinfear we have not room.]

\section*{Societits.}

Soctety of Arts: November 16.-The Cattle Plague -At the opening meeting for the Session 1865-6, Mr. Hawes, the Chairman of the Council, made the following reference to what the Society had done in past times in connection with this suhject:-The Society
from its earliest foundation directed its attention to the encouragement of the breeding of cattle and sheep and I have, with the assistance of Mr. Davenport, found one paper among others, from which I hope it will not be uninteresting to read some extracts.

This paper, written by Mr. Dossie, a member of the then actiog committee of the Society, was printed in Pestilential Disease which appeared among our Cattle in 1769-70, and on the Methods of Preventing Infection, and on the Medicinal Treatment of Beasts seized with it," which appear as applicable now as they then were.

After observations on the liability of cattle and sheep to disease, the writer says: "There is, however, a disease incidental to neat cattle, which, propagating
itself by infection, raging at times in most countries in Europe, and carrying destruction wherever it comes that it may truly be called a pestilence, has in its turn visited our island and made us experimentally sensible malignity at this time on the shores of the with great opposite to us, whence some sparks of the contagion have been lately brought and kindled here in more thar one place, as is imagined;" and he continues, "It is, iodeed, only under particular circumstances, as will be shown, that cattle are susceptible of this infection, because when most diffused the country it extinguishes entirely of itself in favourable periods when the general state of animals is healthful, as we have twice experienced the late seasons, and particularly the great alternations of heat and cold, the continuance of wet weather, and the frequency of easterly windes all of which are injurious to animal strength, and conspiring in this year, have manifestly weakened both vegetables and animals, and have consequently rendered the cattle peculiarly susceptible of this infection, as well as mankind to
those infectious distempers to which they are subject." * * The writer then continues, "The effecte of the contagion were (at first) confined to a few beasts. But it is to be apprehended, from the increased disposition of cattle to receive it in consequence of the unfavourable circumstances of the season, we have most mischievous consequences to dread from the infection if again introduced; and whoever will
examine well the orders and regulations of the Government, made to hinder the spreading of the contagion, will find we can have little dependence upon them for our security against this momentous evi.
The writer then proceeds to investigate the causes of this distemper-the manner in which its contagion acts-the symptomatic appearancess it exhibits-and the mode and success of the trials made to prevent infection and to cure the disease. He says, "many subject, aud professors of physic and academic bodies have heen called upon by the authority of several governurents to deliver their opinions upon it; but little success to practical utility has resulted from auch labours."
which was wanting, but this I cannot extract, though I hope the more important portions of thi
By the historical notice of the disease we find that it appeared in the 18th century, in 1710 and 1711 when it was first observed in Hungary; from thence it went to Dalmatia, to Padua, and spreading over the Venetian States, was dissemiuated through the whole of Italy, and passed, in 1713, to Germany by the Tyrol, from whence it was communicated north to Denmark and Sweden, introducing itself about the
seme time into Great Britain. After this, under the influence of more favourable seasons, the contagion abated, and in about nine years the infection seemed exterminated in most of these countries. About 1730 the disease appeared again, but the infection was soon extinguished; regulations by the Government were ssued for its suppression. In 1740-41 it broke out in the south-east of Europe, and made its way as before, having been brought thither, it was believed, from
Holland, and caused great devastation of the cattle for Holland, and caused great devastation of the cattle for for some time, when it gradually abated, and, as far as it appeared, the infection was wholly lost, and did not reappear till the autumn of 1768 , when it broke out afresh in two or three places-not, there is reason to believe, from the relics of the former contagion, but by new contagion brought from foreigu parts, for
while England was free from it for several jears, it while England was free from it for several years, it
visited other places, Denmark and Jutland in par ticular, where it was more severe than had ever before been known.
From the result of careful inquiry during the latter invasion of the disease in several parts of Europe, the following observations were made:
1. The infection of this disease prevails only at particular times anywhere; acts with greater violence afects onls part of the cattle anywhere, and those with various degrees of malignity.

That where the infection does not subsist, it never comes but after some general cause has weak ened the habit of the beasts in general-such as severe cold; want of sufficient and wholesome food ; repaated alternations of heat and cold; moist air, replete with putrid vapours; long continuatce of easterly winds or, what is more frequent, the combination of two or more of these causes. Thus, he adds, we find contagion invading every part of Europe in 1701, when the season had been so inclement the year before as to
destroy a great part of the sheep in England. In 1741, when, after a very intense frost from December to April, by the rigour of cold and the scarcity of fodder the cattle had been reduced to a debilitated state, aggravated by the constant easterly wind of the summer and autumn following.
I cannot follow all the remarks upon the principles which the writer believes affect contagion generally, but he asserts that the weaker animals are first and most severely attacked, and more frequently die under it; and he gives as the result of his inquiry that th.ough infection is the efficient canse of the murrain in cattle, yet there is a predisposing cause or particular state absolutely necessary to its acting or taking effect, and after inquiring into the causes of these predisposing conditions, he states his conclusions to be-
1. That the murrain is communicated by transmission of contagious matter from infected to sound spread.
2. That it is never communicated through the air.
3. That the contagious matter retains its power oonsiderable time.
4. That the infection will generally be exhibited in a fow days; in a few cases it may not show itself for six or seven, and that after 10 days there is no fear of the diseate.
5. That the eeparation of cattle to prevent or to ascertain the existence of contagion neod not in any case exceed 14 days.
Mr. Dossie then enters at great length into a minute examination of the symptoms and treatment of the disease, and examines in detail the various modes of treatment to provent it, and to cure it after it has appeared, which have been practised in England and foreign countries. He concludes by saying, "But alike has been the success of all the proposed remedies o these several classes, which is, that a remarkably
greater number of the beasts to which they have been administered have died in proportion to that of those who have been left to nature.
The cause of this he carefully examines, and says:"The inefficiency of the supposed remedies for the murrain is lees to be regretted, because a great part o them would be attended with such expense and trouble
as would render their general use inexpedient. Whatever method of cure is proposed to be serviceable must be practicable, with a moderate share of trouble and expense.
The symptoms of the disease and its progress in very stage and the appearance after death are next described, and he concludes thus :-" Hence it follows that the way to assist nature against attacks of this disesse is to keep up the animal strength hy such invigorating means as are compatible, in other respects, with a salutary economy, and he recom-
mends as beed suited for this purpoes,
are to be applied so as to bring them within reamecied cost.

The rest of the paper is devoted 'to the ernminat for preventing contagion ; and fo order recommendel the importance of the question may be fulls insure th a statement is added, extracted from the statiseo records of North and South Holland, of the lom
cattle in the twelve months commencing April 1769:-
Cattle infected

\section*{Died of disease}

April 1 to Soptember 30,1709 monther, from Died
And the total number estimated to have died in the united provinces was above 300,000 .
The paper then
The paper then concludes with these rords:behoves every individual, according to his station,
his utmost to avert this impending danger-one most heavy calamities which can befal any Eun country, and especially Eugland, where the lurnita habits of the common people, and the difficult obtaining a supply of cattle from other places, anit searcity of horneu beasts, and consequently of ail ot provisions, peculiarly grievous and intolerable.
If this would have been so 100 yeara ago, whit would be the calamity of such a loss of cattle no We could hardly look at the prospect which awais
us without the deepest anziety, did we not fee assured that every possible precautionary measure being taken by the Government, and more particular?
by the owners of cattle, to prevent inieation spreading, and to maintain our stock in the h possible condition, though at the same time we canoe but be sensible that an unreasonable fear of infectio may produce a more serious effect on the supply cattle by disease this year. The importance of this subject leads me, however, to the consideration of the question whether, even in ordinary times, those the land entrusted to their care so as to secure for the denre population of these islands the greatest adid cheapest supply of animal food. Although I han acarcely a righ, from my want of practioal knomlede to say a word on this subject, I cannot refraia fro suggestivg that whilst we have the best and cheapes means at command to obtain whatever corn and other means of obtaining any importaut supply of anime food from foreign countries are very limited and moll unsatisfactory, for I find in Mr. Stoet's paper, in whereas in 1853 we imported 120,2088 beasts and
232,037 sheep, we only imported 150,838 433,733 sheep in 1863, the one quantity being a litt mure than six montas and the other scarcely thre monthe' consumption of London. It appears, there fore, looking to these frets, that greater altent animal food than to that of vegetable food; and Ia. assured by those on whose knowledge and practicis skill I can rely, that although "to increase materialy
our supply of cattle and sheep would requiro some change in the present mode of cultivating our la still that the land so cultivated would employ agricultural labour, more capital in farmag, whis more profitable than uader the prees our soil to appropriates \({ }^{\text {co }}\) curge a abroad, to the neglect of the breediug of sheep iu cattle, which can only be produced in the numbers we require at home. It appears to me that ho peop: of this country are as yet only deriviag arin Freetra in agricultural products, and that until all partiee landlords and tenants, co-operate with a to produce the largest quantity and th
of animal food, we slasll be exposed in to a gradual but certain augmentationals, attacks sheep and cattle, to prices theroby seriously injure the healh power of the nation,
I cannot pess from this very interesting subje without directing the attention great waut, at a period like
cattle are being attaciced by properly authenticated agric may be, its amoun
accurate knowledge
one is considering how th
how the cattle attacke which
best recover the loss whim
But unfortunately we are
ing relisble information
accurately ascertained, for surely,
information, we should not hear

We have overy return that can be desired dibe quantity and quality of everal producte, but we ade 20 rerurns relating to our agricultural productions Coe appear tnee of this disease will, I hope, enforce upon ore azriculturists andiate steps being taken for the 2neserty collection of official returns respecting this rerui collect branch of our national industry. It will me a great subject for the new Parliament to enter upon, erhaps the only one in connexion with our internal inde which is enirely mich is therefore open to efficieney and simplicity the thicus perfect returns of every description of produce trom the soil of this country.
It is only from the knowledge afforded by official tharns that, in times like the present, when a fatal dioneos kurdenly attacks our herds, we can, with and atimulate supply, so as to avoid a scarcity of nimel food, any material deficiency in which must be nost injurious to the health and prosperity of the antion.

\section*{Eytan's Herd Book of Hereford Cattle. By :T.} Duckham, Ross. Vol. VI.
Mr . Duckham has issued another volume of his mieminal pablication. It is supplemented by a very full and instructive lecture on the Rise and Progress of the Refore the Ronal Agricultural College. So that there 3 for the general reader a capital "study" of the whole rhich at the present day it consists. What these rarticulars are-about 600 bulls and 600 or 700 cows iod heifers-their pedigrees and owners, and in many instances their actutl appearance, for the rone is well illustrated-is described in the 360
owes of this small octavo volume. How wide-spread and uportant a lireed the Hereforta have been is apparent :om the number and locality of the herds, nearly 300 a Mr. Duckham's many public services that he hae . fuced the Herefurd breeders thus to unite for aemid of their animals, which was on the point of being simalowd for want of support. Many another instance chis public spirit conld be given ; and at the close of ind, munely, the capital meeting of the Bath and West ~ Eusland Society at Hereford, which owed a great vel to his energetic guidance and organisation, it was reolved that a testimonial should be presented to him, as tixen of the good-will and approval of his county \(3 n!\) if agriculturists generally. We have not heard ot
this movement since, but we trust that it is quietly siuning its way to a auccesstul issue.

Sience and Practice in Furm Cultivation. By James Buckman, F.L.S., F.G.S., Lite Professor of Geology Collego. Robert Hardwicke, 192, Piccadilly. 1863. In this handsome and amply illustrated volume we have kren successive "parts," giviug instructions respectively
-How to grow good root crops-How to grow good Irasees-How to grow good Clovers-How to grow 201 l corn-How to grow good fences-How to grow finmer-and How to grow good orchards. It is On of the firit discussion of the wiole plant cultivamost useful circulation among plant cultivators.
the author keeps to his owi aspeet it broughout; and ill his instructions it is the plant Ther than the soil on which he bestows especial itention. Thus of root crops it is their origin from Auiteratinnings, trueness, or degeneracy of sort, and Cigsinns are of foed that
irst-Cuitivated roots are improved wild ones, only to be hane; thys gardeniug or farming being carried on by certain
 "8cond. T Tee differance in sort of roots is caused either by Mreation of soma particular propensloy whiol has been acted "Thirde - The maint seed-gnegrower. Purth -Tho preeervation of a good outline or shape of
 roduces a malformed "Pifth, The difficulties of gotting gond need - whother of
ataltesation sirrt, from carefuliy soiested buibs, or free from

 in partioular soils. The true iusect attacks to be arearted "icufaluess of sood, of a trua sort,-care in growib, inoludes the soionot and Practice

Then in his chapter on Grasses-they are individually described and depicted-an acsount it given of the weeds of pastures and of the modes of deatroying them. "a arable culture," we are told, "one-half the expense is in one way or another connected with wrediug and we are of opinion that if only 1s. per acre wer spent on the weeding of pastures, it would rield 300
per cent. of profit on the outlay." Mr. Buck inan alou gives in this section of the book good practical instruc tion in the laying down and subsequent management o permanent Grass lands, which we shall hereafter extract for our readers.
We need not analyse in detail the subsequent "parts" of the book. Our readers will find in it satisfactory information plaiuly given on many of the aspects presented by most of the rubjects in which the plant cultivator is interested. The whole is printed in large type, and accompanied by a large number of
illustrations on wood and stone. The last part, on Orchards, concludes with a chapter onfthe abuse of drink, to which readers in the weatern counties would do well to direct their attention.
The author has during the past two or thres years left the professorial chair and the work of constant and laborious scientific tenching for the practical carrying out of his teachinge in the feld; comparative leisure of a Dorsetshire farmer's lifer that
he has produced a volume which has appeared at intervals during the past 18 months, and las but just been completed.
-Alas! for the hard and heavy blows so often dealt by death in happy homes, deadening and destroying the interest of public men in their work, oven as attains its achievement and success. Our readers have often had to thank Professor Buckman ors of
papers from his pen on points where the practice of the farmer and the researches of the botamist and naturalist approach or overlap each other. It is not, therefore, of a stranger that we speak, are relationship subsisting between a reviewer and an nuthor for an expression of the sympathy which be commands far beyond the circle of private intimacy and friendship.

during the summer months and gradually later in the day as the winter approaches until moulting time arrives, when the hens cease laying till they have their new feathers, which takes about two months. Although a hen can only lay a determined number of eggs during her lifetime, yet her laying may be stimulated by an appropriate diet, as also by a genial temperature kept in the poultry home. It has been satisfactorily proved that undec such circumstances a hen will lay at least 30 eggs more during the winter months, a time when they are most valuable both for artificial hatching and consumption; and taking an establishment with 2000 laying and 1000 breeding hens, the extra profit will be as follows :-

3000 hens at 30 extra eggs \(=00,000\) at 15s. per 100,0751 . to be ascribed solely to a warm temperature and appropriate diet; but this is not the only advantage derived from a genial temperature during the winter months ; it may save, perhaps, hundreds of pounds in the loss of poultry from diseases caused by exposure to damp and colds. As the laying can be forced by artificial means, so can it also be retarded; and when it is intended to keep some hens for laying during the time that others are moulting, which generally begins n September, it is only necessary to pull out the feathers of such hens and thus produce an artificial moulting about two months sooner, say early in July, when they will cease laying until their feathers have grown again.

Food.-The food for the breeding and laying stock can be composed of a mixture of the various cereals coarsely ground and made into a stiff paste. This food should be put in the feeding fountains, where it cannot be wasted or dirtied. Occasionally, in fine weather, whole grain can be thrown broadcast in the open run. Finely-chopped vegetables, such as the waste of the kitchen garden, Mangel Wurzel, Swedes, \&c., in a green state, mashed boiled Potatos, and rice minced boiled meat maixed into a paste with the liquor from the meat, and seasoned with ealt, pepper, finely powdered oyster shells, or a little chalk, forms a genial condiment. The broken victuals from hotels, large establishments, \&c., can also be used with great advantage for the food of poultry. Powdered charcoal, oxide of iron, and flour of sulphur mixed alterpately at certain intervals with their food, will keep them in perfect health. Geyelin's Poultry Breeding.

\section*{Miscellaneous.}

Size of Tarms in Scotland.-I have obtained an abstract or analysis of the valuation rolls made up under the recent Act, showing the rents paid by tenants under different heads of the following counties, viz. :-
 ranging

Haddingtonsh Berwicksbire Roxburgbshire Dumfriesshi
Pertbshire Kinross-shir Forfarshire Kincardineshi

Total

I have no doubt that the middle or smaller class of tenants in other counties in Scotland form by far thr largest proportion of tenants, and to them I consider the law of hypothec as especially valuable. It is universally known in Scotland, that the middle or smaller class of tenants is a most industrious and deserving class, and many men of eminence in agricul ture and otherwise have risen from them. Mr G. Dal ziel before the IIypothec Commission.

Riuderpest in Sheep.-During the last fow weeks several experiments have been undertaken in Edinburgh, at the request of the French Government, to test the accuracy of the statement that sheop are liable to be affected with rinderpest. In a first series of experiments, four sheep were kopt in the same stable with animals very seriously affected with rinderpest, and were, besides, inoculated with the secretions obtained from the same animals. The results appear to have been entirely negative. In a second series of experiments, four sheep were inoculated with the lachrymal secretion and with the milk of cows affected with rinderpest; of these, one is stated to have exhi bited on the sixth day after the inoculation symptoms of ill-health. Subsequently all the symptoms of rinderpest became developed, and the animal died yesterday morning. We understand that at the post-mortem examination, which was immediately performed in the presence of Professor Maclagan and Dr. Andrew Wood the lesions which are considered to be characteristic of riuderpest were found to exist. In order to prove more concluaively the nature of the disease which caused the death of the sheop experimented upon, a calf was, on Saturday, inoculated with some of the secretions obtained from it. As yet, the animal appears to be in perfect health. If, as is confidently expacted, it fall a victim to rinderpest, no doubt can be entertained that the statement that sheep may become affected with the
cattle plague is perfectly correct. We anderstand cattle plague is perfectly correct. We understand same result: Scotsman.

\section*{Notices to Correspondents.}

Poratos: M. A. You should have got gas-lime together in compost months ago, and turned it frequently if you are dressing. You may apply it broadcast, and leave it for some weeks before turning it in. You should plant early in spring, early sorts in early soils, and no you will run leant risk of the disease.

\section*{The following Resolutions form the basis of the Scheme :-}
1. That there shall take place in London, in 1866 (in the Garden of the Royal Horticultural Society, at South Kensington), a Grand International Horticultural Exhibition and Congress, to be open four days, from May 22 to May 25, and to which the leading Botanists and Horticulturists throughout Europe shall be invited.
2. That Two Morning Meetinga (of the nature of a Congrens) shall be held, at which Papers prepared by leading Botanists or Horticulturists shall be read, the Papers to be previously printed in English and French, or German, and circulated, and discussion thereon invited.
3. That there shall be Two Conversazioni, at which Foreigners invited to assist at the Exhibition and Congress shall have the opportunity of meeting with our own leading Horticulturists, Botanists, Exhibitors, \&cc.
4. That there shall be a Banquet, to which leading Foreign Visitors shall be invited as guests, and to which also Ladies subscribing will be admitted. Tickets 3 Guineas each.
5. That the Committee will endeavour to arrange that the most easilyaccessible English Gardens, in which some feature of British Gardening-such as "Forcing," "Decorative Gardening," \&c.-is well illustrated, shall be open to Foreign Visitors
6. That a Subscription List be opened for the purpose of obtaining the Fuws necessary to the formation of a liberal Prize List (the Prizes offered amnunt to are \&2500), the erection or part erection of the necessary Exhibition Buildins. entertainment of Foreign Visitors, and for the working expenses of the Exhibio and Congress ; and that a Guarantee Fund be also entered ou.
7. That Gentlemen subscribing Ten Guineas shall be entitled to one Dir" Tieket of the value of \(£ 33 \mathrm{~s}\); to onc Card of invitation to each of the \(S\) vira available for one Gentleman and two Ladies; and to Fight Tiekets of admiwisit : the onening of the Horticultural Show, when the admission by parment \(\pi .\). Onc Guinea each person. Subseribers of Five Guineas, or Guarantors of exi. receive one Card of invitation for each Soirée, available for one Gentleman two Ladies, and Four Tickets for the opening of the Horticultural Show. Subsrm and Guarantors of smaller amounts will receive in proportion.
8. Subseribers' Tickets may, if desired, be commuted, so as to be arailable is : 4 Banquet, three of the before-mentioned Tickets for the opening of the Ertii.al being exchangeable for one Dinuer Ticket, provided that notice of sueh wide exchange them is given before the 31st of Mareh, 1866. Subscribers manner t. used on the opening day will admit on any subsequent day, in the mannct stated thereon.

Gentlemen willing to lend their support to this undertaking will perhaps be kind enough to communicate at once with the Secretaries. A SECOND IIST of SUPPORTERS will be published shortiy.

GOTTON'S GUTNEA COLLECTION of BULBS for
 New Seeds, Growth of 1865.

gardener, and give him the amsistanoe of a lionard of scientific horticulturists to knide has operatione The organieation haviag now beon matured, the Cococi Fellow. The Board will consiat of the berar. M. J. Berkelef, F.LS., Mr. Thonas Moore, F.L.S., aus Berkelet, F.L.
Dr. Hogg, F.L.S.
The Report of the Cummitter is published in extenso in the last Number of the Proceedings of
the Sooiety, to whioh we refer those who are the sooiety, to which we refer those who are
desirous of examining it in detail. We contine ourselves bere to a statement of the recommendations which have been adopted. The lieport is comprised under four principal head, having reference (1) to the Garden, (2) to the Staff, (3) to the Students, and (4) to the Eraminations wheh it was thought desirable should be instituted. We will glance through these in the order in whinh hey occur.
As to the Gardens, the principal recommendations approved by the Cuucil, and in be carried out as far as the funds will adenit, are the following: -The examples of cultivation in illus tration of all the departments of Horticultur" and the colleotions of the principal sorts of cul tivated plants at presint at Chiswick are to be completed; and the Committee say they should inelude-
(a) Tender Fruita, as Pinep, Grapes, Melona, Cucumbera.
(b) Orchard-house Fruite, \&e.
(c) Hardy Fruits, as Apples, Pears, Cherrien, Strawberries, dic.
(d) Vegetablea of all kinds in their seanons; examplea of the beat systemn adopted in Private Gurdema, Market Gurdens, \&c.*
(e) Tender Plants, as Stove and Grecnhonse Orun mental Plante, Orchids, Popular Decorative Pot Plante, Fuchsiaf, Pelargoniums, de.
(f) Hardy Plants and Out-door Summer Fluwers of alt kinds, as Bedding Planta, popalar Herba. ceous Perenniale, Ormamental Annuals, and Florists' Flowers.
(g) Hardy Trees, to teat their capability for decora-

Illustrations of Euses nental syatema of priming, 'ribiumg, de., on which lessons should be given.
(i) Hybridiastion. \(\dagger\)
(k) General Kecping, which should he neat and orderly, but need not he of an exponsive character.
As to the Staff, the Council have now separated the duties of superintending the gardens at Chiswick and Kensington. The Superintendent for Chiswiok will have placed under him-
(a) A Kitchen Garden and Fruit Foreman, competent to carry out, and to teach and explain horticultural practice, bo far as concerns the culture o' vegetables and fruits ; and to have charge of the trials of these suhjecta.
(b) A Plant Foreman, having similar qualifications as regards flowers, and to have charge of the trials of flowers.
The Committee recommended that the Foremen should be persons competent to explain the daily operations in the garden, to instruct the students in the theory and practice of Horticulture, and to read and explain to them selected passages from standard Horticultural works b aring on the practice of their reapective departments; and that each Foreman should give a class-lecture or reading at least once a week, for which one hour, at the most convenient time, should be set apart. The Council concur in the advisability of obtaining the best ivformed Foremen available; and hope at some future time to arrange for a series of practical demonstrations in Horticulture, but for the present do not see their way to employ paid Lecturers on theoretical soience.
The persons employed at Chiswick under the respective Foremen, it was recommended, should consist, for the most part, of Students. To enable a person to have his name placed on the books as a candidate for admission as a student, he must have (1) the written recommendation of a Frllow ; (2) he must be at least 20 years of age ; (3) he must have good health; (4) he muet have been three years at least in good private gardens, one year of whioh shall have been in the same garden; ( 5 ) he
*. The best examplea of the cultivation or Vegetablen if carried out on a limited sala, would nat only be beneticas to young gardades, but woportunity to nee or learr the verious modes adopted by successtul market ond gentlemen' gardenom. This subject has beon very much neglocted for thany yearo past, tut no gardening operation is mone important than obtain good kinds and well.
supply of a gentleman's thel
upply of a gentleman's thia
+ This is a subject if the utmost importanoa which ethootld be carried out very fully and rystematically The Council propnoe indo this with the assiathaco bof cidieation experiments under
muat have a gond character: (6) he zowat write a groed hand, ppull will, and have a cumpecent knewledge of arthmetir. It mee exgented that a wremiun wight be paid, of which e protion moht be given to the superintenctent end las assistants for the inatrucitan impartied; but the Cauncil think the premium might the dispeosed wi:b, and the foremen be rewarded by a bonus for every pupil-gurdener when pusmes a eatiofeotery examinatiun rither su Pumological or Promeulfural garden Pructice.
The name and aduress of all candsiates for almission as Siudenta are to the regitatured in the order in whelh the mphications are reoswed : and when a vacuury oecourt, the firat apilicuth on the Int is to tee appoimted, pironided hes tas complied with the befure-mumed eondtions. Thie aludents mny, if they are nite. pase their final axamination at the end of the firat ar meowed reat, but may continue for a ume mot longer then ithree yearm, if ther profer it. Thane wheo meko natiofactury progrias are ta be ayatematically frame ferred from ane deparmentit to abother, the Foremen certitying as to their comduat and proficiency. No Fellow in th hinve, at any lume, more than one nomilice a atudent in the parden.
The weekly wages rocommended to bo paid to students was 13s. for the timt jear, 14s. for the neeond, nud lis. for the third, " mivitid dliny should have passed a satiofeotory examinntion at the end of the first year: limt the (comel) think the whiges might be reduad lyy 1a, or 2a. per week, an no premium will be required, and rewarda will be offered for meritorious preotioal work.
Instruction is to be amparted to all Sludents alike, and is to consint of-
(a) Practice in the ordinary operations of the depart. momt in which for the time beang each is placed, with verbal inatructions and commente thereupion by the superinteradent or has Foreman.
(b) Reading on practient sulforets the the Fonemen.
c) Ocerashanal mpeeial themmatralions und bectures ly peoment qualified in particular miblijela, which,
 A litrury nad the added lierviter.
of Horticalterang romem contaning a priect in eflinternl aciencen, the Ifarlienitural prienticale and such cutierer howka atd educational appliancens at may be attainable.
As to Examinations, the Commitree recommended that an exumination should take place at Lady-day and Michaciman in rach year, fo teet the proficiency of the otudents; and that eandidates not pmaing a matiofactory examination shon'd lie iable 10 be discharged, while thene whe twiee failed to pass should be uncunditi nally dismissed. Thie recommendation has been adupers, exarpit that one examination only is to be he.d in 1866 .
The Final Examination which must be pasead in order to obtain the Sociely's Certificate is to onmprise the following heads, viz: -1 , Subjecte zecessary for qualificatoon as eardeners : to inclade reading, writinge, and arithmetic ; kitchen-garden practice, including forcong, \&e.; frait-garden practice, including the culture of tender fruita: flower-garlen practice, reluding the culture of tender plantr, pruning, training, putting, draining, \&io. 2, Subjuetu necessary for qualutieation as Arsociates of the S, cietr : tu include, in addition to what is specified under No. 1, troak-kerping, practical genmetry, land-measuring and plandrawing, theory of horticulture, byatematio botany, an I the tasteful laying-aut of gardens.

A register of all who gain Certuficates at the examinations is to be kemt, and 15 to be open to Fellows gratis, and to others on parment of a feo of \(2 s .6 d\). If a cops of the Certiticate is required, it is to be obtainable on payment of another 28 . \(6 d^{2}\).

The results of the examination are to be published in the Society's Proceedinge, an't aent to the editors of other Hurticultural periodicals.

The Council announce that they have entered into relations with the Suclety of Arta in refurence to thene questions, and hope to carry out with their aid so much of the Examinations of Gardeners as can be accomplished by written answera. Last sear, they offered prizes for gardeners pasting succusefully the Examinationa of the Society of Arts in Botany, and they have this rear undertaken also to provide the neerssary funds to enablo that Society to employ Examaers in Fruit and Vegetable Culture, and in Floricultare.

We have only space to add that we trust sufficient funds will be found for carrying out this
- The advinntagen of tnetruction aod certificates provided for
 muns, guarded themeiren agatat bewng mpppowat to be fixivg a zeneral stantard of wage for under carlea.ens.

Wurk, whion is entirtly in the right direction, but
whioh, without a fair expenditure on the Garden, Whioh, without a fair expenditure on
it will, we fear, be aseless to attempt.

We have to announce that the Proprietors of the Gardeners' Chronicle will repeat next year their uffer of Ladies' Prizes for the culture of Tri-door plants. The prizes will be of the value of 10l., \(7 l\)., and \(3 l\). respectively, and will be awarded to the first, second, and third best specimens produced in competition by different exhibitors.

The very interesting array of plants which was brought together on the last occasion when these prizes were offered, as compared with the display of the previous year, leads us to hope that the honours will be well contested in 1866-a year which is to mark an era among horticultural competitions.

There will be this difference made on the occasion now announced, that instead of two first prizes for different classes of plants, there will be three prizes-a first, second, and third-for one class, so that the fair competitors will have a better chance of coming off victorious. The principal terms laid down for the guidance of exhibitors are the following: -

The cumpetition, which is to be amongst Ladies only (managing their own plants), will take place in the Garden of the Royal Hortioultural Sooiety at South Kensington on June 14, the day of Special Show for prizes presented to the Society.
The plants are to be such as are suitable for drawing-room decoration. They must have been
grown in a room for AT LEAST six weeks befure the show, and during the whole time have been under the management of the exhibitor, without professional assistanoe. The length of time during which they have been socultivated yOST BE STATED on a tieket attached to eaoh plant, and will be taken ioto necount in amarding the prizes.
Flowering Plants and Foliage Plants will \(00 \mathrm{~m}-\) pete on equal terms, thuse which are best cultivated rectiving the awards. They mey have been grown in \(p\) ts or baskety, of other contrivances
suitable for drawing-rooms, GLASS CASES EXCEPTED.
The plants must be sent in according to the rules in foree for the Special Show of June 14 ; which rules may be asoertained by a reference to
the Hortioultural Sucity's aamouncements for next year's shows.

We are glad to be able to report, in refexnext May in conjuaction with the International Horticultural Exhibition, that the Executive Committee
bas just taken a step which augurs well for the bas just taken a step which augurs well for the
success of this department of the International scheme. M. Alphonse De Candolle, of Geneva, has been nanimously elected Chairman of the Congress,
and we understand that he will sccept the post, and also prepare a comprehensive dincourse relative to the "present: state and mutual position of Botany
and Horticulture. No better selection conld have and Horticulture. No better selection conld have
been made, for MI. Det Andotice pussesses a European reputation; we therefore congratulate the Committee on having appointed so efficient amd influential a person to so impurtant an office. It now remains for Europe and of the British Isles, to be prepared to rally round the chair.
been felt as to the barbarous and and some diggust have one of the handsomest of the newly introduced Palms-viz., the Thris Pacis, Ploenicophorium sechellaeum, Herm. Wendland. The history of the plant in thas
given in a late number of the "Journal of Botans:" given in a late number of the "Journal of Botany:" been going on, and some ahsurd guesses have been ventured ahont the name of a spiny Palm from the Seycbelles with simple leaver, which has now become a more frequent iumate of our gardens than it was when the circuinstance took place to which the genus owee its name. There is no longer uny necessity of making inost reason to be wnnoyed at it thenge person who had himself a pointed pablic allusion to it, by smposing on the plant the name of Ploonicophorium sechellarum, which, freely translated, might be rendered "the Palm derived or carried off from the Seychelles," but whicb gardeners have now more literally rendered "The Thiet Pulm from the Seychelles," some years ago, Mr. Hzrmank Wempland, of the Royal Botanic Gardens of Herrenhansen, and Mr. JOHN SMITH, were looking over the collections at Kew with a view of exchanging plants,
when Mr. Wendrasd's eya fell upon some small Palirs, When Mr. Wendland"s eya fell upon some amall Palis, harum. He expressed a wish to loave, if possible, one of them for the rich Palan collection under his charge
There being only three small specimens, Mr. Smitil could not make up lis sind to accerle to this at once, but told him that he would seo about the matter. The two gentleuen then walked on, looking at other plante:
and probably never thinking any noore about the Palune. The permably never thinking any more about the Palnes, mach to the annoyatice of c very our,
The
one of these rare plants had disappeared, and every body had his own upinion about its disappearauce. The authorities of the garden never could find out ; but Mr. Wendland, for his own satisfaction, succeeded in discovering that it was stolen by an Irishman employed at Kew, who sold it, it is said, for a ferw shillinys. The plant went thence to the continent, and there fetched
\(5 l_{\text {; }}\); ultimately coming into the hands of Mr. Bobsic, of Berlin, who, it is said, had to give at least four times that sum for it. Professor Karl Koch, ignorant of the whole trausaction, and taking the Pahn, from its habit, to be an Astrocaryum, named it in 1859 A. Borsigianum. It was shortly after Mr. Wendeand had succeeded in which he hal obtained herbariame to pecimens, the name of Phcenicophorium sechellarum, afterwards published in a scientific form. Mr. Duncans, curator of the Botanic Gardens of Mauritius, after this gave, in compliment to Governor Stevenson, of Mauritius, the MS, name of
Stevensonia to both this species and a plant (VerschafStevensonia to both this species and a plant (VerschafDelia) somewhat resembling it, but differing generically by any scientific description, must of course fall to the ground, and Pi cenicophorium be upneld. In Doncan's "Catalogue of Plants in the Royal Botanic Gardens,
Mauritius," fol., Port Louis, Mauritius, 1863, p. 87, we find only this entry, "Stevensonia grandiflora, Pal macem, Dependencies of Mauritius. A. [i.e. one of the plants introduced since Mr. Duncas took charge of the garden1]." Grandifiora is doubtless a misprint, the plant more tri (1nently geing under the name of S. grandifolia. This is simply the history of the generic name of the plant (excellently liyured and described in VAN Houttr's Fl.
des Serres, t. 1595-1596). It might perhaps have been desirable to adopt a different nomenclature, but after a name has once been given, nobody can possibly revoke The law of priority does not admit of exceptions."
-In a letter which we publish to-day, occurs a passage relating to the International Horitcultural our part- We are not the apologista of the International Schedule, but we happen to know that it is the result of the jostling and conflict of a great variety of
opinions, and that its several items were uccepted as occupying a mediate position between extremes on all sides. It might have been anticipated, that adividuals interested in particular classes would wish and would prubably seek to depreciate others to a similar extent. The oljject of the Conumittee has, we imagine, been to reconcile such extreme views, and to hold out fair inducements to all. In the case of New Plants versus Roses, for exanple, which is mertioned in the letter to which we allude, without depreciating the interest or value of the former, which we would be the gets his prize fort, the fact remains that the Rose grower gets his prize for high-class culture and finish in the
production of his plants, whilst the new plant grower production of his plants, whilst the new plant grower
makes no attempt at calture, but exhibits mainly for the purpose of obtaining au extensive sale for his novelties, in addition to suech prizes as he may win. Besides, we doubt, after all, if the prizes offered at the London show are in any cases lower than those which our coutinental friends are in the habit of awarding at furm of medals, not of money.

Dr. Hooker has kindly forwarded us for publication a letter addressed to Sir Charles Elliof, the INSECT which proves so destructive to the Orange and Lemon trees at the Cape and elsewhere. Mr. Bicker, in the letter alluded to, gays that he has tried limewater, Tobacco-water, corrosive sublimate, and other things without suecess, but at length he met with an account of some experiments made by a French physician with paraffine or kerosine oil. Mr. Biciken accordingly tried this with his Lime and Lemon trees, and reports most favourable of its efficacy. Two trees that were nearly killed by the scale, were washed over with paraffine oil, which destroyed the parasite, so that the trees are now perfectly recovered, and are in igorous coudition. The mode of application, is as follows:-'Go over the young shoots lightly with a
fcather, and where the bark of the larger shoots is affected, use a paint brush. By so doing (in dry the insect, and after a fow days the scales will fall off and dry of themselves."

THEORY AND PRACTICE OF VENTLLATION. No. 1IE.
Trif great sea currenta of hot water now chim oar ootice. These run north and south in opposite directions, from the equator to the Poles; for the Great Ocean on one side of the globe and the Atlantic on the
other both cross the equator and reach to the poles Two canses maintain these currents in constant action one, and of course the primcipal, is the influence of beat, another the difference of density caused, not by a difference of heat only, but by the addition of solid matter to the wate: I I will notice the last first.
I have never seen a very satisfactory reason ussigned for the saltness of the ocean. Perhaps one of the chief, which reems to have been entirely uverlooked, is that
essential for our world. some parts of the sea en thoin as mueh again of salt as others. Thete pen on
then for the sun is dainty in his tasterated moot water water only, and leaving all the salt aud fith are the saltest. Salt water is hest parts
It follows that Salt water is hearier than freat strongest motive power that could be
ensure the circulation and intermixture o
the mighty deep. And this is just the agent

\section*{water, and hot by the power of a vert}
of hot brine shonts off right and left from the
the poles, with snfficient force and roun the lquatern influence tororgh those icy reglons, and to ertems the cold waters back to the source of heat. And jus \(u\). density induced by salt helpes the adrancing bot met so does the comparative absence of sult
water, origirating in the abundance of rain or a and comparative weakness of evaporation in thase \(a\) regions, atsist it in reaching the equator; for fren water is much lighter than salt, and of cavrso the ant will displace the freest, push it in fact out of the wa
and send it back to thre starting place of the and send
current.
Heat rets in a somewhat different manwes, bot leat to the satie result. Were the currents of the oad maintained by a difference of density cansed by varying per centage of salt only, the hot
of water would flow wong tho bottom sea towards the poles, and inost of its hent be la to us. In the same way the lightnees of the pit water would keep it on the surface. Inteed of the the heat added to thie brine semde it alung the trem of the ocean, and the cold overcomes the levily afll fresh water and sinks it down. Hence we fiud, with few exceptions arising from ascidental circaubinam or for speciad reazom; that the hot water flows oat on lower level; at many pointa they also seem to the opposite sides of the great ocean busin. Searcity min does the water flow im a straight line from the iquati to the poles. The furs and moution of the earth and the laws of fluids, render it impossible for it to stationary. As they advance to the latitade of Eoglan they travel at the rate of 600 miles an hour ceutre of the Atlantic and Pacific that rate is Now water being a flowing liquid it does not accm progression, but lage behind a little in its ocean bul On the other hand, the dense tropichl briue bries with it a revolving speed of 1000 mite an beacth which go round with a velucty only 500 ; and so it has a tendency to go fuster than
the solid earth beneath it. These influeuces give an the solid earth beneath it. These influences give an
oblique set to the currents of the ocean, and seud then circling round aud round in enormous eddies or whit pools. They have an important influente u thorough or complete admixture of the waria geniality and mildne s of our climate. The matus from 'the tropics

One is strongly to rums of to to moralise here, aud it carcely possible to pass on without expresustiquity ton at the subliuity, grandeur,

Saure morke，and contrasting them with the ahort －hifch diecorer hes heating the world with hot water thon the legimuing－the sun His tire，the oeran ，urrents His pipes，and the wide worl！！the house Mi hus warmed and ventilated．And yet man bes only jeurned to go and attempt to do likewise yeaterday， so it were，alter looking on for 6000 years．
It can hardly be mecessary to adil that this flux and defur of water of different temperatares prodaces grat cian ers in the air that impinges every where on its sul－ race，and is a lertile source of wind or ventilation．It silatas be obvin us to all who have accompanied use the far，that water is heated in the very same way us the air，viz．，by couvection or a displacoment of cold stoms by hotter ones throughout its entire volume．
Having thus sat at Nature＇s feet and gathered up a for goneral principles as the basis of the sulject，I rapote endeavouring to elucidate the thenry and pandice of ventilation by considering the air as pechnical furce；as a plant feeder；us a carrier of water sithe conserver and diffuser of heat and light；pro－ coding then to notice modes and places for aluitting sir to our plant－houses；and mechanical contrivancen for regulatiug and working the same．D．T．Piok．

DESSERT ORANGE CULTURE．
FiK \(M\) seldum or never soeing this department of fruit culture practised by our gardeners，I am led to think that it is not reoognised as legitimate by them Thinking thus，I have been induced to visit my neigh bour MI：Rivers，who see？ns to have been the first to reduce the culture of the Citron tribe to anything like methol for the purpose of giving us Lome－grown Dranges fit for dessert．My visit was jaid on the éf th uit．，and if I tell what I saw，an idea may be formed of the time taken to ripen Oranges for our tables．

Ou entering the Orange house，a very eleyaut iron structure，erected by Deusis of Chelmsford，so light aud so bright that one could almost fancy one was in some southern clime instead of in England－and that ton in the dull month of November－myattention was particulanly called to two large standard trees of the mugherine Orange，with remarkahly large fruit on them．Ihe stems of these trees are abont 3 feet in heigat，aud as stout as a broomstick；their age abont 10 years．There was something vesy graceful in the I riztut golden fruit suspeuded by the delicate Wecping Whow hke shoots；bometling novel and very interest in：－These Tangiesiness were quite ripe aud very rich， aromatic，and good．On one of these trees thero were about two dozen fruit，aud some had been gathered； they hung in groups，with the sun shiming on them， and the air being perfumed with the odour of the blussoms of some of the other trees，made it a scene Dot to be forgotten．
of Tangierine Orang pleased with the young tree fruit；these consisted of a fow trees put etting their in summer by being placed out of doors，so that when brought into the fruiting－house in October，they put forth blossoms and are now setting their fruit．It is I learnt，an experiment to ascertain if their fruit will ripeu early in summer．The usual time of the Huwering of this sort of Orange is，in Lisbon，the eud of February or beginning of March，and under proper cuitivation this will be the case in the Orange－house， the fruit then ripening in Octover aud November There appear to be several varieties of this kiud of Orange，probably from sued；some have Pear－shaped is called the Mandarin in Coven Garden
The St．Hichael＇s Orange alsu varies，fome having suooth glossy rinds，and others rough．The trees of this sort are very beautiful，the fruit large，and the branches bending with their weight．
The Maltese Blood Oranges are very distinct in their babit，their foliage very abundant，and the trees robust and full of health．The blood－red colour varies much， for ou the same tree cou have red－Heshed fruit，and others not differing from the St．Michaei＇s
A white－fleshcd Orange from the Azures is a very great bearer，and its frust is of a very superior flavour The variegated Orange has fruit striped with green and yellow；the leaves of this sort are variegated with White，and the tree is very ornamental
The Sweet Lime produces a small fruit，not jet deariy ripe，so that it seems to require stroug heat． The Figg Orange is a variety from St．Michael＇s the uit of which is very handsome
The Ampton Orange，frum Ampton，in Suffolk，is a most beautiful and prolnic sort；its rind is quite Nichath and shining；it seems later than the St． Chichael＇s，and apparently will not be ripe till after duristmas．This is of course some foreign sort intro－ uced and cultivated at Ampton
These few liues on dewsert Orange culture may comifly interest some of jour readers，as I feel ＂Orauce groves＂feattered over the country in place he the we now have，the fruit from which caunot reinget．I can truly say that I never remember thato angthing in the gardening way more cheeriny ：reps somew hote of Orance culture，especially at the The tha in ther glury in November：

noticed also during the past summer that a shoot of it which had escaped through an aperture in the roof of our conservatory grew healthily even in the open air. In habit this Bignonia resembles our common In habit this thignonia resembles our common
produced opposite one another on as single footatalk, produced opposite one another on a single footatalk, which again divides into another short footstalk to each Tendrils ulso issue from between the forks of each pair of leaves. The flowers are produced at the axil of each leafotalk upon the current year's growth, which is not anfrequently covered with bloom for 6 or more feet, thus forming beantiful featoons of rich orange. I remember reeing some very fine specimens of the flowers of this Horticultaral Society about two years ago. They were furnished by Mr. Rogers, gr. to Mr. Noble, Berry Hill, and were the adrairation of all who waw them. Owing to its flowering upon the young wood, it will be
apparent that to have this Bignonia in perfection it apparent that to have this Bignonia in perfectio
ahould be well cut in immediately after blooming.
In preparing a permanent place for this plant, a considerable portion of brick rubbish or good sandstone, should be placed at the bottom of the pit for it, filling up with a mixture of light luam or couch mould and a little peat. As regards general treatment, the best effect is obtained by allowing a properly regulated quantity of shoots to fall down from the ratters or the greater is the effect produced. J.F.

\section*{TRADE MEMORANDUM.}

Wantew, the addrene of Thomas L. Reid, Seedeman, late of No. 47, Cross Cheaping, Coventry.

\section*{Home Correspondence.}

Comparative Hardiness of the Mals and Fomale Bay Lawrel. - Some time since (p. 866) you expressed a wish to know the sexes of any large Bay trees. I inclose two
pieces with flower buds on them; the larger piece is pieces with flower buds on them ; the larger piece is
from the tree mentioned at \(p .868\) in the paragraph on evergreen Oaks, but the dimensions should have been 10 feet 9 inches in height, and 7 feet 11 inches the greatest diameter of the branches. The smaller piece 18 irom a tree 7 feet 10 inches high, and the same in
diameter, about 20 years planted. Charles Palmer, Steokley Grange. [The flowers in both instances are of the male sex.]
-The Blue Orohid of Borweo.-In Mr. F. Boyle's book just published, "Adventures in Borneo." which were accomplished in 1863, occurs the following passage (p. 60):-"For its flowers Bidi is deservedly farnous; from thence have been obtained some of our finest discovered accidentally by Mr. Bentley upon the bough of a tree which he had passed a hundred times. As he from the branch, more gracefully than art could design. The apecimen then discovered ia, I believe, the only one at present known, and hoth Malays and Dyaks are quite ignorant of such a flower, though they begin to
be awre of the present mania for Orchids in England, be aware of the present mania for Orchids in England, readers inform me what are "Delitra?" And what is meant by this unique Blue Orchid, which Mr. Boyle allndes to as "the celebrated ?" P. F. G

Larches, -Last autumn I planted some hundreds of these on my estate, and now to my dismay I find that nearly the whole of them are without their leading shoots, which have been bitten off by bares and rabbits. As I am anxious to raise a good plantation of Larches, and lave no prosible means whatever of getting it spondents favouring me with some advice upon the matter. A Subscriber.
Wellingtonia gigantea.-I have been much iaterested by Mr. Day's account (see p. 1109) ot the Wellingtonia at Theydon Grove, Epping. It must be a very fine however, one or two points in Mr. Day's letter which seem to me to require further explanation. In speaking of planting his Wellingtonia, he says, "I planted it in
well-prepared soil, consisting chiefly of good loam;" will he krindly say, what he did to his soil in order to "well prepare it," and mention of what its other component parts consisted, besides the chief part good valleys in England were planted with Wellingtonias, in a few years their general appearance would be greatly improved. This nay be true, or it may not, but I should like to ask him what would be the value were beginning to improve the general appearance of his valley. I fear the utilitarian owners and occupiers of the valley in question would prefer good crops of
Wheat, Barley, Oats, Mangels, Swedes, and similar nnpoetical und every-day resulis, to all the Wellingtonias in existence; although if veterinarian professors and the rinderpest between them should knock all our cattle on the hend, we may as well plant that portion of our

Wellingtonia or some other ornamental tree, as not, for
the principal use of Swedes and Mangel "will be gone." Even under these distressing circumetances, howerer, would rather recommend to the notice of our valley proprietors Pinas Laricio, for I see by an advertisement in your Paper that it is a highly ornamental tree, aud quality of timber, and it is also said to grow end thrive where Larch will not, and to this advertisement is attached a name wortby of confidence. Pinus Laricio, and hardy, and I may also add cheap, for I have meen it quoted in a nurseryman's catalogue at 10 s .per thonsand, whereas the Wellingtoma, however much it may deserve the title of ornamental, and I hope I may add of hardy, will, I fear, never deserve that of useful, and will be some time yet before it is cheap. I am, however, quite as enthusiastic an admirer of the
Wellingtonia as Mr. Day is, and would wish to see it not only generally planted in suitable situations, but judiciously planted, so as to insure a similarly rapid development with that which has resulted from his well-considered preparation; and it is to enable those ing tree to realive the came pleasing results as he has done, that I aolk him to be so obliging as to detail his actual proceedinge in regard to it. Co F. P., The Grange, Kingston, near Tauntoll.
Lato Peaches in 1860 and 1865.-One bright morning in December, 1860 -it was, I think, on the
15 th-I called upon my neighbour to look at a Peach tree I had given him a few years previously, and which he had sent to tell me was then full of fruit. To my sarprise I found a fine vigorous Peach tree trained to a south-west wall, with its leave green as if it were Auguat, and every branch studded with fruit of a bright crimson and gold colour. I remember standing before
the tree perfectly struck with ita appearance. On the tree perfectly struck with ita appearance.
like the Apples of Sodom, full of ashes-but inerely a Peach full of insipid watery juice, really without the least Peach davour. On the 19th of Decernber of the asme year, only a few days after my visit, our firs severe frost occurred, and then came that fatal one of
the 25 th, which will never be forgotten by those who witnessed it and its effects on vegetation. The frost of
which the 19th of course demolished my neighbour's beautiful looking Peaches. On the 10th of last October I went to my neighbour to take my annual look at my favourite ree. I found it full of fine truit, all crimson and anld; and on tasting them, inatead of the dis-
appointment I experienced in December, 1860, I found them rich and juicy beyond any late wall
Peach I had ever tasted. This sort which I have thus Peach I had ever tasted. This sort which I have thus partially deacribed, is an American variety which I
imported some years ago under the name of Poole's Late Yellow. Downing, in bis "Fruit Trees of America," calls it Poole's Large Yellow, and describes
it as "flesh yellow, red at the stone, ricb, juicy, and of excellent flavour;" its leaves have reniform glands, and its flowers are small. These yellow-fieshed Peaches require clear hot weather, or they are often "flat, stale, and unprofitable." This Poole's Late seems one of the best of them, beating Salway out and out in piquancy; the latter is one of the yellow Mediterranean Peaches which reproduce themselves from stones almost like a species, so that if a traveller brought from Italy bundred stones of yellow Peaches, the chances are he would raise a hundred Salways. On the whole the American yellow Peaches are better than the European, but they will not come out in flavour in dull, clondy weather. Poole's Late Yellow has not, I believe, bee propagated to any extent, and never advertised. The Salway, but seems of a modest nature, making short prolific shoots, and bearing freely. T. \(\boldsymbol{R}\).
Mildness of the Season.-We have several beds of Black Prince Strawberry, which after bearing a large September last, and set a quantity of fruit, which is beginning to ripen. To-day (Nov. 28) I bave gathered several perfectly ripe berries, showing what an extraordinary season it has been even in this part of North Durbam. Thomas Dobson, Whitburn Hall, Sunderland. Porcing Roses.-Many say that Roses taken up in autamn will not do for forcing, but that is a mistake come of the most distinguished Rose growers on the Continent take their Roses up after the occurrence of
one or two severe frosts, and put them into as small pots as possible, filling the latter within an inch and a-half of the brim with soil, so as to leave room for topdressing. They then put them into bottom heat, giving at the same time plenty of air to keep the tops
cool. In four or five weeks they will be well rooted, and ready to be introduced into the proper forcing house. John A. Lederhofer, Oxton, Cheshire.

Orchid Baskets.-Cau any of your correspondents inform me where I can get Orchid baskets of an ornamental character? Alpha. [Those who have such icles on sale should advertise them.]
Srundo conspicuca (see
Arundo conspicua (see p. 1109). -This has fiowered here these last two years, and has been much admired. It is not so robust or stately as the Pampas Grass, but on the other hand it is more dressy and graceful, It stands well upon Grass in a flower garden; its elastic flower stems, coming up in summer with their
drooping panicles of brownish white, contrasting well
associated, whereas the Pampas beiogere 0 s + in their autumnal tinta Thes and ourcse ane a Zealand it requirea no protection. grow most laxuriantly here, plated cline : ituation, whefo freely expused to light and air, in onder thethen ant tems may be induced to grow anficionty mete T. Chinese Banana
you a portion of a cluster of frait of - I bure me nspection. It is the first time it he fruip theres part of the Scotch Highlandi. Hirsel, the residence of the Earl of Home. He also stated that Enarthe fistulosa, which is not recorded as a Scotch plant by Professor Babington, occurg abun-
dantly in Wigtonshire, Kirkcudbrightshire, and Dum-fries-shire, in all of which localities he had collected it. fries-shire, in alf our exhibited specimens of an Aster, apparently Aster salignus (salicifolins), which he
found growing in quantity on an island in the Tay, found growing in quantity on an island in the Tay, near Dalguise, far from any gardens, and apparently
naturalised. He remarked that several species of Aster were spread over Britain, and he exhibited specimens of two species which had been collected near Coldstream, and on the banks of the Thames.Dr. Balfour read a letter from Dr. Murchison, of London, in refereuce to the Falconer Memorial and the stated that the sum now amounted to upwards of \(1800 l\). In order to endow a proper fellowship in the University of Edinburgh, the sum of \(2500 \%\). or 3000 \%. will be required. He requested Scotch naturalists to aid in
the cause.-Dr. Balfour called attention to the Horticultural Exhibition ard Botanical Congress which is to take place in London in 1866. A correspondert of the
Society mentioned that at Boncharch, near Ventnor, Society mentioned that at Bonchurch, near Ventnor,
Isle of Wight, be noticed a Fuchsia nearly 22 feet high, and baving a trunk 7 inches in diameter. - Mr. M‘Nab laid before the Society specimens of Raphanus caudatus, grown in the open air, and atated that he had
exhibited a growing specimen at the last meeting in exhibited a growing specimen at the last meeting in July, but as time did not chen allow or any remarks
being made, he now communited the fol-
lowing notes. The seeds of the plant were received lowing notes. The seeds of the plant were received
from Mr. William Bell, Superintendent of the Botanic Garden, Saharanpore, in April, 1865 , under the name of "Radish, 3 feet long." The seeds
were dibbled into a piece of ground prepared for the purpose, and a two-light frame placed over them. They very soon commenced to grow, so that the glazed frame
had to be removed. Seven weeks after being sown, had to be removed. Seven weeks after being sown,
they flowered profasely, and numerous seed-vessels of a purplish green colour were produced. These went on elongating till many of them hail reached the length
of 2 feet 9 inches, each plant bearing from 18 to 20 of these long tapering snake-shaped seed-vessels. In the young state the siliquas or seed-pods nay be used like the ordinary cultivated ground Radish, as they possess a peculiar pungent taste. They will also be found very
useful for making up mised pickles, \&c. About eight years ago seeds were received from Madras under the saed pods 8 inches long. This variety produces seeds freely, and is annually grown in the garden. It possesses the same pangent taste as the long-fruited plant. Th large Radish is very hardy, as both flowers and fruit were found on it in the open air as late as 9th
November, 1865 . Independent of the various culinary purposes to which this Radish may be turned, it is of ttself a remarkable vegetable cariosity. If the seed is sown singly and each plant is tied upright, the fruit sometimes perfectly straight, at other times assuming contorted forms. This peculiar contortion is most perceptible at the period when the seeds in the upper por-
tion of the siliqua are swelling. At no stage of their growth do either of the varieties show the slightest tendency to produce the Radish under ground. It will be curious to observe the nature of the offspring when the plant is fertilised with the ordinary garden Radish -in all likelihood the bybrids will produce edible Radishes, both abore and under ground.-Mr. Buchan
exhibited a specimen of wood found in peat in Orkney. The specimen was taken from a tree 5 feet in diameter, and was transmitted by Mr. Baikie.

Entomologroal: Nov. 6.-F. Pascoe, Esq., F.L.S. President, in the chair. The deaths of General Sir J. B. Hearsey, who had formed large collections of insecte in India, and of Mr. Bouchard at Santa Marta, in New Granada, were announced by the Secretary. Mr. Stone, of Brightampton, sent for exhibition a remarkable apecimen of Sphinx Atropos, having only one antenna, together with the pupa case, in which the wanting
antenna was represented by a short curved horn. Mr. McLachlan exhibited some beautiful bred specimens of Sterrha sacraria, varying greatly from the type of the species. The larve had been fed upon Poly-
gonum aviculare by the Rev. Mr. Hellins. Mr. F. gonum aviculare by the Rev. Mr. Hellins. Mr. F cuniata; also a series of excellent photographs of McLachlan also exhibited a remartable female epecimen of Calepteryx splendens, the left fore-wing of Which wes coloured as in the mate, and the right corewing blotched with dark colour. Mr. Iansen exhibited three new British Coleoptera of small size, namely, Ingialea rufa, Lithocharis maritima, and Monotoma 4 foveolata. Mr. Stevens exhibited some fine insects of various orders collected in Damara Land were read:-1. On the Glenerg Calamobicas and Hippopsis, by Mr. Pascoe.-2. Manual of Materia Medica and Therapentics: being an Abridgment of the late Dr. Pereira's Elements of
Materia Medica, foc. By F. J. Farre, M.D., F.L.S., assisted by Robert Bentiey, F.L.S., and Robert Warrington, F.R.S. Longmans. 1865. 8vo, pp. 614. Dr. Pereira's work on Materia Medica has long been known as a standard book of reference on the subjects on which it treats. It partakes rather of the nature of an oncyclopedia than of an ordinary text book. It and this remark applies more especially to the therapeatical portion. Dr. Pereira's diligence and research were beyond praise; he compiled most accurate and complete histories of the various substances of animal, vegetable, or mineral origin that are used in medicine, but in treating of the application of these remedies he bewildered the student by the number, variety, and often conflicting nature of the statements he collected from various sources. Seldom, comparatively speaking, did he give the results of his own experience; seldom did he give any clue whereby the apparent discrepancies as to the utility of certain
drugs might be reconciled, and so it has happened to drugs might be reconciled, and so it has happened to
many diligent students of "Pereira," that they have acquired a scepticism as to the value of drugs, which bids fair to be only less mischievous than that excessive trust in physic that characterised our ancestors.

But we have in this place rather to look to the value of the work as a natural history of drugs, than as a
philosophical treatise on their proper use in the various philosophical treatise on their
The present volume is an abridgment of the larger work, and contains an account simply of those material agenta which find a place in the recently published British Pharmacopoeia. Hygienic remedies and agents, influencing the mind, are omitted from thia abstract as is also the historical account of the various systems of classification of drugs.
On the other hand, the editor and his colleagues have added much new matter, so as to bring the work up to the present date.
In its present shape then, Pereira's "Manual" is little else but a new edition of the Pharmacopoia with comprehensive explanatory notes. The Editor has availed himself of the most recent researches on pharmaceutical subjects, and is fortunate in having been assisted by two gentlemen who, from the positions they occupy, and from their long practical experience, are peculiarly well qualified for the task they hav undertaken.

Boors Recerved - My Library, by Pamphilius (Ward, Lock, \& Co.), is to consist of a series of sixpenny volumes, cowprising a "condensation of the primary aspirations of the great, the good, and the and animate virtue, to create emulation, to teach the rising generation to struggle, to endure, and to conquer difficulcies." The two volumes before us-E Eenomy of Life and Patient Boys-contain, in the shape o fragmentary stories, with reflections thereon,
much good advice conducive to this end. much good advice conducive to this end, member of the Victoria Institute explains the origin and objects of that association. Anything that will in any way tend to clear away error and promote truth must receive the sympathy and support of all conscientious workers, but we fear the attempt propoced by the "Victoria Institute or Philosophical Society of Great Britain," will only result in failure and the widening of the breach between the two classes of thinkers. The reasonings and assumptions of theologians seem to as, in many respects, as fallible as those of the students of science. Neither can boast of infallibility, but both should work on withont bias to render their respective
objects of study as free from error as human imperfection will allow.-On the Scientific Investigation of Disease in Animals and Man, by a Fellow of the Royal Society and of the Royal College of Physicians (Harrison). We commend this excellent little pamphlet to the members of the Victoria Institute. It contains
forcible arguments in favour of the prosecution of all branches of knowledge in a spirit of pare inquiry, the author expreseing his confidence that in due time such labours, however unproductive at first of what practical men would call usefal resnlts, will ultimately elicit some important and useful generaliations. The athor's illastrations refer chiefly to nedical science, but they are just as applieable to all other departments of knowlelge. The writer to scientific men engaged in prosecuting particular lines of research, on a plan similar to that which has been fonnd to work well in the case of the Kew Observatory, and, we may add, in the drawing up of Colonial Floras, Mesars. Longman have issue

..ves." A. Pettiarere, Brighton Grove, Mranchester. 2.res." A. Pettigrev, Brighton Grove, Manchester.
In our reply to Mr. Pettigrew's former communi ion (see p . 1 Usis), we did not misunderstand his meauing. In the first place, we object altogether to hives ing. An thing approaching the size of those recommended an our correspondent in his first letter. Bees would rever fill them, and few if any swarms would ever
isue out of them. But we can hardly suppose that he issue out of them. But we can hardly suppose that he
seriously advocates the use of a hive equalling in internat seriously advocates the use of a hive equalling in internal
dimensious ten of those known as Neighbour's c I proved Cottage Hive." This would contain, at s Imenguess, up wards of 11,000 cubic inches of buibding and breedfog space. If Mr. Pettigrew's logic were good, to increase the size of the hives gredually; but es his premises are wrong, so must be the conclusions to Which he has arrived. For argument's sake wo will suppose that hives double or three times the ordinary dimensions are to be recommended. If a swarm of of such be united and hived in it; this is by or more numaal, particularly by the Ayrahire beokkeepers. Surely this must be as well as waiting for two seasoris or more. The bees are enabled to construct a much grew is correct, ought to throw off a swarm of double the usual size the following seaso:. But is this the fict! Cert
We have many times united two first or prime smarms, and placed them in large-sized hives. We have noore than once known doubled swarms, which have domiciled in some large receptacle, such as a small barrel ; but we have never known them succeed after the first season one whit better than colonies arising
from single swarms. The reason is that the queen of any hive, whether large or small, can ouly lay a limited sumber of egge. True it is, that this limited number is very much larger than has boon usually believed to
he the case : but still there is a haging. Consequently, however populous a colony may bave been during the summer and autumu, yot in the adjoining hive which was peopled with a single swarm a: the samo date.
This last summer we had two enormous swarms Lives. The bees were put into secured in soparate hox, which apparently was unable to contain them all. A super therefore was put on in additiou. The lowe \(0 \times\) stock box was rapidly filled with combs, and a super the 25 lb . Weight was taken for our share. But what is nok any of the case at this present timse? Therre are which mant off two swarms in are in one clowe by, epring it most probably will not be at all more prpulous than the majority of the hives in the apiary. arge doubled swarms answer very well the frst summer, provided there is a good honey harvest, but succeeding seasons.
lling its becond swarm may not nearly succeed in ling its hive the first season; the next summer it may sot throw off a swarm, but will fill its hive with combs, and the bees will by the autumn have become very numerous. The following year it may be the strongest colony in the apiary, and throw off large and marly swarms. So it is with these large hives reeom completely Mr. Pettigrew. If the bees are unable to ral necenext, so that we do not imagine there in any madium-sized for incurring the additional expense of termporavily.
But we are also compelled to differ from Mr. Pettigrew in his inference that hives so large as those he recommends, throw off swarms of double or treble the had swarms from very large hives Wet at all exceeding those from cotrom very large hives, not at all exceeding disedrantace cotagers' skepr', and such hives possess the which frequently (at any rate in the south) is fatal to Whe prospect of any honey harrest from the swarm for tummer. While fact was very apparent this last th our ueighbourhood, and several of our own smaller cind of May, sending off swarms from the middle to the eutirely prevented doing so, did not swarm until the mond second week in June. Some of these late Hed their domiciles bady, while the eariy onem have \({ }_{F}\) se shaddition.
Thich Mr. he glad to know what the dimensions are adopted. Wr. Pettigrew would really advies to be If the mammoth hives that he may know to be in use, half mone of interior to be limitud to one-third or oneour part, as it would in most districts be found a great repond.

From time to obliged if Mr. Pettigrem will favour us on the subject of with further hints and suggestions

the Shampock to an Trithmen and prised that it is not adoptod so the national embles I was aswured by a truvelier that he had exbausted bis
inventive powers in devising means to escape eating of
dishes flavoured with this herb, but all in vain. As a dishes flavoured with this herb, but all in vain. As a
dernier ressort, and when half-starved, he determined to live on egge, but the fatal fragrauce parsued him still, much to his astonishment as well as disgust. At last, on carefully examining an egg before attempting to break it, he found that the small end bad been perforated, and some of the favourite herb introduced by the innkeeper, who was resolved that the national taste should be vindicated, and that, too, \(a b\) ovo and in extremis. Dickens's All the Year Round.
Pears Extraordinary.-We (Hertfordshire Express) bave been favoured with an inspection of some season in Mr. Goodwin's garden, at Bancrost House. Of two specimens selected, one measures 20 inches round the long way, and \(14 \frac{1}{3}\) inches in circumference at
about two-thirds its length from the stem. The other about two-thirds its length from the stem. The other
measures \(19 \frac{2}{4}\) inches round lengthways, and 14 inches measures \(19 \frac{2}{4}\) inches round lengthways, and 14 inches
at its greatest circumference. They weigh respectively \(2 \mathrm{lb} .4 \frac{1}{4} \mathrm{oz}\), and \(2 \mathrm{lb} .2 \frac{1}{2} \mathrm{oz}\). These gigantic specimens are also most handsome in appearance, from the perfection of shape in which they are grown. [Of what sort were they? Single fruit of Uvedale's St. Germain sometimes weigh as much as 41 lb .]
Erasine, -Grease, \&c., is readily dissolved by benzine; but the latter has the disadvantage of an offensive odour. A new substance has, however, lately been discovered, which possesses the useful properties of benzine, while, at the same time, any odour it emits is agreeable. It has been called Erasine, and is the product of a species of Pine, accidentally discovered by some persons who were collecting turpentine, and remarked that none conld be obtained in the usual way from certain trees; but, instead of it, a juice possessing the power of dissolving all animal and vegetable oils, without leaving any stains, or injuring the most delicate colours. Erasine has already found its way into commerce, and it would answer well for burning in lamps, but that it is too dear. Intellectual Observer.

The Planetree of Vostitza. - The chief wonder of Vostitza is the celebrated Plane-tree, with the fountain close by. We reached it by a good and clean paved road, creditable to the police of Vostitza. The Planetree, which is now in almost decrepit old age, has suffered greatly since the Revolution. At what period it became hollow, no one knows; but its branches are broken in many places, and the foliage is a scant remember it in its better days, with its white, freshlooking mosque near, its well-arranged encircling seats, its Turkish-built fountain, and all the usual ercouragement and provision for true Oriental kief. The Planetree suffered, about a century ago, from lightning and a fierce whirlwind; but the injury was apparently concircumference of 60 feet; that of the trunk measures 30 feet. A guard keeps watch in the bowels of the tree. It answers capitally as a substitute for a gigantic sentrybox. Not satisfied with this, the Greeks have imposed
upon it a sort of café. We saw chairs and tables placed upon it a sort of café. We saw chairs and tables placed
inside in the usual confusion. The scooped-out centre is capacious enough for all. These hollow Plane-trees are to be found in many parts of Greece. At Cheledonia, near Kephissia, is one, in the interior of which you can dine. Wyse's Excursion in the Peloponnesus.
Corsican Vegetation.-A large portion of the surface of Corsica-I may say all that is not a primeval forest or under cultivation-is covered with what they call
"Maquis." I do not like to use the word brushwood or scrub, for such are very common terms to apply to groves of underwood composed of Myrtle, Arbutus, Cistus, Rock-roses, and Mediterranean Heath, and yet of such is the interminable "maquis" composed. These choice shrubs are the weeds of Corsica, growing Wherever Nature is left to berself, wherever the soil is not covered with timber, and soon again turning even
cultivated lands into brushwood if left uncultivated for a few years. In the northern part of Corsica I found everywhere flowering luxuriantly a very lovely purple Cyclamen. In the Castagniccia it was quite a weed. Larg Mentone, 3d Edition.
Large Mushroom. - At a recent meeting of the Tetbury Horticultural Society, Mr. Reynolds, gardener to the Earl of Suffolk, exhibited a very fine Mushroom, measuring 12 inches across, which was grown in

\section*{Calendar of Operations.} (For the ensuing week.)
Grapes at this season are valuable or otherwise, just in proportion to the degree of perfection in which they have been preserved after becoming ripe. Three conditions of growth are, however, particularly necessary in order to ensure success:-1st, they must be well fed in the berry ; 2 d , they must be thoroughly ripened pretty early in autumn; and 3d, they should receive abundance good root action, which is of more importance than overloading the border with manure; thorough drainage, and such a constitution of soil as will at all times readily transmit moisture, are also necessary in order to ensure healthy growth. To be a dry atmosphere, and a free circulation of air day and night. They should, moreover, be well coloured before sun-heat becomen deficient. Attention to these
principles will scarcely fail to ensure success, As to the application of fire-heat, if the house is too
too daunp, keep fire enough to remedy the evil.

\section*{FLOWer garden and plant houses.}

Advantage should be taken of frosty weather, should occur, to do any rough work in the principal part of the doing of which involves a considerable mess, which can be more easily removed in hard weather. A similar opportunity should be taken to wheel old exhausted
soil from the flower-beds, and to replace it with fresh soil from the flower-beds, and to replace it with fresh material, as this kind of work can be done during frost in half the time that it would take if done when the ground and walks are soft, and with a tithe of the injury to both which would inevitably occur in the latter case. At this time of the year, it often happens that
severe frosts follow heavy wet. When plants are over done with moisture, they are more susceptible of frost than when moderately dry. It is therefore good policy to guard against extremes of either one or the other.
adrioulas. - A double mat will be advisable over the Auricula frame at night, but should it be possible, even in severe weather, to give air, by all means let it be done.

BULBS.-Tulip beds will be more safe covered than xposed; and Ranunculus and Anemone beds had better be thrown up, in order to sweeten and insure the destruction of insects, \&c.
Polyanthuses.-These will, perhaps, now claim extra notice. Those on beds, if parted at the usual time, will often have the collar exposed too much, and roots comparatively bare; independently of this, holes, which, with their castings, give the beds an untidy appearance. One plan of avoiding these results is to carefully fork up the soil, so as to disturb the fibres of the plants as little as possible, removing the rotting or broken leaves; then, with a mixture of decayed leaves and cow-manure, which had been prepared, and under cover some time previously, go carefully over the bed, filling up all inequalities, placing couple of handfuls round each plant; in fact, giving them a complete top-dressing. This operation will prove highly beneficial; and its re
vigorous start in the spring.

\section*{FORCING GARDEN}

Pinks.-Let the temperature of fruiting pits range from \(55^{\circ}\) to \(60^{\circ}\) by night, and from \(65^{\circ}\) to \(75^{\circ}\) during the day : bottom-heat sbould be about \(80^{\circ}\). Admit as much fresh air as possible, moderating the quantity and moisture, should be regulated by the clearness ot and moisture, should be regulated by the clearness of
the weather and the amount of air which can be admitted. Do not on any account allow the moisture to be in such abundance as to condense and run into the plants. Crownless and deformed fruit are the result of moisture being allowed to accumulate in the hearts of the plants at the time the fruit is coming up. Where the pot system is practised, the plants in all stages should be examined once in two or three weeks, and a portion of those whose roots have made the greatest progress should be repotted.
Vinks,-ln starting these, after washing the stems and glass, the woodwork, and everything else about the house, should be painted if not already doue. If the outside border is not already covered with litter, this should be done before the Vines are started. Uness the roots extend into the interior of the house, the border should be covered with 18 inches of fermenting material, such as stable litter and leaves, to produce a gentle warmth in the soil before the inner temperature is raised higher than \(50^{\circ}\). Before the litter is laid on, all loose or exhansted soil should be scraped off the border as far as the roots, and replaced by a topdressing of charred turf, crushed bones, charcoal, and resh horse-droppings. 'The inside border should also have the exhausted soil removed, and be top-dressed with similar mixture. Commence with a gentle heat of from \(45^{\circ}\) to \(50^{\circ}\) night temperature, and from \(50^{\circ}\) to \(60^{\circ}\) by day.
hardy fruit and kitchen garden.
Where fruit rooms are not furnighed with a stove or coil of hot-water pipes, considerable difficulty is often experienced at this season in excluding cold and damp. Of the two, perbaps, the latter is the greater nemy. It may, however, be remedied by spreading some unslaked lime in wide pans or drawers, exposing as much as possible of its surface to the atmosphere,
and exchanging it for fresh as soon as its absorbing powers are somewhat satisfied. Frost should be excluded if possible; but if this is to be effected by the aid of artificial heat, the latter should always be used in connection with ventilation, that the moisture evaporated may be allowed to escape. If there are however, no such conveniences, the simple means of natting up the doors and windows must be adopted and if, in spite of these precautions the internal temperature falls below the freezing point, care must be aken to prevent a sudden thaw by keeping the room close and shaded for a short period after the return of warmer weather. This points out the advantage of constructing such places on the north side of a wall, as ney are thereby preserved from extreme heat in summer and from sudden variations in winter. Many ture of \(60^{\circ}\) for a lew days previous to use; there they
of flavour, while they wonld hattain their fell ride room shrivelling till useless.

manure from any infected farm or cowsheds, and that no eattle, during the prohibited time, be turned upon any road, common, or unenclosed land.
It will be seeu that the Orjer in Council which we give in another page, enables local authorities, if they think proper, to do in their respective distriots nearly all that the Farmers' Club dasires to have done. No order of the kind will be of any avail unless local public opinion sanctions it; and the Government has done well therefore to make the adoption of this order the work of the local magistracy, who alone are capable of judging rightly whether or not it is practicable or advisable. Our readers will find in another column several communications, some of them addressed to ourselves and others to the columns of the Times, on the subject of compensation, treatment, and prevention.

Carts. Wr have used none but Busbr's prize and general usefulness, but they have one grievous defect. The space between the sides and wheels is so very small that if a hard frozen Swede gets jammed, woe to the spokes. Moreover, the iron slot below the tail-board, at least at either extremity where it ought to be extra strong to carry the side stay, is too weak; and the slot bar connecting the shafts behind is faulty, and requires more and better disposed iron work. Now to Busby, supposing him to have been a good type of a man, these facts were of more value than pages of praise. Where were the judges eyes?-for Busisr was cart king for many a day We are told that the stone carts in Paris are very long, and mounted on huge wheels, and carry great weights. A short-bodied oart is always heavy on the horse; perhaps the East Lothian and Berwickshire type is too short. We remember that all the carts used by the grain dealers who bought and carried from Haddington to Edinburgh were long, almost sideless carts. Such is the type of the Edinburgh (Craigleith quarry) stone carts, and of the railway trans-shipment carts of Cameron \& Co., railway carriers for heavy goods in Edinburgh from Waverley Station to Lothian Road, Caledonian Station. We have noted length as characteristic of carts, and our bailiff repeats the observation for Preston and the west of Lancashire. There is an endless diversity in types of carts; but there must be only a very few-perhaps not above three or four good types, as in the case of ploughs, and what are they? The plough question has come to hair-splitting and fiddlefaddle; but grubbers and carts are yet an open question, and well worthy of far more attention than they have yet received. \(H\).

\section*{MR. CLAYDEN ON THE CATTLE PLAGUE.}

THE foilowing is the substance of the evidence given by Mr. Clayden, of Saffron Walden, before the Cattle Plague Commissioners:

I am chairman to the Agricultural Hall Company. I farm about 1800 acres of land; 1000 under Lord Braybroke, and nearly 800 of my own. I am mayor of the borough of Saffron Walden in Essex ; and we have shut up the Saffron Walden market for six weeks last Saturday, also the fair on the 1st day of November next. My wish would be that every head of cattle should be cunfined to the spot where it now is, for at least one month. The disease is of the most virulent and most contagious character, and it requires the most active measures to counteract it, and this season of the year is the best that could be adopted for that purpose.-Meat will keep good for a long time, and the means of conveyance in the country are exceedingly good, and there is no frost to affect the quality of the meat. There are very few farmyards in which a shed could not be soon formed for a slaughter-house. I do not mean to say that it would be as good as a butcher's slaughter-house, but it could be formed ; and if you could confine the disease to the place where it now exists, for one month, which would entail the slaughter ing of all foreign cattle near the port of disembarkation, it would have a very beneficial effect. I consider those strong measures necessary because of the contagious character of the disease, and the loss that it entails both to the purchaser and the seller and the consumer. -It is my opinion that store animals congregating together in a town acquire the disease, and that whon they are sold they spread it through different parts of the country. The profits of farming are now cut down so low that the graziers buying cattle for grazing cannot afford to lose a bullock ; they can scarcely afford to lose his tail ; and great loss is caused throughout the country through the movement of the store cattle, and the farming interest will be reduced to a most woeful state if this thing is to continue. The disease is of that nature that great inconvenience must be felt, but I do not see when it could better come than now, because the country is exceedingly full of feed, and it is a time of year when cattle will not suffer. We know that
there are many grazing farms where they are sold from, but still there never was such an abundance of feed as there is now. I would confine every animal in the whydom, Fugland, Ireland, and Scotland, foreigner would have no cause of oomplaint, because his cattio would be treated just the same as the English farmers'. I feel sure that the butchers' trade could be carried on if all the animals were obliged to be slaughtered on the farms themselves. There is not a farm on which a slaughter-house could not be made, and it is a time of year when meat would not suffer from exposure. In the winter season the meat would be very much injured by the frost, and in hot weather by exposure to the weather, but that is not the case now. "I have the honour of being chairman of a Cattle Fel that the disease was imported by foreign animals and given to the London cows. We have only had two casee in our district, and they both arose from calves bought from the London dairies. In consequence of our having an association, and insisting upon every animal being killed, we have not had a single case of the disease spreading in our district. In the two cases in which the disease originated, every animal was laughtered on the farms, and it did not spread, either the district or in the individual parishes. I would slaughter foreign cattle at the port of disembarkation I would place them on the same footing as English cattle, and you would use the foreign importer more fairly by slaughtering his cattle than you would by putting them in quarantine. Just picture a lot of cattle taken out of the hold of a vessel and put on to a marshy meadow, and having to be there for three reeks; that is more likely to bring the disease than to prevent it

I would extend the prohibition to the movement of sheep as well as cattle. In our neighbourhood, last Saturday three weeks, a man named Ciblin, of Wethersfield, near Braintree, bought 80 sheep at Cotchester market of a man named johnco ; ive died immediately, and they kept dying till Professor Simonds was sent for. Other veterinarians were had recourse to, but they said that it was not the Cattle Plague. Professor Simonds then reduced the lot down to 54, and the other 26 he slaughtered as good for human food. They all died, and they died within 18 days of being purchased. They were wether sheep -shearling sheop. That has made us afraid of this disease ; and to prove that this was the disease a man named Raven, whose fields adjoin Giblin's, and where there was a brook not so wide as this table between the fields, had two cows, one of which took the disease and died, and the other he had killed ; and another farmer in the same parish had the disease also adjoined."

\section*{AGRICULTURAL EDUCATION.}

On Mtddiz Class Education, having reference to the Improvement of the Education of those who depend upon the Cultivation of the Soil for their Support. By Mr. R. Duke, 14, Barton Crescent.
As connected with the welfare of the agriculturist, the improvement of the edacation of those who depend apon the caltivation of the soil for their support is a subject well worthy of the attention of the Royal Agricultural Society. It is, moreover, one which may be expected to have an influence upon agriculture, and, as such, is specially an object of the Society's interest. If improved education contribute also to improved agriculture, it comez legitimately within the scope of its daties, and possesses obvious claims upon its consideration. What, then, is Education-and how can its improvement be effected? In considering this, education may be divided into two kinds-general edacation and technical education. General education is to a great extent of a rudimentary character, and though it may be more or less advanced, it has no necessary connection with the calling or business of life. Technical education, on the other hand, is so connected, and is determined by the profession or calling selected. General education has rather to do with the social position. As such, its value is recognised by the agricultural as by all other classes, and it is hardly necessary to solicit for it the aid of the Society, even if it comes within the sphere of the Society's duties. The agriculturist, however, requires a technical or an agricultural education, and which should comprehend all that relates to the advance of agricaltare. If there are branches of knowledge by means of which agriculture can be improved, a diffasion of that knowledge will be the best means of improving the education of those who depend upon agriculture for support. Here is a large field with which the Society may legitimately have to do. It is a subject of great and growing importance. Unike her other resources, the soil of England does not increase, and it can only be by increasing the productiveness of that soil that its capabilities can be made to keep pace with her increasing population. Since the beginning of the century this population has doubled, and within the next 50 years may be again doubled at the present rate of increase. Can, then, the produce of the land be made Can the pace with this enormous increase of population? Can the noil be made more productive by the applica-
tion of advancing knowledge Beyond a certain limit attained? The great improvements of late years, in implements, in stock, and in all the detalls of practical farining, indicate the advances which may be made. The aduption of these improvements, however, has been in very different degrees in the various parts of the
country. The climate has, doubtless, had much to do with this, but does not altogether explain the differences which prevail. The best farmed districts are those, Where, as on the eastern coasts of the island, the rainfall is least. The climate of Ireland is, in this respect, much inferior, but it is not a sufficient reason for the back ward state of agriculture prevalent there.
Can then a knowledge of these practical improve ments be made"more general-can they be still further advanced by scientific information? This is the problem which agricultural education has to solve. An extension of the knowledge of the best practice must be of unquestionable advantage. How far agriculture may be still further assisted, we shall now consider in examining the eciences which bear upon it.
I. Of these sciences I would first speak of Mathematical knowledge. Not only is this knowledge of the most inproving kind to the mind generally, but it is, including arithmetic, the forndation of two of the most useful aids to the farmer-land surveying and bookkeeping. An agricultural education should comprehend a grod knowledge of arithmetic, of the first four rules with fractions, proportion and interest, and of at least the first bonk of Euclid, with the principles of land
measurement and mensuration generally. To measurement and mensuration generally. To none useful; he should constantly have to do with it, and cim be with advantage guided by it. I can remember on my first experience in farming, distributing a large manure heap pretty evenly over a Turnip field, and being complimented by a labourer saying, "I had
guessed it well ;" but it was not the resuit of guessing, but of measurement. A knowledge of measurement, solid as well as superficial, should be acquired by the farmer, and to him land measurement is of peculiar utility. 1sy it be is enabled to ascertain the contents of any piece of land which may be desired. Even with. triangles or rectangles being laid off, the number of paces in their sides will give with sufficient aceuracy their length in yards, from which the, required result may be computed. With a knowledge of scientific principles this need nresent no difficulty, but without this knowledge it will be impossible in all cases to arrive at accuracy.
Book-keeping, or a knowledge of accounts, is perhaps of all others the kind of knowledge which will be most generally useful to the furmer. The forms of farm book-keeping hitherto published have been too complicated, and the tarmer has in too many instances solved
the difficulty by keeping no book at all. But every fariner the drfficulty by keeping no hook at all. But every farmerer
should be able to keep a book, and to draw up some kind of balance sheet. In every business it is necessary occasionally to take stock and to form some kind of estimate; in none more so than farming. The farmer 12 months must elapse before he can know the result of the actual yield and price obtained. Meanwhile his expenses, family and otherwise, go on as usual, and thus if there is any serious shortcoming he is placed in a difficult position and umable to meet his reut. Farming is a profession involving mnch uncertainty. It is markets. To how great an extent, the following striking Table will show, being a report of the produce upon a Livcolnshire fen farm, where an account had
been kept for a number of rears: been kept for a number of years:-

Prodece of Wheat cpon a Fen Farm.

In this case the rent of the farm was 200l., an amount which is exceeded by the difference between the return for the year 1856, and that for the year 1861.
All these fluctuations the tenant has to fear, his rent is fixed, and many of his other expenses also, so that while in one year a handsome profit may be realised, in another a positive loss may accrue. To none then, more than the farmer, is it necessary to form an estimate; he cannot be too early informed of the probable result, and upon his ability to form a correct estimate, much of the success of farming may depend. That a correct estimate can be formed in regard to a crop, Mr. Coleman, of Woburn Park Farm, has shown in the Mark Lane Express for Sept. 4, 1863, wherein he states 155 acres, was 5115 bield of the crop, 1862, on a farm of 155 acres, was 5115 bushels, and the quartity actually threshed was 5135 bushels. In the case of the Turnip crop, it is still more necessary to form an opinion. What will be the return, and how many head of stock can he To do this juedions the furmer must ask and answer. To do this juagment is required, but the assistance of tigures is also necessary. With these he must be well acquainted, and they should form an integral part of the mathematical knowledge required in his professional education. That mathematical knowledge can tend to the improvement of agriculture must be admitted, and we may proceed to consider those other II. The next science asstance may be derived
II. The next science of importance to the agriculturist is Veterinary science. When the great value of the live stock throughout the country is considered, this importance will sufficiently appear. This is strikingly exhibited in the returns which have been made both in Scotland and Ireland. In Ireland accurate statistics are taken, both of the crops and stock, every year. From this we are enabled to estimate their respective values. The returns for the year 1864 are as given below, made up from the report of the
Registrar-General:-Registrar-General :-

Return of the Irise Crops and Stock for 1864.

From this it appears that the value of the stock is quite equal to that of all the cultivsced crops grown Tise rutes assumed for the stock are those of the Census Commissioners for 1841, since which time the improved character of the stock und inereased price of meat will both have tended to improve its value.
The Scotch returns exhibit the same result. The last year for which these were obtained was 1857. The return for the crop for that year, was, as officially estimated, and taking the prices which then prevailed, muted at the rates given in the Irish retarns, although this may be considered too low in the case of horses and cattle, and perhaps too
great in the case of sheep great in the case of sheep.

Return or the Cropg and Stook in Scotland, \(195{ }^{\circ}\)

qual to that exhibits the value of the stincic: equal to that of the cultivated crops, as in \(: 4\) se
Ireland. In both countries the propori small which is under crop, compared antion extent of the country, being in Scotland, 9 ith,\(\ldots 4\) and 20,808,271 acres, theire, out of 19,352, 53 Scotland this is to a great extent necespective from the great extent of mountain For England we have purposes.
For England we have no similar
be assumed that the rule still hold returns, br a much larger proportion of the country is an that the superior character of the stock rendem inferior in value to that of the cultivate 1 cropa.
These considerations tend to show which the farmer has in his stock. It great in unfrequently more than half his wealth. Whater fore, tends to maintain its value, tends also mater
to his advantage. If the liability to dise to his advantage. If the liability to diseasp ever may diminish this risk will be apparent the object of veterinary science, and no sciences which concern agriculture have of made greater advances. It is not to be exnct, That is a distinct profession, requirine a vetinary of competent knowledge; but it will a great utility to the farmer if he can be enabled to disease by its symptoms, and apply the proper nese. check its progress till the veterinary surgeon information, that he may come provided proper remedies. The death of a single ani able to assert like armer, and although we inay own Cattle Doctor," thata drint his "Every Md eighteenpence each would have saved this ledge of the principles of the veterinary enable the progress of disease to be stajed, t: egular practitioner when called in has a fair cia effecting a cure. Veterinary practitioners now is qualified to fit thembers, and receive an edur qualified to fit them for their profession. It is, ther their assistance when required, and in avail hinser: carry out the treatment which they may precen acquire for himself some preliminary knowledge subject. Veterinary science is also conuected wit mportant subject of ascertaining the age of anim by their dentition. The usual indications of age in: teeth, principally those in the lower jaw. It is practice alone that proficiency in this can be attaine but it is necessary in the first place to be informed wi.d. the indications are to be looked for. This informatin veterinary science will impart, and by it the age of horse can be determined even up to 20 years. I also their dental indications, from which, when nepes sary, their age can be ascertained. Veterinary scien, has an essentially practical bearing upon agrimitura, and as such demands the attention of every enlightened agriculturist.
III. The next science of importance to asriculture Mechanical science. As implements may be chara terised as the right hand of agriculture, 80 mecbania science, it has been said, by improving their form ar advancing their construction, has given cunning to tha right hand. By investigating the strength materials it employs, it makes use of no more overcome the force of resistance, and it seeks to discor that form which overcomes resistance with the leat power. Simplicity of construction, beauty of form mathematical adjustment and symmetrical proportion of the whole machine, are now the characteristics of our mplements, and it is not the fault of either implemen. or implement makers, if field work is not now emicient. neatly, and quickly performed. Amid the multipici of inventions it may not be necessary for the farmer : be an iuventor, but he may still reuder as great service to agriculture by simplifying the action of ar useful machine, and thus renderisg
derangement, as by inventing a new one. The number eminent agricultural engineers who are now to be f. in all parts of the country have, to a great extent, fied the practical difficulties whichare connected wid branch of agricultural science; and the farmer was he great extent leave the matter in their hands, he makes himself acquainted with the particular mo...
and specialities of the machines which daily issue fon and specialities of
their workshops.

The enployment of steam power, however, is branch of this subject which merits special attenuti This great motive power, hitherto employed upu tie farm for threshing, and now coming for ploughing, requires to be understood agriculturist farming on a scale to

 Whole batch. out this is qualitiod by by provious statement which I own
 during which the last great murrain lasted ?
 Aelps of the dayis was furnisthed with a constant supply ficate mp presentation, as one may sas. ower the cilunter.
I will not pay the Commisioners
ine bode compliment of

 i, sir, am didersmugh to retocmber the time when the estat en of chis realm were called upon to pay down twenty millions
for mome black chatels belonging to their follow-citizens, aud what's more, they paid thie mones. I shall not now go into the question of property in hunaan flosh, and whether a goond
itle cam ho mado to it
 abundant nvo or graty, call it by which name you will. To my
justice, or our
peor thinking one thing. however, is cevar. A man has a Wetter titlo before God to the property in a conw than the
property in a man, Le he ten tines the descoudant of Han.
1 therefore comio to the conchusion that the same country
 dianuted crunfiscation, must bo straurely pus lic or any other grounds, it crders peremptory slaughter of a farmer sor dairy
man's stack without at the same time tendering him compennation upon some seale or other. the country was cheated on a great scale during the murrain
of \(1745-5-56\); and had it not beeu the fashion for a loug time nart (halr, in in jke and halc in acarnest) to pile everything from
fross stupidity down to unallowort greediness on the broad
 styled innch forable question of indemnity find its difficulties, I will tell you, sir, what points I expected to find in it, and Inding. \(\begin{aligned} & \text { I expected--for the plague first broke out in the unwhole- }\end{aligned}\) some celliars of the Loudon dairyman-to meet with an order preventing the kecplng of cows in any sheds or stables which
are not aborc ground, aud in every respect as rooms and comfortable 'as stabling for horses, with licensers within the
umits of London and all great In the second place, I expeoted an or ler probibiting the express purpose, one of the conditions of which should be that every beast have room to lie down. A ruminating
animal that is forced to stand upon its legs for any lengthened period is likely, even when it start in a healthy condition, to journey. imitate horrors of the midly by the importers of cattle. I suppose they think that a percentage rill pay sufficiently well,
and that it is no busiuess of theirs, so long as they find In the third place, I expected that. instead of killing foraign have been set apart at the different ports for importation,
where the beast could be rested and brought round a little previous to his siaughter. I should suppose that the reat under such regulations would be muct fitter for human food
and \(I\) see no difficulty in preventing the egress of the animal otherwise than in the carcase

Yourthly, I hope that the Comminsioners would not have neglected to insist uponione of the priucipal conditions in the
directions for the burgin: beasts dying of the plague notified in the Order of Council of 1755 -viz., that the hide should be slashed at an interval of every 6 inches, in order that no
resurrectionist might make it available for the currier, which I am far from supposing may not now be done. Flaughter would hare been insisted on when prudentiy and clear to any one going into the details of the last great plugue that slaughter on the instant of its appearance was the only chance of arresting its progress. These who tried to cure lost
on tun average nine out of 10 ; those who killed at once not unfrequently stamped out the pestileace.
told us the unpalatable but inexorable trutb-that in the previous pestilence (although occasional recoveries tuok place under ail modes of treatment) no certain or even recommendable cure was ever devieed, and that it died out, as it came, Without any nitensible reason, or any arailable remody turning
up. I further expected as rider to the above that they would no syatem or remedy can be recommended to the present date even hope, but that recoveries have taken place under all modes of treatment and without any. inspector and policeman's bill and all the other itenss of expense entailed on somebody by the ueceasary surveillance,
which sort of shepherding, I presume, is not done for nothing
As a plain-dealer \(I\) should like to have been informed on all expressing my disappmintment at finding that none of them are treated in a full or satisflactory manner
I will be judged by any practical man, and do not hecitate
to affrm that an Order in Counctl sulch as I expected would have been hailed by the couutry with gratitude; whereas, I
very much doubt whother the present one is wort very much doubt whather the present one is worth the paper
upon which it will be printed. Finchilsee and Nottinghan, Sastwell Park, Ashjord, Kent, Nov. 24-in the Times.
4. Notrishment; not "Treatsient."-The following facts connected with the outbreak of the cattle disease in my stock
may prove of interest to your readers. They have led mee to
the cunclusion that more may be effected by judicio to support naturo by food than by actíve medieal treatment

To come now to the attempts made to cope with this formidable adversary, some preventive measures were tried, but with-
out success. Chloride of lime was freely used. Some of the
cows were washed in a cows wers. washed in a warm and wealy solution of it, and
vineggar, so confidently recommended by some of your cor
respondents, was tried. with others internally, as well a washing the noses and mouths. Nor was I more fortunate i but soon gave it up. I desired my bailiff to follow a treatment dministered bylmy direction Condy's disinfectant fluid, which his case.
leaths had tand ho thinks with some :success. After someene he gave a wineglassful mixtur cayenne pepper, mustard, and vinegar, diluted, twice a day neeze violently, aud cleared both nobe and throat, an
btimulated the appetite. He persevered with it to th
but it was tho uncertain in its effect to be relied upon. Simply to careful feeding. Good constitutions and good condinourishment few of the nine would have survived. This was Oalministered to each and all three times a day with a bottle. mixture of Barley-mesal and Linseed-cake, ground down and trouble, for ta the tender state of the poor animals mouths
and throats it was difficult to handle them, and some of the caives were so prostrated that they had to be lifted on thei
legs to receive their dose. So satisfied were they with their
nurses' treatment that after a ferw doses they came forward and them. He persevered, however, with his bottle, and the
rallied, and are now well. This simple treatment has, I doubt not, been tried by others, but I question if it has, except in
rare instances, been so sedulously and judiciously applied
Attention to diet is a leading item in the different reports that bave appeared. It forms an essential part of the to the Edinburgh magistrates last month, and I think it will in the treatment of human disorders
mouth and throat are as tender as thel poor cows with the rinderpost, or the stomach loathes its accustomed food, or nourishment to the frame in the form in which it can be

Judging from what has come under my observation, I think to the owners of stock have been too much inclined to look perhape complain of the want of science in the veterinary proy of support, and a larger proportion of recoveries may be
rolied upon.
b. Chelsea Cow Houses. - Many months have elapsed since we firgt heard that a terrible disease had broken out amongst our cattle; and notwithstanding the best efforts of our Government to discover the origin possible cure, or prevention of this so-called "rinder pest," the public are left in a state of greater alarm and doubt on these subjects than even at first.

Tho Special Commission appointed to investigate the
matter seem to have come to the conclusion that cure is impossible, and slaughter the only resource so soon as disease appears; a system which, as now carried out, involves not only the slaughter of the sick animals, but also that of
with them.

They do, however, speak of the possibility of finding means to prevent the plague from spreading, and invite suggestions as to these means. I therefore think it a duty to the public to give my experience in this matter, which is by no means small.

During the first week of the present month I was called in to see a cow in a herd of 18, which was so diseased that I ordered it to be slaughtered, but I set to work earnestly to stop the mischief. I used Condy's Fluid diluted with water (about a wineglassful to a mixed with the grains they fed on. I washed the cows mouthe, as far ass the hand could reach, with alum lime-washed, the walls covered with gas tar about 8 feet high, and prepared the following dose:-Half a pint of whiskey and 1 lb . of spirits of nitre mized in a pail of water arrowroot-and had a quart given to each cow, and there has been no second case on those premises, although a fortnight has elapsed.
Previously to this, about a month cows were attacked in another shed, and I used this fluid, which I am sure is the best disinfecting agent known, being not only innoxious but positively wholesome to inhale or drink. I administered gruel, old ale, and Linseed tea mixed in equal quantities, viz., one quart
of each, and out of the five cows four were saved, and only one died.
In che large district of Chelsea only six cases have occurred, and I attribute our immnnity from this
scourge to the active and intelligent interest Dr.
Barclay, the medical officer of health for Chelsea, takes in the subject. I owe to his instructions the plans for disinfection and purification which I carried out, as described above, with gratifying success. Ealand Alder, Sanitary Inspector to the Vestry of
6. The Polre-Axe.-What an effectual remedy has been propounded to getrid of the cattle plague! Nothing more nor less than the destruction of the animal, even, suspected of being under the influence of the malady or likely to be so. This extraordinary measure, adopted by authority, so contrary to the principles of science, is
now happily wearing out, though it has been exceednow happily wearing out, though it has been exceedfavourably of veterinary skill and practice. Much has been said and written upon the interesting subject of the cow murrain, without throwing much light upon the mysterious disease. No specific is likely to be discovered, because the constitutions of animals which have become domesticated are as various as human beings, and this fact must be taken into consideration before particular and individual treatment is adopted. Though no cure for the Rinderpest is known, yet there are many palliatives very beneficial when the animal is first off infection or mitigate the attack. Precautions, such as cleanliness, proper ventilation, nutritious food, good water, and protection from extreme atmospheric changes, tend to invigorate the constitutions of all animals, and give them a better chance of escaping sickness. Not London treatment, which uses up a healthy cow in two years or less by unnaturally feeding the unfortunate brute to force the milk, and keeping it in dirty, damp, unwholesome stalls. In a civilised country this system is monstrous, not only torturing the animal itself, but distributing to the
public impure milk, which of course must partake of the feverish condition of the cow so shamefully abused. A legislative enactment should be passed early in the forthcoming session of Parliament, to prevent cows being located in large towns. Whether it is or not there is a fine opening, and the speculation would pay dairies within 20 miles of London to supply the inhabitants with pure milk and cream, which they now seldom taste; and the use of chalk, brains, suet, \&c. would then become a matter of history as ingredients to adulterate milk and cream. Falcon.

\section*{AGRICULTURAL ECONOMY.}

The following papor was lately read before the Croydon Tre wise man says, "To everything there is a season, and a time to every purpose under heaven." Now, it certainly is not the time to talk over the profits of the past three years, but it will readily be allowed that it is the proper time to inquire how are the profits to be obtained? And if so, the economy of production must form a very important part of the general question But before we inquire as to the importance of economy the question naturally arises, What is economy ? What
does it consist of ? Perhaps that question can be best answered by first referring to what is not economy.
In the first place, then, we will state without fea contradiction, that bad farming is, not economy; and in the next place, we will assert with equal boldness am convinced that the generality of the farmers of the present day make a grand mistake here. After having ncurred all the fixed charges against the crop, such as rent, taxes, labour, and all the sundries which cannot be avoided, how common it is to see only half a crop, manures. I would ask, is it economy to spend \(5 l\). an acre for half a crop, or 6l. per acre for a full crop? It is not economy to overwork or underkeep, or in any Wise neglect the farm horses. An insufficiency of nourishing food to the live stock generally is not
economy. It is a common mistake to allow an animal economy. It is a common mistake to allow an animal
about sufficient food to enable him just to maintain his condition; whereas a little more-only a little morewould enable him to improve and leave a profit, often to double his value in the course of six months. It is not economy to allow an animal a sufficiency of food, and not also to provide him suitable lodgings, and a good bed, and also to see to it that he is kindly treated; that he is in circumstances, and surrounded by circumis in constant fear he cannot thrive. My own experience is, that it requires one-third more food to keep up the animal heat when exposed in a cold yard, than when suitably and comfortably housed. I believe that if farmers generally knew how mach they annually lose for want of suitable shelter for the animals and What manure, the landlords would hear more about it. enable want in a farmstead is such buildings as will wise not economy to allow wither animala or implements to get out of repair. How true is it that "a stitch in lime saves nine!" "For want of a nail the shoe was lost ; for want of a shoe the horse was lost; for want of a horse the rider was lost." How many a good horse medicine!
cultivation; one year's seeding will cause to se: weeding.

reducing the outgoings of the farm, nor in in most middling crops at a small expense, bat in prodrodec is ofter minutio much lost for want bf a due attention is made up of expenditure. The aggregate expendi were examined one by one, it would bevious it that on some farms from 25 to 50 per cent. of expenditure is wasted, especially on farms occupie , the early part of their hin and naturally enough think they wonld like to form and because they don't know much about it the ftr True, they the bailiff; and what is the comeequenon crops; but what about the expenditure? It may quite as healthy as they expected, but where large profits they prospectively boasted of? \(\triangle\) gool
 should know almost everything. He should undent the scientific and theoretical part of his businem; b woe u
In the simple operation of ploughing the land, 1 han often seen a man and a boy and four horsea, ming antediluvian plougl, doing about \(2_{4}^{3}\) roods per Reckoning each horse at \(3 s .6 d\)., the man at \(2 s\). 3 d, the boy at \(1 s .6 d\). , this costs \(25 s\). per acre; when on the hedge, on similar land, you might see a moden
plough worked by one man and three horsee abren doing an acre per day with ease, making quite as good better work than the other, and, reckoning the how and man at the same rate, at an expense of \(128.6 d_{\text {. por }}\) acre, being a difference of 50 per cent. in the expen of the operntion. And if you look out at seed time you will probably see, if the seed is sown broadenst one man pretending to sow with one hand, and getting probably see a man using both hands, and doing 12 sere day, and malking better work; nay, I have even soon two men, one boy, and two horses, using a drill, wit coulters jacked up, putting the seed on broadias equally well done for 3 d. per acre. Don't undertend me to recommend broadcast sowing; I would almy drill when the land is a proper state. Then, again, the operation of harrowing: in the one case the ashioned wooden harrows will be ground three or four times; and in the other case trin over with a modern implement will make quite land treading. And if you follow out the varion operations of the two fields antil you get the com int the market, reaping in the one case with the sickle, in the other with the reaping machine-- machines, n the case with the most prencine-you will find difference in the expense of about 50 per ant throughout.
The importance of economy is strikingly evinced the different modes of working the fallows. The al system-that of working exclusively with the ploug
and harrows-is very expensive. In this way, four ive ploughings and harrowings, and rollings count, are necessary/to make a respectable fallow. Tecer it has been well exposed to the atmospheric ; but it very doubtful whecher the Couch-grass and othe weeds have been destroyed, unless the weather has been very dry and hot. There has not been lie befor the Couch, and especially the Knot-grass, to drequen ploughings the soil is generally in infavouruble to the sermination of the seeds of meed of course it is a very important p operation to cause the seeds of weeds
which is certain destruction to then important to bear in mind that there is a crown. In this case a shallow broadshari atumn is far more effective than several de ings in the following summer.
of the root with the broadshare, and keep surface of the ground, occasionally moving harrow until it is dead, the bottom part of the rot: it grow without the crown, bat the crown

Some of cur modern farmers discard the plough altogether, using the cultivato better and a much cheaper mode than the of ploughing and harrowing. But my that a medium between the two extremes is best, and quite as cheap as working exclusively cultivator. I prefer to put the cultivator two times through, with intervening harrowing, Couch, \&c., is warked out and kept at the top long to ensure its destruction; and also of surface so perfectly pulverised as to ensure and destruction of all the seeds of weeds, I want to see the other side of the soil nual weeds, is sure to be the result of frest soil op of ant up.
The practice of some farmers is always to plough the land orie stereotyped depth. Now I hold there economy in varying the depth - once in a thoroughly bottomed; then, cost wat it may, it ploughed as deep as it well can be ploughed. I wint leas and general seed furrow I plough a moderate depth; but after the sheep I prefer either to plough very thin, or, if the fitld is not so clean as desirable, I use the caltivator instead of the plough. I consider that ploughing various aepths is not only a great saving of aking near half the power of eight inches in depthof the old beaten, almost waterproof bottom are " The inportance of nutumn cultivation, in an econo mical point of view, cannot well be overstated. It is a
well-known fact that Couch-grass and other weeds do not make much progress so long as there is a good crop of corn on the ground; but let the corn crop be remored, the rubbish will at once begin to grow and prootbold; another will be ripening and maturing its seeds ready for a future crop; and if you allow the weeds undisturbed possession of the ground for about sir weeks after harvest, then plough the ground a nice and the seeds of weeds, then fully matured, will remain in a dormant state for months or years, as the case may be, until they are turned up again, when, if the land is in

But why allow this if we are to farm with ecunomy and proft? These weeds must be destroyed, aud the sooner after the larvest the better. The cultipolled out to the surface, Couch-grass and the roots as to compel the seeds of weeds to germinate. If this is dune, no matter how much rubbish, if it is fairly got
to the top and shot out, and left to bleach until the winter, it may then be quite safely ploughed in; it will cuase \(n 0\) more trouble. It will certainly decay in the ground, especially if it is buried a good depth. It economical point of view. The difference in the erpense between cleaning the land in this way, and of allowing the weeds to increase, greatly impoverishes ipheric iufluences in the process of these autumn Thlows.
The economical farmer will also be careful to apply will also be careful to apply them at the right time. A great deal more effect is produced from manures thus
applied than when improperly applied. It requires apphied than when improperly applied. It requires application of artificial manures is likely to pay. It is difficulties to contend with-if the land is in a rough, rukind state-if it is foul with weeds-or if it is wet for want of draining; but if it is clean, if a good tilth other circomstances are favourable, a judicious outlay in manures will almost invariably leave a large profit upon the outlay-I say a judicious outlay. The different linds of crops require diffierent nourishment, just as the
diferent kinds of animals require different kinds of lood suited to their constitution, and supplied at the proper time, i, e. frequently: I don't believir ini a heavy more than I believe once in two or three years, any solat him two or three weeks. The animal will not mill waste his food, but he will not thrive at all; he would not only supply this land with nourishment every vear, bat two or three times a year where it is prac into goo. It is sound philosophy not only to get the land of econo leart, but to keep it in good heart. As a matte farm labourer proper direction and supervision of the machine, wheels within constructed and within wheel; and if it is not properly I am convinced that a difference of more than 25 per cent. is often made in the amount expended in labour, attribu diferenceirely to the general direction. Instance the done. In one case the carter loads his own cart, then t, perhaps in with the cart to its destination and unloads o be another operations on the land-the spreading horses are aboul half their time waiting for the man,
and the man about half his time writing for the horses. In another case you may sea three men loadiug the cart, aud one horse in the cart. Just as the cart in caded a boy with an empty cart and two horses makes his appearance. He transfers his trace-horse to the boys to drive, and trace-horses according to the distance the manure has to go. At the other end will be two men spreading the manure ont of the cart direct to the land, which they will be able to do just fast enough to keep the fillers at work. Thus there will be a steady stream of manure going out, and nobody waiting, and nobody overworked. Of course the same remarks apply to all carrying operations. There is great economy in paying the men by the piece instead of by the day whenever it can be done. Not only is the work done cheaper, but it is more just to the men. If one man, in onsequence of more strength or skill, can earn more than arother, he ought to be paid for his strength and skill. In common justice to ourselves we are bound to pay for work done, and not simply for time spent. We ar bound to encourage skilled labour in every way we can for we are becoming more and more dependent on it and if the farmer is not sufficiently master of his busi ness to be able to estimate the value of the differen kinds of work done and to let it to his men at a fai price, he must suffer the consequence of his want of kill. If a tradesman or a professional man is not skilled in his business, what is the consequence? Why he has to go to the wall. So it must be with the farmer.
It is said that there are secrets in all trades, and if the furmer does not know the secrets of his own profession, woe betide him. Knowledge is power, but practice makes perfect; and it is only by diligent, intelligent attention to the practical part that the farmer can qualify himself for the successful prosecution of his business. See how carefully and expensively the professional man is educated and trained for his profession; but when he is farly afloat in the world, what can he do without practical skill or good abilities in full practice? An important lesson may be learnt from the commercial and manufacturing world. If you walk round a large manufactory you will not fail to observe what careful attention is given to the very minutiæ of economy. The very existence of the maunfactory depends upon this. A difference of one per cent. in the expense of the productions of the manufactured article would often be fatal to its success. The large fortunes that have been realised by some of the manufacturers is, as a general rule, the result of small (often very small) profits upon a large trade. Such is the severe competition amonsst them that all and every of the essentials of capital and skill, all the modern discoveries of machinery and chemistry, with the most rigid economy, is brought to bear, or success is hopeless. Although his profits are now much smaller upon each manufactured article than formerly, yet, in consequence of a much larger production, by means of modern appliances, his income does not suffer, but otherwise. Is it not even so with the farmer? He is engaged in a severe competition with the whole world, and, so long as the malttax is on, a very unfair competition. He requires all modern appliances with skill and industry, aud he can make two blades of Grass grow where one grew before. He can grow two quarters of corn where one grew
before. And if so, with ordinary seasons and ordinary markets, shall we despair of success? By no means. But another very important lesson may be learnt from the manufacturer. You will always find him paying most attention to, and producing most of that particular article for which there is most demand, and on which there is most profit. You will always find him quickly adapting binself to the wants of the times. He will not bestow his capital and skill upon an article or which there is no longer a good demand. The price of Wheat has gradually declined until it is now 40 per cent. cheaper than it was a few years ago. The price of butcher's meat has gradually increased until it has become nearly double what it was 15 years ago; and this is not an accidental state of things. It is the natural effect of certain causes which will con tinue to operate in perpetuity. Then it is quite evident that if the farmer would succeed, he must not follow the old routine. He must not do so-and-so because his father and his grandfather did so before him. Of course he must continue to grow corn, and the more the merrier; but it must be done on a restricted number of acres, so as to leave an increased area for the production of a much increased quantity of summer and winter green crops. Our corn crops must be the natural result of the green crops, and of the heavy live stoct kept to consume those green crops. The production of butcher's meat must be our primary object, to which we mast look for our chief profit, and the growth of corn a secondary object There are several other points of rural economy upon which I should like to have touched, such as the mportance of labour-saving machines, of providing, but especially of preparing, suitable food for the various kinds of stock, of doing the right thing at the righ time, of attending to the practice of economy in the cheapest and selling in the dearest market, \&c. will conclude by reminding you that economy is not frugality or parsimony, but the economist is de cribed in the dictionary as one who manages his affairs

THE CATTLE MELON AND CATTLE MARROW
Having during the past season supplied a large umber of growers with seeds of my Catile Melon and Cattle Marrons, I need scarcely add that they have been extensively grown in nearly every county of England, also in different parts of Irelaud and Scotland. Many growers have written me very satisfactory ccounts both of the large size of the fruit produced, as well as of the abundant quantity per acre. These correspondents have agreed in a remarkable manner as to he feeding value of the fruit, some having given them with good effect to horses, some to cows and pigs, thers to sheep; all accounts concurring as to the vidity with which the animals consumed them, to which I beg to add my own experience of the past which I beg to add woth of Melons and Marrows, some of which lave been produced as an intermediate crop with Mangel Wurzel, others grown by themselves, have been very abundant, and much superior to the produce of the two previous eeasons, in both of which I grew 40 tons per acre. I have proved the value this season of other sorts and varicties than I had previously rown and the result is very satisfactory both as to the cropping and feeding value of the new sorts; in fact M . fact the Marrows, grown in the open field, are an immense improvemen upon anything I had before seen or ever contemplated and the combined growth of both Melons and Marrow on the same land is particularly advantageous, 60 me coming early to maturity, with great numbers of fruit and but little foliage, athers throwing out most lusuriant and lengthened runners, producing fruit of immense size and valuable feeding properties, as an immense size and vaiuabive fore letter I received from Dr. Voelcker, and his analysis of part of a fruit which Dr. Voelcker, and
weighed 54 lb. :-

Avaitstus Voelcker.
11, Salisbury Square, Fleet Street, much that it not only exhibits valuable properties for the feeding of milch cows, store pigs, \&c., but also constituents really essential for fatting animals, viz, ai and albuminous compounds, including flesh-forming matters, in addition to sugar, gum, and digestible fibre I was in fact quite prepared to expect a good analysis from my new sorts grown this year, my stock having done so well upon them. The young store cattle, both Devons and Short-horns, ar receiving only a limited quantity of Melons and Marrows with Wheat straw, and nothing can show finer condition than they do. The pigs and dairy cows have also a liberal allowance of these fruit daily; the latter get them carted on the pasture, where they are spread and chopped with a spade; in this way they are all consumed without waste. The fatting bullocks have received no other root or fruit except the Meluns and Marrows for the past 17 weess, which are cut with Gardner's cutter, a small quantity of Barley and Bean meal being mixed with the cut fruit, and straw given ad libitum. Upon this feeding they have all fattened well, and will be sold for the Christmas shambles. Tho advantages of this fruitare now becinning to be under tood by agriculturiats and cow-keepers in different parts of the country, wherever they have been fairly officient is no doubt but a limited quantity is aficient upon any farm, say for consumption during November, and August, September, October, and which can compete with them for the feeding of various kinds of stock at the homestead. There is another kinds of stock at the homestead. reason for growing a certain quantity upon farms in general: the culture of various kinds of roots has been carried in many instances to great excess, and the constant repetition of the crop has rendered them far more precarious and difficult to grow than formerly. But the Cattle Melon offers a good alternation of crop, particularly as through its gross foliage it derives so large a portion of nutriment from the atmosphere. I trust that in coming seasons growere in still greater
*Ontaining nitrogen, . 245
nombers will be found ready and willing to aid in the advancement of our agrieultural food productions, and be induced to fairly test the value of the Cattle Melon. Sume of my fields of Melons this year were by the side of the highway, and passers by have had a full opportunity of seeing the crops; they have not been grown in a corner, but have been submitted to the inspection of many first-class fariners, some of whom had, I know, cutertained prejudices against the introduction of thicrop, bat upon viewing it growing have been struck
with astonishnent at the unusual luxuriance and beaty of the crop and the enormcus weight of produce, particularly when grown with Mangel in double culture. Seed of the best soris has hitherto been unattainable for growing in ordinary field culture to any extent, except at a high and comparatively prohibitory price that however will not be the case next season, for shall be prepared to furnish seed sufficient for an acre of land at a moderate pric

\section*{THE BLACKFACED SHEEP}

The following capital paper on this subject was read some the Secretary.
1. On the Breeting of Blacleficed -Sheep.-Blacts. faced sheep are only bred on those high, bleak, and exposed situaticus, where the finer breeds of sheep cannot exist, or be kept with profit to the flockmaster. They are to be met with on the highest hills of Lancashire, Yorkshire, Durham, Northumberland, Cumberland and Westionereland, and on almost all the highest hills and mountains in Scotland. They are the hardiest sheop of which we know. In choosing black-faced ewes from which to breed, the mountain farmer must al ways have an eye to hardihood; for, whatever other good properties the ewe may present, if she shows signs of sofincise or want of constitution, I would reject her as worthless, as her progeny, if ever she managed to have
any in such exposed situations, would in all probability any in such exposed situations, would in all probability
inherit her defects and prove unremunerative. Having secured hardiness in a flock of ewes, I would then select those of good frame, with a broad back, good shoulders and quartors, with a prominent breast, and standing a good width betwixt the forelegs, wh well as straight on their legs, on a good-sized well-shaped foot. As I would reject all those having knack knees or knack houghs, neither do I like a sheep too long in the legs. The ewe for breeding from should have a good sized head, clear full eye, lengthy lace, and good open nostrils. The horns should come from the head with a graceful curve, of fair width, and towards the lowest part of the curve should incline a
little forward (as I do not approve of the back lorued kind), and the horns should be of a fair size; but I neither like too slender horns, which indicate weakness of constitution, or too coare enef, which indicate want of quatity. The head ought to be set on a neck which rises well from the breasit and shoulders, and Which is not. of too short a length. Aud having I would like to see it of a fair thickness, and would reject all those with very small tails, as this also indicates either old age or weakness of constitution.
Having described the body of a breeding ewe in a very inperfect manner, as I am quite sure that, on seeng a tlock of ewes before me I can describe their good and bad properties in a much better manner than
I can on paper from memory, let me say a word respect ing the wool. The Blackfaced ewe having to be exposed in the most ungenial climate of our kingdom, to all the winter blasta, without in gereral havivg any shelter, except what Nature hurnishes her with, it is absolutely necessary that she should be well clothed with wool-this, in the first instance, to keep her comfortable; in the second, to render her profitable to the flockmaster, as a great portion of the Blackfaced master's returns arises from his clip of wool. Aud as that article has of late years commanded much higher more particular aftention. Well, then, I would choose my ewes well set with wool from the ears and cheek all over the body and tail, and well down the lege, but none on the shanks below the knees and hougha. I would have the wrool as thick set as is consistent with good quality and a fair length; but I would object to
increase its thickness by choosing those animals whose increase its thickness by choosing those animals whose
wool it intermired with kemp-hair, as this breed of wool is intermixed with, kemp-hair, as this breed of
sheep are neither profitable to the farmer noir approved sheep are neithor profit
of hy the wool stapler.
-Having described the selection of ewes for breeding, it now behoves me to describe the selection of a tup; and I may state that almost all I have stated regarding the ewe applies with much stronger force to the tup, inasmuch as while the ewe reldom breers more lambs in one year than one, the tup very generally begets in one year three score-so that any defect in a tup puts the whole flock out of order much sooner than the defects in a single ewe. I would select the tup with a good robust constitution - a good firm horn, not coming too
close to his cheeks (if porsible), or not standing too close to his cheeks (if possible), or not, standing too much after leaving bis head notil they curve down, as suck tups generally bogut laubs of in like nature, which lambs nre geuerally very fatal to the ewes in partinricion.
tupe. By this term I mean all tups whose horns do reject all those having bloodhorns. Keeping in mind these remarks, and what I have stated regarding ewes, I do not think any practical man would go far wrong in selecting his tups, although I mast say good ones are very difficult to lay hold of. The best time to put the Blackfaced tups to the ewes on the Northumbrian hills is from the 11th to the 20th of November, according to situation; but I would rather err by being a few days too late than by being too early, as the springe are so uvcertain. And when the lambs arrive before the ewes have milk wherewith to suckle them, the loss of both is often extensive; and if these lambs do survive they are generally of stunted growth, while lambs in the same tlock which are younger, but which have received plenty of milk from their birth; very soon outstrip thena.
2. On the Management of Blackfaced sheep.-In the management of Blacklaced sheep a great deal depends upon having a good sagacious shepherd, to carry out in an effectual manner the instructions of his master; 热d I canhot do better than give you an Mountain Sheep," "On the Qualifications of a Mountain Shepherd," every nord of which I endorse :-
"The shepherd should be honest, active, careful, and, above
all, calm-tempered. A shepherd who at any time all, calm-tempered. A shepherd who at any time gets into a
passion with his sheep, not only oceasionally injures them, but acts at great disadvantage both in herding them and working
among them. A good-tempered man and a close-mouthed dog
will ettect the desired object with half the tinie and tronble that it gives to the hasty, passionate man. The qualification of
a shepherd is not to train his dog to ruming and hounding. a shepherd is uot to truin his dong to sumnthg and hotinding,
but to direct the heeep acoording to the nature of the scil. and
the climate, and the situation of the farm, in such a manner the climate, and the situation of the farm, in such a mananer
as to obtain the greatest quantity of safe and nutritious food
at all seasons of the year. It is not by walk ing mueh.

whndary should be on the top ir ridge of a height, towards
whteh shep are apt to draw at night, it is better to torn his
own a little closer to the boundary
 divided in the morning, withuat dogs, they will be er me sn wel
acquainted with their own side, that at the very sight of the shepherd they will take to it without trouble. Those
shepherds who digg and force their fincks I take to be bad
herdsuicn for their masters, and bad herdsmen for the netghbonring farmers. If the boundary be a burn or brook on Jow ground, where the sheop graze in the middle of the day, the
same plan should be adopled by turning the sheep duwn
tolerably

I will take the management from the time of lamb ing in the spring. When the ewes are about to lamb
it is best to bring them into the most sheltered parts of the farm, and where there is the best bite of Grass for the ewe. After being lambed a fortright or so, according to the season, the ewe and lamb are generally turned out to the those ewes or gimmers which are latest in lambing,
and so on until they are all lambed. About the middle of October, all lambs are brought off the common, and salved or smeared with a misture of tar and butter, or other preparation; but for high exposed situations I have never found any plan answer so well as the mixture of tar and butter. After the lambs have undergone this preparation they are then placed in as sheltered a situation as there is on the farm, or sent where they remain until about the first week in April, and then return home to their native common. After the lambs are salved, then the ewes and wedders undergo the same operation, after which the ewes are generally sorted for the tup. With regard to shearing may state Blackfaced are usually shorn about the end of June or early part of July in each year. The fiedders are geverally kept till they are three years old
and are then usually sold for feeding purposes, but if they are not then sold they are fed off on Grass durin the summer, or on Turnips during the easuing winter. The ewes are generally kept until they are about five years old, when they are sold as draft ewes, and their places in the breeding llock are supplied by the shearling gimmers, which are at this age put to the tup
as breeders. You must understand that in the foreas breeders. You must understand that in the foreto the "breeding and management of Blackfaced sheep," carried on where there is no tillage land or Turnips, but only hay, Grass, and moorland. Where there is a mixed farm, or where the breeding of mule lambs is carried on, as well as Blackfaced lambs, the ages at which the ewes are drafted from the farm, and many other mafters, are materially altered.

It roud be just as consistent to try to make the horse mate. Willirm Smith, Woolstun, Bletchley Stution, Buclo, Nov. 28.
The New Water drill - A few years agn the water nad I believe I had the good fort une to bring the first intn this immediate locality. Houbt and fear were Prellction.s were frcely veutured upon, and were hopeful of Lupeless, as the constitutional temperament of their filly at rest, and to decide what were the merits demerits of the water-drill systemon our Cambridgeshire en lan', I resolved at the outset to make a number of experinents. These were repeated in two or three loces, the reasults, being lurther repetition became need as, the results being uniformly in favour of the uruent theteupon, have been already publiely preseuted, I shall not further refer to then. The suc a wide extension of the principle very soon led to ts adoption ahmost universal. My tirst drill discharged ihe liquid from the cistern with cups affixed to a
revolving cylinder, but this could only be used for the revolving cylinder, but this could only be used for the
cultivation of green crops, there being a deficiency of are in the cisten for a sufficient number of cups for sup. plying the number of cuulters required for the cultivation of cered crops. This limit to the application of the prinnight as highly unsatisfactory. It was then falt that we Oats, a crop always fickle and dangerous, and subsequent experience has tully contirmed the correctness of thes disly impressions. A new principle of drill was then discovered, and the liquid was discharged through small holes in plates fixed in the bottom of the cistern, and orer these platef, lesegulated by a shatially or wholly open or closed at pleasure. This principle required fory careful and attentive drill-men to keep the to be very finely sifted, or small lumps soon stopped the led to serioles. Carelessuess and innttention frequently soon serious losses in the crop. Hence dissatisfaction to the old in its construction as to becone applicable possessed culture of cereal crops. But many who increasingly dissatisfied with their use, eapecially where
bad the money required to fit them up as cup drills, but felt auxions to discover some method whereby an equat and rinitom discharge of liquid could be secured with. Iruly said that "Necessity is the muther of iuvention and wo lave another veriticution of this lact in the cits deviberas. After longe study, und frequent and maxiuns a phan, wheh Mr. C. S. Nillups, of C'hatheris, hit nopos
attempt a description of it here, I would invite every farmer who is interested in the successlul applicathon of the water-drill system to carefully inspect it at the Agricultural Hall, in Loudon, during the catcle show week, where, I believe, it will be exhibited. Nr. Bitups has obtained a patent for it, and wil, bope, place it in the bands of some first-chass implement makers-men of bonour nod skill, and he will then, doubt not., be well repaid for the iabour and rust it hat involved. It is so much superior in every semse to any other principie I have witnessing, that I cuncenve mat! who possess oid siide drills will feel disposed to pliy the patentee a fee, and bave them and nosuredly all who purchuse new drills wil not do so, it they ure wise, until they have carefully examined Mr. Billun's most simple, light and "thicient implement. Alfred S. Ruston, Aylesby House, Chutieris, Nov. 17.

The Earl of lintore said:-I an sure that the terms in which this resolntion is expressed are not at all over-colocred, or de part in any way from the truth. I Hishland swonty in this district will never tail to Hemember all his ach of hinduess and cometesy in the oflichind eatacity which be has so loner held with honuar and areait to bimself, and in now retiring, he leaves us, I im sure, with the good wishes of evely ont
commeted with that branch of the Highand society with which he Lus had to do.

\section*{Farmers' Clubs.}

Bormey and South Hanfs: The Catlle Plaguenot unamimuns in their views, the majority recum mending the most stringent measures, such as a total cessation to the trausit of cattle, in which the others which showed that the disease was the idention ruderpest or Eteppe-murrai,\(~\) of Russia. Nune who ead the evidence could doubt chat the discase was oue of the most iulectious that ever occurred, and that it was of foreigu urigin, ulthough some men, such as Mr. Giblett, lad written to the contrury. A table before him shuwed that 173 cattle in Hampshire had been attacked by the direase, of which 51 died, 102 wore killed, aud 12 remained alive at the date of the table. A great deal had been said and written on the "folly," as it was termed, of courlemuing cattle to be lumpherel in order to ret rid of the infection lad who were in the and eminent scientinc of treating the diseases of animals, were taunted with not having discovered a remedy for this disease; but they should remember that although it had existed on the Cuntinent for the last thousand years, and had carried off millious of cattle, and that although men of the greatest possible skill and science had been engaged in endeavonang to stou itd ravages, yet the diseuse was so iusidrous and so virulent in its character that they had beeu unable to find a specific for it. Uuder these circamstances it was no reproach he contended, to our own scientitic men, thut they, wit their little experience of the disease, had been uuable to actomplish what others on the Coutiueut had solong tried to do in vain. The diseuse was neither typhus nor typhoid fuver as some endeavoured to show ; its ymptoms were peculiar, its poisun sui generis, nothing olse than the "rinderpest," or steppe marrain of Russia, and there really was no "specific" for it, as there was for many other diseases. The best mode of treatment for it seemed to be that which assisted nature in relieving the animal from the poison, and support ing the system afterwurls. He had read of a great many so-called remedies and some wonderful cures, including those of the howocopathic treatment; but he believed that in the wajority of these cases the animals were never really affected, or would have got through without treatuent. Nutwithstandiuy all the remedies that had been tried, in eight cases out of ten the disease had bren fatal. In sume cases the inspectors had been very umeh olamed for ordering ammahs to be destroyed. Iheso inspectors, in most instances, weru veteniuary surgeons, and culd have nu gossible mutive or interest in ordering ammals to be laughtered noelesoly. Un the contrary, it would be usure protitable to them to put the disemseri animals
soundest and heaviest grain. I fancied it was the best economy, as there was no waste-every grain was consumed, and told in forming flesh. Instead of throwing the grain upon the ground, 1 put it into narrow troughs six feet long, with covers with holes in them, just large enongh to admit the head of a fowl. By this plan I avoided waste
"During the first week after being hatched, I gave the young chicks steamed rice, to which I added boiled skim milk, a diet upon which they thrive amazingly. The milk I obtained at a trifling cost, and rice is always to be had very cheap. I gradually changed this diet for ground Barley and Oats, made into a porridge with warm water, pot boilings, \&c., and every day I gave the chicks the refuse of the dinner table-cthey enjoy picking a bone amazingly. A piece of meat as large as a walnut, cut very small with a pair of scissors, will serve as a good daily ration for a dozen chicks.
"Of course I do not reckon the vegetable portion of their diet as costing anything; the outside leaves of Lettuces, Cabbages,'Pea shells, Potato peelings, and other refuse, must have been thrown on the dung heap, had I not been able to bestow it upon my poultry, which profited by ito

Leaves for cost of food, straw, de.
\(\begin{array}{r}3110 \\ \hline\end{array}\) obtained, in 1863, 790 eggs, valued at andate and ate , in 1864, 1087 egge, valued at On band January 1, 1865,29 poulets \(\square\) profit \(3 \quad 3 \quad 0\)
"As my fattened poulets weighed 5 lb . each, the cost of this meat for the table was only \(6 d\). per pound, while I was paying 10 d . and 1s. per pound for prime joints of beef and mutton.
"The eggs I value at 16 a shilling, which is an average price at the cheesemongers for imported French eggs; of course my eggs were always new laid; and might have a much higher value put upon them than I have set down."

\section*{Calendar of Operations.}

December. - The Horse Labour of December will consist in ploughing stubbles and subsoiling where advisable-this should be completed before the new year, in ploughing lea for Oats, in carting lime from the kiln, and marl from the pits or trenches, and spreading them on the fields where they are to be applied; in carting stones to roads, tiles to drains, manure to fields, and grain to market. Also, in carting from market the Linseed, Maize, or other food for cattle, sheep, and pigs, which must be purchased at intervals during the winter,
Draining.-This, with the preceding and succeeding months, is the most convenient season of the year for carrying on this work. It is only necessary to observe here, that while farmers will generally find it most convenient for themselves to effect the drainage of their farms in a gradual manner, field after field, in successive years, they should beware lest, in this piecemeal method of completing the work, they lose sight of the general plan on which the whole should proceed. They should begin with the loweat fields on the farm, and securing a good outfall for the water from them, they will run no risk of an insufficient drainage for the rest of the land. A main drain should run along the lowest edge or line in the farm, and it may be completed piecemeal as it is needed, to receive the water of the drainage, which should gradually extend itself from field to field, towards the higher parts of the estate. Use may be made of the mole plough on pasture lands during this season.

Roads should be attended to this month: stones should be hauled and placed where they are needed for the repairs or new works thet may be necessary.
Any top-dressing the farm will afford, either in manure or soil from ditches, road-sides, \&c., may be applied to Grass lands.

The Cattle should continue to receive the same attention as in November. They must be kept warm, dry, and clean, by the use of abundance of litter. 'I'he common Turnips will now have been finished, and recourse must be had, first, to any hybrid Turnips that may have been grown, and then to the Swedish. The box-fed cattle, excepting when the floors of the boxes re unusually low, will require cleaning out for the first time towards the end of this month; and the yards, too, will be getting pretty full of manure. Both boxes and yards should be emptied during frosty weather, when the dung-cart can be worked without injury to the land. Heaps of manure should be made in the fields intended for green crops next year, the carts being driven over them as they bring their ocditions, so as, by condensation, to check any prema ture fermentation, and the manure should also be covered with earth, and sprinkled with salt and gypeum, to confine and fix the naturally volatile products of that fermentation. When frost and snow set in, breeding cows and ewes should have a daily feed o white or yellow Turnips. Hoggets should have their Turnips sliced for them
Shecp in sheds must be carefully attended to, with
especial reference to the disease of footrot, to which
once a fortnight, and when any festering or decay is apparent, diluted hydrochloric acid should be applied with a feather. As a preventive to foot-rot, it is a good plan to place a couple of sawn boards in front of the feeding troughs,as far apart as will permit the animals to stand on them with both fore and hind feet while feeding. The hard boards keep the hoofs from getting too long, while, at the same time, the soft part of the foot is kept nearer its natural condition, and, conse quently, less disposed to disease. The boards should be turned over and laid above the straw every time the sheep are littered. They will be supplied as usual with Swedes and other food, and regularity should be observed in their meal times. They should be fre quently littered, and thus kept dry. The manure may be removed from under them towards the end of the month. Sheep, especially hoggets, folded in the fields on Turnips, are very subject to inflammatory attacks, during the winter months, from eating frosted tops, and to mitigate this evil, it is advieable to cut off the tops a fow days-three or four-before each removal of the hurdles, in order that they may become withered, in which state they are less injurious to the animals. It is also a good plan in winter to have a plentiful supply of Turnips stored up in heaps, and properly covered with straw and a little earth, to give to sheep during frost or snow. Ewes in the Grass fields ought to be supplied, in rough or snowy weather, with Turnips and cut chaff. Lambs must be very care fully attended to in every respect, increasing, as already named, their quantity of artificial food. Fatting sheep may now be drafted, and those ready for the butcher disposed of. Yearling and grazing sheep should have a few Turnips and Cabbages thrown on their pasture. The Turnips should be at all times carefully cleaned and cut into small slices; and, if allowed to remair a while before being consumed, without being dried up, all the better, as they merely lose a portion of their watery particles.

Pigs should be sold as they fatten, and the larger stores, with the sows after their third litter, should be put up.

Cheese-Making may be said to cease towards the end of the month; all the milk produced being converted into butter and skim-milk cheese. The cows most advanced in pregnancy now go dry, and the animals are put on poor food. Unless the frosts set in unusually early, the cattle in the southern counties are allowed still to pasture in the grounds, to seek for the little Grass there is leit-hay being served to them twice a day, either there or in the yards, to which they come twice a day to be milked as usual. The better plan, however, is to house them all now, feeding them in sheds or byres; water being brought to them twice daily.

\section*{Miscellaneous.}

The Birmingham Cattle Show.-On this day the Cattle Show is opened in Bingley Hall, and it continues open from Monday till Thursday of the coming week. Due allowance being made for unfavourable circum. stances, the entries afford conclusive evidence of the unabated interest which these meetings excite, and the desire felt by all classes of contributors to promote their success. Of cattle there are 135, a larger proportion than might fairly have been anticipated, considering the disastrons effects of the murrain, which, there can be no doubt, will at the last moment induce some intending competitors to abstain from "putting in an appearance," from the fear of contagion. Another difficulty has also arisen. Hitherto all the best animals have been forwarded from Birmingham to London, but the Council of the Smithfield Club have resolved that, in view of the present state of things, no ox or cow which has formed part of any exhibition held during the preceding month shall be eligible for admission to the Agricultural Hall at Islington, and as the bulk, if not the whole of the entries for both places had been made when this temporary regulation was determined upon, persons who had arranged to try their fortunes both here and in the metropolis will have to make their election between the two. We are informed, however, that the cases in which entries have been made of the same animals for both shows are much less numerous this year than usual. There are 90 entries of sheep-a much larger number than on several recent occasions and above the average amount; while in respect to pigs, the catalogue will contain a list of 71 pens. In the department for corn, 45 entries have bsen made; and although the season which has just closed has not been propitious for roots, the judges will have to decide unon the respective merits of no fewer than 110 different lots. In other parts of the building the various classes will be amply filled. The feathered tribes will muster in greater force than usual, for the total of the pens of poultry will be 1676, and of pigeons 331, the latter display being the largest of the kind which has yet been witnessed. To all these the implements, seedsmen's stands, \&c., must be added, and when this is done we have a bill of fare which can scarcely fail to satisfy the reasonable expectations of every class of visitors. Midland Counties Herald.

To those conversant with such sports, the feate monmlished were quite equal to, and in some case smmpled, the average; for although the flat mile race Tassetlow, the short racing was good- 100 yards being aneded the jump of the wirner of the Merton College, (1) ri, prize by 1 foot 9 inches. All the visitor Ye st Quintin, succeeded in getting over 9 feet, and F. Il have attempted a higher jump, had not the Pruident raled that being conqueror by 10 inches, his minushout was very good. The throw of the cricket ball, 59 yards, was no mean throw, being 8 yards further than the chanpion throw at Merton College, Oxford which we again refer to, because the sports there were sell on the day previous. By special request, Mrs Constable presented the prizes-and, making a few kimi manrks to each victor, regretted that the Council's madome prize of a silver medal for the wianer of vinners could only on this occasion be presented by lad to Mr. St. Quintin (the winner of six races). To dinner, which was served in the spacious College Yinll, was an agreeable termination to a very pleasant Tht strength-trying day, and every spectator of it, as vell as of the day's sports, must have been struck with the thorough spirit of unanimity which seemed the pende all, from the Principal downwards. "The
Pricipal, in proposing, among other toasts, "The Preident and the Council of the College," expressed the great regret which the chairman, Mr. Holland, and the Hon. W. Eathurst had in being unavoidably absent, tot was gratified to be able to tell them that in December, probably on the 20th, at the termination of the Sesaion, his Grace the Duke of Marlborough would if so unforeseen occurrence prevented, be among them, to distribute the prizes to those who were successfal in another and more important struggle, and that then they rould see their old friend, Mr. Holland, also, who wes never absent when his presence was a help to any of them.

\section*{Notices to Correspondents.}

Ruou: 3 M. Bacnn should be dried very gradually, and only if heat from woood fire, Bacon will very soon become "rusty" provent the ill effeats from this, it has been known to keep Foll ted, when quite dry, in a now hemopen bag, such as bottom of the bag. This also saves it from flies in the hot Fexther. An airy dry place on the north side of the house, There the tecoperature is as equal as you can find it, is the best preventive to its becoming rusty. Bacon is some-
tumes kept in chests in layers ot malt dust, or Oat or Beantmeal hept in chests in layers of malt dust, or Oat or Bean-

\section*{For Season 1866.}

B．W．WILLIAMS，Paradise and Victoria Nurseries， SEEDS．They have each been carefully tried by compeotent judges， and proved to be qu
given of each below．
MALVERN HALL MELON（Soarlit Flusis）．－A valuable
variety．This kind has been proved by the side of 30 of the
best to be the earliest to ripen，and the freest in setting its fruit． The following description of it by Mr．Edinggton，Head Gardener t
the Earl of Straford，Wrotham Park，in the Scoltish Gardener，con veys a very just idea of its properties．He writes：－
to none in cultivation in asserting that the above Melon is aecond placing in firtivation．I might even go as step turther and not err in the same house，and subjected exactly to the same treatment，bore
no comparison in any one point．The Maivern Hall is most dell－ no comparison in any one point．The Maivern Hall is most dell－
ciously favoured，remarkably thin－skinned a very free setter，and
early．These properties，in my judgment，constitute a fint
eariy．These properties，in my judgment，conte a first－clan
＂The Malvern Hall is nicely ribbed and moderate in size ；those
grew thia season averaged \(2 \sharp 16\) ．-a size 1 consider amply grew this season averaged 27 1b，－a size I consider amply large enough I recommend to do so，and those who have wrill，I think，agree with my remarks．＂Price 2s．per packet．
been in cultivation for serss RED CELERRY．－This variety has it pronounce it to be the best Red Celory．It is a dwarf grown and remarkably hardy，not apt to run to seed，but will last good till the middle of April．In flavour it is much superior to the
other varieties，always possessing that sweet crispness which several作基t qualities will causo it to become the leading varitety．Price 18．per packet．
DIGSWELL PRIZE ENDIVE is invaluable for its hardihood and good hearting qualities．As a curled－leaved sort，holding that happy
medium between a coarse weedy kind and varleties so endwarfed medum between a coarse weedy kind and varieties so endwarfed
and curled as to be of very small inde and very readily cut of by
slight frosts it took slight frosts，it took the First Prize at the International Fruit and Vegetable Show，R．H．S．，1864，and again the First Prize at the
Dublin International Frutit，Root，and Vegetable Show，Oct． 3 ，1866． FIRST－CLASS EDGING PLANT，OXALIS CORNICULATA the＂Journal of Horticulture＂thus speaks of it：－Plant．A writer in ＂For edging purposes in narrow borders or small beds there is no rarely exceeding from 4 to 6 inches high，with foliage resembling the its yourger growths it resembles the Amaranthy melancholicu－
ruber；but as it advances，the foliage assumes a darker tint．it
strep strike winter treatment，or at as meely as a Verbena，and will bear the
same when rather dinficult matter to secure seed，owring to the extreme
irritability of the sced－vessels characteristic of this class of plants．＂ If sown in February and March，like Lobelia ppeciosa，and treated plants，may also be secured by sowing in pans in in frame．Good
summer，and，when large enough to handle， pote in sandy loam with a little leaf－mould and sand，and wintering rockwork．The flowers are charming plant for the lower fissures of

Every day proves more clearly what great caution ought to be exercised in Planting on ground which has formerly been occupiel by trees. A. few sceptical remarks are occasioually heard, leaning simply on mere negatives, but the positive proofs are toonumerous and stringent to leave any room for doubt. We have now before us a portion of the roots of a Wellingtonia, which were in close proximity to an old decayed post, and are now densely clothed with fungous spawn, which is rapidly destroying the tree, one of an arenue of 160 ; and fears are entertained that the rest will suffer. Different remedies have been tried without any success, and we feel convinced that any chemical which could reach the diseased roots through the soil, would soon destroy those roots which still remain sound. The only plan likely to succeed is"to lift the trees carefully, and prune away every diseased root. We have known this treatment auccessful, and we can suggest no other.

There is little doubt that a large portion of the Larch-rot is due to this cause, and we have been informed by an extensive forest owner in Scotland, that after a plantation of Scotch Fir s cut down, it is useless replanting it till the ground is covered with strong. Heath, by which time the old roots have lost their power of mischief. It would be easy to suggest other chemicals than those which have been tried, but we feel quite sure that the attendant expense, which might be considerable, would only end in disappointment. In this, as in so many other instances, prevention is much easior than cure. If trees must be planted
where others hare proceded them, there is litile hasce of success ixcept the ground is deeply ireuched and uvers sout removed. M.J.J.

We have on more than one necasion adverted to the importance of having the Plasts in our public parks and gardens legibly samen, particularly such plants as are of especial interest, owing to their being used as ford, or medicine, or in the arts and manufactures. Without objecting in any way to such plants having their Latin or scientific names attached to them, we would have their Engl:sh names in particular placed conspicuously hefure them. Our putilic parks and gardens, being designed for the recreation and instruction of the people at large, would be rendered mure interesting and instructive by this matter being better attended to.
We alluded to this subject last year when making some friendly criticisms on the subtropical garden at Battersea Park, and on the garden of the Royal Hurticultural Seciety at Chiswiok, and we endeavoured to show how muoh Mr. Gnison would add to the pleasure of the numerous visitors to Battersea if he would put English names to the many interesting things there, which, even without names, attracted thousands from all parts of the metropolis, and indeed from all varts of the country, to look at them. On paring a visit to liattersea a short time ago we were glad to notice that this year the only fault we had to find with the sub-tropical garden had been removid, and that all plants of more than usual interest, cwing to the uses to which they are applied, had their names placed in front of them. Nor were our expectations as to the result of this arrangement at all disappointed. The subtropical garden was apparently more crowded than ever, and the visitors were evidently more thoroughly enjoying the si,ht of the plants on account of being able to ascertain what those odd nn-English looking forms really were. They had been pleased on furmer oceasions with the new and strange sorts of foliage which they looked upon, but now they were doubly interested by knowing, for example, that tha: tall plant with the dark-coloured broad leaves was the Castor Oil, or that another was the Rice-paper plant of Chins, another the Bamboo, and so on. What enjorment has this little addition given to the poor pent-up Londoner, who runs up to Batterses on a Sunday for a little country and fresh air-what pleasant little lectures has he been able to give to his wife and children, and how easily and inexpensively has this enjorment been supplied! All honour, then, to the authorities of Battersea for this new boon to the public, and we say to others, "go and do likewise." We may add that the plants in the sub-tropioal garden this year were particularly luxuriant and healthy. 0 wing to the hot summer and autumn, no doubt, they had made a most luxuriant growth. In former years we have heard more than one person express a doubt as to the success of this style of gardening. The plants, they said, merely existed, but did not grow. This year, however, there could be no doubt as to their growth, which in many instances was of the most luxuriant kind; indeed many of them looked much more healting and vigorous than they do usually in our sto7es and greenhouses.

In Kensington Gardens, in St. James's Park, and in many others of our London public gardens, a laudable desire is erinced to instruct the public by adding the English to the botanical names of our shrubs and trees. Sometimes, however, the attempts to render the Latin names into English, if not very successful, have been at least rather amusing. For example, there is, or was, in Kensington Gardens, a plant named the horrid-looking Colletia, and another was called the fierce Rose. What was horrid about the Colletia horrida, or very fierce-looking about the poor little Rose, we could not discern. The names so translated, if we take them in their vulgar sense, were certainly not very complimentary to either of the plants we have mentioned.

When writing on the subject of naming plants, we are naturally brought to another matter which we think deserves some attention. We allude to the way in which many of our new introductions are named by persons who have butlittle acquaintance with botanical science. The time was, and that not yery long ago, when no one, or at least very few individuals, thought of naming plants unless they were able at the same time to describe them in a scientific manner, and in a way fit for publication. Now-a-days, all who can write their name, and, shall we say, some who are almost unable to do this, take upon themselves the responsibility of
giving plants scientific names (so called !), and trath compels as to say that not unfr quently such names are calculated to bring discredit upon botanioal science. Aad in addition to this the system has a tendency to throw the whole of our garden botanical numenclature into the most inextricable confusion. Fur example, a plant is introluced to England and then sent out to the public with, probably, a long siring of queerlooking Latin names, without its being figured or described in any recognised butanical publication. When, at last, the sail plant reaches the hands of the botanist, either at home or on the Continent, to be described and published, it gets a new name. or is probably referred to a species which has been named and described a lo"g time ago by some old botanical author. In this way our garden nomancl ature becomes chaotic. There is some consolation in knowing that the time will soon come rourd when these so-called names, which have been given to plants by unqualified persons, will be discarded for those which have been given by butanists. They may struggle for existence for awhile, but like the plants in the vegetable kingdom the strong will eventually overcome the weak, and the latter will disappear from a position which they should never have occupied. But nevertheless, there present inconvenience in the practice.
We are perf:ctly well aware that in most instances the names of which we complain are not given with any desire to impose upon the public. People say, and perhals with some truth, that a plant without a name will not sell, and therefore they give it one. But we put it to all adrocates of eorrect butauical nomenclature, who are not sufficiently educated themselves, whether it would not be more desirable to endeavour to have their plants scientifically and correctly named by qualified botanists than to send such plants out to the public oftentimes not correctly named, or not unfrequently provided with names of questionable taste. The suggestion of Professor Kocrr, of Berlin, alluded to in our columns (p.985), that a supp sed new Orohid should be sent for idantification to the botanist who has made Orchids his especial study, and the same with Palms, Ferns, \&e., seems to us a gond one, and a move in the right direstion. In England we have a noble herbariuin at Kew, with some of the best botanists in Europe at work there, and we are quite sure that \(\in\) very assistance would be rendered there to all who would take the trouble to avail themselves of it.
The remarks we have made above do not appls to florists' flowers, or to any mere variety of plant which has no permanent characters. But we are most anxious that all the plants in our gardens which are commonly called species should be correctly named, and that the names which are given to them should be in accordance with the rules of science and of good taste, \(F\).

We have on various occasions alluded to the plan for the Examination of Gardeners which has been arranged by the Royal Horticultural Society with the Society of Arts, in furtherance of the report from the Education Committee to which We drew attention last week. We find in the last Number of the Proceedings of the Royal Horticultural Society some further explanations referring to this subject, which we are happy to transfer to our columns.
These examinations, it is observed, will provide a more efficient and widespread means of bringing out the theoretioal talent in the rising generation of gardeners than any system of examination which the Council would be able to institute in the metropolis or elsewhere by their own machinery; but they propose an extension of their examinations to practical skill in gardening operations, and have decided to bestow diplomas, medals, and eertificates on successful candi lates. At present, at least, such practioal examinations can be held only at South Kensiogton or Chiswick.
1. Diplomas will be granted to those who, having been certificated by the Suciety of Arts, or other publie body of examiners recognised by the Council, in Mensuration, in Biok-keeping, in Practical Geometry, in Botanical knowledue, in Floriculture, and in Fruit and Tegetable culture, Horticultural society for prastical skill in the cultivation of Fruit and Vegetables, and in the culture of Flowers, and shall show a fair amount of skill in Surveying and Plan-drawing, and taste in Laying-out Gardens. Suoh diplomas will confer the title of Associates of the Suciety.
2. First and Seoond-class Certifioates f.
following branches of practioal gardening will be candidates who shall pass the Suciety's examinations in those branches:-
(a) In the operations of the Fruit and Vegetable grime

In the operations of the Flower-garden
A medal will be presented annually to the candidate who, having taken the Certifioates of the Suciety of Arts in Botany, and in the cultivation of Fruit and Vegetables and in Floriculture, shall gain the highest number of marks in practical gardening at the examinations of the Society.

Candidates will be eligible for examination in practical gardening if they have previously obtained Certificates from the Suciety of Arts in Botany and in Floriculture, or in Botany and Fruit and Vegetable culture; and in case they obtain a Certificate in either branch of practical gardening, will have their travelling expenses paid. A candidate who can present a written recommendation from any Fellow of the Royal Horticultural Society, from the President of any Floral or Horticultural Association acknowledged by the Suciety, or from the Director of any pubiic park or garden, may also be examined in practical gardening; but Whether he obtains a Certifioate or not, he must himself bear the expense of his journey,

The names of Associates of the Society will be published with the list of Fellows of the Suciety; and Associates will be entitled to the privilege of free entrance into the Gardens at the shows of the Society and on all ordinary occasions.

The names of medallists, with the year in whioh they obtained their medals, will also be published with the list of Fellows. -

The time for holding the practical examinations of the Royal Hortioultural Sooiety will be hereafter announced.
- Ir a notice of the Gardens at Dangstein of ter Granadilla, Mr. Vair fiude it necessary to ferilise the blossoms, not with the pullen of the Granadilla flowers, but with that of Passiflora coerulea, which is found much more effective. This is a fact similar to those recorded by Mr. Joun scott of the Elinburgh Botanic Garden, in the einhth volume of the Jourval of the Linneau Society, where the details of numerous experiments on this curious subject may be found. It thus appears that many species of Passion-flower are not susceptible of fertilisation by their own pollen, but prefer that of another kind, the potency of their own pollen on other flowers being proved by its effectively fertilising other species.
-IIn our notice of the Roydl Horticuitural Society's meeting ( p .1109 ) mention is made of a branch Mr. Young, gr. to Iaord Fitzwilliam, in which "one eye had produced the usual black coloured fruit of that variety; while another eye on the same shoot, without Grapes, which was found to proluce the same Frontignan flavour as that of the black bunch." Sports of this kind are not unusual, and are not always easily accounted for. Cases of this sort have been recorded wherein Red and White Currants were produced on the same bush; and pure Sulphur Roses among variegated flowers of the red Austrian Briar Ruse, Onc of the most remarkable instances of this nature is that alluded to in our volume for 1855, p. 596, wherein Mr. Telfer, of Woodhonse Hurlet, near Glusgow, is stated to have had a Gooseberry bush, which bore indifferently on each small twig, red or y lllow berries, the red superior in flavour to the yellow, and both dissimilar; the reds, too, were unlike, for some were rough, others smooth; and the yellows bear seed that is red. Chrysanthemums frequently exhibit this tendency to sport. In those not uncommon cases where there are different coloured berries in the same bunch, the phenomenon may be accounted for by intercrossing with the pollen of another kind; thus in a case, the exact reference to which we have not at, the moment ty us , where White Burgundy, Red Rülander, and Black Burgundy Grapes were growing on the same bunch, the three kinds of Grape were growing side by side in continunus rows, so that the pollen might easily have been carried from the anthers of the one to the stigmas of the other. Bat this action of the pollen will not of course serve to explain the other cases of dimorphism so many of their novelties.

GENEALOGICAL TREE OF THE PEACH TRIBE.

\section*{(Concluded from p. 1012.)}

From the foregoing examples it may be seen how by the simple fact of "extension," or of "natural selection," a given type may produce other secondary types.
And Nature does the same for woody plants as she does for the heriaceons ones; our fruit treps, our forest or our orvamental trees furnish numerous examples of this; in all of them a siugle type hay by axtension produced a comeiderable number
appear to be more rare and mure erentimat. ciate because these plants are less frequent? by seeds than are herbaceous plants feque of infancy is considerably lonyer, the also slower in their lonyer, the gelers: individuals appear less apt to become fired. the \& is the same in all cases, but it is produced more stry some than in others.
It is thoroughly understood that all are not equally plastic; some are all mincin permanent.

\section*{become}

In its wild state, the
lias a fibrous, tough, much branched root of colour. Nevertheless, we have procured in generations large, flesky, fibreless roots f moderate length colour, some short, sois varieties are fixed, for the most part, and wild Carrot gathered by himself in th: depar:t Aube, far away from any residence, aud in cotmans in the first generation long, spindle-sbaped, fibreless roots, some of which were white, ellow, and some even were of a reddish violet \(c ;\) Haviug thus given illustrations of the mas is any given type may vary, M. Carriere proceode u apply the prineiples he has laid down th the Peu路.
The various subdivisions of this group are chare terised by the presence or absence of toliar ghads globular or kidney-shaped, or interinediato botrom these two in shape. These "mixel glandi" seem
to belong to the reniform series, os the are generally found in association Many authors have asserted that in those vaitien characterised by globular glands, kidney-shaped onm never exist jaune" possesses both forms, and way be considered ai
a type with "rane glauds." The auuption of that tial serics of glauds has tho advantage of supplying ai additional means of diaguosis betweeu une varietf a another, aud ol pointing out to the ob: erver that ce: f different forms, and thus of readering him areful in lond applrigg names careful in discriminating and applyivg that in yourg seedling plants frequently not well developed till toward the summer, and honce it is better to stud) end adult plants, on well developel branches, and on ti: first leaves that are produced from tie bud. the innetmost loaves having comparatively few glands on them The leaves, too, on the central portions of the brandie: are those which present the most defined characiers.
Next to the glands, the distinctive charecters on dimens and calour of the fluwers; then in the appearance and colour of down the colour and nature of the flesh, whether adherent to the stone or free from it, \&c.
In the progressive development of the Peach group independently of the process of natural saspisce which has given origin to its varjous series, dimpler i has also come into play. An instance of cais made presented by the Nectarine, appearance, has become Exed, gen hrich has given rise in its turn to par rac. s absolutely aualogous to those of the true or general group Peach comprises two large which ruu parallel one to the other, and presea almost complete analogy, one with the other, is thers evolution.

Bufore proceeding further, it is desirable to cails attention tu the fact that as we are unable to relative starting point, being guided in ths assumpie: by the invariabie progress of things from the sime the cumplicated ; and thus we maluvation
the Peach was introduced into culua the simplest and least complex characters mall, leaves prod, bell-shaped flowers with adherent flesh, of a white colour, except with adherant flesh, of a white colour, exe hue
the stone, where it was of a palo rons and Thus the Peach is not only allied to Thus the feach is not onty alied to evin ennfommed with the gemus Almonl, Which it is indeed only and the Almond are ateoasels :lentical: their flowers are alike, their fruit stelr defens in secmatary points. We find among on 5 difers shecoloured, white, and highly-coloured A iners. There are also rosaceons (spreading) corollas, drens. with very small bell-shaped blooms. There sal others with very flmonds leaves of very diffirent size and furm, fruits of all dimensions, sorme long and corred Amaude Cornichon), others regular aud oval. in some cases the rkin is smooth, in others downy. Tbere are it is edible, and of a red colour around the in some is in most Peaches; such is the Almond Peach \(\because\) amande Pe the). There is, moreover, a form of Almond which M. Carrière calls the "doubtful," or -anted Peach" (sic), on account of its intermentate Ahacters. The frut of this is so like a Peach that it is only by observing the stome that it can be
deeruined to be an Almond. But still there are 3ming Peaches some varieties that have stones res llte those of the "Pêcher mixte." 'This intormediate form, moreover, presents in different ceasons the most opposite characters, so much so, that ionmo years the ruits are like those of Almonde, frile in ather seasons they are true of the leaves of this Persica istermedia and those of the glands are like those of the Almond.
Just in the same manner as differences exist in the form of the flowers, fruit, and stones, so there is a corresnonding diversity in the flavour of Peaches; mome are sweet, others insipid, and with less flavour than the Almond Peach. M. Carriere also states that lie has met with Alunonds with short stones rounded at both ends, and furrowed like those of certain rarieties of I'eaches.

OBCHIDS AND THEIR CULTIVATION.-No X.
No plants have had mote experiments performed upin them, in a cultural point of viaw, than Orchids and were it not that they have a suecial orgamsation, differing from other plants, in being furnished with peocdobalbe, and generally with succulent roots, their ritality inevitably mast have succumbed. As it is bowover, many of the samples are very tenacious of IIIa, and can with impunity undergo a somewhat severe ordeal, which accounts, in some measure, for their living and growing under treatment so opposite in its character that no allied plants could be subjected to the like for any length of time without fatal results. And yet, notvithetanding all this, when once an established plant becomes unhealthy, or has "gone queer," as our puthern growers term it, it often requires years to get it into condition again; if it be Paphinia cristata, or even \(\mathrm{r}_{\text {auca }}\) cocrulea, and some others that could he named, it may be disfigured for life, or pine away and die. It is a curives fact, which must he known to every cuitivator of experience, that imported planta, although shrivelled up nearly to the last stages of exhaustion, are much more easily brought into a healthy vigorous state than established plants that have become exhausted through an injudicious mode of treatment. It is, therefore, of the first importance to maintain if possible a bigh order of health; and pots and potting have somebbing to do with it.
Common pots, of whatever size, are generally made as deep as they are wide across the mouth, and in this form they are very serviceable for a variety of plants, ond in some instances also for Orchid cultivation; but when we come to medium-sized specimens, or such \({ }^{38}\) require pots larger than 8 inches in diameter, then, in my opinion, width is more necessary than depth, even in the case of such gross succulent-rooting plants as Odontoglota. What, I would ask, is the use of encumbering a emiterrestrial plant with an unnecessary cairn of broken pote or crocks up to two-thirds of the depth of the pot, Thich is a very common method ? I can understand the necessity, and bave seen the force of the practice, Phale case of purely epiphytal. Orchids, such as Pbalænopsids; Saccolabiums, and their congeners, for the roots of these plants delight to permeate the chinks, and embrace the surface of the burnt clay, but the roots of Odontoglots, Lycastes, Cattleyas, and such like, prefer somewhat stronger feeding. Some may aver that these cairns of putsherds, like those of brickrabbish in Mr. Gibson's sub-tropical garden, are a capital medium for absorbing and diffusing heat and magistre, and on that account form powerful auxiliaries to exuberance ; but the parallel is not complete, and the logic not pertinent, for the plants are growing in an artincial atmosphere, and entirely under control. Such a form of pot, then, as No. 1 represents, which is about a third wider than deep, and which can be made in that proportion up to any size, is admirably suited for the great majority of free-growing ()rchids. For the conl plants with which I an dealivg, the drainage does not require to be more than a couple of inches deep, and mith a careful covering of the most fibry of the material, immediately above, to prevent the smaller particles getting among the interatices, the compost,

\section*{i) mit being inserted, with (eee p. luse of ste prend betultbe the}

least 2 incless above the rim, wich is sumicient, cven making allowance for subsidence, to ward against ny excess of moisture.
The No. 2 pot is one of the most aseful prots in Otchid cul ivation. It emanafed from this place, and is

unquestionably one of the most valuable auxiliarius that has ever been adopted in Orchid growing. A great many of the plants that we were accustomed to grow

No. 2 (plan). -One-sixth full sizo.
upon blocks, after being planted in these hanging pots for a time, put on an appearance that was perfectiy astonishing. They are better in most instances than wooden baskets, because they are neater, more durable, and the roots fasten themselves to the surface, both exterior and interior, with avidity. Three of the most beautiful Cattleyas that the eye can rest upon and three of the most critical to manage under any circumstances - Pinelli grandiflora, superba, and Aclandix, are quite "at home" with us growing in these pots. The motion of the air in comstant circulation about and around the saspended pote, the nutritive matter which can be abeorbed the nutritive mater placed in small compass and by the roots being placed in onall to not so liable to extreme fuctuations as to drought or moisture, obriously explain how such a contrivance is favourable to both roote and leaves in performing their functions. In order that there may be no mistake as to the form of this useful auxiliary, there are two engravings; the one representing, as it were, the ground plan, and the other the elevation. Ample

provision is made by the large holes perforated round the sides, on the one hand for thorough drainage, and on the other for thorough aeration, which not the east desideratum in the culture of Epiphytes. Such pote however, are unnecessary for Odontoglonums of

No. 3 reprements a pot, suisable for mant of the ropical purely epiphytal specios with long thestiy routa regniring extrence of moiture and dronght at ditf.rent peri do of Hue day. Any um nust have olvenved thet

 where monture comtinually pervails, get crammed weth a spection of frad that thoy catin t ifyest, and hence become a mass of cis rupitint. This would be the cxtreme of had management; but even suppose the compost to be pamable to air, if hent zeromonet during the day the embe evil wonld emeriake the rootes, during the day che alomern they would althoneh they wonld tide ower a mowe bate thened period. Sucti a pint, therefore, is is ryparatud in the engraving would meet the difficul'y, if the materind with which it was flled was right in other reeppecta. I have seen a pot after the same fashion at Mr. Veitclin, but it is completely riddled with boles, and hes a false bottom, and must, like the one referred to, be admirably suited for all chese East Indian sems. This patturn which is engraved, I saw at (i) caュow 10 years ain in the hands of a gentleman wh wod to how a tew Orchids at that time. It is of the common form as to outline, the width and depth being the same, and I don't see any reason why these proportione, so fur as the plants in question are enncernen, shoudd bo altered.

I'rifling as the formation of pots may appenr to a novice, yet they ex-reise कn influmee in Orehid cultivation which emmot be overated; anl the frother advanced thr student is in practice, the more ready with he he to acknowledree and appreciate the value of such little things; for, as Bishnp Butler truly remarked. "things, spemingly the most insignifeant imaginable, are perpetnally oliserved to be necessary conditions to other things of the greatest import ance."

Woolen bankets and block a are aloo necesary helpa for promoting tha growth of this large und varied Orchadacens family. It is not advisable, hevever, to treat sickly or imported Odontoglossume to either treat sickly or imported blocks, baskets, or basket-pots. By far the best methor with the race is to put the imported pieces, or sickly plants, into common pots filled with potsherds, and stake the pseudobulbs until they have made roota suffeient to fx themselves. Most of these plants that come to hand have scarcely a veatige of life in their rootr, and are entirely dependent on the vital enercies of their pseudomolbs Moderato hest, and a proportionato deree of bulbs. Moderate heat, and a propro degree of moisture, are all that they have to live upon, and it is beyond doubt, if judicionsly applied, suffeient to recruit the vital forces, to excite growth, and induce roo propagation. These potsful of crocks should be planged into a bed of arnd, where they will retain sufficient moisture to replenish the lose of tuid aaused by perspiration, and where the supply may be regular. Such planta ought to be kept in a tolerably close atmosphere, and about \(5^{\circ}\) warmer than what is recommended for established plants. James Anderson, Meadovo Bamk.

\section*{DOUBLEGLAZING.}

As I observe that a diecusaion has been going on for some time past in your Journal respectilg the merits and demerits of this system of glazing, I wish to offer a fow remarks on the subject, as this systom has beon in operation here for several yeare past. Mr. Anderson (eee p. 987) speake of double-glaged houses as being "all but hermatically sealed from the influence of atmospheric air;" and in another place he states that the supporters of the system enjoin their being ma.le perfectly air-tight ; and IIr. Deal (p. 108 f) speaks of the "great detriment of perfect ventilation," which he assumes to be a necessary resuit. Now it would appear that these writers have confounded together two matters wholly distinct-ventilation and radiation. The effect of double glazing is to reducs the latter to a degree vearly inappreciable. For instance, wero I wholly to withdraw the heating power from one of the houses here at midday, in the depth of winter during hard frost, the temperature of the house being, say \(60^{\circ}\) and ston all ventilation, the reduction of heat on the following morning would not exceed \(3^{\circ}\) to \(4^{\circ}\). So much for radiation. But ventilation is a totally different thing, and is altagether independent of the double-glazing It must be indeed obvious, there being practically no radiation from the roof and sides of the house, that a far greater amount of ventilation may be given without materially reducing the temperature, than if a rapid reduction of heat, were constantly taking place through a single-glazed roof. Here we give air (more or less, ccording to the season, Sc.) night and day all the year round, except during severe gales or frosts. The
result is, that instead of the close, confined, and
oppressive atmosphere too often found in plant houses, oppressive atmosphere too often found in plant houses,
visitors constantly remark upon the sweet, genial, and enjoyable condition of the air in the houses. They never feel close. There is much less difficulty in regulating the temperature of double-glazed houses than that of single ones; in' fact, we can have it whatever we please, no matier what is going 'on outside. We can
keep them warm or cool, dry or damp, precisely as we wish, and consequently the system does not render it in any way necessary to keep Orchids "almost simmering in steam.
So far from the outer roof being "superfluous," not "a positive evil," in summer (see p. 1084), believe it is quite as well adapted for maintaining plants in perfect health and beauty at that season as in
any other. Here we never take the outer roofs off, any other. Here we never tale the outer roofs off,
and as to the condition of the plants which have been growing under them for years past, I have only to say "Come and see them, and judge for yourselves."
great value of double-glazing in summer is, that it enables me to retain a health-giving amount of moisture in the air of the houses in hot weather; whereas with single glass, during sunshine the temperature rises so rapidly, that much ventilation is needel, and this carries off the natural moisture, and the house becomes' dry almost to aridity. This can only be prevented by repeated waterings or syringings, and then we have alternations of dry and moist, highly detrimental to the health of plants.

As to the recommendation of Mr. Deal, that thick woollen or flannel roller covering for the roof at night be substituted for double-glazing, I may say
that we tried this plan for years, and were sick of it. It was a costly, cumbrous nuisance. We have here upwards of 400 feet of doubleglazed houses, spanroofed, averagiug about 20 feet in width. The gardener and his assistants, who would have to cover and uncover these night and morning with "horse-cloth material," would indeed be to be pitied. I suspect at the end of a few years the cost would be found to be far greater than that of a double roof.
Since writing the foregoing I have seen the remarks
" J . F." (p. I107) in reference to double roofs, and wish to correct an error into which he has fallen respecting the plants grown here under that system. He states that the principal plants were Tree and other Ferns. In addition to these we have Orchids and a large collection of stove plants, including many varieties of those remarkable for beautiful foliage. So far from there being any deficiency of colour either in the foliage or flowers, it would appear that double roofing bringe it out with remarkable brilliancy and effect.

A striking illustration has just occurred, indicating the value of double-glazing here. This place lies low and flat, and consequently complete drainage is imprac ticable. We have had during the last 36 hours an excessive fall of rain, and the boiler, which heats two flooded, and the fire out. There appears no hope of relighting the fire for two or three days, and this N E I I have no fear J. Sayers, Gardener to T. Bewley, Rsq., Rockeille, near Dublin.

\section*{TRADE MEMORANDUM.}

Mr. Thomas L. Reid begs to inform our Correspondent (see p. 1132) that his address is 2, Burlington Place, Burlington Road, Fulham, S.W.

\section*{Home Correspondence.}

Evening Work for Gardeners.-Why is a gardener the only operative who does not work by artificial light? -a carpenter, smith, printer, weaver, painter, brickglass rection and do worse when under cover. Now that with warming apparatue that does not require night attendance, there is plenty of work, as preparing tallies, providing drainage, cleaning pots, potting plants, \&c., all of which coald be done in the hour now lost in the mornings and evenings, and greatly relieve the press of work that occurs in the spring, making all work in arrear ; the long winter evenings are a great inducement to resort to the public-honse or cards. I think very few gardeners attenpt to improve themselves by reading. I notice the complaint of a gardener at the low wages given by nurserymen, but the time in winter is but short, and certainly they can learn much in a nursery, and I certainly would sonner take a gardener from a nurseryman's recommendation than from a gentleman's, where if you go and look at his place there is nothing to garden. One who has been Gardening for 40 years. [We hardly think this proposition would be willingly acceded to.]
Double glazing.-Mr. Joseph Goode, gardener to Prince Demidoff, at Florence, says in reference to this pystem of glazing:-"I hope you have by this time have nothing to fear, and I will thank you to place my become in a short time very generally adopted. It will be strange to me if after two or three months' trial of double-glazing for Orehids, your gardener does not come to you, saying something like this: 'It will do, sir, it's first-rate; look at the increased amount of root growth,
the plants don't require hale the attendance. In a word, it is perfection, and no mistake.' My own experience is
similar to that just related. And now allow me to suggest a similar plan, one adopted by my late lamented employer, Mr. Booth, of Hamburgh, viz., make a set of lights to fit inside the rafters below the original roof, and just tack them up in their place with a fillet of of from 4 to 5 inches between the lights. Many thanks o you for keeping up this discussion, the credit of which in a great measure belongs to you." Let us hope that Mr. Goode's remarks may tend to elicit further information from experienced men. Robert Warner, Broomfield.

Winter-flowering Orchids.-Orchids in flower during the dull months of winter are much to be desired; with a little care and management a good collection of them
should produce a fair show of bloom all the year round, should produce a fair show of bloom all the year round,
more especially as we know many kinds will continue in perfect flower for months together should the state of the atmosphere of the house they are in be suitable for the longevity of the flowers. A great want in general prevails amongst Orchid growers, namely, a separate house for plants in flower in which the tempe rature should be kept lower, with rather a dry atmo-
sphere. In my collection at present may be seen in fower the following, viz.:-

\section*{Cattleya labiata
Vanda tricolor}

Leelia ancops

\section*{Oncidium Papalilio \\ Burlingtonia rigida alba
Calanthe Masua}

Phalænopsis amabilis Cypripedium Farrieanum

\section*{Cypripedium insigne
venustu Lycasto Skinneri
marophyllum
Barkeria Skinneri
Epidendrum rhizophorum
Zygopetalum Mackayi
Dendrobium secundum
Catasetum species}

These are grown in four small honses attached to each other, and heated by one of Thomson's excellent retort boilers, each louse having a different temperature As the plants come into bloom they are removed to ool house. P., Fernfield House, Bridge of Allan.
Theory of Ventilation.-Mr. Fish must excuse me I am loot convinced by his very scientific argument
(see p. 1083); on the contrary, he seems to fstrengthen my position unconsciously at every step. He says, for instance, "They (the currents of air) are all governed by this general law-that fluids strive to find rest in n equilibrium of temperature." What is this "striving o find rest" but another mode of expressing the simple law of gravitation, which compels everything, whether water, air, or stone, to seek its centre? Again, he says, "Water being so much heavier than the air, cannot remain as such in the atmosphere, and therefore alls as rain or snow." Surely here is my principle admitted in so many words. The cork, which he used a an illustration in his first paper, floats on water because the water is heavier: but try the very simplest experiment -fill a tumbler with water, as cold as you please, and drop a pebble into :it: it falls with more or less rapidity, in proportion to its weight, to the bottom, and the the water overflows, not from any inherent powers which it has in itself of rising, but because the stone is heavier, and elbows it out, as it were; and so with air, which, in proportion to its density, strives to find rest at the bottom, forcing up the lighter particles to make room for itself; and so, as in all cases, the greater force (or its equivalent, weight) prevails, and the "weaker goes to the wall." In one sense, heat is of course the cause of circulation in air and water; by making one portion light it reduces its power of resistance to the heavier, and so the currents are set in motion. We are agreed as to facts, but I submit that Mr. F. confounds cause and effect, which tends to mislead. I have not the book at hand, but I believe Dr. Arnott (no mean authority), in his work on ventilation entirely supports the theory which I am advocating. As Mr. F. writes under his own name, I have no right to conceal mine. Since writing the above I have read Mr. F.'s third article, in which I observe the following direct confirmation of what I have just said: "Fresh water is much lighter than salt, and of course the salt will displace the fresh-push it, in fact, out of the way." Mr. F. therefore admits all that I have contended for in water, through he denies it in regard to air. T. Phillpotts, Porthgwidden.

Larches (see 'p."1132). -Though I cannot pretend to tell your correspondent "A Subscriber" the best mode of proceeding in the case he relates, I will tell him
what I did with very fair success under similar circum. stances. The leading shoots of a Larch plantation lately planted by me were eaten off by hares. To plant over again trees of a similar size would have been useless, On inquiry I found that some nurserymen were in the habit of throwing away a number of Larches which had grown too large for sale, and occupied ground which
would be more profitably occupied by other stock From one of these I bought a sufficient quantity of Larch, 4 feet high and more, and I planted them. The hares did me some damage, and I had to look after the Larch for some time to fasten them in the ground when mich shaken by wind. Enough of them
prospered to make a good and flourishing plantation, but I got more trouble and saved no time by planting them large. A. K. eating been very much annoyed by hares and rabbits number of young Coniferæ which I bad planted in a Pinetum that was under my care. After trying many
plans, and all to no purpose, I at last found further destruction of the young trees by thace I got some common Furze, and placed a thiow 2 feet from the stem, taking care that out the et for the dace was covered, so as to leave no no ry perim for the depredators. When the trees were Larch wider circle of the Furze placed round them trees planted in a Pinetum arge a layer of P former would be a great deal smaller than the latter. Judging from my own experience than one of the best and cheapest that can be, hain the Fur to protecting the branches and lending and unde prevents the rabbits from homang on and under the young trees, consequently smith. -I.If your correspondent Roy hares and rabbits nipping bis Lar caudle of cloacine, lime, and soot dipuld th previous to planting, the probability is th depredators in question would not whic interfere with them, as it is new work stock to which they are most partial. I hav lacquer of this mixture applied to the stems of \&or., subject to their attacks to be sufficient to bed up or fill in with Pinus anstrin still would thickness, \(i\). e e, three of the latter to one of to dome when every stump of the austriaca would be d before the Larch or anything else were touched,
which time the loaders would be getting out Anon.

Japan Flax.-The Boehmeria nives is meted duce this article of commerce; I received it from Botanic Garden, St. Petersburg with a label that that it was the true plant, and from the large
of fibre it produced, I believe the statement of fibre it pr
correct. Ebor.
Pears. - The months of October, November, December are, par excellence, the Pear seaso, Strawberry, Cherry, Apricot, Peach, Nectarine, lum when Peaches belong to time past, when tho
Golden Drop has been gathered from the wall hours of light lessened, and the dinner can no be finished without the lamp, then do we acknowide the supremacy of the Pear. Foremost among excelling all others in beauty and goodness; Bunne of Jersey, Gansel's Bergamot, whore qualities cannot be adequately described; Hardy, Conseiller de la Cour, handsome and mi flavoured, described by that enthusiastic raiser of Peon
Vans Mons, as " la meilleure Poire existante:" Beome de Caen, a robust cousin of the venerable Broma Beurré, with all the good qualities of that ranit added to a good constitution ; Marie Louise duod hardy, with a clear title to nobility; Dogenne Comice, handsome, well developed, and high! coloured, with remarkable sweetness; Beurré Buche
lier, noble in size, and in all respects good Huyshe's Victoria and Prince
descendants of illustrious sires; Josephine de Malioen a good Christmas Pear-as are also Bergamot d'Eperen, rougb but excellent at heart; Madame Millet ling and delicate; and lastly, with the green leaves of anod fight unto the last the candidates for honours are, as will be seen, on the contrary some of them are very old. ood Pears mow be had during eight months il the year. An extensive field is nevertheless to those who are cunning in the mysteries of new fruits, and the plan of potting the trees designed for seed greatly facilitates the work. By carelulaud intelligent crossing we m
unhoped-for results. Amnes.

Gardeners' Wages in Nurseries.- Your correspondeo G. C." (see p. 1109) deserves the best thanksedr gardeners for introducing this sulject,
hould have told employers that \(12 s\).
nadequate remuneration, without wait
of it in your pages. The most manly way was to admit the fact as well as to remedy it as Mr. Veitch has done.
lear on one point. He says that all regularly mean only such as have filled a si亡uation as headga If so, the proportion of those who advance will be abcut four in every majority of operatives in nurseries being sion o get a place as chief gardener
than ance an cansery, and While this subject is being discussed, mention that Mr. Turner
has always given 14 .
London) to his men, and
ulture he gives 15s. It is only nurserymen to state that the continual changin who are of ccessity unsettied during the time 0 11 nursery,
Lem coniderabie iuss. Juhn Chalineis, Gur gives as one of his reasons for an advance of If he thinks the profits have been larger of If he formelly, he is unistaken; for it is well aste cars than forment branches of the nursery trade, koomn thal pore especially inlly confess that we feel that the other restrobs conviction with them. We may also remark, that ubile we agree with Mr. Yeitch's ensible comments ou :he suhytct (see p. . todied young gardener, inther and ask foreman's situation, or for is first start coudidad fardener, slould be paid less in a nurs ry than us "estad bished head gardener." We consider them an estampetent (without detracting in the least from be merits of experienced men) to do all that ie usually nquired of them; for this reason we have decided upon paing all gardeners employed by us \(15 s\). per week, in our rules, and do as they wculd be done by, when they themselves have the direction of others. Osborn \& Sons, Thembe Turseries, Fulham, S. W.
Fig Trees.-I should be glad to know how to manage my. Fig trees, which have produced a large crop of fruit, but so against a south wall. Ought all the Figs to be pulled off? Westfield. TThe past season has been rety favourable to the production of a great abundance
of what are called second-crop Figs, which very rarely rijen in this country, and that ouly under circums mien in this peculiarly favourable as to soil and situation. from the little embryo Figs which may be scen at the from the the shoots of the present year, and are not points larger than pins' heads. It will be quite proper therefore for you to break off all the young green Figs
of the second crop which have attained to any size of the second crop which have attained to any size.
But as, after very wild wintere, we have known such as are as large or rather larger than Marrowfat Peas to swell out and produce the earliest fruit in the succeeding sammer, we should leave all such for the chance of an early crop. The necessary pruning is confined
to thinuing out the wood. No shortening of the shoot must be practised except where fresh shoots are required for filling up vacancies; and all the bearing mood should be laid in close to the wall its full length. it is just possible that yours may be growing in too rich a soil, in which case it would have a tendency to corrected by root-pruning and a careful attent be stopping the young shoots through the summer, so as to keep the growth more under control, and to produce a good suiply of short.jointed shoots for the succeeding jear's fruit. If the second-coll growth, it will eariy, and when the tree is in full growth, it will often
happen that embryo fruit will be produced from their base, which will swell out and ripen the succeeding summer, but this is never the case when they are left on natil the dormant season. J. C C]
Root Fungi and Flanting.--J. M.," though Corester, must surely be mistaken in the advice
gives planting trees. He says gives about planting trees. He says (p. 1133),
consider it to be a useless and unnecessaiy exuens remore old roots before replanting fresh trees." Experience has proved to me of late that there is grest deal too much of this done at the present day, When we ought to expect better things. I have no doubt but, as stated, J. M.'s trees look healthy and well; to the peculizely thir flourishing condition is due and as for the root Fungur, there is plent'y of time for Ash remain for a loug time in the ground before much decay takes place, particularly if they have been down. Spruce is a little after the tree has been cut remember ever is different, and soon decays, but I do not apon the roots of Fir trees. Elm is perhaps the one of four named that it grows most freely upon. I should not circumstarces lately brought before me instances that forcibly illusgrond for any sort of trees. I was called in by a good plants of the better kiuds of Pinus, none of which had succeeded; they had all a sickly appearance, which on examination was casily accounted for. At planting, small square holes had been dug, in bare proportion to the nature the hall or pot, and the plant introduced. From the nature of the soil these pits were neither more nor less than Water traps, and at all times kept the soil in immediate contact with the roots in a sour state-hence the bad results. A pressure of other work a few years ago
compelled us to plant a way to that which your correspondent mentione, but since to take the progress of the trees has induced us proper manner. -in fact, there are too many of many more instances certain every gentleman planting, or about to plant Whether for purposes of pleasure, shelter, or profit, will gain that end sooner and doubly better by first draining trenching the cired, and then before plauting, properly
in less th.i.t 18 jenta. Where the asie is no: t.hent, in nine cane8 out of ten the hardomooded fonent treen such as will tiver brcome timier, the the soft-woote portion inteaded for thinning will be jeers longor in reaching a profitable beight properly trested malk fine chean proul young frow only foundation for sound good tunber. I Lope, witl your leave, to reiurn to this inturesting sulject again at some future time. Hortus [By all menns do so:
is one of the greatest importatice.]
The Prangipane.-Can you tell me what tree alluded to in the following passage from Willis's" "Trip to the Tropics?": - In oce of the West Iudian is'ands, at St. Pierre, in the islaud of Martinique, while Walling in the suburbs, we passed a garden in which there was a flowering tree of a beanty quite new to us. Its green fulinge was very full, and the tree about as tall as the comaion Tulip tree, but it looked precisely as if a sof damp snow had fallea in the night, and laden down its branclues with as much as they could bear. The rich white flowers lay cupped it the middle of each sproad. ing branch, a large lapful in every cluster. We found on inquiry that it was the Frangipane ree-wonder-
fully-beautiful flowering thee." W. W. [Tie Frangipane is a species of Plumieria.

Wellingtonia gigantea.-In answer to jour correspondent 'C. F. P.: (see p. 1132), I beg to state that the suil which was prepared for the tree in quustion consisted of eight cartloads of rich black loun, two of
forest peat, and a swall portion of road sanl. This was well turued and mixed together. A pit was prepared
some 12 feet across, and sufficiently diep to hold thit quantity of soil. In this my Wellingtoaia was planted, and it has well repaid me for the labour bestowed upon it. This material I apprehend mut resemble the soil in which the Wellingtomia grows in ita native climate, as is reported to be found in a very rich black deep loam. Afthough the timber of the whangonia may this trie may l, ricommended for ornameutal purposes and why I recommended it to be planted in valleys because I have an idea that it likes a moist situation Of several plants in the park here, one is planted in very wet place-in short, its roots are literally covered with water during the winter months. On measuring its growth the other day, I was surprised to find that it Day, Theydon Grove, Epping, Essex.

\section*{Sacteties.}

Royal Horticulitural: Dec. 5.-W. Wileon Saunders, E:q., in the Chair. Five new Fellows were elected. The Rev. M. J. Berkeley directed atten \({ }^{+}\)ion to certain points of interest connected with the differeut subjects exhibited. A ripe fruit of Monstera deliciosa contributed by Mr. Vair, gr. to Lady Dorothy Nevill, was found on trial to be extremely luscious and excellent in lavour ; the spicules in it, howev \(r\), it was said, make it unpleasant to the throat; and it was mentioned that a gardener who had eatin abuut half a fruit suffered considerably from its ©ffecta. It was con sidered doubtful, therefore, whether it would ever become a general favourite. Fruit of Stauntonia ati olia, ripened Duke of Cleveland at Battle Abbey, Sussex; it was not unlike, Mr. Berkeley said, a Brinjal in appearance; upon trial it proved tasteless and of little value, as wds also said to be the case with a species of this genus
which is eaten in Japan. Examples of the horn-like fruit of Mandevilla buaveolens were also shown at this meeting. Among Orchids two Angrecums were communicated-one, sesquipedale, remarkable for the length of its spur; the other, pertusum, less striking in appearance, but nevertheless a gencral favourite on account of the charming way in which the small, waxy, nearly spurless blossoms, are arranged on the spike, so as to resemble an edging of lace. This last came from Mr. Sunnders; the other was shown by Mr. Veitch. Mr. Saunders also furnished a Coelogyne, which important particulars from speciosa, with which it was compared, and to which it bore some resemblance. Attention was next directed to an 0 lontoglossum from Mr. Weir, peculiar in the vertical position of the extreme point of the lip. Cut specimens of Thibaudia ocanensie, and of a Gaultherin, from Mr. Bxteman, also recrived special notice. The strong resemblance which the
Thibaudia bore to Rhododendron Key ii was adverted to ; and of the Gaultheria it was said that it might be a variety of ferruginea. Musa coccinea was nuticud ahaving one of the floral bracts foliace...us, aud with a few words in praise of a handsome rariety of Polsstichum angulare from Mr. Pince, Mr. Beikeley concluded his remarks.
The Chairman then made a few observations respect ing three plants of Oucidium carthaginense which he exhihited. They had been ouly recently imported, and he produced them to show that coasiderable differences, both in regard to and size of blossom petaist in different plants of the same apccies evel in their native habitats. With reference to the Coologsne alluded to by Mr. Berkeley, he pointec out a peculiarity in the side petals, which looked

The Mometern, he kiated, fruited readily nith him every year, and he took ocontion to decoribe the intirnlug and singuar way in whinch the stung
leaf unfulls fiself. As regards culture he nucutio ed that the roota were extremely fond of water, and that when they got into a taule they soon billed it, eauaing the plant to grow with great rapidity. The beauty of hee cut and clached laver, efyec..nly whes riewed againes the light, uas nex: cummented upon, aud it was
stat. d that even if the fruit ehould not prore of much stat d that evers if the fruit should not prore of much
value, the plant was well worth growing, on accuut of its very crumuental appearal.ce
Dec. 5 (Floral Coinmitten).- Collections of highly interesting plants were shown on this occasion by
Mr. Veitch, to whom two Specia? Certificates were awarded. They contained aniong uthe: thinwe pecimens of the pretty scariet winter-flowering Maictha micane, "Lich blossume freely even in 3 -inch puts, aud which will doubtless prove a valuable ba-ket plaut; variuus lictle half staudard Epiphyllums; the white-spotted-leaved Sonerila margaritacen; the red spotted-leaved Ber!o lunia guttata, and the equally handsome hairy rather than downy-leased B. pubeecens; the pretty suiphur atriped leaved Eriocnoma marmorea; a fine rpecimen of
the yellow cariegated New Zealand Flaz ; the extremely handsome Thibuudis macrautha, with large was pinkish fluwers, barred crossways with crimbun ; and the white bloseomed lihododendrou lrinecess Al. andra, The samo collections contained, moreuver, Aucisba japonica vera, losded with haudsome red fruit; various fine varieties of Lycaste Skinneri, the charaing rusy fow hebril Calauthe Veitchii, the unusually hand eome lilac blob-oused Catteya Dominiana, Deldrobium Tattonianum, the Cuybea l. ke Libonia foribunda, and one or two other plauta. From Mr. Wilson Saunders came the Angrecums mentioned above, and one or two other interesting Orchids. To Mesers. Lucoube \& Piuce was awarded a First class Certificate for the handsome variety of Polystichum angulare culled parvissimum, mentioned ly Mr. Berkeley; and a arge cullection of plants came from the Society's Garden, in which were various Cypripeiliums, Barkeria kinneri, the charming little Sophronitis grandillora Lyca.te Skinneri, the Odontoglossum frum Mro Weir alluded to above, Zygopetalum crinitum, Puinsettia pulcherrima, with eqpendid heads of scarlet Honal leaves; Dracænas, Crutons, a Peperomia from Mr. Weir, with silvery marked leaves, Musa coccinea Hibiscus Cooperi, and one or two vither plants.
Dec. 5 (Fruit Committec).-Few suljects of exhilition were produced on this occasion. Mr. Vair sent the fruit of Monstera, adverted to above; Mr. Pursons a dish of very fine Wiuter Nelis and other Pears; and a small, but very good seedling Pear came trom Mr Myatt, of Deptfurd.

Hambsworth Hobtioultural - This Society's Annual Fsuit and Chrysinthemum Show was held at the Town Hall, Birtaingham, on Saturday, Monday and Tuesday last. The display of fruit was excellent The Pears aud Apples were generally large and highly coloured; those from the Channel Islauds were par ticularly well grown and in excellent coudition Chrssanthemums were past their best.
The Society's ten guinea cup for the best collection of fruit, 24 varieties, was awarded to Mr. C. J. Perry, fine Queen, Cayenne, and Euville Pines; large bunches of Muscat, Trebbiana, Al caute, Lady Downes', Barbarossa, and Black Priuce Grapes ; choice specimens Chaumontel, Duchesse d'Angoulême, General Todtleben, G'ou Morceau, Beurré d'Aremberg, and Beurré Diel Pears; and Cos's Orange Pippin, Cornish Gillidower, aud King of Pippin Apples. Mr. C. J. Perry had beautiful examples of Queen and Smooth Cayemue Pines.
- Dessert Pears consisted chiclly of Chaumontel, Duchesse d'Angoulêrne, Triomphe de Jodoigne, Passe Culmar Geveral Todtleben, Vicar of Winkfield, Beurré Clairgeau, Ne plus Meuris, Knight's Monarch, and Colmar. Stewing Pears were remarkably showy. The most noticeable were Belle de Jersey, Catillac, Savarin, Verulau, Beurié d'Espagne, Bzzi d'Heri, Belissinue, and Spring Beurre.
Dessert Apples were beautiful in colour and form, but not large. The best were Coz's Orange Pippin, Ribston Pippin. Corvish Giiliflower, King of Pippine, Scarlet Nonpareil, Dutch Mignonne, Sykeh uze Russet, Golden Harvey, Golden Russet, and Fearn's Pippin. Kitchen Apples were large, aud in excellent con dition. The finest varieties were Alfriston, Blenheim Orange, Reinette du C.nada, Wellington, Emperor Alexander, Duke of G'oater, Mère do Ménage, Royal Russet, and Hanwell Souring.

Cut blooms of Carysauthernums were not generally large, but some excellent flowers were st:aged. The best were Etoile Polaire, Plutus, Robert James, Rev J. Dix, R:flemann, Sam Slick, Cherub, Themis, Anaso Nonpareil, Belladonna, and Lady Hardinge.
 Plucle, Jersey, for a collection of Fruit.

The following extra prizes given by gentlemen interested in Horticulture created keen competition : A silver cup, value five guineas, given by Mr. C. J. Perry for the three Meaviest Cunchbell, Wuodseat, Ashbourne, Derby shire.
An electro-siver dessert set, given by Mr. E. W. Field, fo G. Thomas, of JJersey. five guineas, given by Mr. Jcho Mole, for the hest 12 dishes of Peare, eight in a dish, six dishes to b Jorsey.

\section*{Son, of Bankside, London, for the best by Mesings. Jones} Son, of Bankside. London, for the best 12 dishes of Apples by the exhibitor, a resident of either Warwickstire, Worces arnborougk. Hall, Warwickshire.
Other prizes were open to competition only amongat
eabers of the Society. The principal of these wore awarded me follow 6 in pots : ist, Mr. Chambers. Single ppecimen : Mr. Chanobers.
9 Pompons in pots : 1st, Mr. W. H. Dawes. 6 Pompons. Mr. W. H. Dawes. Single specimen Pompons: 1st, Mr. W. H ertecans. Pine-1st, Mr. W. H. Dawes. Grapes - 9 bunches Denert 4 pples-6: 18t, the Hon. E. S. P. Jervin. Kitchen
Apples-6: iet, Mr. G. Redfern. Dessart Pears-1st, Mr.W. H

Zoologioal of London: Now. 14-J. Gould, Esq in the chair.-Mr. S. Stevens exhibited the egg of an extinct species of Dinornis, supposed to be that of D. ingens, Owen, which had been placed in his hands for sale. - Mr. Blyth exhibited some remarkable horns o the Wapiti atag (Cervus canadensis), and made some remarks on the different varieties of this species deer. - Mr. P. L. Sclater contributed a collection of bird-skins made in the vicinity of Hakodadi, Japan, b Mr. H. Whitely, and pointed out several species of great interest, which had not been previously known to occur in that country.-A communication was read
from Mr. E. L. Layard, of Cape Town, on the habits, nest, aud eggs of Saxicola spectabilis, a new species from She Cape Colony, which had been lately described b Dr. G. Hartlaub in the Society's Proceedings, -Mr A. Newton exhibited and made remarks on a series of bones of an extinct species of Didus, transmitted by Mr. Edward Newton to this country, having been obtained by that gentlemaxis correapondents from caverns in the island of Rodriguez. - Mr. P. L. Sclater exbibited and pointed out the characters of a new species of parrot, of the genus Nasiterna, proposed to be called Nasiterna putio. Two specimens of this diminutive bird had been forwarded to this country by Mr. Krefft, of the Australian Museum, Sydney, having been received from one o the Salomon Islands. - A paper was read by Mr. J. 1. Gurney on a new and very singular raptorial bir tiscovered by Mr. C. J. Anderson in Damara-Land For this peculiar type, which, although Buteonine in its general aspect, presented some points of resemblance to the Owls, Mr. Gurney proposed the name Stringonyx Andersoni. A communication was read from Dr. G Hartlaub on a new species of Francolin discovered in Central Africa during Captain Speke's expedition, and proposed to be called Francolinus Grantii,-Dr. J of a leech (Troclaæta subviridis) found in the viscera of Moluccan Doer:-A paper was read by Dr. J. E Gray, entitled "Notice of Rhodophyton, a new form of Alcyonider fousd on the const of Cornwall." Dr. Gray also communicated descriptions of two new forms of lizards from Damara-Land, proposed to be called Cordylosaurus trivirga'us and Ptenopus macu latus, and gave a short account of part of a skeleton of a. Finner Whale, sent by Mr. Swinhoe from the coast of Formoba.--Mr. Gould exhibited and pointed out the characters of five supposed new species of Asiatic birds belonging to the genera Enicurus, Nectarinia, and Otocompea. - Mr. G. French Angas commanicated the second portion of a resumé of the marine molluscar Pauna of the province of South Australia. - Mr A. G. Butler read a monograph of the Lepidopterous
iasects of the genua Charaxes, of which 68 known apeoies were recognised. Mr. Butler also described six butterflies new to science, belonging to the gonera Heterochroa and Romalosseoma. - D Aray commanicated a note by Miss Staveley on the teeth on the maxillm of Spiders, which arpeared to have bitherto escaped the notice of naturalists. commanication was read from Mr. Gerard Krefft, of species of Sperm Whale, of the cenns Eaphysetes, proposed to be called E. Macleayi. The apecimen apon which Mr. Kreffes description was founded had been stranded at Manly Beaoh, near Sydney, in August last

\section*{dnctions, and capabilities}

The misery entailed by the slave trade in the inland districts is depicted in a style which does honour to the indefatigable traveller, and leaves on the mind of the reader a firm impression that no more than the trutb bas been spoken. To remedy this state of things, Dr Livinggtone looks forward with hope to the future
establishment of commercial intercourse between Europe and the interior of Afrioa, and to this end the results of his journeyings may contribate in various ways. He has discovered, for instal purposes, and a means of available for commercian purposes,

As to the natural productions of the country, indigo has been found growing luxuriantly over large tracts. Cotton of different varieties and of superior quality exists in abundance, and might be much more extensively cultivated than it is, as the soil and climate are pre-eminently suited for its growth. Tobsocn, the Castor-oil Plant, and the Sugar-cane all grow well in his fertile soil. One drawback is mentioned, and that serious one-the occurrence of prolonged droughts once in five years, or in other places about once in 10
or 15 years. Lack of vegetation cannot be assigned as the reason of their occurrence, as the hills and valleys are covered with trees and herbage.
The naturalist will find a great deal of interesting nformation in this volume on beasts, birde, plants, \&c. Space does not allow of our inserting more than the ollowing extract relating to the singular habits of birds.

The Honey-ruide is an extraordinary bird; how is that every member of its family has learned that all men, white or black, are fond of honey? The instant the little fellow gets a glimpse of a man he hastens to greet him with the hearty invitation to come-as Mbia translated it-to a bee's hive, and take some boney. He flies on in the proper direction, perches on a tree, and looks back to see if you are following; then on to another and another, until he guides you to the
spot. If you do not accept his first invitation he follows you with pressing importunities, quite as anxious to lure the stranger to the bees' hive as other birds are to draw him away from their own nests. Except while on the march our men were sure to accept the invitation, and manifested the same by a peculia responsive whistle, meaning, as they said, "All right, go ahead; we are coming.' The bird never deceived
them, but always guided them to a bive of bees, though some had but little honey in store. Has this peculia habit of the honey-guide its origin, as the attachment of doge, in friendship for man, or in love for the sweet pickings of the plunder left on the gro nd? Selfinterest aiding in preservation from danger seems to be the rule in most cases, ns, for instance, in the bird that guards the buffalo and rhinoceros. The Grass is often so tall and dense that one could go close up to these animals quite unperceived; but the guardian bird, sitting on the beast, sees the approach of danger, llaps its wings and screams, which causes its bulky charze to rush off from a foe be has neither seen nor heard; for his reward the vigilant little watcher has the piek of the parasites of his fat friend."
It is greatly to be desired that Dr. Kirk, the naturalist of the expedition, may fulfil the hope thrown out in the introduction to this volume, by giving us an account of the natural history of the country he passed through, and by working up the extensive collections sent home by him, some of which, onfortunately, never reached their destination. In the journeys which Dr. Livingatone is now again about to undertake, we trust he may not be hampered by an "asthmatic" steambont, is so thoroughly in earnest in all he undertakes.

Boors Rearived.-Penny Readings in Prase and Verse, selected by J. E. Carpenter. London: Warne \& Co. Pp. 248. A capital series of extracts from many of our best writors is here offered at mo cheap a rate hat we trust it may have an extended circulation, and erve to divert many a hardworking man during the coming winter evenings. Four volumes of the series have already appeared, characterised by a similar healthy principle of selection to that dieplayed in the one now before us.--British Almanac and Compawion for 1866. Knight \& Co. This is, as ueval, erammed frll of information upon a great variety of subjects for which the public has been taught to look in almanacs In the Companion the reader will find carefully-written articles on Ocean Telegraphy, on the Forests and Open Places round London, on the Conatitution of the Sun, and on Working Men's Institutions, besides a summary \(0^{\circ}\) our artistic, architectural, and political progress as bation. In so extensive and valuable an epitome of things in general, it is not wonderfal that a fow prens errors are to be found. \section*{The Apiary.}

In our reply to Mr . Pettigrew, we did mot altogwhe
ffer from him as to his views on the sabiect Hives; but we certainly thought that he adrme hives of dimensions out of all p requirements of bees, and which if bron to the would prove only a delusion and a sare. Bat agree with him in believing that most of there is little hope of the majoch too small. ing as to the proper size for all hives. Doerpect depends on the district, but it is not alrable matter of locality. We have known sevenl be a radius of a mile, all scientific ability, residing as to the capacity of the hive best adaptel
strict
The Woodbury hive will not, in our opini properly tried, and judiciously managed, be found ed
too large for any part of Great Britain or Irelad is, if anything, too snaall for some of the bat localities of the south of England. The apace the frames available for the bees is 1411 cubic The entire internal capacity is, as stated br Mr. Cu 1892 cubic inches. But the portion of the intenic occupied by the frames, with the spaces of three of an inch between the frames, and the top, botho
back and front sides of the box, mast not be taken account in calculating the internal capacity of bar-an? frame hives.
The hives chiefly in use in our own apiary are moe arger, their full measurement being 2140 cabic incte their real working dimensions containing 17 inches. We have frequently obtained supers
to 54 lb . from these hives, and have very rare grub or an egg above the breeding combs in thei apartments. But hives of this, for British soil, size, may not be adapted to all locilities, and we hestate to recommend their general adoption, on th other hand Mr. Carr's hive appears to be as mach ro small. If its available internal capacity be caleulater in the same way, it cannot, we believe, exeed 10 cubic inches. We should be very sorry to have aid diminutive hives in our apiary
Mr. Carr probably speaks of Keys' when alluning known prior he asserts were the best and frum hives. Here again we must beg to differ from bim Dr. Bevan's and Taylor's bar bives, and the Stemate hives, with many and all improvements on Keys' system.
Mr. Carr's plan for gradully enlarging the supen in good one. It is however not new to as; hep The large hive, usually called the alluded to by Mr. Carr, undonbtedly soems Canada hive this country, but we know that a plan of keeping bee very analogous to it has in America or Cand occasionally been fouud to answor. Wo have been informed by a gentleman of one which came ander notice somewhere in America. He accompnied proprietor on a visit to his bees ror comb for the tel table. A room constituted the bee-hive. On enternic at the door there were visible masses clusters of bees suspended in various parts from ti ceiling or from shelves. The means of exit entrance our informant did not observe path all but he imagined there were slits throug various places. There were no separate aid Tie mer bees worked as their faucy led them. without any protection to hands or face, cat ama much also said that the bees did well, and gave mim trouble. How far such a plan would ansmer amount of honey for male were a dem somewhat say, as our informant, from being sono much sinit on the subject of bees, and rather
them to ventare his sacred person in clicula
did not investigate the matter very particular
Profitable Bee-keoping,-I ean opafirm your mite ment that large hives do not answer, nor evic incher the size you have tried, contaning Wosdbury except in a very good bee country 1899 ing 14 inces aquare in these 1892 equare inches, do not auith nearly al of hives, inoluding हวme my father go after Kay's (query, Keyb') pla decidedly the beat hives improved taining 1408 square inches, whio
The system that I resommend
eping is to prevent swarming,

Mosland are so short that the bees cannot send out omarms and also collect shat is prevented swarming will collect three to jour times the quantity of honey that it would have done if allowed size as the hive, but with only seven surframs instead of nine in the stock-box, so as to ge: thicker honeycombs, weighing from six to nine Pumben I first put the super on, if I think it is too large for the bees to commence work in it, I remove one Pue in its place, and so reduce tha size of the supers to any size that I like; and when they are wanting more roum, this solid pies the super is enlarged as required.

As Mr. Pettigrew says that he has never seen a hive half large enough in any county, I beg to inform him American box hive, containing upwards of 20,000 square inches. I saw one of this inake of hives at work in Uuswell Hill ; it was an ordinary bell-shaped straw hive laced on a shelf near to the top of the box, and the ortom of the hive projected half-way over the shelf. The bees had extended the combs a considerable distance down into the box. The queen in this case was not inducement for layiug in these extended combs, as they continued from the top of the hive, and she laid eggs in them, but nothing like to the extent she might have done if she liad had the eggs to lay, as there were the combs still farther if she required them.
Mr. Tegetmeier, the Secretary of the Society, on the 13 th of April, 1861 , says, after giving this system a fair trial and getting no honey the two last years-"That it is inferior in a profitable point of frames, but that it is interesting to see the bees working in so large a box." William Carr, Newton Heath, near Manchester, Nov. 25.

Bee-hives.-In order to assist the uninitiated, I would suggest that you should, if possible, publish a plan and
section of each of the best formos of hive, which, with section of each of the best forms of hive, which, with
the dimensions, would greatly assist country tradesmen in making them when required. It would also be of great service if clear and precise instructions were given of the best mode of manipulating the various approved bives. J.
We hope shortly to commence a series of articles in which we will endeavour to give full and explicit
directions and measurements. With regard to plans of each hive and its appurtenances, woodcuts will be given, so far as the expense of engraving blocks will permit.

\section*{Garden Memoranda.}

Thr Royal Gardens of Sans Souci, at Potsday, Prossis.-We are glad to have the opportunity of priating the following interesting account of chese H.R.H. the Crown Princess :-

These very celebrated and magnificent Gardens are situate on the island of that name, about 16 English miles south of Berlin. The whole island may be palaces having a share of the general and extensive loost ine arrangements. I will first notice, as being of residence by the Crown Prince and our Princess Royal. It is situate at the west end of the great garden arrangement, and is known by name as the New Palace It was begun by Frederick the Great of Prussia in
the year 1763 , and was finished in 1770 , at a cust of upwards of three million dollars. The style is a mixture of old Dutch and Italian, with an addition of some 230 corinthian pilasters to a dome 176 feet high. Around the parapet at a high elevation, and at proper intervals,
are arranged 428 statues of sandstone, in different attitudes, each from 8 to 9 feet high. The length of the front is 680 feet. The imposing effect must, I think, tell forcibly on the mind of every spectator, as it did upon mine
In tront of this building is a liandsome flower garden, designed by the Princess Royal. It is English iustyle 2 acres. There is a broad centre walk, and the whole 18 surrounded by a double walk with a border between, upon which are placed alternately at intervals, fine Orange trees and white marble statues. The decorative portion of this design is interlined with Box, forming a
highly tinished geometrical design upon a Grass platform. The outside walk is again backed up by fine trees and underwood; but if we consider that here the Ladurels, both Portugal and his Rhododendrons and Laurels, both Portugal and Common, as greenhouse
plants, and also that to get the Grass iu the fine condition in which I saw it, a daily process of watering success in decoration is feel how much the path to nolhing short of great perseverance would ever bring out such results as Mr. Emile Sello has produced in pect to the state of keeping in these gardens.
'I'o the right of the Palare are some squares enclosed
by hedges of Beech soma 20 feet high, and used as play-
gronuds for the RO yal children. To the loft are
similar squares, but the lhedges are lower towards the south, and the gardens are filled with a truly Einglish mixture of fruit, fliwers, and vegetables, plensingly arranged, and kept with acrupulousnent ness; and aithough they, like the gardens on the other Ride, are manly for
the amusement of the looyal children. yet they are frequently visited and superintended by their Inyal Highnesses the Crown Prince and I'rmeess. In à wood close by is a colony of English wild flowers, such a common yellow Prinioses, Polyanthus, Cowslips, Snow-
drops, Lily of the Valley, Foxgloves, \&c. May they continue to flourish, and be as mach at bome and a asppy as their Royal patrons !
The broad centre walk already mentioned, in front of the Palace, is the commencernent of a long straight venue, ruming from east to west, and connecting all the beautiful grounds and gardens of Sans Souci. At main or centre of which, when in full play, throws a column of water to a lieight of upwards of 700 feet. The basin to this is 120 feet in diameter, with a bold
narble curb, and is well stocked with gold fish marble curb, and is well stocked with gold físli
Surrounding the fountain, numerous marble seats and many beautifal statues in the same material are placed A little southward of this, and newly erected by order of the present King, is a white Carrara marble monument of Frederick the Great, by a sculptor of Kome. The site is exceedingly well chosen, as opposite to the north is the famous Castle of Sans Souci, so named by himself, where he spent many hours of hit
life, including the last. The name Sana Souci (without life, including the last. The name Sana Souci (withou care) appears contradictory to what we read of his one son en the top a hill, and made, as it were, the centre of the groundis and the other palaces. The views are also magnificent, few equalling them in their way. Voltaire, who frequently atayed there with Frederick the Great, named thi abode "Le Paradis de Philosophe." The landscap extends as far as the eye can reach over the fine tree of the park ; while between the Castle and a range of hills is a large sheet of water, with numerous sailing vessels passing to and fro, adding life to the scene. Below this Castle, at the foot of the hill, is the great fountain already alluded to. To the left we have the interesting town of Potsdam, with its spires and colossal copper-gilt Atlas supporting the globe, peeping through the trees. This town is noted as the birthplace of the celebrated traveller Alexander von Humboldt. To the right of this is the historical Windmill, still kept in good repair as

In the front of the Castle is a plateau, about one acre in extent, decorated with flower beds on Grass, and sur. rounded at intervals with fine Orange trees. In this centre are several very fine marble fountains. From the plateau extending down to the great fountain are six terraces, each equal in size to the top plateau, and on these are nicely arranged about 400 magnificent the trees at Versailles in their palmiest days were not equal to them. The fronts of these terraces are planted with Vines, Figs, and Peaches, and are termed sun walls, being only covered with glass at the approach o winter to protect the trees. These terraces give. length of 2340 feet of sun wall, and in another part of
the garden there are 7026 feet more, making nearly one and a balf mile of this sort of glass. On each side of these terraces are broad flights of steps, the plateau orming landings. The effect of these terraces is won-
To the left and right of Sans Souci are two buildings oining these terraces. The one is a picture gallery, and has in front a nice flower garden laid out in the Dutch style; the other is used as a residence for the ladies in waiting upon the Queen Dowager, who occupies this palace as a summer residence. From the north, at this point, the view is also fine. In front is an isolated tately Corinthian ruins. Near them is areat reservoir 150 feet in diameter and 12 feet deep, which supplies all the fountains, and is in turn supplied from the River Havel by an engine of 80 -horse power.
A little westward of the Castle are what are named the Sicilian and Northern Gardens, both laid out in the Italian style, and forming terraces on high slopes They contain some nice Conifers. These are surrounded by arbours, and many marble figures, and are enlivene by several fountrius, the upper slope having in its centre a fine grotto. Close to these gardens stands, on another height, a large and imposing Italian erection, with a tower at each end, from which fine views ar obtaiued. This is the Orangery, and is in length 330 feet, formmg inside a sort of magnified winter garden. The root is glass, with an architectural front surmounted by balustrades. In front of this building, which faces full south, is a good-sized flower-garden, also Italian, with numerous statues and fountains. From hence numerous massive flights of stepa lead down to the public road, which runs parallel with the long Fenue betore mentioued.
Following up this public road, wbich has gardens on each side, we come shortly upon two handsome Itatidn villas, one the residence of a royal architect, and her
other that of Mr . Sello, nne of the eight rnyal head other that of Mr. Sello, one of the elight rnyal head
gardeners in this extmblishment, and brother to Mr . Eimile Sello, the gardener to the Crowo Prince and Princess at the New Palace. These are upon the left; while upou the right is a most singular look ing gariten, armed the Paradise Garden, with a stebadiu " (Italian (velhplace) in the centre, and a casc ade opposite t) it The whole garden is planted with the different surts of Vines, Virginian Ureepers, \&i.., which are trained to all kinde of arbours, arches, espaliers, payrdas, de. In suring the gardea is said \(u\) be deliciously scented with the blussume of the Sweet Vine, Vitis od oratissima, and V. riparia. We overlook this Vine in planting creepers benides ita swoetness, it is quite us effective and haruy as may of the American varieties so much praised o ate. Ine whole garden is quite novel and pleasing.
Between thearbours areplanted Mulberry, Chestnut, and Walnut trees in rows, the whole intersected by straight walks and borders of flowers. On each side, joined to this garden, is a large Vineyard of 8 acres in extent, situate on the steep slope of a hill. It is formed into three terraces, with three sun walls each 7.5 teet \(1 \cdots\) and 8 feet high, covered with glass at an amgle of \(75^{\circ}\) one-sixth of these walls is planted with P'eaches and the other portion with Vines.
The system of treatment followed for these is somi thing similar to the English, except in the pruning for thev adopt the loug-spur treatment, instead of the now almost universal system of short pruning which is followed here. The produce of Grapes frow these walls is upwaris of 14,000 bunches a year, with an average those known under the names of Muscatelle, preen, red, yellow, and blue; Muscat of Alexandria; Mul oisin, blue, white, and grey; Cibebe (this has fine arge bunches, it foot in length, and weighs ou hu average 4 to 5 lb ., and appears different from the Weisser Cibebe we know) ; St. Laureut, Chasselas Royal, Chasselas Fontainebleau, Green Edling, Lemić Honour, Frankenthal, or Black Hamburgh; Cypher, white and red; Borromen, blue; Ungar, grey and blue: Lachrymm Christi, with some 50 other sorts. Of Peachet the following are most estermed:-Madeleine, red ant white; Mignonne Ordinaire, Pêche Malti, Galande on Grande Noire de Montreuil, luconparable, Meleaton Hative, La Belle Chevreuse, Belle de Tirlemont, Newington, Téton de Veans, Brugnon Sianwick, de Some of the Vines are trained outside on trellises, and come in about a fortnight later than those on the sum palls.
Pussing some interesting enclosures, of some 70 acre Pbeasant, for foreign and other fowls, known as the Pbeasantry, we enter another extensive pleasure
ground of 120 acres, with a fine Italian villa in the centre. This is named Charlottenhof, and day present of King Frederick William 1II. to Li son, the late King William IV, at that time Grown Prince. It is chiefly noted for its fine Rose garden, aud is much frequented by the people of Berlin during the Rose season. Near to this is another residence of a roya head gardener, also built in the Italian style, and having in connection with it a Roman bath-place. We may here notice that all the residences of the head officials, both gardeners and others, are so placed and built as to form objects in avenues, or to serve features in the views and landscapes; even the engine-house is quite an ornamental piece of architecture. I think we do not consider this sufficiently in England.
Leaving Charlottenhof, on our way eastward we pass fine Japanese Pavilion, surrounded by some stately trees. A little way across the meadow are two fine bouses at the end of a cross avenue, one the rince of Mr. Lenné, the Director General of all the Royal Gardens; and the other occupled by a portion of his taff. Close behind these dwellings is the forcing department, which consists of 25 glass houses and a reat number of pits. Each house is about 120 feet gng, and varying in width from 15 to 24 feet. They Hand Here feet apart, in straight lines, facing ful south. Here they force Peaches, Apricots, Cherries,
Figs, Strawberries, Raspberries, French Beans, Musbroms, \&c. A little further on is another forcing department for Pine-apples, Melons, Cacumber, Plums, \&c. Near to M. Lennés residence is what is known as the Marly Garden, very beautifully laid out and kept as a private gardeu for the Queell Dowager.
Besides the differeut places noticed in this hasty sketch, there are many more fine palaces and gardens on the island, but so nicely com-
bined together that the whole appears to consist of one great park. There is, for instauce, the seat of the present king at Bubelsberg, a new and fine building; Glienicke, the residence of Priuce Charles, brother to the king, attached to which is a tiue park and garden; while opposite is the residence of Prince Frederick Charles; also the Peacocko loland Praueninsel), surrousided by the river Havel; the Marble Paldee, with several others. The river, it inay be noticed, expands into a broad lake, on which a large number of vessels is continually moving about. Most and they also themselves form beautitul objects in the laudscape. J. Fleming.

\section*{Miscellaneous.}

Ladders.-The canse of ladders "snapping" in two of ladders are explightened apoul the subject mar mater

Corsican Wines.-The Mountain of Cap Corso and its mini,es have even a local resutation for their wines. My friends at Bastia repeatedly excited my envy by offred nue. Of late years but little was been they awing to the rarages of the Oitium, which the Corsicans haw not yet learit to conquer. But new Vines are now being extensively phanted everywhere throughout Vorsica, in replare those that have been destroyed by cispase. In a few years large quantities of good wine will be araum make, both in the Cap Corso region and others. In the southern ragions of Corsica the Oidinm is still unknown, and perhaps the best wine of Corsica is still produced there in considerable quantity-the
Vin de Tallano. This wine is made in the vicinity of Sarteno, and is really good and choice. It resembles a full-bodied Burgundy, although it has a peculiar rich thavour of its own. This wine has already obtained suct) a rpputation in Corsica that it has become uincipal grower, tells me that his present prices a \(2 f .50 \therefore\) the litre or quart for the "ine of \(1860,2 f\). 25 e . for that if 1861 , and 2 f. for that of 1862 in the wood. If wines rainel the prize at the recent exhibition a Ajirerio (May 1865). Bennet's Mentone, 3d Edition.
Kidd Testimonial.-A testimonial, consisting of an degant cilver tea servicr, was presented the ot her day Priow. on the ocansion of his comate hossie in the service of that gentleman, as well as to show the wateen in which he is held by his brother gardeners. who, to about the number of 200 , each subscribed half a cuinea towarls the gift. Sicilian Tegetation.-As we approach Catania, the very peculiar, srim, coal-mouth character of the region
1. comes more and more apparent. The walls on the raadside, and in the fields and the outhouses, are al male of clinkers, the road of cinders, the soil of ashes Vineyarls are numerous; the Vines-indred, nearly all phants in Sicily-are planted in the fields between 18 mathes ligh, in order to retain moisture. Even Warat is pated in this way in tufts at the bottom of sune sy, tan is followed. This soil, fermed of dreominn rition sequired for vegetation; everything seeming th tomith and thrive in it, provided there be water of the trees, Beans and Peas are ripe, and Vetches are in full biossom. Lupines, white and blue, are very shandan:, and are extemsively cultivated as lodder
for cattle. The Hellebore is in flower and very emmon; Almond trees are in full leaf, and the frust natural size; white and red Convolvalus and serritt Poppies are common. Occasmally, near siluations, Bambous have new shoots, 3 or 4 feet
 fior a variety of similar purposes. Pomegranate trees Within the last few miles of Catank, where the been mole, rivers of lavia are crofsed, lying in masses, i:n sheets, in phans, athd prombeing little or (mand:.wa. The tertility of the lava is
 hy atmonsheric intluences and by time. Bennet's Mentone, \(3 d\) Edition.

\section*{Calendar of Operations}

\section*{(For the ensuing rooek.)}

Wher out-door work cannot be carried on, let the Fig hoase, Cherry house, and all late forciug houses be made ready for work when required. The walle or painted. Fig trees that have been prope:ly manpaged during the summer will not bow need nuch pruniug; a few of the thickest ioranches may, however,
be taken out if necessary. Fruit trees in pots which it is intended to force next spring should, if not already trost. If Strawberries in pots are not under cover sorme may now be taken into any of the late houses, in order to prepare them for being forced aiter Christmas.

Flower garden and plant houges.
Look carefully over rock plants, and protect the roots of such as are tender. When the walks are dry, mannre may be wheeled on borders, to be dug in during winter as opportunity offers. Land that is nacurally very stiff should receive a coat of sand or lime rubbish, to lighten it; lout by no means disturb the soil unless it is dry and in a fit state for digging. Cabbage and Provins Roses might now be pruned if the weather continues mild; but Chinese and other tender kinds should be left till winter is over. Roll walks and lawns, sweep up leaves, and keep all clean and orderly. If the soil in the pots of plants in pits has become green on the surface, it should be carefully removed while the weather is mild. Scarcely any water will be required at this season; if the plants flag, a little should, however, be given in fine weather. Remove decaying leaves, and give air every fine day.
Azaleas.-These should be kept comparatively cool, and not in too damp an atmosphere. Let the plants stand as near the glass as possible.
Carnations and Picotees.-Keep these clear of dead leaves, and give them as much air as possible while the weather is favourable
Cinerarias.-If not already done, let plants intended for specimens lave a fiual shift. Water, when necessary, should be given in the morning in order that the leaves may get dry before night. Thin out superAuous shoots in order to allow those that remain to have more light and air. Keep the plants as near the light as possible, and avoid frosty draughts.
Dablias.- Examine the tubers, in order to see that
they are in a proper condition to stand the winter. Any seed which nsay have been saved should be wintered in a dry place.
Pelargoniums. - Plants which require shifting should now receive attention. Keep them close for a short time after the operation ; but when established do not allow the temperature to rise above \(40^{\circ}\). In short, if frost is excluded, that will be sufficient. Fancy varieties like a little more heat. Water in the morning, and let the plants stand thinly ou the stages. Train as often as the shoots indicate that that operation is necessary.

FORCING GARDEN
Praches,-These dislike hard forcing therefore apply little fire-heat, unless the temperature falls below \(40^{\circ}\); and when the weather is favourable, give air daily. The outside border should be protected by good covering of leaves, thatched over with straw.
Pines.-It will be a trying task just now to manage these plants, with no other heating material than fermenting litter. Every favourable opportunity should be taken to turn the linings, and add to them if required. Let them at least be protected by some kind of covering; and if possible let them be entirely nclosed, that they may of themselves supply a sufficient amount of heat to do away with the necessity
of keeping the pits covered during any portion of these short days. Young Pines are frequently much drawn during winter, and the mischief is not noticed until they are taken out in the spring to be repotted or planted; aud then it is that the garlener repents not having given more air, and more light, by keeping the lass clean. If the bottom-heat is \(80^{\circ}\), the top may ccasionally be as low as \(55^{\circ}\), without the plant suffer ing; and particular care should be taken that no injury occurs from excessive dampness at the root rom any cause.

\section*{hardy frdit and hitcemi garden.}

Dig or trench all vacant ground, earth up Peas and Beans as they require it, and protect the most forward Celery ridges from frost and too much wet.
Pear Trems.-In pruning very young trees, the object should be to encourage the growth of wood in proper directiong. The form in which the tree is to be rained must be first decided upon. For walls and espaliers the horizontal disposition of the branches is the best ; therefore, if the tree be a maiden plant, it must bs headed back to the three bude best situated for producing a horizontal branch on each side, whilst the third or upperinost is trained upright. If the tree is a year older, and has been treated as above in the former season, the upright is to be cut 1 foot, or four courses of bricks higher than it was formerly. Sometimes a little deviation will be necessary on account of the buts; but generally the upright ehould be cut immediately aboye that bud which is nearest the line of brick-work along which it is desirable the horizontals should be trained. The buds to produce the latter will of course be situated below that line; it is proper they should be so, in order that the shoots take a strictly horizontal direction. These directions with regard to the management of the upright leading shoot are applicable every year till it be finally stopped on reaching the top of the wall or espalier. It the horizontal shoots be weak, it will be advisable to way also now bout one-third. Other hardy fruit trees

ness of growth.

unless local opinion sanctious such a otep : so that unless local opinion sanctions such a otep: so that
in placing the power to such tratio in the hands of local authoritios, it rually has done all that is possitile.

If the majority of local authorities should pu: in exercise the powiro tur thas purpise with wi.i.h they are invescel, it can haraly be dounted that Government would at once crue forward to make the work eamplete by extenilinat the rule over the minority of ca-cs where the lical authority hat not acted. Mcauwhile, phhlie opinion is fant hurrying on to the result thus inaicated. The cases of disease reported duriag the last thret weeks to the Veterimary departament of the Privy Cuncil have been 2c00, 3600, and nearly 4000 respeotively.
- Ir is the trustworths records of pedigrees of our domestic animals, combined with their inherent excellence, which brings all the world to England for such breeds as are deemed suitable for the wants of other uations. It cannot be doubted but that with the world-wide dispersion of the Anglo-Saxon race and the improvement of agrieulture in all the temperate regions of the globe, the traflic in lirst-olass breeding animals is yet in its infancy.

Many a fearful tale of pecuniary loss, mura ruin, and broker hearts circles around the Stud Book; very different results would flow from Siud Books of the Cleveland Bay, the Suffolk Punch the old Enylish cart-horse, and the Ciydesdale The happiest results have attended the formation and publication of the Herd Bonts of the Short horns, Herefurds, Devons, and Puiled Angus. May the circle of usefulness soon be completed by the addition of the Galloway and Ayrshire!
As for our Leicesters, Suthdowns, Cutswolds, and other breeds of lesser note pertaining to com bined tillage and pasture, and the Cheviot, Blackfaced, and other local breeds of upland pastureswhy should the well-earned famo of the national agrieultural or firat-elass leesl agricultural ssemes be lust (so to speak) to the world in the flock of his fortunate owner? We know the value of a name in connection with a herd; we know the value of a Comet, Duke, or Duchess strain of blood. The honest breeder of a prize sheep would welcome a Sheop Stook Book, and the world would ultimately have a moiety of his profits.
In currying out these sugg stions, embodying a few rays of hope propounded in this hour of agricultural distress, perseverance and method, cumbined with honesty of purpose, must grapple with great diffioulties. Here is fitting work for many master minds, as well as for those wh') are content
"to labour and to wait,"-a worthy object for the contributions of the wealthy, aud for the surplus funds of agricultural societies.

We smiled at a neighbour 14 years ago who employed a donkey and cart for odd jobs, but we repented on refleotion, and our gains by following up the suggestion are really enormous:We found a tirst-olass (in point of shaps) Welsh pony, say \(12 \frac{1}{2}\) hands, well fed, esuld do more work than the best stamp of our farm horses. A big horse gets sick or giddy; the abovementioned pony could do doable the amount of horse-work labuur that any hurse cond d.e. Ia the course of a year a thousand and one jobs
will oceur which could bo quite as well executed by a light pony eart as with an ordinary onehorse cart. There is no breaking of a teara; and a boy entrusted with a pony cart rises high in his own estimation and that of his comperrs, -he learns how to handte a pony and aspires to a horse. The effects upon the agricultural training of 12 boys are most satisfactry, \(\boldsymbol{B}, \boldsymbol{M} . \boldsymbol{F}\)

AGRICULIURAL EDUCATION.
On Middle Class Eujcation, having reference to the Improvement of the Education of those when depend the Cultivatinn of the Soil for their Support, By Mr. R. Dekes, 14, Burton Crescent.
(Continued irom p. 1139.)
IV. We now come to the consideration of the im portant subjeet of Chemistry, as the tourth science which is necessary to the improvement of agriculture. Liebig has stated that it is from chemistry alone that any great advance in agriculture is to be expected, ami he has receutly warned the agricultacists of Great Britan, that it will be necessary for them to farm upon more strictly chemically scientitic principles. Cnemistry is a science which takes cognizance of all substances it Nature, both those which are organie, as in the animal and vegetable kingdom \(*\); and tho:e which are inorganic, as in the mineral. The former atso all have a portion which is inorganic; and while their organic part can be consumed and dissipated by fire, the inorganic remains. Now, it may bestated generally, that plants,
for the most part, derive their organic portion from the ur, and ther inorganie from the soil. The latter in men smallep than the formar, bot it is not on that asement to be dasevarded. The bulk of the piant minever, is derivet from the air, and the condition of Ahe atmonthare materially aftects it. Where that coniditiou is unt farou:ab'e, gs in the tropins, we ses the :maznificese of tropieal vezetation. The atmosphere hawever, is heyond our control ; we cannot improve it Ir reater it inare favourable to the growth of plants Unm it is maturally. With the sat, howerer, it in different. From the suil is derived the inarganic part at phants. This inorganic part is composed of severat dffarent substances, as will be seen frem the fullowing Table, taken chiefty from the analyses of 13 oussingatult, published ia his "Eeonmie Rurale," and stowing the composition of the iusrganic part of smane of the cultivated farm erops:

These subatances whioh are found in the phant are also ail grund in the onil, at lexat in a ferthe smit, and are there combined with one another in various wass. (changes are always going on, although slowly, ainonget them by which they are rendered available for the plant. It is only in certain conditions that the plant can take them up. The presence of the air facilitates these changes, an I where it connnt enter, as in the solid rock which mary be composed of the sams entestancen as the soil, no change takes phaee. The mflumee of the uir in eflicating these clameres mus bu cmen in the domertic oper tion he beltime the年 air, the fire is caused to burn ane blas nothing but a chemical change which in going on apermpanied, as chemieal change is, when violent, by light and heat. The coals are being more rapidly com verted into carbonic acid and other gases. In like manner, stirring the snil, by dmit'ing the air, cause changes to go more rapidly forward which are beneficial to the plant. It is by these enabled to rasimilate the substinces in the s iil which are necessary to ita growth But these substances exist in the snil sometines in very small quantities, and may even be altugether sbount. These deficiencies it is the function of mannre to supuly As stirring the soil, or tillage, is a mechanical ncience, so manuring is a chemical science. Manures have alon an important action in momoting the chances in the soil which have been spoken of, The requred subtance may be abundant in the soil, but unavailable for the plant. This subject is still, however, involved in considerable obscurity, and it is only by each farmer comprehending what has already been ascertained, and acting himself in accordance with fixed principlez, that progress em be male. There is nothing in the province of the farmer of grenter importance. Manure is the fountation of all his success, and of the manares he employs tos much cannot bs known. Formerly all the manure emplnyed upin a farm was mado upon it, now there are few fitrma where some extra manure is not made use of. To incusire into the nature and efficaey of the many foreign substances used as manures it peculiarly the province of chemistry. Different kinds of crops req'ure different kinds of mannres. Farnyard monure is suited to every crop, bat it is mots so with these special manures. They mast be applied with competent skill to produce the desired affect. The sane manure produces ditferent effects upon different crops, on different soils, aud in different seasons. An overdose of farmyurd manaure was never apprehended as prejudicial, but with the manures of which we speak it would be passible to kill every plant. They are, moreover, generally very expensive, and require therefor, to be applied with eare to avoid waste, and in order to develop thoir brat ellices. Not only does the application of these manures raquire jndgment, hut their purchase also. They all exist in the murket in a creater or logs derpee of parity, chat is, in a greater or less de gree of strength. Giano, ulthough it may be perfectly genuine, varies considerably in comprition, some kinds being of low rathe, and roaia kinds the most valuable manure that ean be pat upan hand. Bosides guano thare are many substanners coning iutn extented use as spuecial manmres, snch as sulphate of ammonia, nitrates of potash and soda, common salt, srperphosphate, and refase suhstances of varions kinds. But the tarmer ought not to purchase anything of which he does not know the value, and of the effect of which he is not quite sure. These substances have very differing composition, and as manura a function pecaliar to themselves. To understand their differences and their effects the farmer must know something of chemistry; and although there is much which it belongs to the professional chemist to investigate, there is mueh alrealy ascertained whicis masy be usefully aequired.

Parmers, then, need not be chemitst in the profesesional
senne of the term, but thlould y yet possess some knowledge sanse of the tern, but slould yet possess some knowledge
of this subject, succesfolly in thbir business without having recourse to special manuring. To do this upon correct priuciples
is all.important, and these principles chemistry alone can explain.
But it is not only with reference to the subject of manuring that a knowledge of the science is requisite, but in connection also with many questions regarding warmth and shelter necessary? - why are some kinds of food more fattening than others? -which is the best kind of food for young stock, that it may grow to the bone? -for mileh cows, that the quality of their milk may be improved \(P\)-for fattening stock, that they may lay oo flesh ? These are all questions intimately connected with chemistry, and although it may require the labours of the more professional chemiat to clear up these
points, yet a knowledge of this science will alone enable points, yet a knowledge of this science will alone enable
the farmer to comprehend the researches which may be necessary, and appropriate the practical results arrived at. Lastly, chemistry is necessary to a knowledge of the veterinary pharmacoppeia, many of the medicines being purely chemical substances, the nature of which might othervise arise, and to epplioy the remedies with the desired effect.
. Geelogy is the next science to be considered as nseful to agriculture. This science is intimately conthe soil and the loose or drifted matter of which it is composed, we everywhere find the solid rock. This superficial covering of loose materials varies from a few inches to some hundreds of feet. Where the naked rocks present themselves, it is observed that the action of the air, rain, or frost, causes their surfaces gradually
to shiver off, crumble down, or wear away. Hence on to shiver off, crumble down, or wear away. Hence on
comparativoly level surfaces the crumbling of the rocks gradually forms a soil; on those which are more inclined the rain will wash away the loose materials as soon as they are separated, and carry them down to inferred that the earthy matter of all soils is derived

 from these, therefore, must have a similar composition. A sandy soil will be formed from a sandstone, a calcareous soil from a limestone, and a clay from a slate or contains a mixture of earthy ingredients in proportions corresponding to those contained in the rock from which it is derived. The character of the soil, then, is essentially that of the rock from which it is derived. will tend to increase our knowledge of the soil. Rocks are of two kinds: those which occur in layers or strata, and those in which no layers or strata are perceptible, but which are found in more or less solid masses. The latter are of two kinds, the former are divided by geologists into nine different groups or formations, which are again subdivided into numerous beds. Upon are numerous others, although of small extent. These
are all distinguished by their own peculiar characteristics, the most certain of which is the fossil remains peculiar to each, and which is 80 sure an indication, that by the discovery of a single scale of a fossil fish the geological formation of a whole tract of country has been settled. All these beds have for the most part an agricultural character peculiar to themselves. Geology
thus explains to us the cause of the differences which thus explains to us the cause of the differences which of the soils and subsoils throughout the conntry, as they are affected by the character of the rock upon which they rest. As an illustration of this, a comparison of the soils derived from the two kinds of unstratified rock, granite and trap, is interesting. Granite consists of quartz, felspar, and mica, substances which are desti-
tute of lime. Trap on the other hand consists essentute of lime. Trap on the other hand consists essen-
tially of felspar and hornblende; this latter mineral being rich in lime. A remarkable difference exists, therefore, between these two rocks, a difference which must exist in the soils derived from them. A granite soil, in addition to silicions sand, will consist chiefly of silica, alumina, and potash derived from the felspar. A trap soil, in addition to the silica, alumina, and potash derived from the felspar, will generally contain the hornblende. If the variety of trap consist chiefly of hornblende, as is sometimes the case, the soil formed from it will derive nearly \(2 \frac{1}{5}\) cott. each of lime, magneaia, and oxide of iron from every ton of decayed rock. A trap soil contains, therefore, a greater number their healthy growth, and will therefore generally prove more productive, than a soil of decayed granite. . In the former, the two minerals, felspar and hornblende, will form s soil more favourable for vegetable life than the latter, in which the felspar is the principul source of all the earthy matter it is capable of yielding. In the former the potash and soda of which the hornblende is nearly destitute, is abundantly supplied by the felspar, while it yields lime and magneaia, which exercise such Thus, while granite soile may be peculiarly unproductive, trap soils may be eminently fertile, and such is actually

Unproductive granite soils cover nearly the whole of Scotland, north of the Grampians, as well as large
tracts of land in Devon and Cornwall, and in the east and west of Ireland. On the other hand, fertile trap soils extend over thousands of square miles, in the low. lands of Scotland and north of Ireland ; and in Cornwall, where they cccasionallymix with the granite soils. they are found to redeem them from their natural infertility. Among the stratified rocks similar differences are observed in the characters of the soils resting upon them. On some, as on the new red sandstone, the soil is almost always fertile, while on some, as in the coal measures, the soil is in its natural
condition always unproductive, while some districts are found, as the greensand, of extraordinary fertility from the presence so largely of organic remains which abound in phosphate of lime. On different geological formatrons also, burning clays is found to produce different effects: Oxford clay, for instance, is said to be more benefited than Lias clay by this operation. Geology, therefore, is a science which has many close relations with practical agriculture, and it especially throws light upon the nature and origin of soils, on the causes of their diversity, and on the unlike effects the same manure, as lime, may have upon them. It tells beforehand by the mere inspection of a map what is the general character of the soil in this or that district,
where good land may be expected, and where improvewhere good land may be expecte
ments are likely to be necessary.

It only remains to observe upon the discordance which may sometimes be observed to exist between the with the rocks on which they rest, and the actually observed character of those soils in certain districts. This difference is caused by the accumulation of materials transported by various agencies, and from which a soil is produced which often has no relation to the character of the rock on which it rests. It may be true that here and there the original rock may have
been overlaid and the natural soil buried by drifted materials, the character of which a knowledge of the adjacent rocks does not enable us to predict. But this in no way tends to discredit the conclusions to be drawn from the facts and principles of geology. These are still generally true; the exceptiong are local, and the difficulties which they present only demand a more careful study of the disturbing causes. A knowledge of geology then, that is of the kind of rock which appears on the surface in any part of the country, generally enables us, if it be not covered by foreign accumulations, to predict the lind of soil which is likely 'to rest upon it; and it must be abundantly evident that an intimate relation exists between the geological structure of a country and the agricultural capabilities of those soils found on its surface.
VI. The last science which may be considered of importance to agriculture is Botany. The study of the vegetable kingdom has been called botany, and it embraces, 1st, a knowledge of the various parts composing plants, of their functions, and mode of growth; and \(2 d\), an arrangement of plants in classes and families, according to certain prevailing resemblances, by which they are named and described, so that they can readily be known. The former is named vegetable physiology, and the latter systematic botany. The botanist, however, deals with plants in a very different way from the agriculturist. The botanist extends his observation to all plants, the farmer to comparatively few, while the characters and properties which engage the attention of the latter hardly find a place in the classifications of the former. The one has to deal with plants in a natural state, the other in one which is highly arti-
ficial. The diseases of plants, moreover, are still involved in much obscurity, upon which this branch of science has not as yet thrown much light. I incline, therefore, to think that purely scientific botany is of comparatively little value to the practical farmer. A knowledge, however, of the weeds and Grasses is indispensable to him. The character of many soils may be distinguished by the weeds or plants growing upon them, and many of the Grasses are most surely discerned by the minute characteristics which the scientific botanist has observed in them. To some extent, therefore, botany may with advantage be studied by the agriculturist; but it would be a special course of study, which may be denominated agricultural botany, which would most profitably engage his attention.
[The conclusions to which Mr. Duke leads his readers, after Agriculturist is interested several sciences in which the his essay, which will be given the weelc after next.]

\section*{THE CATTLE PLAGUE.}
1. Chloric Ether Treatment.-Presuming that any information likely to be of benefit relating to this epidemic will be acceptable, I beg leave to lay before your readers the result of a treatment I have had an opportunity of testing in this locality. A gentleman hert lost six cows and a calf, and another cow having been attacked, I asked permission of the
inspector to try the effect of a remedy which I had for some time been anxious to do, and which I believed, if taken in time, would prove beneticial and effectual in the early or premonitory atage of the complaint. He did not object, and I administered the medicise; the result was that of three cows attacked two have recovered, and I have not the least doubt

\section*{that if the same means had been comploy that died, some of them might saved. It appears to me a most extright hand
cruel proceeding to destroy inf} out proceeding to destroy infected has been the I believe many will agree with me in inthe anca desire to enter into a controversy uncen. I d influential Journal, I hope the a publicee is is
may prove serviceable. The medicine I chloric ether, combined bappy to give any further particulars to and icie Chemist, Bromley, Kent.
2. Treatment.-To the popular mind the treatmont" mainly suggests or implies a comon or less extended of drug spallowing ablutions, food, \&ce., may be diametricall those which are habitual to it; but suppoly oppoie some potion, weak or strong, is given ato only the result is popularly ascribed to it, and the potion the name of remedy.
Now, not one tittle of evidence has ever met offered to support the assumption that cures het produced by any single drug employed as a remat As to the effect of those mixtures of druge of war: your columns have almost daily offered som to attain the data necessary to be possessed formation of an opinion. So many varying infuen must be estimated, so many collateral circu taken into account, that the problem complex for solution by any human mind. No is more difficult to deal with than the action of dro on man; none requires more patient and phil observation, since the influence of so many asoce circumstances must be fairly estimated, and eliminate if possible, in the calculation which aims to isolate at single drug.

What real knowledge then, in this matter of the ment, is it possible to acquire

It is possible to know what is the ordinary dunci. and intensity of the disease, as well as the mortality th
say 1000 cases (less would be useless, 10,000 woald better, for truth dwells only with large numbin occurring among tolerably healthy cattle, all being he? in clean, and at this time of year warm and sheltera places, and supplied with such external appliances their conditions manifestly require. Such are, briel? warm clothing and drink if the animal is thirsty, nutritious fluids if solid food is refused and the former appear to be grateful; the removal of all dite sive secretions, and the free use of approved disinfoctatis about the house and yards. I am quite certain that considerable portion so treated would recover, we know the proportion it a delusion to suppo such rationalish, that we have sarpod per per cent, of animals, because we have adminatan "

3. Sespension of Cattle Movement. - I have booked with deep anxiety for the suggestion of a remedy for this dire calamiy, and huccess except that Which gives the suises the suspension of the movement of all attle, the recommendation of the majority of the Rosal Commission.
This remedy has been sharply criticised, but the critica have every where failed to suggest a better one. To this remedy till we have been driven to it by the loss of perhaps, till we mallion of our stock. There are tho:e whin hare said that the rennedy disease is, and what it ingay Tre lave seen what the disease if, and what it of the become. I would ask for a brief consideration of the
proposed remedy. The promo-al is that the movement of all horned cattle should be suspended for a certain period, it may be for two or shree mouthis- the ol ject
s self.evident one, being to stop the spread of contagion, Which would likewise also require the exercise of other and fairly adopted, the plague must, cease. On the other hand, it is Baid that carried out, and that the price of meat would be so much enhanced that many of our carnivorous population must become regetarians, and that there would be danger of a riotous outcry.
The price of meat is high now, and must become bigher still if the present fear of infection and uncertainty as to cattle trade are allowed to continue Many fairs and markets have been closed, care unwilling to bay stock, and are too willing to sell and slaughter ill that they have. A single year of the present gystem will ruin the home trade in cattle, and cauc infinitely more mischief than the suspension of trafic plagne. Neither would the loss or inconvendence of would malse it appear. The traffic in store cattle and in milch cows is a minor difficulty, which needs no now be considered. The chief objection to the pro attle, the for interference with the supply of attle from abroad has increased to such an extent that in the Metropolitan market two foreign beasts are now cold to one bred in England. If, there'ore, at half-adozen ports of import, suitable markets and lairs, with slaughter-Lousfs, were provided by the Government, the foreign stock would come for our supply in the like or in increased proportion. They would be killed ander inspection, and the dead meat sent to market. Thus There mint ber or There might be some difficulty in providing the re-
mainder, by killing fat animals on the farms of our graziers, and bringing the dead meat to market ; but the difficulty would very soon disappear. Hundreds of tons of dead meat are weekly sent now to Loudon and other markets by railway.
No doubt there would be incouveniences felt at first bat the benefit would soon counterbalance them. Cnder the present system of fat cattle markets and elanghter-houses in towns, cattle are carried great dis-
tances by rail, and driven by road. On the railways they are fearfully knocked about, exposed to all Teathere, shunted at station after station, and allowed to remain frequently on the road for 30 or 40 hours withont food or water. They are driven through our cowded streets, embarrassing traffic, they themselves being frightened, fevered, and exciter; they are then meat in close and filthy slaughter-houses, and the otherwize be.
In London alone some 5000 cattle are killed weekly each one affording from 2 ewt to to 3 cwt . of filth and oflal. Thus, each week about 600 tons, a good sized tote manure, is brought into our crowded city, to be carried out again after polluting our atmosplere Sarely any system which would get rid of this detest abled practice would be a blessing. The meat of animals form-hhed, would, clearly be preffrable to that killed onder the circumstances above described. The carriage of dead meat would soon be provided for. There is that the body of an or grazing this morning on it parture, may not be to-morrow morning in the London would be provided by railway companies. A few years
hunce people will woudter thow the present hurrible ysten of cirnaze and slaughites has heensol hug twle tated. A different system muat inevi, inbly be intro-
duced for all foreigy catle, inasmuch ns ware the plague stopped bere, tomorrow it would bie broughe all parts of Eastorn Europe.

The time is passing, the cold season is advancing, and grave will be the respunsilility of those who do not now do all that can be done before it beco.
o check this devastation. \(Q\), in the Tinns.

Whaterer the results of the experiments may be, all of them may be easily and cheaply carried out under almost any of the expcriments, whether positive or negative, will bo muluications as to the results of treatment from prac'itioners, and are prepared to give their best consideration to any plans
which may be proposed for experiment. In name of the
6. Isolation.-The long-established British principle is to arrest and imprison any evil: the violators of our laws are adjudged to be kept in confinement-obviously his is the way to sdopt with the cattle plague some such manner as Austria, Prussia, \&c., do. There are rot so many centres where our enemy has estab lished itself as to make it a very difficult or harsh proceeding to do so, but to aid this perfectly compensation should be given for all cattle taken under the control of the country, bearing always in mind the supreme question is to save the people's food. The plarae is reported as baving cattle from an infected district in Norfolk, and by some Irish cattle which had been sent into an infected district where the farmers Were afraid to buy, and so they found their way into Yorkshire, and were sold by the crafty dealer at 4l. 10s. each, when, had they been all right, they were died, but they have been the cause, as your Pape showf, of 1419 being attacked arter the \(18^{\circ} \mathrm{h}\) Nuv. and how many others killed (unreturned), as having been in contact, will never be known. It is said, upon trustworthy authority, that in the alarm farmers are killing cattle and selling the carcase at \(3 d\). per lb., which is then taken by Yorkshiremen to the large manu-
facturing town of that county and Durham, where they retail it at 5 d . to 7 d . per 1 lb . Up to Nov. 18 , the returns of attacks show a total of 27,432 ; double it, and
*The sulphite of soda is a prophylactic, and must not be
confounded with sulphate of sonda (or Glauber salts), which is a purgutive, and not a prophylactic.
say there have been 54,864 . Now if \(10 l\). a.head had been giveu in compensation, there would not have been of the public money expended, and see how this would have interposed an iuducement to the owners not to have sent their contagious cattle into Yorkshire, \&c. This last Order in Council acts upon a wrong principle. How much easier it is to co fine and watch the plague on a small spot than it is for each district to prevent it coming into it! At Thirst it is reported a party whs detected driving off his contag:ous from the public half the ordinary value, he would not have risked inflicting this evil
upon the public of spreading the infection. Booth, of Warlaby, informed a gentleman in Darlington 10 days ago, that it was within three miles of his fine herd, and \(15,000 \mathrm{l}\). was offered and refused for this herd a year ago, and though, if the plague reached Mr. Booth's cattle, it would be a large private loss, yet it would also be a national loss to have this herd decimated. The longer the ultimate necessary measures are de \({ }^{r}\) erred, the more rigorous and extensive they must at last be, I would suggest that the Central Farmers' Club should not be satisfied with their ill success with the Privy Council, but should issue a petition, and send copies of it to all places of importance, with a request to get thes signed as numerousily as possible, one petition to be presented to the Privy We need some strong and active central body, and the fiddle-faddle step-by-step progress of the Privy Council greatly needs the application of outrrard pressure. The last Order in Council is the 7th. I feel sure a very little labour would obtain a monster of a put right the weak nerves and intelligences of our Privy Council. W. Wooler, Sadberge Hall, Darlington, Dec. 2.

\section*{Home Correspondence.}

The Cattle Plague in Herefordshire - I am much grieved to tell you the plague continues spreading. Mr.
Dent has lost 80 of his herd, and 20 more are ill, and Dent has lost 80 of his herd, and 20 more are ill, and
about 20 in a fair way of recovery. He is not so sanguine respecting homœopathy as last week, neither is he so sanguine respecting remedies recommended by Professor Simonds, about an equal number having rec svered under each, and the larger proportion that he has recovering are some to which he did nothing; of these he has 8 out of a lot of 37 he considers quite safe, although they were very ill, and he has hopes of two more. Mr. Goode, of Felton, has lost one cow from his large and valuable herd. Mr. Goatman, of Syde, has lost two; these are freeh sufferers. T. Duckham, Ross.
The New Water Drill.-Since writing to you or the 17th Nov., I have ascertained that Mr. Billap's new principle of water drill will be exhibited at Mr Conltas' stand, No. 37, at the Agricultural Hall during the Cattle Show.week. A. S. Ruston.
Mr. Hodgkinson's Experience in Steam Cultivation.By this morning's post IIr. Hodykinson kindly informed me that he worked his ergine in the three seasons such a nature that none of it coull be ploughed the first time with less than three strong horses, and par of it requires four horses." Mr. Hutchinson says in
his pamphlet, at page 18 , "this farm (Dunton Lodge) his pamphlet, at page 18, "this farm (Dunton Lodge)
consists of such tenacious clay, that with four horses it is seldom ploughed more than 4 inches deep.". Your readers will now have the whole matter fairly before them. Wm. Smith, Woolston, Bletchley Station, Nov. 22.

\section*{Foreign Correspondence}

Osswetl, near StctTgart: The Betroot Sugar Manufactory at S., and its Agriculture. - The Beetroot by Messrs. Fr. R. \& Sons, and though severai manufactoris \(s\) of this kind have been erected since then in the kingdom of Würtemberg, none have achieved so much success, and acquired so high a reputation as the above, especially in what concerns
the agricultural part of this extensive bu:iness The machinery and the buildings of the minufactorywhich has an excellent situation, close to the princtpal railway station of the country, were constructed for the easy working of \(300,000 \mathrm{cwt}\). ( 1 German cwt. equal to Scarcely the half of this sum was manufactured in the earlier years, but now nearly 15.000 tons of Beets are converted into sugar every year. The last season warather fav uralle to the manufacturers, and though latter did not grow too large to apprehend decrease in their saccharine substance. In the manufacture of the Beetrnots Messrs. R. have adopted the gystem of pulping and pressing the was!ed Beetroots, witbout puring on water. There are about 16 large hydraulic preses at the establishment, and nearly 100 tons of Beetroots : re worked just now daily. about 11,500 l. were paid to the Government for duties, at the rate of nearly 9 d . per 100 lb . of washed Beetroots. The produce of sugar is varying, according to the influence of the seasou on the crop,
between 8 and 9 lb . of raw sugar per 100 lb of Beet.
roots. The raw sngar is all refined into loaf sngar, and
the boue-black required for this purpose is prepared by Messre. R. at a place distant about two miles from the manufactory. About 500 workmen are occupied in the Beetroot-sugar manufactory during the "campagre," which begins in October aisd lasts until March or April. Oxen do all the work at the factories and farms, and more than a huudred are employed laily in carting Beetroots to the manufactory from pits, which are partly at a distauce of one to 12 miles from the former.
Messrs. R. think horses too expensive for their work, and as besides they could not be fed so well on the refuse of the pressed Beetroots, only some fow are kept for the use of these gentlemen.
Mr. Adolph R., a cousin of mine, to whom I owe the most of these notes, is the principal manager of the
technical and agricultural department, and although he turned only some 10 years ago to this latter professinn you will see by the following sketch, that by means of colleagues who have been accustomed to farming since their childhood
Messrs. R. \& Sons, who at first got all their Beetroots from adjacent farmers, soon saw the necessity of purchasing and renting land for themselves, with the double intention of getting a larger supply of roots, and of inciting many tardy cultivators to a more extensive cultivation of this crop.
They began with buying some 20 to 30 acres of land near the manufactory, at the rate of 1002 , to 1502. per imp. acre, and possess now within very good land, whilst for some 15 to 20 acres more they pay a rent of \(4 l\). per imp. acre. In a radius of 4
to 10 miles from S . four farms, of 250 to 300 acres each, were rented from time to time in the course of the latter 10 years, including altogether about 1200 w . margen ( 1 acre \(\mathrm{imp} .=1.283\) morgen of Würtenberg) are farmed now by Messrs. R. on their own account. About 5000 to 6000 tons of Beetronts
are culti-ated thus by Messrs. R. theomselres, whilst wo-thirds of the amount required are yet grown by the surrounding farmere. Last year \(9 \frac{1}{2} d\). and tlis year 10 d . per 100 lb . of Beets were paid to the cultivators, who have to cart them to the factory or to one of the stations or stores Messrs. R. have established near several railway stations, at a distance Betr tn 15 miles from the manufactory. The Beetroots are thrown from the waggons into very
long pits, which at their base are dug out abort long pits, which at their base are dug out abcut
4 feet, and for the better ventilation of the routs a wall of earth, 1 foot thick, has lately been left along and in the midst of these holes, which seem to hav thus two compartments. The Beetroots being piled up regularly about 3 feet over the grcund, are covered with earth, and left there till wanted at the manu factory. Having been lately over one of the farms and the style of farming being the same there as on the other 900 acres of land, it may perhaps be of some interest to you and your readers to hear some details on this really well directed husbandry

The farm in question is called "Piesenhausen," and is 951 feet above the level of the sea, at a distance of about 8 miles from the manufactory. Its presentsize is 302 w. morgen (or 236 imp . acres), some 40 acre having been acquired lately at the rate of 50l. per three belongs to the Crown of Writerberge its lease lasts 18 years, from 1858 to 1876, and the rent amount to 16 gulden per morgen, or about 1l. 12s. per Engl'sh acre. The soil of this farm is mastly a rich loan formed of the triassic system, which is partly wanting in Great Britain. It is rich in organic matters, of humus, and consists of a lower stratum of the rich Keuper, called "Lettenkohle" in Germany. The farm steadings do not present so homely an aspect as those o England or Scutland; they consist of a large ban for securing the corn, of a stable for the cattle, and of simple farmh use, winich is habited by the steward and his family. The Beetroots are cultivated now in a two years' shift, viz : -1 , Burley and forage plants dunged 2, Beetronts undunged. Until some years ago two sucseeding crops of Beetroots were taken, but the second crop getting always weaker, Mr. A. R. has found it better to bring a cliange between each root crop. Th 302 w . acres of Piesenhausen were cropped last year in the fullowing manner:-
\begin{tabular}{|c|c|c|}
\hline Barley & q"s. & 63 qrs. \\
\hline Sorgho (seed) & & 6 \% \\
\hline Maize (seed) & & 300 \\
\hline Beetroot .. & & \\
\hline B etront seed & & \\
\hline
\end{tabular}

The cultivation of Surgho (Sorghum sachara'um o Holcus saccharatua), a forage plant, which has som resemblance to the Maize, was introduced from It lly to some 80 M. A. R., who cultivates every yea
which sometimes grows 15 to 18 feet high, nees The land Maize may be grown winter, and in the month of \(\mathrm{M}_{1}\) plongere 12 to 16 inches apart, at the rate seed is dry The Sorgho can be monn thre 10 to according to a more or less warm swice, and to 600 cwt. of green Sorgho per acre. It is is A. R. has found the value of 100 gettle, and equal to that of 35 lb . of good hay. The country, but last year its proluce whipe The panicles, freed from the ripe was very an excellent material for all kinds of brushes.
Mr. A. R. being a great advocate of deep deep by a team of four oxen, which to 18 as iwo ploughs with a couple of oxen befo The ploughs used there are all made manufactory, and are distinguished from on
Brabant or Belpian ploughs by boards, made of hammered iron. Besides Which is got by the stock and the refou
factory, large quantities of horged a cavalry barrack at \(S\). As all dunged before winter, and Mr A R highly of top-dressing, much of the deng in to the Barley and forage crops when they are apper brairding, or some inches out of the ground. By 300 cwt. of stable dung yield nsuall some weeks, straw for litter. Barley of which Cheratien Bavarian kind are chiefly grown, is mostly dunged Finter ; and, as a second furrow is never given land is grubbed and harrowed thoroughly in . 6 in . apart, at the rate of only 22 lb , of Barley pe imperial acre. In considering this really asto:ifb: of the quantity of seed, the advantage and the rentubith cultare will be clear by-and by to the wor Mr . or incredulous individuals,
experiment with, as I was told, a rather success same field, and getting thus two crops in one res For this purpose the drill-sowing machine was arrarg in such a way that between three and four nas
of Barley, the space of a foot's breaith was empty. On the breadth of 8 feet of the drill cam this way at first three rons of Barley ( 6 in , apart), the a row of Maize, 1 foot apart from the Barley, then fo rows of Barley, another row of Mare and then drills of Barley again, and so on. The Mize and Corn was sown or dibbled some weeks after the Barl and yielded besides 5 quarters of the latter still scm 4 to 5 quarters of ripe Maize clubs. Barley is har hoed at the cost or 1s. 6d. per imperial acre, ndi steward of \(\mathbf{P}\). estimates the increase through this oper tion at nearly 4 bushels per imperial acre. Por Sorgb Indian Corn, and Beet-root seed the dung is motl top-dressed and hoed in after some time. Of the Mrite an American kind, callad here Pferte-zahn, or Hore tooth Maize, is grown by preference for the ripa con
of which latter a field of 6 imperial acres yidded 40 quarters of ripe corn.
The culture of Beetroot seed is carried out to a larty extent, as all Beetroot cultivators have to dram the: seed from Mcssre. R., who besides sell large quantitio to other countries. For the cultivation of this crop, th land is grubbed and harrowed repeatedly in spring, \({ }^{2}\) then equares are made by means of a kind uf rake, first along and then' across the field. On each angle the square a sound Beetroot is planted, a applied, wbich serves as a hold to the grown As the seed of this crop does not grow ripe at the san ime, the harvesting of about 1200 cwt of Beetroot seed no trifle ; but considering its large price (last year as mus as \(4 l\). 10 s . were paid per 100 lb . of see ) thim of the Bietroot for the sugar manufactor the most important, and takes on this farm half of the whele areq. As the Beetroot sugar man facturers do not like the roots of a large size contanir: mare water than sugar) no direct dresariey for this crop, and after the stubble of Bariey, wer, been ploughed in deep before winter, the seen ing, in spring, after a repated 8 to 10 lb per acre to 20 acres may be sown daily with Garrett and after the sowng lie land is roled, and a some weeks, horse hoed. The plants are sis the as nossible, and le't at first half a foom the other. At it harvest of the Beetroot the shaws are解 wirter. Lucerne, an excellent kind of here likewise across a field sown Barley. Instead of 20 lb . of seed pir required for broadcast sowing of this crop, yield sometimes 50 to 60 cwt . of Julius Reihlen, Shutgart, Dscomber

Firanees.-Major-General the Hon. A. N. Hood, Charman, presented the lleport, from which it ap peared that the Secretary's receipts, during the past
three months, had been duly examined by the Comthree months, had been duly examined by the Comsociety's accountante, and found correct. The balance in the hands of the bankers on the 30th November mns 923l. 8s. 8 d . The Committee are of opinion that a pinted no ice of arrear should be aitached to the last amber of the Journal which is sent to those who are in arrear of their last year's subscription, in order to draw the attention of the defaulting
Jourval - Mr. Thompson, M.P., reported that the Qist of the Journal for 1865 might be approximately rated at 15292.
Chemical.-Mr. Dent, M.P., reported that Professor otcrmang, and Irrigation. He lhas furuished four papers for the Journal. Papers on Disinfectants, and on the Compo preparation for the forthcoming number; and a lecture on Disinfectants will be delivered at 8 P.M. on Tuesday next.

\section*{The following investigations are in progress :-}
. On Good and Bad Waters for Irrigation.
On the Ceeds and Artificial Grasses.
duriog Hay-makiug and Keeping in the Stack.
During his investigations on Disinfectants the Professor has found much necessity for further inquiry to the disiafecting properties of carbolic acid.
He further suggests that a continuation of field experiments be carried out upon
1. The effects of Salt on Root Crops

On the efficiency of Crude Potash Salts upon (a) Ronts,
On the Growth of Clover Soeds.
In order that these experiments may be uniform, the Professor will be glad to furnish any gentleman ansious to co-operate, with a schedule of the manures to be used in each experiments.
The number of analyses made for Members of the Suciety is wuch as usual.
Aralyses made for Meinbers of the Royal Agricullural Socity,
January to November, 1 S65,

3r. Randell moved that a Committee be appointed
to consider the best means of endearouring to check
the spread of the Cattle Plague by restriceng the
transit of cattle; atd that an apphention be made to the Privy Council to receive a deputation froms the Council of this Socecty thercupon. The motion was seconded by Mr. Thompson, and earried.

Mr. Brandreth Gibls presented the Report of the \(V\) Veterivary Committee, who had received the printed Reports of the Veterivary department of the Privy remedies for the Cattle Mlague, which were reforred to the Society's Veterinary Inspector, Profersor Simonds.

Shon-yard C'ontracts-Mr. landell reqorted tha a uumber of tenders for the societr's Show-lard Works had been receired, which would be examined in detail next week.
On the nomination of Mr. Milward, Mr. Wells was unanimously appointed a Steward of Live Stock in the place of Mr. Dent, M.P., Whose term of office bad expired.
Mr. Holland, M.P., presented the Report of the Edecation Committee.
1. The Committee, after the adoption by the Council of the Report placed before them on the 5th Apri! last, at once proceeded to make the intentions of the Society as widely known as possible, and for this purpose sent circular letters to all the secretarins of the Local Agricultural Societies in lingland and Wales, drawing their attention to the scheme, and soliciting their nssistance. The Committee also sent circular published in the last class lists of the Oxford and Cambridge Local Examinations. Notices were also sent to the principal Agricultural hewepapers and Educational periodicals, and to the local newepapers. The local Secretaries of the Cambridge Local Lixaminations were also apprised of the scheme, from whom, as well as from the authorities of the Cambridge I'niversity itself, the Committee have received the utmost courtesy and attention. It may be further stated that the Cam. bridge authorities have consented to take a fee of 10 s ., nstead of \(1 l .1 s\)., from such of the candidates as compete for the Society's extra prizes (List IIII.) only.
2. The total number of candidates who have entered for the prizes of the Society is 119, drawn from 17 counties of Lugland. Of these candidates, 82 are under the age of 16 , of whom 74 are entered for the eneral junior examinations, 60 for prizes in pure Chemistry, and 1 in Botany. There are 27 under the age of 18 who have entered for the general senior examination, and of these 21 are entered for prizes in pure Mathematics, 12 in applied Mathematics, 2 in Chemistry, 2 in Zoology, 1 in Botany, and 1 in Geology. Those ouly who have passed the preliminary examiua tion are eligible to obtain a prize in a special subject.
In List III., open to candidates not exceeding 25 years of age, 13 have entered to compete for one or and 12 in Chemistry applied to Agriculture. In all these prize lists many candidates have entered in more than one subject. 103 describe themselves as the soms of farmers or others in some way dependent on the cultivation of the soil for their support, and the remaining 16 express themselves as intending to follow agricultural pursuits in after life
3. As regards the examination of the Candidates for the Society's extra prizes (List III.), the Counci have obtained the assistance of Mr. Besant, of
John's College, Cambridge (Senior Wrangler, 1850), to examine in Mechanics applied to Agricuiture, in con junction with Mr. Amos, the Society's consulting engineer. Mr. Liveing, Professor of Chemistry in the University of Cambridge, and the Society's consulting Chemist, Dr. Voelcker, will conduct
in Chemistry applied to Agriculture
The Annual Reports of all thiture.
The Annual Reports of all the Standing Committees were presented by the respective Chairmen.
The Standing Committees for 1866, viz, Finance Cominittee, Journal Committee, Chemical Committee, House Committee, Implement Committee, Veterinary Committee, Stock Prizes Committee, and Education Committee, were appointed.
The Council stands adjourned till Weduesday, 13 th inst., at \(11 \Delta \mathrm{M}\)., to consider the Report of the General Bury Committee.
A Deputation from the Society, consisting of Lord Tredegar, President, Lord Fevershau, Lord Walsing ham, Major-General the Hon. A. N. Hood, Hon. Augustus Veruon, Mr. Dyke Acland, M.P., Mr. Barthropp, Mr. Brandreth Gibbs, Mr. Holland, M,P. Colonel Kingscote, M. M., Mr. Pain, Mr. Kandsel, Mr on the Lord President of the Council, at the Privy Council Office, on Thersday the 7 th instant, and im pressed on his Lordship the following resolutions, which had been agreed to at a meeting of the Council:Resolutions of the cocscil.
1. Tbat it is the opinion of the Council of the Rogal
Agricultural Sciety of England that the most effectual means Agricultural sinceety of englage would be to stop for a time all fairs and markets. If this is impracticab
would suggest the following regulations.
2. That any cattle, sheep, or pigs exhited for sale in a market or fair in or near any town be

That all cattle, sheep, or pigs offered for sale elsewhere than on the premises of the owner, or in any place whatever
where they have not been 21 days previous!y, be branded and \({ }^{\text {where }}\) slaughtered within 48 hours on (or near) the spot where such offer has boon mode.

It is submitted that all forefgu cattio, aheop, and piga

Farl Granville thanked the deputation, and promised that the resolutions should have due consideration.

\section*{midland counties cattie show.}
bingley hall, Birmingham. - The contents of the Hall-of grenter merit than ever in the Poultry department, nud perhaps botler than ever in the section set apart for lout cropis-good as ever, too, in the division occupied by Implements-are less satisfactory in the cattle Classes, aud perhaps generally in the livestock department, than they have been. The regulations of the Smithfield Club forbidding all anmals that had been shown elsewhere, at ouce can celled those entries for all other shows which bad been intended to travel on to the Agriculturai Mall ; and the large numbers of blanks in almost every class show how disastrous an effect has been thus produced upon the promised display at Bingley Hall. Independently of this, however, there have certainly been a larger number of inferior animals exhibited in
 years; both the female classes of Herefords are inferior, the judges withholding many of the offered prizes for want of merit. The Shorthorn class of older oxen may indeed be pronounced the only really good feature of the meeting, so far as the cattlo classes are concerned; the Devon classes being very scantily filled, though showing their usual beautiful quality.
In the older class of Hereforn Oxen the lst prize is awarded to Mr. Aldworth, of Frilford, for a capital specimen of the breed, massive, deep, and well covered; the 2 d goes to Lieut.-Col. L. Lindsay for a less evenly covered beast, very thick over the loin, but not so good forward.
In the younger class, Mr. Shirley, of Bawcott. carries off the prizes with two well-fed thick steers, the best of which. with its deep and long line of riblesh and wonderful size (girthing 7 feet 10 inches and 5 feet 2 inches long (age 2 years and 7 months), reminded one of the extraordinary 2-year old with which he won the gold medal some years ago. He carries off the extra prize for the best animal in the Hereford classes. In Hereford Cows, a very short class, Mr. Baldwin's cow, bred by the late Mr. Rea, and repeatedly taking the lst prize as a breeding animal at the Royal Agricultural Shows, is easily the leader. She girths 8 ft .3 in os with capital rib, and laden with useful meat. She is pronounced the best cow in the yard, thus carrying off the gold medal. The younger class are extremely poor; Mr. Lloyd's heifers should have been killed at home. Mr. Pith, of Chadnor Court, takes the 1st prize without much competition.
We now come to the Shorthorns and to the noble class of oxen, standing first on their list. Mr. Wood's roan, under four years old, girths 9 ft 6 in, and is 5 ft .6 in . long. He is a wonderfully even cylindrically barrelled ox-first-rate forward, and good over rib and loin and flank. Though debarred from competing at the Agricultural Hall, where he might have iucreased the list of his honours, he has carried off sufficient glory here to satisfy his owner. First in his class, he also takes the gold medal as the best ox in the yard25l. as the best Short-horn, 25l. as the best beast, both bred and fed by its exhibitor, 15l. as the best Short horn (bred and fed), and the innkeepers' prize of \(25 \%\). with a silver medal as the best animal in the Cattle classes. Mr. Foljambe's ox takes the 2 d prize.
Among the younger oxen there was not so much com-petition-and the winners are not by any means of first-rate quality.
The Cow 'and Heifer Classes are neither of them satisfactory. In the younger class Mr. Woodward wins with a heifer showing plenty of hair and constitution, good over rib, but thin over loin ; and Mr. Ald worth, of Frilford, is 2d.
The Devon breed shows smaller than ever, buth in number and in size - there are not more than two or three in a class-and the prizes, six to about nine entries, go to Messrs. Smith (of Exeter), Farthing, Frampton, and Taylor, in about equal proportions. We shall see a much larger representation of the breed in the coming week at Islington.
The Long-horn classes are hardly represented, and the Norfolk classes are altogether vacant
A fow Polled oxen, not in any way remarkable
ppecimens of their breed, and a large show of capital West Highland cattle, many of them of good quality, and a few crose-bred animals, complete the show. In the extra classes we have the inevitable Brahma bull, and ! the equally inevitable monstrous working ox -a pair of the latter being shown by Mr. Lythall, of Banbury
The Sheep Classes are many of them fairly filled, the Shropshire breed as usual being in great force. The judges have appeared in many instances to incline to quantity rather than quality; and in one example, where pens of five were weighed against each other, the scale determined the award, though we believe the difference, not more than 6 lb . a sheep, would in all probability have been the other way when the offal came to be deducted.
Mr. Boast's Leicesters and Mr. Kearsey's Cotswolds carried off the prizes in their classes. Lord Radnor's entries in both the Southdown classes stand before Lord Walsingham's; the former are louger sheep, with darker faces; the latter girth more, and would be pronounced by a Sussex man as more truly repre senting the best quality of the breed. The Shropshire classes are very large indeed; still betraying, however, too great a variety of type to be satisfactory
The Class of pens for Fat Wethers is first rate Mr. Beach takes the 1st prize, and Mr. Smith, of Shiffnal, is "very highly commended," and judgments will differ as to the relative merit of the two entries Mr. Smith is 1st in the Classes of old sheep. In the Lincoln and Cotswold Class the former beat the latter Mr. Marshall, of Branstov, who sells and lets 150 sheep a year, at an average of 13\%, taking the 1st prize, and beating Mr. Smith, of Bibury

The Pig Classes are shorter thau usual. Many pens are disqualified by Prof. Gamgee - the dentition indicating either that the pigs in the pen are not of one age, or are over the age specified. We foresee that either this disqualification will not much longer be submitted to, or that those who have the di-agreeable duty of examiuing for it will exercise their powers in only very glaring and unquestiomable cases for the future. So many instances are known to us in which men of unquestionable honour and great carefulness have been drequalified in this way, that it' is plain the indications on which the experts rely are not to be depended upon for the nice determin ition of age.
Mr. Stearn's capital black pigs, the white pige from the Royal farm, Mr. Mangles' and Mr. Crisp's entries, and the capital show of breeding pigs of the Berkshire breed, may be noted as the features of a somewhat oferior exhibition
We refer to the Prizo List for the successful names in the show of Roots. A wonderful display of Mangel Wurzels and extraordinary Carrots and Cabbages and good Kohi Rabi, were the noteworthy points. Wheu a ton of Mangels is made up of about 50 roots, we think we have attained our end as ront-growers.
Messrs. Sutton and Dickson, Perry, and others dis-
play wonderfully fine collections of roots and plants and seeds.
The Implement Stands are well filler. We shall efer to them in detail nex \(t\) week.
The following is the List of Prize

field． Care shonld always be taken to keep the staddles as clear when they are not loaded with corn as when carnied to the ricks iu the sheaves direct from the harsest field：such cases are unavoidable，the remedy for thein will be suggested when we come to the part of this paper which treats of destruction．For the gresent we must confine ourselves to means to prevert the depredations of our little marauding foes．

\section*{}

The Birmingham Poultry Show．－Those gentlemen who have nursed this exhibition to maturity from its infancy，must have been gratifiel at，the result of their exertious and care，when they threw open to the public
on Monday last a collection of two thousand and six pens of the choicest birds in the kingdom．Year after year they lave worked unflincbingly to attain the Dosition they have now made for themselves．They have bed many difficulties and much opposition to contend the head of the list，so that a commendation obtained there tells for more than many prizes gained elsewhere． Mangefforts have been made to get up a show of a similar kind in London；but with the exception of an effort at the Agricultural Hall under the auspices of the Poultry Club，which was a complete failure，nothing is now leard on the subject．
Birmingham is the town for a meeting of the kind and the fact of the Poultry Show being beld in＇con－ junction with that of cattle，sheep，and implements， held alone make it of much more all a inallun Eaglishmen read the will hope that all agricultural of Mondis，read the report of this Show in the Time of Mondiy，Dec．4，and that they noted what wa farm stock and source of revenue．That this branch of produce is claiming some attention may be judged oy the faet that at 4 P．M．on Monday，the first day of the Show，600l．had been taken at the sale office for birds claimed．It would be impossible to condense into one paper a full report of so many classes so worthily require and to give a list of all the winners would is gonerally kpace than is allowed．The competition andes，and Game for fowls，and the Aylesbury ducks．
ft must not be inferred from this that the other mrieties have not their zealous and vigorous sup the the but that the birds do not enlist general notic To the preint clasees．

Dorkinge cor tributed isar pens．The lat prizes were Mensre．C Ntom ia these chasers，that the filpes were obinged to tiseribute commen datons to many peus whech in shows of lees calibre would have taken ligh howowrs， but here did notstand a chance．The White Dorkiugs which are said ly some（erronemaly we thank）to be the originals of all our Jlirkms，woro worthly represented by Messer．Lingwout a Rolmsen，both beng names always assocated with ist prives in thes class．The noble and arncteratic spanshis brouklat more than 50 pens into compretion，and preseuted a atrising front to the admurng and critiensing publice The birds shown were of great merit，aud the priacs were taken＂by Mesers．Lane \＆Rous to ibristul，a which haw been for yrars famous for the excelience of its Spauish fowls，owing priweppally to the pams taken with them by Mensrs．Rake，Junes，and others．
In the Buff cochin Uniza classes the stangle was one of giants．These favourite birds were calititited in great numbers，and nearly all those who sent had been winners at some time or other；the competition was very keen，and the birds of a quality never before equalled．Mr．（qtell wook lot for adults，Mr．John Nelson for chickens，Mr．Scephess of Wulenli for hens Mr．Lingwood of Needham Market for pulleta．Captain Henton，whose success has been great，was olliged \(t\) put up with a 3 d prize and a commendation．In the classes for single cocks，Mrs．White and Mr．Rodiari were lst．Of a durky hue，but wone the less admired on that account，the Brown and l＇artridge feathered Cechins number among tieir patrons Wheu first the Cuchin fowls were importel they were all of this colour，aml great wat the succe 6 achioved all of this colsur，and great wan the succ ess acheved
by them．Meb－rs．Sturpeon of Grays，and the late by them．Messrs．Sturpeon of Grays，amd the late
Mir．P＇unchard of Jiunts Hall，were the first breeders of them．
The classes allotted to them at Biugly Hall were well filled with birds that fully justifiod their sup porters in adding the amateur pirizes to those offered hy the society．The wimers were Mr．Stretch，who took the lion＇s share，ami Captain Heaton．The Wiute Cuchins are those that are always more feebly repre sented than any others，but this fear they have done what poor Mrs．，I）sushey conld not（1）－they hate
＂made an effort，＂and come out in creditable numbers， earning one 1 st priza for \(M \mathrm{M}\) ．Chase，aud oue for the Rev．F．Taylor．
The Pencilled Brahma Pootras，the marvellous winter layers，f．wourites ou that account，and atso ecanse they are so easily reared，were present iu great force，and from their very striking appearance attracted great attention．Messrs．Laty and statter received 1st prizes for old and young hirds respectively．
Yielding to the request of many amateurs and breeders， the lismingham Committee，anxious to give every breed aud variety a fair trial，this year added to its alreads liberal prize sheet two classes fur the light－ coloured variety of Brahmas．The result was satisfactory， and some beautiful birds were exhi＇ited．It is hardly necessary to add that Mr．Pares took 1 st for old birds； he wan，however，beaten in the chicken class by Mr．Clark of Cliswick．What can we say for the Malays ？they have their good qualities and their admirers，but they are few．The biris exhibited were very good，and the Rev．Mr．Brooke and Mr．Hinton each won a lst prize． rial in this country，but there is no doubt they are steadily making way，and are destined to play an important part in this country as egg producers． When fist ther are abited they were sneered at oll arel called bastard Polands，and had to of them，that of neglect and prejudice．One pen or them，that hau won 1st at Marselles，Lyous，Aviznon，and Paris，was exhibited three or four times in this country without attracting any notice more favourablo than that above mentioned．In the classes for aduits and cluckens at Bingley Hall，the lat prizes were taken by Mr． Blinkhorn and Mrs．Hurt respectively．
He is a bold man who rushes into the description of the Hamburghs at Birmingham．Their appearance the catalogue and prize list is like that of the rregular verbs in the Eton Latin Grammar－there is no end to them．Wuo shall deseribe the 18 classes of them，especially when he knows him afterwards？In Golden－Pencilled Hanburghs Mr．Powers of Biggles：wade took 1st prizes in Mr．Powers of to be proud of．Sir St． Goorge Gore took 1st for adult Silvers and for Silver－
 Preston．Mr．Kershaw of Preston，and Mr．Buckley of Asiton，took the 1st prizes for adults and chickens in the classes for Golden－Spangled Hamburghs．Sir st．George Gore was again successful with Silver－ Spangled over one year old．Mr．Hardman winning for chickens，Mr．Palmer for hens，and Mr．Whiteombe for＂pullets．
Mr．T．P．Edwards，as usual，won 1st for adult Black Polands；Mrs．Procter taking 1st for chickens．
Mr．Beldon was succesofal with hat Cond lohsa， and Mr．（3．C．Adk＇ns added this year both list prizes to the many trophies won for ham by his Silver－ Spangled birds．

\section*{Farm Memoranda．}

Cheburar Fabming．－The folioning is the prize essay by Mr．Hry a ood，of Dusham Masey，Altrincham， on the Comparntive Profit of Mating Checoe or Butter， Selling Milk or Grazing，publinte i in the current number of the Agriculcural Sxciety＇e Jurnal：－
On a licte conis leration of this entiget it w． 11 appuar that the comparative profite of these methods of farmmg must necessirily depend，in a great measure．on the nature of the soil，as well as the situation，\(\delta\) ． ，of the respection the ans to momere therere it is ubvious
 are somple the the the casce that are somewhat unalognous as regards the qualiy of the
soil，and are also on a par as regards other advantages． soil，and are also on a par as regirds other advantages．
With this view I propese to state approximately the actual results on sureral farms of（qual sizo of the same description of soil，and situate in the same lueahty，but armed in the three several ways，namely，chece and butter makime，wilk salling and grazing，rather than to write an eman not based on act nasl practice．
In thic first place，I may exphain thut，as butter－ making forms the chief feature on comparatively few farme of any sizn，and us the cxpelnis，stock kept，sinks， and general re－ults are，so fur as my experience goes， very similar to those of ehecermaking，in hoth instaucea the skill of the dairymaid having much to do with the profits，I have represented butter and cheese making by one casc of the latter，and have added a cane of milk－ selling，which is now becoaning a much mare chtended syatem of farming than it formerly＂ar，especinly since our towns have grown so large，and railways have mote them bo ensy of access for produce requirinz a quick despatch isurure their iutrodnction，malk had of neceso sity to be produced in the vicinity of its consumption hut，as the market is now thrown opa farming is now practicuble in almost any part of the country，that equals，if it does not surphas，in protit any other kind of management．
propose at the sume time to show the respertive merits of the different methods an regarda thear ethecte upon the land upon which they are prictised；this， comsider，is an item of as much inportanes as the imme liate pectumary return．

The land in question is of a mixel kind，varying from a strong soul upon a clay sulsonil to a dry friathe loam on sand anl red sandstone．The rentsaverage from \(35 s\) ．to 40 s．per statute acre；the tithes and parish rates being about the customary average，say， respectively，3s．per acre，and \(2 s\) ． \(6 d\) ．in the pound on the amsessment．
I will first tuke the case of the cheese－farm， 200 acres， upon which the stork is 50 milk－cows， 50 ewes（shich， with their lambs，are fed off fat）， 5 horses， 30 pigs， reared up and fattened，and 12 to 15 young horned cattle，cousisting of calves，y earlinge，and two－y car－olds The farm is silf－supplying as reyards all food for stock，having suflicient land under plongh，viz，45 acres in 15 －acre shifts－lea－Oatg，Turnips，and What－to grow the OAts，Turnips，and straw requirel，in addition to the old meadow hay．The value of the proluce of this farm is considerably over the average，on account of the superior quality of the cheese made，which has sold at prices varying from 75 s．to \(8 \overline{5}\) s．per cwt．，the quantity made being aiso large．
The financial results of this farm have been as follows：－

 \(\begin{array}{cccc}\text { L．} & \text { 8．A．} \\ 400 \\ 50 & 0 & 0 \\ 55 & 15 & 0\end{array}\)

For the object of comparing the relative profits of cheese or butter making with those derived from milk selling，I fortunately am enabled to select a farm－the one last described－on which both methods have been practised by the same tenant，who is an excellent farmer．It was managed as a cheese farm up to four years ago with the resulta stated above：since that time，in consequence of the advantage of a railway station within one mile of the farm，and 12 miles from the market town，the tenant has sold－his milk delivered at the station，at 1 s .10 d ．per doz：n quarts， keeping the management of the farm in other respecta precisely as before，the stock and expenses remaining also the same，except that the nu wber of pigs fattened is reduced．

The rosult, under the system of milk selling, is as follows:

Milk of 50 cows, at 1s. 10 d . per doduce. \begin{tabular}{l}
70 lambs, at \(27 s .6 d\). \\
Profit on 50 ewes and wool, at \\
\hline \(15 s\).
\end{tabular} Profit on 50 ewes and woo
15 acres of Wheat, at \(12 l\).
Procit on 10 pigs, at \(5 l\).

Expenses.
As per statement in cheese-maksings.
account
dd cost of exchanging cows to keep up supply of
milk at certain searons

On the grazing farm referred to the stock is 60 cows, 100 ewes (whose lambs are fed off (at), 4 horses.

The result is as follows:-
Profit on 60 cows, at 122 .
140 lambs, at 27 s . \(6 d\).
140 lambs, at 278 . \(6 d\).
15 acres of Wheat, at \(12 l\).

Rent, 200 acres, at 40 s. Expenscs.

Expenscs.
1 man, at 20l.
Extra man
Harvesting
Tradesmen's bills,
other seeds, 200 .
Paid on aceds, 200. 221. 10s, ; Grass secds, \(22 l .108\), ing, 402. ; boning
Paid for oil-cake
Contingent expenses

Profit
The three systems will therefore stand as follows:-
\begin{tabular}{|c|c|c|c|}
\hline & Receipts. & Expenses. & Profit. \\
\hline Cheese or butter making. & \[
\begin{array}{lll}
\hline \mathbf{8} & 8 & d . \\
1213 & 15 & 0
\end{array}
\] & \[
\begin{array}{ccc}
\hline f & 8 . & d . \\
1024 & 15 & 0
\end{array}
\] & \[
\begin{array}{rrr}
£ & \text { s. } \\
189 & 0 & 0
\end{array}
\] \\
\hline Grazing & 116710 & 95115 & 21515 \\
\hline Milk-selling & 142815 & 1124 & 4 \\
\hline
\end{tabular}

It thus appears that the experience of this district is decidedly in favour of milk-selling; but before coming to a definite conclusion on the subject, the strain put upon the land by the two systems-milk-producing and fattening-has to be taken into account.

I feel that the grazing account may require some little explanation to some whose experience may be somewhat different. The profit of \(12 l\). per head on the cows may be thought excessive. I can, however, but state that such is the annual average profit realised by a number of graziers in this immediate neighbourhood, who buy in lean but healthy Short-horns, at an average of \(10 l\). to \(12 l\). per head, in the first two months of the year. They then freshen them on straw, Turnips, and a little cake, putting them out a little each day-weather permitting -until spring, by which time they have fairly begun to grow; and when a flush of Grass comes they do not The cows newly bought, lose time in making a start They are then grazed through the summer, tied up in and sold from the ground Oate, oil-cake, and straw, and sold from the middle of December to the middle of January at \(22 l\). to \(24 l\). per head. The extent of land may also seem small for the number of beasts and kheep kept; hut this is accounted for by the circumstance that all the Grass land is available for pasture, only a small quantity of hay being required for the horses. Again, the practice is to break up a fresh turffield every year for lea Oats, to be succeeded by Turnips, which, aided by the moist climate of the district, is always a very heavy crop, averaging from 33 to 38 tons per statute acre; bence the large amount
from so sunall an extent of arable land.
The item of 50l. for cake may also appear small, but I may state that cake is not used as the chief article for fattening beasts, but rather as conducive to their health and as an aid to the corn and Turnips, which are mainly relied upon for fattening them. The sheep and lambs get no cake.
I may also further state that of the 60 cows grazed, not more than 50 are tied up in the autumn, as the remainder either go out from Grass or as calvers, of which there are always a few, and which pay equally well, regard being paid at the time of purchasing that they are right in their milking organs.
But I should hardly do justice to the merits of this system of grazing by simply giving the practical results of my own neighbourhood, and comparing them financially with those of cheese or batter making and milk eelling. Grazing has collateral advantages in many forms that do not show themselves in such a comparison, but which assume so large an amount in the aggregate, that though milk selling excels it in direct profit by, tay 881 . 5s. per annum on a farm of 200 acrep, I yet consider that in the main grazing is the preterable ystem, as I will endeavour to show.
In the first place, margin in favour of milk selling may fairly be reduced
somewhat on account of the extra risks attending the system from the more general tendency to delicacy and sickness of milking as compared with fattening cows.
-ply being kept is produced per cow in consequence of the

Again, we must not overlook the risk of making bid debts with the milk dealers, who, as a body in the large towns, are not the best of payers. In saying this I
do but speak the experience of milk producers. Again, under the system of grazing, the farm will regularly increase in fertility, as a much greater portion of the nutriment, either extracted from the ground or artificially supplied, is then returned to it again by the animal, than under the system either of cheese making or milk selling. If, then, we suppose a tenant to have a lease for, say 21 years, at a fixed rent, the progressive improvement of his farm under grazing will yearly increase his crops of beef, mutton, and corn : and with improved condition of land comes decrease of expense in cultivation; and thus his profit will yearly go on increasing, the ultimate result being most beneficial alike to himself and his landlord
As regards the labour attending the practice of these systems of farming, that of grazing has a decided advantage over the others, not only in out-door labour, as shown in the accounts of expenditure, but also in the labour and responsibility saved in-doors, since the care asd management of milk in any way entails much of both, and requires an anouut of skill that has often to be remunerated at a very high rate.
One of the best indications of the progressive improvement attendant on this system of grazing is obtained by one simply observing the very great difference in the quality of the dung heaps collected under the respective systems, the comparatively cold, aqueous appearance of that produced from milking-stock contrasting remarkably with the fermenting, oily nature of that collected from fattening beasts. The effect of this difference upon the farm must be obvious to any one In fact, I have myself watched its progressive effect under good management with extreme satisfaction, seeing the ordinary condition of the farm rise gradually to that of high cultivation; the weeds disappearing as the crops become stronger, and easily worked as it becomes more disintegrated by the
more luxuriant growth of the herbage upon it. Here I cannot but state the particular attention paid by the farmers of this district (North Cheshire) to the mode of seeding down their pastures, which, cuupled with the clean fallow or green crop, is undoubtedly, after drain. ing, the foundation of all good farming, and the secret of success in the cases now under my notice. By attention to this particular, a sod is obtained by the aid
of bones, which, after a few years' growth, is equal to of bones, which, after a few years' growth, is equal to
that produced in the ordinary way by 20 years' lea and experience shows me that a good sod that breaks up oily and mellow through the action of the fibres of luxuriant herbage, conduces more to a good and inexpensive course of crops than any manure that can possibly be applied artificially, to say nothing of the economy of restricting the need for euch manures; for, after all, artificial manures are but a defective substitute or the elements as naturally combined in a virgin soil.
Holding these views, and considering the present scarcity and consequent high price of beef and mutton, I cannot commend too strongly a system so conducive to the mutual advantage of both tenant and landlord as that of grazing. Dunham Massey, Altrincham.

\section*{Miscellaneous.}

The Birmingham Dog Show (Times Report). -The show of dogs is larger and better than ever, numbering about 1,000 specimens, now established in the new Curzon Hall, a very spacions and handsome structure erected at a cost of 8000 l . upon ground which cost 8000l. more. But for variety of taste in the choice of hobbies, and division of labour in the culture of fancy things, a visitor might be equally au fait among the cattle, the birds, the produce, the machines, or the dogs. Mankind, however, having divided themselves into groups giving their lives to specialities, you need a handbook at every new show you enter, whereby otherwise imperceptible excellences may reveal themselves, it may be in Roses or Melons, in silkworms or whice mice. You admire the interminable ranks of handsome, lively bits of intelligence and faithfulness; the graceful, sturdy, alert, pompous, or comic creatures that growl, whine, and bark their own in Curzon Hall; but you don't understand a dog, and are perhaps unaware that one side of your newspaper might be
filled with the points of perfection and demerit in the numerous breeds and their subdivided strains. Look, then, at the picturesque, warm your heart with the affection of these playful pets, feel physically powerful in the company of those noble hounds. Perhaps some compassionate critic may lead you round by the elbow and discourse technically of minute differences in build, carriage, and colour of the animals before you, till you wonder whether canine study is not an encyclopædic science. For instance, here is Class 1. The simple-minded answer to the catechismquestion, "What is the chief end of man?"-" His head, sir!" does apply to a pointer ; for this shell of the brain is the seat of that marvellous smelling faculty that forms his main qualification. His jaw is not narrow like that of a hog, his long soft ears hang close to his cheeks, and his throat is devoid of a hairy dewlap. Strength for work demands a broad muscular loin and limbs with strong bone; speed requires a well-set shoulder; his round, cat-like feet have natural shoesoles of horny pad, and his "atern", that warning
index to the aportaman, is long and sharpened to
point. That you may his coat shines whit
patches adorning it patches adorning it. You with lemon or live at combine the graceful art, the great be the strains with a more stalwart frame growing green crops and bushy heathing value the symmetry and constitution of is stanchuess, csurage, action, and sencie dog, an tell little without shooting and se hike a setter's head lighter than a him. without a snipe nose ; his ears round poinded like a Vine-leaf; bis body marked more by breadth; his feet standing straight ; and notice the arching of the toes with the between. The stern curves upward, with
silky " feather," thinning off at the tip oat must not curl, though beautifully; bat th profile of the body. If you are well you will understand the great poinl setter, the coat being deep plool colourio nut or mahogany, not golden yellow, fallo oo unmixed with black that when tested less a black fringe to the ears or or shado rame. And you will doubly admire the profle Gordon blood when you know that he rule in being raven black, with a blue on the brighit lights, in having his "ton" or plam burnt sienna colour, with brilliant red on chell throat, and feet, a spot of tan over each allowable "white shirt-frill," and a stern like a teapot tail" with a curl at the end. His ving the in going longer without water than other ses displaying more variety of attitude The pointers and setters in the pass in numbers and merit the present Show years. The foxhounds inake a very fine show, incoryd. some of the most famous sires from the kennels. The greyhounds are inferior ; the setriese excellent; the spanieis remarkably meritorious, The is a splendid show of bulls and bull terriers, of Jer foundlands, St. Bernards, and toy-terriers, A feature this year is the provision of clases for doges small size and for puppies of every breal The Sher altogether by far the best we have ever seen.

\section*{Calendar of Operations}

December: Claying and Mariing is work proper for the winter months; though if it can be completed befin the frost has left, so much the better. Let us quod an actual experience on peaty and light land gsile, thy Jescrived by Mr. Almack, in the Agricultura
Journal. He says:-I have no besitation Journal. He says:-1 have no hesitation in sal.
that the value of many millions sterling is buried uid what is now comparatively unproductive England alone. As an instance, I was shom Norfolk what a gentleman called his "hidden jeme. so near the surface, that one plunge of his waltiog stick convinced \(m e\) it would be practicable to bring sufficient by merely ploughing deeply with the commun plough the first time he broke up the land, said he intended doing immediately after the tilter rent charge was apportioned. On the surface \(\pi \mathbb{}\) value, yet immediately below was the valuabl coloured clay, ready for its improvement. In the fer near Downham this clay is from 4 to 6 feet belom th surface. Pits are dug about 6 feet br 3 , and? apart, in rows, generally two rows in a chain 22 yards), and they take out two or three spits dee? clay from each pit. In digging one pilt, par The on peat is put in that which was las mare varies, being under or over 50 s per acre, accortiog circumstances ; but it is very well repaid by the of Red Clover, V
The farm of Mr. Cambridge, of South Runston, an be named as a favourable specimen of what has bef done for the soil of Norfolk, and to accoum present productive state ; but so far from has beeu almost of such improvements, quantity of clay applied varying according stances. 51,055 loads of clay have been appiied on li farm to \(286^{\circ}\) acres, or, on an average, 88 ar Mr. Keppel, of Lexlam Hall, has 1 50 loads per acre. Near Swaffham men claying a field from a pit nearly in the conta it; they were paid at the rate
apply 80 such loads per acre under 50 s., though the work was done of horses; employment was thus found labourere, without fear, too, of injury to the lem its being cut in using carts when not
Chalk, also, as well as clay and marl, my and spread on light sandy soils in the December
Fences give some work for young fences 88 possible in the winter months-though also do very well-and to postpone the and relaying fences till February, The following are good remarks by \(M\)

Woro the Newcastle Farmers' Club. He says:-The nd intended for trenching at least 12 month ploug plantiog, and have all the weeds and arion parls as possible cradicated. and a litth utbust as weadrantageously employed in decomposing - regectable matter which may remain 35 regeant, hefore being deposited, is cut through to aset plant, 8 inches long, and then these plants are :a 0 firmly as possible in their bed a furrow with :ineed as hring made, in which the plants are iuserted, ise pade ber cored with soil, and that soil compresse be rools more mould being applied to fill the hf the foot, rovo. A shaxp doe by the surling of enth merely to preserve them ery light sprinkling of earth, merely to preserve them refl gho . They come away beautifully in the spring Sow frost planted now. About seven or eight plant fter being prenough. One advantage of this mode o 2) yurn is, that much less room is required, as you panc the usual cast or mound, and you can .iese and crop your land much nearer to the fences. culurate ade may be objected to on wet land; but such This mode may drained, and that not by an open ditch ing the line of feuce, but by a systematic undercoond drainage. The proper season for planting in from thout the middle of October till the end of Narch, or during the inertness of the sap.
The Thorns being now planted, it is desirable, and Thery, that they should be protected from injury is the treepass of cattle and sheep. The best pro if is is wooden railing. This precaution should be chon immediately on the completion of the fence, or then immedia any animals have access to it. The protection of these joung hedges by railing is expenprotection yet am certain that the young hedges come perfection much sooner when thus protected. The bedge being planted and protected, great care is to be ereccised in opening out those 'Thorns in spring which meen cosered up. This is best done by loosening erth with the hand, or with a small stick; and lett injury be done in this way to the buds, neither a spade nor any other sharp instrument ought ever to bo spade in this operatiou. The most essential point sterwards is to keep the plants clean and free from meeds.
Mr. Martinson adds :-I have endeavoured to ascerthin the best time for cutting old hedges, in order to mare the quickest growth, which is a very desirable aiect. I have found that those cut from about the middle of February to the end of March have shot may again most vigorously, whilst those cut from Sorember to the beginning of February have been much more tardy in shooting forth, and their shoots have been neither so strong nor so numerous. In these cases the hedges were much the same in appearance and age previous to cutting. I am therefore determined to confine the time of cutting, in future, from the beginning of February to the end of March, or to cut as nearly os possible to the rising of the sap, and then the cuts or wounds have not so long to struggle with the inclemency of winter storms.
One further remark we add:-However partially I may lave spoken of Thorn hedges, there is one particular place on the farm where they should never be planted; that is, around the stackyard. That fence ought always to be a stone wall. Hedgerow trees oughtnever to be plauted in Thorn fences. Nothing is more destructive to their growth ; nor anything more prejudicial to adjoining crops.

\section*{Notices to Correspondents}

ABontion : Bsser. This serious evil is often produced by the cive feeding on old pastures on which the old Rye-grase Remore the cattle and change the food as much as possible. hay have been given, change it for straw and oil-cake, and sprarate inediacly tho anitals direatened to do so.
but whether ighgate. The seeds sent belong to this genns Foxtail, or a distinct species, it is difficult to say from the seed alone \(-B 0\) R, The usual practice with regard to the droptings on the pastures is to knock them abroad when they have arrived at a certain degree of consistency. We eneve that an old man and donkey cart might be usefully enpuyed constantly during summer in collecting them and to give him work.
Artifichal Manures: Sci,io. For Italian Rye.grass any washed in once or twice a year. For Turnips superphosphate dir phospo Peruvian guano. The latter is worth its extra farmes For Putatos, as an addition to a dressing of farayard dung, 2 cwt . of guano sown over the dillis before BARKING up.
Barking Trees: \(A\). Kill the hutes and rabbits. If youn natay ni mix it un with soot till abont as thick as paint With thas paint over the tree with a whitewash brush. It lasts

Conse: FF. It is usually grown from seed-hoe in 20 lb . per are in March in rows about 18 inches apart. Cut every aro pow during alternate winters. We believe some kinds Who haverated by cuttings. Perhaps some of our readers circumstances experience will say when, and under what Spable Dinc.

\section*{The following Resolutions form the basis of the Soheme:-}
1. That there shall take place in London, in 1866 (in the Garden of the Royal Horticultural Society, at South Kensington), a Grand International Horticultural Exhibition and Congress, to be open four days, from May 22 to May 25, and to which the leading Botanists and Horticulturists throughout Europe shall be invited.
2. That Two Morning Meetings (of the nature of a Congress) shall be held, at which Papers prepared by leading Botanists or Horticulturists shall be read, the Papers to be previously printed in English and French, or German, and circulated, and discussion thereon invited.
3. That there shall be 'Two Conversazioni, at which Foreigners invited to assist at the Exhibition and Congress shall have the opportunity of meeting with our own leading Horticulturists, Botanists, Exhibitors, \&c.
4. That there shall be a Banquet, to which leading Foreign Visitors shall be invited as guests, and to which also Ladies subscribing will be admitted. Tickets 3 Guineas each.
5. That the Committee will endeavour to arrange that the most easilyaccossible English Gardens, in which some feature of British Gardening-such as "Forcing," "Decorative Gardening," \&co.-is well illustrated, shall be open to Foreign Visitors.
6. That a Subscription List be opened for the purpose of obtaining the Fy necessary to the formation of a liberal Prize List (the Prizes offered amount te \(£ 2500\) ), the erection or part erection of the necessary Exhibition Buildin: entertaiument of Foreign Visitors, and for the working expenses of the Exriid and Congress ; and that a Guarantee Fund be also erterted on.
7. That Gentlemen subscribing Ten Guineas shall be entitled to one DiTicket of the value of \(£ 33 \mathrm{~s}\); to onc Card of invitation to each of the 8 sm available for one Gentleman and two Ladies; and to Eight Tickets of almise ! the opening of the Horticultural Bhow, when the admission by payment rix One Guinea each person. Subscribers of Five Guineas, or Guarantors of sis. receive one Card of invítation for each Soirée, available for one Gentlem two Ladies, and Four Tickets for the opening of the Horticultural Show. and Guarantors of smaller amounts will receire in pmportion.
8. Subscribers' Tickets may, if desired, be commuted, so as to be araihbl- it Banquet, three of the before-mentioned Tickets for the opening of the Ex: being exchangeable for one Dimer Ticket, provided that notice of exchange them is given before the 31st of March, 1866. Subscribers' The used on the opening day will admit on any subsequent day, in the mann stated thereon.

Gentlemon willing to lend thais pupport to this undertaking will perhaps be kind enough to communieate at once with the Secretaries. A SECOND LIST of SUPPORTERS will be published shortly.
COMMITTEE ROOMS-ROYAL HORTICULTURAL GARDENS, SOUTH KENSINGTON, W. OFFICES-1, WILLIAM STREET, LOWNDES SQUARE, LONDON, S.W.

\section*{Foure of the Society, who have bonefited so much by}

\section*{owe oul be} Invilling to sabearibe to provide for one His's recovery is benpeless, and that this is a case way be recummended with contidence to the thes of the charitable. Dintroduced many beautiful ar the decoration of our gardens.
We are glad to learn that the Royar iatmerias Hortictittral SOOrsty, which some ac since was languishing for lace of support, hat now omathened its hands and successful Edinbargh Hetiealtaral society. On the 6 th inst. a apecial axinz of the Caledonian Snciety was held, "to receive
\(t\) from the Council of the arrangements which e been couschuded in regard to the sale and transference of Prperimental Garden to the Bonrd of Works; and as to consider a proposal for the admission of th pembers of the Eainourgh Horticuitural society. eolution confred to. The Experimental Garden will pathon was agreed to. Ourden, and in to be converted into an arboretum. The ampal for the amalgamation of the two Societies was im agreed to; and at the general meeting held on the :llowing day, a Council selected from the two bodies Monctively, and under the presidency of the Dnke of Hrclarcif. was elected. With this accession of mactical strength, we hope to see the Caledonian maity more prosperous in the future than it has been the matt and we must add that every well-wisher to the cause of Horticulture would, with us, be glad to see :ne lmudon Society winning and receiving the general topport of practical men, in like manner.

We hear with much pleasure that His Royal Hahness the Irince of Wales has consented to mome the President of the Gardeners' Royal Benevolen Iaditution, in the room of the late Duke of Norti-
TNBRFLAND, and has presented the Institution with a tratiou of 25 guineas. We also learn that Sir C Westwortis Dilke, Bart., M.P., will take the chair a an anuiversary dimer to be held in the ensuing suinmer, atandantly replenished.

CLIMATE IN SCOTLAND.
Ir your leading article of Saturday, November 23, I sotioe some rather erroneous representations in a mention, "It has been eaid, perhaps with too much aurbity, that north of the Humber one never meets tsting," aud without, perhaps, fully agreeing with this oreeping detraction, you afterwards add, in relation to the above and other assertions, "that it is what might a rast difference in climate." In reply to this, though it may apvear rather egotistical, I must refer to my experience of 70 years' acquaintance with orchard fruits, \(\$ 50^{\circ} 35^{\prime}\) north lat. I have managed orchards for 58 !Pars; bave planted orchards-many thousand Apple and Prar trees in Scatland, Germany, and a small une wiferent countries, and I must say that I have had Apples, and even certain Pears, grown in the Carse of
Gumrie and on Gourdiehill, of the following cypal in quality, beauty, and production to any Irait I have seen:-the Gourdiehill Lemon, the the Plam Apple, the Violet, the Peach or Pine Apple, the Margil, the Winter Strawberry or Cam'nethan Pppin, the Green Fulwood or Irish Green, the the Orange Blenheim, and last, though not leavenstein Lady Johnstone (named after a progenitor of my funily), which I have measured 15 inches round, of the fame form but much larger than the Newtown Pippin of Aew York. Also of Pears, I never ate better than the Past variety of the Galston Muirfowl Egg, a melting Pear, which combines the acid with the sweet; the (rawford Pear, matured to a red cheek, and the lieurré d'Aremberg, all grown npon Gourdiehill.
In 1827 I forwarded apecimens of my fruit, all from Aandard trees, to the London Horticultural Society, and aloo to the Caledonian Horticultural Society, and macived a medal from both. Is this a proof that the chimate north of the Humber cannot produce an Apple rram standard trees worth eating? It is not the Carse of Gowrie only that is famed for fruit, and was still thore famed at a former period, when the climate was armer. More than a degree farther north, on the for foit the Murray Firth, the climate is also favourable productive at the same time highly salubrious, and productive of grain of fine quality ; and the purity of
the alr seema to benefit alike the vegetable and animal kingdoms, airs to benefit alike the vegetable and animal diatrict to Londonent off cargoes of Wheat from that piampaess of grain, not surpassed at and fineness of Folour, though not quite so sharp-ended as that of seer and Kent. I have also found Oats at Thurso, \({ }^{8}\) rown within sight of the Orkneys, superior in plumpbem to any I hase obterved elsewhere. The largent,
a tent of the zarden being an shcient sumb banh from which the mea thed receded. A remarhalite d.fleretre of elimate existe Letween that porthon of : Alend nor: lio of the firamyinn rance and that to the southuario. In the protions rot thward there is less putrid effluvium in the atmophere, and less devel ned dectronts. I have not hat opportanity to obaerve the condition as to onone. On
the shore of the Murray Pirth it is said that beef on the shore of the Murray Pirth it is said that beef or that is, free from putrid taint, under the same temperasurs, that it will do southward of the Grampians. this northern coast there is less leaven of patrenconey in the air to act as a commencing germ, and not so much developed electricity as to interfere to loosen the chemico-vitul attractions iu living org misius, or even on dead organic matter, as in lower intindes. northern latitudes. A freeh leg of mutton bung at the starn of a whaler for six zonths has been found free from taint and gond; while a fers hours at sierra leone where 8o much elwatricity is dereloped, "ould have
rendered it a mass of corruption. The living organism is to a considerable extent sinnilarly afectod. For dyapeptic patients, a high latitude is the moat effectual cure; and even for consmmptive patients, a eummer advantagcous than in Madeisn, where solvent electricity abounds, and where the athosphere is too thin, tou msubstantial, to supply the necessary oxygen where only a portion of the lungs remains in working order. The heat and solvent electricity only hasten the progress of the disease.
Harvest is generally begun in Moravshire the first of any part of the istand morth of Hull and Liverpool East Loothian, and the Carses of (iowrie and of Falkirk follow. The elimate of East Lothian and the north on Morayshire is modified ly having sea to the northward, igher ground to the south-west, having in cousequence less rain, and also being mostly dry-bottom, there is less evaporation to produer cold and cloud-hence under the ong northern day of sunshine here rapid, causing carly harvest; the Carses of Gowrie and Falkirk both being walled in like a garden, especial'y to the northwarid, by ranges of trap hills, and Footh, now elevatel about 20 feet above high water nd dried - are the farourite soil of the Apple and Pear ree, which continue their productiveness for centuries, the subsoil abounding in their matriment, and cousumption never appearing-a disease so common in other soils when the fruit essentiais become exhaustect. Thave found in the Carse eoil Pear-tree roots of considerable size 6 feet deep. A Pear tree onew of the writer, is still productive, though many centuries old. It is about 5 feet in diameter of stem 6 feet up from the ground, and has produced more than 2 tons of fruit in a season. Numbers of other large rees, centuries old and productive, exist in the Carse of Gowrie. Do the valleys of the Thames, the Severn, or the Humber produce many strch? norue the Climate of Exrope, and extending southward even to the Spanish shores of the Bay of Biscay, has been slowly becoming colder for a number of centuries, of which there are many indications, and a time may arrive when neither Scotland nor England can produce an Apple worth eating, But I see no reason to convert a future contingency into a present fact. The cause or purpose of this variation in temperature, this cooling and the probability of a tarning point, is beyond our present science, perhaps may continue beyond our power to compass or influence. At presatural history and to vegetable production, to contend against and so far compensate for decrease of temperature. Had the writer of this disparaging article of the fruit grown north of the Humber visited Gourdiehill orchard two months ago, he might perhaps have seen cause to promulgate a different doctrine. At present I can only refor him to the vendors of fruit in Edinburgh, Dundee, Arbroath, and ABerdeen, for the accuracy of his state mients. Patrick Matthero, Gourdiehill.
[We thank Mr. Matthew for his correction. The remark to which he takes exception, viz., that north of the Humber one never meets with an Apple grown on standard that is worth the eating, was professediy given as not ouron, a matter of opinion whether an Apple is worth eating. The remark was a general one, and it may be true in the main, though it may admit of exceptions. Possibly Gourdiehill is one of these. We beg our readers to remember that the chmate o Britain, if it is to be taken as extending from Land End to John O'Groat's, is an extremely complex subject involving many peculiarities, which obviously cannot be detailed in one article of moderate dimensions. As Scotchman, Mr. Matthew probably Enows the two sets of people, who according to the all the things half done. We hall rejoice if our remarks attract this matter, and we shall rejoice ise of incurring contra attention to it, even at the expere wiser or better diction. By all means let those who are wiser, or better informed than we, say their say. We are farthud or aught ele connected with that country. We may add that
the sbove communication, Mr. Matthew expremos mam than one opinion to
unrceorvedly to ascent.]

\section*{NEW IPEARS}

Ws have recoived the following communication from M. de Jonghe, of Bramele, in reterence to the origin of ur prosent Volume
The Conseiller a la Cour is one of the late Van Mons seedlings, and was procured by him in 1831. A few years after it was dedicated by in originamor Appel," of Bramela. Aner the death of Vin Mons, in Scptember 1811 , the tries of thee lenvain mursery wete tramprorted (in is 15) to Geest S. Remy, near. I moigne 1848-49; and the then posscmer of the variety M. Bivort, gave it the name of Due d'Orlonan in iguo

This Pear then, han three different names: 1st, that Manfchal de la Cour, creating conflanion with the rariefy dedimated hy Van Mona co M. Dillen, "Maróchal de la Cour" of the King of Wurtemburg; 2:ly, that of Due d'Orlíme, given by M. Bivort to an alrendy named mort, whono Iabel had protobly heen last in the
tranoport from Louvain to Geest St. Meny ; the third anop thom Lich is sanotioned by the law of priority and is almo the most widely known, viz, Conseiller at Uour. This variety in in truth very rotuast and hardy: wo much so indead on the (sumee. In my opmion it whould be grown on a free atock amd planted out in the orchard.

Marie Jouise \(d^{\prime}\) 'Ccele is n spedling of the lato M. Gambier, in contemporary of Van Mons, who diei fuite recently at his comutry seat of Rhoule is. (iemise, a village two leagues from 1brusels. Hewe the plant produred its first fruits in 1514 and 1857 . TransUecle bel mging to the same proprietor, the seedling again bore fruit in abundance in 1850. When 1 kaw it in 1851 the tree seemed tol be plamted in a poor and that represented in the Gardeners \({ }^{\circ}\) thmomido p. 1060). It was at that time difficult to judge concerning the growth of the tree, or the form and flavour of the fruit. The pomestor told us that in his garden at Rhode, the tree was more vigorous and the froits finer, so much resembling Van Mous' Marie Louive that he M Gater that this name vould introduce additiona confusicn into the nomenclatnre of Peare, he remarked," know it - there is one Marie Louise obtamed by M. P'Abse Duquenne of Mons, another by Vian Mons of Brussels, and a thitd Manie Louise by Delecourt of Cnesmes, a village near Mons. Nevertheless, I cannot now alter the name, having distributed several grafts to amateurs under that denomination. Besides (added he), this variety will long remain under this name, because ucceeds wonderfully well on the Quince, while the other varieties do not." The surmisen of M. Gambier have turned out
We owe also to M. Gambier the Abricot Pâche Ondant, the Vieux Calvil Apple, and two other good Peare, viz. Beurré de Jonghe and Bergamotte Pendala. In 1857 M. Gambier ufferer, returned to Mhode, where, on account of his ill health, he only received a limited number He continued, however, to the end of his days, the seeds of his best fruits; and on one of my yisits his garden I noticed a certain numbers, which seemed ufficiently deserving to be named, and to take place mong the other choice varieties. J. de Jonghe.

\section*{COPAL RESIN.}

To clear up any of the doubts which exist as to the true source or rather sources of this resin, would be to The term Copal, as is well known, is applied in commerce to most clear resins capable of proaucing a colourless varuish, for instance, East Indian Copal or Piney Varnish is produced by Vateria indica, L., a tree of the astural order Dipterocarpacea, white the African copals are undonbtedly the produce of Leguminous trees. The source of gum Anime is another of these economic puzzles. Oue of the differences between these two
resius-copal and anime- is that the former is mostly very clear and almost colourless, while the latter i always of a brownish tint. Both resins are nometimes rough on the surface, caused by the action of sand while the resin is in a soft state. The trees grow in the neighbourhood of the seashore, and the resin exuding rickles down and buries itself in the sand beneath This roughened surface, called at Zanzibar "goose-akin," ir, of course, found only on the reacters of the resins buried, but the distinguishing characty of meed mention themselves are so well conwerned about is to know how many distinct plants fupnish the Copal of commerce.
Lieat.-Col. Playfair, H. M. Consul at Zanzibar, has recentiy transmitted to the Kew Museum, in answer to a request of the late Sir II.J. Hooker, some fine specimens of the bark of a tree with the resin in situ, tugether with reluits of the same of collected renin. On the bark the resin is
thickly formed in large irregular masses; the external appearance is of a dusky grey, but its fracture is of a
clear light shining yellow. The tree yielding this resin, Col. Playfair thinks, is the true Copal of the manan wanch anxiously look for further confirmation. Believing, however, the fruits to be what Col. Playfair sends them for, viz, the fruits of the Zanzibar Copal tree, there seems little doubt, on eumparing them with specimens in the Kew Herbarium, that they belong to Hymenæa mossambicensis, K reply to Earl Russell's inquiries respecting the suppl of resin, that the value of copal exported from Zanzibar amounted during the year 1863.64 to 163,353 dollars, the average price being about six pounds for one Austrian dollar. These sums were made up as follows:-

> United Kingdom
> British Kndia
> United State
> Itamburgh

\section*{Total \\ 63,353}

If, therefore, a revenue like this is derived from the esin of this particular plant in Zanzibar, it would be could open up a similar traffic in the same commodity
Captain Burton says of the Zanzibar Copal tree, that out of its trunk "canoes have been formed 60 feet long, and that a single tree has sufficed for the keelson of a brig; the average size, however, is about half that height, with from 5 to 6 feet girth near the ground." The trunk "is dotted with exudations of raw gum which is found scattered in bits about the base." The resin is also found in a semi-fossil state, sometimes in places overflowed by the high tides, or when sinking piles for hats, \&c.
Captain Burton further says that "the East African seaboard from Ras Gomani in S. lat. \(3^{\circ}\), to Ras Delgado, in \(10^{\circ} 41^{\prime}\), with a medium depth of 30 miles, may be called the Copal Coast."
At Zanzibar the resin is sifted and cleansed from foreign merchants it finds its way into the hands of the washing in chemical after this it is again cleansed by strength, care being taken to thoroughly purify, but at the same time not to injure, the so-called "goose-skin," all pares of tha
All parts of the plants of the copal-yielaing species of Hymenæa are highly charged with resin, and in none is it more apparent than in the fruits of the species sent home by Colonel Playfair. The little warts or verru• cosities upon the surface of these pods are lumps of clear, colourless resin, simply covered with the thin epidermis or cuticle of the pod. To such an extent are these pods charged with resin that they burn freely upon the least, approach of flame. The same property Hymenæa Courbaril, from the trunk of which exudes very large quantities of resin, but this pod being larger and more ligneous, and the resin distributed in small ducts all over the surface without penetrating the substance of the pod, does not burn so readily, nor is the quantity of resin so large. The oatside of these pods much resembles in appearance the sand-fretted surface of the resin. \(J\).

\section*{Home Correspondence.}

Tresine Herbstii (Achyranthes Verschaffeltii).-As some of your correspondents have very emplatically pronounced in favour of this plant, it is but right to
give publicity to the opposite opinion, which I am convinced is the general one. I will begin by saying that some who praise it did so before it was even tried in the open air in England, and by quoting a few words from that distinguished American, Mr. Hosea Biglow, who says, "It ain't Nater for a feller to let on that he's sick 0 any bizness tbat He went intu off his own free will think that it will be much better during a wet season. According to this it should have been better during the past summer in Scotland, in the west, and in Ireland-in the moister places, in fact, than about London; but the reverse was the case. The Trish Farmers' Guzelte has pronounced the plant "a sell ;" its colour when I visited Liverpool and that to say it resembled a badly shanked bunch of Grapes would be to pay is a high compliment. Even those who admire it confess that it was unsightly till the end of August. This is too true, And what are we to think of a bedding plant that in its best state only begins to look well at the end of August? I am fully aware that at Kew and several other places about London it was beautifal late in the autumn, but I am equally aware that the past autumn has been the inost attributed the well-doing of the plant iu many places late in the season. It should be noted also that specimens in the hand may look well, while their effect a little way off may be wretched, from a habit the plant lhas of turning up the edges of its leaves. It must, too, be patent to every one that a plant which does well at Kew, and badly at Battereen, must have a curions captiousness about it that is arything but a good feature
in a bedding plaut which people have to depend upon from some of the most successful bedders in the country and bardly one in favour of it. Mr. Thomson, of Archerffeld, has"had some planted "in a very favourable
situation, and they looked most unsightly throughout situation, and they looked most unsighty throughout

Mr. Anderson does not think it would have any Mr. Fleming has not yet perceived its beauties, though with a large opportunity of doing so. The Coleus and Amaranthus are in beauty six weeks or more before the Iresine becomes in the least attractive; it is most
uncertain in its effects even under the best manage uncertain in its effects even under the oest manage who have not already tried it, to do so on a small scale at first. I am perfectly aware of the effect it gave in bright and delightful weather, but none the less do I think that the fact of its having disappointed and even disgusted the majority of those who tried it should be as fully known as that it has given satisfaction to a few, particularly in the "shade." If it would grow in the colder parts of the country, where Coleus and even Amaranthus cannot be grown well, it would be a boon; districts. \(W\) Robinson.
Granadilla Fruit.-If Mr. Vair, after eating one of his Granadillas, were to sow the seeds, the produce would be a plant of much hardier habit and probably still catable, supposing that the pollen parent was cocrulea, and that fertilisation had taken place by the agency of that pollen. On the other hand, certain hybrid Passifloras have been found to be barren, or nearly so. A cross between the tender large-fruited sorts, such as laurifolia and quadrangularis, and the hardier edulis, which fruits profusely without artificial impregnation, would be very desirable. R.T.C.
Lime Trees.-I shall be grateful for any information which any of your correspondents will kindly give me as to the relative rapidity of growth and quality of the timber of the two varieties (or is Sir James E. Smith right in considering them distinct species?), Tilia europæa, and T. europæz grandifolia? Selby, in his "Forest Trees," gives not much information about the latter; and Brown, in his "Forester," does not even mention its existence. I also would know whether I can propagate, and the bnst way of doing so, from four
trees of about 16 inches diameter in the trunk, which are all that I have of this variety, or that I know of for miles round. I may remark that this year, on the 8th November, these trees were almost in full foliage whilst some trees of the common species were almost completely stripped of leaf. Diss.
Paterson's Seedling Potatos.-In a late Number (see p. 1107) there is a long report of the presentation of a testimonial to Mr. Paterson, the raiser of some new varieties of Potato. According to some of the speakers at that meeting, Mr. Paterson is entitled to the thanks of the nation at least, if not indeed to something of more substantial value, but unless his new Potatos have proved infinitely better in other places than some of them have here, the glorification accorded to that gentleman as the raiser of them rests upon a very shaky foundation. Tempted by the numerous testimonials in favour of Mr. P.'s seedlings, I was induced to try the following varieties in the garden here-Blue Round, Blue Kidney, Victoria, and Seedling Rock. These were planted in the ordinary way by the side of other older varieties, and treated in the same manner. The haulm grew so luxuriantly that I anticipated a heavy crop, but the blight (which has been more virulent here this season than for several years past)
destroyed the foliage before the tubers had completed their growth, which of course materially lessened the yield. The disease also affected the tubers in quite as great a degree as in any of the older sorts; therefore immunity from blight cannot be claimed for either of those four varieties. Then, as to quality and productiveness:-Paterson's Blue Round is a large late Potato, belonging to the same class as the Lancashire Red, Phillips's Red, or Stgfford Hall, wellknown old sorts, which, being late, have been nearly or quite driven out of enltivation by the prevalent diserse. There is, however, a Potato of this class now known in the London markets by the name of Jersey Blue, which Paterson's Blue so closely resembles, that if the two Ports were thrown together, I question whether Mr. Paterson himself could separate them. In growth and foliage they are also similar, and being both of good quality the new variety possesses no advantage whatever over the old one ; therefore it is no acquisition. Paterson's Blue Kidney is quite distinct in appearance from nar sort known to me. The tubers are long and narrow, and therefore deficient in substance, and it yielded the smallest crop of all the four varieties. The Victoria is one of those irregular-shaped Potatos which cut much to waste in paring. Its quality is good, but in what respect is it superior to the Dalmahoy? With me the crop was not so heary, and it is certainly not better for the table than the Dalmahoy in the proper As to of the latter, which is up to the end of January As tiference between it and the White lithern any from Ireland. Tween it and the White lRock obtaine from Ireland. The same four varieties of Mr. Pater son's Potatos were also grown by Mr. Ivery, Nursery-
my assertion, that in no one property is eith
better than many of been in general cultivation for yearan marto whind The Deepdene Garden, Dorking

Stoneless Berberries.-In tie her information so kindly given by your correspose the may achieve the possession of a tree or trepocione
cooking, preserving, and otherwise asing the
Iris susiana and Fritillaria kamtschatkene nigrum).-Can any of your readers tell me hon
and flower these plants well and freely? they may be kept alive, and perhapy flowered with general treatment, bathaps genera. W. \(\boldsymbol{R}\).

Pears.- Yur correspondent " has given a list of the best late Pears in the mive Octo, Nor., and December, This vare of the very best, namely, Winter from growing it on south-east and west walls, I to have a succession of it till after Christman from a south wall this year are the lar pest I and of quite equal in size to any I ever saw in late Permost delicious havour. In Ama varieties have fruited with me in pots, and were large and of fine flavour, viz: :-Marie Lovies Bonne of Jersey, Beurré Hardy, Conseiller d lac Doyenné de Comice, Josephine do Malines, and Hoym
Victoria. I fully believe with "Ampen system of growing believe with "Amnes" that great advances in raisin new varietios careful hybridisation. The trees being aln the eye of the operator and portable, he can secire fect success in keeping off insects, and procuring pois the proper time. William Tillery.
Raspberries.-Having seen ( p .1109 ) the Rapplem called Belle de Fontenay recommended as a valu autumu variety, I beg to say that we have this here as Rivers Autumn Red. Although the has been very wet for the last three weeks, and bei that time we had a few nights of frost varying tur \(5^{\circ}\) to \(7^{\circ}\), the fruit is not at all of a bad flaporir; ition fair a Moore, Gardener, Mountainstown, Navan, Ireland.

Double-Glazing.-I have virtually used this plan glazing for years upon a house in which are kept a Urchids, and where I desired to prevent drip, by putie Newport, Isle of Wight.
Solanum Capsicastrum.-Having seen this popale decorative plant in an unustally beautiful and perfer state at Bicton recently, a few words as to the wr is treated there may be of use to your readera often seen a somewhat erect and even naked-sided bush, and now and then "spidery" and with neat cultivators I have not seen it anything so good and pretty as with Mr. Barnes, whose p while perfect in shape, hang down so freely as al to obscure the pot, and are densely covered with bert Yet they are grown in the simplest posible They are struck from cuttings, and in the firt turned out in the open garden in early summer; grow and flower away without any attention the summer, and by the time they are wanted for houses in the autumn they are little hillacke dun berries and dense foliage. They are then dug ap potted. Plants grown in frames Nothing could be men scarcely recognise as the same. Noting the conserntorn useful for the winter embelinhment except, perhing, the Tree Carnations which are beautifully mazaged -but of these more anon. W, Robinson

From Mr, Variegated and other Kales, well. grown Carrots, Scorzoncra, Salsafy, Walcheren Broccoli, Savoys Snowball Turnip, Danvers Onion, Parsuips, Mussel burgh L.e.ks, Black-seeded Brown Cos Lettuce, Celery Eudive, and a brace of small Telegraph Cucumbers Esamples of Variega'ed Kanl are cuatributed by Messrs. A. Muludersnn \& Co. Frum the R.v. G. IV St. Juhn cone a collcetion of 12 varieties of Putatos, to which as many First.c'ass Certificates are awarden. Among them are Daintree's now K:dner, a five kind ail to be carlier than the Lap-tote: Fenn's Ouward, a go d sccond early; Hogy's Collstream, senson; Haigh's Kidney, a. fine parple sort Britis! Q.eeen, a seedling from the Fluke Mitchell's Fitrly Albion ant Shutford Seedling, both rood kiuds for forcing; and others, all gruwn on the inge and fur, ow system, with Win!er Greens betweeu he rows. Of the latter spec:mens of Bru-scis sprouts ere contributed to shuw the advantage of using houso sewage as manure, tho e so treated being
abont twice the siza of the sample to which his kind of manure had not been given. Noble spreiurens of Naueham Park Uuion are exhibited by Mesors. Catbush; and Messrs. Dewar, of Newcistle, show Northumberlaad Champion Celery, and examples of their Beet. From Nova Scotia come 38 dishes of Putatcs, most of them coares sorts of Hi lueys; aleo Onious, Gourds, Parsuips, Bzet, and K.Jhl Ralji.

\section*{Rotices of \(\mathbf{W o o k}\).}

The illustrations in the Botanical Magazine for November and December comprise some very intercsting suhjecte. Those of the November number areIonopsis paniculata, a charmingly graceful WhitoLow \& Co. and by far the finest species of its genus; it has linear-lanceolate keeled leaves, and large spreading panicles of white flowers with a purple eye, the lip arge, while the other parts of the flower are small.Calathea tubispatha, a beautiful Tropisal American herb introduced by Mr. Veitch, and extrisited by him during the past summer as a species of Maranta; its broad obovate-elliptic shortly acuminate leaves are of a bright green, variegated with paler green, and marked with two rows of oblong brown blotches, arranged in pairs, and the few pale yellow flowers is:ue from a curious tubular spathe, formed by the convolution of the bracts. -Pachypodium succulantwm, a South African gouty temmed shrub of the Apocynaceous order, itenticis with the nearly forgotten \(P\). tuberosum of Lindley and introduced by W. W. Saunders, Esq. It his pretty rose-coloured flowers. Dr. Hooker observe of this plant, in connection with the Adeniun obesum, and the Vitis Bainesii and macropus -all gouty- -temmed plants, recently figured, that their exceptioual habit in their respective families

6 affords an interesting problem for the consideration of those who incline to the derivative one kind of useful character 'selected,' and thus apparently moulded, by the external conditions to which they have been exposed through a long period of time.-Abronia fragrans is a procumbent he leaves, and large dense umbels of white hypocrateriform flowers, which are said to be very fragrant. "It is the finest species of the suall genus to which it belongs, and may be regarded as a valuable addition
to our garden flora." The plant "comes from the to our yarden flora." The plant comes from the fowered by Mr. Thompson.- Begonia Pearcei, introduced by Berenia, with a succulent leafy stem, yeliquely ovate acuminale irregularly crenato-serrate obliquely ovate acuminate irregularly creth, and large clear yellow flowers; it is allied to B. cinnabarina.
The figures in the December number representPalumbina candida, a slender llegant white-flowered Orchid, already described in our columns (p. 793).Thibaudia Jessices, one of series of magnificent Vacciniaceous shrubs, which have leen much neglected by cultivators. It has pendul and dense racemes of large tubular rosy carmine flowers, and is supposed to come from the mountains of Caraccas, having been derived from M. Linden under the name of T. macrophylla, a plant which is said to differ remarkably in the long pedicels of its flowers.-Calceolaria hyssopifolia, a slender twiggy shrub with linear oblong or oblong lanceolate leaves, revolute at the margins, and corymbs of large pale sulphur-coloured howers, of closed ; it comes from an elevation of \(10-11,000\) feet on the Quitinian Andes, and has been introduced by Isaae Anderson Henry, Esq.-Palafoxia Hookeviana, a showy hardy herbaceous plant, 2 to 4 feet high, with lance-shaped three-ser ved leaves, and corymbs of rosy red flower-heads, the rays of which spread out to a diameter of an inch and a half. It is a nalive of New Mexico, Texas, and Arkansas, and has been raised by Mr. Thomp Gon.- Trichopilia turialve, an interesting pale-coloured literally "white tower,' a name given to the mountain to describe its remarkable appearance from, the sea; this piant was noticed by us at p. 770.-Dianella tasmanica, a handsome greenhouse plant, with rigid ensiform spinulose leaves, and large branched panicles of drooping pale blue flowers, succeeded by dark blue oblong berrieg, from half an inch to three-fourths of an inch ; it is a native of Tasmania, and has been blue berries renders it a conspicuous ornament in a conservatory.
The recent numbers of Seemann's Journal of Botany (33 to 36) contain figures of the following plants-Muenteria tomentosa and M. stenocarpa, two species of a new genus of Birnoniaceæ, separated from Spathodea, the formera tree of 30 feet high, with pinnated leaves, and large showy jellow flowers streaked with reddish-violet; the latter a sinaller tree, with smaller yellow flowers. They were collected in Angola by Dr. Welwitsch.Perdinandia superba, als) collected by Welwitsch, and one of the most beautiful trees of the rich flora of Angola; it is named after his Majesty Ferdinand King of Purtugal, the munificent patron of African explorations, and is a trie 30 to 35 feet high, nearly leafless at the time of flowering. The leaves are pinnate, and the flowers, in short racemer, are very large, with a violet-purple velvety caly \(x\), and a vermiloo phractes Welwitschii, an erect shrub, niveo-tomentose 111 the young state, and bearing numerous showy white a representation of the fruit, "which is unknown to most botanists;" that which Palisot figured being here stated to have belonged to Kigelia.-Toricellia tilicefolia, an Indian plant which the Eaitor rejects from his group Hederaceæ and refere, to Haloragactæ. Of the many intersting papers in these numbers
we can only here briefly mention-l)r. Seemann's revision of Araliactæ; Mr. Carruthers on the Nomenclature of British Hepaticæ; Mr. Ernst on Venezuelan Medicinal plants; Mr. J. G. Buker on Gardens at a l.igh elevation, an interesting paper, which we shall lake an opportunity of reprinting; Dr. Hance on the genus Brainea; Dr. G. Bennett on the Waralah or Wendland on a new classification of Palme.
The Florist and Pomologist for November figures Narcissus juncifolims, a beautiful little hardy bulb of the Jonquil series, native of the mountainous provinces of the south of France and of Spain and Portugal. The December number contains a good representation of Phalanopsis Liuddemanniana.
The Floral Magazine has recently given figures of Pelargonium (zonal) Wiltshire Lass, Gladiolus Sir Jomes Clark, Bignonia argyraa violuscens, Azalea
(indica) Princess Alexandra, Cattleya exoniensis, (indica) Princess Alexandra, Cattleya exoniensis,
Fuchsias: Day-Dream, Lizzy Hexham, Catherine Parr, and Lady Dumbello; and Stauranthera grandiftora.

Catalogees Received.-F. \& A. Dickison \& Sons' Forest Trees is a well-arranged and ample list, and giving the heights of the plants, may be usefully con plan-
from the same. - Louis Van Houtte's Prix Courant de various kinds of seeds-annuals, berbaceous plants, trees, \&c.

\section*{fflolits' fflobelos.}

We take the following practical remarks on the Gladiolus, by a writer who signs himself "Rambler,"
ftom the West of Scolland Horticultural Magazine, well-conducted monthly serial, to which we have referred on various previous occasions:-
The Gladiolus has now fairly established itself as the king of autumn flowers for exhibition. No cut flower presents, when properly staged, such an imposing appearance combined Horticultural Societies will do well to make a point of laving this flower the leading one at their September shows. The effectiveness of Gladioli when staged, however, depends a great deal on arrangemento. At at Kilmarnock, too, nothing could appearance, the mock, too, nothing could arrangement ; but at Glasgow, on the other hand, their beauty was completely lost by their being huddled together in a very chaotic manner, every s'and apparently being put down where room could be found to hold it, without any attention being paid to the position of other stands.
Gladioli, besides being most effective for exhibition, have now become the greatest favourites of the floris!. They are suitable alike for large and small gardens, are easy of cultivation, and rich in variety. For general garden decoration, too, they are highly useful, atd for many purposes they ought to be used more largely than they jet have been. In the back rows of ribbon borders they have a splendid appearance; planted about a yard apart, they add greatly to the richness of the border, and break the level monotony, too ofter observable in this state of gardening. Among the varieties suitable for this purpose, the best perhaps are Breuchleyensis and Penelope, which, planted alternately, have a very striking effect
The improvement in this magnificent tribe of plants has during the past few years been so great, that many of the splendid novelties recently introduced have little resemblance to the dingy-hued sorts of former years. The varieties, however, have so much increased, that cultivators are completely bewildered by the long lists of names presented in trade catalogues for their selection. In all our florist flowers, while new varieties are annually being introduced, a number of old ones are at the same time discarded and pass into oblivion; but with Gladioli, we find the catalogue year after year getting bigger; new varieties are being introduced, but the old ones are retained, till now some of the catalogues tend only to mislead and disappoint purchasers. One trade list received this season contains upwards of 300 varieties, half of which are only fit for the rubbish heap. This is a matter which must be amended. I see no benefit to be gained from growing any variety after it has been surpassed by another of the same class. The sooner all inferior varieties are weeded from the lists, the better for both buyer and seller. A number of seedsmen make a great boast of having large collections, but what is the use of a large array of names, when fully the half of them, either from want of distinctness or from inferiority, are unworthy of cultivation. I am highly pleased to see some of the trade moving in the right direction in this matter, and trust all will follow.
It may here be acked, What constitutes a good Gladiolus? The first requisite is that it should be perfectly distinct from all other varieties ; it should be of a good colour; the flowers should be close on the stem, and open all one way (the worst fault a Gladiolus can have is for the flowers to look in two directions). The flowers should also be well open, with the under and side petals recurved; the bottom petal or ear should be large, and all the petals should be of good substance ; and last, but not least, the plant should be of vigorous growth. The most perfect varieties I know are Penelope and Madame Vilmorin; they are in nearly every respect model flowere. Madame Haquin, too, though wanting in some points, is in its individual flowers all that could be wished.
I shall now proceed to give a list of the principal varietics I have seen exhibited, with my notes regaraing them. For convenience sake I divide them into two classes:-
1. - Varities of Recent Introluction

Charles Dickens, a a very peculiar-coloured variety, described in the lists as delic ite rose, tinted with chamois, blazed and
striped with rosy carmine; its colour makes it very attractive in a stand.
Charles Smith, scarlet red, apotted with violet; a fairish flower, but uot a great acquisition.
Crystal Pulace,
a pretiy light
Cose on the pace, a pretty light flower, white striped with rose on the edge of the peaals, contre of under petala striped
with viclet; when sladed it comes pure white, aud is very beautiful.
petals stained " light rose edged with brighter rose, lower regards form and substance ; poilko very long fower, bota as Edulia, top patais light cherry, with a light stripe of white
in the centre, lower petals white, stained with violot flower medium size, good shape, very difutinct and pretty.
poor as I samimilian, red, with yellowish - white stripen,
Putton, \({ }^{\text {, }}\) vermillon-red, with purple klain; a very fine

These I shall not describe in detail, as they are batter
of the finest varieties, and will meution none but what ojz: o p.ease the most fastidious :
\begin{tabular}{|c|c|}

The two lots above meutioned include the greeter part of the really fine varieties. The finest of tive second lot are also marked with an asterisk, sect from
unacquainted with them need notbeafraid to unacquainted with them need notbe afraid toselect in
it, for \(I\) am confident that there is not an inferior vare! in the lot. Parties who intend to compete muy should grow a few bulbs each of such sorts 2 alatis Poussio, Moms Penelope Tadame de ratro Mathilde de Landevoisin, \&c., as these varieties, if go in good order, are not easily beaten. This season have resolved to discard Aglaë, Dr. Audry, Imperatatice, Daphne, Hé'ène, Hebe, Celine, Triomphe d'Enghiel, Goliath, and a few others, that

\section*{Cbe Apiay.}

The following few extracts from a private Luse we lave received from the Rev. Lility, my stroty, an American apiarian of be unacceptable to our read. Mr. Lang was the original inventor of the Frame Hive, cation of which is now largely in use in this contrge To him, therefore, English apiarians are large indebted for the great advance which has knomledre during the last few years
Mr. Langstrotls says:-"I find little differulty Mr. Langstrotls says:-"I find lithough am sum breeding pure higurian queens, although forsa abounding in them. As soon as bee-forage fail, and stocks commence killing their dows (say ha atroug colonies, and give them drone co in the centre cells worker, and half drone) placed in the hive, and feed the bees with from keep up us long as I need the service In a few days the queen will begin to dieanper 1 lat drones in readiness for pairing with the young qual ruised at that time. Later in the season bat loco a edition of drone
 nise any mecond edition of thones later in the sesson feas of the chances of an impure cross. A gentleman fear our anquanintance, who has reared as many ltarlians queens as perter amount of success with his late bred had a greater amours bred earlier in the season. Mr. Langstroth continues: "I notice what yon say to the eise of my hives, and you will probably be sur pringer, boliting 13, instead of 10, frames. For a long time our bee keepers persisted in using small hives, but the best of them are now convinced that they were ibis besken. Of course I do not presume to affirm that my hive is not too large for your country, but hope myin you and Mr. Woodbury will try a few as large as those described in my work. A writer in your Lnndon Gardeners Chron tok Agrers wral Gaiztte 100 lb . each from two of his hives. So long as our beekeepers persisted_in using very small hives, so long they obtnined very meagre results. A large apiarian, oxing my hives,
We have quoted this part of the letter relating to the wee of. large hives, as it bears upon a matter which Mr. Langstroth's testimony in favour of large hives may be used as powerful evidence on the side of Whe the hive as described by Mr Lenatmethe the late edition of his excellent work, as being tco large for general adoption in this country, but we now find him the advocate for even a larger hive than that one. It must be remembered, however, that America genernlly is a far finer country for bees than ours, and lebours than we can hope to see.

We refrain from publishing Mr. Pettigrew's last communication, as we can bee no good that could arise from it. Mr. Pettigreve expreases his aisike to cono
troveray, which his Jetter could only provolve. We bope, however, that Mr. Pettigrew whll continue his remarks on the subject of his former paper, and if
more agreeable to him, we will defer passing any opinions or comments of our own until he has concladed his observations.

Feeding Bees.-On changing the floor-boards of my hives to suit their new home, I found that I had quite under-estimated the weight of the board of that one the bees and honey of which I lately stated weighed together 17 lb . I now find that the weight of the whole inside contents of this hive is only \(13 \frac{1}{\mathrm{l}} \mathrm{lb}\). Do you
think that this will suffice to carry the stock over the winter, and, if so, to what period in spring?
I administered 55 lb . weight of sugar and honey between the two hives mentioned, which quantity has with what the bees collected, produced about 35 lb . of of which are moderately populous. Whatever amount of honey this may indicate, a considerable part of it is doubtless owing to the Heath in the neighbourhood, to Which, during the month of August, the bees resorted go and come. The Heath-covered hills are about a mile distant, and rise considerably above the eminence on which I live. I was at first doubtful if I should be able to know whether the bees really did go there, but August, every fine \(0^{\prime}\) clock, from high up in the air, higher than it was possible to see them, down came the ber a shower, the Heath, dividing off to the right and left as they reached the range. They had evidently flown straight from the top of the neighbouring hills, across the intervening mile of low country, till just over their hives, and then descended. This going and coming was continued all day, though more apparent at the general evening return. The invitation, "Come into the garden, and see the bees coming home from the Heath," always produced expressions of wonder, and sometimes of pity that it should be necessary to kill such intelligent and Your sas little things.
Your saying in the number of the 14th October that a tolerably free admission of air is conducive to health makes me ask-how much of the entrances of hives would you leave open in winter? When would you take away the wedges which you recommend to be put under the back of the floor boards, for the purpose of tilting the hives forward to promote the escape of condonsed moisture? The back, by the way, would always be better by being a trifle higher than the front, I
(Phe amount of the internal contents of your hive The mopt probably, just carry it through the winter. would not, under the circumstances, give any more at present. At the end of February, or early in March, treat the bees with a small quantity, say 2 or 3 ounces, allow the bottlo forg mild weather, taking care not to necessary, otherwise the moisture, which may condense
in it to a considemble extent, will fll down into the hive and do much injury. If the wintor prove to be very mild oas, virit the hive befow the time , eossumption of malod store something from the Heather. but it haw been a subjuct if general remark that hires whech have beens sent to the Heather this autumn have done little or mong. We usually regulate the width of the entrances of hives in winter (or indeed at all other times) hy thieir strength. Fir a strong and woll-filled live a apace of 3 neches by tinch, is what we allow, but for The wedges used for 2 inches, or even lem.
The wedges used for tilting the hiven wo uanally allow to remain until the time of offording super accommodation. It is a matter of little importance how long they may be in use, except for the convenience of supering.

\section*{Garden Memoranda.}

Bictor.--The houses and the flower-garden are what I now propose to notice; though as regards "the houses," I wonld rather treat that topic as the old
writer did his chapter on the smakes of Ireland, which was headed "Concerning the Snakes of Ireland," or something to that effect, lie then procoeding to say, "There are no snakes in Ireland." Now who could think of investigating "houses" with any degree of interest, when through the glass, one could sce
outside, dark, very dark, and henlthy beds of evergreens, composen of Lady Hume's Blush, and the old white and other Camelias
To describe the instruction gathered and pleasure experienced during three days at Bicton would bo impossible'in this essay. I may however give the "landumrks. First day: passed through an avenue of Araucarias,
25 to 30 feet high, and infestigated the fil wer garden 25 to 30 feet high, and investigated the il wer garden

Araucaria imbricata, after the manner of the Chilian Indiaus; perfect seeds, the first, I Lelieve, that have ripened in Britain. Frotn the towe in the woods looked down upon the clear and delight Hayes Wood in which little Walter Raleigh (whose memory gardeners should respect for first bringug un the Potato), was born, and made an expedition through the forcing houses and kitchen garden. Third aay saw as much as was practicable of an arboretum two miles round, inoluding a magnificent Pinetum.
But about the houses that are situated at the head of the flower garden? To be candid I thought them prosaic. I was looking more outside than in, as the Pampas was waving sumptuously in the flower garden in plenty, and about 16 feet high; there were stately Dracmas-a now sight to me-growing in the turf of Britain, and beds of Salvia splendens quite brilliant with flowers. In short, I did not care for Mr. Barnes's house plants," but wanted to get out, and I "drew him out" as soon as I saw a dense line of the stems of the Belladonna Lily running along the front of the range, supporting numerous balls of seed and the latest Howers. For more than 300 feet, in and out, along the dozen this varied range, there wasing flower, the perfume and effect of which I may leave to the magination of the reader. The soil of the place is congenial to such things, but Mr. Barnes sccommodates these with deep turfy loam intermixed with charcoal. These fine autumnal flowers may be grown equally well in a thousand English gardens in which they do not now exist in perfection.
The flower garden at Bicton is not like any other that I have seen. This may be a fault, bat I felt much more pleasure in it than is possible where mechanical landscape gardening is the chief feature. I cannot tell anything of its plan. I cannot describe it in a few lines, a I could a piece of wall paper, because, both in winter and in summer, the beauty of vegetation obliterates the geometrical lines and twirlings of man. It is an open-air irawing-room, but not one in which interest of detail is sacrificed to general effect. believe it is not considered nice taste to do this in a drawing-room. Every good flower garden should be interesting in its parts, while agreaable being sobsolutely nothing. English flower gardening must come to this-it is coming to it. I do not say that this Bicton flower garden is perfect-it is anything but that; but then fow things that give us great pleasure are; and even Man, the most noble and divine of created things, is in some respects the most imperfect and ignoble. For instance, here is a Pinus macrocarpa 70 feet high and 6 feet 6 inches in diameter-that perhaps meddles with the proprieties, but no matter. The bedding piants, for which there is plenty of space, are gone, but the beauty of euch a garden is, that when they are gone, you don't miss them much. Thujopsis borealis and many elegant and tapering young mediumsized Pines diversify its surface; a great Cryptomeria here and there, drooping with fruit, stops the way now and then ; while beantiful shrubs, standard Wistarias, and elegant Junipers are interspersed. The men are busy planting thousauds of Crocuses, aud rutips, and fugets round the boing its last blooms for the season on the things that like the greenhouse in the north. Rhodo-
dendrons, ineluding a arboreum, campanulatum. and innamomoum - species unually grown indoor-are in healthy buabes on the tariking standaris, from the pecul ar collour of the under nide of to loaves. "Yee" nome of rour northens readers may mer; "but whet is the good of Welling us alwont these things! we can never grow them surely the -a remani wore selfihl and la land are bot the leat worte ports of these iwlands, ar.it rour northern friends have had so much atterition past to them, that they can well epare a hitle cxtra discuss:n on the milder jortion of this inland. The fact is, there are thousands of places an which a result as gon
or better than that ohtinasel at Bi, if I may indulge in a littlo prophecs, in wheh it wil yet be fully attinted. And when this has come to ture, and the lovers of Nature, to pass from the cold nud harsh north, in the glimemage evergentis and richly verdant Conifers and Myrtlea, Camellias and Azaless of the south, all in one day ! It is true some things get touched by a very rare winter lise that of 1860 , lut then they apring up again, and may go on not suffer in the lonst from this severe fromt; the long, not suffer in the lenst from this severe frokt; the long,
long walls of the Fixmouth variety of Magneliag grandslong walls of the Fixmonth wariety of Magnoliar grand-
flons did, however, but the plasta are now growing fast form did, however, but the planta are now growing flas
and covering the walle gain. The two long side walls of the flower garden, running down to the church buil by Lady Bille in memory of her huahand, are given up to this fine plant alone. Daring the flowering season these glants used to scent the vule for a mile around. Mr. Barnes deacription of the perfume reminded me of Lalla Rookl. Dur ng the past smmmer the young plants have made shonts 3 or even 4 tere is a charming plant at Beton, and might he uned with reat effect in many phaces, as ockiat dwith the tor Arundos and the Pampas Grass. There are splendid plants of Dracman longifolia in the flower garden, and nost atrikingly they vary it.
I entertain no doubt that a great many more of such plants might be tried out of doors in similar placep. Would not Cordyline indivisa succeed? It is writ trying, and would have at least as good a chance a except beds of All the bedding plants are gone, except of Camelliaz look remarknbly healthy, and ar: densely studded with bloom buds. If the blonms d., get hurt with a nip of apring frost, there are plenty ready to unfold the day after. Bushes and hedges of Fuchsias are common. The old white and other Camellias are planted out and doing beantifully in the shrubberies around, and, as above stated, Violets abound in spring.
Conifers occur here, there, and everywhere at Bicton. We rambled out of the flower garden to see noble specimens of male Araucaria imbricata studded over with budding cones. Down where the flower garden merges gradually into the shrubbery and wood there in a little rivulet margined with Arundo Donax and the Pampas, and near at hand several noble planta of female plant that has produced abundance of seed this year is away from this, in the arboretum, but Mr. Barnes attends to its wants with branches of male cones. These plants and those which compose the were all planted by Mr. Barnes. He has no belief in the degeneracy of Conifers from home-grown seeds, as there are hundreds of perfect specimens at Bictot raised in that way. There are also noble plants of Pices cephalunica and the Deodar at the lower end of the flower garden, that have been struck from cuttinge Some of the Yuccas make stems 16 feet high.
There is a hollow dell with stony pool on one side of the flower garden among the trees, and here was growing a specimen of Araucaria Cunninghami, nearly 30 feet high, but looking very blue or rather brown, for as it makes its growth at the wrong time of the year it gets nipped and looks disappointed at all times. Here are some very slender rods, tapering and graceful, with a leaf on here and there, arching over this water they are the strong shoots, "water shoots" to use make fishing rods for ladies ishould such be required. It is a graceful and valuable plant for all such situations.
I am not as a rule devoted to idols or shells or to the lordmance of aboriginals-theylare devoid of chlorophyll ; but as some may go to Bicton, taking these observations as a rough guide, it should be said that in shells and Australian spenre, garnished with sharks teeth and clube and boomerangs, with some compound prongel instruments not yet put into a genus ; also Indian idols in white marble, of an angelic type of countenance; and last, and I hope the last of its race, the old Okk stump and ring to which was chained and roasted the last man burnt at Exeter, for the love of God, in the good old times.
I do not know that I should say a word about the planthouses were it not from seeing in the Orangery
that splendid gorgeous greenhouse climber Tacsonia Van Volxemii, in full flower for the first time. It is indeed a grand addition to the resources of thcse who wish to make a feature of climbers in the show-house
or conservatory. It is quite easy of culture under
ordinary treatment, and growe and flowers freely-and such fowers! They hang down from the stem 10 o 12 inches, by a threadlike peduncle, the flower spread ing holdly ont 5 inches or more-not all tube, like some Tacenias, but with none visible. I will not describe the calour-that mistbe seen to he appreciated There may bo a more beautiful free-growing greenhouse climber in the country, but if there is, I eonfess a bed of light loamy earth, and would be best trained aver an arch, or along a beam, but will not be out o place in any position.

The Camellia house is a noble one, a tall span, with fine specimens in the pit, planted out of course, the back wall well covered, and the pillars of the front Camellia grove-you can see very little of the house, but a great deal of a full collection of Camellias. It is 125 feet long, with nent walk all round, affording an
agreeable promenade in winter or on wet days-a agreeable promenade in winter or on wet days-a
delightul one at present, as the plauts are full of flower, and will continue so for months. That such a house does not exist in any public garden is remarkable; it would not be expensive, would not require much cale it well phanted at fhrst, and
conld not fail to be most attractive to the public. Camellias never do so well in pots or tubs as in this way. There were scores of vigorous Tree Carnations embellishing the houses. They are grown in the open air, from young plants, during the summer, and potted
up, rich, fresh, and full of flower for the houses in ()ctober. The Deutzias were in very small pots for forcing, but the heads bushy and full. They are prepared by planting them for the summer on a very sandy poor piece of ground. Such plants flower very
mucl better than they do with the treatment usually pursued. Pinks are very largely forced, and very wisely, because nicely-forced Pinks are among the very cream of forced flowers ; and they may be bloomed as well thus as in the open air. W. Robinson.

\section*{Miscellaneous.}

Nicilian Tegetation in April.-I found on the 17 th of A pril at the Botanical Garden, Palermo, as also in the fine grounds of the Princess Butera, the following plants in bloom :-Salviss, Iris, Roses (White, Red, and China), Wallfower, Anemone, Petunia, Verbena, Mignonette, Sunflower, Gladiolus, Spiræa, Nasturtium,
Poppy, Marigold. Geranium, Candytuft, Hollyhook Poppy, Marigold. Geranium, Candytuft, Hollyhook
( 3 feet high, but not in blossom), Stock, Carnation, Tulip, Pæony, Auricula, Cyclamen, Eschscholtzia, Banksian Rose, Judas tree, Cheatnut tree, Elder tree, Hawthorn (about to blosson), Alyssum, Shrubby Euphorbias, Yellow Jasmine, Nettles and Asphodel, All these flowers, shrubs, and trees I had left equally advanced, and flourishing six days previously on the
Riviera. Peaches were set as large as small Walnuts; Strawberries were served in profusion at every meal at the hotel; Orangee were numerons and first-rate, sweet and juicy. Bennet's Mentone, 3d Edition.

\section*{Calendar of Operations.}

\section*{(For the enswing weesk.)}

Ture chief things to be attended to in reference to classionses at the present tine is to keep as low a temperature as is consistent with the health of the
inmater, us a hint close atmosphere would, in a few days, do more injury than could he repaired during months of care after the mischief is done. Ventilate with
judgment; but let there be ventilation even where the most tender plants are kept, although it be at the cost of a little extra fuel, to maintain the necessary temperature in ennection with a circulation of fresh air. Watering will also require to be done with great caution, and we cannot perhaps do better than to repeat the diree tinns which we have so frequently given, viz, never sufficiently dry to warrant a full supply. Be careful to prevent sourness; as, if this takes place, and is not rectified, the loss of the roots will be the inevitable consequence. Avoid spilling water on the floor when watering, and endeavour by every means to
maintain a sweet and not over-damp nor over-dry atmosphere.

\section*{FLOWRR GARDGN AND PLANT HOUSTg}

Should the weather prove unfavourable for out-don work, prepare lahels for all ornamental trees and shrubs; and when well painted, and thoroughly dry, they can be put in their proper places. Crocuses and other bulbs should be protected from the ravages of mice, for which traps should be employed before they do any mischief, ss afterwards they are very particular about taking the bait. If there are any choice seeds of Rtododendrons or Azaleas which it is desirabie should be saved, they
must be seen to at once, as during the sunay days in January the capsules wili open, and the seeds drop out.

Carnations and Picotees - These are apt occusionally to have small portions of soil lodge in the axils of the leaves. These must be carefully removed, for plants will most certainly be the result. Carnations and Picotees, too, if kept close, will contract mouldiness, being liable to the attacks of parasitical Fungi. The
leaves affected must be cut away ; and, if possible
the affected plants removed from the othere, giving
plenty of air, the want of which, and late planting, stiperinduce these evils.
Pansies. - Those on beds should, if in exposed places, be protected if severe weather should set in; the best material for the purpose consists of small branches of the Spruce Fi
Tclips.-Moop over beds, and cover during severe weather. The tops of the spike being near the surface, this precantion is absolutely necessary

\section*{FORCING GARDEN}

Cuctarbers.-These must now have careful attention. By a proper arrangement of the ventilators a
constant circulation of air should, if possible, be secured whenever the weather is at all favourable.
Prachrs.-Those in pots may now be brought into the honse, and plunged in Oak leaves, that are in a slightly fermenting state; from \(55^{\circ}\) to \(60^{\circ}\) in the
plunging material, whatever it may be, will be sufficient plunging material, whatever it may be, whe sho should range from \(45^{\circ}\) to \(50^{\circ}\) by night, and from \(55^{\circ}\) to \(60^{\circ}\) by day. Syringe frequently during fine weather, but never when it is damp.
Strawberries.-Where very early Strawberries are required, some of the strongest plants of Keens' Seedling may be brought into a pit for starting, but no artificial heat need be applied for the first week or ten
days. Let the plants be freed from decaying leaves, and top-dress the surface with rich loamy soil, laving a sprinkling of soot in it, to drive out any worms which may be in the pots.
VINES. - Let the heat of the litter about the roots of Vines recently started be daily examined; and see that it is regularly kept at a temperature of \(60^{\circ}\), nutil the rods are coming into leaf, when a slight increase of heat should be obtained. It will be well, however, not to exceed \(70^{\circ}\) for some time yet, as too great an anoount or of the atmosphere should be kept at \(50^{\circ}\) by night and \(60^{\circ}\) by day unt:l the buds are all starting, when a rise of one degree earh night may be indulged in until it reaches \(58^{\circ}\) or \(60^{\circ}\), with a corresponding increase \(6 y^{\circ}\)
day. It will not, however, be safe to go beyond \(60^{\circ}\) by right, and a small portion of air stiould be always allowed, to keep the atmosplere sweet and in motion. With sum-heat, should it occur, a rise of \(10^{\circ}\), with a gradual inerease of air, must be obtained as nften as possible, and to assist in this the heat in the pipes must be increased early whenever there is the appear-
ance of sunshine. Vines in pots are greatly benefited by being plunged in a gentle bottom-heat, and their shoots should be depressed, so as to cause them to break all the buds. The atmosphere for these should be similar to that for Vines established in the bard
Hardy fruit and kitchen garden.

The fruit room will now require daily attention. Fruit least likely to lieep should be picked out for mmediate use, or when they decay they will injure that which is cound. Let an uniform temperature be preserved, and give suffioient ventilation to allow damp

Rotatron on Crops.- Previous to the general ma nuring and trenching of vacant ground, the rotation of crops which are to be cultivated upon it during the ensuing summer, should be decided upon. One of the first principles to be attended to in this arrangement is that no annual crop be grown for two successive year on the aame plot of ground. Another variation should be made by taking care that those crops which immediately suoceed each other are not such as are liable to be preyed upon by the same kind of insect, as their increase is encouraged to a fearful extent by thua putting in their way the food of which they are most, fond. It is important that both the manuring and the depth of the trenching be regulated by the requirements of the crops; and their rotation should be so arranged, that the ground be not trenched to the same deptb for two successive seasons, but so that different portions of the soil be brought to the surface in turns. The ars or permanent crops will of course form a cabs by themselves, as many years; but when this is necessary with any portion of them, the ground from which they are removed will fall into the ordinary rotation in the way of a regular exchange. By cultivating the Celery and Cardoon on the Scotch or wide-bed system, a large ridge of soil is thrown up between the trenches, the surface of which is excellently adapted for the cultivation of dwarf Peas, Beans, Spinach, Turnips, and similiar vege-
tables; observing, however, that only the earlier sowings of these several crops should be made on these rides, that they may be removed in due course, before the ground is required for earthing up the principal crop. As a matter of course this arrangement must not interfere with the very. earliest crops of Peas, \&ce, which are generally allowed a place on the side bordera near the walls. For the latent crops of
Peas, de, a portion of ground must be allotted, which, with that occupied by the Celery and Cardoon ridges, will generally amount to about one-third of the gronad occupied by annual vegetahles. The extensive turning over which the Celery and Cardoon soil undergoes, acts admirably in preparing the ground Oor deop-rooting plants, such as Turnips, Carrots, Onions, de., and in the followiag year may be devoted , confined more nearly to the surface. If the vegetable
portion of the general Potato of the cuitro: and will form a fourth course in the rotation the math in after the Brassica tribe. Wotaition, and \(\because \ldots\). Cabbages have been planted during upontion onaz nips ; and the ground which now
 Beet, \&c., have been removed, and which spring be planted with Cauliflower, Br very heavy dressing of manure, which shatic that and the succeeding crop; as the last tew kere fully convinced us of the impropriety of fant Potatos on ground recently manured.

\section*{The agritultural gatette.}

\author{
SATURDAT, DECEMBER 16, 1865.
}
- Aminst all the 'agricultural excitement of the past week, the principal event undoubtedly has buen the deelared resolution of the Council of the Roral Agrieultural Suciety to postpone its naxt annual meeting till 1867. We were prepared for the postponement of very much of it, but
net for the abandonnent of the whole. There mulld have been an opportunity for a prolonged trial and examination of agrieultural implements; and we might have vinad a hrst-rate show of riak of the rinderpest to any one, but with great benefit to all. It appears, however, that it is deemed unadvisable to have a lialf-meeting; and dien interregnum, it may be expected, will tell to the benefit of the meeting in 1865 .
Let no one thinik that this inaction and the onnequent saving in the expenditure of the Sniety will tend to its finaneial prosperity. Inaction and non-expenditure upon the proper agrieultural objeets will tend more than anything die to the withdrawal of members and to the diminution of income. It beloves those responsille for the direction of the Society to take eare that the enforeded postronenient of the annual show next year he as far as possilhle compensated by increased activity in every other way that remains open. Let us hiope that our leaders will take the manition that belongs to them as representatives of English agrienlture in the diffioulties which the phagne has brought upon us, and make the voiee of ithe Roval Agricultural Society of England be heard, and, if possible, obeyed, in the diseussions that are sure to arise on the relations in comnection with this subjeet between consumers and producers, aad Government as representing both.
Dr. Fozlcker gave us a capital leeture last Tuesday on a most important subject-one especially well adapted to the present anxieties for our live stock. The proper objeet of Disinfeetants, and the purpose actually served by them, whether as disinfeetants or as mere deodorisers, or on the other hand as antiseptios, was explained with great lucidity; and we hope next week to be athe to give a fuller report of the discourse. The prineipal disiofectants named were chlorine, obtained from chloride of lime, and from muriatio acid with black manganese, and sulPhurous acid obtained by burning sulphur, quieklime, and common earth. But espiecial weight was most properly laid upon the comparative Theticieney of mere deodorisers and anlisepties, the former of wiich merely lay hold of oertain foul Tases with which the morbifio matter whose Thetruation is desired may be acoorupanied, and the litter of which may not destroy, but on the Wisherary preserve this morbific matter until, alter thre has set it free ayain, it may reappear misenievous as ever. The true agenoy Vetre in the form of its ultimate element the organic poison by which contagioa aots. bhall detane fitst by a thorough scouring, whioh
and by suphurous evid fumee or ohlorine gas, or by butual harmag, or ty that les intanse
oxidation which takes pluse in the pares of carth
 into the detail of the proces as applicd to tif purify yng and disisfectis of hawes, ded hadio.
 dowht be pubisar in full in tha pyse of the
Juurnal, but we inpe to be able to give a fulicr account of it next week.

The sulstanee of Mr. Duterias's paper on Cattle Breeding, read before the Central Jarnairo Clinb last Monday, is given in ane cther page. Mue disenssion which tultwed it was thardly py to the standard of merit whach the dechates of the Farmers' Cluib generally attain.
Mr. Adderman Maniil dectiarei that the fame prineiples of bodily treatment which are sund in the case of the animal man ought to guide us in our management of the other animals of the farm. Theee should \(b\), housed and \(f\) fed in warmth and comfort. Who erer saw a lean lady's's lapdog: If jon want animals to fatten, they too must he placed in comfortable ciroumstanees. Shelter is useful not only for the beaste but for the value of their manure. The slicepfold is better than the dung-cart, simplig because the land in the formor oase gets all the manure, whereas, in the lattur oase, mueh of it, under the unsheltured condition of our yards, is washed to wasto before it is oarried to the land.
Mr. Woonward, of Ashelurreh, beliered as to breeding that the period was best determined by Nature. In the case of preecious s imort-horn stock, if the heifer is not put to the bull as som ns sle is ready, she will turn to fatting inotead of breeding. Abortion in dairy stook, he believed, is often the fault of the bull, and in instances known to him the eril has disappeared when another bull has been used. As to the tive of the Jear for calving, the autumn is the best periud for animals intended to be fed and fitteneel; the spring is the best time for animals to be kept for breeding. Mange Wurzel is bad for breeding stock : the more it was used, the more he had found his cows go barren. Cortinued shelter under sheds is, not good for cattle, unless combiocd with oceasional wastings and frequent use of the ourry-comb.
Mr. MARriort, of Morthamptonshire, agreed with Mr. Woodwand that animals are the better for being rained upon, aud that the outory for sheds and stelter has become excessive.
Mr. Wastoy, of Hampshire, wanted to know why good shedding and proper buildings, if good, have not been provided. Is it to he expeeted that tenants are to build them? It is nee ssary that the lanilord should lend a haui, lay out nare cupital of his own, and offer better security for that of the farmer.
Mr. Suorrinouse urged that the supply of young stoek for feeding is dimivishing, owing to excessive in-and-in breeding in the cass of made hreeds. Herefords, West Highiland, aud Devon aattlo, Blackfaced sheep, and other orizinal breeds oan be bred in-and-in with advantage. But an artificial breed, like Shorthorn aattle and Leeicester sheep, dies out under the process
Mr. Luttuk, of Chippenham, explained how, in his countr, they provide young stook for the feeder. Ěsch cow is made to rear 15 oalves, and even more in the course of the year. By dint of Linseed, Oatmeal, Irish Moss, and other ingredients, diluted milk is made to serve the purpose. And by good feeding afterwards, the ealves being kept in yards continually, and not suffered out at all, they are turned out as yearlings in very excellent and improving condition; and three year old heifers reared in this way often reaoh the priee of 30 guineas eaoh.
Mr. C. Howard combatted Mr. Duckeay's objections to overfeeding for show. Show animals are the exceptional specimens urged to the ntmoss as illustrations of the possibilities of the breed Only one or two in a whole herd are sppied, if, indeed, they are spailed in this may, and in the meantime the adrantage is obtained of a publio opinion, impresed with the full value of the breed in question. As to Mr. Stiobtrootsp's idea of original breeds and artificial ones-Did he suppose that West Highlanders and Devons went into the Ark ? They are as muoh arifificial breeds as Short-horns, and Short-horns are as mueh an original breed as they In
all cases they are the result of artificial circumstances and human ingenuity, and any rule as \(t\), breeding in-and-in or otherwise applies to all alike. As for oboice of breed, Herefords and Devons are very good-for the circumstances of
their reapeotive countiee. He did nut nee why he dearld dop follow an example, and talk a hitulo "shop," Hike hise neighibars; son he would say that while Hereforde and lievons are properly cominued to Mcrelurdthire and Devanehire, ho believed that Short-horns are gad for all the wnl!

Mr. Cobrman, of Wisarn, lulicued 1 ! at erers man w uld do trea to lreed the stueli of his uwn county, whether Herefordohire or llevaushirebut guad as these eitlo are for the graziers of Wher ounties, they are nis to he chtained in sufliejont mumi, \(r\). Shurt-h ras are generally the beat for our purguse, because they can he haid and others cannut. His Ilan was to feed high and hreed early. It is best to take roung stock from a poorish country (eertainly not from sheltered yards, to begrazed elecwhere.

The Charkman duclarud frum his experience that it is bitur to give plenty of cake than only a small quansity. If a bullook in fair condition is put up to fatten, it will take leas crake to make it ready fur the butcher if it eats 14 lb . a day than if it gets only 4 or 5 th. a day.
This was the substance of the dubate, which closed with the usual votes of thanks to the lecturer and the Chairman.

An importent meeting on the aubjeot of the Oattle Plague was held at St. Jamee's Hall on Thursday, under the presidency of Tiscount Com BELaERE. It had been summoned by the Wakeficld Farmers' Club, in the name of many other farmers' clubs throughout the hinglom ; and there wero acouriningly representatives frum the Midland Counties, from Lanoashre and Lorkshire, from Linculushire, aud Gluucestershire, aud 1)evonshire, and Berkshire, and many other oountios. The renolutions adopted declared the insuffioiency of the present Orders in Council, and expressed a general acyuiescence in the resolutions which had \(b\) en adupted hy tho liyal Agricultural sicicts of Englani, and urged by them unon the Gupernment. Mr. MonRe, representing the Mighworth Mutual Cattle Assurance Company, moved that Guvernment should forbid, for a limited time, the removal of any catlle from one place to another, exeopt those fur immediate slaughter, which should be acoumpanied by a certifioate of health. To this resolution the repre sentatives of the Midland Cuunties Agrionltural Assooiation opposed an amendment reoommending in preference a simple expression of confidence in and satisfaction with the recommendations of the loyal Agricultural Sooiety. It would be better t.) insist upon a penalty, as there surgested, for any offence, than to require a certiticate, which would be capable of forgery ; and moreover the effurts of agriculturists to induce the Givernment to take some arbitrary step for the suppression of live cattle traffio would be more efficient if thes were united. The Smithfield Club had adopted the Agrioultural Society's resolutions, and this meeting had better do the same. Mr. Srooner, of South ampton, greatly preferred that the meeting should be indenendent of the Society; and urged the adoption of the original resolution. Mr. RaNDAL, of Evesham, and Mr. Tonr, on the other hand strongly recommended that there should be a unanimous adoption of the proposal to aocept the resolutions of the Central Society, with any further expression of feeling on the subject which the meeting might think proper to add to them. In the end, the resolntions of the Agricultural Society were adopted, along with a rider to the effeet that if the Government deemed it possible, it would be advisable to slaughter all animils before removal, In his remarks on this point, Mr. C. S. Rrad M.P., said that the calamity was of foreign origin and needed a foreign remedy; and if the Gurern ment on its outbreak had taken a holiday for a fortnight, and invited the Emperor over to take their place for a week or two, the plague would very soon have disappeared.
It is plain that public opinion is fast approaching the point at which Goverument interference will be universally weleome, and when, therefore, it is likely to be efficient.

ALE SHEEP IIABLE TO CATTLE PLAGCE?
THR puread of the cattle plague is so certain, and its effects appenr so fatal, that the doek masters of this and otber counties must necessarily feel anxious as to the possibility of sheep being affected with a slumilar diacase. Scientific men have declared that sheep bave been affected with rinderpest during the past autumu, and many practionl men have declared themselves of a contrary opinion.

I may tell you that I formed one of a party of seven practical men who were invited to meet some scientific
men on the estate of Mr. Harvey, M.P., at Crown Point, near Norwich, on the 5th of October last, to examine and consider the state of the lambs, which My opinion then was that the lambs were suffering from a disease (in an aggravated form) similar in almost from a disease (in an aggravated form) serilar ins of my own a short time before.
I retained this opinion until Monday morning the 20th of November, when I became so much alarmed at the condition in which I found my flock of hoggets, that both my shepherd and myself were impressed with the feeling that they were suffering from rinderpest in a most malignant form.

The whole case has been so deeply interesting that I have been requested by \(m y\) friends and neighbours to give the particulars to the public through your colum
if you will kindly insert them at your convenience.
My flock of hoggets comprised 287 healthy animale and since the end of last September they have improved in condition and done well. On the 9th of October they were put on Turnips, each hogget having a daily allowance of \(\ddagger \mathrm{lb}\). of Linseed-cake, and three-fourths of a pint of bran mixed with a little chaff. They had plenty of hardle room from the time they were first put on the Tarnips, and therefore did not suffer from close folding.
On Saturday the 18th of November my shepherd observed one sheep having a slight discharge from the nose and mouth, and on examination the mouth was found to be sore, and some spots on the inside of the lips. On the following morning, Sunday, two more were observed with the same symptoms, and these died ance of nearly the whole lot was so truly alarming that I felt convinced I should lose the greater part of hem.
The symptoms of from 80 to 90 of the worst cases were as follow:-The animals were standing with their backs arched, the ears hanging down, and showing every appearance of suffering great pain. A slimy lutinous from the mouth and nostrils and hung a running from the mouth and nostrils, and hung at least 5 inches from the chin. The animals moved with
difficulty, and staggered as they walked. The tongue was covered with gangrenous.like ulcers, which extended as far as could be seen; and in the sheep that died, these spots were found all the way down the gullet. The outside of the gums was very pale, and here and there were lines of a dead blue colour. On unning the finger oums, the whole surface sloughed off like pieces of thick white
blotting paper, leaving the gums raw and sinless. In the milder cases the gams and lips were much ulcer ated; which symptoms extended through nearly the whole lot of sheep. There was no particular looseness of the bowels, or scouring as it is commonly called; but the excrement of some of the animals was slimy and mixed with blood. These appearances were similar to those I had seen among Mr. Harvey's sheep at Crown Point, but more aggravated.
The sheep were bred on my farm, have never been off it, and we have not a case of rinderpest within
10 miles. \(I\), however, believed my sheep were affected with rinderpest, and immediately went to Mr. Woods (Lord Walsingham's agent) to consult him as to what I had better do under the circumstances.

Mr. Woods went with me to look at the sheep, and said they were worse than anything he had ever seen, and the symptoms were very alarming; but, considering the situation of my farm, which is in a ring fence and abuts on Merton Park, and that the sheep had never been near any other sheep or strange cattle, he did not believe they were suffering from rinderpest; and kindly said if I would place them unreservedly under his care and treatment he thought he could cure them, and even ventured an opinion that be hoped I should not lose 20 more.

I was only too glad to agree to this proposition, and the result has been far more satisfactory than I could possibly have hoped for.
Mr. Woods gave to every sheep a dose of medicine of his own preparing, which had been successful in saving many sheep during the late autumn, and they were removed to another part of the farm and had a complete change of food.

On Tuesday morning, the 21st November, three of the worst cases were found dead, and, as it may interest your scientific readers, I may as well state they were carefully examined, and the post mortem appearances were as follow:-The liver was diseased, being friable to the touch, the lungs were very much congested, the fourth stomach covered with streaky blood-like spots, and a good deal of inflammation about the small bowels. The windpipe was much inflamed, the tongue ulcerated and covered with spots of frothy-like matter, and the eatrance to the gullet had the gangrenous ulcers, which extended down to the panach.

On Wednesday morning the sheep had a second dose of medicine, and, when opening the mouths of the sheep, my shepherd said to me, "These sheep are improving; for the ulcers are scabbing over, and their gums are getting pinky, or their natural colour." The sheep were improving, and the second dose of medicine, been the means under Providence of saving my flock of hoggets.

I have only lost two since Tuesday, the 2let, and the
remaining 280 are, to all appearance, as well as ever hey were, and are now put on to Turnips again.
There is one interesting feature connected with thi disease worthy of notice. Out of the lambs attacked in September, 32 were treated by Mr. Woods and recovered and of that number only two (and those very weakly animals) were affected during the late attack.

I have given the whole fact me plainly as liee in my ower, and can now only say, that if my sheep wer ffected with a disease similar to the rinderpest in in sheep it is curable if proper treatment is adopted Thos. Palmer, Tottington, Thetford.

\section*{ON LONDON MILK.}

\section*{[Read last Wednesday before the Society
J. Chalmers Morton.]}

Ir is the object of the fllowing paper to relate what rer information on the production and consumption f milk in London could be collected within a very imited time by a single volunteer inquirer. The subject was suggested 12 months ago as proper fo discussion before this Society, which occupies itself not only with strictly agricultural questions, but also with matters connected with the it has since then excited unusual interest, owing to the diminished upply of milk which has latterly been occasioned by the cattle plaque. It was not, however, until a fruitless attempt had been made to enlist another inquirer who possessed better opportunities than mine of investigating this subject, that I resolved to devote whatever time could be commanded during October and November to its examination for the purpose of this report.

No justification will be considered necessary of an tempt of this kind to throw all the light that can be brought to bear on an important branch of our food supply-neither has any such justification been required by the great majority of those to whom my inquiries have been addressed. From wholesale and retail dealers in milk-from wholesale and retail consumers of milk-from the railway companies who are carriers of milk-from the district medical officers of the metro polig, whose inspectors have the oversight of the cow houses within their respective districts-from these inspectora, and from all the cowkeepers without excep tion to whom they have introduced me, I have had frank replies to all my questions; and it seemed in this way to be cordially admitted that the outside public, whose interest in the subject I represented, doubtlos perfectly competent for any of these authori ties to have refused to me personally the insight that was desired into their respective shares in the great business of supplying London with milk, but they very kindly took my inquiries as having no personal object whatever, but as emanating from that justifiable interest of the outside public in the subject to which I have referred. Although perfectly aware that every Englishman's house is his castle, they knew that this rule does not apply to his shop. Customers have a right to enter there, and indeed are always welcome They have to be satisfied, informed, propitiated. And however able generally to take care of themselve Government has made, and public opinion sanctions, so many interferences in their behalf, that an inquiry conducted in their interest comes to be received with a civility and friendliness for which in this particular instance my best thanks are due.

It is the result of this inquiry that I have now to lay before you, and it becomes necessary in the outset to state the means of imformation which were open to me, and of which use was made. There was in the first place sufficient acquaintance with the experience of farmers in many of our dairy districts. I know their manaqement, and personally many of themselves in the Vale of Gloucester, in Wiltshire, Cheshire, Ayrshire, and I am thus sufficiontly acquainted with the relation between cow food and dairy produce in the country. Moreover, the precise returns for many years of quantity and produce on the Frocester Court farm, Gloucestershire, have been published by Mr. Harrison; aimilar information has been published by Mr. MacAdam, of Crewe, and the results of prolonged investigations have been given by Dr. Voelcker. To any questions of the quantity and quality of the milk produced under ordiaary country feeding, there are thus sufficient answers. As to the quantity of milk supplied to London, the metropolitan railways have given me monthly returns of their imports-most of them for several years, all of them for several months. The clerks or inspectors of the 44 divisions in which the metropolitan district is arranged, have told me the number of their licensed cowhouses, and they and the Veterinary Department of the Privy Council have given me returns of the number of cows milked in them usually and at present. Thanks for the most part to the inspectors, to whom I was introduced by the medical officers of the geveral districts, I have examined cowhouses in the Hendon district, in the
Islington district, in Marylebone, in St. Pancras, in Belgravia, in the Strand, in the City, in Chelsea, in Clerkenwell, in Bethnal Green, Mile End Old Town, and Limehouse. I have thus seen 51 cow Louses in all, and in every case conversation with
as to the food given, the milk
risks and losses incurred. In Lord Granville's large dairy nea the recorded resuits of several Hendon rood and produce, expenditure years' exp placed in my hands steward; and the corresponding Pinter, bis Talbot's equally large dairy at Sudbury figures shown to me. There is, moreover, the mare experience to some extent of very large com dairy on Mr. Littledale's farm at Bamp monster establishment of Mr. Hare in G'asgow, several of the Leith and E.rt Mr. Collinson Hall znear Brear Woking, which particulars bearing on the subject have leaned. Then as to the trade in milk, I have tes Collinson Hall, wholesale dealers \& Impey and 100,000 quarts a week throughout the supplyt very large number of retail dealers-both keep cows and sell their produce, and have had conversation with the to sell railway traffic.

Lastly, as to the consumption of milk, the stat ? Mansfield and Bedford in England, Lave been cured for me as a sort of datum line for and a good deal of information has been the consumption of milk in country amines. Moreover, I have gone to institutions food of inmates has been under merical an ision, and where the dietary has been framed \({ }^{\text {. }}\) simple view to health, and I have to thank for the numerous different hospitals-not inf for the treatment of patients, but asylums, consumption of milk by many thousand people, including 5300 children under 10 and 3000 adults. And, on the other hand, tha some of the benevolent people labouring in in two or three of the lowest courts district, where it is hard necessity which maximum, not medical advice which minimum, scale of feeding. Lnstly, we all have ns reports of Dr. Smith to Government an immens a of information on the dietaries (including mill) of th poorer classes throughout the kingdom.

Applying such data as we thus obtain to the papa sidered well-fed or not as regards its mill.

Here the question of Quality comes in. Statigy with a very strong impression that London milh \(=\)
almost invariably diluted, I am bound to my the you make your rounds among inspectors, its dellen, even its producers, you find (with many an excep where you cannot doubt the thorough retail dealer) that this impression is equall those who are most closely connected with the the itself. Milk, incapable of being kepr, and with m or less of a variable supply, must be stretches dilution, more or less, to meet even a constan meet an uncertain demand, varying considera day to day. But indeed it matters ver nourishment of the consumer, and ne dilution of the milk be produced by the direc of water or by feeding the cows on watery and suct lent food. I saw two cowhouses in st. Paccia of which was in a wretched plight, great quantities of distillery wash an little Covent Garden refuse greens-and the ver-full perhaps of cows, which, however, were cea kept, and well fed on hay and Mangel and little meal. I would rather have milk from these dairies, notwithstanding that coming unannounced at miking time, 1 saw a co the tins clean water standing convenienty which the milk was being poured. on mere inference from the necestion have been published

think then that on the whie quantity of milk supplied to London, and risks and produce of its manufacture; a other places, and on the risks which ther places, and on toozacers 'run"

Fap made in our produce by the catcle atrop have been to some extent discussed in the teorpt B.ue aud will no doubt be further discussed this

This, then, is the material which has been gradually \#ected during the past thread until time cffered for its mrige ment a few days ago, but of course inspections Juencing and forming the opinions which on the Wbole l believe them to justify. Looking at the thing strely from the outside. just as I have weekly had to 30 with agricultural cridence of all kinds for many past no rith, is must, I beliere, be admitted that we have ine a good witness-with eifficient \(\frac{1}{}\) ruions know ad reporting agricultural matters, to materially reduce we risk of his being mis'ed by what be saw and heardadriference as to the leasons it might teach him, to talke him at ouce industricusly gather facts and agrudgingly accept any conclusions which they hoonledge of a subject comes altogether uuprejudiced a further study of it; but I can unhesitatingly not cared oue jot what the truth might be, and that I lare bad no personal end to servo during this codeavour to discover it. My prejudices were those of s countrym jield the best and wholesomest milk in fieldsthat London cowhouses are a nuisance to be abated aad that they ought to be all removed outside-tha the best way of supplying a large town with milk is to We, cheaper, better to carry 10 lb . weight of milk from ucountry farm to the town cousumer's door, than to carry 60 lb . of green and other food from that farm 108 corhhouse close ly the consumer, there to convert Enally, that Londoners are worse fed with milk than any considerable body of men, women, and children elsewhere in the island. The whole inquiry, I am bound to say, has led me very materially to alter these impresions. I now believe that London cowhouses eestainly as London stables; I believe that the milk made in them is better than what is delivered at our railway stations from the country-that it is a wiser, cheaper, and better thing to carry heavy Mangel, Grass, and hay the few miles needed to the town than to carry one-sixth their weight of the milk they yield 20 or 30 miles from the country. I believe that cows in London cowhouses are and may be healthily and coufortably kept-nowhere more so-and that the risk of loss by disease is not greater here than in the Gloucestershire and Cheshire pastures; and I believe that hilherto, in point of fact, London, badly as it has been supplied, has at least been better fed
These couclusions will startle and perhaps disgust some who may have come here expecting a wholesale condemnation of the existing London milk trade, with all its presumed abominations of fil hy cowhouses and alulterations. I believe them, nevertheless, to be iuevitable bs any one who shall give sufficient time to a fair examination of the sullject. They are the conclusions simply of an agriculturist anzious that the best food should be produced and offered to the consumer. Medical men, who are professionally interested zot only in people being well fed but in their being lept free from active sources of mischief to their lealth, may insist upon it that animals, using and spoiling so much more air than men, should not be I can quite understand the outraged feeling with Which the medical officer of a district having! power given to him to reduce the number of human inmates of a tenement within certain limits, and exercising that power unhesitatingly for their good, finds himself (as in instancessknown to me he has been) thwarted, when de endeavours to secure the dismissal from a thickly lopulated district of animals such as cows, which individually viliate so much more air than is spoiled by men. how to secure my subject; all I have to do with is populated district.
Dismissing, therefore, this aspect of the subject (though I can foresee that it will be strongly, perhap indiguantly insisted upon in the subsequent discussion) farour state once for all, that while the facts are in savor of the milk being made near the consumer and while there are a sufficient number of well-managed conhouses in the town to prove that a cowhouse need not be so great a nuisance as a stable to the dwelling-house next door, yet the conditions of the com arrangement are no doubt best observed whe town, not within situate in the immediate outskirts of a usefully within its boundaries. It may, however, be isefully remembered as regards the metropolis, that a (i) square, one storied, with an avimal to every 40 alwnys feet of surface, and giving, as it almos
the health, bo replaced, as is haally nasy an d robathy yard, with dwelling e ver ag low griund fan and and perhaps wheld ghew huat
procech now, thercifre, to the ficts of the case and laving a great deal of tutular matter to be read in
the Jourual, I bope the tlory way be tuld.without buring sou very wuch with tigures.

\section*{Corvany Pherice.}

Of Country Produce I have not sery much to ay. The herd, aremging 65 cowe fair country shortorns), at Frocester Court Farm, (iloucestershure-fed on Grass and has, wids routs and atrars to Mr. Harrison's careful produced, aceorning to Mr. ithrrisons carefus or 535 gallons cach cow per aumum,-Mr. Meidam, Gorsty Hill, near Crewe, who has long been known as an experienced dairyman, tolls me
that during thie past four years tif cows (Ayrahires) on his farm have averaged \(\because\),int gallons each. - Tuking the Gloucestershire experience as our guide: for every 100 acres (22 being arable, as nacertamed by Mr. farrison in the case of 23 farme) in a district where the average crop of meadow hay is probably 23 cwt olde, four jearlings, four calves, 20 sheep, and three horses, rqual in consuming power to about 32 cows. The hay crop represents perhaps rather less than
tons of Grass, and the aftermath (at ? the first cut) is probably less than 3 tons per acre. The whole cattle food of the 100 acres, half the arable land being taken as in Turnips and Clover, may thus be put at 900 tous of Grass, or 28 tons of green food per cow per annum, equal to 170 lb . of Grass a day to each. This, how in the most wasteful way ; and it is probable that i the calculation had had to deal with the case house-fed cows, it would appear that 15n or green food daily, of the quality of ordinary meadow Cirass. or its equivalent, would suffice
for ordinary Gloucestershire dairy cows. Putiog, however 500 gallons of milk against 28 tons of this green food, we have 1 lb . of milli to every 11 or 12 lb . of Grass, or as nearly as possible 101 gallons of milk to every ton of hay. If the consuming value of hay (i. e the price at which it can be grown at a fair profit
to be consumed upon the land) be ins. or \(\% 0 \mathrm{~s}\). a ton, to be consumed upon milk can be produced in Gloucesterahire to be sold at rd. to 4 ., or say 7 d. per gallicn. And to this the dairy statistics of other countries pretty nearly correspondr. The figures from a farm near Christiania, published in the Agriculturat Gazelle (f. 102, 1803), two years, 41 cows yielded 27,000 gallons in the year, or 630 gallons each, consuming during that time, in all, 229 tous of calculated hay value, viz., in Grass during 120 days of summer, aud Turnips, hay and chaff, with a little oilcake, during the other 245 days of the year. This is at the rate of 100 gallons fo every 17 cwt . of hay, or about 61 d . per gallon for food alone. But the cows (Ayrshire and country cows) wer at least 100 gallons above the average in their aunual produce.
Sixpence half-penny or \(7 \frac{1}{2} d\). per gallon, however, does not cover the risk of loss by disease and death. Mr. Palin, of Stapleford, near Tarvid, Cheshire, tells me that his loss during in eant b0 per cent, from pleuro-pneumonia during two years of the time, and 15s, a cow for loss of mults on fur separate occasions from foot-and-mouth disease. Putting all this together his loss has been 86l. a-year over the 20 years in questio

Mr. McAdam telis me, that out of 1500 corss whicb he has had throuch his bands in country dairies during the past 15 yeare, 19 have died aud 35 have been sold at a loss of \(9 l\). each, from pleuro pneumonia ; two have died from foot-aud-mouth disease, and 21 have died from other causes. The foot-and - mouth disease, moreover, attacked 200 cows in this time (kiling in one per cent. of the cases and) resulting probably in a loss of 10,000 gallons of milk. The whole loss must have exceeded 1300l. or 14002. in the 15 yearr, much less per cent. than the other quoted case. dud to the cost of food, T3 \({ }_{3}^{2 d .}\) per gallon, there must therefore, taking the latter case gallon, for that is what the loss comes to over 1500 times 530 gallons, maining the cost of mink to those who make it from Grass and from hay at about 3l. per ton, at least \(8 d\). per gallon.- \(1 f\) colss are sold fler seven or e ght months mrobably 51 . or 61 . a head to replace them with others just calved, while the consumption of food would probably be rather larger per annum. The produce, in place of being 530 gallons, would be at least to ; and the 200 extra gallons being obtained at produce of the year might not cost more than \(i d\). a gallon ; but the risk from infectious disenses would be very greatly increased -more than doubled or tripled hy the constant change of stock, so that in all probability milk would not be obtained much more cheauly thus than under oot be obtained mord ordinary country management, where cons and fed in the
fice or six years upon an average, and
summer the in paturcs, and in winter tome on lay and straw ans ro. . , with access to both field and Ahed. If course, whea the eljeet is to produce tuik for Lomion, as en maty culltry farme a lonk way from purpooe, better food chan hay, and they will adopt more purpose, better food than hay, and they wiing pows in economical manat thent that grozing dary cows in
growing (irase. Abat thenght hear that in the Aglesbury dirtrict hat and liass and roots and grazing in the field \(u_{i}\) till now ase still the vule, ret no doubt ultimately brewers grains and cut Grass, and eucculent foud o! all Linds given in sheds, will become the rale outtide the tom 13 just ar they are the rule within. Human mature is a pretty constant quantity, whether it be town or conntry bred, and coumirymen who engage in coutracts for the suphy of mils to lowilou dealers very soon timi ont the cheapest way of producing it in the largeat quantity.
That way has long been studied and worked out with all the carnentuess which self-ititerest inspires. You will meet in london with men who hare been engaged in the businesa for 30 and \&0 yeare, with a stall of ect vants, too, who have been in their employ almost as \(1 \cdot \mathrm{mg}\). When the St. l'ancras committoo went romed to innpeet the cowhouses of the parish, and to condemn especially ail of then wh ch were in any way connected with ducling-houses, they were met at the door of olle to wint they ampunced the decisio agninst him with an introduction to his grandfather and his father, then living with him, both of whon had carried on the business there before him "And here, ton, are my chaldren, bentlemenAnd here, ton, are my elshdren, gentlemencows bad been injurious to health, close by them selves." been injurious to heanh, clane by them on for such course where a business has been carrie in this may a long series of yeare, and men come to there has been a long experience of all kinds, both prosperous and adverte-they cannot have much to earn of the best way to supply the demand for milk, veln though the production of it be carried on under the great difficulty, ae one would think it, of their long distance from green fields. But indeed this is no ifficulty at all. Eiven in the midst of green fields the cowkeper finds it the best policy for the procuction of yood, abundant, and wholesome the supply of brewers' crains is so abundant, it being the constant food all the jear round wherever milk is produced for direct consumption - where large can be sumples in abundance during summer at the can be supplied in abundance daring suns or at the cowhouso fur 29 s . to \(25 s\) a a ton, the means of keeping
cows are especinlly ghod. Here, ton, we have that cows are especinlly good. Here, thin we have that
guarantee of the quality of milk which is afforded by high premium on keeping cows in good condition here is here the besi market in the world for cattle of all kinds, if they are fii for the butcher, and probably as poor a market as there is anywlere for poor dry cows; moreover the risk of infections disorders, necessarily greatest in the, crowded cowhouse, makes it especially necessary for the town cowkeeper to keep his stock in fattening condition, that they may be disposable at a minute's notice. And all these circumstances secure the best feeding being adopted heremuch better feeding than satisies the ordinary country Thave as doubt, therefore, that tho mank Fielded by a Loudon cow is better than that which the same cow would produce under ordinary Gloucestershire or Cheshire management.

\section*{London Cowhorses.}
2. What, then, is a London cowhouse? and what the nature of the manufacture - as we may call it-which is carried on in it?
A London cow-house may be, and often is, a piece of ill-conditioned, rather ricketty old stalling, with a sort of brick built manger on the floor, the length divided by short and scauty stall divisions, 7 feet or \(7 \frac{1}{2}\) feet apart, furnished with ropes or straps or chains, with running rings, so as to tie up two between each pair. This foor is roughly causewayed, and there is a gutter lengthwise down it, parallel with the manger, and a ittle more than a cow's length from it. The house may be only wide enougis for a single row of cows, or there mas be one on either side, with the gutter between them for the drainage of both. I amz now referring to the average style of the smaller and inferior cowhouses of the city, and in the poorer districts of the metropolis. Yuu come upon one from some street of thirdrate bouses through an archway, perhaps under a dwelling-house, which leads you into a small back yard, half filled with this poor sheduing. There may be a small pit for the dung, a store of some sort for the grains, and the small quantity of hay and roots which are kept on hand are stowed away in any convenient corner-at present there is room enough, for a fult con house, even of this small class, in London now is a very rare exception. The roof is either low, with plenty of ventilation through its looselg-lying tiles, or if higher, there is a "tallet" or floor overnead where hay and other food is placed, and in which wide spaces are left next the walls and over the heads of the cattlo, and then the space of this upper room is measured into the 1000 cubic feet per cow, which is the rule that must be observed (for instance, in St Paucras) if the cowkeeper wishes to avoid being opnosed for a renewal of his licence. There are
winduw places, which at this season of the year are closerl, peilhaps with a bit of sacking nailed over them. Tus, then, is the ordinary style of a small cow in them six or eight or ten capital Short-horn cows, or perbaps here and there cccasionally along with them a few black and white Dutch cattle. It is either a
clean and tidy place, where both the cowmen and their tock are clean and dry and comfortable, everything in its place, theanimals all lying down, having comfortably fed, and the air with no other perceptible smell than that of the chloride which tie careful owner sprinkie. once or twice a day along the gutter-or, it is a filthy lung pit is boarded over with a loose slab, to be aced after every fresh addition to its contents and the jard is clean and orderly and sweet. In others you will fiud a mess of dirty straw, originally purchased after use in a neighbouring atable, spread abroad to dry and clean itself over poles and hurdes Mangels, and the best hay, with oilcake and peasmeal con and the whal served out regularly and noatly, and the whole thers jou will find a bin of sour distillery wash, and heap of stinking Turnip-tops and Cabbage refuse, and the whole place dirty and offensive. In general the accommodation-limited as it is-is quite apart from the dwelling-house, but there are exceptions even ts this. There is a cowhouse in the St. Pancras district, otherwise well kept, which is the lower apartmentcellar it may be called-of a dwelling-house, though it pens on a yard descending to it from the atreet 16 feet equare and 7 feet high, barely 1800 cubi feet in all, it now holds 2 cows, and formerly it is another in the Strand district not so cleanly kept, where the shop or dairy is approached through he removal, as it were, of the ground-floor front room which is thus laid open to the street, and as you walk through it you look down the central opening upon 8 cowhouse of considerable size in the cellarage, where hree being there at present. They must have been owered to their place by ropes.
Such then is the smaller, tut most numerous sort London cowhouse.
Go a step higher and you como upon a class of men, many of themalso occupying snall farms near town, all of homemer very Jargely disappeare capital, which has however, very largely disappeared during the past autumn under the ravages of the plagne. They keep either in larger establishments of the kind alread described-not unfrequently ram-shackle old buildings with jards attached, either with doublc-rowed cow stalls, or covering a equare, sometimes with a floor overhead and at others open to the roof, where the cows are arranged, first around the walls and then in a quare block, head to head in the midd'e
Sometimes there are parallel rows of roofing together covering a equare, and double rows of stalls under each. And here too there is the came variety of management as to cleanlice.s and order. I could point out some examples eren of this higher class, which are unquestionable nuisances, and others as clean and sweet as a parlour ; for in this middle class of cowhouses, as they may be called, there are

In Cielsea there are many examples where cowr, as good fur milk as any in England, are as comfortably boused as you shall find them anywhere-in sheds open to a clean and airy yard during summer, but prorided with hanging flaps and doors for winter time. Fur example, jou may enter through a wite gateway a passage roofed with glass, covered with Vine-leaf and ciean and comfortable cow-shed on one side, and stabling hay-house, and food store on the other, and an inner cowhouse further on. Both shed and house are filled with first rate large-framed fleshy Shorthorn cows-'fed on grains and hay, and Mangels, meal, and cake in winter, and Vetches or Grass and grain and meal in summer time, and the master, in the highly polished shop and dairy on the premise, hands you testimonials from half the titled families in the west to the quality of his milk. Or you may enter a larger yard in a poorer neighbourhood and find shedcing closed against the winter, providing as good accommodation, in single rows, for as good a herd of dairy cows as I ever sawand cleanliness and good order are apparent everywhere: Or you may pass from a wellokept mews in to a loliy, clean, and though ceiled, well-ventilated and Well-drained apartmoit, 10 or 12 feet high, with, I should suppose, 60 square fect of standing ground to every beast-warm, well waterel, and well ted. Where could cows be core comfortably kent? In every instance I am describing actual examplep.
In Marylebone you find, in a good street, a corner shop, where the side road leads to a well-kept firgt-clars mews. The master takes you through his three-storied cow-house, as jou may call it-and first into an apart ment for 12 or 16 cows, which is the quarantive atation through which after some weeks trial they pass into the other rooms, one directly overhead, reached by a sloping gangway, and the other along. side, but lower down. The floors are all closely bricked
in cement, the upper one being laid on brick arches and the drainage is everywhere perfect. I may refer
nirec!ly to Mr. Drewell's establishment at No 6 , Upuer Weymouth Street, for the example of intelli gence ard pluck with which great losses have been wet by him, and further losscs have been resisted. F has taken special precautions against infecton, an anpearel. The whole of the brick flooring has been taken up and disinfected and relaid. The plan tarring the noses of the cattle, so as to disinfect the very doned fir the neater plan of nailing on the wall befor them a wide strip of absorbent deal well soaked preventive the well preventive, the chal beated by throwing in old iron, and every possible device was used to insure the perfect every possible device was used to
sweetness of floor and food aud air. I can assure this meeting, containing no doubt many countrymen, that they will nowhery find better, cleaner, neater, and sweeter cowhouses than, taking these examples as an London streets.

Lastly, I come to the larger establishments, and Mr. Drewell, holding a couple of large cowhouser, and originally milking 140 to 150 cows, of which, however, he has since lost 100 by the plague, might have been referred to under this division. I refer, however, now the largest houses, where 200 cown and upwards have been generally milked. And here too you find hand where you can touch the ceiling, dark and dirty, and crowded with unfortunate beasts; or where, in spite of ample space and lofty roof the poor cows are comfortless and filthy - and places on the other hand where the accommo dation is first-rate, roomy, clean, and comfortablea sing'e cattle shed, it may be, like Mr. Camp's, of St. Pancras, in the midst of a large and roomy jard, 90 yards long and 26 feet wide, wha broad gangway bi tween two rows of cattle-or several sheds, iean and dry and warm, each well managed, paced Mr \(V\) eale's first-rate establishment in the Acacia Road, St. Johu's Wood.

Such then are the London cowhouses, of many sizes, and of at least two styles of management, in one of Which a daily cleansing of the whole establishment, dung pits included, insures perfect order and condition and in the other muddle and dirt eazily create a uisance
Let me here state it as a mere matter of fact, that the fatality and even the advent of the cattle plague has had no sort of connccion or relationslip with the condition of the cowhouses where it appeared or where it did not appear. Any one going round the London cowhouses to study the cattle plague in them, is thus shat up to the conviction that it is the result of some new and special poison which has been introduced. The largest, cleauest, best managed cowhouses have been swept out, and the filthiest holes have in many
instances escaped. And in Bethnal freen you come repeatedly on small cowkeepers who have lost their all, and close by are others who have not suffered, and there has been 10 difference whatever in their management. Mrs. Nicholls cowhouse (Liy. cock's Dairy), Islington, where tho diseass first appeared, a large and roomy, clean and well-kept place, lost all its cows, and a second lot bought in immed:ately were also carried off. In Mr. Camp's capital house the disease appeared in a couple of instances, and the whole stock was immediately sent to market. Only the other clay, on applying at the Vestry of Mile End 0 d Town for an introduction, through the inspector, to the cowhouses there, I was told, "One of our largest men, Mr. Alexander, is so particu'ar that he won't let you come in if you have been to any other cowhouse in the district." I called on Mr. Alexander, and found that the disease had sppeared or threatened in a case or two in his well-kept establishunent, and he and immediately sent the whole of his stock to market. One cowkeeper in St. Pancras-a capital fellow Iknow be is, for the hearty way in which he stands under the heavy losses he has suffered-had two cowhouses, one lofty, large, and roomy, the other offering very dilapidated, low, and poor accommodation. The cattle in the good house died, and the plague has nercr entered the other. And one of the dirtiest cowhouses I know in London, where calbage refuse, stinking wash, aud dirty stabledung for litter, combined to make as filthy a hole as ever cows were kept in, not far off this place, had not then been visited. And where indeed will jou find a better illustration of the same kind than is afforded by Lord Granville's well-kept, lufty, roomy cowhouses at Grolder's Green, in the midst of green fields. It was as bad a case as any of losses by the plogue, and his 100 cows, among the beat kept in London, were among the first to suffer.

I may here add that as a general rule the London cowkeepers have shown great energy and resolution in combatting their new and dreadful enemy. You smell chlorine in the cowhouses almost everywhere, and the iuteriors are gecerally fresh lime-washed at intervals. Where the disease has occurred, the floor ing has been grubbed up and disinfected with both chloride of lime and caustic lime, the whole place
has been scrubbed and limewashed, and mes time has generally
cows are brought in.

\section*{Tae Mile Producle,}

Such being the cowhouse, what is the mancus version of cow-food into milk, you mint thati: he best animals in the right constitutional and oou must feed them well, and jou Lust warm. Fresh-calved Shorth horn cours or theen:
the black and white Dut therefore eclected. They are fod on dairy) lree: and roots in winter, and grains and Grass in ond and watered regularly. In many dairices me is also always given daily to the cowe, and is given very liberally, but when in heary almost always get a quart of Pea or Briesm
half a peck of bran thrown in with their and evening, and when slrinking their prin
seven or eight months at the pail (and are examples spozen of and sometimes sien in :
all large dairies where cows milk on for one and two and even a third \(y\) ar) thes cake and meal to get them fat as rapiuly as They are sold, you may say invariably, to the bute to the last they are giving some), or the market, is most convenient to the owner ; and of calved cows are bought in their place. The aren time a cow remains on haud varies exceedinit order to keep 100 stalls alwars full of milk. \(100,120,150,170\), and even 200 are annuall bon making in the several instances the average lenath time during which a cow is kept in milk, 12 , 11 , 6 montis ectively; and sometimes they are ca down and kept on a second year. The exchange varies very much, from \(2 l\). or \(3 l\). to \(1 l\). much. a head, and that corresponds o? course mach more per stall, i.e., per cow actual'r in m because there may be 150 of these exchanges in the for every 100 cow stalls. It matters nothing whe you take your examples of management country or from the town, for the masarement experience are alike in both. I give therefore following figures from Lord Granville's dairy fum
Hendon, and from Colonel the Hon. T. W. Tulboti farm at Sudbur from foot-and-mouth disease and plearo-pnoumonis during the last two or three years, and the latter be been in perfect prosperity; the former represents average management as to feeding-the latter represent the highest feeding, and thus the average of the tro may fairly represent the average of the tore dairgmen.

Mr. Janter, his lordship's steward, tells me that the mills from 90 to 130 cowe, averaging 100,108 , and 13 1864, and 1865 respectirely. Taking the middla of these:-To keen 108 cows in milk they soid 161 \(231 \% \mathrm{l}\), or 14 l . 14 s . ench, and bought 163 for \(18 \% .1\). each, louing 47.4 s . apicee by the transaction, buit than 6l. per stall or cow kept milking. The milks.
during that jear fetched 430 ol ., which, at it price it realised, 1 s . 10d. per barn gallon, corr
sponds to 93,818 imperial gallong or 868 gatum per cow in constaut milk, i.e., per stall; and this \(9 \frac{1}{2}\) quarts a day upon an average. They received
\(1 \frac{1}{2}\) bushel of graius apiece, 15 lb . of hay, and 3 Mangels during winter ; and in summer the grio with Grass, viz., \(\frac{3}{4}\) of an acro of a crop equal or hay as the daily rations of 1 co coma 1 cwt. rpicce. Bosides all this, 4 lb . daly of Pes other meal were given with the grans as the er 5 quarts of milk a day they were fat encugh to 80 to butcher. In three years, the stack being from 3900 120 cows respectively, the return varied stall under fecding: from which had to be deducted a searly lo 6l. or \(7 \ell\). per siall to keep the stock of ecntian Daring these jears, howerer, the herd suf requently from oot-and-mouth yield were frequent, and thus the head, or nearly Tl. ner stall, is
\(\qquad\) is higher and there had been n about 80 cows, and sold 153 in the purchased for 102 108 apico and soid apiece unon an average, so that there has been about \(1 l\). per head or \(2 l\). per stall; and the here are \(4090 l\)., which. at \(1 s\). 10 . per ballo or (8 quarts) represeuts 89,236 mperial ghan is close 1100 gallons 3 gallons per vrious kinds, \(B\) or 41 b a head out the year, and the cown quality I have here a Table, giving the daily cow, and in some cases, the ricik in 1 examined hy me, a dizen of whic dairies. The letter F, opposite the food, indicates that in these cases continually

The sumumer ration is
rinins, and a littlo meal.
totween Lord Granville and Colonel Talbot during the past few years. Distillery wash is only mentioned nace in this table; it is lowever given in many dairies of all sizes at from 4 to 10 or 12 gallons dailygenerally mixed up in a
I must now counpare food and produce here, as I did in the case of country milk. Putting hay at 5l. a ton, graine at 3 l. a bushel, meal at 1 d . per 1 lb ., and roots at \({ }_{20} 0\). a ton-the mere food of a town-fed cow may be said to avernge \(9 s\). or 10 s . \& week, and it is often as much rs 12s,s aud the 17 s . 6 d. or more a week. Out of the difference the cowkeeper has to pay for rent and labour, and for the cost, under natural deterioration and occasional disease, of keeping the stock good. There are no actual records attainable on a sufficient believe that the disposal of at least one in every ten of the cows that are bought is a forced
stie. This is mainly owing to the occasional sweeping attacks of pleuro-pueumonia which are suffered. The first symptoms of its approach are almays carefully watched for, and the animal is at ouce sold to the butcher at whatever sacrifice. The whatever from these changes. Under good feeding the stock is often kept at full value for milking purposes without loss. But taking forced and hurried sales into account, the loss can hardly be considered less than 54 a year per stall, or 2 s . a-week. For 12s. a-week these noimals may be kept to yield 17 or 18 gallous of milk, which is at the cost of about 9 d . an imperial gallon. I cannot tell you in detail what the expense of rent and labour on the average of London dairies is. These items, and fair profit too, were cousidered in the but, adding rent and labour, and fair profit to the cost of keeping stock in food and health in
towns, the wholesale price of \(1 s\). an imperial gallon does not much exceed the total cost of it. The expense of labour must be very considerable, and the lile generally is a hard one, both of the labouring men and of the master, who generally shares it and always ruperintends it.
You rise at 4, clean out the house, and milk the cows, taking probably 12 to your own share. The milk is taken from you to the dairy, and there placed in the cans in which it is carried round to customers. You then feed the cows with half a bushel of grains or more to each, with perhaps a quart of meal in it, or half a peck of bran, or it may be no addition at all. I have or with the use of spiced meal or condirnent in two give them a bit of hay apiece, and you then sweep up the house and go to undertake the labour, or at leas a ehare of it, of carrying round the milk and crying jit along the streets. At 8 o'clock you breakfast, and a 9 the cows are watered, and perhaps 20 lb . of Mangels and another lot of hay, 2 or 3 lb . apiece, are served round, and then they are swept out and left till milking.time again. This is at 1 o'clock, when the place is again cleaned, and the gutters swilled out and the fows are milked and fed on grains and hay as before, and you then go round with the milk again, come in and give them roots and hay and water, and litter them down or leave them for the night. Or take the
example of a farm 20 miles from London; I quote the letter of a correspondent :-
"We begin milking at 1 oclock in the morning; each man
 "They are fed as follows: - each man gives about 4 lb . of
meadow hay to his 15 cows, and then gocs to bed. At 7 o'clock he mixee at bushel of grains with a bushel of swect chaff, aud a

 te cafurcel for Lan in?"
S) much for mere labour: and, now, what for trouble aud anxiety of mind -The cowkeeper has to of animals, and his mode of keeping her on the richest succulent food and in if possible constan house is a point of great importance to ita productiveness of wilk-goes no doulit to increase the natura sensibility to the utmost. Moreover, he has to deal with one of the most carily spoiled and sensitive of commodities. Everything may he said to be in the condition of ticklish equulibriuan-a breath of infecto almost ruinous luss: a passing thun ler storm or blast of hot air may spoil the contents of the dairy. I say that if milk is delivered to the murchaser ans the cow delivers it to the pan, the cowkect than nlmost any other mauufacturer or tradesman. And unquestionably the milk very often is delivered genuine,
for the milk dealers who give \(2 s\) a barv gallun (hess formerly, but more at present) often come aud milk the cows themselves.

\section*{The remainder off this papor will he given next week.]}

\section*{Home Correspondence.}

Steam Cultivation.-Mr. R. T. Smith, of the Whitchurch Steam Ploughing Company, has not supplied me with the names and addresses of the occupiers of the 48 farms in question ; I therefore jump at the conclusion that he does not want me to test his atatementa of quantity and depth, \&c. Well, I am content, leaving the public to draw their own oonclusions rom his silence. Here the matter might have ended, but
Mr. Huthinson will not be content until the public know the whole truth about the hedges, and a little about Mr. Smith, who has so recklessly branded him with untruthfulness. He las called my attention to what he said about the hedges in his essay published two years ago, and he has forwarded to meacopy of the correspondence that has recenty anssed beg your indulgence to allow me to explain. At pare 8 of Mr. Hutchinson's essay he writes thus:- "The quantities refer to the eatate survey, consequenty include the fences." This is positive evidence that he did not make even a mistake in including the hedges, but a mere oversight in not. placing a note at the foot of his statement showing that the hedges were included. Mr. Futchinson's cla seot Mr , stands untarnished; now let us see about ir. R.
Smith's. Mr. R. T'. Smith says in his letter (dated (Cct. 16, 1865) when speaking of removals:-
"You would require eipht (horscs) under fivnurable circumhad to travel, you would have wanted eight-and-twenty
Now, if this is his conviction, I will show you that he sticks to it. In another letter of his (dated Oct. 25, 1865) he writes thas:-
"1 know something abnut moving heavy engines about the country with horses, and adhere to my statement that in oome of the bad roads we have had to travel at least cight-and-
twenty horses would have been required to move your tackle., It is plain that there was plenty of time for him to well consider what he said (nive days after his first statement), and it is plain that he wrote the last time in earnest. Well, at all evente, it does not say much for the New Highway Act that has been put in force in the county of Sluropshire in opposition to the wish of the general body of rate-payers. Let us see What awful roads they to draw a set of my tackile cver them. A set of my tackle weighs 8 tons-this divided by 28 gives to each horse not quite 6 cwt . Why, in the old pack-horse time the hosse used to carry as much upon his back through the then bad roads. Have the Shropshire roads gone back to the state in which they were in tiue pack-horse day? They must have gone worse, for, according Mr Smith's account, a horse could not for, acoll moth to say nothing about carry now pull mor Win believe him? I will not and I cannot think that his neighbours in Shropshire will be over pleased with him for trying to make the world believe that their roads are so very bad that it needs 28 horses to draw 8 tons weight over them. Mr. R. T. Smith says, in his letter dated October 18, 1865-
have seen both engines (Fowler's) suak 3 feet deep, ono in nid culvert, the other in a beg hole that had receno wheels,
filled up. A few fence rails were thrown before tho and both engines fought their way out on the solid ground
withunt any aid whatever, and they were in surch a withunt any aid whatever, and they were in surch a posing This happened in the Now, sir, just look at Fowler's 14 -horse engine, 12 tons weight, standing " 3 feet deep in a bog hole."

The front wheele over their lubs, the back wheedo up to their hulus. and the fire box and water tank imbedded before the wheela." muat lowve laid upan the bog above before the wheels" muat lave laid upan the bog above
the wident part of the wheels "rongecting forward. I vill wet helveve that the ctaine wheets, standing 36 inchus in mud, could tuount those raile. Nir. R. T Smith must prut my Lord hill and his many other genticmen into the nitiess-10x, or I will not believe
ft. I will how leate Mr. K. T. Sinith's G:91 acres, worked from 12 to 16 inches deep, untested; leave him grovelling over bis dirty shopolire roads with his 28 lionses, and with his two engines fstuck in the mud a yard deep, to get over the road and out of the mud the best way he eat. The word untruthfulnese 'e hand. Willian Emith, Irualstun, Biletchley Station, Bucks, Dec. 5 .

Mfeting at Bray St. Emenends. -The General Hury Committee reported that they had consulted the members of the Locel Bury Commitise as to whether it would be desirable to hold in \(1: 566\) a Show limited to Implements and Horsers, or to post proue the Show to 1867 ; and having read the Minute of the Stock Prizes Committee ucommending such poutponement, the Mayor stated that the hocal Committee would meet on Friday, and that he should desire to take their opinion on the subject. The minute of the Stock Prizes Comthat in consequence of the cattle plague it is desirable -aubject to the concarrence of the authoritics of Bury St. Edmund's-to postpone the Heeting of the Society intended to be held next year in that town to the year 1867." A letter from the authoritics of lsury St. Edmund's having been read the Council resolverd, on the motion of Sir John Slielley, seconded by Mr. Thompeon, that in reference to the communication from the Mayor of Bury, the Secretary be inntructed to inform the Bury authorities that the Council left to the Local Committee the selection of one of two proposilions, viz.:-
1. That a Show of Implomenta and Honees ahould be held
at Bury 10 I868.
2. That the Meeting at Bury be postponed to 1807. That the socioty will be preparod to vote half of the sum of 200L. to be paid to the Tenant for any extra 10 which may ee incurred by him owing to sich pastponement If docity wil not hold itself iesponsiblie for any further Society will not hotd
Show-yard Cuntractr.-Mr. Randell reported that e Cominittee had received six Tenders for the Show yard Worke, and five for the Portable Buildings. For the entrances and portable buildings attached thereto, they recommend that the plans be reconsidered with a view to reduction of costa, and they ask the Council to continue to this Conmittee the authority to modify the present plans, and to ask those who lave now tendered for these works to send in fresh tenders. For the Show-yard Works they recommend that Mr. Pollard's tender be accepted for the year 1867, subject to his concarrence in the postponement of the Show to that year, and to further inguiry as to his responsibility. This Report was accepted.
The draft Report to the General Meeting was then settled, and the Council adjourned to their Meeting in February.

Genfral Metiting.-At the General Meeting of the Society held on Wednesday, Lord Tredegar in the chair, the following Report was read:-
Since thelast General Moeting, one governor and 43 memfrom the list by retirement or otherwise, and three governors and 129 new members have been elected; so that the Society now consists of is Life Governorr, Si Aunual Governors,
1394 Life Members, 4261 Annual Members, and 16 Hnnorary Members ; making a total of 5533 ; being an increaso of

\section*{Mr. George Clive, M.P., of Perrystone Court, Ross. Here-} fordshire, has been elected a meniber of Council to fill the The finances of the Society are in a satisfactory condition, as shown by the balance sheet to the 30th June, which has been large expenses attendant on the Plymouth Show, and the sum devoted to the purchase of show-yard plant, the Council has been compelled to sell out 20013 . of the funded property, which now stauds at 19,02" \(1.19 s .6 d\) in the New Three per Cents. The phans and specifications for the show-yard works have been prenared by the Society's surveyor, and the Council trust cost of the buidings required at the country meetiogs. They have purchased from the former contractor a large portion of the plant-consisting nf porcable hilidings, turnstiles, exits, ast for some years. The acquisition of these has necessarily thrown a heavy charge on the funds of the Society this gear.
The Guvernors of the Ruyal Vetcrinary College in their aunual repert of the pongress made at that Institution in the application of the veternary art and the treatment of the application of the sheernary pigs, state that the mumber of pupils qualified to act as practitioners in carrying ont these
objects of the society continues to increase; but they regret objects of the society continues to increase, blt they regre
oxtensively of their privilege of sonding diseased animals in a
live or dead state to the college; thus furuishing means for
the acquisition of a larger amount of practical experience by the acquis
A apecial circular was prepared by the Veterinary Committec
and forwardod to every menuber of the Society, drating attel and forwardod to every menuber of the Society, drawing atten-pleuro-pmeumonia. and the mouth and foot disease. The circular also set out the precuations which the committee at
that time recommenders the attention of agriculturists.
The Plynouth Mceting his been one of the largest in prin of receiphts ever held by the society, althongh a ceneral Flec-
tion was grong on throughout the country at the time. The tion was guing on throughunt the country at the time. The
Irince and Prinecss of Wa'es were pleased thonour the society
by a visit to the show yard un Wednesday, the 19 th July which
added considerably to its success. Their Royl Hishnesses added considerably to its success. Their
were please lo expresp to the Prevident the satisfaction with
the whole of the arrangements made for their reception and entertaimuent. The atractions of the show were further inereased by the presence of the French fleet, of an Auatrin
man-of-war: and of the ships of the Channel squadron, and the number of the fircign officers and sailors. Although the 6200 , the outhy runired for so extensive an assemblage n
implements and cattle, aud for the elaborate and higbly satis factory trial of implements on the occasion, has proved so great meetitug am
Plymouth and Durouport, and to the local committee and
others who had zenlously cowperated with the Council in promnting the success of the meeting, an exprial

The Cemucil have ubtaned the
 and tbe society's consulting chemist, Professor Voolcker, wil Professor Voeleker has delivered lectures before the members of the Sncuety on Irrigation and Disinfectants.
The Cuunchl have frum time to time been
farious communications from her Majesty's Secretary of Stat for Forelgn Affairs, and from the Lord President of the Council Proceedings of the Meetings at which they were read.

The adoption of the Report was moved by Mr. Dinck ham, who adverted to the imperfect and insufficient mea sures taken by the Government for the restriction of the cattle plague.-Dr. Crisp declared the Order in Counci to be utterly useless; the inspector, on whose " pass \({ }^{3}\) the cattle traffis was to depend, conlil not by any possibility detcet disease in its incipient stare-not only sbeep but six listinct species of ruminants were capuble of taking the disease, and packs of hounds traversiug the country were capable of couveying the contagion conld but absolate isntation of the infected anima could hinder the spread of the mischief.-Lord Wilsingham explained the case in his neighbourhood to whioh Dr. Crisp had referred, in which a llock of sheep had been attacked, and treated by Mr. Woods, his lordship's agent, with remarkable success. [Referencs is made to this case in another column.

Professor Simonds gave a detailed account of experiments and observations on the relations of sheep to the cattle plague, proving conclusively that they are liable to it, aud that it was an fatal in their case as in that of others.
Thanks were voted to the auditors and to Lord Tredegar, as President of the Society, and the meeting closed.

\section*{THE SMITHFIELD CLUB CATTLE SHOW.}

The four days of capital weather during which the Show has been open have probably answered the purpose of the Agriculturai Hall Company as well as the five days, which is the usual period, have hitherto done. The attractions have not generally been as good as usual; but they have been equally efficient in drawing a multitude of spectators. Excepting the
Devous, the Sussex, and the Kyloes, the cattle classes have not generally been up to the ordinary standard. The sheep classes are indeed firet-rate-they were riever better; but, on the other band, the pig show is inferior in both nuuber and quality. The galleries and area around the central hall are filled with an unusual display of implements.
The show may be said to have suffered somewhat from the cattle plague, seeing that Mr. Wood's ox which was first at Birminglam, and which has during the week heen holding levéps at the Crystal Palace, is hindered by it, or rather by the consequent rules of the
Club, from appearing here-for nothing so good is extibited in the Agricultural Hall. Every preeantion against infection is taken around and within the building; the whole area and all its approaches are repeatedly disinfected every day, and every sheep and pig has been more or less daily dredged with a \({ }^{6}\) ' satety " powder, and no harm, that we have heard of, has arisen
during the week.

The Cattle Classes commence with an admirable
display of Devons. The younger class of steers in this breed hold their own for ripeness and precocity with the corresponding class of any of the other breeds. Indeed the few Devon steers under 30 months of age appeared to us to be even riper and fatter for the butcher than the animals certainly of the Hereford breed, and
perbaps also of the Shorthorus. Mr. Overmin's perhaps also of the Short-horus. Mr. Overmins
1st prize young steer girths 7 ft .8 in ., though only 2 years and 5 months old, and is wonderfully ripe and gool for its age. General Hood's 2d prize ste \({ }^{\circ}\) for its age-particularly good over loin and in flank, perhaps hardly so straight to the end as the others The 2il class, steers under 39 months, is well filled and very meritorious. Mr. Overman's bullock is a great
thick massive animal, well deserving its first place. Mr. Frampton, Mr. Coate, Mr. Burton, General Hood, and others show well. In the older class General Hood takes the 1.t prize for a very large and massive ox of good quality, straight from end to end, with good flank and loin. Mr. Heath's ox, particularly good on the whole class is admirable. The class of heifers, small in number, is of excellent quality. Mr. Farthing's 1st prize heifer is wonderfully thick, and well covered
with flesh along the ribs. Mr. Walter takes the \(2 d\) prize with a very beautiful animal. There f no more attractive class in the Show for those of fastidious taste as to form and colour. The
older class of Devon cows is of inferior quality, and suall in numbers.
We now come to the Herefords. There are only two young steers, and they are not equal in quality and ipeness to the Devons of the same age. The older classes are the same grand and massive animals that wo all well know. The 2d class, though ripe and good, is, however, not equal in merit to what we have seen on other occasions. They are various as to colour; the roan and mottled face takes precedence in point of
merit to the more characteristic red and whito. Mr. Loyd's 1st prize ox is a grand thick massive animal, not of remarkable quality. Mr. Wortley and Lord Ditrnley re z .1 and 3 d . The older class is a very fine one. Mr. Heath's lat prize ox is of great length and size and girth. Mr. Pike's ox is very thickly covered, especially over loin and filuk. The female classes,are not particuarly well filled.
The Shot thorn Steers under 30 months old are represented by a larger number of anmals than in any of the other breeds; and in that way, but not especially by the ripeness of the individual specimens, is the superior precocity of the breed illustrated. There are however a number of well-fattened beasts in the class, and in particular Mr. How's 1st prize steer is very thick and large and good. Lord Aylesford's white ox is a beauty ; and Colonel Lindsay's steer is heavily fleshed. The older class of steers contains 10 , most of them good beasts. Messrs. Martin's ox is straight and thick, with grand bosom and capital over lcin. Mr. (treenwav's \(2 d\) prize beast is round and ripe and straight. Mr. Upson's ox, with its drooping back, and Mr. Ciayden's with its cow head and neck are not first rate. Mr. Wood, the prize taker at Birmingham, exhibits here a fair ox, inferior in the hind quarter, but good forwards. On the whole the chass is not first rate. The older class of oxen contains 14 animals, Mr. Baker's 1st prize ox, coarse headed and of not first-rate quality, s good over back and loin. Colonel Pennant shows a good beast, and Lord Spencer's is ot good quality. The class is not first-rate. The heifer class is beautiful. Lord Radnor is 1at with a massive thoroughly well fed beast, with beautiful head. and thick everywhere rather coarse on the shoulder, and not very deep though wide in the twist. Lord Hardwicke's heifer is good forwards and middle, rather light in the hind quarters. Mr. Aldworth's heifer is good. The Short-horn cows are a lot of grand and massive animals.
There never was a better show of Sussex stock, for length and breadth and quality. The oxen, and especially the beifers, are first-rate. The cows are uneven, and some of them particularly ugly. Messrs. Heasman, Napper, Shoosmith, Cane, and lotting have made a capital display for their county. The Norfolk breed is represented by a few thick, well-made Galloway-lookiug beasts, of a breed as good as any for milk; they are also first-rate for tho butcher, and deserve more general extension then they have received.
The Kyloes are capital classes. The Silver Cup for the best ox in the yard was awarded to the Duke of Sutherlanl's rich brown brindled ox a this class, receiving it in competition with the best Short-born, Hereford, and even Devon. He is a great, massive, deep, straight-backed, long, wide, well-rounded beast, carrying plenty of first-rate meat, and he has well-earned his distinction. This competition amongst breeds, which in the award of this and two or three other cups, arises at this Show, is one of the most usefnl parts of the rivalry here displayed; and great good is done by an unusual award of this kind. Whether it excites displeasure or not-at all events it puts the men of other breeds upon their mettle, and will whip them on to greater effort. The Polled Angus breed is well represented hy a very excellent clas9, of high and uniform merit. The Irish class is a medley of all sortis. The Welsh, a large black breed, are fairly represented, and the Crose-bred classes are very fairly filled. Mr. Druce
takes the lat prize in the class of Steers, with a very
showing a very fair proportion of both breets an appearance, In the older class, Mr. Nipree that The following is the award of pron and sman Classes:-

\section*{NEW PRIZE MELONS.}

\section*{E. G. HENDERSON \& SON}

Respectfully offer the following Varieties as worthy of a place in all selections of DESSERT FRUIT, hies received high commendations in favour of their superior quality and growth.
Wills's Oulton Park Hybrid (scarlet-fleshed). Wills's Green Pine-apple Gem (green-fahi Fruit round, of medium size, from 2 to 2 l 1 lb , in weight; flesh This beautiful and distinct variety in growth is of \(8 \mathrm{x}=\) bright salmon-searlet, very rich in favour, remarkably tender and
 misted on two occasions as "a great acquisition among Melons." The plant is vigorous in growth, not subject to canker or die off a second crop almost ociual to the first. Of this variety Lr. Hod bears his testimony as follows :- "Y our Melon is by far the finest scariet-fleshed variety I ever tasted, and very distil,
and well deserves the highest Certificate which has been awarded." Thistitution, free and vigorous, not subject to dee or base of the stem, an abundant bearer, sure setter. (dem," from which it was obtained by a cross with th
Cashmere" variety. The fruit is generally smooth, bot beautifully variety. Flesh fruit is green as grass, tender and a rich Pine-apple flavour. It was regarded by the appointee -
by whom it was awarded. a Certificate, as the best green-lact by whom it was
in cultivation.
The above rarities of Melons received their respective Testimonials of Merit from the Fruit Comma: of the Royal Horticultural Society.
Seed Packets, Rs. 6d. and 5s. each. The Trade supplied.

 fruits is botanical, of that they are not interde! to please the ere merely. If this in so, why alatint them at all: We can harlly imarine any amation or auy botanist caring to pry el. sely into the dirtylooking tubs and fins when exhtrited at K.insington. The request that visitors should abotain from touching is needless in sueh a care. In the studs or the work-room, the matter would be very different, and these "pickles," mstead of inspiring discust, would be regarded with keen interest.
Anvone, tow, looking at the frorions colours of the Guurds, the savoys, the erisped many-hued Kails, the ruddr Apples, the mellow browns and yellows of the Pears, must have felt that a fine opportunity was lost. What a group might have been made of some of these things to delight the eye, not only of an artist, but of the most prosaic visitor! As it was, a costermonger's barrow, or, still more, a greengrocer's shop in Christmas week, prosents a much more efteotive and pheturenque appearance. Let the reader who happened to notice the fine cone of Encephalarlos Altensteinii, now in full beauty in the Society's Conservatory, consider how comparatively ineffective it would look, if remored from the centre of its coronal of noble leaver, and placed by itself on a stoneware dish! And yet this is what was done with the Pineapples on this occasion, though we must in justice to some of the exhibitors of these noble fruit, say that they showed a sense of propriety and good taste, by placing a few flowers at the base of the specimens.
It was aggravating to see huge primrosecoloured Pommeloes and Shaddocks, glowing Peare, and blushing Lady Apples, thus huddled together without regard to effect. Of course we are quite aware of the many difficulties in the way of such an arrangement as would at the same time satisfy the eye of taste, and supply the requirements of the professional exhibitor or spectator ; but we can see no reason why, after the judges have made their award, some concessions should not be made in this matter; and if it is not desirable that all the objects exhibited should be thus tastefully arranged, at least some of them misht be thus treated-the inferior and uncertificated ones, for instance, by way of compensation for their want of success in the oompetition. The "undecorated" articles would, in this way, attract even more general admiration than their more highly honoured rivals.
Where a show only lasts for one day, the main difficulties of arranging such group or groups as we should like to see, would consist in the short space of time available for the purpose; but in a case like this, where the Show lasts for several days, the objection on the seare of want of time, can hardly be said to exist.
Thouga we have on this occasion confined our remarks to the effective arrangement of fruit and vegetables, they will apply, though in a less degree, to the grouping of flowers at flower shows-in a less degree, because, fortunately, it is impossible, however much some exhibitors may try to do so, to conceal the leaves altogether. At any rate, next May, we earnestly hope we shall see something done to remedy this state of things, and inaugurate a new era, for if we persist in the old plan, we shall be a laugbing stock to our Continental friends, who pay great attention to what they call the "toilette" of their shows.

Beer at 3d. a pound! We can fancy a chorus of thrifty housewives eagerly demanding where; and, not to iseep them in suspense longer than we can help, we point to Queensland as the spot where meat is to be had at this low price. We have already published in our columns (p. 1037) a report from Mr. Hill, the Colonial botanist, upon the agricultural capabilities of certain districts discovered by him. Brisbane papers since received contain additional reports npon other regions explored by the same diligent observer during the latter part of the year 1864. No corner, from the outermost limits of Moreton Bay to the Macalister River, has escaped his searoh, but before proceeding to give the substance of Mr. Hill's observations, we extract a few partioulars from the RegistrarGeneral's report for the year 1864, which may be of interest to some of our readers who are thinking of migrating to that rapidly advancing colony.
Queensland extends "from the northern boundary of the colony of New South Wales, in latitude \(31^{\circ}\) south, to the extreme northern part of the Australian continent at Cape York, in latitude \(11^{\circ}\) south. This wide extent of country,

 incluts chmatos vartms in pemperatuse, in hamduy, and in selntrity. The changes are, h.w.vir. lurily so morkne se thow fand in other chantros of mistar atem. Irom worth wath the climaty a! s! remal esemtally A wralian,
 Cape lonk, where the healthimeaset the liap pean Iowabitatis is remarhahle, the mid-day ha it is not greater than it is at limetrane - ahthmag the average reading of the thermometer whil duubtless be found higher, the temperature being more even

Inland, on the elevated table land, whether at the Valley of Lagoons in lat. \(19^{\circ}\) south; or the Poak downe, in lat. \(22^{\circ}\) nouth; or on the Darling downs, in lat. \(28^{\circ}\) south, the climate atill shows the usual Australian peouliarities, observable in its highast elevation, and differing but little in temperature, the summer aun being equally hot, and the winter nights equally cold." The total population is estimated at about 74,000 , only 2s,001 of whom are femalen.

The number of marriages is generally considered as one of the movt certain indications of getheral prosperity, of abundanoe of money, and of a high rate of wages. In thic country the marriage rate is said to be 16.40 to every 1000 inhabitants, whereas in Qucensland, taking the mean of five years, the proportion of marriages was 24 in a thousand.
Revertiog now to the before-mentioned reports f Mr. Hill upon the distriots visited by him, we find that he speaks of the land as being in most instances exceedingir well adapted for eultivation; n one instance only dues mr. Minl report unfavourably. What could be expeoted from a place called "Humpie Bong?" The district with this odd name is situated on the northern shores of Moreton Bay, and seems generally unsuitable for arricultural purposes, although even here small quantities of excellent sugar and tobacco have been obtained.
The quantity of timber to he cleared is one drawback, but this is compensated for by the facilities offered by water communication. The want of proper ruads also forms \& great objection to some of the localities. Many of the "reserves" are well adapted for thi growth of oaten hay, which is largely imported into Brisbane, and also for the oultivation of Whent. Sugar-growing, as we learn fro:n the Brisbane Courier, is rapidly extending; the growth of Cotton is also being vigorously carried on. Maize, Arrowroot, Tubacco, Ginger, are all more or less the objeets of the cultivator's oare, and all might be greatly inereased, while promise of the future production of tropical fruits is held out by the receipt of a Wardian case from Sir Henry Barkly, the Governor of the Mauritius, containing plants of the Mangn, the Avocado Pear, the Mangoateen, the Argan tree of Mogador, the Matingola Plum of Natal, \&e

Conscious that this pleasing picture must hare its reverse side, we trust any of our readers who may be thinking of wenciog their way to this popular colony will not do so without making full inquiries for themselves. We frequently receive applications from intending emigrants as to the colony they should choose, but it must be obvious that all we can do, without incurring the risk of giving what may turn out. to be disastrous counsel, is to lay before them such facts as we have reason to believe are beyond dispute.

Looking at the matter in another aspect, we think botany in general, and Kew ia particular, have reason to be proud that two of the finest districts in Australia were not only discovered but recommended for immediate colonisation by Colonial Botanists, viz: :-Liverpool Plains by Allan Cunningham, and the plains watered by the Macalister River, made known by Mr. Hrls, in the reports to which we have alluded.

Australia at least should never raise the cry of cui bono against the botanists, for she is under the heaviest obligations to Cunningham, Firminand Mueller, and Hill.

OUr readers will see in another column that the Council of the Royal Horticultural Society has determined to award a new medal, to be called the Lindiey Medal, to meritorious Exhibitors at the Tuesday Scientific Meetings only. As a marly of respect towards the memory of one who worked hard for the Society, and in recognition of the interest and value of the Tuesday meetings, this medal is doubly appropriate.
- From a communication of M. Kolb, the recentre of Botanic Garden of Munich, in
learn that an lnseritute for the Study or mee Physiologix or Plants asic Garden at Munich. There last four years in the Botanic Garden at Munich. There prosecution of rescarches into the composition of the soil, and that of the plant. The experiments are conducted under the dirrection of Bason Lifbig, the Volumard. A first set of experiments, of which we need not reproluce the details, has shown that the substances found in the ashes of a plant, when added to a sterile soil, render it fertile.

The general demand at this festive season for Leaves and Berries for Decorative Purposes recals to us the Aucuba, which in a very few years will take its place with the Holly and the Mistleto in the adornment of our houses. How effective it will be may be judged by a visit to the Conversatory at South Kensington, where also Solanum pseudo-Capsicastrum asserts its claim to be employed in a similar manner.

The Portrait of the late Dr. Lindiey, which we some time ago promised to give in our columns, is the first Number in the New Year.

\section*{OUR SMALL FRUITS}

We are perhaps too apt to think of our Gooseberries, Raspberries, and Currants with some little contempt, as being fruits more adapted for the king some very interesting traits in fruit culture are passed over. Gooseberry and Currant bushes without culture and half. wild in appearance are to be found in cottagers' and farmers' gardens in summer, and the comfort of the industrious housewife. How vividly the idea of the first Gooseberry pudding at Whitsuntide comes to one's mind, tasting of spring and the singing of birds; and theu again, in July, the
first Currant and Ruspherry pudding-what delight! first Currant and lisspherry pudding-what delight !
what an aroma when it is opened to administer the proper quantity-a large one-of sugar! It is only
those who have spent all their young lives in the country that can have such feelings, more vivid perhaps because a little more mildly sensual, than finding the frst blackbird's nest in March.
We took pen in hand to write about a few varieties of our small fruits, and have unconsciously got into
the poetry of a country boy's life, if puddings and pies are at all in that way. At first our idea was to commence in a business-like alphabetical way with Currants, and so on to Gooseberries and Raspberries, but a great interest in Raspberries has got hold of me (I cannot hold on with the editor like "we "), and so to them I will devote a few lines.
our market gardens, but to berry it properly belongs would be found on inquiry a difficult question to solve, almost every large cultivator having his favourite-one perhaps asserting that the true kind has canes nearly smooth, another that the sufficient to say that most of the sorts known under this name produce good fruit, capable of making a rich jam, now a profitable article of export to our colonies, many pleasant days spent in the "old country."
Next to the Red Antwerp in estimation is the Fastolf, Which came accidentally from seed in a garden at Filby, great noise in the horticultural world from its being happily named after the Castle of Fastolf, near Yarmouth, and from its realising a considerable sum to the firin that named it and sent it out. It is simply a good and prolific red Raspbe
There are several other varietios of red Raspberries, ome of which adapt themselvea to peculiar soils, and thus become favourites. Among these Carter's Prolific,
a Yorkshire sort, is prolific and good, with fruit large and more round than conical; its flavour rich and pleasant. The Fillbasket, a Northumberland sort, is also a hardy free-bearing variety, with nothing remarkable belonging , either in size or taste
The Prince of Wales (Cutbush's) is remarkable for the vigorons growth of its canes, its large fruit of good flavour, and from ite root producing too many suckers, which in momes soils are oftena great evil. Another of these vigorous-growing varieties is a sort with a very last summer it was, faithful to acidity, and its fruit not remarkable for size. A variety called the Round Antwerp is worthy of notice from its large round fruit several sorts of red Raspberries from seed. The sort most worthy of cultivation in our climate is Vice-
President French; this sort produces large fruit, more round than conical, and of excellent flavour.
In French catalogues 10 or 12 varieties of red summer Raspberries are enumerated, besides those superior to, or even equal to our favourite English varieties.
I have thus far enumerated the varieties of red or three yellow-frinited sorts unanlly culttvated for the
largest, sweetest, and best of these is the Sweet Yellow states that it was known by his grandfather, and cultivated by him about 1780; he supposes it must have been one of the sorts imported from Holland, as it was called simply the Yellow Antwerp. It differs from the
numerous sorts of yellow Raspberries so named in pronumerous sorts of yellow Raspberries so named in pro-
ducing slender canes, deeply tinted with brown, with but few spines or bristles, and giving large yellow fruit, very rich and sweet. Of the Yellow Antwerp there are
several varieties, some of them worthless trom their small fruit and tendency to produce crowds of suckers. The true sort, known in France as "Framboisier du Chili"-perhaps because it never grew in Chili-pro duces fruit ratber large than otherwise, and of a good flavour ; this does not produce suckers in profusion,
and is a good variety. A yellow Raspberry which was introduced from America a few years since, ander the name of Brinckle's Orange, I had great hopes of, as it is highly esteemed there, but its fruit proved sinall and acid, and its suckers thick as leaves on
ground in November. The size and flavour of its fruit were evidently influenced by our cloudy skies, for during the past summer, which was Americanlike in clear skies and great heabl, succeed in France, for in the Revue Horticole some cultivator speaks highly of it, and offers canes at two francs each -a most profitable crop if it gives suckers there as here
A comparatively new race of Raspberries has of late climates north of the Trent, but very fertile in warm autumns in the south and east of Eugland. One of the best of these is the October Red, raised in France from an autumn-bearing cane of the Fastolf, and named Merveille des Quatre Saisons Rouge. Why it should be called a Marvel of Four Seasons, when it only bears one good crop, is a sort of lucus \&c., not easily compre hended. Its English name of October Red is much more applicable, for although the canes of the preceding year give a few small fruit in July, its main crop-and young summer canes in October, and bat rarely before that period. Its fruit are too delicate to gather singly the long racemes should be clipped off with scissors, and then turned up and placed on the dessert table gently. They are very ornamental, and the fruit delicate and agreeable, reminding oue of summer when summer has fled. A sort with exactly the same characteristice is the October Yellow; this was raised in France from the October Red, and named Merveille \&c. à Fruits jaunes. We owe both the English names to Mr. Rivers.
This is sweeter than the red variety, with the same very tender flesh. In dry warm autumns it is a very nice addition to the dessert.
A sort of autumn-bearing Raspberry, raised or sent out by a Mr. Rogers, of King's Road, Cbelsea, between 20 and 30 years since, nader the nane of Rogers Victoria, is a delicate grower, but bears full-aized red
fruit, of good flavour. Its peculiarity is its ripening in September, nearly a montin before the Dctober Red, The Belle de Fontenay, an autunnal red Raspberry, is a pestilent weed, from its putting forth crowds of suckers; replanted every season it gives large fruit.

I now come to a very peculiar race of autumna Raspberries, interesting alike to the physiologist and
cultivator.
Many years ago I cultivated a sort of summer Raspberry sent to me as the Black Raspberry, said to be a cros bewten the Dewberry (Rubus cœssius) and the Rapp reddish, its canes were of a dark purple, and its for in this sort, and raised several generations of seedlings from it; some of them bore fruit larger and of a darker purple than others, but on the whole I found them adhering pretty closely to the parent stock. It was after doing this, and perhaps some ten years ago, that I received, among other fruits from my numerous American friends, a variety of the Black Cap (Rubus occidentalis), called the Ohio Everbearing : this is a curious fruit, seeming very firm backberry as a Raspberry, with and a web-like film. Moreover, in this climate it produces its fruit in autumn. I must add that its canes are purplish-red, covered with a purple bloom. Well, on receiving thisinteresting sort of Laspberry it was planted with other new kind near my summer Black Rappberry, from which I continued to raise seedling. Amons. the first batch raised after the introduction of the Black Cap, I observed several with purple canes quite distinct
from the parentstork. I watched them with some interest, and soon found them quite new in character, giving but a few small fruit in summer, but producing an abundant crop in September and October. I selected a canes purple, and their fruit as large and as black as our common Blackberry. These select few were planted by themselves, so as apparently to be safe from casual impregnation. Seed from them was sown, and, much to my surprise, for I quite hoped that I had eatablished a race, produced warieties almost endless, some coloured fruit, some nearly white, others of a flesh colour, and otheres from pale to dark red, the flavour of each differing: those with black fruit having purple canes like the Black Cap, and partaking of the flavour of the Blackberry; those with orang
unpleasant acidity.
proved to be summer Rampertics these August, September, and October. till to be regretted, that, like the dman is carten them, producing the largest fucker, so that \(C\) Raspberry, cannot be propagated: cater roots even failing to grow. This race seems to offer a curious study to the
for we have the curious plants varying but little for many and always retaining the usual our English Raspberries in bearing fruit ir nature from the ouly foreign species. In the whole course experience in raising seedling trees and plants never found anything so remarkable, and white ver the innumerable variations in a few hundeal seedling Raspberries- 110 two being exactly alitem led to the belief that as yet we are onlyce margin of the " Origin of Species."
A mong American small fruits are some varieties Blackberry (Rubus fruticosus), which have beea mo written about and advertised by our counins Cret 0 named from a new Rochelle; this is much like our commot is berry, but its fruits are more conical, and in this comen not so large. The other sort is the Dorchester gives fruit of the same shape, but a trifte smailer !
the preceding. Their flavour does not difter for the preceding. Their flavour does not difter from:
English sort, being sweet and flat, but their tine ripening is very different, as they ripen here caris August, nearly six weeks before our Blackberr

\section*{some varieties of the Dewberry (Rubus cip} been figured in the American periodicale, end described truly they may be of interest. \section*{DOUBLE-GLAZING}

THE article (see p. 987) containing Mr. Anderom conservative promulgations" concerning my reat endation of a system which, in apite of hiv apatim Eations, English gardens," has unfortunately but juot now mes to my notice. I therefore hasten to send a fer lismi bably have induced some of your readers to interpre silence into a tacit acknowledgment of the palidir Mr. A.'s hyperbolic anti-double-glazing assertions.
Much to my astonishment I see that Mr. A. deses for a single moment hesitate to condema a sitem which, as may readily be deduced from his own remar he has never as yet even had an opportunity of mitting to a test; and Interest of the advancemeu orticulture in general, and of Orchid culture in par ticular, have been far more judicious on Mro A' \({ }^{\prime}\) p had he refrained from publishing his prejudicial on this subject until such a time, at least, sly enabled him to support his
phion, (which mpartial) by something like a "thorough prac experience " in the matter.
tentions as those mil Mr. A. has not scrupled to impute to one who has erse been fond of England and its gardening, whio, Morews: a total stranger here, and who, consequ gau British gardeners," or for "tilting one connir he other" (que de bruit pour une omelethe. merely refer him to Professor Koch's ", ür Gärtnerei und Pflanzenkuuce, from the columon. of which contain a few translations reuarks furnishing most unquestiona of my admiration of the flourishing gardening us of my high appreciation
British cultivators. Mr. A. will find ranslations signed "R. Hamilton," a pseudonyn I assumed to avoid being charged with "Anglomas But reenons a nos moutons. habour under the strange mistake that by advin fight double-glazing I intended to ventilation whatever. If he will looking over my remarks on the convince himself of his error, for mentione a house that requires to be made per but have simply recommen
if I bave forgotten or
aention in partscular that "rery one ided wib

reviletion as ever a propar treatment of the plants is culains dremnde, nevar deomed any one ceccintric ows in to believe that such an abnormity as at - bermety whatever, far less by oue wio, alchungh not astuwase euvigh to possess such " thoroughly practica
as our Meadowbank celébrite, is neverthelce got quite eo dentitute of a moderste share of practical apperia
Br taking a glance ut my former remarks I find that spating of the Palm house of A. Bornig. Esq., I disJeetined for airing;" and if it is found indispensable t veutilate lalm houser, how much more so must it be i the case of so decidedly epiphytal a clase of plante as Orchuts in deneral are, and which, as every one know, samilate the greater pat of the constitucnts of their mishment directly from the surrounding atmosphere I ain as much in favour of thurough, i.e. a suftictent degree of ventilation, as ar. A. can possibly be,
yet I have minveterate averon for an "overeuticient one," that is for ull dhanght, especially for cond draughts and dry currents in Orehid houses; and if I pot which unfortunately to so great an extent exist in Finglieh collections, to the deticiencies of single roofs, Ir. A., whe hambelf has been ase wioh in couch find mumplea of various furms as those which, in comjunction Sencribed in No. 7 ( \(\mu .147\) ), will certainly find no rensonabie grounds for contradicting ine.
If therolore appears to me that, even if all other advant.ages which air-tight double-glazing offers were for a moment left out of consideration, the only one of ewaping from it within the direct control of the cultiawor, would centainly in itself be important enough to induce every Orchid-grower to adopt this system, for it must be obviuns to every one that a iouse so constructed is comparatively far superior to the deficient singleglazed structures, which, through the medium of the innameiable spertures formed by every lap of glass and every joint about the buildug, offer nis many "open crepacies, and a host of insects besides. If the dimensions, insignificaut as they may seem, of all such apertures tbout a single-roofed house could be summed up into one collective figure, this figure would
represent an opesing of such as size as would, if properly considered, undoubtedly greatly assist Mr. A. varieties of spot as those which he has described himself, and the origin of which appears to him so deeply immersed in mystery.
Aext to cold draughts and over-moisture, I consider aridity the must dangerous agent in the production of epot. The exceedingly hot summer we had this year hin furnighed examples of it here, which, on some future occasion, I may speak of at length.
If Mr. A. finds it necessary to remind me of the importance of such agents in Orchid culture as soil, ar, circulation, and moisture, it may in return not be ant of these important agents are in a great measure, and in a most direct way, dependent upon the conAstion of the roof
As for Mr. A.'s plants, the measurements of which he gives with so much complacency, and which he 50 modestly calls "magnificent examples of first class cultivation" (in my opinion they might, a juste titre, be called Orchidaceous prodigies), I must avow that, in spite of every exertion, I cannot find anything here to surpass, if even to equal them, Pbalæoopsis Schilleriana excepted; the plant in the collection of L. Reichenheim, Eqq, mentioned at p. 963 , having lately produced two new leaves, the first of which has attained 17 inches in length, by \(5 \frac{2}{3}\) iuches in width, the other fairly promaising to reach the same size, although since its or rather panicles, has thrown out woady be counted over 140 buds, viz., 119 on one, and 22 on the other; as this number may increase yet, and as the flowers will probably all be expanded at one time, this plant will by far surpass that of Mr. Anderson. Although this
Phalænopsid will ever rank very high among even the most precious of our Orchidaceous gems, I am inclined to consider it, in point de vue of culture, an Orchidaceous weed, for it seems to succeed equally well modes of treatment
Since Mr. A.'s plants are open to inspection, I may on my next visit to England take the liberty of availing myself of an opportunity offering so rare a treat; and
in that case I shall not at all be surprised (despite the in that case I shall not at all be surprised (despite the
incomprehensible aversion which he at present is ahowing for the "excellent system") to find most donbleroof, and and especially his "prodigies," under a not have been of so miraculous a nature as to laave induced the already fine-sized leaves of his Phalenopsis Encete to assume the size of those of a Musa to surpass an preudobulbs of his thriving Odontoglots noportheless feel conhibition Pumpkin in corpulence, I insurance againet all druaghts and sudden fluctuation of temperature the draughts and sudaen fuctuation
exclusion of slumst all husects, d.. will have mure than outweighed the dieadrantage of a si.ght what fucti.n to this construetion unit. ing Ily afters, but which, if brought into close coseih rathis, is ans Lis far so decrinathat hensions, uspucially rexardm: those mast valualle of all Orchids- - lle distithous leaved spucico uf Eat Imlan Fandere, which-stratage ooincidence-are als thase mostexposed to spoting of ail descriptions Some of degree fond of slatue, (speciatly dusing ther seisas of of growth-for instance, the beantiful Vama (Renauthera) which camot even fur halt au hour le expused to th direct inflaence of astroug sumber nua with impunity As may readily be inferred from the above remarks, I am as much enamoured of double glazing an ever and if Mr. A.'s "opinion" induces hima to condeun it the "experience" of others induces and entitles thew ever being discomfited in mantanimg that an mortightly glazed double roof is superior to a single onfe and alchough I wilingly concede that if Emgland hat Andersons enough to cultivate ita (hechide, duableI still have eubstantial reasons for douhting that such is the case, and I therefore profit by the oceastem once more to recommed my pet system. I nm minchievom enough to believe, and even to ansert, that through the inappreciable adrantages of double-glanamg, many a one whose Orehids are at present more adunned with spot most formidable rival to the "northern paragon,"" and such plauts as those which he may justly be proud of will thereby be brought within the secple of every one' ndmiration and enjoyment who will not shm the few extrd expenses whichdouble-ghzing willncecsanily cause since a few well-known culivators have taken the matter in hand in a fur more efficient way than that o indulging in polemics upon the subject, that is by sub mitting the system to a practical test, I consider further discussiou of the matter catirely supertluous, a least for the present; and I therefore conclude my
observations, hoping that whenever Mr. A. will tako fancy again to refute remarks as well intended as those which, in the interest of the advancement of horticul ture in general, and of Orchid culture in particular, wave ventared to make on the subject in queation, the kindness to select a inoment fors so doing when his hamour will be a little more couleur de rose than it has been in this instance.
Fear of incurring his censure once more, keeps me from availing myself of this opportunity to state that I have for some time past been indulging in specula tions on the appropriation of the liygrometer for horti cultural, and especially Orchidocultural purposes ; ani although the complicated uature of the contrivances at present in use under this denomination, as yet pre cludes the possibility of its general introduction, am confident that as soon as a modification of it combining simplicity, accuracy, and durability, shal make its appearance, it will find a most rapid propaga the thermometer at present epjoys. \(A\). \(R_{\text {。 }}\) II。
[The publication of this letter has beon unavoidabl delayed.]

\section*{TROPICAL BOTANY.-No. II.}

We alluded in a former article on this subject to the singular fact of the Indian spring taking place in the driest and hottest month of the year, and it is no less strange that we never observed this fact noticed by any writer on India. As we could not account for the phenomenon by any favouralle conditions of climate, such as subterranean or atmospheric woisture, it was concluded that the evolution of buds, tender shoots, \&c., was due to specific with external circumstauces.
If this is the correct interpretation, then it must be admitted that European writers, judging from the pheuomena of temperate climates only, have but partial and incorrect opinions on this sulject, for they tell us, one and all, that heat alone sets the vital principle of plants in motion, and that an increase of temperature is the cause of the appearance of soring, and that dryness in the air is fatal to vegetation. But and that dryness inact is before our eyes every March, the extraordinary fact is before our eyes every
that in an atmosphere which curls up the stiffest boards, that in an atmosphere which curls up the stiffest boards, forth her tenderest productions, and that, too, unaffected by this apparently adverse condition of the air.
One of the greatest of living botanists has written to us to say that the Indian spring is a puzzle, and he has suggested a serien of observations
f the ground at a depth of 3 feet.
Fortunately we are already in possession of auch a series of observations, taken during the three years 1843 to 1845 by Mr. Caldecott at Trevandrum. From this we observe that the lowest temperature of the earth at a dopth of 3 feet is in July, when vegetation is in its greatest luxuriance, and the highest is in April, when tree vegetation only has already made considerable progrese, and that between these two extremes there are only about \(5^{\circ}\) Fahr.
From Auguat to January the temperature of the earth at 3 feet in almost mationary at \(84 \frac{1}{2}^{\circ}\), while from

Fel ruary to Apall thero is a gradual rise \(20891^{\circ}\) Thoes frets woem to give support to the genera opinion that the rise in tomperasure during Merch is
the caune of the crolution of buds, young shoots, and

\section*{biosemes.}

11 reqreiy lee thicet that an earth tomperawru of \(811^{\circ}\) is quito high ouougla for any plant in the world; nor could wo bring ounselves to believo that, if the tcraj crahure wore themain etealfast at \(941^{\circ}\), crourthan what they are.

We are supportod in this view by the fhct that there oo a partial spring for screral tropical trees in necember when the Mountrin Olive (Olee dioice) sende forth multitudes of now leaves and fragrant bloseoms.
Moroover, if a thee whech watally derciops new eavensive injury in July, the homit of luncot earch temperature, nil the afpeanameco of kymy will then take phace. It is in July that many young Mange treen send forthew bramere and we hennered to nutice a Mhowa tree (lamsia) which in dume lutt its crown in a sturm, puah forth with incrediole force wew bramehes throughs the old burk in the following month. Fact nach us these meem is show that the higher carth temperature of March has nothing to do with the appoarance of spring.
It may be coucludel, therefore, that these is a prinepple of life prealnar to each speches of tree, mind ammetimas even to individuals, as in the care of tho (ihnstonbury Thorn and ('adenham Gak. the former blooning and tho latter budding in the depth of winter.
It is by this principle of lifo that a eced, a dormant buid, a wheel auimalcule, and a helix, cats remain as if would bo immediately suljget to the laws of inorganic nature.
From hagrometrical obecrvations uade at lenaren y Mr. Janes Irmmep, it appears that at that place January is absolutely the driest mouth in the ycar, i. e., that there in a less quantity of aqueous vapour
in a given quantity of air in Janumy, thau in muy other month of the sear; but yet, ownge to the gradual increase of temperature, the arying puner of the air is five times greater in March Watm in Datuary, and foes on increasing till May. The depremsion of the wet bulb thermometer a January, and 14.0 in May. From thas month it
decreabes rapidly till Auguet, when there is no dill ennoce betwoen the wet and dry bulb thermometer. We have seen from the tables of terrestrial heal taad e crown of a tree in July w. can reproduce the appearance of epring, and we con clude that the terrestrial heat of March is rather an accompaniment to the phenomena of apring than the cause of them: and that the season in which arboreal regetation begine and continues to be developed is no inconsequence of circumstances favcurable to it, but in spite of circumstancen most opponed to all the conditions generally regarded at necuasary to vegetation N. A. Dalzell.

\section*{Home Correspondeace.}

\section*{Climate of Scotland.-I have observed (see p. 1105} some remarks made by you upon the Chanmontel Pear and other fruits grown in the north. I have therefore beent" athered from a staudard growing within walled garden of \(6 \frac{1}{2}\) acres. The produce has been about half a bushel of fruit of somerhat corresponding size. This is the third year since 1857 in which th fruit has ripened of the same size. The two former years were 1858 and 1859, some of the produce of which was sent to Dr. Lindley, who said that it was about equil to that grown on standards in the south of England. This corrolorates sour own ideas that climate does not at all times correspond with latitude We are about \(2^{\circ}\) north of Edinburgh, and what you described as failing to succeed ons a wall there, does
well here in the shape of standards. We are however favourably situated, being near the south shores of the Moray Frith, and our soil is of a warm and earl character, containing a good proportion of silicate. enclose two or three other examples of Pears to show you what our climate can 10 in the cane of other varie ties. I employ largely the root lifting of fruit trees, and I attribute some portion of my success to the roots being well up towards the nurface. J. Webster, Gordon Castle [The Pears which accompanied this communication were of good size, well coloured, and in other respect quite cqual to the same kinds grown in the south. Education of Gardeners.-The proposed scheme of the Royal Horticultural Society, in reference to this subject, is a step in the right direction, and I hope it will meet with good bealthy support. I also trust that the Society will use its best endeavours to obtain men who are well qualifed to impart instruction to tbose that are under them. It is well to know how to prone, how to nail trees to make them look workman-like, how to pot, and the different soils to use for certain plante, \&ce.; and it is quite as well to know low to dig. How many ycung men are there in fine estallishments in this country, who know how to perform this operation properls ? Put a spade into their hards, and tell them to go and turn over a certain piece of ground
 put it into the ground with that ease and grace with which ought to be done. some may think that this statement is an exaggeration; but let me see a man dig, and I will tell you what he is worth. He of the kid-glove fraternity have; he may not be able to tell my lady in glowing terms the component parts of his garden soil, yet he knows what quarter of his garden suits such and such a crop, and above all, be keeps the family well supplied with vegetables, whicl is a great matter. Let the Society impress this upon the minds of their students- I can scarcely say students the word sticks in my throat. And wherefore does it ? Because it is like putting the kid gloves on the young men at the very beginning. Go, go to college, journey man gardener! do not forget thy scent-bottle, thy cambric handkerchief; above all, remember thy cane and gloves! Brassica.
Mr. Paterson's Potatos.- At page 1180 I observe a near Dorking, in which he speaks disparagingly o certain varieties of Mr. Paterson's seedling Potatos and whereil he also seems to infer that the testimonia so recently presented to that gentleman by lis neigh bours, for tl e service he has rend red to his country b his success in raising new and improved varieties of the Potato, has been somewhat questionably bestowed Now, as I would rather leave the defence of Mr Paterson's reputation as a raiser of Potatos to those who know him best, I trust I may be permitted to say a few words respecting certain sorts of that gentleman's Potatos which I have grown daring the past summer I received them origiually twelve months ago from source in which I can place implicit confidence, and I have no doubt whatever that they are quite true to name. Among the sorts which I grew were Scotch Blue, Irish Blue, Blue Kidney, Buff Kidney, Goliath White, Seedling Rock, Seedling Regent, Victoria, Napoleon, Paterson's Larly, and several other varieties of which I cannot at present recall the namies, but all of Mr. Paterson's raising. The whole of them were grown in one plot of ground, with more than 20 other good standard varieties, and thus I was euabled to contrast them with the rest in all their respective pointe. Mr. Whiting apparently depreciates the worth Mr. Paterson's Potatos apon the strength of having tried four sorts, and of these four I have alread discarded two from my collection as not possessiug sny especial features to make them worth retaining these were Seedling Rock and Blue Kidney, thus showing that two out of the four he grew were in \(m\) estinution among the worst of the whole. But the two varieties seem to merit some further consideration Whiting the Victoria, which, judging from Mr he possesses true to name; with me it has provether aplendid cropper, strong and erect in the haulm, with a particularly handsome white tuber, of a flattish round shape, and with very shallow eyes. With respect to the vand Blue I can only say that I grew no blue he gives of it. The best of the Blues with me was the Scotch Blue, a Potato apparently as good of its class as the Victoria, which it somewhat resembles in shape, while it is of a beatiful purple along with Napoleon, a brother Potato to the Victoria, Paterson's Regent, and Paterson's Early, I found not only to be among the best round Potatos of my collection, but I also believe them to be among the best sorts in cultivation. There is yet one other recommendation to be attached to them, viz, that while nearly all the other late Potatos suffered more or less from the disease, especially the older kinds, not one of Mr . Paterson's was attacked; and, from the time of their being dug till the present moment, I have not found a single diseased tuber among them. I
have been induced to pen these remarks somewhat uuwillingly, because, although I had intended at some future tance to bave given a statement of my experience in this mat:er, I did not wish to do so until I had given my Potatos the test of another years' growth, which I believed would then have placed me in a position to pass upon their merits an unbiassed and experienced verdict. Had Mr. Whiting but waited for further experience, and extended his experiments to a larger number than four sorts of Mr. Paterson's Potatos, I feel certain that his opinion of that gentleman's labours would have been very different. While upon this subject I sloould like to say two upon Polato culture generally. From the experience of the past year or two I am led to believe that one great aid in warding off the attacks of the disease is to plant as moon as possible, whether early or late kinds, that is, not later than the early part of March. I have found this practice to be very successful, as the Potatos have usually reached their full Growth before being, attacked; and then, as soon as und smell, I set the riphook to work, and cut off the whole of it, believing it best to be cleared away in order to give free access to the sun and air to purify the goil The only piece of Potatos in which I was troubled
with the disease to any extent consisted of some

Regents which were rot planted till a crop of
winter stuff had been cleared off, and these suffered everely. I have another practice, which I believe be a good one, and that is to expose the seed Sigeos out or doors have become very recn and digging, until they have become think that has a tendency to harden the constitution of the Potato, and in proof of this 1 may say that last winter a few tubers of that very popular variety, Webb's Imperial, having been left lying on the open ground till near Christmas, were put down upon and brick-floor of an outhouse, with a north aspect protected during the whole of the winter, exposed o all the frost, and yet, when the genial influences of spring came to be felt, they put forth strong roots and shoots, and grew apparently uninjured. The practice of storing Potato for seed in a large bulk, whether in pits or heaps, is necessarily very exhaustive to the tubers; and although doubtless many will plead want of space to store them otherwise, yet this practice cannot be too strongly deprecated. The whole of my seed Potatos for next season's planting are now lying upon the floor of an old barn, exposed to all the light and air they can obtain ; and should severe frost set in, a few mats and some straw will soon make all safe, and can speedily be removed when the danger has passed away; then the advantage of the plan is seen, as 1 shail be enabled to plant the whole of my sets with robust well-hardened shoote, instead of leaving them that operation to perform in the soil, which must be the case
where they have previously sprouted and the shoots have been rubbed off. Alexander Dean, Maybush.
Gardeners' Wages in Nurseries. -- We have much pleasure in stating that the Messrs. Lee, Royal Vine yard Nurseries, Hammersmith, have advanced the wages of all the gardeners now employed by them
(without exception) to \(15 s\). per week. And we take this opportunity of returning our best thanks to them for having done so, as the increase was given with heerfuiness. The Gardeners employ St. Leonard's Lodge, near Horsham, Sussex, during the past six months of 1865 :-

Total, 19 in. S.F.-I have to ask your readers attention for a few moments to a request on this subject, the importance of which in relation to is now some years since I began collecting returns of the fall of rain-with what success I will mention presently, but iny main difficulty has been to find out the persons who keep such records, and one of the most obvious sources of assistance is the public press; I now, therefore, ask from each and every journal in the lection was first organised in 1860, scarcely 200 persons were known to observe and record the rainfall by steady perseverance, and the aid of a portion of the press, the number has been raised until there are now more than 1200 places whence returns are regularly re ceived. Still I know there are many more, probably hundreds, who have either never heard of the establish ment of a central depot to which copies of all rain records should be sent, or they have been too diffident to send them. It is of paramount importance to gather these, and make the tables yet more complete I therefore beg to ask every reader to think for moment if he or she knows of any one who keeps, or has kept, a rain gauge; or who has any tables of rainfall (or old weather journals) in their possession And if they do know of such persons, I ask them on bebalf of science, of my fellow-observers, and on my own behalf, to use every effort to secure their assist ance, and to favour me witl their names and addressee, We want old records, we want records for the present Britioh may add that an intuential commite of and assist in my invertigations, and that they cordially support my present application. G. J. Symons, 136 Camden Road, London, N. W.
Spiders' Webs.-Much of the myetery of the spider's web may be cleared up by describing first, its atructure and then the form and parts of the spinning apparatus. The first has been attempted in your columns of November 26, last year (p.1132) ; it now remains to try the latter. The spinning apparatus of the garden spider consists of six lobes or spinnerets-two posterior (nearly in a line with the vent), two anterior, opposite to these; and two smaller central ones, close together, in the depression between the other four. All these spinnerets are furnished at their sunmita with numerous spinning tubes, drawn out to horny points of exquisite fineness; the posterior and central spinnerets have
conical shape and wide open extremity,
in proportion to the spinning tabes of a common drawing-pencil is to its to the deposition of gum drops, they are of other uses: especially it seems not improbey my through one of these the insect sometimeste that into the air as from a syringe; from the thron the spinning tubes this would be imposerible hoek, the patriarch of microscopists, Lear centuries ago observed a difference in the narig : spinning tubes, and it las been noticed described
careful preparation
isclose other tubes, the spinning apparatus, delicate texture, springing from the bases, of the posterior spinnerets, and extending nearly
summits; these seem fitted for ponring a thread, and are perhaps used in appiying that det saline fluid which films over the elastic cross-ban their globules. We have, then, the spiuning tuty he scaffolding of the web, the side and radia which are gum drops drawn drops and elastic cro for fluids gum drops drawn out; and the pourin for fluids: but in what way the spider applie When the parts are so small as to be invisible use, we can have only the evidence of results. \(S\)
Solanum Fruits.-Can any of your correa arnish me with the name of the plant which prod the orange-coloured egg-shaped fruit shown at recent exnibition at Suuth Kensington by M Michael's." They are about the size of a bantari egg, or a little larger, and of a fine rich colour. \(S\).

Dahlia imperialis. - We herewith forward a flowent specimen of Dahlia imperialis, sent to us by Mr. Grie
of Culford Hall Gardens, near Bury st. Edmut Mr. Grieve has not named the size of his plant, but think M. Roezl stated in his former
required to be potted from the garden in lieight, asd o the conservatory, whes \(\epsilon\) it succeeds the Clirsar themums in bloom. Its style of growth is minem amongst herbaceous plants; and its Aralia-lite lan of immense size when seen in a detached pasitioo,
very attractive. The branching side growth, wilt large conical buds and partially drooping flowern, give you an idea of its effective character as a large conservatories. E. Ln the specimens sent the ray forets, which ton inches long, and lanceolate acuminate in form yellow. The heads appear to be abundautly produed in succession. The two forms of involucral sale ate remarkably distinct.]

Micmac Potato. - What is the Micmac Potato? looking over a recent number of the Noma "Journal of Agriculture," I find the following peos "In Mr. B. Murdoch's valuable 'History of Nova the Micmac name of Shubenacadie is said to gaa ban akady,' (place where the Saa-gaa-ban or Potato grows). Can any red the banical name known, a specimen of the plant itself would ansmer vell." Enquirer. [This is doubtless the Apios taberoce which a figure is given at p .165 of our vo
on," bears sorry testimony to the way Herbstii has bebaved itself in many parts country and which, if fully acted rent its doing duty again. But when I conside as much or more was said against Amaranthus cholicus, which I suppose
correspondent as the best plant for cold soils and iure Itake courage, and hope that artion be inchioed to give Iresine indeed in the Horticultur Gardens at South Kensington, where fonr bels watil The plants were well The plants were well hardened off beiore them out, and they grew and filled th the whe othey wore ss mac? beauty. I think, on the when the afternoon sul dalted as the coleus
lighted up its leaves, the colours were and, not producing seed, it keeps its leaves longer in the autumn than tue Amarazuas. fore venture to hope that as it bas done mi. I ber at Kew, many will be induced to try thger that little doubt it will outh
been said against it. \(\boldsymbol{E}\).
Thief Palm. - My attention bas been called to article in your impression of the 2 ding to the Thie from the "Journal of Bot it
wherein it is stated thic Gardens at Kel thought that this Palm affair we

\section*{Mr. Hermann Wendlund for th}
ascertaining the real thief to be
and I am quite certain that the late
Smith, as well as a young man wao hold will certify situation in the Botanic Garden
adeither Wand, act, or part in this Palm job. Had Mr. Heruama he would have saved himself a great deal oi The Palm, and not an Irishman. It is well known that this young man was dismissed from the gardens at that i: N., Kev. [The statement in the above communication agrees with what we have ourselves heard of the matter. It does German was dishonest, that all are so As well say all Irishmen are Fenians!

\section*{Foreign Correspondence}

Rbitish Columbia Botanical Association.-The foll.wing are extracts from the interesting journal of mittee. It 18 writtell from Rogue River Villey Sittee. Oregn (lat. \(42^{\circ} 25^{\prime}\) N.), and dated 26 th August last:- I have just returned from the journey into the country east of the Cascade Mountains, and embrace the first opprimity which my return to the white
settlements gives me to furnish an outline of the character and resulls of that exploracion.
On the 17 th of July the little village of Eugene, at
the liead waters of the Willamette River, wns alive with the unwonted stir of mounted troopers taking their departure for the "plains" and the Indian country, and on the afternoon of the same day they marched eastward. That same evening I overtonk
them, and I need not say received a warin weleome as a guest of the United States' Government, and was duly installed a member of the officers' mess, which was aiready constituted, seated on logs, stumps, rocks, and sadilles round the military chest, under the shade of a noble Oak (Q. Garryana?); and what with the tents, the troops of horses pasturing under mounted guards, trees, the whole scene presented quite a Tartarlooking encampunent. Before I bade good-bye to my military friends I had got familiar enough
with that scene. The space at my disposal and the shortness of my tiine will only permit me to place the summary of the last month's travels into a diary form. Amongst others, I obtained seeds of the Mabonia glauca, Iris temax, \&c. ; and I noticed here,
for the first time, Libocedrus decurrens, Torr., a stately tree, not unlike in general appearance to Thaja Menziesii, but hardly so elegant in contour and in the downward sweep of the brancles. On the 18th we
were off by break of day, and camped before noon-the usual routine. We passed quaint little primitive farms, at the base of rocky bluffs, during the first few hours of our march, then the farms got fewer and fewer, middle fork of the Willamette, and left all settlements behind. We rode along in sight of the Willamette, which is here a picturesque little strean, gliding along between wooded banks of Pine and Alder and yellow-leaved Maple, or through cultivated valleys between rocky "buttes." On the 20th we travelled eight miles over a very bad gulfs" beyond. I saw no tree of any great interest with the exception of Libocedrus, though Abies
Douglasii was everywhere the common tree as yet. On Prairie, and entered the beautiful valley of Grande Prairie, and on the 22 d ramped on Little Prairie,
where we lay over until the 23 d . Rattlesnakes (Crotalus lucifer, Bdird), and the western chip monk (Tamias Townsendi1, Bach.), began to appear in considerable numbers.
On the 24th we travelled in a south-easterly course, through woods of fine timber, Abies Douglasii, Thuja gigantea, Libocedrus decurrens, Picea grandis, aud
amabilis; and I now noticed, for the first time so far north, splendid trees of the stately Pinus Lambertiana Rhododendron maximum, L., began to appear, associated (C. a southern shrub, Castanea chrysophylla, Dougl. autkanus and divaricatus (ill R. nutkanus only Variety of R. odoratus?) I also noticed Alnus oregana, Nutt., and a amaller species, probably Alnus viridis.
By the stream appeared Populus monilifera (the stately Cottonwood tree), characteristic of the western rivers, and Cornus Nuttallii, with its showy white blossoms. I may here remark that I have never found what Selieve it to be only a synonym of Thuja gigantea, Natt. It was described as being found on the islands
north-west of the Straits of Juan de Fuca. I have visited several of these slands, amongst others Whitby' Islarid, and there I have seen a Thuja resembling it nothine size and denser branches, but considered believe Dr. Cooper of San Francisco also coincides. also observed thickets of Ceanothus velutinus, Dougl Which is, I believe, what I sent in th ecollection of 1863 as Oreodaphne, sp. No. 11. (?) I had not then seen its
flower. It is a very fracrant shrub, with bright Elistening leaves.
We were up at break of day at reveillé, saddled our dawn of "stable call"-catching them in the grey hunting themsant suminer mornings on the prairie, or on a-head and selecter, surgeon, and myself would go
on a-head and select the camp. After taking something
to ant would separnte thnugh the fragrant woode in twos or threes, or alone; in my came up the hills or Pine the prairie pickiag up plants and seede, chmbing with my note brok on my knee, meditatin: on Dr Nuttull's species, or Mr. Andrew Murray's synonyme, sometimes, more than once, to drop asleep in the shade As we travelled along, P. Lambertiana became quite common, disputing the ground with its congener-not unlike P. ponderosa in appearance-here a very stately tres, different from the same species in the northern portion of British Culumbia. We had beell gradually menced the passage of the Cascudes, couth of Diamond Peak, in right earnest. The ascent was a very easy grade. thengh much more difficult than some of the passes in the Rucky Mountains (e. g., the "South Pass," where the
grade is almost imperceptible), but the altutude showed grade is almost imperceptible), but the altitude showed
itself in the Flora. Plants in seed in the valleys we had passed through, were here in flower. The Rhododendrons were in unripe seeds at the base, but as we rode on they appeared partially in flower, until as we gained the summit we passed through fragrant thickets in a flush of their phink-biossoms, standing out
in retief from the snows of Diamond Penk, giving one some idea of what the Rhotodendron thickets of the Himalayns must be. Here also I found maguificent species of Lilium, the seeds or Here, also, were shrubberies of Ceanothus velutinus, Dougl, with its bunches of white blonsoms. The Dianond Peak probably 10,000 , and a littio south of the 44th parallel of north latstude. The rcenery was splendid. The bold crags of Diamond Peak were on
the left, and away in the southern distance the snows of Scott's Peak and Mount Williamson, while the woded valleys and lesser heights of the main chain of the Cascades lay beneath us,
As we passed through the snow-drifts I found several trees of the true Abres Williamsonii, Newb., a tall graceful tree, though spresding and somewhat irregular in its habits. Newberry found it, whilst attached to the Pacific Road Survey, a little north of this, above 6000 feet in height. There is no doubt of the identity, and I am inclined to believe that the Abies No. 189, which I discovered on the Puntledge Mountains, Vancouver's Island, last year, if not identical, is closely allied. The descent to the "Deschutes (Falls) River" was an easy grade through groves of Pinus contorta, Dougl., probably the "black Pire" described to me by the U. S. explorers as growing in the waterless desert east of this.
Before arriving at Deschutes River, we observed two beautiful lakes in the valleys, surrounded by wooded shores, and lying calmly glistening in the aun. Here we found in great abundance, though, as always bappena, sparingly in fruit, Taxus Lindleyana, Murro, which might, when found near the sea, be profitably exported as a wood for bows. Abies Douglasii now
disappeared, as indeed most of the Coniferæ of the western blopes. The two declivities of the Cascade Mountains, and the productions on either side, differ more widely than do the two sides of the Rocky Mountains-different soil, different climate, different animals, and different species of plants. This bears true until the termination of the range, though towards mate, it is less marked ; but in Oregon, Wrshington Territory, and British Columbia, the most superficial observer cannot fail to notice it.
For the next seven days our course lay through a dry sandy country, covered with pumice-stone and streams of lava, thrown out of the many now extinct streams flowing from the snow peaks. These streams presented a curious phenomenon characteristic of most of the creeks flowing from the snow peaks in the southern section of Oregon and in California. In the by the melting of the snow under the hot sun, they gushed from bauk to bank. Near Shasta Butte, in N. California, travellers may be seen waiting, thirsty and anxious, until the stream come down, which towarts the end of the season does not happen often antil 9 P.M., when horses and men rush to the stream three- P contorta, P. Lambertiama, and P. ponderosa though I believe that many of the groves were of the variety (or species shall I call it ?) described by Professor Balfour for the Oregon Committee, under the name of P. Jeffreyi. It may posibly be a constant variety
(which is a speciea to all intents and purposes) (which is a species to all intents and purposes)
hough \(P\). ponderosa is very sportive, and would affor materials for long study. It is more than likely that . brachyptera, 2 and P. Benthamiana, Hartwe are all merely varieties. Often on the same tree may be found such differences. In these mountains may be also found Picea uobilis, Pinus mono phylla and flexilis, which I will search for later in the season, when have secured the earlies Zucc, on the summit of these ranges. Pinus Sabinians Dougi, with its huye cones, now makes its appearance in these lati'udes, though Mr. Donglas's deseription is not of the tree I have seen, hut agrees better with that

Apple" of the Mericans (Arctontapliylot glacaca), now made it uppenrance, though the figures I have secth of it ate very erromenua, as indeed are most botanical drawings of trees made by artint who were more anxious to secure telling picture than an accurate figure of the general habit and appearauce of the object.

\section*{Eorirtig.}

Royal Horticcltebal: Dec. 19-W. Wibon Saundern, Esq., in the chair. Iwo new Fellows were elected. The Chairman, adverting to magnifiont groop of Lycasto Skinneri and other winter-fowering plants ahown at this meeting by Mr. 'eitch, stated that the Council, in order so indicate the high appreciation in which such display: are held by it, had resolved to have a new medal prepared, to be awarded at the Tuesday meetings ouly, to exhibitions similar to that furnished on this occasion thy Mr. Veitch. This is to be pcond in value to the gold Banksian, and is to be culled the Lindley Medml, in honour of one who had done so much for the Suciety, sud whose loss it now had to Ininent. Mr. Saundere alluded in terms of satiretion to the success which had atlended coree tion that they would be even more interesting next cemon than they had beou during the year now about to close. The Rev. M. J. Berkeley directed nttention to three uew
were shown by Mr. Hobson, gr. to G. Comper, Eng. Old Kent Road. Two of them had yellow and brownenoured blossoms, somewhat resembling those of Hallii or radiatum; the other, which looked like a apotlers variety of O. Alexandra, evidently belonged, he sand, to the same category as Pescatoret, pulchellum, and membranacenan, but differed from al these in having the column fringed instead of loved, ua is the case in the apecies just mamed. The great value of Poinsettia pulcherrima for the decoration of conservatories in winter was next pointed out; after which attention was directed to borne fruit freely this year at Orton Longeville, nea Peterborongh, one of the seats of the Marquis of Huntly. It was stated that in its native country this Libucedrus forma a magnificent tree 120 feet in height, with a stem some 7 feet in diameter. In this country it was said to be difficult to propagate by cuttings, which, although they callus, refuse to root; theretore, if it should prove to ripen seeds, a point of considerable importance will be gained. Mr. Wilson Saunders drew attention to numbers of cut sprigs of Chimonanthus fragrana and the variety grandiflorus, which were placed on olle of the tables for distribution. This favourite hardy wall plant, he said, seldom seeds; the largeflowered variety had been obtained from cuttings struck from fragrans-a singular aport, the true origin of which had, he thought, never yet been satisfactorily explained.

Dec. 19 ( Floral Committee).-Mr. Veitch's valuable collection of plauts above alluded to consisted of no or Lycaste Skinueri, no two of which were eractiy alike, blowing
in an eminent degree the great liability to variation which exists in this species of Orchid. Associated with them were also Barkeria Skinneri and its darker coloured variety called atropurpurea; the Australian Dendrobium Tattouianum; the charming Rhododendrons Princess Alexandra and Princese Helena, the first mearly pure white, the second bright rosy pınk; Thibaudia mac"antha; Poinsettia pulcherrima; three kinds of Aucuba, viz., longifolia japonica vera, and variegata, all bearing bright red fruit; and the clear yellow-blossomed Urceolina a valuable Amaryllidaceous plant introduced by Mr. Veitch, a year or two ago, from Peru. From the garden of the Society came planta of the common variegated Aucuba in fruit; useful shrub at this season of the year; Musa coccinea, one or two Crotons, D) racemas of different sorts, one of the newer linds of Gymiogramma, and other plants.
Dec. 19 (Fruit Committee).-A dish of Tangierine Oranges was shown on this occasion from Mr. Rivers, and 1i. Capeinick, of Glent, reproduced the collection of Apples and Pears shown by him last week at the International Exhibition of Fruit
came from Messrs. Stuart \& Mein.

Zoologicat of London: Nov. 28.-Dr. J. E. Gray, F.R.S., in the chair.-Mr. Sclater made some remarks
on some recent interesting adutions to the Soclety's on some recent interesting additions to the Soclety
Menagerie, and on some animals which he had observed in various zoological gardens ou the Cuativent.-An extract was read from a letter addressed to Dr. Günther by Capt. J. M. Dow, F.Z.S., on the occurrence of two additional specimens of a poisonous fish (i'lallassophryne) at Panama-Extracts were read from letters addressed to the Secretary by Mr. R. Swinhoe, H.M. Vice-Consul in Formosa, concerning specimens intended to be transmitted to the Society's Menagerie. -Dr. Gray communicated a revision of the species of Folden Moles (Chryseht wis), founded upon an examination of the specnneus in the British Museum. He also read some notes on the habits of the Kinkajou (Cercoleptes caulivolvulus), and on the exterual
chiaracters presented by two species of Ratel, as
observed in the specimens living in the Society's Menakerie. A communication was read from Capt. George Bulger, Corr. Memb, on the habits of
the Musquash of North Ameried (Fiber zibethicus). Mr. A. D. Bartlett read a paper on the athinities of the Prong Buck (Antilocappra furcifera). The conclustons arrived at by Mr. Bartlett were-1. That the Provg animal sheds its horns ; and 3 , That the stracture of these organs appearis to be ilmperfectly understood - Dobroyde, N.S.W. on the nidification of a species of Dobstralian Lark (Mirafra Horsfieldi).-A communicalion wats rend from theut. R. C. Beapan, Corr. Memb. entitled "Indian Ornithological Notes, chielly on the migration of species." - A communication was rea from Dr. J. C. Cox, of Bydney, containing descriptions of seven new species of Australlian Land. \&hells, - Mr it Deseriptions of Two New Species of Marine Bivalv "Shells from South Australia,"-A paper was read by Mr. A. G. Butler, F.Y.S., entitled "Description of ह New Specfes of Cetonin, with Remarks on allied species. Mr. F. Moore comisuiunichted the first portion of an in Bengal by Mr. A. E. lussell, of the Bengal Civi Service. This patt consisted of a list of the species of the families Papilionidæ, Erycinidæ, Lycemidæ, Hesperidæ, Sphingide, and Bombycides, embracing descriptions o various new genera, and of upwards of 120 new species. -Dr. J. E. Murie, Prosector to the Society, read paper upou the Hairy-nosed Wonsbat (Phascolomys ridentical with the species previously described by Professor Owen under the name Ph , latifrons. Murie, having examined a series of specimens of this form in the collections of this country had arrived at the conclusion that there were three goorl species of Wombats at present known to
science, Two of these, P. Wombat and P. platyrhinus, Owen, belonged to the typical genus Phascolomys; the third, \(\mathbf{P}\). latiffrons, Owen, offered such striking distinctions in its osteological characters as would neeessitat the adoption for it of the generic term Latiorhinus, proposel for it by Dr. Gray on its external characters.
Ir. Gututher pointed out the characters of a new British species of Charr, from Loch Killen, in Invernesshire, Mr. W. H. proposed the natre Sollmo killenensis.various points of the structure of a large Fia Whale (Plysalus antiquortum, Gray), lately stranded in Pevensey Bay. Mr. Mr. P. L. Sclater read a paper won
the structure of the bird called Leptosoma discolor, from Madagasear, which had been generally referred to the Cuculidide, but which, from various charactert, he as type of a separate family in the neighbotirtioot of the Cotaciidæ.

Nova Scotita Fruit Growers' Association \(\omega\) The Anvual Exhibition of the Fruit Growers' Association of Nova Scoth was held at Welfuile on the 11 th Getobe belfeved, were never before brought together at ningle exhibition in any country. They were both fine One feature of the Exhibition showed a healthy bign namely, the great effort on the part of the fruit growers not to much to extend the number of varietiea as to bring forward the best possible samples of well
known standard torts. There were, for example, 18 lots of Ribston Pippin (in addition to those exhibited in collections), 17 lots of Gravenscein 22 lots of Bellefleur, 25 lots of Rhode Island Greening, and other market Apples were represented in nearly the same full manner. The weights of the largeat Apples were as follows:-Ribston Pippin, \(9 \frac{1}{2} 0 \%\).
Nonparefi, \(100 \%\); Greening, \(110 \%\); Yellow Belleflear, 11 oz. ; Baldwin, \(12 \frac{1}{2}\) oz.; Gravenstein, \(13 \frac{1}{2}\) oz. ; Cat head Pippin, 171 oz.; Emperor Alexander, 18 oz , Gloria Mundi, 20 oz. Nova Scotia Journal of Agriculture.

The Harvest of the Sea: a Contribution to the Natural and Economic Hiatory of the Brithon Foad Fishes By Jawen G. Bertram. London : Marray.
This book contains a most usoful and comprehensive account of the present position and future prospects of
the Fisheries of Great Britain. The author has collected a vast amount of information and very numerous statistics upon this most interesting subject, and the result forms a volume of 500 pages, the perusal of which will delight the varied tastes of all clatses o readers.
Beginning with the classification of fish, their ohape, form, and colour, wo are next presented with the of the orum until it becomes a full-sized perfect fish. Tho more useful herring is not neglecter, but has many a page devoter to it, as have also the herring
harvest, and the various processes of curing and packing performed in that town of Wick which is so notorious or its "ancient and fish-like odour.
The White-fish fisheries claim a large share of
mussels are
mussels are not overioind ants for care and interest. Mertrain's boo contailis a flll account of the piscatorial establishmente of Euningue, Comacchfo, Buisse, and the Stormontfield salmon-breetling ponds. The anglet also will find not only an account of the fish he may obtain, but how and where he may best catch them. The author's style is an agreeable one, and he has a pleasant way of interspersing his more solid information with sketches ike the following:-

There are pointo of contrast between the saimon end the herring which I cannot pass without notice.
They form the St. Giles's and St. James's of the fish vorld, the one being a portion of the rich man's food, aud the other flling the poor man's dish. The salmon is hédged round by protecting Acts of Parliament, but the herring gets leave to grow just as it swinas, parliamentary statutes being thought unnecessary for its protection. The salmon is born in its fine nursery, and is wakened into life by the music of beautiful over its cradle and guide its infant ways ; but the berring, like the brat of sume wandering pauper, is droped in the great ocean workhouse, and cradled mid the hoarse roar of the ravening waters; and whether it lives or dies is a matter of no moment, and no one's business. Herring mortality in its infantile stages is appalling, and even in its old age, at a time when the rich man's fish is protected from the greed of its enemies, the herring is doomed to suffer the most. And then, to finish up with the same appro priateluess as they have lived, tain of marble, while the vulgar but beautiful herring is handled by a dirty costermonger, who hurls it about in a flthy cart reproduction thë salmon is guarded with fealous care from the hand of mon, whilst at the same season the herring is offered up a wholesale eacrifice to the destroyer. It is ouly at its comes it to pass that what is a highly punishable crime in the one instance is a governnient-rewarded merit in the other? To kill a gravid salmon is as nearly as possible felony; but to an a herriog rests on the spa
 some of the sketches being from the pencil of such and E. W. Cooke, Eisq., R.A
We cordially recommend this clever compilation to the notice of our readers, whether finh eaters orfish cultivators.
Books Rechrived. The December Number of the Geological Magazine opens with an announcemont that its price is in future to be raised to 1 s .6 d ., which, considering the excellence of the imatter, is not the reasonable. The present part has, among other thinge, paper on some new species of Cyprea from the Eocene near Highgate, accompanied by a lithographed plate. The subject of most interest to botanists dis. cussed in this Number is contained in an abstract of a paper on Calamite fruits from the Spathic iron-ore, spikes in question are cylindrical, tapering at both ends, and consist of a series of sharply pointed overlappiug scales, 15 in a whorl; these scales conceal five cavities, into which project five sets of spore cases, each set consisting of five egg-shaped spore capsules, with hard ehining shells attached to a central stalk, which emerges from the main axis of the spike. Woodcuts are given to illustrate thle curious relic. The Techrologist for this month contains articles on the Propagation of Trout in America ; on Torbite, a new preparation of Peat; on the Food Products and Chemicals at the Dublin Exhibition, \&ce. The notice on the uses of Peat as a fuel is particularly worthy of attention, as it is estionated that there are available some twenty thousand millions of tons of this material, which is most valuable in the iron manufacture, and also for the generation of steam.--Nos. 31 and 32 of the Journal of the Linnean Saciety (Zoblogy) contain a great variety of interesting papers on subject address is mainly occupied with an account of the various publications of the several European Academies and Natural History Societies, as well as of independent journald. The list is a very extensive one, and, how-
ever satisfactory os a proof of the universal interest felt in the fatural history sciences, is anything but agreeable to the student who has to refer to such vast collections. It is, however, fortunate that moat of these publications are accessible at the \$ociety's library, or that of the Royal Society, under the same roof. In the same Number are to be fouud the obituary notices
of Fellows deceased within the jear.-With the Iwelfth Part the re-issue of Webster's Dictionary terminates. The present Part contains a variety of miscellaneous information, adding considerably to the value of the Dictionary.- Science Gogsip for December opens with an article "in memoriam," and refers to the severe losses which Science has this year sustained by the death of so many of its masters. The remaining articles are such as will sustain the repute of this ellent periodical, now 12 months old, and which

parts, and a soil will bo rich, and yet light and ope delicate rootlets of the plant will should b into which heat can be turned at should be placed as near the glass as posibiter good drainage is thereby secured; and whil de roots is equis rill apeedily remove them. Such a visitation need cause tho grower no uneasiness, as, if other conditions are should it be necessary during the prevalence of frost :o aphly fre-heat, some alr chould be given at mid-day if possithle, as a dry atmosphere of this character tonds if proluce red spider. On the other hand, in cold and dull moist weather, the plants should be carefully mbered, so that the
About Janury the plants should recefve a final shif Teto the blooming pots, using a soil compounded of good condung, if it can be pocured, and leaf-mould with the additiou of some silver sand. When shifted they thould be kept close for a few days till estahlisho i not, hinwerer, excluding nir altogether if needed. Ily the middle or con of February they will make rapid arowth, and thenceforth in sumny warn weather the proringed. It is, however, in sumny weather that great insechief is often done to the plants. A rapid evanoration of mosisture takes place, and unless waterine is the folage flers and and a suitable shaning pro This point cannot be too strongly or too often insisted on. At the period of rapid growth all superfluous leaves and emall shoots should be thinned out, so as to admit air freely and prevent mildew. When near Hooming time, they should be removed to the green
house or conservatory, where they will make a good dimplay for a considerable time.
As the Cineraria soeds very freely, bomb oan very readly be saved. A few pianks of the very best kinds,
that is liaving florets of the hest possible form, and of clear, weil-regulated, well-defined colours, should be seiected and placerl in a cluse house, to which air can be admitted at will; as fust as the seed heads busst
they should be gathered, as in a remarkably short time they become seattered. The seed should be sown in Ausust in a seed pan, using fine sandy soil, and should be placed in a cool place. Wheu the plants are large enough they should be pricked off thinly into shallow pots, and tiuen again into pots siugly when they have
grown large enough. When the crop of seed is gathered from the old plants, they should be cut down to about 4 inchess from the
bese of the stalk, and pleoed under a wall or fence having a north aspect. Late in the summer small offhoots are thrown tup from the roots, which oan be stock plants require proteotion frote heavy or cons thoroughly, soddened.
But little has been seen at the shows of the new
fiowers sent out in the suturnin of 1864 and apring of 1865. Caliban, an intensely bright white, with deep odging of rich fiery crimeson ant dark dise; Louisa, white with a deep edging - flower of aplendid form and very striking; and Unique, pure white, with a very deep edging of purplish lilac, of a beautiful colour when just opening and dark disc, a flower of fine form-theee were the cream of the lact batch of new flowers. This autumn adds but little to what is already possessed, with the exception of Lord Amberley, a remarkably fine violet plume colonred self, with a wonderful richness of colour, the rariety the floral Committee awarded its highest Certificate. Two or three self flowers from Slough, not Williams coudition, were yet promising, and Mr. B. S. to have been exhibited as seedlinges. Quo.

\section*{Cye Gpiary.}
loft off bremern hive, says Apis, had in Septomber an my resorting to feeding, that they commenced I have this year been nufortunate in my attempt to stocks from which Italian queens. In four of my old reigning queens have become hylurinised, and breod few black ured bees. This seems strange, as there are problewek hees kept near me, but it doess seem vary Ligurinns in a pure state. I think of occasionally importing queens from abroad, in order to keep up imported queen, two jears old this last summer, whic

Lipurines, huving this your become of very fino-coloured darker been ? From finquirice, I find generally that hives are very light, and have, in sowe lustances, boen brought beck from the moors lighter than when semt
in August. I foar, therefore, that there mill he a grint mortality among the hives this winter.

I fancy that the hybrid Ligurian queens, and aloo the drones, are handsomer than the pure-bred owes Frim the of my lueens sent to me from Switzerland, a breeder of pure boee, I raised several young queens, Which were the finest I have ever soen, but every one vexing and dhtwationag to foll, whan if fancil drunes-those to me, undet present circumstamoe betes noires-that my joung I lalians beoome crusised the common diones, and breed impure bees. 1864 every one of my joung queens came true; wut have been kept rathor closer to mo than formerly. To this I raust attribute my what of suocose in riaing pure breeding quoens."
Continuous feeding late in autumu will always stimulate the queens to lay eggs, and the bees to
hatch out the brood. Whether this forced breediug is beneficial or not to the prosperity of a hive, is a would seem highly cominciso to the prosperity of the hive in the coming semson. The young beps thus hatched so late in the yaar, are in thoir prime the
fulluwing early nprins, and live later than their wher sisters, therehy helphig on the col ny to the time when the lange sprong increake in thes tuke offeet, and the 1) us this foreed brectink, at a time woen the quewt womad maturaily te at reat, affect their focumity at a audecatud as to tho real facto of the eiso. With artificial awarms, raised rather late in the senson, we have no doubt that judicious feeding, for the purpose
of stimulating late breeding, is a very good thing: but how far it may be of real permanent benelit to well. established atocke, we are as yet unable to speak pusitively.

Apis" will refer to the few extrasts from a private letter of the Rev. L. L. Langetroth, in our last week's number, he will see that the best time for raising mure breeding Liguran queens is in Augnet, after the disappearince of the black drones in the ordinary course. Then, by the judicious allministration of food, the Ligurian queen mothers are iudnced to depnsit egge, and by the insertion of drone combs in the centre, drone eggs. Then, when these drones arrive at naturity, the young princesses will stand the very best chance of meeting with only pure isilurian dronce We would, therefore, recommend him to depend on the late-bred queens in his apiary only, for the per petuation of the species, and adopt the system recom-
inended by Mr. Langstroth, and previously allopted by Mr. Woodbury, and to some extent by ourvelves.
With regard to the queen, which "Apis" says was, when imported, \& breeder of pure Italians, but has since falleu off in this respect-is it at all certain that the queen now in the hive is the original one as imported? It is almost impossible for any apiarian, howaver close an observer he may be, to detens, or their identity with those which might have been at the head of his stocks oaly a few months previously Queens are changed, either from accident or by premeditation, far oftener than the majority of beo-zeepers have any idea. So it may be with the queen of the bive mentioned by "Apis.
There is a great difference to be seen among hives at o their weight and provision for the winter. In the south, many of the old hives, and the early swarma have stored up ample supplies, and are in fact really very heavy. The later swarms and soue stocks which contrary very light seemed to make all the difference in the prosperity of the swarms. Our later natural and artificial swarmes which arrived or were made about the middle of June all required feeding to enable them to stand the winter, while those established at the beginning of the month were very amply supplied with all necessaries.
Hence it will be manifest how great is the advantage which arises from obtaining early swarms, either natural or forced.
Some of the hybridised queens are cortainly mont beantiful creatures, and are splendid breoders. From one, wo this yoar ha dine 11 aribe seen at all equalled, so fine and woll marked were they.
The bees too were to all appearance quite pure ; but The bees too were to all appearance quite pure; but thin hive - and we started a large number-turned out aluost worthless, 80 far as breeders of good coloured bees was concerned. There must have been a cross, which only shows itself in the succeeding generation, as this queen still continues to breed most beautifull \(y\) coloured bees.
Truly there is mach yot to be leaxat rempeoting these wonderful insecta.

Bee Howses. - What would yous advise the to do in the following case? My boe house, containing three hives, was blown over in the late storm. The hives,

Which wero furniebed with supers and all complote Wuro much injured, the crowno were kuocked uif, and fusion. 1 have athmptod to remedy the misfortune by setting up the combe on the foorboards as well a 1 could, putting the hives down over thom. The bees have celweuted them together. The hiree eecen to have sustainede very great iujury, and 1 fear will hardly If you the freme hiree, you could readily have done nuch to remedy the unfor you conle recident have done could have been fired in the fremes by wires or small laths of wood; the bees would quickly beve made all mecure. It would, howover, have beeu adviamble to unite the boen and combs so as to form two stocks
 own apiary. have united the whole so es to constitute one strong colony. Perhaps as tho wiuter is so far advanced, it would be better to leave them as they now are until Late in Felruary or carly in March, when Wou can haspect the state of aftairs, and act accordingly. Wo most probsbly should then re
of the whole into one good stock.]

From the villuge an agreeable and somewhat picturesque road shortly brinus us to the quiet suburban retreat of Sibalunar. In g.nug towards it we pase the vicange grounde, in wincha the s me hanisame trees that wesling the rond, and bave a protty effect. Two growing in the valley are particularly worthy of notica -one a large and graceful Weeping Willow (Salix babylonica), of iteelf a perfect picture; the other a noble example of the common Poplar (Populue nigra), surpassed by auy of its kind inatry we think is no

The grounds of Shatumar are nut catensive, hut have been arranged with much judgment, so as to comblue uthlity with convenience and good taste. The house is a subintantind and commodions building, plaed on a slightly elevated platorm, from whieh the ground gradually slopes towards the east. Attached to it, and entered from the drawing.room, is a landeme conservatory, containing come nicely grown Ocange and Lemon trees, in fine health, and loaded with large and beautiful fruit, equal to any, from the sumy South when perfectly ripe, and occationally sent to table an a part of the demert. Camellias, Azalem, and a variety succeasion throughout the year, and are mont effective for decorating this delightful appendage to the honse, and rendering it more interesting and attractive. On the north and west there is a con-
siderable exteut of triuly kept lawn for recreation and dausement, with suitable walk for air and exercise when the turf is wet and untit for walking on. Adjoining the piensure ground on the south, but gercened from it by ghrubbery, is thr fruit and kitchen garken, in which Mr. Hiekards to.k great interest, especially in all that relatod to the culture and forcing of the various fruite that are most enteomed for the dessert. Some might objuct to the garden being pluced so near the homee, but we do not think a more convenient or appropriate site could have been chosen for it, nor one that offer a better example of the way in which the useful and ornamental departments of gardoning may be made to harmonise with each other, than is to bo found here. The first thing that attracts attention on entering this garden is the neat appear ance of the fruit trees in the borders on either side of the principal walks. They are all espaliers, trained to wire trellisels, which is periuaps the best mode of training that could have been adopted for making the most of a garden of limited extent. The trees occupy but iittle room, and while their branches are exposed to the sun and air, they are prevented from being broken by high winds, and the fruit trom bemg blown down just when it has uearly arrived at maturity in the autumu Gooseberrion, as well as Red and White Curnats, are also trained to wite trellises, and by means of a thin covoring being thrown over some of the bushes, the fruit is protected from birda and preserved in a perfect tate until the middle or latter end of Oetober
Within the last few years a consileroble extent of glass has been erected here. Agnimst the east wall is an orchard hon-e. 95 feet long, 18 fiet with, and 11 feet high, with a tront wall 3 feet hash, in which are openings for the admisaion of air, besides the ventilator in the saches on the plan recommended by Paxton.
Trained to the wall are 0 me fine Laalthy Yeach and Neotarise trees, while along the middle of the house dwarf Plum and Cherry trees are planted at proper cistances, and others in pots are grown between
and highly esteemed for its delicious fruit, which is proluced in abundance, and attains a tolerable size. We coniller this dwarf evergreen shrub to be admirably adapted for orchard-bouse cultivation. It is nearly hardy, requiring no more than a slight protection from frost, and the fruit, though small, is of exquisite flivour, surpassing in this respect that of any other flyour, surpassing in this respect that of any other with which we are acquainted. No artificial heat is or a variety of purposes during winter, and is a good example of the kind of glass structure which the late Sir Joseph Paxton was the means of bringing into notice.

The Fir-house is a lean-to against the north wall of he garden, and adjoins the orchard-house. It is 32 feet long, 11 feet high, and 11 feet wide, heated by hot water, and ventilated by moveable openings in the sashes in Paxton's manner, but has no front wall. The trees are planted along the back, and trained against the wall; while in front are Vines trained up the rafters near the glass.
For early Peaches there is a house of the same limensinns as the Fig house, heated and ventilated in a similar manner. Trees are placed agairst the back wall, and others in front are trained to horizontal wires, stretched along the house within a short distance of the glass. Forcing is usually commenced about the niddle of December, in order to have ripe fruit in the beginning of June
For Grapes there are two vineries, each of which is 30 feet long, 15 feet wide, and 15 feet high, with upright sashes in front, both heated by hot water. In
one of these, we were informed, the Vines had become exhausted and unproductive, owing perhaps to repeated liard forcing. It was, therefore, deemed advisable to remove them, and young Vines were accordingly grown ior the purpose of occupying their place. When these were ready, the old Vines were started early, and a li,lerable crop obtained from them last May. They were then removed, the border thoroughly remade,
and the young Vines planted in their stead. These have now filled the house with strong, bealthy, ehort-jointed rods, that we think will amply repay with choice froit the little extra labjur and rpense that may have been incurred towards its pronetion.
Pines are grown to great perfection. Indeed, we never saw plants in finer condition, or more promising in their ahow of fruit. The house they occupy is 30 ft . lung, and 13 ft . wide, heated by hot water. The sorts relerred are the Smooth-leaved Cayenne and Black I Imaica for winter fruiting, and the Queen for general cuiture. A very handsome specimen of the latter that we had an opportunity of seeing weighed, exceeded 4 lb .
The true Dwarf Banana (Musa Cavendishii) has been riccessfully grown and fruited here. As it forms a valnable addition to the dessert, we are somewhat The fruit ripened in this country is stated to have an insipid taste, but the specimen with which we were fivoured from this plant, proved luscious and sugary, risembling a rich Beurré Pear, far surpassing in flavour
that of the Bananas from Brazil, which we have repeatedly eaten and enjoyed.
Melons and Cncumbers are as usual grown throughrit the season, and scarcely a day passes without a Cucumber being sent to table.

Strawberries are a favourite fruit at this place, and in great request, either forced or when they can be whained from the open garden. The varieties which have been proved to be well adapted for forcing are Reeves's Felipse, Myatt's Eleanor, Sir Joseph Paxton, and Sir Charles Napier; and for late forcing none sur"'sses Ingram's Pine. Keens' Seedling used to be one if the best sorts to depend on for a crop, but from some miknown cause it has of late years failed to sustain its
former high character. The forcing-house is spanrrofed, 30 feet long and 13 feet wide, heated by hot water. A footpath is carried down the centre, and on ctch side is a bed in which dwarf Figs are grown in vts and forced.
The usisal time for commencing Strawberry forcing a about the middle or latter end of November, so as to live ripe fruit in February or early in March, after which a sriccession is kept up until fruit can be athered from the beds in the garden.
Besides the varieties above mentioned, there is ninther grown here under the name of "Brown Bess," which we do not remember to have seen or heard with Mr. Webb, of Calcot, near Reading. The l, it is vary large and highly-coloured, but irregular iu shape, and compressed in such a manner as to in that of the best variety in cultivation. Although usnsuited for early forcing it has been found very usetul for the latter part of the season.
The raising of Mushrooms is carried on with as much rrgularity as that of the different sorts of vegetables riquired for daily use. For this purpose a house at the biack of one of the Vineries has been fitted up with teds on the floor, and on shelves. The first bed is n-nally prrpared in the early part of October, and in *. \(x\) or eight weeks Mushrooms are expected to be wrepared and spawned in buccession from time to time Wepared and spawned in succession, and thus a constant rupply is maintained throughout the senson, until they Lecome plentilul in the open fields.

Leaving the fruit and forcing garden, the orchard ext claims attention. It is a long and rectangular piece of ground, facing the south, with a geutle slope towards the east, and forms a valuable addition to the kitchen garden, from which it is separated by the coach-house and stables. On the north it is screened by trees, so as not to be seen from the approacb, and is enclosed by a strong Thorn hedge. In front of the latter is a wide border for the growth of early crops, and such as require occasional protection. The rest of the ground is set apart for the culture of vegetables, and the smaller kinds of fruit-such as Currants and Raspberries, \&c. A walk surrounds the whole, and another crosses in the centre. In the long borders on the south and north espalier fruit trees are planted and trained to wire trellises, like those in the sitchen garden already noticed. This obviates the necessity of having larger spreading trees interspersed among the vegetables and small fruit bushes, to shade and otherwise injure them. One of the most striking features in this orchard is a long row of pyramida Pear trees of the very best kinds, both for dressing and the dessert. They are well grown and beautifully traioed in the manner called by the French "e quenouille," bat with this difference, that the points of the shoots are tied down so as to check the upward flow of sap, and induce the formation of fruit-buds. The plan is an excellent one, which we remember to have seen practised many vears ago in the garden of the Horticultural Society at Chiswick.

In concluding our remarks on this place, which contains many objects of interest to the amateur as well as the practical horticulturist, we think it is due to Mr. Gilbert, the able and experienced gardener, to atate that the clean and orderly manner in which every thing under his charge is kept, does him great credit He seems to be thoroughly imbued with a love of his profession, and takes a pride in trying to bring what ever he cultivates to the highest degree of perfection Alas! that even since the preceding remarks were penned, his excellent employer has been removed from amongst us by death. M. \(\boldsymbol{E}\). \(\boldsymbol{H}\).

\section*{Calendar of Operations.}
(For the ensuing veek.)
As the weather still continues favourable, if not already done, trimming and cleaning out hedges should receive attention before the season commences, when other things will occupy all spare time. As neatness should always be a leading feature in every garden, everything that can be done to promote this should be forwarded now, when little else can be per formed. Anything that appears unsightly, and that will make manure, should be removed to the rot covered with a little soil to prevent all noxious effluvia from escaping. The soil also mixes among the decaying vegetables, and becomes excellent compost. Soap suds have a good effect on many kinds of vegetables and should not be thrown away; they act beneficially on soils where Cabbages are infested with the club, and in some instances have been known to entirel cure that disease.

\section*{flowkr garden and plant houses,}

Soldom have we had such a fine season for out-door improvements or alterations as that now about to close. Tender plants are, however, in a somewhat forward state, and it is necessary to keep them securely protected at night, as frost may come upon us when we little expect it.

Auriculas.-These may soon be top-dressed, removing carefully the surface-soil, and substituting some two-year decayed hotbed manure and leaf-soil. Avoid all hot, stimuiating composts, for though they may increase the size of the flowers for the current season yet they are so uncongenial with the nature of the plant that the foundation of future disease will, in all probability, be laid.
Cape Heaths.-Let these have close attention as to watering. Keep up a gentle ventilation day and night if possible; let the air steal in moderately, and dispense with strong fires.
Carnations.-Still give these all the air poseible. If green-fly begins to be troublesome, remove it with camel-hair brueh.
Pansibs.-In some places these are showing a tendency to bloom, arising from the past mild weather. The blossoms, however, will be better removed, as their being allowed to remain will only weaken the plante.
Pelargoniums. - Give air whenever the weather will admit of it; but avoid cold draughts, and keep out frost. On the other hand, be careful, however, not to use too much fire-heat. Training and shifting must also receive attention

Priss.-Soon after the shortest day the wireworm gets more active and mischievous. If there is reason to suspect that any of these lurk in the beds, cut a Potato into quarters, inserting a skewer in each ; place them in various parts just below the soil, and examine them daily. This is an effectual trap.
Polyanthuses.-Plants grown in pots may be kept moderately moist, and a similar top-dressing to that recommended for the Auricula will be of infinite service to them. They may, however, be grown on beds, with a north-east aspect, with great success. A cool bottom,
sine quâ non for their perfect culce bor
Ranunculuses. - In selecting roots choose those with a high crown in profer Tyso's Edgar, yellow edged voown koonin Tyso's Edgar, yellow edged with pace
Apollo, crimson self; Mr. Welch, deep pink: Madeline, white, beantifer odod Bartlett's Charlotte, superbly mootlled Bxy white, purple edge. The very old flo ent splendid dark; Socrates, olive; and I pink str

TuLips.-As yet there has been bat litin en affect these. As they advance they will, hat require strict attention to guard them effects, as well as from those of heary wot FORCING GARDEN.
CuOUmbers. - Continue to prepare fand materials for the growth of these in frames
Pines.-If in looking over the succesion pla are observed to be uuhealthy, the sooner the disrooted and repotted the better, choosing a mind or the operation. They will soon begin to methe roots in the fresh soil, and will be re-established be they are required to make a start. Those plathe require the soil to be shaken from them, ber shifted into larger-sized pots, will do better if il deferred for some time yet.

Vines.-If there is ample means of obtaio:igs : atmosphere, it will be necessary to pay some ave to this point during damp close weather: \(23: \mathrm{L}\),
sible to have more than is necessary for tha la the Vine after it is in leaf. Keep watch sticts fermenting material upon the borders, and exa them frequently to see if the heat is regular.
hardy fruit and kitchen gardey. Continue to trench, dig, and ridge every apa f ground when frost permits, during which manure necessary be wheeled out for the w spring cropping, laying it in heaps, either on the: where it will be wanted, or as near as possible. .. That portion not required for immediate digre should be piled in small mounds and soiled ore: prevent loss by evaporation
Fruit Trees.-With regard to bush fruit, if as have stated before, dressings with hot lime anis when the trees are wet were more attended to, we sa not hear so much of the ravages of birds buds, and we would recommend their application to standard Plum trees wherever practicable, as: not only keep them free from Moss and Lich assist in the extirpation of those insect
for which birds commit such ravages.

\section*{Che \(\mathfrak{F l g r i t u l t u t a l ~ G a t e t t ~}\)}

\author{
SATURDAX, DECEMBER 23, 1865.
}

IT will be seen from the correspondence in another column, that the Home Secretary is at length endeavouring to collect Statistics of our Live Stock. Surely those who have hitherto obstructed Government in the attempts which have been already made to gather information on this subject, lest they should facilitate a suspected class taxation, must regret their lack of publio spirit now that an appeal is being made to the Chancellor of the Exchequer for help to bear a
blow which through that class has fallen upon the whole community. The information now sought will be gladly rendered; but the facts will not be obtained so accurately under hurried inquiry of this kind, as they would have been by this time under the periodical correction of an annual inquiry, had the work begun some years ago. We shall however no doubt now learn with sufficient accuracy what the weight of the blow which has befallen us is in exact proportion to the width of the shoulders on which, unaided and alone, it in the meantime rests. If the average loss attendant on live stock management has been hitherto not more than 6 or 8 per cent. per annum, we shall see what a frightful multiple of the ordinary losses this cattle plague amounts to, and the need of diminishing if possible the severity of the blow by distributing its weight will become apparent. It seems only fair that those should ber a share of it in whose interest Government interference has already in many instances aggravated its destructive effect ou individual fortunes.
The disease has at length attacked our great Dairy districts, Cheshire, Glouctstershire, and Wilts. In the first cuinty there were 1200 fresh Wild. In the whole number 3000 ases last week, and artacked, nearly 2000 were dead, about 900 being still under treatment.

THE Society of Arts has latterly been occupying itself pretty frequentlywith agrioultural affairs. On Wednesday of last week the subject of London milk was discussed before it in an elaborate paper, which has since been given in our oolumns. And on a previous Wednesday Mr. Bailey Drition called attention, as he has often dune before, to the important question of the water supply, especially in country places. We are not about to connect these two subjeots by any remarks
of oure, es wee attempted by a witty apeaker last Wednedar. Neither shall we pretend to eatimate their relative agricultural importance. That the therduction of milk is a considerable bracoh of the production of milk ised manufacture is unquestionathe, and II fs equally cortain that the calo ooneequent upon ite production for London of at least \(30,00000 \mathrm{ws}\) a fat ment, every year in the rers prime of their power as milk producers and as treeding stock, is a great and influential fact in the agricultural eonomy of this country. The water supply is also an agricultural subject of the very formont clasa. And neone hes dane more than Mr. Bailey Dentor to take it out of the rauk of merely social questions and to illustrate its agricultural relations. It is indeed to him, originaily we may say alone, that we owe the position as an agricultural question which is now everywhere secerded to it. The relations of land draiuage to this suinjeot have boen thoroughly atudied by him, and urged repeatedly upon the alluntion of localities, sucieties, and Government. And in his paper read the other day before the suciety of Arte, they were once more laid before the public.

There may atill the some who think that the difliculties of the water supply bolong exclusively to towne and densely populated districts ; and who imarine that in the country all that in needed for the supuls of any house is just to sitik a well. They require perhaps to bo infurmed that over large tracte in this country wells have to be dug 100 yards and deeper before water is reached; and that the area which depende on surface water collection is very great indeed. In cases of prolonged drought, such districts labour under very serious difficulties. Evaporation reduces the eontents of the ponds until the water in them becomes a saturated solution of misohievous impurities ; and fatal diseases often rise which are fairly traceable to this source. Moreover, the supply of water to the livestook of the farm then beoomes both diffoult and laborions. On both sides of the valley of the Thames, where the river travernes the chalk, there hes been thus during the last two summers an immense amount of labour involved in watering stook. Farms five or six miles from the river have had to devote at least a quarter of their horse power for month together to the carriage of water. And thus it is that the supply of water to country places beoomen a atriocly agrioultural question.

It was, however, left to Mr. Bailky Denton to point out that in a still directer way the agricultural relations of the subject are of the very highest importance. Land drainage is supposed to have diminished the supply of rivers, but this is a mistake. The more rapidly that rain-water finds its way to rivers, the less waste by evaporation will it suffer on its way. Land drainage has thus increased the river supply. But it does this intermittently. Floods in the lower grounds are more frequent than they were, and they follow the rainfall more rapidly than they used to do. And thus, though lagging by the way, as water does in undrained districts, tends to lose by evaporation, it also tends to a more uniform supply. Land draiaage, which is of course promoted, and will be so still more, simply for its fertilising influence, is thus rather increasing than dimioishing the difficulties of the water supply to country districts. The remedy which Mr. Denton urges is the conservation of the winter etore for summer use. This winter store from "through" drainage, whatever its aotual quality may be, is certainly better than that of mere surface colleotion. It is the latter on which many a village now depeuds, and it is this which often fails them in a drought. If the drainage water of the neighbourhood of any village (of only a few acres indeed) were collected and stored up, the quality would be better and the quantity would be surer.

This is the point on which Mr. Denton has so long insisted, and which he has illustrated both by prolonged observation of the relations between the rainfull and the drainage water in the case of soils of various porosity, and by published plans and estimates suitable for various local circumstances. A very competent body of men are now engaged under a Royal Commission in examining the relations of the rivers to the towns. The water supply of ooe-half the population is thus being investigated, and we shall learn no doubt from their labours much that will tend to its improvement. The water supply of the other half of Her Majesty's subjecte who live in country places is equally deserving of in vestigation; and we are contident that any one who should take up such a sub jeot for thorough and exhaustive treatment, would find it large enough, as well as sufficiently difficult
fruitful, and important, both to need much special information and ability for its efficient examination, and to offer many valuable economienl and social results as the reward of its patient investigation.

In our reference the other day to the need of Herd Books for the several breeds of cattle and of sheep, we expressed the hope that the circle of usefulness might soon be completed by the addition of the Galloways and Ayrahires to the list at uresent incomplete. We find on examining the Preface to Mr. Ravenschoft's Polled Herd Book that an effort has already been made in the direction of the Galloways; and though, owing to the apathy of breeders, it contains a poor array of names, yet there is in that volume a distinet and separate list of some of the Galloway herds. It is, however, certain that the Galloway and Angus cattle do not exist as pure and separate breeds. The very best Angus breeders cross with Galloways, and vice tersa, and probably the best plan for reoording their several herds would be by the issue of an Improved-polled Herd Book, in which breeders should frankly acknowledge their obligations to one another.

\section*{Paper Pipes for Water and Drainage.} Sheets of paper dressed with bitumen rolled on a mandril under heary pressure. We believe they have stood the test of 10 or 12 years as Gas pipes in Paris. Is it known how long these pipes will last underground? For a turbine they can be safely recommended as far as strength and cheapness are concerned, but durability is the question. There is no power like water for blades to regulate supply according to demand, for 1-horse power pulper, or \(1 \frac{1}{2}\)-horse power chaffcutter, or 4-horse power threshing machine, have muoh to recommend them.

Wind Power for Turnip Cutters for Sheep is particularly worthy of the attention of flockmasters ou the bretzy South Downs. Twenty years ago we remember a olever shepherd who, When there was a suffioiency of wind, took off the Turnip cutter handle, fixed on a simple windmill, and cut the roots. The whole framework for the vanes consisted of light iron rods. B. M. F.

\section*{StATISTICS OF LIVE STOCK.}

THE Secretary of the Bourd of Trade presents his compliments to the Editor of the Gardeners' Chronicle and Agricultural Gavette, and requests that he will be spondence that has passed between the Board of Irade and the Home Office respecting the collection of returns of the number of live stock in Great Britain, together with a copy of the Schedule to be issured by the Board of Trade, and of a letter that has been addressed by Sir George Grey on the subject to the Lords-Lieutenants of the several counties. The form will be sent to, and is to be returned by, each occupier of land through the post office (wherever available), and the returu is to be made by the occupier upon the day that will be specified in the Schedule, probably not earlier than the 1st March, 1866, owing to the very large number of Schedules that will have to be printed and distributed.

Whitehall, Dec. 16, 1865.
"Oßice of Committee of Privy Council for Trade,
"Sirr,-I am directed by the Lorlds of the Oommitte of Privy Council for Trade, to request that you will move Secre-
tary Sir George Grey to cause the County Magistrates in
Kemghand and Wales (and the corresponding authorities in Soorland and wales (and the corresponding authorities in Board of Trade for the purpose of accertaining the number of

 gaseous contagious matters are get, who ears by ammonia, which may be considered in tumnt receives a gaseous form, just as it iontus Lat causing the smell of innumerable substanco mean volatility, and many of which have no odour Liebig, in 1840, who said-"Ammonia is very
produced in cases of disesse produced in cases of dibease. It is always present in the chambers of those aftlicted stroying the vehicle of the disease by fixing ammonia, simply describing gypsum as a deodoriz then named what further means of prevenu
by disinfection I had found by to be the most effcacious. Apart from wy oxperies rience, your reviewer will find in Meehi"s "Sarre Towns," App. p. 89, a table of disinfectants. co I recommab, wherem it is stated that tho 2 Condy's Fluid, is among all the deodoriser only "complete disinfectant" which is same time a "powerful direct oxidiser." The
other complete disinfectant is chloride of lime however, he describes as a "powerful ind oxidiser," in consequence of which it is also a powerti destructive agent, and this latter property is no donke a reason for its injurious action upon the muman membrane and lunge, which should in all animals (men or beast) be carefully avoided if possible during epidemics and epizootics.
My whole theory consists in the prevention of fixing the ammonia which carries it matter, and \(t\) ? place, and it has been found in practice that this phas most effectual.
I may add that a cure will be found almost certas. by immediately after the disease is discovered adm:cs. tering an injection of a wineglassful
Fluid in a quart of warm water mouth half a pint of Linseed oil, mixed with a by thater of a pint of good spirits of turpentine after which the animal should bo well what sponged all over with Condy's Red Fluid, of the strength of a wineglassful or more and quickly and carefully rubbed dry with cioths, and
well covered up to secure warmth. About an locar well covered up to secure warmth. About an loon
or less after the oil and turpentine have been given, a wineglassful of the following mixure should be given every hour for twelve hours:Half a wine-bottle of Condy's Red Fluid, \(1 \frac{1}{2}\) or. \(d\) sulphuric acid, and water sufficient to fill up the bottle. The cow should then have a quiet rest for is hours, when a wineglassful per hour during the day may be given of a mixture of equal quantities Condy's Red Fluid and water without acid for soms the falaishing the doses or fist six hours, instend of alcoholic stimulants it has been found better to administer every three hours a dose of 2 oz. of good coffee (without chicory) made in a pint of hot water, and when sufficiently cooled to be given warm with horn, both liquid and grounds. This will b
found to act as an astringent, antiseptic, tonic and stimulant
dose of the Red Fluid will be better omited During this time great care should be tuken to kep the ammonia ueutralised, and the shed and feneed disinfected by Condy's Red Fluid ; and all other animaza in the same herd would be better well sponged cem. sionally with the fluid and rubbed dry, and lare administered to them once or twice a day uaid a mater by the horn thll the fflicted animal is cured. Duriog the illness no food should be given that requires rumination, but bran water and starehy food will we found the best. After recovery, which should betaken place in three to four dayss, great care shand not too many Turnips or raw Potatos, which have in many cas canmed the death of animals rapilly recovering. J. Lundy, Leith, Dec. 14.

It will be seen by the reader of this Table that in eight cases ont of nine in the Strand district the milk was diluted up to 40 or 50 per cent, with water. In Ketsington and Camilen Town a somewhat smaller proportion was found to he adulterated.-In a lute repirt, to the Maryleboue vestry, Br. Whitmore, the results of analyses by himself, from which you gather that out of 20 saumples indiseriminatefy purchased there were only cight adulterated, and of the others some were particulatly rieh, containing 10,11 , and even 14 per cent. nt cream. Mr. Druitt, in one of his uurterly publications, as medical offieer for St. George's, Hanover Square, speaks of 82 analyses made in the autumn months of 1861, of samples purchased indis. criminately from 45 dealers all over that parish, and probably genuine, were poor-23 were of extremely probably genuine, were poor-23 were of extremely
low specific gravity foom the addition of water, and three were in such a condition (it is supposed (rom artifieial treatment) that they would not coagulate with remet, and were probably therefore untit for children. As to the specific gravity. Dr. Whitmore allegis its inadequacy, owing to the fact that low specific gravity may be due to the excess of either nome or other of these very different ingredients-but Dr. Voeleker informs me that cream, though lighter than milk, is heavier than water, and therefore, excepting the ase when water has been udded in well devised proportion to skim milk! (and when therelore the adulteration must be obvious at once) the specific gravity test may be depended on.
Tuere are, I believe, cowkeepers in this room Who kuw, from thicir own conscientious manageial in London slops (and remember, I have
 consume!s, with a personal knowledge of those with whom they deal, getting good milk-it is of the supply upon the whole to the millions of the metropolis that 1 lave been speaking) yet I believe that cowkeepers will pmpular prejulice on this point is no doubt correct. As to the other popular prejudice, however, connected with thesuhject-the idea for intance that chalk is adiled, the outragenns idea that "brains," as we have heard, and other fithly animal jellies areadded, they may be dismixsed as utter fiction. Thave never met with a chemist who has detected chalis in milk, and to any one who knows bow wiffeult it is even in country houses to keep good milk sweet for any length of time, the idea of any other addition than pure water is absurd. I am not here to aefend nor yet to condemn the London milk trade, but
ann's to tell the truth about it, regariless whom it in if iffect, and I have no doubt the cruth is, that the I. k Which we drink in London is (probably in the henj rity of cases) diluted; nor can there be the slightest heritation in declaring that this dilution, supposing it valent to tieft; so also is the sale, as new, of milk that has been skimmed.
Well, gentlemen, how are you going to avoid being cleated in this way? Are you going to depend on

Che lange and Whatenale management of misalar of gentictine grial can,

 whet higherem in the fields aud hats and cothage of euntry life than in the shope an i streets of eities, and the deaier-1 mean of cmase the haneat deaier-vicu fills his cans amides green fichis, wid have wo better chance (though a very food one rim doubt he has) of Anpplym you mith matimated milk than the man who tahes his milk frum loudun cowhoraes la every case, too, whether that of a company or of a town or case, too, whether that of a company or of a town or enuntry demler, you are dependent (rememaly, no domot, safely dependent on hre honesty of the servant who
distributes it. But l)r. Whitnure tells me that his analyses have proved that milh purchased casnaily in the shop, and unlk delivered by the earrier at the door of the consumer from the very same shop, are often very difterent thugg. A dishonest carrier hars the ehance, if he chooses, of suppiyng milk to a dishonest retal dealer, and filling up his can with water. In fact adulteration can only be prevented by the extablish. ment of analytic supervision - a scientific ugency constantly employed in comparing the composition of the milk offered in the shopss with that of the milk Irawn from the cow. A: agency of the kind woula, tombtless, be a very emicient and useful depmatment of prolice, and there scems no reason why guahty should not be tested constantly in this way by compraison with the genuine artich, seeng that quantity is being constantly determined by the official comparison
weights and mepsure with the proper atmdaris. helieve the per centage of honesty on thi great scale to be) a pretty comenant qumtity and genarally prevalent; how then about cemutr! mik an comparea with that of the Lohdon cowhuise? Why, even then I believe the latter is likely to be the better of the two. First, it is more the interest of the cowkeeper here to feed his stock well then it would be the interest of the cowkeper there; the latter has conveniences for calving his cows and keeping them on the latter must sell his cows as they get dry to the butcher. Secondly, milk brought 50 or 60 mites, as 12 very much now is, to loodon, munt be at least 12 hours old before it reaches the consumer; that from the London cowhnuse is abont four hours ofd, or barely so much. Thirdly, the shaking of the milk along the course of 50 or 60 miles of railway, and the rattling over the roads to and from the station, is certain in a proportion of imatance to iujure the milk, in other eases ulterly to spmil it - in all, I may say, so far to injure it that it will not keep so long nor be so useful for certain purposes. That is the presumptive case agamat the country milk as compared with that produced in Londou? What is the fact? If you want to know the real value of one or other, you must find out, not what the consumens of it give, but what dealers in it can afford to give whosumply the shops-that unquestionalit is the true measure of its value. Daters in milk wil give from \(4 d\) to \(6 d\). per barn zallon more for town-shed milk than for what is delivered by the railway And no wonder, for even now it often comes in sour, an what must it be in the hot weather of summer it is with very great regret indeed that the retail dealer find himself cut off from his supply of town-rhed milk, and forced to betake himself to the dealer from the cuntry London milk in London is worth more by \(\frac{1}{2}\) d. to " d . a quart than country milk in London; and that is a difference quite enough to account for the fact that bulky Grass and Mangels are carried many miles to London cowhonses, there to be consumed instead of being consumed by cows at home, even though there were not the great advantage which the London cow-keeper has in thie close neightiourhood of the great breweries, with their enormous supplies of grains.

But whatever the superiority of the town-hed milk, it plain from the way in which the cowhomes have been id the plarie that London will hereafter been ford for be fed from the country more geneally than it has been. What is the quantity whech has been hitherto consumed in town? I have here the published return from the metropolitan association of medical officers of health of the number of cowslieds and of cows, so far as could be ascertained by inspection and inquire, on the \(13^{\prime}\) h of August list. Four districte out of \(4 . t\) sent no returns, but adding a prop, itionate number for them, it apmears the the aumber usnally kept in the metroit appears the the for 18 oon and very pro-
 bably in outlying paristhe, senaing wis by rallway, there may be sivenal thoueands more. I may therefore probably assume that london has been litherto supplied by 24,000 cowe, besides what it has got by

\section*{railway.}

Thave to thank the managers of the several metro. politan railway for the material of the folluming Truble, From phich I see that the (treat Western Railway has ent very little up till latterly; that the North Western has sent up \(40,000,60,000\), and 100,000 gallons annually during the lust three years; that the (treat Northern has sent up 250,000 and 300,000 galtons in 1863-4; that the Great Enstern has sent up 600,000, \(800,000,300,000\), and 1,060,010 gnllons reapectively in he last fone years ; hat the Sjuth lastern han eent up 120,000 to 180,000 gallons; the Brighton about

Soicn) Eailows, and the South Wentern about
 wose chus brometh up hast gear, and this anamt he mided

 year. This is just 8 gullons (is) pinte) a bead per ammain: Pather more thate ouesobith part of a pimt of will a day apuee.

The returns given in another Table, for which I have to thank the vestry clerks and inspectors of the several parishes within the metropolitan districts, khow the way in which the number of licences for town cuw.

number of the cows has been told me in very few
instances ; but I see that Mr. Jones, of the East London Cowkeepers' Association, announces that of 4456 cows Cowkeepers A8sociation, announces that of 4406 cows And though this is much beyond the average of other districts (for instance, in Chelsea there were 745 cows usually kept, 182 have been sold fat during the autumn, and not above 10 or a dozen have been killed by the plague, and 45 fresh cows have been bought in ;) but I gather from an inspection of the returns, yet imperfect, to the Privy Council Office that there is no reason to doabt that more than one balf of the London cows have disappeared, and we are probably now dependent on 10,000 instead of 24,000 cows in and around London.
Under these circumstances of course the railways have been brought into more active use, and they cestainly now must lay themselves out more systematically than hitherto for the conveyance of milk. Special trains perhaps will be appointed, and special carriages constructed to enable its prompter and more safe couveyance. The Table shows that the Great Western Kuilway, formerly conveying little milk, brought in 23,000, 39,000, and 103,000 gallons in August, September, and October (much of it from Wiltshire); the London and North-Western Railway in four successive autumn months imported \(6000,17,000,57,000\), and 92,000 gallons; the Great Eastern rose from 70,000 to 100,000 , and at length 112,000 gallons monthly. The South-Western has risen from 1500 to 3760 gallons a day, bringing much of it more than 100 miles; and other railways have increased in somewhat similar proportion, so that London'was supplied in October last with country milk at the rate of \(5,000,000\) gallons annually, which, however, was still a very inadequate substitution for the milk of the 14,000 cows which we have lost.

\section*{The Consumption of Mifis.}

I shall now state, as shortly as possible, such facts as I have gathered on the consumption of milk. Fourteen schools and asylums for children, containing 5321 betweed 2 and 16, with aboat 500 adults to take care of them, consume, as I have been kindly informed by the managers of them, as nearly as possible 1650 quarts a day. Two adult asylums, not infirmaries, nor gaols, nor workhouses, containing 2350 adults, men and women of all ages, consume only 350 quarts. I belteve a company of 5320 children, up to 16 years of age, need about 9000 adults of all ages to be added to them, in order to make a community of all ages in the proportionate number which such ages represent in every general population. Add, therefore, to the consumption of these that of 9000 adults, according to the quantity of the two instances already specified, and you have a total of abont 2400 quarts drunk daily by 11,320 people, which is as nearly as possible (. 42 pint), 2.5 ths of a pint a day apiece consumed by a large general popuiation under medical direction. It is plain, then, that London, which under the very liberal eatimate already made does not get one-half of this quantity a head, is very imperfectly fed with milk.

What do other places get? Stirling, in Scotland, has a population of 12,500 persons, and is supplied by 190 cows in the town, besides 200 gallons a day of buttermilk (a most nutritive and useful food) brought in by rail and otherwise. We have here a cow to every 60 people; and this, at the average of 800 gallons yearly to every cow in milk (less than I have put the produce of a London cow, because there is not so frequent a change among them) gives 100 imperial pints per annum to every man, woman, and child, or about \(2-7\) ths of a pint a day apiece, very nearly the medical standard, and indeed exceeding it when the 200 gallons a day of butter milk are taken into account, for this would furnish half a pint a day to the 3200 belonging to the labouring class in a community of Stirling, for the above thank Mr. David Morton, of Take now the above facts.
Take now Mansfield, in Nottinghamshire. There are here about 10,000 people, and 108 cows, one to
every 98 people, just mideay bet

London. Taking these at 800 gallons a head per annum, and adding 20 gallons of skim milk daily, of which I hear as being sold in the outskirts of the town, we have only 9 galions ( 72 pints a head) per annum, or 1-5th of a pint a day apiece-one half the medical standard.
And this result corresponds to the ascertained consumption of seven working men and their families in Mansfield. These included 31 souls, and their consumption per week of milk cost altogether 4s., just 1d. a day to each family, for which they would get l-10th of a gallon-5 gallons a week for 31 people, or 40 pints for 217 days of one person, is less than one-fifth of a pint a day. I have to thank Mr. Henry Wilson, of
Take, now, Bedford. It contains at present about 15,000 people, and there are exactly 100 cows in the town, and 123 gallons of milk, the produce of about 50 other cows, are brought in by railway. One hundred and ut the same as at Mansfield ; and this, at 800 gallons a cow, is about 70 pints a year, or one-fifth of a pint a year apiece-one-half the medical standard. I have to thank Messre. Howaid, of Bedford, for the above statistics.
All these instances exceed the London standard, though the two last are not so much beyond the metropolitan supply. It is plain, however, from
these figures, that London is imperfectly supplied, yet I have still to justify the Jbelief I have expressed that it is as well fed as many south-country villages. Single instances will hardly prove this, or I could say that in my own village there are labourers' families with many small children who hardly ever taste milk after
they are weaned. And I have of an Essex labourer who received the prize of \(5 l\). offered for many years by Mr. Wood, of Rochford, for the best-kept year's cash book, kept by an agricultural labourer. His family with five children spent \(6 s\). \(2 d\). skim milk 1863, representing probably 150 pints o milk for one, but of skim milk for seven dails What the thing cannot be proved by individual cases. Let as therefore take the result of Dr. Smith's inquiry for Government into the diet of the poorer classes of the
country. He found that the weekly consumption of milk in the families of agricultural labourers (and he examined into from 10 to 30 cases in each county, chosen with a special view to fairness) was 12 pints in Devonshire, \(2 \frac{1}{2}\) pints in Somerset, 3 in Dorset, \(3 \frac{3}{4}\) in Wilts, 3 or 4 pints in Bucks, Herts, Cambridgeshire, 1.3d of pint in Surrey, 1.5 th of a pint ( 9 families examined) in Gloucestershire. Of course I am choosing the lowest examples on his list, but they are all examples of whole counties. Now, these numbers have to be divided by 5 (the average number of the family), and by 7, the days of the week, before you can ascertain the quantity consumed by each individual daily.

I find that in a poor court in the Strand there are 57 families, 294 souls living in 13 houses, and their daily consumption of milk is lees than \(4 s\). in all, for which they get 9 quarts or thereabouts. This is \(\frac{1}{10}\) th part of a pint apiece, and there was among them a baby brought which hy hand, which had 1 pint a day to its own share, The milk for the baby, I may add, cost \(2 \frac{1}{2} d\). in the shop, or \(3 d\). if had direct from thie cow. This is very little indeed, but there was an unusual number of adults in the company, only 40 children out of 294 ; and I will engage to find within two miles of my house at Streatley households numbering 294 in all, with double this number of children among them, who don't spend 48. a day on milk nor anything like it, and wao have
not the chance of buying milk even at \(3 d\). a pint from not the chance of buying
the cow if they wished it.
Looking at the quantity consumed by agricultural labourers in some of the southern counties in Gloncestershire, for example, which may be called a land flowing with milk, I think I am right in saying that Lundon, badly off as it is, is yet as well supplied as many south country villages. Of course, however, it will not do to compare the quantity consumed in London with that which is used in Westmoreland and Northumberland and Scotland. Dr. Smith returns them there at 24 to 30 pints per family each week, or nearly a pint a day
In Berwickshire and many Lowland connties it is almost universal for the farm labourers with families to keep cows and drink the whole of their skimomilk in the labouring population of Scotland and proof than in the labouring population of Scotland and the North
of England, of the truth of words which I venture quote from a letter of Mr. Chadwick to myself:-
"I can atate as my general conclusion, from all my observation and information iu respect to populations, that ascleap
and abundant supply of fresi and good milk is of more im
portance for their portance for their health and atr good milk is of more ime
supply of than an abundiant
suply and south. Now our strongest and beat labourers aro from
milk and oatmeal fed, or milk and bread and milk and fed children, as also from millk and oatmeal men with fittle or no meat. The strongest navvies are from the bill districts of Westmoreland, from the hill districts of \$cotland, Aberdeenshire in particular. These have been the favourite recruiting grounds for Guardsmen and soldiers of the greatest size and
I add here that I am told the Northumberland militia regiment, recruited from the milk-fed agriculthan population of that connty, covers more ground
milk. If the facts I have collog subject mik. If the facts I have collected shatl in the minds of its consumers, and exaggention in them will not have consumers, the labo may will not have beeu useless; bot may have some influence on the trade; that the
attention being directed to the the rallway carriage of it, some enormons facility and safety of the traffic may be effent above all, that attention being directed deficient supply of milk to London, some tincrese the oo enterprise in milk production may ensure,
One word more: On Tuesday of last \(w\)
been all day over Clerkenwell been all day over Clerkenwell, and Bathnal I 4 :
and Milo End Old Town through sonse 12 or 14 cowhog with the ineper tark when we reached the last ases, and saw what I had not seen all day before house - 70 or 80 first-rate short-hore, a fall o. nd comfortably housed, lighted up with busy working with for the night - the bee bey You seem all alive here. I said to \(h_{x}\) cowhouse to-day before ;
here ?" He told me that he hod had and killed by it; but the he had had 40 pastures, and so were saved. It said hail been iu: more than 40 here. You have shown great the bringing your 40 home and buying others," "We grubbed up the floor, double lime-wahad math verything and waited a inches of hot lime on believe therefore we are safe. They tell mol mad," he added; "but it is a madness I take g delight in, and as lung as I have monery l'll have her."-"Well," I said,
you are making a pretty penny now with Man uap and grains for the asking, and milk and quart. He gave me, I suppose, banter for my babie or we all know that pure milk is to be bought whe \(1 d\). more. " \(5 d\). a quart!" he said; "I won"t whll fum milk to you or any other man for less than \(6 d\). , you can get a quart of something in the sloop there \(3 d\). if you like." Now if any gentleman here is d posed to say "name!" I must refuse to give the nam or I have not aimed at personality at all course of this statement, and have only named onec wo where especial credit was due; but if the inspect who was with me then be present now remember the conversation and also the la
followed his own assent to the nature something."- "Yes," he said, "blue ruin." represents a very large portion of of解 coines from the very best cou in orld, for both milk and flesh-from the best fed con in the world, taking all the year round-and, taking t average experience, most of it from the most comfortal housed cows in the world, taking 24,000 everywhere el and all the year round. I will also siy that it comes from the hands of one of the most hearty and energetic ses. of men in the world; for the London cowkepes especially of course those in large busiures, wai neither energy nor intelligence. And, seeing thi ountry mill whether good at the railway terminus, London milk is origiun the best milk in the world for Londmers very generally spoiled between the milk-pail and th tea-cup-so that when it reaches the consumer it ana little better than what Mr. Inspector called \(\mathrm{it}-\mathrm{a}\) mere ruin.

LORD SPENCER ON THE CATTLE PLAGEE.
The following is the greater portion of his lordship's spea Smithfield Club.
At this time there is a great necessity for arr. culturists to improve their breeds of cattle. consumption of meat in this country has for some ! been ivcreasing to an enormous extent, and muat be been the result ? People who before hardly at meat once a year have it now almost imporation
supply tieir wants there has been a vast impor foreign stock. I do not think the country are generally aware how grea United the year 1862 there were imported nited Kugdom 97,887 head of neat cartie and
sheep. 'Ino years later, in the year \(186 \pm\), the ation of neat cattle had increased to of sheep to 496.243 ; an
come out still larger. It number of Fure ish stock ioficatt to colupare tock for at this woment there are no reliable retu in existence it is computed, however, that are in the United Kingdom
is a mere guess. The farmer
dark with regard to the number of citt entire the and I think it is really a matter of great in that there should be some reliable statistics (haike Kingdom.
find that in 1862 the number of English \({ }^{\circ} 2\) sent ints the metropolitan markets was \(2+y, 5\) of foreign 51,466.
off to 220,224 , and the foreign had i 119,174. The English farmer cannot pan to
b. -t he can competo most successully with curciuy reved breeds azainst all fureignere. There is oo country in Earope (iollect hat taiked of foreign heace which fetched 4ill, apiece, and i know Hungary hesula wea good stock, but there really are no anmals so prod for meat as the Englifh. Breeders, however, ought Th stuily to preserve their power of succeseful competiin ly :my rowine the that the cattle di-eare has most Ther in affected the interest unt only of the agrimat cer.os:, Iut of all classes in the kingdom, who will teel wost feverely the pressure which will have to be put upou thim if the plague be not stayed. I was chosen the ratle plague. That commission first met at the beginning of October, and it proceeded with its investibegions vithout delay. We examined into the earliest onses, and had the evidence of those who first brought ery som carne to the conclusion that we ought to recomniend the Government to take measures to weck, if nossible, the spread of the disease in the comutry. Fut wo had to remember that this country ms a very different one from those of the Coninent, and we therefore did not adopt the details of those measures to the consideration of our Government. Our first report was a preliminary one, and referred almost polely to measures of sanitary police. We had ton us as to the introduction of the direase into this country, and \(j t s\) origin. As to how it canve or how it originated \(\int\) say nothing; but speaking indtvidually as to the spread of the disease in lungland,
it is my opinion that it was first found in the Metropolitan mariset, and wherever it has been found in the country it has been carried thither by beaste from the Metropolitan market or in immediato com. munication with it. Wherever a strict cordon could be maintained to prevent importations, those districts have becu kept free. I adduce, for example, the cases and in all similar ones, the cattle have escaped. In France the same thing has happened. It has broken out once or twice, but a strict isolation has been maintained, and it has not spread. There is a case in point just now in Paris. The disease was taken there by sone gazelles bought in London and sent to the Paris Zoological Gardens, but immediate and vigorous steps were taken, and I believe it has not gone any further \(S_{0}\) far I have been speaking of contagion by coutact but candour compels me to go further, and say that when once the disease is introduced into a district, it is impossible to trace its spread in every case to actual contact. I believe it never breaks out spontaneously, but when it is once established its spread seems to be due to atmospheric causes. I know that in admitting that I lay myself open to the questionThat may be a very proper objection; but what we want to do is to localise the disease as much as possible. If we have a runaway horse we can do nothing with bin; but when we get him to moderate his speed we are again able to manage him, and perhaps prevent
him from starting again. And so, if we can but once him from starting again. And so, if we can but once localise this disease, we may be able to do something with it-we get a breathing time to seek for a cure, or perhaps find the means of stamping it out altogether but so long as it is raging through the country at such a terrific rate, we shall not be able to stop it. At missioners took a disposition to think that the Com missioners took too serious a view of the matter, but
since then most people have come round to our conclusions. The disease increased rapidly from the 14 th of October to the 2 d of December; and the number of places at which cattle have been attacked within three weeks advanced from 3398 to 5118 . That really shows a terrible state of things, and by this time no fewer than 30,000 cattle have perished by the plague. Although there has been much discussion everywhere, all the views of the Commissioners have been confirmed, and they do not wish to alter the recommendations they offered to the Government one
tittle. There is one other point which I should litle. There is one other point which I should disease. Much wonder has been expressed that the Commissioners have not recommended some system of treatment ; but the truth is they came to the conclusion that they ought not to recommend any treatment unless they knew it to be really good. We should have been mere quacks to recommend this or that medicalcolleaguestolook really good. We asked our doing so. Various eminent scientific mell have taken different branches to investigate : they will shortly report the results to the Commissioners, and I trust we tions soon be able to make some useful recommenda eventually prove to be the most useful result of our Will throw considerable lify discoveries made which the disease, and considerable light upon the pathology of the disease, and may possibly lead to the discovery of \(a\) cure. And I must mention, as a proof, that we are ofrnest in our endeavours to find out the best mode of treatment, that experiments are now proceeding am not a lomgoepath myself; but every proponition
offering a fair chance of sticeens ought to be testad The experiments wow gaing on in Norkith are and I thall be gland it they can make a satantactory
 "patly" which will give us a cure for the diacmes. The commercial afpect of thre quection is Fotmewhat remarkalic. I was rurprined to find what a large trade we do with llumand in the matier of Etanh. Out Of elland. catle imported, 144,(1in) came from Hollamd they am, heretore, tmly ronry to kay that in diseare, and that the cumbir is in a hall condithon. Wic have had a report from the Dutch C'ommienionerss nom sitting with reference to the plague, and it is most unsetisfactory. They suy that in the districte isclated the disease is increasing, nimi that during the lant three weeks they bave had many more cases. Thie but still it seems to be that the caed that the disess will not disappear till all the ammals are catried off. The report complains of the grons carclenstuess of owners of stock, who are reckless about what tha byy, who bring fresla cattle into infected shede, who do 1.0 disinfect the manure of direased animale, but the seeds of the contagion all over the country. This ought to be a warning to us to practieo evcry possible care. I believe this diseave is us cateling nit the small pox where there is no vaccimation ; nud we ought to nurse and attend to the animals suflering from it as we would murse our houreliolde, fly small-pox were raging in the menghtionthood. Ther is one fact worth mentiuming. The from the disease with the intensity that Euglinh animals do; and even in our London dairies by far the greater uumber of these cured are luteli It has also been ohserved in Russia that if stock there
has any cross of Euglish blood, they kufter more than those which are purely native. I fear we have a dark future before us ; but I really do not see what can be done oxcept isolating our cattle as much as possible and of getting, if possible, one uniform system of actiou throughout the country. The disease ought to bo combated in its very earliest stages, and cleanliness and care will, I think, be found more effective than any medicine we yet know of.

\section*{THE CATTLE PLAGUE}
1. The following returns were isfued yesterday These returns do not profess to give the total number of cases which have occurred in Great liritain, but only those which have been ascertained from the official information received at this office from inspectors, whether appointed by the Clerk of the Council, or by the local authoritief. The divisions of England are those of the census. Column 1 only records the cases reported as having commenced during the weeks indicated by the headings, "back " cases being added to column 2.

2. Permission of Fat Cattle Trafric.-Amongge
2. numerous suggestions now rising uppermost with
regard to the Cattle Plague, the following are the 1. The pre ninent -

The siop pare for two monthe or more of all fairs, manhis, males, and Ehowe, so far as cattle aro 2. The athentate stoppage of all morement of live cattle, whether fat or lean.
3. Intemmity for those persons whose cattle havo died frim the plague, or been killed in consequatace thereof.
4. Govermint insurance.

The majurity of those interested in the sulyeet agree as to the jropricty of the first proposition, Lut Government, dreading the difficulty as to the rupply of meat, are not disposed to asseut : principally because it is unwilling to sluat out fat cattle from lalington market.
The Smithield Club, whilot retommading the extreme meanure, has not scrupled to hold its meeting, and cyeu to uliow the animals to be seut away to any parts of Englani. Probably it might be well in certain detiven populens places to allow fat cattle to be sent on conditen that they are to be flaughtered within кeven days. Suphosnig, however, this proposition to be accepted with or without the exception referred to, let us consider the recond properition-the absolute let us comsider the recond proporition- the absolute
man-removal of eattle from place to place. The ailvoentes of this extreme meakure montly resilio in districts where the cattle plague exiets, but thicy are equatly denitous of extending the ban to districto not affected by the plague, somewhat on the principle of the fox that ne nubmitted to to ret rid of the sreater, and exclaim, "What is temporacy inconvenience compared to the losses from the cattle plague ?"
In district (and by a dietrict we mean a petty seesional divipion where the plague exinta), the nonremoval of amimals, whether fat or lean, may be very desirable, and is pretty well secured hy recent mieasures; but as the divisious free from disease are far more numerous than thone suffering under it, we question very much if the plan so glibly recommended of sending the butcher to the beast instead of the beast to the butcher is the better plan of the two. Let us sce how it operates in a healthy distriet, by which we mean one in which there has been no case for the last two months. First, then, let us consider the butcher to the beast plan. A grazier has half a score of fat bearts fit for slaughter, and the food being exhausted and the mones wanted he informs his butcher, Mr. A., who drives over a distance of 6 or 7 miles to look at them, and probably takes a man nith him. After a great deal of higgling about price (each thinking the other wauts to take advantage of the plague to enbance or reduce the price), the bargain is made, and the time fixed for Elaughtering the animals, which must not be removed alive. Of course they are not all wanted at once, but probably on three or four different occasions. Two men are sent over for the purpose of slaughtering, and of course, as the meat requires to be hung some time, another visit with two carts is required to bring home the carcases. Thus there are seven journeys made to the farm, involving the travelling of 100 miles before these 10 animals are converted into hmman food. The farm and of course the herd of cattle are
the visits of the men on all these occasions.
If there is no disease for many miles round, the only effect is that the beasts must be bought under the value, or the public muat pay a much higher price than usual, in order to reimburse the butcher for his extra expenses, Hut supposing that the disease exists some 10 miles off in another direction, and that a number of weasts are slaughtered for fear they should become affected by the disease to which they may have been exposed. The same butchers us in the former case are probably called in to slaughter the animals, and probably conse of their repeated visits to the farm from which the first ten beasts came. So that we contend that besides the increased expense and inconvenience, the dauge of infection is greater from the butcher to the beast plan than that from the beast to the butcher, for as in the latter instance the animal passes to that bourne from whence no traveller returns, no injury can possibly arise. A tight cord is all very well, but if it suaps from overtightness the security is less than before. Then, again, take the case of breeding heifers
A farmer with a lot of dairy cows is leaving his farm A farmer with a lot of dairy cows is leaving his farm
or has no keep for them ; although the district is quite healthy, he must not sell, and if a poor man, he is ruined. Another farmer has a large number of in-calf cows and \({ }^{\text {Cheifers }}\) at straw-yard on an arable farm where there is no dairy. As they calve they are sold to replenish the dairies of others, But no! although all the surfound. must not sell, and the other farmer must not buy ; the cows must not go where they are wanted, but must stay where they are not wanted, to the infinite detriment of both farmers, and the injury of the commonwealth, without the slightest influence on the extinction of the rinderpest. We leave the subject to the common sense of our readers, and in our next we will consider the two propositions-Indemnity and Government Insurance. W. C.S.
3. HUnTingdonshibs: Tilbrook, Kimbolton. That dire diseace, the cattle plague, haviug baffled th okill of our professional men, any treatment which proves successful should, I think, be made public. In
this village we have been visited severely, a neighbour of mine having lost 28 out of 30 beasts. I have lost
12 beasts out of 18 ; ouly one having as yet escaped the 12 beasts out of 18 ; only one having as yet escaped the bled, and two of them bave recovered. One of the three, which has recovered, I had not the slightest
hopes of, but after bleeding she rapidly got better. I have had nine calves taken with the disease, to all o which I gave Day, Son, \& Hewitt's Gaseous Fluid, but the disease upon any of my farms, I shall certainly bleed them, and give starch in their gruel. Thomas Smith.

AGRICULTURAL EDUCATION
Oq Middle Class Education, having reference to the Improvement of the Education of those who depend
upor the Cultivation of the Soil for their Support. By Mr. R. Doke, 14, Burton Crescent

\section*{Continued from p. 1182.)}

Tabse, then, are the sciences by which agriculture may be assisted, and from which its advancement may
reazonably be expected. Science has been said to be shortened experience, and as such, in all that bears upo his profession, it has an interest for the practical man. But attainments in science will not teach agriculture. The chemist is no more necessarily a farmer than the veterinary surgeun or agricultural engineer. Agriculture is an art to be acquired by observation alone. The late
Lord Ducie expressed this truth forcibly by saying, that a young man would never be a farmer unless he could enjoy sitting for two hours on a hurdle to look at a slieep. Practical observation should be the foundation his subsequent success. 'To judge of the rent of land and of its capabilities-of the proper time and state of the weather for ploughing, for sowing, and all the other operations of the farm-to know the lind of seed and his soil, the time and mode of harvesting and disposing of his crop, and, above all, to be a judge of stock, is not to be attained from scientific information, but must be acquired in the field by persoial observation. practical knowledge must be obtained, and it shonld precede the acquisition of seientific iuformation. The if he is a farmer's son, he has upon the farm on which he has been brought up, the required opportunity That his practical knowledge may be advanced, we have culture, and therefore their acquisition is further necessary. But it has been obiected that this scientific knowledge may render the practical man less practical but is there anything antagonistic between them? to be the case in other profess. at the , for instance, is eminently a par an, attainments. If this profession is thought to be to limited and exceptional to illustrate this point, that of Pernilor is an instance of one of a more common character Perhaps there is no calling or busiuess in life of so Bound at an early age to their profession, seamen hav little opportunity of acquiring education, and their sub sequent mode of life presents few occasioni for remedy ing the deficiency. A certain anount of science, being required in navigating a ship, the Board of Trade has of late years made it requisite that all masters and mates of foreign-going ships shall possess a certificate, gation ; this certificate is grented upon their passing an examination, the requirements of which in the case of a secoud mate are as follows:-" He must be 17 years of age, and have been four years at mea; he must write a legible hand, and understand the first five rules of arithmetic, and the use of logarithms; he must be able to the Mearing, method; to correct the sun's declination for longitude, and find bis latitude by meridian altitude of the sun, may be put to sextant, and be able to observe with it, and read off the are."
In addition to this, an examination in practical seamauship. For a first or chief mate still hightr qualitications are rectuired. He must be 19 years of to the qualifications required for \({ }^{\circ}\) a second mate he must be abie to observe and calculate the aunplitude of the sun, and deduce the variation of the compass therefrom, and be able to find the longitude by chronometer by the usual methods. He must kuow how to lay off the place of the ship on the chart both by bearings of known objects, and by latitude and longitude. He must be able to determine the error of a sextant and adjust it, and find the time o high water from the known time at full and change." The qualifications required for a master are stil higher.
Here, then, wo have a considerable amount of seientifle requirement from men whose education has been of the most practical kind, and who are not allowed to rise i
their profession without these scientific attainments.

Science, then, is not autagonistic to practice, nor its acquisition incompacible with practical ability. The case of the agriculturist is no exception to thia rule

The best farmer is not necossarily an uneducated man. An extended literary education he may not require, but Hossess. How this knowledige is to be ogtained we shall further see, but may, in the firat place, inquire of what ralue its acquisition will be to its possessor. Will his ttaimnents, if examined into and certified to by the Royal Agricultural Society, act prejudicially to him, or
as a recommendation in his favour? Would he be considered to have attained a competent knowledge of his business, or merely to have acquired some superfluous information? Would he be looked upon as a man who was likely to get on in his profession, or as one of whom be answered that this would be seen in the result. But this result would depend upon his opportunities. Agriculture is not a business in which a man can followed independently of the cousent of others. In order to get a farm, as a tenant farmer he must deal with his landlord, as a land steward with his employer. It will therefore be necessary to solicit their sympathy for any educational scheme. If they should look with
disfavon upon agricultural science, there will be little inducement to study it. A young man, previous to obtaining a farm, is not likely to do so if it is to be prejudicial to him. On the other hand, when it is obtained, he is, as it were, mettled for life, and he has no object in acquiring information of which he does not know the value, even if the daily avocations of a farm admitted of it.
Among the numerous landed proprietors who are supporters of the Royal Agricultural Society, there are doubtless many who are interested in the welfare of agriculture. Could their assistance be unlisted in this matter? As landlords it must frequently happen that they are in want of good tenants, who, besides all the ordinary qualifications, might be able to bring extraordinary qualifications in addition. Would they be disposed to consider the attainment of scientific knowledge as a recommendation, and favourably to regard the claims of those who had acquired it? Young agriculturists might thus be induced to come forward and add to their practical knowledge an acquaintance with those sciences which may assist it. With the view of promoting this object the following suggestion is made: Let the Royal Agricultural Society ammally hold an examination at which all who are candidates for her diploma or certificate of compotence may be examined. but to lead candidates to come forward some inducement must be held out. Could there be any inducement like the prospect of a settlement in life? If the Society were able to announce that the proprietors of a
certain number of farms had communicnted their intention of confering them upon holders of the Society's diploma, what an incentive would be thus created! And this ueed involve no sacrifice on the part tenant, and is He is desirous of obtaining a good Society as an indication of competence on the parti of its possessor. Let then the diploma of the Society be an introduction for the young tenant to his future landlord, and where both parties are mutually satisfied, a bargain may be concluded, and the farm let in the usuall manner. Of course satisfactory evidence must and thed as to the possession of the necessary capital, and the young tenaut need not expect any further qualified agriculturist he is competent to enter upon a arm, to judge of its capabilities, and of the rent that he should offer. In offering this general idea it is not necessary to go into detail, but where the candidates were numerous, and the openings few, they might be offered to them in succession according to the rank obtained in the diploma examination; or all might be considered candidates equally, and each allowed to send in his application for the farm he might desire to obtain. A landlord would be thus enabled to consider each case, and select the temant he thought most suitable. In another way, also, might this suggestion be carried out, and perhaps with more satisfaction to both parties. Let a landowner select his own tenant, and offer him a farm if he suoceeds in obtaining the Society's certificate. In this way he would obtain teuant who was eligible, and who was also possessed of the qualifications necessary for Society's diploma procure situations as land-stewards or biliffs for those who were unable, or did not intend, to follow farming on their own account. In the ways suggested, then, might value be given to an agricultural diploma, so that it would be regarded, not merely as an honour, but an leading possibly to mubtantial advantage
The Society might also institute a series of prizes of their own, as the reward of successful examination for
their diploma. The number and amount of these might be matter for consideration, but 50l. might we? be bestowed for the undoubted honour of standing at the head of the examination list-of being in fact, enior wrangler in agriculture.
Thus, then, might the youth be assisted and stimuated, who, intending to inake agriculture his profession, bad come forward to receive the Society's diploma. It is as thas diploma has a practical value that it will be sought for, and valued when obtained. The Highland
dates for their diploma, which, shows that apart acquirements is not a sufficient inducement the Royal Agricultural Society ascoment influence in giving a practical valus to ith its It is thus that the knowledge it is the meass enabled to practise what he knowd the young frat ing opportunity is of comparative inutiluow ed ge e proportion as this latter is afforded, that its its acquisitio

Water Supply.-In those districts of England when surface spriugs and constant strea 1,8 do \(110 t\) abound 8 depth, a supply of good water in reasonuble of gras is often very deficient in the cottages of the labaten To overcome this great need, cach cotto luboare cottages should be supplied with an underground in which the surplus water falling on the roof daries periods of abundant rainfall can be preserved iu
use. The advantage of these tantes ficially felt in this village during the dry been so beoc. past few years, that I venture to give the result of experience for the benefit of those who cann themselves without the provident care of the owner the cottage or farm. Cottages should be tiled or slated,
and iron or copper guttering fixed uuder th and iron or copper guttering fixed uuder the caves ron cistern, containing trom 50 to 100 gallons. Th will supply the daily wants of a family in wet sem without recourse to the pump. The overflow of these cisterus must be conveyed into the tank, which is und ground and covered over with an arch of brick. or light should be admitted into these reservoin water is preserved in greater sweetness and cooln-m than when exposed to the atnuosphere. The methow building these tanks is first to dig a hole of the requied size, then build walls of stone, brick or बlint, 12 inches thick, fill them well iu with grouting or creto against the earth, and make a concrete bottom of one or two courses in thickuess, according to the streugh, required ; leave a man hole at the top, and two hole as the ends, one to admit the water, the other for the overflow and for the admission of the lead pipe of pump. After the walls lave become tolerably perhaps in a fortnight, coat the walls and bottom covering of good Romau cement, or with two as three courses of tiles laid in guod grey lime mortar; all work requires to be, carefully and substantially
In less than a month the tank will be ready for The water where admitted should not run down walls, but empty itself through a piece of iro earthen pipe clear of the wall. The size of these tank varies from 30 to 300 hogsheads, but one of 50 hoge heads will be guffion for pair of cottages If the average rainfall of a district be about 30 inches quantity of water which would fall on the roof of of good-sized cottages may be estimated at abool hogsheads. This water will be sweet, cool, and whole than spring wuire to fll household purposes, for breming, for tea, and cooking, and especially for washiog, a vithout soda it will save more than balf the sasp. tank of 50 hogsheads will require to be 12 feet long 6 feet wide, and 6 feet deep inside measure. The asill us allowing the arcis to be entirel underground. To build such a tank, there will required 18 tons of flints, 15 tons of sand and coal ashes, 10 quarters of lime, 5 casks of cement, and about The ricks for the arch if only one brick in thicknea The cost of digging out will be about 30 s., or 40 yan at 9 d., and the bricklayer's work about tank can thas be built for about 14l; a galvanisiel cistern \(36 \times 30 \times 24\) inches would cost 50. ., ff aboal guttering and pump about \(6 l^{2}\). For the sum of water when wells vary in depth from 100 to 300 feet, thy labour of drawing water is very great, and falls, chied on the man on his return home from a hard as the water With a tank the wife or child can pump as pay
is required. A cottager would cleerfully pod water is required

The Champion Wheat Crop.- Will you kindly gir insertion to thle letter? As Mr. Hallett has gives, an account of his 7 acres of Wheat, it about mine, that Mr. II. has finally refused to go on with the the He tells us that he has grown 11 sacks an all that have seen my crop pronounce
largest they ever saw. I paid one guinea cuttiug it, and my workpeople will make an affla before a magistrate that there were sacks a than Mr. Hallett atates his more, it is worth shillings per quarter
and half as much again as his Pedigree think I have pretty fully proved that Mr. not suow us how to double o challonged the reckoned without his host when of Wheat

The fuc is, and I have slated it before, that there rnis syatem that will beat the best ancient oue.
of Woolston, says I am a bold man when have proved myself still bolder when hallenge of one who says he has grown
Wheat an acre, and theretmer I think entit'al to wear the bell, and I shall weas it leng time betore those who faw less than a acre can wrest it from me. What say you
armers? I remain 「therefore] the Champion (irutcer of England, Charles Bates.
The Best Rotation for Light Land.- The past two easen most light-land farms. conserocutly of returns on such farms have been below the average of a series of years. On such soils the four-course system of copping has long been practised, and was, and still is, managers the best rotation for such soila. Within the and the high prices of store stook and butchers' meat rarious other rotations have been tried in different iocalities, and with various degrees of success. I trust a comparison of the different methods may not be 1 , wheat; \(\rightleftharpoons\), roots, fed off with sheep, which now generally receive au allowauce either of coru or calke, Dom down with seede ; 5 , seeds, generally grazed with aboep, eating corn or artificial food. The only practical objection to this systum is the occurrence of two whit to spend from 20s. to \(30 s\). per acre in the purchase o artiticial manures for the second crop, in order to insure an average return. The great merits of this syatem principally devolve on the more general certainty of fall crop inadequate importance when we consider that the lose of the seed crop does not and with a single year, but exerts a deteriorating influence on the whole crops
throughout the rotation. Another five-course throughout the rotation. Another five-course is rome-
times practised-1st, Whent; 2 d , roots, eaten on the ground as before described; 3d, Barley, Oate, or spring Wheat, sown down with Clovers or mixed grazed. Under the existing prices of corn aud meat we think this cannot fail to be the most profitable
rotation for many of the weak sandy suils of the country The seeds if grazed both years, and artificial food used at the same time, the mannial and prodnctive powers would also be more zelf-supporting, and unless as stimulant to the root crop, the purchase of artificial vation would likewise be reduced ; thus, for instance, on a farm of 200 acres the reduction of horse and 100l. a year, and though the average of corn grown yearly would be less by 20 acres than that of the four course, yet from the superior condition of the land nearly an equal gross produce inight be expected. The the seeds increased by 30 acres; a sufficient supply of green food could thus be produced oll a farin of 200 acres, equal to the keep of from 300 to 400 sheep tbroughout the year. The six-course rotation is now
obtaining more general favour ; Ist, Wheat ; 24 , Oats or Barley ; 3d, lioots; 4th, Barley or Oats; 5th, seeds, grazed as before; 6th, seeds grazed. Here we have
the same extent under cereals as in the four-course system, but lose \(16 \frac{2}{3}\) acres in roots, and gain the same extent in seeds, so that the same number of stock cannot be kept when the land is cultivated on the sixcoarse that it will support when under four or ve-course with two years seeds, \(a\) fact which was never Iurray, Elvaston Castle, Derby.

Disinfectants. -The following is an abridged report of Dr. Voelcker's Lecture on this subject on Dec. 12. He first spoke of disinfectants, their mode of action, and their comparative efficacy; next, the application
of disiufectants to particular purposes ; then of preventives. It would be well if the word disinfectant were confined solely to those solid, liquid, or gaseous materials which possessed the power of disorganising or destroying all matters capable of reproducing to substanauimals. Frequently the word was applied smelling gases and vapours, did not destroy that which produced them. Properly these were deodorisers, and not disinfectants. The application of chlorine ceeding from acid not only removed the smell proup the organic matter and resolved it into ultimate products, comparatively harmless. Chlorine and nitrous acid, therefore, had to be considered, not merely as deodorisers, but also as true disinfectauts. The means
used for the purpose of preventing or retarding putrefaction, which give rise to foul odours, were often regarded as disinfectants. If, however, a disinfectant was that which broke up the constitution of organic ranter and destroyed it altogether, the same term was inapplicable when applied to substancea which, instead
of hastening the destruction of orpanie enattens, proserved mobatanoes which retarded or preventod putrofiotion were autioeptics. Thas, earbobice aeni, creonote, and
 were capabie of preventia putrefaction, wore true anls repties, and the very reveree in their action on orgme natter to dibiufeetants, sueh as chorine and mitric ach. Ie would cail dismfectants there sulistances which would destroy all matters capablo of producing disonso stmelling gases without destreying the organic bodie from which they (emanated; whilst substances em ployed to prevent putrefaction, or impeding the putrefaction, should be called entisoptics rather than isinfectants.
The various disinfectants : chloride of lime, chlorin gas, sulphurous acid gas, nitrio and nitrous said gas, charcoal (both wood and peat), quick lume, the acid salte, and last, though not least, fire, lieat, and air Chloride of lime, common bleaching powder, containe bypochlorous acid and lime. The aend was very rapidily destroyed; or rather it bruke up very rupidly into free oxygen and chlorine, two gesen which, neting pon meat and nearly all animal and vegetable matters destroyed or burned them, and disurganised theus com plotely. For use, I lb. of chloride of lime to throc gallons of water. Chlorine gas, which was a still more powerful disinfectant, must be regardod as a convenient and concentrated form in wheh a powerful disiufectant of organic matter can be appleed. For certan purposes, the disinfection of conslieds in preticular ccasional fumigation might be resort in propriety. Sulphurous acid, wheh acted in a simmar way, but not in a precinely similar manner amonlorime
gas, but destroyed organic mattere, might also be unod aas, but destroyed organic matters, might also betino ospecially recommended this because it was so readily prepared. Light some flowers of sulphur; the resultpowerful destroyer of orgalic matter, and might he usefully cmuloyed in the disinfection of air and parte f buildings not otherwise accessible to bleaching powder or other disinfectauts. Nitric acid might also be used for the Eame purpose. Your upon \(40 \%\) of powdered nitre 4.Oz, of vitriol, to which 20. of wates had been added. 'The mixture mhould be putinto an developed by pouring upon 2 or 3 oz of copper shavings half a pornd of concentrated nitric acid. The mixture should be placed in a tall jar or common basin. Wood or peat charcoal possessed a remarkable destroying power on organic subatances. It had been supposed that charcoal preserved ment; but the investigations of Dr. Stenhouse had shown that charcoa actually hastened very much the destruction of 1lesh, meat, and all kinds of animal matter. It was very porous, and its pores were filled with condensed oxygen to the exteut of eight times its bulk. Wo had herefore in charcoal, oxygen gas, which supports com bustion, or lights fires, in a condensed and more active
condition than in common air whioh we ordinarily condition than in common ar whiche me or contact breathe. Hence it was that orgauic mattress charcoal were so rapidly destroyed. Peat charcoa might be similarly used. Where neither could be obtained, earth was an efficient disinfectant. In purno manner, and perhaps mustic soda, or soda ash acted in destroying animal matter. The soda ash of commerce appeared to be superior to quick-lime for disinfecting purposes, for the simple reason that it rapidly dissolved in water, and could enter porous substances-like wood, which could not be readily touched by quick-lime. Moreover, soda was a powerful detergent ; it was a good washer, and removed what would not be removed by bleaching power. Condy' Disinfecting Liquid was a solution of much utility as disiufectant ; but he was afraid that for the purpose of the farmer it would scarcely be applicable. In permanganic acid we had oxygen in an active condition operating as a powerful destroyer of organic matte Fire, air, heat, steam : heat at \(250^{\circ}\) Fahrenheit
destroyed readily infectious poison. Boiling water and, better still, high pressure steam, completely dis infects meat from diseased animals, and henco might be used for boiling down carcases of diseased animals and utilising the fat
Of deodorisers, perchloride of iron in solution sulphate of iron, sulphate of zinc, nitrate of lead, and chloride of zine were mentioned.
Autiseptics, or preventers of putrefaction, were creosote, carbolic acid, and several most powerful dis infectants prepared from coal tar, among them being McDougall's and Tomlinson's Disinfectants.

For all the purposes for which a farmer or dairyman might require to have recourse to disinfectants, his choice of materials might well be confined to chlorid of lime, quick-lime and earth. to which might perhap be added, fumigation with sulphur and chlorine. Soap or soda, plenty of water, a copious supply of fresh air were the most important disinfectants on which to rely for the disinfection of sheds; for although certain artificial disinfectants were necessary for the perfect destruction of the infectious matter, yet the use of these should always be preceded by the free use of sof soap or soda ash and water, aud be followed up by fully ventilating the place two or three days before
putting on the promine hoalthy stock igsin. The dioolurges from and tho akins of discosed animuls were the principal and primary coat of tho infeotious matter of the evtile pagne. Therefore, manure which the the shad they had used should be woll scraped and wasted with nof moap and wator, or, better atill, with
 hot mixture of lime and water, anl astiv, chlorid of lime, should bo ured, ant the parement should bo relad in a fresh betdage of consete; the floor of lime to mal of water. The infeetion might be carried into the walls and raftern. In auch oneo he reoommended fumigation with sulphurove ecid, or chlorine gas, or nitrous noid. All ventiletorn, windowes and apertures must be elosed, and everything prepared for the fumigation. For a copious eupply of mutphurous acid for a comehed, il lb, to 1 lb . of sulphur burned on The windows and doorr of the cowhouse muat be well The windown and doorm of the cowhouse muat be wel in tho neight oarhood. 'Slis, indeed, wan the objeo tion to employing chlurime or sulphatinh anilgat In tho country funngation frenemt a densely populated lucality it was not cany to apply comedy whicls womld make nee whole would bo the cough and run away for gafety, which wouldition, or consld not be effeotually oloned. After the fumigution had been carried on for 2- hours with clowed door and windows. the shed mbuld he venthated hy opening the winduws and doors, and the walle he whitownehed If the Hoorn were taken u!, clenused, and rolaid, at ho hed described, and the shed afterwards fumigated and Whitewashed, the divinfertion would be us perfect an it could bo.
As to the disposal of the manure of disonsed cattle suoh manure should not on any mocount be allowed to be ueed with other manure. Any hay or atraw loft by the diseesed cattle mhould be burned at once. The smanure that would have to be dumoved ahould be covered over with quick-lime. For a ton of manure or a good cartload, he would take not lea than 5 cwt of quick-lime, previnusly slack ad. It wont he useless ta; mubatitute a mall quantily of chlonite of lime. The manure should be carted into the field, and put with earth in alternato layers, onding with earth. As an extra preanation he would cover the heap with pea charoonl or quiakslime. In three or four mouth there wonld be a valunble compost heap, which might be spread without any fear ms to ite containing infec tious matter.
As to the dirinfection of pastures. All that could be done was to knook about with the pitchfork the droppings of cows, and then apply a dressing of lime at the rate of 100 bushels to the acre. In two or thre weeks, bovided rain had fallon in the interim, stock might be safely placed in such pastures.
Agricultural itwplements and utemsils should be cleansed with soft sonp and chloride of lime, hall a pound to a vailful of water.
As to preventives. Were there any means by which the divease could be prevented from extending There ahould be perfect isolation of disensed atoors perfeot deatruction of the infection by fire, chtoride of ime, sulphurous acid, or other disinfectants. Inas cannot always be employed, because themelven destruotive to animal life, we were practically thrown on perfect isolation as the only means at present known of safety from the spread of the cattle plague.
Colonel the Hon. W. P. Talnor, who has a large dairy at Which had been attacked by the cattle playme last Thursday,

 and mustard, two setons placed in the stomseb, and the

Smithfield.-We must delay for a week the pro. mised report of the Implement Gilleries at the late
Show of the Smithifeld Club. The following is the Show of the Smithueld Club. The following is the
Report of the Council laid before the General Meeting of the Club at its late Anuual Meeting, and then adopted:-
The Council has held three meetings during the year, which
have been well attended, especially the important one on the st November last
The following subjects, in addition to the ordinary routine
 at the Show, as it involves their boing in London several days.
The Council resolved that they should receive a fee of lol. each.
II. The preparation of the Prize Sheet for the present Show,
and the suggestions that had been made relative to the ages of and the suggestions that had been made relative to the ages of
animals - the rules of competition and new classes. Various
prizes have been increased in amount, and the condition of the prizes have been increased in amount, and the condition of the classes adjusted, so as to establish a class for Kentish and
Romney Marsh sbeep, and a distinct one for any other longwoolled sheep no
divisions specified. The Council resolved to offer a Silver Cup in lieu of a Gold
Medal for the best pen of pigs. And also to give a Gold Medal
to the breeder of the best ox or steer, and to the breeder of the best cow or heifer in any of the classes, in lieu of the Silver
Medal, as bitherto; also that there be three Butchers' Cups
instead of one, viz., 20l. to the largest purchaser of Beasts, 15l. to the largest purchaser of Sheer, \(10 l\). to the largest
The rules of the Club respecting fines for the non-exhibition of animals entered have boen considered and amended. The Implement Committee appointed by the Council have for the management of implement galleries during the exhi. bition.
most serious and earnest consideration the alarming aspect the cattle plague, and felt that under existiug circumstances it became their duty to take unusual and exceptional means in order to lessen, as far as lay in their power, the risk there
wonld be of animals sent to the Show becoming infected. Would be of animals sent to the Show becoming infected. That the date :
of December (instead of Monday the to Monday the 11th of a weember (instead of Monday the to Christmas than was originally fixed
it a
That no beast, sheep, or pig that has been exhibited at Club Show within one month previous to the Sinithfied to enter the Agricultural Hall. from a qualified veterinary surgeon, showing that each animal is free from the rinderpest, and has not been on the same farm where infected animals have been within
21 days previoualy. The Council appoi
meuts respecting disinfected conveyances in which animals for the Show may be carted from the railway way autboritics in reference to the conveyance of auimals That every animal shall undergo an inspention on its College be requested to make arrangements for the That, with the concurrence of the Agricultural Hall
Company, the Show shall not remain open so usual, and that it shall close on Thursday eveniog instead of the Fividay.
A Oirulurar was forthwith sent to every Exhibitor, informing immediately through the London press and the agricultural ournals.
tural Hall Company their thanks for the ready and cordial manner in which they have acceded to the wishes of the
Council in this matter, involving as it does the loss of payment for the admission of the public for a whole day.
The Council have further to express their acknowledgment to the Governors of the Royal Veterinary
arrangements so kindly made by them to admit of the The Committee appointed in reference to the conveyance of Stock decided that exhibitors be recomroended to send all animals in covered carts from the respective farms on which forwarded to London, as this precaution would materially diminish the risk of infection between the farms and the animals be sent in horse bozes on the railways. The attention and while it is to be regretted that the Directors of the principal lines have not acceded to the request made to them in respect may not have precluded exhibitors using horse-boxes.
admitted into the Smithfield Show conveyed in any hired cattle carts, rans, \&c., which had not been cleansed and disinthat purpose by the Club.
The Council have to
proprietors of cattle conveyances and vaus who have met the
 IV. The Council selected the judges for the present Show,
Cups one the necessary arrangements respecting the Prize Cups, on the same principle that gave satisfaction last year,
viz, that the winner sluall have the option of selecting any
other plate of the same value
They also prepared the House List of members whorn they recommended to aucceed the
at this meeting by rotation.
. The Council having
it has been decided Club to the consideration of thents for the Hotel, Bridge Street, Blackfriars, on Weduesdav next, andley's special letter has been addressed to each member of the Club, larger attendance than there has been for the last few years,
The Councl have the pleasure of stating tbat the animals arrived at the fard in a most satating that the animals
veterinary inspectors, who were in constant attendance night and day, had not to reject a single animal, and it is most atight
factory to find that up to this time no case of the rinderpest
has shown itself. A special Divine service was held on Sunday evening for the
herdsmen and shepherds in attendance on the animals. The herdsmen and shepherds in attendance on the animals. The
Council have to return their thanks to the Rev. D. Wilson, the
Vicar of Islington, for the arrangements made by him for the Vicar of Islington, for the arrangements made by him for the
attendance of the Rev. J. W. Bardaley, who olfiated. The
Hon. Secretary reports that the attendance was most
Hon. Socretary reports that the attendance was most satis
factory. The Councl have the pleasure of laying before the
meeting the annual audited balance-sbeet, whioh ahows

\section*{紋的tes.}

Rinderpest, its Prevention and Cure; and Gypsum as a Sanitary Agent. By John
W. P. Nimmo, Edinburgh.
"Mr. Lundy is wild upon gypsum." He is not, how ever, very well pleased at our saying so. Perhaps we ought rather to have used the word "ignorant," but we fear that it would have pleased him even less. "Ignorant," however, would undoubtedly have been the right word in the right place, for, so far as its multitude of references to gypsum is concerned, his pamphlet is very much what might have been written a quarter of a century ago ; and we have learned a good deal since then which goes for nothing in its pages.
Sir Humphry Davy, Sprengel, and Liebig (of 1840) are the authorities on whom its statements rest; and accordingly it is full of the powers of gypsum as a fixer of ammonia and deodoriser, as a manure o sickness, as increasing the growth of wool, as o service for Barley, Oats, and Wheat, as an excellent auxiliary to the action of other manures for Turnips, as promoting the growth of Fotatos with a finer and cleaner skin, as doubling the value of the farmyard manure to which it is added, as a deodoriser of the filthy refuse heaps of glue yards and tanneries, also of graveyards and ceneteries. We submit that the author of these assertions is fairly described as being not only wild upon his subject, but ignorant of it As to the power of gypsum to fix the ammoniacal funes of putrefying organic matter, which is here alleged, we
should have heard of it from Dr. Voelcker the other evening, in his lecture on Disinfectants, if it had been so great. But among the many deodorisers and antiseptics and true disinfectants referred to in that lecture, gypsum was not even named. Its imperfect solubility, and the near equality of the affinities which on the one side tend to retain the elements concerned, as sulphate of lime and carbonate of ammonia, with those on the other, which would redistribute them as sulphate of ammonia and carbonate of lime, give it
very inferior power as a fixer of ammonia, And indeed Mr. Lundy's assertions of the very:remarkable fertilising power which he supposes gypsum to possess, are not more valuable than his idea of its relations to ammonia. They are made apparently in ignorance of all our experience since 1840. It was the fashion to write then about gypsum just as Mr. Lundy writes about it now. The chemist's dictum, founded both on the existence of gypsum in the ashes of plants, aud on the unrivalled powers which it was then supposed to have as a But of ammonia, was then received as final But we have learned since then to value the dicta accurately. He is required to know his agriculture as well as his chemistry before the farmer now will listen to him at all. And so le ought to be. Why should any man with fields and crops and live farm management out of which they enable him to pay his rent and maintain his family, go to school to the mere chemist, who can only tell him the relations of dead atoms as they are found to act on one another in flask and tubes and crucibles. Let the latter rather come to school upon the farm and learn there what the relations are which his elements and compounds sustain to one another within the living plant and in the great labora tory of Nature. And so he gladly does; and he thus learns that which is instructive not only to him self as a man of science, but to the other also as a practical man. If any oue, whether he be a chemist or a farmer, wants to know the value of gypsum in English agriculture, whether as a disinfector or manure, let him not seek it, as Mr. Lundy seems to have done, in the pages of Sprengel, Sir H. Davy, or even Liebig, but let him study it in the experience of the last quarter of a century in English homesteads and in English fields. Is a disinfector it
has been found inferior to many other substances. And as a general rule the addition of it to our soils as a manure has proved altogether useless. There is probably enough of it already in most soils-at all events no one uses it. And from having once enjoyed considerable reputation, it has now, we may say, altogether disappeared from the price lists of manure dealers, and it is not likely to reappear from the wild and ignorant
assertions upon the subject which are to be found in assertions upon the
Mr. Lundy's pages.
But it is not only through gypsum, and its powers as a disinfectant, that the author deals with rinderpest. That we may not misrepresent him here, we quote all le saye on mangar e.
In a letter tu the Leith Burghs Pilof of 21st September last, I siated, that in attempting to account
urine of the cow, in a fresh state, ranging in 100,000 part pasture, he found one part of oride, of manging in a manganese gets into the system. If in the falt unnatural mode of stall-feeding upay be that br is (ryass, \&ce, it is deprived of foud which, sem, manganese, or the atmosphere of the byres loaded cnough to keep free from disease when gaseous case, it may be that the oxide of manganese, se from the permanganate of an alkali (like any of Con natural scavenger for all organic putriditoxygen cure for the disease by simply supplying the manganese in the system.
diseased, manganese acts as a ton healthy as well portion of the liberated oxygen from the per-mangan no doubt combines with the hydrogeneone maes passes off as water, precipitating sulphur, or form gulphate of potash, poder either case agaiolina charged with 'wind ' and undigested food, that shan great desideratum in attempting to cure the diame Since then black oxide of manganese has bean trich
a wita varied success.
Our readers will no doubt experience varied sema
their efforts to understand this passage; bo
Mr. Lundy were any beiter acquainted witl chemistry than he is with agriculture, he would have ventured to build a curious theory of rinderpes pon ".001 per cent. in one of Sprengel's aulyee whatever be the efficiency of any of Condy's Fidid which be connects with it, the facts are cersainl altogether opposed to the author's statement of the pame of manganese as a preventive. The "varied success" black oxide of manganese as a remedy, ought, we athor's conviction that cattle will retain their healt if they receive a small quantity of Condy's Fluid dails as been found in examples within our knowledge gool for nothing. Mr. Lundy says of this pradice, with or nothing

Were it universally adopted to pour a mall quan bity into all the water given the cattle to drink, and the stantly deodorised with gypsum, to fix the ammonia and sweeten the atmosphere, the rinderpest would be swep from any locality in a fow days, without resorting he knife.
We repeat the few words which were used the other day to characterise his pamphlet, certain that they were very properly applied:-

Mr. Lundy is wild upon gypsum. Neither crops nor animals can grow healthily without it; and its use bave hindered Rinderpest. This particular plagoa however, is more connected with the absence of mab ganese from the body! Sprengel foul

\section*{0,000 of cows urine to be manganese.}

The Game Question and Agricultural PoliticnThere was a very uphill game for any manager of at estate where there was ont ye maintained that it was necessary for th tenant to have some sort of protection, whether it were iven in the shape of a lease agriculture of this conntr It was impossible that the agriculture of this con. A could progress unless tenants had some protection.
regarded game, he hoped no one would suppose that regarded game, he hoped no one would supie the totul abrogation of the game laws. What he protest against was excessive game preserving, gitimate epor Iention been made by the Chairman of the bono conferred upon the county of Norfolk by the Prince Wales becoming a Norfolls landowner and farmer. one appreciated that honour more than be did; was a noble and soul-stirring sigght to see the Penerer b Wales in the hunting field in Nortion to every farmer within 20 or 30 miles ould thought it necessary to go and meet him
many as 400 or 500 mustered ab oce urb a nob Now, if the fox happened to escape such a oret sportsmen, away they all went heller-sies. clover, the young Wheat, an pounding a nag in the foremost of the throng? farmer who raised the ironical cry
and went bang through it himself. pleased with himself? He fancied, was contributing something to the aport the of Wales. He was delighted at the fact the Wales. He was deliguted at to join in the
a to held in his cob, and sat back in his saddle tell his neighbour to believe the almost impossible fact that Albert Edward Prince of Wales, the foture King of Euyland, had that very morning lett and fotare creat lords and fine ladies by whom he was suribe crest, and come up to him and said, "Good ronded, Mra Bull," and shaken him by the hand: Trainat a total change would come over the spirit of That farmer's dream if his landlord were then to chat to him that that day two years he should intimate his Royal Highness to a battue! Look at the dis the misery, and the utter ruin, which, in a dry and loas, mason, the protection of that game would barren What was the result? Why, that for four or fire hours his Royal Highness, and eight or 10 members of the aristocracy, slaaghtered between 4000 and 5000 bead of game, and the only drawback they experieaced in the full enjoyment of the sport was, that the stupid pheasants would make them believe that they lind come to feed and not to shoot them. Now, he moust remark that, in common he believed with almost every other farmer, he was pleased with the alteration which was made in the poor law in the last sises not go far enough, and the legisLatare ought to abolish the law of settlement altoget her. As a matter of course they found the great towns, mying, "We have had free-trade enough, we have had enough alterations of the poor laws;" they did not like giving up the choice of sending back the caral Englisk poor, and especially the Irish emigrants. But in his opinion the Government had Jat a noble opportunity of doing away with the exceptions which now exist. How did it come to pass that there were certain real properties in this conntry that paid no share of the local burdens? He contendel that whether land produced a crop of Wheat or a crop of timber, whether it were stocked with sheep or mith game, whether it produced iron or clay, it ought to pay a fair and equal share of taxation. He would not say a word on the subject of the cattle plague, berause, laving had it only about 100 yards from his own door, he was sick to death of it. Neither would he say a word about the Malt-tux, except that that dire and dreai' fulcalamity which had befallen the country would not make them forget what was due to themselves and to the country at large. It would be remembered that the temporary sun of prosperity which beamed upon them during the Crimean war diverted their attention from the question of the repeal of the obnoxious impost to which he now alluded. Let them, now that they were really depressed, be armed with the courage of despair, and go to the Government to ask for nothing more and nothing less than justice. Mr. C. S. Read, M.P., at the Annual Dinner of the London Farmer8 Club.
Mr. Thomas Bowick.-We extremely regret to learn that severe illness, for which perfect bodily rest is prescribed, has enforced Mr. Bowick's resignation of the management of Messirs. Howard's steam-cultivated farms near Bedford, which he has held for some years. Mr. Bowick has for many years been known as a clever and original agricultural writer and a good practical agriculturist, and we sincerely hope that his withdrawal from active work may be only temporary. The Bedford paper tells us that the men employed on his farms met the other day for the purpnse of presenting to Mr. and Mrs. Bowick a testimonial of their esteem. "The deepest sympathy is felt here for Mr. Bowick in his affliction, and the earnest hope was expressed that the period of absolute rest enjoined by his medical udvisers, may result in restoration to perfect health and strength, and that he may be able again to enter on the duties of active life. The highly successful cultivation of these farms, and the promise afforded of their greatly increased productiveness, have more than confirmed the high reputation previously earned by Mr. Bowick!; whilst the kind and judicious efforts of Mr. and Mra. Bowick to promote the welfare of all who are employed on the farms are highly appreciated, and have greatly endeared them."
Royal Agricultwral College.-On Wednesday afternoon last the Duke of Marlborough presented the prizes to the students at the Agricultural College. In doing so his lordship paid a bigh compliment to the Principal, his staff, and the students for the great efficiency which they had attained, and thanked them for the position to which they had called him as patron of the College. Earl Ducie, Mr Sotheron Estcourt, the Hon. W. H. Bathurst, Mr Edward Holland, M.P., and the Rev. Dr. Barry also addressed the students. The prizemen were Mr. Mundry, Mr. Carter, Mr. Elliott, Mr. Boastead, Mr. Jones, Mr. Kingdon, Mr. Tapley, Mr. Field, Mr. Farley, Mr. Matson, Mr. Ricketts, Mr. Stace, Mr. Wilson, and Mr. St. Quintin.

 Further marticulars, may he hat on ayylieation to the Exser
of the late J. Kellook, The leell Nursery, Ruck Ferry, Cheshire.

We have much pleasure in introducing this valu. able variety, raised by Thomas Laxton, Eseq., Stamford, to the notice of the Trade; some pods (in a green state) were exhibited by us at Mark Lane, in June last, aweraging 11 and 12 Peas in a pod, and they were pronounced by several eminent members of the London Seed Trade to bean excecdingly fine variety, For a serond Early Pea, and a leat for early sowiug in autumn, there is no Pea of a similar clazs -in cultivation to equal it, and we feel every confidence that it will be in general cultivation in a very few years. The Pea has the same habit and character as "Dickson's Favourite" and "Auvergne," excepting that the pods are nearly double the size of these varieties. We have been favoured with the annexed Testimonials, wherein will be found full corroboration of our own opinion as to its being a "First-class Pea."

In Sealed Quarts and Pints, 3s. 6d. per quart, 2s. per pint.
Price to the Trade on application.
A LIST OF THE SEEDSMEN WHO HAVE ORDERED SUPPLIES OF THIS INVALUABLE PEA WILL BE PURLISHED IN NEXT WEEK'S GARDENERS' CHRONICLE.

\section*{MCLEAN'S LITTLLE GEM PEA.}

A dwarf prolific Green Wrinkled Mrarow; habit similar to Beek's Gem or Tom Thumb, and is a first carly.
*** This Hea is a great acquisition, as the chief fault heckerto in early Peas has been want of flavour, and this valuable varints lans all the sugary flayour of the int: wrinkled Peas coupled with a first early Pea; height 1 foot, and requires no stakes. This Pea will give great satisfaction both as an early aud late Pea, if sown in suctessimb.

Price, per Quart, 3s. 6d.

\section*{CARTER'S SUMMER BROCCOLI.}

A now variety, with enormous close white heads, having the desirable merit of being fully a fortnight later than Curter's Champion (fiom which it was selected, and whit has hitherto been considered the latest variety in rultivation). "Carter's Summer Braceoli" may be had fit for use in June, thus tilling up the gap which formerly exit between Broceolis and Cauliflowers. This variets is very distinet from all other sorts, in seed, foliage, and head.

Per Packet, 2s. 6d.
James Carter and CO., SEED MERCHANTS, 237 and 238, Higit ilolborn, LONDON, W.C.

The Garmenerge Chromide.
SATURDAY, DECEMBER 30, 1865.

Nature has pretty equally divided her gifts, according to the Old World the genus whioh produces the largest flowers-Raflesia; to the New that which has the largest undivided leavesVictoria; and, strange to add, she had hidden these most gigantic of all vegetable forms from European eyes until the end of last century. No sooner were they made known, than they became the prize on the attainment of which the lieart of every true hortioulturist was set; but although efforts were made to bring them into cultivation, about half a century elapsed before that olject was attained. At last, in 1849, Victoria regia was safely lodged in our hothouses, and few will forget the thrill of delight which ran through the gardening world when it was announced that the Queen of Water Lilies was actually in Hower at Chateworth. We have had to record many horticult ural triumplis, such as the cestahlishment of Cinchona Plantations in India, and the successful cultivation of Orobanchen, the flowering of the dwarf Cocoa Nut, and the fruitiog of the Mangosteen in Europe; but none of these events excited such attention as that at Chatsworth. A few years later, in 1854, a yet greater hortioultural feat was achieved. Mr. TEysmann, the Curator of the Botanic Gardens at Buitevzorg in Java, succeeded in cultivating the largent of all known flowers, that ourious stemless, leafless parasite, the Raffesia Arnoldi, bearing flowers which often meastire 3 feet acruss, petals a foot long, and nectaria capable of holding 12 pints of water. How long will it be before this "flower, very large beautiful! wonderful!" as the Malay servants justly termed it, when running breathlessly to Dr. Arnold to tell him of what they had just seen in the Sumatran forest-how long will it be, we may ask, hefore this flural giant will be in our hothouses? How long will the tropical house which Loudor designed for Raffesias in the centre of the Birmingham garden remain a castle in the air? Twelve years have elapsed since Mr. Teysmans succeeded in growing the plant, and published the secret of his mode of cultivation, and yet we have not heard of a single honest attempt to profit by the example of the great Dutch gardener and explorer.

After carefully reading his report, and bearing in mind that we do now grow many genuine parasites, such as Cusoutas, Orobanches, and Loranthaceæ, formerly deemed beyond the gardener's skill, we cannot but think that the cultivation of the Rafflesias is merely a matter of \(£ s\). d., a whim, if you like to call it so, which any gentleman can gratify by writing a cheque for a few hundred pounds; or a good advertisement, and a cheap one to boot, for any enterprising nursery man who has the pluck to go into it.

Rafflesia Arnoldi has been ascertained to grow parasitically on two species of Cissus, viz., C. scariosa and C. serrulata; but there is reason to believe that, like most parasites, it is not very particular what exact species it takes up its abode on, provided climatic and other circumstances are is known to flourish on at least two species of Vine, shows it to have a tendency that way. This may prove a great point in our favour. Our readers are aware that moaern science has eatabas we have good representatives of the latter genus in the shape of Vitis vinifera, the Grape Vine, some of our Vineries might be converted into Rafflesia houses, and the seeds might be sown on the roots and lower part of the stem of strong old plants. Rafflesias would require a higher temperature than is generally accorded to the Grape Vine, but wo haso eaen tho atater bearing frate in
 anticipate any obstacle from applying the nown on stems of common Vine. It is impossible ex cathedra to give any hints
abont the means to he adopted in iniroducing the seods of these 13 ral giante. We know very litile indecd of the nature of the Refllesia seede, and how lung atid under what circumotances tl ey relain thir vitall!. The safiel gian. of courbe, would be to dig up come tolerably large Sumatren Tilis, etalolith them whll in IV ardian casem, and moculat the liatlicia Efuls in the manner Mr. Tersmanar hee done. Wo do not think that it would be necessary to ship "a few huedred feet of the elsumde of a tropical climber innculaied with the germe of the wondrous Raflesis." The chances ane that a Vitic of suoh length, suddenly deprived of the iereater part of its Ruots. a ad irausported to Europe. Would die brefore it reacliced its deatination.

But ihere may, after all, be no real necessity for having recourse even to the procautions we have mentioned. They can only be reguired, if the assumpition be cerrec: that Rafllesia scede lone their ferminainge power very rapidly unless they are inoculated without lors of time in the planis uperis whah they grow. The Raflesias decay a few bays after Howering, and the ripening of the recids must therefore be very rapid. Mr. Till:MaNN's idea is that they are earried awny ly ansecta, probalily by some living unlirground, as he found the greater numbir of the hals on tho thinner roots of Vitis, nlehough as fen 1fowerm were also notied by him on the slem meveral fect nhove the ground. But with all duedelern nee to Mr. Meysminn, the itmets may not da anythinge of the fort : the rede may be mevitteren atrut as thase of ather flanta; they
may ritain their vitality for a reasunablo period, and begin to germinate, like those of Orobanches, the moment thes come in contact with the plant upon which they live. At all eventa, before any Ereat expense is incurred, it might be worth while to act upon the inexpensive asoumption that liafltsia seeds retain their vitality for a reasonable priod, and will grow on our Grape Vine as readily as on any of the Viaes of the virgin forests of Sumatra.

A Memoik by Dr. A. S. Taydor, on a case of Poisoning with l'ungi at lpswich, appears in the last number of the Guy's Hospital Repirts, p. 381, Which, coming as it does from such an unquestionable authority on matters which relate to medical jurisprudence, requires some notice, as it contains one or two matters which might hereafter mislead. Dr. Taylor does not profess to be a mycologist, and were it not for a reference contained in the report, to a case which ocourred near Bury St. Edmund's during the past summer, and which was noticed by us in this Journal, Sept. 2'3, 1865, one or twoinaccu racies might perhaps have been passed by as harmless. We were however in correspondence with Mr. Image on the case in question, and he kindly gave us every information, and forwarded us specimens of the supposed fungous matter which was found on a post mortem examination. As the examination of these gives a very different impression from the erroneous report which was published at the time in a country paper, and which did anything but justice to Mr. Image's observations, we think it imperative io state what we believe to be the actual case.

It is not necessary to make any other statement With respect to the Ipswich case repurted by Dr. TAylor, than to say that some of the fungi which were forwarded to him, and which from theiruffensive smell, resembling that of putrescent animal matter, and their actual state of putrefaction, could scarcely have admitted of correct determination even by a practised mycologist, were referred to Amanita citriaa of Paolet. Why a memoir should be referred to which was published by Paulet in 1776, rather than to the works of Fries or some modera author, Dr. Taylor does not explain. The peculiar form of Agaricus phalloides, figured by PacLET, is certainly not a very common one in this country, but the species, as well as the very similar one, Agaricus mappa, is undoubtedly highly poisonous, and Orfila reports a case in which six persons suffered who partonk of a stew composed of it. Dr. Taylor speaks in the memoir referred to, of some Fungi from Cambridge supposed to be poivonous, which were submitted to Dr. Livnuey. That excellent botanist, how ever, wonld never have ventured in a matter of some importance to determine the species of an Agaric had it been submitted to him, as he was confessedly unacquainted with the subjet. The truth is that the article on Fungi in the "Veretable Kingdom" was not prepared by Dr. LiNdeEX at all, but by another person, as stated in a foot-note,
and to whom Professor Henslow sent the speoimens in question.

Dr. Taylor strangely confounds Agarious arvensis with the true A. Georgii. The latter has white gills, but not the former, whioh is far more commonly sold in Lundon than A. campestris, except where specimens of the latter are derived from artificial cultivation.

These, however, are matters of little importance. The Bury case, however, is not so, as it may be quoted hereafter in some judicial investigation on the authority of Dr. TAy Lor. It is quite true that some granults were found in the stomach of a child 53 days after death under suspioious circumstances, and the presence of these granules suggested the probability or possibility of poisoning with Fungi. A practised myoologist would not have been misled, even supposing the nature of these granules clearly ascertained, as he would have known that though they might possibly have been produced by some mould, they were not the least likely to have been reforable to any form of an Agaric. Mr. Image most kindly sent some of the granules to us, without the slightest reservation, and the first impression on submitting one to the microscope was certainly in favour of its being a particular state of some Fungus. But on reflection it seemed so improbable that it had anything to do with the death of the child that we determined to submit what remained to a chemical test, and on treatiog them first with sulphuric acid and then with nitric acid, they passed away with strong effervescence, and when the moisture was evaporated left crystals, which as far as we could ascertain from the minute quantity we had to examine, were crystals of carbonate and nitrate of lime. The probability is, though we have no information to that effect, that the child had taken chalk mixture,
and that the granules were due to it. We did not detect any crystals of arsenic, and it is very possible that the child may have been poisoned with Fungi, though the granules afforded no evidence that such wis the case, and could not probably have suggested any suspicion as to poisoning with Fungi. Certainly the Bury case ought not to be quoted in any treatise on medical jurisprudence, except to show how easily erroneous conclusions may arise from phenomena which are not thoroughly anderstood.

No general rule can be given for the determination whether Fungi are puisonous or not. Colour is quite indecisive, and some of the most dangerous Fungi, and amongst them Agaricus phalloides, are void of any unpleasant smell when fresh, though the most wholesume may be extremely offensive when old. Lxperience is the only safe test, and no one should try species incautiously with whose character he is not thoroughly aequainted. \(M . J . B\).

The Annual General Meeting of the Gardenerg' Royal Branevolrnt Institution is to be held at the Bedford Hotel, Covent Garden, on Thursday, the 18th January next. It is announced that on this occasion two of the candidates for election, namely, Wimiak Snow, late of Patney, aged 67, a subscriber of 22 years ; and FanNy Fostrer, of Clapham, aged 72, widow of the late John Fosper, a subseriber of 21 years, having in every way complied with the regulations, will, in conformity with the rules, be placed upon the list of pensioners without an election. Let us add that the commencement of a new year affords a good opportunity to those who have not hitherto recognised the duty of supporting such an Institation, to make amends by becoming subscribers.

We understand that the remarks we made at p. 1201 on the non-mferctive Arbangements at our present Exitbicions have already borne fruit, and that it is intended to hold a discussion on the subject at the first of the Royal Horticultural Society's Tuesday
meetings in next year, which takes place in the Council Room on the 23d Jnnuary. The discussion is to be "on the best inethod of arranging Flower and Fruit Shows, with a view to the introduction of a more artistic and decorative mode of displaying the various specimens sent for exhibition." We are informed that Mr. Joms HuNGerpord Pollen will open the discussion with a
short address on the subject. We hope some practical and practicable hints may be dropped, which will lead to a general improvement in these matters, for certainly that exhibitors will fall in with such changes for the better as it may be found possible to adopt.
Tuomas We learn from a Californian paper that Mr. explorations in Chili, Peru, and Bolivia, and more recently in Pauama, California, and British Columbia, died on the 9 th of November lnst, while on his return
from a scientific expedition to Nicaragua. Not only botany, but ornithology, entomology, and conchology have profited largely by Mr. Bripari's reearchas, and
his loss will be generally regretted by the cultivators o these various sciences.
We We regret also to announce the death of Mr. G. Francis, the able Superintendent of the Adelaide Botanic Garden. He has, we hear, been succeeded in
his office by Dr. Schomburak, the brother and fellowtraveller of the late Sir Robert Schomburak.

\section*{New Plants.}
322. Odontoglossom Dawsonianum. Afi. Odontoglosso corulescenti. A. Rich. et Gal. ! et
centi Lindl. Racemo paucifioro tri- quadríloro, triangulis carinactis, sepalis lanceolatis subacutis apicem usque maculatias petapisis cunaeto-oblongis acutis, labelli
ungue a basi dilatata trangrerse ovato-ligulato, apice abrupte bidentato, dentibus divaricatis papuliformibus, carina
interjecta, lamina abbreviata subrotuuda retuse crenulata,

Oh these Odontoglots! Which is a species? Which is a variety? Which is a mule? Why do Messrs. Low \& Co. introduce such quantities of illegitimate plants, not bearing proper certificates as to their descent? And why do they call for names for all such introductions? Would it not be safer to have blossoms of three times the number of the new company, and thus to put one's mind right as to species and hybrids? These are our ideas as to all these new thingg-new-looking to-day and doubtful to-morrow, when with cruel boldness an uuexpected connecting link makes its appearance.

No wonder we were doubtful as to this very pretty introduction. Imagine a lovely plant, in the way of Odontoglossum Rossii, bearing slender racemes of tbree or four flowers, each larger than a florin; the sepals rose-coloured, with crimson blotches extending to the apex, and the petals and lip pure rose. "Why do you not call it Ehrenbergii?" Odontoglossum Ehrenbergii, we reply, has the callosity at the base of the lip quite blunt at the apex, without any teeth; its colours, too, are those of the old Odontoglossum Rossii, Lindl. "But why is it not Odontoglossum cocrulescens of Achille Richard and Galeotti?" This has larger longer flowers, with narrower acute sepals and petals, a much larger and longer plate on the lip, and the anterior callosity quite retuse, bearing a keel on each side. "And why is it not Odontoglossum rubescens of Lindley \(P\) " This, too, has a much longer flower, quite as long as that of O. coerulescens, and is scarcely well distinguished by the anterior callosity being emarginate and very broad. "Are you sure of the coustancy of these features?" No; no one can say he is; but, from all we have seen, we believe they are so. But if ever, as is possible, connecting links between all these species should be found, and such as are certainly not hybrids, Hence we do a sery distinct and most lovely variety, Hence we do not hesitate to name the beautiful plant Odontoglossum Dawsonianam, in honour of an eminent collector, T. Dawson, Esq., of Meadow Bank near Glasgow.
This Odontoglot has just been introduced by Mesers. Low \& Co, who have favoured with dried flowers sent home by their most assiduous Mexican collector, one of those rarce aves among collectory, who, instoad of wally hy and smoking, as they now sppear to do generally, think of science and begin to dry specimens. belong to H . Ge discovery of the species appears to very curions unpablished opecies of this genus. H, \(G\).

\section*{THEORY AND PRACTIUR OR VENTILATLOE No. IV.}

Wr come now to treat of the phynical gravite and mechanical force of the air. The galite
materialised the air too much. With amcien ranked as an element. Earth, fire, water air built up their universe. However wrom a their theories, or mistaken in their classiticati- ns, were not far from the truth in their bruad staiemente fact. That present order of thiugs is wainly buitt of elements, as they called them. The earth thers basis on which all rests. Water is Nature's gow solvent. Heat or fire unlooses the strong gre attraction of cohesion on solid matter, and gnemp loosens or disintegrates it to supply the went vegetable and animal life. And the air wants once the workers and the workshop for transforming the raw materials of the world into forms of usefulates,
beauty, and glory. beauty, and glory.
If our fathers overrated the importance of atmosplere, we err still more by underrating it. O true theories concerning it have not yet permeated deep enough to reach or control our practice. Benon the air is not seen, it is too ofter spoken of and treath measure alike the extent of their faiti and the amoun of their knowledge by the limited ravge of their bodily vision, but by many whose education has taugit them a more rational standard of faith, and a broader basis of wisdom. Men intelligent on most other subject continue profoundly ignorant on this. For proop, if proof were needed, it is only necessary to listen to th loose language and take note of the equally loo practice prevalent among gardeners in reference
ventilation. "Put on," or "take off" that ventilation. "Put on," or "take off" that air aro
their daily, hourly orders. Now, either ther that such erders are absurdly impossible, or thes do not; and in either case it is high time these formuln should be altered. The influence of our daily habita, thoughts, and language soon neutralises the effect of special teaching. Constantly speaking of the air, fo astance, bs a nomething that can be kept in or thul on at pleasure, will speedily override our true theories on the subject, supposing these to exist. But too ofteu our everyday language in reference to any matter, ledge. I decline, however, to accept this as the exple nation of the looseness of expression in reference to ventilation. Multitudes who know better thus speak from habit and convenience alone. But there are man. more who verily believe that air can be kept out or in as easily as a load of soil or bricks can be carted from one place to another. Air with them is a mere mechanical thing, used solely as a coutroller of temperakeep up, so air is swept through their houses to beep down the beat. In their estimation, when their house are shut up they are dentitute of air, when open they have "air on"," Nothing could well be mere contrary to fact.
Such ideas have the worst possible influence upon the young mon engaged in gardening. As a clama it it
generally admitted they are lews studious thas they were. Doubtless there are many honourable exceptions but taking them as a whole they seen to have resolved to learn their business more by the teaching of example than by the stady of first principles that has distinguished so many of their predecessors - hence they are almost sure to accept many of our ideas about the air
on trust. These ideas are most erroneously conveged on trust. These ideas are most erroneously convesed theories are propagated, and loose careless practice engendered. To a young man who either looks upon the air as a mere mechanical contrivance to control temperature or a thin attenuated essence that he may safely etherialise off the face of the earth if he can strict orders about its circulation on chemical on alimentary grounds would seem absurd. Present him its whole complex marvellous power on vegetabie life, and he would cease to be an obstructive auto maton grovelling in the dark, and become an intelligent agent to guide the elements of nature into the desired channels of special production.
It is much easior to find fault with existing practices and custome than to originate new and better ones, at it is incumbent on those who condemn ohd formale snbstitute new in their place. If "give" and "aks air are to be abolished, what better expressions ared available? "Ventilate that house," would be objected to by many as inaccurate. Aeratsence of better terms nounce and indefinite. In the abseace or
venture to suggest "open" and "phat." These are short as the usual words, and can become definite by stating back or front, or top and bottom, as at preseat. Quch tity can readily be stated in inches or parts of an nacul To facilitate exactuess in this respect, an inde move form part of all mechanical appliances for make no ment of ventilators. These expressions far prefer able to referring to it merely to convey false notions about it as at pressant. The index, as a test of It would wonld also have a good indirect influeuce. of the air to vegetable life.
As illustrative of this importance I will notice sempe of the physicul properties of the atmoesphere. These co
yithin the range of our senses. The first leson we force and mative power. Wind is simply air in motion Tbe gentlest zephyr that plays with the blushing Rosebud without robling it of the pearly dew drons which add new hutre ever streweit earth or ocean with the heupest that evesolat ion, are only air moving at different vrelocities. From whence does the air itself derive these ventle or mighty powers? - simply from the fact, that sir, subtile and intangible though it seems at first sight is endowed with most of the properties of solids aud liquids. It is subject, for instance, to the great law of attraction, and possesses inertia, in
pressibility, Atraction is that latent power that binds all bodies to each other ; imparts weight to matter, maintains suns and planets in their courses, and at the same moment steers falling of an Apple or the return of an yegum of dust to the earth. It is also the strong invisible cable that draws the air like a thick garment around the world, with a strain of 15 lb . to every square inch
Were this to be snapped asunder, the amazing velocity of the earth's course round the sun and on its own axis would speedily sweep off all the air, clear the world of vegetable and auimal life, dissipate water, the earth whirling roand the sun, a barren blaciz mass of primitive rocks. Were it ever to relax its hold sufficiently to cause any serions difference in the velocities of the solid earth and its aerial envering, the pro-
babilities are that the friction thus induced would rend babilities are that the friction thus induced would rend
asunder the hardest rocks, and scatter the substance of our globe in fragmentary débris throug'ı space. But the strong power of attraction binds the atmosphere so glightly before the earth at different points sufficiently to give a desirable and a most useful bend to the wind Speaking generally, the earth and air may be said to whinl through space together at the same velocity of air, this is perfectly wonderful. That solid
bodies should remain together in masses and adhere to the earth is to us natural enough. Thei particles are bound together by the attraction of That fluids, such as water, should remain on the surface is more wonderful. But chemical attraction comes to the aid of slight cohesive attraction to keep them there But the air is a simple admixture of two gases; its particles instead of cohering, actually repel each ot influenced, an it probably is, by magnetic or electrica attraction, these are quite as likely to repcl it from as to draw it to the earth. As far as we know, the attraction this power is we cannot tell. We can only allude to a few of the laws by which it works. The chief of these are - that the attractive power of all
substances is in proportion to the quantity of matter they contaiu. Substances of equal bulk may contain very different quantities of matter. Lead attract each other equally the respective bulk of these substances would vary as 12 to 1. The large piece of cork, however, would only then contain the same this principle that the attraction of the atmosphere on the earth is almost nil, while that of the solid earth on the air is so powerful. And all bodies draw other bodies to them in proportion to their mass. Attracbodies. Its force is greatest as bodies approach each other. Its power increases or diminishes in proportion to the squares of the distances between separate masses of matter. These laws of attrac-
tion of gravitation are of the first importance as bearing upon the atmosphere. It is in virtue these that the atmosphere presses downwards, and is endowed with gravity or weight. For the same and various altitudes. The air at diferent the poles than at the equator, independent of the great difference tion of atmospheric weit or pressure on the tion of atmospheric weight or pressure on the top of high mountains. For every mile of ascent the downward
pull of the earth on the air is lessened and weakened by the square of the distance. Hence the rapid diminution of atmospheric pressure on ascending into the atmosphere. It is not a correct explanation of this extraordinary difference of weight to say that it originates from the fact that the higher strata of the atmoschere have less of the superincumbent mass of air to support than those nearer the surface, and that they are consequently
lighter, just as the bottom layers of a load of wool will be wore compressed than the top. For apart from the ivfluences of attraction of gravitation, there is no reason Why the air should press itself more firmly down against the solid earth than up against the open
sky. It is well known that up and down, however convenient, as expressions, have no existence in fact, and there is a strong reason why the present
order of atmospheric pressure should bo reversed. But the truth is, the diminution of weight in the atinosphere fact, that the arises chiefly, if not entirely, from the leas strongly is the air we ascend above the earth, the
consequently, ite particles bound further apurt from pressure or weight, then, is simpily one of the resulter of attraction of gravitation, and a mensure of the foren with which the solid mass of the earth pulls its outer gaseons envering around it. It is of such vital ineportance to ventiation, and, indeed, the whole acienos of gardening and the ceonomy of the univenee, that a amonstrntive of its existence, and illastrntiv

\section*{D. T. Mith.}

TUREING OVER VINE BORDERS.
Tra question as to whether it is dexirable or not to turf over the borders of fruit trees comes up ocea-
sionally to the surfice of the thoubled see of min dern gardening literature, but never seems to excito any very great dogree of attention, or claiu much observa. tion, probably bocauso practical men generally can perceive at a glance that the prectice is very mach in opponition to that which they are acoustomed to oow becal now, because some time back a correapondent expressed his intention of turting over his Vine borders, and keeping the Gress short; first, as he said, for the sake of a neat appearance; next, beoause, boing laid at proper slope, heavy rains would pass away witholu important conditions affeoting the well-boing of the roots; and he concluded by asking for information. Now, if my opinion were to be asked on the eubjec I should foel inclined to give it in the curt form in which advice was once offered to persons about to marry-"don't;" but as that would be but scant courtesy, and as the subjoet in not an unimportant one, which, beariug on the subicet, may perhaps he found of a general as well as individual interest.
The inference that the praotice would be beneficial to the roots forms the sole test on which a reply can be founded, and my opinion will most probably not coincide \({ }^{\circ}\) with that of the querist the roots implies that they are placed in a medium
from and through which they may extrect the necessary elements of food, consisting of gascous and ntinospheric matter, 'in such proportions ns we are taught by experience are most conducive to the healtay perrequisite in thr furniehing of this medium is a thoroughly efficient system of drainage, which when secured is of itself emivently calculater to correct and render harmless one of the evils which the turfing over the border is intended to remedy, vis, the accumulation of heavy rains. This will be still further strongthened materials of which the border is formed shall be of such a composition as is calculated to preserve and maintain a certain degree of openness of texture, so that both air and water may permeate freely through it to the drainage below. It is also imperative that the light and heat of the sun may be free to act upon the surface of the border.
vines are gross feeders, and no border, however certain period so thice to supply their wants beyond to surface cultivation, by which I mean keeping the surface of the border loosened, and frequently applying those stimulating substances by which the roots are ttracted and preserved nearer the surface, and there fore most readily acted upon by the beneficial inftuences of the atmosphere,' without which support other means would avail nothing.
Supposing, therefore, a border to be ever so wel made and planted, and then turfed over with Grass, is obvious that many of the conditions which we are accustomed to consider essential to good cultivation must be dispensed with. The benefit to be derived from the action of the sun's rays on the surface of the border would to a greate extent wo neutrailsed feed upon the best constituents of the border while the absence of stimulating matter at the surface would cause the Vines to strike root deeper into the ground in search of fresh food. Al the in the lon to tell to the disadvantage of the Vines in the long run; first in the ill-colouring of the whole system of the tree. Fortuitous circumstances arising from soil and situation might modify this to some extent in few isolated instances, but under ordinary condition of soil and cultivation such would be the effect of forcing the roots downwards in search of nourishment It is certainly very desirable during certain stages of the growth of the line to be abm too gres off the injurious efinto the border during heavy rains, but this may very easily be carried too far, and suck officious treatment might, with a very efficient drainage be much more advantageously dispensed with than som of the other conditions which govern succese. At the same time it is well to have such means at com a in case of emergencies-such, for instance, as when ripe fruit is required to hang long on the trees. And after all, the actnal tine during which such con trivances are really required is comparatively so sbort unpleasing in appearance should be well considere
before boing ellowed to weysh malat the regurcmeuts of muperior cultivation. 1 would further obuerve that there is no nood for such oontrivancen to bo very uneightly. Thus large nhooth of corrugatod zino are oortainly not ugly in appearnnoe.
Then remarts are not founded on theory. I have in the coune of my experience turfed over more than

 whatever. Un the cntrary, an mer caine thees were so much deterionatel se to retier it wecesary to
ro-make the border athd remorate the hats. 1 should indeod ronener expect to tind Vimer troural.ng under a good coatiug of well-rollod grevers sinam
under Grase however woll kopt it might be.
Amonget the conalderntions which ought to infurnce ons in arriving at a jutut deciaion on this mubjeot, is that of the temperature to which she Vines ane to bo ruhjected-whether they are to te foreed rery early, of but moderately early, or whee her naturat com infion and influenoes are mmply to be amialod by tome nearly is that of thene comentries in whech the lime is found to forriat and attain perfeotion without the aid of artificial heat. It is very certain that Vinen do
not arrive at grent perfecton urlese the tumpereture be constantly mamamed up to a cortain degreo. which the climate of this comntry does met attor atimulus of artifiemal heat: lhat is ayp'yous thes heat we nught not to forget that in commines where tho Vine arriver at perfection in the open ar, the beat of the sun acto powerfully upon the eurth, end thus the roota are constantly subjectod to a tomporutaro very nearly assimilated to that in which the treos are growing. If therefore we apply artifioial heat to Vinee, which is turfod over, we are subjecting the roote to a proportionately much lower temperature than that by which the branchea are surrounded; and considering what an important part the cun playe in the matter, it is obvionsly the better penction to koop the murface of the border loose, wo to permit of its aboorbing and retaining as much heat at the temperature of the earth to that of the atmospherc has jod in many instances to the mdoption of heated chambers, ly which a ge:ial war nth is ilff ined in tho soil of the borders from benenth, but even bere to the border and present its radiating from the surface, for radiation will nlways take place undir kizeh circum-
 heatod air to amalgamate.
In conclusion, 1 camnot imagine any condition in which it could be advantageons or deairable to ary fruit border, exceppt for the sake of appearance ; snd i this is taken into consideration, the guestion of fruit growing is necessarily mado a secondary object. Johem Cox.

\section*{VIOEETS AT BICTON.}

AT a dinner party, of which one of the guests was an American judge, the green Peas were boing handed himself after the ordinary 19th century fashion, he poured the dishful on to kis plate! "I guess stranger," said he to a diner who looked at him with some amazement, "you think I'm \& whalo at Peas ! I went to Bicton, expecting to see some thinge done in a colossal way ; knew uat an bla of Conifers of the largest type, from the extraordinary fruiting apecimens sent to the Regent's Park exhibition last summer. I had good reason too to suppose him a whale among cultivators of the king of fruits, but I was equally
Just outside the fine Camellia house, 125 feet long now gay with thousands of varied blooms, there was ine of Russian Violets, about 2 feet wide, the flower beginning to peep up over the healthy green foliage
although the plants had then been only a fortnight in By this time they are (and I was tol that all through the spring they would be) a mass o blue, and there was every indication of it. Thousands of bunches of Violets are required, and thousands may be easily gathered from this and numerous oves furnish about. They are all young plants; the old one furnish howers too sthert flowering. They are growing on the lag which runs along in and the soil, plants, and all are "fresh every year. When the Violet season is past, both plants and soil are removed. When the time comes again for plan the row of flag-stones, and fresh turfy loam put to the depth of a fers inches
depth of a ferw inches.
The Camellia house forms one side of a quadrangle of bouses and pits, and in consequence the shelter for this particular bed is perfect, while the aspeet and of numerous other beds too, which come in after thisbeds in the kituluen garden, beets in many facer abour
besides plantations in the shrubberies, all consisting o young but isy no means small plants. The seed in borders with a north aөpect for the summer months, They are then lifted and planted in these warm little later. The quadrangle was fragrant with them Mr. Barnes's description of the delight that , and Mr. Barnes's description of the delight that these
"Violets dim, but sweeter than the lids of Juno's eyes or Cytherea's breath," afforded him when the clear days of spring have induced the flowers to come ou and sun themselves

\section*{Never having previously seen this delightful little} special note readers. The fine climate of course makes such culti vation all the easier, but there are many places equally well off in that respect, but in which Viola is poorly treated; and similar borders, which could be made in most places where houses are numerous, would no
doubt afford a nearly equally satisfactory result in doubt afford a nearly equally satisfacto

\section*{Home Correspondence.}

Mr. Paterson's Potatos. -The unfavourable ophion expressed by Mr. Whiting (see p. 1180) respecting these Potatos has no doubt somewhat damped the expectations of those who, like my self, had determined on giving them a trial this season, but I am glad to find (see favourable report of them. Now, although I have every confidence in the judgment and experience of Mr. Dean, still the unqualitied expressions of such an excellent
cultivator as Mr. Whitiug seem to point to the fact, cultivator as Mr. Whiting seem to point to the fact,
that these Potatos have not, as has been asserted, the valuable property of being entirely free from disease, and it would be well if those who have their experience of them, in that as well as in other particulars. Apart from the property just alluded to, especially those of recent introduction, whiny kinds, especially those of recent introdaction, which in point the side of Mr. Paterson's varieties. The few rencarks made by Mr. Dean respecting the culture of the
Potato ore very good, especially those relating to early planting, for I have invariably found that if you can get a crop of Potatos matured, or nearly so, before the disease makes its appearance, they are safe; and I have found it good practice to take them up directly the remain, as is generally done, till the haulm is completely gone. Of course this only applies to early kinds, for it is impossible to get such varieties as the Fluke or
Rock sufficiently ripe Wefore the disease arrives, which is generally the latter part of July. I may remark, however, that the two varieties just named appear to to resist disease than most other varieties, and this seems to support Mr. Paterson's view of the case, viz,
that it may be possible eventually to produce a race of Potatus which will bid defiance to the ravages
Eleagnus reflexa.-It may gratify some of you readers to invite their attention to this very ornamental shrub. It is hardy, evergreen, and of rapid growth, making long shoots in one season. The leaves are of a bright green above, and of a golden bronze colour beneath. It is now (December 25) covered with numerous white blossoms, about the size of those of a
Privet, and they are faintly aromatic in smell. \(G\)., Bath. Iresine Herbstii alias Achyranthes Verschaffeltii.Mr. Robinson's remarks (see p. 1180) respecting this plant are very severe. During the season, it has been observations by me respecting its beauty would be super fluous. I was among the first to recommend it for
decorative purposes, and all that I bave said in its favour has been fully realised at Osberton. Nr. R. states that if it would grow in the colder parts of the country
wisere Coleus and even Amaranthus will not it would be a boon. Now I am pretty certain that it will succeed even in comparatively cold districts, although I admit that there is no rule without an exception. For instance thus does well with us during the summer months, but dies off too carly in autumn. The Iresine is in fal beauty for weeks after the Amaranthus has passed
away; and because the Iresine does not succeed well everywhere, I cannot see why it should be so strongly condemned. The Amaranthus fails to my knowledge in many places, as does also the Cloth of Gold Pelar gonium ; while in others it is all that could be desired
The Iresine, notwithstanding Mr. R.'s remarks, will, feel confident, yet be a general favourite; indeed, question if it is not the very best decorative plant for
the flower garden which we possess, With little trouble it can be had of all. sizes and of varying beights; and with respect to its hardiness,
allow me to state that after the Which we have had at Osberton, vizo, Nov. 4, \(15^{\circ}\) Nov. \(14,17^{\circ}\); Nov. \(27,22^{\circ}\), plants of it are atill alive just below the surface of the soil, and are pushing
young growths. I may add that it was not a handfui of plants that have looked beautiful here during the
past season, but nearly 700. I trust that those who may not have seen this plant in perfection will not discard it before giving it a fair twial, fidwoard Bennett, Osberton Mall, Worksop, Notts,
I concur with "E." (see p. 1204) and Mr. Bennett their appreciation of the Iresine Herbstii, but I differ from the speculation of the latter as to the cause of its success at Osbertou. He grew it in a damp, sheltered garden; mine, which was quite as successlul, was in great beauty for three months on high ground, fully liglited the south and west, on clay soil-his was in light sand. My best success with it was in the shape
of two rows, inclosing within them a row of Amaranthus of two rows, inclosing within themarow of Amaranthas
melancholicus, for the close upright growth of the former contrasted and harmonised with the more spreading tendency of the latter. The season, however, seemed especially to favour all crimson-leaved plants, as I never saw the Coleus do so well in the open air in Notts as it has done this year. G. H. V.

Pears.-Mr Webster (see p. 1203) may obtain at Gordon Castle halt a bushel of fine Pears from a standard Chaumontel. But are they fit for anything but show? I had last year from my garden in Notts Pears fit to eat in every month of the year except July This is effected by judioions application of the four walle to the varieties suited to each. I mention this to prove that after 50 years' experience I should not have extir pated the Chaumontel had I not found that while almost every other sort has found a situation where it would ripen duly, we never found it mellow or well flavoured even on a south wall. Gansel's Bergamot and
Glou Morceau also require a south wall to do them justige. Pyramid Pear trees succeed well with my neighbour 300 feet below me, but mine keep much better. G. B. \(V\)

Planting Pears on Quince Stocks.-A neighbour of mine recently asked my advice as to how he should plant his Pears, which were budded on Quince stocks; he had been instructed to plant them so as to have the juncture of the bud or graft with the stock 2 or 3 inches
below the surface, in order that that part might be completely buried. I showed him a plantation of Peare on Quince atocks, in which every tree was planted so that the junction in question might be just above the surface, leaving about half an inch of space between the lower part of the graft and the soil. He wished me to explain why I did this, and I told him that a few years ago I had received directions for planting similar to his, but that my soil being deep and rich, the graft or trees thus lost the effect of the Quince stock, and started into vigorous growth, and I was obliged to take them up, remove all the Pear roots, and replant as he now saw them. I mention this very simple matter in order that some of your readers who may liave been wrongly advised may avoid the trouble to which I have been put. W. L. B.
Heating Tine Borders.-I am intending to put up a Vinery for raising early Grapes, and am somewhat perplexed as to whether I should heat the borders by means of iron pipes, as recominended by Mr. Thombon in his book, in preference to other artificial means of reeping the roots warm. I observe that Mr. Meredith, in an article on Vine borders, does not allude to heating
them in this manner ; and correspondents frequently recommend other atificial means of procuring warmth without mentioning iron pipes. One authority to whom r spoke on the subject said that he did not believe in this way of giving warmth to the roots, and preferred concreting the surface of the border. Dr. Lindley, notice, also lays stress on this manner of treating Vine an open question, perbaps your correspondents will give ,
Mow Chok Bamboo.-Can anybody tell me the botanic name of a Bamboo so much boasted of by Mr. Fortune in his work, "Residence among the Chinese," under the Chinese name of mow-chok? I have planted In the open air B. gracilis, B. Metake, B. aurea, B. nigra, B. officinalis, B. mitis, B. scriptaria, B. verticillata, B. pinosa, B. Thouarsii-is this mow-chok to be referred any of the preceding? K. O. F., Florence.
Evening Work for Gardeners.-In your Paper (p. 1156) "One who has been Gardening for 40 years" asks-"Why is a gardener the only operative who does oot work by artificial light?" Surely, if the exchequer of that 40 years' gardener has only increased in the same ratio as his judgment has improved, he will be credited with but a small balance at his banker's. He says that a carpenter, smith, printer, weaver, painter, bricklayer, \&c., can and do work even under cover. We all know that a journeyman of any of these trades can command from 25s, to 30 s. per week for his labour is it fair, therefore, to put a journeyman gardener ( beg pardon, a student that is to be), against those trades, when he only receives from 12s. to 18s. per week? Who would be a gardener? The long pinter evenings are a great inducement to resors to the public-house, he says ; yes, and be ought to bave added, die high rate of wages gardeners receive enables them o go often! I think that he measures a bushel out few gardeners attempt to been) when he says readint. This is incorrect; for it is well known, ns a rule, that no class of workmen improve them selves by reading more than young gardeners do nul as they have a character to uphold highe than that of other workmen, it natarally make
have let the opinions-kouse. It were best, pertisp regard to this subject, die a 40 jears gardener advances others which ought to be deatl. Bat says that "he would sooner take adverter nurseryman's recommendation than a gardene where, if you go to look at his plat to garden." In such a case, what need he has nothin a gardener? If the garden is but smali, gentlem result that he hae nothing to garden. and a general routine of busiuess is carried ould it be better the equal to task, whethe ion from a place like this, or from a recommen I consider a man learns very little calculated to beere him in his capacity of gardener to a gentleman. Pracen -Do the many operative mechanics and otherassica. by your Correspondent, work overtime by alti. without being paid for it? Has your Correspondet derived his practical lessons from either or from the following branches :-worked at budding nursery, not omitting the ground-budding of Maneti tocks; kept large pots free from weeds; togged ama at two 4 gallon waterpots from 6 to 6 , awidet shons and trees surrounded by buildings, causing a heat subs to that experienced in an Indian Corn field. moreover followed the foreman, executing orders in and other deciduous trees; taking them up in wet clagey ground, with little room to stir?-a navvy's work, the removal of a mass, en masse, is easy comparatively
with this. Has he likewise event the winter amidst Orchids, \&c., and when going out from thens in the morning to breakfast, or at night to tea, in sharp weather, has he found his limbs shivering and his hair highly charged with atmospheric moisture, standin Has he, I would inquire, followed any of these phe of nursery life, and can he say that such afterewort as he suggests would be even desired by the very excellent and esteemed nurserymen of our day? Nothingo in short, could be gained by late over. Work, for with s will a man is capable of doing a good day s rabour ere upon the shortest day. William Early, Digawell. (Wi have received other letters on this subjedt, all pointing out the inutility of night work.]
Culture of the Cocoa Nut.-Can any of your correspondents furnish me with the name of any book
treating on the culture of the Cocoa Nut (Cocos nucifera) in tropical regions? L.

\section*{Foreign Correspondence.}

British Columbia Boranicat Absociatore - (C)n tinued from \(p\). 1205\()\). - Onithe 3 d of August we arized
at the famous Klamath Marsh of Fremont, where I searched for Darlingtonia californic
You may remember that it is a curious Pitcher Plant, found in a " marsh bordering a tributary of the Sacramento River." I obtained several good plants here, which I will notice further on. During the past we We had progressed slowly along, not disturbed
Indians. We lad seen them in the distauce paddl in their "dug outs," gathering the seeds of the yellow Water Lily (Nuphar advena, Ait. ?) for food, a sort

At Klamath Marsh I bade good-bye to my travelling companions, and started westerly over a ridge of mountains, in company with Lieutenant M‘Call and an escort of dragoons. We travelled through one of the finest groves of Pinus Jeffreyi I had ever seen, with Sugar Pine (P. Lambertiana) and Picea grandis and amabilis. Through these quiet glades we often sam the Californian Coyoté wolf skulking along, his exodus rather expedited by a carbine bullet. Sugar Pines (only the burnt ones), we picked the famous surar which ives its popular name. It is sweetish, pieasant, and usefully cathartic. After rid some 15 miles, from the brow of a riage we looka down into the valley of Klamath Basin, with the long expanse of green prairie suut in by snow.lipp the island in some lake, and by evening we arrived at Fort Klamath, where we received a most courteous wel from the cormandant, Major Reinhart, and his officers. At the Fort I remained a couple of days to recruit and participated in several excursionsing country, to the Great Lake, \&c., and about to take my solitary journey over the moun to the valley of Roque River, when Mr. Hunting arrived with his escort. Huntingdon was abouk 50 miles east of the Fort, into the country of Mosis kasketz, to meet the Snake chiefs, and asked me accompany him. As the trip was to a new part, would only occupy a few days, I jo, Piver, where travelled east to the valley of Sprague's River, for seven days we encamped; and whilst Hunting risearches around, and obtained many seeds of flower Dougl. Though trees were rare, the Sage bush deserts now commencing, (the fruit not sufficiently ripe), the tree known a Juniperus occidentalis, Hook. (Andiana of Nuiperos though if this is J. occidentalis, then the Ju. Jun.) is very different. I have been nometimes afraid it was he same but this settles me. The "Sage bush"
- Piscipully Axtomisie tridentata On the 14th the ceer usenionable I returned to the Fort On the way we welch several sceds, amougst others a species of
Lilacea, the Howers of whieh I did not see. Thi I was informed that it was very fine. to return with him to the Warm Springe' Agenoy, I
wok the journey to Roque River Yalley on the 16th of August. Whilst frassing the Great Klamath Lane; we rieited some of tery degraded, and only rank superior to the D.ggers of the mountains of California, and are as moggers onferior to the Warm Springs aud most other cribes as theese are inferior to the highest class of Clucasians. They were busy laying in one of the
staples of their winter's food, the wokas, or seeds of the Nuphar, which covered the borders of the lake; and hers we had an instauce of the truth of the old truism, that "one-half of the world does not know how che ounes loads of the freah capsules, while others were drgiag thom in heaps; then, in another place, some squaws were breaking them the seed with platters wove of tule (Scirpu hacuatris Linn.); whilet, finally, another group of wowen were bagging it and carefully stewing it of for use. Wheu a hlamath squaw: gets up on a
wiuter morning, her first duty is to take some of this wokab, stir it up in a platter with a few hot coals (of wood, aud so parch it, and then grind it between two littla water. Sometimes they float the shells off and eat it whole. In this condition it tasten not unlike parched corn, and is said to be very nutritive and trongthening. The Indianssay they cen travel further on this than on any other description of food. We
crossed Williansou's Iunn, and travelled until after dark to find a spring, the waters of the lake being almost undrinkable on account of alkali.
Next day we rode round among rocke, up and down steep ascents by Iudian trails, and through thickets of she Wila Plunn (Prunus subcordata) mul Amelnuchier olpifolia, Nutt. 'Towards afternoou we left the Klamath Heriog, pud, struck S, En Before, however, leaving these the plant either observed of gathered here by me or others, principally Dr. Newberry. I could profitably have gpont a summer hore, but os my objecte were
different, I had to limit my collection to fuol as I could get seeds of:--Erssimume elatum, Nutt.; Hook. ; Livum perennes, Livoes growing 皆 natural fields and used by the natives here, as also in the Qherth, for nets, lives, \&e.; Erodium cicutarium, LiHerit, \({ }^{3}\) though I have seen mainy people badly, hurb with this "Oak," yet it never is jured me; Frangula californica, Lindl.; Enothera trichiocalyx, Nutt.; Megarrhiza regana, Nutt. ; Ribes, with large red berries, perbaps carpus racemosius; Galium Aparine and boreate; Aster falcatus, Lindl.; Chequactis Douglasil, H. \& A.; Pentstemon speciosum, Dougl. ; Mimulus primuloides, Benth.: Scutellaria antirrhinoides, Benth.; S. "galericulata, L. ; Eutoca phacelioides, Bentho ; Emmenanthe tiana simplex, A. Gray; Obione argentea, Moq. ; Blitum rubruw, Reich.; Atriplex patula, Linn.; Polygonum tenue, Michx.; Rumex maritimus, Linn.; Typha latiOlia, Linn. ; Potamogeton natans, Linu.; Sagittaria variabilis, Linn.; the bulbs of this plant form a great called by them "wappato," which is also the word for Potato;" Sagittaria littoralis of Douglas is, perhaps, 28 suggested by Dr. Cooper,' an Abronia, as the former plaut is not now used in the locality stated by that is dug up for food by the the present day an Abronia culatus var. aristulatus, Torr., \&c.
At Link River we found a camp of Klamaths, who Boiling Spring, and the curious natural stone bridge Las the Rrevailing off to the eastward. An Elymus ags the prevailing Grass, and much reliohed by the
he was described to me as the renl "Bunch 1863. "of the (emigrants, and as such sent to you in present occasion Mr. Applegate, who is an old moun taineer, assures me that, though that Elymus is occasionally cailed "Bunch Grass"" yet the Grass to which the name ought "to be and is generally! applied is scabrella, "Torr. I obtained a little seed from it. I also On therasus marginata, with its bitter fruit River the night of the 17th we camped on the Klamath River, a few miles north of the California boundary struck N. W. up a wooded slope, through forests of Sogar Pine and Pinus ponderosa, and finally emerged Emigrant Trail. The country soon begange, on the thenge, and Abies Douglasii resumed possession (in joint coth we entered Ronderosa) of the forest, On the Missoari direction, I am told, untt you get to the
on either aide terminating the three principal laben ghabroas above and below. The scorn is solitary or clustered,' nearly wetilo: ghoud mound opoid or frequently elliptical, terminatug in an acato propecting point, greenish brown in oolour, 1 to 11 inot long, in a dry long cup, hemiapheriesl, and oovered with elongated acute sombes. It is Quercus Follonsii, Nowb. as far as I in usare not yet itrodioel into The other was cartainty the Querca and the Q. ioagiglandia, Frem. It is allieil to U aiba but apparently distinot. Of both I will endeavour to secure a supply in good preservation. (In both were clustered great quantitiot of a npecie of Miatleto, and on P. pondenoss, the Lichen, Evernis Fremonti, Tuck., In the afternoon frequently bofore on P. contorta.
In the afternoon we came to a apring whare a very good description of aierated water rushes out of the ground, This was the first siga of civilisation, aud here an onterprising Yankoo had builk a ho-tol, which with a cliurch and a "whisky-still," forms the first clements of a rising "oity" in the West. Au buur befure we had crobsel Keen's Creck, where, a year or two ago, in a fight with Indians-inferior in numbera \(\rightarrow\) the whites were repuleod, and Keen kulled. We moon after crossed Bear Creek, famous for fevor nund ague; and then we entered the high road from Cillifornia, with protty little farms, crops all cut their treen were breaking down with londs of fruit At Mr. Lindiay Applegate'n I saw bunohes of ripe Grapes growing in the opon air, ripened by the fow mouths of summer heat: for snow falis bere in the winter, and the mean temperature, from observation made by the surgeon at Fort Lane, is \(38^{\circ} 39^{\prime}\), whilst Forb Vancouver, on the Colunbia, is \(3 y^{\circ} 54^{\prime}\) (owing to the warmer winters). though (irapos will not riper there. I arrived at the hittle town of Jack sonville, the
centre of the Roque River Valley, on the 21 st of August, 1865. I: start off to-morrow (haviug been occupied thpse last few days in sssortiug my collections, and answering my correspondenoe, whilat may horse nepta), ou a colleetng journey over and through the mountaine until I strike the sea, \(1<0\) miles west from this place returning from which i promise moyself, if the season the ascent of some of the peaks.

Linnean : December 7.-(7. Beutham, Esq., President, in the chair. Dr. Kirk exbibited numerous specinens of the Teetze fly, received by him from the Kidele miasion near Acera, West Africa, a locality in which that insect had been hisherto unknown. The cattle there had suffered for some time, aud had died in great numbers from a disease which was eventually found to be due to the attacks of the Teetze. J. G. Jeffreys Esq., and the Rev.S.Tarratt Nevill, were elected Fellown The following papers were read:-1. Notes on some of the Climbing Plants near Desterro, in South Brazil, by Herr Fritz Mūller, in a letter to C. Darwin, Esq The ruthor, alluding to Mr. Darwin's statement that be had seen no tendrils formed by the modification of brancher, pointed out that such exist in a species of nosæ, a still more interesting example occurring in climbing papilionaceons shrub supposed to belone to the Dalbergiæ. In this latter case the highly modified tendrils might be seen changed again into true branches. In two different plants which he had observed, however, the very branches without modi fication acted as tendrils. One of these being leafless at the time it was noticed, was unknown ; the other was a Securidaca, and a most powerful climber -2. Remarks on the genus Moringa, by N. A Dallzell, Esq. In this paper the author poirted out the remarkable resemblance of the ripe capsule in Moringa to the fruit of the Bignoniacese, and indicated other points of resemblance, from all which be arrived at the conclusion that the genus should be placed in the Bignonial alliauce.-3. On Arthonia melaspornella Nyl, by W. Lauder Lindsay, M.D.-4. On a Double fowerea variety of Orchis mascula, by M. .. Masters, aM.
hair. The Rev. T. Wiltshire was elected a Fellow. The Secretary read s letter from Sir C. Wentworth Dilke Bart., dated Alice Holt, by Farnham, Surrey, announcing that a specimen of the rare Gyr-falcon had just been killed by one of his keepers. The following papere were read:-1. On the Metamorphosis of (Chlason) on the Habits, History, and Mieroscopic Charaeter of the Cymips Rosce, by II. Hailey, Esq.-3. On Amber, by P. J. Butler, Eeq.; communicated by Bax periments by Prof. Lewelart ; and on the Relationship existing betwoen the free and parasitio Nematoids, by H. C. Bastian, M.A., M.B.

Entomoloarcal: Dec. 4.-F. Pascoe, Esqe, F.L.S. President, in the Chair. An interesting colleotion of insects made in British Burmah by Lieuto Beavan, was exhibited, amongst which were new speeie of butcertie belonging to the Hesperiidæ and Euplea, and a curious exhibited a very beartifal colleation of butterlies and
motho taken near Bombin Merthe in Vemerudh, by the Eto Mr. Bouctand, nouttiniug many new aproie. Also inmect brougts home by Mr. De Chillis tue only 100 miles dietance from Feren do Vaze in hie hatry retront from the interior. Mr. Stininton catithid amme dark brown spocimens of thes cioncelin. reated from dand Birch treas at Lhaumaitet, ily Ms. Gregnon. Mr. E. Smith exlutited ppectactis of the sau-A 9 , Chesus septentrionaling, whelih the thal resped from the larvin it the end uf suptewber inst. He from Austmlis by Mr. Goorge Benooth which is fod apon by tho nativen and which proves to be a very greasy species of uoth belomaing to the genus Agrotis. Some convernation took place an to the orisin of the anive acribod to the donth-watcto. Mr. molactian read a praper on the recently reared varietion of the moth Sterche morarin, im which he entered upon fice genaral question of the caun and extent of modiWeations in species of lacpuidopleroun iasecte. Prof. Wentwoud read dererption of of reral new phecties of nemis, but formiug donkremp nubgesesa, for whiselace he proposed a series of uuturm subgeneric names. The lier. . Greene exlubited eome specimens of the new British the Bupreatide of New Hollend, hy Mr. C. A. Wiloon, of Adelaide, were mead by the Beoretary; aloo the dencriplion of a now apeoien of Papilin ( \(P\). Godafroy \(i\) ). (roas one of the Pacifc ielende, by G. Semper, Kıq , of Altonn. A flue series of Drawiuge of the lissecth of North Anerica injurious to the Cotton, Orange, Lime by Mr. Moore intended for publication, was estribited

Botanical of Edimbugoli: Dec.14.-Prof. Balfour in the Chair. The following comumnications were Teach
 Mr. Mife, 1865. Communicaled by Mr. Jobn Sadler, taken plare in Fernandu P'o and itn wecinits, by the clearing of the ground, and the plantina of C'moviale rees and Cothin. By the end of this year one firm will these plants will produce iu 1867 about \(500,000 \mathrm{lb}\). of cocoa, During the early stage of the phatation, Cuiton been erd among the Chocinte trees. O Ite mas Miso alludes to the bark of a tree called siricu, which, he nay, is more rapidly fatal in ite effecte than the Calubar Bean, and is need as an ordeal poison by the natives. He alludes to the introduction of the Mango, Breadruit, Soursop, Citron, Tamarind, and other importaut plants into Calabar and the Gaboon. Mr. Milue then gives an account of an excurxion to the Camero
Mountains, and notices some of the plants collected.

\section*{Notíes of 300Kg.}

\section*{The Life of Man, symbolised by the Montine of the Yeon} 4to. Longmans. 1865.
We hardly know how to speak without seeming to exaggerate, of the beautien of this superb volume. It consists of a series of illustrations by Juhn Leighton, from the cradle to the grave. Nany of these, especially from the cradle to the grave. Many of these, especially the larger ones, show traces of the influmnce on the
designer's mind of Albert, Dürer, but, beautiul as they are, we even prefer the smaller woodcate, the initial letters, and the tail-pieces; the latter are in particulat very charming. The text comprises a large and wellselected series of extracts from a great number of authors, most carefully prinfed on toned paper, and the types so arranged as to indicate the period at which the authors, from whose works the extracts are made, lived, A passage from Caxton, for instance, is printed in black letter, one from Cicero in Roman type, und so forth.
As 20 beautiful a specimen of art workmanship and literary taste is likely to be a gift-book not for this seasontionly but for many othere, we wation on the page following the title page to "Auguat," which may possibly be rectified in another isaue.

Report on the Cheap Wines froms France, Italy, Austria, Greece, and Hungary, Sce, by Robert Druitt.
Loudon: Renshaw. 1865. Without assenting to all Loudon: Renshaw. 1865. Without assenting to all and specially not being disposed to exalt light wines as a common beverage in preference to sotund wholesome malt liquor, we nevertheless feel that the pablic is under obligation to Mr. Druitt for his unsparing condemnation of Hamburgh sherry, and similar vile compounds, and for his advocacy of a very narvicable, palatable, aud pure class of wines.
Several foreign serinls, which have been for some In Neerlands Plantentuin (Af. 11-12) the plato
represent a group of Herbaceous Delphiniums, con sisting of formosum coelestinum, a greyish blue, Hermann Maddame Guichard ind Madame Bedinghaus; Roella ciliuta; and Abies Nordmanniana, a sketch of a young tree. The plates give a low idea of the present state of Dutch art.-La Bel, ique Horticole (liv. 10) figures
Disemma coccinea, a New Holland climber with red Disemma coccined, a New Holland climber with red sanguinolenta, the Erauthemum sanguinolentum gardens.-In L'Horticulteur Français (Nos. 10, 11) are illustrations of Pelunius M1. Chaté fils, Beauté des Parterres, and La Renommée; they are striped kinds, the first with a reticulated lilac star in the centre, and five werlge-shaped lilac blotches on the edges of the segments; the second white with five long bilobed wedge shaped cerise bars; the third crimson wim are both novel aud curious. What is called Rhododendron Maddeni appears to be rather R. calophyllum. Calceolaria \(E\). Hamel is a yellow-flowered shrubby variety, with a large crimson blotch. Pelargonium Martial de Chanflourd, described as the first of the full double scarlet-tlowered sorts; it was raised by M. Martial de Chanflourd, a distinguisbed amateur, who ha
The Flore des serres, which for some time past had been issued at distant and irrecular intervals, has lately appeared more frequentiy. The numbers which have been sent out during the present year (liv. 172 to 178) comprise representations of many interesting plants, o which the more striking are the following :-Gymno stachyum Verschaffeltii, changed to Fittonia Verschaf feltii in a subsequent number. Dendrobium nodatum. Eranthemum

Codonopsis gracilis, a graceful climber, with blue tubulose flowers, not yet introduced from India. Malus floribunda, a hardy Japanese tree of great beauty, represented in three states-a tree in size. The flowers are bright red on the outside, and as they are so abundant as literally to crowd the branches, the effect must be very gorgeous. It was introduced by M. von Siebold. Aplotaxis gossypina, a dwarf woolly headed Carina-ike Thistle duced. Dischidia Raflesiana, a curious Asclepiadaceous pitcher-bearing plant from Malacca, recently introduced to M. Van Houtte's establishment. Maximoviczia
chinensis, the Kadsura chinensis of some botanists, a Siberian sarmentose shrub, with obovate elliptic leaves, dicecious Howers, and loosely-spicate pear-shaped cinnabar-red berries attached to an elongated torus Phoenicophorium sechellarum, the beautiful Seychelles schaffeltia splendid \(a\), the Regelia majestica ; and Ver Abutilon megapotamicum, the pretty red-sepal gardens petaled Mralvaceous plant, cailed Abutilon vexillarium Cacti of New Alexien, Iresine Herbstiii, under the latys, with a most remarkable inflorescence. Vande suavis Irubyana, a very handsomely spotted variety,
distinguished by its broad sepals and petals, and short
lip. Rhodorlendron lip. Rhododendron Madrme I. Van Houtte, one of which are white edged with flesh-colour. Eucodonopsis negelioides, a large-flowered dwarf plant Gloxinia-like as to flower and babri, but with the colours of a Tydæa, rose spotted with crimson. It is a very beautiful hybrid production. Aucuba. japonica, the female plant with berries. Four double plates full of choice varieties of Hippeastrum, from M. Van Houtte's establishment. Three
double plates of \(A\) zalea indica - punctulata, punctulata variegata, and punctulata omnicolor, the two latter being sports from the first, which is a red-striped sort, the second superior "in shape and white-edged like variegata, and the third producing, besides flowers like two last, others which are self-coloured and red. Odontoglossum Pescatorei. Rose (Bourbou) Madame Josephine Guyet, a deep crimson. Clianthus Dampieri flore-albo rubro-marginato, in which the flowers are Lilium Thunberoianum aureum nigro-maculatum a fine orange-coloured Lily marked with scattered black spots. Clematis Jackmanni and C. rubro-violacea. Pardanthus sinensis. Dendrobium formosum giganteum. Camellia japonica planipetala, a very beautiful cup-petaled double white, apparently quite distinct in character
Phalconopsis Luddemanniana. Schizostylis coccinea Nagelia Sceptre Cerise, a very handsome variety with vermilion flowers spotted with yellow, and rich bronzyred leaves. Rose (Tea) Maréchal Niel, a decided acquisition amongst pure yellow Roses. Finally, a group of parti-coloured Peruvian Alströmerias completes
No. 178 , the last which hat No. 178, the last which has reached us.

\section*{-florists' \(\sqrt{-10}\) lonerg.}

IT is refreshing to see even a pasising, notice of florists' flowers in these degenerate (floral) days, and I read with real pleasure a few practical notes on the from the "Weat of Scotland Horticultural Magazine." "Rambler's" experiences relative to the most beautiful of autumn flowers accord with mine on most points, but one variety, Roi Leopold,* which he proposes to discard,

I consider most charming, and have ordered two extr bulbs for uext season from my good friend Mr. Dean, o Shipley. This flower attracts the notice of ladies at certainly quite distinct from any other sorts I knowand of a qood or beautiful thing the ladies, as a rule, are no bad judges.

Rambler's" lists of new flowers, and of those of olde date, are in my opinion judicious. To each of them propose to make a few additions of sorts which please well in this country, and which will probably assis yourg growers in making their selection; and I wil add a third short list of about a dozen of garden ornament or for the exhibition table. I would call "Rambler's" attention to the fact that of this choice list of sorts of great beauty sone five or six come from a source of which he seems to be as yet unaware; I allude to the splendid collection of Mr. John Standish formerly of Bagshot, and now of the Royal Nursery, Ascot, a very enthusiastic and most successful raiser on Gladioli, rauking secoud only to M. Souchet, of Fontainebleau. Mr. Staudish's flowers are well known and most justly valued in Eugland, and also in this country, where the Gladiolus is an immense
favourite, and attains to great perfection, owing, doubtless, in a great measure to the richmess our soil, and the softness and humidity of our climate. and with us I may add that no collection is considered omplete which does not contain a large infusion Mr. Standish's flowers
For several years I have ordered what seemed to bo considered the "cream" of the Continental and English novelties, and have amused myself in crossing the sorts which seemed to possess the best constitutions, the finest shapes and the richest colouring; and as I shall bloom some 800 to 1200 well-bred seedlings annually, and have been rewarded with a few fine novelties already, I am sanguine as to future results from my labours. Seed generally ripens with us frou the 1st to the 20th of September. I sow it as soon as ready in pans in a cool greenhouse, and the great majority of the bulbs will bloom in about two years, and will take up fine and large, fully as good as are generally offered for sale by our leading nurserymen.
The Gladiolus seems to become hardier every year left one bed of seedings out undisturbed all last winter, merely topdressing to the extent of about 2 inches with rich loam and leaf-mould in November and in April they came up well and blooned finely It is a pity we cannot discover some means of averting "the rinderpest" which sometimes strikes our choicest flowers so suddenly, often when the spikes are in their full glory, mostly rendering the bulb beneath black and worthless; but doubtless the disease (whatever it be) affects the bulb first and the spike afterwards. While on this branch of the suhject I may add, that where splendid spikes of bloom have rewarded iny labours, the bulbs (most of which I take up early and dry in the sun), now and then turn bad, and are good for nothing after three or four weeks. Those exceptional, and I may add, inexplicable deaths, number with me about one in 40 or 50 ; and though my seedlings did not
seem the worse for wintering out last year, I find the best practice with my general stock is to take them up bulbs in the sun and air, before the autumn frosts set in. As regards the position which the Gladiolus should take at our autuman exhibitions, all that "Rambler" uggests has already been fully carried out in Ireland. At our metropolitan shows handsome prizes are
annually offered in the various classes, which usually consist of stands of \(36,24,12\), and 8 , with three prizes in each class, and the sums given are much more hiberal than those of the great London societies. The sure and certain result of this wise liberality is a magnificent display, delightful to all beholders, and likely to exercise a powerful influence on incipient floricultural exhibitors.
The following may be safely added to "Rambler's" list of new and first-rate varieties :-
 Princess Maude (Standish)
Blair Athol (Standish)
Rnscius (Standish) Garibaldi (Standish) Lady Alice Hill (Standish)
Aureliau (Standish) Mone, Lebrun D'Albanne

\section*{To the list of older flower \\ I would add-}

Rembrandt
Madame Eugène Verdior
Walter Scott (Souchet)

\section*{Plino
Prive Imperial
Maid of Perth \\ The Favourite (Standish)}

Walter
Julia
Rebec
The following round dozen I would consider the very best, for the number, of all the good Gladioli at present in cultivation :-

\section*{Prirce of Wales
Madame de Sorion \\ Madame de Soriga
Fultor
Mayerbeer
James Veltch
Madame Furtado
Princer}

My list of "diecarded " is just the same as "Rambler", with three or four additions. These subtracted, I find that my list of real genuine good corte, muny of them alto very moderate in price, still conmists of over 150 varieties, Autis, Dublin, Dec. 19.)

\section*{The satay.}

The Christmas season is usually considered, anow certain class of people, as a time of rest from banme wonderment to some that we should find anyulticis
all to say about bees at this periud of are at rest, and nothing of interest can, "when tey when no care or attention

\section*{But}

\section*{Christmas Day, in the south of Devan, not quite, for} carrying in considerable quantities of po.leu. s. our little favourites choose to avail themselves of ate favourable opportunity for adding to their stores e renerally begines, for signs of work and pollen gathering about the e. January or beginning of February, but we are inc to believe, from the observations of two or three \(m\) may provided the weather be sufficiently fine ald the season. In the north, and in colder districts ours, there is doubtless a period of more decided But whether the bees rest or not at this time the no reasou why their owners should entirely rett a all their apiarian labours until thie hives are fairly going ahead in the spring
Now is the time to go throagh the apiary aul what the requirements may be for the coming campin Now is the fitting period for deciding what addition may be required, or any other of the apporton of a well-ordered apiary. If any such be want would advise the services of a good carpenter to be
in requisition as soon as may be in requisition as soon as may be. Let the nimad Have every completed and quite ready for immediate use, some th before you may actually need them. Aroid mer possibility of the bees getting ahead of yor and of desired appliances not being at hand. Much low mit accrue from a departure from this rule. A very she delay in supplying needful accommodation in cat summer may involve the entire loss
first swarms; or may be fatal to the successfal futimo of a mach wished-for super. Therefore decide in yon own mind, and avoiding all hurry, let every deficient in your apiarian department be rectified no
Many bee keeper's rest contented with an witic neglect of their bees in winter. They never pay the a visit, believing that they are all right and canol require any attention. This is frequentiy a grea mistake. Hives may become saturated with moiston exterially or otherwise; after a time of protracted on the entrances may be partially or entirely ctooked on by dead bees. In some districts a small but destrodir eviemy may be constantly at work, destroying findied of most valuable lives. This enemy is the tometit, is often very destructive among the bees in winter, is little that is likely to be necessary to attend among the bees themselves, and an occaslonerify inspection is all that will be

The bees of some hives in the immediate vienits Exeter were obsërved to be cairrying in a considerable quantity of pollen on Christmas Day. This was more particularly noticeable in respect to some

We witily wioh all piarians, for their bees as as for themselves, "A Happy New Year."

Securing Bee-hives.-During the last great storm was asked to lend my aid to a friend who was at a los know what to do with a hive which had been blom on On proceeding to the spot, I found a large octagonal to be the subject of the misfortun was broken down, and very much injured. Thes been picked up and placed anyhow inside chilled, had not been huout then cince the little rond could result from attenpting to the combs in frames for being transferred to a I therefore brushed the bees from the combs on to floor board, and resting that on
an adjacent populous colony, in, and were received without any fighting. carefully for a queen, but failing to distingime or left on the ground. What made this a
more vexing was, that to this live, bein winter store, many pounds of food had we
few week previously. Nuch of this was stored and sealed, but the combs were in have been prevented if the precaution give Number of the Chronicle, of securely fastening 'to. Apiator.

may be
Thuse are in all eight of them, of which in lesigth, is devoted to Cattleyas and a few It has a pathwny up the centre paved with , and a table on cacl) side of the same material. T:e venthition of this house is so plamed that the iaportance as regards the bealth of Orchids. Among khe plauts mere manr fine sperimens of C. Mossiæ and its
eight flower-sheaths; C. labiata Percatorei, of
size, with 13 flower-spikes; the rare C. Dawgoni, numiber woucerful plant, together with some fine exemples of Lelia elegans, Of L. purpurata there were a grat mand amethystina. The latter are grown well here to get too dry the bulbs and leaves sbrivel, after whish meommon to ste large rpecimenes, 3 and 4 feet in que' with them now-a-diays; this is to be regretter), as ily flower at a time whin few Catheyas are in blomm, and blossming tuice a year is another advantage whe llysis Limminghiii in excellent condition, and the rate Dendrobium Schöderi, generally called D. densiGfonm atom, the flowers of which continue in per-
fectimn much longer than those of densiflorum. Immedialeiy orer the central pathway were coma splendia pla.ts of Oncilium crispum, throwing up strong spikis when on blocks it gets too dry, but when ficured at page 1155, it succeeds admirably: and aluars with success; for example, C'attleya superba, Which is seldon foumd doing well - here it grows å Hiselli, and Wa'keriana. Pleione lagenaria, Wallichii and maculata were in an equally good condition and bissom every year as freely as a Crocus. The give them a season of rest, and when in active grow th a good supply of water, which must be withleld when
growth is completed; but when they commence dhowing flower, a little water may be given to assist them in expanding their lovely blossoms. At the end of this house is a glass case, in which are sown seeds ago he sowed some seed of Phalænopsis, from which he doubtless anticipated a good crop; but after wery careful examination of the stumps upon which they
were sown, nothing in the shape of plants could The next
length and 12 feet in width with is about 40 feet in Ride. A magnificent sight here presented itself, for two lovely banks of the most beautiful Orchids were in selected a prettier subject for a painting than these tables furnished, for they contained all shades of colour and the plants being arranged with good taste, and graceful.folinged plants, had a highly imposing effect, produced. Miltonia Clowesiana had 40 spikes of flowe on it. Here also were the rase Oncidiam crispum marginatum, hearing a charming spike of bronzy
flowersedged with orange-yellow; a variety of Oncidium Lanceanum, with flowers of a beautiful dark colour and Cattleya Aclandiæ, with several fine blossomes on nearly 2 fret in diameter. Associated with these wase
an Uncidium much in the way of divaricatum Calrathe Dominii in the way of C. Nasuca; Vanda parieties of Cattlo two fine spikes of flowers; two producing sume fine large white blossoms; Lælia different, a charming species, producing large flowers, Which it is somelimes said to be marginata, with notile, a luvely kind, with several spikes of sweet thomed and mans on it; the slowy Dendrobiun chrysanThe East India bouse conten in your colomns of 1 ugus 19 ( \(p .771\) ) come under my of the finest plants that have ever magnifieent my rotice. On the centre table was a Aeride plant, 6 feet in height, as was likevise trime Aerides and Fundas occupied one of the side tables, in heicht; Aerides. Larpentre, Aanda Batemanni, 5 feet and Coslogyne Larpentæ, A. odoratum purpurascens, Was a good collection of Cypripediums, accompanied ruvo Dendrobin Dendrobium anosmuth, and of the with these weautiful of its class. Keeping company
and II. Devonianum, which in seidoin grown well.
This was in a bathet filled with Moer Trom was in a Larhet filled with Moes and suspereded
front. The general calce of this fine speciee not thrivinz is that it is lept too dry, and thes ito leares get attacked hin red mider.
In a coultr loume with ter
In a couler house, wath two epan roof, was a measured several feet acrors, producing sumettimes a many as 60 flowers at one time! A. eburneum, a was also here; as were likewise fine eppecimens of Lyraste Skinnerỉ, Leolia cinnábarina, L. anceps sliowing 18 flower spikes, Cologyne cristata equally fine Cattleys Skinneri, Fpidendrom nemorale majus, the finest of all the Eqidendrums a heo severul phats if the
new Laelia Wolstenho!mixe, I'hajos maculatus, Zrgopetalum "maxillare, growing on a block, on which it stecceeds better than in a pot; and the rare Cattleya
quadricolor and Uropedium Lindenii. In the ame house, moreover, was a number of imported plantu colsisting of about 50 Cattleya Trianeri, and no doabt many other sorts.

Another house contained a mircellaneous collection of plants, among which was a fine lot of imported Odonto glossums, such as Blantii, Pescatorei, gloriosum, membranaceum, and many supposed new onenp, aleo
Trichopiliss, nearly all throwing up strong groat has; L.eelia majulis, Epidendrum vitellinum, of which I notic. some good varieties in brom. 'Ihe showy Lapmeria rosea was likewise here, atong with all the beat varie ties of Nermum lothergili, loaded with rearlet flowers. These ought to he cultivated more extemsively than hey are, ranking es they \(\mathrm{d}_{\text {, atmong the mot lively of }}\) the bulb tribe; they require the same trentuent us the Amaryllis. The Odontoglossums were starting vimonsiy. They were first put into swall pots and phanged in samid
 imported Orchids, as it causes their bulbs to rot and their young growths to dump off.

The nixt house was devoted to OJontoglossoms ; it is pancroofed, and has pathway up the centre, and a tahle nn each side; it also contains a division for plants
requiring a different temperature. Your readers have doubtless often both heard of and seen Odontoglossum grande, and I bave done the same, but never did I witness such a splendid sight at one time as this plant furnished here. One side of the house was a mass of bloom. On some of the planta I counted 20 spikes, on some of which were 15 expanded flowers: smaller plants were also magnificento In the same house was likewise Odontoglossum Pescatorei, with large bulbs, producing strong spikes, on which are sometimes as many as 100 flowers. Absociated with this were \(O\). caudatum, a noble plant, which has produced 300 blooms this year, and 1 believe as many with 20 spikes 0 wach of which were some 10 flowers; and many other fine plants. In an adjoining house was splendid plant of Odontoglossum citrosmum roseum, 3 feet in diameter
In anotier house of the same size as the last, with a division in the centre, were two grand plants Puaænopsis Schilleriana, with leavea some 18 inches in the rare Vanda cristata; Saccolabium pramoramm, in particularly good health; S. ampullaoeum, and the pretty Phalænopsis cornu-cervi.
One often hears it stated that where Orchids predominate little else is cultivated ; but it is not the case here, for other classes of plants are grown in great perfection. For example, at Meadow Bank is the finest collection of Amaryllis in the country, the bulbs of which are of an enormous size and promise toyield a finedisplay of bloom. Mr. Dawson admires these plants quite as much as Orchids; and what are more showy? They bloom when flowers are scarce, and by skilful management they may be bad in flower all through the winter and spring months. There was bet one in bloom at the tive or my visit ; it was named Unique, a splendid kind, of fine form, the petals being broad and of a brilliant scarlet, while the centre of ceach was shaded with black, and the throat was marked with white. I also noticed some fine bulbs of Ackermanni, which is one of the largest flowering kinds, and bright crimson in coloar; ikewise pulcherrima, which is one of the best in cultivation, generally bearing four flowers, fine in form, of a rich violet purple colour, shaded with crimson. Hawkinsiana is also a splendid variety, having flowers of large size aud of a rich velvety crimson colour. The collection contained, moreover, marginata venusta, marked with scarlet and white; Bearii, great favourite of Mr. Anderson, producing fine white flowers flamed with crimson; also Graveana, the flowers of which are well formed, and of an orange scarlet colour; venoss grandiflora, bright scarlet with almost invisible white stains; gicantea, with large scarlet flowers, of fine form ; and Edith, prodajor is beautiful light-coloured blossoms. Joind, which pro. also a fine bright crimson sike; as is also Wheelerii, duces eight flowers on a In the same house was the beautiful Vallota purpurea, which is one of the moss lovely of summer and autumn-flowering piant. I cannot leave this class of bulbs without expressing regret that they are not grown more than they are greatly neglect them after they have finished blooming
them by laving nompleted, a good rest should be given them by laying theu down on their sides ancil they
are ready tin stant fean. Ste moil beat adaptad for

 dating, as they can be stowed mway under atagen whilst other plants oocupy their pleces. 22 gaten, and onwarde ho arge show greenhoume ath well ventitialiad at: the tin. Thie is furumhed with a centre and two nide tiblen, wind has a pout ic.:al it.

 Recimen of Eriostemon, Hh luhe suct-s.l.thd opinosa, in the alsape of a large plaut, which bloomn well annually : Roudeletia apeciosa : and quantities of Tritoni urea. This lat makes a good show in Auguat and september. Thero were moreover a good collectivn of Zonal Polargonioms, which make a erand dieplays

 HiLh

 of the grecuhouse plants they hat a pretty oflict.
Another greethonse was fille whel sperimen Azaleses, consisting of ill the bent kinde, the whole of the plants being models of cultivation and well set with bloom. Adjoining was a manll span-rooled houne for foliage phants, amonest whell wien a ...... m, of Croton angustíolum; alco a good ezample of thit rare Pandanus reflexas, a siogular plant, and re seldom secu. In the sauc house was lihen ine a large specimen of Seloginoll csetia arbores, of a beantifal blue colour

Farther an are two large vinerien, the ofrat devoted to lsach Ifaminagh Grapes, of which there had been a cood Muscate, the buncises of which were not large, hut the berries were good. In this house is grown a collection
of Camellias, amonget which I noticed Pauline Maggie, Queen of Denmark, Leopold I., Cup of Bearty, Duchem of Orleans, Saccoi Nova, Bianca, Countens of Werby, Cuntess of Ellesmere, Candidissima, Imbricata, Mathotiana, Boihuclliama, Mrs. Alby Wil ier, Arcl:duchess Augusta, Reine des Flears, ac. Let us hope that Mr. Dawson may ere long build a house specially fos
this fine collection, to which it is well entitled. B. W.

\section*{Miscellaneous.}

The Silkworm.-The following account is taken from the report of Mr. Meadow, H.B.M. Conaul at the port of Newchwang:- "In a journey to the Corean borders during the antumn of 1863, I found mywelf, 80 soun as I had crossed the watershed of the Leaou monntains, travelling through a silk-producing country. I had, indeed, heard betore of silk being protuced at and near Fung-hwang city, but had con-idered it morely an amateur domestic occupation, mot capable of being developed into a trade. That it is muehasore than thas, and that it may furnish in time what the port greatly wants, an article of export to Ean"M: I aw now no doubt. Questions have been raised as to the nature and characteristics of the silkworm peculiar to this district, but only a personal visit to the silk-producing country for the express purpose of getting information could enable me to give answers to them on which I myself could place full reliance. It is diflicult enough to extract midst of the things inquire ? about ; at a distance it is next to impossible. As an instance of this, I may state that in spite of all my frequent inquiries, made both when in the silk-proaucing district and at this port from natives of that diatrict, it in only within the lust few mathe that I hare heard of another tree besides the \(O\) O bueh is called l cally Po hit ko tsi. The other bush is called Chien tsu tsi. Its leaves are narrow and lons, as compared with those of the Oalrobush. It bark is of a greenish white luee, and is smooth, and its trunk and branches atraight and ungnarled as com pared with those of the Oak. It, produces a seed of Beech the silk prodaced by worms fed erclusively on this bush is said to be stronger than it is when they are fed on the Oak. It is, I fear, beyond doubt that the Oak-leaf-eating worm, the shankeen or monntain worm as the Chmese here call it, is of a different species from the Mulberry-leaf-eater, which is lere called the kea keen or domestic worm; and that, therefore, the hope a ther hand, the Mulberry-leaf-ater or domestic worm
of the Newehwang consular district does beem to be of
the same species as thet of middle China; and it might the same species as the the effects of a crossing with an be desirable to try lhe effects of a crossations heen a animal that has probably for many generations heen

Society of Arts.
Foyal For:sis. - The accounts lately issued for the year ending with March, 1863 , show that the receipts from the Jew Forest in that year amounted to \(16,636 l_{\text {. }}\), \(7,407 l\)., and the expenditure was 5,9447 .; the mines bringing in a furtber sum of 14,8411 , minus 1,970 , expenses. High-meadow Woll Holts, 5,301l.; 1,6i1l.; expenditure, \(642 l\). Wooluser Estate, \(1,114 l\), 6191.; Parlshurat Woods, 369.., minus 331le; Hazleminus \(889 \ell\), D Delamare Woods, 6,1342 ., minus \(1,543 l\). Epping Forest-receipt, nil: expenditure, 507.; Chopwel woods-receipts, 33l.; expenditure, 446l.; and the mines produced 58l. An epidemic has been prevailing for a long time among the Larch in Chopwell woods; described by the superintendent some months since as assuning a blackened, sickly hue, holding out but a poor prospect of uitimate successful divelopment. The and woodlands (without reckoning the items above given in relation to mines) amonuted \(42,807 \mathrm{l}\). ; the expenditure was \(23,765 \%\). But the growing timber is represented as increasing in value d) not include. Windsor Park and woods; the year's receipts from that great Royal domain amounted to \(8095 l\)., and the expenditure was \(18,922 l\).; but it must be remembered that it is not maintained for mere In the Royal forests there are but about 100,000 bare forestal right, and Crown has more than, a of the land is subject to riglits of common on the part of a numerous body of persons, much being also not worth cultivation. More than 50,000 acres, however, are enclosed and planted with timber; it requires thbove a century to bring an Oak to maturity, but the plantations bave reacbed the stage in which
they pay their expenses and yield a small income by the sale of the thinnings that are cleared away to make room for the crop that is to grow to maturity. In the of Parliament, the Crown allotments which admitted o more profitable occupation than for the growth of navy timber have been converted into furms.
Sicilian Vegetation.-The city of Messius, and its northern and western suburbs, show the influence of the snow-covered Calabrian mountains; there is all but a complete sbsence of the sonthern vegetation of Olive trees, and the Orange and Leinon trees disappear or are only ubser vid in sheltered corners. The Fig
trees were culy just beginuing to show their leaves, the

Vines were only sprouting on the 25 th of April, and
there were very few flowers in bloom to be been. Indeed, the proximity of the cold Calabrian mountains appeared to have brought the northern suburbs and are in the same latitude as Palermn, to tise level of Caunes. Bennet's Mentone, 3d Edition.

\section*{Calendar of Operations.}

\section*{(For the ensuing week.)}

The season of the ycar has arrived when everything in the shape of flowers is scarce. Fruit-bearing plimts will therefore now be in requisition, and foremost Aucuba, Solanuins of various sorts, and last lut not least, the small fruited sorts of Oranges. These will all form plants suitable either for room or conservatory decuration. A very good effect may also be produced by bringing pruminently into view plants winh hand.
some foliage. What can be finer for example than Herns whea well grown? The Puinsettia pulcherrina, Calathea zebrina, Dracena terminalis, and many other plants of a similar feseription are aloloured leaves o braces.

\section*{flowhr garden and plant houses}

While the weathor is still favourable look carefully over bilffhardy stock, and if any has not already received sufficient protection, let no time be lost in endering it as secure as possible for the winter
Cimmbers.-Attention shoald now be paid to securing as much light as possible in all plat-houses; where the rafters or roofs, therefore, are used as trellises for clinbers, the latter should be rednced within convenien bounds, Late-flowering sorts hs yet unpruned will now be sufficiently ripened for the purpose, but hases than should be done after removing the changed leaves chan lio deferred till March or Aprit. If larger and stronger shoots are cut now, they are apt to commence growing,
inspite of the moderate temperatore, and thusexpend the atreng th which ought to be reeerved till spring. The shoots of Matrandyas should be considerably reduced in tulk, as they are affected by the slightest damp during avinter.
admit of it; but avoid cold draughta, and keep put frost. On the other hand, be careful noti to use too much fireheat. 1 Training and shifting must also receive attention.

Solanem Capsicastrom.-As even amall plants of this bear berries frcely, the following hints as to its cultivation may be worth atteation:- If good-sized specinens are wanted in a comparatively shorb time, fet the young plants be introduced into. warnth early in spring. and as soon as they have started freely into growth shift them into larger sized pots When potted place them again in heat, giving little water for a time ; but syringe overhead occasionally in order to keep the atmosphere muist. - After that, water with water of the same temperature as that od house in which they are growing. They will now succeed perfectly well ander che krowing state, paying attention to stopping all straggling shoots For ordinary purposes 6-incis pots are large placed Abous in as and sunny situstion as possible, when they will keep flowering and set fruit better than they would indoors. In September let them be moved under glass, where, when covered
with brilliant orange-scarlet berries, they are extiremely ornamental. Indeed few plants can be compared with this for winter decoration, and what is important, the berries are so nermanent that the bushes bearing them etan their rivid colonring for severul manths at time. The soil most suitable for thas \&olunum is a light fibry loarh interinixed with a little peat and sand.
Verosicas.-Andersoni, Liadleyaua, aud Meldensis, are charming plante for the decoration of conseryatories at this seasou, and should be everywhere grown for that purpose. They may be made, to form standards, and iu that shape produce a good effect when intermixed with low-growing plants.

\section*{forcing garden. lall}

Cucumbsis.-Give those growing in pits all the light possible by taking off the covering early in the morning, and keeping the glass olean. He careful that red apider does not make its appearance, which may be the are in Pine stoves, where the drier atmosphere favours its increase.
Pines.-Do not allow cold weather, should it occur, to seal up the ventilators; the admission of air must, of course, be gradually reduced in accordance with the season, but this is a very different matter to almost discontinuing it. Let water be very sparingly used during the present dull weather, but have an eye to thase plants which stand near flaes or hot-water pipes, as they are liable to get dry before their neighbours. Vines.-In some instances housed from which the ruit has been cut wil! long before this time bave been converted into greenhouses; the Vines uader-auch circamstances require to be kept cool and dry, and the plants want very nearly the same treatment; front, however, must be carefully excluded. While the plants
are in these temporary dormitaries, pirticel should be takea to keep thenu perfeetly clean an a
from insects of all descriptions leave broods behind them, whicia will be very tso some another season.
hardy pruit and kitcelen gardry
Examine fruit and root stores to see if all state of good preservation. The dressing of fruit against wals, with Ciohurst Cuiwpound or a miston: tubacco has beeu boiled), with a small

\section*{The agricultural gatett.}

Tre new Order in Council meets the difficulty which Lord Carvarvon's letter in another column refers. Authority is now given to the county magistrates to place the live cattle traffic under restriotions-not in petty sessional districts, but in quarter sessions assembled. The area is thus increased over which any restriction tells, and one step more is taken towards that centralisa tion of autnority on the subject towards which public opinion is tending as being alone sufficien puble with the will no doubt be adopted as soon as the existence of a corresponding local urgency of feeling every where exists.

The letter from Mr. Caird on the homceopathio treatment of the disease, and the extract from the "Medical Journal" on the character of the disease, will be read with interest. It appears now to be admitted that the disease is an eruptive or spotted* fever of the same class to which small spox belongs. And it is possible therefore that some method of preventiag it, correspending to that of vaccination in the analogous disorder, may be discovered.

The number of new cases reported during the past week was 6256-the largest number yet reported in any one week. And in Cbeshire alone upwerds of 1600 fresh instances of attack are reported : and the daily deaths were 162.
The Annual Meeting of the Smithfeld Clab is
as busy and urgent a time for the implement manufaoturer as it is for the stook feeder. Almost mannfaoturer as it it ary department of agrieulture indeed is well
roprenented in the Agricultural llall that week. The soll itwelf cannut be prewented, but the implemonts by which it is cultivatel, the fint is it has grown, and the summals they have fod, are all erhthited, and each in epecioncus of the v.ry higheat ment. For illuatratians of the carlacit maturity and mast rajd grawth, whese wad you Ind mure wonderful spectmene than the castle, sheep, and pigs in the area, or the Manfoln, iwedes, Cattle-thelans, (irasses, extathted in the galleries? When \(W\) urz is atorage tre:wera 4 and 20 ib , apreoe, arid Swedis reach is and 20 lb ., and Kohl Rabi exceed a sione. and Turmips are many of them ovir a quarter of a ewt., there does nut seem asuch ofportazity for improvement. And wo tay telace that, thanks to the implements extitited, and through the plants extrbited, and lis means of the varied improved breeds of stack extibithed, the raximuen per acere of foed for man has been extracted from the senl. We have not tutherto given a detailed ripart of the machifnery exhbuted on these annazal vecariozan; for the implament Catalogue of the Simithfiedd Club in rouch the na:no thing as that of the R. gal A -rtcultural society of Hingland: and the area and gatletios of the Agioultural Hull are very much the same thing as the country show yard ouvored in.
The powerful englues and thresting machinery on best mikern are repriacented on 2n different stands. Impluments of hillage and of cutture, and for seeding-staam phoughs and culticators, ordinary floughs, common and "excelvior" harrows, grubiers, horne thoes, corm disills and manure dintributore, are sell cherywitre All kinds of machinery for harvisting crops and for pregarang tome, seapers, moners, hatvest curts, rakes, hay tedders, chaff cuttere, of the one class and Turnip outters and pulpera, conn crukhera mills, and steaming apparatus of the ether (thene last probatily the most appropriate el oss of saplements for the season and lie o.caston) are extibited at almost every stand. D. meotic apiraratus, Washing michince, cooking contrivances, mineing mackinen, \&e., are shown in large numbers. And, reverting to the farm, barn machitiery, from the threshing machive and winnower to the weighing machine and the back holder, is amply illustrated. The whole range of manufacture in which the farmer or his wile is ioterested is thus r-presented. And at many of the stands many thousand pounds worth of machinery are exhibited. So that the whole furms a wonderful illustration, both of the extent and the enterprise of the English agricultural machine trade.

Among the specialities deserviug notice at the recent Slow may be named Mr. Brilut's contrivance for evenly dividing and distributung the water of a water drill among the several coulter drilis into which it falle. It is manufactured by Mr. J. Coultas, jun., of Grantham (Linvoln).Mr. Penner's adjustable eora separator, in which a cylindrical spiral wire soreen is made fine or coarse by the simple expedient of squeezing it together, or elongatiog 1t, also deserves mention. -Mr. Patrenson's (Beverley) erushing mill is noteworthy fur the simple way in which a rub and a squeeze are combined by the approach to one another of tho bevilled surfaces of two wheels or disos, one larger than the other, and placed at an acute angle to it. - Wendale's (Hurnchurch) enormous apparatus for distributing liquid wanare may be of service for market gardens and fur richer liquid than commou sewage; but it can hardly be supposed that the poor watery stuff of our sewers will pay for any other carrier than itself.
Sainty's (Burnham Market) spring coulters for the corn drill, first shown at Piymouth, are extibited here on several stands.-Gikant's (Staplehurst) portable railway for both 11 -inch and 2 feet 2 -inch gauge, is exhibited with its turn-table and waggons.-Boyd's (Leadeuhalt Street) turnip cutter and pulper in one, with fap in the hopper between the two enabling yu to choose whether your roots shall be delivered in finger-shaped pieces or in "sawdust," must be named.-A great variety of churns are exlibited; Tinklek's (Penrith) simpie barrel churn on a friction ruller; Ireland's (Manchester) 3-motion vertical ohurn, oscillating, plunging, and revolving all in one ; and others.

Among the more important of the larger machines exhibited is Allen's double expansion ongine, to which we have already directed notice in our columas. A saving of fuel and water is promised by it of upwards of one-half, besides a reduction of wear and tear. If this be true, it seems impossible that the old form of engine oan
hold its position. Since the introdnction of steam ploughing, agriculturists are getting acoustomed to higher pressures, and with this it appears inevitable that more use should ise made of the steam than is now done. To let it out of the cylinder at the same pressure at which it enters, or nearly so, is perfectly monstrous, but this is actually done in ordinary engines, although nearly three times the power is theoretically obtainable if the steam be fully expended. Mr. Allen's arrangement accomplishes the most complete expansion, and this without duplication of cylinders ; and actual experience shows that \(3 \frac{1}{2} \mathrm{lb}\). of coal and 2 gallons of water per actual horse power per hom are sufficient for engines made on his plan, whereas \(10 \frac{1}{2}, 13\), and even 141 b . is the usual consumption. We strongly recommeud an examination into this znatter by both farmers and contractors.

On Slevees. We once saw a sledge used for hay on boggy ground near Loch Katrine, which was well adapted for the work and ground. In one of Murray's Handbooks, published in 1847, we find that sledges are preferred to carts on the quays of Rotterdam; a vessel of water with a little spigot is suspended in front of each on the runner of the sledge, to diminish the iriction. We believe that the quays are very narrow-little room to turn a cart. Sledges can be drawn from front or rear. They are oceasionally used for many purposes in Devonshire, and very properly so under certain circumstances. Having a rough harrow-and-brushwood-carrying sledge tried in the hay-field, we were so much plensed that we used to borrow it from neighbours, and have repeatedly pressed a stout field gate into service in the hay field. A lad can load a sledge; a little boy, girl, or woman can lead a horse yoked to it with plough and trace gear, up to the riek, leave it for a man to piteh, and return with empty sledge or gate. It is well to reflect on novelies and always to remember to live-not vegctate-and learn. What may not the value of this hint in a catchy hay season be?

When a farmer meets with a new machine -grist-mill, straw-cutter, \&c., the vital question to put to the exlibitor is-What parts are most suliject to tear and wear, and breakage, and how
cau it bo repaired? Most of the steel corncrusters, until the American grist-mill appeared, were a case in phint. There was a smart fellow
frum London selling sewing-machines at the West of England Agricultural Show for 40 s , or 60 s . On being taken aside aud asked, if the machine was broken, how it could be repaired, he told us that it could not be repaired, which was all we wished to know. B. AM. F

\section*{THE CATTLE PLAGUE.}
1. New Order in Council-The new Order publistied on December 23, revokes so mach of the the local authority in Great Britain, and defines it now as follows:-Subject to the powers reserved by the Order of the 23d of November to the Clerk of her Majesty's Privy Council, the local authority within the City of London and the liberties thereof shall be the Lord Mayor; in every borough in Municipal Corporation Act the mayor; in every county, riding, or division of a connty, or liberty Peace in England or Whales the Justices of the Peace for the said county, riding, or division of a courity, or liberty, in General or Quarter Sessions assembled, provided that no county of a city, or c unty of a town, or borough "hich is within the provisions of the Municipal Corporatines Act shall be deemed for the purposes of this Order part of a county, riding, division,
or liberty. The local authority in every burgh or town in Scotland having a Town Council shall be the provost or other principsl magistrate; and in any other place
in Scotland the justices of the county in sessions in Scutlanid.

The cattre Plagúe under Homosopatity.-In the attempt to treat this firmidable disease, the Association instituted three weeks ago the first of a series of careful experimental trials in Norfolk. Notice of this was experienced veterinary sargeon, under their direction, has daily watched and noted the proceedings. The Association engaged the services of a skilful and experiassistants, has remained in constant attendance on the cases. The local and persoual influence of Lord Bury Wanding all these advantages, the result of our first trial has been that, of 36 cases undertaken on the first day of this month, only six remained alive and were

The cases were taken fairiy and undiseriminately, some
and stages of the disease.
Our first trial has thus fallen far short of the anticipations formed from the subcess of similar practice in Holland. We have but 16 per cent. of cures to place against 46. the proportion shown under all kinds on
treatineut by the Dutch returns of the 22nd November This may possibly be accounted for in pate by the different coudition of the food of the Euglish and Dutch
cattle, the former having been on their winter food of roots and fodder, while the latter were still on thein succulent and easily digestible pastures. There would seem to be something also in the nature of the animal observed that Dutch cows recover from the disease in much lagger proportion than Englisti.
But, though we have to lament the want of success which has attended our firsi trial, it has been full of proved very fatal, it is not incorable, and many cases which had been successfully trented relapsed from the subsequent use of improper food. Our experience in regard to diet is clear and decisive, and I venture to
urge it as a vital point in the management of this urse it as a vital point in the management of this
disease, whatever principle of medical treatment may be adopted.
Solid food in any form, in the active stages of the disease, is positively pernicious. It arrests recovery, and when partial, or even complete, restoration from the disease itself has been effected, it carses a relapse which almost certainly proves fatal. The safest and
only necessary food is well-boiled gruel, given in moderate quantities four times a day, a quart or a pint be made of Wheat, Indian Corn, Barley, or Rice-meal, whichever is handiest. When the appetite returns, soft, fresh made mashes of pollard, mixed with meal, may loe given lukewarm, but no roots in any mode of prenaration until the animal is convalescent. Then boned roots in moderate quantity may be given with
the mash, but, Turnips, from their action on the kidueya, are objectionable at any stage. All straw and dry folder should be kept out of reach, aud, if necessary, the head of the animal should be so tied as to prevent it cating its litter. The aniunal should be kept comtortably warm, and be well rubbed over from time to time, and the discharge from its eyes, nose, and other parts carefully wiped at
The nature of the
The nature of the disease is not yet understood. It is epidemir, highly contagious, but yet not uniformly so. It is an exanthematous disense-that is, lever, attended with eruption on the skin; whether analogous may beruptive fever of man is not yet determined. It most complex in its inature, the bolies even in many cases are affected. Other diseases seem to give way before it. Where it enters, the foot-und-mouth disease
and pleuro pneumonia disappear. The formidable character of this disease, its rapid spread, and weekly nicrease both in this country and Holland, and the fear that it may be communicable to sbeep, render the consideration of its curative treatmont a subject of the
gravest national importance. We are not diamayed by the comparative failure of a
first trin?. The difficulties have been great-a new, complex, and terrille discase, dumb patients unable to give their medical attendant any history of the case, attendimis sometimes careless and ohstinate, and never with any earuest laith in the possibility of cure; but Norfolls we are about to carry into Chashire. From a feeding we pass into a breeding and dairy district, where the cure of the animals is even of more vital importance. Our practice is open to public inspection aud its results will be faithfully reported. The field is ample enough for many inquirers and for different remedies. We clain for ourselves 10 more than \(\Omega\) place in that field, wherein we may hope to gain, by patierice and perseverance, some mastery over a disease the danger of which to the wellare of the community cannot be exaggerated. In the name of the Association James Caird,. Vice-Chairman, 6, Adelphi Terrace Strand, Dec. 26. (In the Times.)
3. Nature of the Digorder, - Mr. Ceely, of Aylesbury, has, we believe, thoroughly satisfied limself that the rinderpest is a specific eruptive fever, having no relation either 'to typhnis or typhoid fever. He has satisfled himself, from historical records, that the specificeruptive fever; and it was from this study of the past history of the disease that he came to this conciusion. If, he argurd, the present cattle epidemic is the rinderpest of lurmer days, it must be accom panied with an eruption. Like Le V, rrier with his new planet, he said to patholngiste, "Seels for an eruption, and you will find one." Pathologists have sought, and have
 disease. The Medical Commitlee of the Norwich
Cattle Plague Association, who have just issued eport, refer to the fact in, who following terms:"Quite recontly the attention of your Committee has been nppears now to becertain that some portions of the skiu, and or markiugs are presert uy be lighto They aro aleo rendered hing the integument up to th

This phase of the case will naturally bring formiard the question of vacciuation as proplylactic of the
disease. We shall hope shortly to lay before the pric fession a full account of Mr. Ceelys before the prin mission above alluded to is a valuable aut inatruct acument. The members of the Commistee are D. Measis. Wells and Sinith, M.R.C.V.S., and Mr. Firrether summarily to allude to it. Their conclasionily abre ollow
"1. That the disease is the result of a speoifio blo d poisent

diseasu may often be diagnosed," lise Committee adrl, that they have as yet no data wefore them from which to judye of the efticacy of ang
4. Staftstics of the Plague.-Believing it to be of great importance to ascertain whether the cattle clearly proved no communication with any infected sonicts has taken place, may I beg any of your numeroes readera to favour me with reports on this point, where to the best of their belief the disease lias broken out i their own stock or that of their immediate neiguboun where there has been no communication mid
diseased animals, or nny other mode by whici iufection frem disensed sources could be conveyed. I shall any partics who have themselves hal the oppranity of investigating the fucts on the spot. It will be or dog, or other animal has been about the premises that coulh possibly have come in contact will any diseased animal or contaminated inatter previously to the appearance of the plagne. I tust :hat some gentren'm in Scolland and the morth will favur ne with commmications on this immortant question homas Ingle, M1.D., The Tillettr, Emsivorth, Hants. would be satisfactory to learn when it first was known would be satisfactory to learn when it first was known
among the stock north of the Tweed, and how far north in Scotland it is now prevuiling, and if in sotme of the remote districts instances of the spontaneous generation of the plague have not occurred. They of coured must be well attested, and direct from a party on the tpot, or they could not be regarded as conclusive,
5. From Lord Carnaryon.- There are yet six weeks to the meeting of parhament and the consideration of egishative mensur: for the suppression of the in the plague, and with every week a marked increase in the
ravages of the disorder is note: in the offi ial returns of the Veterinary Departinent of the Privy C :uncl Office The Govermment, whather rightly or wromgly I mil not now determine-have songht to cist the re-pmal bility and the burden of action upon the noper anthorities, telling us that the powers cone stficient
them under the last Order in Council are sen Whether this be so or not, local authorities have clearly no alternative but to exercise thiose powers to fullest legal extent.
A week hence the entire magistracy of the countr. will meet in quarter sessions, and though their powery are narrow, and the difficulty of effiective great, all opportunity of practical goon will be lost they separate without an attempt
ourse of action.
Apart from minor suggestions and regulations there
Apart from minor suggestions and reguatedenimle-
1. To otop all fars and markets and the public sale or
estibision of aninals, whether fat or atore, in any place
wibin the several petty sasional divisions; 2. To wiblin the several petty arasional catle from any other part of the Cuited Kingdon within the same limits;
suppri- of ail loads where the movement of cattle is lisc, and, br means of a single inspector, inpretion of practicable, with a proper removal and dwinta ting of all contagions matter; 4. To obtain, as far as poss lying within the counties. These measures, is fainly crme linit the spread of disease from centres of intetim, limit the spread of disease from within, of them, as autborised by the 16 th and 18th sections of by the magistrates of this county and of Gloucester. praposal in Hampshire at the ensuing quarter sessions there.

On thie other hand, thère is a difficalty in giving
 intrusted are not the magistrates acting in quarter adopt co nprehensive ambl conistant measures for the whote combty, but the mayintrates acting in gessiuns fur thie smaitions. This subdivision of authmyty, imnintained in practice, must be obvionsly fatal to unifurmity of action. One division will more too fast, nnother too slow, another not at all, and in this irregu-
lari' \(y\) of procedure points will be left anguarded in the line of delence, by which the disease will make its way into the leart of a county. But thougl quarter independence of the petty sessional divisions, yet it onght not to be difficult in a court where all parts of a iog as to the courese to be adopted in each division. common form of order with reference to thic sale, the movement, and the introduction of cattle caut easiy be Whole county by an agrecinent of the several petty zessions to accept the sawe individual; nor need there it, in creatipg , whera local circumstances may require with the various petty sessional divisions, may contribute towards uniformity of action on questions arising from
time to time. In counties which are as yet fre for time to time. In counties which are as yet free from country, and a more or less suspension of traffic, offers, for the present at least, a reasonable chance of escape; and even in connties where the plague tras broken ont, very rigid isolation of the places infected, in addition to operati in of the esil; but neither nom-intercourse nor suspencion of traffe, nour the isolation of particular
places, will avail nithont unformity of action pret time has already heen lont in waiting for belp from the G.vernmeit; halt meacures are as uselest as they are large and incelligent farmers in the Suath of England are rearly and inxious to subinit to the sacrifices and inconveniences involved in the adoption of stringent mensures in order to escape the infinitely greater losses and
suffering which the further spread of the pestilence must necessarily cutail upou them. Carnarvon, Pixton, Somerset, Dec. 23.

\section*{AGRICULTURAL EDUCATION.}

On Middle Class Education, having reference to the Improvement of the Education of those who depend ppon the Cultivation of the Soil for their Support.
By Mr. R. Dore, 14, Bartoin Crescent. Triren (Concluded from p. 1214.)
of the Societs consider how the certficiate or diplomia Exuminations are nom the conferred, and tipon whom. gualifications, and a great deal is made to depend apon of the Crown All the appointments in the Civil Service tione The are now made as the result of examinaof India are made in the same way In An the majority of these apyointments no special technical knowlodge is required. ssill more may a properly conducted examination test technical qualifications. These require cannat fonded on sulstantial information, and they tion, then, in ogriculture and its kindred sciences, Fould to a great extent indicate the qualificarions of instituteulturist. Let the Royal Agricultural Society institute sucis an examination, which should include, in
addition to the sciences which have been mentionerl,
a thacrough examaination in practical agriculture ; The prepailing practice of the most improved district woald be this examination competent examivers for agricalture. Three of each of the sciences, and one the chemist, the consulting engineer, and the veterinaty the eun of the Society. Otliers might be appointed for
fill would be subjecte, the most difficult of which to
present day, this would not be imponable. Thitere of the nation might be held annually in in London, The examiiustance, and other opportunities inight be inbrequently
The when required
The standard of examination should be lixed by shoult be sufficiently high, that the diploma of the Suricty might be a certificate of considerable the inente. This would reqcire more attention in the firs instance till the character of tiese examinations wat be attached to ench diploms of the expense, a fee might liminary fee required from all who presented themselvi curred to secure the sirvices of competent examinern In the first iustance, however, the Society might willing to bear the whole expensc. As a grectimimary to examination, a certificate of reside nee umom a farm migh also be required; one year's residence at least with rent-paying farmer, as some guarantee that the cand farm some observation must be exercised, ind some practical knowledge acquired, and thus the fommation laid of a sound agricultural education. Beins thms assured that the practical qualifications were acquith
afield, the examinera would proced to ascintin the attamments of the young agromlumist in these other branches of knowledpe which have hen combiderel.
Hore it mizht be emsinerel that the sisiety wom assist him in obtaining this sicutific howhorke, that the action of the society might commence, and some means be provided for supplying these additional acquirements. This, however, would not be altoget her ou the part of Government, as many as two thousand examinations yearly, and yet the Government has not the information which must be acquired to pasp thing examinations. Nor is there this necessity. It is not more true that Nature abhors a vaccum than that be considered the present rendering of the old philo. sophic maxim. If therefore prizes ase to be won and distinction gained, candidates will come forward who
will take care to be furnished with the required in formation. The examinations of the Royal Agricultaral Society would create a demand which it would be the Candidates educatious means of the country to supply their practical knowledge, would be able to show an acquaintance with those branches of science by which that practical 1 nowledge might be further assisted.
The Society, however, might aid materially, and perhaps also most usefully, on this matter. The \(\mathrm{r} t\) sp: ctive hanches of has,wlafge, might be authorised to give a course of lectures, each ap in his own particular sthinect. This would have the speecin agriculture, as has been notical mader Bitany. The examiner or profesor of agrienture metht alat give a course of lefures uphn the mot improved practice, and coll attention to all the newes improve
ments that may appear. Thoe lecture room poasesses many advantages for this, even urer a model or experimental farm. It is imphalle \(p\) fore snil's and conditions, as for heavy and for light land, so as to exhibit the difference between sheep and enttle management, between tillage and grazuns, breeding and feeding, dairy husbandry and corn farming. If
some of these are suited and proper for a district, then others are unsuited and wrong. If a little of each are adopted and carried on, in an experimental manner, then the result is, that the farm is carriwh on at a hane. the balance slacet exhibits a deficiency, and profitable farming is thas depreciated in the eyes of the stadent, who ought to consider that as the fondamental principle of any system. It is for this reason that of auhering to the practice best suited to the district, they are neressarily ohliged to alopt a varie!y of practice, much of which is utasaited, sud enerefing to be sadd against them. on the coutrary, they may be to be said against them; on the contrary, they may but it is imposible upou thee same farm to extivit all ties varieties of practice which necessarily prany \(d^{*}+\) Arice \(^{2}\) but still differences exist with which it is neeassary fur the agriculturist to beenme acequanted. He may uns be able to determine his own lot in life, or to tix benreplaced. It is impossible, however, to expect a young man to have lived on scveral differeut farms, merely to learn his profession, cyen if opporturillits were nvailate. This requirement a course of lectures oa agricnture and agricultural reading may supply. Beins already in possession of a certain amount of pencticilet, he is competent to understand descriptions of more improved practice. There are many practices being daily autopted by practical men of which they have is an instance of thit, asd to a still more general extent machine reaping. These great improvenents of liste

 hy adding to their previously acquired experlewoe,
bring up their koowlodge to a leval with hin own. In sommection with chis salject, and at a materin? meaps of Sasistance to 2 ny coure of mpricultural lecturce, the F. hmatirph the 11 thand and Agricatearal Socioty wase a liry isele fat ma, conlainiug a oollection of seods rootn, aud evoryining of ncricultural interoot Thare fa alan e momenm in cannantion with the lest anes on agriculture delivered in tho Univenity of Edin burgh, is which is conthined a sorics of paintinge of al
the breeds of dowe: The li, ya thit...? ioly lay a implersents used in agriculcure, by various malera Which in both intereating and uwdu; Gul perbupe thit

 the it may in thio way supply thies meame of agricul. tural enduention.
An examination, then, in agriculture and ite kindrod sciences having boen suocensally prased, would be the busis on which the diploma or the soc.cly would be awarded. The remalt would be determined by marke, and the numbers might be publiehed, as is at preeent done with ourtain examinations for the army, All onming up to acortain atandard wonld receive the Society's diploma, which would thus be a certificate of agricultural attnimment on the part of its possesor The education thus certified to would be tive twet that could bo obtained, and the young a-ricutcuriat would now be as well qualified to embark in hie pro'ctation an the young engincer to enter upon hiv, or the young medical man to tare a practice.

It only remains to consider who are to be milmiltod to these examinations. The object of the Jluyal Agricultaral Society ahould be, by producing gnod agricul-
 information to any parcicular clas. Therefore exumine all who present themselves who can certily to their having acquired practical knowledge by a certaia revidence upon the farm of a rent-pasing fariner. The somndness of thil knowhedge and the extent of their attainments in aclence, it will be the province of the eraminers to ascertain.
Naturally it will he those wha intend in make furming their proffaxion, the ans an! or: er relatives of that willdefine agrimbtual milite Cant, the present temant farmars of hingiand, wion wiai praent themselvés. Acconding to the lias censis the number number of sonis and other rolatives rea haig with the n \(92,32 l\), when more tahing fart in the mangement of the farm, doubtules wht the vien of fotionmige azriculture as their proiessian, enther ... temant tarmors or farm bailifts. The muntier of thes. latur, thumzh comparmively omall, ostribits cousiderahn inmentso of late years, hrving lisen from 10,561 in 1451, to 15.593 in is63. Th underther, then, difceely the whention of this large hody, which, rectumted ain, froms allees sumets,
 beyond the meass at the commana of the Rend Agricultrural Society, and would require nothing shont of a nstional system of education. But if the mustain entunot come in Mahoult, Malumt may go to the monntain, and if the attractions of the diph man of the Soncicty can conhance the prpularty of semantie agricalcure, and intlumee thas luge bity \(L\) avail themselves of the means of eviuctaion which wust in consequence arise, the creat ohjpet mill he equally attained. Local examibations mixil diren he helin, abil
 England be implioved. It th by incereasin, theis knowledge that the progress of agriculture mas bo (flected, and mate to kerp pren eith the requituments of the population. This proereses rests essentially whth them, and it is hy advancing their e.bnction rather than of those below the:m that it will he ase mp ivhed. The education of the agricuitura laburer is an- ther matter, and is connected rather with his social p sition than with the improvement of agrimaltare. The acquisition of knowledge which he camnot employ will not avail him, and it is throngh the enlightened practice of the improvinu arrimulturist that the labourer is best cducated for his datiza

It is then with the education of the farmer that the Asiety has to do, and in conclating I wond renall the words of Mr. Homlam, at the discomsion of the subject of agricultwal ediontion before the society in Aprii. 1564, in which "he trused that as the question of cilueation man been fairly mooted, they would not leave the lad who was intended to be a farmer in the lurch, after
having assisted to give him thie benefit of a good
education, and perhaps encouraged and stimulated him
hy means of prizes in concection el by means of prizes in counection either with agricult
directly or with the natural sciences which \(w\) directly or with the natural sciences which we
connected with agrieulture, but that they would anbe to hit upon some plan for aiding these who were inmediately after leaving schoo', and give them a opportuuity of improving their kuowledge in the sciences connected with their profession."
These ohjects it has been the aim of th!s essay to
discuss, and to offer some suggestions by which the Roral Agricultural Society inay carry out the seventh
ohject of its Charter, viz, to take measures for the ohject of its Charter, viz, to take measures for the
improvement of the education of those who depend npon the cultivation of the soil for their support, in accordance with the spirit of the Society's practical motto, "Practice with Science."

\section*{THE CHEMISTRY OF WOOL.}

THis was the subject off lecture by Professor Anderson before the Highland Society at Invernesso. We make the following extracts :-The subject I lave selected for consideration, thken in its broatest napect, is one of grent extent, and might, in fact, be made to include the entire management of the sheep; for the protuc-
tiou of a good croy of wool of the lighest quality involves the nicest attention to the breed of the aninnal and its perfect heulti. But these, and especially the Sormer, are matters which do not come within the
provinee of chemistry, and cannot, therefore, be dis. provinee of chemistry, and cannot, therefore, be dis.
cumed heren Neither is it alwaya posibibe to explain by analygis the cauee of the difference in quality of different kinds of wool, the commercial value of which is dine not so unch to its composition as to its structure.
We shatll see presently that there are often differeaces in the composition of the various kiude of wool, but on the other hand two ssmples may bo chemically undistinguishable from one nother, although the ex-
perienced woul stnuler will set down out as of the higherest, und the other of the low sst quatity. Even the wool of a single Hepee is separated by the manufacturis into mapy qualties, filted for difflereut purposes, and bearing very different values. The canse of thia
is rendered obvious when the wool is ezannined by the mioroscopes, when it in seen thigt its quality depends party oll the fineness aud uniformity of the fibre, and partly on the length of the staple, which fitd it for the manufacture of partieulur fabrica. It is well known that these qualities are greatly affecte. by the breed and the cliwation which
lived, and it is by atentionp to the former that the character of Scotel wool has beeu so wuch raisted; while the latier is a difficully with which our sheep farmers widh ulways: have to contend, sud which matat prevent our wool in general from bringing as high a price as of the food supplied to the sheep has, no doubt, a inaterial influence on the quality of the wool, and is a ubjent which well mexits attention. But I do not propose to enter upon the consideration of this question information regarding it is of the most scanty descrip. tion; and lheve fuiled to discover any experiments on the influence of the foud on the weight or quality of the obtuined from animals fed on the richest pastures, but it is not possible to tell how fur the superiority is due to the more nutritions character of the Grasses or merely to the more fuvourableclimates. The composition and nutritive value of the cultivated aud natural Grasses of lowland districts are woll known, but there is are no doubt the same, as those found in the lower districts, and their composition is probably very imilar, though others are different, and of their composition we are entirely igncraut. There would, of course, be no difficulty in making analgses of these; but the information they would convey would be of little use, unless it were coupled with a knowledge ble, indeed, that the higher or lower value of mountain pastures depend not so much on the difference in the nutritive value of the Grasses of which they are com. posed, as outhe grenter or less abundance of those which finer Grasses, and are only compelled by hunger to consume the coarser species, although they are often just as nutritive as those they select. The influence of an abundant supply of food on the quantity at least of more striking when we consider what that quantity is, and how active must be the animal functions by which it is produced. 'To do this it is necessary to look at the relative weights of the fleece and the snimal which produces it. These vary greatly with the breed, as may those which are mout widely diatributed in this Kountry:
Lang-vooilled, Lincolnabise, 8 to 10 lb : Detrons, 716. F Leicester, 7 lb ; Black raced, 3 lb .

Intermediate - Dorset, \(6 \mathrm{lb} \cdot\) Cheviot, 5 lb .
Sfiort-woolled.-Merimo, 6 to 8 lb .; Shropshire Down, 7 lb . Southdown, 3 to 4 lb .
Thking all the breeds together, theaverage weight of a
fleece may be set down at 6 lb ., while that of the sheep
in the uufattened condition will not exceed 90 or 100 lb . quantity of wool equal to about a sixteenth of its own weight. Even this, however, does not give a perfect
id a of the matter, which can only be obtained b! nuking the comparison between the dry wool and the dry matter of the slieep. Wool in its natural state ance be made for dirt adhering to it, the weight of ctual wool in each Heece is about 5 lb . But the entire body of the sheen containg about two-thirds of wool) it would weigh on'y 30 ll, ; and heace it oflow
that a sheep prodnces anually, in the shane of dr wool, a quantity of matter equal to about one-sixth the solid substinces contained in its body. These facts re sufficient to show the importance of an alaundan
supply of nutritive food to support the drain in the supply of nutritive food to support the drain in the
system occasioned by the growth of this large quantity of aminal matter. When we further consider the
delicate organisation of the skin, each hair of the wool rowing within a litte tabe of its own, furnisted with minute glands, by which it is furnished with a peculiar ily secretion neevessary to promote its growth and keep Which the pergpiration is evolved, and that the gowth
of the wool depends upon all this complex maclinery performing its, functions in a perfectly bealthy manner, the importance of an exact knowledge of
ull the conditions affecing them will be sufficiently abvious. Withoutt venturing to discuss the physiological questions counected with the functions of the skin, I proced to remark that the chemical composition of the vool is extremely complex. As removed from the animal, it conesists of two parto-the wool-proper, that "the fibre; which is used by the nanufacturer; and the "yolk," \(\{\) peenliar substanice secreted by the glands of the skin, by which the fibre is moistened and prorected. In tine process of scouring the wool, which is ie first step in its manufacture, the grenter part o gents, the action of which will be afterwarls explained,
 them entirely, and then obtaius the pure fibre, which then differs but littie from the hair of other animals. The pure wool is of itself a very complex ench of these coutains a small quantity of fixell or mineral matters, which are left behind in the ash when it is burnt, and thre contains a comparatively larye quantity of silica, a substance fivand in extremely linaited quantity in the nimal body. Thettine anide these substances, the wool consists of -carbon, 50.65 ; hydrogen. 7.02 ; nitrogen, 17.71 ; qulpbur, \(2.31 ;\); orygen 22.3 . Total, 100.00. Iu compositions, therefore, it does not reaterially difiser from she nitrogenous constiturents of other parts of the animal body. It is as rich in nitrogen as the gelatine of the bones, and surpaspes every other animal substance in the proportion of sulplaur it contains.
peculiar. A very distinguishod Fiench chemist, M. Chevreul,

 those which completely destroy the f

The largest number of organic mbatances are com posed of only three dements of simple bodies rith carbon, hydrogen, and oxygen, and even in many the atter substance is absent-for examnle, in many essential oils and the products resulting from the destructive distillation of organic rubstances, whilat hose which contain oxygen aro chiefly represented by starches, gums, resins, organic acids, and fizer oils nother clase, such as morphine, quinine, and indigo contain nitrogen, in addition to the subatancer mentionied. There is another cless of subtranees, limited in number, which contain sulphur and phowhome besides the four elements" 'ubove "citod'; "these "ure epreserited by slbumen, corresponding to the white of an egs of the serum of blood in animals; fibrine, represented in animals by the clot of blood: caseiuo, characterised in animals by the curd of milk. Therefore the whole of the organio matter of the vegetable kingdom is représented by the pretivg together in various portions (influenced by particular molecular arrangements) of six elemente, vis, carbon, hydrogen, rysen, nitrocen, sulphur, and phosphoras

Although organic matters are composed of two or nore of these elementary substances, they are never found in vegetable matters in their pure and isolated condition. They are always combined with a certain quantity of mineral matters which appear essential to the healthy condition of plants, and are, so fur as wo know, essential to the formation of the organic bodies hemselver. Thus chemists have ascertained that plants generally contain lime, potash, soda magnasia xide of iron, sulphuric acid, phosphoric acid, \&c
Let us examine the principal sources from Which plants derive the elenients essential to their formation, growth, or healthy progress. The most important element of all vegetable substances, and which, in fact, characterises all organic, matter, is carbon, or what is ommonly called charcoal. This edement is derived entirely in vegetables from a colourless, invisble; and slightly acid gas, having a specific gravity of 1.52 , and You will easily conceive on reflection what an enormous proportion of carbonic acid must be produced annually, when you consider the vast amount of vegetation which surrounds us, produced either by the hand of man, under the influence of the plough and other instruments, or by the rapid growth of trees and other vegetation which covers our hills and mountains. truth, the Divine Being has provided for an abundant supply, for there exist many sources of production of this gas so necessary to vegetation. It is uselfss to record here the well.known modes of producing this gas by respiration and combustion, but I wish to call your attention to some more special sources of its production with which you may not be so perfectly acquainted.
M. F. Kuhlmann, a well-known chemist, published in 1861 and 1862 a most interesting series of papers on the production of carbonic acid through the oxidation and reduction of the oxides of iron by their contact ith organic matter. Thus he found that, if he took a clod of earth, the bulk of the iron existing on its surface

Another eoures of the production of cartromio soll gare is one lately pointed out by a gentloman whom I cibed late your with gratt, tout not eroggontod jraine, as a mucemanful domonatrator of the butruth of the theary of mpontancorn geaumtion. M. Panour bes demonntrated that whepewer there inderest thera in life -thot, in fart, the sajud decay of oiparice mothor depends in egreat mownare on the exintence and omintevance of balergoopio heflaks. andi, na I stated in my last sear's lecture, denth th lit Nor M Puteur hew shown thet in all deonying matter expowad to the atmosimere, there exiet miconternut which-cary the oxygen of the atmouphere to the organio mathen eore vertang it ceatbon in cowbonle abldj it hyarogoe into water, ite eulphur into sulphriric acid, it phosphome noto phowhorio mak. At' to st nitrouen, other chetoical acthons come into play. There in atill another sourco of production of carbonie acid, which I cannot pean by in silence, for though at the proment day its activity is decreased by the better cativation of rand, ite infurace raut hato beon very smat whm men were leas numorous on the salface of our planet, and no doubt, oven now, that source of proluclion of carbonic nejd plays s greet part in the regetation Southem Amerlea'" Dr. Lyon Playfiry; Mr. J. A: Ren. sotno, and Mi Morla, yroved sonno yearn since that eertain sumall vegetable aubetances. known under the memee of conforves and alge, had the property, uniter the influenve of light, of decompesing carbonic acil ; while, od. the contrary, in diffued light or darknent they yield carbovil acid. "Shrange it it to thiml that often some of the trees of these wild foresta carry on thoir surface or their bark the vegelables which are to destroy them by absorbing their sap, and to feed them by liberating the carbonic neid enecutial to their growth.
As to the conferve, which exist in marrly lade, pools, and other slagnant waters, they disappear by the ladid of man as lo drulns 'the land and improve abuadant the atmosphere apta contain but a minute quantity, viz., four parts in 10 (100. Tbis fact may be regarded as owing, first, to a luw dibovered by Dalton of the extraordinary property which zases havo of being diffused and mingling togetber; scoondly, to the immensity of the atmonphere as compared evers with the abundant sources of carbonic acid; thirdly to its removal by conatant recetation, cither on land or in the oceau ; fourthly, that a grent portion of the carbonic acid which is produced in the interior of soils is absorbed by the spongelets of plants. Liebig calculated, some years since, that it our sources of production of carbonic acid were to ceace, and the present state of vegetation on the murface of our planet atill continued, there was \& \(\begin{gathered}\text { whficient mount of }\end{gathered}\) carbonic acid in the atzosphere to maintain it in full activity for's great number of sares fy to the decola position of chroonic acid by the leaves of plasts undex the influence of the cliemical rays of light-Acientific points which bave engaged the attention of many chemists, among whom I may cite Rouessingeult, Dr. Gladstone, Griowenden, and others, it is unnecessary that I should do more than state that the carbon of the carbonic acid is retained by the plant and contributes to produce the organic matters which form the frame of it, whilst the orygen is liberated in a pure state to contribute again to the reproduction of carbonic acid by tastog thelf on the carbon of decaying matter, or that which is produced by combustion or animal respitation.

NrTROQEY- Tho Ahsocption and firation of nitroren in plants are of the highest importance to vegetation and wo subject has more engaged the attention of chemists and agricuiturists than the ascertaining how nitrogen was supplied to plants, for if vitrogen is found but in small quantities in plante, atill its supply to vegetation is esential to the growth and bealth of thome plants. The quantity of nitrogen that a plant requiresis but small, but still, as it is an essential element to the formation of nitrogenated aub
tion of advancing knowledge? Beyond a certain limit / cows, by Mr. Egerton Harding, of Old Springs, Market
this may not be possible, but has this limit been attained? The great improvements of late years, in implements, in stock, and in all the details of practical The adoption of these improvements, however, has been in very different degrees in the various parts of the country. The climate has, doubtless, had much to do with this, but does not altogether explain the differences which prevail. The best farmed districts are those, where, as on the eastern coasts of the island, the rainfall is least. The climate of Ireland is, in this respect, much inferior, but it is not a sufficient reason for the backward state of agriculture prevalent there.
Can then a knowledge of these practical improvements be made more general-can they be still further advanced by scientific information? This is the problem which agricultural education has to solve. An extension of the knowledge of the best practice must be of unquestionable advantage. How far agriculture may be still further assisted, we shall now consider in examining the sciences which bear upon it.
I. Of these sciences I would first speak of Mathematical knoveledge. Not only is this knowledge of the most improving kind to the mind generally, but it is, including arithmetic, the forndation of two of the most useful aids to the farmer-land surveying aud bookkeeping. An agricultural education should comprehend a good knowledge of arithmetic, of the first four rules with fractions, proportion and interest, and of at least the first bonk of Euclid, with the principles of land measurement and mensuration generally. To none useful; he should constantly have to do with it, and can be with advantage guided by it. I can remember on my first experience in farming, distributing a large manure heap pretty evenly over a Turnip field, and
being couplimented by a labourer saying, "I had being couplimented by a labourer saying, "I had
guessed it well;" but it was not the result of guessing, but of measurement. A knowledge of measurement, solid as well as superficial, should be acquired by the farmer, and to him land measmrement is of peculiar utility. By it he is enabled to ascertain the contents of any piece of land which may be desired. Evelu with out iustruments this may be done. The necessary triangles or rectangles being laill off, the number of paces in their sides will give with sufficient aceuracy their length in yards, from which the, required principles this need present no difficulty, but without this knowledge it will be impossible in all cases to arrive at accuracy.
Book-keeping, or a knowledge of accounts, is perhaps
of all others the kind of knowledge which will be most of all others the kind of knowledge which will be most
generally useful to the furmer. The forms of farm book-keeping hitherto published have been ton complieated, and the tarmer has in too many instances solved the difficulty by keeping no book at all. But every farmer slould be able to keep a book, and to draw up some kind of balance sleet. In every business it is necessary occasionally to take stock and to form some kind of estimnte; in none more so than farming. The farmer
reaps his harvest and it may appear abndant. 12 months must elapse before he can know the result of the actual yield and price obtained. Meanwhile his expenses, family and otherwise, go on as usual, and thus if there is any serious shortcoming he is placed in a
difficult position and unable to meet his ront difficult position and unable to meet his reut. Farming is a profession involving much uncertainty. It is influenced by the seasons and dependent upon the markets. To how great an extent, the following striking Table will show, being a report of the produce upon a Lincolnshire fen farm, where an account had been kept for a number of years :-
\begin{tabular}{|c|c|c|c|c|}

In this case the rent of the farm was 200l., an amount Which is exceeded by the difference between the return for the year 1856, and that for the year 1861.
All these fluctuations the tenant has to fear, his rent is fixed, and mavy of his other expenses also, so that while in one year a handsome profit may be realised, in another a positive loss may accrue. To none then, more than the farmer, is it pecessary to form an estimate; he cannot be too early informed of the probable result, and upon his ability to form a correct estimate, much of the success of farming may depend. That a correct estimate can be formed in regard to a crop,
Mr . Coleman, of Woburn Park Farm, has shown in the Mark Lane Express for Sept. 4, 1863, wherein he states that the estimated yield of the crop, 1862, on a farm of 155 acres, was 5115 bushels, and the quantity actually threshed was 5135 bushels. In the case of the Turnip crop, it is still more necessary to form an opinion. What will be the return, and how many head of stock can he feed, are questions the farmer must ask and answer.
To do this judgment is required, but the assistance of figures is also necessary. With these he must be well acquainted, and they should form an integral part of the mathematical knowledge required in his professional education. That mathematical kuowledge can end to the improvement of agriculture must be admitted, and we may proceed to consider those other
sciences from which assistance may be derived sciences from which assistance may be derived.
II. The next science of importance to the agriculturist is Veterinary science. When the great value of the live stock throughout the country is considered, strikingly exhibited in the returns which have been made both in Scotland and Ireland. In Ireland accurate statistics are taken, both of the crops and stock, every year. From this we are enabled to estimate their respective values. The returns for the year 1864 are as given helow, inad
Registrar-General :-

Return of tie Irish Crops and Stock for 1864

From this it appears that the value of the stock is quite equal to that of all the cultivated crops grown. The rates assumed for the stock are those of the Census Commissioners for 1841, since which time the improved character of the stock and increased price of meat will both have tended to improve its value.

The Scotch returns exhibit the same result. The last year for which these were obtained was 1857. The return for the crop for that year, was, as officially estimated, and taking the prices which then prevailed, as follow. The stock is estimated at the rates given in the Irish retarng, although this may be considered too low in the case of horses and cattle, and perhaps too great in the case of sheep.

Return of the Crops and Stock in Scotland, 195\%,
\(\begin{array}{ll}\text { Whent } & \because \\ \text { Barloy } & \because \\ \text { Bats }-. & \because \\ \text { Bere } . & \\ \text { Beanis and Peas }\end{array}\)

qual to that of the value of the stock to Ireland. In both countries the proportion the case of small which is under crop, compared with thand extent of the country, being in Scotland, 2,083,063 toced and in Ireland, \(4,034,938\) acres, out of \(19,352,323\) acree, and \(20,808,271\) acres, their extents respectively. In Scotland this is to a great extent necessarily the case, from the great extent of mountain pasture quite Fr cable for arable purposes.
be assumed that the rule still holds, and that althong be assumed that the rule still holds, and that althong
a much larger proportion of the country is arable a much larger proportion of the country is arable, set inferior in value to that of the cultivated crops.
These considerations tend to show the great inter which \({ }^{\text {º }}\) the farmer has in his stock. It is, in fant, not unfrequently more than half his wealth. Whatever, there fore, tends to maintain its value, tonds also materialiy to his advantage, If the liability to disease and consequent losses therefrom be considered, the value of what.
ever may diminish this risk will be apparent. ever may diminish this risk will be apparent. This is the object of veterinary science, and none of the sciences which concern agriculture have of late yean made greater advances. It is not to be expected that every farmer will or can become a veterinary surgeon, That is a distinct profession, requiring a great amount of competent knowledge; but it will be of the greatest utility to the farmer if he can be enabled to detect a disease by its symptoms, and apply the proper means to check its progress till the veterinary surgeon can be called in, and meanwhile communicate to him such information, that he may come provided with the proper remedies. The death of a single animal may be a serious loss to a farmer, and although we nay not be able to "assert like old Clater, in his "Every Man his own Cattle Doctor," that a drink or two at a stillhng or
eighteenpence each would have saved this, yet a knowledge of the principles of the veterinary art may so enable the progress of disease to be stayed, that the regular practitiouer when called in has a fair caance of effecting a cure. Veterinary practitioners now ex:in considerable numbers, and receive an eduration wer.
qualified to fit them for their profession. It is, herifore, to the interest of the farmer to avail himself of their assistance when required, and in order properiy carry out the treatment which they may preseribi, acquire for himself some preliminary knowledge of the subject. Veterinary science is also connected with the important subject of ascertaining the age of animmis by their dentition. The ustal indications of age 11 the horse are derived from certain marks in the incioor
teetb, principally those in the lower jaw. It is by teetb, principally those in the lower jaw. It is by
practice alone that proficiency in this can bo attained, but it is necessary in the first place to be informed what the indications are to be looked for. This information veterinary science will impart, and by it the age of the horse can be determined even up to 20 yeara. The other domesticated animals bred upon the farm have also their dental indications, from which, when necessary, their age can be ascertained. Veterinary scienec
has an essentially practical bearing upon agrieniture, has an essentially practical bearing upon agriciture,
and as such demands the attention of every enlightened agriculturist.
III. The next science of importance to agriculture is Mechanical science. As implements may be churacterised as the right hand of agriculture, so mechanical science, it has been said, by improviug their form and advancing their construction, has given cunning to that right hand. By investigating the strength of the materials it employs, it makes use of no more maten to in the manufacture of implements than is sufic disorer overcome the force of resistance, and it seeks to the least
that form which overcomes resistance with the power. Simplicity of construction, beauty of mathematical adjustment and symmetrical proportion of the whole machine, are now the characterisico oments implements, and it is not the fault of eithow efficient neatly, and quickly performed. A mid the multipici of inventions it may not be necessary for the farmer be an inventor, but he may still reuder as grea a service to agriculture by simplifying
useful machine, and thus rendering eminent agricultural engineers who are now to be tound in all parts of the country have, to a great extent, fied the practical difficulties whichare connected branch of agricultural science; and the hands, \(p\) a great extent leave the matter in the particular in and specialities of the machines which daily issue fr their workshops.

The employment of steam power, however, is a hrauch of this subject which merits spec

with no other food than good hay. On putting the same animal upon London food-grains, Swedes, and cake-it was true that the yield of milk was increased
frou \(3 \frac{1}{2}\) gallons to 5 gallons per day, but there was not one ounce more butter in the latter quantity than in the former, and the \(3 \frac{1}{2}\) gallons yielded an equal quantity of nutritive constituents to the 5 gallons. Thai cow produced at the present price of milk \(88.4 d\). per day, him about 2l. profit, an anount which he thought a dairyman ought to be satisfed with. He thought London would be better supplied with milk from the conntry than from within itself, but the great difficulty at present was the transit of the article by railway; and when he stated the fact that from Aylesbury and per day were sent, at a cost of about 3000 l. per annum, and that 10 such stations would jiald a return of 30,000 . a year to the railway company, he thought it would be to the interest of the company to supply proper appliances to convey the milk to London in an uninjured condition. For that purpose he suggested the employment of tracks with double roofs like the carriages in India and Egypt, so that the current of air passing through the double roof would keep the milk in a cool state, while a simple mechanical contrivance deteriorated the milk. He further suggested that the deteriorated the milk. He further suggested that the
loads of milk sent up at night should remain in the loads of milk sent up at night should remain in the
trucks all night (especially in hot weather) in a siding four or five miles from London, and that they should be brought up to town specially at an early hour in the morning. By these means the quality of the milk would be best preserved. In his opinion the future supply to London would depend entirely upon prising cowkeeper who lost the whole of his stock and a great part of a second stock, and unless there was a cessation of the discase he felt pretty certain that cowkeeping in London would cease altogether, and their only supply would be from the country.
Mr. Jones stated that as an amateur dairyman be had on some occasions a great deal of milk thrown on his hands through being spoilt in leeping, and this led him to adopt the plan of cooling the milk down by placing it in pans of water. With regard to the alleged better quality of London mills, he would be glad to be informed in what gense the term "better" was taken? Did the superiority consist in the quality of in the mind of the London dealer the milk which would keep the longest was best for his purposes, and he did rot tronble himself eitlier about the proportions of caseine ar other constituents, or its specific gravity. If the country milk were treated in the same way as the London, the probibility was it would arrive in better condition; but if nilk was put intc the cans warm, and closed over so that the steain could not escape, the condensed vapour dropping into the milk would have a prejudicial effect in promoting decomposition.
Mr. LUNDY, of Edinburgh, suggested, a mechanical contrivance for the carriage of milk by railway, similar As a member of the Sanitary Committee of the Town
Council of Edinburgh, he expressed himself very strongly against the system of feeding the milch stock of that locality on the coarse rank Grass produced on the Craigentinny meadows by sewage irrigation. Yet it was thie fact that those meadows were let to cowkeepers at the enormous rent of 40. . per acre.
The Chairman said the time had now arrived when it became his agreeable duty to propose a vote of
cordial thanks to Mr. Morton for the exceedingly interesting and valuable paper he bad read:-If time had permitted, he should have been, glad to have entered a one point to which he would refer. The subject treated of in the paper was the supply of London with milk, and Mr. Morton had not taken up the sanitary considerations pertaining to the question; but in such a large population as existed in London he thought the sinitary question was one that ought not to be over-
looked. the meeting when he said they tendered to Mr. Morton their best thanks for the exceedingly able, clear, aud interesting paper which he had read.
Mr. Morton said be was much obliged for the compliment pand him. He would merely confirm the statement made by Mr. Lundy, that the rank Grass produced by the Edinburgh sewage brought the enormous rent of \(40 l\). per acre for the production of milk. He thought this was a sufficient answer to the objections urged by that gentleman against feeding cows on that description of pasture.

\section*{Farmers' Clubs}
2.Cirencemina: Dacimber 4:- Tovon. Sumage.-A lecture on "Seqwage" was delivered by Dr. J. E. Gilbert at Cirencester. The chair was occupied by \(\mathbf{F}_{4}\) Bowly, Eaq. There was a gord attendapce of the farmer and gentlemen of the neighbourthood.
Dr. Gllbert commenced by referring to the difficulties that beset the question. The objects desired were perfect utilisation of excretal matter, and at the same time perfect freedom from nuisance. In those countries, as China and Japan, where ithe "dry" system was adopted, the utilization was very perfect, but the

\section*{naisance}

He thonght that Moule's "dry earth" closets might be employed in villages with success, but in towns the use of water was the only means consistent with confurt or health.
The licquid sewage obtained on the present plan when turned into the rivers iestroyed the fish, and rendered the water monit for human consumption, Could th contains would be turned to account, while the drainage water from the fields would be so far free from impurities that rivers would not be polluted by it. Taking this as the scheme that nowst be uned both to utilise and purify the sewage of towns, the next point is the value of sewage as a manure.
The composition of sewage was liable to great fluctuations, from the varying anount of rain and drainage water mixed with it. In the experiments at Rugby, conducted by the Royal Commission, 93 analyses of sewage had been made during a period of nearly three years, each sample being an average of several days' sewage; the highest anount of nitrogen found was equal to 15.64 grains of ammonia per gallon ; the lowest to 2.55 grains per gallon. The average composition of the sewage for the 31 months was 7.0 grains of ammonis per eallon, or in 1000 tons 224 lb . of give the ammonia a value of \(8 d\). per lb ., this will include the value of the other important ingredients. The value of the Rugby"sewage thus calculated would be \(1_{4}^{9}\) d. per ton-this is of course giving the ammonia the value it has in dry and portable manures.
The lecturer referred to other calculations, which gave as the composition of human excrements, \(12 \frac{1}{2} \mathrm{lb}\). of aminonia per head per anmm, for a mixed popula-
tion; with a value of \(8 s .4 d\). These \(12 \frac{1}{2} \mathrm{lb}\). of ammonia tion; with a value of \(8 s .4 d\). These \(12 \frac{2}{2} \mathrm{lb}\). of ammon
were at Rugby distributed through 56 tous of fluid.
With regard to the sewage of London the lecturer had Professor Way's permission to refer to sume analyses recently made by bim, which pointed to a lower value for London sewage than that obtained at Iugby.
Since sewage was in composition a nearly perfect manare, it would appear suitable for a great variety of crops; in practice, however, the application was almost confined to Grase. Other crops can only be treated with small amounts of sewage, and that only in dry
weather; moreover, the simple plan of distribution by open runs is inadnissitle. The sewage has thus to be conducted over a larger area, and at a greater cost, than is the case with Grass. Moreover, sewage must be employed on the land all the year round, or the ivers suffer pollation.
At Rugby the average crop of Grass obtained was, with 3000 tons of seware, \(22 \frac{1}{4}\) tons; with 6000 tons, \(30 \frac{1}{4}\) tons ; and with 9000 tons, \(32 \frac{1}{2}\) tons. The felds were not large enough for the same sewage to be repeaiedly used, so that the increase was not so great as it would be under more favourable circumstances. Of the two fields, that which gave the smaller natural produce gave somewhat the larger under the influence of sewage, being flatter, and the soil of a more porous natare

The Royal Commission had applied the sewaged Grass at Ruyby to the fattening of oxen and the production of mailk. The increase in weight of the became tolerably good when oilcake was added. With cows the result was much better. The Grass from 5000 tons of sewage will yidll about 1000 gallong of milk; this at \(8 d\) a a gallon gives a return of \(\$ 3 \mathrm{l}\). Were the whole sewage of a given population converted into
By feeding animals with sewaged Grass, and manur ing arable land with the dung thns obtained, sewage would contribute to the production of grain crops. Thelecturer then passed in tefiew the resulta oftalited in various towns. In most cases very large quantilies of sewage were applied, and over 60 tome of Grass per
acre were in some places produced. The pupification of the sewage when large quantities were applied was very imperfect; the Commissioners recommended the use of only 5000 tons per acre.
With regard to profit by towns from the application of sewage, it must depeud chielly on the cast of dim tribution. Where the sewage could be conveyed to
Grass land by gravitation, a profit may be looked for; but if machinery had to be eniployed, or the se, rage taken to a distance, the nndertaking, though necessary on sanatory grounds, might not cover its expenses.

At the conclusion of the lecture a short discussion followed. Mr. BowLy then rose and said, he had been asked not to let the meeting separate "ithout suggest-
ing the formation of a Farmers' Club for the district of Cirencester. He dwelt on the kenefit conferred by the club which had formerly existed; and trusted they might look to the College for assistance in the supply of lecturers.
Mr. Rucx then moved the formation of a Parmers' Club, and proposed Mr. Bowly as chairman. The resolution was unanimously agreed to.
The Rev. J. Constable said, on behalf of the College, they were ready to give their hearty co-operation to the scheme, and expected its benefits would extend to their own institution.
It was then arranged that a meeting should be held on the Monday following, and that Prot. Murray should

Since the 18 th inst., frosh cases have 134 different places in which the disease has maniferted itself. The number attacked during the past Theek has been 1651 or 235 per diem, and chbse ded and villed, 1139 , or 162 per diem. move -" That a memorial be presented to the S.ecretary state for the Home Department, otepresenting that in the opinion of chis Court to ig expedient, with a view to nsure for the future prompt end simultaneous action on the isubject of the cattle plague that firther meastires be adopted for the regulation of cattle trafic throughout the area if measures for the regulation of eattle traffic, provision be made for the transfer, with due precaution, of live cattle from the farms where they rare reared to the ferms where such eattle are asially grazed. wold further, that proviston be made for the supply, inder sach restrictions only as may be absolutely necessaty, of cattle for mamediate slaughter to the consuming popula. tion, subject, however, to the condition that cattle so ent to any town or prace be allowed to leave such lown or place alive." Cases havewsen reported in Eseex at Great Bentley, Wix, St. Osyth, \&c., but the disease does not appear to be extending very seriously. - The cattle plague is spreading and increasing in viralence in Oxfordshire, more particularly in the cates have occurred in the paxishes of Cassington, Yarnton, Kidlington, and Watereaton, which is one of the finest grazing villages in the county. The homoenpathic system is still being tried there, and on a farm at Tuscot, on the banks of the Cherwell and adjoining Mareton, where the plague almost decimated the horned cattie, the Russian remedy, the vapour bath, has liad rial, the apparatus being most elaborate, but the four cues subnitted to it have all resulted fatally. In the Oimoor towns (Bicester district) it has also appeared, as well as at Crawley (Witney district), The neighbouring counties of Berks and Bucks have aleo felt the inuance of the plague.- The disease has been making great strides in Suffolk, in the neighbourhood of Mildenail. Messrs. Gittus, Youngman, Butcher, Aves, Rolfe, and others lave lost altogether nearly 30 beasts, aldn thie 1 xworth diatrict the inspector has had no fresh cases to report, and he has now no diseased beasts on his hands; The ring the past week, however, three beasts bave died. The rieighbourhood or Rickinghall is also now free from the dinease. Of the whote number of beasts attacked hetonging to Messrs. 28 Wheldrick, Bryant, and Clarke, five have been saved under the treatment pursued by M. W. Rush, veterinary surgeon.

\section*{THE ELEVATOR GUN.}

SECURED BY ROYAL LETTERS PATENT.
The Invention of EDWARD CHARLESWORTH, Esq., F.G.S., who after traversing the noted robber passes in the mountains of Mexico, turned his attention th construction of a FIRE-ARM, which should comprise within the smallest possible compass the greatest amount of power, and which, in the hands of a Traveller, shr be equally effective as

\section*{A WEAPON of DEFENCE, or a FOWLING-PIECE.}

\section*{THE UNDERSIGNED HAVING OBTAINED FROM MR. CHARLESWORTH AN}

\section*{EXCLUSIVE LICENGE FOR THE MANUFACTURE AND SALE OF THE ELEVATOR GUN,}

HAS, BEFORE INTRODUCING THE INVENTION TO THE PUBLIC GENERALLY, OBTAINED FROM GENTLEMEN, WELL KNOWN THROUGHO THE UNITED KINGDOM, THEIR OPINION OF ITS MERITS.

Captain Burton, the African explorer, says:-
"The, utility of the Elevator is sufficiently established. I am taking one out with me to South
Captain W. H. Patten-Saunders, K.C.G., says:-
"Your Elevator Gun is a step in advance of anything 1 have ever seen. I can certainly do with it
what I have never been able to do with any other."
Viscount Milton says:-
"I consider Mr. Charlesworth's Elevator Gun peculiarly adapted for traveliors."
John Phillips, Esq., of Granville Park, says :-
"I have tried the Klevator Gun constructed by Mr. Charlesworth, and for general purposes much prefer it to the shoulder gun; while the readiness with which this new fire-arm can be used on horsebeck, and the small compass in which it can be stowed a way, make it invaluable to travollers."

Captain Norton, in a communication to the Times, speaks of the Elevator Gun as "a very remarkable weapon."
Colonel Battersby (Stanley Villa, Surbiton), in a letter to Captain Norton, speaking of the death of Captain Speke, and the numerous gun accidents occurring about the same date, writes :-
"Though time alone must decide how far the adoption of the Elevator principlo may diminish the combination of power, portability, and facility of shooting these Eleevator guns surpass anything yet known.
Mr. W. P. Colchester, writing from Grundisburgh Hall, Suffolk, tells me that he took out one of those guns winh him on Jamaica, and that, thought the princippe was then quite new con hu, he found he back he could get shots in positions where the shoulder gun could not have been used. Itherefore own myself won over to the opition you have expressed in the Times, and am prepared to see the shoulder pieces of our guns succumb to the Elevator in the same way as fint and steel have given way before the

Captain Norton, in reply to the above, says :-
" 1 am most happy to hear that Mr. Chariecworth's Elevator system of ahooting is attracting the
ttention it so greatly deesrves,
Public lectures are most necessary to attention it so greatly deserves, Public leotures are most necessary to guard against gun accidents,
and if the youths at schools were in this way instructed, it would be the means of saving many valuable lives and most serious injuries,?

Samuel Waring, Esq., of The Oaks, Gipsy Hill, Norwood, writes :"I find I can shoot quite as well with the Elevator as with the shoulder gun, and nuch prefer it throws the recoil on the hands, which are mud
nileo much chooper, lightor, and cortainly aafer."
F. H. Sailvin, Esq.. of Killingboch Hall, Leeds, author of "The Falconry of th British Islands," writes :-
"The Elevator Gun, for which I enclose a cheque, has arrived safely, and I like it upon very much."

Edmund Thomas Higgins, Esq., M.R.C.S., says:-
"I have found Mr. Charlesworth's Elevator Gun a most useful companion in my omilthoic Captain BeDr of the Free Museum, Liverpool, remarks of these guns :-
"When last exprossed himseif highly attifed with the cast,"

\section*{Richard Taylor, Esq., of Wimbledon Commow, says :-}
" 1 have had but one opportunity of trying the patent Elevator Gun which I purchased last but that was a very satisfactory one.
"I went out for an hour in the afternoon on Wednesday last in the plantations of Carclew, Con and shot with it three times The frrst time at a a black birr on the wing, the
the third at a woodcock, killing all three, finding the gun very handy and quick."

The late Sir Angus Campbell, of Dunstaffnage Castle, Argyleshire, writes:"I have received the Elevator Gun, and find it a very handy weapon. My keeper at the find

From J. B. Davies, Esq., of the Natural History Museum, Edinburgh :"I have given one of these guns a trial, and aan report favourably of the faoility and eatrainty and zoology of New Zealand, has taken one with him."
The Editor of Bell's Life, after trying these guns, says, in the columns of that Pape We the "Wo are inclined to think with Captain Norton, that this Elevat

\section*{GENERAL ADVANTAGES}

Presented by the ELEVATOR GUN over the shoulder fowling-piece:-It is less costly, far more portable, more easily cleaned; has nothing about it liable to break by an ordinary fall; is less liable by bursting or accidental diseharge to injure the shooter or his companions ; offers complete security against the loss of an eye by the escape of the percussion cap.

\section*{SHOOTING ADVANTAGES}

Greater effectiveness in thick cover, as it comes up quicker, and commands sho positions not available with a gun resting against the shoulder

Especially adapted for shooting in boats and for ornithologists. As a house Especially adapted for shootis an of a gun, while, like a pistol, it can be loaded under lock and key in a bedroom drawer, or in its case.```
